
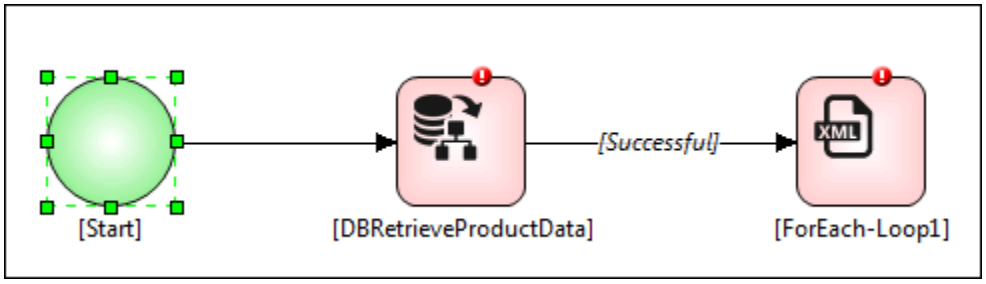
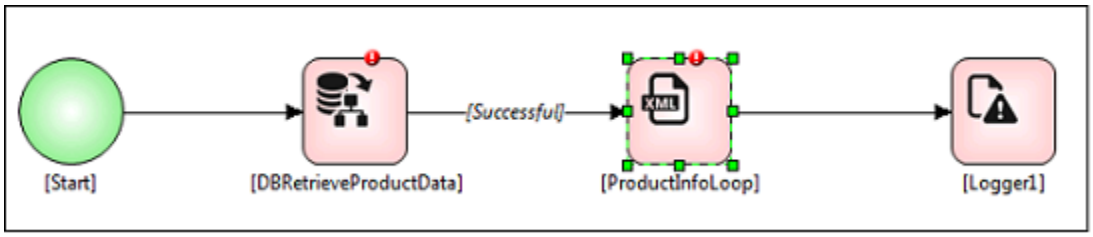
2. Add the connector and add the connector value as 'Success'.

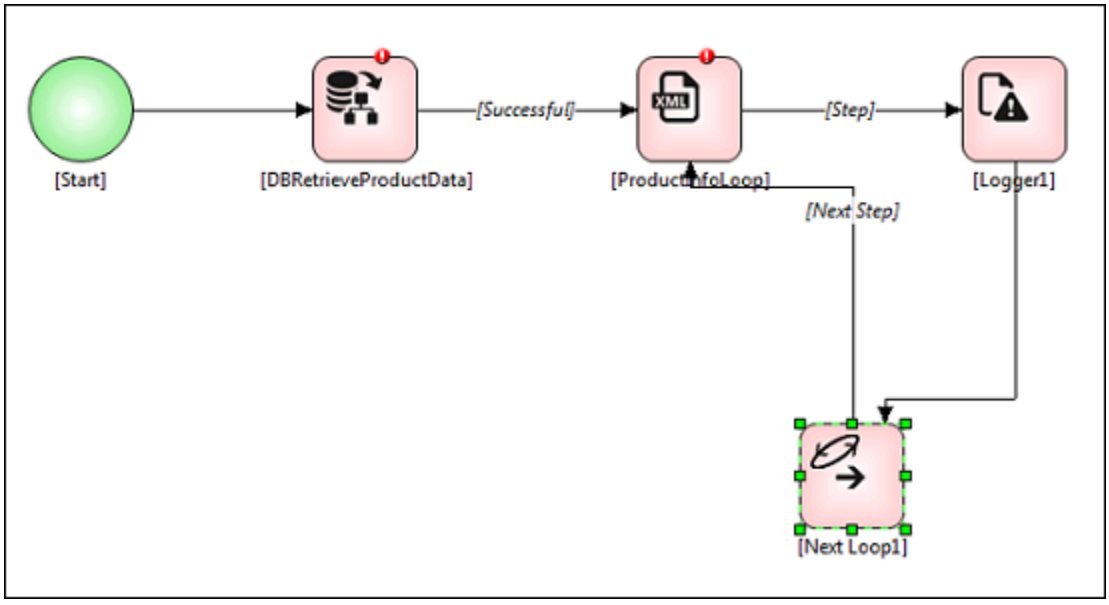


© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Go to the Property window of ForEachLoop. Change the Activity Name, if needed. Assign the XMLIterator which is created above in the last step of database activity. Click Save.
4. Add the logger to log the information of the iterated node values.



5. Add the step event to the connector.
6. Change the properties of the logger. Add Logtype as 'Information'. Click on the LogMessage icon to get the editor below.
7. Select XML variables, iterator and variable. Click on the Update button.
8. Save the Logger workflow.
9. For foreach loop workflow, we need to have a 'Next Loop' activity to go to the next node in the XML variable. Add the NextLoop workflow.
10. Add the connector between the Logger and Next Loop.
11. Add the connector between Next Loop and foreach loop.
12. Add the "Next Step" event to the connector of Next Loop and foreach loop.
13. Save the Next Loop activity.



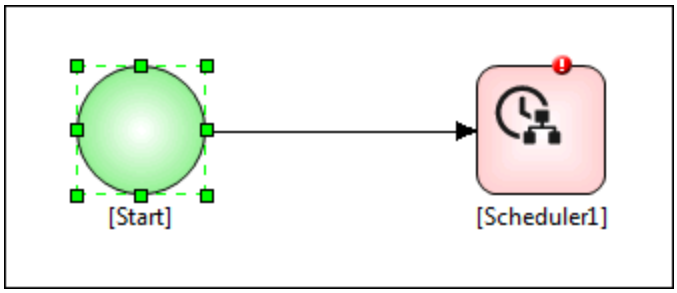
Edit Scheduler Activity

Database activity or complete workflow can be scheduled to run on weekly basis or at a specified date-time.

Output result of the Scheduler activity can be input to the next activity like the Database activity.

1. Select the Scheduler activity from the Scheduler activities group.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



2. Go to the properties of the Scheduler activity. Mention the Scheduler name, Scheduler details and the output path.
3. Configure the Scheduler details by clicking on the Scheduler details icon.
4. Let us configure the weekly scheduler as every Sunday, 1 AM recurring. Mention recurrence as 0 for having infinite recurrence. Click on the Update button.
5. Configure the output path. The Output path is the result of the Scheduler task after it is executed at the scheduled time. Let us keep its value as "executed".
6. Click on the **Save** button and connect it to the database activity. Select the "executed" event on the Scheduler connector.

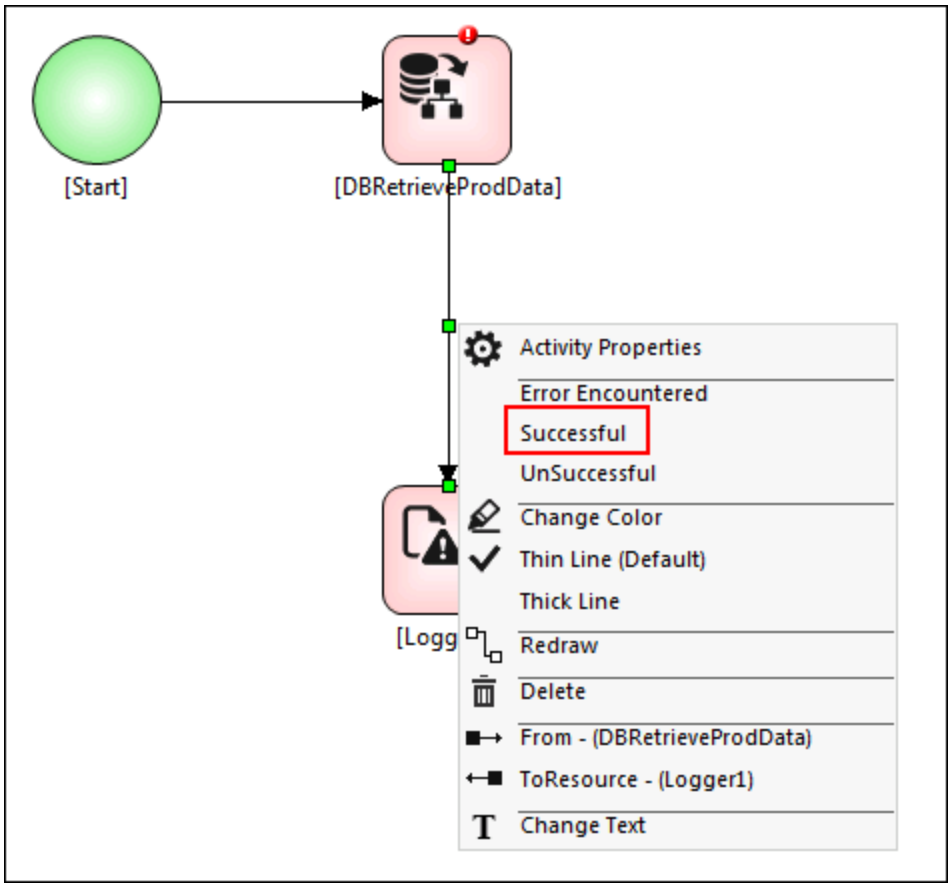
Diagnostics

To add Logger activity

We can add the logger activity to show the retrieved data in the logger. In the example, on successful execution of the Database activity, the retrieved data will be stored to the XML variable outXmlInfo. The value from this variable can be shown in the logger.

1. Add the Logger activity.
2. Add the connector between database activity and logger and ensure that Successful event is selected.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Go to the property window of **Logger** and select **Logtype** as Information.
4. Mention the logger message using the Expression Editor. Expression Editor is needed to show the XML variable values. Click the **Expression Editor** icon to open the Expression Editor. Add the text to editor and click the **OK** button.
5. Save the **Property** window of the logger.
6. Publish the activity and **Test Run** it.

   The results can be seen in the Logger Console.

Move System Platform Galaxy and AVEVA Work Tasks Repository from Engineering Environment to Production Environment

This document gives detailed instructions to move the System Platform Galaxy and AVEVA Work Tasks Repository from engineering environment to production environment. In addition, this document also gives the detailed steps to move only the workflow and some of the galaxy objects from engineering to production environment.

Following three scenarios have been explained in this document:

- Moving System Platform Galaxy and AVEVA Work Tasks Repository from Engineering Environment to Production Environment
- Moving only the Workflow from Engineering Environment to Production Environment
- Moving a Gateway Object, Workflows, and Associated Workflow Events

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Prerequisites

- Prior knowledge of AVEVA Work Tasks is required.
- AVEVA Work Tasks Repository should be provisioned from ArchestrA in the engineering environment.
- In the production environment, System Platform Workflow Connector should be installed on the GR Node and System Platform Workflow Extension should be installed on the AVEVA Work Tasks Server.

Move System Platform Galaxy And Repository

This section gives you step by step instructions on how to import ArchestrA Galaxy and Repository Database from engineering environment to production environment:

- Importing Repository Database from engineering environment to production environment
- Importing ArchestrA Galaxy from testing environment to production environment

Move Repository

We recommend to have the same domain and galaxy name on both the engineering and production environment.

The following steps also take care of domain and galaxy name change in the production environment.

Complete the following steps to import Repository Database from engineering environment to production environment:

1. Take a backup of the required Repository database present in engineering environment's Server.
2. Copy the database backup file in the production environment.
3. Restore the database in the production environment of the Workflow server.
   a. Open SQL Server Management Studio and connect to Database Engine.
   b. In the **Object Explorer**, go to the Database.
   c. Right-click the Database and select **Restore Database** from the context menu to restore "XXX" database.
4. Execute the SQL script given below on the restored Repository database in production environment.

   Before executing the script the following changes needs to be done:
   - Set or change the value of @OldRepositoryName with Workflow Repository name as in the engineering environment.
   - Set the value of @UniqueEnvironmentName with Unique Environment Name used in the engineering environment while provisioning the Repository from ArchestrA.

     -- Declaring variables

     DECLARE @OldRepositoryName AS NVARCHAR(150)

     DECLARE @OldUniqueEnvironmentName AS NVARCHAR(150)

     -- Set the Old Workflow repository name

     SET @OldRepositoryName = '<Old Repository Name>'

     -- Set the Unique Environment name - The Unique Environment Name used to initially while provisioning the workflow repository in engineering environment

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
SET @OldUniqueEnvironmentName = '<UniqueEnvironmentName>'

-- Deleting all ArchestrA external connections details entries from SKExternalConnectionDetails table

DELETE FROM SKExternalConnectionDetails WHERE RecordParentItemId IN (SELECT Id FROM
SKExternalConnections WHERE SourceType='ArchestrA' AND Application=@OldRepositoryName AND
Title=@OldUniqueEnvironmentName)

AND Application=@OldRepositoryName

-- Deleting all ArchestrA external connections information from SKExternalConnections table

DELETE FROM SKExternalConnections WHERE SourceType='ArchestrA' AND Application
=@OldRepositoryName AND Title=@OldUniqueEnvironmentName

-- Deleting Galaxy User resource mapping from SKESGResource Mapping table

DELETE FROM SKESGResourceMapping WHERE UserId In(SELECT Id FROM SKVirtualActor WHERE
Provider = @OldUniqueEnvironmentName AND ResourceHandler=@OldRepositoryName)

AND Application=@OldRepositoryName

-- Deleting galaxyuserprovider and galaxyrole provider entries from SKEntityDataSourceProvider table

DELETE FROM SKEntityDataSourceProvider WHERE Provider='galaxyuserprovider' OR
Provider='galaxyroleprovider' AND Application=@OldRepositoryName AND
InstanceName=@OldUniqueEnvironmentName

-- Deleting 'galaxyaduserprovider' and 'galaxyadroleprovider' entries from SKEntityDataSourceProvider
table

DELETE FROM SKEntityDataSourceProvider WHERE Provider='galaxyaduserprovider' OR
Provider='galaxyadroleprovider' AND Application=@OldRepositoryName AND
InstanceName=@OldUniqueEnvironmentName

-- Updating SKEEventAssociations table and Setting EventBindingXML with rootnodes where ever
EventBindingXML is empty

-- This step is required to avoid the 'Root Element is missing' message while attaching the datasource and
creating a repository

UPDATE SKEEventAssociations SET EventBindingXML = '<EventBind></EventBind>' WHERE
RTRIM(EventBindingXML) = '' AND Application =@OldRepositoryName AND
EventProviderName='ArchestraEvents'

-- Truncating Galaxy Role User Mappings table

DELETE FROM GalaxyRoleUserMappings WHERE UserId IN (SELECT Id FROM GalaxyUsers where
UniqueGalaxyName=@OldUniqueEnvironmentName)

-- Deleting Galaxy Role Security Group Mappings table

DELETE FROM GalaxyRoleSecurityGroupMappings WHERE Id IN ( SELECT Id FROM GalaxyRoles WHERE
GalaxyName = @OldUniqueEnvironmentName)

-- Deleting Galaxy Roles from Galaxy Roles table

DELETE FROM GalaxyRoles WHERE GalaxyName = @OldUniqueEnvironmentName

-- Deleting Galaxy Users from Galaxy Users table

DELETE FROM GalaxyUsers WHERE UniqueGalaxyName = @OldUniqueEnvironmentName
```

5. If the Repository in the engineering environment is also provisioned from MES, then the SQL script (given below) needs to be executed on the restored Repository Database in the production environment.

   Before executing the script the following changes needs to be done:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Set or change the value of @OldRepositoryName with Workflow Repository name as in the engineering environment.
- Set the value of @UniqueEnvironmentName with Unique Environment Name used in the engineering environment while provisioning the Repository from MES.

  -- Declaring variables

  DECLARE @OldRepositoryName AS NVARCHAR(150)

  DECLARE @OldUniqueEnvironmentName AS NVARCHAR(150)

  -- Set the Old Workflow repository name

  SET @OldRepositoryName = '<Old Repository Name>'

  -- Set the Unique Environment name - The Unique Environment Name used to initially while provisioning the workflow repository from MES in engineering environment

  SET @OldUniqueEnvironmentName = '<UniqueEnvironmentName>'

  -- Deleting all MES Connection details entries from MESConnectionDetails table

  DELETE FROM MESConnectionDetails WHERE RecordParentItemId IN

  (

  SELECT Id FROM SKExternalConnectionDetails where RecordParentItemId IN

  (

  SELECT Id FROM SKExternalConnections WHERE SourceType='MES' AND Application=@OldRepositoryName AND Title=@OldUniqueEnvironmentName

)

  AND Application =@OldRepositoryName

)

  -- Deleting all MES external connections details entries from SKExternalConnectionDetails table

  DELETE FROM SKExternalConnectionDetails WHERE RecordParentItemId IN (SELECT Id FROM SKExternalConnections WHERE SourceType='MES' AND Application=@OldRepositoryName AND Title=@OldUniqueEnvironmentName)

  AND Application=@OldRepositoryName

  -- Deleting all MES external connections information from SKExternalConnections table

  DELETE FROM SKExternalConnections WHERE SourceType='MES' AND Application =@OldRepositoryName AND Title=@OldUniqueEnvironmentName

  -- Deleting MES User resource mapping from SKESGResourceMapping table

  DELETE FROM SKESGResourceMapping WHERE UserId In(SELECT Id FROM SKVirtualActor WHERE Provider = @OldUniqueEnvironmentName AND ResourceHandler=@OldRepositoryName)

  AND Application=@OldRepositoryName

  -- Deleting mesuserprovider and mesroleprovider entries from SKEntityDataSourceProvider table

  DELETE FROM SKEntityDataSourceProvider WHERE Provider='mesuserprovider' OR Provider='mesroleprovider' AND Application=@OldRepositoryName AND InstanceName=@OldUniqueEnvironmentName

  -- Updating SKEEventAssociations table and Setting EventBindingXML with rootnodes where ever EventBindingXML is empty

  -- This step is required to avoid the 'Root Element is missing' message while attaching the datasource &

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

creating a repository

UPDATE SKEEventAssociations SET EventBindingXML = EventBindingXML + '</EventBind>' WHERE SUBSTRING(EventBindingXML,LEN(EventBindingXML)-11,12) != '</EventBind>' AND Application = @OldRepositoryName AND EventProviderName='MESEvents'

6. Repository Data Cleaning: If you do not wish to retain the workflows runtime data, then execute the following script on restored Repository Database in the Production environment.

   -- Script for removing workflows runtime data

   TRUNCATE TABLE SKWorkItem

   TRUNCATE TABLE SKHWSActivity

   TRUNCATE TABLE SKWorkItemTransaction

   TRUNCATE TABLE SWTaskList

   TRUNCATE TABLE SKMultipleTimeoutWarning

   TRUNCATE TABLE SWActionEventLog

   TRUNCATE TABLE SWActionEventLong

   TRUNCATE TABLE SKWorkItemCounter

   TRUNCATE TABLE SKChannelWorkItem

   TRUNCATE TABLE SKWorkItemData

   TRUNCATE TABLE SKWorkItemFields

   TRUNCATE TABLE SWExecutionDetails

   TRUNCATE TABLE SWExecute

   TRUNCATE TABLE SWVariables

   TRUNCATE TABLE SKWorkflowEvents

   TRUNCATE TABLE SKChildWorkflows

   TRUNCATE TABLE SWCustomTimerDetails

7. In the production environment, navigate to Central Configuration to access the workflow server.
8. Click the **Datasource Settings** link.

   The **Datasource List** window is displayed.
9. Click the **Create Datasource** link.

   The **Manage Datasource** window is displayed.
10. Enter all the required values. Ensure that the restored database is selected for the Database value.
11. Click **Test Connection**. After the Test Connection is successful, a message is displayed.
12. Click **Ok**.
13. Navigate to **Central Configuration > Repository Settings** to view the **Repository List**.
14. Click **Add**.

    The **Manage Repository** page appears.
15. Select the appropriate data source (DevDS1) and check the **Attach Datasource** check box.
16. Enter the repository name, repository description, server name, and select the required Resource Provider from the drop-down list in the **Manage Repository** window.
17. Click **OK** to create the Repository.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Config Administrator** window is displayed.

18. Select "admin [AVEVA Work Tasks List]" in the **User Lookup** field and click **OK**.

    In this page, configure the administrator for the Repository.

    - In case the provider is "WorkflowManagementList", select the default user admin as administrator.
    - In case of other providers, use the user lookup and select the required user to configuring as an administrator.

19. Navigate to the Repository List and click the Site Path (url) to open the Enterprise Console Page.
20. Login to the Enterprise Console site and check whether all the workflows are displayed in the Workflow list.

Move System Platform Galaxy

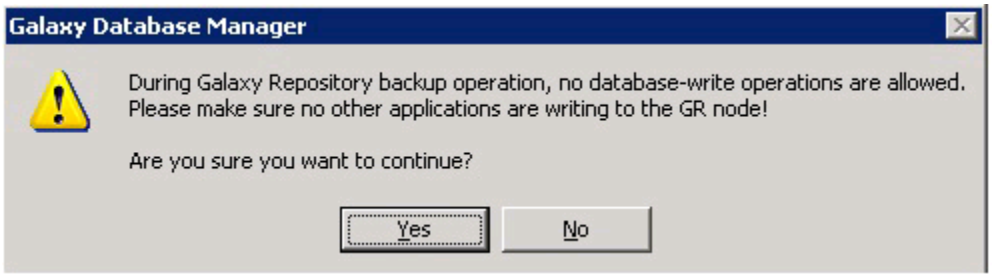
Steps to import ArchestrA Galaxy from testing environment to production environment:

1. Access the engineering environment in your machine.
2. Go to **Start > Run > aaSMC** and click **Enter**.

   The **ArchestrA System Management Console** is displayed.
3. Expand the Galaxy Database Manager.
4. Select the required galaxy instance which has to be moved to production environment.
5. Right-click the Database and select the **Backup** option.

   The Galaxy should be in Un-deploy state before taking the galaxy backup in the engineering environment.

   A warning message as shown in the following image appears.



6. Click **Yes**.
7. Select a path where the *backup.cab* file has to be saved and click **Save**.

   The **Galaxy Database Manager** screen appears.
8. Click **Close** after the backup is saved and copy the .cab file from the folder in which it was saved.
9. Access the production machine and create a new galaxy with the same name as in the engineering environment.
10. Go to the **Start > Run > aaSMC** and click **Enter**.

    The **ArchestrA System Management Console** appears.
11. Expand the Galaxy Database Manager.
12. Right-click the galaxy DevToProd and click the **Restore** option.
13. Select the ArchestraWorkflowSoftware.cab backup file and click on **Open**.
14. After restoring successfully, access System Platform IDE and change the GR_Platform network address to the actual production GR address. Save and close the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

15. Open WorkflowGateway (WGO) derived template/instance and re-provision with restored Repository in production environment.

    While re-provisioning let's keep Unique Environment Name same as existing (specified in the engineering environment)

    If multiple Workflow Gateway objects are present, then each of the Workflow Gateway object needs to be re-provisioned to the Repository.

    In case of derived template instances, only derived template need to be re-provisioned.
16. After re-provisioning the WGO, deploy the entire platform.
17. After successful deployment, you can see the all associated workflows under the workflow tab of the respective instances. Now trigger the workflow to test whether it is working or not.

    Ensure you use the same user in engineering and production environment, to see the associated Workflows.
18. If the Workflow is not triggering, then go to **Start > Run >** type **Services.msc** and click the **Enter** button.
19. Verify if SkeltaConnectorClientArchestrA service is running or not. If it is not running, then right-click on the service and click the **Start** option.
20. Verify again whether the workflow is triggered or not.

See *Using Workflow Features Inside System Platform IDE and Runtime* to provision a WorkflowGatewayObject and trigger a workflow.

Move only the Workflow

In this scenario:

- A workflow is exported from the engineering environment.
- A new workflow is created through the Workflow Management tab in the System Platform IDE.
- Workflow exported from the engineering environment is imported to the production environment and published.

1. Access the System Platform IDE in the engineering server.
2. Open the instance where workflow has been associated with the events.
3. Select the workflow, and then click **Unpublish**.

   A confirmation message about successful unpublish appears.
4. Click **Close**.
5. Select the workflow again, and then click the **Design**.

   The **Process Designer** window appears.
6. On the menu bar, click **Tool**, and then click **Export**.

   The File Download dialog box appears.
7. Click **Save** to save it as an XML file.
8. Move the Workflow XML file to production machine.
9. Open System Platform IDE in the production machine.
10. Open the specific instance to which you want to associate this workflow.
11. Create a new Workflow event. For example, *WF_Event4*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

12. Select **Workflow Gateway** instance from the drop down list.
13. Click **Select**.
14. Click **New Workflow**.

    The **New ArchestrA_Workflow** window appears.
15. Enter the **Title** and **Description**.
16. Click **Save & Continue**.

    The **Process Designer** window appears.
17. On the menu bar, click **Tool**, and then click **Import**.

    The **Workflow Management – Import – Process Definition** dialog box appears.
18. Click **Import** to import the XML file you copied from the engineering machine.

    It imports the actual workflow which you have designed in engineering machine.

    Assigned actor(s) can be changed using the activity property, if required.
19. Create all the associations required in the workflow.
20. On the menu bar, click **Publish**.

    A confirmation message about successful publish appears.
21. Click **Close,** and then go back to the System Platform IDE.
22. In the System Platform IDE, add the **Event Expression** and then click **Save** to save the instance.
23. Deploy the object.

    When an event occurs, the associated workflow will be triggered.

Move a Gateway Object, Workflows, and Associated Workflow Events

In this scenario:

A Workflow Gateway Object (WorkflowGateway_002) is created and a Drum_Conveyor instance is created. The Drum_Conveyor instance uses the WorkflowGateway_002 to associate workflow event. The steps followed for this are given below:

1. Create a Workflow Gateway Object in the engineering environment and provision it to AVEVA Work Tasks Repository.
2. Create a Drum_Conveyor instance. Add Workflow Event and associate a workflow to it.
3. Save and deploy the Workflow Gateway Object and Drum_Conveyor instance. Trigger the workflow.
4. If everything is working as expected, access System Platform IDE in the engineering machine.
5. Select the WorkflowGateway_002 and Drum_Conveyor_002.
6. Select **Galaxy > Export > Object(s)**.
7. Save the exported object in a disk. In addition, follow the steps 1-8 to export the workflow given in the above section Move only the Workflow.
8. Move exported objects (.aaPKG) and workflow (.xml) to the Production machine. Follow the steps given below.
9. Open the System Platform IDE of Production machine.
10. Go to **Galaxy > Import > Object(s)**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

11. Select the .aaPKG file that was moved from the engineering to production machine.
12. After successfully importing, re-provision the WorkflowGateway_002 with the Repository in production server.
13. Save and deploy the **WorkflowGateway_002**.
14. Open the Drum_Conveyor_002 and click the **Workflows** tab.
15. Select the events you have created in the engineering environment. Click the **Refresh** button of the **Workflow Gateway** drop-down list.
16. Select **WorkflowGateway_002** from the drop-down and click the **Select** button.
17. Click **New Workflow** and follow the steps given in "Move only the Workflow" (Steps 11 to 19).

Diagnostics: Logger Integration with ArchestrA Logger

In the AVEVA Work Tasks Integrated ArchestrA environment, troubleshooting is made easy by having a single tool for debugging messages from WTLogger Console and Wonderware Logger.

The Logger is able to log messages to the Logger, thereby leveraging the rich UI features of System Management Console for viewing messages. The Logger has rich UI features such as filtering and search option. Using the Logger Integration, you will be able to debug messages more effectively. The following screenshot of the Log Viewer show details of logged messages.

Available Log Options in AVEVA Work Tasks

AVEVA Work Tasks has the following logging options available:

- aaLogViewer
- AWS Logger
- Event Viewer
- Mail Handler
- Log file

If you install the AVEVA Work Tasks in the same environment as System Platform then the following default options are available:

- aaLogViewer
- AWS Logger
- Mail Handler

To modify the above-mentioned options, you must add the following registry entry of type string:

- Path: HKEY_LOCAL_MACHINE\SOFTWARE\AVEVA\WorkTasks
- Key: logToOptions
- Value: Refer to the following table:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Value	Description
ALL	AVEVA Work Tasks will log to aaLogViewer (If Wonderware environment), AWS Logger, Event Viewer, Mail Handler, Log file.
WL	Only AVEVA Work Tasks will log to aaLogViewer.
SLC	Only AVEVA Work Tasks will log to AWS Logger.
ML	Only AVEVA Work Tasks will log to Mail Handler.
EV	Only AVEVA Work Tasks will log to Event Viewer.
LF	Only AVEVA Work Tasks will log to file.

Note: If you have modified any values, restart the AVEVA Work Tasks services for the change to take effect.

Known Issues

- **"Could not create class ArchestrA.Toolkit.ArchestrAWorkflowGateway.ArchestrAWorkflowGatewayConfigtime. Class not registered" gets logged in the ArchestrA logger during Gateway Object configuration.**

  Possible Cause:

  This error is seen by Beta users. There is already a Gateway Object instance for a non-active Galaxy. If you are using the release AppObject, ensure that all the Galaxies are cleaned by removing the Gateway Object instance from the non-active as well as the active Galaxy. This error is due to a Gateway Object version change (from Beta to Release candidate).

- **Wonderware Information Server (WIS)**
  - The theme functionality will not work in WIS.
  - Before uninstalling Workflow Server WIS extension, you should stop the Workflow Engine service.
  - If you are configuring multiple server repositories for WIS, you will lose the Workflow Repository Node and Workflow Farms Node links if you uninstall the servers - WorkflowserverWIS.

- **Workflow Association**
  The Synchronize XML UI pop-up window displays invalid Help text. To synchronize, the user has to only click the **Synchronize** button.

- **JavaScript Error**: A JavaScript error occurs if you right-click on a workflow item.

- **Gateway Object:**

  Exception occurs if two Gateway objects mapping to different repositories are provisioned to the same data source. Ensure to have a separate data source for each repository.
  Renaming of gateway object and event is not supported.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Enterprise Console repository:**

  The EC repository list displays "No Providers" after provisioning the Galaxy for a repository. A workaround is to perform an IISRESET.

- **Windows opened are not closed if Change user or Change Galaxy is done from IDE.**

  While creating or editing a workflow event from the workflow tab of an object, you can open different windows as popup. Without closing these windows if you try to change the galaxy or user, these windows will not get closed automatically. Similar behavior can happen for the popup windows opened from the tabs shown using workflow toolbox.

- **Clicking multiple times on 'New workflow' or 'Existing Workflows' or 'Manage workflows' icon in Event association page is opening multiple windows.**

  While creating or editing a workflow event from the workflow tab of an object, you can click multiple time on the ribbon bar('New workflow' or 'Existing Workflows' or 'Manage workflows') of workflow association section, which will result opening new separate windows. Similar behavior can happen from the tabs shown using workflow toolbox.

- **Reference warning on importing a template or object which has multiple workflow events associated with it.**

  The user exports an object or template which is associated with multiple workflow events. The same object or template is imported to a different Galaxy, which does not have workflow gateway object with the same name as in the parent Galaxy. Warning messages are shown in the Instance Property window.
  We recommend to follow the steps given below to avoid the reference warnings on importing a template or object:

  1. Close the System Platform IDE.
  2. Go to the <ArchestrA Install Path>\ArchestrA\Framework\FileRepository\CustomCategoryUIFiles folder. Remove ArchestrA.Workflow.IDEExtension.dll from this folder. Take a backup of the dll prior to removing it from the folder.
  3. Go to the <ArchestrA Install Path>\ArchestrA\Framework\Bin\IDEExtensions folder. Remove ArchestrA.Workflow.IDEExtension.dll from this folder.
  4. Open the System Platform IDE.
  5. Open the respective template instance.
  6. Go to the Script tab and open the scripts with names starting with _aaWFE. Find and replace the workflow gateway object name with the workflow gateway object name from the parent Galaxy.
  7. Save the details and close the System Platform IDE.
  8. Place ArchestrA.Workflow.IDEExtension.dll in the below mentioned path:

     <ArchestrA Install Path>\ArchestrA\Framework\FileRepository\CustomCategoryUIFiles
  9. Open System Platform IDE and verify.

- **Mouse-over options not available for Form or Control properties**

  When the Form or Control properties are opened in the Forms Designer window and saved, you do not get the mouse-over options against that control. It is recommended to refresh the Form Designer window to get the mouse-over options.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Limitations

- The Workflow-Toolbox provides a list of GatewayObject instances configured in Galaxy. Selecting a GatewayObject instance will list the EC menu for the mapped repository in Tree view. Clicking on the link will open the respective tab window on the right side of the IDE. Using the Workflow-Toolbox users can work with multiple repositories. However, there is no support for working with multiple repositories (GatewayObject instance) at the same time. Close all the open windows for a repository before working on another repository. Switching over to one repository while having one or more windows open for different Repository could lead to termination of session. Multiple presses on the Back button on these windows is not supported.
- Authentication or Verifier user credential used for the 'Write' Attribute should be a user-created before deploying the GatewayObject. Any user used for authentication or verification after GatewayObject deployment may not work and may require a redeploy of GatewayObject.

Troubleshoot Issues

Problem

Error while trying to start **ArchestrA Connector Client** service, which was paused or stopped. The following error is logged while redeploying the **Gateway** object:

```
Error while trying to start ArchestrA connector client service, which was paused  or
stopped. Error :System.InvalidOperationException: Cannot start service
SkeltaConnectorClientArchestrA on computer '.'. ---> System.ComponentModel.Win32Exception:
An instance of the service is already running
   --- End of inner exception stack trace ---
   at System.ServiceProcess.ServiceController.Start(String[] args)
   at System.ServiceProcess.ServiceController.Start()
   at Skelta.Runtime.Gateway.GatewayRuntime.CheckServiceStatus(Object nullParam)
```

Resolution

Undeploy the **Gateway** object and ensure that no errors are getting logged into the logger. Redeploy the **Gateway** object.

Problem

Inbound authentication user could not be validated in platform. The following error is logged while provisioning and deploying the **Gateway** object:

```
Inbound authentication user (SKELTANB26\John)  could not be validated in platform, this
could affect the inbound connection from workflow server.Please provide valid user
information and re deploy Gatewayobject.
```

Resolution

1. Ensure that the inbound information entered is correct.
2. If the user belongs to the local machine, enter **Authentication User Domain** as **localhost** instead of giving the machine name.
3. Click **Save**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Problem

The given key was not present in the dictionary. The following error is logged while deploying the gateway object:

```
System.Collections.Generic.KeyNotFoundException: The given key was not present in the
dictionary.
at System.ThrowHelper.ThrowKeyNotFoundException()
at System.Collections.Generic.Dictionary`2.get_Item(TKey key)
at Skelta.Connector.Proxy.SingletonProxy`1.ReCreateConnection(String
multiHostSingleProxyIdentifier)
at Skelta.Connector.Proxy.SingletonProxy`1.GetConnection(String
multiHostSingleProxyIdentifier, Boolean& isOldConnectionExpired)
at Skelta.Connector.Proxy.EngineProxy.GetChannel()
at Skelta.Connector.Proxy.EngineProxy.ConnectorRuntimeShutdown(String connectorPluginName,
String uniqueEnvironmentName, String[] connectorContext, String repositoryName, String[]&
error)
```

Possible Cause

The gateway object is initially deployed with machine name as the **Server Address**. The user redeploys the gateway object by changing the **Server Address** to either **localhost** or IP address.

Resolution

1. Undeploy the **Gateway** object.
2. Edit the **Server Address** as required and click **Save**.
3. Reauthorize and redeploy the **Gateway** object.

Problem

Authorization fails with the following error after entering the credentials when the **Provider** selected is **Galaxy Users** and none of the **Gateway** objects are deployed from that **Galaxy** to the same repository.

Resolution

Ensure that at least one **Gateway** object is deployed from this Galaxy to the same repository.

Problem

Page Not Found error or blank page in the **System Platform IDE**.

Possible Cause

‘**--**‘ prefix in the in the **Enterprise Console** site URL

Resolution

Remove the ‘--’ prefix while editing the **Enterprise Console** site URL in the workflow **Gateway** object.

Problem

"**Could not connect to the Workflow Server...**" error on **Test Connection** while connecting **Galaxy** to the **Workflow Server**.

Resolution

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Turn off the **Windows Firewall**.
2. Ensure that the **Workflow Engine** service is running.
3. If the **Workflow Engine** service is not running, start the service. Check the message logged in the logger and note down the **Port Number** for further verification.
4. Enter the required information for **Gateway Configuration**.
5. In the **Advanced** tab of the **Gateway Configuration**, ensure that the **Outbound Connector Port Number** is same as the **Port Number** logged in the logger.
6. Click **Test Connection** and verify.

Problem

Slow response time from **AttributeReadWrite** object.

Possible Cause

Failed to acquire any type of license feature **MXAccess_Runtime**.

Resolution

Acquire a valid **MXAccess_Runtime** license on the node where the **Workflow Gateway** object is hosted.

Problem

The Enterprise Console menu does not load when you try to connect to the GR node through IDE, from a different server.

Possible Cause

The required files are not copied on the IDE node,therefore the Enterprise Console menu does not load.

Resolution

1. Open **System Platform IDE**, specify the **GR node name** and **Galaxy name** ,and connect to the galaxy.
2. Open **Workflow Gateway Object** and close it without saving.
3. Restart IDE and connect to the galaxy.
4. Go to **Workflow - Toolbox**
5. Select **Workflow Gateway object** from the dropdown.
6. The Enterprise Console menu is displayed.

Problem

The Enterprise Console page crashes in IDE with the message: Error decrypting the request (The input is not a valid Base-64 string as it contains a non-base 64 character, more than two padding characters, or an illegal character among the padding characters).

Possible Cause

The DLL files are mismatched as they are not copied from the object location to the **CustomCategoryUIFiles** and **IDEExtensions** folders.

Resolution

Manually copy the connector DLL files from **C:\Program Files (x86)\ArchestrA\Workflow\IDEExtension** to:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **C:\Program Files (x86)\ArchestrA\Framework\FileRepository\CustomCategoryUIFiles**
- **C:\Program Files (x86)\ArchestrA\Framework\Bin\IDEExtensions**

Problem

The page does not get displayed for InTouch OMI when the controls does not load.

Possible Cause

- The Workflow Gateway Object might be configured with a user that might not be available in the current provider.
- Browser caching issue.

Resolution

- Deselect all the checkboxes for **Compatibility View Settings**.
- Clear browser cache.

  To clear Chrome browser cache, go to **Settings** --> **Clear browsing data** --> **Advanced** tab, and then select **Password and other sign-in data** checkbox.
- Set User Authentication for Security Settings - Internet Options
  - For Internet

    Navigate to **Custom Level** --> **User Authentication** (scroll down towards end) --> **Logon**. Select **Automatic logon only in Intranet zone** option, and then click **Ok**.
  - For Local Intranet

    Navigate to **Custom Level** --> **User Authentication** (scroll down towards end) --> **Logon**. Select **Automatic logon only in Intranet zone** option, and then click **Ok**.
  - For Trusted Sites

    Navigate to **Custom Level** --> **User Authentication** (scroll down towards end) --> **Logon**. Select **Automatic logon only in Intranet zone** option, and then click **Ok**.
  - For Advanced Tab

    Select **Enable Integrated Windows Authentication** option.

Problem

On importing the Workflow Gateway Object .pkg file in the Upgrade environment, below errors are logged in aalogviewer:

```
System.MissingMethodException: Method not found: 'Void
Skelta.WinForms.ExtendedWebBrowser.UIHostBase.set_OverrideTabAndDeleteKey(Boolean)'.
at ArchestrA.InTouch.SkeltaControls.Controls.BAM.BAMControl.InitializeComponent()
at ArchestrA.InTouch.SkeltaControls.Controls.BAM.BAMControl..ctor() Error in constructor
BAM control
System.MissingMethodException: Method not found: 'Void
Skelta.WinForms.ExtendedWebBrowser.UIHostBase.set_OverrideTabAndDeleteKey(Boolean)'.
at ArchestrA.InTouch.SkeltaControls.Controls.FillForm.FillFormControl.InitializeComponent()
at ArchestrA.InTouch.SkeltaControls.Controls.FillForm.FillFormControl..ctor()Error in
constructor FillForm control
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Probable cause

The IE Web Browser control is replaced by Microsoft Edge WebView2 control. Hence, the errors are logged because of caching after the upgrade.

Resolution

Clear the cache and restart System Platform IDE.

Problem

In System Platform IDE, if configured with AIM and provisioned with AIM repository, sometimes it prompts for AIM credentials on browsing Enterprise Console pages, and sometimes not.

Probable cause

There is no logout mechanism available in it, so it will take from cache and not prompt for AIM credentials.

Resolution

To access Enterprise Control pages, you must provide AIM credentials if prompted.

Work with Extension for OPC UA

OPC or OLE Process Control is a series of standard specifications resulted from the collaboration of a number of leading worldwide automation suppliers working in cooperation with Microsoft. It was originally based on Microsoft's OLE COM (component object model) and DCOM (distributed component object model) technologies. The specification defined a standard set of objects, interfaces and methods for use in process control and manufacturing automation applications to facilitate interoperability. The COM/DCOM technologies provided the framework for software products to be developed. There are now hundreds of OPC Data Access servers and clients.

OPC UA or OPC Unified Architecture is a new set of specifications that are not based on Microsoft COM. The Extension for OPC UA helps you to read or write tag values from the OPC UA server.

Capabilities:

- Connect AVEVA Work Tasks to one or more existing OPC UA servers on the network.
- Read or Write Tag values from the OPC UA server which is connected to the AVEVA Work Tasks Server.

Provision Repository for OPC UA

The AVEVA Work Tasks OPC UA Repository Provisioning Tool is used to provision a workflow repository for OPC UA. Only the provisioned repositories can be connected to OPC UA. Workflow repository provisioning for OPC UA should be done only after installing AVEVA Work Tasks.

OPC UA Repository Provisioning Tool

You can use the **AVEVA Work Tasks OPC UA Repository Provisioning Tool** to provision a workflow repository for OPC UA. Only the provisioned repositories can be connected to OPC UA. Workflow repository provisioning for OPC UA should be done only after installing AVEVA Work Tasks.

The **AVEVA Work Tasks OPC UA Repository Provisioning Tool** is installed during the installation of AVEVA Work

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Tasks Extension for OPC UA.

To Provision a Repository for OPC UA:

1. Run the **AVEVA Work Tasks OPC UA Repository Provisioning Tool** from the **Start** menu > **All Programs** > **AVEVA** > **Work Tasks** folder.

   The AVEVA Work Tasks Extension for OPC UA Configuration window appears. This window displays all the repositories from the system.
2. Right-click on any cell column of the particular repository, and then select the **Provision** option.

   Alternatively, you can click the row arrow corresponding to the particular repository. When the repository row gets selected, click **Provision**.

   The following message appears:

   Provisioning will modify the repository database by adding new tables and adding or updating of records in the existing tables. It is highly recommended to take a backup of the repository database before provisioning, as there is no option to revert the provisioned changes. To revert back the repository database to its previous state, use the Database Restore option. Do you want to Continue?
3. Select **Yes** to provision the workflow repository.

   The repository provision is successful.
4. Click **Close**.

To UnProvision a Provisioned Repository:

To unprovision an already provisioned repository, right-click on any cell column of the particular repository, and then select the **Unprovision** option.

OPC UA Connections

To create or establish a new connection to OPC UA

The OPC UA External Connection can be created through the OPC UA Connection screen. You can use this screen to create or establish new OPC UA connection in AVEVA Work Tasks which will communicate to the OPC UA installation.

Prerequisites:

Provision a repository to create OPC UA connections.

To create an OPC UA Connection

1. Log on to the **Enterprise Console**.
2. Access the repository which is provisioned for OPC UA.
3. In the Enterprise Console, click menu icon, click **Tools**, and then click **External Connections**.

   The **External Connections** page appears.
4. On the **Action bar**, click **New**, and then **New OPC UA Connection**.

   The **OPC UA Server Connection** screen appears.
5. Enter the required details.
   - Title: Unique connection name.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Server URL: .OPC UA server URL.
- Authentication Settings: Select the Authentication Settings required for establishing the connections. The Authentication Settings can be set as Anonymous or User Name.
  - Anonymous - Anonymous tokens are associated with servers which do not require user authentication.
  - User Name/Password tokens are associated with servers with any password based system, such as Windows
- User ID: User ID.
- Password: Password.

6. Click **Test Connection**.

   If successful, click **Save** to save the connection.

Activity: OPC UA Tag Read Write Activity

Use the **OPC UA Tag Read Write** activity to read or write the tag values from and to the OPC UA server which is connected to the AVEVA Work Tasks Server.

Activity Properties:

Specify appropriate values for the activity properties to configure the **OPC UA Tag Read Write** activity.

Right-click the activity, and click **Properties** to open the **Activity Properties** window. Alternatively, select the activity, and then click **Activity Properties** in the tool bar of the **Process Designer** window.

The activity properties of the **OPC UA Tag Read Write** activity are described below.

Name & Description

Use these properties to specify the name and description for the activity.

- **Name**: Specify a name for the activity.

  Property Type: Mandatory
- **Description**: Specifies a brief description to be displayed for the activity.

  Property Type: Optional. Set this property only if required.

Configuration

Use these properties to configure the functionality of the activity.

- **OPC UA Server Connection**: Use this property to select an OPC UA Server Connection. The drop-down list displays the list of all the OPC UA Server Connections created through the External Connection List.

  Property Type: Mandatory. This property must be set for the workflow to communicate with OPC UA Server.

  For more information, see OPC UA Server Connection.
- **Tag Operation**: Use this property to set the type of operation, either Read or Write, to be performed on the OPC UA Server.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Mandatory. This property must be set for the workflow to communicate with OPC UA Server.

- **Select Attribute**: Use this property to read or update the value of variables and XML variables, that can be used in the subsequent activities. The type of operation that can be performed using the Select Attribute property depends on the value selected in the Tag Operation property.

  Property Type: Mandatory. This property must be set for the workflow to communicate with OPC UA Server.
- **Retry Count**: Use this property to specify the maximum number of attempts the activity should make to connect to the OPC UA Server, if the first attempt to connect to the OPC UA Server fails. The default value is 3.

  Property Type: Optional. Set this property only if required.

Note: For the Write operation, the tags can be dynamically added to the Variables/XmlVariables. You can select these variables in the "Select Attribute" property.

Exception Behavior

- **Raise Error on unhandled linked output**: Each activity has the Raise Error on Unhandled Linked Output property. This property shows all the default configured mapped error outputs in red with their check boxes selected.

  Property Type: Optional. Set this property only if required.

  See Mapped Error Output for more details.

Looping Behavior

- **Loop through this action if output is**: Use this property to specify the looping behavior of the activity.

  Property Type: Optional. Set this property only if required.

OPC UA Server Connection

1. In the **OPC UA Tag Read Write** activity properties window, click **OPC UA Server Connection**.

   The OPC UA Server Connection configuration window appears.
2. Select a Connection from the drop-down list.

   The drop-down list shows only the connections in the External Connection List of type OPC UA Server Connections.
3. Click **Save**.

Select Attribute

Select Attribute Property window

You can select the variables or XML variables and set the values to them or read values from them in this property window. To open this window, click the button for the Select Attribute property.

Tag Operation is selected as Read

If the Tag Operation is selected as Read, you can read OPC UA server values into variables or XML variables of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

workflow.
On the left-hand side, a variable can be used to store the attribute value. The variable and type can be added from Variables property in Start activity.
Select the attribute from which the read action needs to be performed in the right-hand side. For the 'Read' operation, the OPC Client Browser will be displayed on the right-hand side.

Tag Operation is selected as Write

If the Tag Operation is selected as Write, you can update variables or XML variables of the workflow with OPC UA server values.
For write operation, the OPC Client Browser will be displayed on the left side of the screen. Click this link to populate the OPC Client Browser.
Select the attribute to which the write action needs to be performed in the left hand side. On the right hand side use expression builder or a variable to get value. The variable and type can be added from Variables property in Start activity.

Mapped Error Output

Each activity has the Raise Error on Unhandled Linked Output property clicking on which, all the default configured mapped error outputs in red with the respective check boxes selected will be displayed.

Mapped Error Outputs

The Mapped Error Outputs list contains the error outputs (shown in red) that cause the Workflow to complete abruptly. This can happen if the error outputs are not linked to the next activity in the Workflow. To change the mapped error outputs, select or de-select the relevant options and click Ok.

Workflow Behavior for Error Outputs

If the error outputs are not linked to the next activity in the Workflow, and if the 'Stop with Error' option is selected, the Workflow will complete with errors. Similarly, if the 'Exit Activity with Error Output' option is selected, the Workflow will not finish with errors, but will give an Error Encountered output.

Note: The changes made to this property will take effect only if you set the value for Raise Error on Unhandled Linked Output to Yes in the Start Activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Developer Guide

This section is for process developers who use AVEVA Work Tasks to create and implement business processes. It assumes that you have basic knowledge of business process design and are familiar with Business Process Management Notation (BPMN).

Get Started

This section provides information to help you get started on AVEVA Work Tasks. Complete the prerequisites as required to access the AVEVA Work Tasks features.

Prerequisites to Access AVEVA Work Tasks Features

Complete the following prerequisites to access the **AVEVA Work Tasks** features:

1. Install **AVEVA Work Tasks**.
2. Create a **AVEVA Work Tasks** repository.
   The AVEVA Work Tasks Repository Database contains workflow definitions, queues, calendars, settings, and workflow execution data for an application. For example, if you define workflows for your organization, the organization must be defined as a <your organization name> Repository. You can create Repositories from the Central Configuration Site.
   For more information on how to create and manage repositories, see *Administrative Guide*.

Installation and Administration

The *Administrator Guide* provides detailed instructions for:

- Product installation and activation
- Product configuration
- Setting up repositories
- Common system administration procedures and uninstallation

Interfaces and Features

This section provides information on the user interfaces and management features of AVEVA Work Tasks.

- Overview of User Interfaces
- Access and Manage AVEVA Work Tasks Features

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Overview of User Interfaces

The AVEVA Work Tasks functions are performed through the following interfaces:

Workflow List: The Workflow List is a list of all the workflows defined for a repository. The Workflow List provides options for categorizing, designing, and publishing workflows. Options in the Workflow List are wizard-driven, with wizards provided for all the core activities.

For more information, refer to the **Workflow List** topic under the **AVEVA Work Tasks** chapter in the *User Guide*.

Process Designer: The Process Designer provides a Visio-like interface with a drag-and-drop functionality for process modeling. For more information on the **Process Designer**, refer to the *About the Process Designer* topic under the *Working with the Process Designer* chapter in the *User Guide*.

Queue Management: The Queue Management window allows you to create and manage queues for allocation of workflow activities. For more information about **Queues**, refer to the *About Queues* topic under the *Working with Queues* chapter in the *User Guide*.

Calendar: The Calendar interface enables creation of hierarchical organization and resource calendars. Calendars are used to determine availability of resources, calculate timeouts, and perform other scheduling functions. For more information about working with **Calendars**, refer to the *About Calendars* topic under the *Working with the Calendars* chapter in the *User Guide*.

Work Items List: The Work Items List is a web-based interface to which workflow activities are delivered. For more information about the **Work items list**, refer to the *About Work Item List* topic under the *Working with the Work item List* chapter in the *User Guide*.

Business Activity Monitoring Dashboard: The **BAM Dashboard** enables monitoring of workflow execution and provides an array of real-time reports on workflow statuses and performance. For more information about using the **Business Activity Dashboard**, refer to the *About the BAM* topic under the *Business Activity Monitoring & Reports* chapter in the *User Guide*.

Access and Manage AVEVA Work Tasks Features

You can access the AVEVA Work Tasks features and interfaces using the following:

Enterprise Console

The Enterprise Console is a central portal with options for **Workflow design**, **Workflow Management**, **User Creation**, **BAM Analysis**, **Work Items Lists**, **Queues** and **Calendar Management**. The **Enterprise Console** is mapped to one or more **Repositories**. You can login to the **Enterprise Console** to access all the above functions of a specified repository. The **Enterprise Consoles** are created from **Farm Server Configuration Manager** and mapped to repositories in the **Repository Settings** page of the **Central Configuration**.

For more information on creating and configuring **Enterprise Consoles** and **Repositories**, refer the *Administrator Guide*.

For more information on working with the **Enterprise Console**, see *Enterprise Console* chapter in the *User Guide*.

Embed AVEVA Work Tasks Controls in Applications

AVEVA Work Tasks Controls for Process Designer, Queue, Calendar, BAM, and Work Item List can be embedded into an ASP.NET application.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For more information about setting up the development environment, and customizing AVEVA Work Tasks for use in applications, see *Developer Guide*.

AVEVA Work Tasks Services

Before you use AVEVA Work Tasks, ensure that the following services are running:

Server Installation

- **Workflow Engine**: This service is required for the execution and control of workflows.
- **Task Scheduler**: This service handles the execution of all scheduled tasks.
- **Communication Service**: This service handles incoming Email and SMS communication. In addition to the above services, the following service is required in the case of Enterprise Server installations.
- **Advance Server Service**: This service provides Load Balancing and Failover. This service will be enabled only if Load Balanced Server license is acquired.
- **Mobile Notification Service**: This service handles notifications sent to the AVEVA Work Tasks Pro mobile application.
- **Client Service**: This service is required to install, start, and monitor AVEVA Work Tasks services. In case of an Enterprise Server, this service will also install, start, and monitor Advance Server Service.

Client Installation

- **Advance Server Service** - This service provides Load Balancing and Failover. This service will be enabled only if Load Balanced Server license is acquired.
- **Client Service**: This service is required to install, start, and monitor AVEVA Work Tasks services. In case of an Enterprise Server, this service will also install, start, and monitor Advance Server Service.

Enterprise Console

For information about Using Enterprise Console, see *User Guide*.

Message Queue

The **Message Queue Connections** option allows you to configure the connection and queue details in the Enterprise Console. This can be used in Workflow Association and Event Provider.

The **Message Queue Repository Provisioning Tool** allows you to provision a workflow repository for Message Queue.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Message Queue Connections

The **Message Queue Connections** allows you to configure the connection and queue details in the Enterprise Console. This can be used in Workflow Association and Event Provider.

Note: Message Queue application must be installed and AVEVA Work Tasks must be configured with a provisioned repository.

To configure Message Queue connection details

1. Log on to the Enterprise Console.
2. On the menu, click **Tools** and then click **Message Queue Connections**.

   The **Message Queue Connections** window appears.
3. Click **New** and then click **Item** to create a new Message Queue connection item.

   The **Message Queue Connection** window appears.

Field Name	Description
Title	Enter the title for the connection.
Description	Enter the description for the connection.
Connection Type	Select **Send** option to send the message to the message queue or **Receive** option to receive message from the message queue.
Durable	Select **Yes** or **No** based on the **Durable** feature of the message queue.
Binding Type	Select either **WM Option** or **XML** or **JSON** based on the type of message sent to or received by the message queue.
User Name	Enter the user name with which you want to configure connection.
Password	Enter the password.
Additional Settings	Enter any additional settings.
Queue Name	Enter the name of the message queue.

4. Click **Save** to save the configured settings.

Note:
- After creating a new connection or editing the existing connection, restart the Workflow Engine to utilize the connection.

- To execute Quickflow, ensure to enable *rabbitmq_amqp1_0* plugin. To enable the plugin, run the below command in Message Queue Command Prompt (sbin dir) with Administrator mode:
`rabbitmq-plugins enable rabbitmq_amqp1_0`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- In the upgraded environment, the existing Message Queue Connection will have **Connection Type** as **Send**, **Binding Type** as **WM Option**, and **Durable** set to **Yes** as the default values.

- The Message Queue Connection is validated with RabbitMQ versions 3.10 and 3.10.5.

- While adding Virtualhost in Additional Settings, only root (/) is verified and supported. Custom Virtualhost is not supported.

Message Queue Repository Provisioning Tool

You can use the **Message Queue Repository Provisioning Tool** to provision a workflow repository for Message Queue. Only the provisioned repositories can be connected to Message Queue. Workflow repository provisioning for Message Queue should be done only after installing AVEVA Work Tasks.

The version of the Message Queue is 3.10.5.

Note:
In the upgrade environment, the new features added to the Message Queue will not work for the already provisioned repositories. For the new features to work, the repositories should be unprovisioned.

When you unprovision the repository,
- The Message Queue connections and the associations will be deleted.
- The workflow containing the Message Queue Activities is not modified and the Message Queue Activities should be manually removed for the workflow to work properly.

To provision a Repository for Message Queue

1. Run the **AVEVAWorkTasksMQProvision.exe** as an Administrator. This EXE is available in the **<Installed Path>\Bin** path. A window displaying all the repositories from the system appears.

   If you are not using the default Enterprise Console site, copy the **SE.Bpm.RabbitMQ.dll** from the Bin folder of the default Enterprise Console site to the Bin folder of your custom Enterprise Console site.

   The DLLs are available in the **<Installed Path>\Bin** path.
2. Right-click on any cell column of the particular repository, and then select the **Provision** option.

   Alternatively, you can click the row arrow corresponding to the particular repository. When the repository row gets selected, click **Provision**.

   The following message appears:

   Provisioning will modify the repository database by adding new tables and adding or updating of records in the existing tables. Do you want to Continue?
3. Select **Yes** to provision the workflow repository.

   The repository provision is successful.
4. Click **Close**.

   During provisioning, if you have already logged in to the repository, then logout and login to the repository after provisioning the repository to Message Queue.

To unprovision a Provisioned Repository

To unprovision an already provisioned repository, right-click on any cell column of the particular repository, and then select the **Unprovision** option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To configure Listener:

You can create and configure your own listener using the **Configure Listener** option. To create listener assembly, implement the **SE.Bpm.RabbitMQ.Interfaces.IRabbitMQConsumer** interface from **SE.Bpm.RabbitMQ.dll**. Follow the below steps to configure the custom listener.

1. In the **Message Queue Repository Provisioning Tool**, click **Configure Listener**.
   The **Configure Message Queue Listener Details** dialog box appears.
2. Enter the following details:
   Assembly Path: Enter the path of the custom dlls to configure custom listener.
   Class Name: Enter the class name (which implements the **SE.Bpm.RabbitMQ.Interfaces.IRabbitMQConsumer** interface from **SE.Bpm.RabbitMQ.dll**).
3. Click **Update** to change the listener configuration details.

Note: If the repository is already provisioned to Message Queue, ensure to unprovision the repository before configuring the Message Queue listener.

In the upgrade environment, the Listener Configuration screen displays new assembly details (e.g. SE.Bpm.AMQP.Listener.AMQPListener). But this will work only after you unprovision all the repositories and provision the required repository.

MQTT Connections

The **MQTT Connections** allow you to configure connection details to MQTT, based on WebSockets, in the **Enterprise Console**. These connections then can be used to access data from external systems.

The tested Message Broker versions are:

- RabbitMQ version 3.10.5
- Mosquitto version 1.5.4

To configure MQTT Connection Details

1. Log on to the **Enterprise Console**.
2. On the menu, click **Tools** and then click **MQTT Connections**.
   The **MQTT Connections** page appears.
3. Click **New** and then click **Item**.
   The **New MQTT Connection** window appears.
4. Enter the required connection information, and then click **Save**.
   The configuration is saved, and an information message appears.
   Note: See *Connection Information* for more details.
5. Click **Close**.
   The information message is closed.

Connection Information

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The connection information required to create an MQTT Connection is as follows.

Field Name	Description
Name (Mandatory)	Name for the MQTT Connection.
Description	Descriptive name for the MQTT Connection.
Server (Mandatory)	IP address of the MQTT server.
Port (Mandatory)	Port number of the Web Socket protocol in the MQTT server. The default value is **8080**. **Note**: The Broker should be enabled with Web Sockets.
Secure Connection	Allow or disallow secure WebSocket. • Select **Yes** to allow secure WebSocket using TLS. • Select **No** to disallow secure WebSocket. The default value is **No**. **Note:** For secure WebSocket, ensure to install CA Root Certificate on client under Trusted Root Certification Authorities. If the Enterprise Console Web Application is configured with secured protocol, you need to select **Yes** for the MQTT Connection to work properly. When the Enterprise Console Site is configured as Secured (HTTPS protocol), then the MQTT connections would work only with Secured configuration.
WebSocket Endpoint (Mandatory)	Enter the WebSocket Endpoint. For example, **mqtt** or **ws**. The default value is **mqtt**.
Client ID Prefix	Client ID prefix for the MQTT Connection, if required.
Anonymous	Allow or disallow all users. • Select **Yes** to allow all users. In such cases **User Name** and **Password** are not required.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description
	• Select **No** to disallow all users. In such cases **User Name** and **Password** are required. The default value is **No**.
User Name (Mandatory)	User ID for the MQTT Connection. **Note:** User Name is not available if **Anonymous** is set to **Yes**.
Password (Mandatory)	Password for the MQTT Connection. **Note:** Password is not available if **Anonymous** is set to **Yes**.
MQTT Version	Version of the MQTT. The default value is **3.1.1**.
Reconnection Attempts (Mandatory)	Number of times to try connecting when the MQTT Connection fails. The range is between **-1** to **20**. If the value is set to **-1**, then there is no limit to the number of attempts, and if the value is set to **0**, then there will be no attempts. The default value is **3**.
Reconnection Period (Mandatory)	Time (in milliseconds) between the connection attempts when the MQTT Connection fails. The range is between **10000** to **300000**. The default value is **30000**.
Quality of Service	Quality of service for the MQTT Connection. • **At Most Once**: The message is sent once. The message is also deleted, and no duplicate messages are possible. • **At Least Once**: The message is sent multiple times. The message is also stored, and duplicate messages are possible. • **Exactly Once**: The message is sent and acknowledgement is awaited. The message is also stored, and no duplicate messages are possible. The default value is **Exactly Once**.
Update Rate (Mandatory)	Time (in milliseconds) at which data is updated. The range is between **0** to **3600000**. If the value is set

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description
	to **0**, then the data is updated immediately. The default value is **0**.

To Test an MQTT Connection

1. In the **MQTT Connection** window, click **Test Connection**.
   The configuration is tested, and an information message appears.
2. Click **Close**.
   The information message is closed.

Note: When packaging artifacts that make use of MQTT Connections, the connections should be recreated at the destination.

Logic App Connections

The **Logic App Connections** allow you to configure connection details to Logic Apps in the **Enterprise Console**. These connections then can be used to call **Logic App Workflows**.

To configure Logic App Connection Details

1. Log on to the **Enterprise Console**.
2. On the menu, click **Tools**,and then click **Logic App Connections**.
   The **Logic App Connections** page appears.
3. Click **New** and then click **Item**.
   The **New Logic App Connection** window appears.
4. Enter **Title**, **Description**, and **Connection String**, and then click **Save**.
   The configuration is saved, and an information message appears.
   Note: Enter a valid connection string as the connection string is not validated.
5. Click **Close**.
   The information message is closed.

Note: When packaging artifacts that make use of Logic App Connections, the connections should be recreated at the destination.

Controls

The following controls are found in AVEVA Work Tasks:

- **Process Designer Control**: The Process Designer provides an interface to design the workflow processes.
- **Work Items List Control**: The Work items list allows the workflow actors to view and respond to the work items assigned to them in a user interface that is similar to Outlook.
- **Calendar Control**: The Calendar control allows you to define and configure multi-level organizational

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

calendars.

- **BAM Control**: The Business Activity Monitoring (BAM) control provides features that can be used by a process administrator to monitor and control various instances of the workflow(s) in a repository.
- **Queue Control**: The Queue control is used to group resources as a common pool and assign tasks to the group.
- **List Control**: List Controls lists out the Workflows, Navigation Details, Users, Event Providers and Event Associations.
- **Form List Webpart Control**: Forms List Webpart Control lists out the forms available.
- **Workflow Execution View Control**: The WorkflowExecutingReport Control shows the Process Execution View of the currently executing workflow.

Add Controls in the Application

AVEVA Work Tasks provides out-of-box server controls. You can configure the properties of AVEVA Work Tasks server controls to suit diverse applications.

The controls should be added using a panel.

To add Controls using a Panel

1. Drag and drop a panel.
2. In the underlying code, create a new instance of control and add the instance to the panel as in the example below:

```
Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject("Telematics");//Repository name
object loggedinUserId = "2d52b2c0-4cf8-4af6-acad-a0c9908eeab5";
Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext(loggedinUserId,
application, "skeltalist");
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl WIL = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
WIL.ApplicationName = uContext.Repository.ApplicationName;
WIL.UserIdString = uContext.LoggedInUserId;
WIL.ID = "WorkItemListControl";
WIL.DisplayGroupUI = true;
WIL.Height = Unit.Percentage(100);
WIL.ReadingPaneInPopupWindow = true;
Panel1.Controls.Add(WIL);//add control to the panel
```

Note:
- To load all the controls separately on aspx page, set the user context first. For example: Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext(loggedinUserId, application, "skeltalist").
- When utilizing these controls embedded in a custom application, a separate Client Connection License is used upon accessing the custom application.

Server Controls

AVEVA Work Tasks provides the following server controls out of box:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Process Designer Control
2. Work Items List Control
3. Calendar Control
4. BAM Control
5. Queue Control
6. List Control
7. Workflow Execution View Control

Create an ASP.NET Project in Visual Studio .NET

You can create an ASP.NET web site in Visual Studio and make the required changes to successfully embed the AVEVA Work Tasks controls in the application.

To create a Web Site

1. Open **Microsoft Visual Studio**. The **Visual Studio Start Page** appears.
2. On the **File** menu, point to **New**, and then click **Web Site**. The **New Web Site** dialog box appears.
3. In the **Templates** pane, select **ASP.NET Web Site**.
4. Select **HTTP** as the **Web Location**, and browse the path where the new web site has to be created. For example, *http://localhost:9000/TelematicsWebSite*.
5. Click **OK**. A new web site gets created.
6. Copy the following files and folders from the *AVEVA Work Tasks Installed Path* to the created web site's folder:
   a. Copy the **BPMUITemplates** folder from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\BPMUITemplates* to the created web site's folder.

      For example: If the TelematicsWebSite web site is created in *D:\Develop\TelematicsWebSite* folder, then copy **BPMUITemplates** folder to *D:\Develop\TelematicsWebSite*.

      Or

      Create a Virtual Directory in the name of **BPMUITemplates** mapping to the physical folder of BPMUITemplates under the created IIS WebSite.

      This step is required due to the following reasons:

      a. ASP.NET applications that use AVEVA Work Tasks should include these files.
      b. BPMUITemplates folder assists in the localization of the AVEVA Work Tasks controls.
      c. The User Interface can be changed according to the user.
      d. Changes to User controls like Work Item, Queue, Process Designer, BAM, and Calendar can be done in
      e. BPMUITemplates folder.

   b. Copy the **App_Code** folder from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\EnterpriseConsole* to the created web site's folder.
      For example, if the WMTestSite web site created in D:\Develop\WMTestSite folder, then copy App_Code folder to D:\Develop\WMTestSite\.
   c. Copy the **ComponentArt.Charting.lic** and **ComponentArt.Charting.WebChart.dll** file from the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\EnterpriseConsole\bin* to the created website's bin

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

folder.
Create a bin folder under the created web site's folder, if it does not exist.

d. Copy the **TempReports** folder from *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**EnterpriseConsole* to the created web site's folder.

e. Copy the **FrameworkData** folder from *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**EnterpriseConsole* to the created website's folder.

7. Create the following .aspx pages for embedding AVEVA Work Tasks Web Server controls.
   - Designer.aspx for Process Designer control
   - WorkItemList.aspx for Work items list control
   - Calendar.aspx for Calendar control
   - BAM.aspx for BAM control
   - Queue.aspx for Queue control
   - List.aspx for List control
   - FormsWebpart.aspx to view Fill a form control
   - Execute.aspx to execute the workflow
   - ExecuteReport.aspx to view the workflow status

   Note: Ensure that all the pages created above have the doctype tag **<!DOCTYPE html>**.

8. Add the following tag in the source of all the .aspx pages, except *Designerbase.aspx*, under the existing <DIV>tag:

```
<asp:Panel ID="Panel1" runat="server" Height="100%" Width="100%"></asp:Panel>
Add the style tag for <DIV>tag:
<div style="height:100%;">
Add the following style on each page within the <head> tag.
<style type="text/css''>
html, body, form
{
height: 100%;
}
</style>
```

9. Complete the following changes in the Web.config file of the custom application website or copy the Enterprise Console Web.config file to the custom application website.
   - Add the following entries within the **<system.web>** tag.

```
<pages validateRequest="false" clientIDMode="AutoID"
controlRenderingCompatibilityVersion="3.5"/>
<httpRuntime requestValidationMode="3.5"
encoderType="HtmlAttributeEncodingNot" maxQueryStringLength="9000"
enableVersionHeader="false" enableHeaderChecking="false"/>
```

   - Add the following entries within the **<system.web>** tag.

```
<compilation debug="false" targetFramework="4.8">
<assemblies>
<add assembly="System.Transactions, Version=4.0.0.0, Culture=neutral,
PublicKeyToken=B77A5C561934E089"/>
</assemblies
</compilation>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

10. Copy all the dll files which has entries in the web.config file of Enterprise Console to the custom site bin directory from AVEVA Work Tasks installed folder bin directory. Alternatively, you can add all the entries under the <assemblies> tag within Enterprise Console Web.Config to file to the custom site web.config file.
    - Add the following entries within the **<system.web>** tag.

```
<membership>
<providers>
<add name="SkeltaMemberShipProvider" type="SkeltaMemberShipProvider" />
</providers>
</membership>
<webParts>
<personalization defaultProvider="SkeltaPersonalizationProvider">
<providers>
<add name="SkeltaPersonalizationProvider"
type="SkeltaPersonalizationProvider.SkeltaPersonalizationProvider" />
</providers>
<authorization>
<allow users="*" verbs="enterSharedScope" />
</authorization>
</personalization>
</webParts>
<customErrors mode="RemoteOnly" defaultRedirect="error.html" />
```

    - Add the following entries within the **<httpHandlers>** tag.

```
<add verb="*" path="Reserved.ReportViewerWebControl.axd"
type="Microsoft.Reporting.WebForms.HttpHandler,
Microsoft.ReportViewer.WebForms, Version=11.0.0.0, Culture=neutral,
PublicKeyToken=89845dcd8080cc91" validate="false" />
<add path="Telerik.Web.UI.WebResource.axd" type="Telerik.Web.UI.WebResource"
verb="*" validate="false"/>
```

    - Add the following entries within the **<system.webServer>** tag.

```
<validation validateIntegratedModeConfiguration="false" />
<httpProtocol>
<customHeaders>
<remove name="Server" />
<remove name="X-AspNet-Version" />
<remove name="X-AspNetMvc-Version" />
<remove name="X-Powered-By" />
</customHeaders>
</httpProtocol>
<security>
<requestFiltering>
<requestLimits maxQueryString="9000"/>
</requestFiltering>
</security>
<staticContent>
<remove fileExtension=".woff" />
<mimeMap fileExtension=".woff" mimeType="application/font-woff" />
</staticContent>
```

    - Add the following entry within the <system.webServer><handlers> tag.

```
<add name="ReportViewerWebControl" verb="*"
path="Reserved.ReportViewerWebControl.axd"
type="Microsoft.Reporting.WebForms.HttpHandler,
Microsoft.ReportViewer.WebForms, Version=12.0.0.0, Culture=neutral,
PublicKeyToken=89845dcd8080cc91" />
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Add the following entries within the <system.web.extensions> tag.

```
<scripting>
<webServices>
<jsonSerialization maxJsonLength="4096000" />
</webServices>
</scripting>
```

11. Right-click the hosted website, go to **Manage Application**, and then click **Advanced Settings**. The **Advanced Settings** dialog box appears.
12. It is recommended to set the Application Pool property to **AVEVA Work Tasks Integrated**.

    If you use any other application pool or service to access Work Tasks, you need to add them to one of the following groups:

    - Administrators
    - aaAdministrators
    - aaConfigTools

      For more details, refer to Cryptography Settings.

Note:
- Ensure to copy **NewtonsoftJson.dll** and **AntiXSSLibrary.dll** files from the **Bin** folder of the AVEVA Work Tasks application to the **Bin** folder of the custom application.

- Register the Telerik tag in all the mentioned aspx pages.

```
<%@ Register TagPrefix="telerik" Namespace="Telerik.Web.UI" Assembly="Telerik.Web.UI" %>
```

- Add the following entry under the form tag of mentioned aspx pages.

```
<telerik:RadScriptManager runat="server" ID="RadScriptManager1" />
```

Create User Context

For every control, the AVEVA Work Tasks User Context object must get instantiated. Find below the steps to create User Context Object.

To create User Context Object

1. Before creating user context object, Create an ASP.NET Project in Visual Studio .NET.
2. Go to **UserContext.aspx.cs** page.
3. Create a user context object.

```
using System;
using System.Collections;
using System.Configuration;
using System.Data;
using System.Linq;
using System.Web;
using System.Web.Security;
using System.Web.UI;
using System.Web.UI.HtmlControls;
using System.Web.UI.WebControls;
using System.Web.UI.WebControls.WebParts;
using System.Xml.Linq;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
public partial class CreatingUserContext : System.Web.UI.Page
{
protected void Page_Load(object sender, EventArgs e)
{
Work Tasks.Entity.UserContext userContext = new Work Tasks.Entity.UserContext("john",
new Skelta.Core.ApplicationObject("LeaveReportsRepo"), "activedirectory");

}
}
```

The **UserId** value varies based on the authentication provider configured. This value should have the Entity instance mapped for the repository to be prefixed along with real id of the user.

- If the repository is mapped to **AVEVA Work Tasks List** user provider, the UserIdString will be skeltalist::[GUID]. Here the GUID is of the user "john", taken from SKEUsers table present in the Repository DB.

Example: skeltalist:: C99B4110-C8CC-410B-BF70-93F3A7E34EDF

That is, User object will be created as:

```
Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext("C99B4110-C8CC-410B-
BF70-93F3A7E34EDF", new Skelta.Core.ApplicationObject("LeaveReportsRepo"), "skeltalist");
```

- If the repository is mapped to the **Active Directory** user provider, the UserIdString will be activedirectory::[samAccountName]. Here, samAccountName is an active directory property value.

For example: activedirectory::john

That is, the user object will be created as:

```
Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext("john", new
Skelta.Core.ApplicationObject("LeaveReportsRepo"), "activedirectory");
```

- If the repository is mapped to the **Forms** user provider, the UserIdString will be sqlprovider::[UniqueIdentifier]. Here UniqueIdentifier is the unique identifier id for resource.

For example: sqlprovider::6fb03011-68b7-437e-972e-21c67e4e2fe7

That is, the user object will be created as:

```
Skelta.Entity.UserContext userContext = new
Skelta.Entity.UserContext("6fb03011-68b7-437e-972e-21c67e4e2fe7", new
Skelta.Core.ApplicationObject("LeaveReportsRepo"), "sqlprovider");
```

- If the repository is mapped to **ASP.NET Membership** user provider, the UserIdString will be membershipprovider::[UniqueIdentifier]. Here, UniqueIdentifier is the unique identifier id for resource.

For example: membershipprovider::a9bfc969-cc82-4c4b-99b9-50d9e1a91c01

That is, the user object will be created as:

```
Skelta.Entity.UserContext userContext = new
Skelta.Entity.UserContext("a9bfc969-cc82-4c4b-99b9-50d9e1a91c01", new
Skelta.Core.ApplicationObject("LeaveReportsRepo"), "membershipprovider");
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Process Designer Control

The Process Designer provides an interface to design the workflow processes. Workflows can be designed and deployed using the Process Designer.

To add Process Designer control using a panel

Before adding the Process Designer control in a panel, create an ASP.NET project in Visual Studio .NET 2012. You must add two .aspx pages for this control, one to embed the control and other to create the list definitions and call the Designer.aspx page.

- Designerbase.aspx
- Designer.aspx

1. Open the **Designerbase.aspx.cs** page.
2. Add the following code in the page load of this page.

```
string applicationName = " ApplicationName ";
string listName = "Workflow";
string workflowName = "WorkflowName"; // Use unpublished workflow Name
Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject(applicationName);
// Create User context as given in this topic http://sun.skelta.com/DeveloperGuide/
CreatingUserContext.html
Skelta.Entity.UserContext usrcn = new Skelta.Entity.UserContext("47D5EA43-B471-492C-
A2C3-41DC41C15EC8", application, "skeltalist", "", "", false);
Skelta.Repository.Web.List.ListPageParameters param = new
Skelta.Repository.Web.List.ListPageParameters(); param.ListName = listName;
Skelta.Repository.List.ListDefinition list =
Skelta.Repository.List.ListDefinition.GetList(application, listName);
param.ListId = list.Id;
Skelta.Repository.List.ListDataHandler ldh = new
Skelta.Repository.List.ListDataHandler(applicationName, listName);
param.ListItemId = ldh.GetListItemId(workflowName);
param.ApplicationName = applicationName;
//specify the version information //param.VersionStamp = "1";
param.LoggedInUserId = usrcn.LoggedInUserId;
string encParam = param.GetSecuredUri();
//Give the page name where the Process Designer control is placed.
string url = "Designer.aspx"; // specify the page where ProcessDesigner is embedded
if (url.IndexOf("?") > 0)
url += "&" + encParam;
else
url += "?" + encParam; this.Context.Response.Redirect(url);
```

3. Open the **Designer.aspx.cs** page.
4. Ensure that you have initialized the User Context object, as per the steps given in Create User Context
5. In the underlying code, create a new instance of control and add the instance to the panel in the Page_Load, as shown in the sample code:

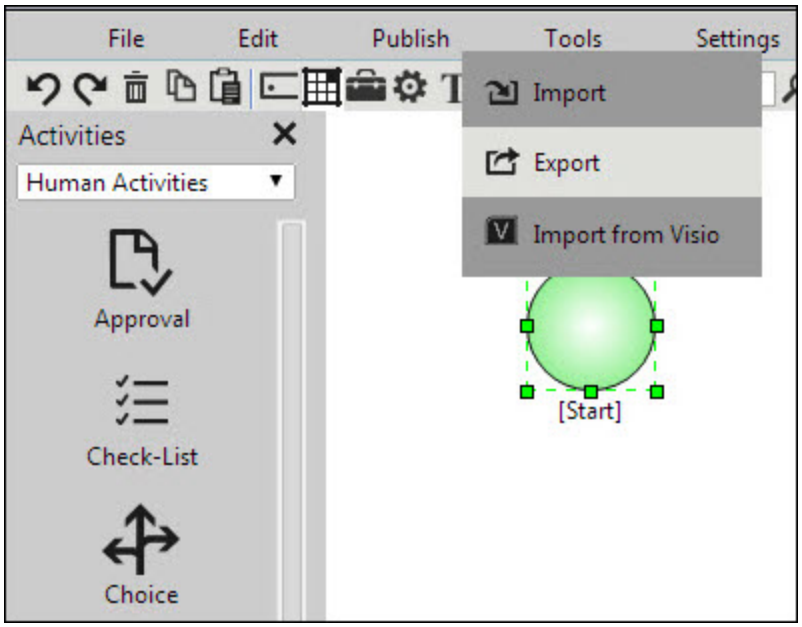
```
string applicationName = "Telematics Repository";
Skelta.Core.ApplicationObject application = new Skelta.Core.ApplicationObject
(applicationName);
Skelta.Entity.UserContext usrcn = new Skelta.Entity.UserContext
("81734457-B3DB-4BC9-894A-C3149828C65C", application, "skeltalist", "", "", false);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
Workflow.NET.Web.Designer.ProcessDesigner pd = new
Workflow.NET.Web.Designer.ProcessDesigner();
pd.ApplicationName = usrcn.Repository.ApplicationName; //Provide Application or
Repository name. This is mandatory.
pd.WorkflowName = "Test Workflow"; //Provide Workflow name. This is mandatory.
pd.UserIdString = usrcn.LoggedInUserId; //Provide user id string. This is mandatory.
pd.ID = "ProcessDesigner"; // This is mandatory.
pd.Height = Unit.Percentage (100);
Panel1.Controls.Add (pd);
```

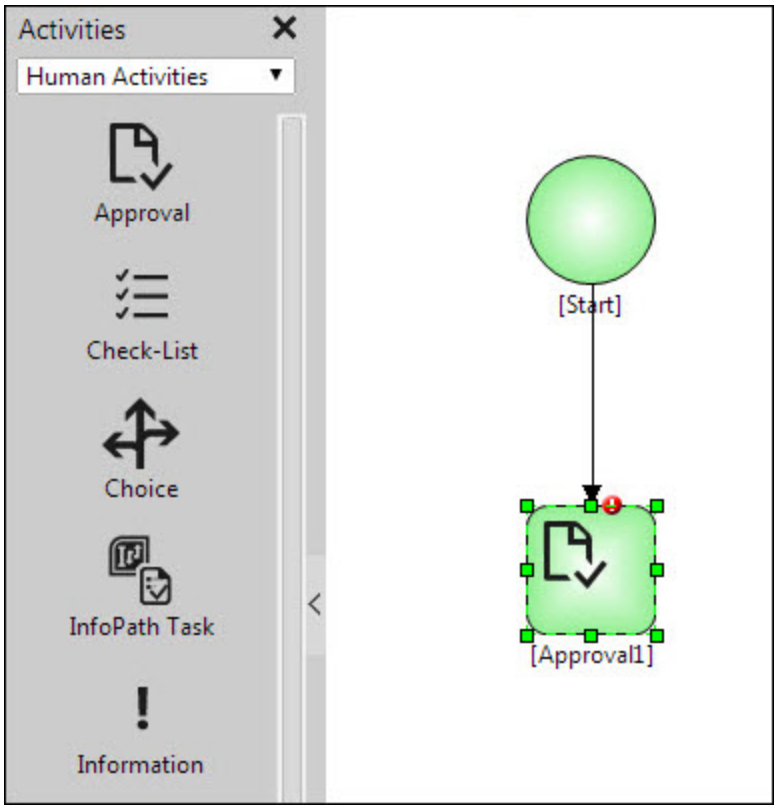
Properties that can be set for Process Designer Control

- **ApplicationName:** Provide the Application or Repository Name.
- **CanExportProcessDefinition:** If the CanExportProcessDefinition property is set to false, then the "**Export**" option will not be displayed and you cannot export workflows.



- **CanImportProcessDefinition:** If the **CanImportProcessDefinition** property is set to false, the **Import** and **Import from Visio** options will not be displayed and you cannot import workflows.
- **CanWriteInProduction:** If the **CanWriteInProduction** property is set to false, you can design the workflow but will not be able to publish it.
- **WorkflowName:** Provide the workflow name to design the workflow.
- **FileName:** This property should not be used since it is an obsolete property; instead of the **FileName** property, you can use the **Version** property.
- **CanWriteInStaging:** If the **CanWriteInStaging** property is set to false, you can only view the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



To use Process Designer as an Embedded Control in Custom Applications

Consider a scenario where a user creates a custom application and uses the Process Designer control as an embedded control. In such a scenario, the user will have to follow the steps given below in order to publish/ execute the workflow.

1. Repeat the steps given under the section **To add Process Designer control using a panel**.
2. Create another page in the Visual Studio and add the following code sample. Alternatively, if the page is already created through which the user can navigate to the Process Designer page, then the user has to use the code snippet given below in the event which calls the Process Designer page. For example, the event used here is 'Button_Click'.

```
protected void Button _Click(object sender, EventArgs e)
    {
        string applicationName = " ApplicationName ";
        string listName = "Workflow";
        string workflowName = "WorkflowName";
        Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject(applicationName);
// Create User context as given in this topic http://sun.skelta.com/DeveloperGuide/
CreatingUserContext.html
        Skelta.Entity.UserContext usrcn = new
Skelta.Entity.UserContext("47D5EA43-B471-492C-A2C3-41DC41C15EC8", application,
"skeltalist", "", "", false);
        Skelta.Repository.Web.List.ListPageParameters param = new
Skelta.Repository.Web.List.ListPageParameters();
        param.ListName = listName;
        Skelta.Repository.List.ListDefinition list =
Skelta.Repository.List.ListDefinition.GetList(application, listName);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
        param.ListId = list.Id;
        Skelta.Repository.List.ListDataHandler ldh = new
Skelta.Repository.List.ListDataHandler(applicationName, listName);
        param.ListItemId = ldh.GetListItemId(workflowName);
        param.ApplicationName = applicationName;
 //specify the version information
 //param.VersionStamp = "1";
        param.LoggedInUserId = usrcn.LoggedInUserId;
        string encParam = param.GetSecuredUri();
//Give the page name where the Process Designer control is placed.
        string url = "PDesigner.aspx"; // specify the page where ProcessDesigner is
embedded
        if (url.IndexOf("?") > 0)
            url += "&" + encParam;
        else
            url += "?" + encParam;
        this.Context.Response.Redirect(url);
    }
```

3. On click of the button, the **Process Designer** page will appear. The user will be able to perform all the actions related to the workflow.

Work Items List Control

The **Work items list** allows the workflow actors to view and respond to the work items assigned to them in a user interface that is similar to Outlook. Work items are delivered to the actor's Inbox with a detailed view available on selection of the item.

To add Work items list Control using a panel

1. Before adding the Work Items List control in a panel, create an ASP.NET project in Visual Studio .NET 2012.
2. Open **WorkItemList.aspx.cs** page.
3. Ensure that you have created the User Context object as per the steps described in Creating User Context.
4. In the underlying code, create a new instance of control and add the instance to the panel in the **OnInit**, as shown in the example below:

```
Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject("ListRepo");//Repository name
object loggedinUserId = "4952ffff-e0db-401b-bb7d-70a0fec1df07";
Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext(loggedinUserId,
application, "skeltalist");
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl wi = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
wi.ID = "WorkItemControl"; // This is mandatory.
wi.ApplicationName = userContext.Repository.ApplicationName; //Provide Application or
Repository name. This is mandatory.
wi.UserIdString = userContext.LoggedInUserId; //Provide user ID string. This is
mandatory.
wi.Height = Unit.Percentage(100);
wi.Width = Unit.Percentage(100);
wi.ReadingPaneInPopupWindow = true;
Panel1.Controls.Add(wi);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Call the following function within the <body> tag.

```
<body onload="ResizeGrid();">
```

Different properties that can be set for Work items list

The properties for the AVEVA Work Tasks Work items list Web Part are categorized as:

Actions:

- **Allow AutoOwnership on row click**: Selecting this option allows you to take ownership of the work items by clicking on the row.
- **Enable hold**: Selecting this option allows you to put work items on hold. The Hold button would be visible for the work item, only if hold is enabled.
- **Enable Export**: Selecting this option allows you to control the visibility of the export icon in the Work Item details grid status bar.

Display:

- **Show Inbox Details without Left Grid view**: On selecting this option, only the Inbox view without the folder list to the left tree menu will be displayed.
- **Show Manager View**: On selecting this option, only the Manager View for the list will be displayed.
- **Show Filter Bar Always**: Selecting this option enables you to either show or hide the filter bar.
- **Display left tree menu without workflow(s) grouping**: On selecting this option, you can view the Work items list page without grouping the workflow(s).
- **Show Queues**: Selecting this option displays a folder for the Queues that you are participating in.
- **Show Work Item Fields**: Selecting this option displays work item fields.
- **Record Size**: The number of messages displayed in the work item is based on the property specified here. For example, suppose, there are totally 35 messages and this property is set as 20, then 20 messages out of 35 will be displayed in the work items.
- **Retain the Sort Column**: To retain the selection of recently sorted column after submitting the work item and also while expanding the left tree menu view items. If this is set to true, then selection of the recently sorted column is retained. If set to false, then the selection of the recently sorted column is not retained.
- **Queue Name**: Enter the Queue name to be displayed in the left tree menu of the Work Items Web Part. If the Queue name is not specified, all the available queues will be displayed in the left tree menu.

  Multiple Queue names can be specified separated by a semicolon. For example: Manager;Support
- **Layout View Name**: This property loads a specific layout.
- **Show CustomLink in Left Grid Menu**: Selecting this option enables you to display a custom link in the left pane of Work Items Web Part.
- **Show Queues in the LHS grid view menu only if they have work items**: On selecting this option, the queues in the left hand side grid view menu will be displayed only if they have work items.
- **Display the count in the Left Hand Side Grid View**: Enabling this option will display the work items count in the left hand side grid view.
- **Display Classic Paging**: Enabling this option will allow you to display the Classic Paging properties. The navigation feature of Work item Control is not supported with Classic Paging enabled.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Show Standard Columns**: This property displays the work item field columns based on the Workflow Name property of Workitemcontrol.
- **Display the columns with auto fit**: If you have less number of columns to be displayed, enable or check this option. If you have more number f columns to be displayed, disable or uncheck this option. Then you can use the scroll bar to view all the columns.

Multi Select:

- **Enable Multi Select**: Selecting this option enables you to select multiple work items.
- **Show multi select window in center**: This option will display a multi select window in the center of the page.
- **Show detail view with multi select option enabled**: Selecting this option will display the detail view with the multi select option enabled by default.
- **Display multi select option by default for queue items**: Selecting this option will display the queue items with the multi select option by default.

Item Details:

- **Show Reading pane in popup window**: If this option is selected, the work item details will be displayed in a separate window and not in the Reading Pane below the Inbox.
- **ShowDetailsonRowDoubleClick**: Selecting this option enables you to open the Work Item Details page (Custom ASPX page) on double-click.
- **Display Navigation buttons Next and Previous in the Work Item detailed view**: Selecting this option enables you to navigate to the next or previous work item from the Work Item Details view page.
- **Enable Move to the next work item after submitting the work item from the detailed view**: Enabling this option will take you to the next work item when a work item is submitted from the detailed view.
- **Show Queue Detailed View Without Picking**: Selecting this option allows you to act on a work item without picking it.

Filter and Group:

- **Workflow Name**: Enter the workflow name to be displayed in the left tree menu of the Work items Web Part. If the workflow name is not specified, all the available workflows will be displayed in the left tree menu. Multiple workflow names can be specified with semicolon. Example:Leave Application;HRProcess
- **Group Total Columns**: This property is used to calculate the total of the column(s) name when the grouping operation is performed on columns. Multiple column names can be specified with semicolon. Example:Expense Amount,true;Leave Days,false
- **Group Count Columns**: This property is used to calculate the count of the columns when the grouping operation is performed on columns. Multiple column names can be specified with semicolon. Example:Leave Days;Expense Type
- **Group Average Columns**: This property is used to calculate the average of the columns when the grouping operation is performed on columns. Multiple column names can be specified with semicolon. Example:Expense Amount,true;Leave Days,false

DisplayGroupUI

If the DisplayGroupUI property is set to 'false', the option to enable and disable the Multi-select option icon will not be displayed in the Work Item List Control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If multiple work items related to approval activities get displayed in the Work items list, you can select all the check boxes related to the approval activity and then act on all the work items from the GroupUI window.

DisplayLeftTreeMenuAtApplicationLevel

If the DisplayLeftTreeMenuAtApplicationLevel property is set to 'true', then the work items of all the workflows will be displayed at Application Level and there will not be workflow segregation displayed in the Left Tree menu view of Work Item control.

DisplayManagerView

If the DisplayManagerView property is set to 'false', the Manager View will not be displayed. Using this property, the manager can see all the tasks assigned to his/her subordinates (peers) who report to him/her. The Manager can perform the following operations from the Manager view:

- Reassign a work item to another user.
- Delegate a work item to another user.
- Set the priority for the work items assigned to his subordinates (peers).

The Manager View will be displayed only for managers. For this property to function correctly, it is mandatory to have the purpose="manager" attribute set in the entity data source provider as well as at the Entity Level.

Set RecordSize

Using this property, we can control the number of work items that will be displayed per page.

Show Queue

If the ShowQueues property is set to 'true', only the "Queue" icon and the Queue will be displayed in the Left Tree menu view.

If the ShowQueues property is set to 'false', the Queue icon and the Queue will not displayed in the Left Tree menu view.

Work item Fields

If the ShowWorkItemFields property is set to 'true', the work item fields will be displayed in the work items details grid. However, this property will be effective only if you are loading the Work items list control with the Detail view and you have not customized the view by creating Global Layout or Workflow level Layout.

If the ShowWorkItemFields property is set to 'false' then the work item fields will be displayed in the work item details grid.

ShowInboxViewOnly

If the ShowInboxViewOnly property is set to 'true', only the work item details grid will be displayed and the Left Tree menu view showing the workflow segregation will not be displayed.

If the ShowInboxViewOnly property is set to 'false', the work items details grid as well as the Left Tree menu view showing the workflow segregation will be displayed.

ShowManagerViewOnly

If the ShowManagerViewOnly property is set to 'true' then the Manager can see all the tasks assigned to the subordinates (peers) who report to him/her without the Left Tree menu view of workflow segregation display. The Manager can perform the following operations from the Manager View:

Reassign a work item to another user

Delegate a work item to another user

Set the priority for the work items assigned to his subordinates (peers)

UserIdString

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Provides the UserIdString of the Actor who will act on the activity.

Different UserIdString formats

- If the repository is mapped to AVEVA Work Tasks List user provider, the UserIdString will be skeltalist::[GUID]. Here, the GUID is taken from the SKEUsers table present in the Repository DB.

  For example: skeltalist:: C99B4110-C8CC-410B-BF70-93F3A7E34EDF
- If the repository is mapped to Active Directory user provider, the UserIdString will be activedirectory::[samAccountName]. Here, samAccountName is an active directory property value.

  For example: activedirectory::stephen
- If the repository is mapped to Forms user provider, the UserIdString will be sqlprovider::[UniqueIdentifier]. Here, the UniqueIdentifier is the unique identifier ID for the resource.

  For example: sqlprovider::6fb03011-68b7-437e-972e-21c67e4e2fe7
- If the repository is mapped to ASP.NET Membership user provider, the UserIdString will be membershipprovider::[UniqueIdentifier]. Here, the UniqueIdentifier is the unique identifier ID for the resource.

  For example: membershipprovider::a9bfc969-cc82-4c4b-99b9-50d9e1a91c01

EnableHold

If the EnableHold property is set to 'true' then in the Manage Work Item drop-down list, "Hold" will be displayed so that the Actor can put the work item on hold.

The Hold option will be available only if the activity is assigned to a single user. If the activity is assigned to multiple users, the Hold option will not be displayed in the Manage Work Item drop down.

ShowFilterBarAlways

This property can be set for displaying or hiding the filter bar. For example, if the ShowFilterBarAlways property is set to false, the filter bar will not be displayed.

If the ShowFilterBarAlways property is set to true, the filter bar will be displayed.

Application Name

Provides the Application or Repository Name.

Workflow Names

Based on the Workflow Names property specified, the Left Tree menu view shows the workflows.

EnableExport

Based on this property, you can control the visibility of the Export icon in the work item details grid status bar. If the EnableExport property is set to 'true', the "EnableExport" icon will be displayed.

If the EnableExport property is set to 'false', the "EnableExport" icon will not be displayed.

QueueDisplayOrder

The QueueDisplayOrder property is used to display the queues in a specific order in which you want them to appear in the Left Tree menu view.

Create a SortedDictionary<int,string> that specifies the Order and the QueueName. Assign the SortedDictionary to the QueueDisplayOrder Property of the Workitemcontrol.

For example, if the Queue Names are A,B,C and if you want to display them in "C,A,B" order, the following code

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

can be used:

```
Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext();
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl wi = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
wi.ID = "WorkItemControl"; // This is mandatory.
wi.ApplicationName = uContext.Repository.ApplicationName; //Provide Application or
Repository name. This is mandatory.
wi.UserIdString =uContext.LoggedInUserId ; //Provide user id string. This is mandatory.
System.Collections.Generic.SortedDictionary<int, string> Qdisplay = new
System.Collections.Generic.SortedDictionary<int, string>();
Qdisplay.Add(1,"C");
Qdisplay.Add(2,"A");
Qdisplay.Add(3,"B");
wi.QueueDisplayOrder = Qdisplay;//Assign the SortedDictionary to the QueueDisplayOrder
Property of the Workitemcontrol
Panel1.Controls.Add(wi);
```

ShowStandardColumns

If the ShowStandardColumns property is set to True then the standard columns will be displayed. If the ShowStandardColumns property is set to 'false', then the specific work item fields related to the workflow along with the Subject column will be displayed.

The columns (fields) will get displayed based on the Workflow Name property specified. If the property is not set, then the work item fields for all the workflows of the repository will be displayed.

GroupTotalColumns

The Group Total Columns property is used to calculate the total of the column(s) name when the grouping operation is performed on columns.

For example, consider a scenario where the 'Leave Days' and 'LeaveReason' are added as work item fields for the workflow 'Employee Leave Details'. To calculate the total number of leaves taken by the employee:

1. Set the GroupTotalColumns property for the columns for which the total has to be calculated when the grouping operation is performed on other columns.
2. The following code snippet shows how to use GroupTotalColumns property:

   ```
   Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext();
   Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl wi = new
   Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
   wi.ID = "WorkItemControl"; // This is mandatory.
   wi.ApplicationName = uContext.Repository.ApplicationName; //Provide Application or
   Repository name. This is mandatory.
   wi.UserIdString =uContext.LoggedInUserId; //Provide user id string. This is mandatory.
   //The bool parameter in the SortedDictionary is to specify whether the currency symbol
   should appear before the column values are not.
   System.Collections.Generic.SortedDictionary<string, bool> groupcolumns = new
   System.Collections.Generic.SortedDictionary<string, bool>();
   groupcolumns.Add("LeaveDays", false);
   wi.GroupTotalColumns = groupcolumns;
   Panel1.Controls.Add(wi);
   ```
3. Go to Inbox. The total number of leaves are displayed as shown below when the grouping is done on any column. In this case, it is the Activity Display Name column.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

GroupCountColumns

The **GroupCountColumns** property is used to calculate the count of the columns when the grouping operation is performed on columns.

For example: Consider a scenario where the 'Leave Days' and 'LeaveReason' are added as work item fields for the workflow 'Employee Leave Details'. To calculate the number of rows based on LeaveReason column:

1. Set the **GroupCountColumns** property for the column for which the count is to be calculated.
2. The following code snippet shows how to use the GroupCountColumns property.

```
Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext();
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl wi = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
wi.ID = "WorkItemControl"; // This is mandatory.
wi.ApplicationName = uContext.Repository.ApplicationName; //Provide Application or
Repository name. This is mandatory.
wi.UserIdString =uContext.LoggedInUserId; //Provide user id string. This is mandatory.
System.Collections.Generic.SortedDictionary<string, string> groupcntcolumns = new
System.Collections.Generic.SortedDictionary<string, string>();
groupcntcolumns.Add("LeaveReason", "LeaveReason");
wi.GroupCountColumns = groupcntcolumns;
Panel1.Controls.Add(wi);
```

3. Go to Inbox. The total count is displayed when we group the Activity Display Name.

GroupAverageColumns

The GroupAverageColumns property is used to calculate the average of the columns when the grouping operation performed on a column. The user can also display the currency symbol ($) for numeric fields.

This property is of type SortedDictionary<string,bool> where key<string> specifies the column name and value<bool> specifies whether the currency symbol needs to be displayed or not.

For example: Suppose that the 'Expense Amount' and 'Expense Type' work item fields are added to the 'Expense Approval' workflow and you want to calculate the average of the 'Expense Amount' column.

1. Set the GroupAverageColumns property with the column name for which the total is to be calculated.

```
Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext();
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl wi = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
wi.ID = "WorkItemControl"; // This is mandatory.
wi.ApplicationName = uContext.Repository.ApplicationName; //Provide Application or
Repository name. This is mandatory.
wi.UserIdString =uContext.LoggedInUserId; //Provide user id string. This is mandatory.
System.Collections.Generic.SortedDictionary<string, string> groupavgcolumns = new
System.Collections.Generic.SortedDictionary<string, string>();
groupavgcolumns.Add("Expense Amount", "Expense Amount");
wi.GroupAverageColumns = groupavgcolumns;
Panel1.Controls.Add(wi);
```

2. Go to **Inbox**. The average of **'Expense Amount'** will be displayed.

WorkflowDisplayOrder

The WorkflowDisplayOrder property is used to display the workflows in a specified order.

Create a SortedDictionary<int,string> variable, which specifies the Order and the Workflow Name. Assign the SortedDictionary to the WorkflowDisplayOrder Property of the Workitemcontrol.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For example, if the Workflow Names are Employee Leave Details, Expense Approval, and Purchase Order and if you want to display them as Expense Approval, Purchase Order, and Employee Leave Details, then use the following code.

```
Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext();
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl wi = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
wi.ID = "WorkItemControl"; // This is mandatory.
wi.ApplicationName = uContext.Repository.ApplicationName; //Provide Application or
Repository name. This is mandatory.
wi.UserIdString =uContext.LoggedInUserId; //Provide user id string. This is mandatory.
System.Collections.Generic.SortedDictionary<int, string> Qdisplay = new
System.Collections.Generic.SortedDictionary<int, string>();
wDisplayOrder.Add(3, "Employee Leave Details");
wDisplayOrder.Add(1, "Expense Approval");
wDisplayOrder.Add(2, "Purchase Order");
wi.WorkflowDisplayOrder = wDisplayOrder;
Panel1.Controls.Add(wi);
```

LayoutViewName

This property is used to load a specific view when we load a Work items list control.

ShowCounter

This property is used to show or hide the counters for the work items Inbox. When this property is set to False, you will not be able to see the number of items count under each section in the Left tree menu view in the work item Inbox.

```
ShowCounter = true;
```

If this property is set to False, you will not be able to see how many items there are in the work item Inbox.

Sample Code

```
Skelta.Entity.UserContext usrcn = new Skelta.Entity.UserContext("John", new
Skelta.Core.ApplicationObject("Telematics"), "activedirectory", "", "", false);
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl wi = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
wi.ID = "WorkItemControl";
wi.ShowCounter = false;
wi.ApplicationName = uContext.Repository.ApplicationName; //Provide Application or
Repository name. This is mandatory.
wi.UserIdString =uContext.LoggedInUserId; //Provide user id string. This is mandatory.
Panel1.Controls.Add(wi);
```

ShowDetailsOnRowDoubleClick

This property enables you to open the Work Item Detail view on double-click of the row in the Work Item details grid.

Sort on the subject column in Work Item Inbox has been enabled. Also, the sort order in Work Item Inbox will be retained after submitting a work item.

ShowQueuesWithWorkitems

Showing the queues with work items under the left hand side workflow grouping of the Work items list control is controlled by the Workitemlist Control Property - ShowQueuesWithWorkitems. Based on this property, you can control the behavior of showing only the queues with work items under the workflows even though you may be a participant of those queues.

ShowDetailViewWithMultiSelect

Showing the work items detailed view with the Multi Select option is controlled by the Workitemlist Control

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

property (ShowDetailViewWithMultiSelect). Based on this property, you can control the behavior of showing the Work Item Detail view with the Multi Select window enabled.
Showing the Work Item Detail view with the Multi Select option also depends on the ShowDetailsonRowDoubleClick property.

If the ShowDetailsonRowDoubleClick is set as 'true', the Work Item Detail view will open on double-clicking the row with the Multi Select option enabled.

If ShowDetailsonRowDoubleClick is set as 'false', then the Work Item Detail view will open on selecting the row with Multi Select option enabled.

You can select all the work items within a group and act on it with the help of Selectallwithingroup option available as context menu with the Multi Select mode.

ShowMultiSelectWindowInCenter

The Multi Select window displayed in the center of the screen is controlled by the Workitemlist Control Property - ShowMultiSelectWindowInCenter. Based on this property, you can control the behavior of showing the Multi Select window.

QueueDetailViewWithoutPicking

Showing the Queue Detail view without picking the item from the Queue is controlled by the Work items list control property - QueueDetailViewWithoutPicking. Based on this property, you can enable or disable this feature in the Work items list control. By default, this feature is disabled.

Viewing the Queue Detail View page is possible in two ways.

- Double-click the item from the grid to get the Detail view.
- Through the context menu

The Queue Detail View page can be seen from the context menu option available from the Queue Work Item. Select Form Instances > Main Form to view the work items in detail.

EnableMoveNextPreviousWorkitem

This property enables you to navigate between different work items from the Work Item Detail view. This prevents the need to go back to the main details grid which shows the list of work items. You can also sort the Work Item Detail grid in some particular order and then navigate through the work items in that order.

EnableAutoMoveNextWorkitem

This feature enables you to view the Work Item Details for the next work item after submitting a work item. Moving to the next work item on submission of the work item from the detailed view is controlled by the WorkItemlist control property - EnableAutoMoveNextWorkitem.

A check box Show next work item on submission is available on the Work Item Detail view.

If selected, details of the next work item are shown after submission of the current work item.

If de-selected, the Work Item Detail view window will get closed without navigating to the next work item.

Split Bar in the Work Item List control

Split bar has been implemented in the Work Item List control. It can be used to adjust the width of the Work Item List control, if the workflow name or the Queue name is very long.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Use Events of Work Item List Control

Code snippets for using events of Work Item List Control are explained below

Sample code snippets for adding a work item control and adding events. There are several delegate events available for work item control. They are InitializeDataSourceEvent, InitializeLayoutEvent, InitializeWorkItemRowEvent, ColumnsAlignmentEvent, ColumnstoMakeInVisible events.

The following code snippet shows how to add a work item list control using the events.

```
protected override void OnInit(EventArgs e)
{
Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext();
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl WIL = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
WIL.ApplicationName = uContext.Repository.ApplicationName;
WIL.UserIdString = uContext.LoggedInUserId;
WIL.ID = "WorkItemListControl";
WIL.DisplayGroupUI = true;
WIL.Height = Unit.Percentage(100);//680;
WIL.ReadingPaneInPopupWindow = true;
WIL.EnableHold = true;
WIL.ShowInboxViewOnly = false;
WIL.ShowManagerViewOnly = false;
WIL.DisplayLeftTreeMenuAtApplicationLevel = false;
WIL.ShowStandardColumns = true;
WIL.ShowDetailsonRowDoubleClick = true;
WIL.ShowWorkItemFields = true;
WIL.ColumnstoMakeInVisibleEvent += new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl.ColumnstoMakeInVisible(W
IL_ColumnstoMakeInVisibleEvent);
WIL.InitializeDataSourceEvent += new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl.InitializeDataSource(WIL
_InitializeDataSourceEvent);
WIL.InitializeWorkItemRowEvent += new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl.InitializeWorkItemRow(WI
L_InitializeWorkItemRowEvent);
WIL.InitializeLayoutEvent += new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl.InitializeLayout(WIL_Ini
tializeLayoutEvent);
WIL.ColumnsAlignmentEvent += new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl.ColumnsAlignment(WIL_Col
umnsAlignmentEvent);
PanelWIL.Controls.Add(WIL);
}
```

Sample code snippet for adding a new column to the dataset which gets passed from the event used for showing the work item details grid.

```
/// <summary>
/// To add a new column to the dataset which gets passed from the event
/// </summary>
/// <param name="sender"></param>
/// <param name="e"></param>
void WIL_InitializeDataSourceEvent(object sender,
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorklistDataSourceEventArgs e)
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
DataColumn checkdatacolumn = new DataColumn();
checkdatacolumn.ColumnName = "New Column";

if (!e.workItemListDataSet.Tables[0].Columns.Contains(checkdatacolumn.ColumnName))
e.workItemListDataSet.Tables[0].Columns.Add(checkdatacolumn);
}
```

Sample code snippet for adding a new column to view it in the work item details grid.

```
/// <summary>
/// To add the new column to the see in the grid
/// </summary>
/// <param name="sender"></param>
/// <param name="e"></param>
void WIL_InitializeLayoutEvent(object sender,
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorklistInitialzeLayoutEventArgs e)
{
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkitemListColumns workitemListcolumn =
new Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkitemListColumns();
workitemListcolumn.Name = "New Column";
workitemListcolumn.Caption = "New Column";
workitemListcolumn.Bound = false;
workitemListcolumn.ColumnType = "text";
workitemListcolumn.Width = 50;
workitemListcolumn.AllowGrouping = false;
workitemListcolumn.AllowSorting = true;
workitemListcolumn.AllowSizing = false;
workitemListcolumn.WorkitemListColumnCollection.Add(workitemListcolumn.Name,
workitemListcolumn);
e.WorkItemColumnsList = workitemListcolumn.WorkitemListColumnCollection;
}
```

Sample code snippet for setting values for the added column for the row in the work item details grid.

```
/// <summary>
/// To set the values for the added column for the row in the grid
/// </summary>
/// <param name="sender"></param>
/// <param name="e"></param>
void WIL_InitializeWorkItemRowEvent(object sender,
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorklistDataRowEventArgs e)
{
  DataRowView dr = e.WorkItemRowView;
string value = dr.Row["ExecutionId"].ToString();
e.WorkItemColumnTextandValue.Add("New Column", value);
}
```

Sample code snippet for aligning the columns and setting the formatstring. We have to specify the exact ColumnName and not the caption of the ColumnName.

```
/// <summary>
/// Event to use to align the columns and setting formatstring
/// </summary>
/// <param name="sender"></param>
/// <param name="e"></param>
void WIL_ColumnsAlignmentEvent(object sender,
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorklistAlignmentArgs e)
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkitemListAlignmentColumns
wilAlignColumns1 = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkitemListAlignmentColumns();
 wilAlignColumns1.ColumnName = "ActivityDisplayName";
 wilAlignColumns1.ColumnAlignment = "right";

Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkitemListAlignmentColumns
wilAlignColumns2 = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkitemListAlignmentColumns();
 wilAlignColumns2.ColumnName = "CreatedDateTime";
wilAlignColumns2.DataFormatString = "dd.MM.yyyy";

e.WorkitemAlignmentColumnList.Add(wilAlignColumns1.ColumnName, wilAlignColumns1);
e.WorkitemAlignmentColumnList.Add(wilAlignColumns2.ColumnName, wilAlignColumns2);

}
```

Options available for ColumnAlignment are: Left, Right, and Center.

Options available for DataFormatString are:

For Date Columns, you can define this format:

1. "dd.MM.yyyy" - It will display the date like 04.08.2008
2. "d" - It will display as short date like 08/26/2008
3. "D" - It will display as long date like Tuesday, August 26, 2008

For Numeric Columns you can define this format:

1. "N" - Displays as general format.
2. "F" - Displays as Fixed format.
3. "c" - Displays as Currency Format.

Sample code snippet for hiding the columns in the Work Item Details grid.

```
/// <summary>
/// To hide the columns
/// </summary>
/// <returns></returns>

string[] WIL_ColumnstoMakeInVisibleEvent()
{
string[] columns = new string[2] { "ResponseBy","CreatedDateTime"};
return columns;
}
```

Layout Customization

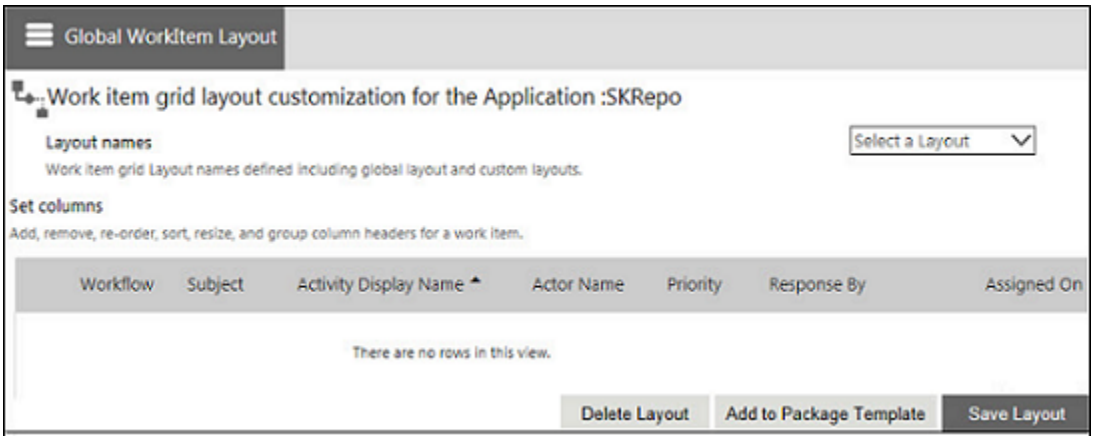
You can define have a specific view for a repository so that the defined view appears when you load the work item list control.

You can save a specific layout or global layout by selecting **Settings > Global Work Item Layout** from the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Enterprise Console pull-down menu.

On clicking **Global Work Item Layout**, the following page will be displayed:

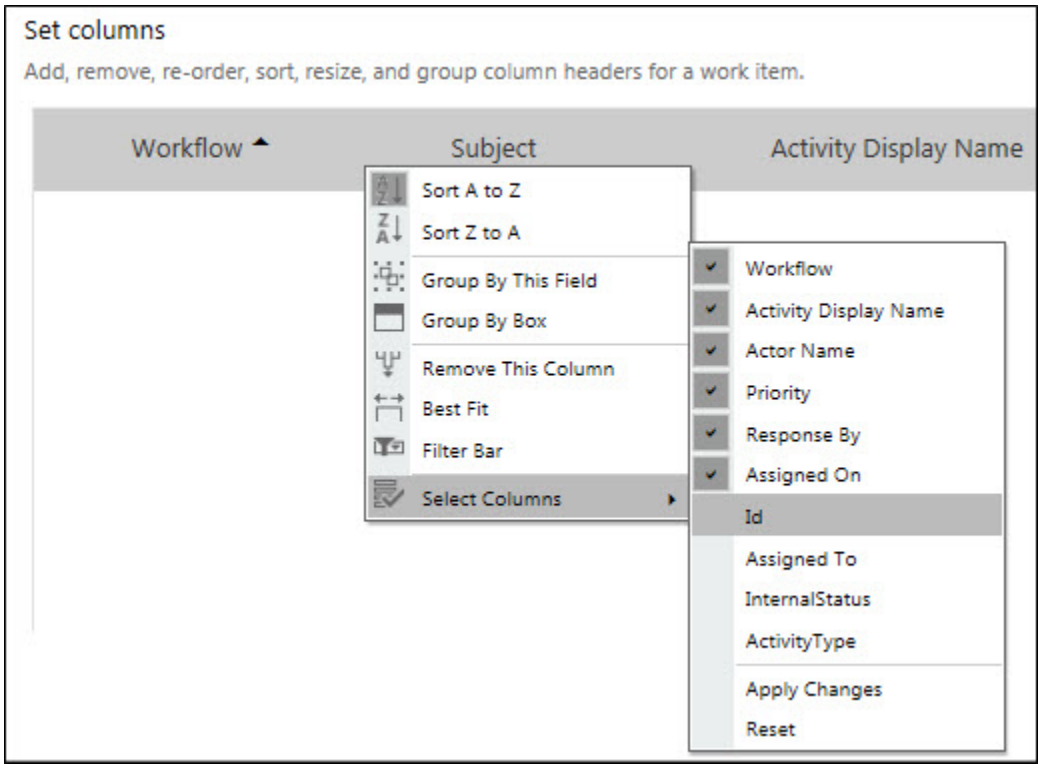


There are two ways to set layouts:

1. GlobalLayout
2. CustomLayout

To save Layout as Global Layout

1. Select **Settings > GlobalWorkItem Layout** from the Enterprise Console pull-down menu.
2. In the global layout page, select **GlobalLayout** from the **Layout names** drop-down.
3. Right-click any column fields and select the required column fields, as shown below



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Select **Apply Changes** and then **Save Layout**.
5. Go to Inbox. The layout will be displayed with specified column fields defined.

There may be a scenario where we want to have different layout specific to different processes.

To save Layout as Specific Layout

1. Select **Settings > GlobalWorkItem Layout** from the **Enterprise Console** menu.
2. In the global layout page, select **CustomLayout** from the **Layout names** drop-down.
3. Click **New Custom layout**.
4. Give a layout name in the **New Custom layout name** text box. For example, 'Leave Details View'.
5. Right-click any column and select the required column fields.
6. Select **Apply Changes** and then **Save Layout**.
7. The following code snippet shows you how to specify a custom layout for the work item control. Set the **LayoutViewName** property with the custom layout name. For example, 'Leave Details View'.

```
Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext();
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl wi =  new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
wi.ApplicationName = uContext.Repository.ApplicationName; //Provide Application or
Repository name. This is mandatory.
wi.UserIdString =uContext.LoggedInUserId; //Provide user id string. This is mandatory.
System.Collections.Generic.SortedDictionary<int, string> Qdisplay = new
System.Collections.Generic.SortedDictionary<int, string>();
wi.LayoutViewName = "Leave Details View";
//LayoutViewName property is used to load the specified layout.
```

Note: If the LayoutViewName has not been specified, then the Global Layout created for the repository will be considered as the default layout for the Work Item list control.

8. Go to the **Work items list** Inbox. The layout will be displayed with specified column fields.

Note: If you save the customized layout with the **Actor Name** column, this column will be displayed in the Work Item List control only for the Queue view. However, this column will not be displayed for the Inbox and Manager views.

Create Custom Link in Work Item List Control

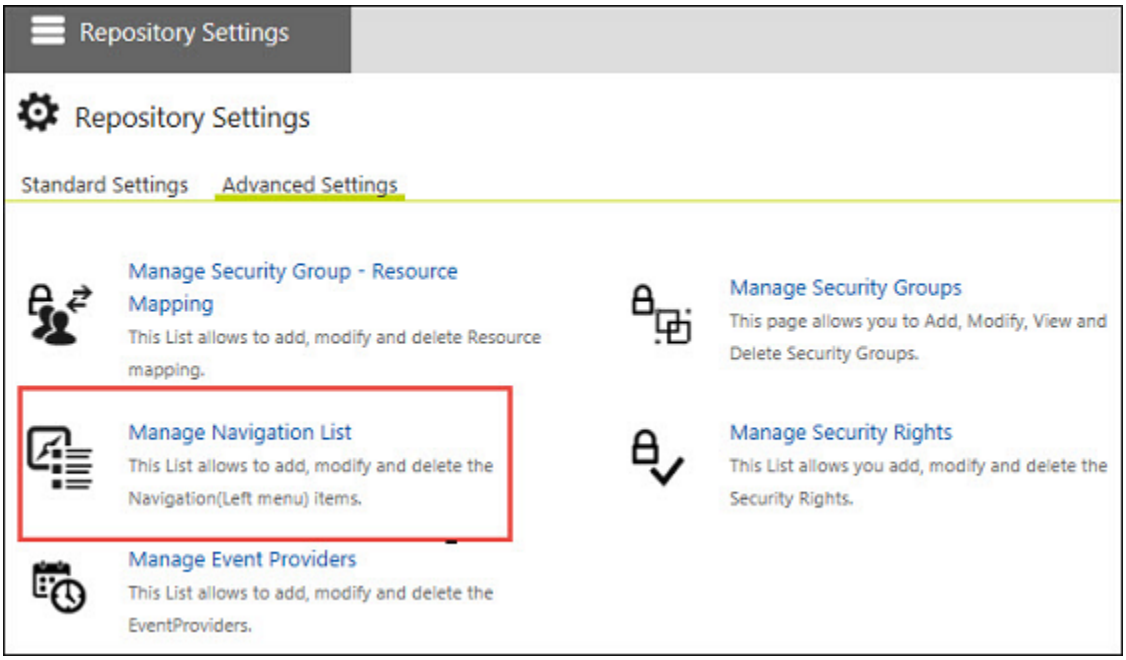
This feature enables you to create custom links in the left hand side tree view menu of the Work items list control.

Scenario

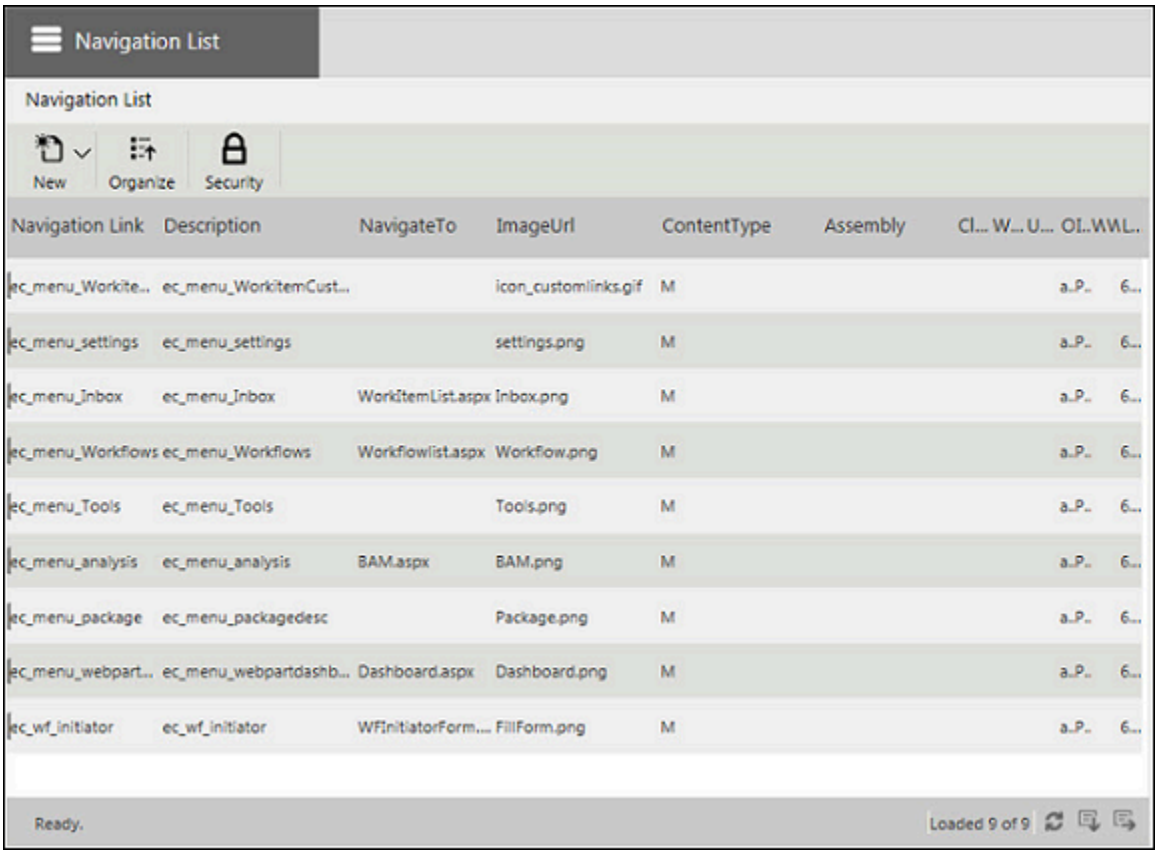
John is the manager in Telematics organization acting on the HR and Accounts Payable Process. The manager wants to view a custom page like the Workflows list page from the work items Inbox on click of a link from the LHS tree menu view of Work items list control. Also, wants this custom link to be secure so that only the users with proper rights should be able to view it and also wants sub links under the main custom link with different navigations.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

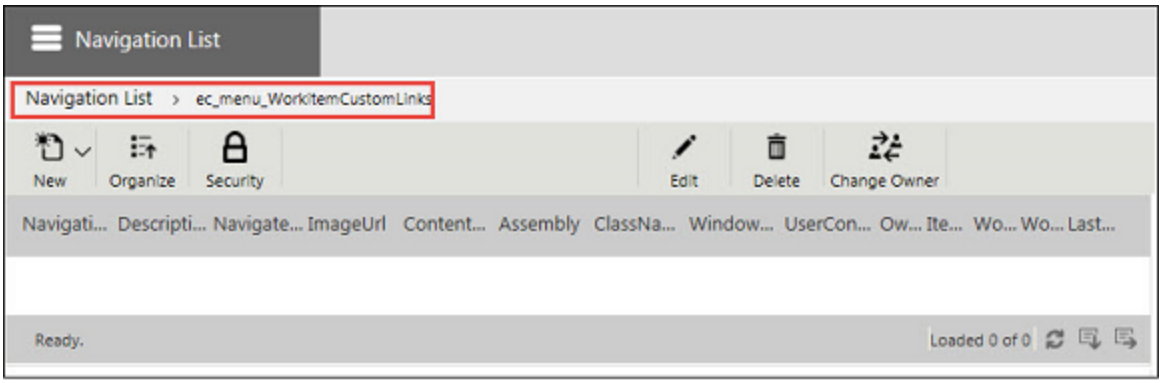
You can create custom links through the **Navigation List of Repository Settings**.



Whenever a new repository is created, an entry - **ec_menu_WorkitemCustomLinks** is created in the Navigation List. You can create sub links under this Navigation link or can edit the link for adding a page if no sub link is needed.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Calendar Control

AVEVA Work Tasks Calendar control allows you to define and configure multi-level organizational calendars. The Calendar interface enables creation of hierarchical organization and resource calendars. The Calendars are used to determine availability of resources, calculate time slots, and perform other scheduling functions.

To add Calendar control using a panel

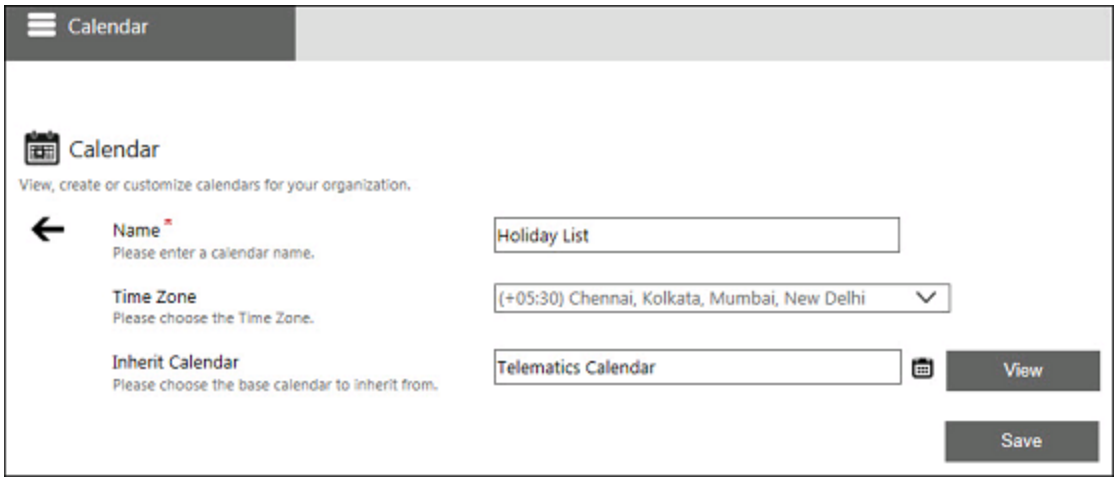
1. Before adding the Calendar control in a panel, create an ASP.NET project in Visual Studio .NET 2012.
2. Open **Calendar.aspx.cs** page.
3. Make sure that you have created the User Context object as per the steps given in Create User Context
4. In the underlying code, create a new instance of control, and add the instance to the panel in the Page_Load as shown in the following example.

```
Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject("ListRepo");//Repository name
object loggedinUserId = "4952ffff-e0db-401b-bb7d-70a0fec1df07";
Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext(loggedinUserId,
application, "skeltalist");
Skelta.HWS.Web.CalendarControl.CalendarControl cc = new
Skelta.HWS.Web.CalendarControl.CalendarControl();
cc.ApplicationName = userContext.Repository.ApplicationName; //Provide Application or
Repository name. This is mandatory.
cc.ID = "Calendar"; // This is mandatory.
Panel1.Controls.Add(cc);
```

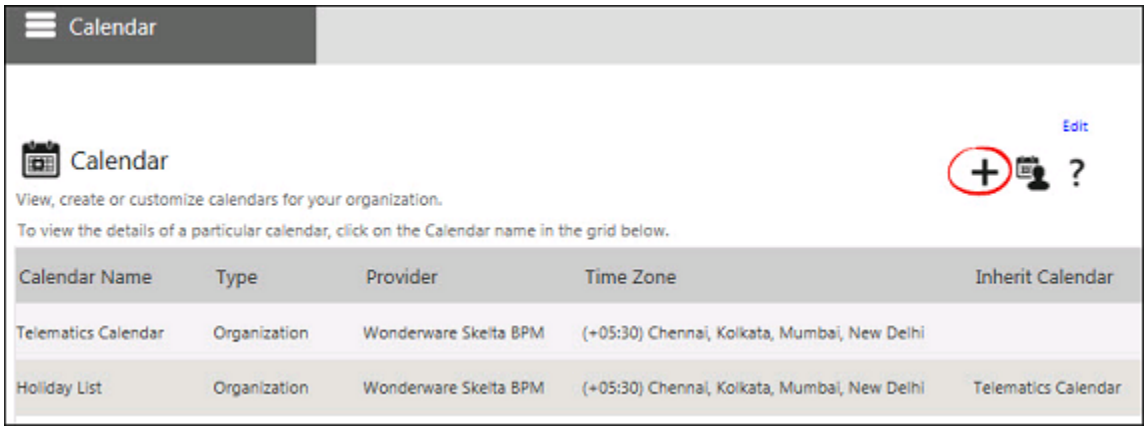
Properties that can be set for Calendar control

- **ApplicationName**: Provide the name of the application in which you want to use the calendar.
- **CalendarName**: Set the name of the calendar.
- **UserIdString**: Calendar can be created for a specific actor by providing UserIdString of that actor. Click Create User Context to view the different UserIdString formats.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



- **Can Add calendar**: If **CanAddCalendar** property is set to false, the "**Add New Calendar**" button will not be displayed and you will not have the rights to add calendar. If the **Can Add Calendar** property is set to true then the user can also Add/Delete Calendar Workslot.



- Can Add calendar workslot
- Can Delete calendar workslot
- **Can Delete calendar**: If CanDeleteCalendar property is set to false, the "Delete" button will not be displayed and you will not get rights to delete calendar.
- **Can List calendar**: If CanListCalendar property is set to false, the "List" button will not be displayed and you cannot get the list of calendars.
- **Can View calendar**: If the CanViewCalendar property is set to false, the "View" button will not be displayed and you will not have rights to view the inherited calendar.
- SecurityUserIdString

Properties that are not used in Calendar control

- CanAddCalendarWorkSlot
- CanDeleteCalendarWorkSlot

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

BAM Control

The Business Activity Monitoring (BAM) control provides features that can be used by a process administrator to monitor and control various instances of the workflow(s) in a repository. It provides a graphical representation of the various instances of the workflows using three different views.

To add BAM control using a panel

1. Before adding the Process Designer control in a panel, Create an ASP.NET Project in Visual Studio .NET.
2. Go to **BAM.aspx.cs** page.
3. Ensure that you have initialized the User Context object as per the steps given in Create User Context.
4. In the underlying code, create a new instance of control and add the instance to the panel in the Page_Load, as in the example below.

```
Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject("ListRepo");//Repository name
object loggedinUserId = "4952ffff-e0db-401b-bb7d-70a0fec1df07";
Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext(loggedinUserId,
application, "skeltalist");
Skelta.BAM.UserControls.BAMControl bam = new Skelta.BAM.UserControls.BAMControl();
bam.ApplicationName = userContext.Repository.ApplicationName; //Provide Application
or Repository name. This is mandatory.
bam.ID = "BAM";
bam.UserIdString = userContext.LoggedInUserId; //Provide user id string. This is
mandatory.
bam.Height = unit.Percentage(100);
bam.Width = Unit.Percentage(100);
Panel1.Controls.Add(bam);
```

5. If the bin folder does not exist in the user project (D:\Develop\SkeltaTestSite), create the bin folder under user project (D:\Develop\SkeltaTestSite).
6. Copy **ComponentArt.Charting.WebChart.dll** and **ComponentArt.Charting.lic** from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\EnterpriseConsole\bin* to bin(*D:\Develop\SkeltaTestSite\bin*) folder of the user project.
7. Create "TempReports" folder under the project.
   This step is required because temporary data (Example like Output files generated at the time of exporting the report) of BAM reports is stored in the "TempReports" folder.
8. Create BAM Reports folder in path *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks*.
9. Provide complete "Access rights" to NETWORK SERVICE account to the folders specified below in Windows Server 2003 machine. In the case of Windows XP, provide full "Access rights" to ASP.NET Machine account to the same folders specified below:
   a. TempReports: Which is under project
   b. Image folder: Exists in the path *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\BPMUITemplates\Default\BAM folder*
   c. BAMReports: Exists in the path *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks*.

Properties that can be set for BAM control

- ApplicationName: Provide application name or repository name to get information about workflow status.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- UserIdString: Provide UserIdString of the actor to get the status of workflow where the actor is part of workflow. Click Create User Context to view the different UserIdString formats.
- WorkflowNames: Provides filtering so that the status of only the workflows specified in the WorkflowNames property only be displayed.
- ShowCategories: Shows only those categories as mentioned in the ShowCategories property, i.e. the categories as shown in the left pane of the BAM Reports (Dashboard, Analyze).

Note: The BAM Control properties ShowNodes, HideNodes, and ShowTree are obsolete and should not be used with AVEVA Work Tasks.

Add Individual BAM Report to aspx Page

In some scenarios there may be a requirement to render an individual report in an aspx page, and also to control some of the characteristics of the report just by specifying the properties of the BAM control.

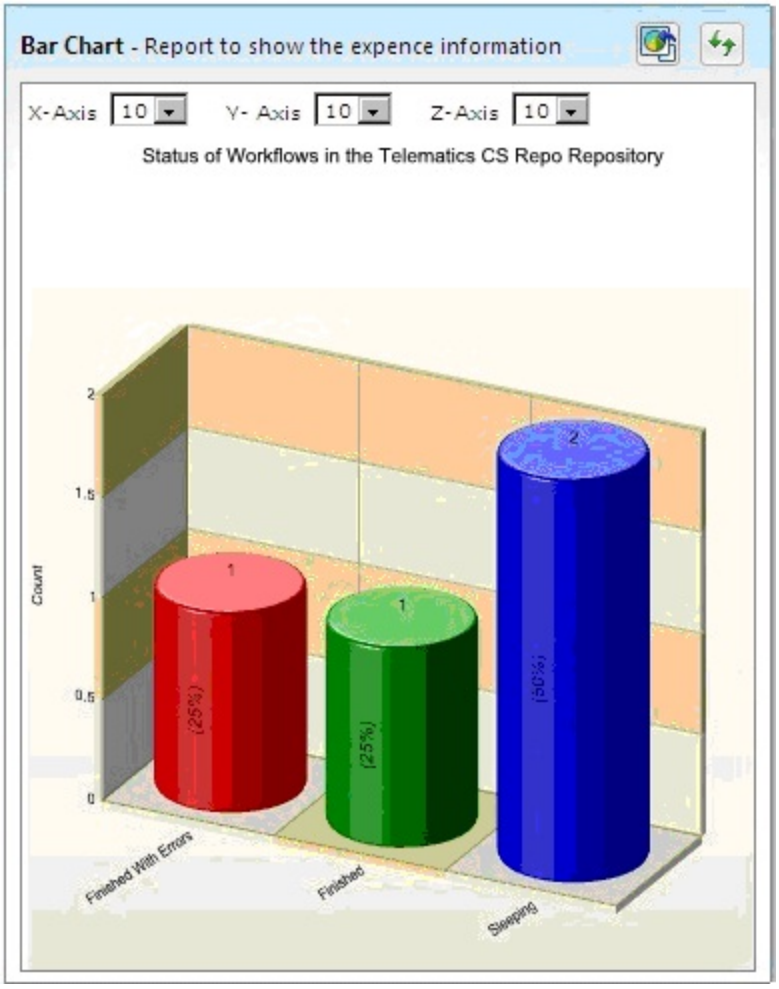
Features

- Support for rendering an individual report in an aspx page.
- Characteristics of the report can be controlled just by specifying the report properties.
- Security enabled report rendering.
  To enable rendering of individual report in an aspx page, BAM report has been enhanced with some more properties to it. Below are the properties that can be used to render an individual report in an aspx page.
  - **IsAnIndividualReport**: If this property is set as true, it enables the individual report rendering. Else default configurations will be considered for rendering the report.
  - **ReportName**: This is the hierarchy of the report in the BAM Control. For example, to render all the executing instances in an aspx page, ReportName property can be set with 'Analyze/Execution/Executing'.
  - **ReportID**: This is a unique Id for any report. This information will be taken from the database where the report information is stored.
    'ID' column of 'SKBAMMenu' table, this information will be unique.

    Note: If both the properties 'ReportID' and 'ReportName' are set then, 'ReportName' will be considered for rendering the report.
  - **Width**: Width of the control can be set using this property.
  - **Height**: Height of the control can be set using this property.
  - **Web Part Border**: If this property is set as true, it will render the individual reports with border else it will render them without border.

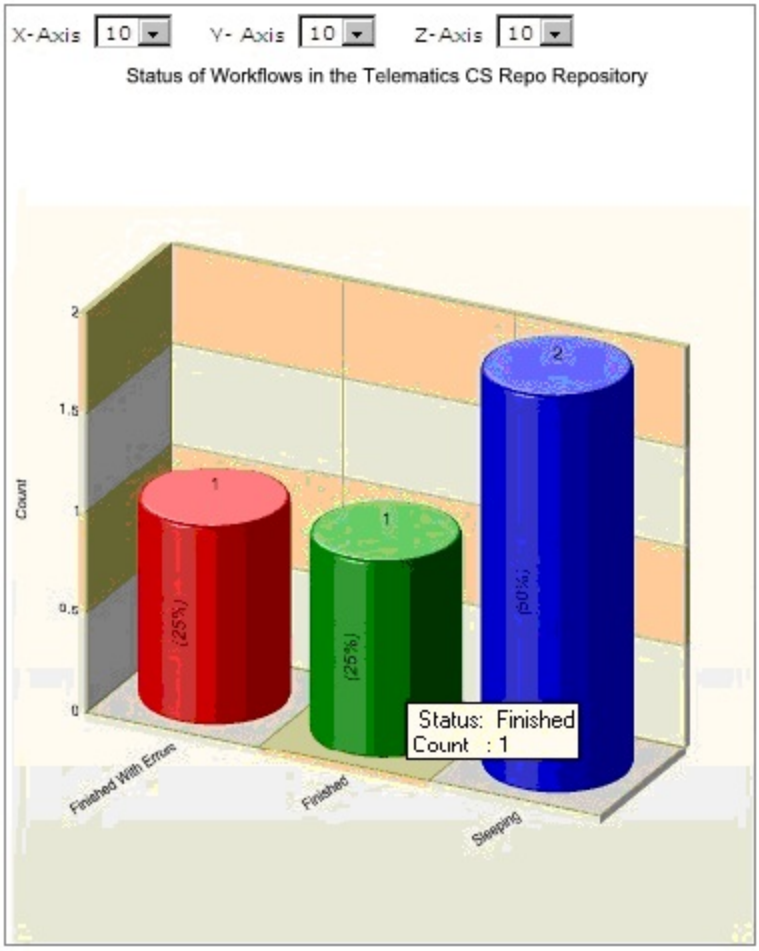
With Border:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Without Border:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



- ReportTitle: Title of the report which will be displayed on the top left corner of the report.
- ReportDescription: Description for the report which will be displayed next to the report title.

Scenario
'XYZ' organization is one of the leading supply chain management companies. 'XYZ' has a web site in which home page needs to be displayed with one of the customized BAM reports.
The above scenario can be achieved by using Business Activity Monitoring control. By specifying the properties of the BAM control, it is possible to render an individual report in an aspx page.

Design of the above scenario involves the following steps:
Step 1: Drag and drop the BAM control to any aspx page
Step 2: Set the BAM properties
The following code sample shows how to set the properties of the BAM control to render the report individually.
Sample ASPX page:

```
<%@ Page Language="C#" AutoEventWireup="true" CodeFile="IndividualBam.aspx.cs"
Inherits="IndividualBam" %>
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head runat="server">
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
    <title></title>
    <style type="text/css">
    html,body,form
    {
    height:100%;
    }
    </style>
  </head>
  <body>
    <form id="form1" runat="server">
    <div style="height:100%;">
    <asp:Panel ID="Panel1" runat="server" Height="100%" Width="100%"></asp:Panel>
    </div>
    </form>
  </body>
  </html>
```

Sample Code file:

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.UI;
using System.Web.UI.WebControls;
public partial class IndividualBam : System.Web.UI.Page
{
protected void Page_Load(object sender, EventArgs e)
{
//Instance of BAM Control
Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject("Telematics Repository");//Repository name
object loggedinUserId = "81734457-B3DB-4BC9-894A-C3149828C65C";
Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext(loggedinUserId,
application, "skeltalist");
Skelta.BAM.UserControls.BAMControl bamControl = new
Skelta.BAM.UserControls.BAMControl();
//Application Name
bamControl.ApplicationName = "Telematics Repository";
//UserID
bamControl.UserIdString = userContext.LoggedInUserId;
//BAM ControlId
bamControl.ID = "myBAM1";
//ReportName
bamControl.ReportName = "Workflow Instances";
//ReportId [If ReportName is set, this property will be ignored.]
bamControl.ReportId = "DF2878B5-A97B-478F-BD14-89E591D46BB9";
//To Show as an Individual Report
bamControl.IsAnIndividualReport = true;
//Report Title
bamControl.ReportTitle = "Bar Chart";
//Report Description
bamControl.ReportDescription = "Report to show the information";
//Height
bamControl.Height = Unit.Percentage(100);
//Width
bamControl.Width = Unit.Percentage(100);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
//Add the Control to Panel
Panel1.Controls.Add(bamControl);
}
}
```

View Specific Workflow Instances in BAM Control

BAM is used for viewing all the workflow instances in different categories like Running Workflows, Failed Workflows, Aborted Workflows, Paused Workflows and Completed Workflows. This feature allows you to filter and show only specific workflow instances in the BAM control.

Showing the specific instances of the workflow in BAM is controlled by the property – **InstancesToBeShown**. This property is an ArrayList property to which you can add the Executionids of the workflow instances for which you want to see the details.

The property InstancesToBeShown is set say for the Execution ids 25, 24, 23, 22, 21. The report will be shown only for these workflow instances.

Queue Control

The Queue control is used to group resources as a common pool and assign tasks to the group.

To add Queue control using a panel:

1. Before adding the Process Designer control in a panel, Create an ASP.NET Project in Visual Studio .NET.
2. Go to **Queue.aspx.cs** page.
3. Make sure that you have initialized the User Context object as per the steps given in Create User Context.
4. In the underlying code, create a new instance of control and add the instance to the panel in the Page_Load as in the example below:

```
Skelta.Core.ApplicationObject application = new Skelta.Core.ApplicationObject
("Telematics Repository");//Repository name
object loggedinUserId = "81734457-B3DB-4BC9-894A-C3149828C65C";
Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext
(loggedinUserId, application, "skeltalist");
Skelta.HWS.Web.QueueControl.QueueControl que = new
Skelta.HWS.Web.QueueControl.QueueControl();
que.ID = "Q1"; //This is mandatory.
que.ApplicationName = userContext.Repository.ApplicationName; //Provide Application
or Repository name. This is mandatory.
que.UserIdString = userContext.LoggedInUserId; //Provide user id string. This is
mandatory.
Panel1.Controls.Add (que);
```

Different Properties that can be set for Queue control are:

- **ApplicationName** - Provide the application or repository name where Queue has to be created.
- **UserIdString** - Provide the actor UserIdString who wants to create or view the queue. By default, the user who creates the Queue will be the owner of the queue. Click Create User Context to view the different UserIdString formats.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

List Control

List Controls lists out the Workflows, Navigation Details, Users, Event Providers and Event Associations.

To add List control using a panel:

1. Before adding the Process Designer control in a panel, Create an ASP.NET Project in Visual Studio .NET.
2. Go to List.aspx.cs page.
3. Make sure that you have initialized the User Context object as per the steps given in Create User Context
4. In the underlying code, create a new instance of control, and add the instance to the panel in the Page_Load as shown in the following example:

```
Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject("Telematics Repository");//Repository name
object loggedinUserId = "81734457-B3DB-4BC9-894A-C3149828C65C";
Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext(loggedinUserId,
application, "skeltalist");
Skelta.Repository.Web.ListControl listControl = new
Skelta.Repository.Web.ListControl();
listControl.RepositoryName = userContext.Repository.ApplicationName;
listControl.ListName = "Users";
listControl.ID = "listControl1";
listControl.LoggedInUserId = userContext.LoggedInUserId;
listControl.FilterColumn = "";
listControl.FilterValue = "";
listControl.Height = Unit.Percentage(100);
Panel1.Controls.Add(listControl);
```

Different Properties that can be set for List Control:

- **Repository Name:** Provide the repository name created by the user.
- **Filter Column:** Provide column name for which user needs to apply filter. Example: Filter column = Title
- **Filter Value:** Provide the value for filtering. Example: If Filter value=test then "test" is searched based on "List Name" provided. Suppose, if the List Name is 'Workflow' then the workflow with name 'test' will be searched.
- **Filter Query:** Use the FilterQuery property if you want to filter with more than one condition.

  Sample code:

```
Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext();
Skelta.Repository.Web.ListControl listControl = new Skelta.Repository.Web.ListControl
();
listControl.RepositoryName = userContext.Repository.ApplicationName;
listControl.ListName = "Workflow";
listControl.ID = "listControl1";
listControl.LoggedInUserId = userContext.LoggedInUserId;
ListControl1.FilterColumns = "ItemType";
ListControl1.FilterQuery = "ItemType = 2 or ItemType = 3";
Panel1.Controls.Add(listControl);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

In this example, the ItemType refers to the filter query conditions to be specified in order to categorize the list of workflows.

- **List Name:** Provide the List Name.
  - **Example1**: If List Name= Workflow, then the workflows are displayed depending on List Id or List Item.
  - **Example 2**: If List Name= NavigationDetails, then information regarding the navigation of control is displayed.
  - **Example 3**: If List Name=Users, then all the "list provider" users are displayed.
  - **Example 4**: If List Name= Event Providers, then different providers for association are displayed.
  - **Example 5** :If List Name = Event Associations, then all the workflows for which association is created is displayed.
- **LoggedInUserId**: Provide the user ID of the user. Click here to view the different UserIdString formats.

Form List Webpart Control

Forms List Webpart Control will list out the forms available.

To add FormsList WebPart control using a panel

1. Before adding the Process Designer control in a panel, Create an ASP.NET Project in Visual Studio .NET.
2. Go to FormsWebPart.aspx.cs page.
3. Ensure to initialize the User Context based on r the steps given in Create User Context
4. Add the following style within the <head> tag.

```
<style type="text/css">
html, body, form {
height: 100%;
margin:0;
padding:0;
width:100%;
box-sizing:border-box;
}
</style>
```

5. Modify as follows:

```
<div style="width:100%;height:98%;box-sizing:border-box;">
```

6. In the underlying code, create a new instance of control and add the instance to the panel in the **Page_Load** as in the example below.

```
Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject("ListRepo");//Repository name
object loggedinUserId = "89b95a29-4931-44f1-8f4d-3e78036a936f";
Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext(loggedinUserId,
application, "skeltalist");
Skelta.WebParts.FormList frmWebPart = new Skelta.WebParts.FormList();
frmWebPart.ID = "formListWebpart";
frmWebPart.ApplicationName = userContext.Repository.ApplicationName;
frmWebPart.LoginName = userContext.LoggedInUserId;
frmWebPart.Height = new Unit(100, UnitType.Percentage);
frmWebPart.Width = new Unit(99, UnitType.Percentage);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
frmWebPart.InlineFormHeight = new Unit(90, UnitType.Percentage);
Panel1.Controls.Add(frmWebPart);
```

Different Properties that can be set for FormListWebPart Control

- **ApplicationName**: Provide the ApplicationName or Repository Name for the workflow report to be viewed.
- **LoginName**: Provide the User ID of the user who has logged in. Click here to view the different UserIdString formats.

Workflow Execution View Control

The WorkflowExecutingReport Control shows the Process Execution View of the currently executing workflow.

To add workflow executing report control using a panel

1. Before adding the Process Designer control in a panel, Create an ASP.NET Project in Visual Studio .NET.
2. Go to **ExecuteReport.aspx.cs** page.
3. Make sure that you have initialized the User Context object as per the steps given in Create User Context.
4. In the underlying code, create a new instance of control and add the instance to the panel in the Page_Load, as in the example below.

```
Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject("Telematics Repository");//Repository name
object loggedinUserId = "81734457-B3DB-4BC9-894A-C3149828C65C";
Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext(loggedinUserId,
application, "skeltalist");
Workflow.NET.Web.Report.WorkflowExecutionReport wf = new
Workflow.NET.Web.Report.WorkflowExecutionReport();
wf.Application = userContext.Repository.ApplicationName;
wf.ExecutionId = 1;
wf.Height = Unit.Percentage(100);
Panel1.Controls.Add(wf);
```

Different Properties that can be set for WorkflowExecutingReport Control are:

- Application:Provide the ApplicationName or Repository Name for the workflow report to be viewed.
- ExecutionId:Provide the ExecutionId (from the table SWExecute) of the workflow for which report has to be viewed.
- OnlyAnalystsView: If the OnlyAnalystsView property is set to true, then only the AnalystsView will be displayed (Progress View and Execution View will not be displayed).
- CanControlWorkflow: If the CanControlWorkflow property is set to true, then you can **Abort Executing Workflow** and **Pause Executing Workflow**.

Different views in the Process Execution Window

- The Analyst's View is a simplified view of the process design intended for end-users. You can save the simplified view of the process as a file and associate this filename in the Start Activity to enable this view for the end users.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The Progress View shows the workflow progress on the Process Diagram, up to the point that the Execution View is selected. It consists of the execution view mapped on to the Process Diagram. You can click a completed activity to view the Step Details window. You can view the step details, variables, contents, content (raw content passed to the workflow) using the corresponding tabs. The links that have already been traversed are represented by thick lines.
- The Execution View shows the workflow execution status up to the point the execution has happened.

Configure New Repository

This section explains you how to configure a new repository in AVEVA Work Tasks.

Set up Source Elements Directory

AVEVA Work Tasks allows extensive customization of its User Interface and of several other functional aspects. Most of this configuration information is stored in the *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**WorkflowElements**Default* directory.

Each application or workflow can point to a specific WorkflowElements Directory, so that the necessary customization of the entire user interface or functionality can be done at the application or workflow level.

The **AVEVA Work Tasks Templates** directory contains a number of XML files, which define the Actions used by AVEVA Work Tasks, as well as the behavior of Controls such as BAM, Work Item List. By modifying these files, you can extend or customize AVEVA Work Tasks.

The **Source Elements Directory** is configured as a part of **AVEVA Work Tasks Repository** settings.

Set up Email Addresses for Repositories

Email addresses to be used to send emails from AVEVA Work Tasks are specified in the Email Settings field in Repository Management and in the Farm Configuration Wizard.

Email settings specified at the repository level, farm and activity levels are used as follows:

- Activities using mail channel: Emails are sent from the email address specified for the repository.
- Send email activity: The email address specified in the action property is used.
- Exception Email: All exceptions logged in the console will be emailed to the mail address configured in Farm Configuration Global Settings in the "From Email" and "To Email" fields.
- Exception emails during activity execution are sent to the address configured in the "From Email" and "To Email" fields of the repository. Exception email will be sent to the Submitted by user if the workflow initiation fails in the engine.
- Repository "From mail": It is used to send activity mail to the actor.
- Action Property "From Email Address": It is used for sending information (like adding the task) to the actor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Set up User Providers for Repositories

AVEVA Work Tasks uses the concept of User Providers for connecting to users participating in the workflow process. This allows it to use a wide variety of User Data Sources, such as Active Directory or Native-Application-specific Application Database. AVEVA Work Tasks provides a default user database which is available in the User Provider options for a repository as AVEVA Work Tasks List.

Refer to *Administrator Guide* for configuring user providers.

Set up Document Web View Control for Repositories

AVEVA Work Tasks uses ASP.NET Server Controls to render the workflow data to various participants in the workflow. This data is displayed to the participants when they are performing actions such as Approvals or working on tasks, and is entirely application specific. A class implementing the INativeWebFormUIControl, ISkeltaAddInProvider interface can be configured to display the information specific to the application, in the activity list.

To configure the default document view handler of AVEVA Work Tasks

1. Create a new html file which should be the new default document view and put that file in the *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks*[*WorkflowElements**Default**en-US**Activities**Activity**Custom* folder with any name.
2. Create a class library project and add reference to the following dlls in the AVEVA Work Tasks Bin folder:

   ```
   Workflow.NET.NET2.dll
   Skelta.HWS.dll
   Skelta.HWS.WorkListChannel.Web.dll
   ```

   Create a class which implements the following interfaces

   INativeWebFormUIControl

   ISkeltaAddInProvider

   WebControl

   Inside the class, override the Render() function where you can change the default properties of the document view. In the function, change the default page url to the new page which you have created.

   ```
   using System;
   using System.Collections.Generic;
   using System.Text;
   using Workflow.NET;
   using Workflow.NET.Engine;
   using Workflow.NET.Interfaces;
   using Skelta.HWS.WorkListChannel.Web;
   using Skelta.HWS;
   using Skelta.Core;
   using Skelta.Events;
   using System.Web.UI.WebControls;
   using System.Web.UI;
   namespace CustomDocView
   {
   public class docview :WebControl, INativeWebFormUIControl, ISkeltaAddInProvider
   {
   #region INativeWebFormUIControl Members
   ```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
private WorkItem _WorkItem;
private Context _Context;
private string _Settings;
private Guid _Id;

private WebWorkItemAdapter _WorkItemAdapter;
private string _UserId;

public docview()
{
}
public docview(string settings)
{
this._Settings = settings;
}
public void SetContext(WorkItem workItem, string channelName, string formName)
{
_WorkItem = workItem;
_Context = _WorkItem.CurrentContext;
_WorkItemAdapter = new WebWorkItemAdapter();
_WorkItemAdapter.ProcessWebChannelRequest();
_UserId = Convert.ToString(_WorkItemAdapter.LoggedInActor.RealActorId);
}
protected override void Render(HtmlTextWriter htw)
{
Workflow.NET.Parser parseHtml = new Parser();
string strTempDirectoryPath =
_WorkItem.HWSActivity.CurrentContext.ProcessDefinition.ActionsDefinition.DirTemp;
string strDirectoryPath =
_WorkItem.HWSActivity.CurrentContext.ProcessDefinition.ActionsDefinition.DirSourceEle
ments;
parseHtml.Replace("application", _WorkItem.Application.ApplicationName);
parseHtml.Replace("workflow", _WorkItem.CurrentWorkflow.WorkflowName);
parseHtml.Replace("instanceid", _WorkItem.ExecutionId.ToString());
parseHtml.Replace("submittedby",
_WorkItem.CurrentContext.SubmittedBy.Properties.Name.Value.ToString());
parseHtml.Replace("executiondetailsid", _WorkItem.ExecutionDetailsId.ToString());
parseHtml.Replace("workitemid", _WorkItem.Id.ToString());
parseHtml.Replace("activityname", _WorkItem.CurrentActivity.Name);
//parseHtml.Replace("datasubmitted", _WorkItem.CurrentContext.Data);
object cssPath = Workflow.NET.TemplateExpressionBuilder.GetUrl("");
string relativeUrl = cssPath.ToString();
parseHtml.Replace("VirtualDirectory", relativeUrl);
//Change the path of the default page which should be displayed for document view by
default.
//use the HTML controls instead of asp.net controls for designing the custom document
page
htw.Write(parseHtml.CheckAndProcessFileGetString(strDirectoryPath +
"Activities\\Activity\\CustomDocument.htm", strTempDirectoryPath + "cache",
"Activities\\Activity\\"));
base.Render(htw);
}
#endregion
#region ISkeltaAddInProvider Members
public Guid Id
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

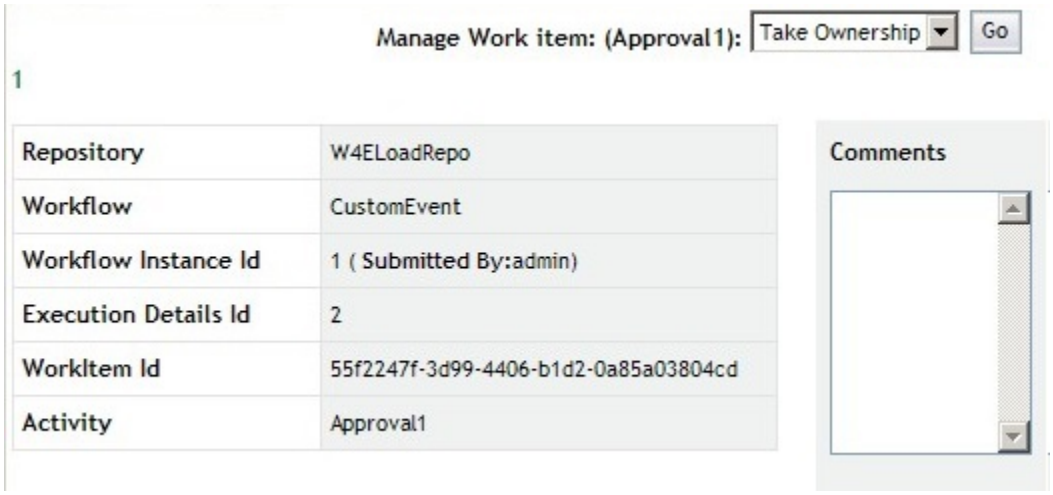
```
get { return _Id; }
}
public void InitializeProvider(string settings, Guid id)
{
_Settings = settings;
_Id = id;
}
public string Settings
{
get { return _Settings; }
}
#endregion
}
}
```

3. Compile the project and create the dll.
4. Copy the dll to the AVEVA Work Tasks bin folder.
5. The custom document view is loaded through AddInProvider. An entry has to be made to the AddInProvider table in the repository database as given below.

   You will find an existing in SKAddInProviders with 'Name' as 'DocumentWebViewControl'. Rename it and execute the below Query.

   INSERT INTO SKAddInProviders (Type,[Name],ClassName,[Assembly],Settings,IsGacAssembly) VALUES ('DocumentView','DocumentWebViewControl','Namespace.ClassName','bin\<DLLName>.dll','',1)

   As you can see in the figure below, the document view is displayed without the 'Data Submitted By' field which is present in the default Document view.



Content for the html file CustomDocument.htm

</tr>
 </table>
 </body>
</html>
```

Activities

AVEVA Work Tasks supports many activities while creating a workflow. The activities are organized in different groups based on the function it performs. Each activity has a corresponding activity icon and, you can use them

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

in the Design Area by dragging and dropping or by using the Context menu option while designing a workflow in Process designer.

You need to configure each activity by specifying appropriate values for the different properties in the Activity Properties area. The properties are described under each Activity topic in this chapter.

Note:
- A colon character (:) is not supported for the Activity Name while designing a workflow in Process Designer.
- While defining the output for activities, where you can define custom output for the action, make sure you do not use the names of the pre-existing menu items of the pull-down menu.
- Alphanumeric, space, and dot are the only supported characters for activity outputs.

Start Activity

Activity Description

The Start Activity is the first activity in a workflow. The icon corresponding to this activity is displayed by default in the Design Area. The Contents and Variables used in the execution of the workflow are declared here. The starting point for redirection can also be set in this activity. This will enable redirection at the beginning of the workflow until it is turned off later in the workflow.

Note: Workflow utilizes CDATA sections exclusively and nesting is not allowed in CDATA section. So, while passing Variables in workflow, CDATA should be avoided.

Activity Properties

The Start activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking the Activity Properties tool in the tool bar or by selecting the appropriate option from the right-click menu for the Start activity.

Note: Every time you input a value for a property, ensure to save the data. Click the **Save** button on the **Activity Properties** window. You need to save the property so that the subsequent properties in the activity can inherit the required information.

The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

You can use these properties to specify the name and description of the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

You can use these properties to specify the web service details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Variables - The variables used in the workflow, including Local Variables, can be specified using this property.

Property Type: Optional (*Set this property only if needed*.)

Steps to set the variable property

1. To specify the variables, click the button for the 'Variables' property to open the property window.
2. Enter the variable name in the **Workflow Variables** field. Prefix the variable name with '@' if it is a local variable.
3. Select the corresponding variable type from the **Type** drop down field.
4. After entering the variable details, click **Add Row** to add this variable and to display a new row for entering another variable.
5. Remove rows if necessary by selecting them and clicking **Remove Selected**.
6. After entering all the variables, click **Update**.

Steps to set Variable for Queue Action user

1. To specify the variable, right-click the Start activity icon in the workflow and select Activity Properties.
2. To declare the variable, click the icon near Variables property.
3. In the Workflow Variables, define the variable in the following format:

   ^+CurrentActivityName+'QueueActingUsers'

   For example, ^HRFormQueueActingUsers

   HRForm is the activity name.
4. Select the Type as "**Array**".
5. Click **Update** to save the variable.
6. Click **Save** in the Activity properties pane to save all the data entered.
   The value of the user who acts on the HRForm activity will be stored in the variable. The Approval1 task will be assigned to the same user.

See Start - Variables for a detailed description of the Variables property window.

Contents - The contents that can be passed to the workflow can be specified using this property.

Property Type: Optional (Set this property only if needed.)

Steps to set the contents property

1. To specify the content, click the button for the 'Content' property to open the property window.
2. Enter the content description in the **Content Description** field.
3. Select the content type from the **Type** drop down field.
4. Enter the XPath expression in the **XPath Expression** field.
5. Enter the attribute name in the **Attribute Name Blank for InnerString** field. This parameter is optional and needs to be set only if necessary.
6. After entering the content details, click **Add Row** to add this content and display a new row for entering another content.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. Remove rows if necessary, by selecting them and clicking **Remove Selected**.
8. After specifying the contents, click Update.

See Start - Contents for a detailed description of the Contents property window.

XML Variables - The XML Variables used in the workflow can be specified using this property.

Property Type: Optional (Set this property only if necessary.)

Steps to set the XML Variables property

1. To specify the XML Variables, click the button for the 'XML Variables' property to open the XML Variables window.
2. Click **New Variable** to add a new variable.
3. This will enable the **Variable Name** field. Enter the name of the new XML Variable in this field and a description in the **Description** field.
4. Now select the XML Variable type from **Type** drop down. You can select from either **XMLDocument** or **XMLIterator**.
5. Click the **Schema** tab caption 'Schema' to specify the schema for the XML variable.
   - If XMLDocument was selected in Step 4, clicking this tab will display the corresponding set of controls.
     - You can select Variable or Content as the option for internal storage from Use [ ] for Internal Storage drop down field.
     - Specify a file name or browse for the file containing XML Data. Click the Load button to load the contents of the file. The XMLschema corresponding to the loaded file is displayed in the configuration area.
       You can also build the schema from scratch within this area.
   - If XMLIterator was selected in Step 4, clicking this tab will display the corresponding set of controls.
     - You can select the XML Variable from which you can extract the node to be set as the XML Iterator.
     - Select the node to be set from the Select Node drop down field. The XML schema corresponding to the selected node is displayed in the configuration area.
       You can also build the schema from scratch within this area.

     a. Click the Save Variable button, to save the new XML Variable.
     b. Click Close to close the Property window.

See XML Variables for a detailed description of the XML Variables window.

Analyst's Process Model Filename for Execution View - This property is used to specify the file name of the Process Model, which has been saved as the Business Analyst's view. This view will be displayed to the Analyst as the Process Execution view. You can specify this property by entering the file name in the text box for the property or by building an expression for the file name using the Expression Editor, which you can open by clicking the **Expression Editor** icon next to the property name.

Property Type: Optional (Set this property only if necessary.)

SOA Object Instances - This property is used to create multiple instances of a class. Without instantiating a class, you cannot consume the methods available in a class. The Static member of the class can be consumed without creating any instance.

Property Type: Optional (Set this property only if necessary.)

See *SOA Object Instances in SOA Property topic in Developer Guide* for more information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Exception Behavior

You can use these properties to raise exceptions if the output is not linked to the next activity in the workflow and also define and configure email templates and users for the exception mails.

Raise Error on Unhandled Linked Output? – This property can be configured to raise an error if the output is not linked to the next activity in the workflow.

Property type: Optional (This property needs to be set only if necessary)

The Configurable values for this property are **Default [Backward Compatible],Yes** and **No**. If the value is set as **Default [Backward Compatible],** then the workflow will behave as per the existing behavior.

Scenario

Telematics Organization maintains different workflows like Invoice Workflow and Leave Workflow under the Telematics repository for their HR and Accounts Payable Processes. John has designed a workflow using the Human Activities and has assigned the human activities to the actors. When the activities are getting executed, if a particular actor is not found, then the Workflow Engine will give the output as 'Not Enough Resources to Acknowledge'. If this output is not linked to the next activity, then the workflow will finish successfully. However, if 'Yes' is selected for the Raise Error on Unhandled Linked Output property, the workflow will raise errors at finish.

Steps to set the Raise Error on unhandled linked output

- Select Yes or No from the **Raise Error on Unhandled Linked Output** drop-down list.

Each activity has the Raise Error on Unhandled Linked Output property. If you click on it, all the default configured mapped error outputs in red with the respective check boxes selected will be displayed.

Mapped Error Outputs

The Mapped Error Outputs list contains the error outputs (shown in red) that cause the workflow to complete abruptly. This can happen if the error outputs are not linked to the next activity in the workflow. To change the mapped error outputs, check or uncheck the relevant options and click Ok.

Workflow Behavior for Error Outputs

If the error outputs are not linked to the next activity in the workflow, and if the 'Stop with Error' option is selected, the workflow will complete with errors. Similarly, if the 'Exit Activity with Error Output' option is selected, the workflow will not finish with errors but will give an Error Encountered output.

Note: The changes made to this property will take effect only if you set the value for Raise Error on Unhandled Linked Output to **Yes** in the Start Activity.

Exception Mail Template Configuration – This property can be used to define and configure Email Templates and Users for the exception mails, whenever an exception occurs in workflow execution.

Property type: Optional (This property needs to be set only if necessary)

The Exception Mail Template and Users at the repository level are configured from the Central Configuration site

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

section. For more information, refer to *Configuring Exception Mail Template* under the *Administration Tasks* in the *Administrator's Guide*.

Property type: Optional (This property needs to be set only if necessary)

You can configure Exception Email Templates for two groups - Group A and Group B, both at the workflow level.

It is not mandatory to set both Users Groups A and B.

For example Administrator type of users can be configured under Group A and Normal type of users can be configured under Group B.

Email Templates can be configured through two modes – one is by selecting an existing predefined Default or Sample template, and the other is by using an editor.

Based on the Exception Mail Configuration, the members of each group will receive mails.

The Template file has to be placed in the folder 'Exception Template' under the 'Workflow elements' folder. In the Template file, we can place the Variables, Contents and XMLVariables Placeholders in the html file.

Scenario

John has designed a workflow using Human Activities and has assigned these activities to the actors. When the activities are getting executed, if a particular actor is not found, then the Workflow Engine will give the output as 'Not Enough Resources to Acknowledge'. If this output is not linked to the next activity, the workflow will finish successfully. However, if the Raise Error on Unhandled Linked Output property is selected as 'Yes', then the workflow will raise errors at finish.

There should be a notification to the users about the Exception occurred in an activity. These users should be configurable and the template for the exception mails should be configurable.

Steps to configure the Exception Mail Template

1. Click the edit button of the **Exception Mail Template Configuration** property. The **Exception Mail Settings** window appears.

   Users can be configured through the User Lookup screen or the Role Lookup screen. By default, the User is selected.
2. Click the **User Lookup** icon. The **User Lookup** screen appears.
3. Select the required Provider from the **User-based Advanced Search in provider** drop-down list.
4. Key-in the name of the user in the **Search For** field and select the Display Name from the drop-down list.
5. Click **Search**.
6. All the users get listed in the **Available Resources** field.
7. Select the required user and click the right arrow to display the users in the **Selected Resources**.
8. Click **Update**.
9. To configure a user through the Role Lookup, select the **Role** radio button.
10. Select the required provider from the provider drop-down. Also, note that the provider drop-down doesn't appear, if the repository has a single provider only.
11. Key-in the name of the required role and click **Search**.
12. All the users get listed in the **Available Roles** field.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

13. Select the required role and click the right arrow to display the users in the Selected Roles.
14. Click **Update**.
    The user's name (either User or Role) will now appear in the **Exception Mail Group A** field.
15. Select the template from the **Template File** drop-down list.
    You can select either a Default template or a Sample template.
16. Follow the same steps to select a User or Role and a template for the **Exception Mail Group B**.
17. Click **OK**.

To create your own template for the exception mail

1. Select the **Create/Open** option in the **Exception Mail Settings** screen. The Editor screen appears.
2. Select the required values from the **Field** and **Standard Placeholders** drop-down lists and click **Append**.
3. Use the editor to design your template and click **Update** and **Close**.

Note: You must use only the actor variable, and not any of its sub properties, to initialize a variable of type actor.

Start - Variables

Variables Property Window

You can set the workflow variables in the Variable property window. To open this window, click the button in the 'Variables' property. The Variables dialog box is displayed in a grid, which has a blank row where you can enter the parameters for a new variable.

The dialog has two tabs at the top to manage the rows of variables in the grid.

- **Add Row** - You can click this tab to add the newly entered variable and display a new row to the grid where you can add another variable.
- **Remove Selected** - You can click this tab to remove the selected variable in the grid.

The grid has the following parameters that you need to specify for the new variable.

- **Workflow Variables** - You can use this field to enter the variable name. Prefix the variable name with '@' if it is a local variable.
- **Type** - You can use the drop-down list in this field to select the data type for the variable. The drop-down list displays the following data types - string, number, date, array, actor, object, boolean, float, and decimal.

There are two buttons and a check box at the bottom of the dialog box.

- **Update** - You can click this button to save the newly added variable(s).
- **Close** - You can click this to close the property window without saving the newly added variables.
- **Last Row needs to be added** - You need to select this check box to save the last row added.

Note: To initialize the **Date** variable, enter the date in mm/dd/yyyy format.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Start - Contents

Contents Property window

You can set the workflow contents in the Contents property window. To open this dialog box, click the button in the 'Contents' property. The contents are displayed in a grid, which also has a blank row where you can enter the parameters for a new content.

The dialog box has two tabs at the top to manage the rows of contents in the grid.

- **Add Row** - You can click this tab to add the newly entered content and display a new row to the grid where you can add another content.
- **Remove Selected** - You can click this tab to remove the selected content row in the grid.

The grid has the following parameters that you need to specify for the new content.

- **Content Description** - You can use this field to enter the content description.
- **Type** - You can use the drop down in this field to select the data type for the variable.
- **XPath Expression** - You can enter the XPath expression for the content in this field.
- **Attribute Name Blank for InnerString** - You can enter the attribute name in this field to get the XML attribute. If left blank, it will retrieve the XML value.

There are two buttons and a check box at the bottom of the dialog.

- **Update** - You can click this button to save the newly added content(s).
- **Close** - You can click this to close the property window without saving the newly added contents.
- **Last Row needs to be added** - You need to select this check box to save the last row added.

XML Variables

AVEVA Work Tasks uses XML variables to provide data inputs to workflows. XML variables can be configured in the Start activity through the XMLVariables property.

About XML Variables

AVEVA Work Tasks uses XML variables to provide data inputs to workflows. XML variables can be configured in the Start activity through the **XMLVariables** property.

Different Types of XML Variables:

The following table lists different XML variables:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

XML variable	Description
XML Document	Using 'XML Document' variable, the required items can be fetched.
XML Iterator	'XML Iterator' variable allows you to define variables for repeating XML elements and attributes.
XML List	Using 'XML List' variable, the data from any list can be fetched.
XML List Iterator	'XML List Iterator' variable is used to iterate through the list items (parent items) of a list and helps to retrieve or update data from a workflow.
XMLForms Data Grid	'XML Forms Data Grid' variable is used to read or modify the selections of a Data Grid control used in Forms or Lists

The XML Variable Interface provides the following functionality:

- Defining XML schema for the XML Variable either by specifying the complete schema or loading an XML document which is the source of the schema
- Defining XSL transforms for the defined variable
- Defining variables of type XML Document to retrieve data from XML files
- Defining variables of type XML Iterator to retrieve data within repeating nodes within an XML schema. The XML Iterator represents a collection of XML Nodes at some level in the XML variable schema. It allows you to perform actions on XML nodes such as looping through XMLnodes and getting the value of a specific node at any location.
- Defining variables of type XML Forms Data Grid to retrieve or modify selections of Data Grid Control used within Forms or Lists which maps with the Grid Configuration for the selected XML node of the Form

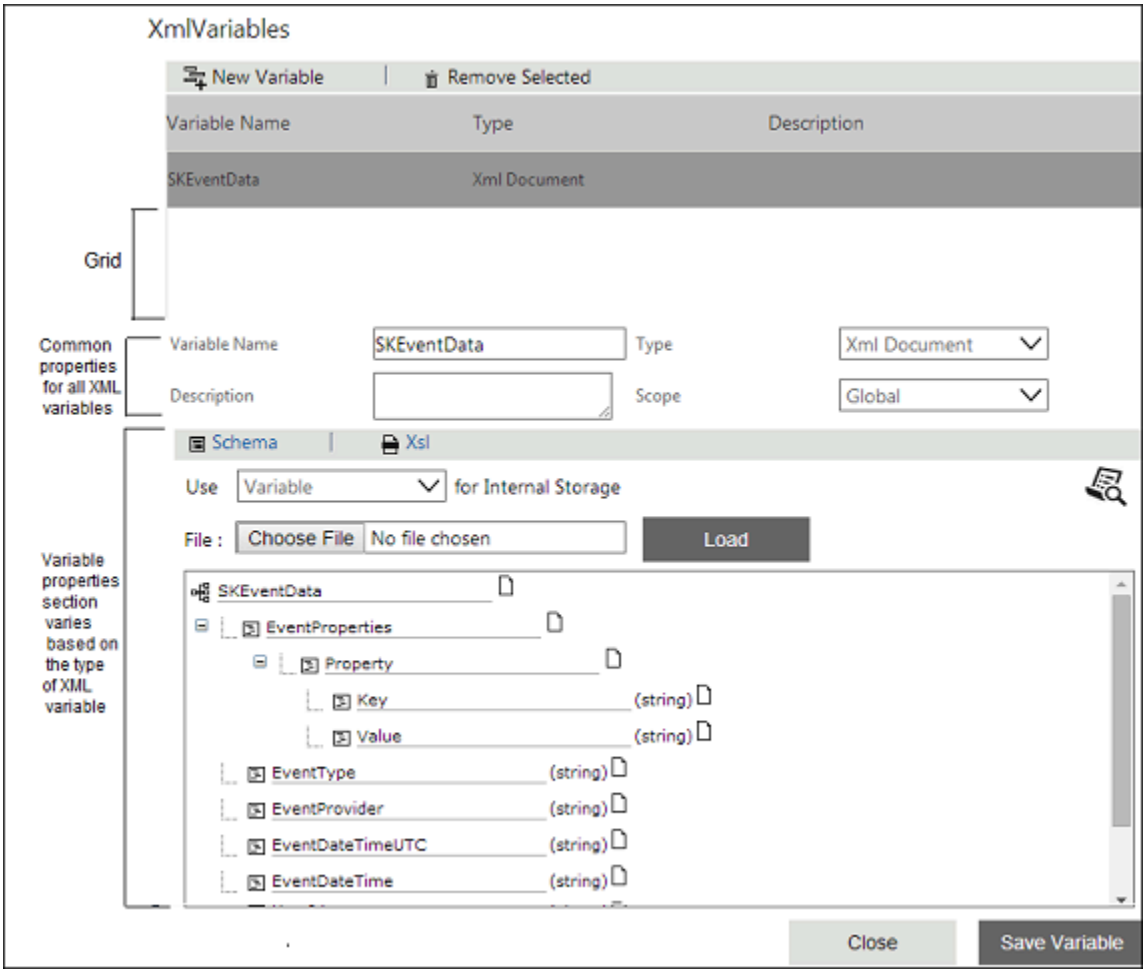
Note:
- The special characters such as ! = | ~ @ # $ % ^ & * ( ) + ` - { } : " < > ? [ ] ; ' , . / and space are not supported for XML Variable names.
- Support for Special Characters in XML node Names of XML Variables: Special characters such as, < > { } * ? [ ] ( ) - _ , = | ; ` +, and % are allowed while naming XML node of XML Variables. XMLVariable will not support **XML node names** with special characters, such as \ ~ ! ' : " # ` & . @ ^ and $.

XML Variable User Interface

The XML Variable User Interface is for configuring XML Variables. This window is opened when you click the **XMLVariables** property of the **Start** activity. All XML Variables added for the workflow are displayed in rows in the **grid**. The variable properties that are specific to a XMLVariable are displayed in the Variable Properties section for an XML Variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

XML Variable User Interface



Common Properties Available for All XML Variables

The following properties are common for all XML Variables:

XML Variable Property	Description
Variable Name	This property is used to specify the name of the variable.
Type	This property specifies the type of the XML Variable. The available XML Variable types are XML Document, XML SAPTable,XML ListIterator, XML List and XML Iterator.
Description	This property specifies the description of the XML Variable

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

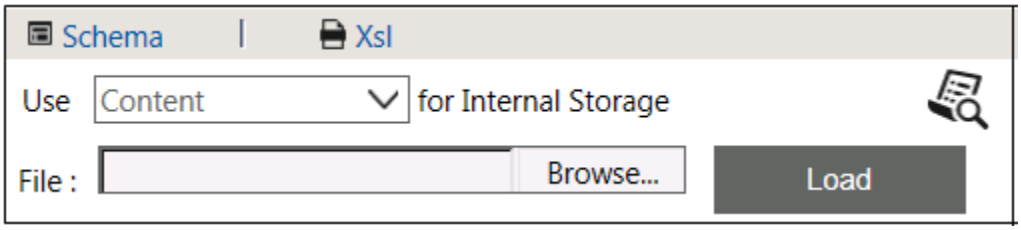
XML Variable Property		Description
Scope	Global	If the XML Variable is of Global scope, then you have to set the value of this field as Global for the variable. Where that variable can be used anywhere in that workflow instance.
	Local	If the XML Variable is of Local scope then the value of the variable is local to a workflow instance.

XML Variable of Type 'XML Document'

An XML Variable of type **XML Document** can be used to fetch the required items.

XML Variable of type 'XML Document'

When the variable type is 'XML Document', the following properties are displayed as seen in the image below.



Property Description

XML Variable Property	Description
Internal Storage	This property is used to specify the internal storage type of the XML Variable. • If the selection is Content, then XML Variable value will be stored as content in workflow context. You cannot update values for such XML variables, since the content data cannot be changed during workflow execution. • If the selection is Variable, then the same will be stored as a variable. You can update the values for such XML variables using "Update Variable" activity under engine activities.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

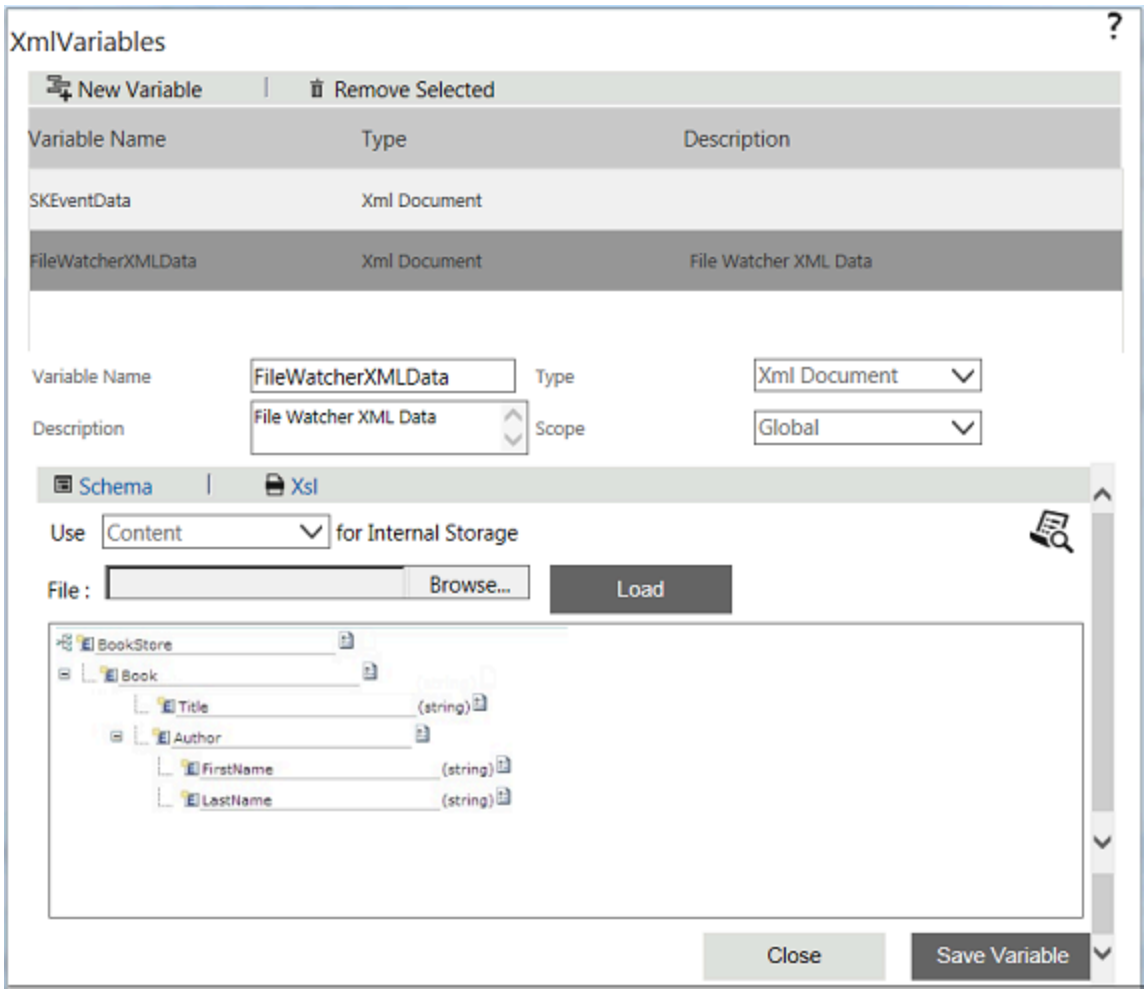
XML Variable Property	Description
	Note: The default storage option of XML variable is Variable.
File	Location of the schema file, if any XML schema is available. Otherwise user can create the schema using Schema designer.

Create XML Variable of Type 'XML Document'

To add a XML Document Variable

1. Click **New Variable** button in the XML Variable User Interface.
2. Enter the following information:
   - **Variable Name**: Enter the name of the variable.
   - **Type**: Select XML Document from the drop-down list. This field defaults to XML Document. The XML Iterator type option is available only if another variable of XML Document type exists.
   - **Description**:- Enter a description for the variable.
   - **Scope**: Select the scope of the variable. The scope of the variable can be either Global or Local. Select Local, if the value of the variable is local to a workflow instance.
3. **Schema**: Build the XML Schema. You can either build the schema or use the existing XML file to create the schema.
4. Specify how the variable is to be used in Use for Internal Storage field. The field defaults to Content. To store as variable, select Variable in this field. If the scope of the variable is **Global**, you must set this field to **Variable**.
5. Click **Save Variable** to save the new variable.
6. Click **OK** to save the node properties.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



See Also: Build XML Schema

Build XML Schema

You can build a XML Schema in two ways:

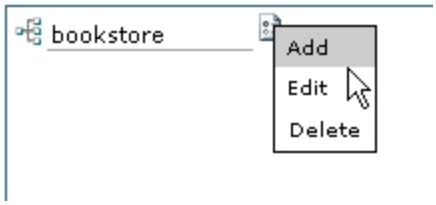
1. Define schema in the XML Variable interface
   a. Adding a Node
   b. Editing a Node
   c. Deleting a Node
2. Loading schema from an existing file

Defining Schema in the XML Variable Interface

When a new variable is created, the schema displays the root node by default. Click the string "root"and type the name over it.

The following image shows the node options:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



To add a node

1. To add a node, click the Properties icon to the right of the name. Select **Add**. The **Properties** window for the new node appears.
2. Specify the following properties of the node:
   - **Name**: Enter a name of the node.
   - **Type**: Select the node type. The options available are **element** and **attribute**.
   - **Data Type**: Select the data type. This property specifies the data type of the XML Node. The available data types are string, integer, long, double, decimal, date, time, dateTime, boolean, and base64binary.
   - **Repeating**: Select this check box, if the node is a repeating one.
3. Click **OK**.
4. Click **Save Variable** to save node properties.
5. Click **OK**.
6. To add more nodes, repeat step 1 to step 6.

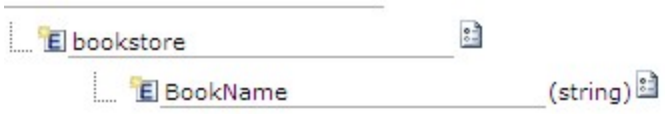
Note: Select the respective node where you want add a node. If a node is of Attribute type, then you cannot add a node under it. The Add option will be disabled for Attribute type of node.

To edit an existing node

1. To edit an existing node, click the **Properties** icon to the right of the node to be edited.
2. Select **Edit**. The Properties window for the existing node appears.

3. Modify properties in the Properties window.
4. Click **OK**.

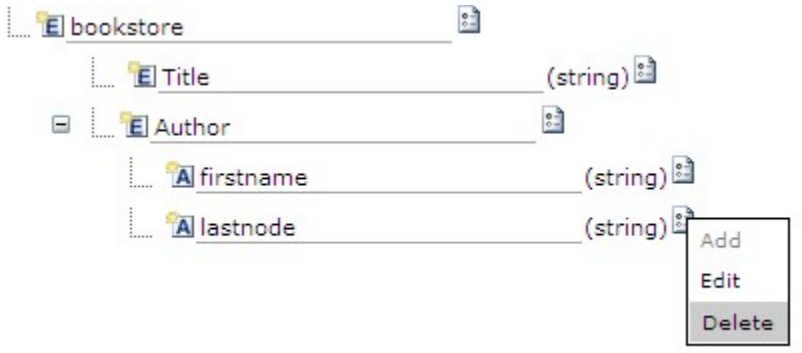
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



5. Click **Save Variable** to save node properties.
6. Click **OK**.

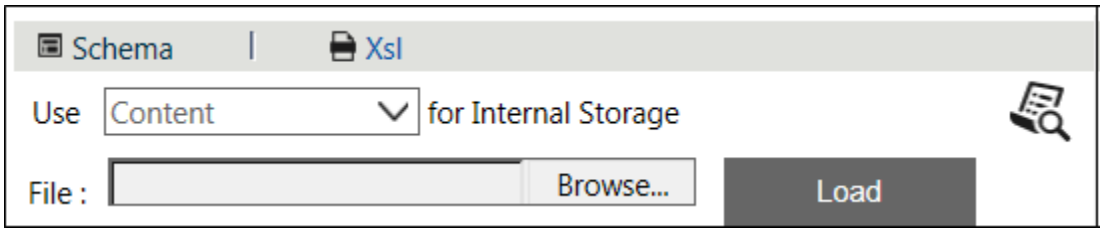
To delete a node

1. To delete a node, click the **Properties** icon to the right of the node to be deleted.
2. Select **Delete**



To load Schema from an Existing File

1. Click **Browse** to select file with schema information. You can select XML files to load schema



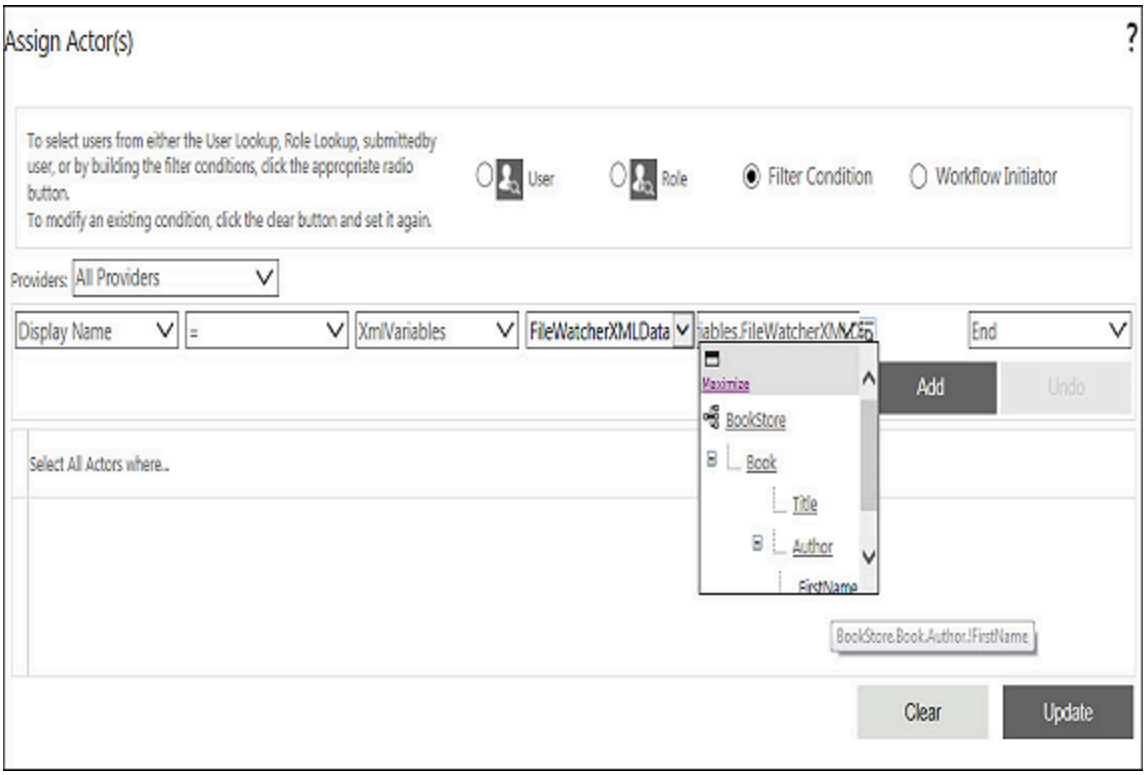
2. The XML schema is loaded from the file.
3. To edit a node, right-click the node, and then select **Edit**. Modify properties in the Properties window.
4. To delete a node, right-click the node, and then select **Delete**

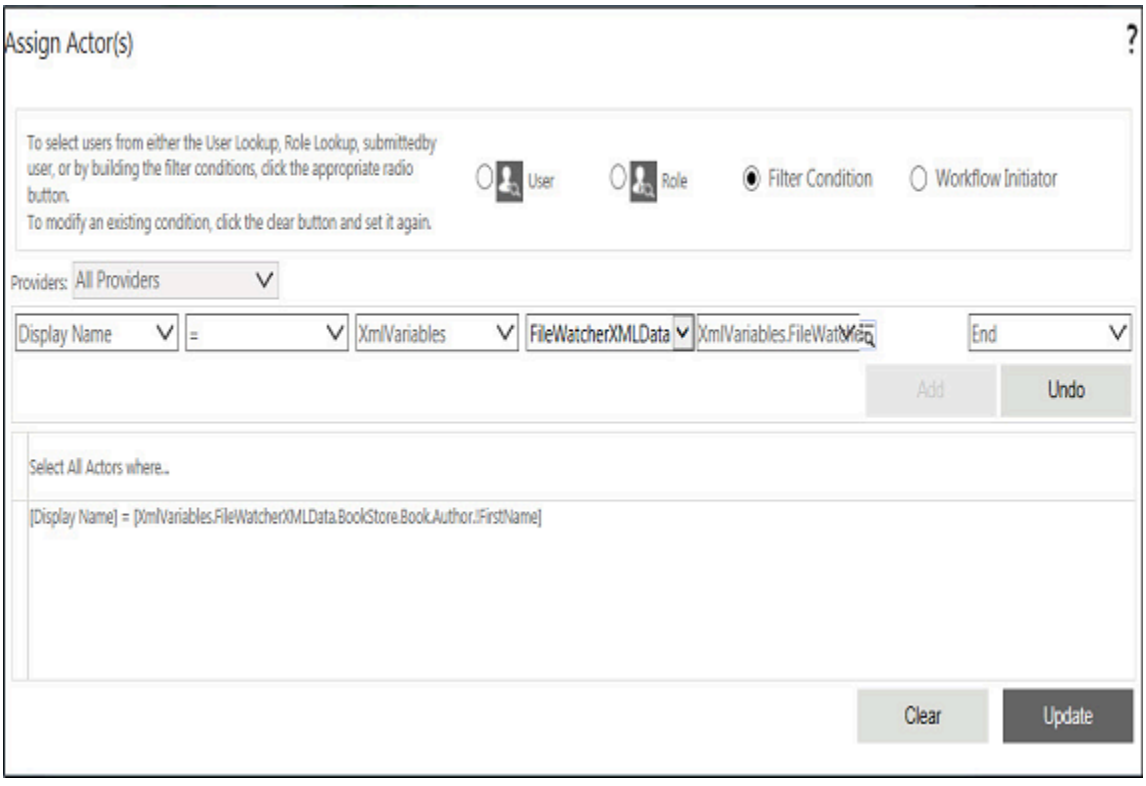
Use XML Document of Type 'Variables'

XML Variables can be used like regular workflow variables or contents to build conditions for setting Activity Properties. In the example below, the condition for the Assign Actor property of the **Approval** activity has been built by specifying the "firstname" element from the "Author" node of the XML Variable.

Example of using XML Variable to set the Assign Actors property

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



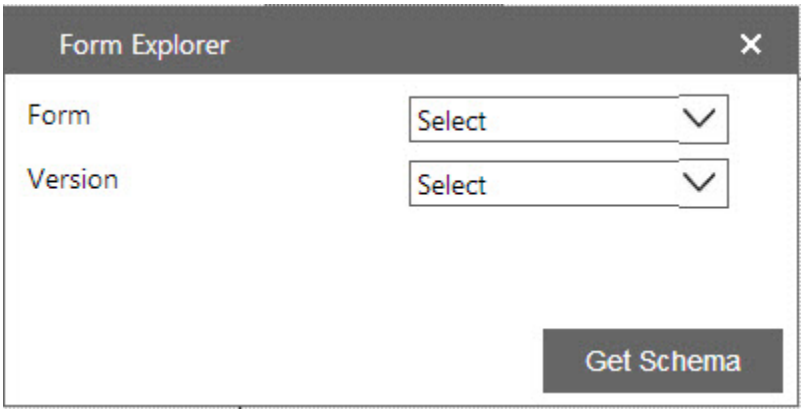


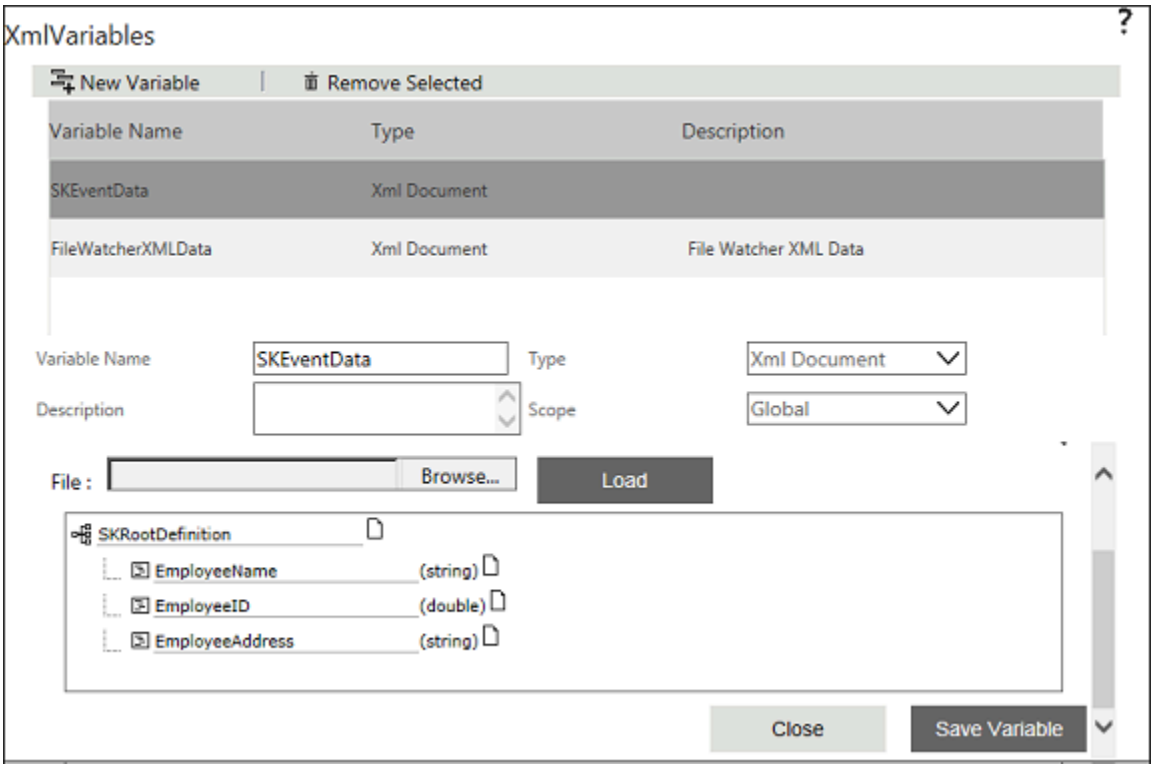
Determine XML Variable Schema from Forms

After a form is associated to a particular workflow, the form creates the XML Variable named **SFFormData** of type **XML Document** in the **Start** activity of that workflow. This will have the schema of the form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

AVEVA Work Tasks provides the **Form Explorer** icon to choose the form and its version. This icon will get displayed only for XML Variable of type XMLDocument. Any XML Variable of type XML Document can now get its schema from any form and its version available in the **Manage Forms** List.





Before introducing, when some changes were done in the form, the XML Variable had to be deleted and the form had to be re-associated in order to get the updated list of controls.

For more information, refer Forms and Lists Guide.

XML Variable for List

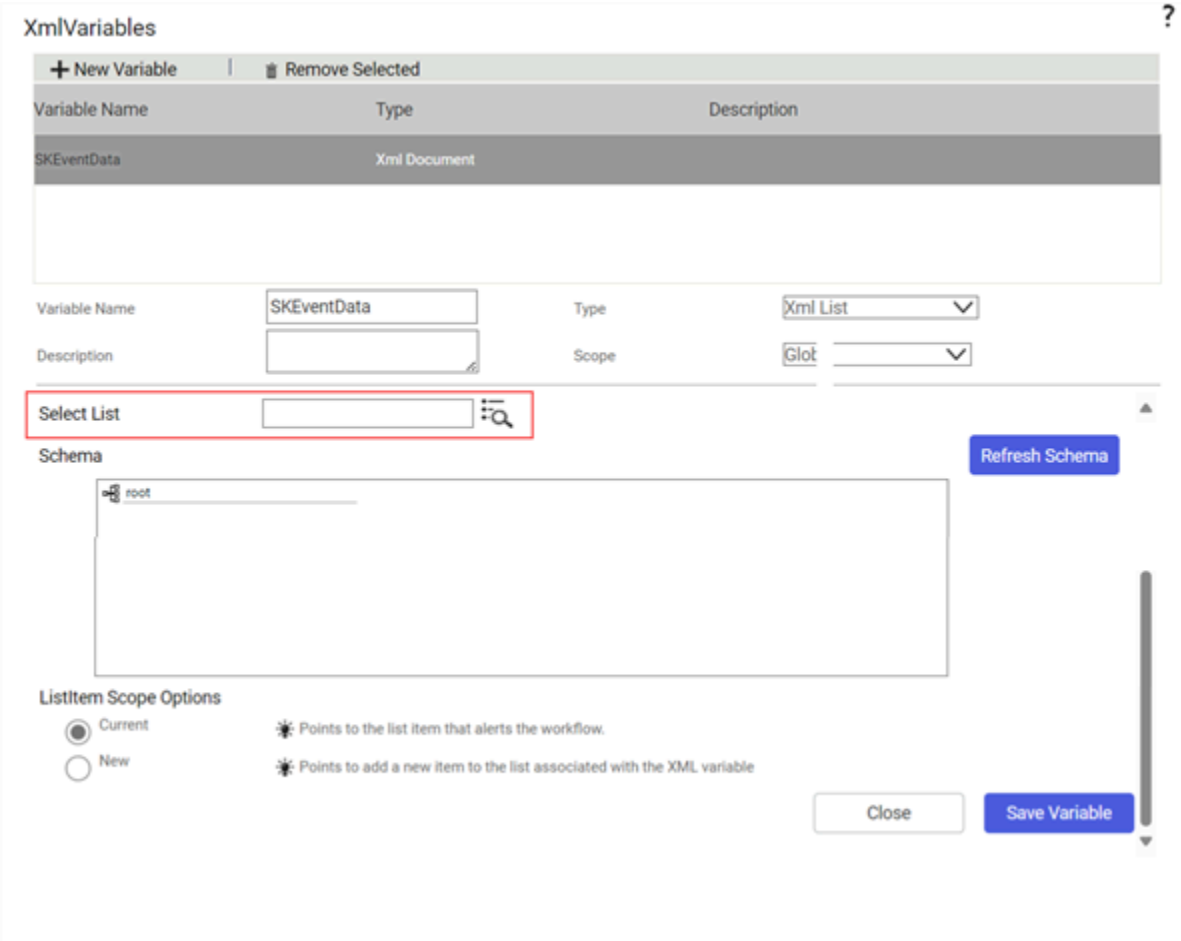
An XML List type XML Variable can be mapped to any list schema, that is either to lists provided out of the box or to lists created dynamically using create list option, to perform retrieval of data of a list item.

Using XML list XMLVariable, you can fetch the data from any list. XML Variable for XML list can be mapped to any XML List schema for inserting, updating and retrieving list items. Also you can attach the list to a workflow very easily in a few steps.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

XML Variable of type 'XML List'

When the variable type is changed to **XML List**, the following extra properties and **ListItem Scope Options** are displayed as seen in the image below.



Property Description

'XML List' XML Variable Property	Description
Select List	User can enter list name in this field or use the icon to select the required list.

The following are the ListItem Scope Options:

- **Current:** The XML Variable will be pointed to the list item that alerts the workflow.
- **New:** This points to add a new list item to the list associated with the XML Variable. Accessing this XML Variable before adding an item will not give any details. After adding a list item, this XML Variable will have the details of the added item. To add another item, use a **List Navigator** activity to re-initialize the scope as New.

See Creating an XML List type XML Variable for more information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

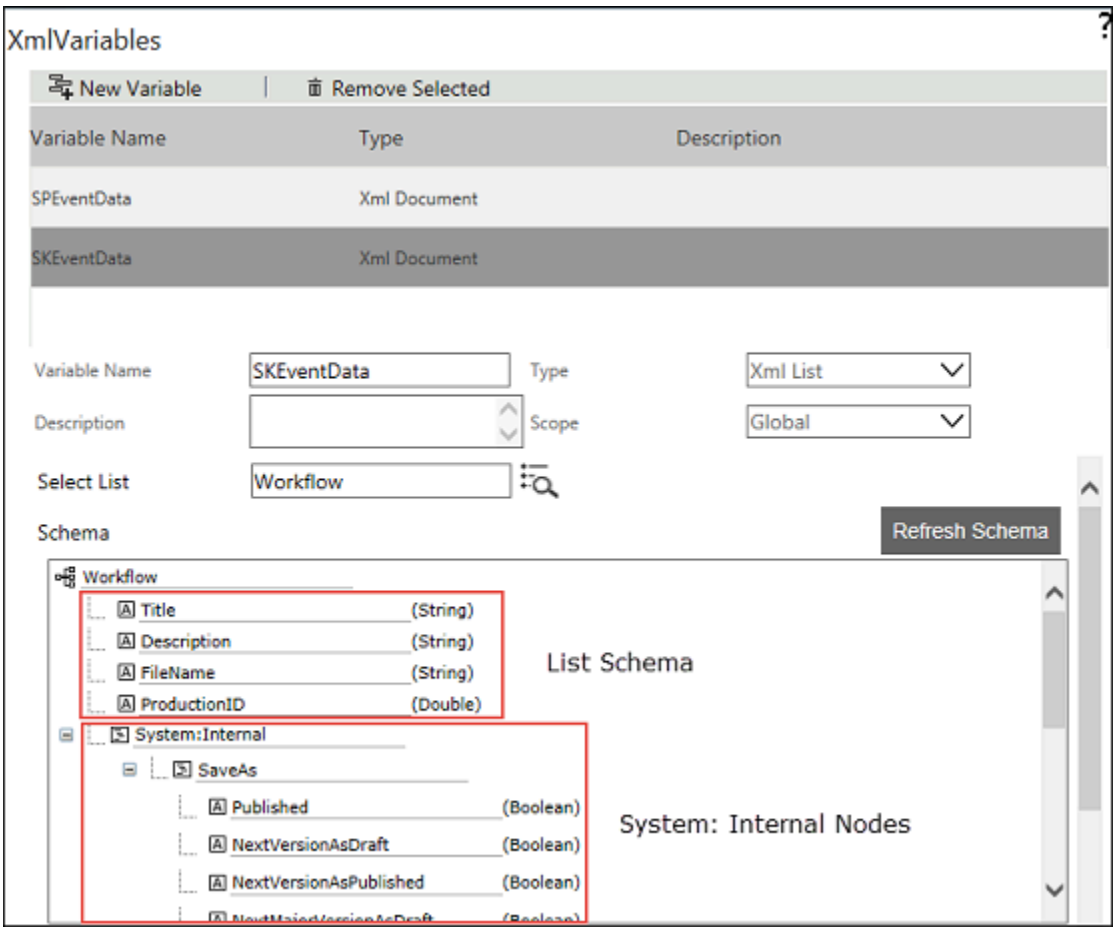
ListItem Scope of XML List of Type XML Variable

List XML variable can be set to **Current**, **New** and **List Query** scopes. You can set Current and New scopes at the time of creating XML List type XML variable and all the three scopes including List Query can set up in the List Navigator activity properties.

- **Current:** The XML variable will be pointed to the list item which initiated the workflow.
- **New:** The XML variable will be pointed to add a new list item to the list. Accessing this XML variable before adding an item will not give any details. After adding a list item, this XML variable will have the details of the added item. To add another item, use a list navigator action to re-initialize the scope as New.
- **List Query:** This property allows you to build a query for the list and fetch the items based on the query.

Schema of XML List of Type XML Variable

The schema of XML list includes schema of the list and system internal nodes.



System Internal Nodes

When you create a list XML variable for the list, system internal nodes are also created automatically for internal use. This will help you to save your list item as a different version as **Published** or **Draft** status when you update an item. It will also help you to save the item **As Folder** and **Published**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If you want to add a new listitem with **Published** status, select **Published** from the **SaveAs** option under **System: Internal** and then set value as **True**.

Create an XML List of Type XML Variable

XML Variable of List type can be configured in the Start activity through the XML Variable property. XMLVariable of List type can be mapped to any list schema i.e. either to lists provided out of the box or to lists created dynamically using the create list option, to perform retrieval of data of a list item.

To create an XML List type XML Variable

1. Select the **Design the Workflow now** option from the **Workflow Options** screen while creating a workflow for the list.

   The **Process Designer** screen appears.
2. Right-click the **Start**, and then select **Activity Properties** from the options. The Activity Properties screen appears.
3. Click the **edit** icon in the XMLVariables field. The XmlVariables screen is displayed
4. Click **New Variable** to add a new variable.
5. Type a variable name in the **Variable Name** field.
6. Select X**ML List** from the Type drop-down list.
7. Type the List name in the **Select List** field or click the icon to select the list.
8. The XML schema displayed in the tree-view are the XML nodes that are mapped to the controls while creating the list. Also you can see the System Internal nodes that are created automatically for internal use. This will help you save the list item in another version as draft or published and help to create folder.
9. Select the scope from the **Choose the ListItem to work on** section. The available options are:
   - **Current**: This will help to work with the list item that initiated the workflow.
   - **New**: The XML variable will be pointed to add a new list item to the list.
10. After entering all the required data, click **Save Variable.** A message is displayed saying 'Variable Updated'. Close the window. Now you have created an XML List type XML Variable.

    Note: You can modify the variable later. Click the **Refresh Schema** to reload the changes made to the list. After refreshing the schema, click **Save Variable** to save the changes.

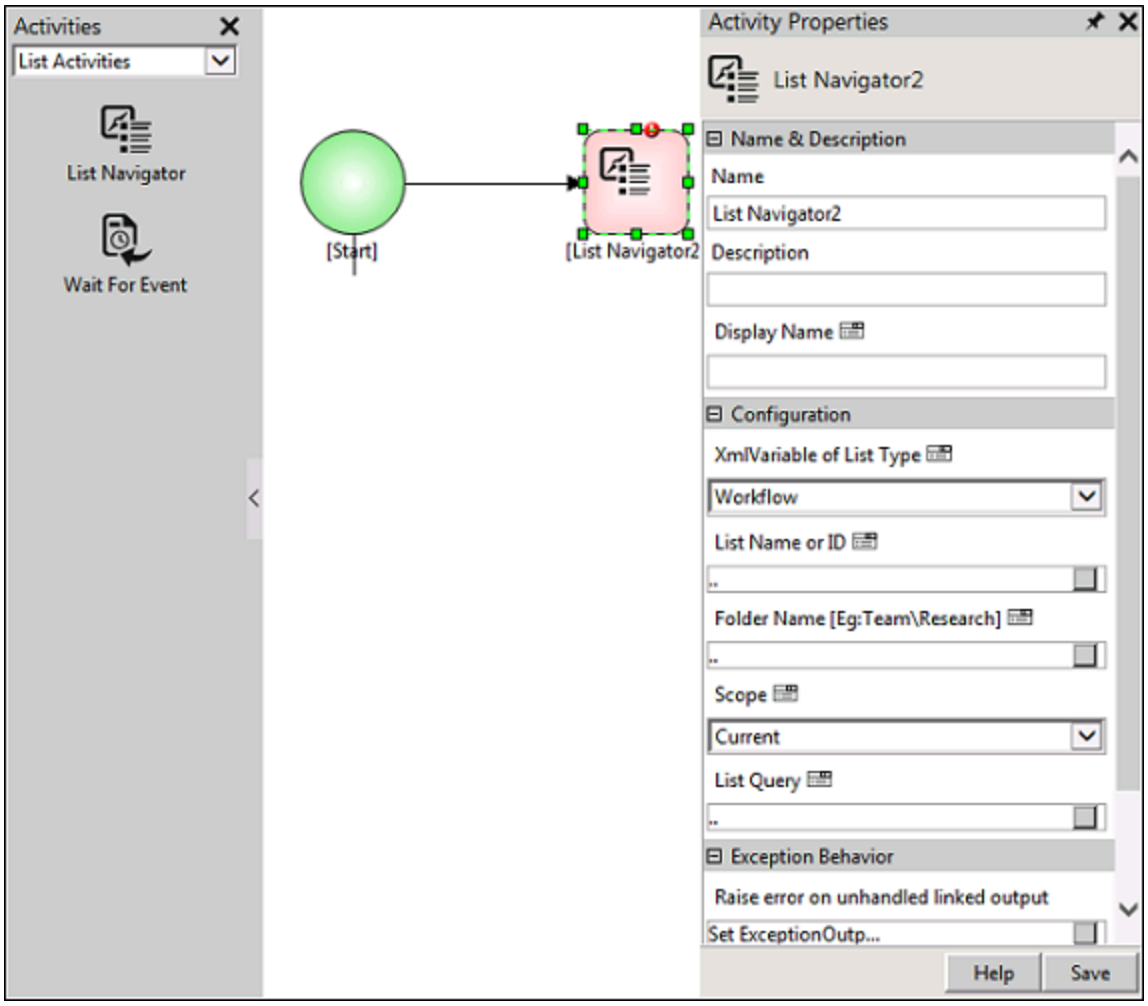
Change Scope of the XML List of Type XML Variable

The scope (**Choose the list item to work on** options) of the XML list XML variable can be changed during the runtime. Once the scope is changed, the XML list XML variable will use the changed scope. You can change the scope of the XML list XML Variable using the List Navigator activity during workflow execution. Using this action, you can also navigate the XML list XML variable to another list which has a similar schema.

To change the scope of the XML List XML Variable

1. Click **Activities** and select **List Activities** from the options.
2. Drag and drop **List Navigator** activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Select the XML variable, for which the scope needs to be changed, from the **XML Variable of List Type** drop down.
4. Type/select the list name in the **List Name or ID** field. This property helps to change the list that you need to work on. The list entered here should have the same schema of the list from which the XML variable was created. If you do not want to change the working on list, then leave this field blank. Once you change the list, the XML variable will use the changed one.
5. For example, you have a list called **Purchase Orders** and another list called **Approved Purchase Orders** which has the same schema as the **Purchase Orders** list. If you want to add/update some item in the **Approved Purchase Orders**, you do not have to create separate XMLvariables for both the list. You can use the same XML variables since both lists have the same schema. In this case, create XML variable for Purchase Orders. Enter the List Name as Approved Purchase Orders and set the scope as New. This will point to the Approved Purchase Orders list and add/update the item in that list.
6. Click the drop-down and select the scope from the options. The available options are **Current**, **New** and **List Query**. Here you can change the scope.

Note: You can also use list id. Id should be inside curly braces. Format to use {ListId}. This is optional and list id need not be given when the list name is provided and vice versa. Also, they can provide both as {ListId}ListName format.

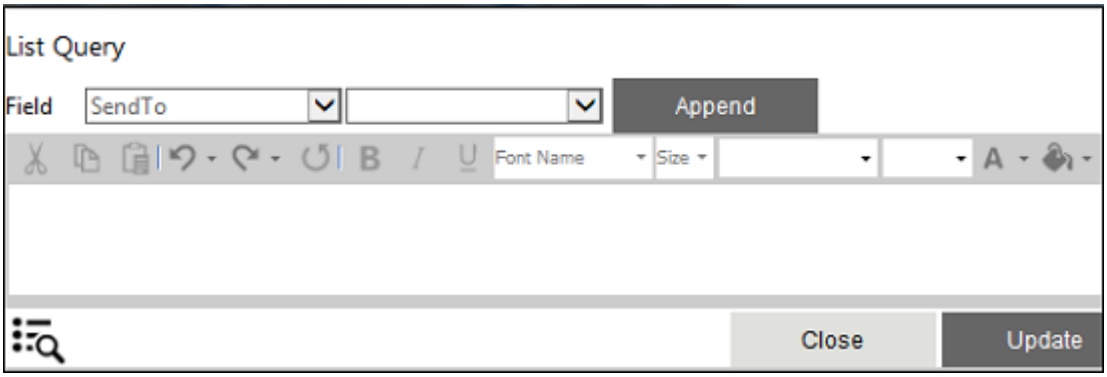
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Set up List Query Scope

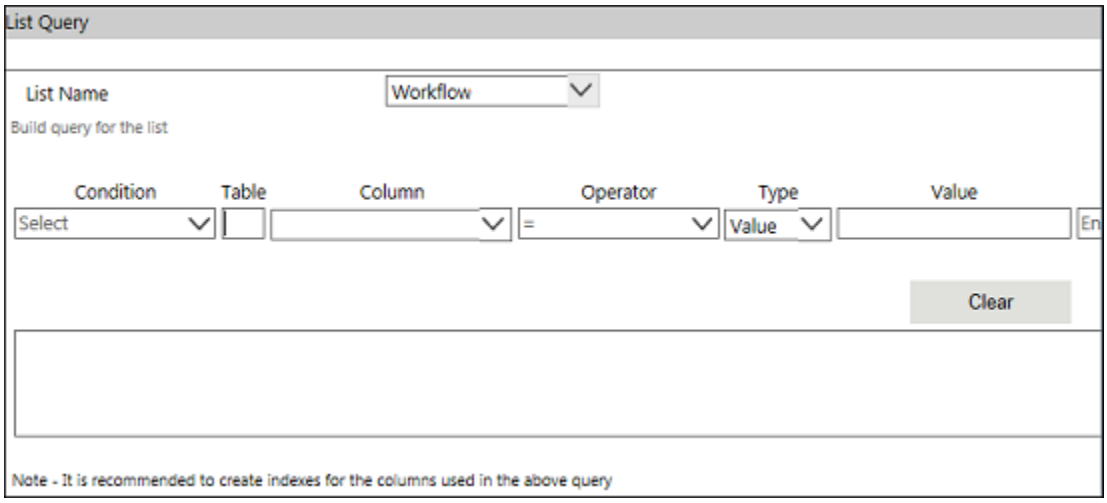
This property allows you to build the query for the list and retrieve the data based on the query. You need to point to any particular item to perform a task based on the respective item. This can be done by building the query using List Query.

To set up the list query scope

1. Select **List Query** as the scope and click **Save**. Click the edit icon of **List Query** property. The following screen is displayed.



2. Click the search icon. The following screen appears.



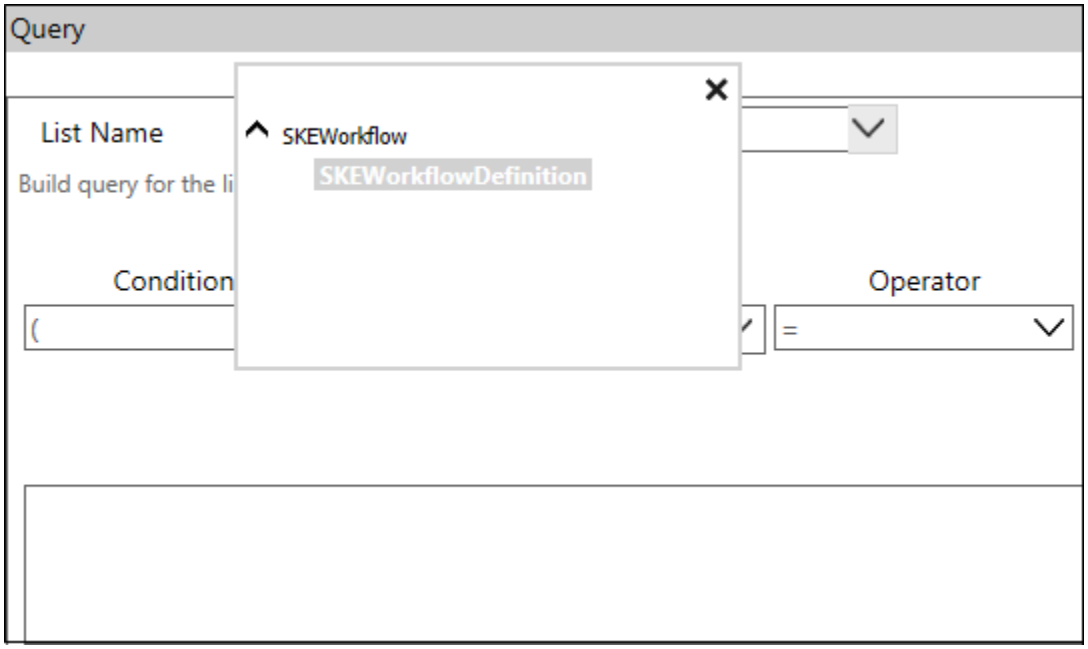
3. The following are the field values for List Query window:

Field	Description
List Name	Select the list from List Name drop-down.
Table	By clicking on this text box, a pop up allows you to select the corresponding table for query. The respective table name will display in the pop up window based on the list you select.
Column	From this drop down you can select the column or

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
	field of the corresponding list.
Operator	From this drop down you can select an operator (either one of =,>, <,>=, <=, <>, IN, Not IN, Like) to build the query.
Type	From this drop down you can select a type. The value will be automatically displayed in the text box.
Condition	From this drop down you can select the condition [either of End, And, Or, '),' '('.
Add	You can click this button to add a query in the field.
Clear	You can click this button to clear the query contents.
OK	You can click this button to save this query.
Close	You can click this button to close this window.

4. Enter the details, and click **Add** to add the List Query.
5. Click **OK** and then click **Close**.
6. For example, you have a list named Workflow and you want to update the records that have the Id value '12345' and '6789' . This query can be built using list query.
7. Click the icon to build the query for the list Workflow. The **List Query** screen appears.
8. The list name *Workflow* is selected automatically. If the list is not selected, select your list from the **List Name** drop-down. Click the **Table** field. The pop up window allows you to select the table of the '*Workflow*'.

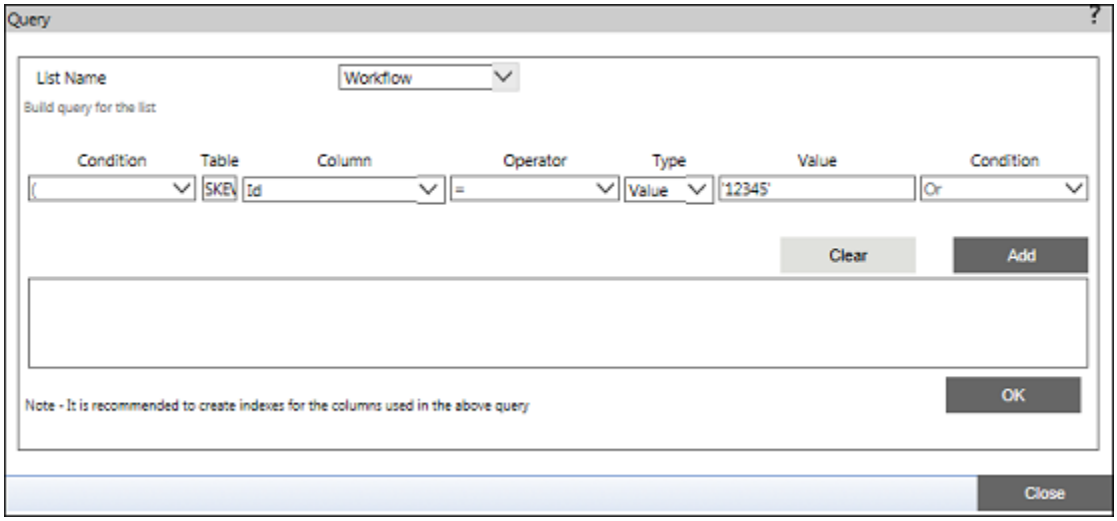


9. Click **SKEWorkflowDefinition**. This will be displayed automatically in the text box. Here, the table names

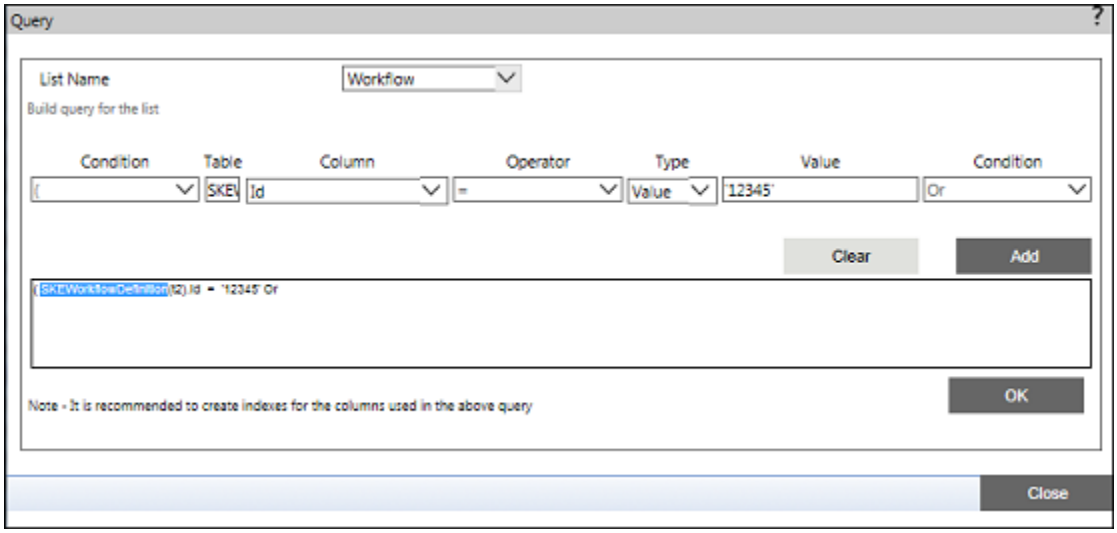
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

displayed in the tree view are the parent table (one on the top) and the child table (the one below).

10. Click the **Column** drop-down.
11. Select **int1** from the options since the field **Reference No** is mapped to this column of the database.
12. Select '=' operator from the **Operator** drop-down list.
13. Select **Value** from the **Type** drop-down list.
14. Type **'12345'** in the text box.
15. Select **OR** from the **Condition** drop-down list to add another query.

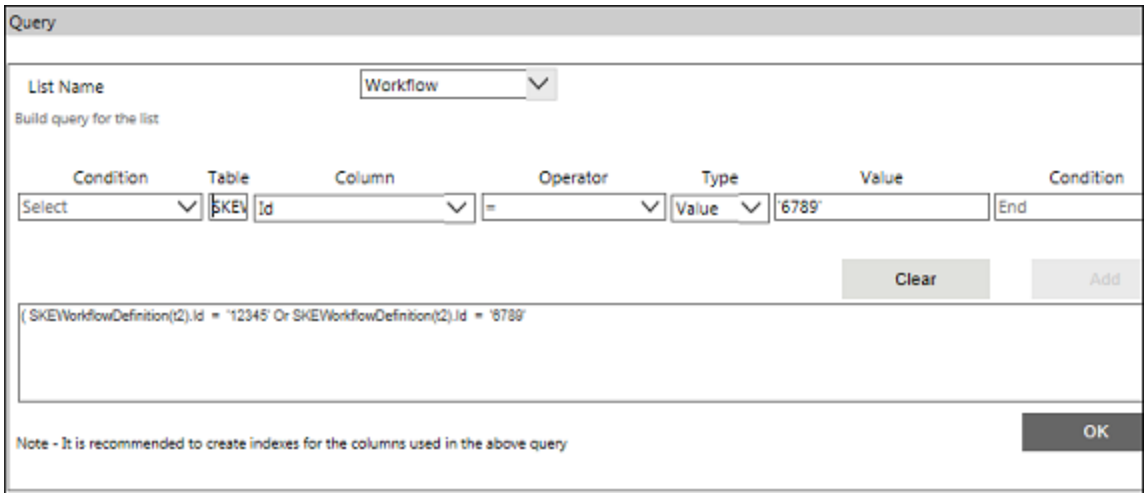


16. Click **Add** to add the condition in the text field.

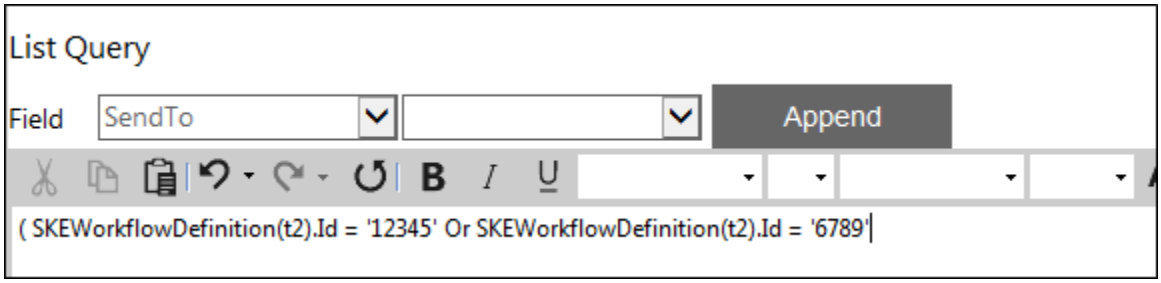


17. Here, **SKEWorkflowDefinition** is the table name where the list has been stored and **t2** is the internal name that has been used for the main table. If there is any child table, it will be displayed as **t2**. Id is in the field name, to which you want to point your XML variable and **12345** as the value for that field.
18. Repeat the same steps for the list item that has **'6789'** as **Reference No**.
19. Enter the value as **'6789'**.
20. Select **End** from the **Condition** drop-down list.
21. Click **Add**. The build query will be displayed in the text field.

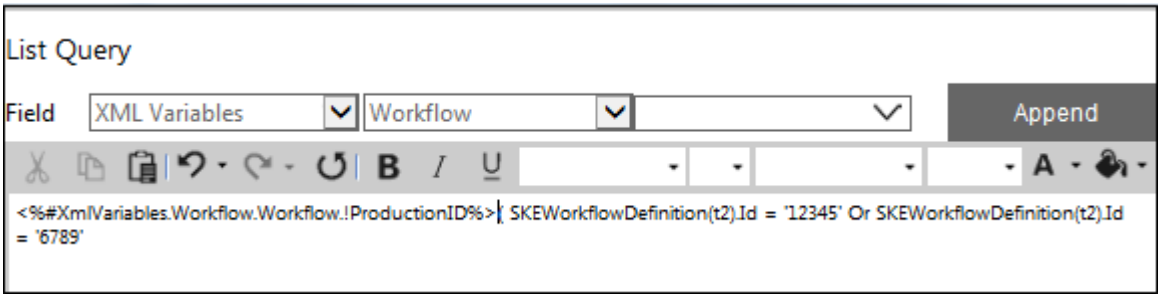
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



22. Click **OK**, and then click **Close**.



23. Click **Update**.
24. You can replace the value for the query, with the variables. To replace, select the text/value to be replaced, and then select the respective field from the drop-down list and click **Append**.



25. Click **Update**, and then close the window.

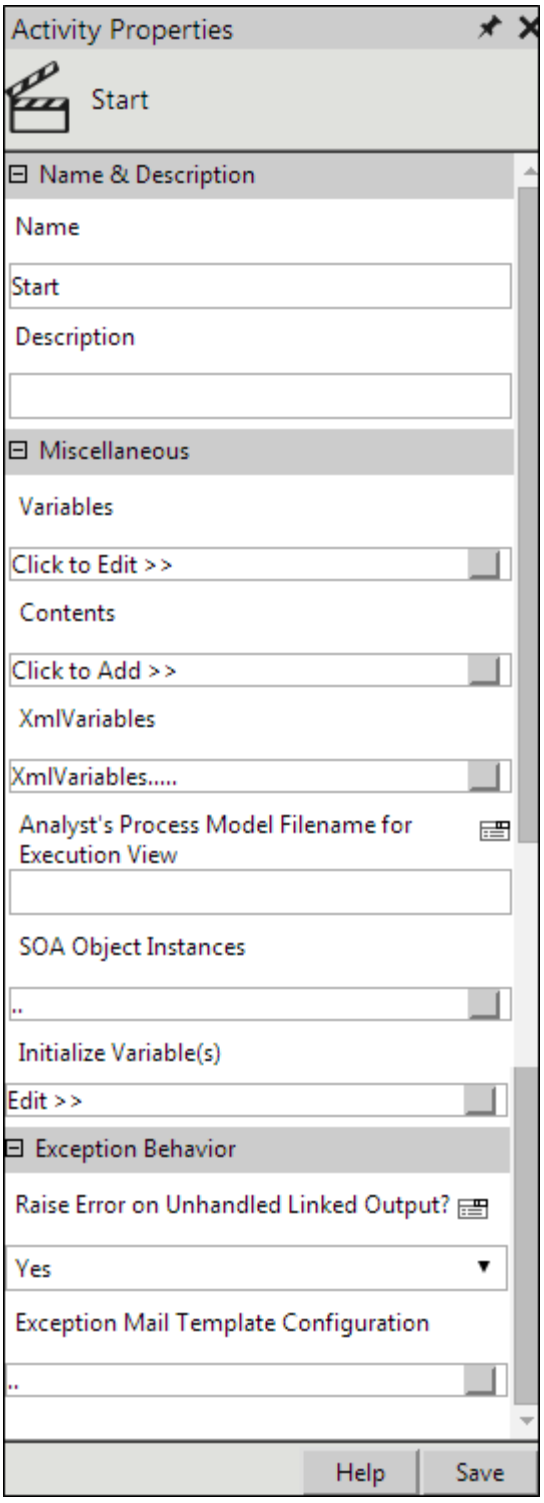
Create an XML List Iterator of Type XML Variable

XML List Iterator type XML variable is used to iterate through the list items (parent items) of a list and helps to retrieve/update data from a workflow.

To create an XML List Iterator type XML Variable

1. Right-click the **Start** Activity, and select **Activity Properties** from the options. The **Activity Properties** appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

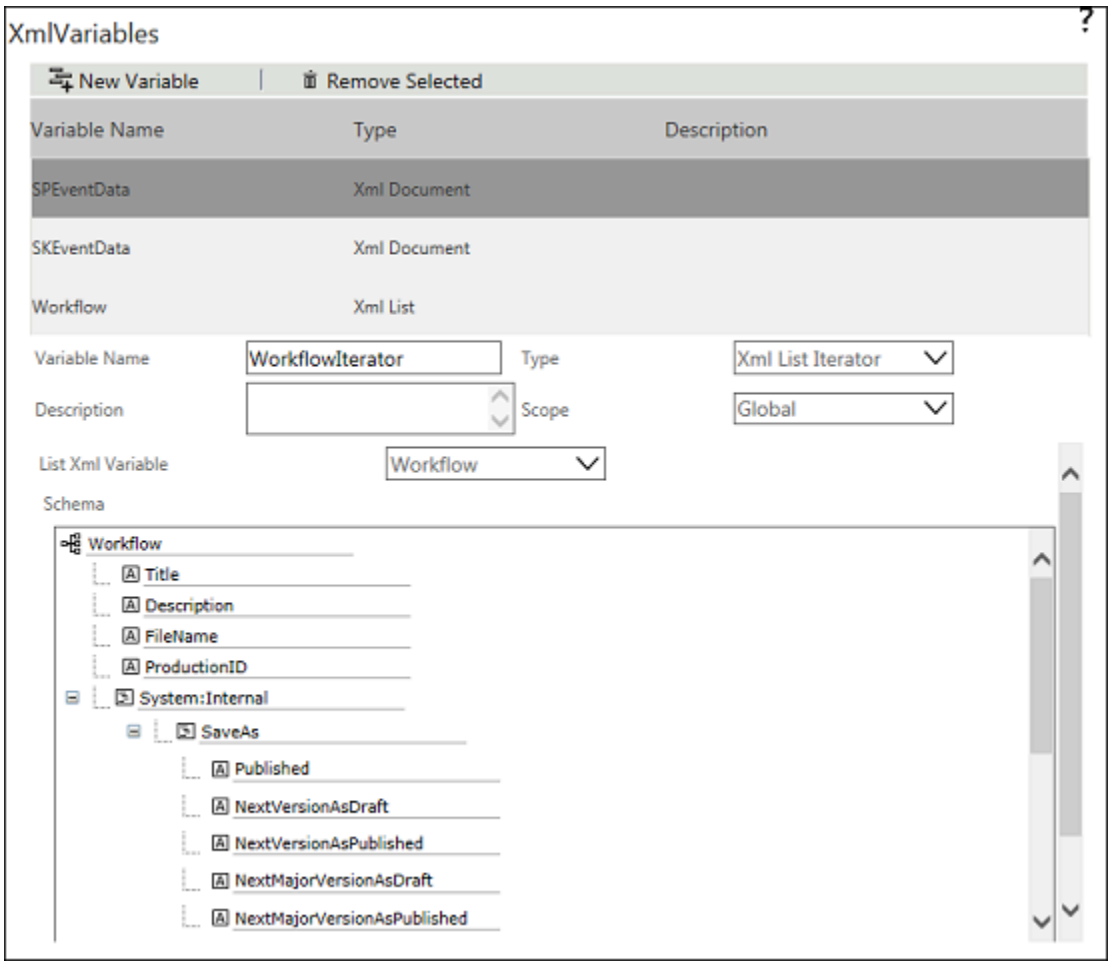


2. Click the edit icon in the XMLVariables field. The XMLVariables screen appears, with the list of the existing XML variables.
3. You have to create a XML List type XML variable before creating the XML List Iterator type XML variable. If you have already created XML List type XML variable, you can proceed to the following step. See Creating XML List type XML Variable to create XML List XML variable.
4. Click New Variable to add a new variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Enter a variable name in the Variable Name field.
6. Select XML List Iterator from the Type drop-down list.
7. Select a XML Variable from the List XML Variable drop-down list.

Note: If you need to loop through the grid items of an item while iterating through the list items, you need to select the respective **XML List Iterator** type XML variable.



8. Click **Save Variable**. A message is displayed saying 'Variable Updated'.
9. Close the window.

Create an XML Iterator of Type XML Variable for Grid Items

XML Iterator type XML variable is used to iterate though the child items (grid items) of a list item in a workflow.

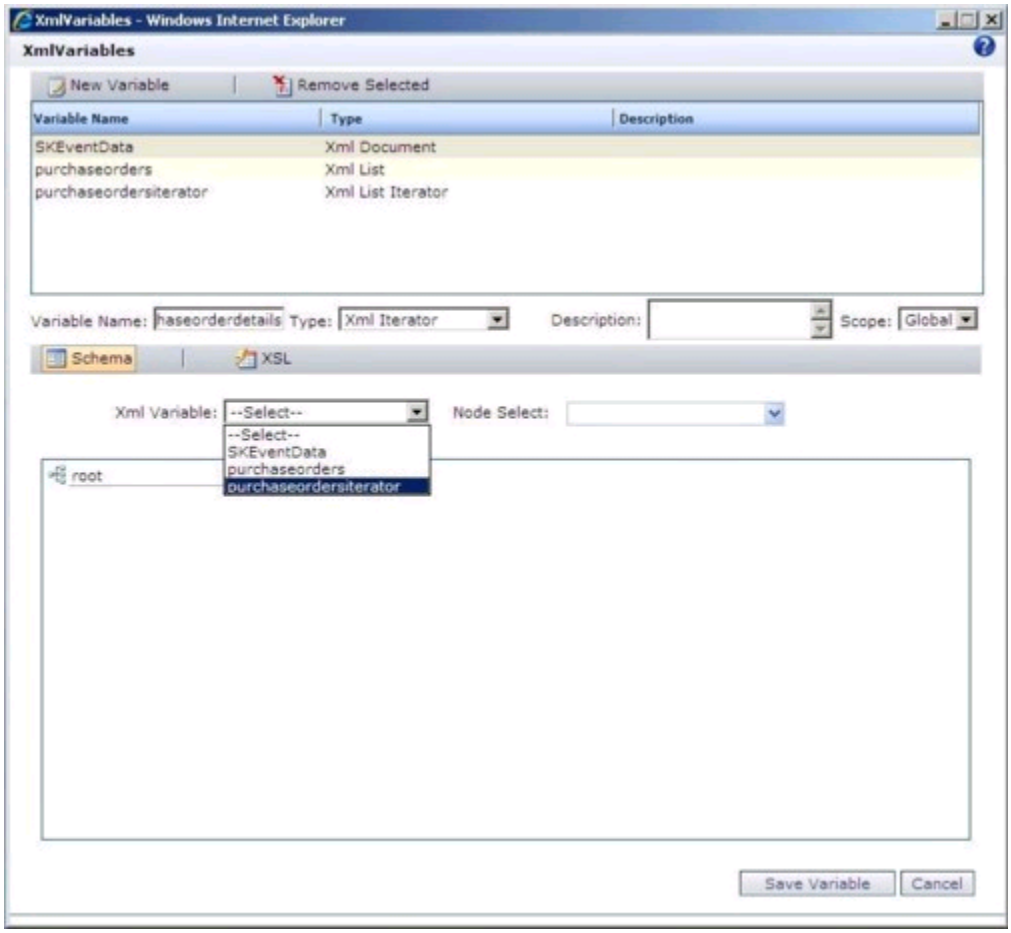
To create an XML Iterator type XML Variable for grid items

1. Right-click the **Start** Activity, and select **Activity Properties**.
2. Click the edit icon in the **XMLVariables** field. The **XMLVariables** screen appears, with the list of the existing XML variables.
3. You have to create a XML List Iterator type XML variable before creating XML Iterator type XML variable. If you have already created XML List Iterator type XML variable, you can proceed to the following step. See Creating XML List type XML Variable to create XML List XMLvariable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

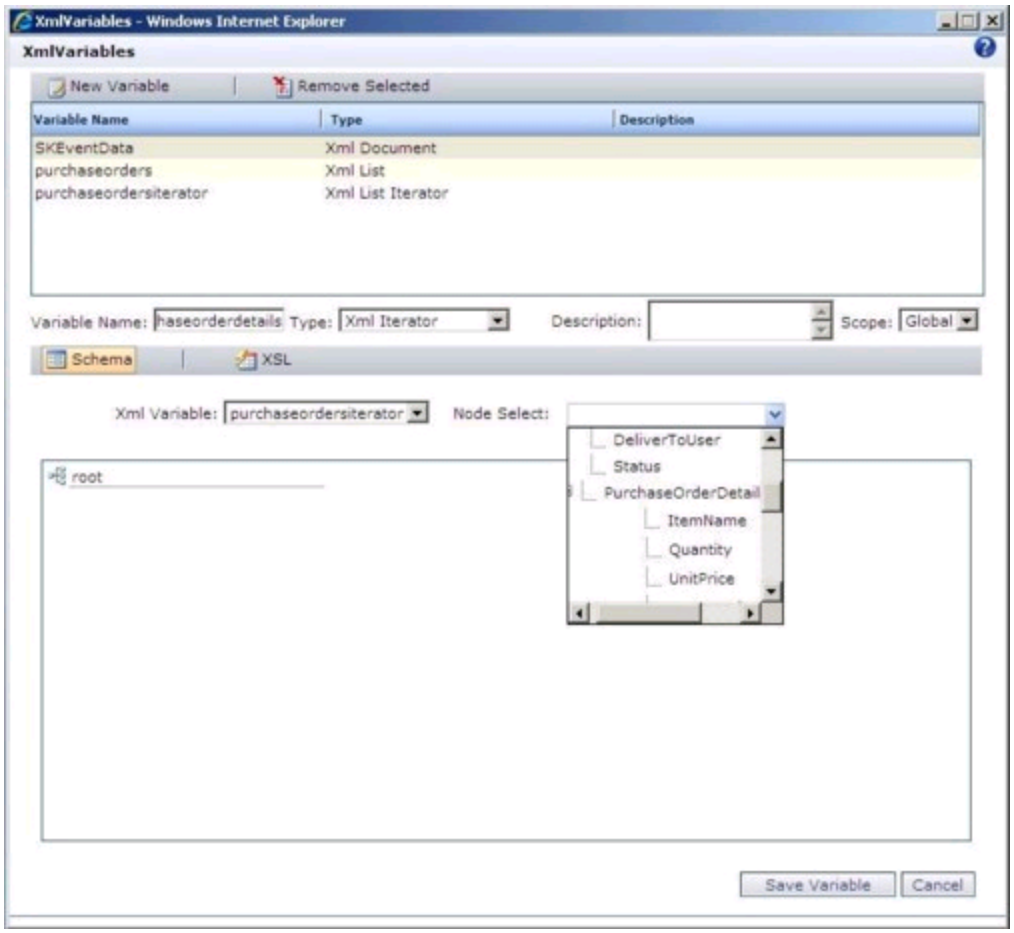
4. Click **New Variable** to add a new variable.
5. Type a variable name in the **Variable Name** field.
6. Select **XML Iterator** from the **Type** drop-down list.
7. Select a **XML Variable** from the **XML Variable** drop-down list as shown in the following screen.

Note: If you need to loop through the grid items of an item while iterating through the list items, you need to select the respective XML List Iterator type XML variable.



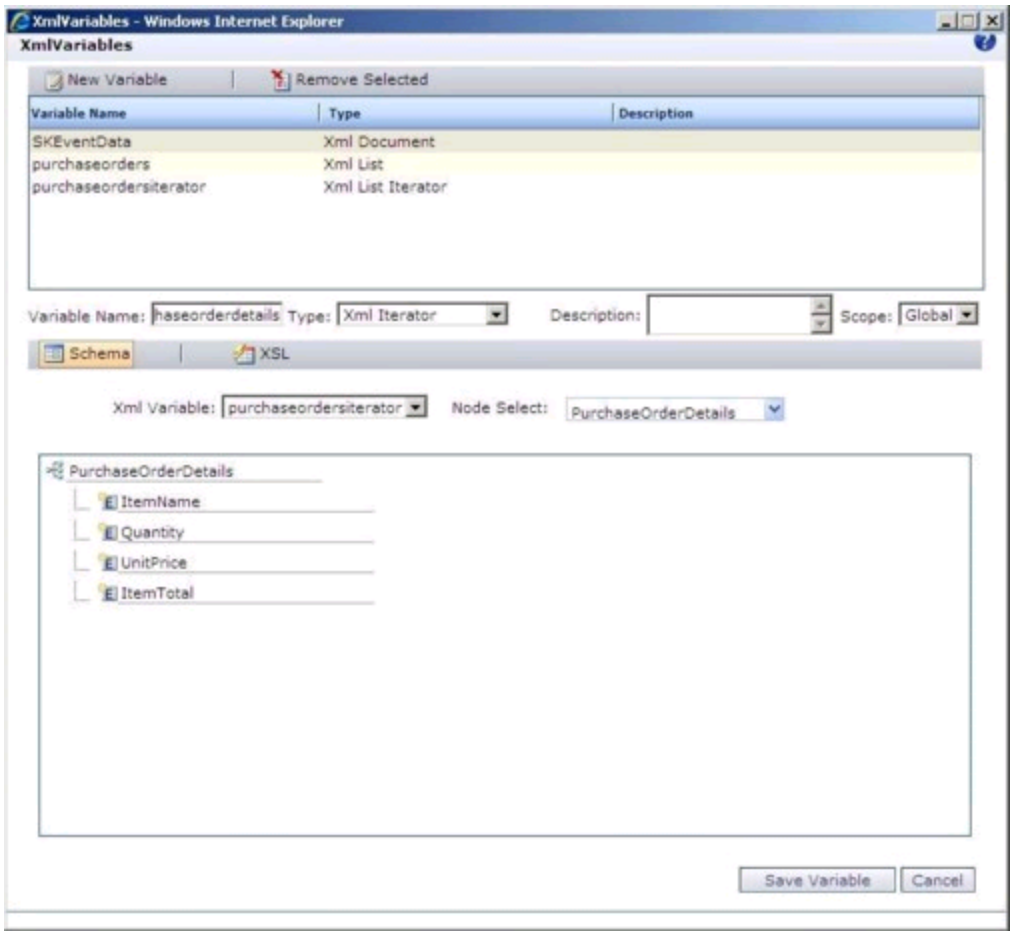
8. Select a repeating node from the **Node Select** drop-down list. Select the XML node which is mapped for the grid in the list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



9. When you select a node, the following screen is displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



10. Click **Save Variable**. The message 'Variable Updated' is displayed. Close the window.

Create Workflow for a List in a Single Step

The List Workflow option in the Workflows ribbon bar helps to create and associate a workflow to a list in a single step.

To create a Workflow for a list

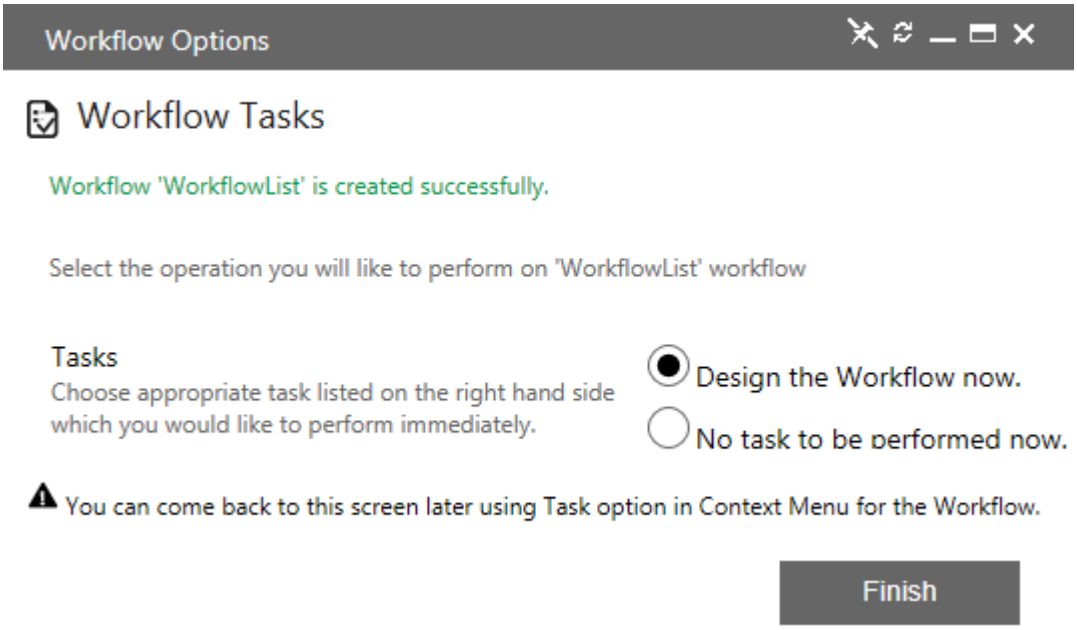
1. Log on to the **Enterprise Console** and create a list.
2. Click the **Enterprise Console** menu on the top and select **Workflows** from the drop-down list. The Workflows screen is displayed.
3. Click **New** and then click **List** on the ribbon bar. The **New List Workflow** screen appears.
   Enter the required details.

Field	Description
New List Workflow	
Title	Enter a title of workflow for the List in this field.
Description	Enter a description for the workflow in this field.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Associate to List Event - This can also be done using the 'Associate' icon in the AVEVA Work Tasks Workflow List Menu.	
List	Select a list ID. The **List Explorer** screen opens. Select the list name from the drop-down list and click **Submit**.
Event	Select an event from this drop-down list. The available options are **OnCreate**, **OnDelete**, **OnPublish**, **OnUnPublish**, and **OnVersionChange**.

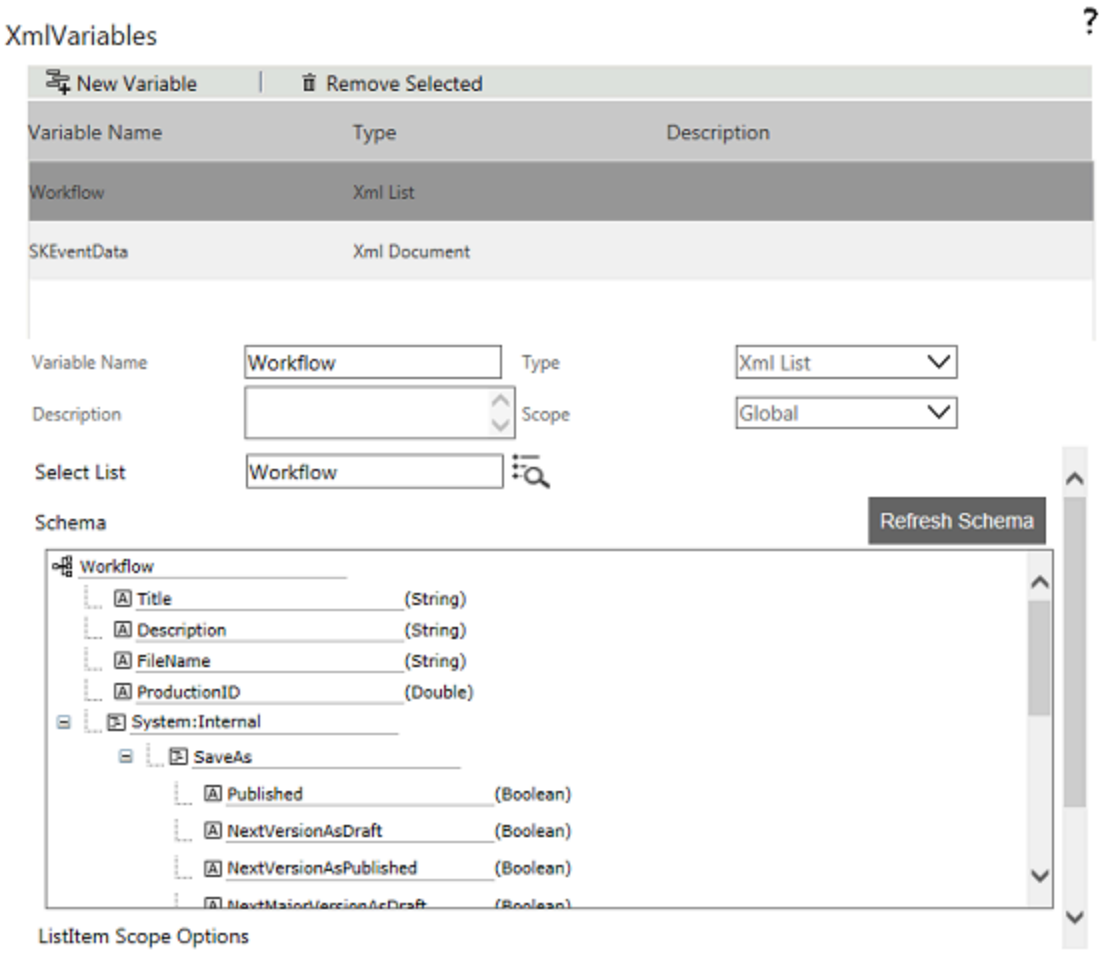
4. Click **Save & Continue**. The following screen is displayed.



5. Select the required task, and then click **Finish**. The **Process Designer** screen opens.
6. Following behavior is observed while using List Workflow.

- Workflow Creation
  When you click **Finish**, a workflow is created for the selected list. You can open this workflow either by selecting Design the Workflow now from tasks or using **Design Workflow** in the context menu of the workflow item.
- List XML Variable
  An XML variable of XML List type is also created by default and the List name is used as the Variable name. To view the XML Variable, go to the workflow designer screen. Right-click the **Start** activity, select **Activity Properties** from the options and then select the **XML Variables** icon from the **Activity Properties**.

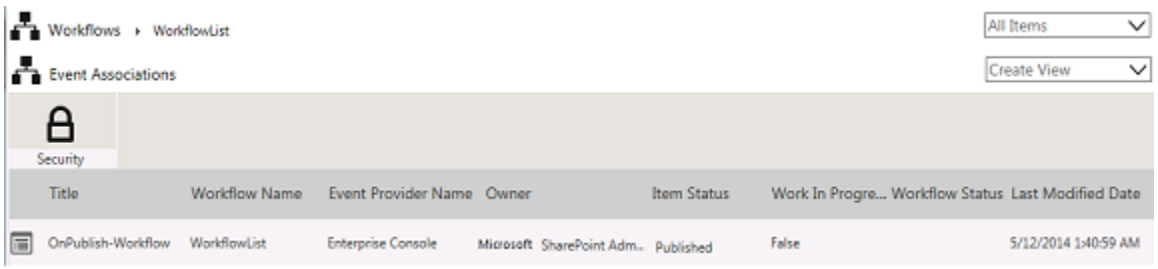
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



You can notice that, the variable is created with scope as **Current**, which means, this variable is responsible to give the information of the list item which initiates the workflow. The XML variables displayed in tree-view are the XML nodes that are mapped to the controls while creating the list.

System nodes are also created automatically for internal use. This helps you to save the list item in to another version as published or draft and also helps to save the item as folder for the list item.

- List Event Association
  This workflow is associated to the list event that you have selected at the time of execution. To view the associations, select the workflow, right click and select **View Associations** from the options.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Understand XML Node Mapping

This section explains the importance of XML Nodes while designing a List or a Form. The XML node allows binding a SQL Database to a List and the List to be mapped to a Form.

The following are the XML Nodes with an example of a library database.

- Database contains the table with columns such as, Id, Title, Author, Application.
- In the List, the Author control is bound to the DB column Author.
- In the Form, the Author Name control is mapped to the Author control in the list with the XML Node named Authorname.

A table column is mapped to a List control using the List control property 'Bound to DB Column' and the List control is mapped to Form control using 'Mapped XML Node'.

When you input data using a Form and the data is stored in the corresponding List, the List then updates the database table.

Note: When you design a List or Form, the Mapped XML Node allows mapping of a List to a Form. When you add a control for the first time, the XML Node is dynamically altered to reflect the Tag Name. Editing the Mapped XML Node at a later instance will affect the mapping between Forms, Lists, and Workflows.

XML List of Type XML Variable Scenarios

Using XML List XMLVariables, you can add, update, save, and perform other functions of list items.

Add New List Item

AVEVA Work Tasks allows you to add a new list item to the list using XML List XML variables. Update Variable activity can be used to add/update an item to the list. To add an item you need to select the scope as New from Choose the List Item to Work on options. You can also use List Navigator Activity to set the scope. With the help of a scenario, we will explain this function.

Assume that you have created a list called Purchase Orders with the following fields.

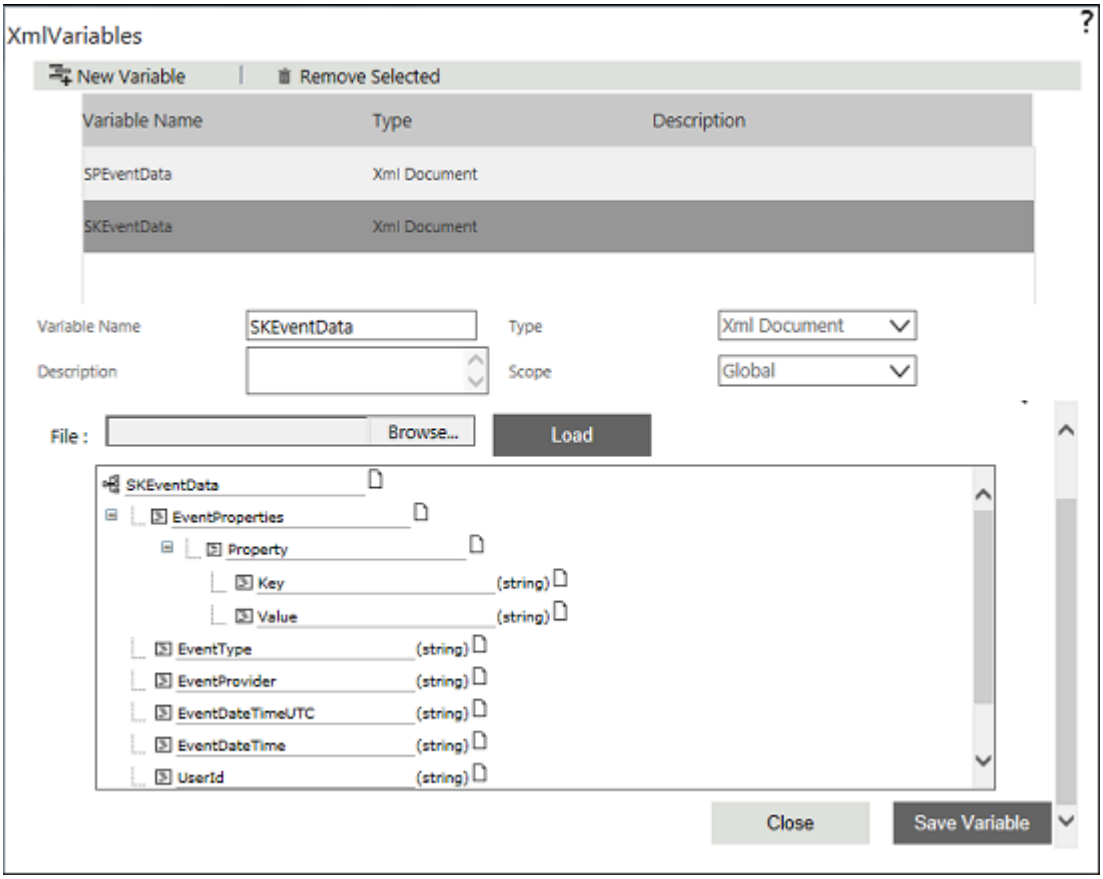
- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price
  - Item Total
- Total Purchase amount

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Now you want to add items to this list.

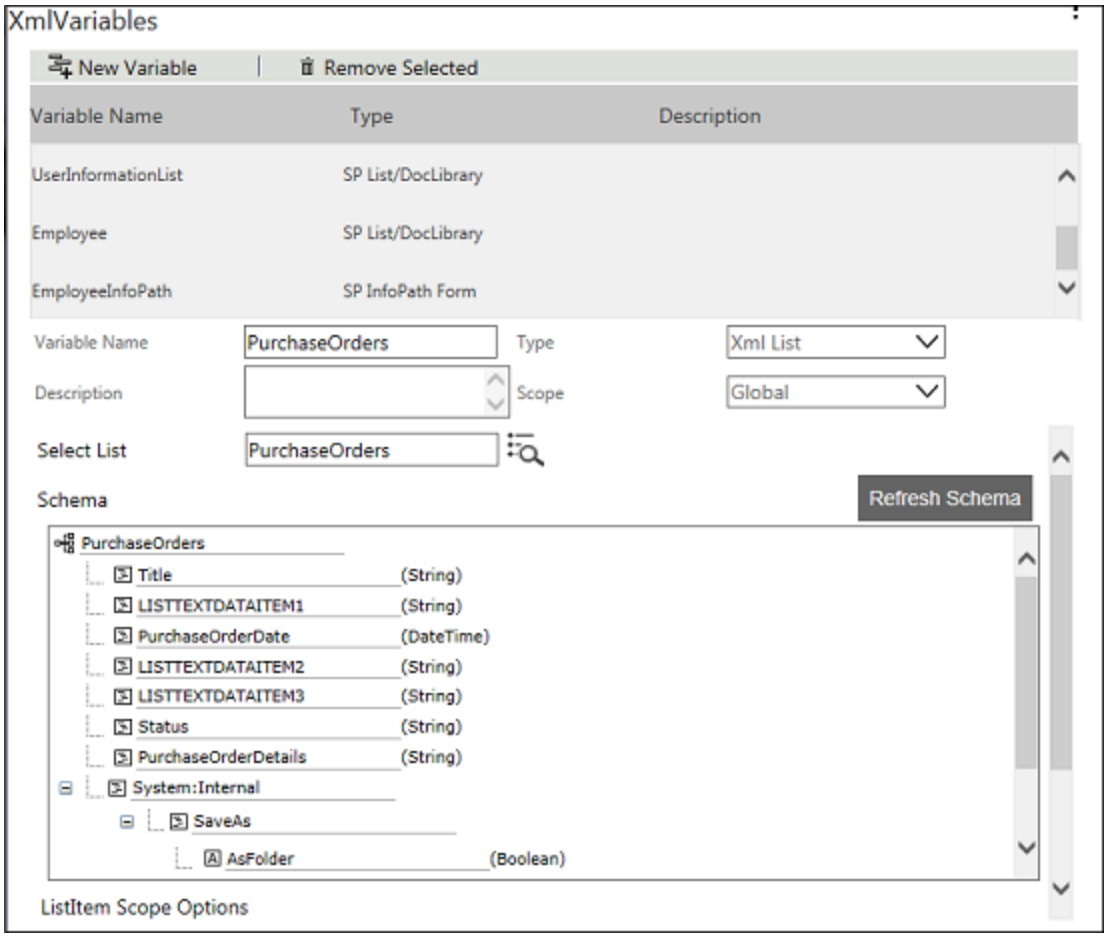
To add a new List Item

1. Login to the **Enterprise Console** and launch the **Workflow Designer** page.
2. You need to create an XML List type XML variable for the Purchase Orders list. If the variable is not created, follow the below mentioned procedure to create.
3. Click the edit icon in the **XMLVariables** property from the **Start** Activity Properties. The following screen is displayed.

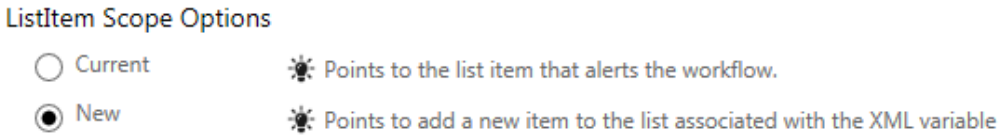


4. Click **New Variable** to add a new variable.
5. Type the variable name as 'purchaseorders'.
6. Select **XML List** from the **Type** drop-down list.
7. Type the List name in the **Select List** field or click the icon to select the list. In this case, select Purchase Orders list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

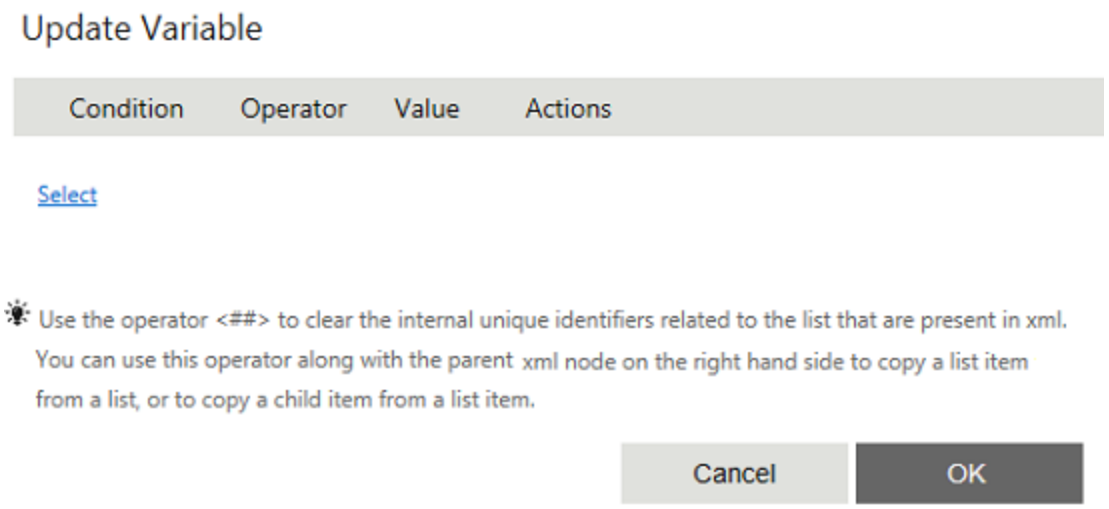


8. Select **New** as the scope from the ListItem Scope Options to point to a new item in the Purchase Orders list.

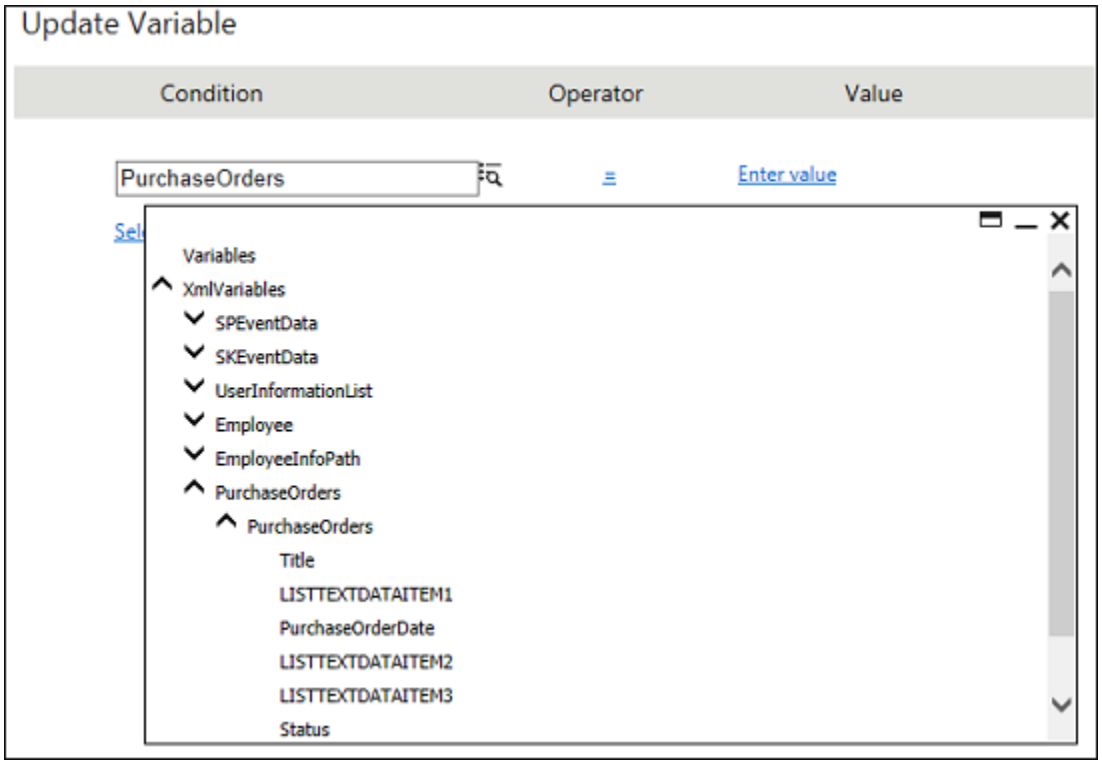


9. Now you can see the XML nodes in a tree-view that are mapped to the controls while creating the list.
10. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window.
    Note: If you set the scope as Current while creating the XML List type XML variable, you can change it in to New using List Navigator activity.
11. Drag and drop **Update Variable** activity to add an item to the list.
12. Click the edit icon in the **Set Variable** property. The following screen is displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

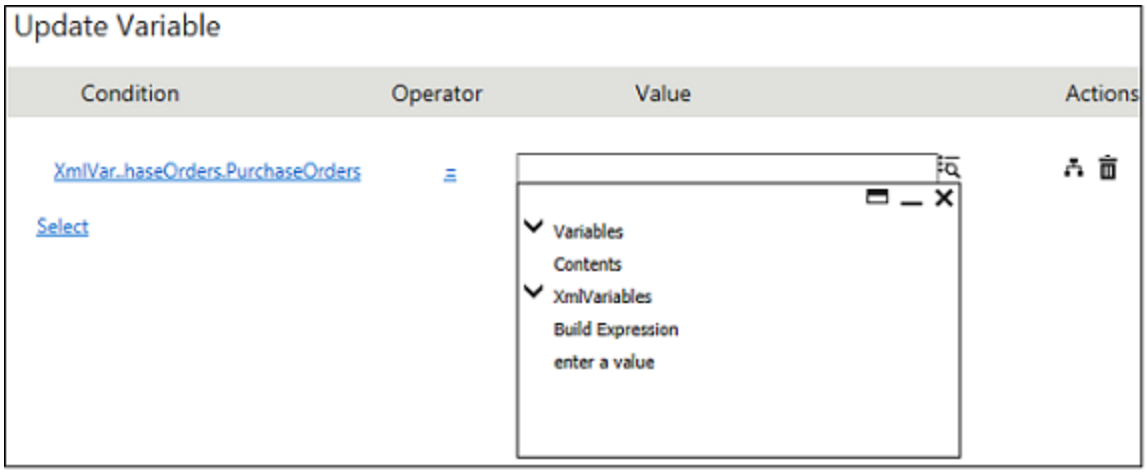


13. Click the **Select** link and select the respective field of the XML List type XML Variable created for the list (in this case purchaseorders). The fields displayed in the tree-view represent the XML nodes of the controls in the list.

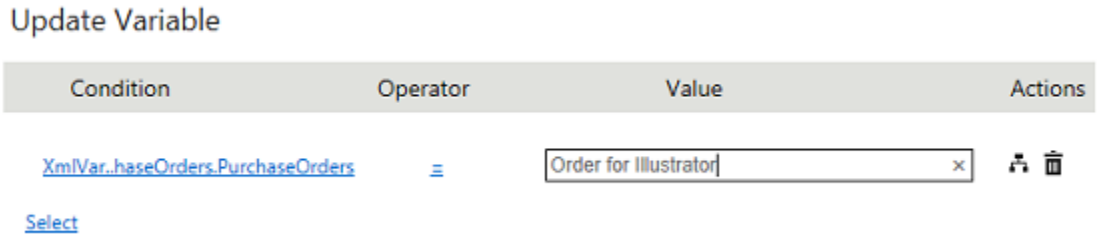


14. Select a field for which you want to set the value, from the tree-view and enter the value for the field in the right-hand side text box, or you can use the icon to set the value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



15. If you want to set the value, select **enter a value** from the tree-view, and then enter the value. Also you can select variables or contents or any XML Variable nodes directly by selecting the respective node from the tree-view. If you want to combine multiple node values, you can build an expression by selecting **Build Expression**.



16. In the same way, you can set the value for all other fields in the list for the new item. Make sure to specify the values for all mandatory fields of the list.
17. After setting the value for the entire field, click **OK**. When you execute this workflow, a new item will get added based on the value that you have set.

Update the List Item that Alerted the Workflow

AVEVA Work Tasks allows you to update the list item that alerted the workflow using XML List Type XML Variable. Update Variable activity can be used to add/update an item to the list. To update an item, you need to select the scope as Current from Choose the List Item to Work on options. You can also use List Navigator Activity to set the scope. With the help of a scenario, we will explain this function.

Assume that you have created a list called Purchase Orders with the following fields and alerted the workflow.

- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

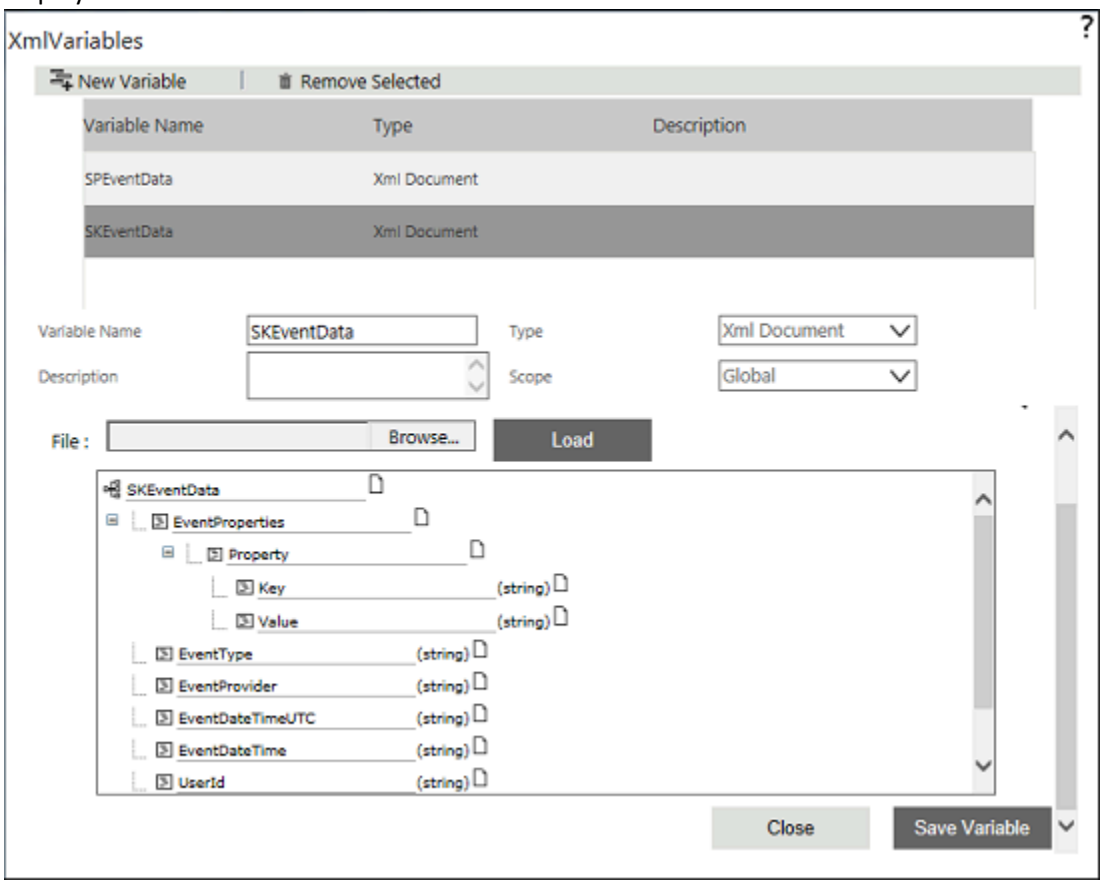
- Quantity
- Unit Price
- Item Total

- Total Purchase amount

Now you want to update an item in the same list. Follow the procedure given below.

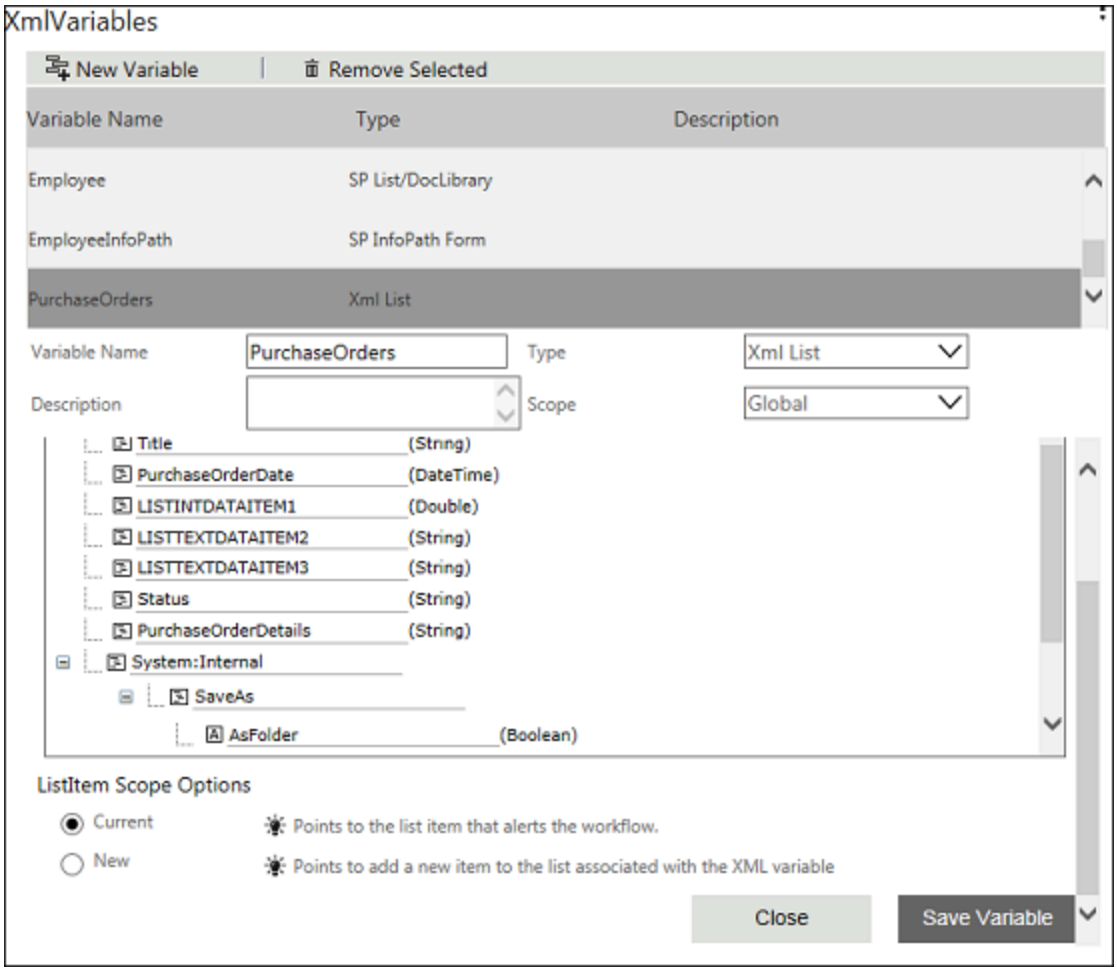
To update the list item that alerted the workflow

1. Login to the **Enterprise Console** and go to the Workflow Designer page.
2. You need to create an **XML List** type XML Variable for the Purchase Orders list. If the variable is not created, follow the below mentioned procedure to create.
3. Click the edit icon in the **XMLVariables** property from the **Start** Activity Properties. The following screen is displayed.

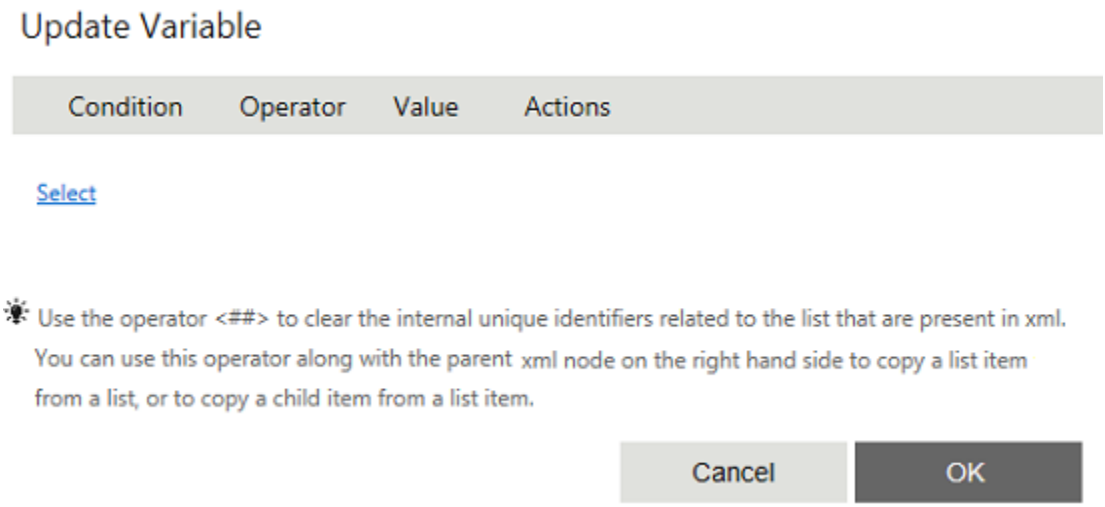


4. Click **New Variable** to add a new variable.
5. Type the variable name as 'purchaseorders'.
6. Select type as **XML List** from **Type** the drop-down list.
7. Type the List name in the **Select List** field or click the icon to select the list. In this case, select 'Purchase Orders' list.
8. Select Current as the scope from the **ListItem Scope Option** to point to an item in the Purchase Orders list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

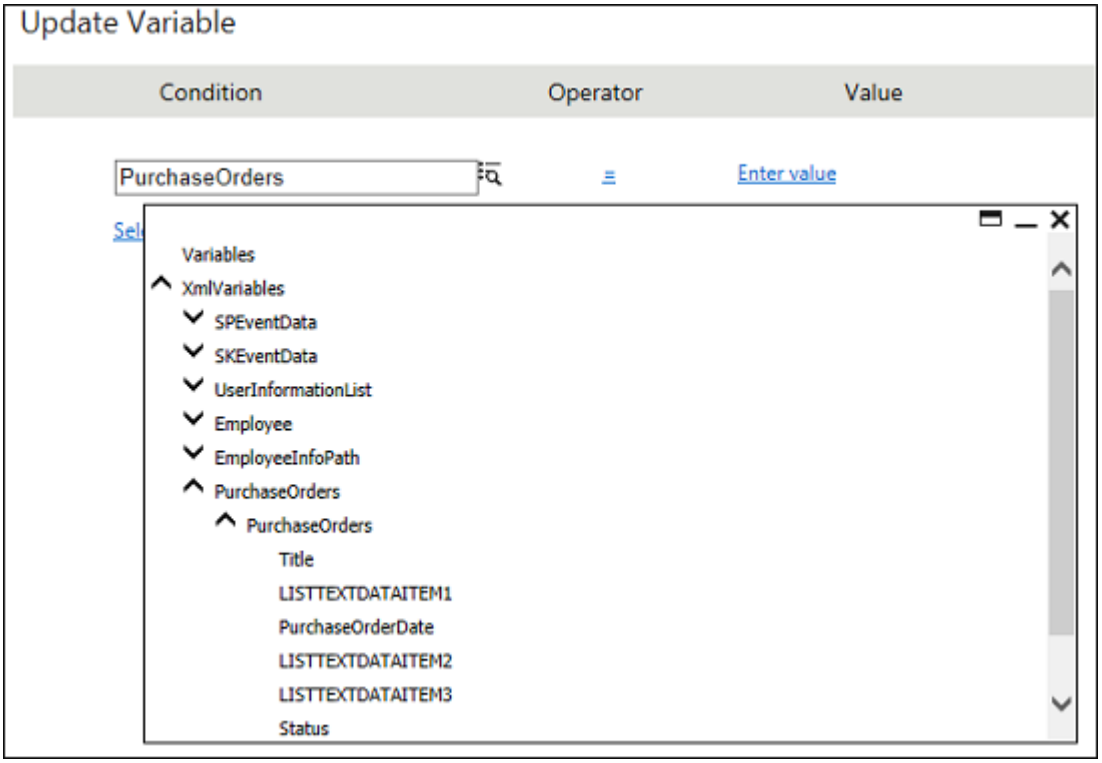


9. Now you can see the XML nodes in a tree-view that are mapped to the controls while creating the list.
10. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window.
    Note: If you set the scope as **New** while creating the **XML List** type XML variable, you can change it to Current using List Navigator activity.
11. Drag and drop **Update Variable** activity to update an item in the list.
12. Click the edit icon in the **Set Variables** property. The following screen is displayed.

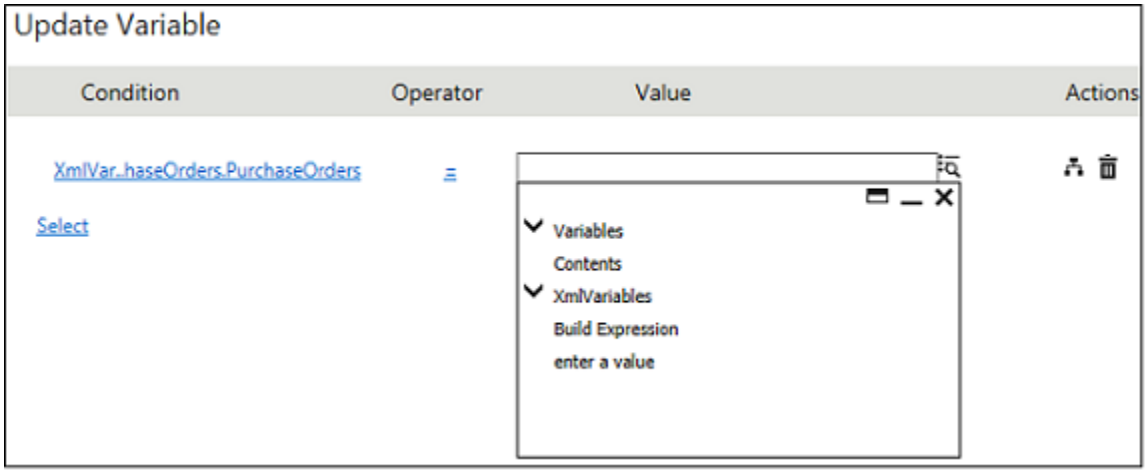


© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

13. Click the Select link and select the respective field of the XML List type XML Variable created for the list (in this case 'purchaseorders'). The fields displayed in the tree-view represent the XML nodes of the controls in the list.

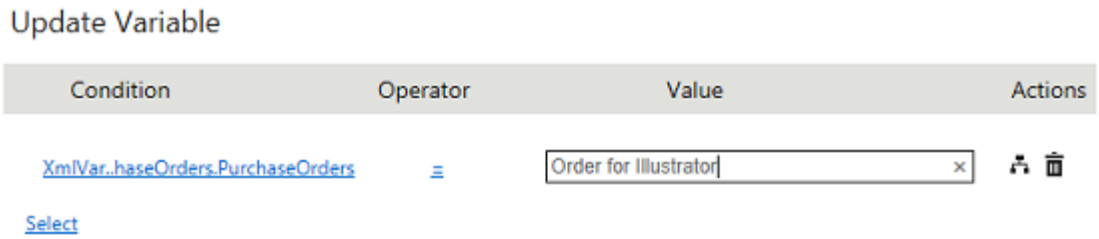


14. Select a field for which you want set the value from the tree menu. Enter the value for the field in the right-hand side text box or click the icon to set the value.



15. If you want to set the value, select 'enter a value' from the tree-view and then enter the value. Also, you can select variables or contents or any XML variables nodes directly by selecting the respective node from the tree-view. If you want to combine multiple node values, you can build an expression by selecting Build Expression.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



16. The same way, you can set the value for other fields that you want to update. In this case, you are only updating the field 'Title' which has the value 'Order for Illustrator'.
17. Click **OK**. When you execute this workflow, the item get updated based on the value that you have set.

Save the List Item as Different Version as Draft/ Published Using Xml Variable

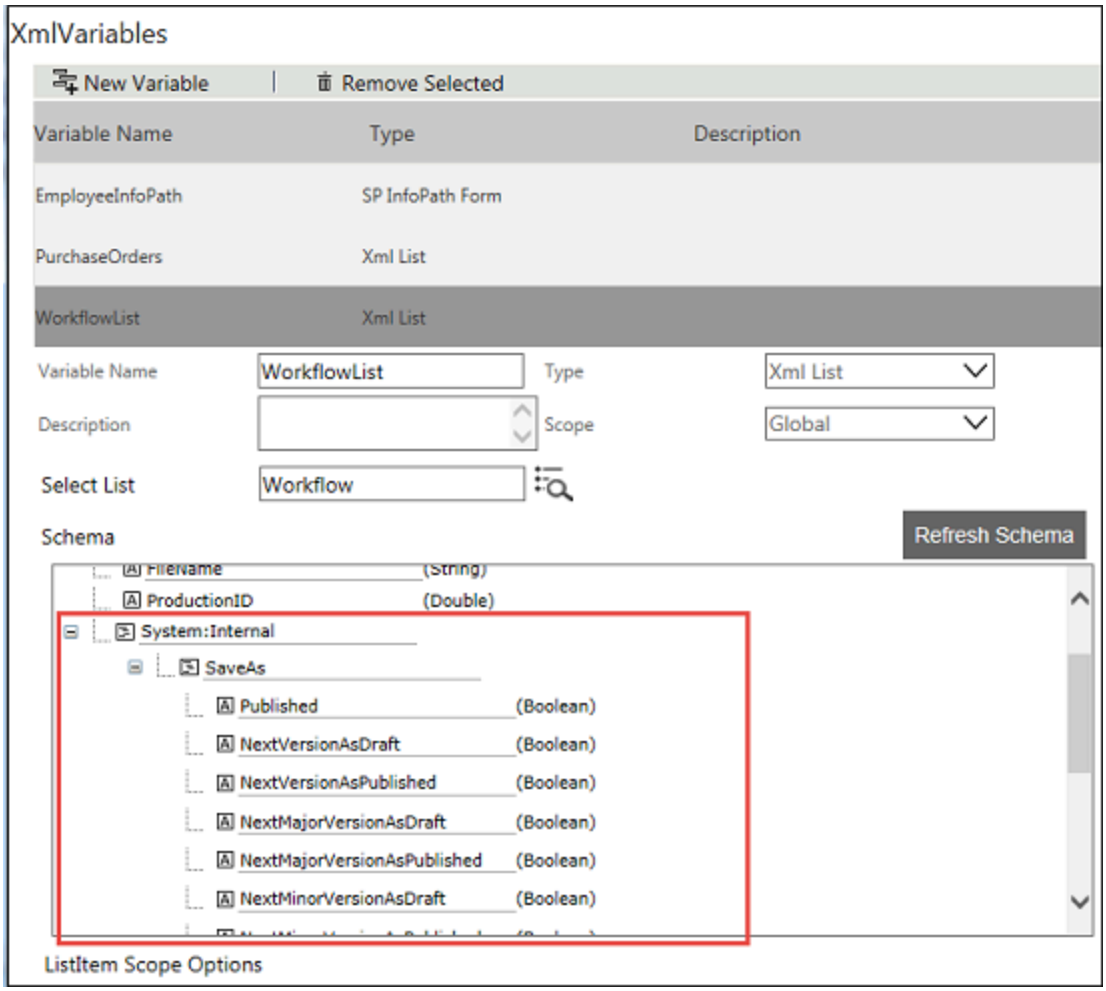
There are two kinds of list, version enabled and version not enabled. If your list is version enabled, you can save the item as a different version as published or draft using System Internal variables. This can be done at the time of setting the value for activity.

Assume that you are creating a workflow and it is attached to the out of box list workflow which is version enabled.

To save the list item as different version as draft/published using Xml Variable

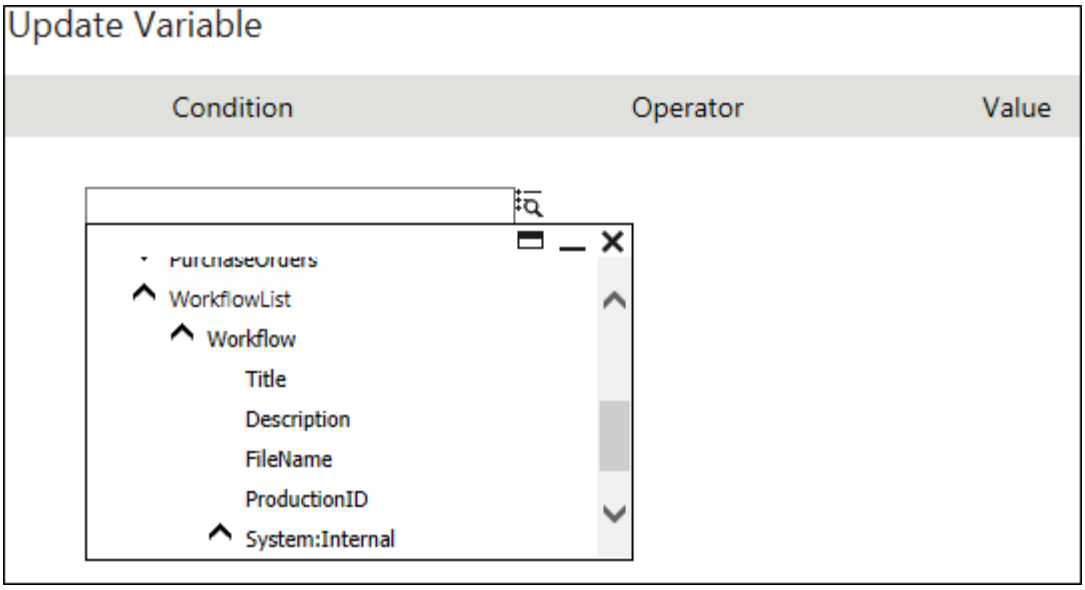
1. Right-click the **Start** activity and select **Activity Properties** from the options.
2. Click the edit icon in the field. The following screen is displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

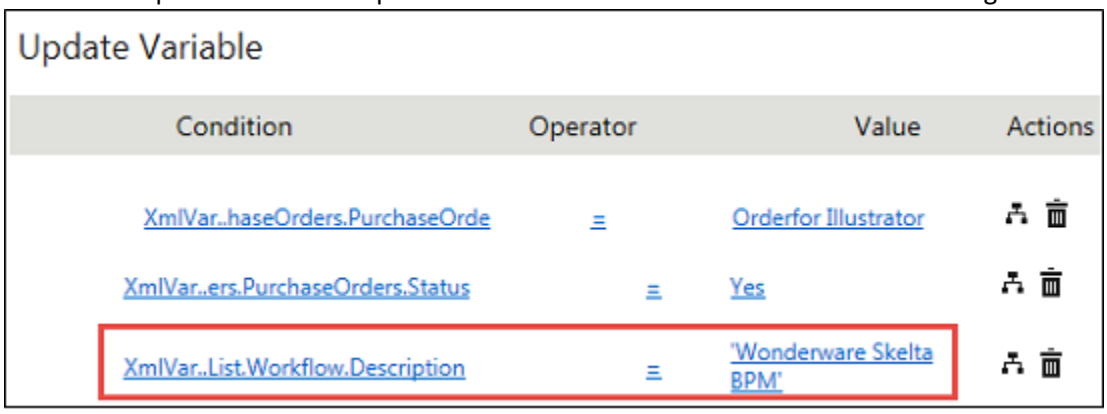


3. For the version enabled list, you can see the list of schema in a tree-view under System:Internal. Nodes include Save As > NextVersionAsDraft, NextVersionAsPublished, and so on. You can use these nodes to save an item to another version as draft or published.
4. Use **List Query** and point to an item that you want to update and save as different version. See Setting up the List Query Scope.
5. Drag and drop **Update Variable** activity. Click the edit icon in the **Set Variables** field.
6. Click the **Select** link and then click the drop-down list that appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

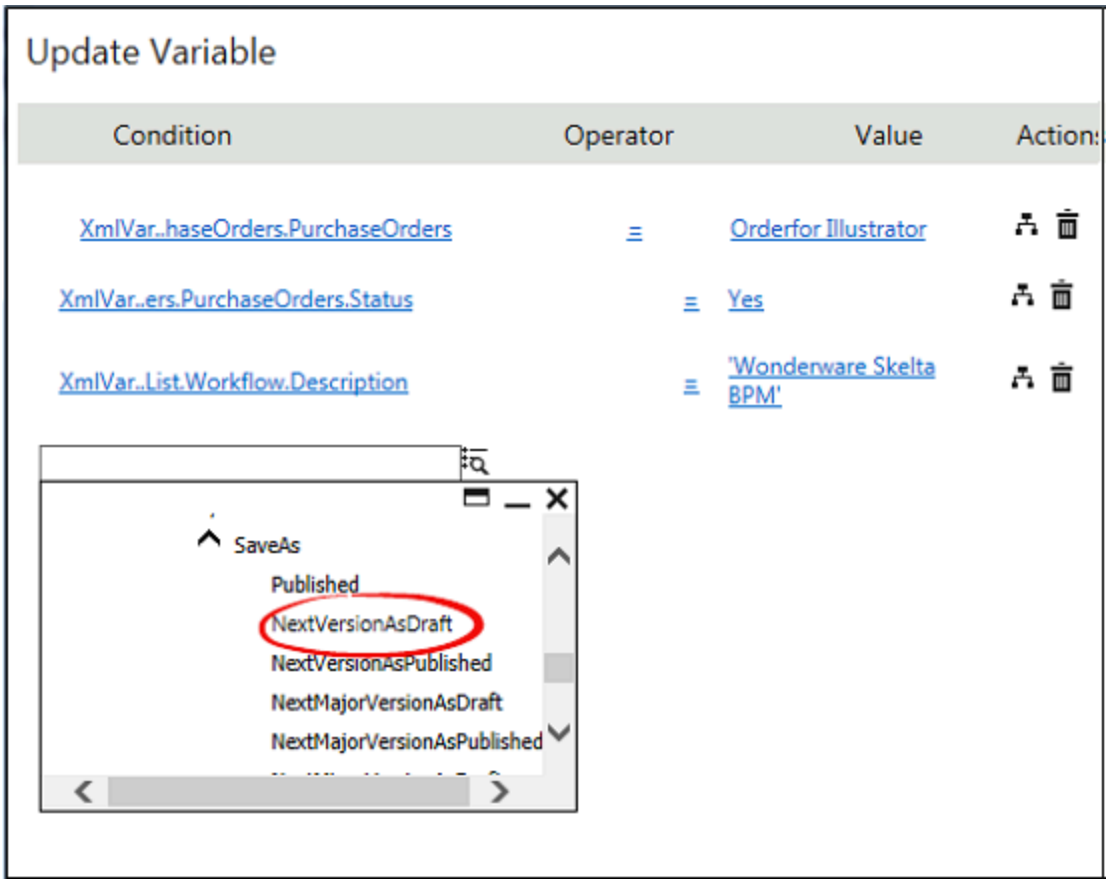


7. Assume that you want to update the item **Description** having the value 'Workflow Management'. Select Description from the drop-down list and enter the value as 'Workflow Management'.

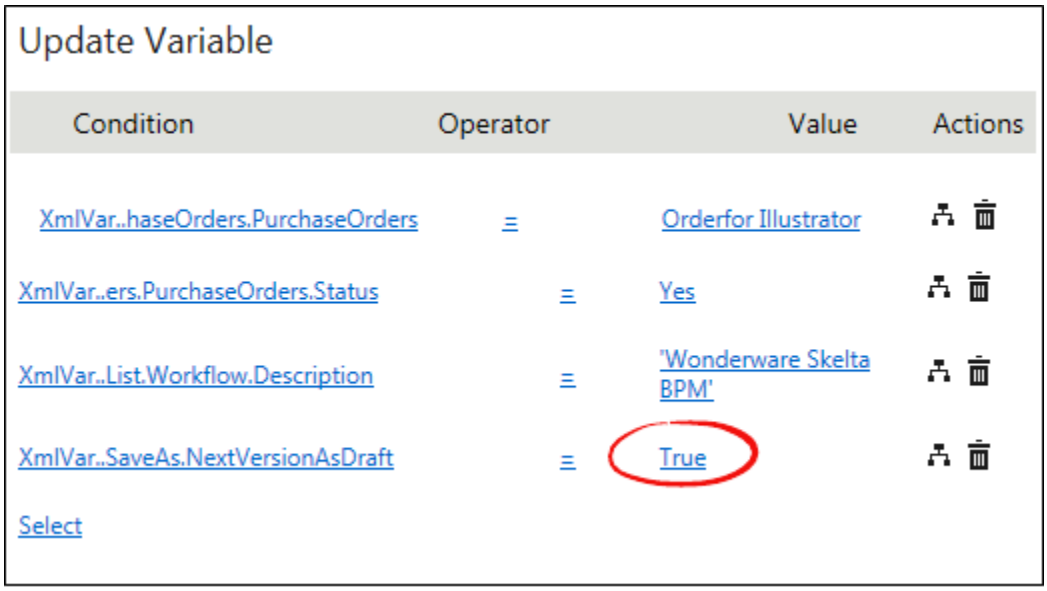


8. If you want to save this item as **Next Version > Draft**, click the drop-down.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



9. Select **NextVersionAsDraft** from the SaveAs options under **System:Internal**.
10. Enter the value as 'True'.



11. Click **OK**. This will update the item **Title** and also save the item as next version as draft.
12. In the same way, you can save any item to different versions like Next Major Version as Published/Draft, Next Minor Version as Published/Draft while updating the item.

Note: If you select multiple SaveAs conditions and set the value as **True**, the last condition will be taken into

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

account and the item will be saved based on the last condition. Also for the list that is not version enabled, the system will automatically save the item as published.

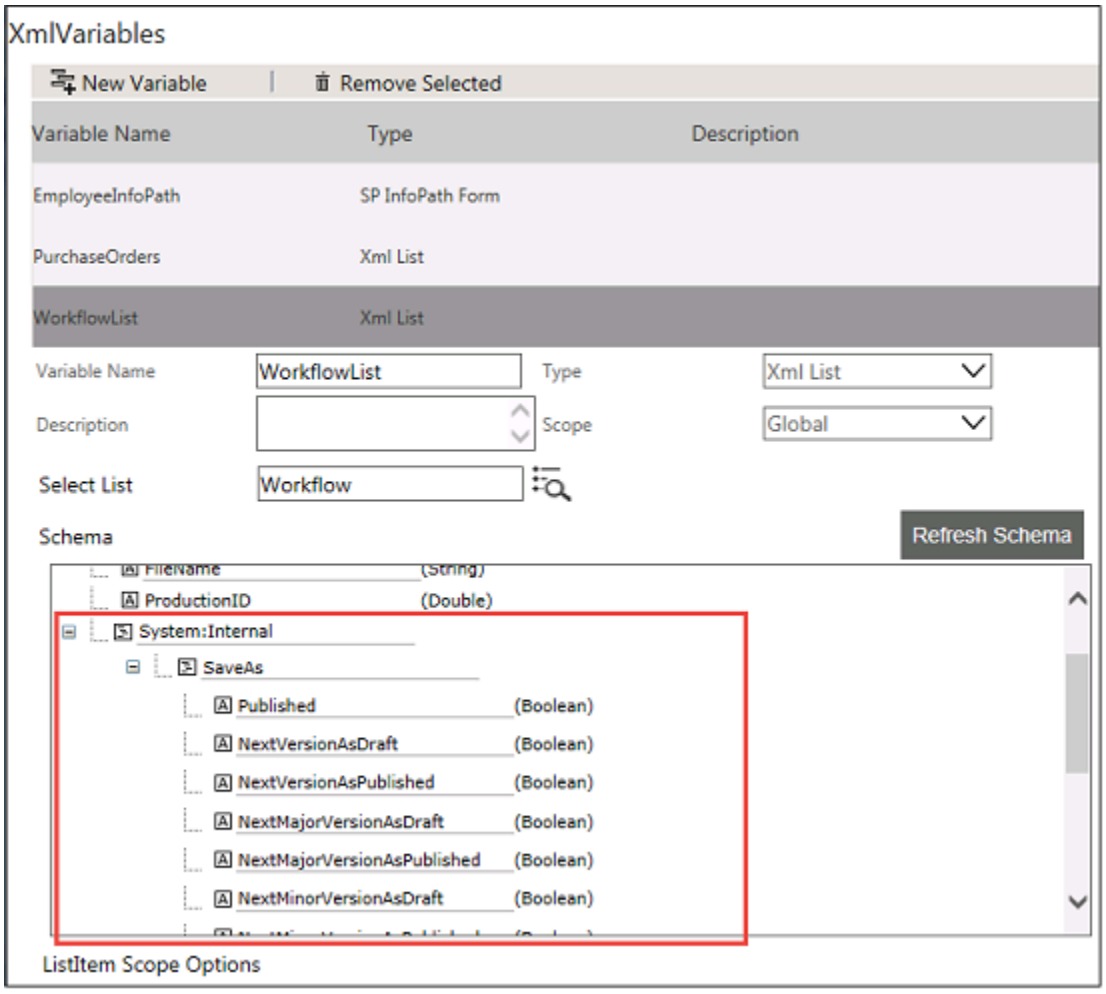
Create New Folder Using Xml Variable

If your list is version enabled, you can save the item into a folder using System Internal variables. This can be done at the time of setting the value for **Update Variable** activity.

Assume that you need to create a folder in Workflows list which is version enabled.

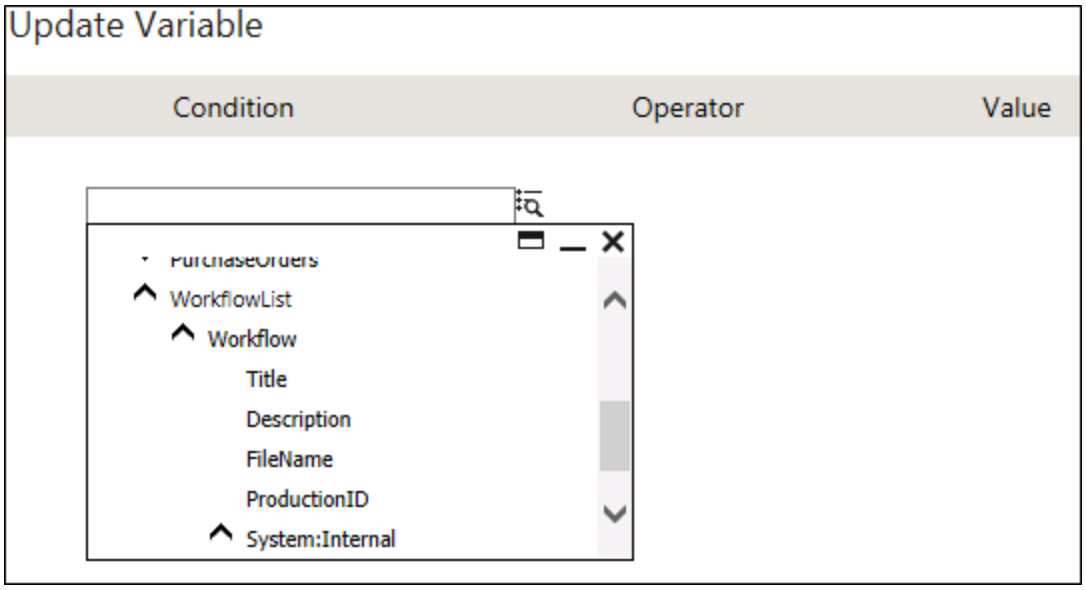
To create a new folder using XML Variable

1. Right-click the Start activity and select **Activity Properties** from the options.
2. Click the edit icon in the **XMLVariable**s field. The following screen is displayed.

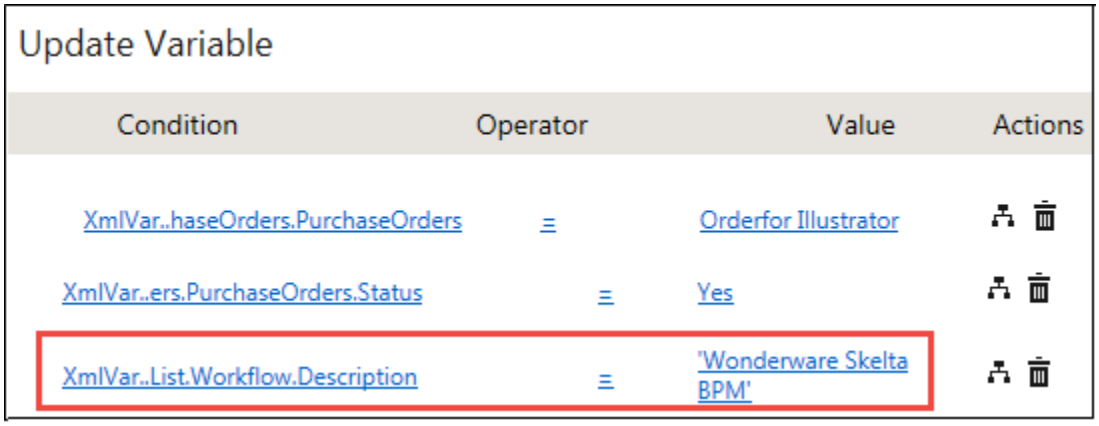


3. For the version enabled list, you can see the list of schema in a tree-view under **System:Internal**. Nodes include Save As NextVersionAsDraft, NextVersionAsPublished, **AsFolder** and so on.
4. Drag and drop **Update Variable** activity. Click the edit icon in the Set Variables field.
5. Click the **Select** link and then click the drop-down that appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

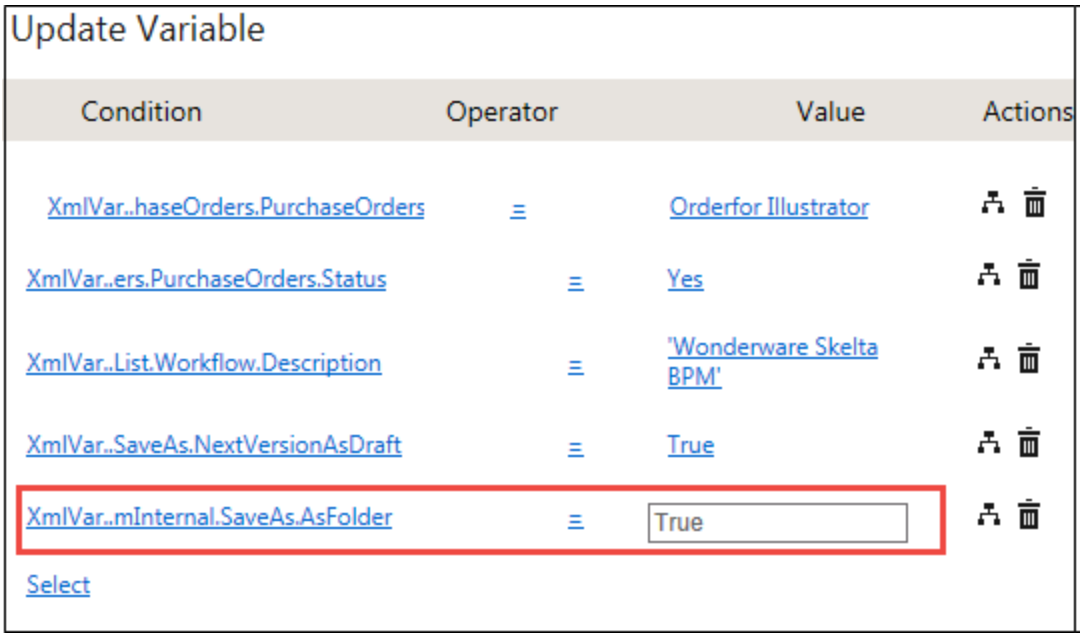


6. Assume that you want to save the item **Description** as a folder with the folder name as 'Workflow Management'. So, select **Description** from the tree-view and enter the value as 'Workflow Management' in the right-hand side text box.



7. To save this item as folder, click the drop-down.
8. Select **AsFolder** from the **SaveAs** options under System:Internal.
9. Then enter the value as 'True'

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



10. Click **OK**. This will update the item **Description** and also will create a folder with the name 'Manager'.

Note: Folder names should not have special characters like such as, :, ", \, \, " ", ', <, >, ;, |, *, /, {, }, and ?.

Add New List Item with Grid Items

AVEVA Work Tasks allows you to add list items with grid items to any list using XML variable. Update Variable activity can be used to perform this task. An XML Iterator type XML variable should be created to add the grid items (child items) and the XML Navigator activity can be used to point to the grid.

This can be explained through the scenario mentioned below.

A list, Purchase Orders, has been created with the following fields.

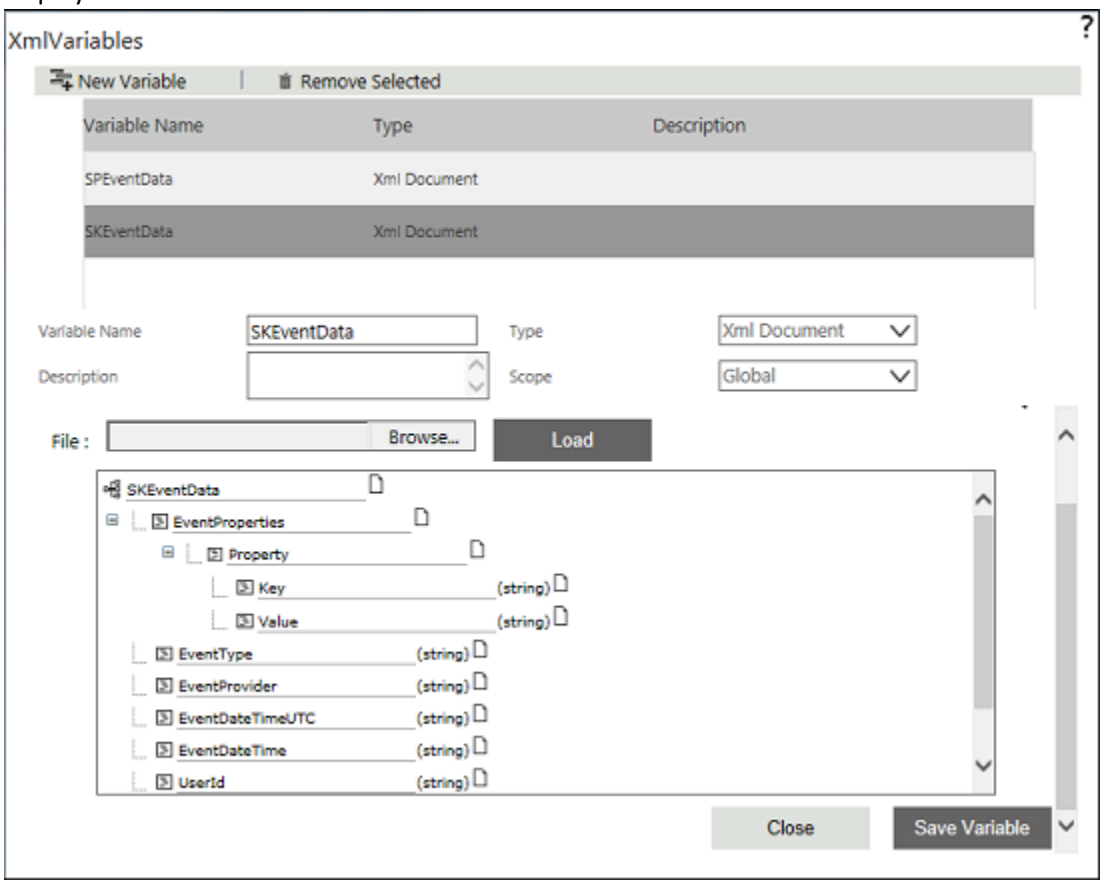
- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price
  - Item Total
- Total Purchase amount

From the workflow, you have to add an item along with the child item to the Purchase Orders list.

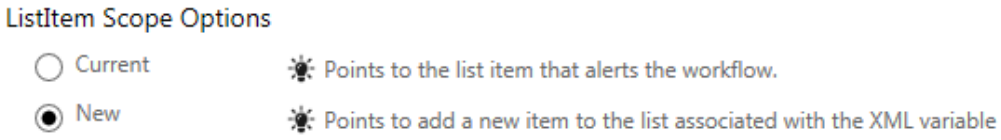
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To add a new list item with grid items

1. Log on to the **Enterprise Console** and launch the **Workflow Designer** page. You need to create an XML List type XML variable for the Purchase Orders list. If the variable is not created, follow the below mentioned procedure to create it.
2. Click the edit icon in the **XML Variables** property from the **Start** Activity Properties. The following screen is displayed.



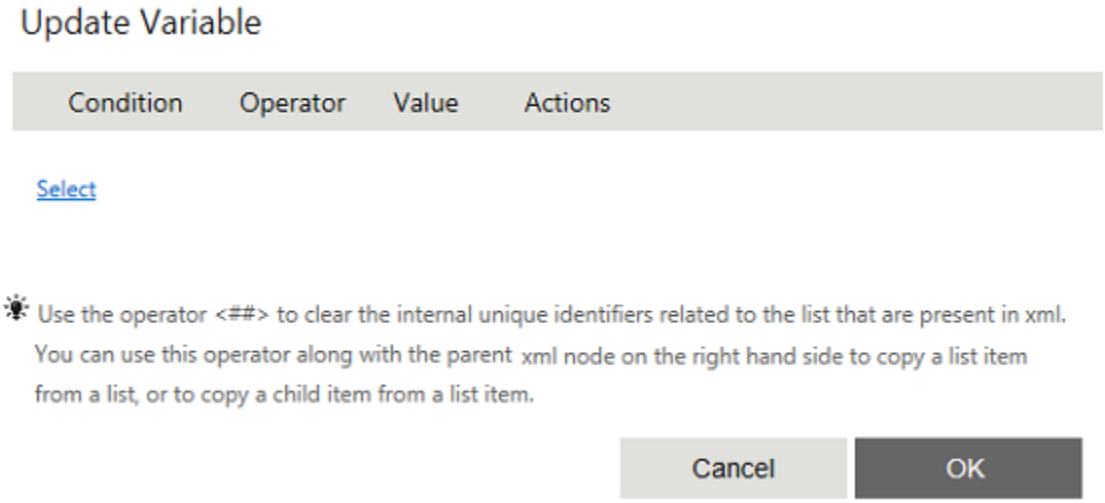
3. Click **New Variable** to add a new variable.
4. Type the variable name as 'purchaseorders'.
5. Select **XML List** from the **Type** drop-down.
6. Type the List name in the **Select List** field or click the to select the list. In this case select Purchase Orders list.
7. Select **New** as the scope from the **ListItem Scope Options** to point to a new item in the Purchase Orders list.



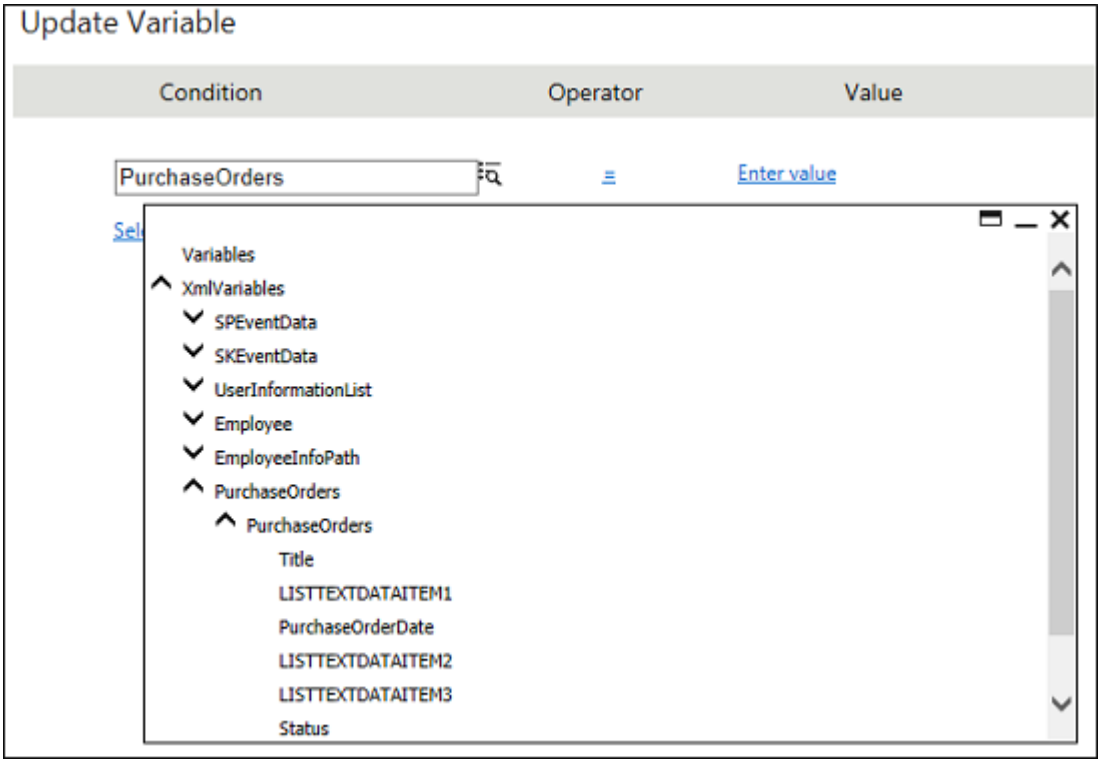
8. Now you can see the XML nodes in a tree menu that are mapped to the controls while creating the list. You can also notice that the parent XML nodes and child XML nodes (PurchaseOrderDetails grid) are also displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window.
10. Drag and drop **Update Variable** activity to add an item in the list.
11. Click the edit icon in the **Set Variables** property. The following screen is displayed.

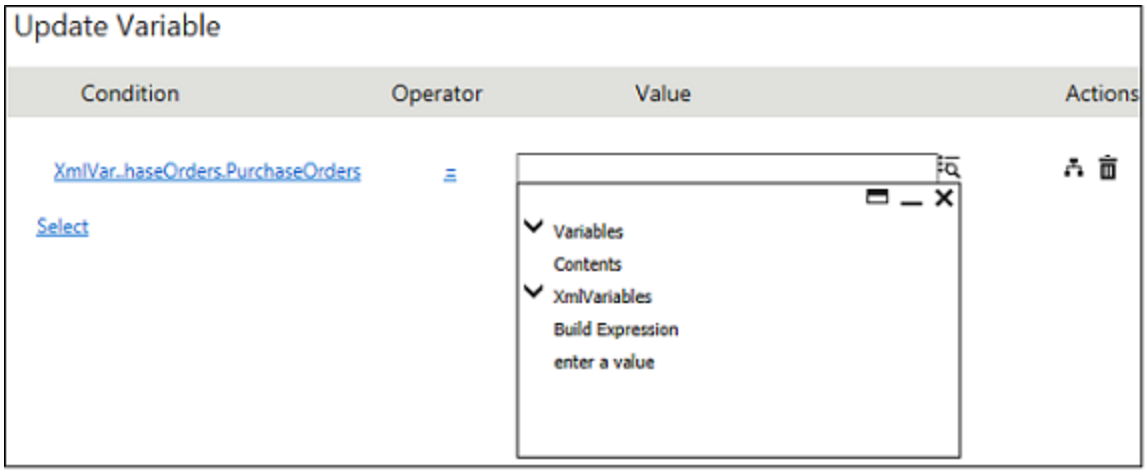


12. Click the **Select** link and select the respective field of the XML List type XML Variable created for the list (in this case 'purchaseorders'). The fields displayed in the tree-view represent the XML nodes of the controls in the list.



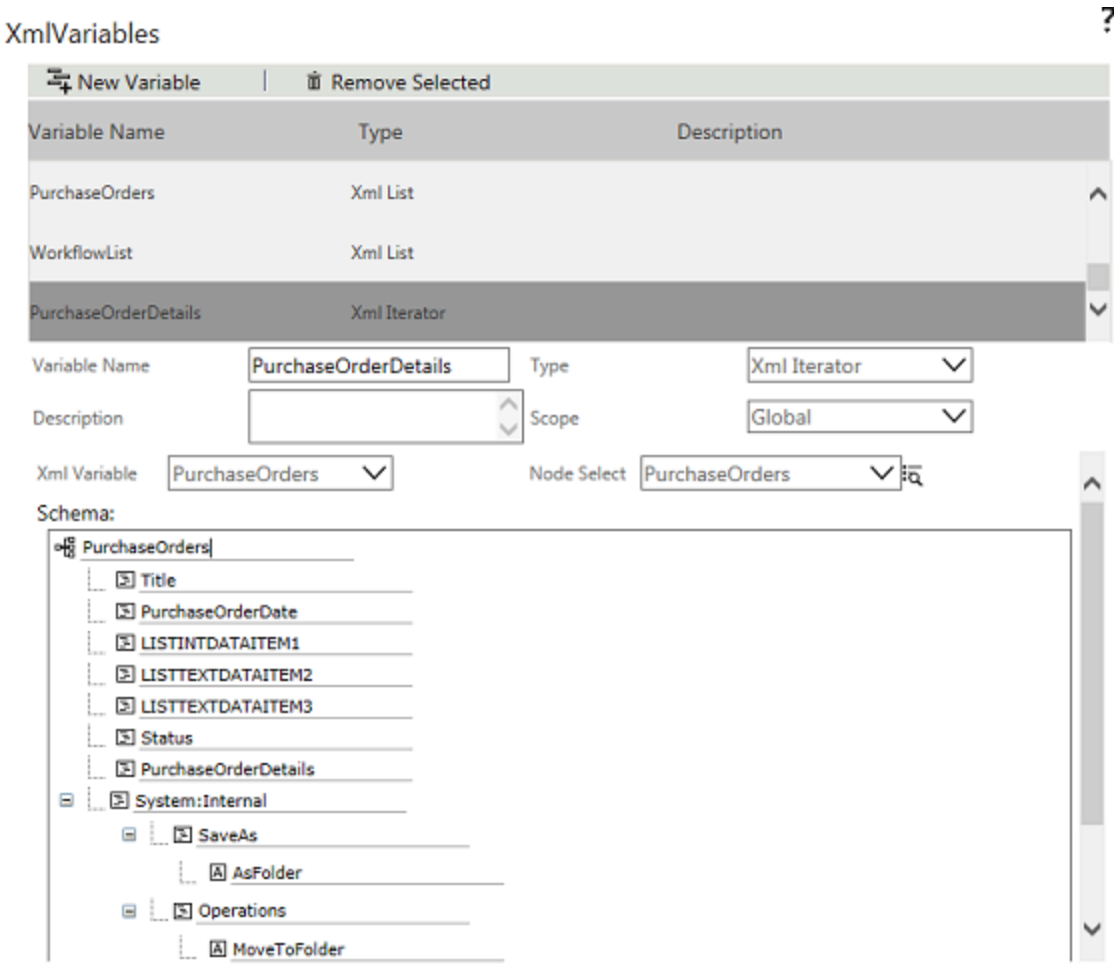
13. Select a field for which you want to set the value from the tree-view. Enter the value for the field in the right-hand side text box. If you want to set the value, select **enter a value** from the tree-view, and then type the value. Also, you can select variables or contents or any XMLvariables nodes directly by selecting the respective node from the tree-view. If you want to combine multiple node values, you can build an expression by selecting **Build Expression**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



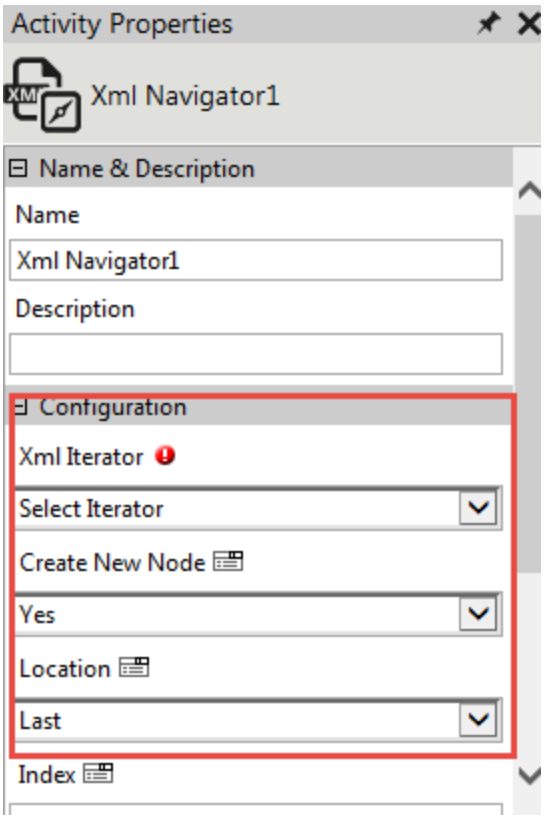
14. After setting the value for all the fields in the parent item (controls in the main form) that you want to add, click OK. This will add a list item to the list, while executing the workflow, with the fields in the main form. If you want to add an item to the grid (in this case, if you want to add a Purchase Order Details grid item), use XML Navigator activity. XML Navigator can be used to point to an item in the grid (Purchase Order Details in this case). For this purpose, you need to create an XML Iterator type XML Variable. This can be created from the Start activity XML variable property.
15. In the XML Variable screen, click **New Variable**.
16. Type the variable name as **PurchaseOrderDetails**.
17. Select **XML Iterator** from the **Type** drop-down list.
18. Select **PurchaseOrders** from the **XML Variable** drop-down list.
19. Select the repeating node (Qualification) from the **Node Select** drop-down list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

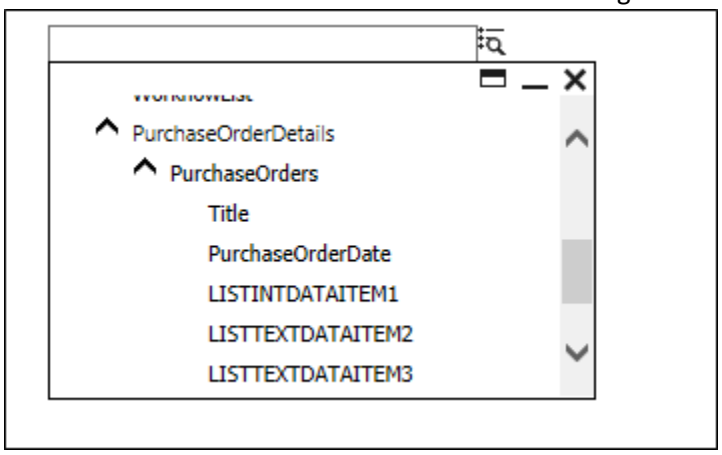


20. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window.
21. Drag and drop **XML Navigator** activity.
22. Select **PurchaseOrderDetails** from **XML Iterator** drop-down list and select **Yes** from **Create New Node** properties, to create a new node.
23. Select the appropriate **Location**. The available options are:
    - First: Navigates to the first record in the collection.
    - Last: Navigates to the last record in the collection.
    - Next: Navigates to the next record based on the current location.
    - Previous: Navigates to the previous record based on current location.
    - Index: Navigates to the record identified in the Index field.
      Since we have to append the items in Purchase Order Details grid, select the option as Last.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



24. Click **Save**.
25. Drag and drop the **Update Variable** activity to enter the grid field values.
26. Click the edit icon in the **Set Variables** property.
27. Click **Select** and choose the respective field of the XML Iterator type XML Variable created for the list (in this case PurchaseOrderDetails), that is, grid items. The fields displayed in the tree-view represent the XML nodes of the controls in the Purchase Order Details grid.



28. Select a field for which you want to set the value from the tree-view and type the value for the field in the right-hand side text box.
29. After setting the value for all the fields in the child item, click **OK**. A new item with grid will be added to the list while executing the workflow.

Note: If you want to add multiple items, use XML Navigator and Update Variable activities for Iterator within the For-Next Loop activities.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Add New Grid Item to the Existing List Item

AVEVA Work Tasks allows you to add list items with grid items to the existing list item using XML variable. The Update Variable activity can be used to perform this task. An XML Iterator type XML variable should be created to add the grid items (child items) and the XML Navigator activity can be used to point to the grid. Also, you have to use the List Query property of List Navigator activity to build the query and to point to the list item to add a new grid.

This can be explained through the scenario mentioned below.

A list, Purchase Orders, has been created with the following fields.

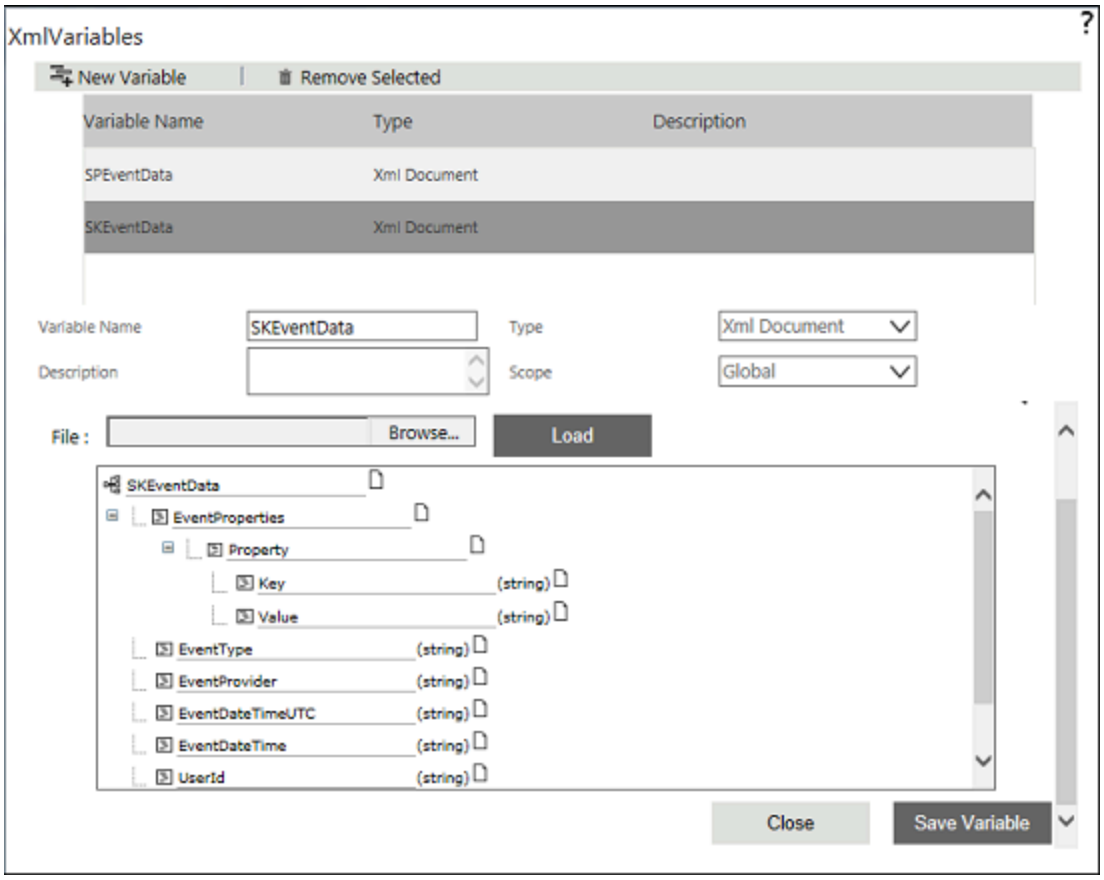
- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price
- Item Total
- Total Purchase amount

From the workflow, you have to add a grid item to a particular order say Reference No. 456789 in the Purchase Orders list.

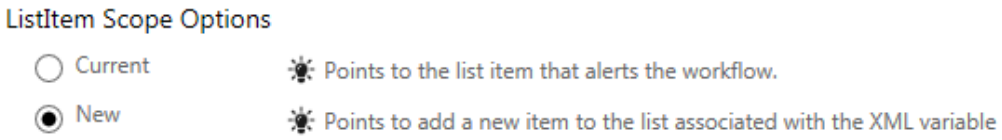
To add a new grid item to the existing list item

1. Login to the **Enterprise Console** and go to **Workflow Designer**. You need to create an XML List type XML variable for the Purchase Orders list. If the variable is not created, follow the below mentioned procedure to create it.
2. Click the edit icon in the **XMLVariables** property from the Start Activity Properties. The following screen is displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



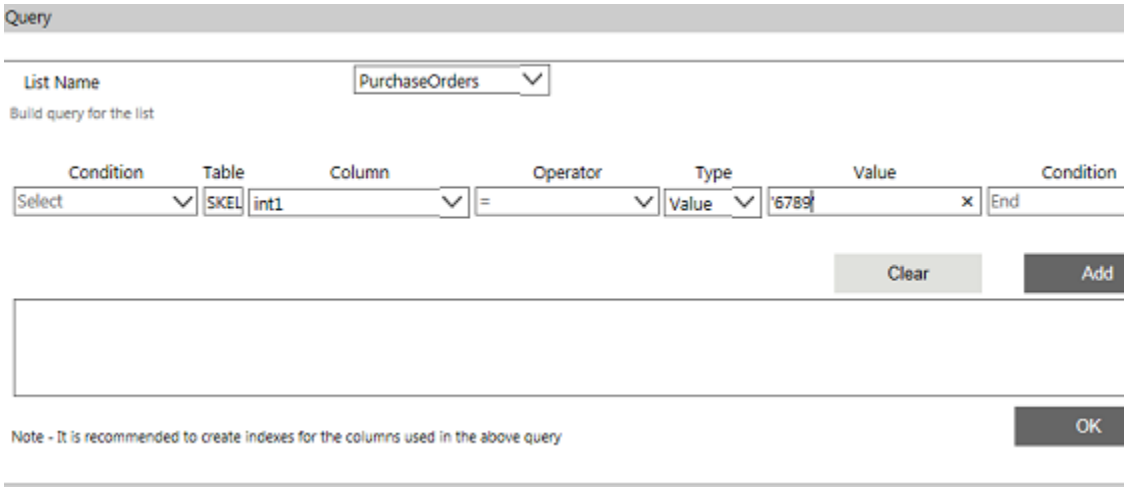
3. Click **New Variable** to add a new variable.
4. Enter the variable name as purchaseorders.
5. Select **XML List** from the **Type** drop-down list.
6. Enter the List name or click the icon to select the list. In this case, select **Purchase Orders** list.
7. Select **New** as the scope from the **ListItem Scope Options** to point to a new item in the **Purchase Orders** list.



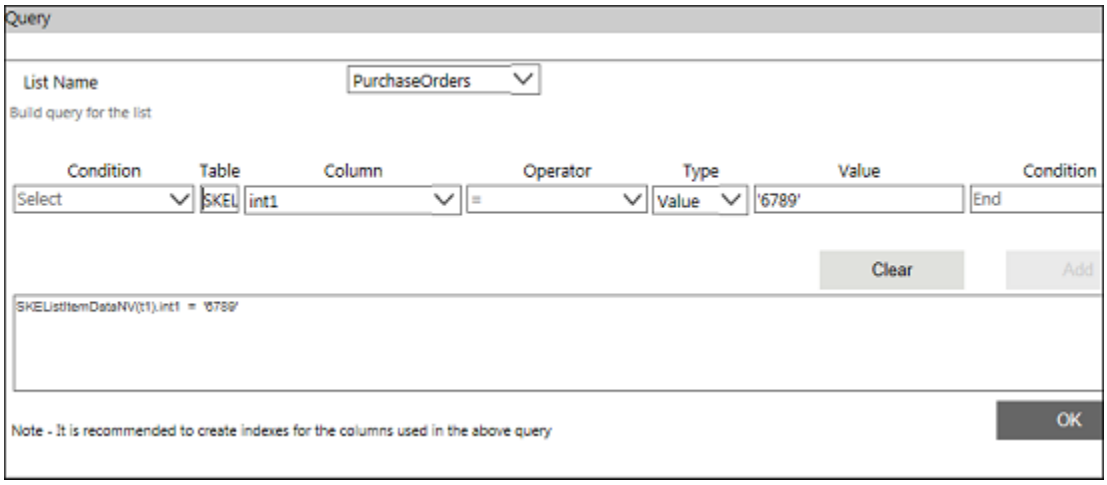
8. Now you can see the XML nodes in a tree-view that are mapped to the controls while creating the list. You can also notice that the parent XML nodes and child XML nodes (PurchaseOrderDetails grid) are also displayed.
9. Click **Save Variable**. A message is displayed saying '**Variable Updated**'. Close the window.
10. Drag and drop List Navigator activity and select **List Query** as the scope.
11. Click edit icon in the **List Query** property. The following screen is displayed.
12. Click the icon to build the query for the list **Purchase Orders**. The following screen is displayed.
13. Select **Purchase Orders** from the List Name drop-down list.
14. Click **Table** field to select the table.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

15. Select SKEListItemDataNV displayed on the top of the tree-view, since you are building a query for an item in the parent table. This will be displayed automatically in the text box.
16. Click the **Column** drop-down list.
17. Select int1 from the options as it is mapped to the Reference No field.
18. Select the operator '**=**' from the Operator drop-down list.
19. Select **Value** from the Type drop-down list.
20. Type '456789' in the text box.
21. Select **End** from the **Condition** drop-down list to end the query.

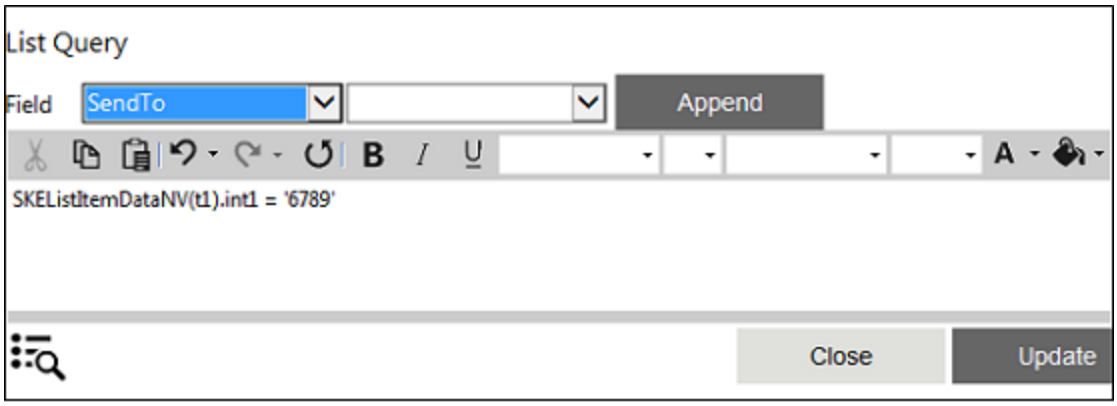


22. Click **Add** to add the condition in the text field.



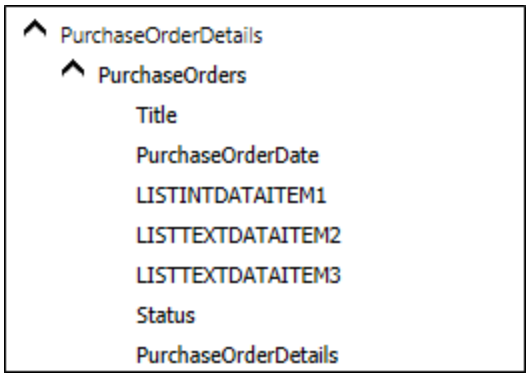
23. Here, SKEListItemDataNV is the table name where the list has been stored and t1 this the internal name that has been used for the main table. If there is any child table also, it will display as t2. Int1 this the field name to which you want to point your XML variable and 6789 is the value for that field.
24. Click **OK**, and then click **Close**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



25. Click **Update**.
26. If you want to add an item to the grid (in this case, if you want to add a Qualification grid item), use **XML Navigator** activity. XML Navigator can be used to point to an item in the grid (PurchaseOrderDetails in this case). For this purpose you need to create an XML Iterator type XML Variable. This can be created from the Start activity XML variable property.
27. On the XML Variable screen, click **New Variable**.
28. Type the variable name as `purchaseorderdetails`.
29. Select XML Iterator from the **Type** drop-down list.
30. Select purchaseorders from the XML **Variable** drop-down list. Select the repeating node (Qualification) from the **Node Select** drop-down list.
31. Click **Save Variable**. A message is displayed saying '*Variable Updated*'. Close the window.
32. Drag and drop XML Navigator activity.
33. Select purchaseorderdetails from XML Iterator drop-down list. Select Yes from Create New Node properties to create a new node.
34. Select the appropriate Location. The options available are:
    - **First:** Navigates to the first record in the collection.
    - **Last:** Navigates to the last record in the collection.
    - **Next:** Navigates to the next record based on the current location.
    - **Previous:** Navigates to the previous record based on current location.
    - **Index:** Navigates to the record identified in the Index field.
35. Since we have to append the items in **Purchase Order Details** grid, select the option as **Last**.
36. Click **Save**.
37. Drag and drop the **Update Variable** activity to enter the grid field values.
38. Click the edit icon in the **Set Variables** property.
39. Click **Select** link and choose the respective field of the XML Iterator type XML Variable created for the list (in this case purchaseorderdetails), that is grid items. The fields displayed in the tree-view represent the XML nodes of the controls in the **PurchaseOrderDetails** grid.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



40. Select a field for which you want to set the value from the tree-view. Enter the value for the field in the right-hand side text box. If you want to set the value, select 'enter a value' from the tree-view and then enter the value. Also, you can select variables or contents or any XML variables nodes directly by selecting the respective node from the tree-view. If you want to combine multiple node values, you can build an expression by selecting Build Expression.
41. After setting the value for all the fields in the child item, click **OK**. Now, a grid item will be added to the list while executing the workflow.

Note: If you want to add multiple items, use XML Navigator and Update Variable for Iterator within the For-Next Loop activities.

Copy List Item with Grid Items

AVEVA Work Tasks allows you to copy a list item with grid items to another list provide both the lists have the same schema. You can perform this task with the help of Update Variable activity. To iterate through the grid items, you need to create XML Iterator type XML variable for the grid. This feature can be explained with the help of a scenario.

"Telematics" is an organization which maintains a Purchase Orders list to keep a track of all the purchase orders raised by the company.

The purchase Orders contains details like:

- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price
  - Item Total
- Total Purchase amount

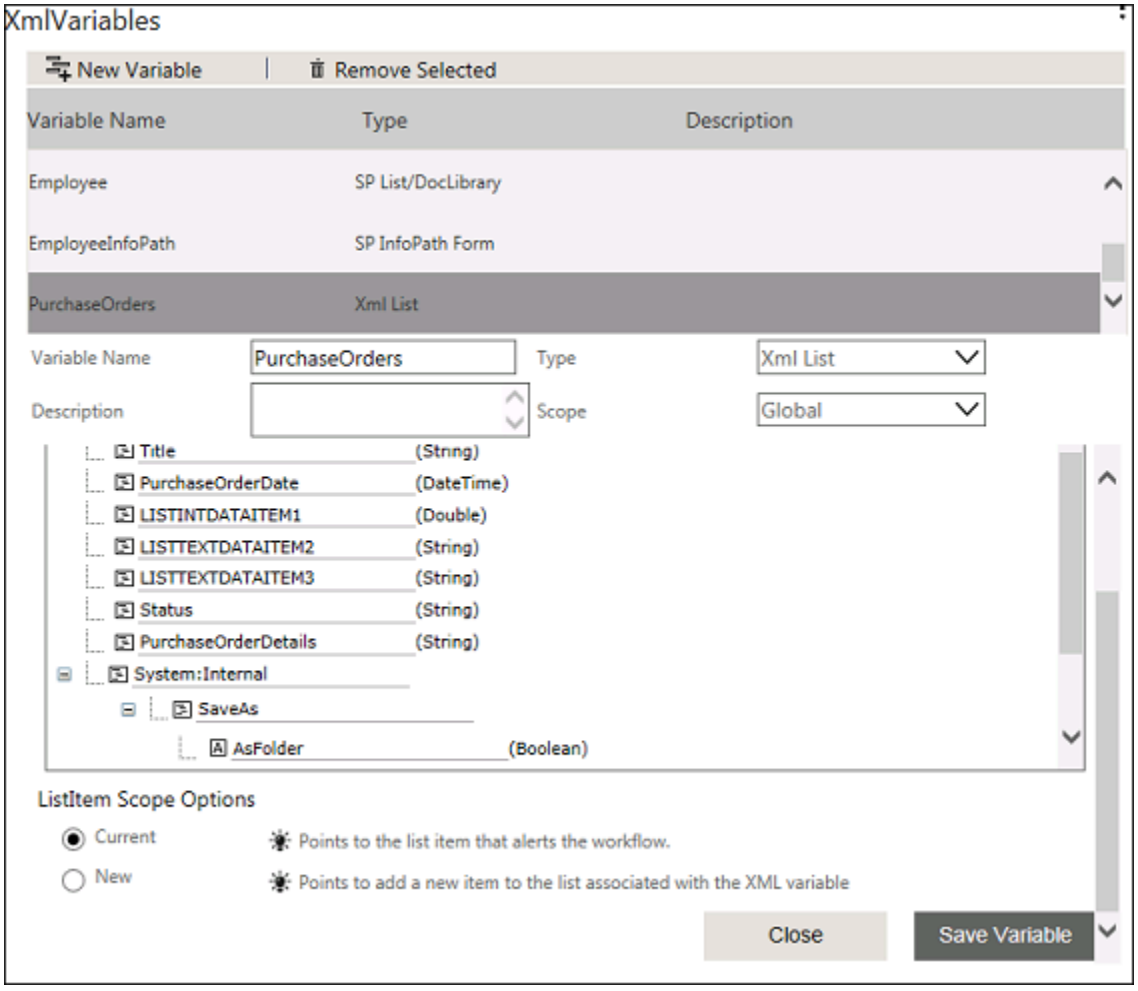
Telematics also maintains another list called Approved Purchase Order which has the same schema of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Purchase Order list. Now you want to copy an item with grid (Purchase Order approved) to the Approved Purchase Order list when the item is approved.

To copy a list item with grid items

1. Login to the Enterprise Console and go to Workflow Designer.
2. You need to create an XML List type XML variable for the Purchase Order list. If the variable is not created, follow the below mentioned procedure to create.
3. Click the edit icon in the XMLVariables property from the Start Activity Properties.
4. Here, for Purchase Order list you need to create an XML List type XML variable to work with the current purchase order item and XML Iterator type XML variable to loop through the child/grid nodes of the current purchase order item.
5. Click New Variable to add a new variable.
6. Type the variable name as 'purchaseorders'.
7. Select type as XML List from the Type drop-down list.
8. Type the List name in the Select List field or click the icon to select the list. In this case, select Purchase Orders list.
9. Select Current as the scope from the ListItem Scope to point to the an item in the list.

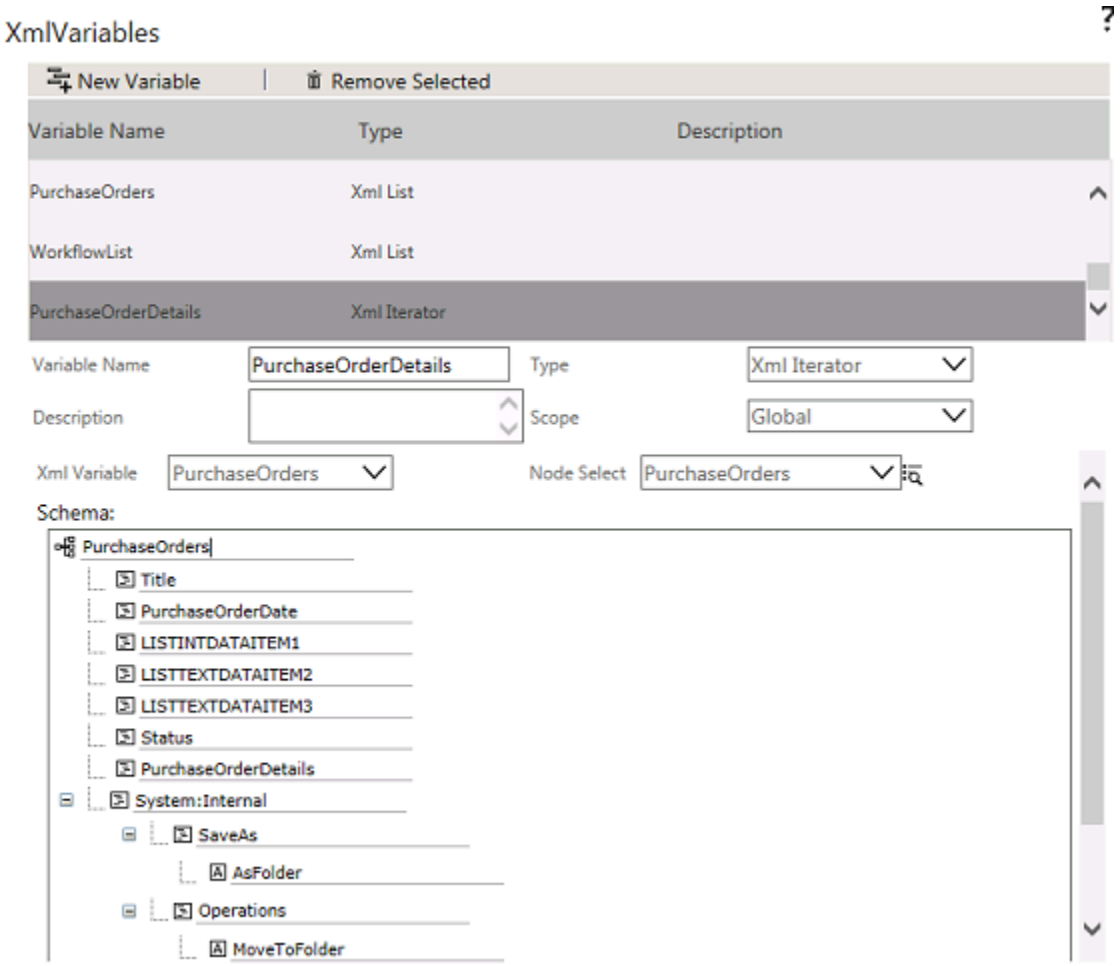


10. Now you can see the XML nodes in a tree-view that are mapped to the controls while creating the list. You

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

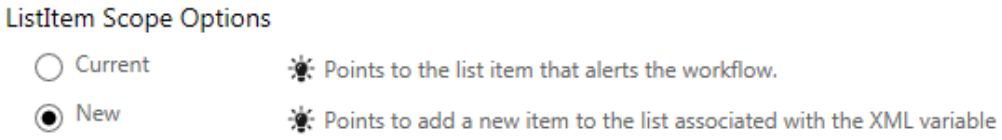
can notice that the parent XML nodes and child XML nodes (PurchaseOrderDetails grid) are also displayed.

11. Click Save Variable. A message is displayed saying 'Variable Updated'.
12. Now, you need to create XML Iterator type XML variable to iterate through the child nodes (in this case, PurchaseOrderDetails). For that, click New Variable from the XML Variable screen.
13. Enter the variable name as purchaseorderdetails.
14. Select XML Iterator as type from the Type drop-down list.
15. Select purchaseorders from the XML Variable drop-down list.
16. From the Node Select drop-down, select the repeating node, that is PurchaseOrderDetails.

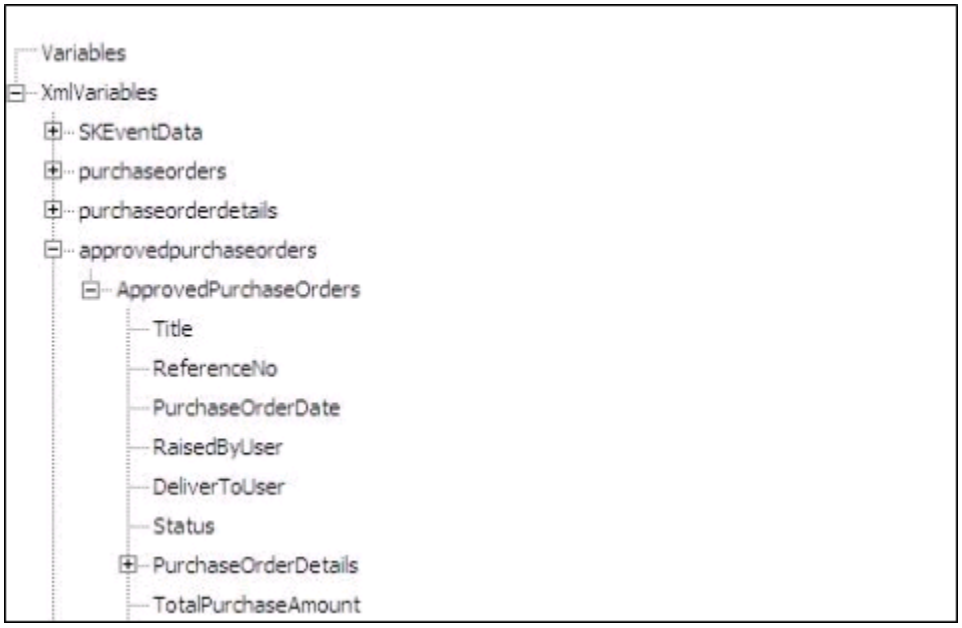


17. Click Save Variable. A message is displayed saying 'Variable Updated'.
18. In the same way you have to create XML variables for Approved Purchase Order list. For Approved Purchase Order list, you need to create XMLList type XML variable to add an item and a XML Iterator type XML variable to map to the grid items of the new purchase order item.
19. Click New Variable to add a new variable, from the XML Variable property of Start activity.
20. Enter the variable name as approvedpurchaseorders in the Variable Name field.
21. Select XML List as type from the Type drop-down list.
22. Enter the List name in the Select List field or click the icon to select the list. In this case, select Approved Purchase Orders list.
23. Select New as scope from the ListItem Scope Options to point to the new item in the list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



24. Now you can see the XML nodes in a tree-view that are mapped to the controls while creating the list. You can also notice that the parent XML nodes and child XML nodes (PurchaseOrderDetails grid) are also displayed.
25. Click Save Variable. A message is displayed saying 'Variable Updated'.
26. You need to create XML Iterator type XML variable to iterate through the child nodes. For that, click New Variable from the XML Variable screen.
27. Enter the variable name as approvedpurchaseorderdetails.
28. Select XML Iterator as type from the Type drop-down list.
29. Select approvedpurchaseorders from the XML Variable drop-down list.
30. From the Node Select drop-down, select the repeating node, that is PurchaseOrderDetails.
31. Click Save Variable. A message is displayed saying 'Variable Updated'.
32. Drag and drop Update Variable activity to set value for the parent nodes or the item.
33. Click the edit icon in the Set Variables property.
34. Click the Select link and select the respective field of the XML List type XML Variable created for the list (in this case approvedpurchaseorders). The fields displayed in the tree-view represent the XML nodes of the controls in the list.



35. Select a field for which you want set the value from the tree-view under approvedpurchaseorders. The selected variable for the field Title will be displayed in the text box as 'XMLVariables.approvedpurchaseorders.ApprovedPurchaseOrders.Title.'
36. Enter the value for the field in the right-hand side text box. Select the respective field of the purchaseorders XML variable (purchase order item to be copied). The selected XML variable for the field will be displayed as 'XMLVariables.purchaseorders.PurchaseOrders.Title'. Set the value for all other fields in the same way.
37. After setting the value for all the fields in the parent form (controls in the main form) that you want to add,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

click Ok. This will add a list item to the new list (Approved Purchase Order), while executing the workflow, with the values in the current Purchase Orders item.

38. Next, you need to iterate through the grid/child items of the current purchase order and to add the child items in the new list (Approved Purchase Order). Drag and drop ForEach-Loop activity to loop through the grid items.
39. Select XML Iterator type XML variable that you have created for the current Purchase Order from the XML Iterator drop-down list (in this case, purchaseorderdetails).
40. If you want to add an item to the grid (in this case, if you want to add a purchase order details grid item), use XML Navigator activity. XML Navigator can be used to point to an item in the grid (purchaseorderdetails in this case).
41. Drag and drop XML Navigator activity.
42. Select approvedpurchaseorderdetails from XML Iterator drop-down list and select Yes from Create New Node properties to create a new node.
43. Select the appropriate Location. The available options are:
    - First: Navigates to the first record in the collection.
    - Last: Navigates to the last record in the collection.
    - Next: Navigates to the next record based on the current location.
    - Previous: Navigates to the previous record based on current location.
    - Index: Navigates to the record identified in the Index field.

    Since we have to append the items in Purchase Order Details grid, select the option as Last.
44. Click **Save**.
45. Drag and drop **Update Variable** activity to set the value for the grid item fields of the new list item.
46. Click the edit icon in the **Set Variables** property.
47. Click the Select link and select the respective field of the XML List type XML Variable created for the list (in this case ApprovedOrderDetails). The fields displayed in the tree-view represent the XML nodes of the controls in the list.
48. Select the XML variable PurchaseOrderDetails from the tree-view. You can either select PurchaseOrderDetails node or select all child nodes separately. In this case, you are selecting the PurchaseOrderDetails node. The variable will be displayed in the text box as 'XMLVariables.approvedpurchaseorderdetails.PurchaseOrderDetails'.
49. Set the value in the right-hand side text box. Select the respective field of the purchaseorderdetails XML variable (purchase order item to be copied) from the tree-view. The selected variable will be displayed in the text box as 'XMLVariables.purchaseorderdetails.PurchaseOrderDetails'.
50. After setting the value for the fields in the child item that you want to add, click OK. This will add a grid item to the new list (Approved Purchase Order), while executing the workflow, with the values in the current (Purchase Order) list.

    Note: You can also select each node in the grid separately and set the value for each node.
51. Complete the loop with a Next activity and finish the workflow with appropriate link conditions.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Iterate through the List Item and Grid Item of the List

AVEVA Work Tasks allows you to loop through the list items and grid items of a list. A XML List Iterator type XML variable can be used to iterate through the list items, where XML Iterator type XML variable can be used to iterate through the grid items of a list. This feature can be explained with the help of a Purchase Order list scenario.

The Purchase Orders contains details like:

- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price
  - Item Total
- Total Purchase amount

Now you want to loop through the approved purchase order items (items with status as Approved) as well as its child items.

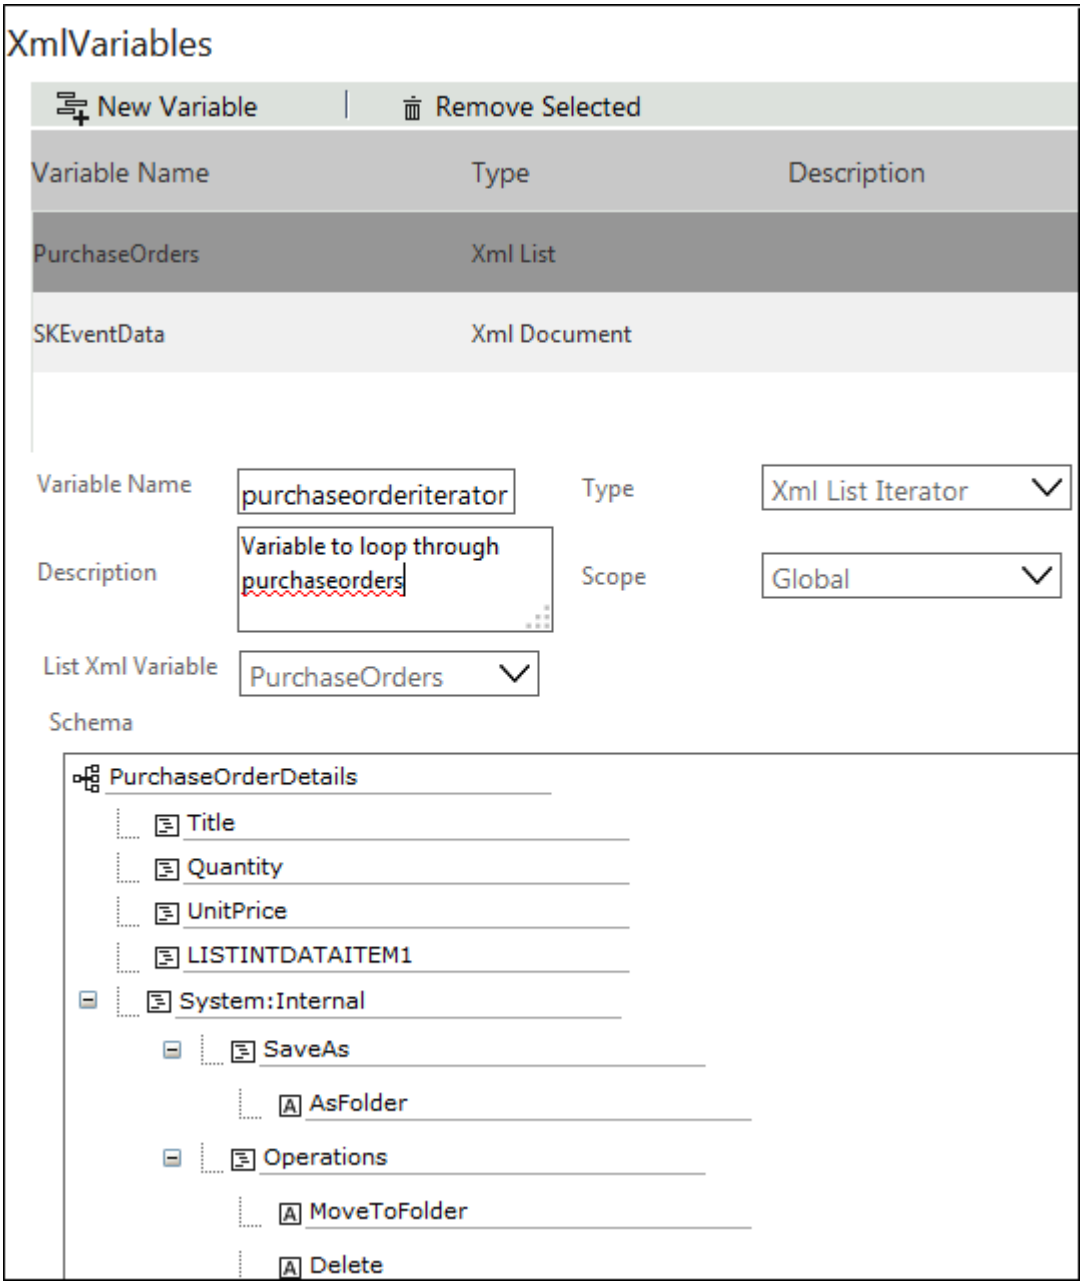
To iterate through the list item and grid item of the list

1. Log on to the **Enterprise Console** and go to **Workflow Designer**.

   Note: As a first step, you need to create an XML List type XML variable for the Purchase Orders list. If the variable is not created, follow the below mentioned procedure to create.
2. Click the edit icon in the **XMLVariables** property from the **Start** Activity Properties.
3. Click **New Variable** to add a new variable.
4. Enter the variable name as **purchaseorders**.
5. Select **XML List** from the Type drop-down list.
6. Enter the List name or click the icon to select the list. In this case, select Purchase Orders list.
7. Select the scope from the **ListItem Scope Options**. Later, you can change the scope of the variable to List Query to query the approved purchase orders using List Navigator activity.
8. Click **Save Variable**. A message is displayed saying 'Variable Updated'.
9. Now, you need to create XML List Iterator type XML variable to iterate through the approved purchase order items. Click **New Variable** from the XMLVariable screen.
10. Type the variable name as **purchaseorderiterator**.
11. Select **XML List Iterator** from the **Type** drop-down list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

12. Select **purchaseorders** from the **List XML Variable** drop-down list.



13. Click **Save Variable**. A message is displayed saying 'Variable Updated'.
14. You need to create XML Iterator type XML variable for the purchaseorderIterator (XML List Iterator type) XML variable to iterate through the child nodes of the currently iterating purchase order item. Click New Variable from the XML Variable screen.
15. Type the variable name as **purchaseorderdetails**.
16. Select **XML Iterator** from the **Type** drop-down list.
17. Select **purchaseorderiterator** from the **XML Variable** drop-down list.
18. From the **Node Select** drop-down List, select the repeating node that is, PurchaseOrderDetails.
19. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Use **List Navigator** activity to query the approved purchase order items.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

20. In this case, the following query is used to retrieve the approved purchase orders.

    SKEListItemDataNV(t1).nvarchar3 = 'Approved', where **SKEListItemDataNV** is the table used to store the list items and **nvarchar3** is the table column mapped to the Status field.

    Use ForEach-Loop and Next Loop activities to loop through the approved purchase order items.
21. Select **purchaseordersiterator** from the **XML Iterator** drop-down list of ForEach Loop activity.
22. Use any action as per the requirement to retrieve the data. You need to access the value of the parent nodes from the purchaseordersiterator XML variable.

    Use another set of ForEach-Loop and Next activities within the existing loop to iterate through the grid items (PurchaseOrderDetails).
23. Select purchaseordedetails from the XML Iterator drop-down list of ForEach Loop activity.
24. Use any action as per the requirement to retrieve the data. You need to access the value of the parent nodes from the purchaseorderdetails XML variable.

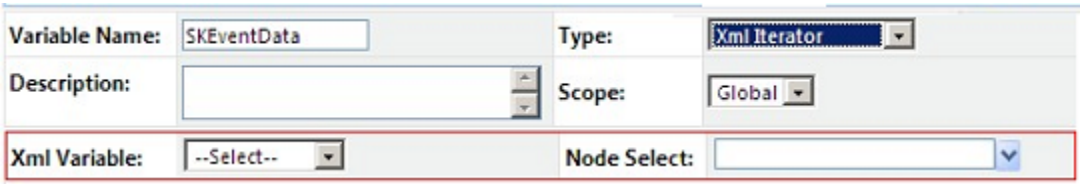
XML Variable of Type XML Iterator

XML Iterator Variables allows you to define variables for repeating XML elements and attributes. This variable type represents a collection of XML nodes at any level in the XML Variable schema. It allows you to perform actions on XML nodes such as looping through XML nodes and deriving the value of a specific node at any location.

Note: The XML Iterator type option is available only if another variable of XML Document type exists.

XML Variable of type 'XML Iterator'

When the variable type is changed to **XML Iterator**, following extra properties are displayed as seen in the image below.



Property Description

'XML Iterator' XML Variable Property	Description
XML Variable	All variables of type XML Document and XML Iterator are listed for selection. Select the parent XML Variable. The parent variable of an XML Iterator variable can be another XML Iterator Variable.
Node Select	Only nodes in the parent variable are displayed in this drop-down. Select the node that the variable represents.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

See Create XML Variable of Type XML Iterator for more information.

Create XML Variable of Type XML Iterator

To create XML Variable of type XML Iterator Variable:

- Click **New Variable** button in the XML Variable Interface.
- Enter the following information:

  Variable Name - Enter the name of the variable.

  Description - Enter a description for the variable.

  Type - This field defaults to XML Document. Select XML Iterator from the drop-down. The XML Iterator type option is available only if another variable of XML Document type exists.

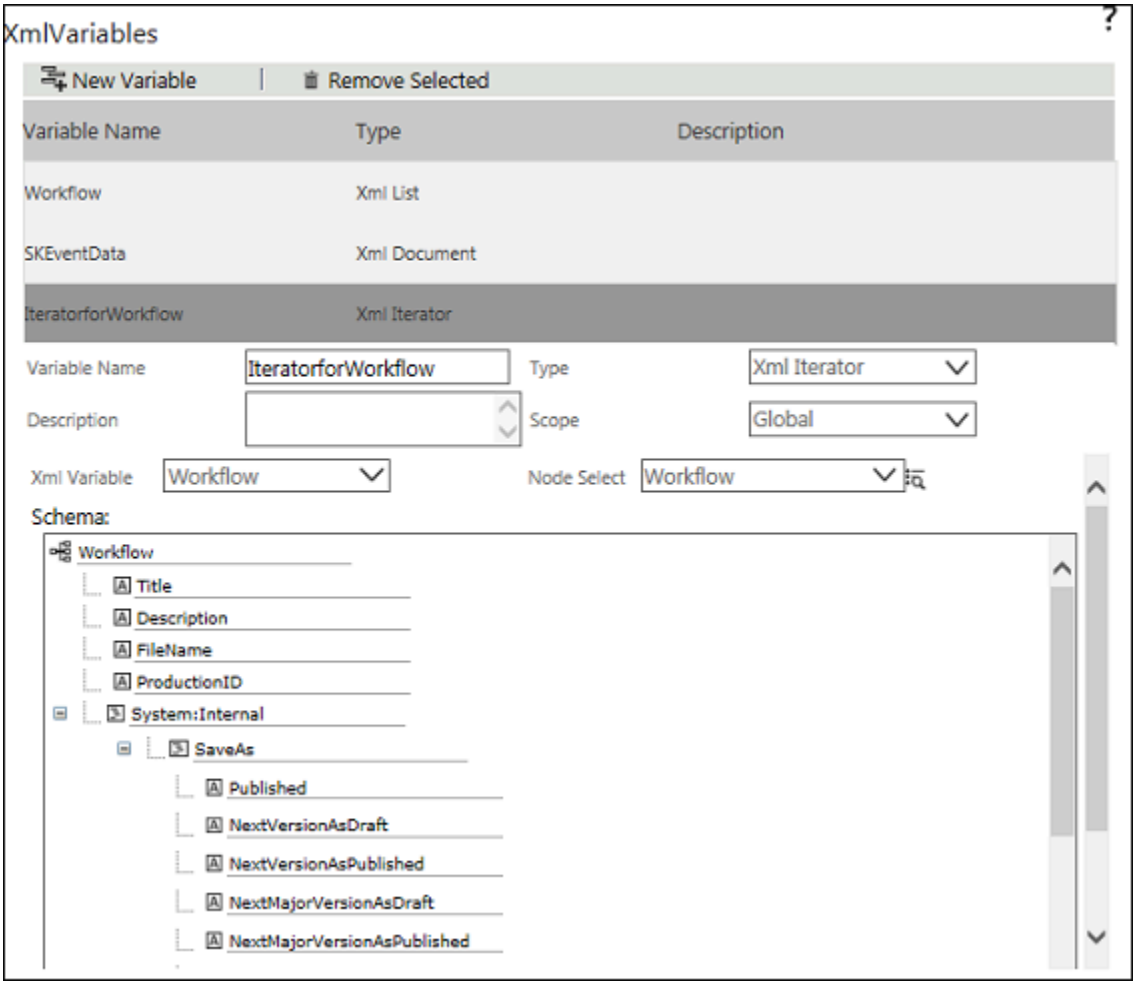
  Scope - Select the scope of the variable. The scope of the variable can be either Global or Local.
- When the variable type is changed to **XML Iterator**, two additional properties are displayed as seen in the image below.

  XML Variable - Select the parent XML Variable. All variables of type XML Document and XML Iterator are listed for selection. The parent variable of an XML Iterator variable can be another XML Iterator Variable.

  Select Node - Select the node that the variable represents. Only the nodes in the parent variable are displayed.
- Click **Save Variable**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

XML Iterator Variable Properties



Use Variables of Type XML Iterator

XML Iterator Variables can be used in any of the following ways:

- **Building conditions for setting Activity Properties** - XML Iterator Variables can be used like an XML Variable to build conditions for setting Activity Properties. However, when you select the XML Variable of XML Iterator type, only the nodes under the selected node of the parent variable are shown.
- **In ForEach Loop activity** - XML Iterator variables can be used in the ForEach Loop activity to loop through an activity till it executes for the entire collection in the XMLIterator variable. Example of XML Iterator Variable in For-Each .
- **Navigate to a specific node in the collection** - XML Iterator variables can be used in the XML Navigator Activity to go to a specific node in the collection and then perform an action. Example of XML Navigator Activity

Example of XML Iterator Variable in ForEach Loop

In this example, the XML Iterator Variable is used to get approval from all managers in the Managers.XML file

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

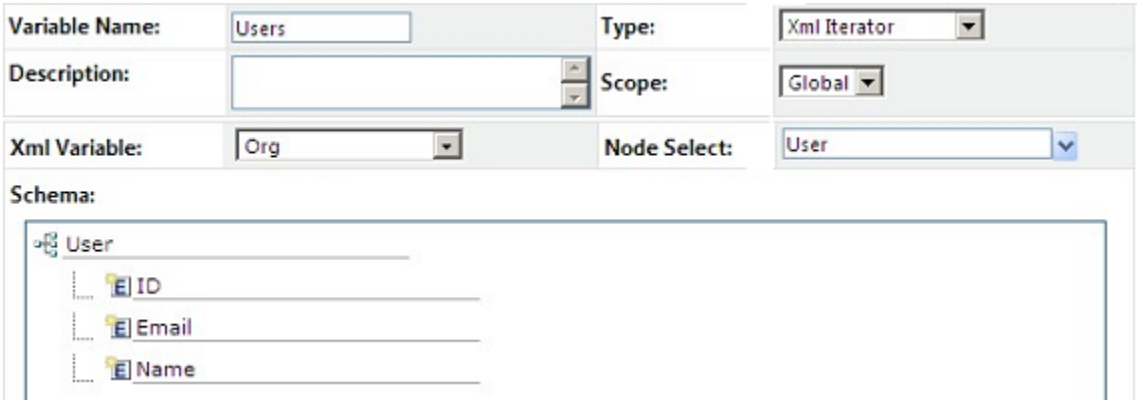
containing the list of all the users who are managers.

Managers.XML file

```
<Managers>
<Users>
<User id=1>
<Name>John</name>
</User>
<User id=2>
<Name>Jim</name>
</User>
<User id=3>
<Name>Victor</name>
</User>
<User id=4>
<Name>Andy</name>
</User>
</Users>
</ Managers >
```

Step 1: XML Iterator Variable is defined for users. The node Users holds the collection of managers.

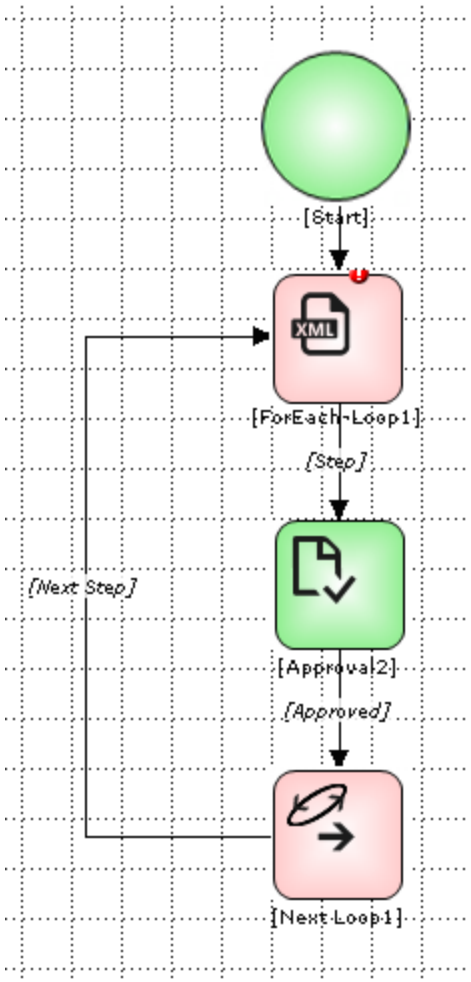
XML Iterator Variable for Managerial Users



Step 2: The approval activity is set within a ForEach Loop activity.

ForEach Loop Activity for Looping Approvals

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

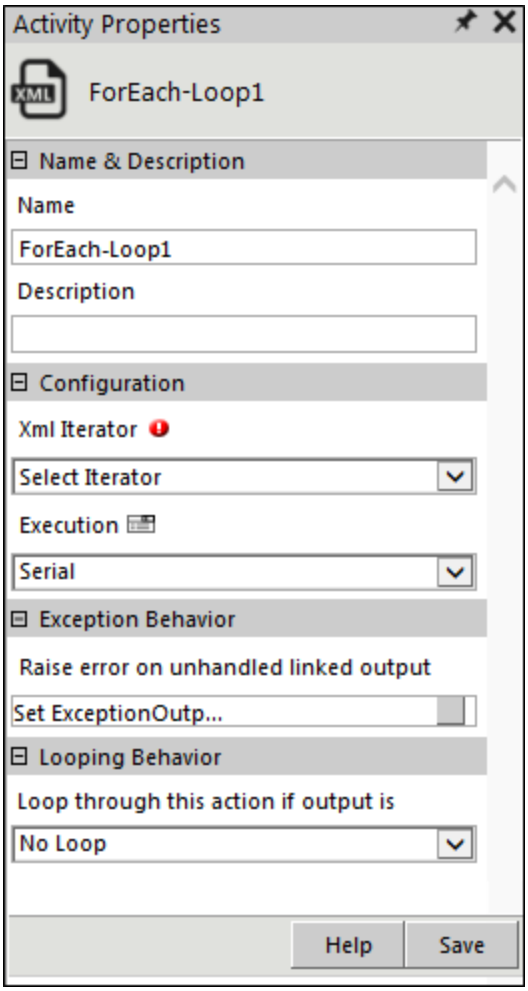


Step 3: The XML Iterator Variable 'Users' is defined in XML Iterator field of ForEach Loop properties. The Execution type is set to Serial as the approval is to be processed serially.

Note: The Execution type is set to Parallel as the approval is to be processed simultaneously by all approvers. When the Execution type is Parallel, the Next Loop activity is not required.

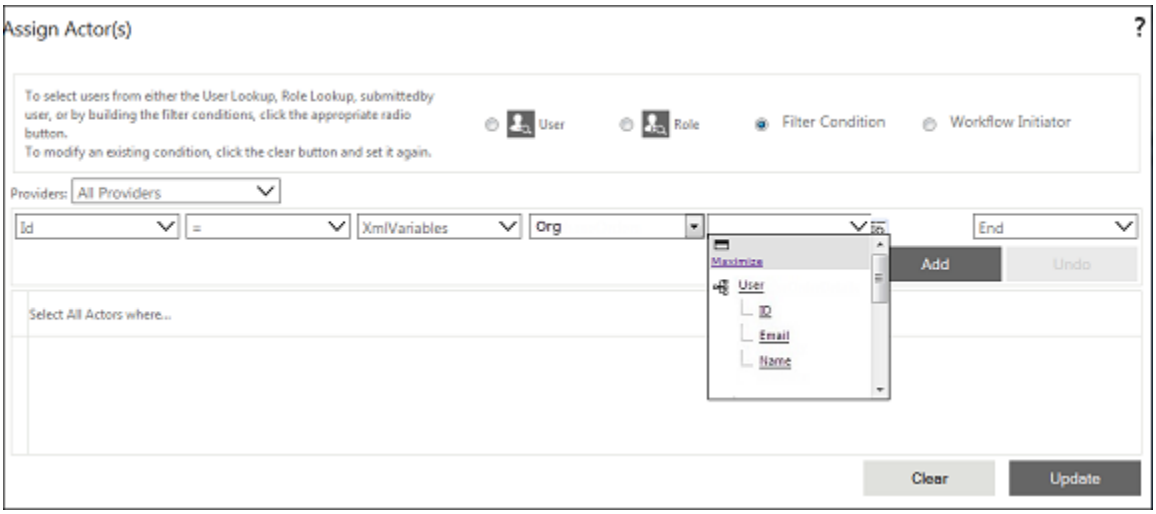
ForEach Loop Property for XML Iterator

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Step 4: The XML Iterator variable is specified in the condition for selecting actors for the approval.

Actor Selection for Approval Activity



Step 5: When the above workflow is invoked, the Workflow Engine resolves "XMLVariables.users.user.ID". It gets the ID of each manager and assigns the task to that manager.

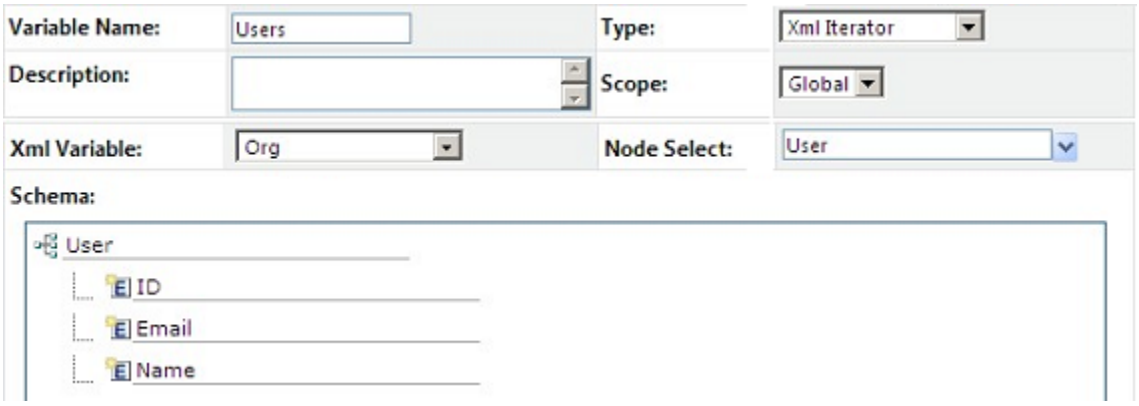
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example of XML Navigator Activity

A company allocates new laptops to employees as and when new inventories are received based on date of requisition. Allotments are to be approved by the manager of the requisitions user. Users with requisitions are added to a waiting list by the Facilities Management System. Allotments are made to the user at the top of the list. When the allotment is complete, the user is removed from the list. If a manager rejects the allotment, the allotment is made to the next person in the waiting list. This example demonstrates how the XML Navigator Activity is used to automate a process.

Step 1: A global XML Iterator variable is defined for the node users.

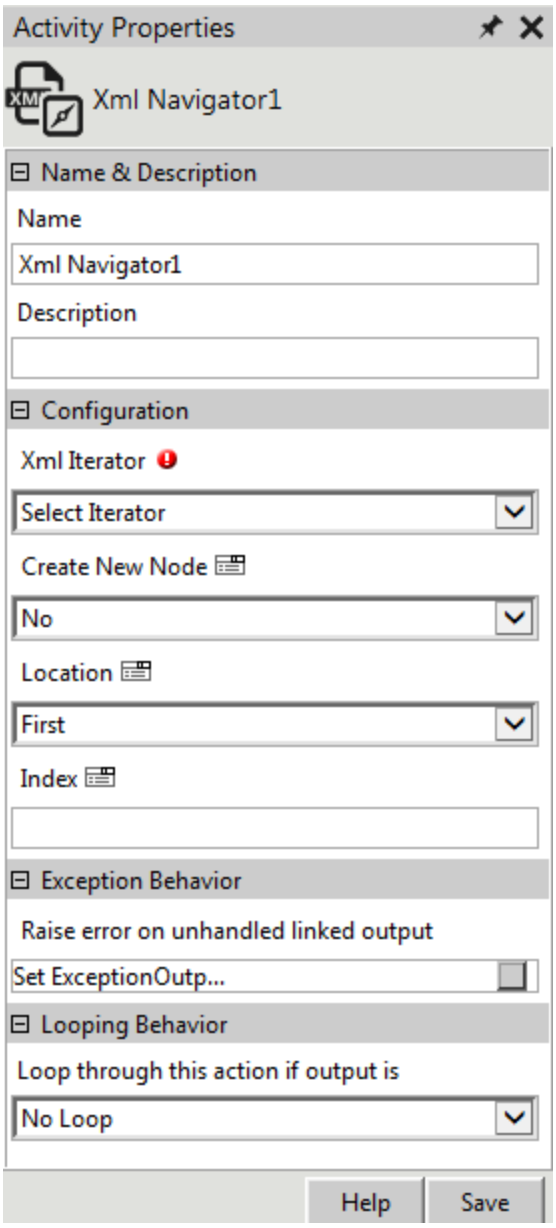
XML Iterator Variable for Users



Step 2: The XML Navigator activity is added to the workflow with **Location** set to First.

XML Navigator Properties

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

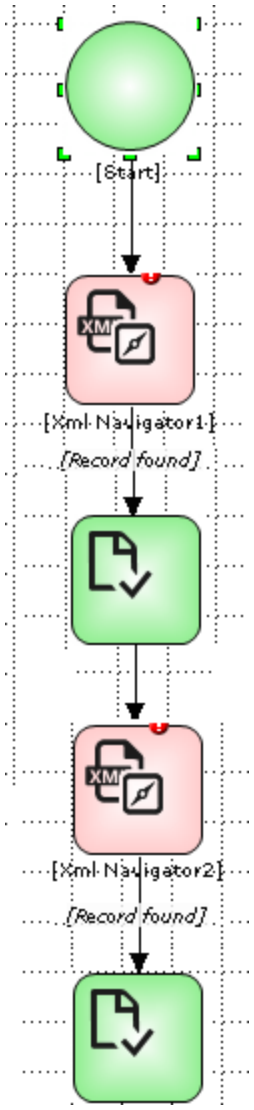


Step 3: An Approval activity is added after the XML Navigator Activity that sends an approval task to the manager of the user at the top of the list. The XMLNavigator links to Approval only if a record is found in the waiting list.

Step 4: The Approval task is linked to another XML Navigator Activity with the property set to **Next**.

Step 5: The following figure depicts the workflow after adding these two properties.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



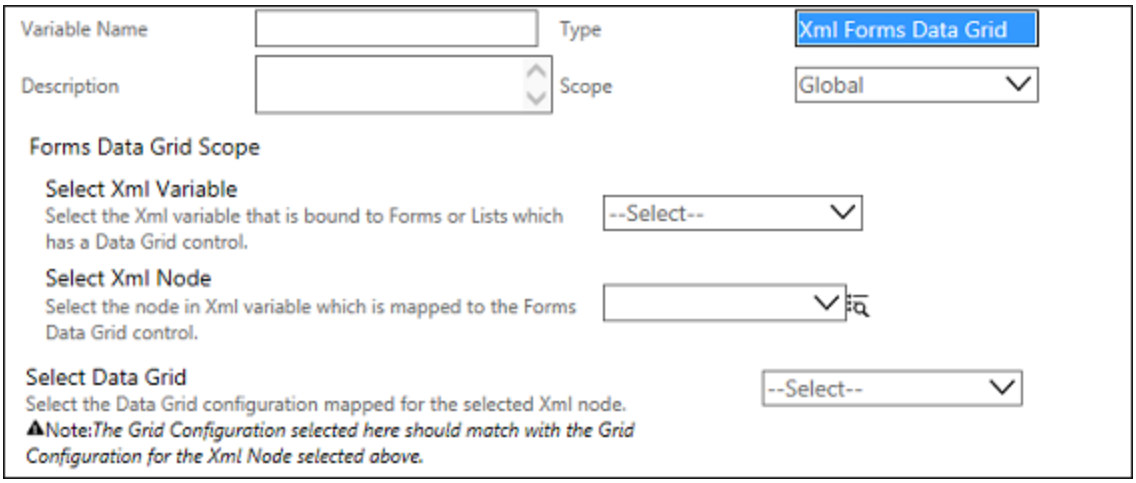
XML Variable of Type XML Forms Data Grid

Xml Forms Data Grid variable is used to read or modify the selected values of a Data Grid control used in AVEVA Work Tasks Forms or Lists.

XML Variable of type 'XML Forms Data Grid'

When the variable type is selected as XML Forms Data Grid, following properties are displayed as seen in the image given below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Property Description:

'XML Forms Data Grid' XML Variable Property	Description
Select Xml Variable	Xml variables of type Xml Document and Xml list are listed here. Select the parent Xml Variable that is mapped to Forms or Lists which have a Data Grid control.
Select Xml Node	Only nodes of the parent variable selected above are displayed here. Select the Xml Node which is mapped to the Forms Data Grid control.
Select Data Grid	Lists the Grid Configurations created. Select the Data Grid Configuration mapped for the selected Xml node. The Grid Configuration selected here should match with the Grid Configuration for the Xml node selected above.

See Creating XML Variable of Type 'XML Forms Data Grid' for more information.

Create XML Variable of Type XML Forms Data Grid

To create XML Variable of type XML Forms Data Grid:

1. Click **New Variable** button in the XML Variable Interface.
2. Enter the following information:

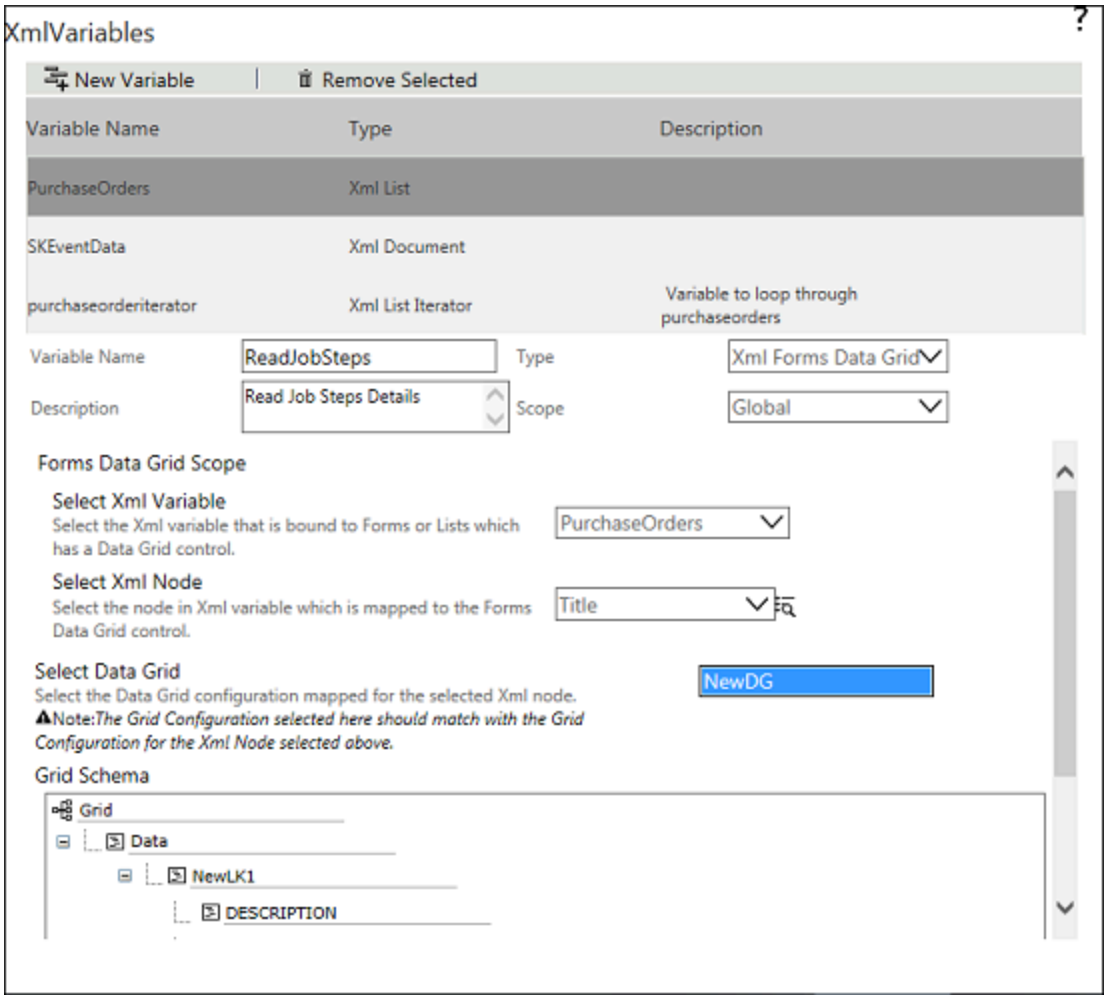
   Variable Name: Enter the name of the variable.

   Description: Enter a description for the variable.

   Type: This field defaults to XML Document. Select XML Forms Data Grid from the drop-down.

   Scope: Select the scope of the variable. The scope of the variable can be either Global or Local.
3. When the variable type is changed to XML Forms Data Grid, following additional properties are displayed as seen in the following image.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



a. **Select Xml Variable** - Xml variables of type Xml Document and Xml list are listed here. Select the parent Xml Variable that is mapped to Forms or Lists which have a Data Grid control.

b. **Select Xml Node** - Only nodes of the parent variable selected above are displayed here. Select the Xml Node which is mapped to the Forms Data Grid control.

c. **Select Data Grid** - Lists the Grid Configurations created. Select the Data Grid Configuration mapped for the selected Xml node. The Grid Configuration selected here should match with the Grid Configuration for the Xml node selected above.

4. Click **Save Variable**.

Use XML Variable of Type XML Forms Data Grid

The XML Forms Data Grid variable usage can be demonstrated using the following two scenarios:

1. Create "Xml Forms Data Grid" type Xml Variable and use it in a workflow to iterate through row selections done in the Data Grid.
2. Use "Xml Forms Data Grid" type Xml Variable to change/add row selections in a Data Grid control using Workflow.

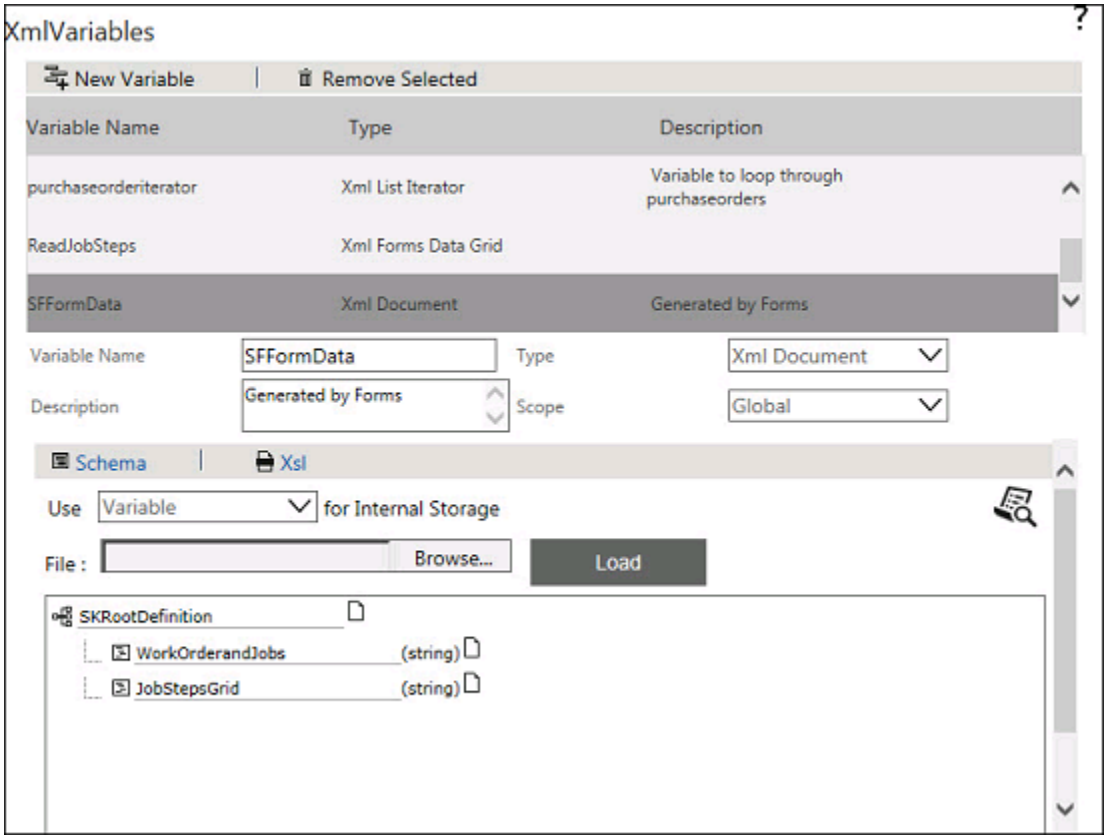
Let us consider a typical **Work Order – Job** manufacturing process scenario. In a manufacturing process, a **work order** is a collection of jobs that produce an item. A **job** is a list of **steps** or procedures that is executed to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

produce an item or a version of an item. The list of steps can be grouped together into **Step Groups**. Multiple jobs can be performed to produce a single item.

Prerequisites

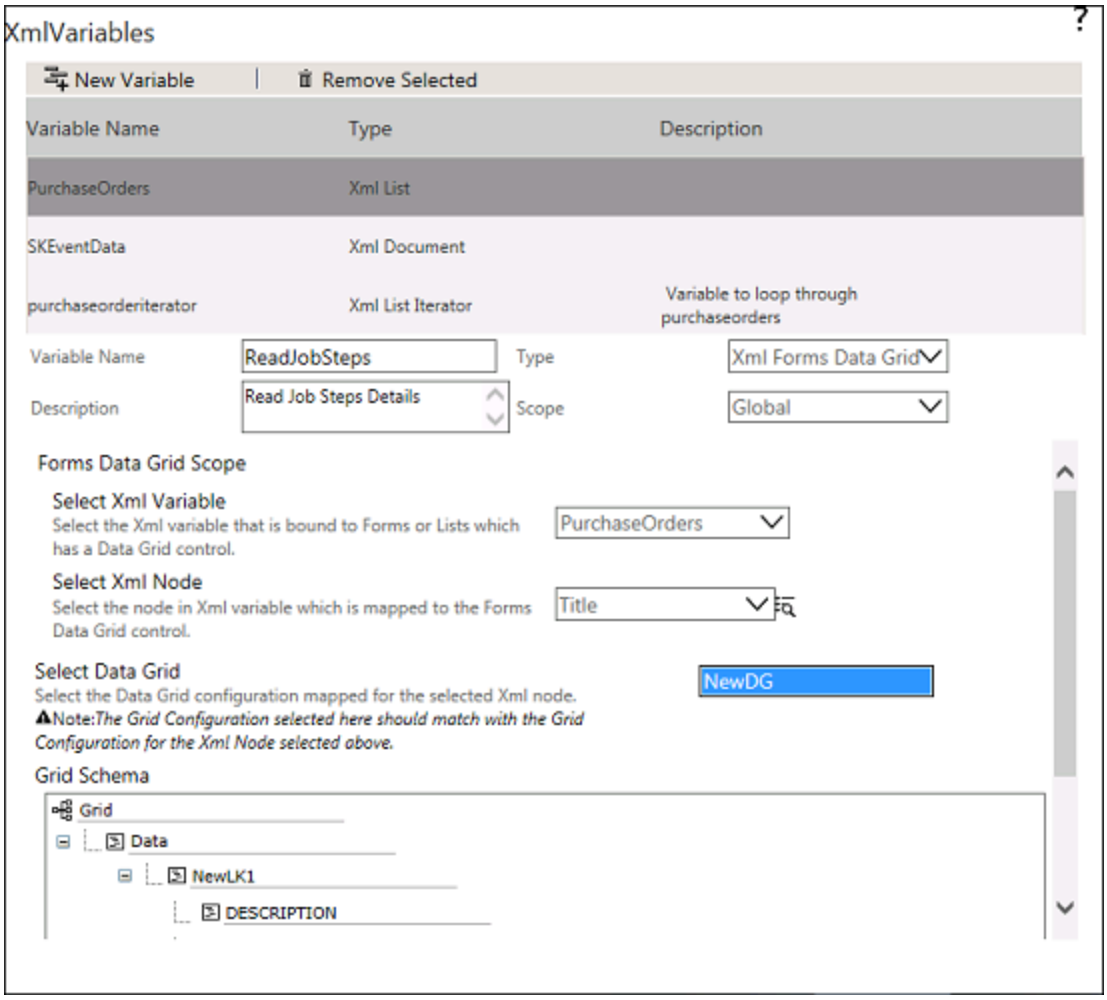
1. AVEVA Work Tasks Form with two Data Grids. One Data Grid will be showing the Work Order and Jobs details and the other would show the Job Step details. When the user selects a Job in the Work Order and Jobs grid, the Job Steps grid will be populated with the relevant Job Steps.
   The grid selection information is stored in the XML nodes mapped to the Grid Control. To extract the required values and use it within workflows, we need to create XML variables of type XML Forms Data Grid.
2. This form is associated to a new Workflow. The XML variable SFFormData will be added to the XML Variable collection. (Form XML variable can also be created without association, i.e. by selecting the corresponding Form from the XML Variable interface).



Scenario 1: Create Xml Forms Data Grid type Xml Variable and use it in a workflow to iterate through selections done in the Data Grid

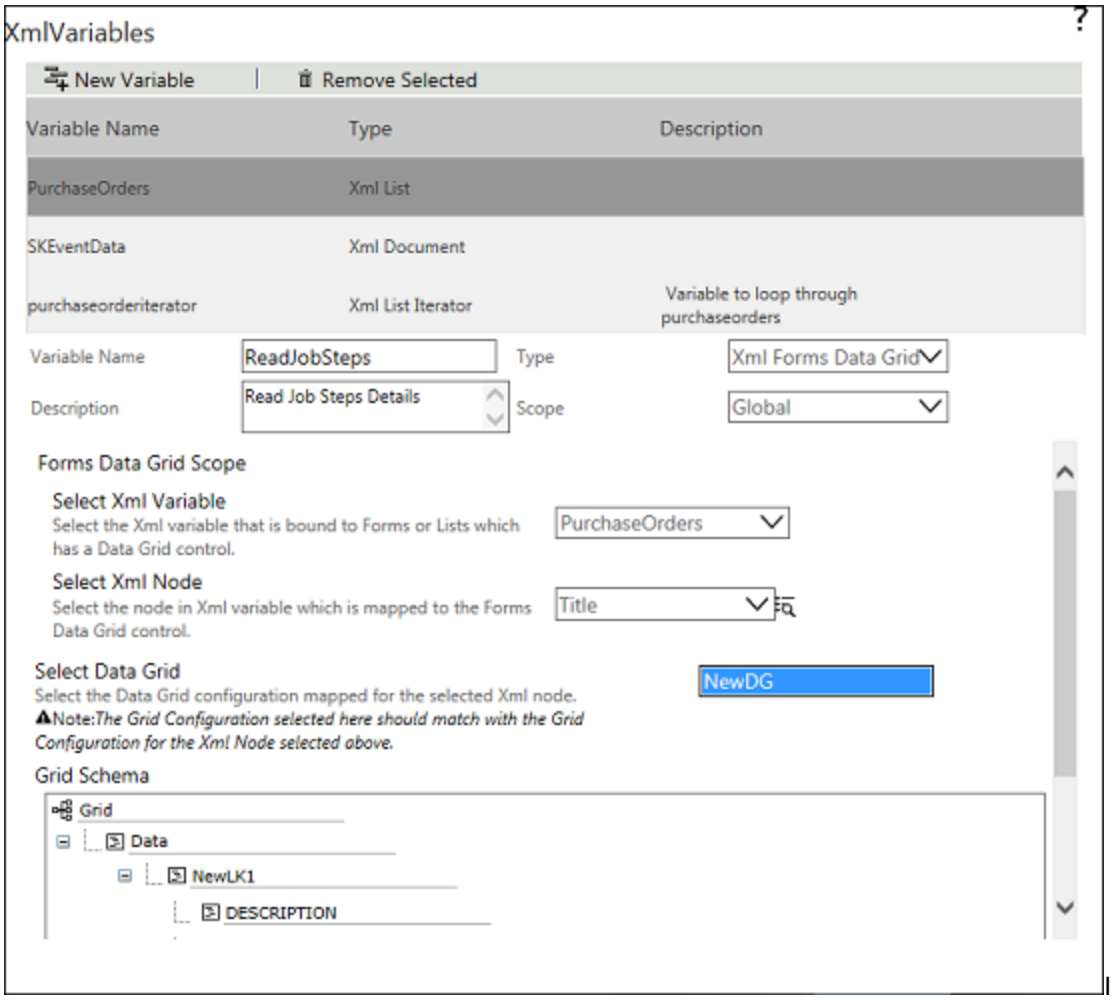
1. Create an XML variable of type XML Forms Data Grid as shown below for Job Steps Grid. Select JobStepsGrid XML Node which is mapped to the Job Steps Grid Configuration. (This will contain the complete selection information of the Data Grid once the form is submitted.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



2. As the selected job can have multiple steps, we need an XML Iterator variable to iterate through the multiple steps selected in the Job Steps Grid. Create an XML Iterator variable 'LoopJobSteps' with repeating node(Node Select) as JobStepLookup.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

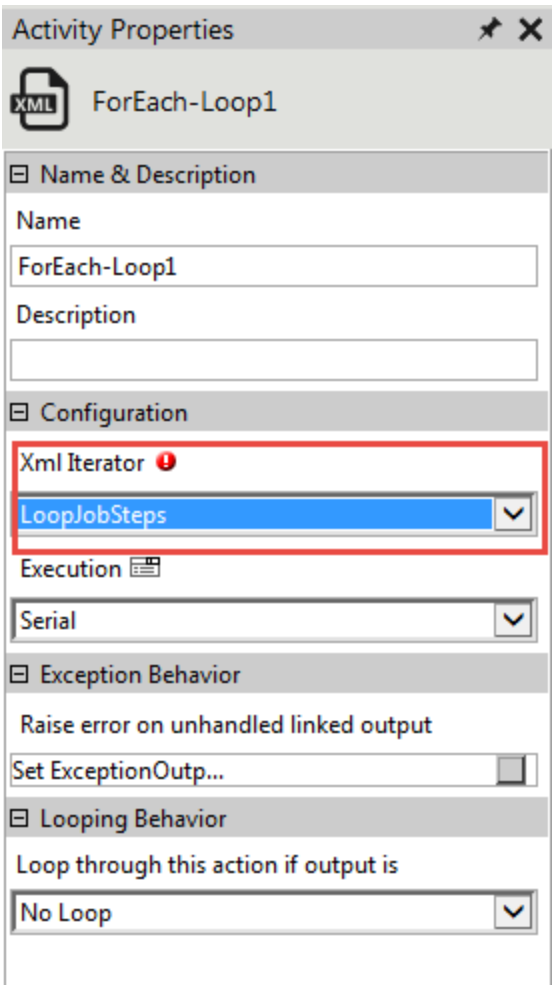


Note: The XML Iterator variable is created to iterate through the multiple selections. To get more information on the selections in the parent hierarchy levels, an XML Iterator needs to be created for the parent node (which is repeating) also.

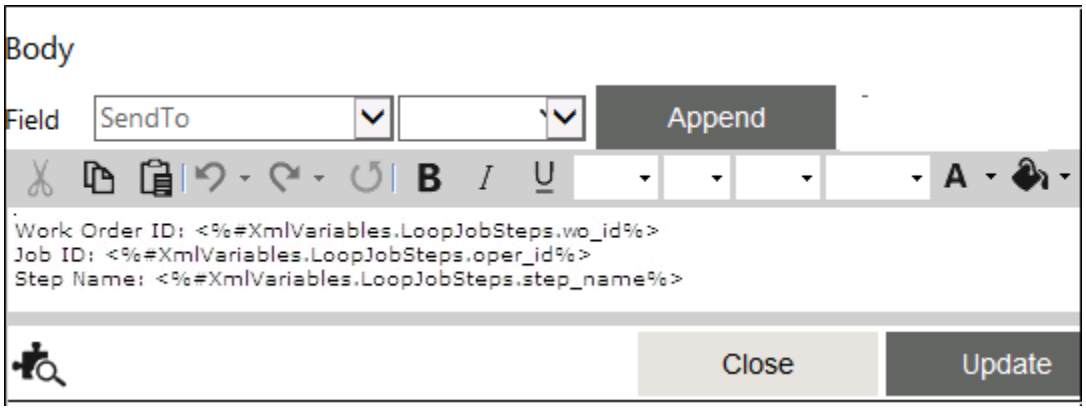
For example, if we have to loop through the multiple selections of Work Order we need to create Iterator variable with the repeating node as 'WorkOrderLookup'.

3. Add a ForEach Loop activity. Set its XML Iterator property with the Iterator variable created above.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

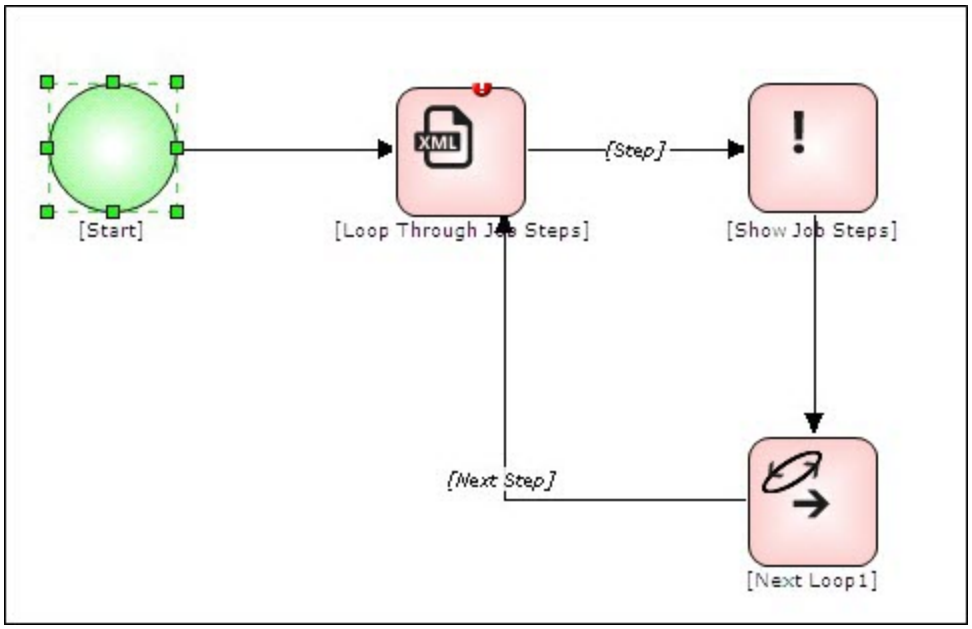


4. Add an Information activity to display the selections made. Set its Body property as shown below:

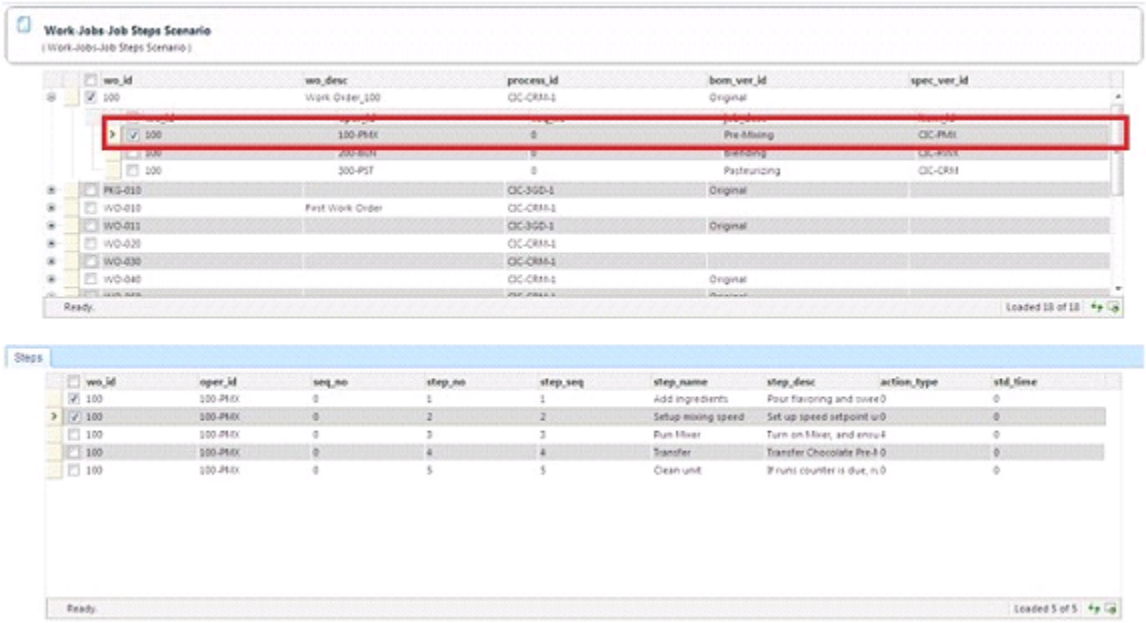


5. Design the workflow as shown below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

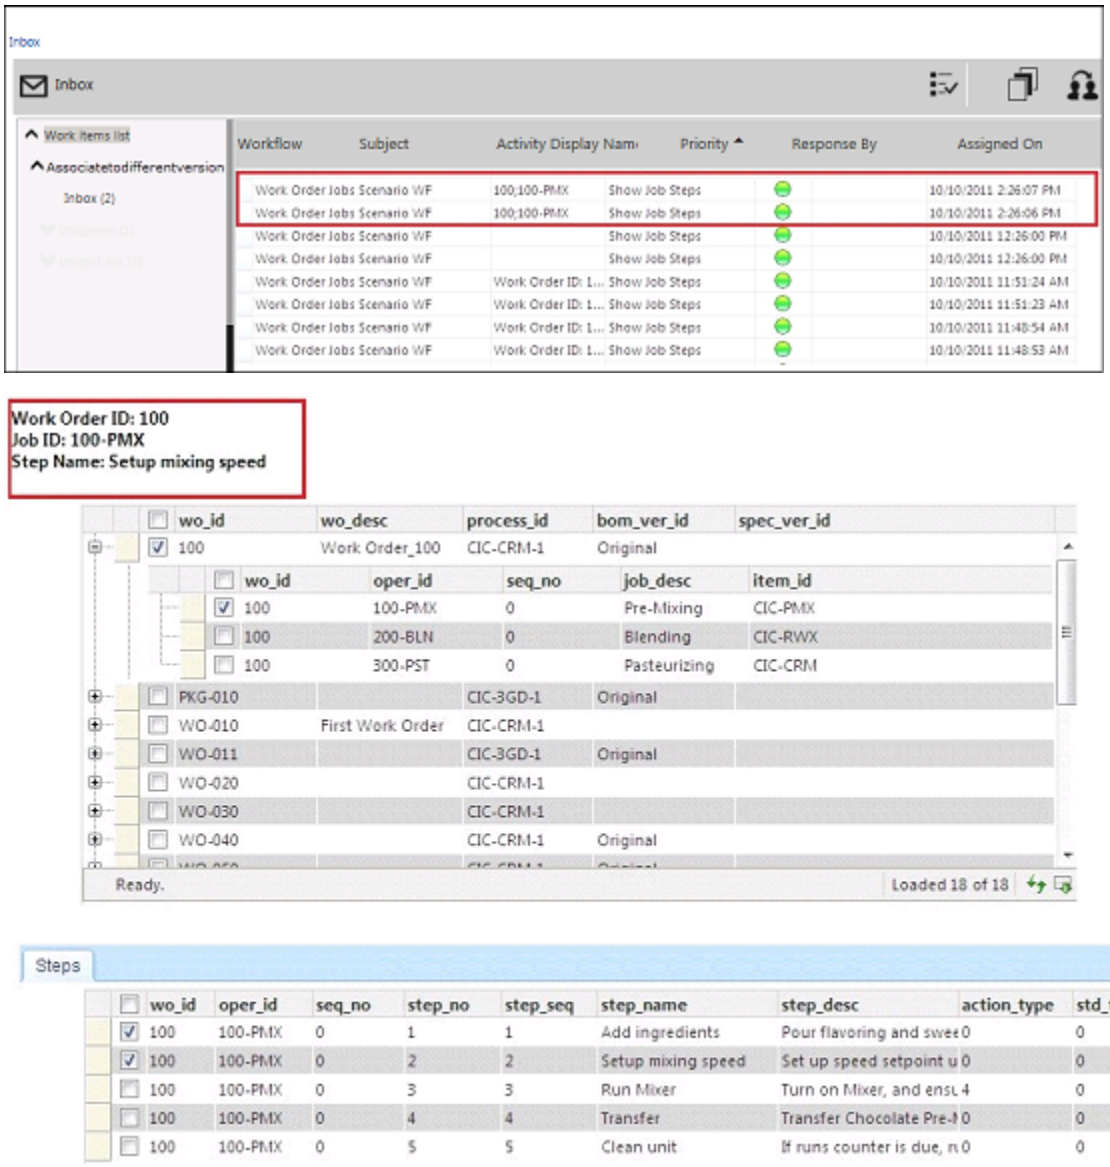


6. Publish and Test Run the workflow.
7. Select rows from Work Order Jobs Grid in the form. The Job Steps Grid gets populated with the steps for the selected job. Select the Steps and then click Finish.



8. Information is sent with Step details of the selected job.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

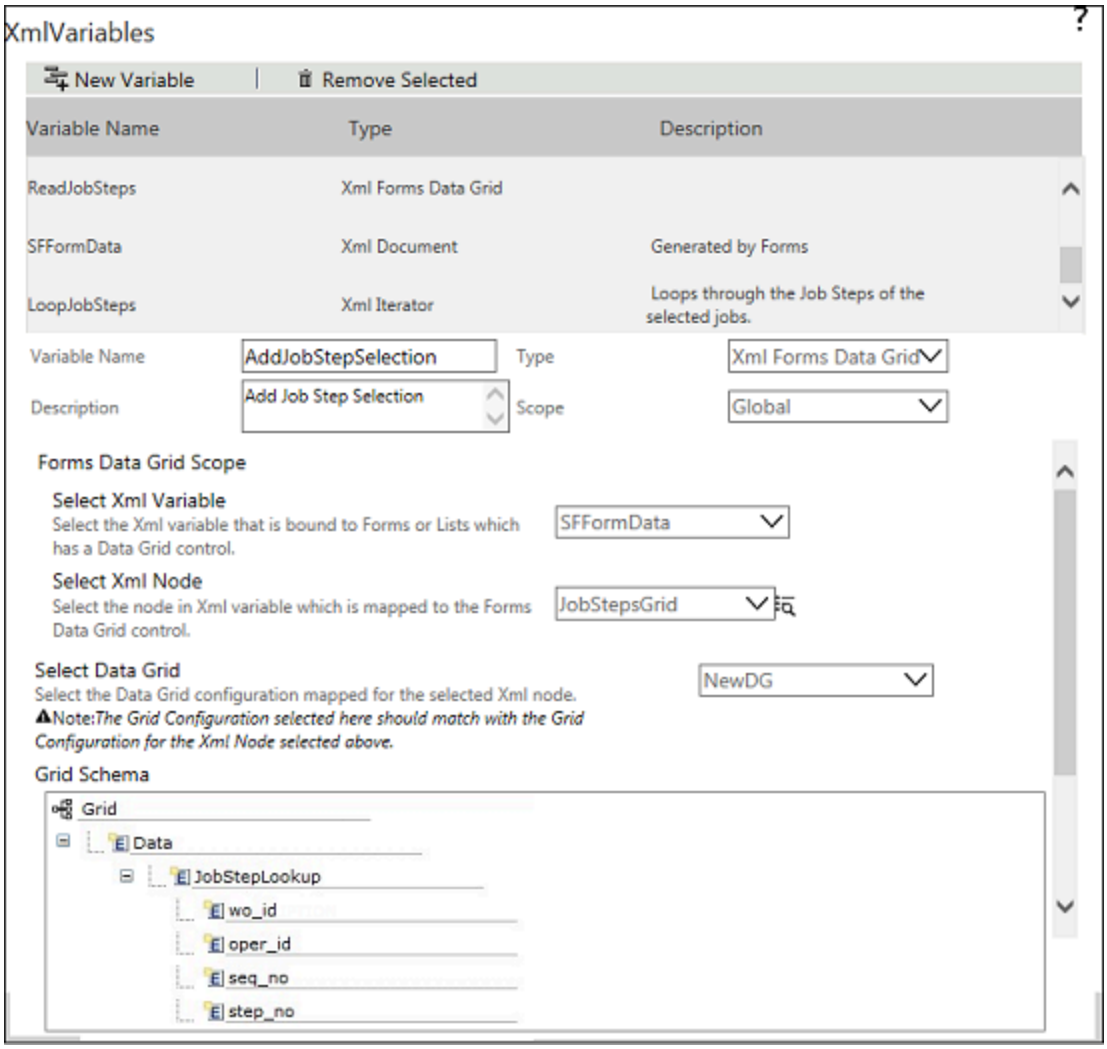


Scenario 2: Use Xml Forms Data Grid type Xml Variable to change/add row selections in a Data Grid control using Workflow.

The Forms Data Grid XML variable can also be used to add/modify the row selections done in a Data Grid control. The below scenario explains how to add a row selection to the existing row selections using workflows.

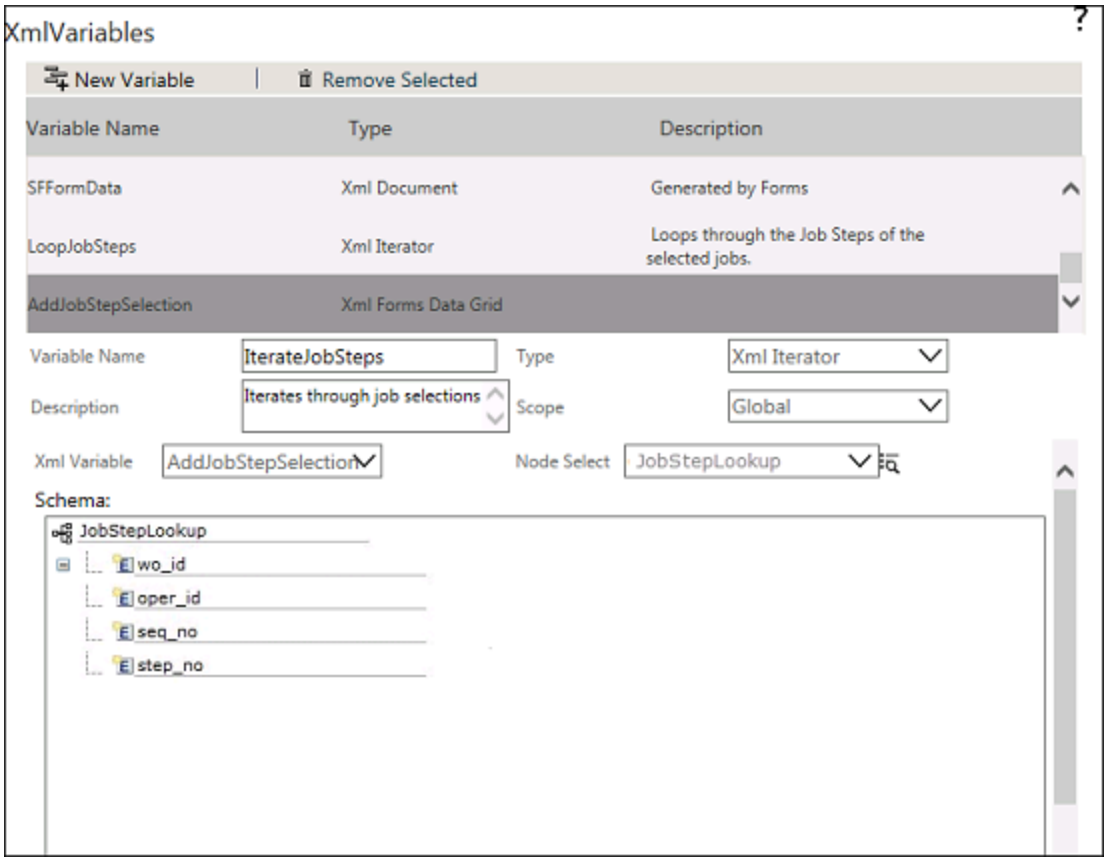
1. Create an XML Forms Data Grid Variable for the Jobs Step Grid Configuration as shown below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

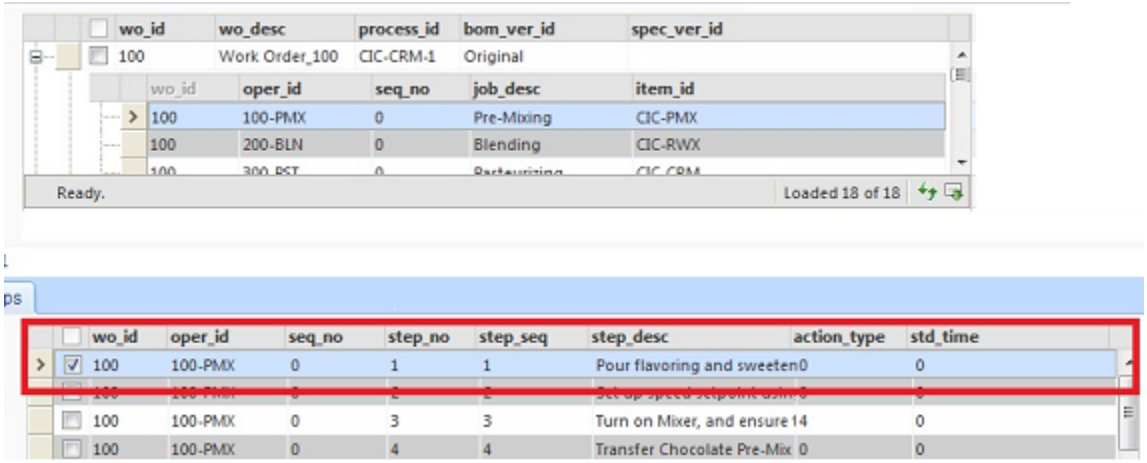


2. Create an XML Iterator variable to iterate through the Jobs Steps for the selected job.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The form instance XML generated for the form with a Job Step selected will be as given below. [However, note that the XML generated will be in the encoded format in the Form instance XML].



```
<Grid>
<Data>
<JobStepsLookup>
<wo_id><![CDATA[100]]></wo_id>
<oper_id><![CDATA[100-PMX]]></oper_id>
<seq_no><![CDATA[0]]></seq_no>
<step_no><![CDATA[1]]></step_no>
<step_seq><![CDATA[1]]></step_seq>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<step_name><![CDATA[Add ingredients]]></step_name>
</JobStepsLookup>
</Data>
</Grid>
```

To add another row selection using workflows, another XML node has to be created for the JobStepsLookup node (which is the repeating node). If another node is added, the XML will be generated as shown below:

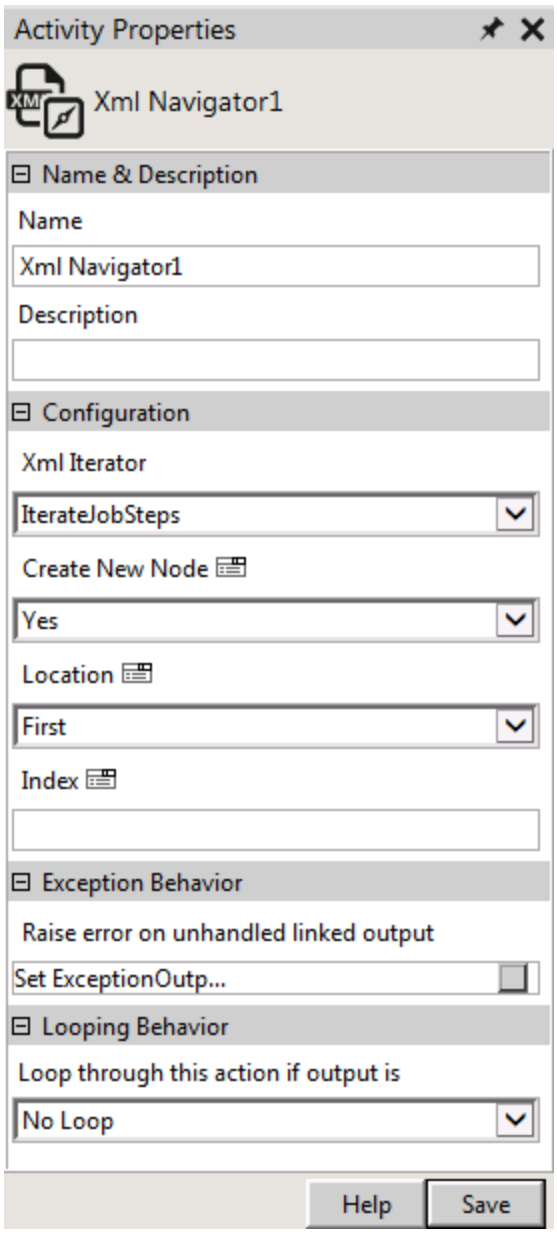
```
<Grid>
<Data>
<JobStepsLookup>
<wo_id><![CDATA[100]]></wo_id>
<oper_id><![CDATA[100-PMX]]></oper_id>
<seq_no><![CDATA[0]]></seq_no>
<step_no><![CDATA[1]]></step_no>
<step_seq><![CDATA[1]]></step_seq>
<step_name><![CDATA[Add ingredients]]></step_name>
</JobStepsLookup>
<JobStepsLookup>
<wo_id><![CDATA[100]]></wo_id>
<oper_id><![CDATA[100-PMX]]></oper_id>
<seq_no><![CDATA[0]]></seq_no>
<step_no><![CDATA[3]]></step_no>
<step_seq><![CDATA[3]]></step_seq>
<step_name><![CDATA[Run Mixer]]></step_name>
</JobStepsLookup>
</Data>
</Grid>
```

wo_id	oper_id	seq_no	step_no	step_seq	step_desc	action_type	std_time
100	100-PMX	0	1	1	Pour flavoring and sweeter	0	0
100	100-PMX	0	2	2	Set up speed setpoint usin	0	0
100	100-PMX	0	3	3	Turn on Mixer, and ensure	4	0
100	100-PMX	0	4	4	Transfer Chocolate Pre-Mix	0	0

To achieve this, XML Navigator activity is being used in this scenario.

1. Add an XML Navigator activity to add a new row selection to the JobSteps grid. Set the properties as shown below. Please note that Create New Node property is set as Yes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

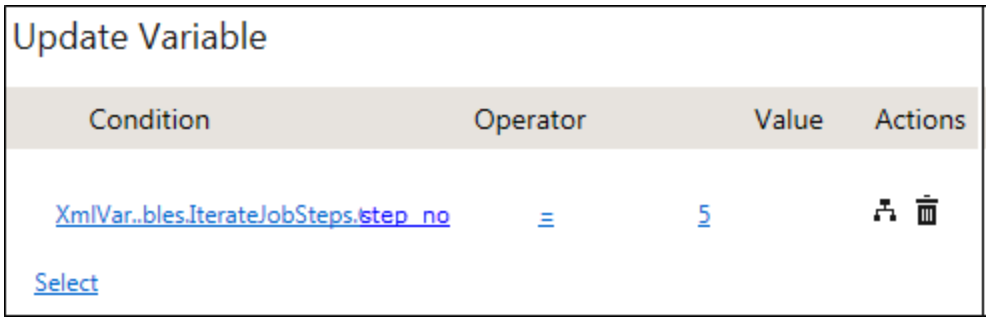


Note: To add selections at multiple hierarchy levels, an Iterator variable has to be created at the parent levels with their corresponding repeating nodes.

2. To set the value for the row selection an Update Variable activity is used. This activity needs to update the value to the Value field of the lookup data source of the Grid Configuration.

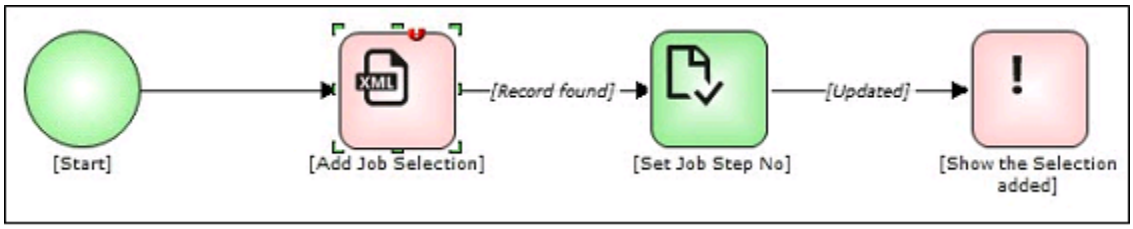
   Here the Value column for the Jobs Step Grid Configuration is: step_no.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

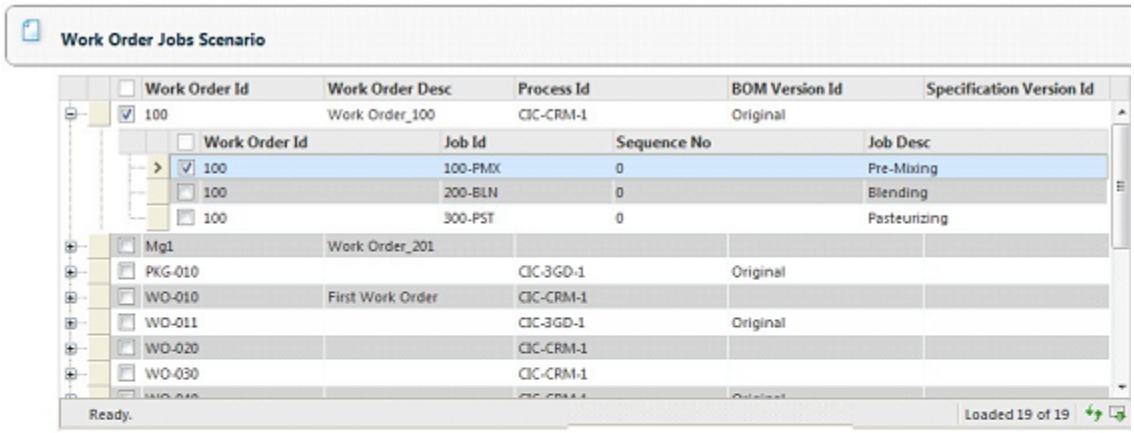


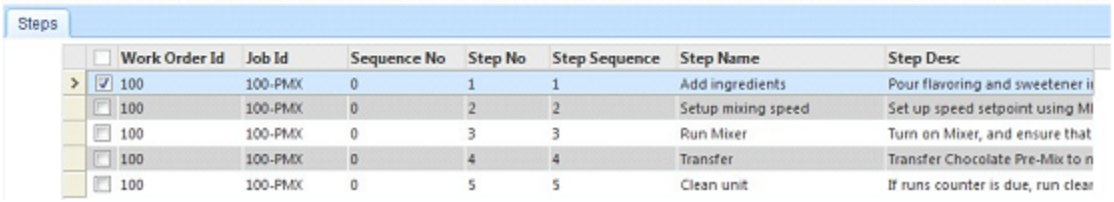
Note: This update does not update or modify any data to the data source lookup configured for the Data Grid Control.

3. Design the workflow as shown below:



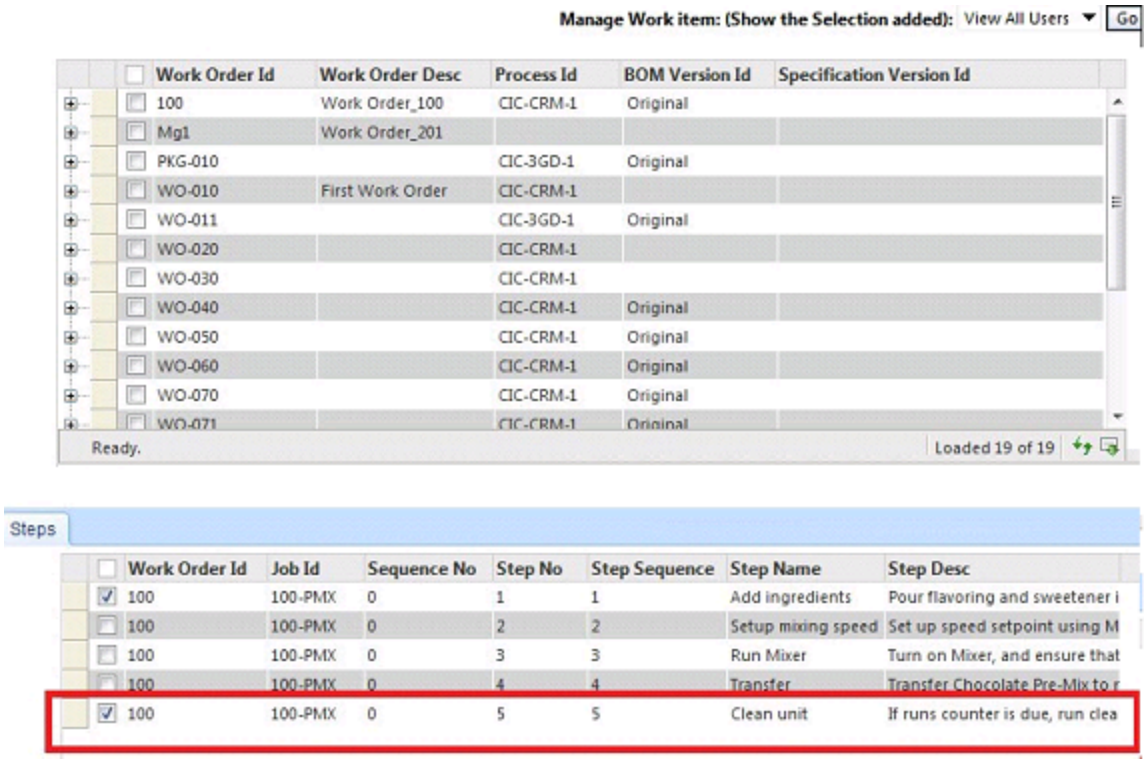
4. Publish and Test Run the workflow.
5. Select rows from Work Order Jobs Grid in the form. The Job Steps Grid gets populated with the steps for the selected job. Select the Steps and then click Finish.





6. Once the workflow execution is complete, information is sent with the updated Job Step selection details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

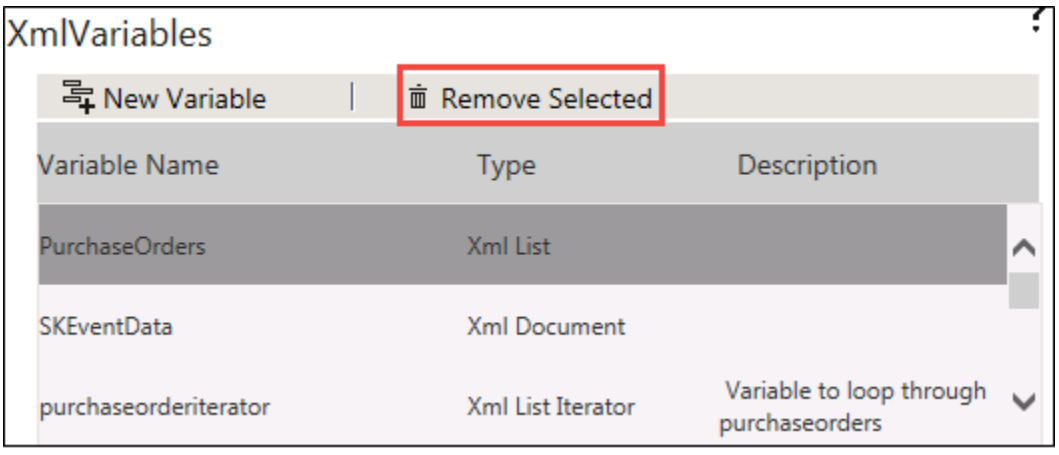


Note: To modify an existing selection, go to the specific node and update the Value field of the lookup data source. If a definite node is not specified for updating the selection, then by default the first selection is modified and updated.

Delete XML Variables

To delete an XML Variable,

- Select the variables to be removed.
- Click **Remove Selected** in the **XMLVariables** window.

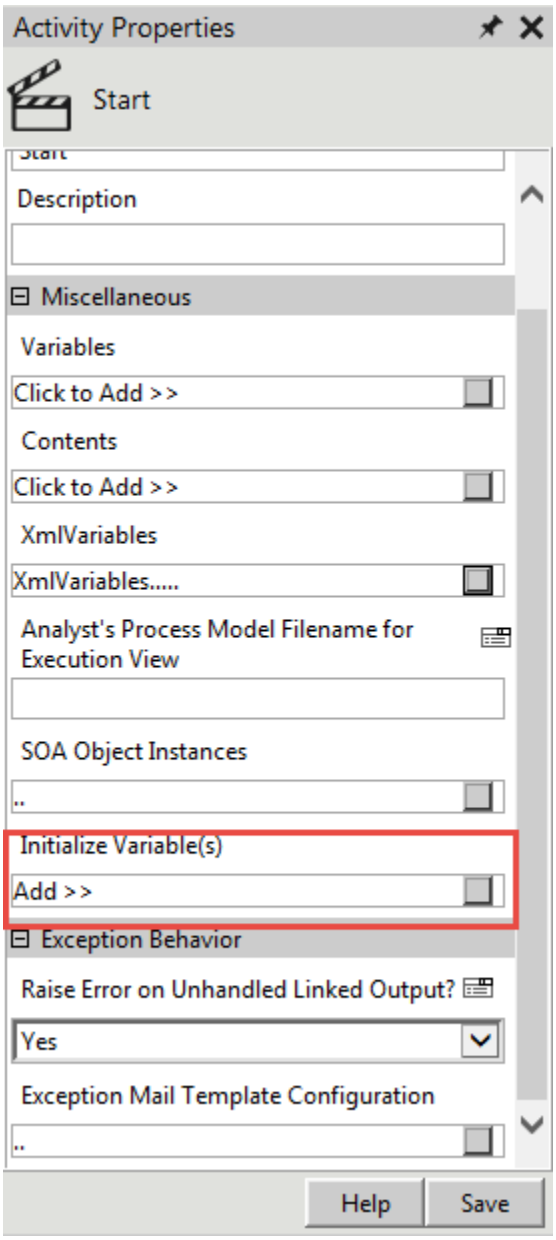


Note: You cannot delete a variable that is the parent of another **XML Iterator** type variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Initialize Variables

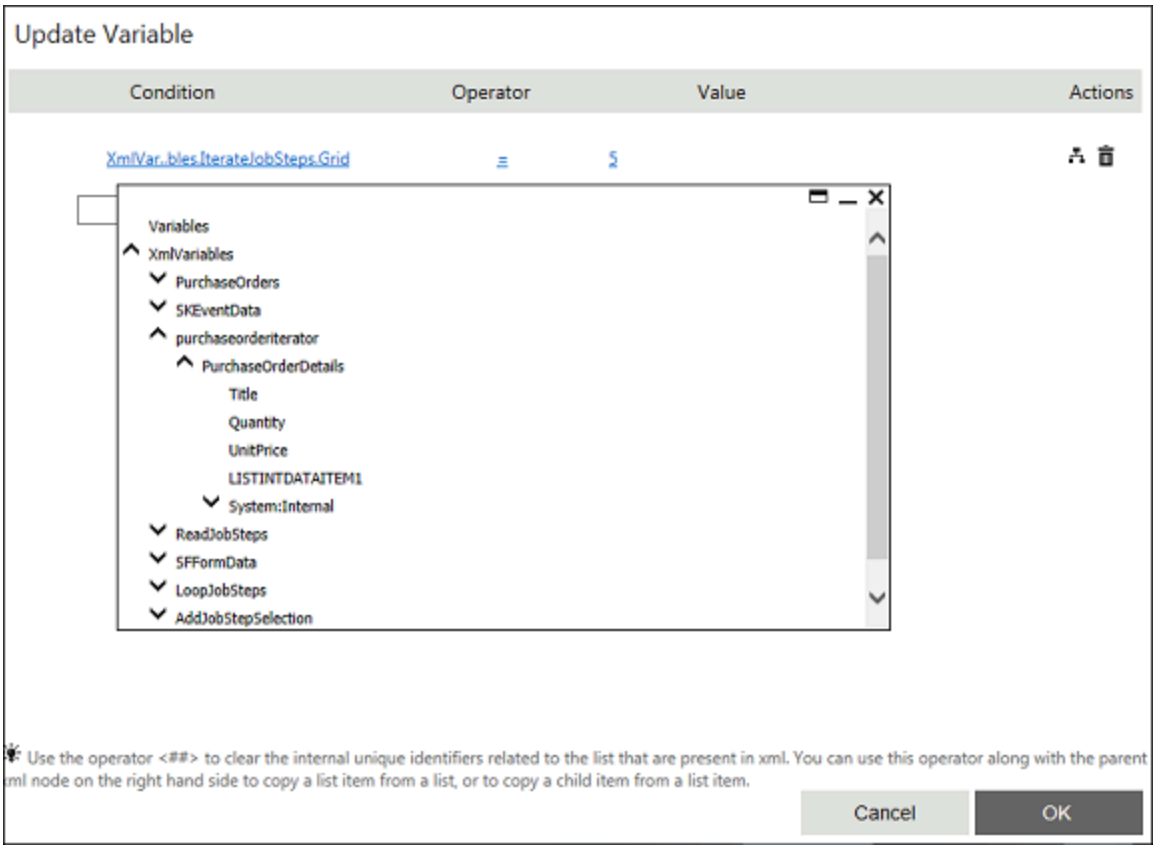
As soon as you create a variable, you have the option to initialize it.



You can update the variable values using the Update Variable activity, if needed. The supported types for initialization are:

- Variables
- Content variables
- XML variables

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Note:
You can also use the Expression Editor to initialize variables.
For number data types, the minimum and maximum values are not validated. Enter only valid numeric values for number data types.
For DateTime, Date, or Time data types, ensure that the date or time input format is based on the culture set. You can enter the input or use the Date and Time picker to enter the required date and time.
Date.CurrentDate is not supported. Use the tree view option to pick the required date and time.
The time format supports long data type to enable you to enter seconds.

Mapped Error Outputs

Each activity has the Raise Error on Unhandled Linked Output property clicking on which, all the default configured mapped error outputs in red with the respective check boxes selected will be displayed.

Mapped Error Outputs

The Mapped Error Outputs list contains the error outputs (shown in red) that cause the workflow to complete abruptly. This can happen if the error outputs are not linked to the next activity in the workflow. To change the mapped error outputs, select or de-select the relevant options and click OK.

Workflow Behavior for Error Outputs

If the error outputs are not linked to the next activity in the workflow, and if the 'Stop with Error' option is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

selected, the workflow will complete with errors. Similarly, if the 'Exit Activity with Error Output' option is selected, the workflow will not finish with errors, but will give an Error Encountered output.

Note: The changes made to this property will take effect only if you set the value for **Raise Error** on **Unhandled Linked Output** to **Yes** in the **Start Activity**.

See *Exception Behavior* in Start Activity topic, for detailed information on configuring **Exception Behavior** properties.

Human Activities

The following activities are found under Human Activities:

- **Approval Activity**: The Approval Action is used in the AVEVA Work Tasks Workflow process design in cases where an approval request has to be approved by an actor or set of actors.
- **Checklist Activity:** The Checklist Activity is incorporated in the AVEVA Work Tasks Workflow process design to send questions that need to be answered by actors in a workflow.
- **Choice Activity**: The Choice Activity is used in the AVEVA Work Tasks workflow process design in cases where a task needs to be assigned with multiple options for an action.
- **Information Activity**: The Information Activity is included in the AVEVA Work Tasks workflow process designs when there is a need to provide some information to a set of actors.
- **Resource Set Activity**: The Resource Set Activity is used in the AVEVA Work Tasks workflow process design when the actor for executing the subsequent activity needs to be selected by another actor in the previous activity of the workflow.
- **Task Activity**: The Task Activity is used in a AVEVA Work Tasks workflow process design in order to assign a task to an actor or set of actors.
- **Work Activity**: The Work Activity is used in the AVEVA Work Tasks workflow process design in cases where custom activities are required.
- **Invoke Form Activity**: The Invoke Form Activity is basically an activity inside workflows, wherein the workflow actually invokes the form.

Approval Activity

Activity Description

The Approval Action is used in the AVEVA Work Tasks Workflow process design in cases where an approval request has to be approved by an actor or set of actors.

Application Scenarios

Typical application scenarios include the Leave Approval Workflow Process, which will have an Approval activity by a Manager, and the Purchase Requisition Workflow, which will have an Approval activity by an Accounts Manager.

Workflow Variables for Approval:

Steps to define variables for use in the Approval activity:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

This section describes how to define variables for use in Approval activities. It gives the syntax for creating the variables and typical examples for different cases.

Variables for capturing WorkItemIds

The Activityids for the activity can be retrieved using a variable of type array, with the following syntax:

'^'+CurrentActivity.Name+'WorkItemIds'

For example, ^ManagerApprovalWorkItemIds

Variables for capturing All Actors' Details

The details of the actor(s) to whom the approval work item gets assigned can be accessed by declaring a variable of type array with the following syntax:

'^'+CurrentActivity.Name+'ActingUsers'

For example, **^ManagerApprovalActingUsers**.

Variables for capturing Responding Actors' Details

The details of the actor submitting the approval/rejection response can be accessed by declaring a variable of type resource with the following syntax:

'^'+HWSActivity.ActivityName+'RespondingUser'

For example, ^ManagerApprovalRespondingUser.

This variable stores the responded user information. In case of multiple users, it will retrieve the last user details.

Note: For single user, you can declare this variable as Resource type. If task is assigned to multiple users, to get all responded users information, then declare this variable as **Array**.

Variables for capturing Approving/Rejecting Actor Details

The details of the actor(s) submitting either approval or rejection response can be accessed by declaring a variable of type Array with the following syntax:

'^'+ activityName+'ApprovingUsers' (or)

'^'+ activityName+'RejectingUsers'

For example, **^ManagerApprovalApprovingUsers or ^ManagerApprovalRejectingUsers**.

Variables for capturing Comments

To capture the comments entered by an actor, add a variable with a name prefixed by '^', with the following syntax:

'^'+_WorkItem.HWSActivity.ActivityName+'CommentApproved'/'CommentRejected'.

For example, if a comment entered along with an approval submission has to be retrieved from an activity named 'ManagerApproval', add a variable with **^ManagerApprovalCommentApproved** as its name. If a comment entered along with a rejection submission has to be retrieved from the same activity, i.e., 'ManagerApproval', add a variable with ^ManagerApprovalCommentRejected as its name. The variable gets initialized with the comment entered by the actor, after the activity response is submitted.

Variables for assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the Start activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To assign multiple queues, specify the queue-ids with semicolon (;) as a separator.
Skelta.HWS.Queue.QueueCollection class can be used to retrieve queue information.

Variable for Queue Acting Users

You can declare an Array type variable to get updated information about the name of the actor to whom an activity gets assigned from a queue.

In the Workflow Variables, define the variable in the following format:

^+CurrentActivityName+'QueueActingUsers'

Ex: ^HRFormQueueActingUsers

HRForm is the activity name.

For example the value of the user who acts on the HRForm activity will be stored in the variable. The Approval1 task will be assigned to the same user.

Variable for storing timeout warning value

Suppose if you want to store the timeout warning value for an Approval activity in your workflow. The naming convention for the system variable to be declared is:

^<ActivityName>ResponseByWarningTimeout

The value returned by the variable will be in UTC format. For multiple user scenarios the highest timeout value calculated for a user will be available in the variable.

Note: Multiple timeout warnings cannot be tracked using this feature.

Every time you input a value for a property, ensure to save the data. Click the **Save** button on the **Activity Properties** window. You need to save the property so that the subsequent properties in the activity can inherit the required information.

Activity Properties

The **Approval** activity has to be configured by specifying appropriate values for the different properties in the Action Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Approval activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Display Name - This property specifies the name to be displayed for the activity in the Web Work Item List. The **maxlength** attribute for type String is added in **Action.XML** and set the default value as **100**. You cannot add more than 100 characters.

If you want to increase the Action name length then you have to manually update it in **Action.XML** file as well as they have to increase the column size in DB.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Action.XML file changes

<property category="cat_name;01" name="Action Display Name" displayname="Display Name" type="string" maxlength="100" helpstring="Display name for the action in activity list."></property>

Database Changes

You need to modify the following tables to increase the column size for action name to more than 100:

1. SWExecutionDetails - Change *ActionName* column.
2. SKHWSActivity - Change *ActivityName column.*
3. *SKWorkItem - Change* ActivityDisplayName column.

Property Type: Optional (This property need not be set if the display name is already configured in the Actions.XML. The name entered here overrides any display name that is configured for this activity in the Actions.XML file.)

Configuration

You can use these properties to configure the functionality of the activity.

Delivery Channels - This property is used to specify the delivery channels to deliver this activity to the assigned actor(s). Multiple channels can be specified giving the actor(s) different options to act on the work item.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Delivery Channel Property

1. To select the Delivery Channels, click on the button for the 'Delivery Channels' property, the Proper window will be displayed.
2. In this window, the Delivery Channels that have been configured are listed on the left along with a check-box against each channel. Click and select the check-box corresponding to the channel you wish to select. You can select multiple channels by selecting the respective check-box.
3. Click on Save Channels button.

See Approval - Delivery Channels for a detailed description of the Delivery Channels property window.

Work Item Fields - This property is used to set the Work Item Fields to be used to display application data as well as value in variables and content in the Work Item list when this activity is executed.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Work Item Fields property

1. To select the Work Item Fields, click on the button for the 'Work Item Fields' property to open the property window.
2. In this window, the Work Item Fields that have been set are listed in a grid. Click on a row to select the corresponding Work Item Field.
3. Right click on the row, and select the "SetWorkItemField" option from the context menu to set it.

See Approval - Work Item Fields for a detailed description of the Work Item Fields property window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Actors

The properties in the Actors group have been described below. You can use these properties to specify the actors who will work on the activity and related properties.

Assign Actor(s) - This property is used to specify the actor(s) who has to take up the Approval activity. It is tagged with the Ignore Unavailable Actors property which in turn is tagged with the Alternate Actor Allowed property. This will be explained in detail later.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any actor(s).)

Steps to set the Assign Actor(s) property

1. To specify the actors, click on the button for the 'Assign Actor(s)' property to open the property window.
2. In this window build an expression to select the actors using the resource properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking the **Add** button. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking the **Undo** button
5. You can also clear an existing expression if necessary by clicking the **Clear** button. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click the **Update** button to save it.

See Approval - Assign Actor(s) for a detailed description of the Assign Actor(s) property window.

See the Using XML Variables section in the About the XML Variable User Interface topic for details on how to use the XMLVariables to build the expression.

Assign Queue(s) - This property specifies the queue(s) to which the Approval activity is to be assigned.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any Queue(s).)

Steps to set the Assign Queue(s) property

1. To specify the queue(s), click on the button for the 'Assign Queue(s)' property to open the property window.
2. In this window select the queue(s) from the **Available Queues** list. You can select multiple queues by selecting all the required queues while having the <Ctrl> key pressed.
3. After selecting the required queue(s) click on the [>] button to move it to the Selected Queues list. You can click on the [>>] button to select all the queue(s) and move them to the **Selected Queues** list.
4. You can remove any queue from the selected list by selecting the required queue and clicking on the [<] button. You can remove all the queues by clicking on the [<<] button.
5. After adding the required queue(s), click the **Assign** button to assign the activity to the selection
6. Click the Close button to close the window without saving the selection.

See Approval - Assign Queue(s) for a detailed description of the Assign Queue(s) property window.

Min. Ownerships [% or Number] - This property, which can be specified as a number or percentage, is the minimum number of actors who should take ownership of the Approval request. This property is related to the 'Timeout warning for Ownership' and 'Timeout for Ownership' properties.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- To illustrate, when 'Timeout for Ownership' is reached, the activity first checks if the ownership count is less than Min.Ownerships (if it is set).
- If it is, the work item will be removed from all Work Item lists.
- If the 'Min.Ownerships' has already been satisfied, then the work item will be removed from the Work Item lists of those who have not taken ownership.
- If the Min.Ownerships value is 0, then the activity checks if the ownership count is less than Max.Ownerships (if it is set).
- If it is, the work item will be removed from all Work Item lists. Else the work item will be removed from the Work Item lists of those who have not taken ownership.
- If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work Item lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Max. Ownerships [% or Number] - This property (referred to as Max.Ack), which can be specified as a number or percentage, is the maximum number of actors who should take ownership of the Approval request.

- If 'Timeout for Ownership' is specified and achieved, and the 'Min.Ownerships' is also satisfied, then the activity waits for action from those who have taken ownership.
- If the Min.Ownerships value is set to 0, then it checks if the ownership count is less than Max.Ownerships. If it is, the work item will be removed from all Work Item lists. Else the work item will be removed from the Work Item lists of those who have not taken ownership.
- If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work Item lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Enable Take Ownership? - If this property is set to **Yes**, then the actor is provided with a **Take Ownership** option in the Work items list to take ownership of the task. If you are not required to take **Take Ownership** of the Work items list, then set this property as **No**.

Note: By default, this property is set as **Yes**.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Enable Take Ownership? property

- Select **Yes** or **No** option from the **Enable Take Ownership?** drop-down list.

Re-Assign Allowed? - If this property is set then the actor is provided with a Re-Assign option. Using this the approver can re-assign the work item to another resource.

Property Type: Optional (This property needs to be set only if necessary.)

Ignore Unavailable Actors? - This property provides the following options - **Yes**, **Yes** - **holidays excluded** and **No**.

- If this property is set to 'No', when the Approval activity is assigned to the actor's Work Item list, a check is first done to see whether the actor is available. If the actor is not available then a check is made for an alternate actor assigned to the unavailable actor. Simultaneously the value of the property 'Alternate Actor Allowed' is checked. If that is also set, then the Approval work item is assigned to this actor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- If this property is set to **Yes - holidays excluded**, the Workflow engine will ignore the fact that actors are not available if the day is an organization holiday and the output Not Enough Resources will not be generated.

Property Type: Optional (This property needs to be set only if necessary.)

Alternate Actor Allowed? - This property is set to assign a particular task to an alternate actor in the absence or unavailability of any actor.

Property Type: Optional (This property needs to be set only if necessary.)

Notification Contents

The properties in the Notification Contents group have been described below. You can use these properties to specify the content used to notify actors about the activity.

Subject - This is the subject of the Approval request. The subject can be customized for each actor.

Property Type: Optional (This property need not be set. If it is not set, the default subject line from the Actions.XML file is displayed.)

Steps to set the Subject property

1. To specify the subject, click the button in the 'Subject' property to open the property window.
2. In this window enter the subject text directly in the text editor.
3. If you want to customize the subject, you can do so using the **Field** controls to add resource property values. For example, to add a subject that includes the email id of the actor submitting the leave application, you can do as follows: First type in the text "Submitted By". Next select "Variable" and "Variable.SubmittedBy.Email" from the two drop downs for **Field** and click **Append**. This will add the placeholder for the variable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the email id.
4. You can edit the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes and zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the subject, click **Update** to save it.
7. Click **Close** to close the window without saving the subject.

See Approval - Subject for a detailed description of the Subject property window.

Body - This is the actual message body of the Approval request sent to the actor(s). The message can be customized for each actor. There is an Enterprise Console Explorer(plug-in) edit icon in the Body property window to get the Work item details URL. See Enterprise Console Control (EC Plug-in) for more information.

Property Type: Optional (This property need not be set.)

Steps to set the Body property

1. To specify the message body, click the button for the 'Body' property to open the property window.
2. In this window, enter the body text directly in the text editor.
3. If you want to customize the body you can do so using the **Field** controls to add resource property values. For example, to add a body that includes the name of the actor submitting the leave application, you can do as follows: Type in the text "Hi, Please approve the leave application submitted by". Select "Variable" and

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

"Variable.SubmittedBy.name" from the two drop downs for Field and click Append. This will add the placeholder for the variable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the name.

4. You can edit the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command and also zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the body, click Update to save it.
7. Click **Close** to close the window without saving the body.

See Approval - Body for a detailed description of the Body property window.

From Email Address? - This property is used to specify the email address from which notification messages will be sent for the activity.

Property Type: Optional (This property needs to be set only if necessary. If it is not set, the default value in Actions.XML will be used.)

Hide Responses? - If this property is set to 'No', then actors can see the responses of other actors in a group approval scenario. To view these responses i.e., ownerships, approvals or rejections, select the 'Take Ownership' option. This will open a new pop up with the responses of other actors who have taken ownership.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Show Custom Document View Window - If this property is set to 'Yes', then the Custom Document View Window will be shown to actors in their Work Item Lists.

Property Type: Optional (This property needs to be set only if necessary.)

Priority - This property is set to indicate the priority of the approval request. Enter the values 0-33 to set as Low, 34-66 for Medium, or 67-99 for High. The default value is set to 34.

Property Type: Optional (This property needs to be set only if necessary.)

Send Notification Email - If this property is set to 'Yes', then notification emails will be sent to the actors. If it is set to 'Yes-HTML', then the emails will be sent in HTML format.

Property Type: Optional (This property needs to be set only if necessary.)

Notify if alternate actor is considered - If this property is set to 'Yes', then notification emails will be sent to the actors when an alternate actor is considered.

Property Type: Optional (This property needs to be set only if necessary.)

Redirect URL - This property is used to get the URL of the web page to redirect the client to, in the case of synchronous execution of the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Redirect URL property

1. To specify the Redirect URL, click on the button for the 'Redirect URL' property to open the property window.
2. In this window, enter the Redirect URL directly in the text editor.
3. If you want to customize the Redirect URL you can do so using the Field controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for Field, and

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

clicking **Append**. This will add the placeholder for the variable in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the URL.

4. You can edit the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command and also zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Redirect URL, click **Update** to save it.
7. Click **Close** to close the window without saving the Redirect URL.

See Approval - Redirect URL for a detailed description of the Redirect URL property window.

Custom Document View URL - This property is used to get the URL of the page to which the custom document dlls does a post. The data posted to the page are application, workflow, executionid, executiondetailsid, and workitemid. The posted data can be retrieved as Request.Form["workitemid"].

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Custom Document View URL property

1. To specify the Custom Document View URL, click the button for the 'Custom Document View URL' property to open the property window.
2. In this window, enter the Custom Document View URL directly in the text editor.
3. If you want to customize the Custom Document View URL you can do so using the Field controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for **Field**, and clicking **Append**. This will add the placeholder for the variable in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the URL.
4. You can edit the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command and also zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Custom Document View URL, click **Update** to save it.
7. Click **Close** to close the window without saving the Custom Document View URL.

See Approval - Custom Document View URL for a detailed description of the Custom Document View URL property window.

Mail Channel

The properties in the Mail Channel group have been described below. You can use these properties to customize the approval activity(activities) with different mail channel templates.

Use html template from property - If this property is set to **'No'**, then it will take the mail channel template from the physical path

'[AVEVA Work Tasks Installed Path]\WORKFLOW MANAGEMENT.NET\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\AprovalEmail.html.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If this property is set to **'Yes'** and the "**HTML Template**" property is empty, then it will take the mail channel template from the physical path

'[AVEVA Work Tasks Installed Path]\BPM.NET\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\AprovalEmail.html.

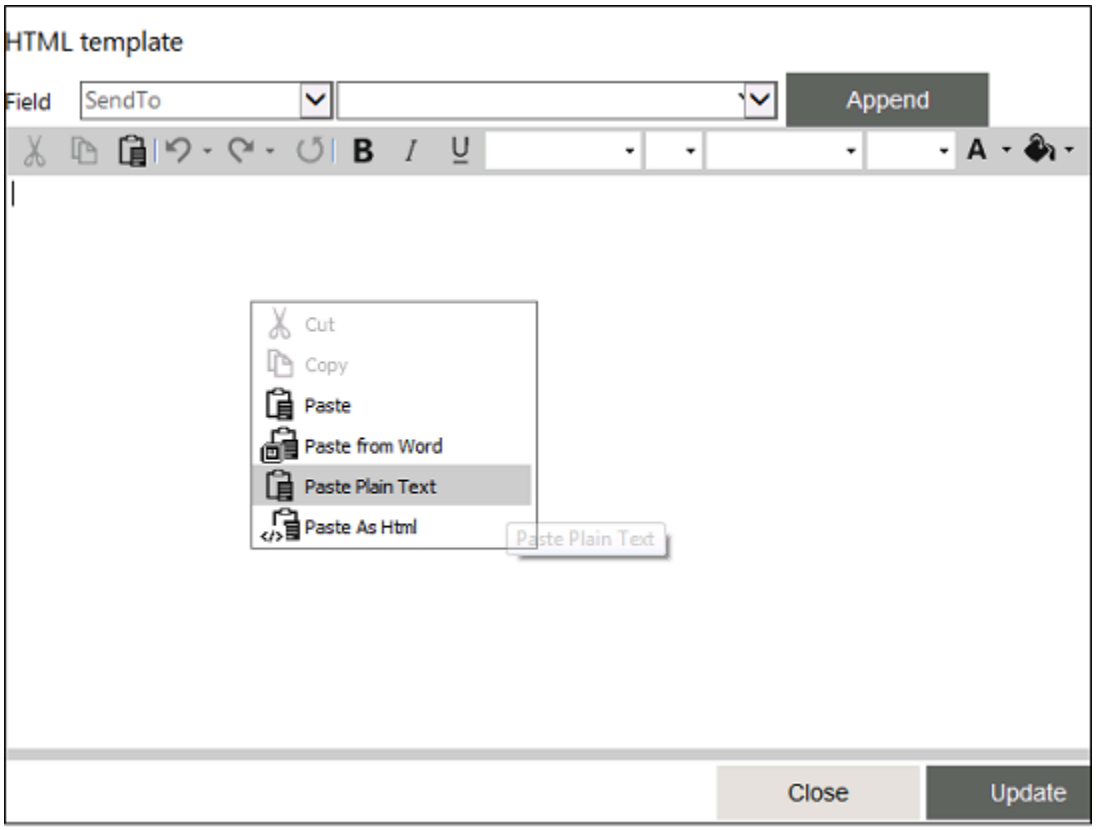
Property Type: Optional (This property needs to be set only if necessary.)

HTML template - This property is used to define the html template for mail channel.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the HTML template

1. To specify the HTML template, click the edit icon to open the property window.
2. In the **HTML template** window, provide template which should be in html format. If you are pasting a copied html content, then right-click the **HTML template** window and paste it as **"Paste Plain Text"**.



3. Click **Update**.

See Approval - HTML Template template for a detailed description of the property HTML template window.

Attachment

This property is used to configure Report to be sent as an Email attachment.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Attachment property

1. To specify the **Attachment** property, click the edit icon to open the property window.
2. In the **Configuration of Mail Attachment** window, select the required attachment type by clicking the radio

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

button.

3. In the **Attach Report** property, you can attach a report by selecting the **Report Reference Variable** through the Expression Editor. Alternatively, you can get the **Report** by clicking the Report icon and selecting the required report from the Reports list screen. To attach multiple reports, add new rows using the **Add** link.
4. Click **Submit**.

See Approval - Attach Reports for a detailed description of this property.

Decision Influencers

The properties in the Decision Influencers group have been described below. You can use these properties to specify some parameters that influence the outcome of the activity.

Affirmative Answer for Approval [% or Number] - This property is used to check what percentage or number of persons should take action for approval. Decision on the approval is taken only after the specified number or percentage of actor(s) have taken the action. The work item waits for the actors' action until the 'Timeout for activity' is reached.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Action Limit [% or Number] - This property specifies the minimum number of approvers to act on the Approval before the 'Timeout Warning for Action'. If the activity limit is reached before the 'Timeout Warning for Action' then the warning message is not shown.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Wait For All The Participants To Act -

- If this property is set to 'Yes', then the engine will wait for all the approvers to act on the approval activity. Once the activity count (no. of approvals and rejections) reaches the 'Max.Ownerships' limit value, a decision for approval is taken if the 'decision count' (no. of approvals) is >= 'Affirmative Answer for Approval'. Otherwise, the activity is rejected.
- If both 'Affirmative Answer for Approval' and 'Action Limit' are set to 0, the activity is considered 'approved' only if 'decision count' >= 'rejection count'.
- If this property is set to 'No', the engine will take the decision for the activity based on the values for 'Affirmative Answer for Approval(AAA)', 'Max.Ownerships', 'Min.Ownerships' and 'Action Limit (AL)'
  - If AAA is set and 'decision count' >= AAA, the activity is approved.
  - If AAA is set and 'decision count' < AAA and Max.Acks = AAA and if at least one rejected, the activity is considered rejected.
  - If AAA = 0, and AL is set, if Max.Acks = AL, and if at least one rejected, the activity is rejected.
  - If AAA = 0, and AL is set, and if 'decision count' >= AL, the activity is approved.
  - If AAA is set and 'rejection count' > AAA/2, the activity is rejected.
  - If AAA = 0 and AL is set and 'rejection count' > AL/2, the activity is rejected.
  - If 'activity count' = Max.Ownerships, a decision for approval is taken if the 'decision count' >= AAA. Otherwise, the activity is rejected.
  - If both AAA and AL are set to 0, the activity is considered 'approved' only if 'decision count' >= 'rejection count'.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Escalation & Timeout

The properties in the Escalation & Timeout group have been described below. You can use these properties to specify escalation and timeout settings for the activity.

Set Calendar for Timeout - This property is used to specify the calendar to be used to determine activity timeouts.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to Set Calendar for Timeout

1. To specify the calendar for timeout, click the button for the 'Set Calendar for Timeout' property to open the property window.
2. In this window, select the required calendar by clicking the calendar name in the tree structure.
3. Click **Set Calendar** to set the selected calendar.
4. You can specify that a resource calendar should be used, if available, by clicking to select the corresponding check box.

See Approval - Set Calendar for Timeout for a detailed description of the Set Calendar for Timeout property window.

Minimum available time for Activity - This property is used to check the availability of an actor to whom a task must be assigned while executing the activity. The availability check for the actor is done based on the Calendar settings (Global or Resource Calendar). If the time taken to complete the task is within the value set for the **Minimum available time for Activity** property, then the task will be assigned to that actor. However, if the time taken to complete the task exceeds the value set for the **Minimum available time for Activity** property, then the task will be assigned based on the values set for the **Ignore Unavailable Actors?** and **Alternate Actor Allowed?** properties.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout for Ownership - This property specifies the time until which actors are allowed to take ownership, i.e. the time until which the Approval activity will wait for actors to take ownership.

- If Min.Ownerships is set and is not reached, the work item is removed from all Work Item lists.
- If Min.Ownerships is 0, it will check if ownership count is less than Max.Ownerships. If it is, the work item is removed from all Work Item lists. Else the work item will be removed from the Work Item lists of those who have not taken ownership. The work item will remain in the Work Item list of those who have taken ownership and wait for action from them.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout Warning for Ownership - This property specifies the time at which a warning is provided to an actor to take ownership of the work item assigned to him/her. If the actor does not take ownership within this time the engine is notified with a warning.

- Thus if 'Min.Ownerships' is set, and it is not satisfied before the given time then a warning is sent.
- If Min.Ownerships is 0, it will check for Max.Ownerships. If the ownership count does not reach the Max.Ownerships value within the set time, a warning is sent.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- If both Min.Ownerships and Max.Ownerships are not set, this property is ignored.

Property Type: Optional (This property needs to be set only if necessary.)

Understand how Ownership Properties relate to each other:

- Approval activity is assigned to the approvers in the approval list by the Workflow Engine. Approval activity has a default property set that at least one person has to make to Take Ownership of the Approval activity.
- A drop down interface has been provided for the actor to Take Ownership. However, the actor can act on the Approval without taking ownership first, in which case ownership will be considered to be done, i.e. if the actor acts upon the Approval activity without acknowledging, then it is considered as an ownership with action taken.
- After the actor has taken ownership, a link is provided to the actor, which opens a pop up with the details of the other approvers. This is again tagged with the 'Hide Responses?' property. The link will be provided only If 'Hide Responses?' is set as 'No'. The pop up will have details like Approver name, Ownership Status, Action taken, Comments.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number], then the 'Timeout Warning For Ownership' property is not considered.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] and the 'Time Out For Ownership' is also reached, then the work item is removed from other approvers' Work Item list and the work item waits for action from those who have taken ownership.
- If the 'Min.Ownerships' limit is not reached for the Approval activity, and the 'Timeout Warning For Ownership' has been exceeded then the actor is notified with a warning by including an email or an information activity, with the Timeout Warning for Ownership link to it.
- If 'Timeout For Ownership' is set, if the Approval activity has not reached the minimum limit (Min.Ownerships) and the 'Time Out For Ownership' has been reached, then the work item is removed from the Work Item lists of all the approvers.
- If 'Min.Ownerships' = 0 and if 'Max.Ownerships' is set, the activity waits for actors to take ownership or action until the 'Time Out For Ownership' is reached (if this is set).
- If none of the ownership properties are set then the work item waits until the actor takes ownership or acts upon it.

Timeout Warning for Activity - This property specifies when a reminder has to be provided for the approvers to act on the Approval request, if the activity count has not been reached. If properties such as Max.Ownerships, Affirmative Answer for Approval (AAA), and Action Limit (AL) are set, once the property values are reached then a warning is sent to the actor. When the timeout is reached, the following checks are made: If AL is set, when the activity count i.e. the no. of approvals or rejections (AC) < AL, then a warning is sent; if AL = 0 and AAA is set, and when AC < AAA, then a warning is sent to the participant.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Timeout for Activity - This property's value is used to decide until what time the work item should wait for user action.

If properties such as Max.Ownerships, AAA, AL are set, once the property values are reached the work item is removed from the Work Item lists of all the approvers.

- When the timeout is reached, the following checks are made:
  - If AL is set, when the activity count i.e. the no. of approvals or rejections (AC) < AL, then the timeout for activity is performed and the activity is removed from all Work Item lists.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- If AC > AL, it checks with the no. of approvals or 'decision count' (DC) and AAA. If DC >= AAA (if it is set), the work item is considered approved; otherwise, it is rejected.
- If AAA = 0 and if DC >= AL, the work item is considered approved; otherwise, it is rejected.
- If AL = 0 and AC < AAA, then the timeout for activity is performed and the work item is removed from all Work Item lists. If AL = 0 and AC > AAA, it will check with DC.
- If DC > AAA it is approved; otherwise, it is rejected. If AL = 0 and AAA = 0, then if DC is at least 1, then it is considered approved; otherwise, it is rejected.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Multiple TimeOut Warning - This is used to set recurring timeout warnings that will be sent to the actors who have to take action. To set multiple timeout warnings, click the 'Multiple TimeOut Warning' button in the Properties pane for the Approval activity. A new window pops up. In this window, set the interval for the recurring warning as well as the output message. You can also set the Recurring Time Interval. This can be used to set a different recurring time out after the first timeout happens. For example, if 'Time Interval' for the property is set as 7 days and 'Recurring Time Interval' is set as 2 days, then the first time out will happen after 7 days and there will be a recurring time out every second day after the seventh day (first) time out.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Steps to set the Multiple TimeOut Warning property

1. To set the multiple timeout warning, click the button for the 'Multiple TimeOut Warning' property to open the property window.
2. Enter the time interval for the timeout in the **Time Interval** field
3. Select "Yes" from the drop down for the **Recurring**? field if you want the timeout warning to recur. Select "No" otherwise.
4. Enter the output message corresponding to the timeout warning in the **Output** field.
5. Enter the time interval for the recurring timeout in the **Recurring Time Interval** field.
6. After entering the content details, click **Add Row** to add this timeout setting and display a new row for entering another timeout setting.
7. Remove rows if necessary by selecting them and clicking **Remove Selected**.
8. After specifying the timeout settings, click **Update**.

See Approval - Multiple Timeout Warning for a detailed description of the Multiple TimeOut Warning property window.

Miscellaneous Top

Redirection Enabled? - This property enables redirection. When this property is set to Yes, the workflow redirects the user to the URL in the Redirect URL property in the next activity.

Activity outputs:

The Approval Activity returns the following values -

Approved: Displayed when the request is approved.

Rejected: Displayed when the request is rejected.

Not Enough Resources to Acknowledge: Displayed when the filter condition did not yield enough actors to whom the request can be sent.

Timeout - Acknowledge: Displayed when the specified minimum number of actors did not take ownership of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

request in the given time.

Timeout - Action: Displayed when some or all of the specified actors did not perform the required activity in the given time.

Timeout Warning - Acknowledge: Displayed when a warning is generated that the specified minimum actors have not taken ownership of the request in the given time.

Timeout Warning - Action: Displayed when a warning for timeout is generated because some or all the actors did not perform the required activity in the given time.

Note: The following outputs will return only if you assign tasks to a queue user.

Resource Unavailable for Queue - If a queue is assigned to a task and if there are no resources available in the queue then this output will get triggered.

TimeOut for Queue Task - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting the completion of that task.

Timeout Warning -Queue - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting in sending a warning out put. However, the task will still be sleeping.

Timeout Warning -Queue Participant - This output will get triggered when the task in the queue is picked by an user but still not acted on that task within the queue escalation time out settings resulting in triggering a warning output. However, the task will still be sleeping.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Looping Behavior

You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Approval - Delivery Channels

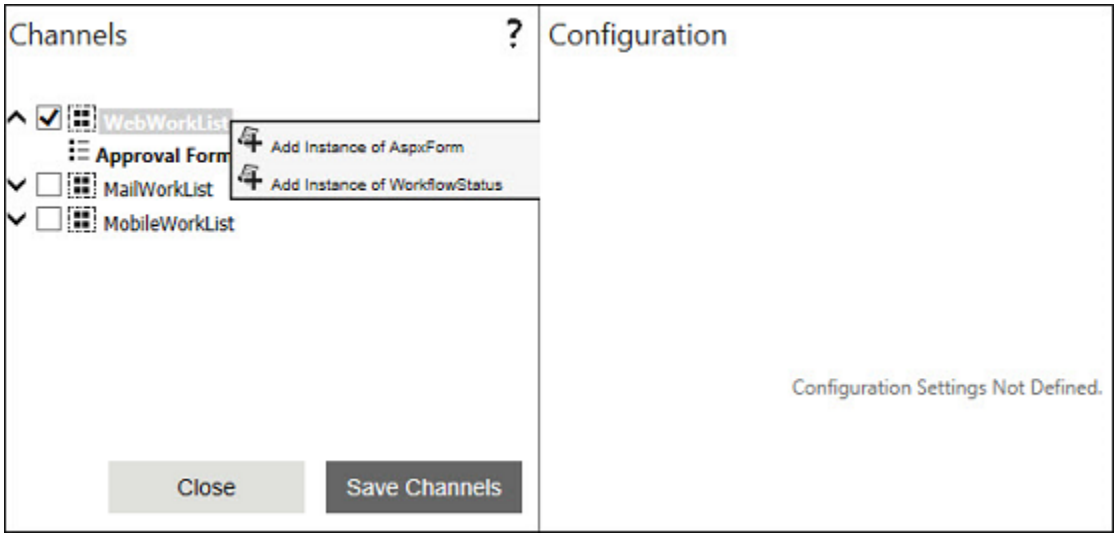
Purpose

The purpose of this chapter is to describe the feature of WorkflowStatus Form of Delivery Channels property under the category Configuration of any human activity available in AVEVA Work Tasks.

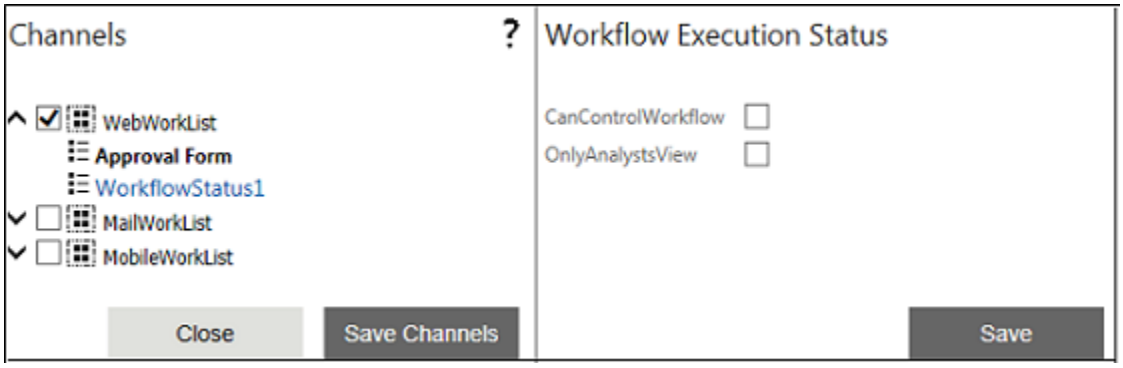
Description: This feature enables us to view the status of the workflow in the work item list in the graphical form. **[Optional]**

1. Select the **Approval Activity**.
2. Click the **Delivery Channels Property**.
3. This will open a window like the one shown below.

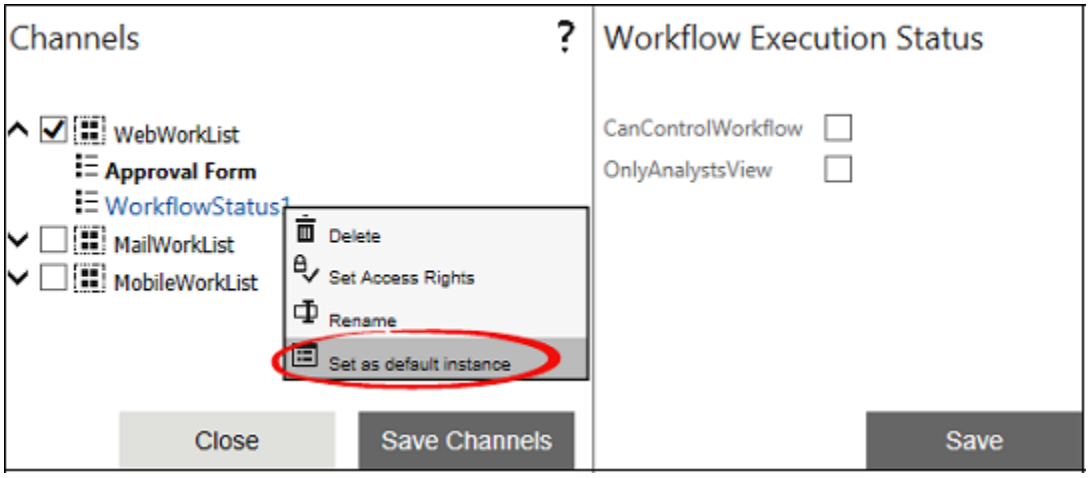
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



4. Right-click the WebWorkList to display the context menu with the Add Instance of Workflowstatus option as shown below.



5. Set the Properties for the Execution View Status Graphical view. Click **Save**.
6. If you want to Set the workflowstatus form as the default instance you can do it by right-clicking workflowstatus1 and selecting the **Set as default instance** option from the context menu.



7. Click the **Save** and **Save Channels** buttons.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Output

Now, when you click on any row in the Work Item List, you will find this Execution view page being displayed as the detailed view, if you set it as a default instance.

Otherwise Workflow status form will appear in context menu of each row in Work items list and you can open the execution view by selecting it from the context menu.

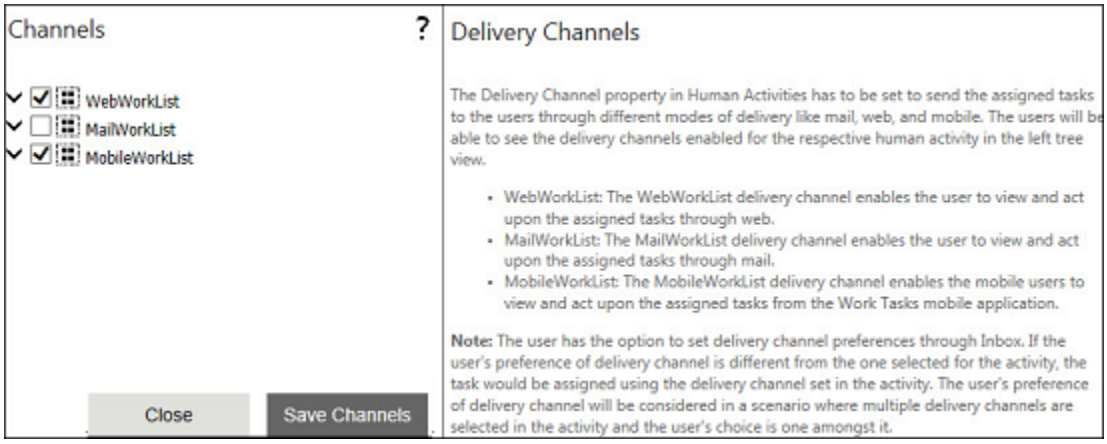
Delivery Channels - MobileWorkList

To deliver the work items to the mobile device, the **MobileWorkList** option in the Delivery Channel property needs to be selected. This allows mobile users to view and act upon the tasks from the Inbox that is rendered on their mobile devices.

This topic describes the steps required to configure the **MobileWorkList** option in the **Delivery Channel** property of the Approval activity.

To configure 'MobileWorkList' option in the Delivery Channels Property

1. In the **Process Designer**, drag and drop the **Approval** activity on to the design area. The activity properties pane of the selected activity appears on the right side of the design area.
2. In the **Activity Properties** pane, expand the **Configuration** node and select the **Delivery Channels** property.
3. In the **Delivery Channels** window, select the **MobileWorkList** check box in the **Channels** section.



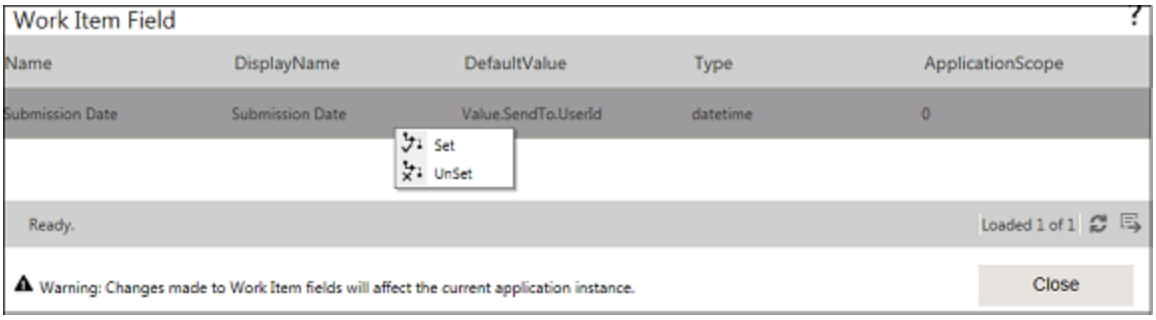
4. Click **Save Channels** and **Close**.
5. Set all the other properties and click **Publish and Test Run**.

Approval - Work Item Fields

Work Item Fields Property Window

You can set the Work Item Fields for this activity in this property window. To open this window, click the button for the 'Work Item Field' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a grid listing all the Work Item Fields that have been set for the process.

- Each row in the grid represents a Work Item Field. You can click a Work Item Field to select it.
- The context menu has the **Set** option, which you can use to set the selected Work Item Field for this activity. It also has the **UnSet** option to remove the Work Item Field setting.
- **Close** - You can use this button to close the window.

Note: While entering a value in the Work Item field, it is recommended to keep it less than the specified database column size. If there is a need to increase the size of the Work Item field, the user should manually increase the column size in the database.

Approval - Assign Actor(s)

Assign Actor(s) Property Window

You can set the actors to whom the approval work item is to be sent in this property window. To open this window, click the button for the 'Assign Actor(s)' property.

See Assigning a Task to a Manager for more details.

The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Different Methods of Assigning an Actor

- **Assigning an Actor by building an expression:**

Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

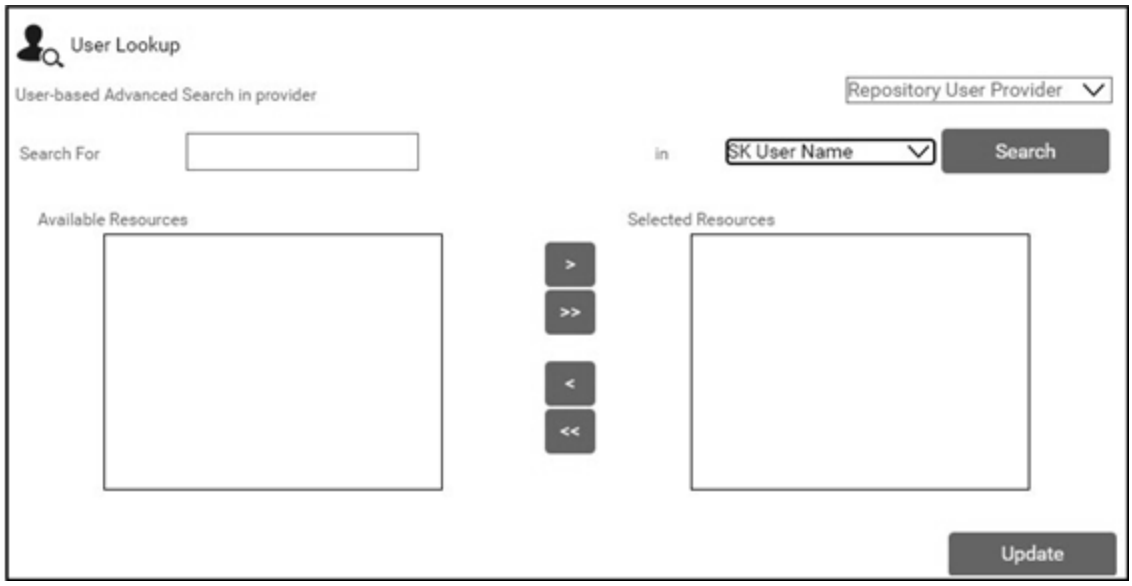
- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

- **Assigning an Actor through User Lookup**

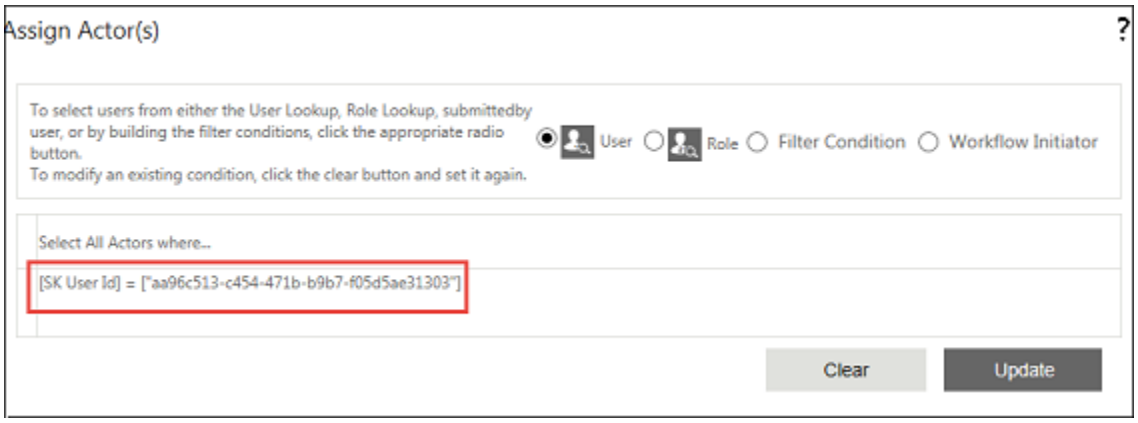
Through the **User Lookup** you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.
2. The **User Lookup** dialog is displayed, search and select the required actor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:



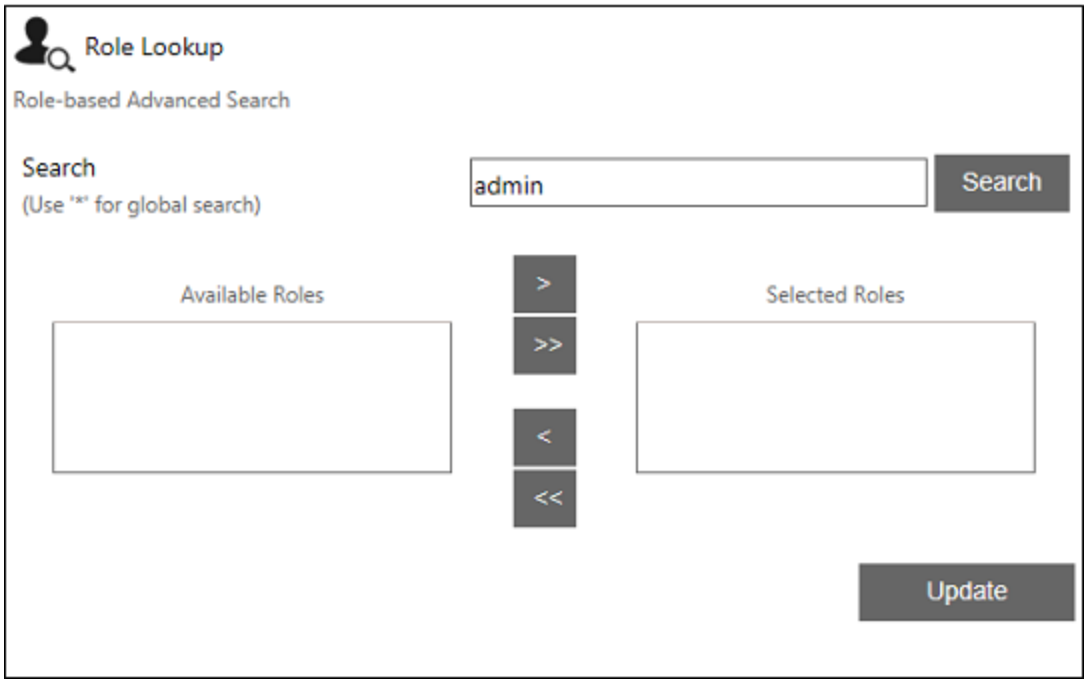
4. Click **Update** in the Assign Actor(s) window to update the selected actor(s) in the **Assign Actor** property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

- **Assigning an Actor through Role Lookup**

Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

1. Select the **Role Lookup** option.
2. The **Role Lookup** dialog is displayed, search and select for the required role.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



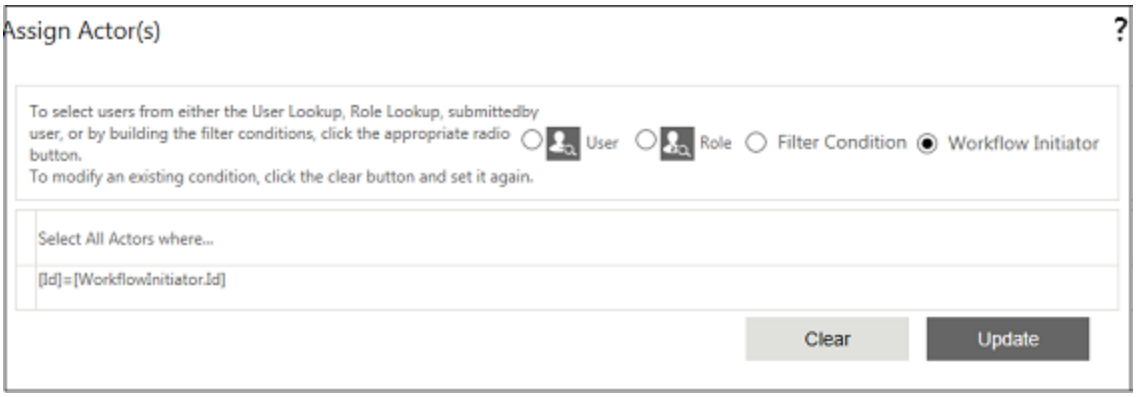
3. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

4. Click **Update** in the Assign Actor(s) window to update the Assign Actor property.

- **Assigning an Actor through Workflow Initiator**

Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

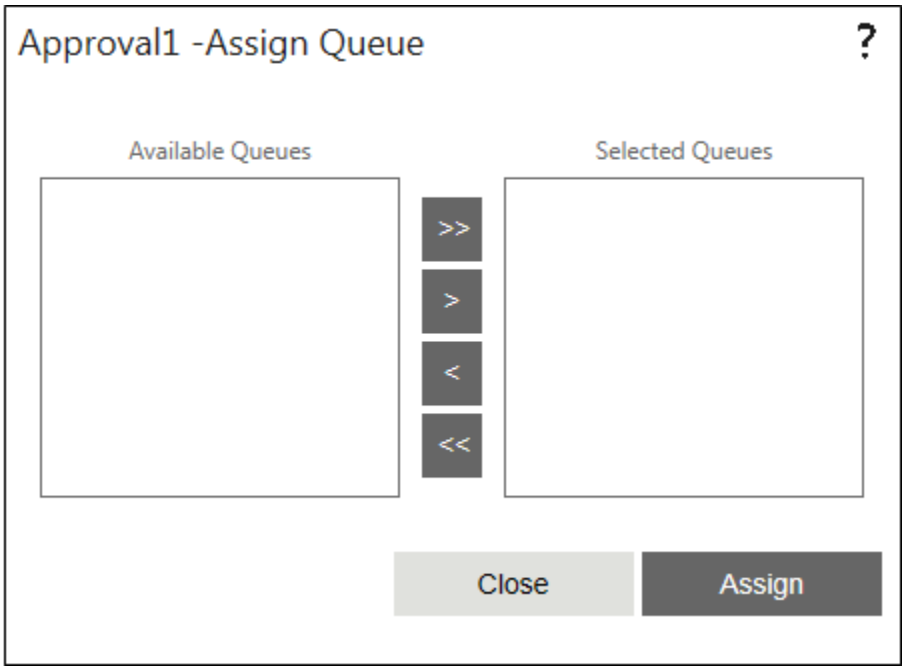
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Approval - Assign Queue(s)

Assign Queue(s) Property Window

You can select the queues to which the approval work item is to be sent in this property window. To open this window, click the button for the **'Assign Queue(s)' property**.



The window has a pair of list boxes to specify the queue(s). The **Available Queues** list shows all the available queues. You can select the required queue(s) from this list box. The **Selected Queues** list shows all the selected queues to which the activity will be assigned.

You can use the following buttons located between the list boxes to move the queues to and from the list boxes.

- [>>] - You can click this button to add all the queues in the Available Queues list to the Selected Queues list.
- [>] - You can click this button to add the selected queue(s) to the Selected Queues list.
- [<] - You can click this button to add the selected queue(s) from the Selected Queues list to the Available Queues list.
- [<<] - You can click this button to add all the queues in the Selected Queues list to the Available Queues list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

At the bottom of the window you will find the following buttons:

- **Assign** - You can click this button to assign the activity to the selected queues.
- **Close** - You can click this button to close this window.

Assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

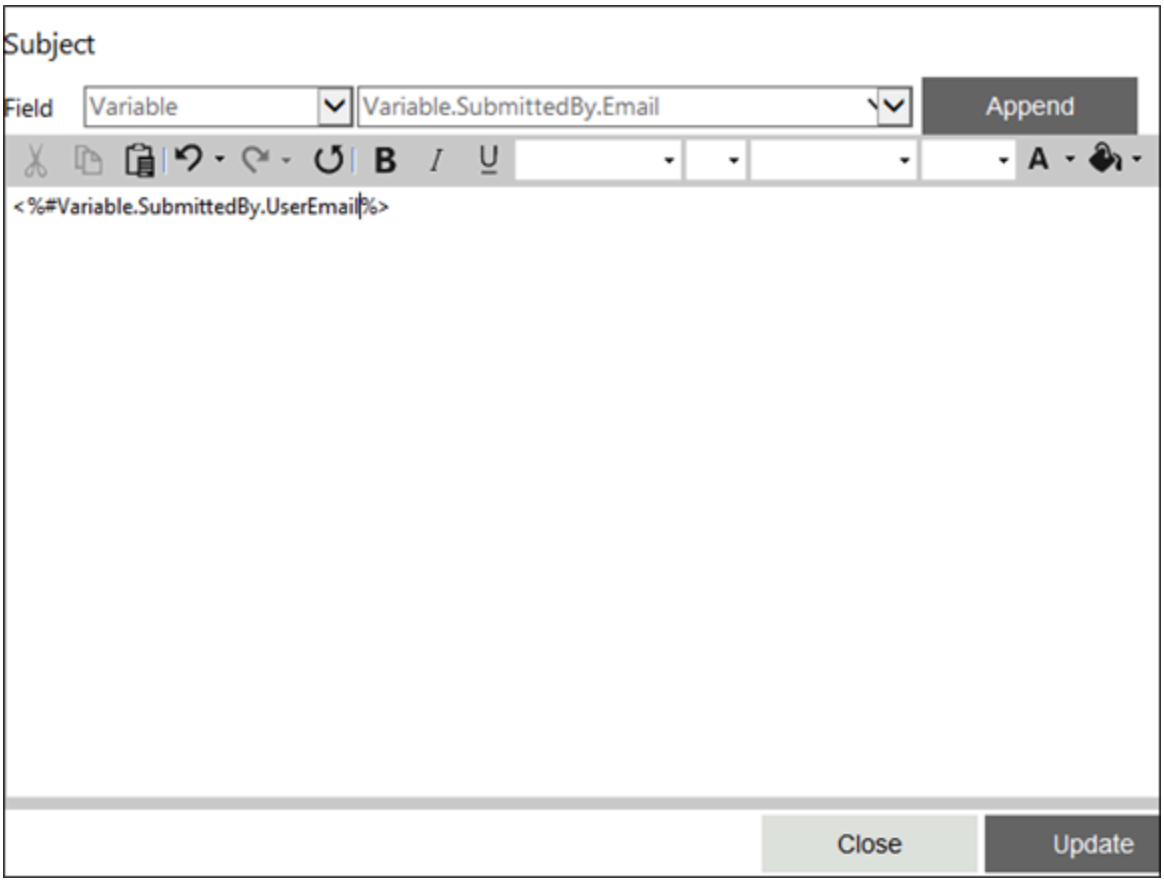
For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the **Start** activity with the Type as **String**. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

To assign multiple queues, specify the queue-ids with semicolon (;) separator. **Skelta.HWS.Queue.QueueCollection** class can be used to retrieve queue information.

Approval - Subject

Subject Property Window

You can specify a subject for the Approval work item assignment in this property window. To open this window, click the button for the 'Subject' property.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The window has a text editor to enter the subject. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the subject. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the subject in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the subject.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the subject using a combination of discrete value and variable or content. For example, in the image above, the subject entered is "Submitted By <%#Variable.SubmittedBy.Email%>". Here, the string "Submitted By" has been typed directly in the text editor. The second half of the subject is a placeholder, which will be replaced by the variable value during run-time. This has been added by selecting the appropriate variable option from the **Field** drop down and clicking **Append**.

The text tool bar above the text editor allows you to manage and format the subject. It has the following text tools:

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools:

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

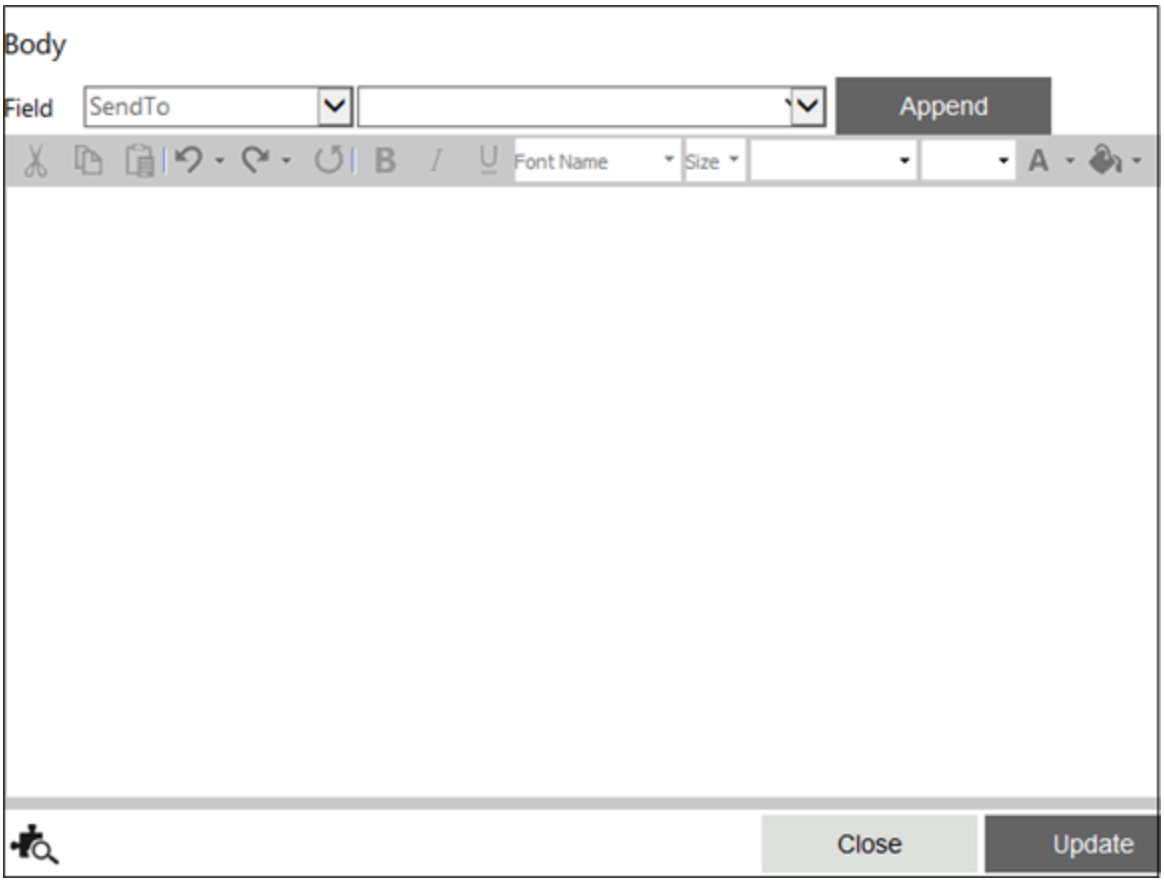
- **Update** - You can click this button to save the subject.
- **Close** - You can click this button to close this window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Approval - Body

Body Property Window

You can specify a message Body for the Approval work item assignment in this property window. To open this window, click the button for the 'Body' property.



The window has a text editor to enter the body text. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the body using a combination of discrete value and variable or content. For example, in the image above, the body message entered is "Hi, Please approve the leave application submitted by <%#Variable.SubmittedBy.name%>". Here, the string "Hi, Please approve the leave application submitted by" has been typed directly in the text editor. The second half of the body is a placeholder, which will be replaced by the variable value during run-time. This has been added by selecting the appropriate variable option from

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the **Field** drop down and clicking **Append**.

The text tool bar above the text editor allows you to manage and format the body text. It has the following text tools:

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools:

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the body message.
- **Close** - You can click this button to close this window.

Approval - Redirect URL

Redirect URL Property Window

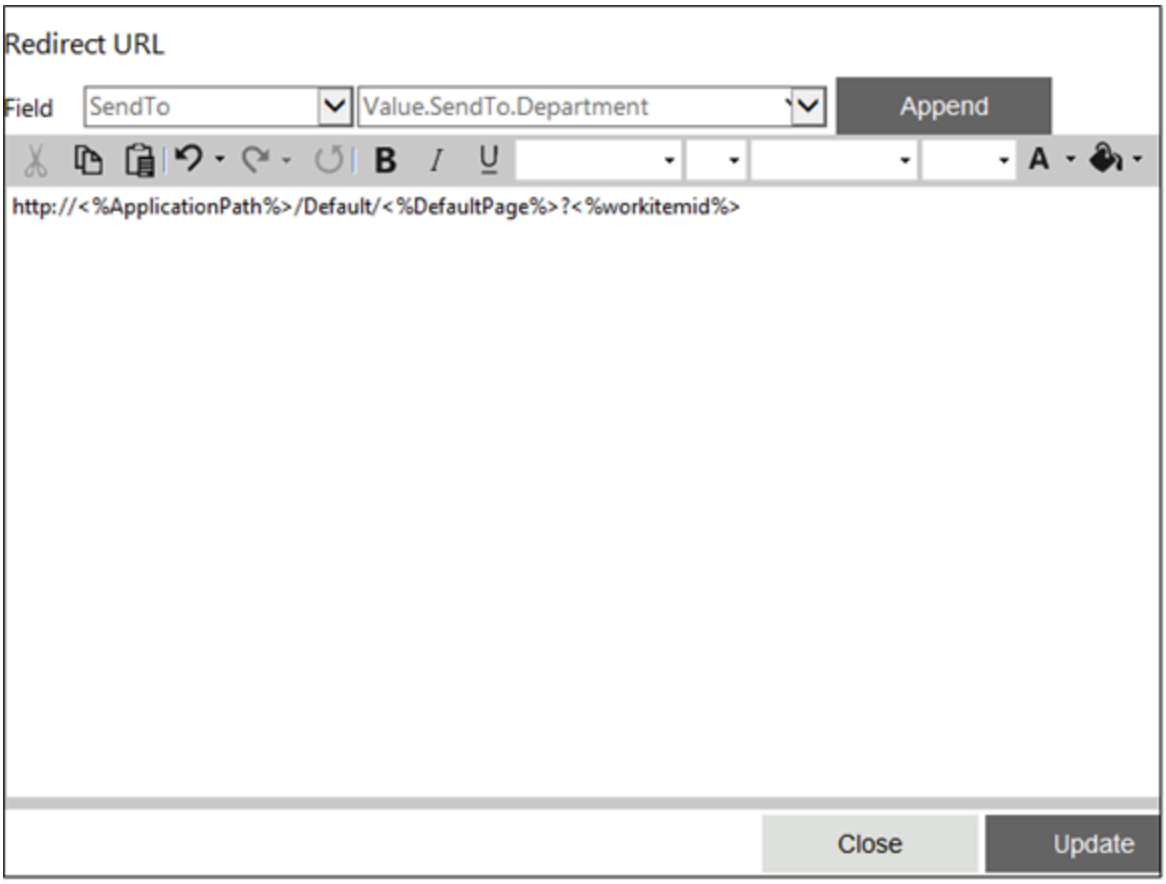
You can specify a message Redirect URL for the Approval activity in this property window. To open this window, click the button for the 'Redirect URL' property.

Set Redirection URL property as

http://<%ApplicationPath%>/Default/<%DefaultPage%>?<%workitemid%>

Note: While pasting the above URL, remove the extra spaces.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the Redirect URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/ drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Redirect URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Redirect URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Redirect URL. It has the following text tools:

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

It also has the following formatting and other tools:

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

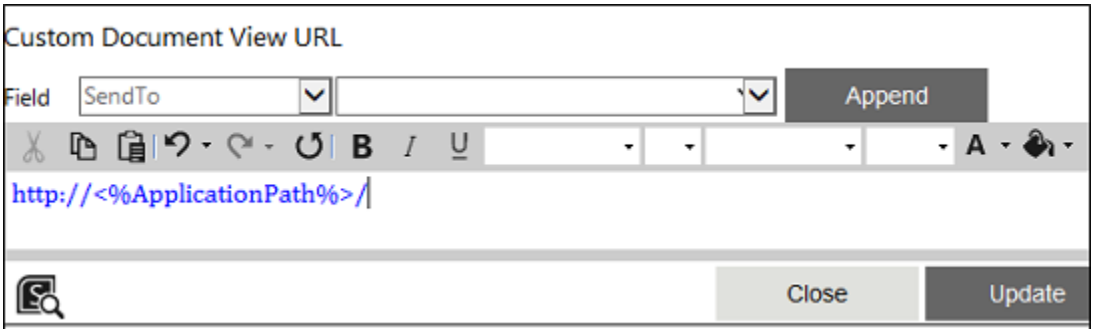
- **Update** - You can click this button to save the Redirect URL.
- **Close** - You can click this button to close this window.

Approval - Custom Document View URL

Custom Document View URL Property Window

You can specify a message Custom Document View URL for the Approval activity in this property window. To open this window, click the button for the 'Custom Document View URL' property.

For more details, see Custom Document View URL



The window has a text editor to enter the Custom Document View URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Custom Document View URL in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

to assign the Custom Document View URL.

- Append - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Custom Document View URL. It has the following text tools:

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools:

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window, you will find the following buttons:

Update - You can click this button to save the Custom Document View URL.

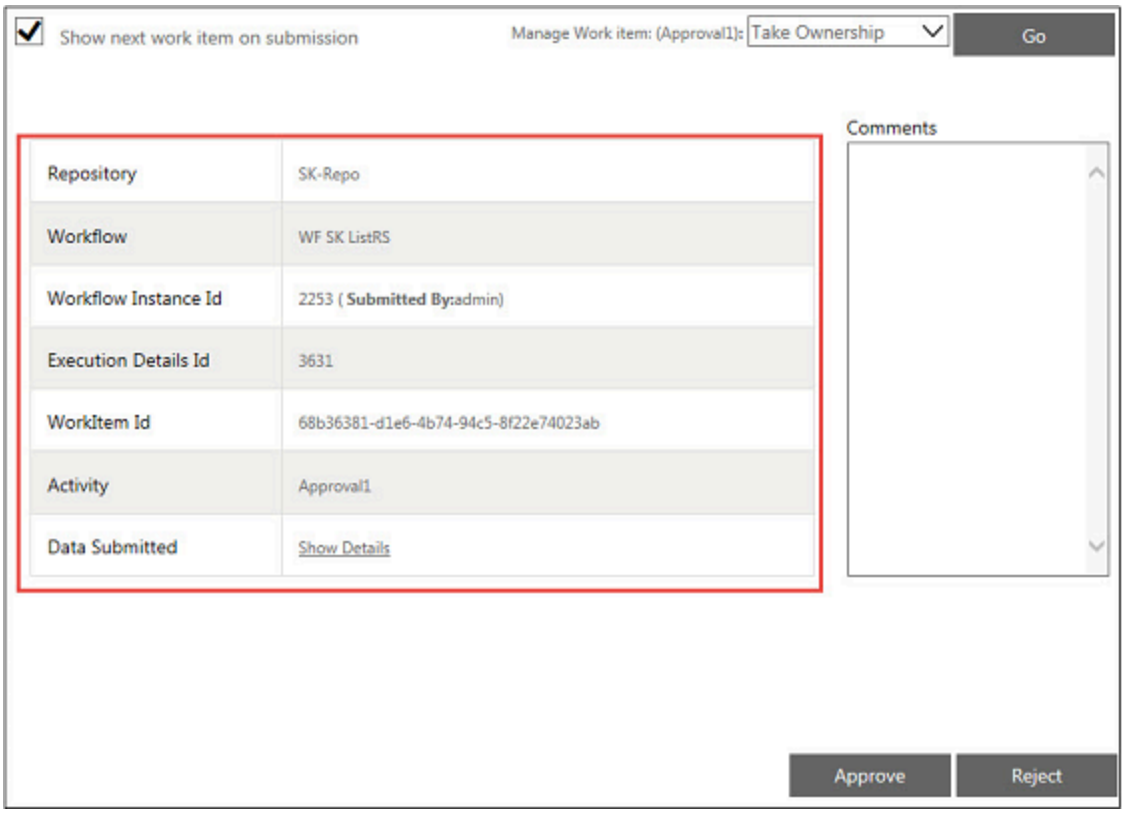
Close - You can click this button to close this window.

Custom Document View URL

Custom Document View

Custom Document View can be viewed on the left side of the Work Item Detail View page inside the frame as shown in the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



In AVEVA Work Tasks, you can provide a custom document view while using any human activity. Enter the proper URL for the Custom Document View URL property to view the custom document view. By default, the custom document view for any human resource activity normally shows the item metadata that alerts the workflow.

1. In AVEVA Work Tasks, if the workflow is alerted due to a Enterprise Console event association, document view shows the list item metadata that alerted the workflow. For example, if the workflow is alerted due to a workflow event association to a list, document view shows the list item that alerted the workflow.
2. If the workflow is alerted due to a workflow association in Forms, document view shows the form that alerted the workflow.

You can change the document view as required. If a URL is provided to the custom document view URL property, this can be overridden with the default document view.

1. If you want to show a different form in the Custom Document View, see Custom Document View URL for Forms.
2. If you want to show a different form or list item in the Custom Document View, see *Custom Document View URL for List Item*.

You can provide any URL to this property. This URL can be a URL to your custom page, too.

Custom Document View URL for Forms

If the workflow is alerted due to a workflow association in forms, document view shows the form that alerted the workflow.

Use the following URL with respective parameters to show any forms.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
http://<%ApplicationPath%>/BPMUITemplates/Default/SkeltaForms/
FormDocumentView.aspx?FormName=<Form Name>&FormVersion=<Form
Version>&FormInstanceXmlVariable=<Xml Variable Name>
```

FormName: Name of the form to be loaded in document view.

FormVersion: Version of the form to be loaded. By default the latest published version will be loaded. This parameter need to be used only if a specific version has to be loaded.

FormInstanceXMLVariable: XML variable name which is to be used for populating the form. If this parameter is not passed, SFFormData XML Variable will be considered as default.

Example:

For showing any form and populate data from XML variable, pass the following parameters in query string provided both having same XML schemas.

FormName=<Form Name>& FormInstanceXmlVariable=<Xml Variable Name>

Sample URL:

```
http://<%ApplicationPath%>/BPMUITemplates/Default/SkeltaForms/
FormDocumentView.aspx?FormName=Leave Report&FormInstanceXmlVariable=LeaveReportxml
```

When the workflow is executed, the **Custom Document View** of the specified form populated using XML variable is displayed in the Work Item detail View page.

Custom Document View URL for List Item or Enterprise Console

If the workflow is alerted due to a workflow association in list, document view shows the form that alerted the workflow.

Use the following URL with respective parameters to show any List Item metadata:

```
http://<%ApplicationPath%>/BPMUITemplates/Default/SkeltaForms/
FormDocumentView.aspx?FormName=<Form Name>& ListName=<List Name>&ListItemId=<List Item
Id>&FormInstanceXmlVariable=<Xml Variable Name>
```

FormName: Name of the form to be loaded in document view.

ListName: Name of the list from where the list item need to be loaded. This parameter needs to be passed only if ListItemId parameter is used.

ListItemId: Id of the list item which need to be loaded to populate the form. If the value of this is passed as 0, then list item id which alerted the workflow is considered as default. This parameter need not be passed, if form is populated using a FormInstanceXMLVariable.

FormInstanceXMLVariable: XML variable name which is to be used for populating the form.

Example:

- To show any form and populate data from XML variable, pass the following parameters in query string: FormName=<Form Name>& FormInstanceXmlVariable=<Xml Variable Name>

  Sample URL:

  ```
  http://<%ApplicationPath%>/BPMUITemplates/Default/SkeltaForms/
  FormDocumentView.aspx?FormName=Leave Report&FormInstanceXmlVariable=LeaveReportxml
  ```
- To show any form and populate data from a list item, use the following format:

  FormName=<Form Name>& ListName=<List Name>&ListItemId=<List Item Id>

  Sample URL:

  ```
  http://<%ApplicationPath%>/BPMUITemplates/Default/SkeltaForms/
  ```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
FormDocumentView.aspx?FormName=Leave Report&ListName=Leave
Application&ListItemId=4b3a003-1719-4015-9128-2fe29b9dc535
```

If <List Item Id> is passed as 0, then list item ID which alerted the workflow is taken.

Sample URL:

```
http://<%ApplicationPath%>/BPMUITemplates/Default/SkeltaForms/
FormDocumentView.aspx?FormName=Leave Report&ListName=Leave Approval&ListItemId=0
```

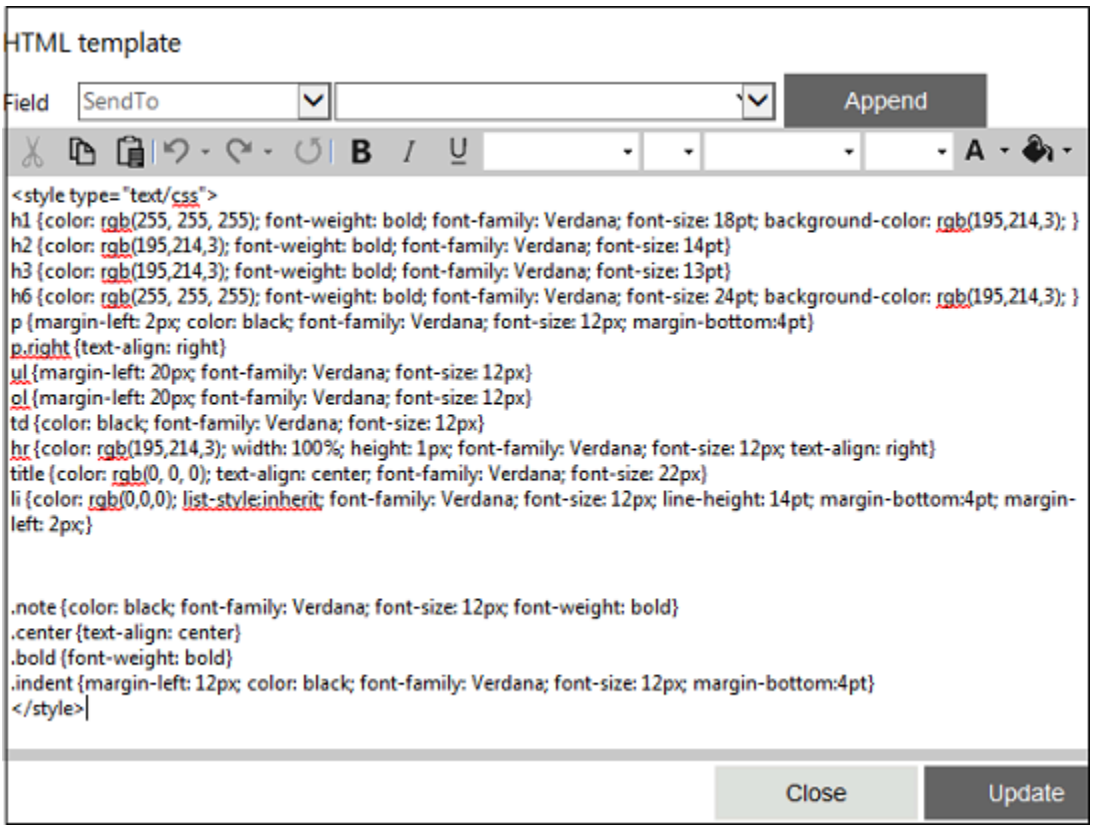
Approval - HTML Template

HTML Template Property Window

You can specify a html template for the Approval activity in this property window. To open this window, click the edit button for the 'HTML template' property.

In this property window, user can write their own html template for approval activity or make use of the default approval activity template for customizing the email.

See Using 'HTML Template' property of Approval Activity for more information.



The window has a text editor to enter the body text. You can do this either by entering a html template directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the message body. The control displayed

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.

- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the html template. It has the following text tools:

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools:

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

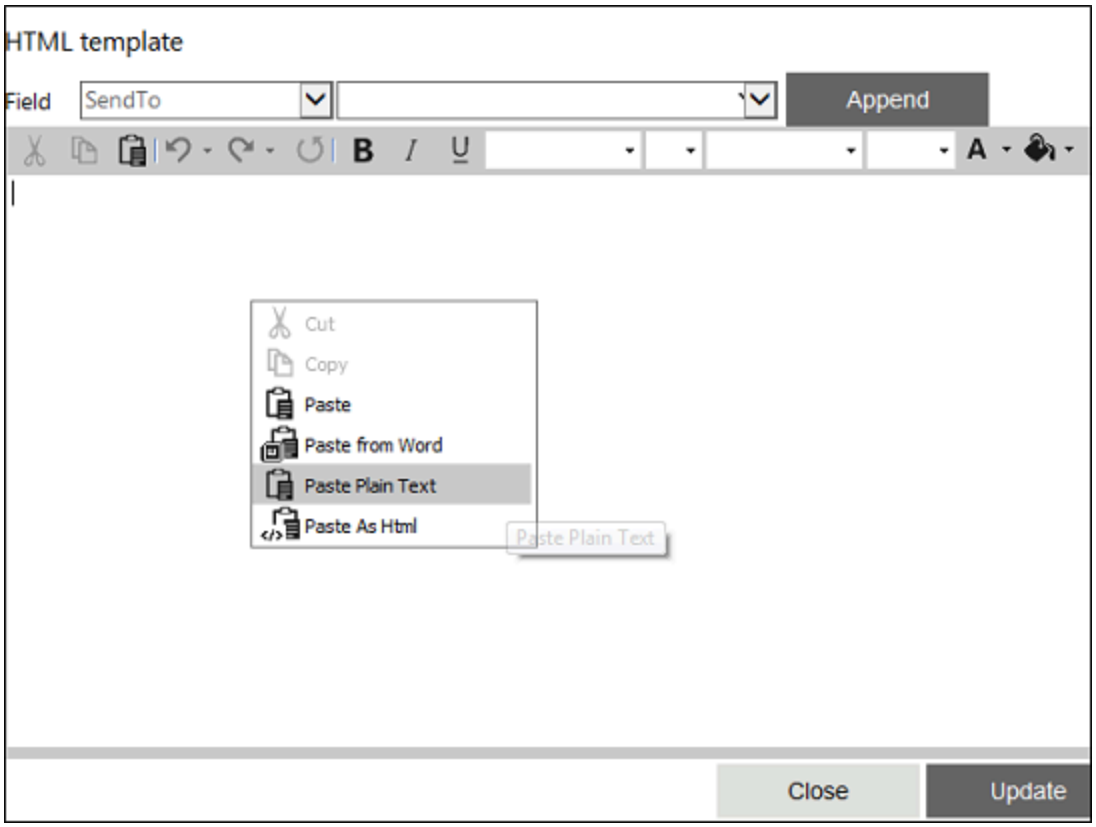
At the bottom of the window you will find the following buttons:

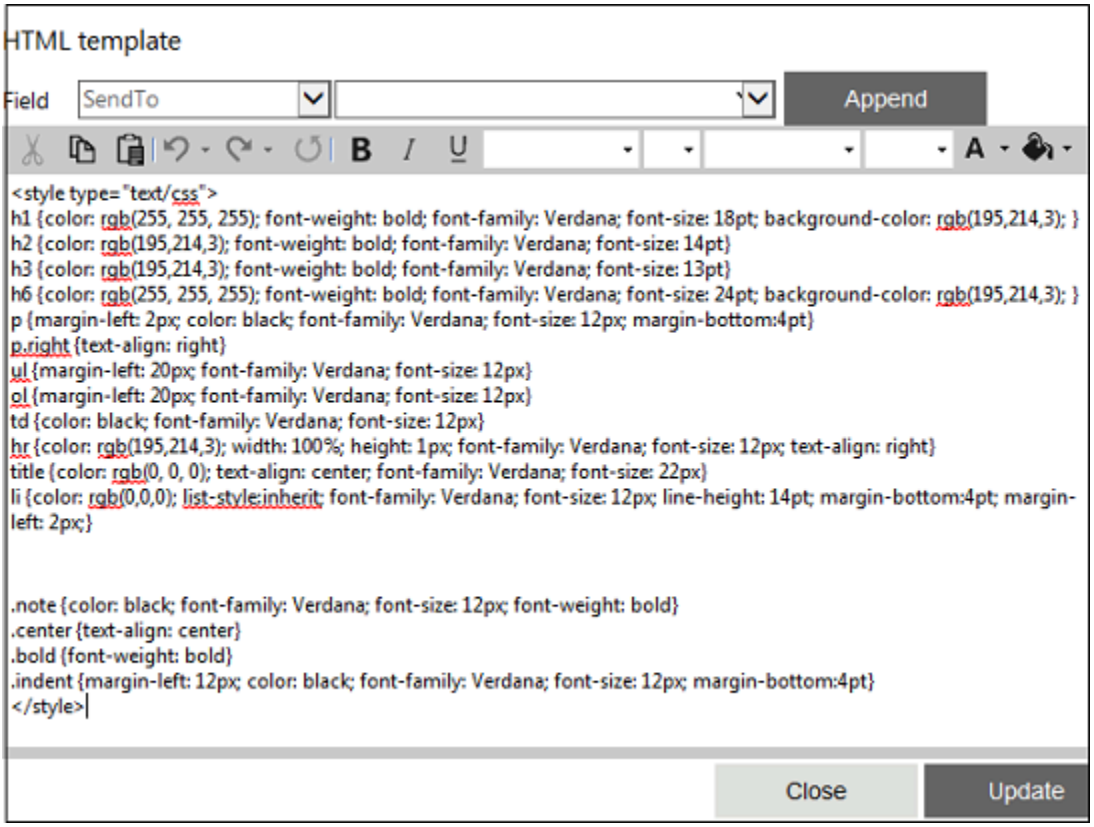
- **Update** - You can click this button to save the HTML template.
- **Close** - You can click this button to close this window.

To set the HTML template, follow the steps given below:

1. To specify the HTML template, click the edit icon to open the property window.
2. In the **HTML template** window, provide the template which should be in html format. If you are pasting a copied html content, right-click the **HTML template** window and paste it as **"Paste Plain Text".**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.





3. Click **Update**.

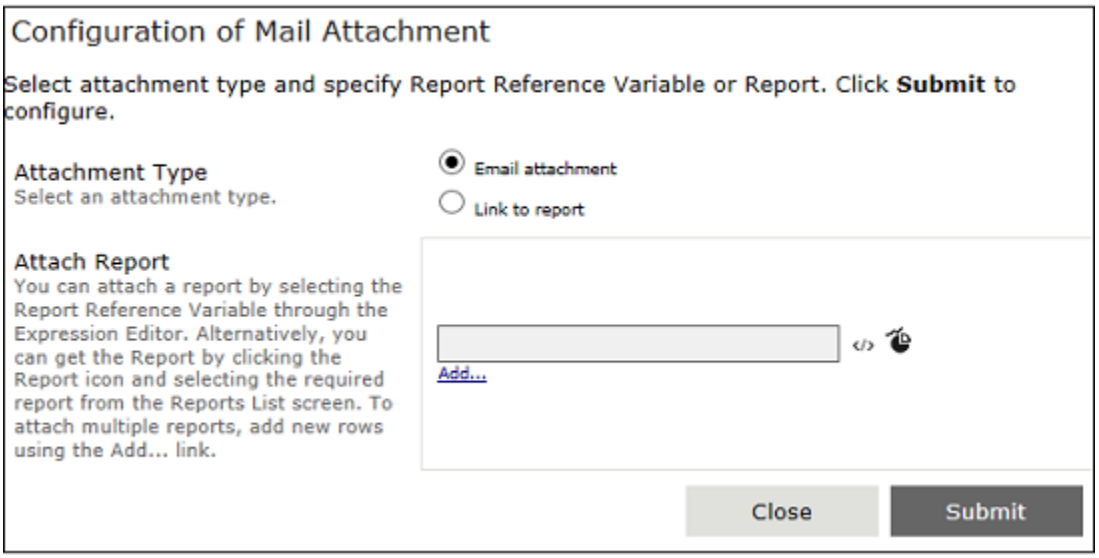
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Approval - Attach Reports

Configuration of Mail Attachment property window

You can configure the **Attachment** property for the **Approval** activity in this property window.

In this property window, you can configure the report attachments to be emailed.



- **Attachment Type:** Use this property to select the type of attachment for sending the report as an email.
  - **Email attachment:** Select this type to send the report as an email attachment.
  - **Link to report:** Select this type to embed a link in the email to download the configured report.
- **Attach Report:** Use this property to attach a report generated by the **Report Generator** activity within the workflow or to select a report from the list of generated reports.

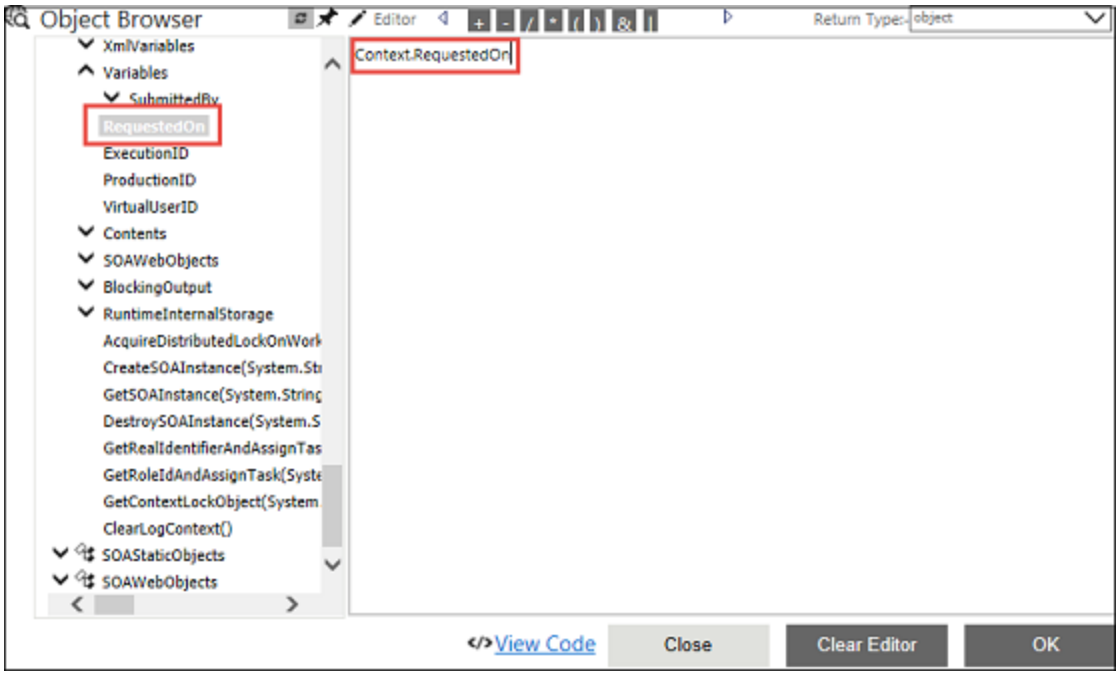
  You can attach a report by selecting the required **Report Reference Variable** using the **Expression Editor**. Alternatively, you can select the report from the Reports List window which consists of the already generated reports.

There must be at least one **Report Generator** activity before an **Approval** activity in the workflow to select the **Report Reference Variable** (using Expression Editor) as an **Attachment**. The **Report Reference Variable** is generated while configuring the **Report Generator** activity. By default, the report reference variable is **[Template Name]_[activity Name]**. For more information about **Report Reference Variable**, see Configure Report Template.

To configure mail attachment

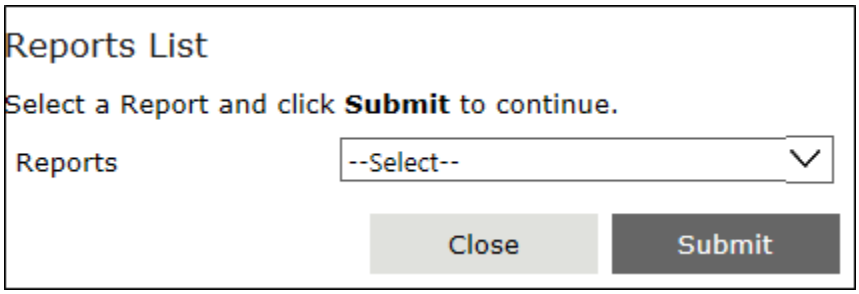
1. Click the edit button for the **Attachment** property.
2. Select the required **Attachment Type**.
3. In the **Attach Report** text box, you can either use the expression editor to get the variable of the report or use the **Reports List** to select the report.
4. To get the variable, click the **Expression Editor** icon given beside the text box to select the required **Report Reference Variable**.
5. In the **Expression Editor** window, select the required variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



6. Click **OK.**
7. Click **Close**.

   The variable appears in the **Attach Report** text box.
8. To select the report from the Reports List dialog box, click the **Reports** icon.



9. In the Reports List dialog box, select the required report, and then click **Submit**.

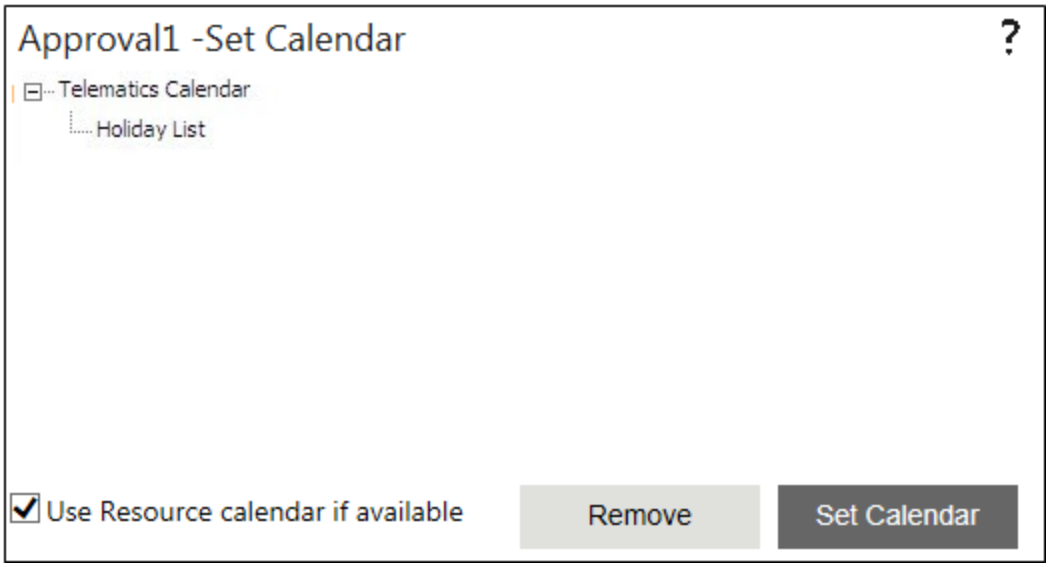
   This window closes automatically.
10. Click **Close** to close the configuration window.

Approval - Set Calendar for Timeout

Set Calendar for Timeout Property Window

You can set a Calendar to calculate the timeout for the Approval activity in this property window. To access this window, click the button for the 'Set Calendar for Timeout' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



This window lists the available calendars in a tree structure, with lower-level calendars nested within the respective top-level calendar. You can click a calendar to select it for setting.

There are two buttons in this window:

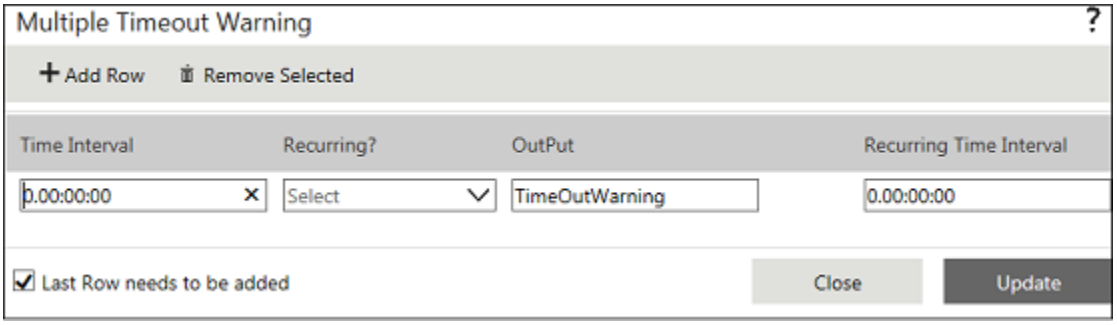
- **No Calendar** - You can click this button to indicate that there is no calendar set for the activity.
- **Set Calendar** - You can click this button to set the selected calendar.

The **User Resource calendar if available** check box can be selected to enable the use of resource calendars if none are displayed in this window for selection.

Approval - Multiple Timeout Warning

Multiple TimeOut Warning Property Window

You can set Multiple Timeout Warning in this property window. To open this window, click the button for the 'Multiple TimeOut Warning' property.



The window has two tabs at the top to manage the rows of timeout settings in the grid.

- **Add Row** - You can click this tab to add the newly entered timeout setting and to display a new row in the grid where you can add another timeout.
- **Remove Selected** - You can click this tab to remove the selected timeout setting row in the grid.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The grid has the following parameters that you need to specify for the new timeout setting.

- **Time Interval** - You can use this field to enter the time interval in which you to generate a timeout warning. You must enter the time in d.hh:mm:ss format.
- **Recurring?** - You can use the drop down in this field to indicate whether the timeout is recurring or not. You can select "Yes" to set the timeout warning to recur.
- **Output** - You can enter the output message corresponding to the timeout warning here.
- **Recurring Time Interval** - In this field, you can set the time interval in which the timeout warning has to recur. Enter the time in the d.hh:mm:ss format.

There are two buttons and a check box at the bottom of the screen.

- **Update** - You can click this button to save the newly added timeout settings.
- **Close** - You can click this to close the property window without saving the newly added timeout settings.
- **Last Row needs to be added** - You need to select this check box to save the last added row.

Checklist Activity

Activity Description

The Checklist Activity is incorporated in the AVEVA Work Tasks Workflow process design to send questions that need to be answered by actors in a workflow. These questions can be sent with a Text box, Memo, Checklist, Drop-down, or Radio Button to capture the answers provided by actors.

Application Scenarios

A typical application scenario could be a Technical Support Request Workflow Process, which will have a set of radio buttons on the Request Form which the customer can use to select the Support option applicable to him/her. A Checklist activity can be used in the workflow to display these radio buttons and retrieve the customer selection information.

Workflow Variables for Checklist

Steps to define variables for use in the Checklist activity

This section describes how to define variables for use in Checklist activities. It gives the syntax for creating the variables and typical examples for different cases.

Variables for capturing WorkItemIds

The Work Item Id's for the Checklist work item can be retrieved using a variable of type Array, with the following syntax:

'^'+CurrentActivity.Name+'WorkItemIds'.

For example, **^ReviewDocumentWorkItemIds**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Variables for capturing All Actors' Details

The details of the actor(s) to whom the Checklist work item gets assigned, can be accessed by declaring a variable of type array with the following syntax:

'^'+CurrentActivity.Name+'ActingUsers'

For example, **^ReviewDocumentActingUsers**.

Variables for capturing Responding Actors' Details

The details of the actors' submitting the Checklist response, can be accessed by declaring a variable of type resource with the following syntax:

'**^'+HWSActivity.ActivityName+'RespondingUser'**

For example, **^ReviewDocumentRespondingUser**.

This variable stores the responded user information. If it is more than one user, it will retrieve the last user details.

Note: For single user, you can declare this variable as Resource type. If task is assigned to multiple users and to get all responded users information, then the variable has to be declared as Array.

Variables for capturing Comments

Comments entered in a Checklist can be retrieved using a variable with the following syntax:

'^'+_HWSActivity.CurrentActivity.Name+'CommentCheckList'.

For example, **^ReviewDocumentCommentCheckList**.

(To add a comment field to the Checklist HTML page create a Text box control in Checklist HTML pages with the name "txtcomment". The HTML template pages for the Checklist activity can be found under the ..[AVEVA Work Tasks Install Path] \WorkflowElements\Default\en-US\Activities\Activity folder.)

Variables for capturing Checklist Questions and Answers in HTML format

Question and answers entered in the Checklist can be accessed in HTML format by using a variable with the following syntax:

'**^'+CurrentActivity.Name+'AnswersHTMLCheckList'**

For example, ^ReviewDocumentAnswersHTMLCheckList.

Variables for capturing Checklist Questions and Answers in XML format

Question and answers entered in the Checklist can be accessed in XML format by using a variable with the following syntax:

'**^'+ CurrentActivity.Name+'AnswersXMLCheckList'**

For example, **^ReviewDocumentAnswersXMLCheckList**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Variables for assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the Start activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the Workflow.

To assign multiple queues, specify the queue-ids with semicolon (;) as the separator. Skelta.HWS.Queue.QueueCollection class can be used to retrieve queue information.

Variable for Queue Acting Users

You can declare an Array type variable to get updated information about the name of the actor to whom an activity gets assigned from a queue.

In the Workflow Variables, define the variable in the following format:

^+CurrentActivityName+'QueueActingUsers'

Ex: ^HRFormQueueActingUsers

HRForm is the activity name.

For example the value of the user who acts on the HRForm activity will be stored in the variable. The Approval1 task will be assigned to the same user.

Variable for storing timeout warning value

Suppose if you want to store the timeout warning value for Checklist activity in your workflow. The naming convention for the system variable to be declared is

^<ActivityName>ResponseByWarningTimeout

The value returned by the variable will be in UTC format. For multiple user scenarios the highest timeout value calculated for user will be available in the variable.

Note: Multiple timeout warnings cannot be tracked using this feature.

Retrieving Stored Checklist Data:

When an actor has acted upon the checklist, it is marked as completed and the details are stored in XML format in the database. It can be retrieved as SELECT DATA FROM SKWorkItem SKW, SKWorkItemData SKWD WHERE

SKW.DataId = SKWD.Id AND SKW.Id = <WorkItemId>.

See the XML file to know how the details are stored in the database.

The following image shows the format in which the Checklist Details are stored in the XML file:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
- <checklist>
  - <question identifier="q1" decisionmaker="" questiontype="radio" questiontypecount="radio1" optioncount="1" includeinxml=""
      mandatory="yes" defaultvalue="" submittedby="John Smith" submittedbyidentifier="" name="RADIO">
      <option value="FirstQuestion">FirstQuestion</option>
      <answer>FirstAnswer</answer>
    </question>
  - <question identifier="q2" decisionmaker="" questiontype="radio" questiontypecount="radio2" optioncount="2" includeinxml=""
      mandatory="yes" defaultvalue="" submittedby="John Smith" submittedbyidentifier="2" name="RADIO1">
      <option value="SecondQuestion">SecondQuestion</option>
      <option value="SecondQuestion1">SecondQuestion1</option>

      <answer>SeventhAnswer</answer>
    </question>
</checklist>
```

Activity Properties:

The Checklist activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Checklist activity. The Activity Properties are organized under the following groups of related properties.

Name & Description

You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Display Name - This property specifies the name to be displayed for the work item in the Work items list.

Property Type: Optional (This property need not be set if the display name is already configured in the Actions.XML. The name entered here overrides any display name that is configured for this activity in the Actions.xml file.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the functionality of the activity.

Delivery Channels - This property is used to specify the delivery channels to deliver the activity to the assigned actor(s). Multiple channels can be specified giving the actor(s) different options to act on the work item.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Delivery Channels property

1. To select the Delivery Channels, click on the button for the 'Delivery Channels' property the property window will be displayed.
2. In this window, the Delivery Channels that have been configured and will be listed on the left along with a check box against each channel. Click and select the check box corresponding to the channel you wish to select. You can select multiple channels by selecting the respective check-box.
3. Click on Save Channels button.

See CheckList - Delivery Channels for a detailed description of the Delivery Channels property window.

Questions - This property is used to define the Question and Answer Types in a Checklist Activity; the Answer Types provided are Textbox, Memo, Checklist, Drop-down, and Radio button.

Property Type: Mandatory (This property must be set for the activity to be used in the workflow.)

Attributes of the Questions property

- The user interface displays the Question and Answers
- Decision Maker functionality
  - There can be a Decision Maker associated with a Checklist. The outcome of the Checklist Activity is determined by the Answers tagged with the Decision Maker. A Question marked with a red exclamation mark ! is said to be the 'decision maker' for the Checklist activity.
  - Only Drop-down can have the Decision Making functionality tagged. There can be only one 'decision maker' for a Checklist activity. For example, if the decision maker is tagged with a Question which has 'Approved' & 'Rejected' as values, and the Checklist is submitted with 'Approved' selected in the drop down, then the engine is alerted about the 'Approved' status and the engine executes the next process in the workflow.
  - Whenever an actor acts upon (submits) the checklist the engine is notified with the answer to the question, provided the question is marked as a decision maker.
- Mandatory Functionality
  - If an answer type is marked as mandatory the actor will be prompted to enter the value before submission. A Question marked with a red asterisk * is set as 'mandatory' when the actor fills up the Checklist. The actor cannot submit the checklist answers without filling the 'mandatory' questions.
- Default Functionality
  - Inputs given as default will be shown as the default answer for the answer type in the user interface.
- Edit and Delete options have been provided
- To add Questions and Answers:
  - First the actor clicks on the Add New button (the option to add more than one question has also been provided.)
  - Then the actor is asked to enter the question and the answer type,
  - Based on the answer type the actor is asked to enter the values (for example, if the answer type is drop-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

down, then you have to enter "display text" and the value for the display text.)

Steps to set the Questions property

1. To specify the questions and answers, click the button for the 'Questions' property to open the property window.
2. In this window, specify the number of questions to add in the **No. of additional questions** text box and click **Add New**. This will open a new window.
3. In the second window, enter the question in the text box under the **Questions** column.
4. Next specify the answer type for the question by selecting an option from the drop down under the Answer Type column. Depending on your selection, the question will take answers in a text box or memo, or as options in a drop-down, check box, or radio.
5. Specify the number of options for the selected answer in the **No. of Options** text box.
6. If you selected "drop-down" as the answer type in step 4, a radio is displayed under the ! column. Click this radio, if you want to make this question the decision maker. This implies that the answer to this question will determine the outcome of this activity.
7. Select the check box under the **Mandatory*** column to make this question mandatory.
8. Repeat steps 3 through 7, if you are adding more than one question in the checklist.
9. After setting the parameters for all the questions click on the **Next** button to go to the next window.
10. In the third window, specify the options that will be presented to the actor to answer the question (if the question type is drop-down, check box or radio) in the text boxes under the **Options** column.
11. Next, specify the option that will be the default value by clicking the corresponding radio button under **Default Value** column.
12. You must also specify the values that the answer will take internally in the **Values** text box.
13. In addition you can select a variable from the drop down for the **Map question answer to variable** field. The answers to this question will be stored in the selected variable and will be available for use in the workflow.
14. After completing all the details you can click on the **Finish** button to save the question.

    The first window is displayed again when you click on the Finish button. It shows the newly added question(s). You can modify or delete the new question or add more new questions. If you do not wish to perform any more operations, click Close to exit this window.

See CheckList - Questions for a detailed description of the Questions property windows.

Work Item Fields - This property is used to add the Work Item Fields to be used to display application data as well as value in variables and content in the Work items list when this activity is executed.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Work Item Fields property

1. To select the Work Item Fields, click the button for the 'Work Item Fields' property to open the property window.
2. In this window, the Work Item Fields that have been set are listed in a grid. Click on a row to select the corresponding Work Item Field.
3. Right click the row, and select the "SetWorkItemField" option from the context menu to set it.

See CheckList - Work Item Fields for a detailed description of the Work Item Fields property windows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Actors

The properties in the Actors group have been described below. You can use these properties to specify the actors who will work on the activity and related properties.

Assign Actor(s) - This property is used to specify the actor(s) who has to take up the Checklist activity. It is tagged with the Ignore Unavailable Actors property which in turn is tagged with the Alternate Actor Allowed property. This will be explained in detail later.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any actor(s).)

Steps to set the Assign Actor(s) property

1. To specify the actors, click the button for the 'Assign Actor(s)' property to open the property window.
2. In this window build an expression to select the actors using the actors properties. Select an attribute from the first drop-down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop-downs. Select "End" from the last drop-down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See CheckList - Assign Actor(s) for a detailed description of the Assign Actor(s) property window.

See the Using XML Variables section in the About XML Variables topic for details on how to use the XML Variables to build the expression.

Assign Queue(s) - This property specifies the queue(s) to which the Checklist activity is to be assigned.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any Queue(s).)

Steps to set the Assign Queue(s) property

1. To specify the queue(s), click the button for the 'Assign Queue(s)' property to open the property window.
2. In this window select the queue(s) from the **Available Queues** list box. You can select multiple queues by selecting with the <Ctrl> key pressed.
3. After selecting the required queue(s) click the [>] button to move it to the **Selected Queues** list box. You can click the [>>] button to select all the queue(s) and move them to the **Selected Queues** list box.
4. You can remove any queue from the selected list by selecting it and clicking the [<] button. You can remove all the queues by clicking on the [<<] button.
5. After adding the required queue(s), click **Assign** to assign the activity to the selection.
6. Click **Close** to close the window without saving the selection.

See CheckList - Assign Queue(s) for a detailed description of the Assign Queue(s) property window.

Min. Ownerships [% or Number] - This property, can be specified as a number or percentage, is the minimum number of actors who should take ownership of the Checklist request. This property is related to the 'Timeout warning for Ownerships' and 'Timeout for Ownership' properties.

To illustrate, when 'Timeout for Ownerships' is reached, the activity first checks if the ownership count is less

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

than 'Min.Ownerships' (if it is set).

- If it is, the work item will be removed from all Work Item lists.
- If the 'Min.Ownerships' has already been satisfied, then the work item will be removed from the Work Item lists of those who have not taken ownership.
- If the 'Min.Ownerships' value is 0, then the activity checks if the ownership count is less than 'Max.Ownerships' (if it is set). If it is, the work item will be removed from all Work Item lists. Else the work item will be removed from the Work Item lists of those who have not taken ownership.
- If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work Item lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Max. Ownerships [% or Number] - This property, which can be specified as a number or percentage, is the maximum number of actors who should take ownership of the Checklist request.

- If 'Timeout for Ownerships' is specified and achieved, and the 'Min.Ownerships' is also satisfied, then the activity waits for action from those who took ownership.
- If the Min.Ownerships value is set to 0, then it checks if the ownership count is less than Max.Ownerships.
- If it is, the work item will be removed from all Work Item lists. Else the work item will be removed from the list of those who have not taken ownership.
- If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work Item lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Enable Take Ownership? - If this property is set to **Yes**, then the actor is provided with a **Take Ownership** option in the Work items list to take ownership of the task. If you are not required **Take Ownership** option in the Work items list, then set this property as **No**.

Note: By default, this property is set as Yes.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Enable Take Ownership? property

- Select **Yes** or **No** option from the Enable Take Ownership? drop-down list.

Re-Assign Allowed? - If this property is set, then the actor is provided with a Re-Assign option. Using this the actor can re-assign the work item to another actor.

Property Type: Optional (This property needs to be set only if necessary.)

Ignore Unavailable Actors? - This property provides the following options - **Yes**, **Yes** - **holidays excluded** and **No**.

- If this property is set to 'No', when the Approval activity is assigned to the actor's Work Item list, a check is first done to see whether the actor is available. If the actor is not available then a check is made for an alternate actor assigned to the unavailable actor. Simultaneously the value of the property 'Alternate Actor Allowed' is checked. If that is also set, then the Approval work item is assigned to this actor.
- If this property is set to **Yes - holidays excluded**, the Workflow engine will ignore the fact that actors are not available if the day is an organization holiday and the output Not Enough Resources will not be generated.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if necessary.)

Alternate Actor Allowed? - This property is set to assign a particular task to an alternate actor in the absence or unavailability of any actor.

Property Type: Optional (This property needs to be set only if necessary.)

Notification Contents

The properties in the Notification Contents group have been described below. You can use these properties to specify the content used to notify actors about the activity.

Subject - This is the subject of the Checklist work item. The subject can be customized for each actor.

Property Type: Optional (This property need not be set. If it is not set, the default subject line from the Actions.XML file is displayed.)

Steps to set the Subject property

1. To specify the subject, click the button in the 'Subject' property to open the property window.
2. In this window, enter the subject text directly in the text editor.
3. If you want to customize the subject you can do so using the Field controls to add resource property values. For example, to add a subject that includes the email id of the actor submitting the checklist, you can do as follows: First type in the text "Submitted By". Next select "Variable" and "Variable.SubmittedBy.Email" from the two drop downs for Field and click Append. This will add the placeholder for the variable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the email id.
4. You can edit the text, using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes and also zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the subject, click **Update** to save it.
7. Click **Close** to close the window without saving the subject.

See CheckList - Subject for a detailed description of the Subject property window.

Body - This is the actual message of the Checklist sent to the actor(s). The body can be customized for each actor. There is an Enterprise Console Explorer(plug-in) edit icon in the Body property window to get the Work item details URL. See Enterprise Console Control (EC Plug-in) for more information.

Property Type: Optional (This property need not be set.)

Steps to set the Body property

1. To specify the message body, click the button in the 'Body' property to open the property window.
2. In this window, enter the body text directly in the text editor.
3. If you want to customize the body you can do so using the Field controls to add resource property values. For example, to add a body that includes the name of the actor submitting the checklist, you can do as follows: Type in the text "Hi, Please cast your vote in the poll conducted by". Select "Variable" and "Variable.SubmittedBy.name" from the two drop downs for Field and click Append. This will add the placeholder for the variable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the name.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. You can edit the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command and also zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the body, click **Update** to save it.
7. Click **Close** to close the window without saving the body.

See CheckList - Body for a detailed description of the Body property window.

From Email Address? - This property is used to specify the email address from which notification messages will be sent for the activity.

Property Type: Optional (This property needs to be set only if necessary. If it is not set, the default value in Actions.XML will be used.)

Hide Responses? - If this property is set to 'No', then actors can see the responses of other actors in a group response scenario. To view these responses, such as ownerships and action, select the 'Take Ownership' option. This will open a new pop up with the responses of other actors who have taken ownership.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Priority - This property is set to indicate the priority of the checklist request. Enter the values 0-33 to set as Low, 34-66 for Medium, or 67-99 for High. The default value is set to 34.

Property Type: Optional (This property needs to be set only if necessary.)

Show Custom Document View Window - If this property is set to 'Yes', then the Custom Document View Window will be shown to the users in their Work Item Lists.

Property Type: Optional (This property needs to be set only if necessary.)

Send Notification Email - If this property is set to 'Yes', then notification emails will be sent to the actors. If it is set to 'Yes-HTML', then the emails will be sent in HTML format.

Property Type: Optional (This property needs to be set only if necessary.)

Notify if alternate actor is considered- If this property is set to 'Yes', then notification emails will be sent to the actors when an alternate actor is considered.

Property Type: Optional (This property needs to be set only if necessary.)

Redirect URL - This property is used to get the URL of the web page to redirect the client to, in the case of synchronous execution of the action.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Redirect URL property

1. To specify the Redirect URL, click the button in the 'Redirect URL' property to open the property window.
2. In this window, enter the Redirect URL directly in the text editor.
3. If you want to customize the Redirect URL you can do so using the Field controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for Field, and clicking Append. This will add the placeholder for the variable in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the URL.
4. You can edit the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

and redo changes, repeat the last command and also zoom in and zoom out the view as well as print the text.

5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Redirect URL, click **Update** to save it.
7. Click **Close** to close the window without saving the Redirect URL.

See CheckList - Redirect URL for a detailed description of the Redirect URL property window.

Custom Document View URL - This property is used to get the URL of the page to which the custom document dlls does a post. The data posted to the page are application, workflow, executionid, executiondetailsid, and workitemid. The posted data can be retrieved as Request.Form["workitemid"].

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Custom Document View URL property

To specify the Custom Document View URL, click the button in the 'Custom Document View URL' property to open the property window.

1. In this window, enter the Custom Document View URL directly in the text editor.
2. If you want to customize the Custom Document View URL you can do so using the Field controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for Field, and clicking Append. This will add the placeholder for the variable in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the URL.
3. You can edit the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command and also zoom in and zoom out the view as well as print the text.
4. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
5. After adding the Custom Document View URL, click **Update** to save it.
6. Click **Close** to close the window without saving the Custom Document View URL.

See CheckList - Custom Document View URL for a detailed description of the Custom Document View URL property window.

Mail Channel

The properties in the Mail Channel group have been described below. You can use these properties to customize the approval activity (activities) with different mail channel templates.

Use html template from property - This property is set to 'No', then it will take the mail channel template from the physical path

'[AVEVA Work Tasks Installed Path]\BPM.NET\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\CheckListEmail.html.

If this property is set to **'Yes'** and the "**HTML Template**" property is empty, then it will take the mail channel template from the physical path

'[AVEVA Work Tasks Installed Path]\BPM.NET\WorkflowElements\Default\en-US\Templates\

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

OutlookEmailTemplate\CheckListEmail.html.

Property Type: Optional (This property needs to be set only if necessary.)

HTML template - This property is used to define the html template for mail channel.

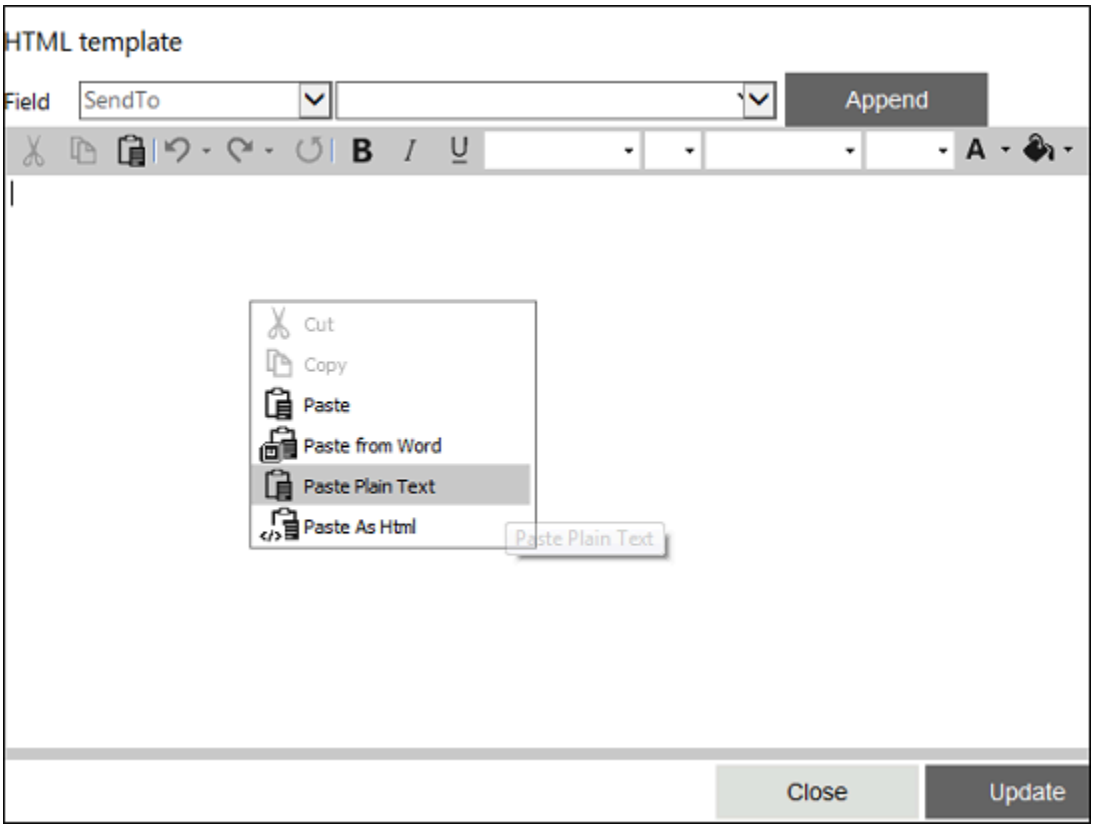
Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the HTML template

1. To specify the HTML template, click the edit icon to open the property window.
2. Click **Update**.

See CheckList - HTML Template for a detailed description of the property HTML template window.

Attachment



Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Attachment property

1. To specify the Attachment property, click the edit icon to open the property window.
2. In the Configuration of Mail Attachment window, select the required attachment type by clicking the radio button.
3. In the Attach Report property, you can attach a report by selecting the Report Reference Variable through the Expression Editor. Alternatively, you can get the Report by clicking the Report icon and selecting the required report from the Reports list screen. To attach multiple reports, add new rows using the Add... link.
4. Click **Submit**.

See CheckList - Attach Reports for a detailed description of this property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Decision Influencers

The properties in the Decision Influencers group have been described below. You can use these properties to specify some parameters that influence the outcome of the activity.

Max Actors Required For Checklist Completion [% or Number] - This property is used to check what percentage or number of actors should take action on the Checklist. Decision on the Checklist is taken only after the specified number or percentage of actor(s) have taken the action. The activity waits for the actors' action until the 'Timeout for activity' is reached.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Min Actors Required For Checklist Completion [% or Number] - This property specifies the minimum number of actors who need to act on the Checklist before the 'Timeout Warning for Activity'. If the action limit is reached before the 'Timeout Warning for Action' then the warning message is not shown.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Escalation & Timeout

The properties in the Escalation & Timeout group have been described below. You can use these properties to specify escalation and timeout settings for the activity.

Set Calendar for Timeout - This property is used to specify the calendar to be used to determine activity timeouts.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to Set Calendar for Timeout

1. To specify the calendar for timeout, click the button in the 'Set Calendar for Timeout' property to open the property window.
2. In this window, select the required calendar by clicking on the calendar name in the tree structure.
3. Click **Set Calendar** to set the selected calendar.
4. You can specify that a resource calendar should be used, if available, by clicking to select the corresponding check box.

See CheckList - Set Calendar for Timeout for a detailed description of the Set Calendar for Timeout property window.

Minimum available time for Activity - This property is used to check the availability of an actor to whom a task must be assigned while executing the activity. The availability check for the actor is done based on the Calendar settings (Global or Resource Calendar). If the time taken to complete the task is within the value set for the **Minimum available time for Activity** property, then the task will be assigned to that actor. However, if the time taken to complete the task exceeds the value set for the **Minimum available time for Activity** property, then the task will be assigned based on the values set for the **Ignore Unavailable Actors?** and **Alternate Actor Allowed?** properties.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout warning for Ownership - This property specifies the time at which a warning is provided to an actor to take ownership of the work item assigned to him/her.

- If the actor does not take ownership within this time the engine is notified with a warning. Thus if 'Min.Ownerships' is set, and it is not satisfied before the given time then a warning is sent.
- If Min.Ownerships is 0, it will check for Max.Ownerships. If the ownership count does not reach the Max.Ownerships value within the set time, a warning is sent.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- If both Min.Ownerships and Max.Ownerships are not set, this property is ignored.

Property Type: Optional (This property needs to be set only if necessary.)

Understand how Ownership Properties relate to each other:

- Checklist activity is assigned to the actors in the Checklist assignment list by the Workflow Engine. Checklist activity has a default property set that at least one actor has to make a Take Ownership of the Checklist activity.
- A drop-down interface has been provided for the actor to Take Ownership. However, the actor can act on the Checklist without taking ownership first, in which case ownership will be considered to be done. i.e. if the actor acts upon the Checklist activity without taking ownership, then it is considered as an ownership with action taken.
- After the actor has taken ownership, a link is provided to the actor, which opens a pop up with the details of the other actors. This is again tagged with the 'Hide Responses?' property. The link will be provided only If 'Hide Responses?' is set as 'No'. The pop up will have details like Actor name, Ownership Status, Action taken, Comments.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] then the 'Timeout Warning For Ownership' property is not considered.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] and the 'Time Out For Ownership' is also reached then the work item is removed from other actors' Work Item list and the work item waits for action from those who have taken ownership.
- If the 'Min.Ownerships' limit is not reached for the Checklist activity, and the 'Timeout Warning For Ownership' has been exceeded then the actor is notified with a warning by including an email or an information activity, with the Timeout Warning for Ownership link to it.
- If 'Timeout For Ownership' is set, if the Checklist activity has not reached the minimum limit (Min.Ownerships) and the 'Time Out For Ownership' has been reached, then the work item is removed from the Work Item lists of all the actors.
- If 'Min.Ownerships' = 0 and if 'Max.Ownerships' is set, the activity waits for actors to take ownership or action until the 'Time Out For Ownership' is reached (if this is set).
- If none of the Ownership properties are set then the activity waits until the resource takes ownership or acts upon it.

Timeout for Ownership - This property specifies the time until which taking ownership is allowed i.e. the time until which the Checklist activity will wait for ownership.

- If Min.Ownerships is set and is not reached, the work item is removed from all Work Item lists.
- If Min.Ownerships is 0, it will check if ownership count is less than Max.Ownerships.
- If it is, the work item is removed from all Work Item lists. Else the work item will be removed from the Work Item lists of those who have not taken ownership. The work item will remain in the Work Item list of those who have taken ownership and wait for action from them.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout warning for Activity - This property specifies when a reminder has to be provided for the actors to act on the Checklist request, if the action count has not been reached. If properties such as Max.Ownerships, Affirmative Action for Checklist (AAA), and Action Limit (AL) are set, once the property values are reached then a warning is sent to the participant. When the timeout is reached, the following checks are made: If AL is set,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

when the action count i.e. the no. of Checklists (AC) < AL, then a warning is sent, if AL = 0 and AAA is set, and when AC < AAA, then a warning is sent to the participant.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Timeout for Activity - This property's value is used to decide until what time the activity should wait for the actors' action. If properties such as Max.Ownerships, AAA, AL are set, once the property values are reached the work item is removed from the Work Item lists of all the actors.

When the timeout is reached, the following checks are made:

- If AL is set, when the action count i.e. the no. of Checklists (AC) < AL, then the timeout for action is performed and the work item is removed from all Work Item lists.
- If AC > AL, it checks with the no. of Checklists or 'decision count' (DC) and AAA. If DC >= AAA (if it is set), the action is considered completed.
- If AAA = 0 and if DC >= AL, the action is considered completed.
- If AL = 0 and AC < AAA, then the timeout for action is performed and the work item is removed from all Work Item lists.
- If AL = 0 and AC > AAA, it will check with DC. If DC > AAA it is completed.
- If AL = 0 and AAA = 0, then if DC is at least 1, then it is considered completed.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Multiple Timeout Warning - This is used to set recurring timeout warnings that will be sent to the actors who have to take action. To set multiple timeout warnings, click the 'Multiple TimeOut Warning' button in the Properties pane for the Checklist activity. A new window pops up. In this window, set the interval for the recurring warning as well as the output message. You can also set the Recurring Time Interval. This can be used to set a different recurring time out after the first timeout happens. For example, if 'Time Interval' for the property is set as 7 days and 'Recurring Time Interval' is set as 2 days, then the first time out will happen after 7 days and there will be a recurring time out every second day after the seventh day (first) time out.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Steps to set the Multiple TimeOut Warning property

1. To set the multiple timeout warning, click the button for the 'Multiple TimeOut Warning' property to open the property window.
2. Enter the time interval for the timeout in the **Time Interval** field.
3. Select "Yes" from the drop-down for the **Recurring?** field, if you want the timeout warning to recur. Select "No" otherwise.
4. Enter the output message corresponding to the timeout warning in the **Output** field.
5. Enter the time interval for the recurring timeout in the **Recurring Time Interval** field.
6. After entering the content details, click **Add Row** to add this timeout setting and display a new row for entering another timeout setting.
7. Remove rows, if necessary, by selecting them and clicking **Remove Selected**.
8. After specifying the timeout settings, click **Update**.

See CheckList - Multiple Timeout Warning for a detailed description of the Multiple TimeOut Warning property window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Miscellaneous

Redirection Enabled - This property enables redirection. When this property is set to Yes, the workflow redirects you to the URL in the Redirect URL property in the next activity.

Activity outputs:

The Checklist Activity returns the following values -

Action Completed: Displayed when all the actors have taken part.

Action Completed - Affirmative Percentage Not Reached: Displayed when all the actors have not taken part.

Not Enough Resources to Take Acknowledge: Displayed when the filter condition did not yield enough actors to whom the request can be sent.

Timeout - Acknowledge: Displayed when the specified minimum number of actors did not take ownership of the request in the given time.

Timeout - Action: Displayed when some or all of the specified actors did not perform the required action in the given time.

Timeout Warning - Acknowledge: Displayed when a warning is generated that the specified minimum actors have not taken ownership of the request in the given time.

Timeout Warning - Action: Displayed when a warning for timeout is generated because some or all of the actors did not perform the required action in the given time.

Note: The following outputs will return only if you assign tasks to a queue user.

Resource Unavailable for Queue - If a queue is assigned to a task and if there are no resources available in the queue then this output will get triggered.

TimeOut for Queue Task - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting the completion of that task.

Timeout Warning -Queue - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting in sending a warning out put. However, the task will still be sleeping.

Timeout Warning -Queue Participant - This output will get triggered when the task in the queue is picked by user but still not acted on that task within the queue escalation time out settings resulting in triggering a warning output. However, the task will still be sleeping.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

CheckList - Delivery Channels

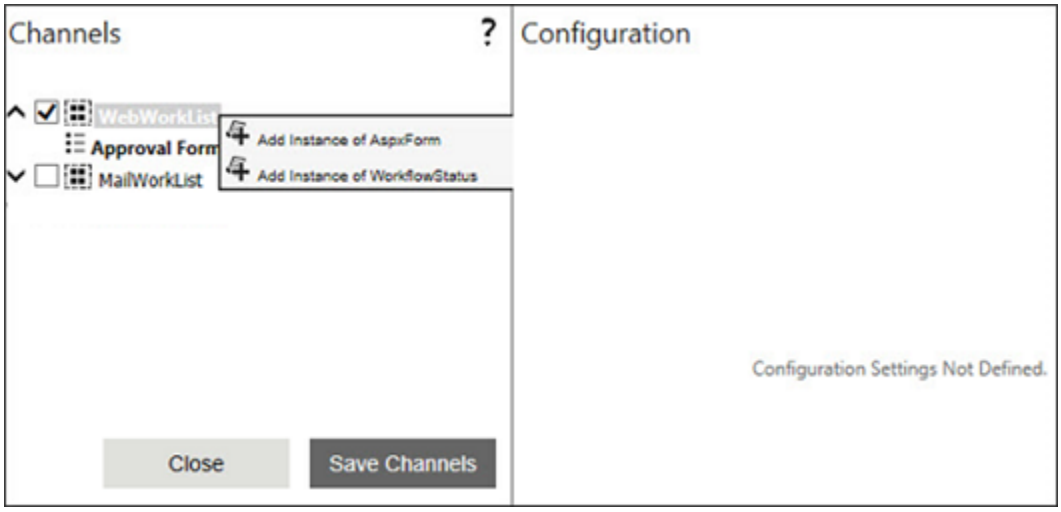
Purpose

The purpose of this chapter is to describe the feature of WorkflowStatus Form of Delivery Channels property under the category Configuration of any human activity available in AVEVA Work Tasks.

Description: This feature enables us to view the status of the workflow in the Work items list in the graphical form. [Optional]

1. Select the **Human Activity**.
2. Click the **Delivery Channels** Property.

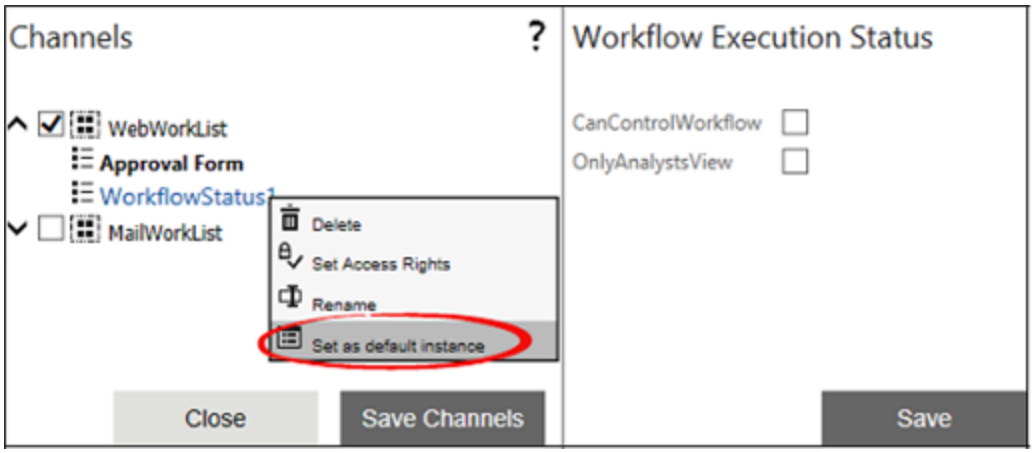
   The Property channel will be displayed as shown in the image below:



3. Right-click **WebWorkList** to display the context menu with the **Add Instance of Workflowstatus** option as shown below.

4. Set the Properties for the Execution View Status Graphical view.
5. Click **Save**.
6. If you want to set the WorkflowStatus form as the default instance, right-click **WorkflowStatus1**, and select **Set as default instance** from the context menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



7. Click the **Save and Save Channels** buttons.

Output

Now, when you click on any row in the Work items list, you will find this Execution view page being displayed as the detailed view, if you set it as a default instance.

Otherwise, Workflow Status form will appear in the context menu of each row in Work items list and you can open the execution view by selecting it from the context menu.

CheckList - Questions

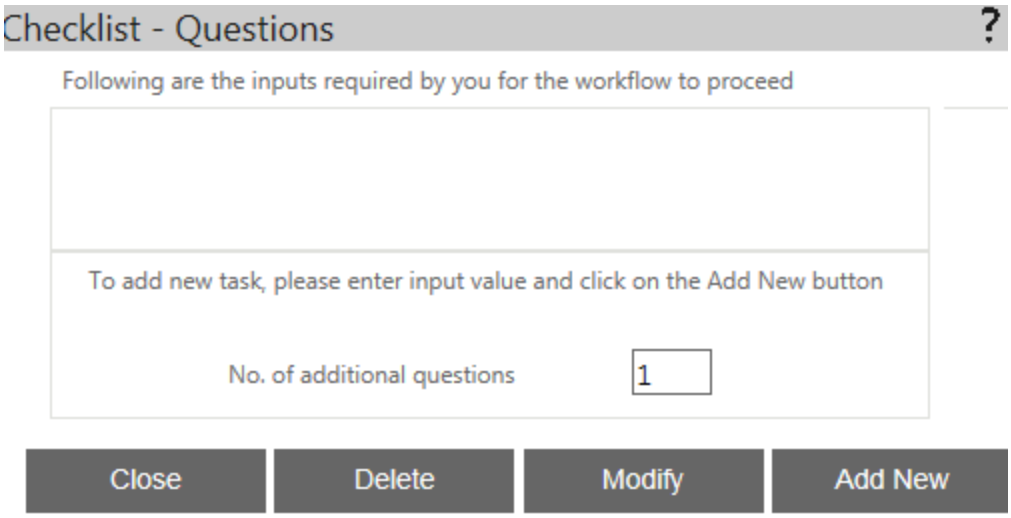
Questions Property Window

You can set the questions and answers that will form the checklist in this property window. To access this window, click the button in the 'Questions' property.

The window shown in the image below is used to Add, Edit and View the Questions and Answers added in the Checklist activity. This is the first window in the Questions property user-interface. It lists all the questions that have been added to the checklist. It has the No. of additional questions field to specify the number of questions to add. This window has the following buttons:

- **Add New** - You can click this button to add new questions. This will open the second window in the Questions user-interface where you can add the questions. The number of questions you can add will depend on the value set in the No. of additional questions field.
- **Modify** - You can click this button to edit the selected question(s). You can select a question for editing using the check box next to it.
- **Delete** - You can delete the selected question(s) by selecting them as described above and clicking this button.
- **Close** - You can click this button to close the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Checklist - Listing of Questions, Answers, Decision Maker, Mandatory Questions

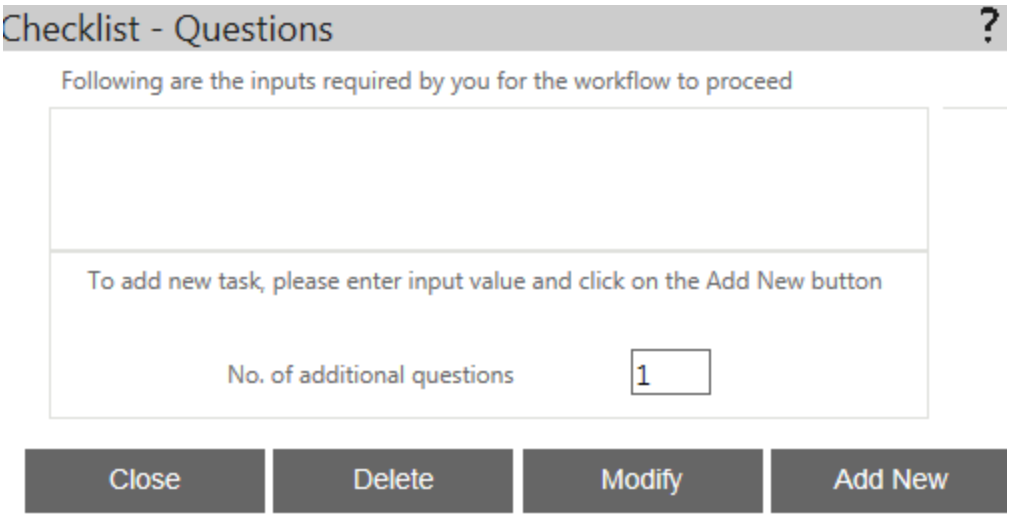
The window shown below is the second in the user-interface for adding questions to a checklist. This interface is displayed after the actor selects **Add New** or **Modify** from the first window shown above. You can add as many questions as were specified the first window and a separate row of fields is displayed for every new question. For each question, the following parameters can be set here:

- **Question** - You can enter the question in this text box.
- **Answer Type** - You can specify the answer type for this question by selecting an option from the drop-down. The options available are text box, drop down, memo, check box, and radio buttons.
- **No. of Options** - You can specify the number of options of the selected Answer Type in this text box.
- **!** - You can click the radio button in this column to specify whether this question is to be the Decision Maker or not. This option is displayed only when you select "drop-down" as the Answer Type. If set, the answer to this question will decide the outcome of the activity.
- **Mandatory*** - You can click the radio button in this column to make the corresponding question mandatory. If set, the checklist cannot be completed without giving an answer to this question.

This window has the following buttons:

- **Back** - Click this to go back to the first window
- **Next** - Click this to go to the next window
- **Close** - Click this to close the window

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

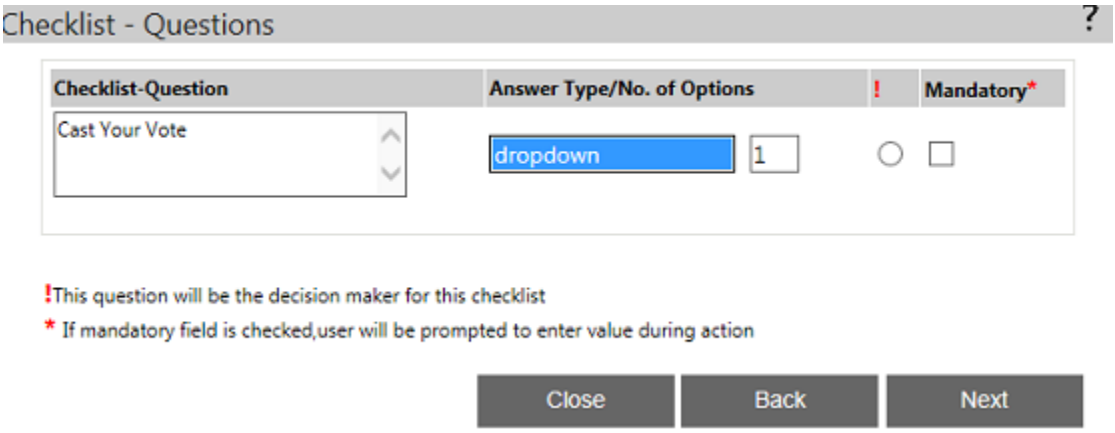


The window shown below is the third in the user-interface of the Questions property. In this window you can set the following parameters:

- **Options** - You can specify the options that will be presented to the actor to answer the question (if the question type is drop down, check box or radio button) in the fields in this column.
- **Default Value** - You can specify the option that will be the default value by clicking the corresponding radio button in this column.
- **Values** - You can specify the values that the answer will take internally in the fields in this column.
- **Map question answer to variable** - In this drop down you can select a variable to which you want to map the question's answer. The answers to this question will be stored in the selected variable and will be available for use in the workflow.

This window has the following buttons:

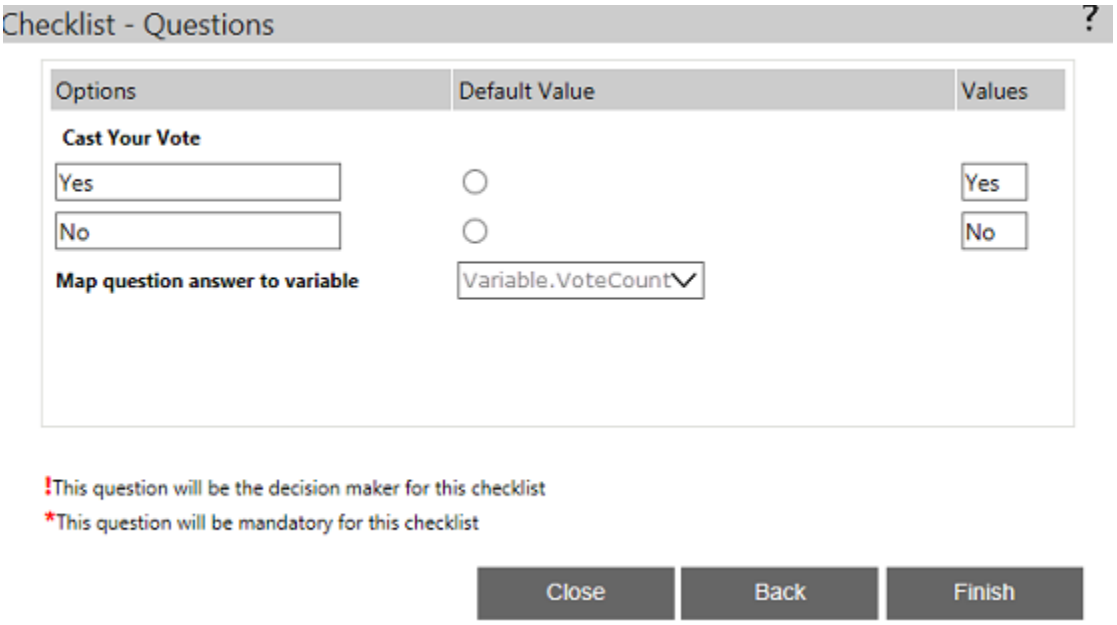
- **Back** - Click this to go back to the first window
- **Finish** - Click this button after completing all the details to save the question
- **Close** - Click this button to close the window.



The window shown below is the last in the sequence and is displayed when you click **Finish** in the previous

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

window. It is identical to the first window with the difference being the newly added question that is displayed here. You can modify or delete the new question or add a new question. If you do not wish to perform any more operations, click **Close** to exit this user interface.

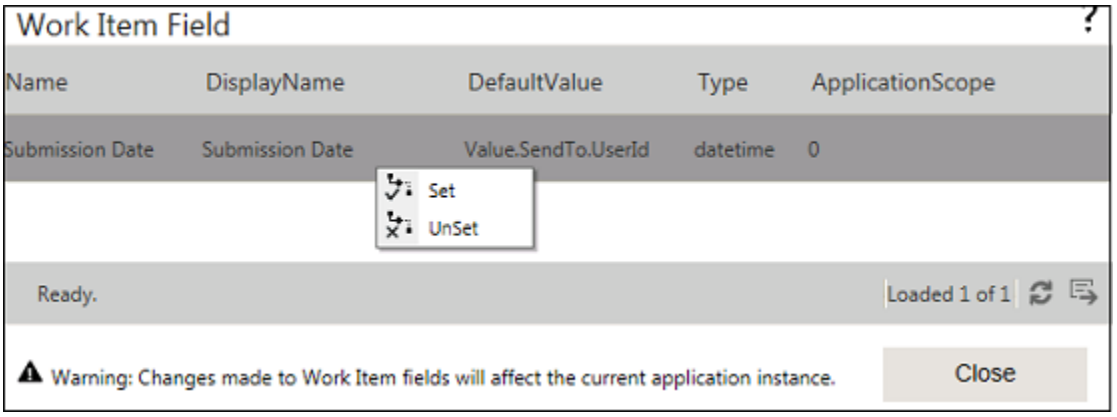


Note: Do not use hash (#), colon (:), and semicolon (;) in the Questions. Also, avoid multi-line questions.

CheckList - Work Item Fields

Work Item Fields Property Window

You can set the Work Item Fields for this activity in this property window. To access this window, click the button in the 'Work Item Fields' property.



The window has a grid listing all the work item fields that have been set for the process.

- Each row in the grid represents a work item field. You can click a work item field to select it.
- The context menu has the Set WorkItemField option, which you can use to set the selected work item field for this activity. It also has the UnSet WorkItemField option to remove the work item field setting.
- **Close** - You can use this button to close the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: While entering a value in the Work Item field, it is recommended to keep it less than the specified database column size. If there is a need to increase the size of the Work Item field, the user should manually increase the column size in the database.

CheckList - Assign Actor(s)

Assign Actor(s) Property Window

You can set the actors to whom the CheckList work item is to be sent in this property window. To access this window, click the button in the 'Assign Actor(s)' property.

See Assigning a Task to a Manager for more details.

The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

Different Methods of Assigning an Actor

- Assigning an Actor by building an expression:

Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

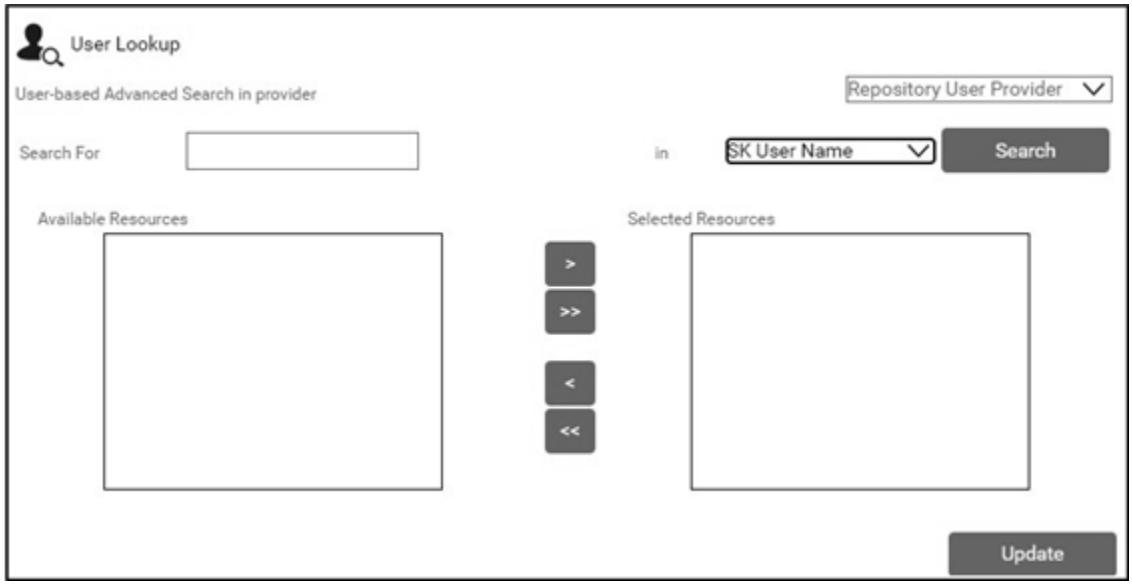
At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

- Assigning an Actor through User Lookup

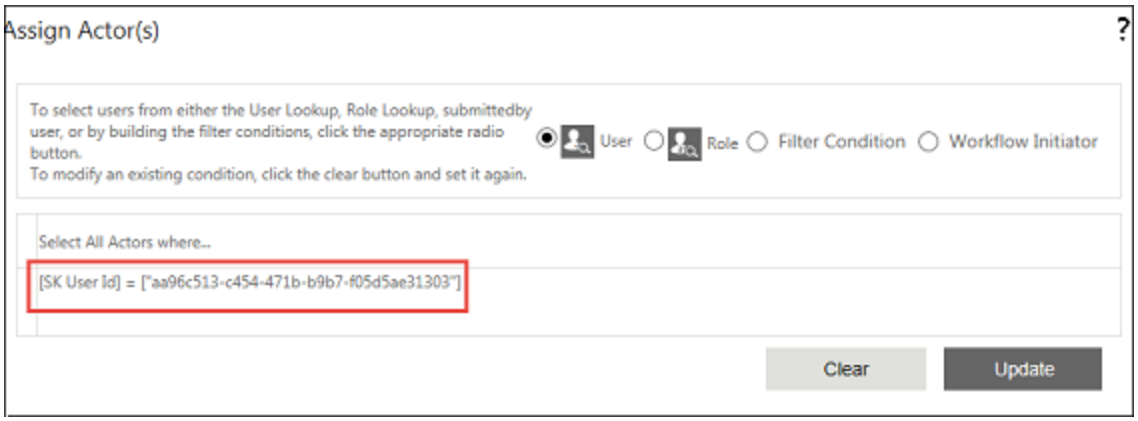
Through the **User Lookup** you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.
2. The **User Lookup** dialog is displayed, search and select the required actor.



3. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
4. In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



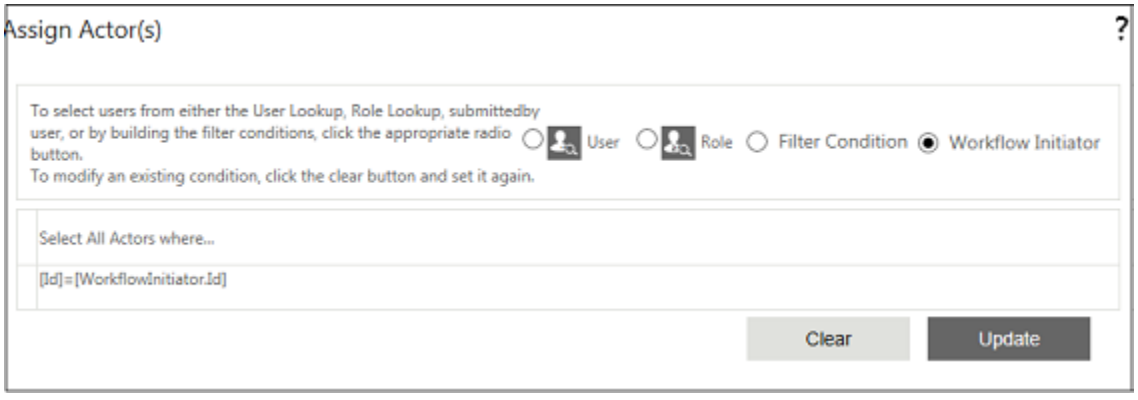
5. Click **Update** in the **Assign Actor(s)** window to update the selected actor(s) in the **Assign Actor** property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

- Assigning an Actor through Role Lookup

Through the Role Lookup you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

1. Select the **Role Lookup** option.
2. The **Role Lookup** dialog is displayed, search and select for the required role.
3. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
4. In the **Assign Actor** window, you will see that an expression is displayed.
5. Click **Update** in the Assign Actor(s) window to update the **Assign Actor** property.

- **Assigning an Actor through Workflow Initiator**
  Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:



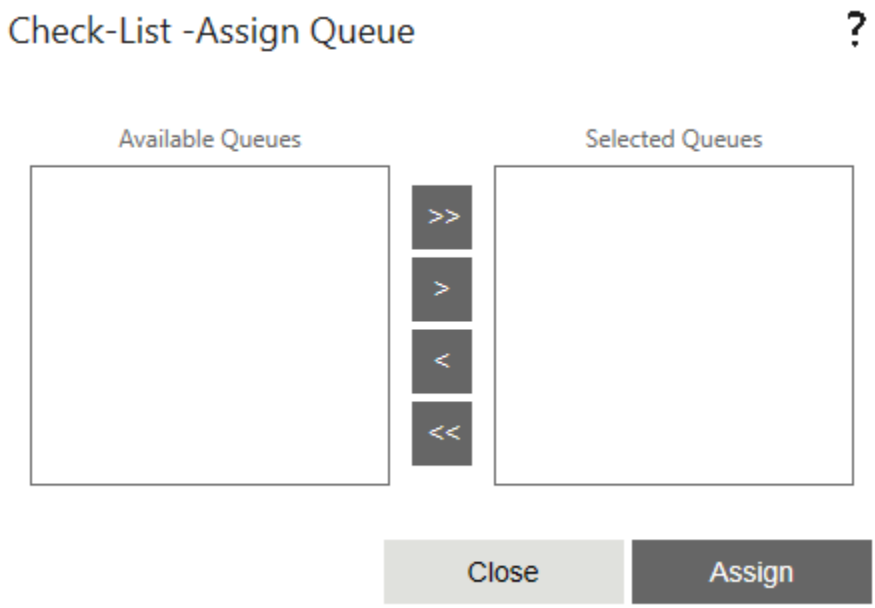
CheckList - Assign Queue(s)

Assign Queue(s) Property Window

You can select the queues to which the CheckList work item is to be sent in this property window. To access this

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

window, click the button in the 'Assign Queue(s)' property.



The window has a pair of list boxes to specify the queue(s). The **Available Queues** list shows all the available queues. You can select the required queue(s) from this list box. The **Selected Queues** list shows all the selected queues to which the activity will be assigned.

You can use the following buttons located between the list boxes to move the queues to and from the list boxes.

- [>>] - Click this button to add all the queues in the **Available Queues** list to the Selected Queues list
- [>] - Click this button to add the selected queue(s) from Available Queues list in to the Selected Queues list
- [<] - Click this button to add the selected queue(s) from the Selected Queues list to the Available Queues list
- [<<] - Click this button to add all the queues in the Selected Queues list to the Available Queues list

At the bottom of the window you will find the following buttons:

- **Assign** - Click this button to assign the activity to the selected queues
- Close - Click this button to close the window

Assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the **Start** activity with the Type as **String**. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

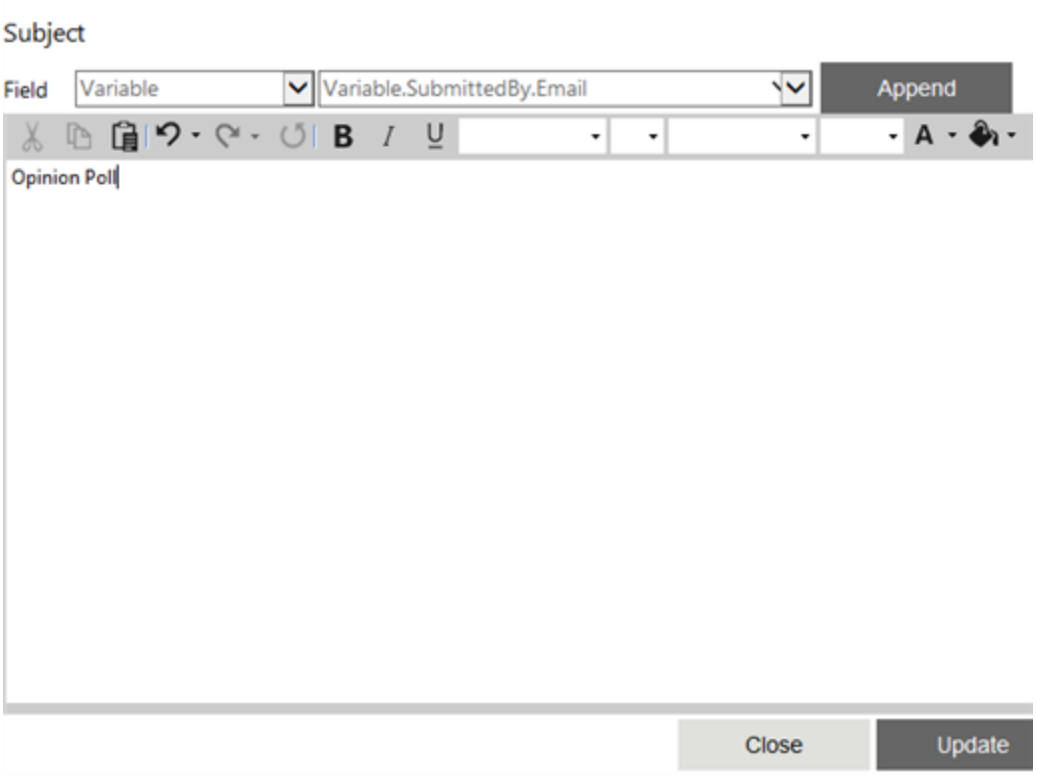
To assign multiple queues, specify the queue-ids with semicolon (;) separator. **Skelta.HWS.Queue.QueueCollection** class can be used to retrieve queue information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

CheckList - Subject

Subject Property Window

You can specify a subject for the CheckList work item assignment in this property window. To access this window, click the button in the 'Subject' property.



The window has a text editor to enter the subject. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the subject. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the subject in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the subject.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the subject using a combination of discrete value and variable or content. For example, you can specify the subject as "Submitted By <%#Variable.SubmittedBy.Email%>". Here, the string "Submitted By" should be typed directly in the text editor. The second half of the subject is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the **Field** drop down and clicking **Append**.

The text tool bar above the text editor allows you to manage and format the subject. It has the following text tools –

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text
- At the bottom of the window you will find the following buttons:
- **Update** - Click this button to save the subject
- **Close** - Click this button to close this window

CheckList - Body

Body Property Window

You can specify a message Body for the CheckList work item assignment in this property window. To access this window, click the button in the 'Body' property.

The window has a text editor to enter the body text. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The Value text box/drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the body using a combination of discrete value and variable or content. For example, you can specify the body message as "Hi, Please cast your vote in the poll conducted by <%#Variable.SubmittedBy.name%>". Here, the string "Hi, Please cast your vote in the poll conducted by" must be typed directly in the text editor. The second half of the body is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the Field drop down and clicking Append.

The text tool bar above the text editor allows you to manage and format the body text. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

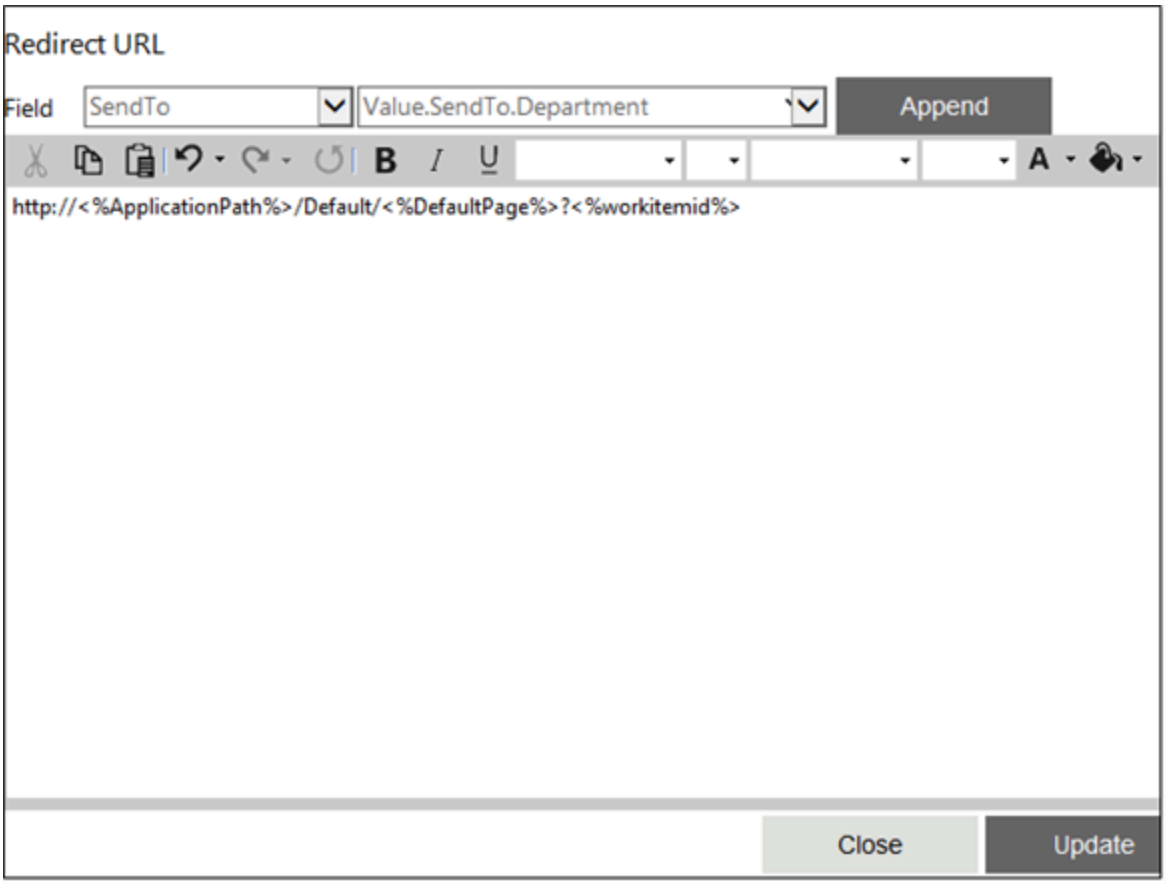
- **Update** - Click this button to save the body message
- **Close** - Click this button to close this window

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

CheckList - Redirect URL

Redirect URL Property Window

You can specify a message Redirect URL for the CheckList activity in this property window. To access this window, click the button in the 'Redirect URL' property.



The window has a text editor to enter the Redirect URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Redirect URL in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Redirect URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

  The text tool bar above the text editor allows you to manage and format the Redirect URL. It has the following text tools
- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

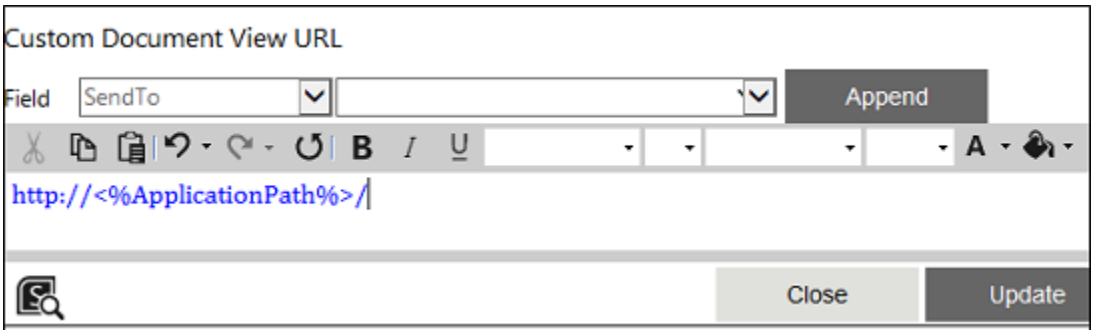
- **Update** - Click this button to save the Redirect URL
- **Close** - Click this button to close this window

CheckList - Custom Document View URL

Custom Document View URL Property Window

You can specify a message Custom Document View URL for the CheckList activity in this property window. To access this window, click the button in the 'Custom Document View URL' property.

For more details, see Custom Document View URL



The window has a text editor to enter the Custom Document View URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

or XMLVariables here.

- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Custom Document View URL in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Custom Document View URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Custom Document View URL. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - Click this button to save the Custom Document View URL
- **Close** - Click this button to close this window

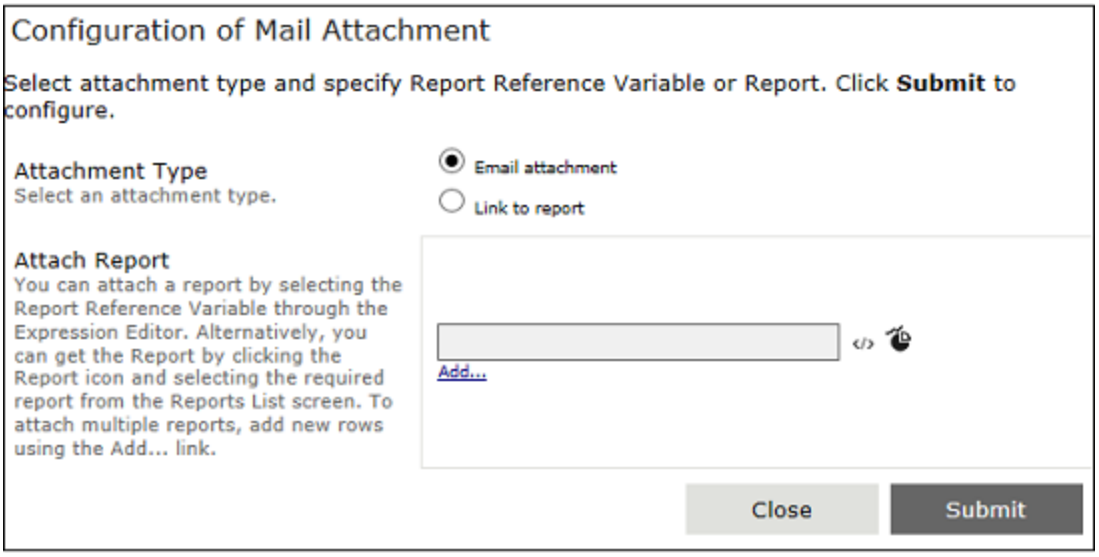
CheckList - Attach Reports

Configuration of Mail Attachment property window

You can configure the **Attachment** property for the **Approval** activity in this property window.

In this property window, you can configure the report attachments to be emailed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



- **Attachment Type:** Use this property to select the type of attachment for sending the report as an email.
  - **Email attachment:** Select this type to send the report as an email attachment.
  - **Link to report:** Select this type to embed a link in the email to download the configured report.
- **Attach Report:** Use this property to attach a report generated by the **Report Generator** activity within the workflow or to select a report from the list of generated reports.

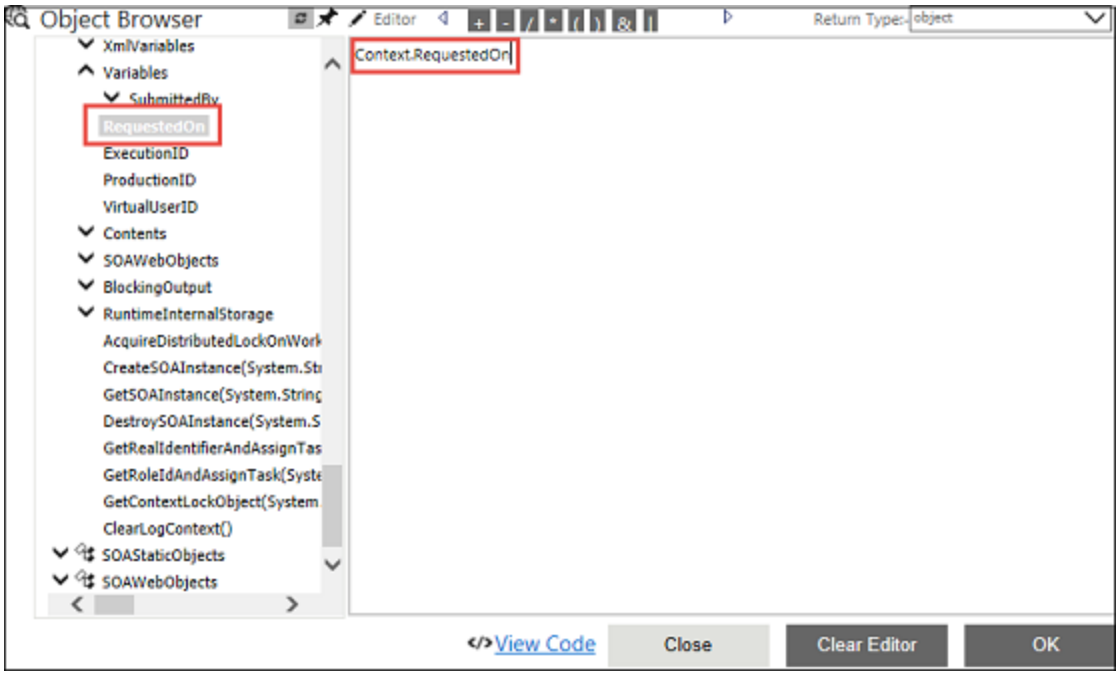
  You can attach a report by selecting the required **Report Reference Variable** using the **Expression Editor**. Alternatively, you can select the report from the Reports List window which consists of the already generated reports.

There must be at least one **Report Generator** activity before an **Approval** activity in the workflow to select the **Report Reference Variable** (using Expression Editor) as an **Attachment**. The **Report Reference Variable** is generated while configuring the **Report Generator** activity. By default, the report reference variable is **[Template Name]_[activity Name]**. For more information about **Report Reference Variable**, see Configure Report Template.

To configure mail attachment

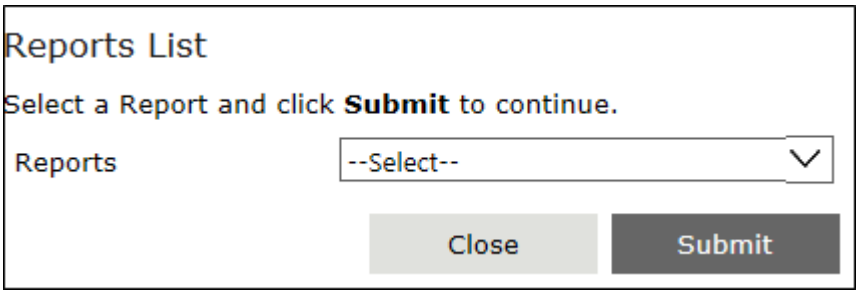
1. Click the edit button for the **Attachment** property.
2. Select the required **Attachment Type**.
3. In the **Attach Report** text box, you can either use the expression editor to get the variable of the report or use the **Reports List** to select the report.
4. To get the variable, click the **Expression Editor** icon given beside the text box to select the required **Report Reference Variable**.
5. In the **Expression Editor** window, select the required variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



6. Click **OK.**
7. Click **Close**.

   The variable appears in the **Attach Report** text box.
8. To select the report from the Reports List dialog box, click the **Reports** icon.



9. In the Reports List dialog box, select the required report, and then click **Submit**.

   This window closes automatically.
10. Click **Close** to close the configuration window.

CheckList - HTML Template

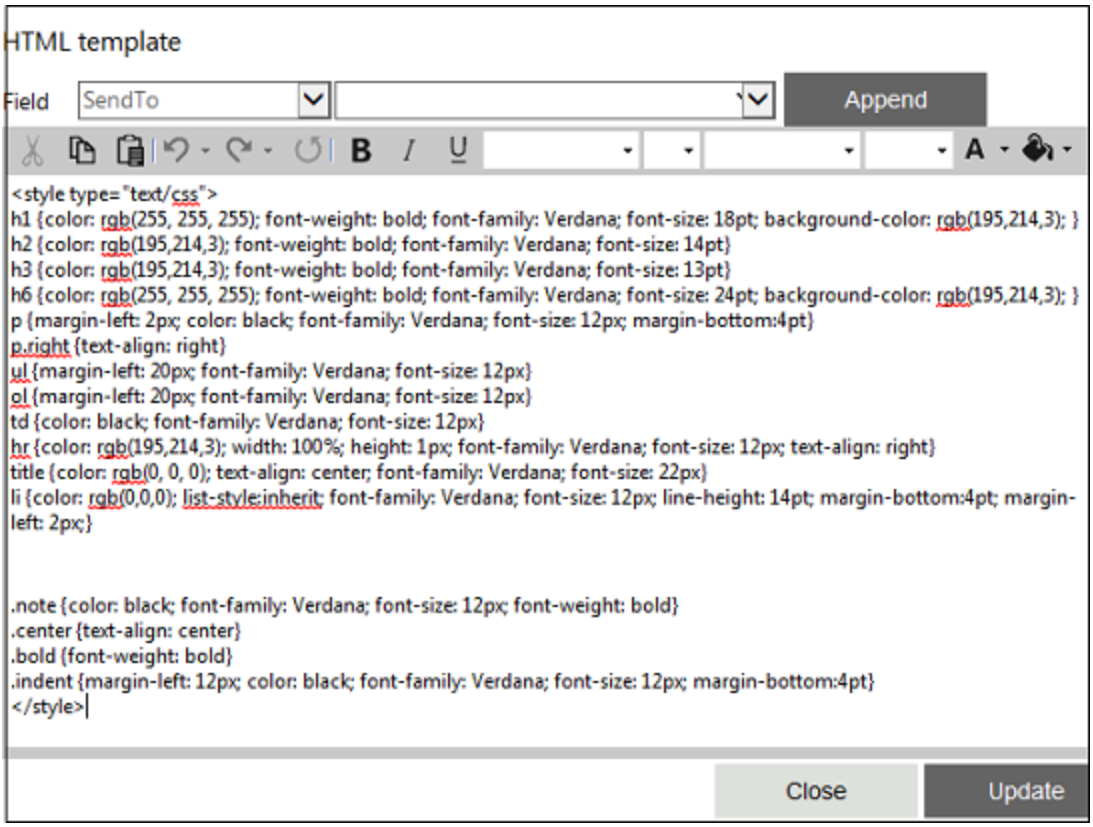
HTML template Property Window

You can specify a html template for the CheckList activity in this property window. To access this window, click the edit button in the 'HTML template' property.

In this property window, you can write your own html template for Check-List activity or you can use the default Check-List activity template for customizing the email.

See Using 'HTML Template' property of Check-List Activity for more information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the body text. You can do this either by entering a html template directly in the text editor or by using the Field controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop-down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop-down instead of the field. This drop-down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the html template. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

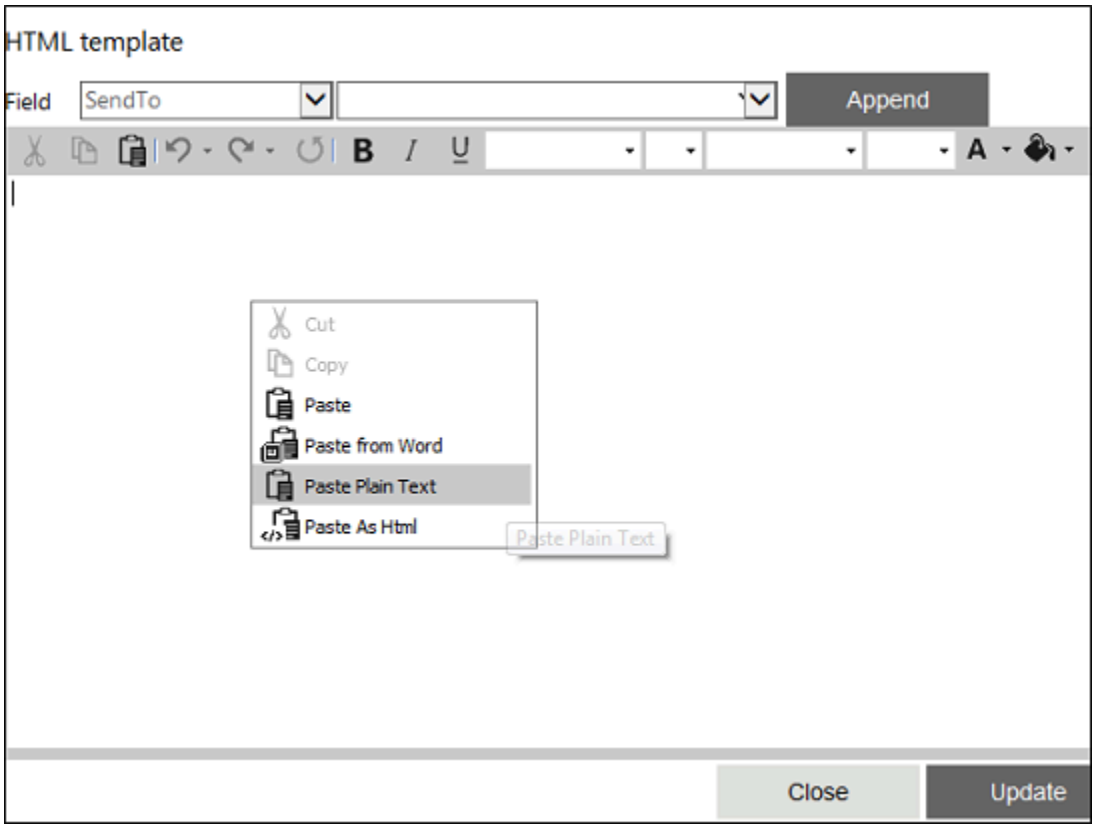
- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

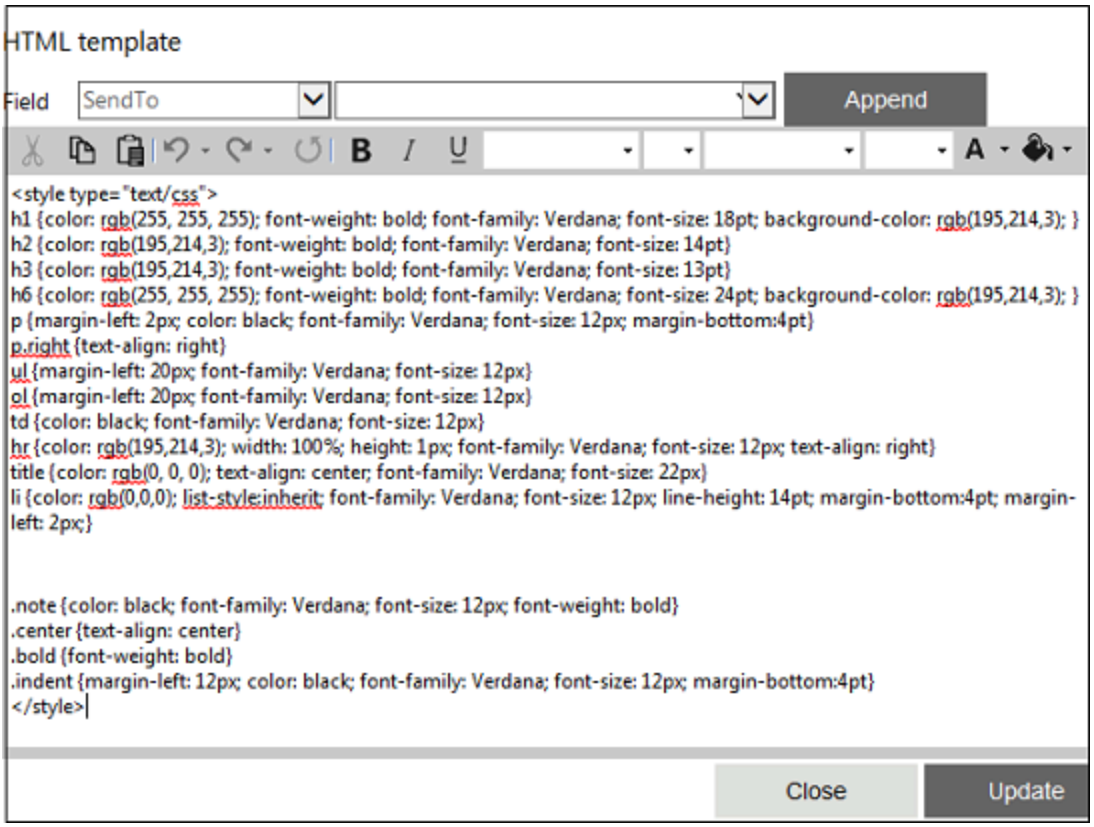
- **Update** - Click this button to save the HTML template
- **Close** - Click this button to close this window

To set this property, do the following steps:

1. To specify the HTML template, click the edit icon to open the property window.
2. In the **HTML template** window, provide template which should be in html format. If you are pasting a copied html content, then right-click the **HTML template** window and paste it as "**Paste Plain Text**".



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



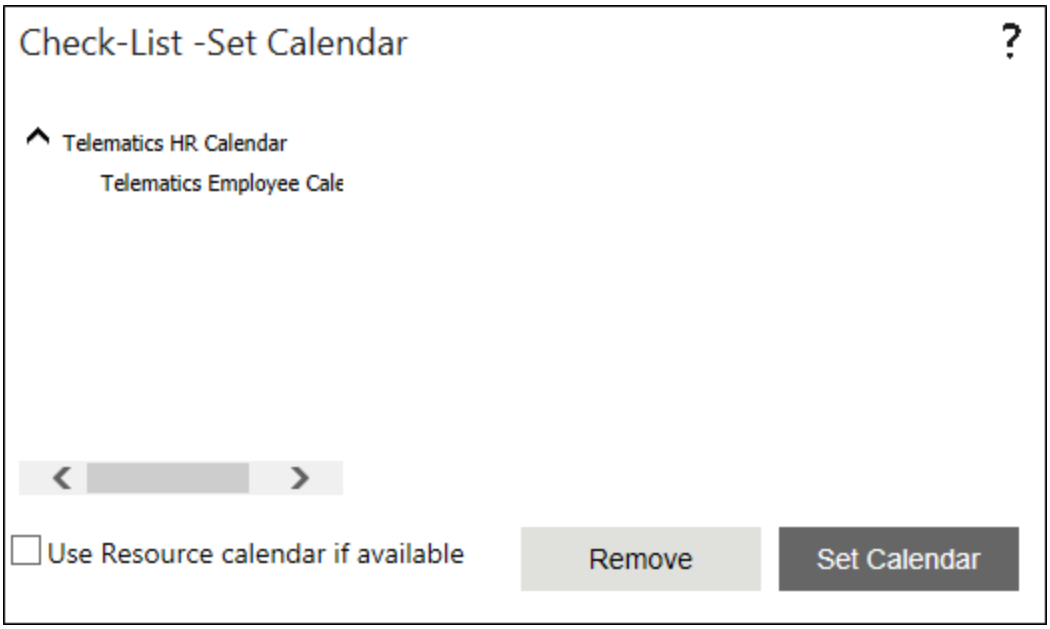
3. Click **Update**.

CheckList - Set Calendar for Timeout

Set Calendar for Timeout Property Window

You can set a Calendar to calculate the timeout for the Checklist activity in this property window. To access this window, click the button in the 'Set Calendar for Timeout' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



This window lists the available calendars in a tree structure, with lower-level calendars nested within the respective top-level calendar. You can click a calendar to select it for setting.

There are two buttons in this window:

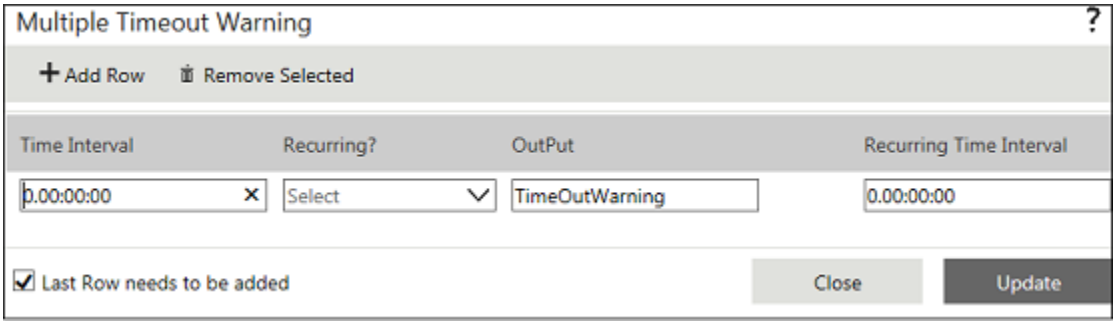
- **No Calendar** - Click this button to indicate that there is no calendar set for the activity
- **Set Calendar** - Click this button to set the selected calendar

The **User Resource calendar if available** check box can be selected to enable the use of resource calendars if none are displayed in this window for selection.

CheckList - Multiple Timeout Warning

Multiple TimeOut Warning Property Window

You can set the Multiple Timeout Warning in this property window. To access this window, click the button in the 'Multiple TimeOut Warning' property.



The window has two tabs at the top to manage the rows of timeout settings in the grid.

- **Add Row** - You can click this tab to add the newly entered timeout setting and display a new row to the grid where you can add another timeout

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Remove Selected** - You can click this tab to remove the timeout setting row selected in the grid.

The grid has the following parameters that you need to specify for the new timeout setting.

- **Time Interval** - You can use this field to enter the time interval in which you can generate a timeout warning. You must enter the time in d.hh:mm:ss format.
- **Recurring?** - You can use the drop down in this field to indicate whether the timeout is recurring or not. You can select "Yes" to set the timeout warning to recur.
- **Output** - You can enter the output message corresponding to the timeout warning here.
- **Recurring Time Interval** - You can set the time interval in which the timeout warning has to recur here. Enter the time in d.hh:mm:ss format.

There are two buttons and a check box at the bottom of the screen:

- **Update** - Click this button to save the newly added timeout settings
- **Close** - Click this to close the property window without saving the newly added timeout settings
- **Last Row needs to be added** - Select this check box to save the last row added

Choice Activity

Activity Description

The Choice Activity is used in the AVEVA Work Tasks workflow process design in cases where a task needs to be assigned with multiple options for an action. This activity can be configured with buttons, with the provision to set the output of each as task completion makers. A maximum of ten such buttons can be configured.

Application Scenarios

To illustrate the functionality of the Choice activity, consider a scenario in which the approval activity in a process requires a provision to send back the approval request in addition to the standard responses of approval and rejection. In this case, the Choice activity can be used to create a customized approval activity with an additional button named 'Send back' in addition to the 'Approve' and 'Reject' buttons. Without this activity, a custom activity would have to be created to achieve this functionality.

Workflow Variables for Choice

Steps to define variables for use in the Choice activity

This section describes how to define variables for use in Choice activities. It gives the syntax for creating the variables and typical examples for different cases.

Variables for capturing WorkItemIds

The Work Item Id's for the Choice work item can be retrieved using a variable of type array, with the following syntax:

'^'+CurrentActivity.Name+'WorkItemIds'.

For example, **^CandidateApprovalWorkItemIds**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Variables for capturing All Actors' Details

The details of the actor(s) to whom the Choice work item gets assigned can be accessed by declaring a variable of type array with the following syntax:

'^'+CurrentActivity.Name+'ActingUsers'

For example, **^CandidateApprovalActingUsers**.

Variables for capturing Responding Actors' Details

The details of the actors' responding to the Choice work item can be accessed by declaring a variable of type resource with the following syntax:

'^'+HWSActivity.ActivityName+'RespondingUser'

For example, **^CandidateApprovalRespondingUser.**

This variable stores the responded user information. If it is more than one user, it will retrieve the last user details.

Note: For single user, you can declare this variable as **Resource** type. If task is assigned to more than one user and to get all responded users information, then declare this variable as array.

Variables for capturing Comments

Comments entered in a Choice work item can be retrieved

using a variable with the following syntax:

'^'+_HWSActivity.ActivityName+'CommentChoiceStatus'.

For example, **^CandidateApprovalCommentChoiceStatus**.

Variables for assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the Start activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

To assign multiple queues, specify the queue-ids with semicolon (;) separator. Skelta.HWS.Queue.QueueCollection class can be used to retrieve queue information.

Variable for Queue Acting Users

You can declare an array type variable to get updated information about the name of the actor to whom an activity gets assigned from a queue.

In the Workflow Variables, define the variable in the following format:

^+CurrentActivityName+'QueueActingUsers'

Ex: ^HRFormQueueActingUsers

HRForm is the activity name.

For example, the value of the user who acts on the HRForm activity will be stored in the variable. The Approval1 task will be assigned to the same user.

Variable for storing timeout warning value

Suppose if you want to store the timeout warning value for Choice activity in your workflow. The naming convention for the system variable to be declared is

^<ActivityName>ResponseByWarningTimeout

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The value returned by the variable will be in UTC format. For multiple user scenarios the highest timeout value calculated for a user will be available in the variable.

Note: Multiple timeout warnings cannot be tracked using this feature.

Activity Properties

The **Choice** activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right-click menu for the Choice activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Display Name - This property specifies name to be displayed for the action in the Work Item List.

Property Type: Optional (This property need not be set if the display name is already configured in the Actions.xml. The name entered here overrides any display name that is configured for this activity in the Actions.xml file.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Delivery Channels - This property is used to specify the delivery channels to deliver this activity to the assigned actor(s). Multiple channels can be specified giving the actor(s) different options to act on the work item.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Delivery Channels Property

1. To select the Delivery Channels, click the button for the 'Delivery Channels' property to open the property window.
2. In this window, the Delivery Channels that have been configured are listed on the left along with a check box against each channel. Click and select the check-box corresponding to the channel you wish to select. You can select multiple channels by selecting the respective check-box.
3. Click on Save Channels button.

See Choice - Delivery Channels for a detailed description of the Delivery Channels property window.

Action Outputs - This property is used to specify the outputs of the Choice work item assignment. These outputs can be specified as buttons, which will be displayed in the Work Item list of the recipient. To assign activity outputs, click the 'Activity Outputs' button in the Properties pane for the Choice activity. A new window pops up. In this window, enter the name of each button and indicate whether it is a completion maker or not.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Mandatory (This property must be set for the activity to be used in the workflow.)

Steps to set the Action Outputs property

1. To specify the Action Outputs, click the button for the 'Action Outputs' property to open the property window.
2. Enter the button name in the **Button Name** field.
3. Select "Yes" from the drop down for the **Completion Maker** field to set the button output as the completion maker of the Action Output. Select "No" if you do not want the action output.
4. After entering the output details, click **Add Row** to add this variable and display a new row for entering another output.
5. Remove rows if necessary by selecting them and clicking **Remove Selected**.
6. After entering all the variables, click **Update**.

See Choice - Action Outputs for a detailed description of the Action Outputs property window.

Work Item Fields - This property is used to add the Work Item Fields to be used to display application data as well as value in variables and content in the Work Item list when this activity is executed.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Work Item Fields property

1. To select the Work Item Fields, click the button for the 'Work Item Fields' property to open the property window.
2. In this window, the Work Item Fields that have been set are listed in a grid. Click a row to select the corresponding Work Item Field.
3. Right-click the row and select the "SetWorkItemField" option from the context menu to set it.

See Choice - Work Item Fields for a detailed description of the Work Item Fields property window.

Actors

The properties in the Actors group have been described below. You can use these properties to specify the actors who will work on the activity and related properties.

Assign Actor(s) - This property specifies the actor(s) who has to take up the Choice activity. It is tagged with the Ignore Unavailable Resources property which in turn is tagged with Alternate Resource Allowed. This will be explained in detail later.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any actor(s).)

Steps to set the Assign Actor(s) property

1. To specify the actors, click the button for the 'Assign Actor(s)' property to open the property window.
2. In this window build an expression to select the actors using the actors properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Choice - Assign Actor(s) for a detailed description of the Assign Actor(s) property window.

See the Using XML Variables section in the About the XML Variable User Interface topic for details on how to use the XMLVariables to build the expression.

Assign Queue(s) - This property specifies the queue(s) to which the Choice activity is to be assigned.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any Queue(s).)

Steps to set the Assign Queue(s) property

1. To specify the queue(s), click the button for the 'Assign Queue(s)' property to open the property window.
2. In this window select the queue(s) from the **Available Queues** list box. You can select multiple queues by selecting with the <Ctrl> key pressed.
3. After selecting the required queue(s) click on the [>] button to move it to the **Selected Queues** list box. You can click the [>>] button to select all the queue(s) and move them to the **Selected Queues** list box.
4. You can remove any queue from the selected list by selecting it and clicking the [<] button. You can remove all the queues by clicking the [<<] button.
5. After adding the required queue(s), click **Assign** to assign the activity to the selection.
6. Click **Close** to close the window without saving the selection.

See Choice - Assign Actor(s) for a detailed description of the Assign Queue(s) property window.

Min. Ownerships [% or Number] - This property, which can be specified as a number or percentage, is the minimum number of actors who should take ownership of the Choice request. This property is related to the 'Timeout warning for Ownership' and 'Timeout for Ownership' properties. To illustrate, when 'Timeout for Ownership' is reached, the activity first checks if the ownership count is less than Min.Ownerships (if it is set). If it is, the work item will be removed from all Work items lists. If the 'Min.Ownerships' has already been satisfied, then the work item will be removed from the Work items lists of those who have not taken ownership. If the Min.Ownerships value is 0, then the activity checks if the ownership count is less than Max.Ownerships (if it is set). If it is, the work item will be removed from all Work items lists. Else the work item will be removed from the Work items lists of those who have not taken ownership. If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work items lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Max. Ownerships [% or Number] - This property, which can be specified as a number or percentage, is the maximum number of actors who should take ownership of the Choice request. If 'Timeout for Ownerships' is specified and achieved, and the 'Min.Ownerships' is also satisfied, then the activity waits for action from those who have taken ownership. If the Min.Ownerships value is set to 0, then it checks if the ownership count is less than Max.Ownerships. If it is, the work item will be removed from all Work items lists. Else the work item will be removed from the Work items lists of those who have not taken ownership. If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work items lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

scenarios.)

Enable Take Ownership? - If this property is set to **Yes**, then the actor is provided with a **Take Ownership** option in the Work items list to take ownership of the task. If you are not required **Take Ownership** option in the Work items list, then set this property as **No**.

Note: By default, this property is set as **Yes**.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Enable Take Ownership? property

Select **Yes** or **No** from the **Enable Take Ownership** drop-down list.

Re-Assign Allowed? - If this property is set then the actor is provided with a Re-Assign option. Using this the approver can re-assign the work item to another actor.

Property Type: Optional (This property needs to be set only if necessary.)

Ignore Unavailable Actors? - This property provides the following options - **Yes**, **Yes** - holidays excluded and No. If this property is set to 'No', when the Approval activity is assigned to the actor's Work item list, a check is first done to see whether the actor is available. If the actor is not available then a check is made for an alternate actor assigned to the unavailable actor. Simultaneously the value of the property 'Alternate Actor Allowed' is checked. If that is also set, then the Approval work item is assigned to this actor. If this property is set to **Yes** - **holidays excluded**, the workflow engine will ignore the fact that actors are not available if the day is an organization holiday and the output Not Enough Resources will not be generated.

Property Type: Optional (This property needs to be set only if necessary.)

Alternate Actor Allowed? - This property is set to assign a particular task to an alternate actor in the absence or unavailability of any actor.

Property Type: Optional (This property needs to be set only if necessary.)

Notification Contents

The properties in the Notification Contents group have been described below. You can use these properties to specify the content used to notify actors about the activity.

Subject - This is the subject of the Choice work item. The subject can be customized for each actor.

Property Type: Optional (This property need not be set. If it is not set, the default subject line from the Actions.xml file is displayed.)

Steps to set the Subject property

1. To specify the subject, click the button for the 'Subject' property to open the property window.
2. In this window enter the subject text directly in the text editor.
3. If you want to customize the subject you can do so using the **Field** controls to add resource property values. For example, to add a subject that includes the email id of the actor submitting the approval request, you can do as follows: Type in the text "Submitted By". Select "Variable" and "Variable.SubmittedBy.Email" from the two drop downs for **Field** and click **Append**. This will add the placeholder for the variable after the text entered in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the email id.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the font or size, set text color or background color.

6. After adding the subject, click **Update** to save it.
7. Click **Close** to close the window without saving the subject.

See Choice - Subject for a detailed description of the Subject property window.

Body - This is the actual message body of the Choice sent to the actor(s). The body can be customized for each actor. There is an **Enterprise Console Explorer** (plug-in) icon in the Body property window to get the work item details URL. See Enterprise Console Control (EC Plug-in) for more information.

Property Type: Optional (This property need not be set.)

Steps to set the Body property

1. To specify the message body, click the button for the 'Body' property to open the property window.
2. In this window, enter the body text directly in the text editor.
3. If you want to customize the body you can do so using the **Field** controls to add resource property values. For example, to add a body that includes the name of the actor submitting the approval request, you can do as follows: Type in the text "Hi, Please cast your vote in the poll conducted by". Select "Variable" and "Variable.SubmittedBy.name" from the two drop downs for Field and click **Append**. This will add the placeholder for the variable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the name.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the body, click **Update** to save it.
7. Click **Close** to close the window without saving the body.

See Choice - Body for a detailed description of the Body property window.

From Email Address? - This property is used to specify the email address from which notification messages will be sent for the activity.

Property Type: Optional (This property needs to be set only if necessary. If it is not set, the default value in Activities.xml will be used.)

Hide Responses? - If this property is set to 'No', then actors can see the responses of other actors in a group Choice scenario. To view these responses i.e., ownerships, choices or rejections, select the 'Take Ownership' option. This will open a new pop up with the responses of other actors who have taken ownership.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Priority - This property is set to indicate the priority of the Choice request. Enter the values 0-33 to set as Low, 34-66 for Medium, or 67-99 for High. The default value is set to 34.

Property Type: Optional (This property needs to be set only if necessary.)

Show Custom Document View Window - If this property is set to 'Yes', then the Custom Document View Window will be shown to actors in their Web Work Item Lists. The data posted to the page are application, workflow, executionid, executiondetailsid, and workitemid. The posted data can be retrieved as Request.Form["workitemid"].

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Send Notification Email - If this property is set to 'Yes', then notification emails will be sent to the actors. If it is set to 'Yes-HTML', then the emails will be sent in HTML format.

Property Type: Optional (This property needs to be set only if necessary.)

Notify if alternate actor is considered - If this property is set to 'Yes', then notification emails will be sent to the actors when an alternate actor is considered.

Property Type: Optional (This property needs to be set only if necessary.)

Redirect URL - This property is used to get the URL of the web page to redirect the client to, in the case of synchronous execution of the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Redirect URL property

1. To specify the Redirect URL, click the button for the 'Redirect URL' property to open the property window.
2. In this window, enter the Redirect URL directly in the text editor.
3. If you want to customize the Redirect URL you can do so using the **Field** controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for Field, and clicking **Append**. This will add the placeholder for the variable in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the URL.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Redirect URL, click **Update** to save it.
7. Click **Close** to close the window without saving the Redirect URL.

See Choice - Redirect URL for a detailed description of the Redirect URL property window.

Custom Document View URL - This property is used to get the URL of the page to which the custom document dlls does a post.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Custom Document View URL property

1. To specify the Custom Document View URL, click the button for the 'Custom Document View URL' property to open the property window.
2. In this window, enter the Custom Document View URL directly in the text editor.
3. If you want to customize the Custom Document View URL you can do so using the **Field** controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for **Field**, and clicking **Append**. This will add the placeholder for the variable in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the URL.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Custom Document View URL, click **Update** to save it.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. Click **Close** to close the window without saving the Custom Document View URL.

See Choice - Custom Document View URLfor a detailed description of the Custom Document View URL property window.

Mail Channel

The properties in the Mail Channel group have been described below. You can use these properties to customize the Choice activity(activities) with different mail channel templates.

Use html template from property - If this property is set to **'No'**, it will take the mail channel template from the physical path

'[AVEVA Work Tasks Installed Path]\BPM.NET\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\Choice.html.

If this property is set to '**Yes**' and the "**HTML Template**" property is empty, it will take the mail channel template from the physical path

'[AVEVA Work Tasks Installed Path]\BPM.NET\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\Choice.html.

Property Type: Optional (This property needs to be set only if necessary.)

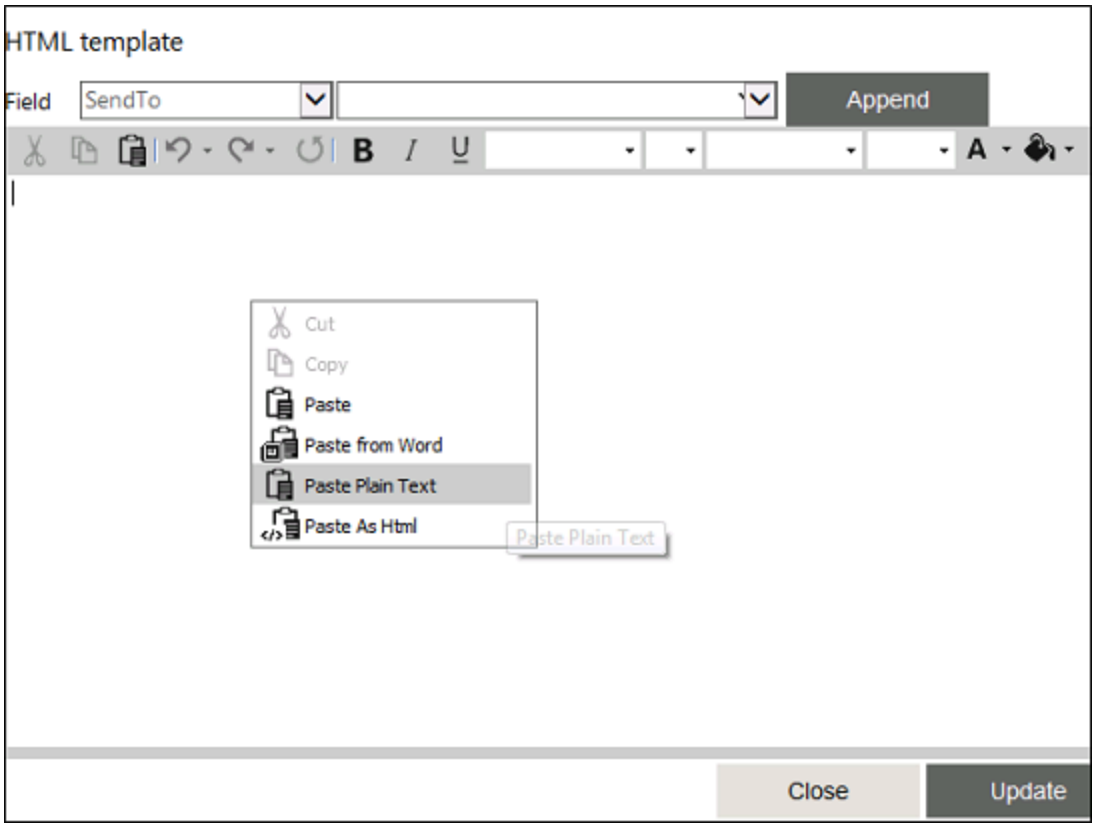
HTML template - This property is used to define the html template for mail channel.

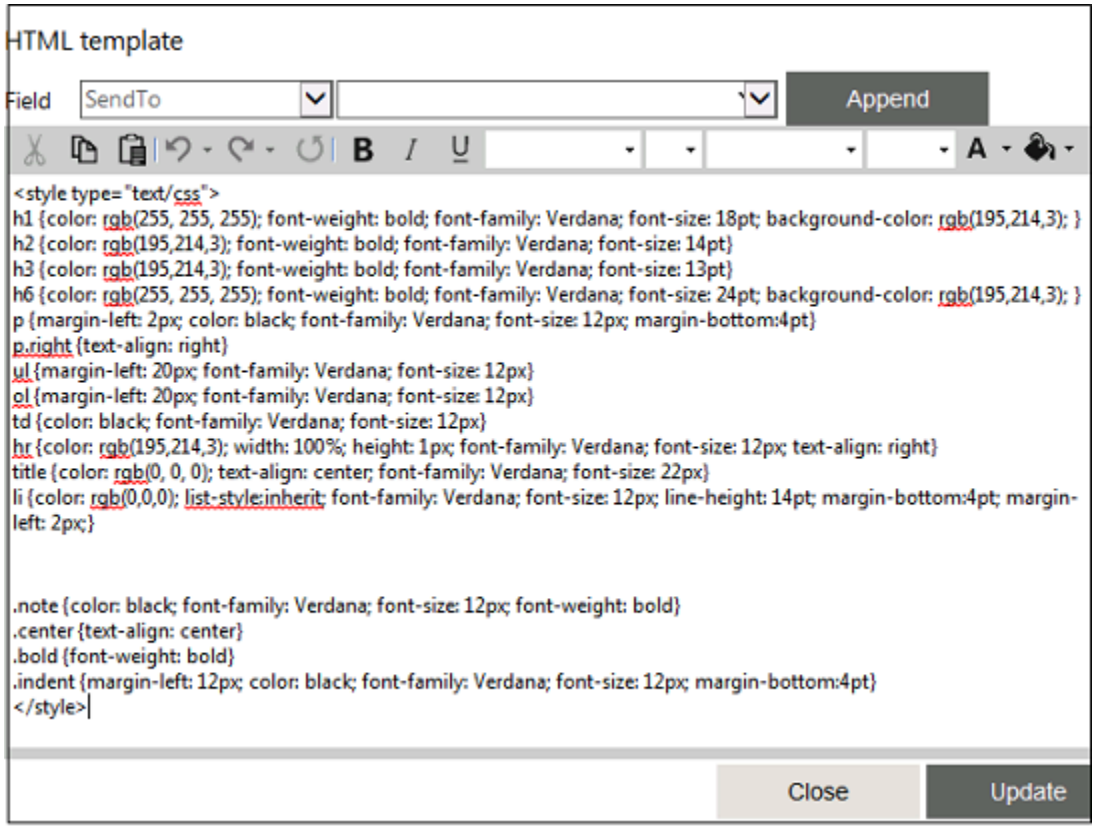
Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the HTML template

1. To specify the HTML template, click the edit icon to open the property window.
2. In the **HTML template** window, provide the template which should be in html format. If you are pasting a copied html content, right-click the **HTML template** window and paste it as "**Paste Plain Text**".

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.





3. Click **Update**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Attachment

This property is used to configure Report to be sent as an Email attachment.

Property Type: Optional (This property needs to be set only if necessary.)

See Choice - Attach Reports for a detailed description of this property.

Decision Influencers

The properties in the Decision Influencers group have been described below. You can use these properties to specify some parameters that influence the outcome of the activity.

Max Actors Required For Choice Completion [% or Number] - This property is used to check what percentage or number of actors should take action for Choice. Decision on the Choice is taken only after the specified number or percentage of actor(s) have taken the action. The activity waits for the actors' action until the 'Timeout for action' is reached.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Min Actors Required For Choice Completion [% or Number] - This property specifies the minimum number of actors to act on the Choice before the 'Timeout Warning for Activity'. If the action limit is reached before the 'Timeout Warning for Activity' then the warning message is not shown.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Escalation & Timeout Top

The properties in the Escalation & Timeout group have been described below. You can use these properties to specify escalation and timeout settings for the activity.

Set Calendar for Timeout - This property is used to specify the calendar to be used to determine activity timeouts.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to Set Calendar for Timeout

1. To specify the calendar for timeout, click the button for the 'Set Calendar for Timeout' property to open the property window.
2. In this window select the required calendar by clicking the calendar name in the tree structure.
3. Click Set Calendar to set the selected calendar.
4. You can specify that a resource calendar should be used, if available, by clicking to check the corresponding check box.

See Choice - Set Calendar for Timeout for a detailed description of the Set Calendar for Timeout property window.

Minimum available time for Activity - This property is used to check the availability of an actor to whom a task must be assigned while executing the activity. The availability check for the actor is done based on the Calendar settings (Global or Resource Calendar). If the time taken to complete the task is within the value set for the **Minimum available time for Activity** property, then the task will be assigned to that actor. However, if the time taken to complete the task exceeds the value set for the **Minimum available time for Activity** property, then the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

task will be assigned based on the values set for the **Ignore Unavailable Actors?** and **Alternate Actor Allowed?** properties.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout warning for Ownership - This property specifies the time at which a warning is provided to an actor to take ownership of the work item assigned to him/her. If the actor does not take ownership within this time the engine is notified with a warning. Thus if 'Min.Ownerships' is set, and it is not satisfied before the given time then a warning is sent. If Min.Ownerships is 0, it will check for Max.Ownerships. If the ownership count does not reach the Max.Ownerships value within the set time, a warning is sent. If both Min.Ownerships and Max.Ownerships are not set, this property is ignored.

Property Type: Optional (This property needs to be set only if necessary.)

- Choice activity is assigned to the actors in the Choice assignment list by the workflow engine. Choice activity has a default property set that at least one actor has to Take Ownership of the Choice activity.
- A drop down interface has been provided for the actor to Take Ownership. However, the actor can act on the Choice without taking ownership first, in which case ownership will be considered to be done. i.e. if the actor acts upon the Choice action without taking ownership, then it is considered as an ownership with action taken.
- After the actor has taken ownership, a link is provided to the actor, which opens a pop up with the details of the other actors. This is again tagged with the 'Hide Responses?' property. The link will be provided only If 'Hide Responses?' is set as 'No'. The pop up will have details like Actor name, Ownership Status, Action taken, Comments.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] then the 'Timeout Warning For Ownership' property is not considered.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] and the 'Time Out For Ownership' is also reached then the work item is removed from other actors' Work items list and the work item waits for action from those who have taken ownership.
- If the 'Min.Ownerships' limit is not reached for the Choice action, and the 'Timeout Warning For Ownership' has been exceeded then the actor is notified with a warning by including an email or an information activity, with the Timeout Warning for Ownership link to it.
- If 'Timeout For Ownership' is set, if the Choice activity has not reached the minimum limit (Min.Ownerships) and the 'Time Out For Ownership' has been reached, then the work item is removed from the Work items lists of all the actors.
- If 'Min.Ownerships' = 0 and if 'Max.Ownerships' is set, the activity waits for actors to take ownership or action until the 'Time Out For Ownership' is reached (if this is set).
- If none of the Ownership properties are set then the work item waits until the actors take ownership or act upon it.

Timeout for Ownership - This property specifies the time until which actors are allowed to take ownership, i.e. the time until which the Choice action will wait for actors to take ownership. If Min.Ownerships is set and is not reached, the work item is removed from all Work Item lists. If Min.Ownerships is 0, it will check if ownership count is less than Max.Ownerships. If it is, the work item is removed from all Work Item lists. Else the work item will be removed from the Work Item list of those who have not taken ownership. The work item will remain in the Work Item list of actors who have taken ownership and wait for action from them.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout warning for Activity - This property specifies when a reminder has to be provided for the actors to act on the Choice request, if the action count has not been reached. If properties such as Max.Ownerships,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Affirmative Action for Choice (AAA), and Action Limit (AL) are set, once the property values are reached then a warning is sent to the actor. When the timeout is reached, the following checks are made: if AL is set, when the action count i.e. the no. of Choices or rejections (AC) < AL, then a warning is sent, if AL = 0 and AAA is set, and when AC < AAA, then a warning is sent to the actor.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Timeout for Activity - This property's value is used to decide until what time the activity should wait for actors' action. If properties such as Max.Ownerships, AAA, AL are set, once the property values are reached the work item is removed from the Work Item lists of all the actors. When the timeout is reached, the following checks are made: If AL is set, when the action count i.e. the no. of Choices or rejections (AC) < AL, then the timeout for action is performed and the activity is removed from all Work Item lists. If AC > AL, it checks with the no. of Choices or 'decision count' (DC) and AAA. If DC >= AAA (if it is set), the activity is considered approved; otherwise, it is rejected. If AAA = 0 and if DC >= AL, the activity is considered approved; otherwise, it is rejected. If AL = 0 and AC < AAA, then the timeout for action is performed and the work item is removed from all Work Item lists. If AL = 0 and AC > AAA, it will check with DC. If DC > AAA it is approved; otherwise, it is rejected. If AL = 0 and AAA = 0, then if DC is at least 1, then it is considered approved; otherwise, it is rejected.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Multiple Timeout Warning - This is used to set recurring timeout warnings that will be sent to the actors who have to take action. To set multiple timeout warnings, click the 'Multiple Timeout Warning' button in the Properties pane for the Choice action. A new window pops up. In this window, set the interval for the recurring warning as well as the output message. You can also set the Recurring Time Interval. This can be used to set a different recurring time out after the first timeout happens. For example, if 'Time Interval' for the property is set as 7 days and 'Recurring Time Interval' is set as 2 days, then the first time out will happen after 7 days and there will be a recurring time out every second day after the seventh day (first) time out.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

1. To set the multiple timeout warning, click the button for the 'Multiple TimeOut Warning' property to open the property window.
2. Enter the time interval for the timeout in the **Time Interval** field.
3. Select "Yes" from the drop down for the **Recurring?** field if you want the timeout warning to recur. Select "No" otherwise.
4. Enter the output message corresponding to the timeout warning in the **Output** field.
5. Enter the time interval for the recurring timeout in the **Recurring Time Interval** field.
6. After entering the content details, click **Add Row** to add this timeout setting and display a new row for entering another timeout setting.
7. Remove rows if necessary by selecting them and clicking **Remove Selected**.
8. After specifying the timeout settings, click **Update**.

See Choice - Multiple Timeout Warning for a detailed description of the Multiple TimeOut Warning property window.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Miscellaneous

Redirection Enabled? - This property enables redirection. When this property is set to Yes, the workflow redirects the user to the URL in the Redirect URL property in the next activity.

Action outputs:

The Choice Action returns the following values -

Action Completed: Displayed when all the actors have taken part.

Action Completed - Affirmative Percentage Not Reached: Displayed when all the actors have not taken part.

Not Enough Resources to Take Acknowledge: Displayed when the filter condition did not yield enough actors to whom the request can be sent.

Timeout - Acknowledge: Displayed when the specified minimum number of actors did not take ownership of the request in the given time.

Timeout - Action: Displayed when some or all of the specified actors did not perform the required action in the given time.

Timeout Warning - Acknowledge: Displayed when a warning is generated that the specified minimum actors have not take ownership of the request in the given time.

Timeout Warning - Action: Displayed when a warning for timeout is generated because some or all of the actors did not perform the required action in the given time.

Note: The following outputs will return only if user assigned tasks to a queue user.

Resource Unavailable for Queue - If a queue is assigned to a task & if there are no resources available in the queue then this output will get triggered.

TimeOut for Queue Task - This output gets triggered when the task in the queue is not picked by any users within the queue escalation time resulting the completion of that task.

Timeout Warning-Queue - This output gets triggered when the task in the queue is not picked by any users within the queue escalation time resulting in sending a warning out put. However, the task will still be sleeping.

Timeout Warning-Queue Participant - This output gets triggered when the task in the queue is picked by user but still not acted on that task within the queue escalation time out settings resulting in triggering a warning output. However, the task will still be sleeping.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Choice - Delivery Channels

Purpose

The purpose of this chapter is to describe the feature of WorkflowStatus Form of Delivery Channels property

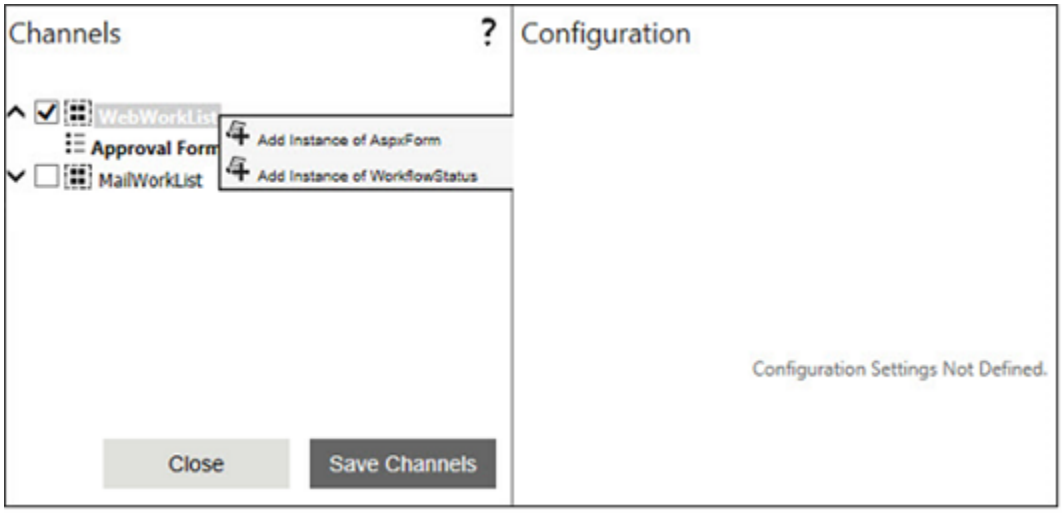
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

under the category Configuration of any human activity available in AVEVA Work Tasks.

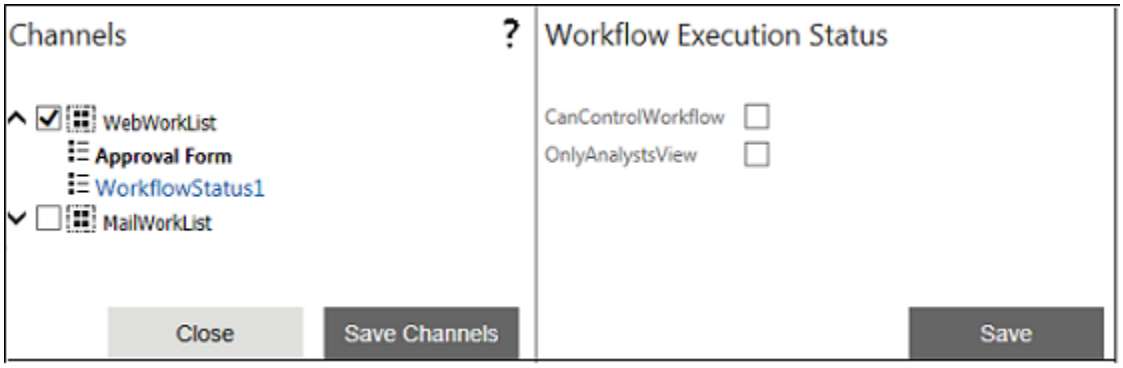
Description: This feature enables us to view the status of the workflow in the work item list in the graphical form. [Optional]

1. Select the Human Activity.
2. Click the **Delivery Channels** Property.

   This will open a window like the one shown below.

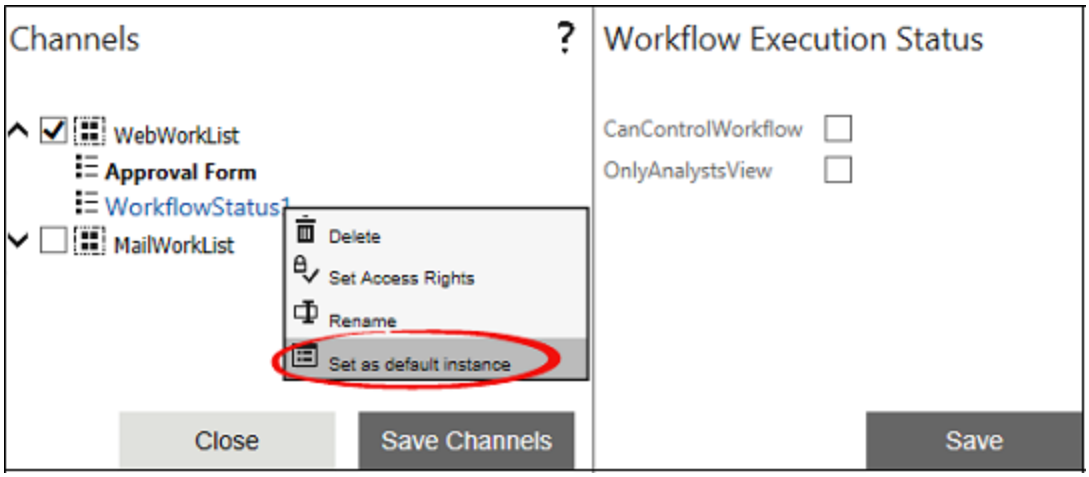


3. Right-click **WebWorkList** to display the context menu with the **Add Instance of Workflowstatus** option as shown below.



4. Set the Properties for the Execution View Status Graphical view.
5. Click **Save**.
6. If you want to set the workflow status form as the default instance, right-click **WorkflowStatus1**, and select **the Set as default instance** option from the context menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



7. Click **Save** and **Save Channels**.

Output

Now, when you click on any row in the Work items list, you will find this Execution view page being displayed as the detailed view if you set it as a default instance.

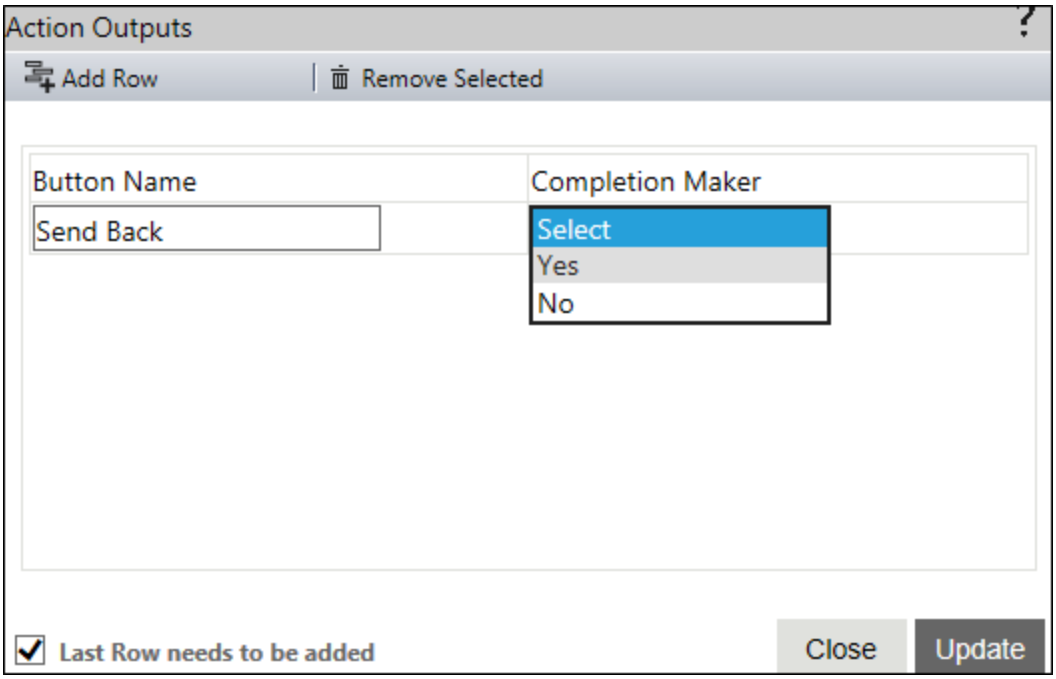
Otherwise, the workflow status form will appear in the context menu of each row in the Work items list and you can open the execution view by selecting it from the context menu.

Choice - Action Outputs

Action Outputs Property Window

You can specify the possible outputs of the Choice activity in this property window. To open this window, click the button for the 'Action Outputs' property. It displays the Outputs in a grid, which also has a blank row where you can enter the parameters for a new action output.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has two tabs at the top to manage the rows of outputs in the grid.

- **Add Row** - You can click this tab to add the newly entered output and display a new row to the grid where you can add another output.
- **Remove Selected** - You can click this tab to remove the output selected in the grid.

The grid has the following parameters that you need to specify for the new output.

- **Button Name** - You can use this field to enter the action output.
- **Completion Maker** - You can use the drop down in this field to specify whether the corresponding output is the completion maker for the activity by selecting "Yes" from the drop down. Select "No" if you do not want the output to be a task completion maker.

There are two buttons and a check box at the bottom of the screen.

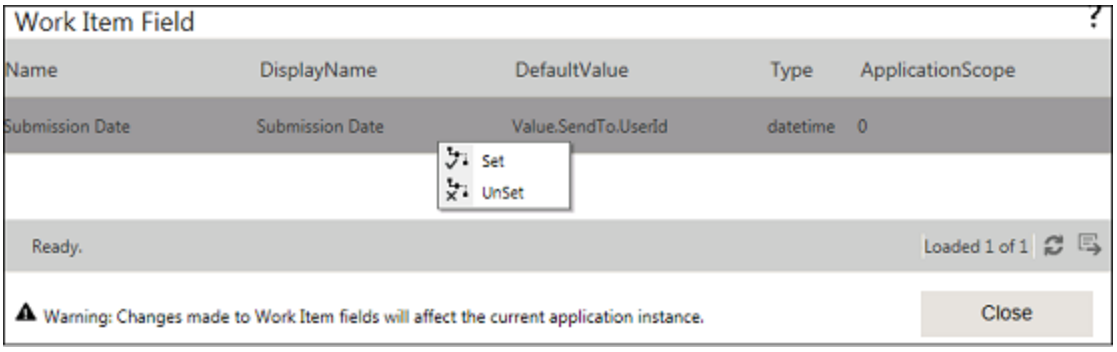
- **Update** - Click this button to save the newly added output(s)
- **Close** - Click this to close the property window without saving the newly added output(s)
- **Last Row needs to be added** - You need to check this check box to add the last row of action outputs that you have entered. If this is not checked, the last row is ignored.

Choice - Work Item Fields

Work Item Fields Property Window

You can set the Work Item Fields for this activity in this property window. To open this window, click the button for the 'Work Item Fields' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a grid listing all the Work Item Fields that have been set for the process.

- Each row in the grid represents a Work Item Field. You can click a Work Item Field to select it.
- The context menu has the Set WorkItemField option, which you can use to set the selected Work Item Field for this activity. It also has the UnSet WorkItemField option to remove the Work Item Field setting.
- **Close** - You can use this button to close the window.

Note: While entering a value in the Work Item field, it is recommended to keep it less than the specified database column size. If there is a need to increase the size of the Work Item field, the user should manually increase the column size in the database.

Choice - Assign Actor(s)

Assign Actor(s) Property Window

You can set the actors to whom the Choice work item is to be sent in this property window. To open this window, click the button for the 'Assign Actor(s)' property.

See Assigning a Task to a Manager for more details.

The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Different Methods of Assigning an Actor

- Assigning an Actor by building an expression:

Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

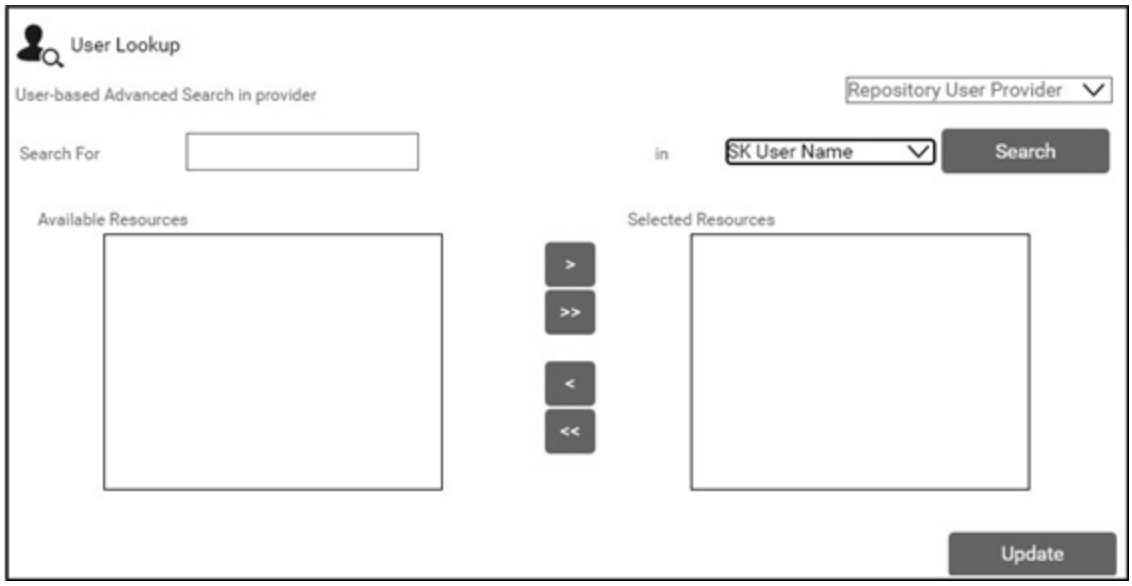
At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.
- **Assigning an Actor through User Lookup**

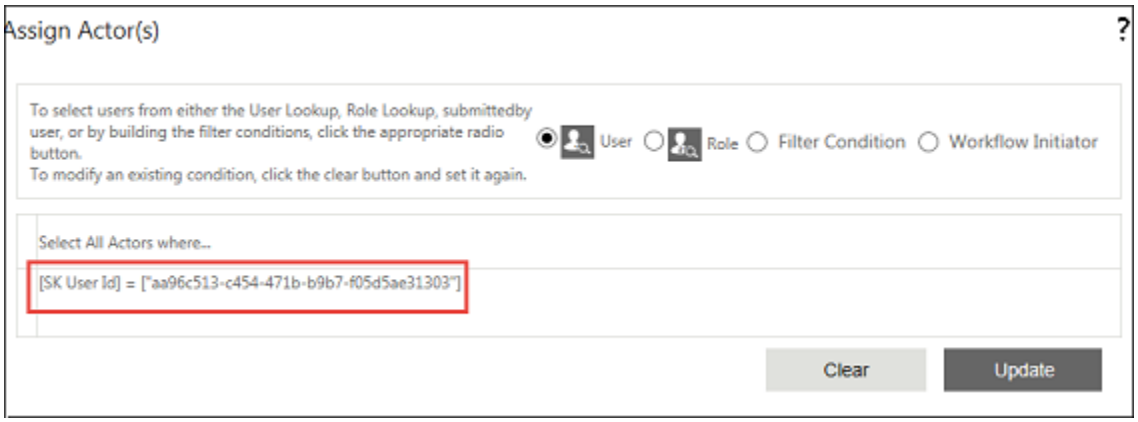
Through the **User Lookup** you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.
2. The **User Lookup** dialog is displayed, search and select the required actor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:



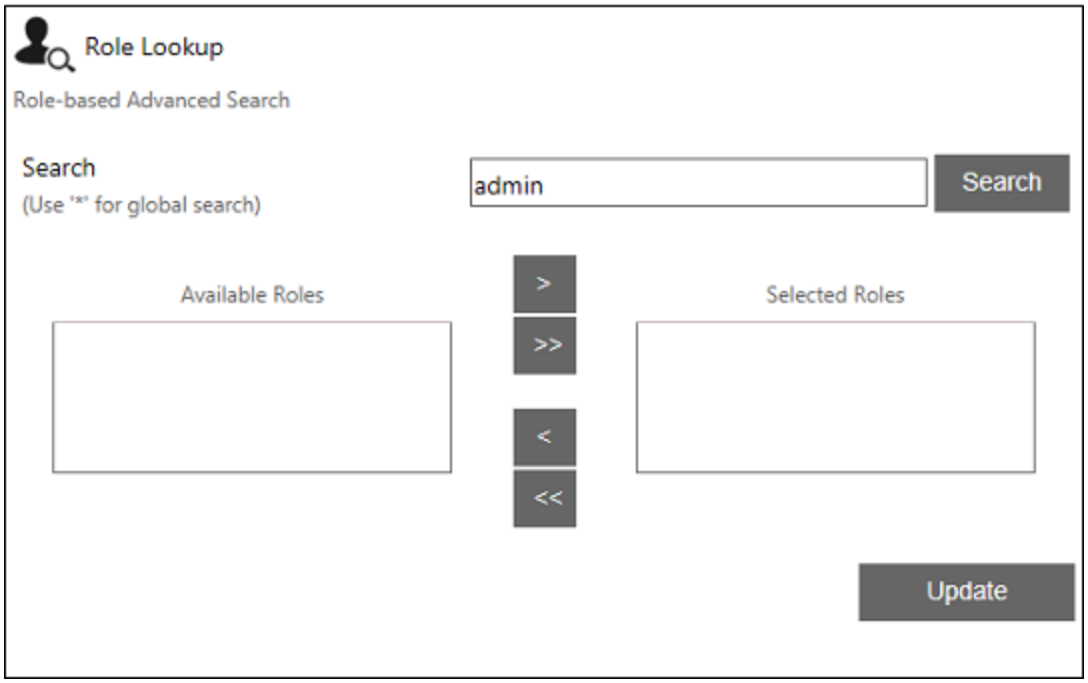
4. **Click Update** in the Assign Actor(s) window to update the selected actor(s) in the **Assign Actor** property.
   Actor(s) selected through User Lookup will be updated in the Assign Actor property.

- Assigning an Actor through Role Lookup

Through the Role Lookup you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

1. Select the **Role Lookup** option.
2. The **Role Lookup** dialog is displayed, search and select for the required role.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



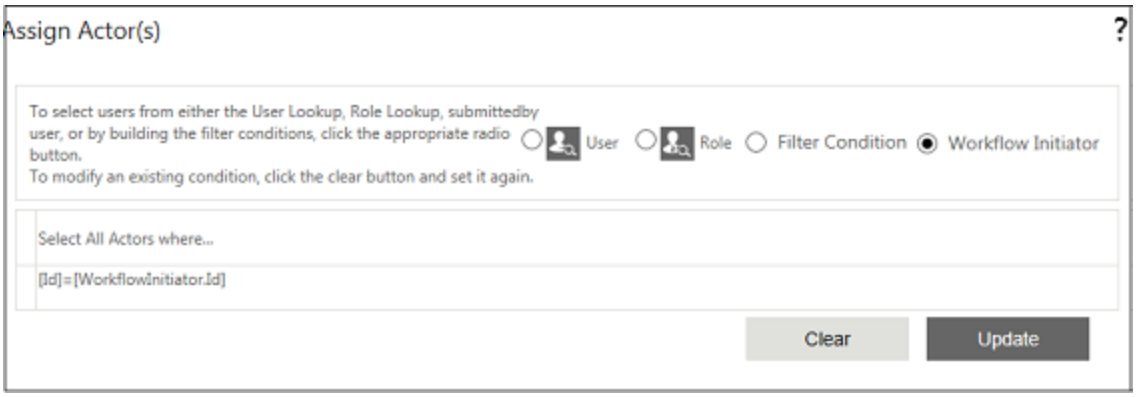
3. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

4. Click **Update** in the Assign Actor(s) window to update the **Assign Actor** property.

- Assigning an Actor through Workflow Initiator

Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

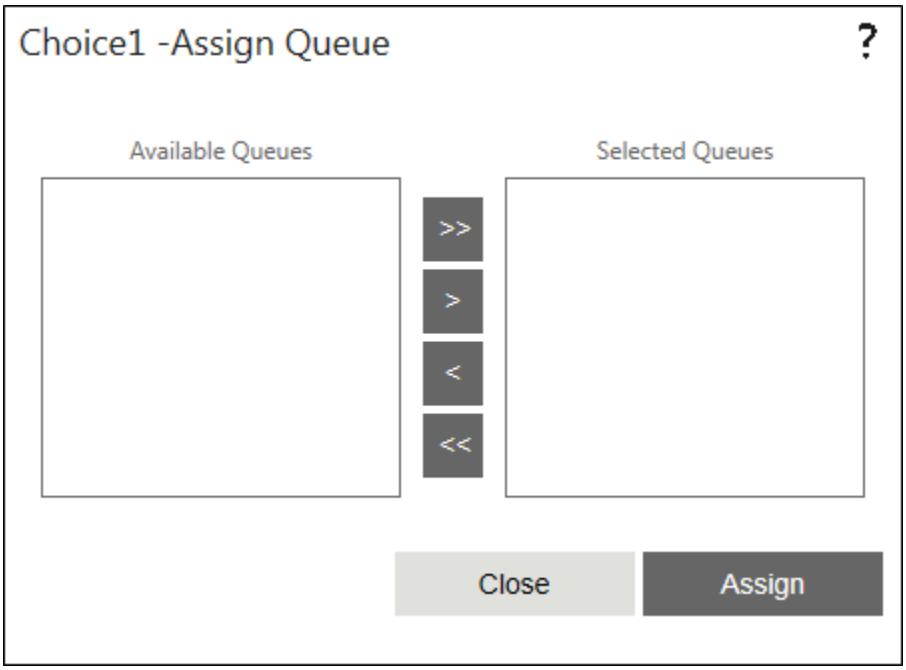
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Choice - Assign Queue(s)

Assign Queue(s) Property Window

You can select the queues to which the Choice work item is to be sent in this property window. To open this window, click the button for the 'Assign Queue(s)' property.



The window has a pair of list boxes to specify the queue(s). The **Available Queues** list shows all the available queues. You can select the required queue(s) from this list box. The **Selected Queues** list shows all the selected queues to which the activity will be assigned.

You can use the following buttons located between the list boxes to move the queues to and from the list boxes.

- [>>] - You can click this button to add all the queues in the Available Queues list to the Selected Queues list.
- [>] - You can click this button to add the selected queue(s) to the Selected Queues list.
- [<] - You can click this button to add the selected queue(s) from the Selected Queues list to the Available Queues list.
- [<<] - You can click this button to add all the queues in the Selected Queues list to the Available Queues list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

At the bottom of the window you will find the following buttons:

- **Assign** - You can click this button to assign the activity to the selected queues.
- **Close** - You can click this button to close this window.

Assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

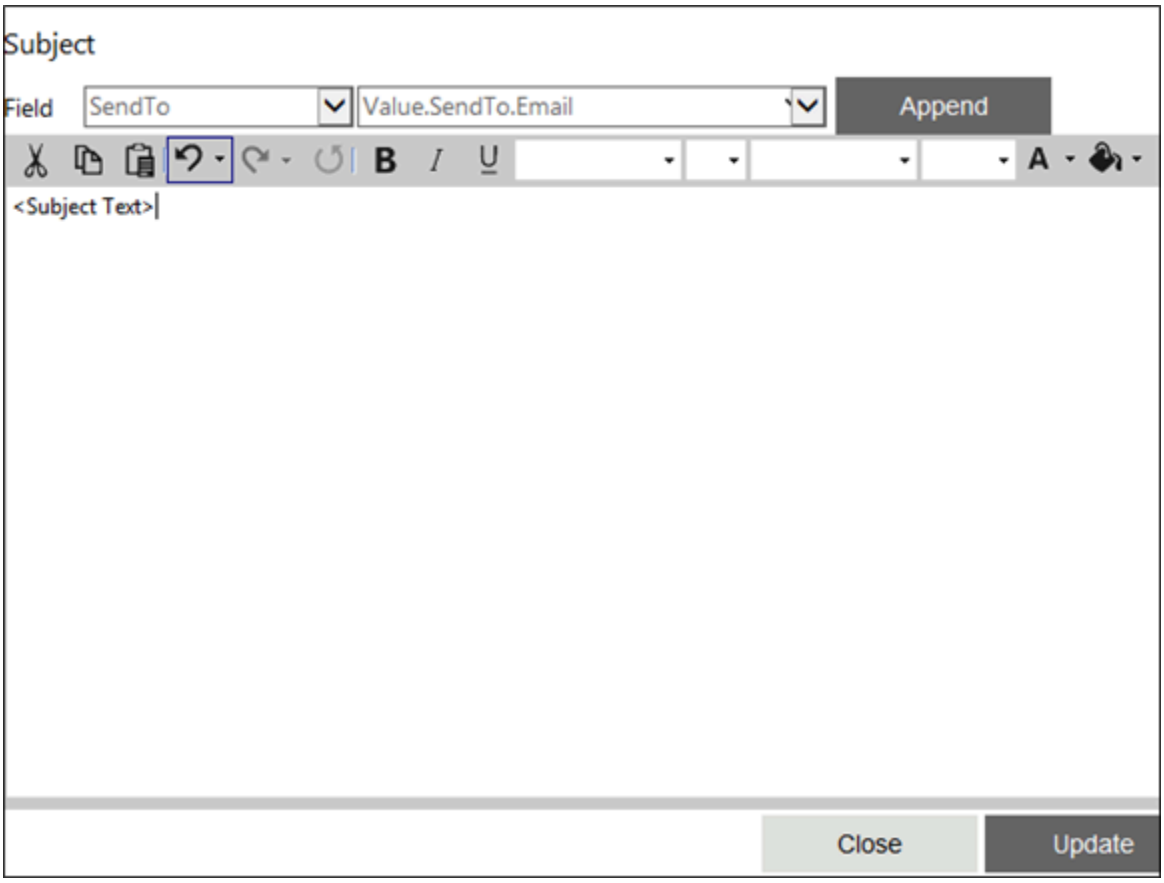
For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the Start activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

To assign multiple queues, specify the queue-ids with semicolon (;) separator. **Skelta.HWS.Queue.QueueCollection** class can be used to retrieve queue information.

Choice - Subject

Subject Property Window

You can specify a subject for the Choice work item assignment in this property window. To open this window, click the button for the Subject' property.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The window has a text editor to enter the subject. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the subject. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the subject in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the subject.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the subject using a combination of discrete value and variable or content. For example, you can specify the subject as "Submitted By <%#Variable.SubmittedBy.Email%>". Here, the string "Submitted By" should be typed directly in the text editor. The second half of the subject is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the Field drop down and clicking Append.

The text tool bar above the text editor allows you to manage and format the subject. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the subject.
- **Close** - You can click this button to close this window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Choice - Body

Body Property Window

You can specify a message Body for the Choice work item assignment in this property window. To access this window, click the button in the 'Body' property.

The window has a text editor to enter the body text. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the body using a combination of discrete value and variable or content. For example, you can specify the body message as "Hi, Please approve the leave application submitted by <%#Variable.SubmittedBy.name%>". Here, the string "Hi, Please approve the leave application submitted by" must be typed directly in the text editor. The second half of the body is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the Field drop down and clicking Append.

The text tool bar above the text editor allows you to manage and format the body text. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

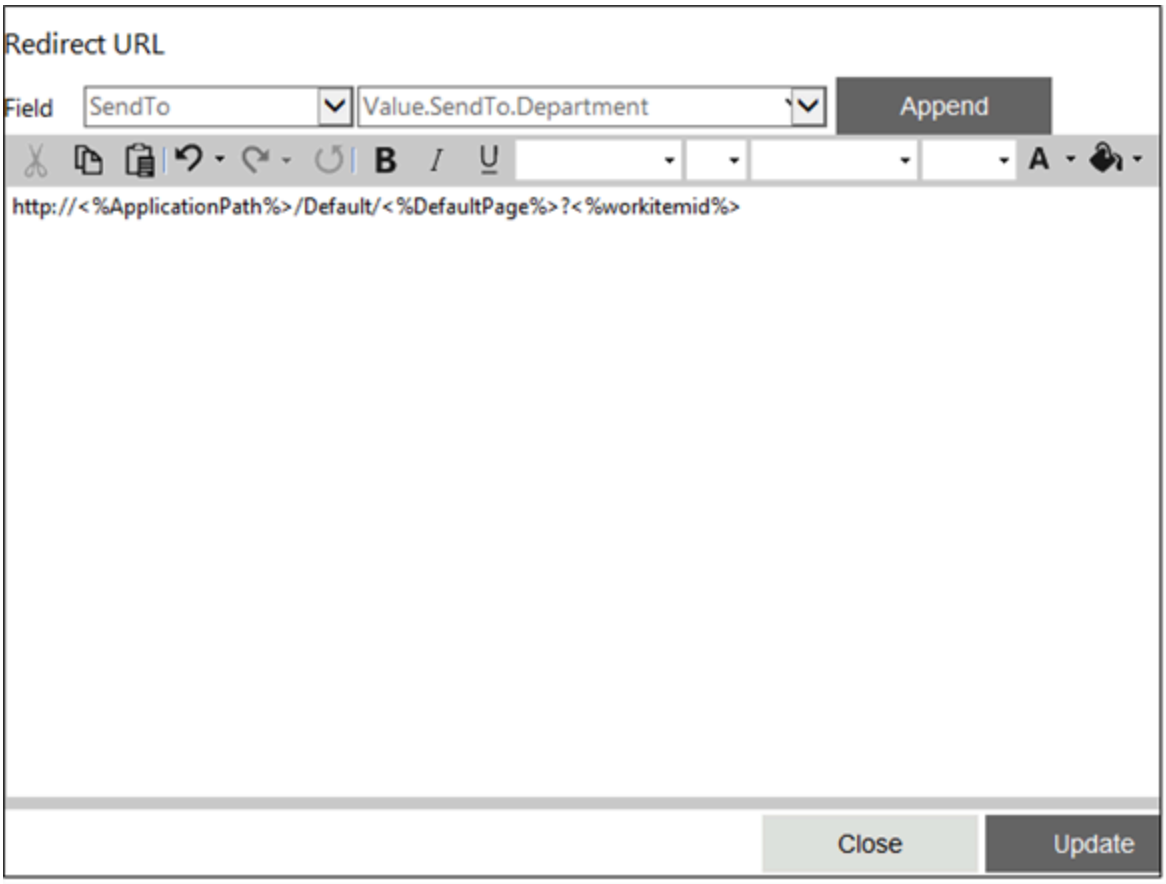
- Update - You can click this button to save the body message.
- Close - You can click this button to close this window.

Choice - Redirect URL

Redirect URL Property Window

You can specify a message Redirect URL for the Choice activity in this property window. To access this window, click the button in the 'Redirect URL' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the Redirect URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Redirect URL in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Redirect URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Redirect URL. It has the following text tools

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to re the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

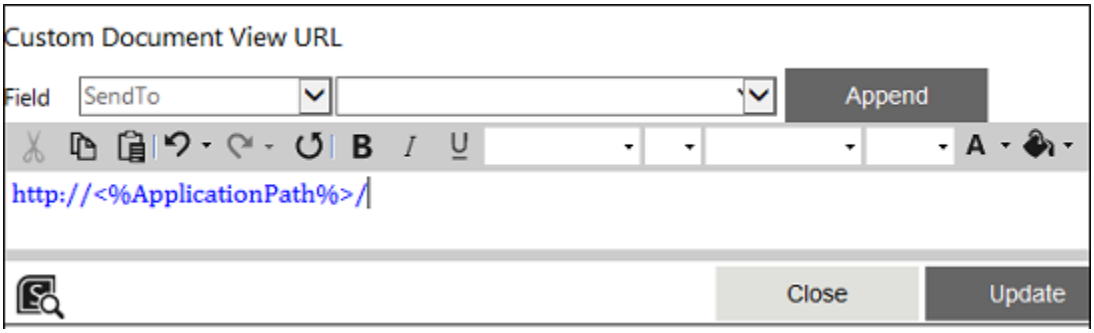
- **Update** - You can click this button to save the Redirect URL.
- **Close** - You can click this button to close this window.

Choice - Custom Document View URL

Custom Document View URL Property Window

You can specify a message Custom Document View URL for the Choice activity in this property window. To access this window, click the button in the 'Custom Document View URL' property.

For more details, see Custom Document View URL.



The window has a text editor to enter the Custom Document View URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop-down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop-down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop-down. If you had selected "Value", it will display a text box here. You can enter the Custom Document View URL in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop-down instead of the field. This drop-down will have the variable

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Custom Document View URL.

- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Custom Document View URL. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the Custom Document View URL.
- **Close** - You can click this button to close this window.

Choice - HTML Template

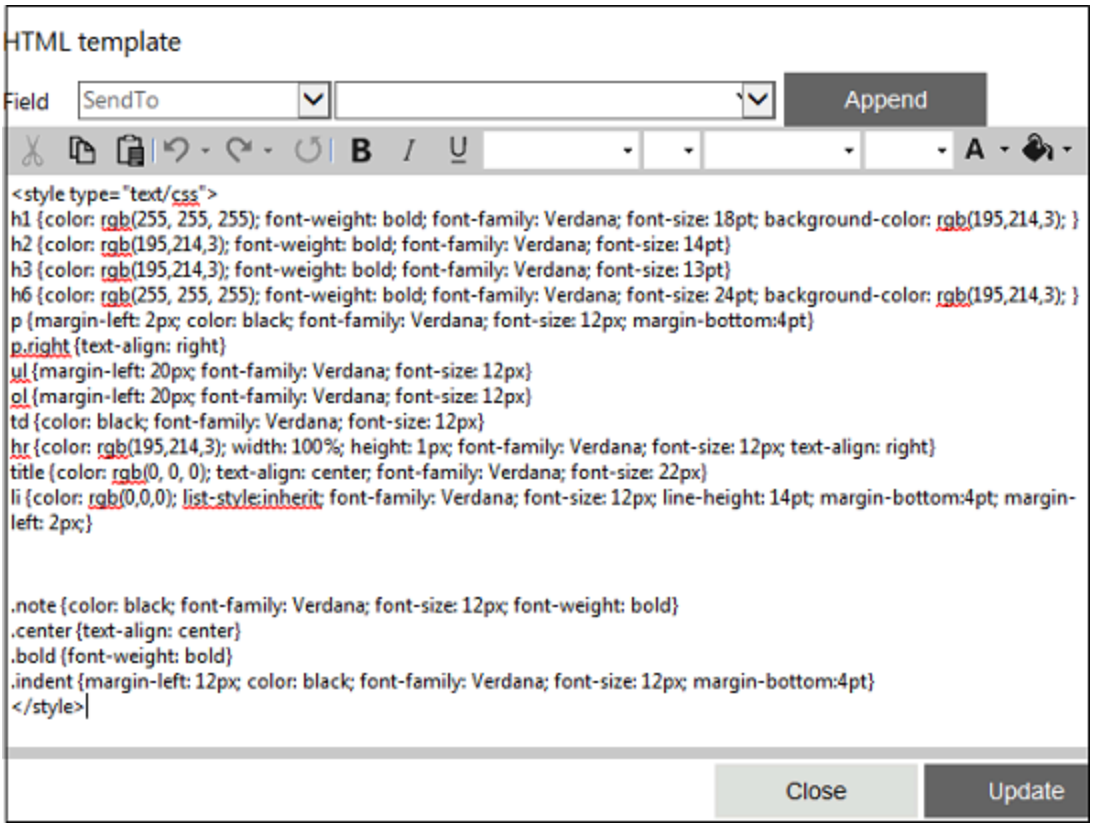
HTML template Property Window

You can specify a html template for the Choice activity in this property window. To access this window, click the edit button in the 'HTML template' property.

In this property window, user can write their own html template for Choice activity or user can make use of default Choice activity template for customizing the email.

See Using 'HTML Template' property of Choice Activity for more information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the body text. You can do this either by entering a html template directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop-down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.
- Append - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the html template. It has the following text tools

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

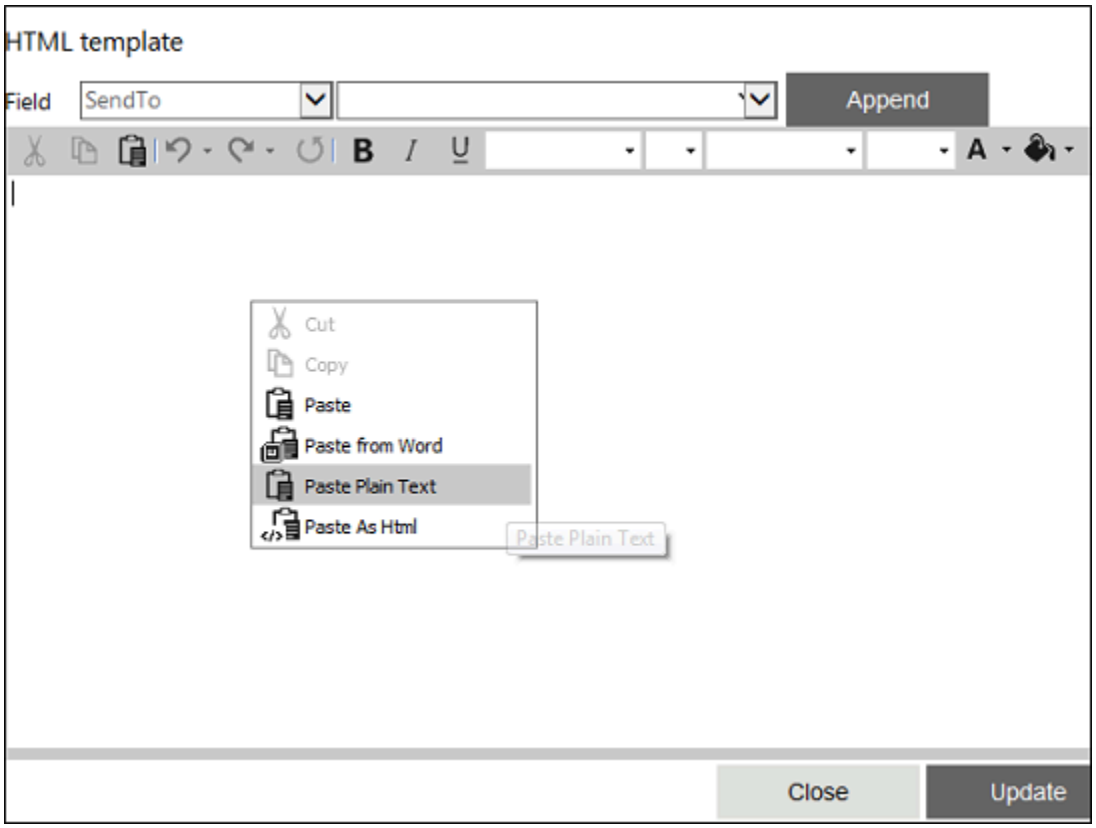
- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

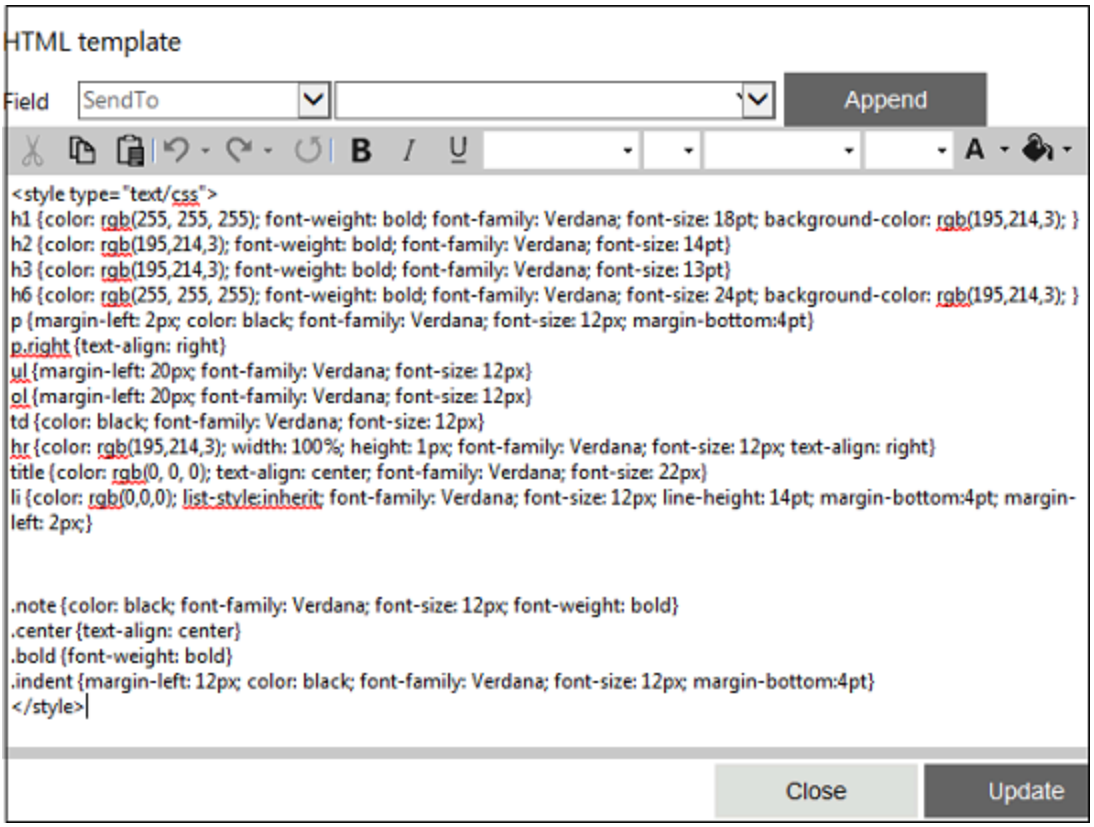
- Update - You can click this button to save the HTML template.
- Close - You can click this button to close this window.

To set HTML temple, follow the steps given below:

1. To specify the HTML template, click the edit icon to open the property window.
2. In the **HTML template** window, provide the template which should be in html format. If you are pasting a copied html content, right-click the **HTML template** window and paste it as **"Paste Plain Text**".



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click **Update**.

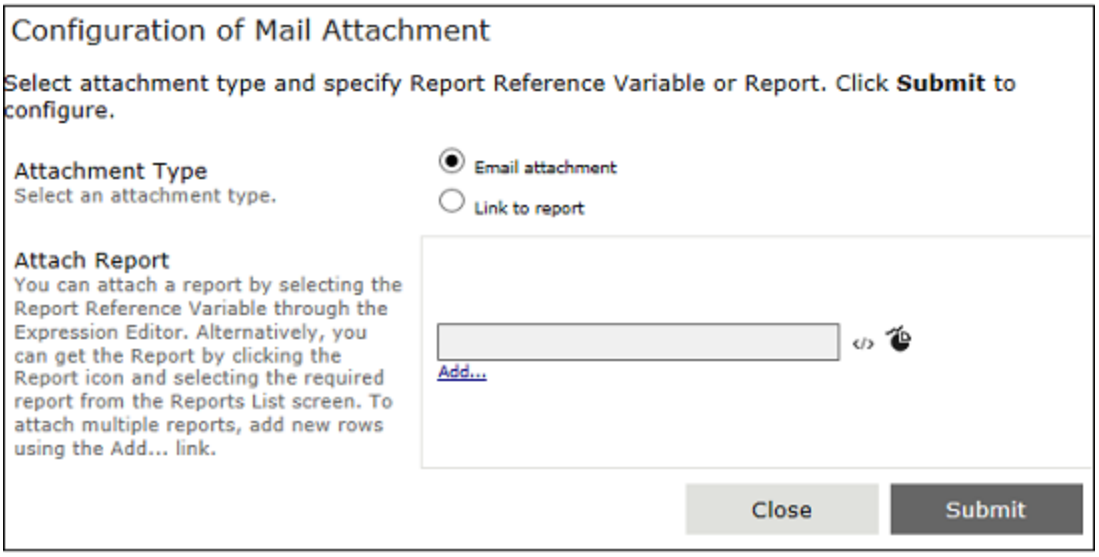
Choice - Attach Reports

Configuration of Mail Attachment property window

You can configure the **Attachment** property for the **Approval** activity in this property window.

In this property window, you can configure the report attachments to be emailed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



- **Attachment Type:** Use this property to select the type of attachment for sending the report as an email.
  - **Email attachment:** Select this type to send the report as an email attachment.
  - **Link to report:** Select this type to embed a link in the email to download the configured report.
- **Attach Report:** Use this property to attach a report generated by the **Report Generator** activity within the workflow or to select a report from the list of generated reports.

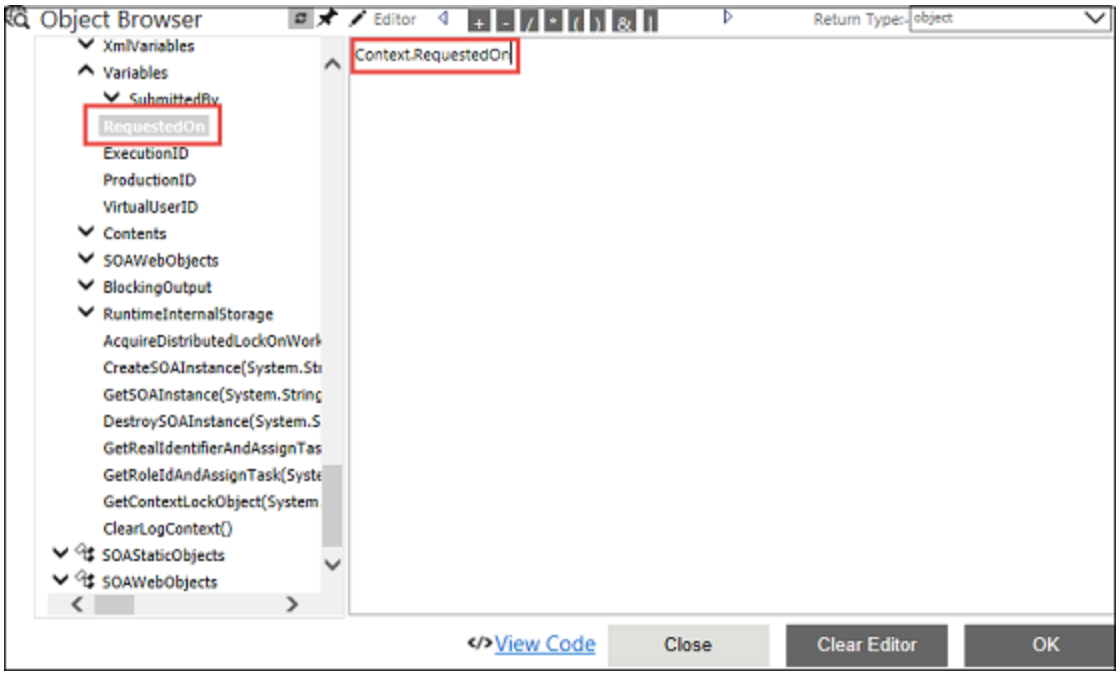
  You can attach a report by selecting the required **Report Reference Variable** using the **Expression Editor**. Alternatively, you can select the report from the Reports List window which consists of the already generated reports.

There must be at least one **Report Generator** activity before an **Approval** activity in the workflow to select the **Report Reference Variable** (using Expression Editor) as an **Attachment**. The **Report Reference Variable** is generated while configuring the **Report Generator** activity. By default, the report reference variable is **[Template Name]_[activity Name**]. For more information about **Report Reference Variable**, see Configure Report Template.

To configure mail attachment

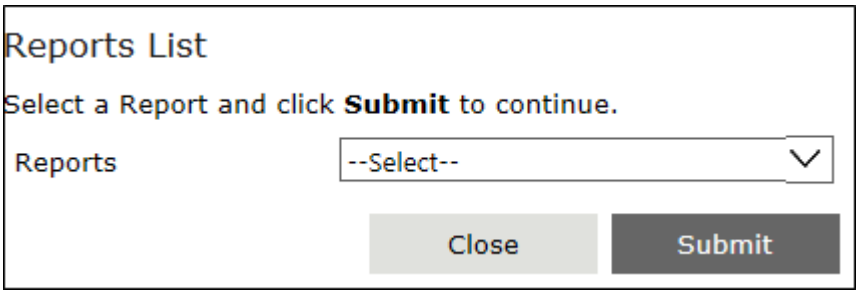
1. Click the edit button for the **Attachment** property.
2. Select the required **Attachment Type**.
3. In the **Attach Report** text box, you can either use the expression editor to get the variable of the report or use the **Reports List** to select the report.
4. To get the variable, click the **Expression Editor** icon given beside the text box to select the required **Report Reference Variable**.
5. In the **Expression Editor** window, select the required variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



6. Click **OK.**
7. Click **Close**.

   The variable appears in the **Attach Report** text box.
8. To select the report from the Reports List dialog box, click the **Reports** icon.



9. In the Reports List dialog box, select the required report, and then click **Submit**.

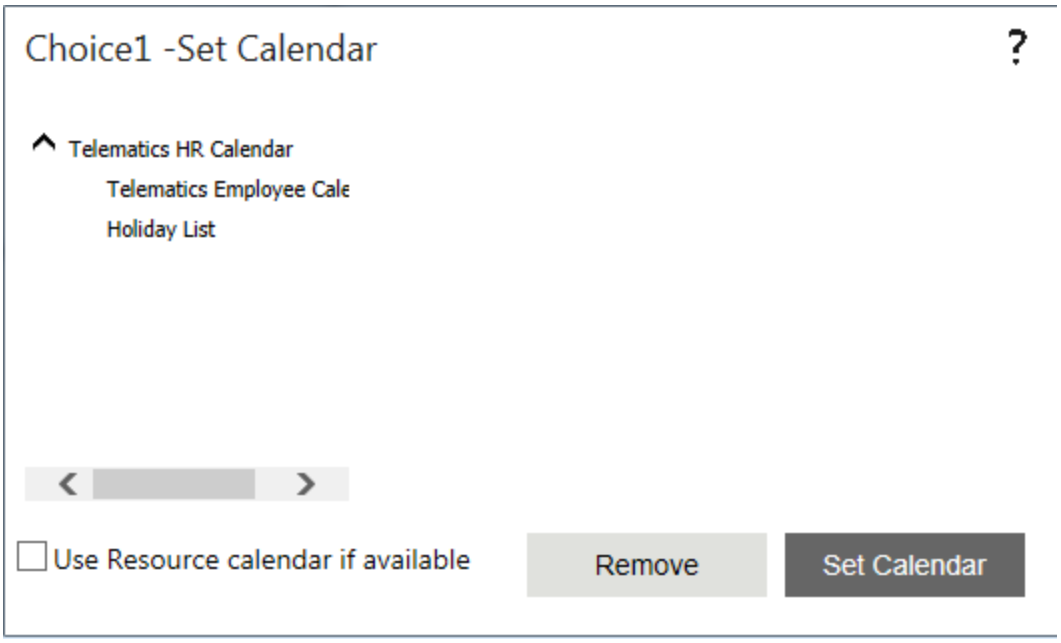
   This window closes automatically.
10. Click **Close** to close the configuration window.

Choice - Set Calendar for Timeout

Set Calendar for Timeout Property Window

You can set a Calendar to calculate the timeout for the Choice activity in this property window. To access this window, click the button in the 'Set Calendar for Timeout' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



This window lists the available calendars in a tree structure, with lower-level calendars nested within the respective top-level calendar. You can click on a calendar to select it for setting.

There are two buttons in this window.

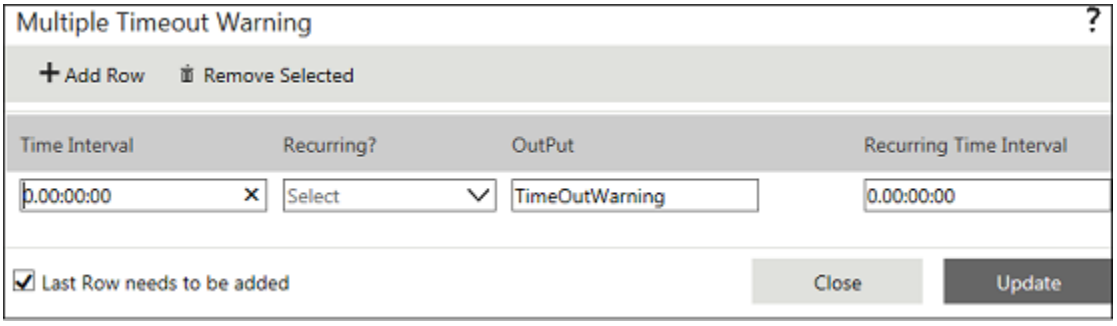
- **No Calendar** - Click this button to indicate that there is no calendar set for the activity.
- **Set Calendar** - Click this button to set the selected calendar.

The **User Resource calendar if available** check box can be selected to enable the use of resource calendars if none are displayed in this window for selection.

Choice - Multiple Timeout Warning

Multiple TimeOut Warning Property Window

You can set the Multiple Timeout Warning in this property window. To access this window, click the button in the 'Multiple TimeOut Warning' property.



The window has two tabs at the top to manage the rows of timeout settings in the grid.

- **Add Row** - You can click this tab to add the newly entered timeout setting and display a new row to the grid where you can add another timeout.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Remove Selected** - You can click this tab to remove the timeout setting row selected in the grid.

The grid has the following parameters that you need to specify for the new timeout setting.

- **Time Interval** - You can use this field to enter the time interval in which you want to generate a timeout warning. You must enter the time in d.hh:mm:ss format.
- **Recurring?** - You can use the drop down in this field to indicate whether the timeout is recurring or not. You can select "Yes" to set the timeout warning to recur.
- **Output** - You can enter the output message corresponding to the timeout warning here
- **Recurring Time Interval** - You can set the time interval in which the timeout warning has to recur here. Enter the time in d.hh:mm:ss format.

There are two buttons and a check box at the bottom of the screen.

- **Update** - You can click this button to save the newly added timeout settings.
- **Close** - You can click this to close the property window without saving the newly added timeout settings.
- **Last Row needs to be added** - You need to select this check box to save the last row added.

Information Activity

Activity Description

The Information Activity is included in the AVEVA Work Tasks workflow process designs when there is a need to provide some information to a set of actors. The actor(s) to whom the information is to be sent can be selected on the basis of various factors like first name, department, designation, email etc. The subject and contents of the information can be customized for each actor.

Application Scenarios

Typical application scenarios could be the Leave Application Workflow Process, where information needs to be sent to the applicant if the leave is approved or rejected, or the Technical Support Request Workflow Process, where information needs to be sent to the appropriate technical support person about the support task being assigned to him/her. The Information activity can be used to send the information in both cases.

Activity Properties

The Information activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Information activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Display Name - This property specifies the name to be displayed for the activity in the Work items list.

Property Type: Optional (This property need not be set if the display name is already configured in the Actions.xml. The name entered here overrides any display name that is configured for this activity in the Actions.xml file.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Delivery Channels - This property is used to specify the delivery channels to deliver this activity to the assigned actor(s). Multiple channels can be specified giving the actor(s) different options to act on the work item.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Delivery Channels property

1. To select the Delivery Channels, click the button for the 'Delivery Channels' property to open the property window.
2. In this window, the Delivery Channels that have been configured are listed on the left along with a check box against each channel. Click and select the check box corresponding to the channel you wish to select. You can select multiple channels by selecting their respective check box.
3. Click **Save Channels**.

See Info - Delivery Channels for a detailed description of the Delivery Channels property window.

Work Item Fields - This property is used to add the Work Item Fields to be used to display application data as well as value in variables and content in the Work items list when this activity is executed.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Work Item Fields property

1. To select the Work Item Fields, click the button for the 'Work Item Fields' property to open the property window.
2. In this window, the Work Item Fields that have been set are listed in a grid. Click a row to select the corresponding Work Item Field.
3. Right-click the row, and select "SetWorkItemField" from the context menu to set it.

See Info - Work Item Fields for a detailed description of the Work Item Fields property window.

Actors

The properties in the Actors group have been described below. You can use these properties to specify the actors who will work on the activity and related properties.

Assign Actor(s) - This property specifies the actor(s) who has to take up the Information activity. It is tagged with

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the Ignore Unavailable Resources property which in turn is tagged with Alternate Resource Allowed. This will be explained in detail later.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any resource(s).)

Steps to set the Assign Actor(s) property

1. To specify the actors, click the button for the 'Assign Actor(s)' property to open the property window.
2. In this window, build an expression to select the actors using the actors properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Info - Assign Actor(s) for a detailed description of the Assign Actor(s) property window.

Assign Queue(s) - This property specifies the queue(s) to which the Information activity is to be assigned.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any Queue(s).)

Steps to set the Assign Queue(s) property

1. To specify the queue(s), click the button for the 'Assign Queue(s)' property to open the property window.
2. In this window, select the queue(s) from the **Available Queues** list box. You can select multiple queues by selecting with the <Ctrl> key pressed.
3. After selecting the required queue(s), click the [>] button to move it to the **Selected Queues** list box. You can click the [>>] button to select all the queue(s) and move them to the **Selected Queues** list box.
4. You can remove any queue from the selected list by selecting it and clicking the [<] button. You can remove all the queues by clicking the [<<] button.
5. After adding the required queue(s), click **Assign** to assign the activity to the selection.
6. Click **Close** to close the window without saving the selection.

See Info - Assign Queue(s) for a detailed description of the Assign Queue(s) property window.

Notification Contents

The properties in the Notification Contents group have been described below. You can use these properties to specify the content used to notify actors about the activity.

Subject - This is the subject of the Information work item. The subject can be customized for each actor.

Property Type: Optional (This property need not be set. If it is not set, the default subject line from the Actions.xml file is displayed.)

Steps to set the Subject property

1. To specify the subject, click the button for the 'Subject' property to open the property window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. In this window, enter the subject text directly in the text editor.
3. If you want to customize the subject you can do so using the **Field** controls to add resource property values. For example, to add a subject that includes the email id of the actor submitting the approval request, you can do as follows: Type in the text "Submitted By". Select "Variable" and "Variable.SubmittedBy.Email" from the two drop downs for **Field** and click **Append**. This will add the placeholder for the variable after the text entered in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the email id.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the subject, click **Update** to save it.
7. Click **Close** to close the window without saving the subject.

See Info - Subject for a detailed description of the Subject property window.

Body - This is the actual message of the Information sent to the actor(s). The body can be customized for each actor. There is an **Enterprise Console Explorer**(plug-in) icon in the Body property window to get the work item details URL. See Enterprise Console Control (EC Plug-in) for more information.

Property Type: Optional (This property need not be set.)

Steps to set the Body property

1. To specify the message body, click the button for the 'Body' property to open the property window.
2. In this window, enter the body text directly in the text editor.
3. If you want to customize the body you can do so using the Field controls to add resource property values. For example, to add a body that includes the name of the actor submitting the approval request, you can do as follows: Type in the text: "Hi, Please cast your vote in the poll conducted by". Select "Variable" and "Variable.SubmittedBy.name" from the two drop downs for **Field** and click **Append**. This will add the placeholder for the variable after the text entered in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the name.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the body, click **Update** to save it.
7. Click **Close** to close the window without saving the body.

See Info - Body for a detailed description of the Body property window.

From Email Address - This property is used to specify the email address from which notification messages will be sent for the activity.

Property Type: Optional (This property needs to be set only if necessary. If it is not set, the default value in Activities.xml will be used.)

Send Notification Email - If this property is set to 'Yes', then notification emails will be sent to the actors. If it is set to 'Yes-HTML', then the emails will be sent in HTML format.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Redirect URL - This property is used to get the URL of the web page to redirect the client to, in the case of synchronous execution of the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Redirect URL property

1. To specify the Redirect URL, click the button for the 'Redirect URL' property to open the property window.
2. In this window, enter the Redirect URL directly in the text editor.
3. If you want to customize the Redirect URL you can do so using the **Field** controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for **Field**, and clicking **Append**. This will add the placeholder for the variable in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the URL.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Redirect URL, click **Update** to save it.
7. Click **Close** to close the window without saving the Redirect URL.

See Info - Redirect URL for a detailed description of the Redirect URL property window.

Custom Document View URL - This property is used to get the URL of the page to which the custom document dlls does a post.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Custom Document View URL property

1. To specify the Custom Document View URL, click the button for the 'Custom Document View URL' property to open the property window.
2. In this window, enter the Custom Document View URL directly in the text editor.
3. If you want to customize the Custom Document View URL you can do so using the Field controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for **Field**, and clicking **Append**. This will add the placeholder for the variable in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the URL.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Custom Document View URL, click **Update** to save it.
7. Click **Close** to close the window without saving the Custom Document View URL.

See Info - Custom Document View URL for a detailed description of the Custom Document View URL property window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Mail Channel

The properties in the Mail Channel group have been described below. You can use these properties to customize the Information activity (activities) with different mail channel templates.

Use html template from property - If this property is set to 'No', it will take the mail channel template from the physical path

'[AVEVA Work Tasks Installed Path]\BPM.NET\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\Information.html.

If this property is set to **'Yes'** and the **"HTML Template"** property is empty, it will take the mail channel template from the physical path

'[AVEVA Work Tasks Installed Path]\BPM.NET\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\Information.html.

Property Type: Optional (This property needs to be set only if necessary.)

HTML template - This property is used to define the html template for mail channel.

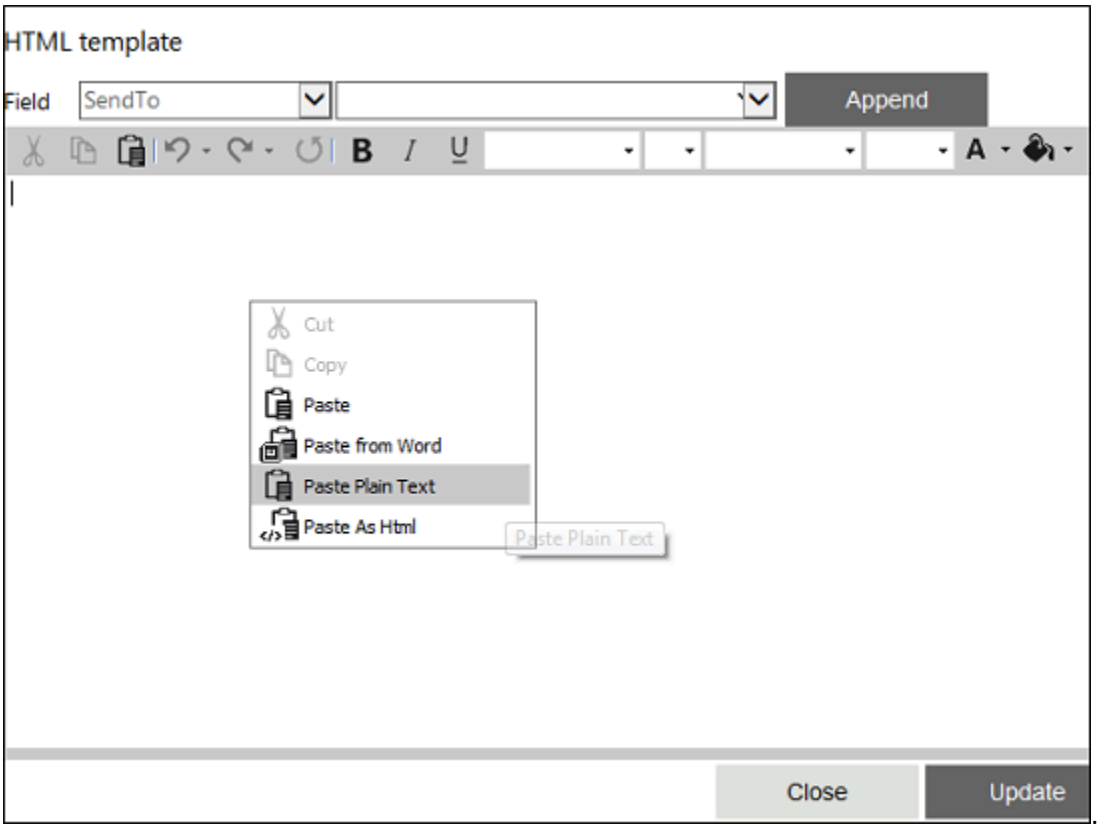
Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the HTML template

1. To specify the HTML template, click the edit icon to open the property window.
2. Click Update.

See Info - HTML Template for a detailed description of the property HTML template window.

Attachment



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Attachment property

1. To specify the **Attachment** property, click the edit icon to open the property window.
2. In the **Configuration of Mail Attachment** window, select the required attachment type by clicking the radio button.
3. In the **Attach Report** property, you can attach a report by selecting the **Report Reference Variable** through the Expression Editor. Alternatively, you can get the **Report** by clicking the **Report** icon and selecting the required report from the Reports list screen. To attach multiple reports, add new rows using the Add link.
4. Click **Submit**.

See Info - Attach Reports for a detailed description of this property.

Activity outputs

The Information Activity does not return any value.

Escalation & Timeout

You can use this property to specify escalation and timeout settings for the activity.

Timeout for Activity - This property is used for setting timeouts for the information activity. If specified, the activity will be timed out after the specified time span and will be moved from the **Inbox**.

The timeout setting must be specified in the below format:

0.00:00:00 which indicates Day.HH:MM:SS

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Info - Delivery Channels

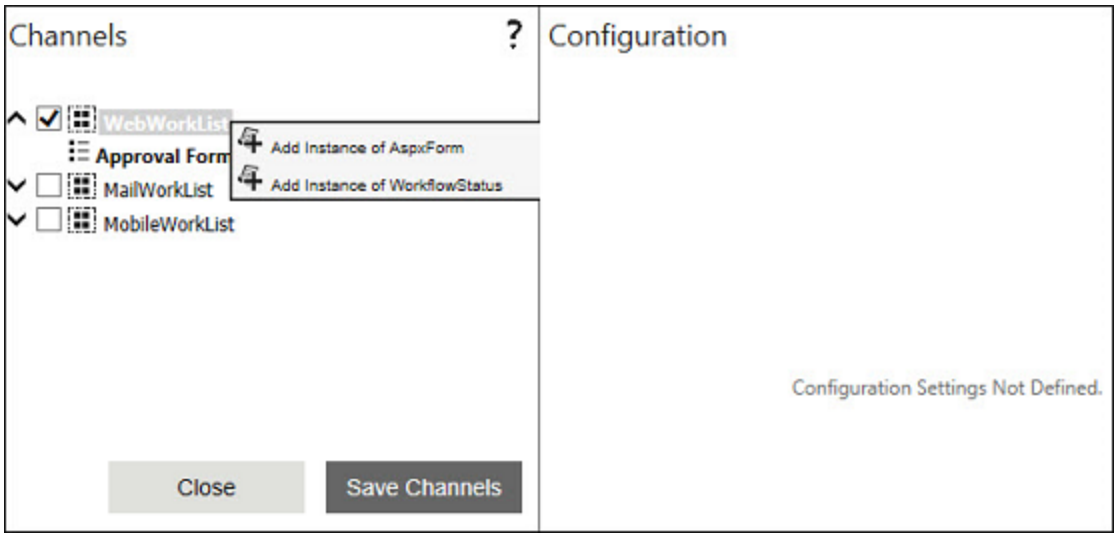
Purpose

The purpose of this chapter is to describe the feature of WorkflowStatus Form of Delivery Channels property under the category Configuration of any human activity available in AVEVA Work Tasks.

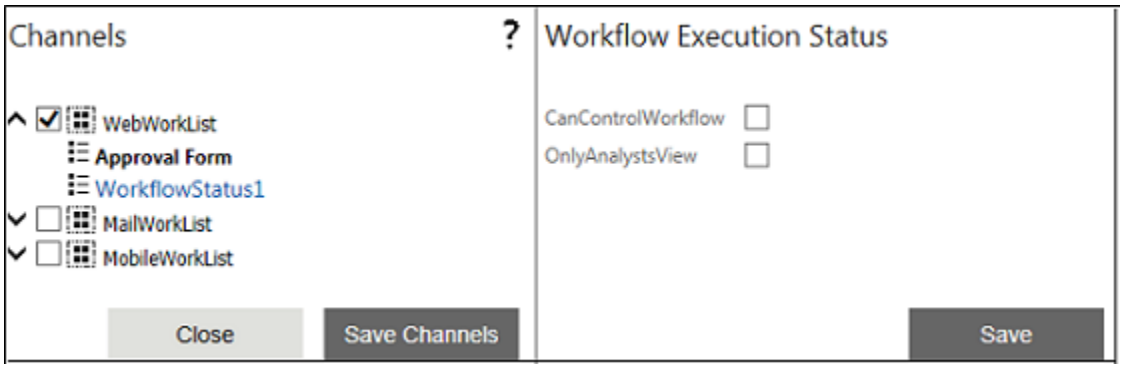
Description: This feature enables us to view the status of the workflow in the work item list in the graphical form. [Optional]

1. Select the Human Activity.
2. Click the Delivery Channels Property.
3. This will open a window like the one shown below.

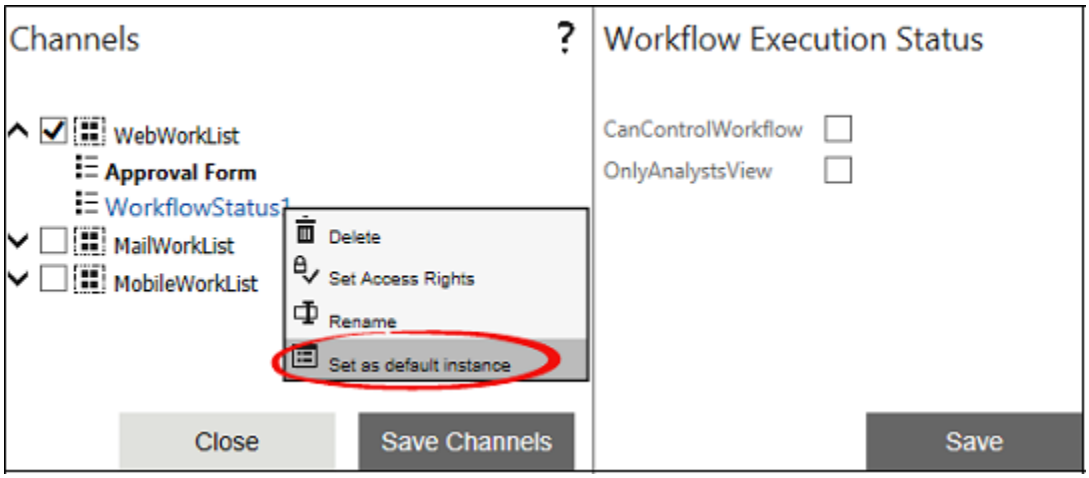
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



4. Right-click the WebWorkList to display the context menu with the **Add Instance of Workflowstatus** option as shown below.



5. Set the Properties for the Execution View Status Graphical view. Click **Save**.
6. If you want to set the workflowstatus form as the default instance, you can do it by right-clicking workflowstatus1 and selecting **the Set as default instance** from the context menu.



7. Click the **Save** and **Save Channels** buttons.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Output

Now, when you click any row in the Work items list, you will find this Execution view page being displayed as the detailed view if you set it as a default instance.

Otherwise, the workflow status form will appear in the context menu of each row in the Work items list and you can open the execution view by selecting it from the context menu.

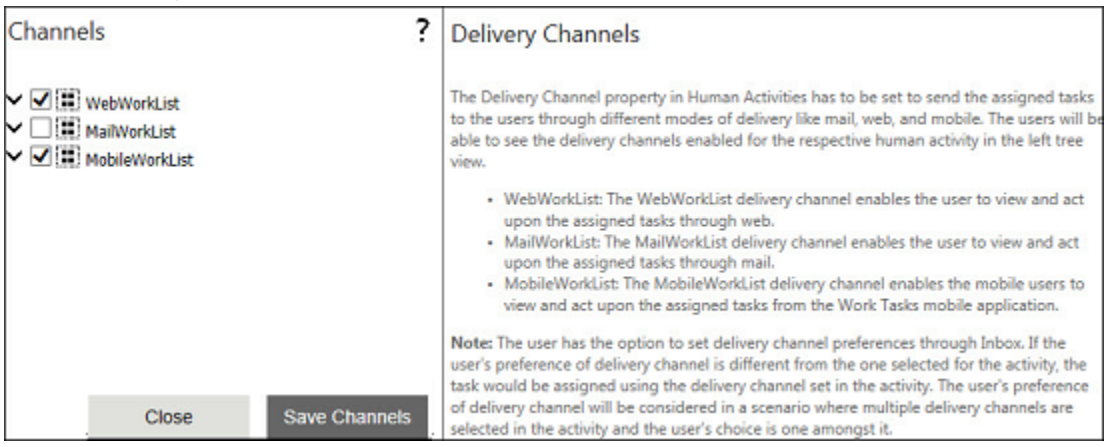
Delivery Channels - MobileWorkList

To deliver the work items to the mobile device, the **MobileWorkList** option in the Delivery Channel property needs to be selected. This allows mobile users to view and act upon the tasks from the Inbox that is rendered on their mobile devices.

This topic describes the steps required to configure the **MobileWorkList** option in the **Delivery Channel** property of the Information activity.

Configuring 'MobileWorkList' option in the Delivery Channels Property

1. In the **Process Designer**, drag and drop the Approval activity on to the design area. The activity properties pane of the selected activity appears on the right side of the design area.
2. In the **Activity Properties** pane, expand the **Configuration** node and select the **Delivery Channels** property.
3. In this window, select the **MobileWorkList** check box in the **Channels** section.



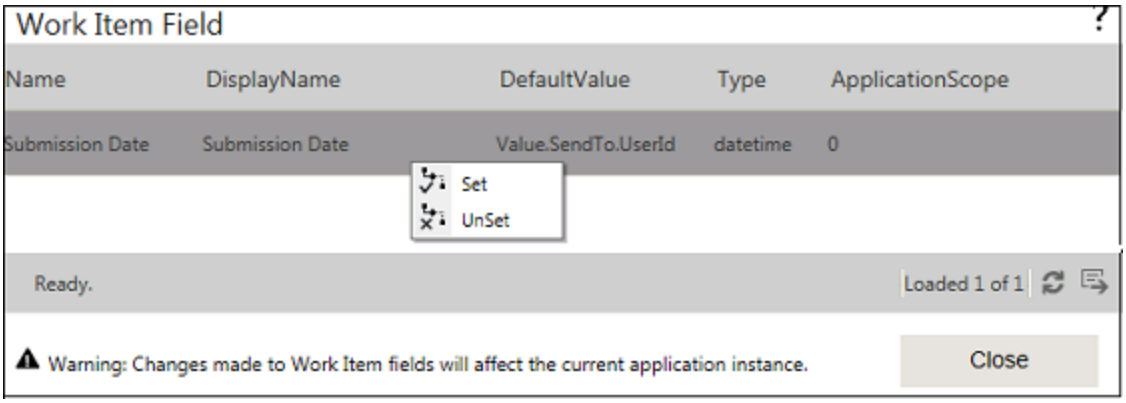
4. Click **Save Channels** and **Close**.
5. Set all the other properties and click **Publish and Test Run**.

Info - Work Item Fields

Work Item Fields Property Window

You can set the Work Item Fields for this activity in this property window. To open this window, click the button for the 'Work Item Fields' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a grid listing all the Work Item Fields that have been set for the process.

- Each row in the grid represents a Work Item Field. You can click a Work Item Field to select it.
- The context menu has the Set WorkItemField option, which you can use to set the selected Work Item Field for this activity. It also has the UnSet WorkItemField option to remove the Work Item Field setting.
- **Close** - You can use this button to close the window.

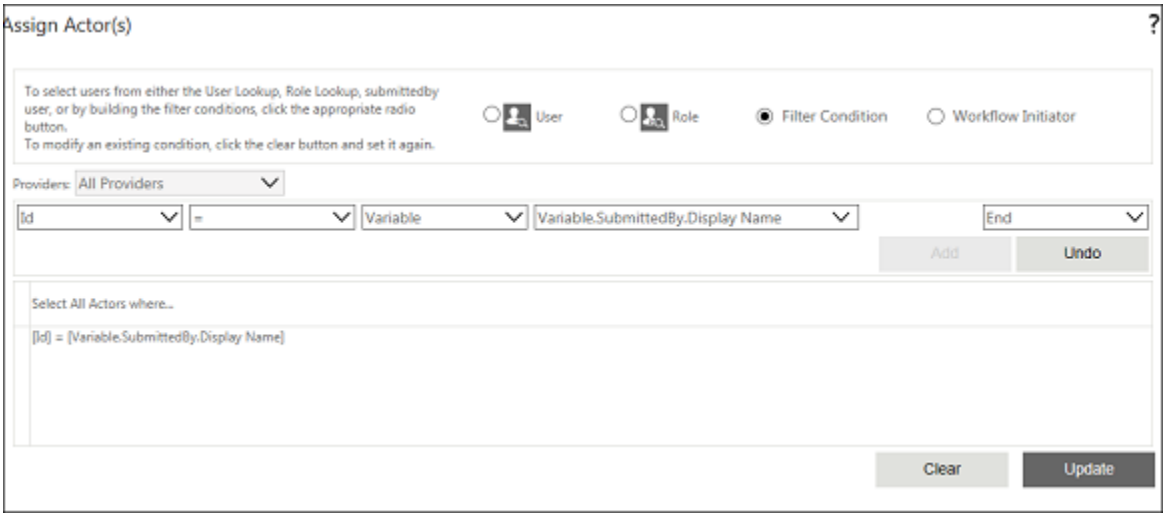
Note: While entering a value in the Work Item field, it is recommended to keep it less than the specified database column size. If there is a need to increase the size of the Work Item field, the user should manually increase the column size in the database.

Info - Assign Actor(s)

Assign Actor(s) Property Window

You can set the actors to whom the Information work item is to be sent in this property window. To open this window, click the button for the 'Assign Actor(s)' property.

See Assigning a Task to a Manager for more details.



The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Different Methods of Assigning an Actor

- Assigning an Actor by building an expression:
  Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.
  - The Providers drop-down- You can select the required provider from the Providers drop-down.
  - The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
  - The Operator drop down - You can select the operator for the expression here. E.g., "="
  - The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
  - The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
  - The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
    - **Add** - You can click this button to add the new expression to the text area.
    - **Undo** - You can click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

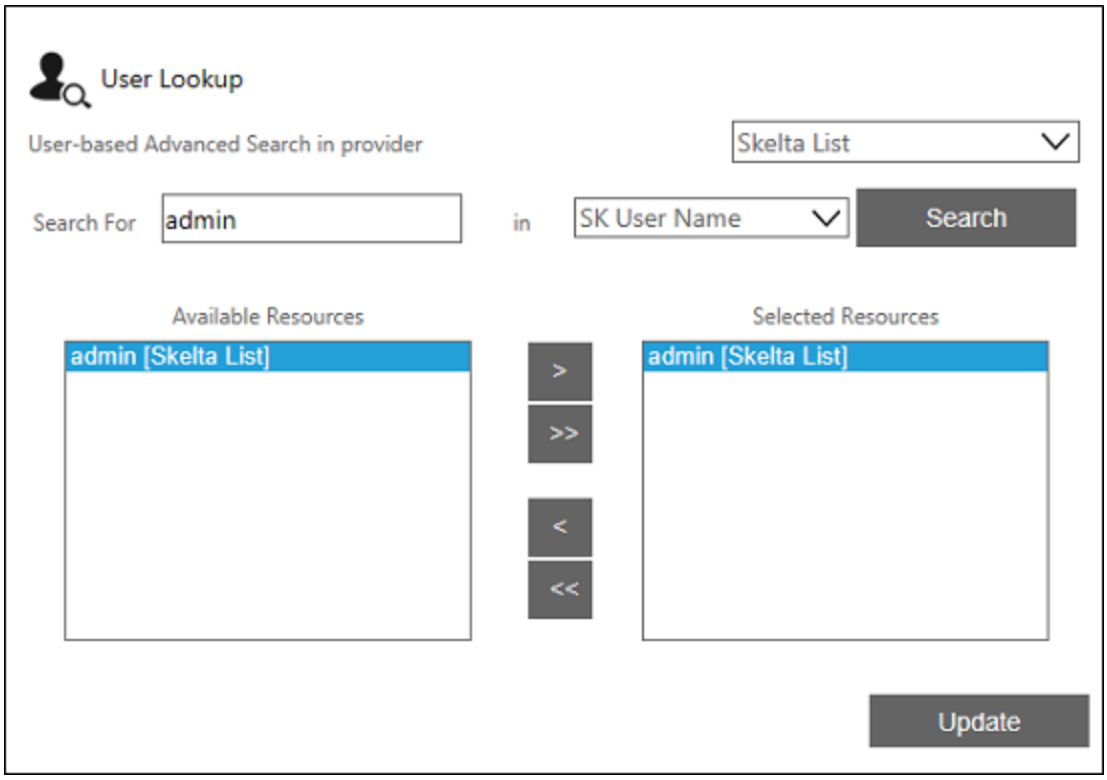
- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

- Assigning an Actor through User Lookup

Through the User Lookup you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.
2. The **User Lookup** dialog is displayed, search and select the required actor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



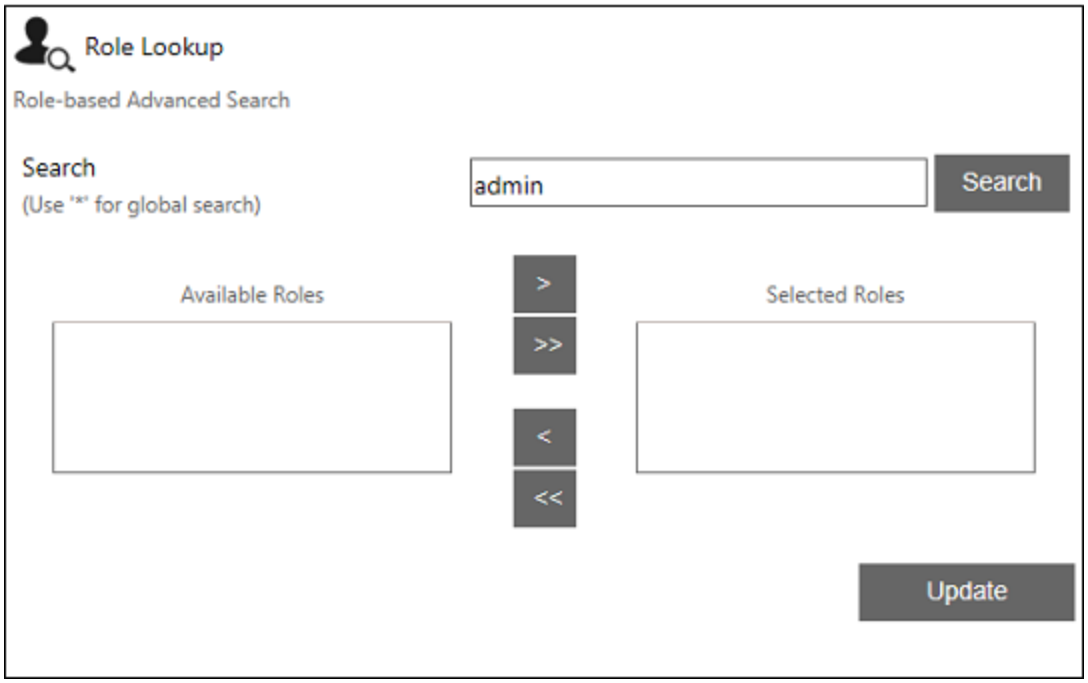
3. Click **Update** in the User Lookup dialog and verify the Assign Actor window.
4. In the Assign Actor window, you will see that an expression is displayed, refer the image below:
5. Click **Update** in the Assign Actor(s) window to update the selected actor(s) in the Assign Actor property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

- Assigning an Actor through Role Lookup

Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

1. Select the **Role Lookup** option.
2. The **Role Lookup** dialog is displayed, search and select for the required role.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



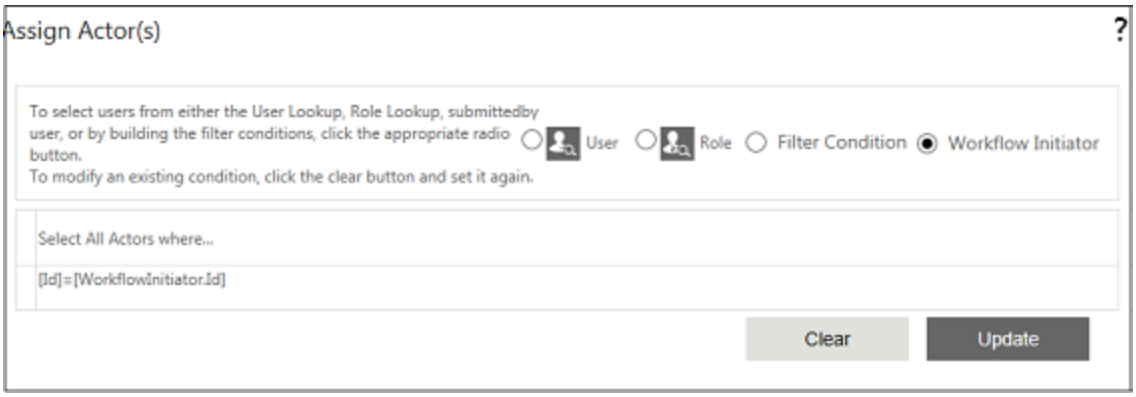
3. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

4. Click **Update** in the Assign Actor(s) window to update the **Assign Actor** property.

- Assigning an Actor through Workflow Initiator

Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

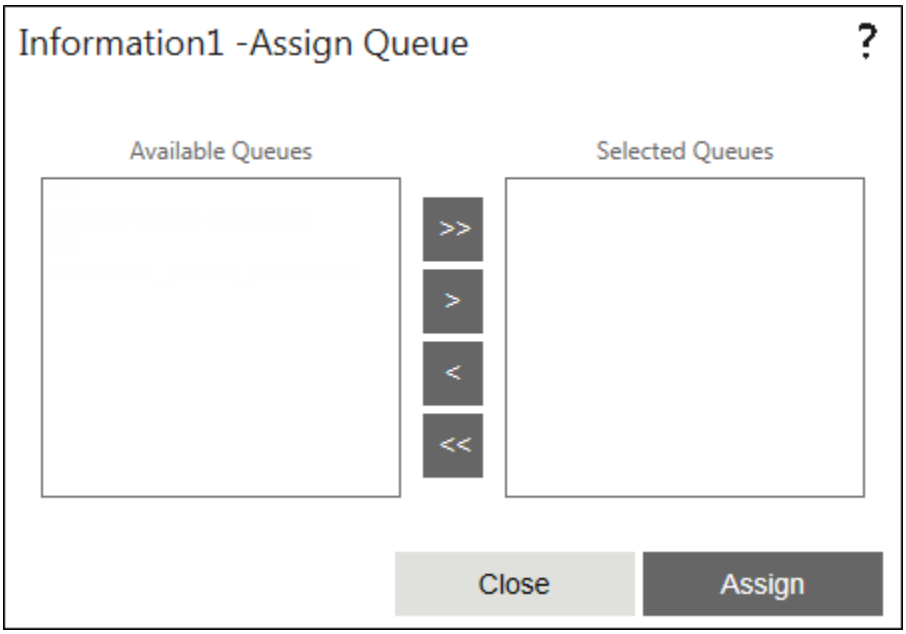
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Info - Assign Queue(s)

Assign Queue(s) Property Window

You can select the queues to which the Information work item is to be sent in this property window. To open this window, click the button for the 'Assign Queue(s)' property.



The window has a pair of list boxes to specify the queue(s). The Available Queues list shows all the available queues. You can select the required queue(s) from this list box. The Selected Queues list shows all the selected queues to which the activity will be assigned.

You can use the following buttons located between the list boxes to move the queues to and from the list boxes.

- [>>] - You can click this button to add all the queues in the Available Queues list to the Selected Queues list
- [>] - You can click this button to add the selected queue(s) to the Selected Queues list
- [<] - You can click this button to add the selected queue(s) from the Selected Queues list to the Available Queues list
- [<<] - You can click this button to add all the queues in the Selected Queues list to the Available Queues list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

At the bottom of the window you will find the following buttons:

- **Assign** - You can click this button to assign the activity to the selected queues.
- **Close** - You can click this button to close this window.

Assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

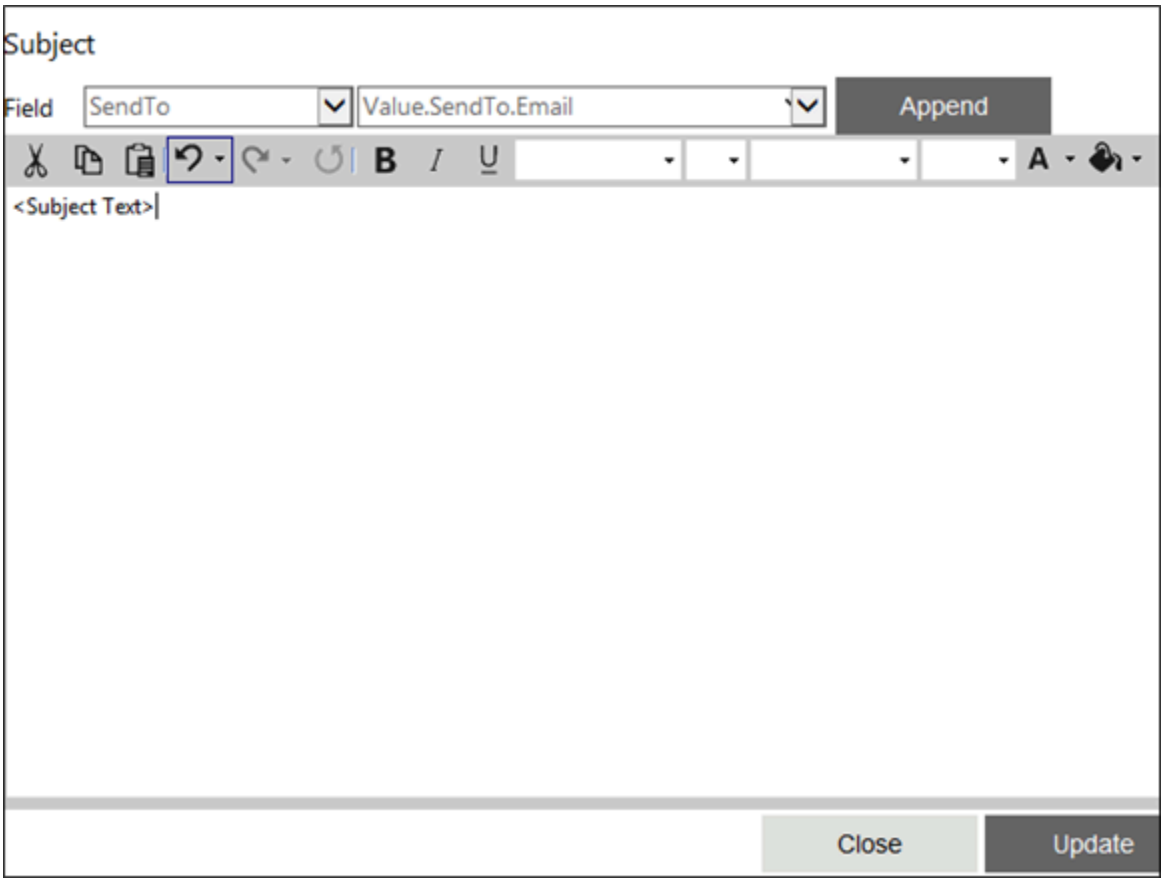
For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the Start activity with the Type as **String**. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

To assign multiple queues, specify the queue-ids with semicolon (;) separator. **Skelta.HWS.Queue.QueueCollection** class can be used to retrieve queue information.

Info - Subject

Subject Property Window

You can specify a subject for the Information work item assignment in this property window. To open this window, click the button for the 'Subject' property.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The window has a text editor to enter the subject. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the subject. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the subject in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the subject.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the subject using a combination of discrete value and variable or content. For example, you can specify the subject as "Submitted By <%#Variable.SubmittedBy.Email%>". Here the string "Submitted By" should be typed directly in the text editor. The second half of the subject is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the Field drop down and clicking Append.

The text tool bar above the text editor allows you to manage and format the subject. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the subject.
- **Close** - You can click this button to close this window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Info - Body

Body Property Window

You can specify a message Body for the Information work item assignment in this property window. To open this window, click the button for the 'Body' property.

The window has a text editor to enter the body text. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the body using a combination of discrete value and variable or content. For example, you can specify the body message as "Hi, Please approve the leave application submitted by <%#Variable.SubmittedBy.name%>". Here, the string "Hi, Please approve the leave application submitted by" must be typed directly in the text editor. The second half of the body is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the Field drop down and clicking Append.

The text tool bar above the text editor allows you to manage and format the body text. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

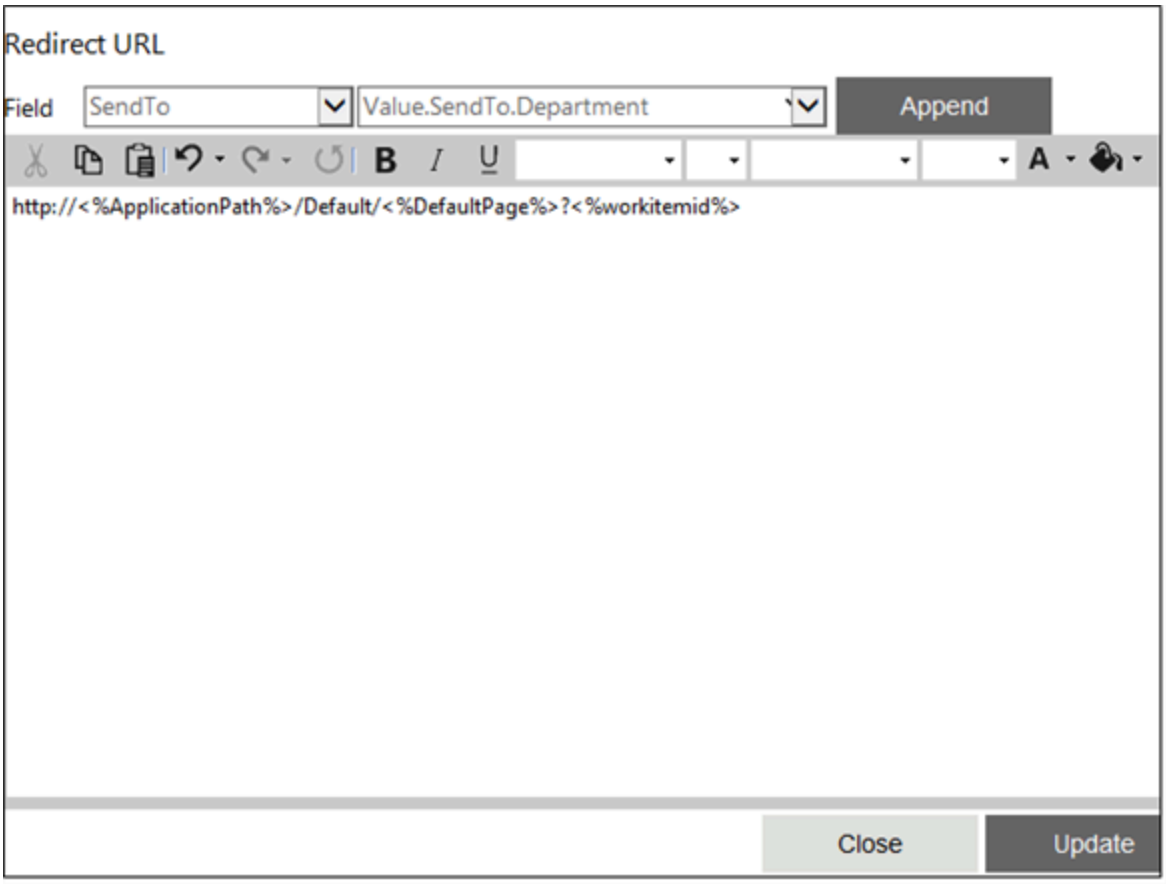
- **Update** - You can click this button to save the body message.
- **Close** - You can click this button to close this window.

Info - Redirect URL

Redirect URL Property Window

You can specify a message Redirect URL for the Information activity in this property window. To open this window, click the button for the 'Redirect URL' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the Redirect URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/ drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Redirect URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Redirect URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Redirect URL. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

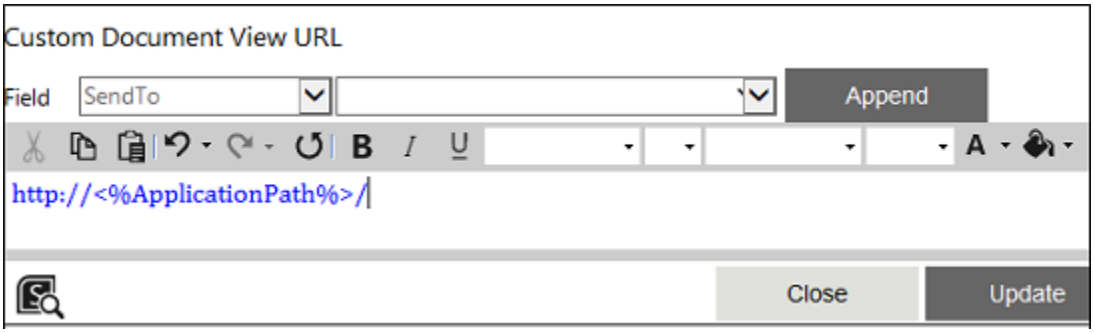
- **Update** - You can click this button to save the Redirect URL.
- **Close** - You can click this button to close this window.

Info - Custom Document View URL

Custom Document View URL Property Window

You can specify a message Custom Document View URL for the Information activity in this property window. To open this window, click the button for the 'Custom Document View URL' property.

For more details, see Custom Document View URL.



The window has a text editor to enter the Custom Document View URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

here. You can enter the Custom Document View URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Custom Document View URL.

- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Custom Document View URL. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the Custom Document View URL.
- **Close** - You can click this button to close this window.

Info - HTML Template

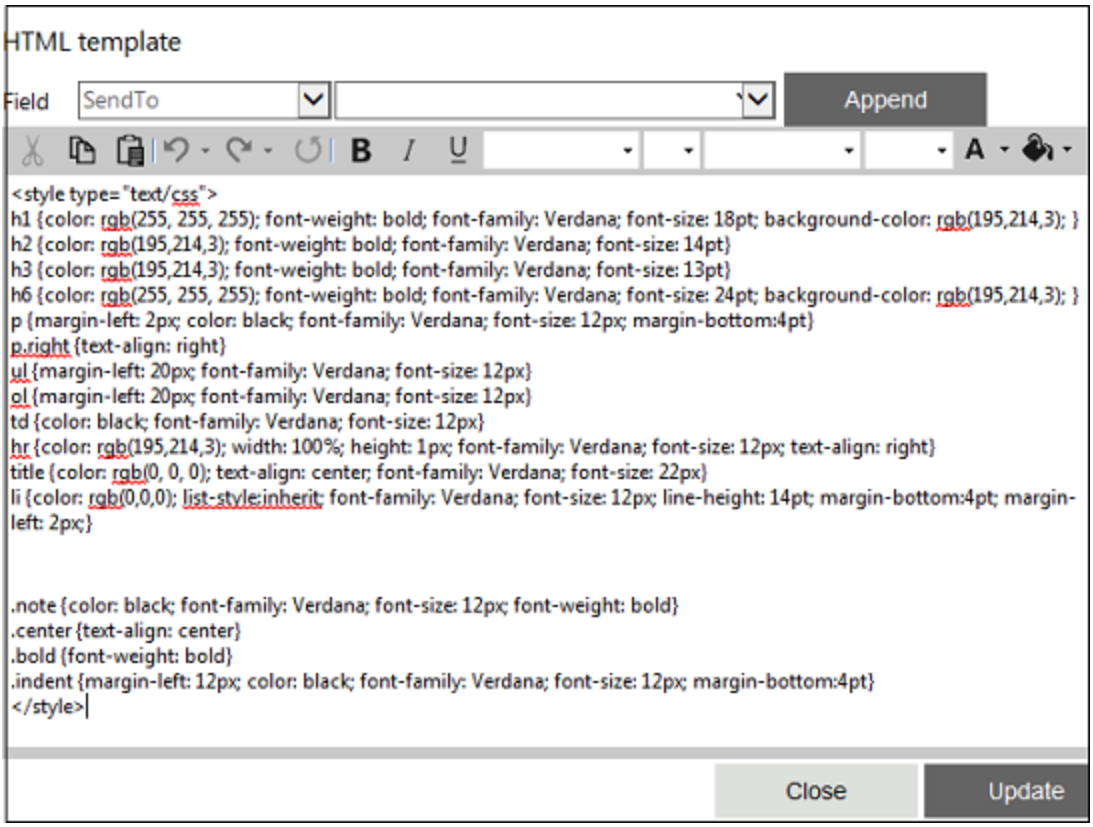
HTML template Property Window

You can specify a html template for the Information activity in this property window. To open this window, click the edit button for the 'HTML template' property.

In this property window, users can write their own html template for Information activity or make use of default Information activity template for customizing the email.

See Using 'HTML Template' property of Information Activity for more information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the body text. You can do this either by entering a html template directly in the text editor or by using the Field controls at the top of the window. These controls are described below:

The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.

The Value text box/drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.

Append - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the html template. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

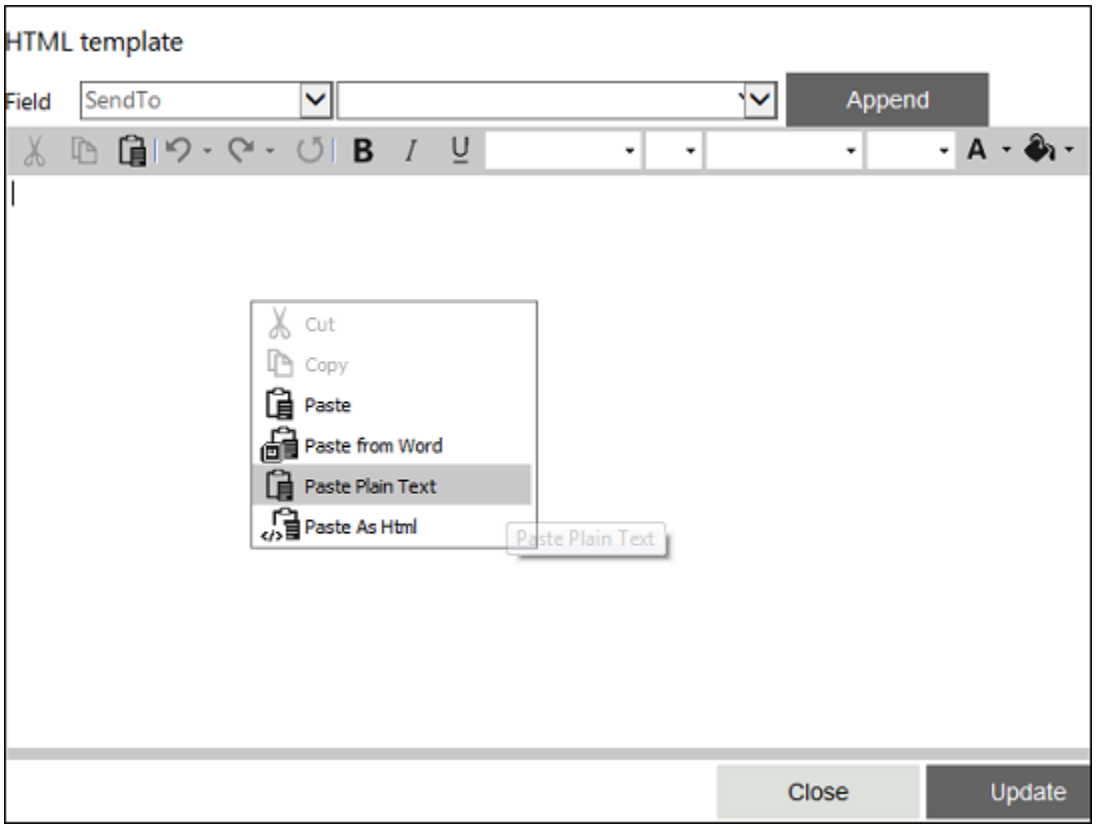
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

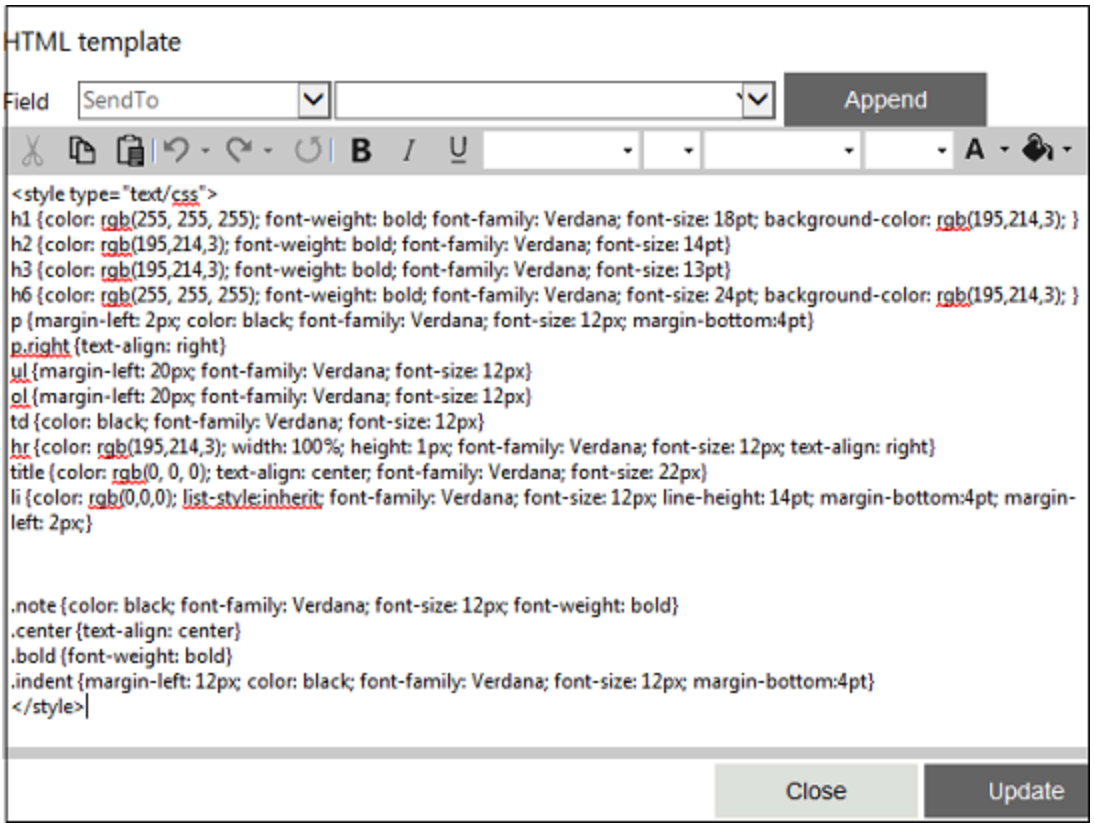
- **Update** - You can click this button to save the HTML template.
- **Close** - You can click this button to close this window.

To set HTML temple, do the following steps:

1. To specify the HTML template, click the edit icon to open the property window.
2. In the **HTML template** window, provide template which should be in html format. If you are pasting a copied html content, then right-click the **HTML template** window and paste it as "**Paste Plain Text**".



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



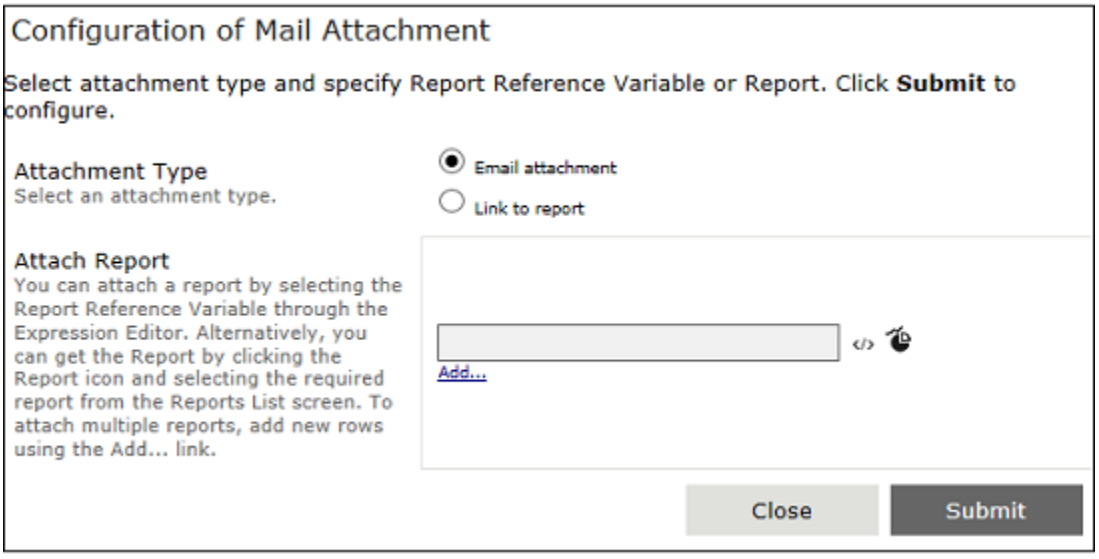
3. Click **Update**.

Info - Attach Reports

Configuration of Mail Attachment property window

You can configure the **Attachment** property for the **Approval** activity in this property window.

In this property window, you can configure the report attachments to be emailed.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

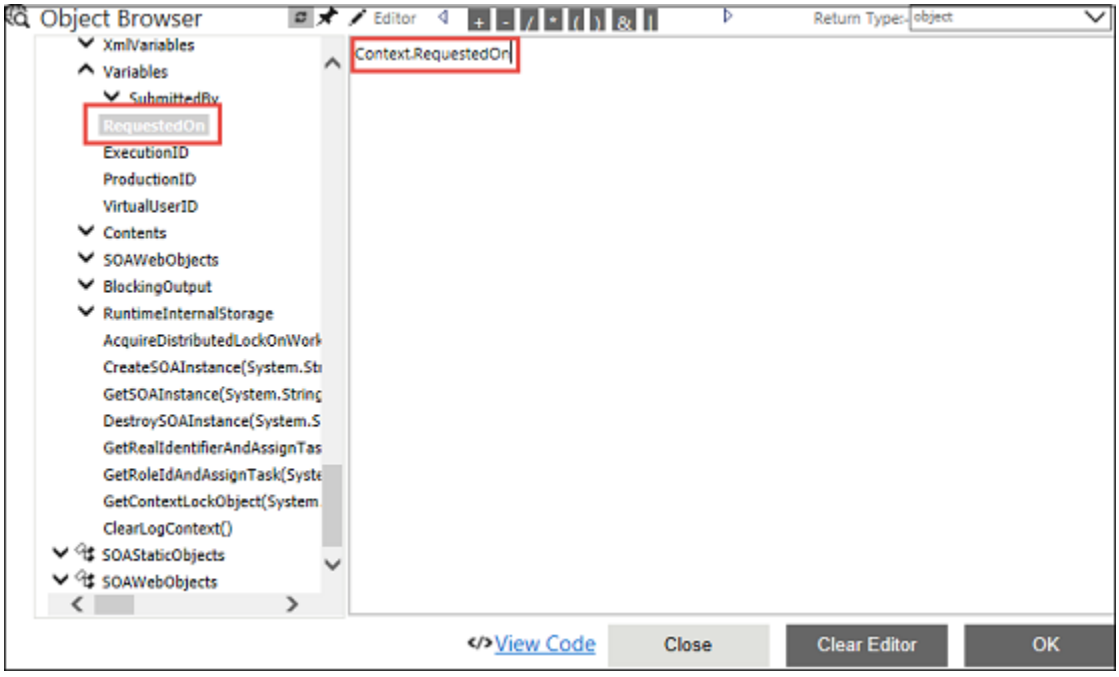
- **Attachment Type:** Use this property to select the type of attachment for sending the report as an email.
  - **Email attachment:** Select this type to send the report as an email attachment.
  - **Link to report:** Select this type to embed a link in the email to download the configured report.
- **Attach Report:** Use this property to attach a report generated by the **Report Generator** activity within the workflow or to select a report from the list of generated reports.

  You can attach a report by selecting the required **Report Reference Variable** using the **Expression Editor**. Alternatively, you can select the report from the Reports List window which consists of the already generated reports.

There must be at least one **Report Generator** activity before an **Approval** activity in the workflow to select the **Report Reference Variable** (using Expression Editor) as an **Attachment**. The **Report Reference Variable** is generated while configuring the **Report Generator** activity. By default, the report reference variable is **[Template Name]_[activity Name]**. For more information about **Report Reference Variable**, see Configure Report Template.

To configure mail attachment

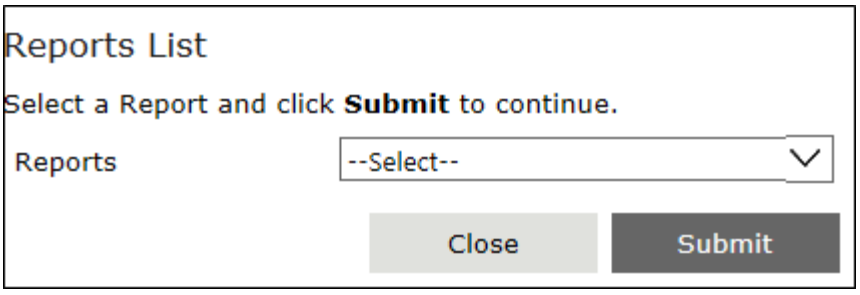
1. Click the edit button for the **Attachment** property.
2. Select the required **Attachment Type**.
3. In the **Attach Report** text box, you can either use the expression editor to get the variable of the report or use the **Reports List** to select the report.
4. To get the variable, click the **Expression Editor** icon given beside the text box to select the required **Report Reference Variable**.
5. In the **Expression Editor** window, select the required variable.



6. Click **OK.**
7. Click **Close**.

   The variable appears in the **Attach Report** text box.
8. To select the report from the Reports List dialog box, click the **Reports** icon.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



9. In the Reports List dialog box, select the required report, and then click **Submit**.
   This window closes automatically.
10. Click **Close** to close the configuration window.

Resource Set Activity

Activity Description

The Resource Set Activity is used in the AVEVA Work Tasks workflow process design when the actor for executing the subsequent activity needs to be selected by another actor in the previous activity of the workflow. This activity displays a list of actors in the Work items list of the actor who will make the selection.

Application Scenarios

A typical application scenario could be a Technical Support Request Workflow Process, in which the support request needs to be assigned to the appropriate technical support person for action. The Resource Set activity can be used to allow a supervisor to assign the support request on the basis of some condition.

Variables for Capturing Resource Details

The details of the resource submitting the ResourceSet response can be accessed

by declaring a variable of type resource with the following syntax:

'^'+Action Name+'RespondingUser'

This variable stores the responded user information. If it is more than one user, it will retrieve the last user details.

Note: For a single user, you can declare this variable as **Resource** type. If the task is assigned to more than one user and to get all responded users information, then declare this variable as an array.

Variables for assigning queue system variable:

To assign queues instead of setting the queue through **Assign Queue** property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the Start activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

To assign multiple queues, specify the queue-ids with semicolon (;) separator.
Skelta.HWS.Queue.QueueCollection class can be used to retrieve queue information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Variable for Queue Acting Users

You can declare an array type variable to get updated information about the name of the actor to whom an activity gets assigned from a queue.

In the Workflow Variables, define the variable in the following format:

^+CurrentActivityName+'QueueActingUsers'

Ex: ^HRFormQueueActingUsers

HRForm is the activity name.

For example, the value of the user who acts on the HRForm activity will be stored in the variable. The Approval1 task will be assigned to the same user.

Variable for storing timeout warning value

Suppose you want to store the timeout warning value for Task activity in your workflow. The naming convention for the system variable to be declared is

^<ActivityName>ResponseByWarningTimeout

The value returned by the variable will be in UTC format. For multiple user scenarios the highest timeout value calculated for a user will be available in the variable.

Note: Multiple timeout warnings cannot be tracked using this feature.

Variables for capturing Comments

To capture the comments entered by an actor, add a variable with a name prefixed by '^', with the following syntax:

'^'+_WorkItem.HWSActivity.ActivityName+'Comments'

For example, if the activity name is 'ResourceSet1' then declare the variable as ^ ResourceSet1Comments in the Start activity.

Note: By default, the comment field is not available in the "ResourceSet" activity.

To add a comment field to the ResourceSet activity, create a Textbox control named 'txtComment' in the 'ResourceSetUI.htm' page which is available under ("[AVEVA Work Tasks Installed Path]\WorkflowElements\Default\en-US\Activities\Activity folder").

Activity Properties

The Resource Set activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right-click menu for the Resource Set activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if necessary.)

Display Name - This property specifies the name to be displayed for the activity in the Work items list.

Property Type: Optional (This property need not be set if the display name is already configured in the Actions.xml. The name entered here overrides any display name that is configured for this activity in the Actions.xml file.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Delivery Channels - This property is used to specify the delivery channels to deliver this activity to the assigned actor(s). Multiple channels can be specified giving the actor(s) different options to act on the work item.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Delivery Channels property

1. To select the Delivery Channels, click the button for the 'Delivery Channels' property to open the property window.
2. In this window, the Delivery Channels that have been configured are listed on the left along with a check box against each channel. Click and select the check box corresponding to the channel you wish to select. You can select multiple channels by selecting the respective check box.
3. Click the **Save Channels** button.

See Approval Activity for a detailed description of the Delivery Channels property window.

Actor Selection Filter - You can define the list of actors who will be available to the user acting on the Resource Set activity using the Actor Selection Filter. The output of the Resource Set activity is the actor(s) set by the user who acts on the Resource Set activity. The actor receives the list of available actors as input through the Assign Actor drop-down.

Property Type: Mandatory (This property must be set for the activity to be used in the workflow.)

Steps to set the Actor Selection Filter property

1. To specify the actors, click the button for the 'Actor Selection Filter' property to open the property window.
2. In this window build an expression to select the actors using the actors properties. Select an attribute from the first drop down list. Select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See ResourceSet - Subject for a detailed description of the Actor Selection Filter property window.

See the Using XML Variables section in the Approval Activity topic for details on how to use the XMLVariables to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

build the expression.

Assign Actor - This property allows you to select the workflow variable to which the actor will be set by the actor acting on the Resource Set. The variables will have to be created in the properties for the Start activity. The variables can be one of the three types - String, Array or Resource. String variables take one UserID at a time, while Arrays take in a number of UserIDs pointing to different actors. Resource variables will take the complete resource properties. In a group action scenario, where more than one actor acts on the Resource Set activity, the selection of the last actor to act will be assigned to the variable.

Property Type: Mandatory (This property must be set for the activity to be used in the workflow.)

Work Item Fields - This property is used to add the Work Item Fields to be used to display application data as well as value in variables and content in the Work items list when this activity is executed.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Work Item Fields property

1. To select the Work Item Fields, click the button for the 'Work Item Fields' property to open the property window.
2. In this window, the Work Item Fields that have been set are listed in a grid. Click a row to select the corresponding Work Item Field.
3. Right click the row and select "SetWorkItemField" from the context menu to set it.

See ResourceSet - Work Item Fields for a detailed description of the Work Item Fields property window.

Actors

The properties in the Actors group have been described below. You can use these properties to specify the actors who will work on the activity and related properties.

Assign Actor(s) - This property specifies the actor(s) who has to take up the Resource Set activity. It is tagged with the Ignore Unavailable Resources property which in turn is tagged with Alternate Resource Allowed. This will be explained in detail later.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any actor(s).)

Steps to set the Assign Actor(s) property

1. To specify the actors, click the button for the 'Assign Actor(s)' property to open the property window.
2. In this window build an expression to select the actors using the actors properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking Undo.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See ResourceSet - Subject for a detailed description of the Assign Actor(s) property window.

See the Using XML Variables section in the About the XML Variable User Interface topic for details on how to use the XMLVariables to build the expression.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Assign Queue(s) - This property specifies the queue(s) to which the Resource Set activity is to be assigned.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any Queue(s).)

Steps to set the Assign Queue(s) property

1. To specify the queue(s), click the button for the 'Assign Queue(s)' property to open the property window.
2. In this window, select the queue(s) from the **Available Queues** list box. You can select multiple queues by selecting with the <Ctrl> key pressed.
3. After selecting the required queue(s), click the [>] button to move it to the **Selected Queues** list box. You can click the [>>] button to select all the queue(s) and move them to the **Selected Queues** list box.
4. You can remove any queue from the selected list by selecting it and clicking the [<] button. You can remove all the queues by clicking the [<<] button.
5. After adding the required queue(s), click **Assign** to assign the activity to the selection.
6. Click **Close** to close the window without saving the selection.

See ResourceSet - Subject for a detailed description of the Assign Queue(s) property window.

Min. Ownerships [% or Number] - This property, which can be specified as a number or percentage, is the minimum number of actors who should take ownership of the Resource Set request. This property is related to the 'Timeout warning for Ownership' and 'Timeout for Ownership' properties. To illustrate, when 'Timeout for Ownership' is reached, the activity first checks if the ownership count is less than Min.Ownerships (if it is set). If it is, the work item will be removed from all Work items lists. If the 'Min.Ownerships' has already been satisfied, then the work item will be removed from the Work items lists of those who have not taken ownership. If the Min.Ownerships value is 0, then the activity checks if the ownership count is less than Max.Ownerships (if it is set). If it is, the work item will be removed from all Work items lists. Else the work item will be removed from the Work items lists of those who have not taken ownership. If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work items lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Max. Ownerships [% or Number] - This property, which can be specified as a number or percentage, is the maximum number of actors who should take ownership of the Resource Set request. If 'Timeout for Ownership' is specified and achieved, and the 'Min.Ownerships' is also satisfied, then the activity waits for action from those who have taken ownership. If the Min.Ownerships value is set to 0, then it checks if the ownership count is less than Max.Ownerships. If it is, the work item will be removed from all Work items lists. Else the work item will be removed from the Work items lists of those who have not taken ownership. If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work items lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Enable Take Ownership? - If this property is set to **Yes**, then the actor is provided with a **Take Ownership** option in the Work items list to take ownership of the task. If you are not required **Take Ownership** option in the Work items list, then set this property as **No**.

Note: By default, this property is set as Yes.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to set the Enable Take Ownership? property

1. Select **Yes** or **No** option from the **Enable Take Ownership?** drop-down list.

Re-Assign Allowed? - If this property is set then the resource is provided with a Re-Assign option. Using this the actor can forward the work item to another actor.

Property Type: Optional (This property needs to be set only if necessary.)

Ignore Unavailable Actors? - This property provides the following options - **Yes**, **Yes** - **holidays excluded** and **No**. If this property is set to 'No', when the Approval activity is assigned to the actor's Work items list, a check is first done to see whether the actor is available. If the actor is not available then a check is made for an alternate actor assigned to the unavailable actor. Simultaneously, the value of the property 'Alternate Actor Allowed' is checked. If that is also set, then the Approval work item is assigned to this actor. If this property is set to Yes - holidays excluded, the workflow engine will ignore the fact that actors are not available if the day is an organization holiday and the output Not Enough Resources will not be generated.

Property Type: Optional (This property needs to be set only if necessary.)

Alternate Actor Allowed? - This property is set to assign a particular task to an alternate actor in the absence or unavailability of any actor.

Property Type: Optional (This property needs to be set only if necessary.)

Notification Contents

The properties in the Notification Contents group have been described below. You can use these properties to specify the content used to notify actors about the activity.

Subject - This is the subject of the Resource Set assignment. The subject can be customized for each actor.

Property Type: Optional (This property need not be set. If it is not set, the default subject line from the Actions.xml file is displayed.)

Steps to set the Subject property

1. To specify the subject, click the button for the 'Subject' property to open the property window.
2. In this window, enter the subject text directly in the text editor.
3. If you want to customize the subject you can do so using the **Field** controls to add resource property values. For example, to add a subject that includes the email id of the actor submitting the Resource set, you can do as follows: Type in the text "Submitted By". Select "Variable" and "Variable.SubmittedBy.Email" from the two drop downs for **Field** and click **Append**. This will add the placeholder for the variable after the text entered in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the email id.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the subject, click **Update** to save it.
7. Click **Close** to close the window without saving the subject.

See ResourceSet - Subject for a detailed description of the Subject property window.

Body - This is the actual message of the Resource Set sent to the actor(s). The body can be customized for each actor. There is an **Enterprise Console Explorer**(plug-in) icon in the Body property window to get the work item details URL. See *Enterprise Console Control (EC Plug-in)* for more information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property need not be set.)

Steps to set the Body property

1. To specify the message body, click the button for the 'Body' property to open the property window.
2. In this window, enter the body text directly in the text editor.
3. If you want to customize the body you can do so using the **Field** controls to add resource property values. For example, to add a body that includes the name of the actor submitting the Resource set, you can do as follows: Type in the text "Hi, Please cast your vote in the poll conducted by". Select "Variable" and "Variable.SubmittedBy.name" from the two drop downs for **Field** and click **Append**. This will add the placeholder for the variable after the text entered in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the name.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the body, click **Update** to save it.
7. Click **Close** to close the window without saving the body.

See ResourceSet - Body for a detailed description of the Body property window.

From Email Address? - This property is used to specify the email address from which notification messages will be sent for the activity.

Property Type: Optional (This property needs to be set only if necessary. If it is not set, the default value in Activities.xml will be used.)

Hide Responses? - If this property is set to 'No', then actors can see the responses of other actors in a group Resource Set scenario. To view these responses i.e., ownerships, Resource Sets etc., select the 'Take Ownership' option. This will open a new pop up with the responses of other actors who have taken ownership.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Priority - This property is set to indicate the priority of the Resource Set request. Enter the values 0-33 to set as Low, 34-66 for Medium, or 67-99 for High. The default value is set to 34.

Property Type: Optional (This property needs to be set only if necessary.)

Show Custom Document View Window - If this property is set to 'Yes', then the Custom Document View Window will be shown to actors in their Work items lists.

Property Type: Optional (This property needs to be set only if necessary.)

Send Notification Email - If this property is set to 'Yes', then notification emails will be sent to the actors. If it is set to 'Yes-HTML', then the emails will be sent in HTML format.

Property Type: Optional (This property needs to be set only if necessary.)

Notify if alternate actor is considered - If this property is set to 'Yes', then notification emails will be sent to the actors when an alternate actor is considered.

Property Type: Optional (This property needs to be set only if necessary.)

Redirect URL - This property is used to get the URL of the web page to redirect the client to, in the case of synchronous execution of the activity.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to set the Redirect URL property

1. To specify the Redirect URL, click the button for the 'Redirect URL' property to open the property window.
2. In this window, enter the Redirect URL directly in the text editor.
3. If you want to customize the Redirect URL you can do so using the **Field** controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for **Field**, and clicking **Append**. This will add the placeholder for the variable in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the URL.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Redirect URL, click **Update** to save it.
7. Click **Close** to close the window without saving the Redirect URL.

See ResourceSet - Redirect URL for a detailed description of the Redirect URL property window.

Custom Document View URL - This property is used to get the URL of the page to which the custom document dlls does a post. The data posted to the page are application, workflow, executionid, executiondetailsid, and workitemid. The posted data can be retrieved as Request.Form ["workitemid"].

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Custom Document View URL property

1. To specify the Custom Document View URL, click the button for the 'Custom Document View URL' property to open the property window.
2. In this window, enter the Custom Document View URL directly in the text editor.
3. If you want to customize the Custom Document View URL you can do so using the **Field** controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for **Field**, and clicking **Append**. This will add the placeholder for the variable in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the URL.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Custom Document View URL, click **Update** to save it.
7. Click **Close** to close the window without saving the Custom Document View URL.

See ResourceSet - Custom Document View URL for a detailed description of the Custom Document View URL property window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Decision Influencers

The properties in the Decision Influencers group have been described below. You can use these properties to specify some parameters that influence the outcome of the activity.

Max Actors Required For ResourceSet Completion [% or Number] - This property is used to check what percentage or number of actors should take action for Resource Set. Decision on the Resource Set is taken only after the specified number or percentage of actor(s) have taken the action. The activity waits for the actors' action until the 'Timeout for activity' is reached.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Min Actors Required For ResourceSet Completion [% or Number] - This property specifies the minimum number of actors to act on the Resource Set before the 'Timeout Warning for Activity'. If the activity limit is reached before the 'Timeout Warning for Activity' then the warning message is not shown.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Escalation & Timeout

The properties in the Escalation & Timeout group have been described below. You can use these properties to specify escalation and timeout settings for the activity.

Set Calendar for Timeout - This property is used to specify the calendar to be used to determine activity timeouts.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to Set Calendar for Timeout

1. To specify the calendar for timeout, click the button for the 'Set Calendar for Timeout' property to open the property window.
2. In this window select the required calendar by clicking the calendar name in the tree structure.
3. Click **Set Calendar** to set the selected calendar.
4. You can specify that a resource calendar should be used, if available, by clicking to select the corresponding check box.

See ResourceSet - Set Calendar for Timeout for Timeout for a detailed description of the Set Calendar for Timeout property window.

Minimum available time for Activity - This property is used to check the availability of an actor to whom a task must be assigned while executing the activity. The availability check for the actor is done based on the Calendar settings (Global or Resource Calendar). If the time taken to complete the task is within the value set for the **Minimum available time for Activity** property, then the task will be assigned to that actor. However, if the time taken to complete the task exceeds the value set for the **Minimum available time for Activity** property, then the task will be assigned based on the values set for the **Ignore Unavailable Actors?** and **Alternate Actor Allowed?** properties.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout warning for Ownership - This property specifies the time at which a warning is provided to an actor to take ownership of the work item assigned to him/her. If the actor does not take ownership within this time, the engine is notified with a warning. Thus if 'Min.Ownerships' is set, and it is not satisfied before the given time then a warning is sent. If Min.Ownerships is 0, it will check for Max.Ownerships. If the ownership count does not reach the Max.Ownerships value within the set time, a warning is sent. If both Min.Ownerships and

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Max.Ownerships are not set, this property is ignored.

Property Type: Optional (This property needs to be set only if necessary.)

Understand how Ownership Properties relate to each other:

- Resource Set activity is assigned to the actors in the Resource Set list by the workflow engine. Resource Set activity has a default property set that at least one actor has to make Take Ownership of the activity.
- A drop-down interface has been provided for the resource to Take Ownership. However, the actor can act on the Resource Set without taking ownership first, in which case ownership will be considered to be done. i.e. if the actor acts upon the Resource Set activity without ownership, then it is considered as an ownership with action taken.
- After the actor has taken ownership, a link is provided to the actor, which opens a pop up with the details of the other actors. This is again tagged with the 'Hide Responses?' property. The link will be provided only If 'Hide Responses?' is set as 'No'. The pop up will have details like Actor name, Ownership Status, Action taken, Comments.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] then the 'Timeout Warning For Ownership' property is not considered.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] and the 'Time Out For Ownership' is also reached then the work item is removed from other actors' Work items list and the work item waits for action from those who have taken ownership.
- If the 'Min.Ownerships' limit is not reached for the Resource Set activity, and the 'Timeout Warning For Ownership' has been exceeded then the actor is notified with a warning by including an email or an information activity, with the Timeout Warning for Ownership link to it.
- If 'Timeout For Ownership' is set, if the Resource Set activity has not reached the minimum limit (Min.Ownerships) and the 'Time Out For Ownership' has been reached, then the work item is removed from the Work items lists of all the actors.
- If 'Min.Ownerships' = 0 and if 'Max.Ownerships' is set, the activity waits for actors to take ownership or action until the 'Time Out For Ownership' is reached (if this is set).
- If none of the Ownership properties are set then the activity waits until the actor takes ownership or acts upon it.

Timeout for Ownership - This property specifies the time until which actors are allowed to take ownership, i.e. the time until which the Resource Set action will wait for actors to take ownership. If Min.Ownerships is set and is not reached, the work item is removed from all Work items lists. If Min.Ownerships is 0, it will check if ownership count is less than Max.Ownerships. If it is, the work item is removed from all Work items lists. Else the work item will be removed from the Work items lists of those who have not taken ownership. The work item will remain in the Work items list of those who have taken ownership and wait for action from them.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout warning for Activity - This property specifies when a reminder has to be provided for the actors to act on the Resource Set request, if the action count has not been reached. If properties such as Max.Ownerships, Affirmative Action for Resource Set (AAA), and Action Limit (AL) are set, once the property values are reached then a warning is sent to the actor. When the timeout is reached, the following checks are made: If AL is set, when the action count i.e. the no. of Resource Sets (AC) < AL, then a warning is sent. If AL = 0 and AAA is set, and when AC < AAA, then a warning is sent to the actor.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Timeout for Activity - This property's value is used to decide until what time the activity should wait for the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

actors' action. If properties such as Max.Ownerships, AAA, AL are set, once the property values are reached the work item is removed from the Work Item lists of all the actors. When the timeout is reached, the following checks are made: If AL is set, when the action count i.e. the no. of Resource Sets or rejections (AC) < AL, then the timeout for action is performed and the work item is removed from all Work items lists. If AC > AL, it checks with the no. of Resource Sets or 'decision count' (DC) and AAA. If DC >= AAA (if it is set), the action is considered completed. If AAA = 0 and if DC >= AL, the action is considered completed. If AL = 0 and AC < AAA, then the timeout for action is performed and the activity is removed from all activity lists. If AL = 0 and AC > AAA, it will check with DC. If DC > AAA it is completed. If AL = 0 and AAA = 0, then if DC is at least 1, then it is considered completed.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Multiple Timeout Warning - This is used to set recurring timeout warnings that will be sent to the actors who have to take action. To set multiple timeout warnings, click the 'Multiple TimeOut Warning' button in the Properties pane for the Resource Set activity. A new window pops up. In this window, set the interval for the recurring warning as well as the output message. You can also set the Recurring Time Interval. This can be used to set a different recurring time out after the first timeout happens. For example, if 'Time Interval' for the property is set as 7 days and 'Recurring Time Interval' is set as 2 days, then the first time out will happen after 7 days and there will be a recurring time out every second day after the seventh day (first) time out.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Steps to set the Multiple TimeOut warning property

1. To set the multiple timeout warning, click the button for the 'Multiple TimeOut Warning' property to open the property window.
2. Enter the time interval for the timeout in the **Time Interval** field.
3. Select "Yes" from the drop down for the **Recurring**? field if you want the timeout warning to recur. Select "No" otherwise.
4. Enter the output message corresponding to the timeout warning in the **Output** field.
5. Enter the time interval for the recurring timeout in the **Recurring Time Interval** field.
6. After entering the content details, click **Add Row** to add this timeout setting and display a new row for entering another timeout setting.
7. Remove rows if necessary by selecting them and clicking **Remove Selected**.
8. After specifying the timeout settings, click **Update**.

See ResourceSet - Multiple TimeOut Warning for a detailed description of the Multiple TimeOut Warning property window.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Redirection Enabled? - This property enables redirection. When this property is set to Yes, the workflow redirects the user to the URL in the Redirect URL property in the next activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Outputs

The Resource Set Activity returns the following values -

Action Completed: Displayed when all the actors have taken part.

Action Completed - Affirmative Percentage Not Reached: Displayed when all the actors have not taken part.

Not Enough Resources to Take Acknowledge: Displayed when the filter condition did not yield enough actors to whom the request can be sent.

Timeout - Acknowledge: Displayed when the specified minimum number of actors did not take ownership of the request in the given time.

Timeout - Action: Displayed when some or all of the specified actors did not perform the required action in the given time.

Timeout Warning - Acknowledge: Displayed when a warning is generated that the specified minimum actors have not taken ownership of the request in the given time.

Timeout Warning - Action: Displayed when a warning for timeout is generated because some or all the actors did not perform the required action in the given time.

Note: The following outputs will return only if user assigned tasks to a queue user.

Resource Unavailable for Queue - If a queue is assigned to a task & if there are no resources available in the queue then this output will get triggered.

TimeOut for Queue Task - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting the completion of that task.

Timeout Warning -Queue - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting in sending a warning out put. However, the task will still be sleeping.

Timeout Warning -Queue Participant - This output will get triggered when the task in the queue is picked by user but still not acted on that task within the queue escalation time out settings resulting in triggering a warning output. However, the task will still be sleeping.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

ResourceSet - Delivery Channels

Purpose

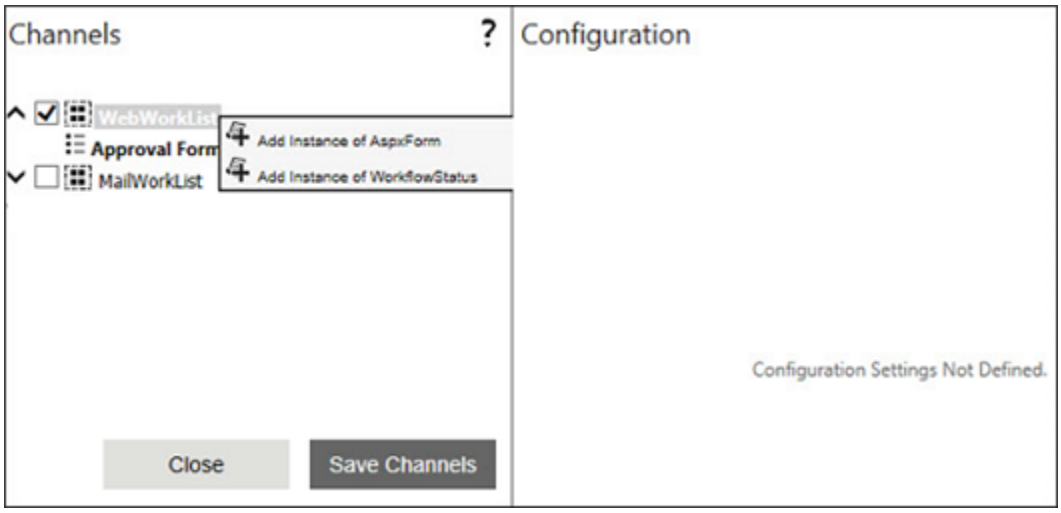
The purpose of this chapter is to describe the feature of WorkflowStatus Form of Delivery Channels property under the category Configuration of any human activity available in AVEVA Work Tasks.

Description: This feature enables us to view the status of the workflow in the work item list in the graphical form. [Optional]

1. Select the Human Activity.
2. Click the **Delivery Channels** Property.

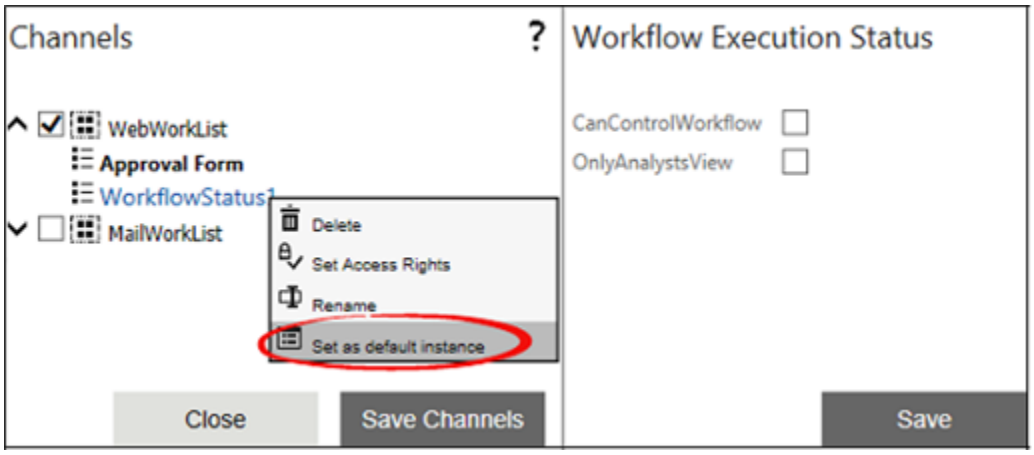
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

This will open a window like the one shown below.



3. Right-click **WebWorkList** to display the context menu with the **Add Instance of Workflowstatus** option as shown below.

4. Set the Properties for the Execution View Status Graphical view.
5. Click **Save**.
6. If you want to set the workflowstatus form as the default instance, right-click **WorkflowStatus1**, and select the **Set as default instance** option from the context menu.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. Click **Save** and **Save Channels**.

Output

Now, when you click on any row in the Work items list, you will find this Execution view page being displayed as the detailed view if you set it as a default instance.

Otherwise, workflow status form will appear in the context menu of each row in the Work items list and you can open the execution view by selecting it from the context menu.

ResourceSet - Actor Selection Filter

Actor Selection Filter Property Window

You can set the actors to whom the Resource Set work item is to be sent in this property window. To open this window, click the button for the 'Actor Selection Filter' property.

The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

Different Methods of Assigning an Actor

- Assigning an Actor by building an expression:

Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- Add - You can click this button to add the new expression to the text area.
- Undo - You can click this button to remove a condition you have added to the expression.

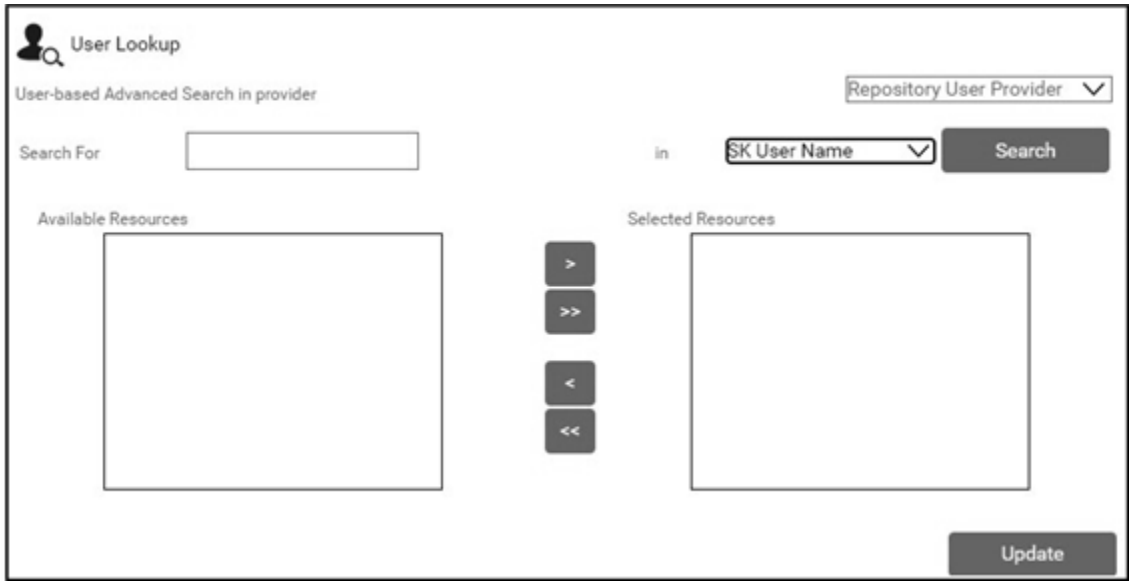
At the bottom of the window you will find the following buttons:

- Clear - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- Update - You can click this button to save the expression that has been added to the text area.

- Assigning an Actor through User Lookup

Through the User Lookup you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.
2. The **User Lookup** dialog is displayed, search and select the required actor.



3. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

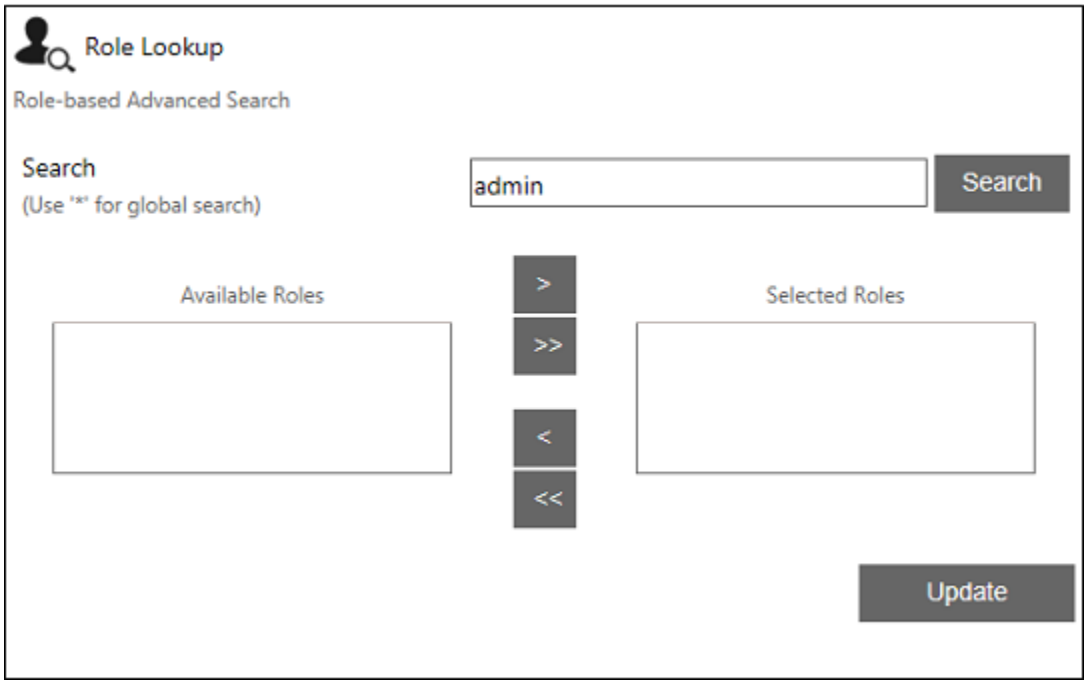
4. Click Update in the Assign Actor(s) window to update the selected actor(s) in the Assign Actor property.
5. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

- Assigning an Actor through Role Lookup

  Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

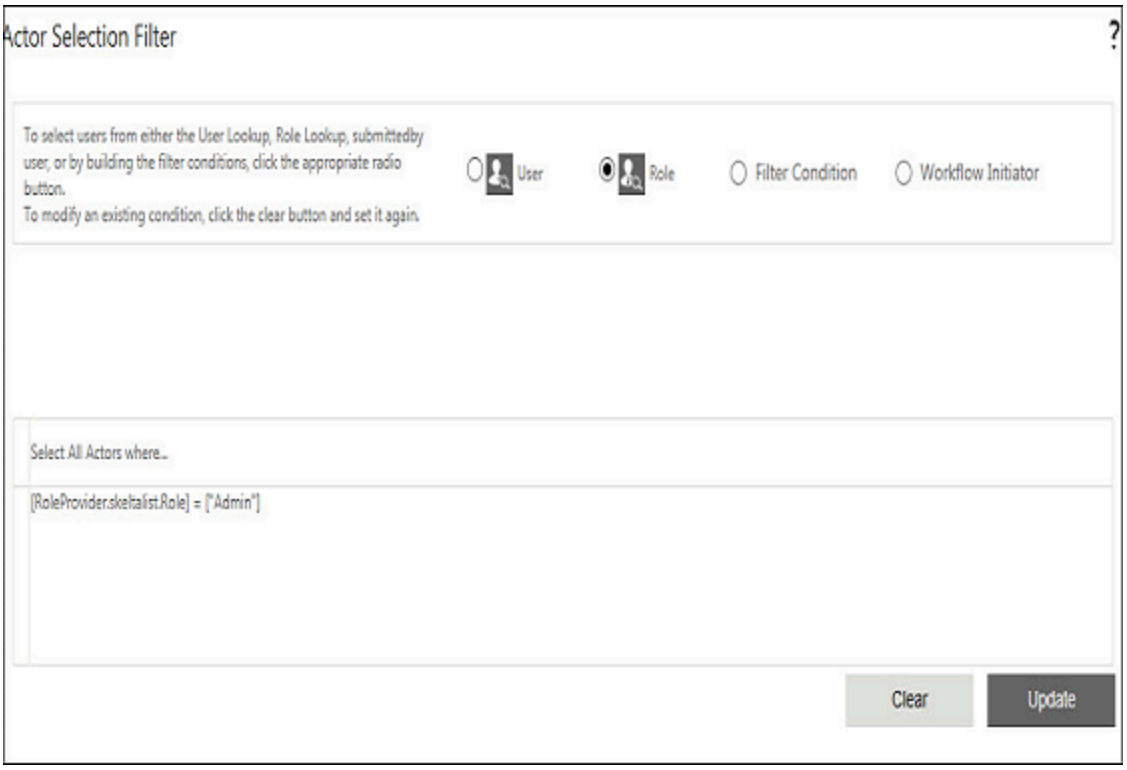
  Select the **Role Lookup** option.

  The **Role Lookup** dialog is displayed, search and select for the required role.



1. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
   In the Assign Actor window, you will see that an expression is displayed, refer the image below:

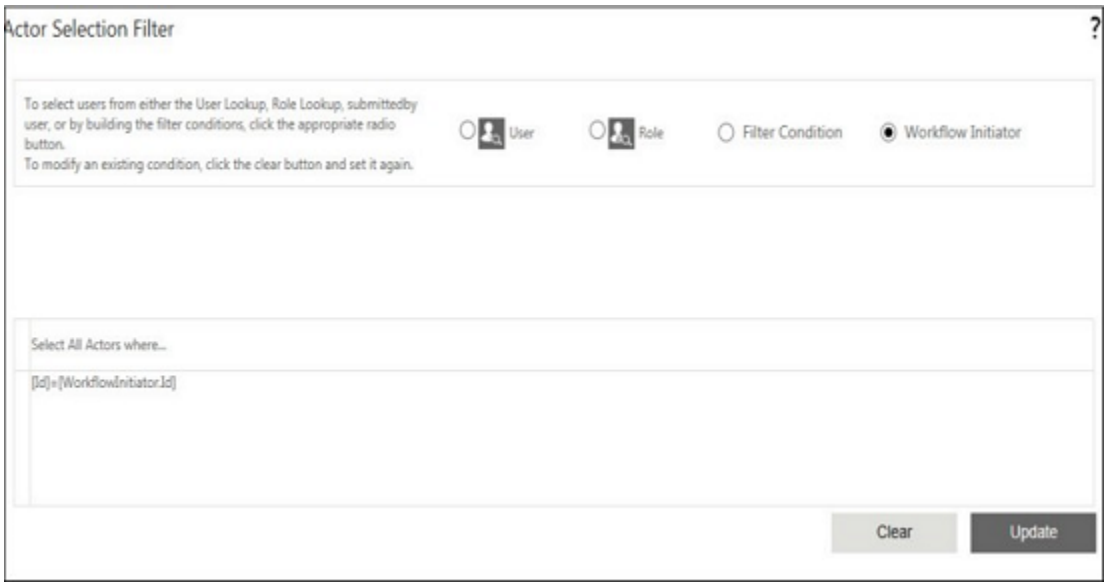
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



2. Click Update in the Assign Actor(s) window to update the Assign Actor property.

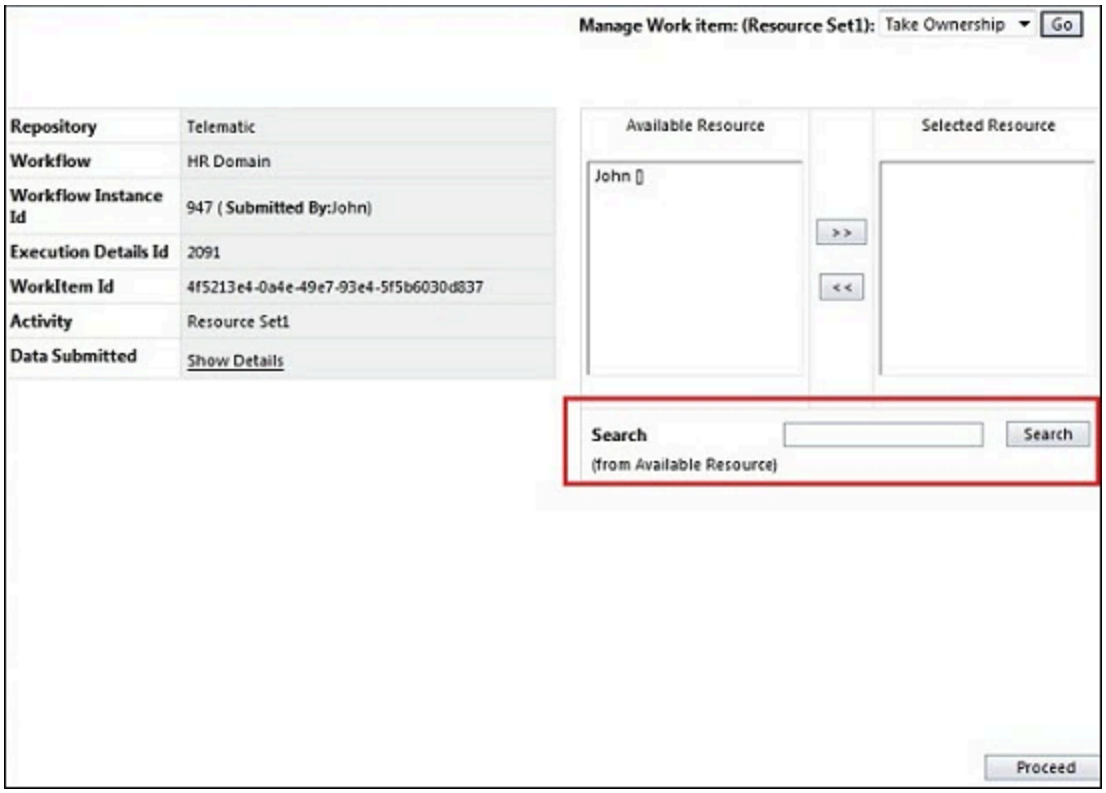
- Assigning an Actor through Workflow Initiator

  Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:



Note: When Actor Selection Filter is set through User Lookup and Filter Condition, the Work Item Detail view will have a Search option available. This search option allows you to perform a search within the Available Resource. Refer image below:

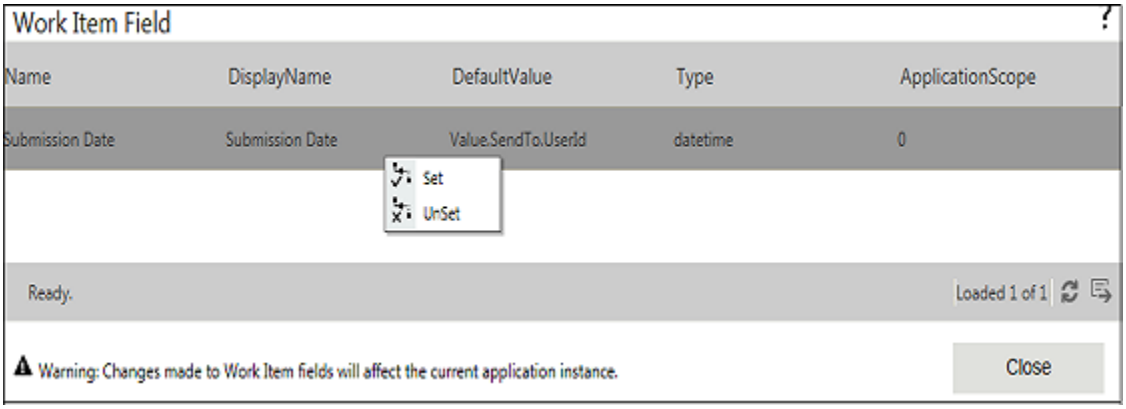
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



ResourceSet - Work Item Fields

Work Item Fields Property Window

You can set the Work Item Fields for this activity in this property window. To open this window, click the button for the 'Work Item Fields' property.



The window has a grid listing all the Work Item Fields that have been set for the process.

- Each row in the grid represents a Work Item Field. You can click a Work Item Field to select it.
- The context menu has the Set WorkItemField option, which you can use to set the selected Work Item Field for this activity. It also has the UnSet WorkItemField option to remove the Work Item Field setting.
- **Close** - You can use this button to close the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: While entering a value in the Work Item field, it is recommended to keep it less than the specified database column size. If there is a need to increase the size of the Work Item field, the user should manually increase the column size in the database.

ResourceSet - Assign Actor(s)

Assign Actor(s) Property Window

You can set the actors to whom the Resource Set work item is to be sent in this property window. To open this window, click the button for the 'Assign Actor(s)' property.

See Assigning a Task to a Manager for more details.

The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

Different Methods of Assigning an Actor

- Assigning an Actor by building an expression:

Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

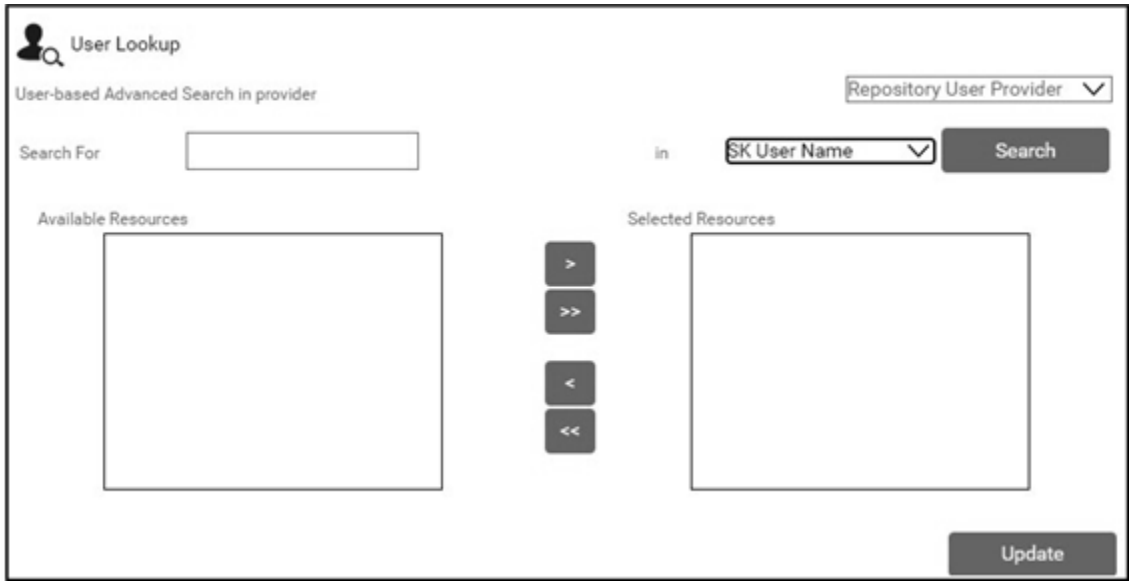
At the bottom of the window you will find the following buttons:

- Clear - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- Update - You can click this button to save the expression that has been added to the text area.

- Assigning an Actor through User Lookup

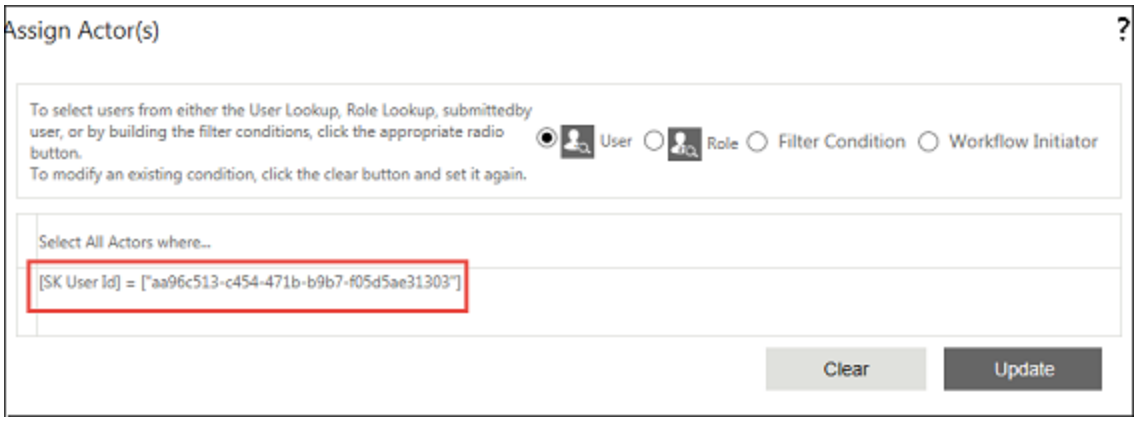
Through the User Lookup you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup.

1. Select the **User Lookup** option.
2. The **User Lookup** dialog is displayed, search and select the required actor.



3. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
4. In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

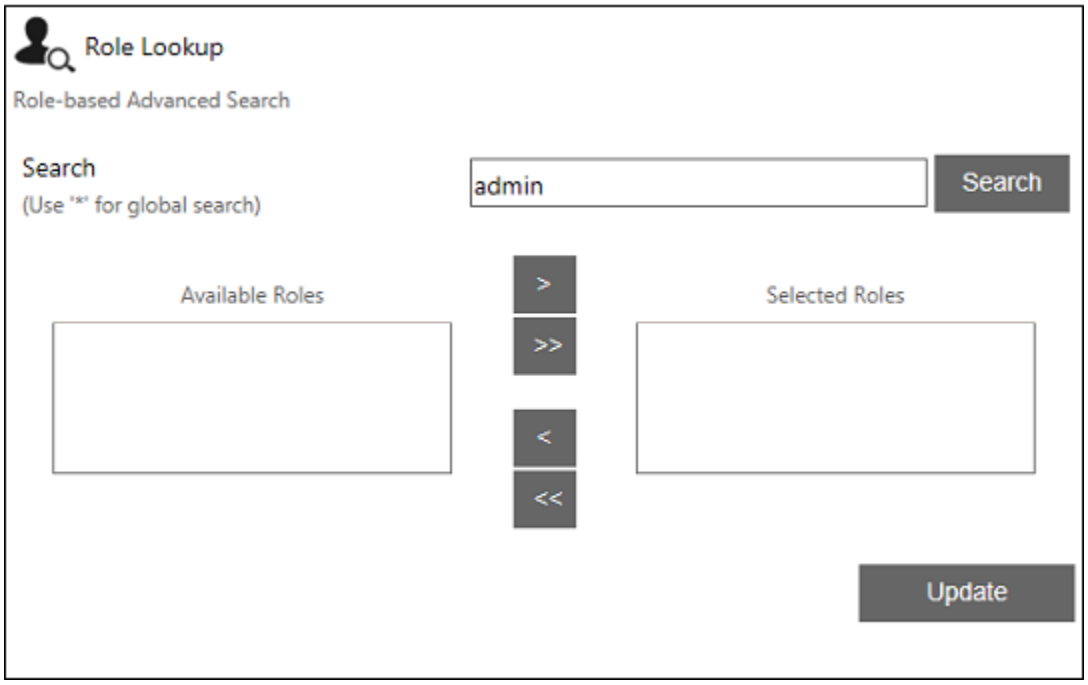


5. Click **Update** in the Assign Actor(s) window to update the selected actor(s) in the **Assign Actor** property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

- Assigning an Actor through Role Lookup

Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

1. Select the **Role Lookup** option.
2. The **Role Lookup** dialog is displayed, search and select for the required role.



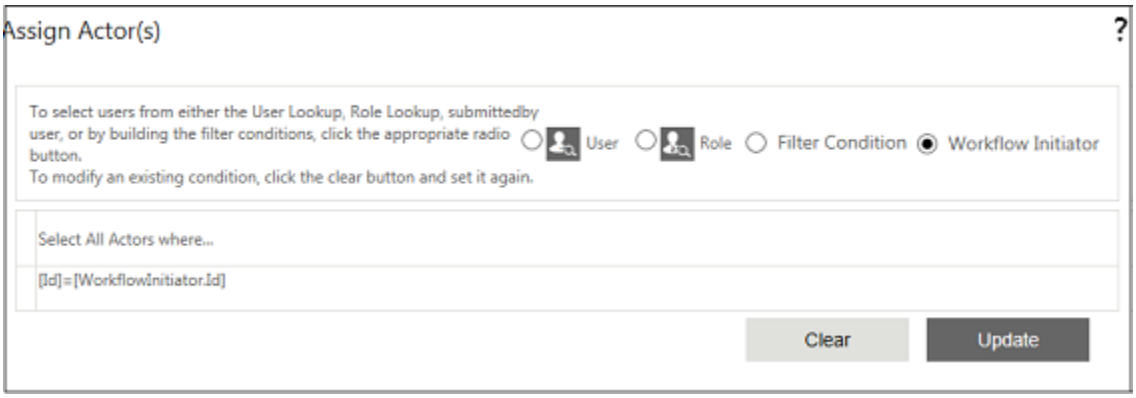
3. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click **Update** in the Assign Actor(s) window to update the `Assign Actor` property.

- Assigning an Actor through Workflow Initiator

Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

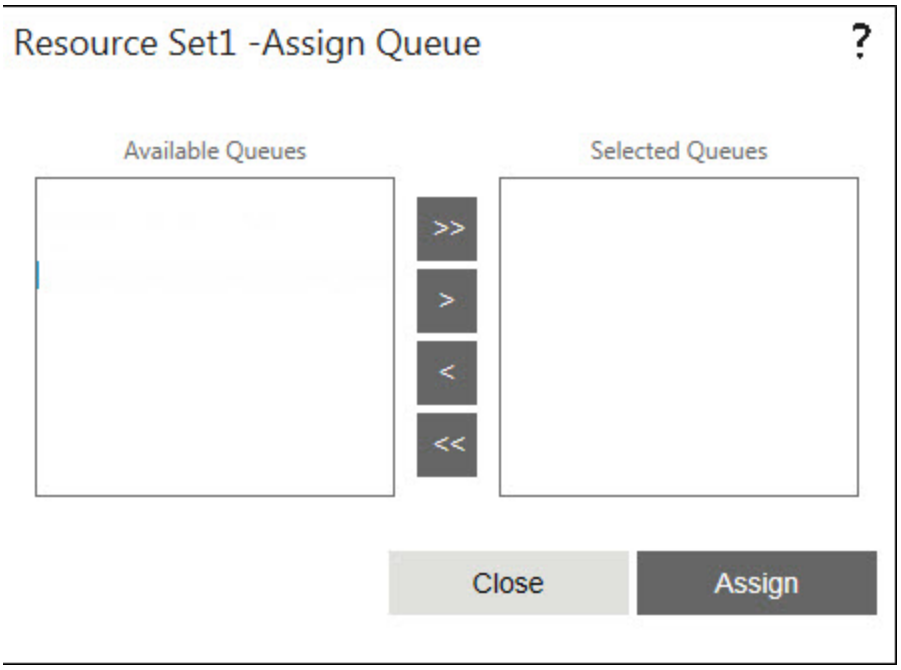


ResourceSet - Assign Queue(s)

Assign Queue(s) Property Window

You can select the queues to which the Resource Set work item is to be sent in this property window. To open this window, click the button for the 'Assign Queue(s)' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Assign Queue(s) Properties window for Resource Set

The window has a pair of list boxes to specify the queue(s). The Available Queues list shows all the available queues. You can select the required queue(s) from this list box. The Selected Queues list shows all the selected queues to which the activity will be assigned.

You can use the following buttons located between the list boxes to move the queues to and from the list boxes.

- [>>] - Click this button to add all the queues in the Available Queues list to the Selected Queues list
- [>] - Click this button to add the selected queue(s) to the Selected Queues list
- [<] - Click this button to add the selected queue(s) from the Selected Queues list to the Available Queues list
- [<<] - Click this button to add all the queues in the Selected Queues list to the Available Queues list

At the bottom of the window you will find the following buttons:

- **Assign** - You can click this button to assign the activity to the selected queues.
- **Close** - You can click this button to close this window.

Assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the Start activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

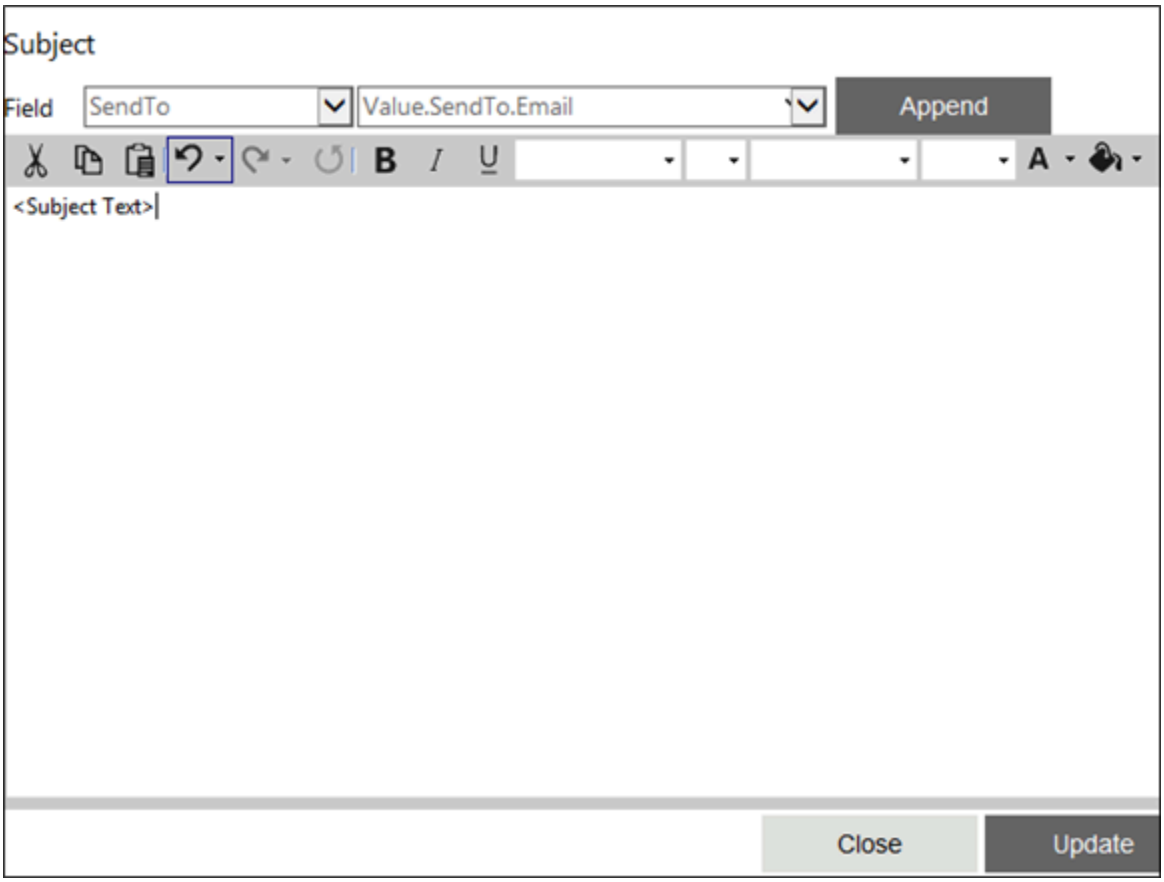
To assign multiple queues, specify the queue-ids with semicolon (;) separator. Skelta.HWS.Queue.QueueCollection class can be used to retrieve queue information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

ResourceSet - Subject

Subject Property Window

You can specify a subject for the Resource Set work item assignment in this property window. To open this window, click the button for the 'Subject' property.



The window has a text editor to enter the subject. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the subject. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the subject in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the subject.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the subject using a combination of discrete value and variable or content. For example, you can specify the subject as "Submitted By <%#Variable.SubmittedBy.Email%>". Here, the string "Submitted By" should be typed directly in the text editor. The second half of the subject is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the Field drop down and clicking Append.

The text tool bar above the text editor allows you to manage and format the subject. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

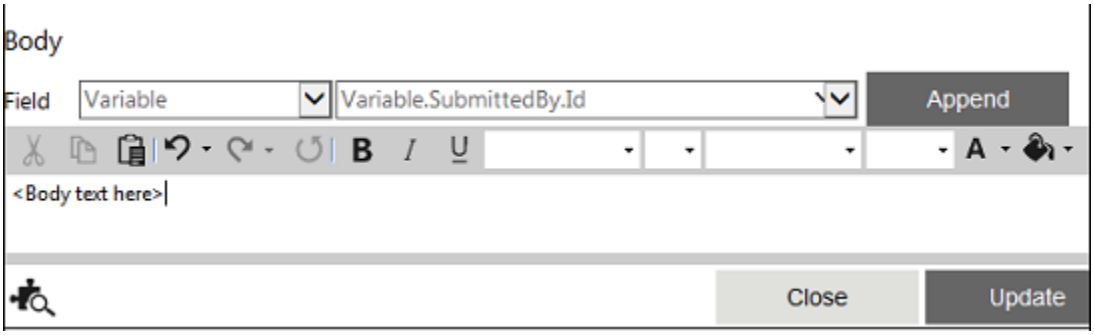
It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text
- At the bottom of the window, you will find the following buttons:
- Update - You can click this button to save the subject.
- Close - You can click this button to close this window.

ResourceSet - Body

Body Property Window

You can specify a message Body for the Resource Set work item assignment in this property window. To open this window, click the button for the 'Body' property.



The window has a text editor to enter the body text. You can do this either by entering a discrete value directly in

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/ drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the body using a combination of discrete value and variable or content. For example, you can specify the body message as "Hi, Please approve the leave application submitted by <%#Variable.SubmittedBy.name%>". Here, the string "Hi, Please approve the leave application submitted by" must be typed directly in the text editor. The second half of the body is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the Field drop down and clicking Append.

The text tool bar above the text editor allows you to manage and format the body text. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

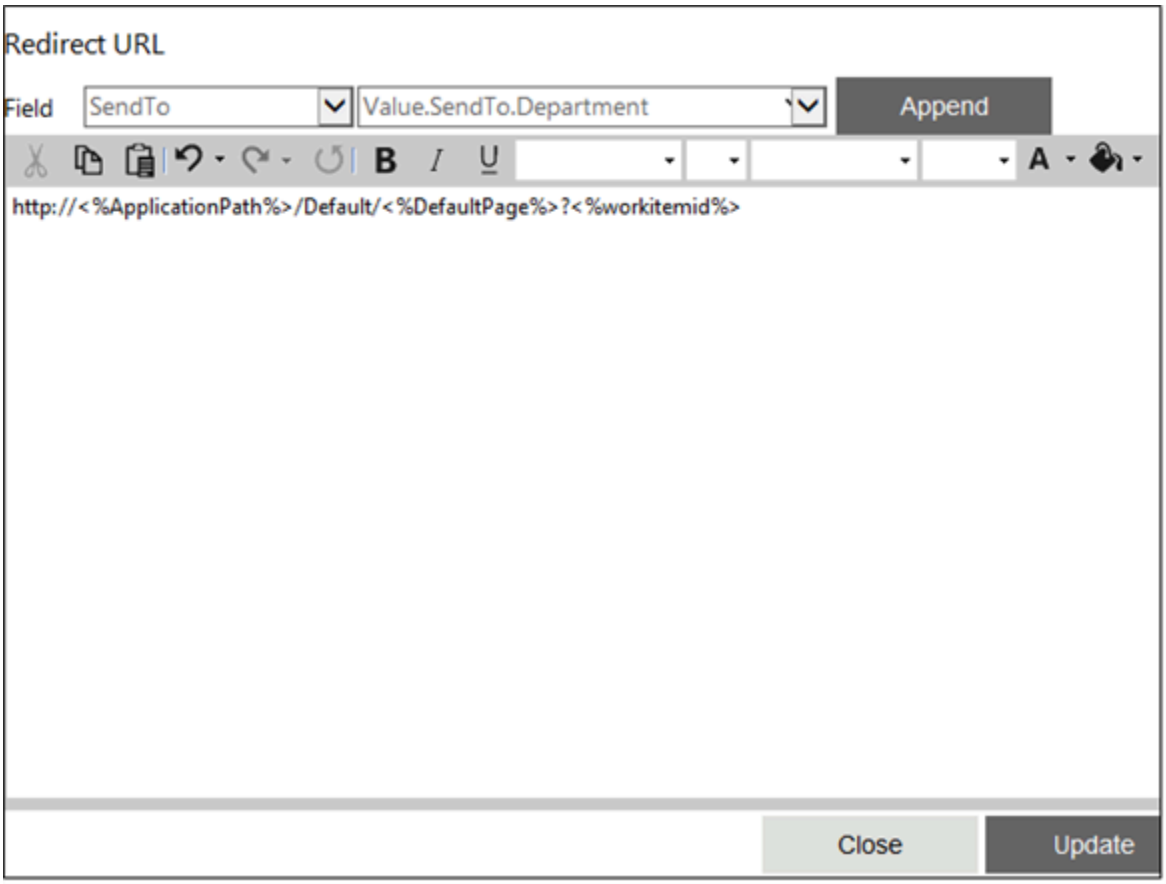
- **Update** - You can click this button to save the body message.
- **Close** - You can click this button to close this window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

ResourceSet - Redirect URL

Redirect URL Property Window

You can specify a message Redirect URL for the Resource Set activity in this property window. To open this window, click the button for the 'Redirect URL' property



The window has a text editor to enter the Redirect URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Redirect URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Redirect URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Redirect URL. It has the following text tools –

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the Redirect URL.
- **Close** - You can click this button to close this window.

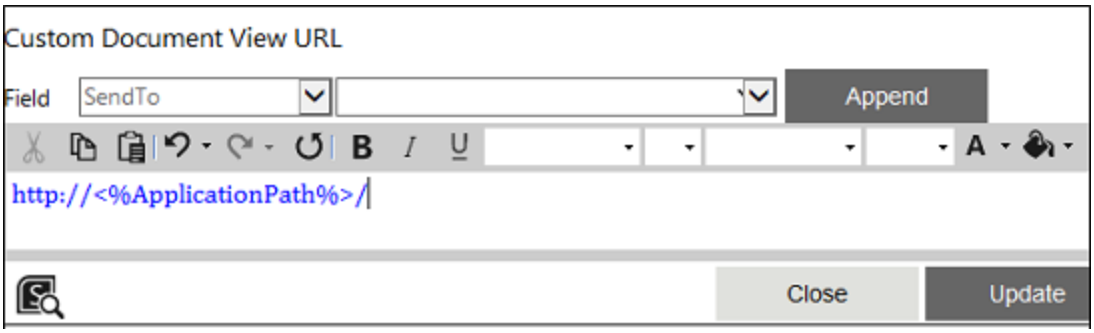
ResourceSet - Custom Document View URL

Custom Document View URL Property Window

You can specify a message Custom Document View URL for the Resource Set activity in this property window. To open this window, click the button for the 'Custom Document View URL' property.

For more details, see Custom Document View URL.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the Custom Document View URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Custom Document View URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Custom Document View URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Custom Document View URL. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Print - to print the text

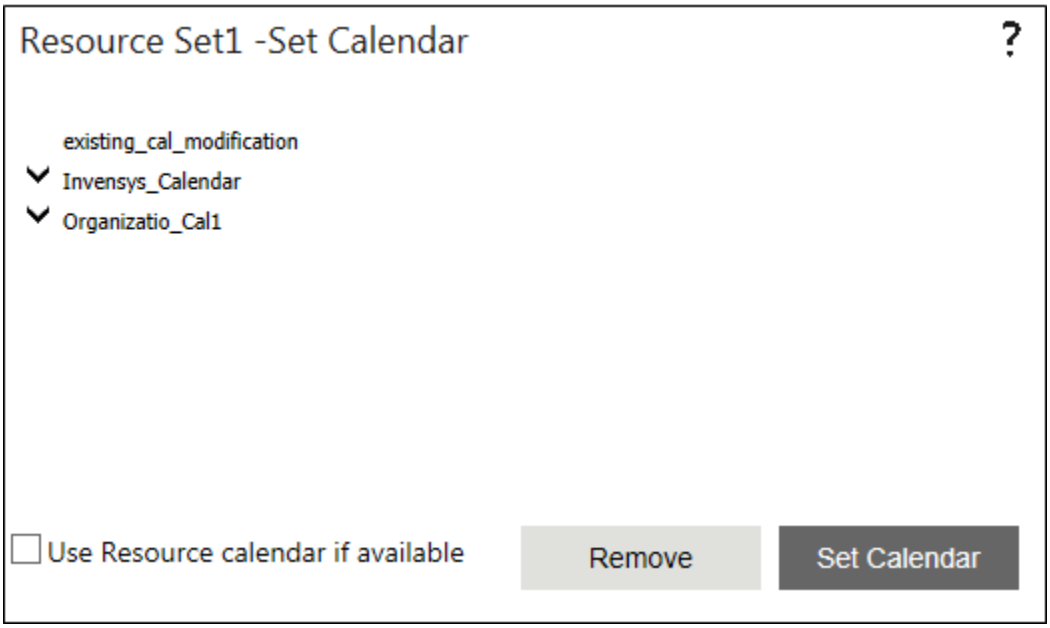
At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the Custom Document View URL.
- **Close** - You can click this button to close this window.

ResourceSet - Set Calendar for Timeout

Set Calendar for Timeout Property Window

You can set a Calendar to calculate the timeout for the ResourceSet activity in this property window. To open this window, click the button for the 'Set Calendar for Timeout' property.



This window lists the available calendars in a tree structure, with lower-level calendars nested within the respective top-level calendar. You can click on a calendar to select it for setting.

There are two buttons in this window.

- **No Calendar** - You can click this button to indicate that there is no calendar set for the activity.
- **Set Calendar** - You can click this button to set the selected calendar.

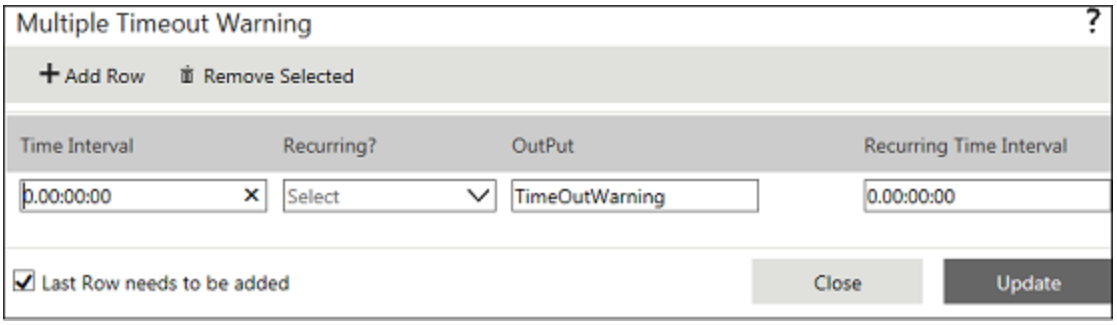
The **User Resource calendar if available** check box can be selected to enable the use of resource calendars if none are displayed in this window for selection.

ResourceSet - Multiple TimeOut Warning

Multiple TimeOut Warning Property Window

You can set the Multiple Timeout Warning in this property window. To open this window, click the button for the 'Multiple TimeOut Warning' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has two tabs at the top to manage the rows of timeout settings in the grid.

1. **Add Row** - You can click this tab to add the newly entered timeout setting and display a new row to the grid where you can add another timeout.
2. **Remove Selected** - You can click this tab to remove the timeout setting row selected in the grid.

The grid has the following parameters that you need to specify for the new timeout setting.

- **Time Interval** - You can use this field to enter the time interval in which you want to generate a timeout warning. You must enter the time in d.hh:mm:ss format.
- **Recurring?** - You can use the drop down in this field to indicate whether the timeout is recurring or not. You can select "Yes" to set the timeout warning to recur.
- **Output** - You can enter the output message corresponding to the timeout warning here.
- **Recurring Time Interval** - You can set the time interval in which the timeout warning has to recur here. Enter the time in d.hh:mm:ss format.

There are two buttons and a check box at the bottom of the screen.

- **Update** - You can click this button to save the newly added timeout settings.
- **Close** - You can click this to close the property window without saving the newly added timeout settings.
- **Last Row needs to be added** - You need to select this check box to save the last row added.

Task Activity

Activity Description

The Task Activity is used in a AVEVA Work Tasks workflow process design in order to assign a task to an actor or set of actors. This activity is used to define the task type and the associated status.

Application Scenarios

A typical application scenario could be a Bug Tracking Workflow Process, in which bug fixing tasks will be assigned to developers. The task can have a drop-down that will function as a task completion maker. From the drop-down, the developer can select the status of the task, selecting "Closed" when the bug is fixed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Workflow Variables for Task

Steps to define variables for use in the Task activity

This section describes how to define variables for use in Task activities. It gives the syntax for creating the variables and typical examples for different cases.

Variables for capturing WorkItemIds

The Activityids for the Task work item can be retrieved using a variable of type array, with the following syntax:

'^'+CurrentActivity.Name+'WorkItemIds'.

For example, **^SolveNetworkIssueWorkItemIds**

Variables for capturing All Actors' Details

The details of the actor(s) to whom the Task work item gets assigned can be accessed by declaring a variable of type array with the following syntax:

'^'+CurrentActivity.Name+'ActingUsers'

For example, **^SolveNetworkIssueActingUsers.**

Variables for capturing Responding Actor Details

The details of the actor submitting the Task response can be accessed by declaring a variable of type actor with the following syntax:

'^'+HWSActivity.ActivityName+'RespondingUser'

For example, **^SolveNetworkIssueRespondingUser**.

This variable stores the responded user information. If it is more than one user, it will retrieve the last user details.

Note: For single user, you can declare this variable as Resource type. If task is assigned to more than one user and to get all responded users information, then declare this variable as array.

Variables for capturing Comments

Comments entered in a Task can be retrieved using a variable with the following syntax:

'^'+_HWSActivity.ActivityName+'CommentTaskStatus'.

For example, if a comment entered along with a task response submission has to be retrieved from an activity named 'SolveNetworkIssue', add a variable with ^SolveNetworkIssueCommentTaskStatus as its name. The variable gets initialized with the comment entered by the resource after the activity submission.

Variables for assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the Start activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

To assign multiple queues, specify the queue-ids with semicolon (;) separator. Skelta.HWS.Queue.QueueCollection class can be used to retrieve queue information.

Variable for Queue Acting Users

You can declare an array type variable to get updated information about the name of the actor to whom an activity gets assigned from a queue.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

In the Workflow Variables, define the variable in the following format:

^+CurrentActivityName+'QueueActingUsers'

Ex: **^HRFormQueueActingUsers**

HRForm is the activity name.

For example, the value of the user who acts on the HRForm activity will be stored in the variable. The Approval1 task will be assigned to the same user.

Variables for storing timeout warning value

Suppose, you want to store the timeout warning value for a task activity in your workflow. The naming convention for the system variable to be declared is

^<ActivityName>ResponseByWarningTimeout

The value returned by the variable will be in UTC format. For multiple user scenarios the highest timeout value calculated for a user will be available in the variable.

Activity Properties

The Task activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right-click menu for the Task activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Display Name - This property specifies the name to be displayed for the activity in the Work Item List.

Property Type: Optional (This property need not be set if the display name is already configured in the Actions.xml. The name entered here overrides any display name that is configured for this activity in the Actions.xml file.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Delivery Channels - This property is used to specify the delivery channels to deliver this activity to the assigned actor(s). Multiple channels can be specified giving the actor(s) different options to act on the work item.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to set the Delivery Channels property

1. To select the Delivery Channels, click the button for the 'Delivery Channels' property to open the property window.
2. In this window, the Delivery Channels that have been configured are listed on the left along with a check box against each channel. Click and select the check box corresponding to the channel you wish to select. You can select multiple channels by selecting the respective check-box.
3. Click the **Save Channels** button.

See Task - Delivery Channels for a detailed description of the Delivery Channels property window.

Select Task Type - You can define Task Type and Status under Select Task Type in a Task Assignment. The Status added under Task Types is used to maintain the status of the Task assigned.

Property Type: Mandatory (This property must be set for the activity to be used in the workflow.)

Attributes of the select Task Type property

- The user interface displays the Task Type and Status under them.
- Task Completion Maker functionality.
  - There can be a Task Completion Status associated with a Task Type. A Task Status marked as ! is said to be the Task Completion Status for the Task Activity.
  - The outcome of the Task Assigned is determined by the Task Completion Status tagged with Task Type.
  - Whenever a actor acts upon (submits) the Task, the engine is notified with the Task Completion Status of the Task, provided the status is marked as Task Completion status. For example, if the TASK COMPLETION Task Type has COMPLETED and ON-HOLD as status, and COMPLETED is tagged with the Task Completion Maker, then, when the Task is submitted with COMPLETED as the selected status, the engine is alerted about the 'COMPLETED' status and it executes the next process in the workflow.
- Edit and Delete options have been provided.
- First the actor clicks the Add New button. (The option to add more than one Task Type is also provided.)
- Then the actor has to enter the Task Type and the Number of Status to be added under the Task Type.
- For the Task Type, the actor has to enter the Status.

Steps to set the Select Task Type property

1. To add Task Types and their Status, click the button for the 'Select Task Type' property to open the property window.
2. In this window, specify the number of task types to add in the **No. of additional Task Types** text box and click Add New. This will open a new window.
3. In the second window, enter the task type name in the text box under the **Task Type** column.
4. Specify the number of status options for the new task type in the **No. of Options** text box.
5. Repeat steps 3 and 4, if you are adding more than one task type for the task.
6. After setting the parameters for all the task types, click **Next** to go to the next window.
7. In the third window, specify the status options that will be presented to the actor to set the status for the task, in the text boxes under the **Task Type & Status** column. The number of rows displayed for specifying the status options correspond to the number specified in step 4.
8. Specify the status option that will set the task status as completed by checking the corresponding check box

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

under the **Task Completion Maker!** column.

9. You can delete the status if required in the **Delete?** column.
10. After completing all the details you can click on the **Finish** button to save the new task types.

The first window is displayed again when you click **Finish**. It shows the newly added task type(s). You can modify or delete the new task types or add more new task types. If you do not wish to perform any more operations, click **Close** to exit this window.

See Task - Task Type for a detailed description of the Select Task Type property windows.

Work Item Fields - This property is used to add the custom fields to be used to display application data as well as value in variables and content in the Work items list when this activity is executed.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Work items fields property

1. To select the Work Item Fields, click the button for the 'Work Item Fields' property to open the property window.
2. In this window, the Work Item Fields that have been set are listed in a grid. Click a row to select the corresponding Work Item Field.
3. Right-click the row, and select "SetWorkItemField" from the context menu to set it.

See Task - Work Item Fields for a detailed description of the Work Item Fields property window.

Actors

The properties in the Actors group have been described below. You can use these properties to specify the actors who will work on the activity and related properties.

Assign Actor(s) - This property specifies the actor(s) who has to take up the Task activity. It is tagged with the Ignore Unavailable Resources property which in turn is tagged with Alternate Resource Allowed. This will be explained in detail later.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any actor(s).)

Steps to set the Assign Actor's property

1. To specify the actors, click the button for the 'Assign Actor(s)' property to open the property window.
2. In this window, build an expression to select the actors using the actors properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking Undo. You can also clear an existing expression if necessary by clicking Clear. This is useful if you want to clear large expressions in the text area in order to build a new expression.
5. After building the expression, click **Update** to save it.

See Task - Assign Actor(s) for a detailed description of the Assign Actor(s) property window.

See the Using XML Variables section in the About XML Variables topic for details on how to use the XMLVariables to build the expression.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Assign Queue(s) - This property specifies the queue(s) to which the Task activity is to be assigned.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any Queue(s).)

Steps to set the Assign Queue(s) property

1. To specify the queue(s), click the button for the 'Assign Queue(s)' property to open the property window.
2. In this window, select the queue(s) from the Available Queues list box. You can select multiple queues by selecting with the
3. After selecting the required queue(s) click the **[>]** button to move it to the Selected Queues list box. You can click the [>>] button to select all the queue(s) and move them to the Selected Queues list box.
4. You can remove any queue from the selected list by selecting it and clicking the [<] button. You can remove all the queues by clicking the [<<] button.
5. After adding the required queue(s), click **Assign** to assign the activity to the selection.
6. Click **Close** to close the window without saving the selection.

See Task - Assign Queue(s) for a detailed description of the Assign Queue(s) property window.

Min. Ownerships [% or Number] - This property, which can be specified as a number or percentage, is the minimum number of actors who should take ownership of the Task assignment. This property is related to the 'Timeout warning for Ownership' and 'Timeout for Ownership' properties. To illustrate, when 'Timeout for Ownership' is reached, the activity first checks if the ownership count is less than Min.Ownerships (if it is set). If it is, the work item will be removed from all Work Item lists.

If the 'Min.Ownerships' has already been satisfied, then the work item will be removed from the Work Item lists of those who have not taken ownership. If the Min.Ownerships value is 0, then the activity checks if the ownership count is less than Max.Ownerships (if it is set). If it is, the work item will be removed from all Work Item lists. Else, the work item will be removed from the Work Item lists of those who have not taken ownership. If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work Item lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Max. Ownerships [% or Number] - This property, which can be specified as a number or percentage, is the maximum number of actors who should take ownership of the Task assignment. If 'Timeout for Ownership' is specified and achieved, and the 'Min.Ownerships' is also satisfied, then the activity waits for action from those who have taken ownership. If the Min.Ownerships value is set to 0, then it checks if the ownership count is less than Max.Ownerships. If it is, the work item will be removed from all Work Item lists. Else the work item will be removed from the Work Item list of those who have not taken ownership. If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work Item lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Enable Take Ownership? - If this property is set to Yes, then the actor is provided with a Take Ownership option in the Work items list to take ownership of the task. If you do not required the Take Ownership option in the Work items list, then set this property as No.

Note: By default, this property is set as Yes.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to set the Enable Take Ownership? property

1. Select **Yes** or **No** option from the Enable Take Ownership? drop-down list.

Re-Assign Allowed? - If this property is set then the actor is provided with a Re-Assign option. Using this, the actor can forward the work item to another actor.

Property Type: Optional (This property needs to be set only if necessary.)

Ignore Unavailable Actors?

This property provides the following options - **Yes**, **Yes** - **holidays excluded** and **No**. If this property is set to 'No', when the Approval activity is assigned to the actor's Work Item list, a check is first done to see whether the actor is available. If the actor is not available then a check is made for an alternate actor assigned to the unavailable actor. Simultaneously, the value of the property 'Alternate Actor Allowed' is checked. If that is also set, then the Approval work item is assigned to this actor. If this property is set to Yes - holidays excluded, the workflow engine will ignore the fact that actors are not available if the day is an organization holiday and the output Not Enough Resources will not be generated.

Property Type: Optional (This property needs to be set only if necessary.)

Alternate Actor Allowed? - This property is set to assign a particular task to an alternate actor in the absence or unavailability of any actor.

Property Type: Optional (This property needs to be set only if necessary.)

Notification Contents

The properties in the Notification Contents group have been described below. You can use these properties to specify the content used to notify actors about the activity.

Subject - This is the subject of the Task assignment. The subject can be customized for each actor.

Property Type: Optional (This property need not be set. If it is not set, the default subject line from the Actions.xml file is displayed.)

Steps to set the Subject property

1. To specify the subject, click the button for the 'Subject' property to open the property window.
2. In this window, enter the subject text directly in the text editor.
3. If you want to customize the subject you can do so using the Field controls to add resource property values. For example, to add a subject that includes the email id of the actor submitting the Task, you can do as follows: Type in the text "Submitted By". Select "Variable" and "Variable.SubmittedBy.Email" from the two drop downs for Field and click Append. This will add the placeholder for the variable after the text entered in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the email id.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the subject, click Update to save it.
7. Click Close to close the window without saving the subject.

See Task - Subject for a detailed description of the Subject property window.

Body - This is the actual message of the Task sent to the actor(s). The message can be customized for each actor. There is an **Enterprise Console Explorer(plug-in)** icon in the Body property window to get the work item details

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

URL.

See Enterprise Console Control (EC Plug-in) for more information.

Property Type: Optional (This property need not be set.)

Steps to set the Body property

1. To specify the message body, click the button for the 'Body' property to open the property window.
2. In this window, enter the body text directly in the text editor.
3. If you want to customize the body you can do so using the **Field** controls to add resource property values. For example, to add a body that includes the name of the actor submitting the Task, you can do as follows: Type in the text "Hi, Please act on the task assigned to you by". Select "Variable" and "Variable.SubmittedBy.name" from the two drop downs for **Field** and click **Append**. This will add the placeholder for the variable after the text entered in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the name.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the body, click **Update**.
7. Click **Close** to close the window without saving the body

See Task - Body for a detailed description of the Body property window.

From Email Address? - This property is used to specify the email address from which notification messages will be sent for the activity.

Property Type: Optional (This property needs to be set only if necessary. If it is not set, the default value in Activities.xml will be used.)

Hide Responses? - If this property is set to 'No', then actors can see the responses of other actors in a group Task scenario. To view these responses i.e., ownerships, Task status etc., select the 'Take Ownership' option. This will open a new pop up with the responses of other actors who have taken ownership.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Priority - This property is set to indicate the priority of the Task assignment. Enter the values 0-33 to set as Low, 34-66 for Medium, or 67-99 for High. The default value is set to 34.

Property Type: Optional (This property needs to be set only if necessary.)

Show Custom Document View Window - If this property is set to 'Yes', then the Custom Document View Window will be shown to actors in their Work Item Lists.

Property Type: Optional (This property needs to be set only if necessary.)

Send Notification Email - If this property is set to 'Yes', then notification emails will be sent to the actors. If it is set to 'Yes-HTML', then the emails will be sent in HTML format.

Property Type: Optional (This property needs to be set only if necessary.)

Notify if alternate actor is considered - If this property is set to 'Yes', then notification emails will be sent to the actors when an alternate actor is considered.

Property Type: Optional (This property needs to be set only if necessary.)

Redirect URL - This property is used to get the URL of the web page to redirect the client to, in the case of

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

synchronous execution of the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Redirect URL property

1. To specify the Redirect URL, click the button for the 'Redirect URL' property to open the property window.
2. In this window, enter the Redirect URL directly in the text editor.
3. If you want to customize the Redirect URL you can do so using the Field controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for Field, and clicking Append. This will add the placeholder for the variable in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the URL.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Redirect URL, click Update to save it.
7. Click Close to close the window without saving the Redirect URL.

See Task - Redirect URL for a detailed description of the Redirect URL property window.

Custom Document View URL - This property is used to get the URL of the page to which the custom document dlls does a post. The data posted to the page are application, workflow, executionid, executiondetailsid, and workitemid. The posted data can be retrieved as Request.Form["workitemid"].

Property Type: Optional (This property needs to be set only if necessary.)

See Task - Custom Document View URL for a detailed description of the Custom Document View URL property window.

Steps to set the Custom Document View URL property

1. To specify the Custom Document View URL, click the button for the 'Custom Document View URL' property to open the property window.
2. In this window, enter the Custom Document View URL directly in the text editor. If you want to customize the Custom Document View URL you can do so using the Field controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for Field, and clicking Append. This will add the placeholder for the variable in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the URL.
3. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
4. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
5. After adding the Custom Document View URL, click Update to save it.
6. Click Close to close the window without saving the Custom Document View URL.

Mail Channel

The properties in the Mail Channel group have been described below. You can use these properties to customize

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the Task activity(activities) with different mail channel templates.

Use html template from property - If this property is set to **'No'**, then it will take the mail channel template from the physical path '[AVEVA Work Tasks Installed Path]\BPM.NET\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\TaskEmail.html.
If this property is set to '**Yes'** and the **"HTML Template"** property is empty, then it will take the mail channel template from the physical path '[AVEVA Work Tasks Installed Path]\BPM.NET\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\TaskEmail.html.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the HTML templates

1. To specify the HTML template, click the edit icon to open the property window.
2. In the **HTML template** window, provide the template which should be in html format. If you are pasting a copied html content, then right-click the **HTML template** window and paste it as "**Paste Plain Text**".
3. Click **Update**

See Task - HTML Template for a detailed description of the property HTML template window.

Attachment

This property is used to configure report to be sent as an Email attachment.

Property Type: Optional (This property needs to be set only if necessary.)

See Task - Attach Reports for a detailed description of this property.

Decision Influencers

The properties in the Decision Influencers group have been described below. You can use these properties to specify some parameters that influence the outcome of the activity.
Max Actors Required for TaskAssignment Completion [% or Number] - This property is used to check what percentage or number of actors should take action on the Task. Decision on the Task is taken only after the specified number or percentage of actor(s) have taken the action. The activity waits for the actors' action until the 'Timeout for action' is reached.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Min Actors Required for TaskAssignment Completion [% or Number] - This property specifies the minimum number of actors to act on the Task before the 'Timeout Warning for Action'. If the action limit is reached before the 'Timeout Warning for Activity' then the warning message is not shown.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Escalation & Timeout

The properties in the Escalation & Timeout group have been described below. You can use these properties to specify escalation and timeout settings for the activity.

Set Calendar for Timeout - This property is used to specify the calendar to be used to determine activity timeouts.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to Set Calendar for Timeout

1. To specify the calendar for timeout, click the button for the 'Set Calendar for Timeout' property to open the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

property window.

2. In this window, select the required calendar by clicking the calendar name in the tree structure.
3. Click **Set Calendar** to set the selected calendar.
4. You can specify that a resource calendar should be used, if available, by clicking to select the corresponding check box.

See Task - Set Calendar for Timeout for a detailed description of the Set Calendar for Timeout property window.

Minimum available time for Activity - This property is used to check the availability of an actor to whom a task must be assigned while executing the activity. The availability check for the actor is done based on the Calendar settings (Global or Resource Calendar). If the time taken to complete the task is within the value set for the **Minimum available time for Activity** property, then the task will be assigned to that actor. However, if the time taken to complete the task exceeds the value set for the **Minimum available time for Activity** property, then the task will be assigned based on the values set for the **Ignore Unavailable Actors?** and **Alternate Actor Allowed?** properties.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout Warning for Ownership - This property specifies the time at which a warning is provided to an actor to take ownership of the work item assigned to him/her. If the actor does not take ownership within this time the engine is notified with a warning. Thus if 'Min.Ownerships' is set, and it is not satisfied before the given time then a warning is sent. If Min.Ownerships is 0, it will check for Max.Ownerships. If the ownerships count does not reach the Max.Ownerships value within the set time, a warning is sent. If both Min.Ownerships and Max.Ownerships are not set, this property is ignored.

Property Type: Optional (This property needs to be set only if necessary.)

Understand how Ownership Properties relate to each other:

- Task activity is assigned to the actors in the Task assignment list by the workflow engine. Task activity has a default property set that at least one actor has to make Take Ownership of the Task activity.
- A drop-down interface has been provided for the actor to Take Ownership. However, the actor can act on the Task without taking ownership first, in which case ownership will be considered to be done. i.e. if the actor acts upon the Task activity without taking ownership, then it is considered as an ownership with action taken.
- After the actor has taken ownership, a link is provided to the actor, which opens a pop up with the details of the other actors. This is again tagged with the 'Hide Responses?' property. The link will be provided only If 'Hide Responses?' is set as 'No'. The pop up will have details like Actor name, Ownership Status, Action taken, Comments.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] then the 'Timeout Warning For Ownership' property is not considered.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] and the 'Time Out For Ownership' is also reached then the work item is removed from other actors' Work Item list and the work item waits for action from those who have taken ownership.
- If the 'Min.Ownerships' limit is not reached for the Task activity, and the 'Timeout Warning For Ownership' has been exceeded then the actor is notified with a warning by including an email or an information activity, with the Timeout Warning for Ownership link to it.
- If 'Timeout For Ownership' is set, if the Task activity has not reached the minimum limit (Min.Ownerships) and the 'Time Out For Ownership' has been reached, then the work item is removed from the Work Item lists of all the actors.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- If 'Min.Ownerships' = 0 and if 'Max.Ownerships' is set, the activity waits for actors to take ownership or action until the 'Time Out For Ownership' is reached (if this is set).
- If none of the Ownership properties are set then the activity waits until the actor takes ownership or acts upon it.

Timeout for Ownership - This property specifies the time until which actors are allowed to take ownership, i.e. the time until which the Task activity will wait for actors to take ownership. If Min.Ownerships is set and is not reached, the work item is removed from all Work Item lists. If Min.Ownerships is 0, it will check if ownership count is less than Max.Ownerships. If it is, the work item is removed from all Work Item lists. Else the work item will be removed from the Work Item lists of those who have not taken ownership. The work item will remain in the Work Item list of actors who have taken ownership and wait for action from them.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout Warning for Activity - This property specifies when a reminder has to be provided for the actors to act on the Task request, if the action count has not been reached. If properties such as Max.Ownerships, Affirmative Action for Task (AAA), and Action Limit (AL) are set, once the property values are reached then a warning is sent to the participant. When the timeout is reached, the following checks are made: if AL is set, when the action count i.e. the no. of Tasks or rejections (AC) < AL, then a warning is sent, if AL = 0 and AAA is set, and when AC < AAA, then a warning is sent to the participant.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Timeout for Activity - This property's value is used to decide until what time the activity should wait for the actors' action. If properties such as Max.Ownerships, AAA, AL are set, once the property values are reached the work item is removed from the Work Item lists of all the actors. When the timeout is reached, the following checks are made: If AL is set, when the action count i.e. the no. of Tasks or rejections (AC) < AL, then the timeout for action is performed and the work item is removed from all Work Item lists. If AC > AL, it checks with the no. of Tasks or 'decision count' (DC) and AAA. If DC >= AAA (if it is set), the action is considered completed. If AAA = 0 and if DC >= AL, the action is considered completed. If AL = 0 and AC < AAA, then the timeout for action is performed and the activity is removed from all Work Item lists. If AL = 0 and AC > AAA, it will check with DC. If DC > AAA it is completed. If AL = 0 and AAA = 0, then if DC is at least 1, then it is considered completed.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Multiple Timeout Warning - This is used to set recurring timeout warnings that will be sent to the actors who have to take action. To set multiple timeout warnings, click the 'Multiple TimeOut Warning' button in the Properties pane for the Task activity. A new window pops up. In this window, set the interval for the recurring warning as well as the output message. You can also set the Recurring Time Interval. This can be used to set a different recurring time out after the first timeout happens. For example, if 'Time Interval' for the property is set as 7 days and 'Recurring Time Interval' is set as 2 days, then the first time out will happen after 7 days and there will be a recurring time out every second day after the seventh day (first) time out.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Steps to set the Multiple Timeout Warning property

1. To set the multiple timeout warning, click the button for the 'Multiple Timeout Warning' property to open the property window.
2. Enter the time interval for the timeout in the Time Interval field.
3. Select "Yes" from the drop down for the Recurring? field if you want the timeout warning to recur. Select "No" otherwise.
4. Enter the output message corresponding to the timeout warning in the Output field.
5. Enter the time interval for the recurring timeout in the Recurring Time Interval field.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. After entering the content details, click Add Row to add this timeout setting and display a new row for entering another timeout setting.
7. Remove rows if necessary by selecting them and clicking Remove Selected.
8. After specifying the timeout settings, click Update.

See Task - Multiple Timeout Warning for a detailed description of the Multiple TimeOut Warning property window.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Miscellaneous

Redirection Enabled? - This property enables redirection. When this property is set to Yes, the workflow redirects the user to the URL in the Redirect URL property in the next activity.

Activity Outputs:

The Task Activity returns the following values -

Action Completed: Displayed when all the actors have taken part.

Action Completed - Affirmative Percentage Not Reached: Displayed when all the actors have not taken part.

Not Enough Resources to Take Acknowledge: Displayed when the filter condition did not yield enough actors to whom the request can be sent.

Timeout - Take Acknowledge: Displayed when the specified minimum number of actors did not take ownership of the request in the given time.

Timeout - Action: Displayed when some or all of the specified actors did not perform the required action in the given time.

Timeout Warning - Take Acknowledge: Displayed when a warning is generated that the specified minimum actors have not taken ownership of the request in the given time.

Timeout Warning - Action: Displayed when a warning for timeout is generated because some or all the actors did not perform the required action in the given time.

Note: The following outputs will return only if user assigned tasks to a queue user.

Resource Unavailable for Queue - If a queue is assigned to a task & if there are no resources available in the queue then this output will get triggered.

TimeOut for Queue Task - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting the completion of that task.

Timeout Warning -Queue - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting in sending a warning out put. However, the task will still be sleeping.

Timeout Warning -Queue Participant - This output will get triggered when the task in the queue is picked by user but still not acted on that task within the queue escalation time out settings resulting in triggering a warning output. However, the task will still be sleeping.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Task - Delivery Channels

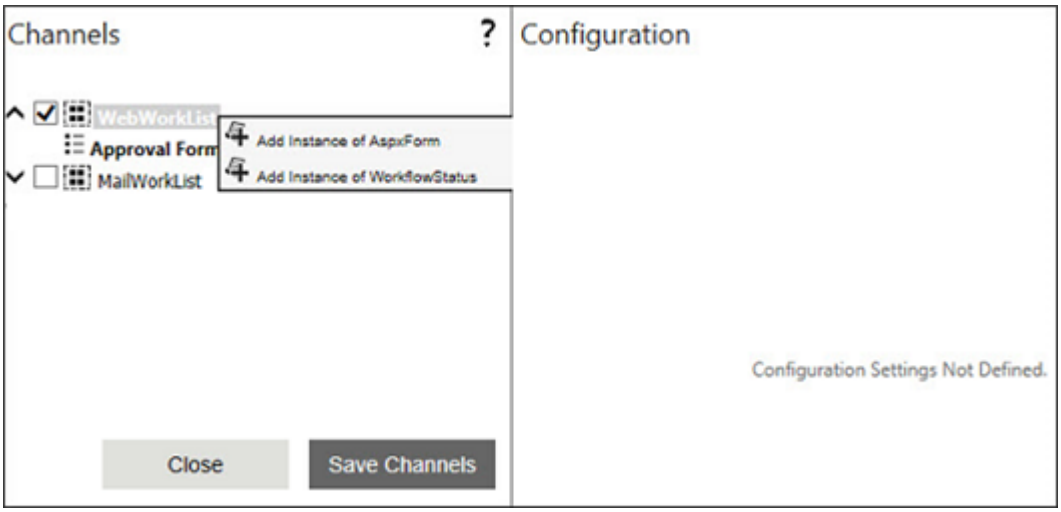
Purpose

The purpose of this chapter is to describe the feature of WorkflowStatus Form of Delivery Channels property under the category Configuration of any human activity available in AVEVA Work Tasks.

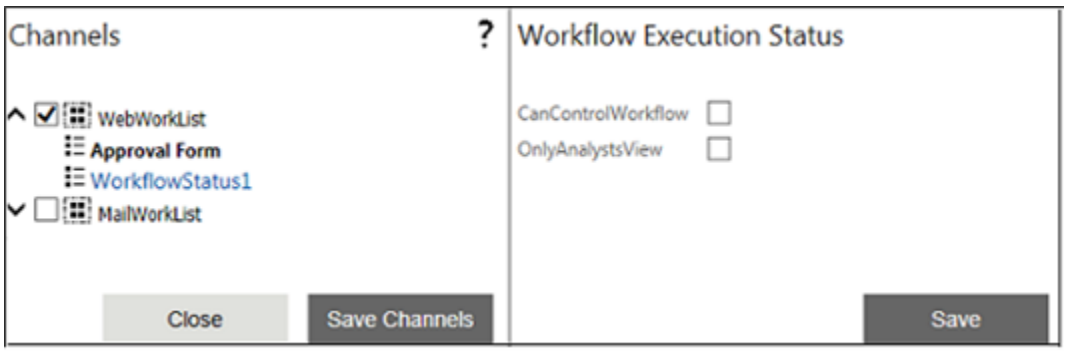
Description: This feature enables us to view the status of the workflow in the work item list in the graphical form. [Optional]

1. Select the Human Activity.
2. Click the **Delivery Channels Property**.

   This will open a window like the one shown below.



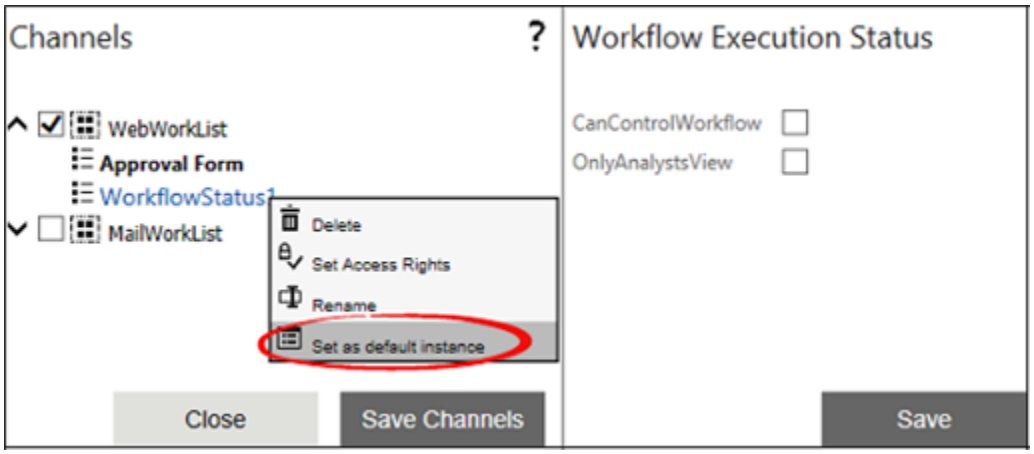
3. Right-click **WebWorkList** to display the context menu with the **Add Instance of Workflowstatus** option as shown below.



4. Set the Properties for the Execution View Status Graphical view.
5. Click **Save**.
6. If you want to Set the workflowstatus form as the default instance, right-click **WorkflowStatus1**, and

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

select the **Set as default instance** option from the context menu.



7. Click **Save** and **Save Channels**.

Output

Now, when you click any row in the Work items list, you will find this Execution view page being displayed as the detailed view if you set it as a default instance.

Otherwise, workflow status form will appear in the context menu of each row in the Work items list and you can open the execution view by selecting it from the context menu

Task - Task Type

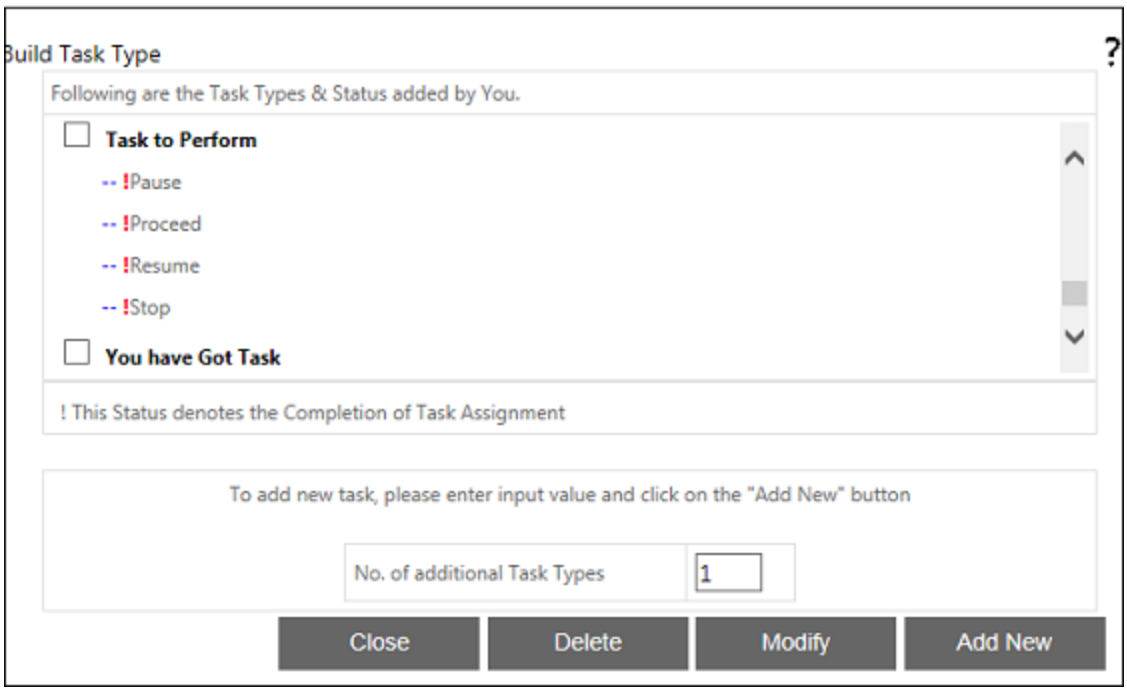
Task Type Property Window

You can add the task types and the corresponding status in this property window. To open this window, click the button for the 'Select Task Type' property.

The window shown in the image below is used to Add, Edit and View the Task Types added for the Task activity. This is the first window in the Select Task Type property user-interface. It lists all the tasks that have been added for the task. Each task in the listing has a check box. You can use this to select the task for editing. The window has the **No. of additional Task Types** field to specify the number of questions to add. This window has the following buttons:

- **Add New** - You can click this button to add new task types. This will open the second window in the Select Task Type user-interface where you can add the tasks. The number of questions you can add will depend on the value set in the No. of additional Task Types field.
- **Modify** - You can click this button to edit the selected task type(s). You can select a task type for editing using the check box next to it.
- **Delete** - You can delete the selected task type(s) by selecting them as described above and clicking this button.
- **Close** - You can click this button to close the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window shown below is the second in the user-interface for adding task types for a task. This interface is displayed after the actor selects **Add New** or **Modify** from the first window shown above. You can add as many task types as were specified the first window and a separate row of fields is displayed for every new task type. For each task type, the following parameters can be set here:

- **Task Type** - You can enter the name of the task type in this text box.
- **No. of Status** - You can specify the number of status options for the Task Type in this text box.

This window has the following buttons:

- **Back** - You can click this to go back to the first window.
- **Next** - You can click this to go to the next window.
- **Close** - You can click this to close the window.

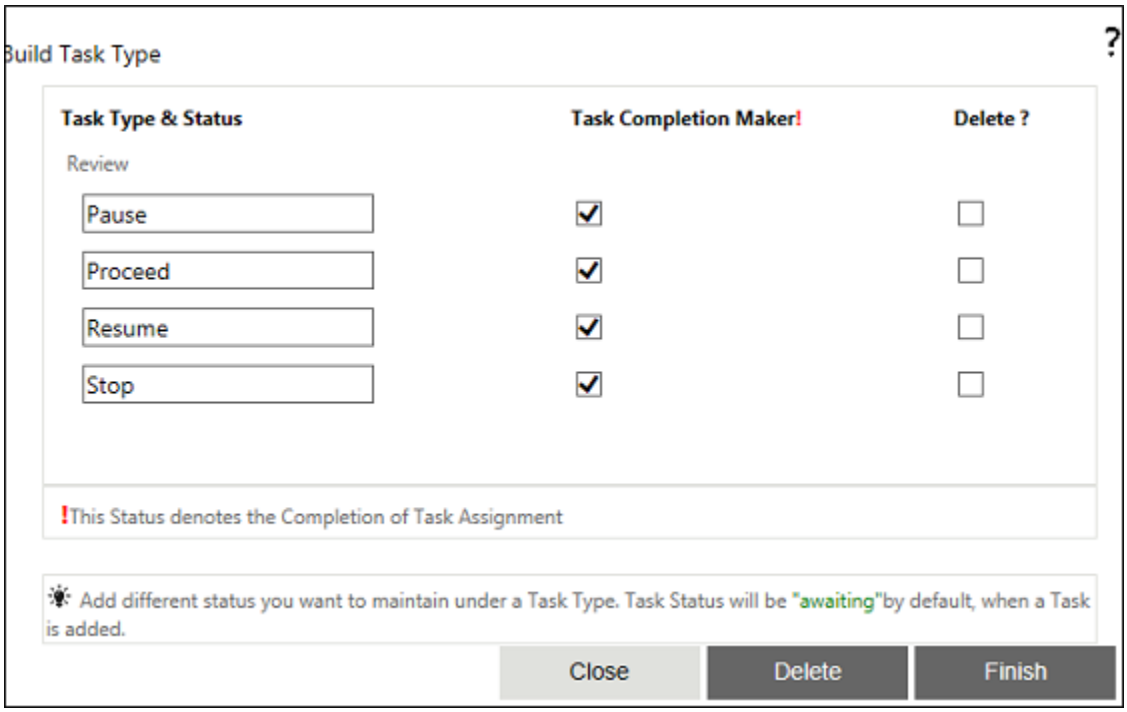
The window shown below is the third in the user-interface for adding task types for a task. In this window, you can set the following parameters:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Task Type & Status** - You can specify the status options that will be available to the actor to set for the task in the fields in this column.
- **Task Completion Maker!** - You can specify the status option that will set the task status as completed.
- **Delete?** - You can delete the status from this column.

This window has the following buttons:

- **Back** - You can click this to go back to the first window.
- **Finish** - You can click this button after completing all the details to save the question.
- **Close** - You can click this button to close this window.



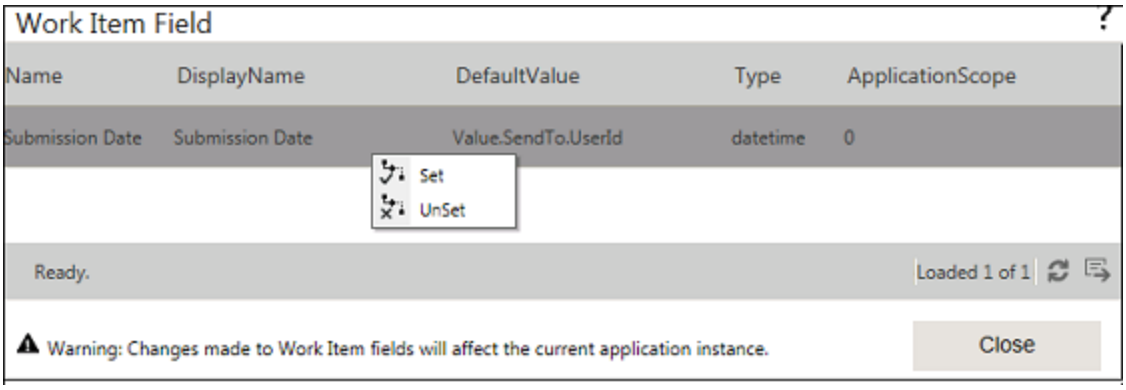
The first window is displayed again when you click Finish in the previous window. It shows the newly added tasks along with their status. You can modify or delete the new task or add a new task. If you do not wish to perform any more operations, click **Close** to exit this user interface.

Task - Work Item Fields

Work Item Fields Property Window

You can set the Work Item Fields for this activity in this property window. To open this window, click the button for the 'Work Item Fields' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a grid listing all the Work Item Fields that have been set for the process.

- Each row in the grid represents a Work Item Field. You can click a Work Item Field to select it.
- The context menu has the Set WorkItemField option, which you can use to set the selected Work Item Field for this activity. It also has the UnSet WorkItemField option to remove the Work Item Field setting.
- **Close** - You can use this button to close the window.

  Note: While entering a value in the Work Item field, it is recommended to keep it less than the specified database column size. If there is a need to increase the size of the Work Item field, the user should manually increase the column size in the database.

Task - Assign Actor(s)

Assign Actor(s) Property Window

You can set the actors to whom the Task work item is to be sent in this property window. To open this window, click the button for the 'Assign Actor(s)' property.

See Assigning a Task to a Manager for more details.

The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Different Methods of Assigning an Actor

- **Assigning an Actor by building an expression:**

Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

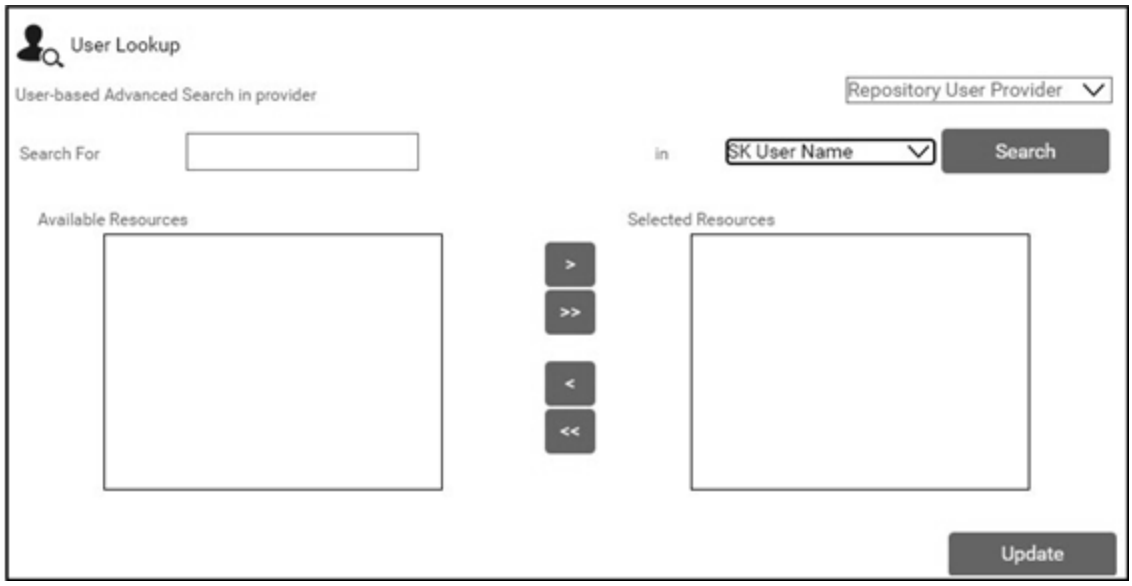
- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

- **Assigning an Actor through User Lookup**

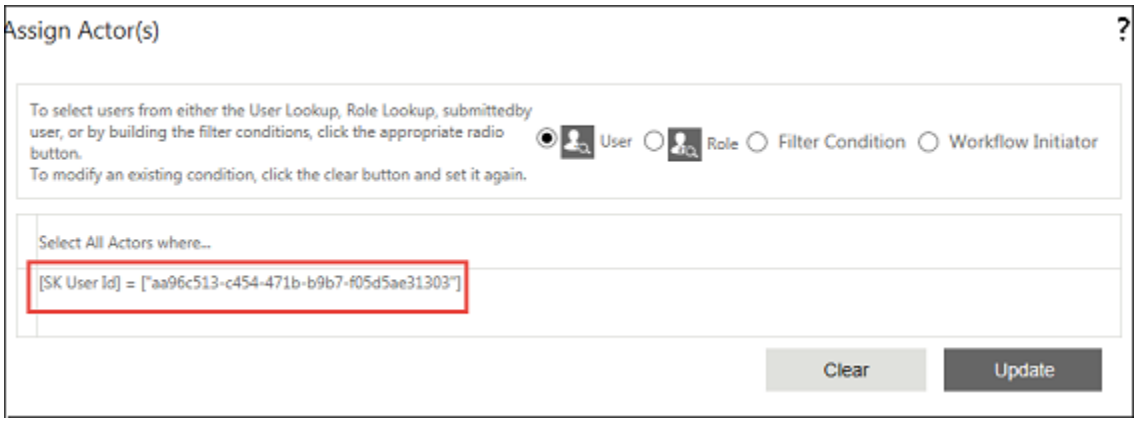
Through the User Lookup you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.
2. The **User Lookup** dialog is displayed, search and select the required actor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:



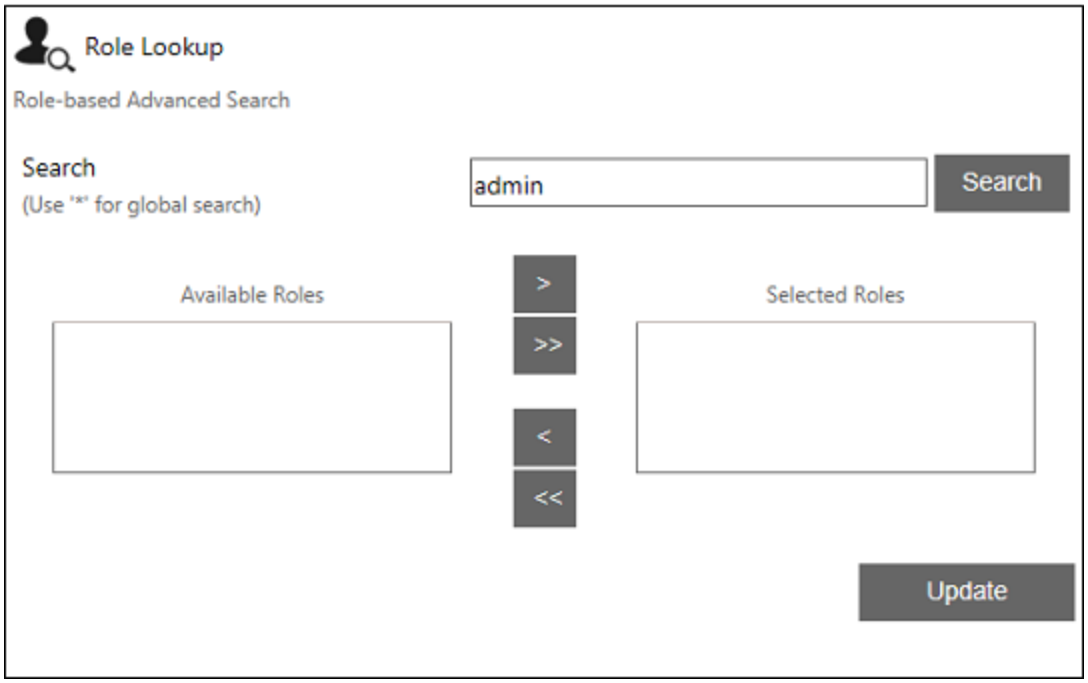
4. Click **Update** in the Assign Actor(s) window to update the selected actor(s) in the Assign Actor property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

- **Assigning an Actor through Role Lookup**

Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

1. Select the **Role Lookup** option.
2. The **Role Lookup** dialog is displayed, search and select for the required role.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



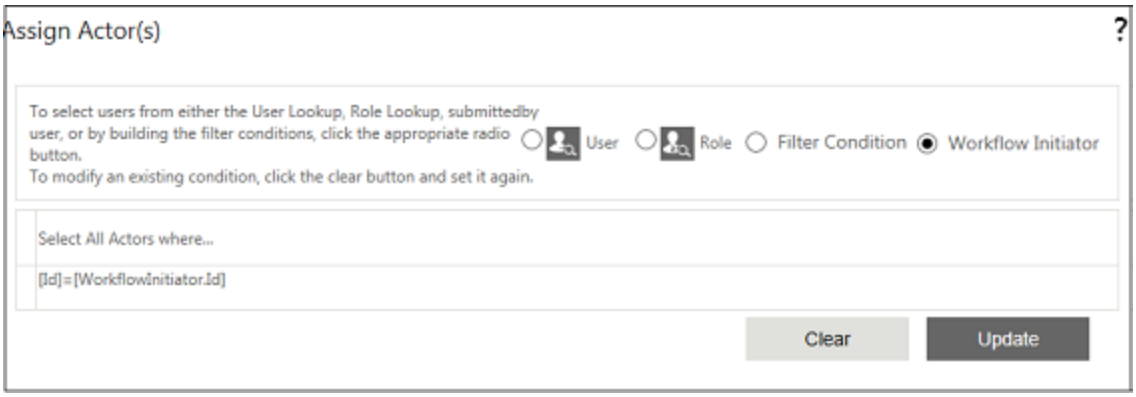
3. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

4. Click **Update** in the Assign Actor(s) window to update the **Assign Actor** property.

- **Assigning an Actor through Workflow Initiator**

Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

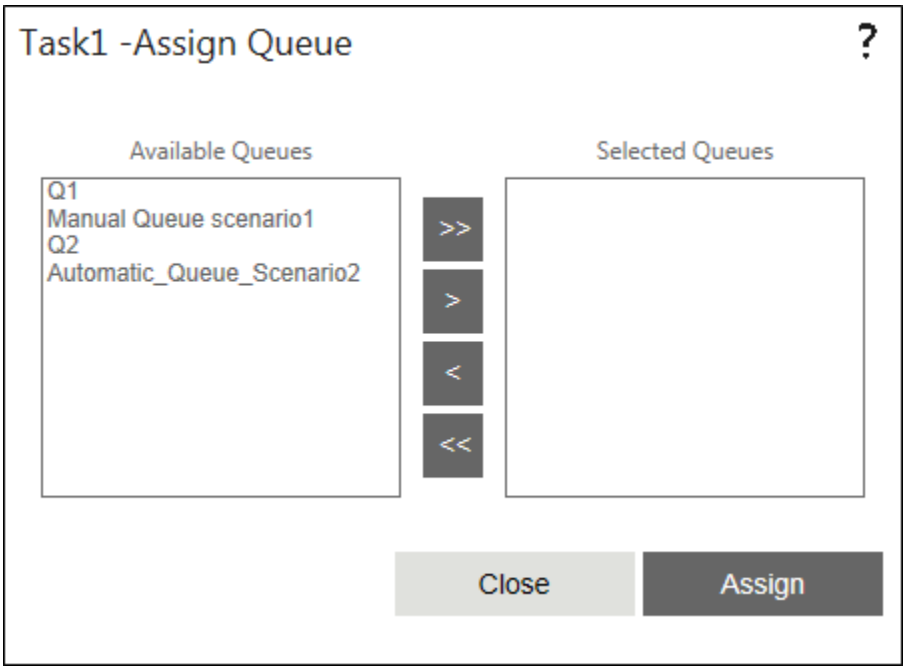
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Task - Assign Queue(s)

Assign Queue(s) Property Window

You can select the queues to which the Task work item is to be sent in this property window. To open this window, click the button for the 'Assign Queue(s)' property.



The window has a pair of list boxes to specify the queue(s). The **Available Queues** list shows all the available queues. You can select the required queue(s) from this list box. The Selected Queues list shows all the selected queues to which the activity will be assigned.

You can use the following buttons located between the list boxes to move the queues to and from the list boxes.

- [>>] - You can click this button to add all the queues in the Available Queues list to the Selected Queues list.
- [>] - You can click this button to add the selected queue(s) to the Selected Queues list.
- [<] - You can click this button to add the selected queue(s) from the Selected Queues list to the Available Queues list.
- [<<] - You can click this button to add all the queues in the Selected Queues list to the Available Queues list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

At the bottom of the window you will find the following buttons:

- **Assign** - You can click this button to assign the activity to the selected queues.
- **Close** - You can click this button to close this window.

Assigning queue system variable

To assign queues instead of setting the queue through **Assign Queue** property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

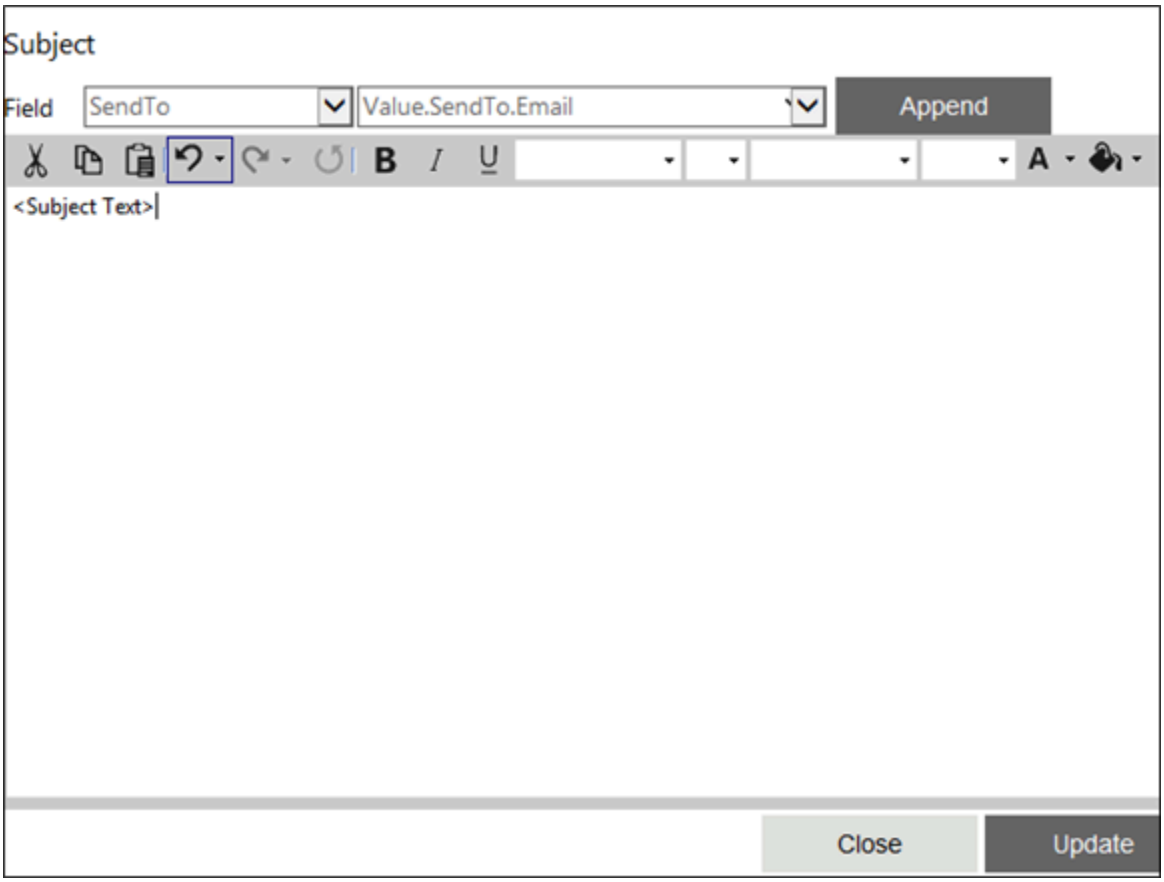
For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the Start activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

To assign multiple queues, specify the queue-ids with semicolon (;) separator. **Skelta.HWS.Queue.QueueCollection** class can be used to retrieve queue information.

Task - Subject

Subject Property window

You can specify a subject for the Task work item assignment in this property window. To open this window, click the button for the 'Subject' property.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The window has a text editor to enter the subject. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the subject. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the subject in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the subject.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the subject using a combination of discrete value and variable or content. For example, you can specify the subject as "Submitted By <%#Variable.SubmittedBy.Email%>". Here the string "Submitted By" should be typed directly in the text editor. The second half of the subject is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the **Field** drop down and clicking **Append**.

The text tool bar above the text editor allows you to manage and format the subject. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the subject.
- **Close** - You can click this button to close this window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task - Body

Body Property window

You can specify a message Body for the Task work item assignment in this property window. To open this window, click the button for the 'Body' property.

The window has a text editor to enter the body text. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/ drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the body using a combination of discrete value and variable or content. For example, you can specify the body message as "Hi, Please cast your vote in the poll conducted by <%#Variable.SubmittedBy.name%>". Here, the string "Hi, Please cast your vote in the poll conducted by" must be typed directly in the text editor. The second half of the body is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the Field drop down and clicking Append.

The text tool bar above the text editor allows you to manage and format the body text. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

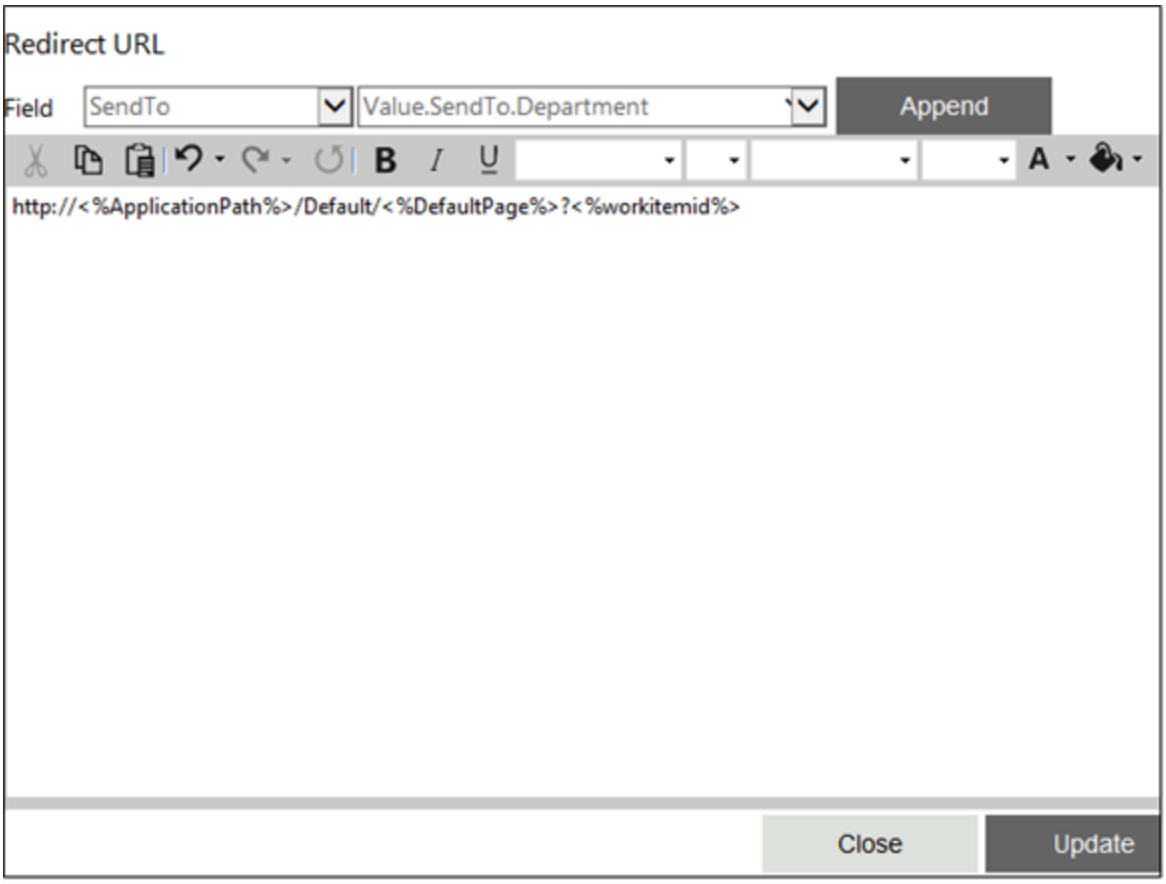
- **Update** - You can click this button to save the body message.
- **Close** - You can click this button to close this window.

Task - Redirect URL

Redirect URL Property window

You can specify a message Redirect URL for the Task activity in this property window. To open this window, click the button for the 'Redirect URL' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the Redirect URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Redirect URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Redirect URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Redirect URL. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

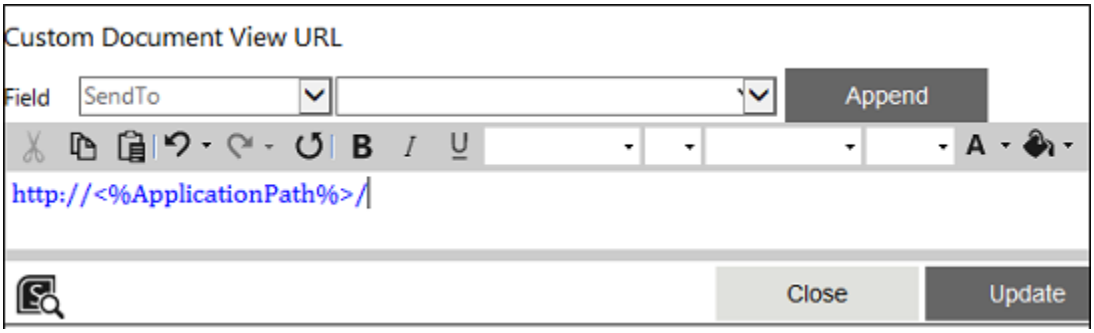
- **Update** - You can click this button to save the Redirect URL.
- **Close** - You can click this button to close this window.

Task - Custom Document View URL

Custom Document View URL Property window

You can specify a message Custom Document View URL for the Task activity in this property window. To open this window, click the button for the 'Custom Document View URL' property.

For more details, see Custom Document View URL.



The window has a text editor to enter the Custom Document View URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Custom Document View URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Custom Document View URL.

- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Custom Document View URL. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the Custom Document View URL.
- **Close** - You can click this button to close this window.

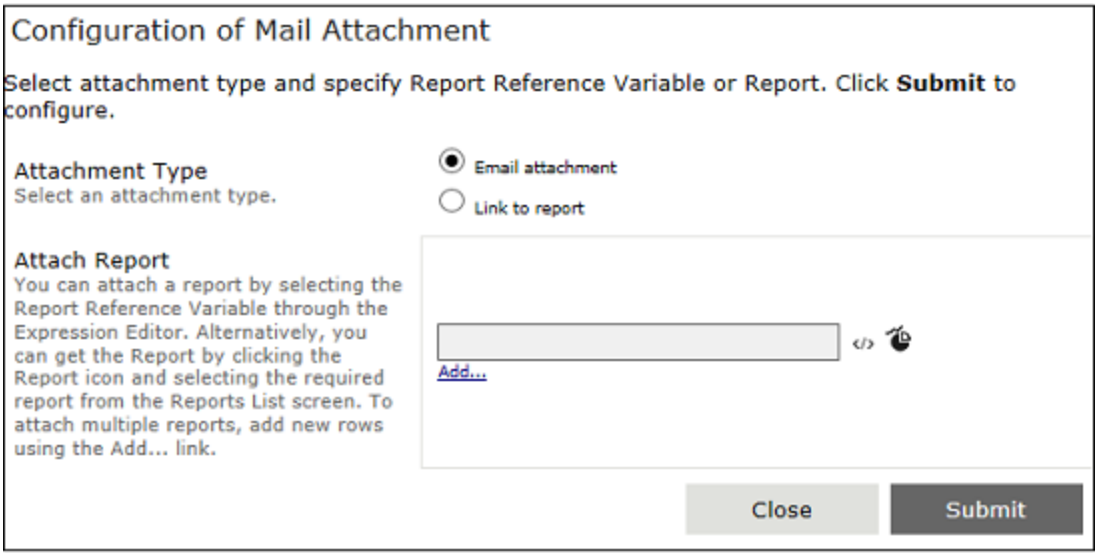
Task - Attach Reports

Configuration of Mail Attachment property window

You can configure the **Attachment** property for the **Approval** activity in this property window.

In this property window, you can configure the report attachments to be emailed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



- **Attachment Type:** Use this property to select the type of attachment for sending the report as an email.
  - **Email attachment:** Select this type to send the report as an email attachment.
  - **Link to report:** Select this type to embed a link in the email to download the configured report.
- **Attach Report:** Use this property to attach a report generated by the **Report Generator** activity within the workflow or to select a report from the list of generated reports.

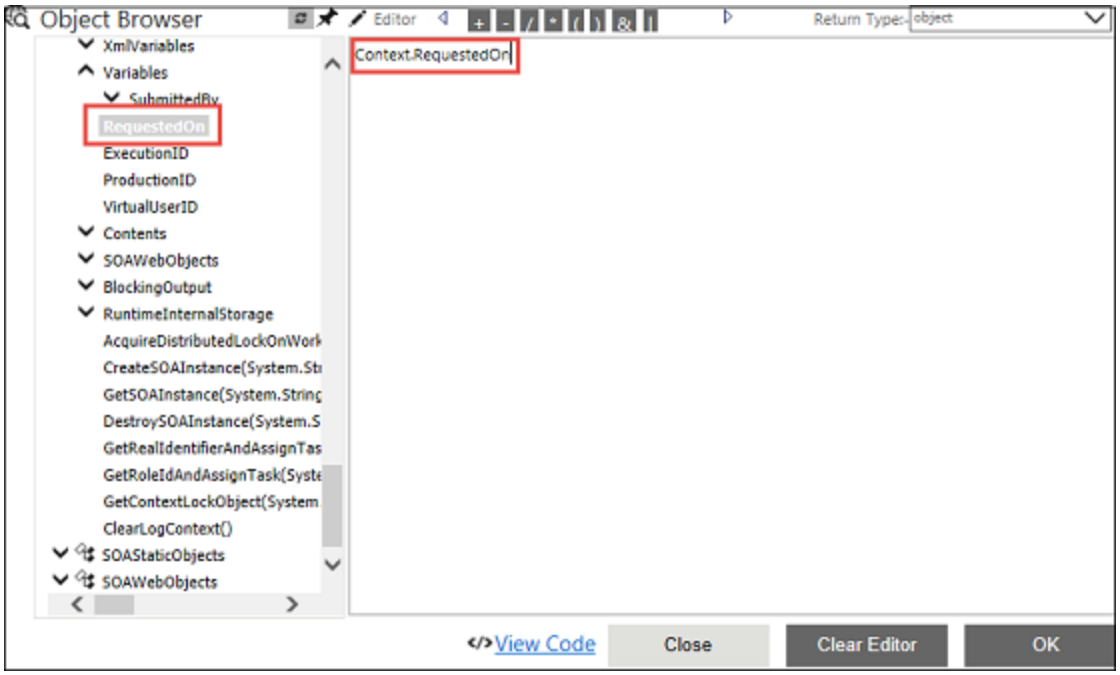
  You can attach a report by selecting the required **Report Reference Variable** using the **Expression Editor**. Alternatively, you can select the report from the Reports List window which consists of the already generated reports.

There must be at least one **Report Generator** activity before an **Approval** activity in the workflow to select the **Report Reference Variable** (using Expression Editor) as an **Attachment**. The **Report Reference Variable** is generated while configuring the **Report Generator** activity. By default, the report reference variable is **[Template Name]_[activity Name]**. For more information about **Report Reference Variable**, see Configure Report Template.

To configure mail attachment

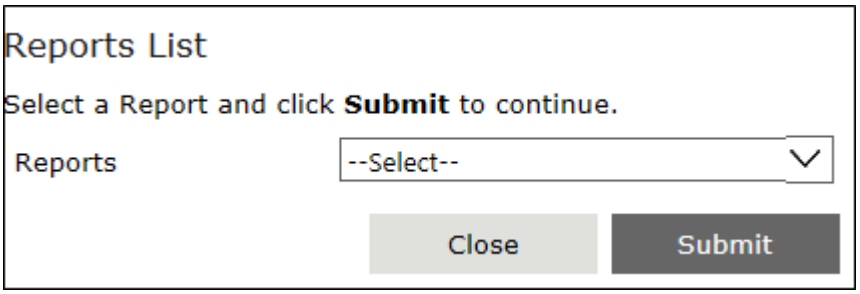
1. Click the edit button for the **Attachment** property.
2. Select the required **Attachment Type**.
3. In the **Attach Report** text box, you can either use the expression editor to get the variable of the report or use the **Reports List** to select the report.
4. To get the variable, click the **Expression Editor** icon given beside the text box to select the required **Report Reference Variable**.
5. In the **Expression Editor** window, select the required variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



6. Click **OK.**
7. Click **Close**.

   The variable appears in the **Attach Report** text box.
8. To select the report from the Reports List dialog box, click the **Reports** icon.



9. In the Reports List dialog box, select the required report, and then click **Submit**.

   This window closes automatically.
10. Click **Close** to close the configuration window.

Task - HTML Template

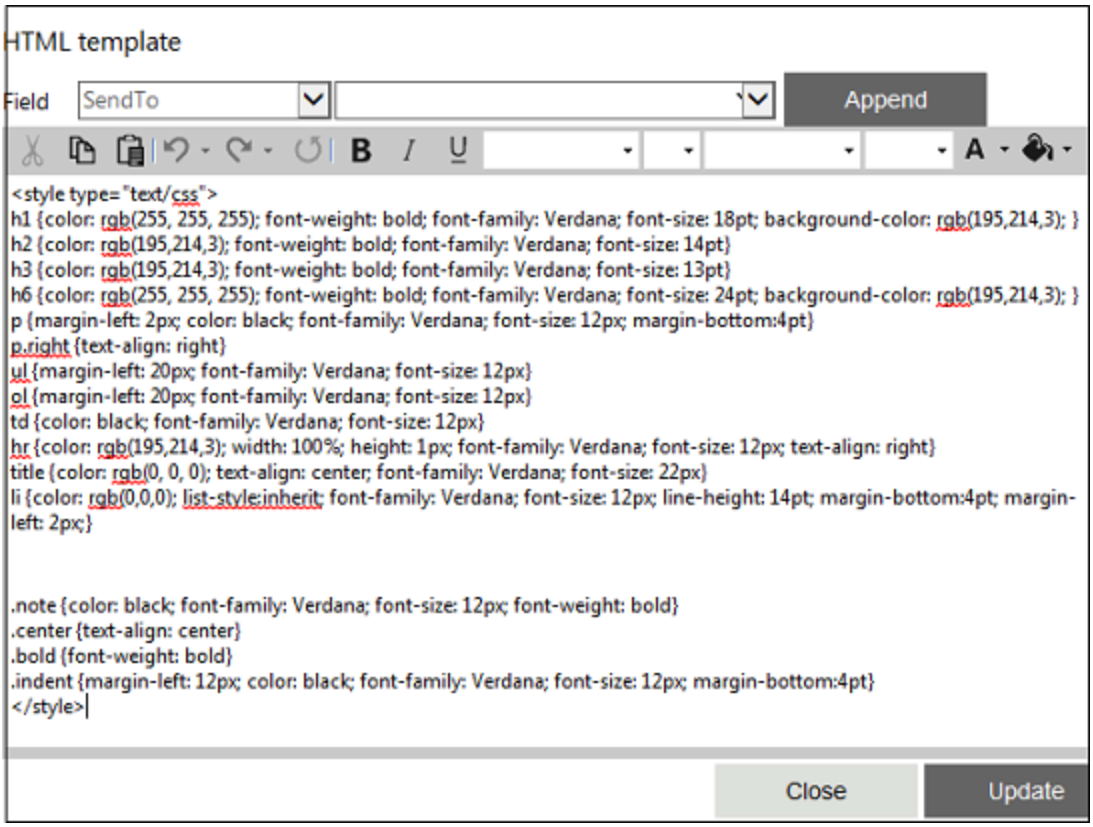
HTML Template Property Window

You can specify a html template for the Task activity in this property window. To open this window, click the edit button for the 'HTML template' property.

In this property window, user can write their own html template for Task activity or user can make use of default Task activity template for customizing the email.

See Using 'HTML Template' property of Task Activity for more information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the body text. You can do this either by entering a html template directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the html template. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

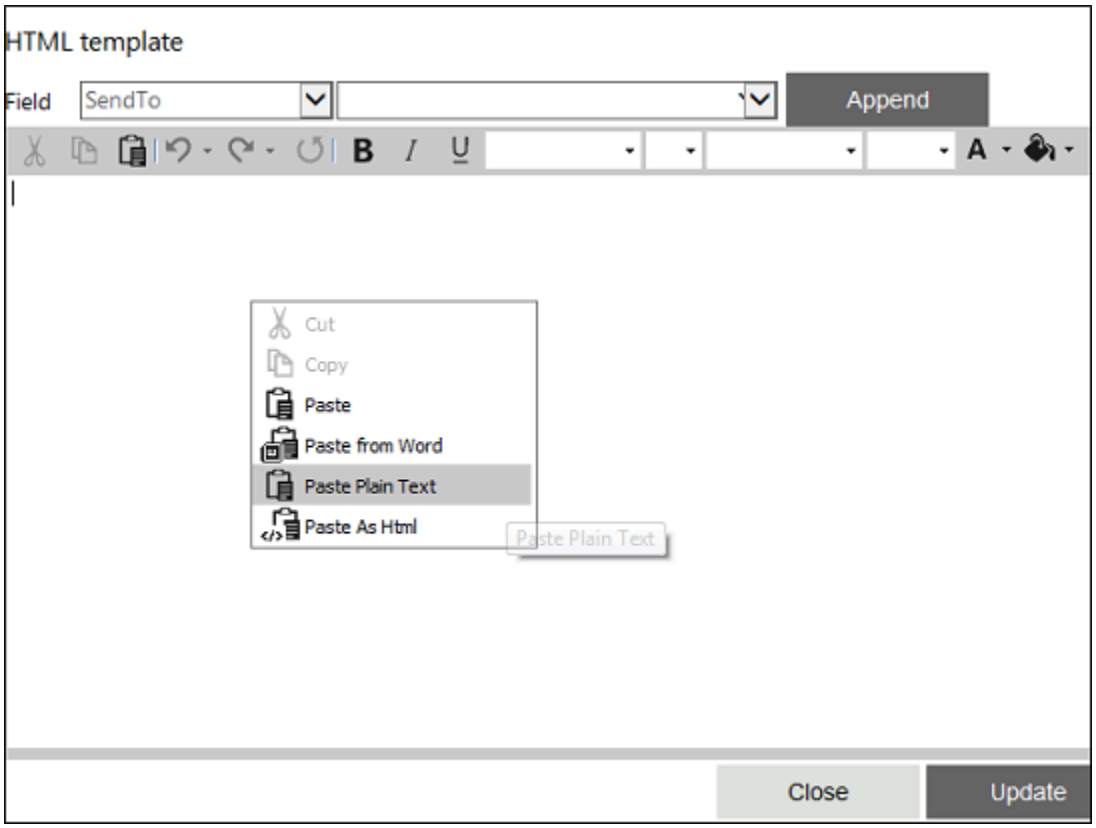
- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

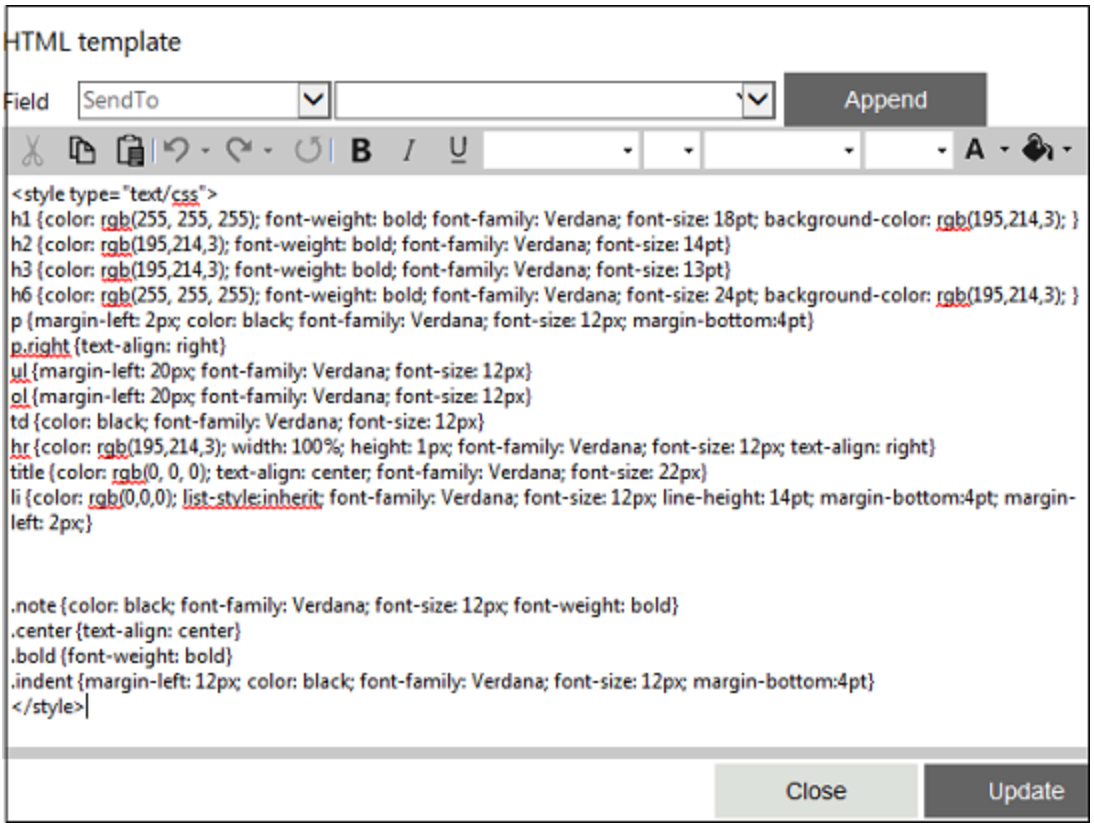
- Update - You can click this button to save the HTML template.
- Close - You can click this button to close this window.

To set HTML temple, follow the steps given below:

1. To specify the HTML template, click the edit icon to open the property window.
2. In the **HTML template** window, provide the template which should be in html format. If you are pasting a copied html content, right-click the **HTML template** window and paste it as "**Paste Plain Text**".



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



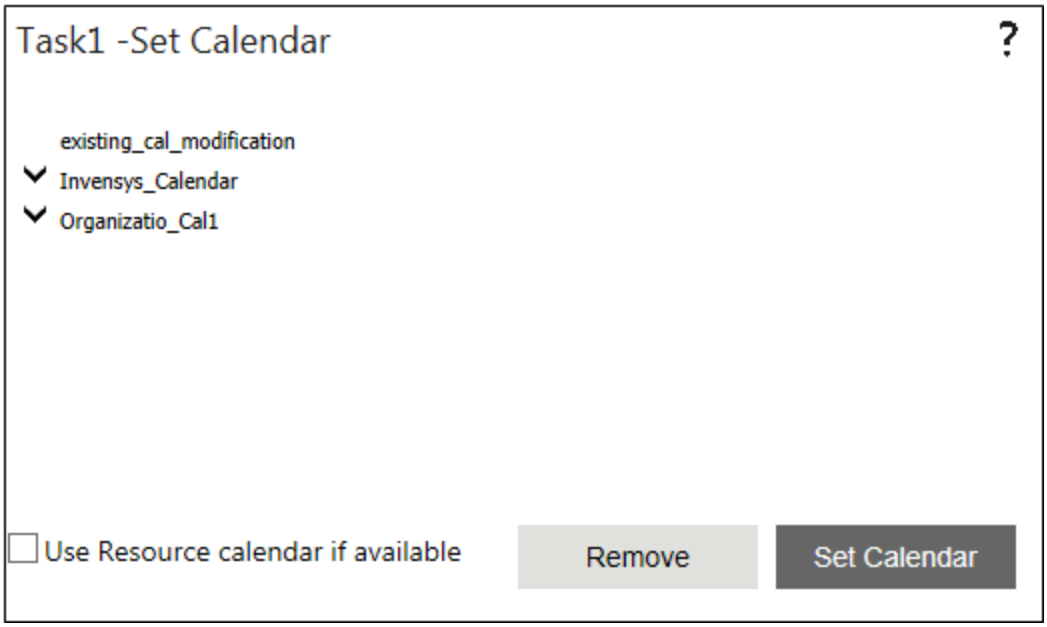
3. Click **Update**.

Task - Set Calendar for Timeout

Set Calendar for Timeout Property window

You can set a Calendar to calculate the timeout for the Task activity in this property window. To open this window, click the button for the 'Set Calendar for Timeout' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



This window lists the available calendars in a tree structure, with lower-level calendars nested within the respective top-level calendar. You can click on a calendar to select it for setting.

There are two buttons in this window.

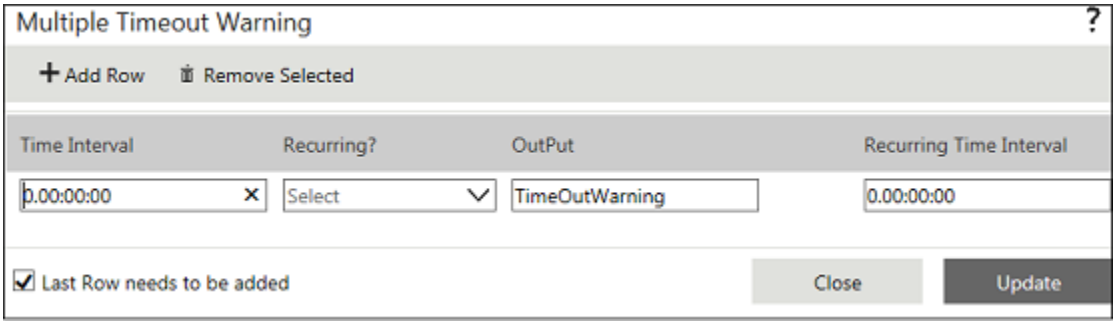
- **No Calendar** - You can click this button to indicate that there is no calendar set for the activity.
- **Set Calendar** - You can click this button to set the selected calendar.

The **User Resource calendar if available** check box can be selected to enable the use of resource calendars if none are displayed in this window for selection.

Task - Multiple Timeout Warning

Multiple TimeOut Warning Property window

You can set the Multiple Timeout Warning in this property window. To open this window, click the button for the 'Multiple TimeOut Warning' property.



The window has two tabs at the top to manage the rows of timeout settings in the grid.

- Add Row - You can click this tab to add the newly entered timeout setting and display a new row to the grid where you can add another timeout.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Remove Selected - You can click this tab to remove the timeout setting row selected in the grid.

The grid has the following parameters that you need to specify for the new timeout setting.

- **Time Interval** - You can use this field to enter the time interval in which you want to generate a timeout warning. You must enter the time in d.hh:mm:ss format.
- **Recurring?** - You can use the drop down in this field to indicate whether the timeout is recurring or not. You can select "Yes" to set the timeout warning to recur.
- **Output** - You can enter the output message corresponding to the timeout warning here.
- **Recurring Time Interval** - You can set the time interval in which the timeout warning has to recur here. Enter the time in d.hh:mm:ss format.

There are two buttons and a check box at the bottom of the screen.

- **Update** - You can click this button to save the newly added timeout settings.
- **Close** - You can click this to close the property window without saving the newly added timeout settings.
- **Last Row needs to be added** - You need to select this check box to save the last row added.

Work Activity

Activity Description

The Work Activity is used in the AVEVA Work Tasks workflow process design in cases where custom activities are required. This activity can be configured using XML configuration files and HTML templates allowing a high degree of flexibility in defining its functionality.

These configuration files are located in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Actions\WorkAction* folder. The Work activity can be configured with Action Outputs, Input Variables, and Output Variables.

Application Scenarios

A typical application scenario would be a Performance Appraisal Workflow where different user-interfaces will have to be shown to evaluators and those being evaluated. The Work activity with its role-based user-interfaces will help implement this functionality.

Workflow Variables for Work:

Steps to define variables for use in the Work activity

This section describes how to define variables for use in Work activities. It gives the syntax for creating the variables and typical examples for different cases.

Variables for capturing WorkItemIds

The Work Item Id's for the Work work item can be retrieved using a variable of type array, with the following syntax:

'^'+CurrentActivity.Name+'WorkItemIds'.

For example, **^WorkActivityWorkItemIds.**

Variables for capturing All Actors' Details

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The details of the actor(s) to whom the Work work item gets assigned can be accessed by declaring a variable of type array with the following syntax:

'^'+CurrentActivity.Name+'ActingUsers'

For example, ^WorkActivityActingUsers.

Variables for capturing Responding Actors' Details

The details of the actors' responding to the Work work item can be accessed by declaring a variable of type resource with the following syntax:

'^'+HWSActivity.ActivityName+'RespondingUser'

For example, ^WorkActivityRespondingUser.

This variable stores the responded user information. If it is more than one user, it will retrieve the last user details.

Note: For a single user, you can declare this variable as Resource type. If task is assigned to more than one user and to get all responded users information, then declare this variable as array.

Variables for capturing Comments

Comments entered in a Work work item can be retrieved using a variable with the following syntax:

'^'+_WorkItem.CurrentActivity.Name+'CommentWork'

For example, **^WorkActivityCommentWork.**

Variables for assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the Start activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

To assign multiple queues, specify the queue-ids with semicolon (;) separator.
Skelta.HWS.Queue.QueueCollection class can be used to retrieve queue information.

Variable for Queue Acting Users

You can declare an array type variable to get updated information about the name of the actor to whom an activity gets assigned from a queue.

In the Workflow Variables, define the variable in the following format:

^+CurrentActivityName+'QueueActingUsers'

Ex: ^HRFormQueueActingUsers

HRForm is the activity name.

For example the value of the user who acts on the HRForm activity will be stored in the variable. The Approval1 task will be assigned to the same user.

Variable for storing timeout warning value

Suppose if you want to store the timeout warning value for Work activity in your workflow. The naming convention for the system variable to be declared is

^<ActivityName>ResponseByWarningTimeout

The value returned by the variable will be in UTC format. For multiple user scenarios the highest timeout value calculated for a user will be available in the variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: Multiple timeout warnings cannot be tracked using this feature.

Activity Properties:

The Work activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Work activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Display Name - This property specifies name to be displayed for the activity in the Work Item List.

Property Type: Optional (This property need not be set if the display name is already configured in the Actions.xml. The name entered here overrides any display name that is configured for this activity in the Actions.xml file.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Delivery Channels - This property is used to specify the delivery channels to deliver this activity to the assigned actor(s). Multiple channels can be specified giving the actor(s) different options to act on the work item.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Delivery Channels property

1. To select the Delivery Channels, click the button for the 'Delivery Channels' property to open the property window.
2. In this window, the Delivery Channels that have been configured are listed on the left along with a check box against each channel. Click and select the check box corresponding to the channel you wish to select. You can select multiple channels by selecting the respective check box.
3. Click the **Save Channels** button.

See Work - Delivery Channel for a detailed description of the Delivery Channels property window.

AdvanceUI Fields - The property is used to specify the advance UI fields of the Work activity. These fields, which define the Work activity, include the input variables, activity outputs and output variables. In addition, the AdvanceUI template can be specified along with the GroupUI template. The Work activity can be configured to be Role-based or Non-Role-based with the Role-based version allowing the flexibility of exposing different sets of fields according to the role selected. To assign activity outputs, click the 'AdvanceUI Fields' button in the Properties pane for the Work activity. A new window pops up. In this window, specify whether the activity will be Role-based or Non-Role-based using the radio buttons provided, and proceed to specify the UI fields in subsequent windows.

Property Type: Mandatory (This property must be set for the action to be used in the workflow.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to set the AdvanceUI Fields property

1. To specify the AdvanceUI fields for the Work activity to be assigned, click the button for the 'AdvanceUI Fields' property to open the property window.
2. In this window, select the type of work activity – Role Based or General – using the **Role Based View** or **General View** radio buttons. Click the **Next** button to go to the next window to add the activity details.
3. If you select General View, you will open the Action Outputs setting window for the General View.
4. Specify the Advance UI XML configuration file in the **File Name** field and the GroupUI HTML Template file in theGroupUI File Name field at the top of this window.
5. After specifying these values click on one of the radio buttons to view the corresponding parameter window. The Activity Output radio button is selected by default and the corresponding controls are displayed in the lower half of the window.
6. Map the outputs of the activity with the possible outputs and specify whether the output is a task completion maker using these parameters. Click Save Action Outputs to save the settings.
7. Click Template Placeholders to open the corresponding window.
8. In this window, specify the values to assign to the template placeholders by selecting from the value type and value drop downs. Click Save Template Placeholders to save the settings.
9. Click the Output Variables radio buttons to display the corresponding parameters. Specify the output variable and the HTML element mapped to it here. Click Save Output Variables to save the settings.
10. If you select Role Based View in step 2, add a new role using the fields in the Role Definition window that is displayed. Click Define Filter to open the parameters to define the participant filter for the role. This needs to be done only for the first instance when the Work activity is being used. Click Next to go to the next step.
11. Select the role for which the view is being configured from the Role drop down.
12. Configure the parameters as described in steps 4 through 10 for the selected role.

See Work - AdvanceUI Fields for a detailed description of the AdvanceUI Fields property window.

Work Item Fields - This property is used to add the Work Item Fields to be used to display application data as well as value in variables and content in the Work Item List when this action is executed.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Work Item Fields property

1. To select the Work Item Fields, click the button for the 'Work Item Fields' property to open the property window.
2. In this window, the Work Item Fields that have been set are listed in a grid. Click a row to select the corresponding Work Item Field.
3. Right-click the row, and select "SetWorkItemField" from the context menu to set it.

See Work - Work Item Fields for a detailed description of the Work Item Fields property window.

Actors

The properties in the Actors group have been described below. You can use these properties to specify the actors who will work on the activity and related properties.

Assign Actor(s) - This property specifies the actor(s) who has to take up the Work activity. It is tagged with the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Ignore Unavailable Actors property which in turn is tagged with Alternate Actor Allowed. This will be explained in detail later.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any resource(s).)

Steps to set the Assign Actor(s) property

1. To specify the actors, click the button for the 'Assign Actor(s)' property to open the property window.
2. In this window, build an expression to select the actors using the actors properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.

   Add the condition to the expression by clicking Add. This will display the expression to the text area.

   You can remove a condition already added to the expression by clicking Undo.

   You can also clear an existing expression if necessary by clicking Clear. This is useful if you want to clear large expressions in the text area in order to build a new expression.

   After building the expression, click Update to save it.

   See Work - Assign Actor(s) for a detailed description of the Assign Actor(s) property window.

See the *Using XML Variables* section in the About XML Variables topic for details on how to use the XMLVariables to build the expression.

Assign Queue(s) - This property specifies the queue(s) to which the Task activity is to be assigned.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any Queue(s).)

Steps to set the Assign Queue(s) property

1. To specify the queue(s), click the button for the 'Assign Queue(s)' property to open the property window.
2. In this window, select the queue(s) from the Available Queues list box. You can select multiple queues by selecting with the
3. After selecting the required queue(s) click the [>] button to move it to the Selected Queues list box. You can click the [>>] button to select all the queue(s) and move them to the Selected Queues list box.
4. You can remove any queue from the selected list by selecting it and clicking the [<] button. You can remove all the queues by clicking the [<<] button. After adding the required queue(s), click Assign to assign the activity to the selection.
5. Click Close to close the window without saving the selection.

See Work - Assign Queue(s) for a detailed description of the Assign Queue(s) property window.

Min. Ownerships [% or Number] - This property, which can be specified as a number or percentage, is the minimum number of actors who should take ownership of the Work assignment. This property is related to the 'Timeout warning for Ownership' and 'Timeout for Ownership' properties. To illustrate, when 'Timeout for Ownership' is reached, the activity first checks if the ownership count is less than Min.Ownerships (if it is set). If it is, the work item will be removed from all Work Item lists. If the 'Min.Ownerships' has already been satisfied, then the work item will be removed from the Work Item lists of those who have not taken ownership. If the Min.Ownerships value is 0, then the activity checks if the ownership count is less than Max.Ownerships (if it is set). If it is, the work item will be removed from all Work Item lists. Else the work item will be removed from the Work Item lists of those who have not taken ownership. If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

removed from all Work Item lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)
Max. Ownerships [% or Number] - This property, which can be specified as a number or percentage, is the maximum number of actors who should take ownership of the Work request. If 'Timeout for Ownership' is specified and achieved, and the 'Min.Ownerships' is also satisfied, then the activity waits for action from those who have taken ownership. If the Min.Ownerships value is set to 0, then it checks if the ownership count is less than

Max.Ownerships. If it is, the work item will be removed from all Work Item lists. Else the work item will be removed from the Work Item lists of those who have not taken ownership. If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work Item lists. Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Property Type: Optional (This property needs to be set only if necessary.)

Enable Take Ownership? - If this property is set to Yes, then the actor is provided with a Take Ownership option in the Work items list to take ownership of the task. If you do not not required the Take Ownership option in the Work items list, then set this property as No.

Property Type: Optional (This property needs to be set only if necessary.)

Note: By default, this property is set as Yes.

Steps to set the Enable Take Ownership? property

1. Select Yes or No from the Enable Take Ownership? drop-down list.

Re-Assign Allowed? - If this property is set then the actor is provided with a Re-Assign option. Using this the actor can forward the work item to another actor.

Property Type: Optional (This property needs to be set only if necessary.)

Notification Contents - The properties in the Notification Contents group have been described below. You can use these properties to specify the content used to notify actors about the activity.

Subject - This is the subject of the Work assignment. The subject can be customized for each actor.

Property Type: Optional (This property need not be set. If it is not set, the default subject line from the Actions.xml file is displayed.)

Steps to set the Subject property

1. To specify the subject, click the button for the 'Subject' property to open the property window.
2. In this window, enter the subject text directly in the text editor. If you want to customize the subject you can do so using the Field controls to add resource property values. For example, to add a subject that includes the email id of the actor submitting the Task, you can do as follows: Type in the text "Submitted By". Select "Variable" and "Variable.SubmittedBy.Email" from the two drop downs for Field and click Append. This will add the placeholder for the variable after the text entered in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the email id.
3. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
4. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
5. After adding the subject, click Update to save it.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Click Close to close the window without saving the subject.

See Work - Subject for a detailed description of the Subject property window.

Body - This is the actual message of the Work sent to the actors. The message body can be customized for each actor. There is an Enterprise Console Explorer(plug-in) icon in the Body property window to get the Work item details URL. See Enterprise Console Control (EC Plug-in) for more information.

Property Type: Optional (This property need not be set.)

Steps to set the Body property

1. To specify the message body, click the button for the 'Body' property to open the property window.
2. In this window, enter the body text directly in the text editor.
3. If you want to customize the body you can do so using the Field controls to add resource property values. For example, to add a body that includes the name of the actor submitting the Task, you can do as follows: Type in the text "Hi, Please act on the task assigned to you by". Next select "Variable" and "Variable.SubmittedBy.name" from the two drop downs for Field and click Append. This will add the placeholder for the variable after the text entered in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the name.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the body, click Update to save it.
7. Click Close to close the window without saving the body.

See Work - Body for a detailed description of the Body property window.

From Email Address? - This property is used to specify the email address from which notification messages will be sent for the activity.

Property Type: Optional (This property needs to be set only if necessary. If it is not set, the default value in Activities.xml will be used.)

Hide Responses? - If this property is set to 'No', then actors can see the responses of other actors in a group Work scenario. To view these responses i.e., ownerships, Works or rejections, select the 'Take Ownership' button. This will open a new pop up with the responses of other actors who have taken ownership.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Priority - This property is set to indicate the priority of the Work assignment. Enter the values 0-33 to set as Low, 34-66 for Medium, or 67-99 for High. The default value is set to 34.

Property Type: Optional (This property needs to be set only if necessary.)

Send Notification Email - If this property is set to 'Yes', then notification emails will be sent to the actors. If it is set to 'Yes-HTML', then the emails will be sent in HTML format.

Property Type: Optional (This property needs to be set only if necessary.)

Notify if alternate actor is considered - If this property is set to 'Yes', then notification emails will be sent to the actors when an alternate actor is considered.

Property Type: Optional (This property needs to be set only if necessary.)

Redirect URL - This property is used to get the URL of the web page to redirect the client to, in the case of

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

synchronous execution of the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Redirect URL property

1. To specify the Redirect URL, click the button for the 'Redirect URL' property to open the property window.
2. In this window, enter the Redirect URL directly in the text editor.
3. If you want to customize the Redirect URL you can do so using the Field controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for Field, and clicking Append. This will add the placeholder for the variable in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the URL.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Redirect URL, click Update to save it.
7. Click Close to close the window without saving the Redirect URL.

See Work - Redirect URL for a detailed description of the Redirect URL property window.

Custom Document View URL - This property is used to get the URL of the page to which the custom document dlls does a post. The data posted to the page are application, workflow, executionid, executiondetailsid, and workitemid. The posted data can be retrieved as Request.Form["workitemid"].

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Custom Document View URL property

1. To specify the Custom Document View URL, click the button for the 'Custom Document View URL' property to open the property window.
2. In this window enter the Custom Document View URL directly in the text editor.
3. If you want to customize the Custom Document View URL you can do so using the Field controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for Field, and clicking Append. This will add the placeholder for the variable in the text editor. At run-time, this placeholder will be replaced by the corresponding value, i.e. the URL. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
4. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
5. After adding the Custom Document View URL, click Update to save it.
6. Click Close to close the window without saving the Custom Document View URL.

See Work - Custom Document View URL for a detailed description of the Custom Document View URL property window.

Decision Influencers

The properties in the Decision Influencers group have been described below. You can use these properties to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

specify some parameters that influence the outcome of the activity.

Max Actors Required for WorkAssignment Completion [% or Number] - This property is used to check what percentage or number of actors should take an action for Work. Decision on the Work is taken only after the specified number or percentage of resource(s) have taken the action. The activity waits for the actors' action until the 'Timeout for action' is reached.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Min Actors Required for WorkAssignment Completion [% or Number] - This property specifies the minimum number of actors to act on the Work before the 'Timeout Warning for Action'. If the action limit is reached before the 'Timeout Warning for Action' then the warning message is not shown.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Ignore Unavailable Actors? - If this property is set to 'No', when the Work activity is assigned to the actors list a check is first done to see whether the actor is available. If the actor is not available then a check is made for an alternate actor assigned to the unavailable actor. Simultaneously, the value of the property 'Alternate Actor Allowed' is checked. If that is also set, then the Work is assigned to this actor.

Property Type: Optional (This property needs to be set only if necessary.)

Alternate Actor Allowed? - This property is set to assign a particular Work to an alternate actor in the absence or unavailability of any actor.

Property Type: Optional (This property needs to be set only if necessary.)

Escalation & Timeout

The properties in the Escalation & Timeout group have been described below. You can use these properties to specify escalation and timeout settings for the activity.

Set Calendar for Timeout - This property is used to specify the calendar to be used to determine activity timeouts.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to Set Calendar for Timeout

1. To specify the calendar for timeout, click the button for the 'Set Calendar for Timeout' property to open the property window.
2. In this window select the required calendar by clicking on the calendar name in the tree structure.
3. Click Set Calendar to set the selected calendar.
4. You can specify that a resource calendar should be used, if available, by clicking to select the corresponding check box.

See Work - Set Calendar for Timeout for a detailed description of the Set Calendar for Timeout property window.

Minimum available time for Activity - This property is used to check the availability of an actor to whom a task must be assigned while executing the activity. The availability check for the actor is done based on the Calendar settings (Global or Resource Calendar). If the time taken to complete the task is within the value set for the **Minimum available time for Activity** property, then the task will be assigned to that actor. However, if the time taken to complete the task exceeds the value set for the **Minimum available time for Activity** property, then the task will be assigned based on the values set for the **Ignore Unavailable Actors?** and **Alternate Actor Allowed?** properties.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Timeout Warning for Ownerships - This property specifies the time at which a warning is provided to a actors to take ownership of the work item assigned to him/her. If the actors do not take ownership within this time the engine is notified with a warning. Thus if 'Min.Ownerships' is set, and it is not satisfied before the given time then a warning is sent. If Min.Ownerships is 0, it will check for Max.Ownerships. If the ownership count does not reach the Max.Ownerships value within the set time, a warning is sent. If both Min.Ownerships and Max.Ownerships are not set, this property is ignored.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout for Ownerships - This property specifies the time until which actors are allowed to take ownership, i.e. the time until which the Work activity will wait for actors to take ownership. If Min.Ownerships is set and is not reached, the work item is removed from all work item lists. If Min.Ownerships is 0, it will check if ownership count is less than Max.Ownerships. If it is, the work item is removed from all work item lists. Else the work item will be removed from the work item lists of those who have taken ownership. The work item will remain in the work item list of those who have taken ownership and wait for action from them.

Property Type: Optional (This property needs to be set only if necessary.)

Understand how Ownership Properties relate to each other:

- Work activity is assigned to the actors in the Work assignment list by the workflow engine. Work activity has a default property set that at least one actor has to make a Take Ownership of the activity.
- A drop down interface has been provided for the actor to Take Ownership. However, the actor can act on the Work without taking ownership first, in which case ownership will be considered to be done, i.e. if the actor acts upon the Work activity without taking ownership, then it is considered as an ownership with action taken.
- After the actor has taken ownership, a link is provided to the actor, which opens a pop up with the details of the other actors. This is again tagged with the 'Hide Responses?' property. The link will be provided only If 'Hide Responses?' is set as 'No'. The pop up will have details like Actor name, Ownership Status, Action taken, Comments.
- If the 'Min.Ownerships' property is set and the Ownership count has reached the set limit [percentage or number] then the 'Timeout Warning For Ownership' property is not considered.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] and the 'Time Out For Ownership' is also reached then the work item is removed from other approvers' work item lists and the work item waits for action from those who have taken ownership.
- If the 'Min.Ownerships' limit is not reached for the Work action, and the 'Timeout Warning For Ownership' has been exceeded then the actor is notified with a warning by including an email or an information activity, with the Timeout Warning for Ownership link to it.
- If 'Timeout For Ownerships' is set, if the Work activity has not reached the minimum limit (Min.Ownerships) and the 'Time Out For Ownerships' has been reached, then the work item is removed from the work item lists of all the actors.
- If 'Min.Ownerships' = 0 and if 'Max.Ownerships' is set, the activity waits for actors to take ownership or action until the 'Time Out For Ownership' is reached (if this is set).
- If none of the Ownership properties are set then the activity waits until the actor takes ownership or acts upon it.
- Timeout Warning for Activity - This property specifies when a reminder has to be provided for the actors to act on the Work request, if the action count has not been reached. If properties such as Max.Ownerships, Affirmative Action for Work (AAA), and Action Limit (AL) are set, once the property values are reached then a warning is sent to the actor. When the timeout is reached, the following checks are made: If AL is set, when the action count i.e. the no. of Works or rejections (AC) < AL, then a warning is sent. If AL = 0 and AAA is set,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

and when AC < AAA, then a warning is sent to the participant.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Timeout for Activity - This property's value is used to decide until what time the activity should wait for the actors' action. If properties such as Max.Ownerships, AAA, AL are set, once the property values are reached the work item is removed from the work item lists of all the actors. When the timeout is reached, the following checks are made: If AL is set, when the action count i.e. the no. of Works or rejections (AC) < AL, then the timeout for action is performed and the work item is removed from all work item lists. If AC > AL, it checks with the no. of Works or 'decision count' (DC) and AAA. If DC >= AAA (if it is set), the activity is considered approved; otherwise, it is rejected. If AAA = 0 and if DC >= AL, the action is considered completed. If AL = 0 and AC < AAA, then the timeout for action is performed and the work item is removed from all work item lists. If AL = 0 and AC > AAA, it will check with DC. If DC > AAA it is completed. If AL = 0 and AAA = 0, then if DC is at least 1, then it is considered completed.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Multiple TimeOut Warning - This is used to set recurring timeout warnings that will be sent to the actors who have to take action. To set multiple timeout warnings, click the 'Multiple TimeOut Warning' button in the Properties pane for the Work activity. A new window pops up. In this window, set the interval for the recurring warning as well as the output message. You can also set the Recurring Time Interval. This can be used to set a different recurring time out after the first timeout happens. For example, if 'Time Interval' for the property is set as 7 days and 'Recurring Time Interval' is set as 2 days, then the first time out will happen after 7 days and there will be a recurring time out every second day after the seventh day (first) time out.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Steps to set the Multiple Timeout Warning property

1. To set the multiple timeout warning, click the button for the 'Multiple Timeout Warning' property to open the property window.
2. Enter the time interval for the timeout in the Time Interval field.
3. Select "Yes" from the drop down for the Recurring? field if you want the timeout warning to recur. Select "No" otherwise.
4. Enter the output message corresponding to the timeout warning in the Output field.
5. Enter the time interval for the recurring timeout in the Recurring Time Interval field.
6. After entering the content details, click Add Row to add this timeout setting and display a new row for entering another timeout setting.
7. Remove rows if necessary by selecting them and clicking Remove Selected.
8. After specifying the timeout settings, click Update.

See Work - Multiple Timeout Warning for a detailed description of the Multiple TimeOut Warning property window.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity. Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Miscellaneous

Redirection Enabled? - This property enables redirection. When this property is set to Yes, the workflow

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

redirects the user to the URL in the Redirect URL property in the next activity.

Activity outputs: The Work Activity returns the following values -

Action Completed: Displayed when all the actors have taken part.

Action Completed Affirmative Percentage Not Reached: Displayed when all the actors have not taken part.

Not Enough Resources to Take Acknowledge: Displayed when the filter condition did not yield enough actors to whom the request can be sent.

Timeout - Take Acknowledge: Displayed when the specified minimum number of actors did not take ownership of the request in the given time.

Timeout - Action: Displayed when some or all of the specified actors did not perform the required action in the given time.

Timeout Warning - Take Acknowledge: Displayed when a warning is generated that the specified minimum actors have not taken ownership of the request in the given time.

Timeout Warning - Action: Displayed when a warning for timeout is generated because some or all the actors did not perform the required action in the given time.

Note: The following outputs will return only if user assigned tasks to a queue user.

Resource Unavailable for Queue - If a queue is assigned to a task & if there are no resources available in the queue then this output will get triggered.

TimeOut for Queue Task - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting the completion of that task.

Timeout Warning -Queue - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting in sending a warning out put. However, the task will still be sleeping.

Timeout Warning -Queue Participant - This output will get triggered when the task in the queue is picked by user but still not acted on that task within the queue escalation time out settings resulting in triggering a warning output. However, the task will still be sleeping.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Work - Delivery Channel

Purpose

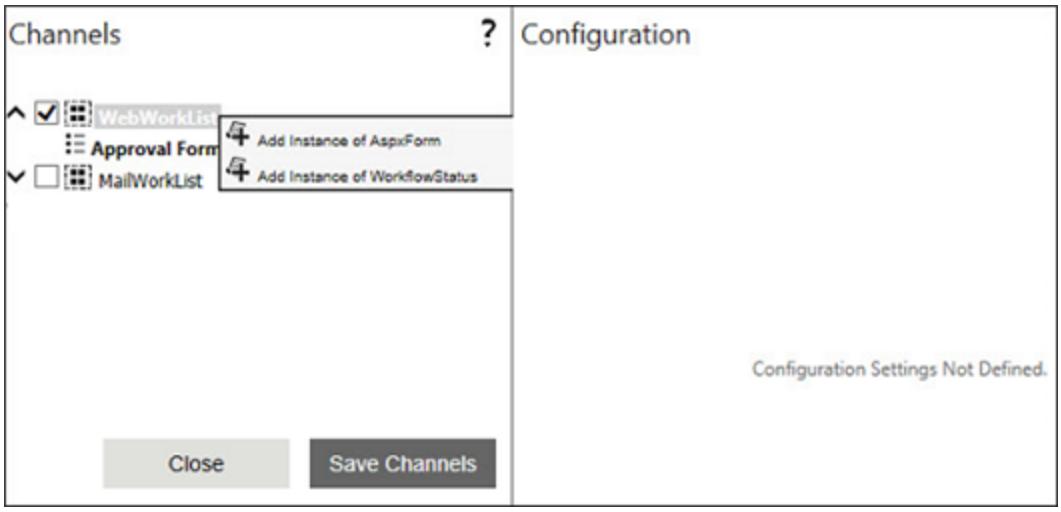
The purpose of this chapter is to describe the feature of WorkflowStatus Form of Delivery Channels property under the category Configuration of any human activity available in AVEVA Work Tasks.

Description: This feature enables us to view the status of the workflow in the work item list in the graphical form.[Optional]

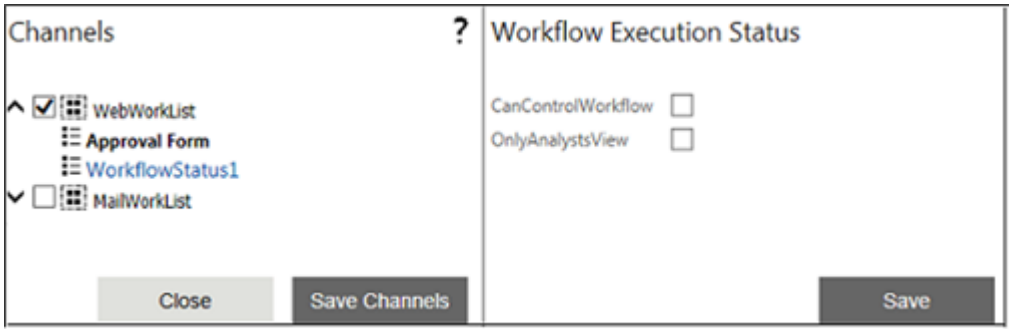
1. Select the Human Activity.
2. Click the **Delivery Channels** Property.

   This will open a window like the one shown below.

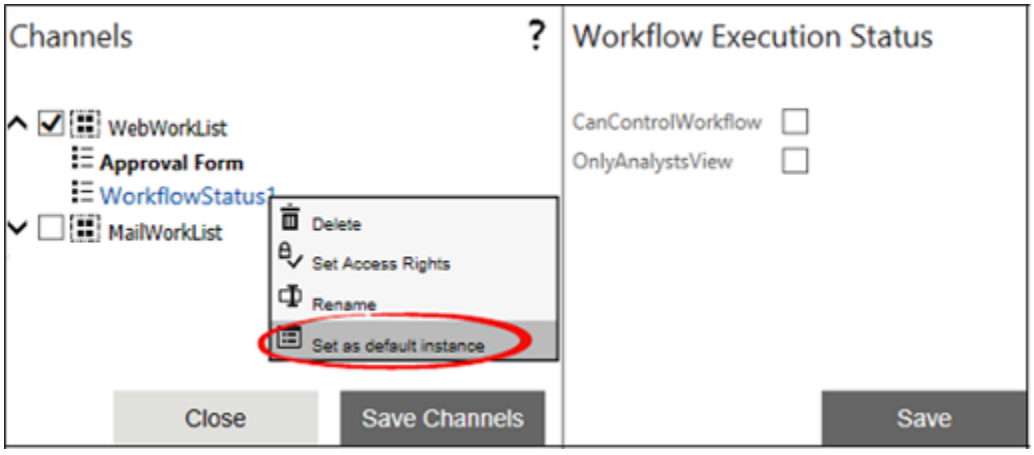
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Right-click **WebWorkList** to display the context menu with the **Add Instance of Workflowstatus** option as shown below.



4. Set the Properties for the Execution View Status Graphical view.
5. Click **Save**.
6. If you want to set the WorkflowStatus form as the default instance, right-click **WorkflowStatus1**, and select the **Set as default instance** option from the context menu.



7. Click the **Save** and **Save Channels** buttons.

Output

Now, when you click any row in the Work items list, you will find this Execution view page being displayed as the detailed view if you set it as a default instance.

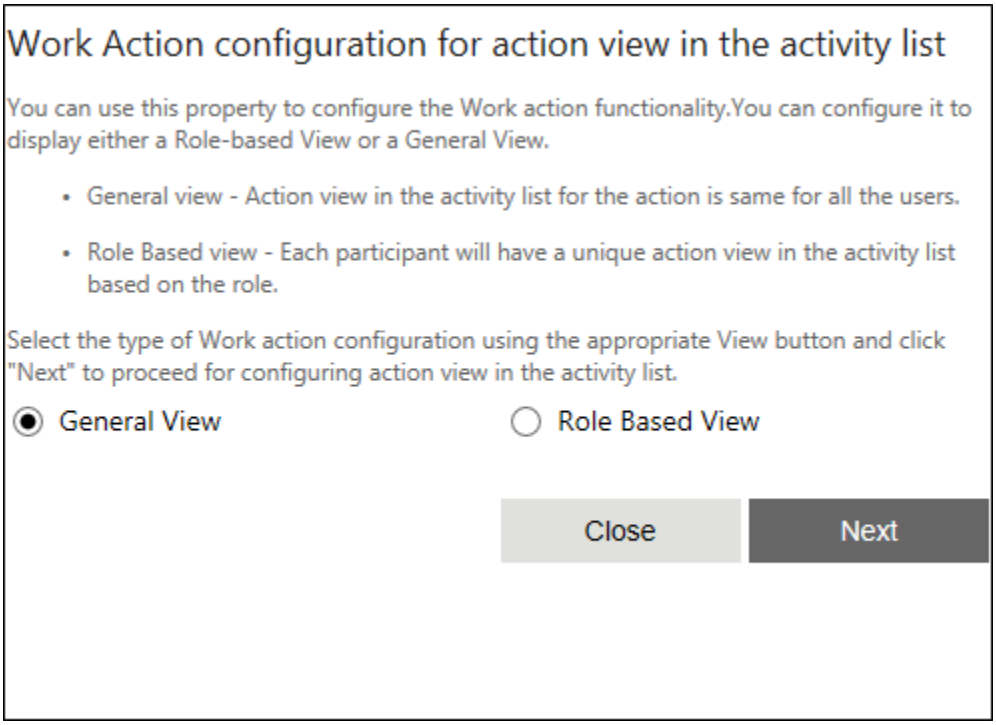
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Otherwise, the workflow status form will appear in the context menu of each row in the Work items list and you can open the execution view by selecting it from the context menu.

Work - AdvanceUI Fields

AdvanceUI Fields Property window

You can launch the user-interface to configure the functionality of the Work activity from this property window. To open this window, click the button for the 'AdvanceUI Fields' property.



You can select the type of work activity view to configure – General or Role Based – using the two radio buttons in this window.

- General View
- Role Based View

You can click **Next** to go to the next window for adding the activity details. This will vary depending on the type of view selected.

Configuration for General View

The window shown below is opened when you click the General View radio button in the previous window. It is used to specify the action outputs for the Work activity with the General View. This window has two fields common to the General View, which are displayed at the top of all the corresponding property windows.

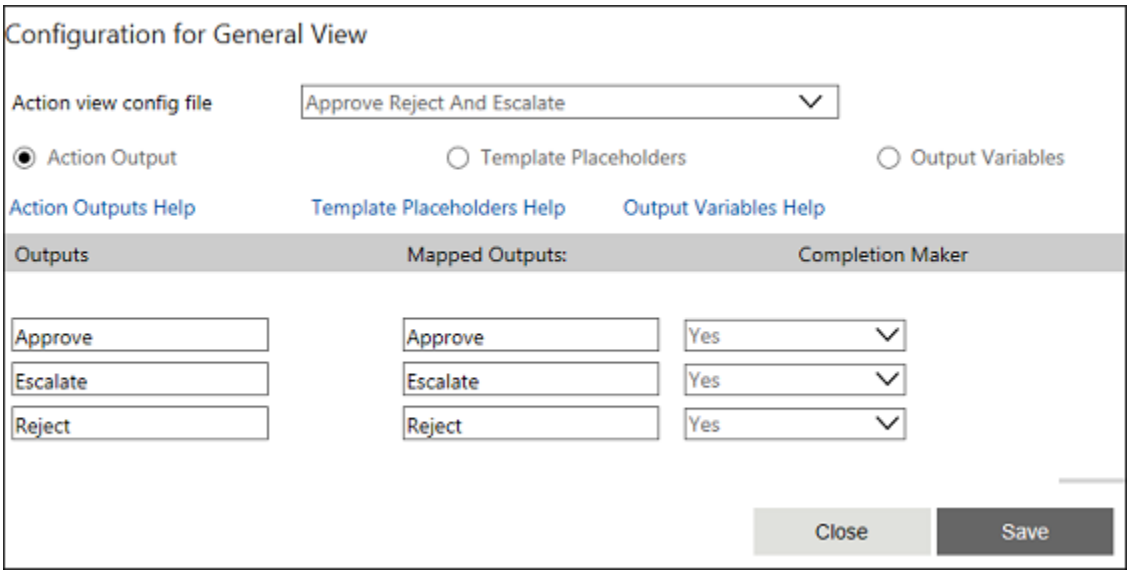
- **Action view config file**

You can specify the Advance UI XML configuration file in this field.

There are three radio buttons – **Action Outputs**, **Template PlaceHolders**, and **Output Variables** – that can be selected to display the respective property setting controls in the lower half of the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The window shown below is displayed when the Activity Output is selected. It can be used to map the outputs of the activity with the possible outputs and specify whether the output is a task completion maker.

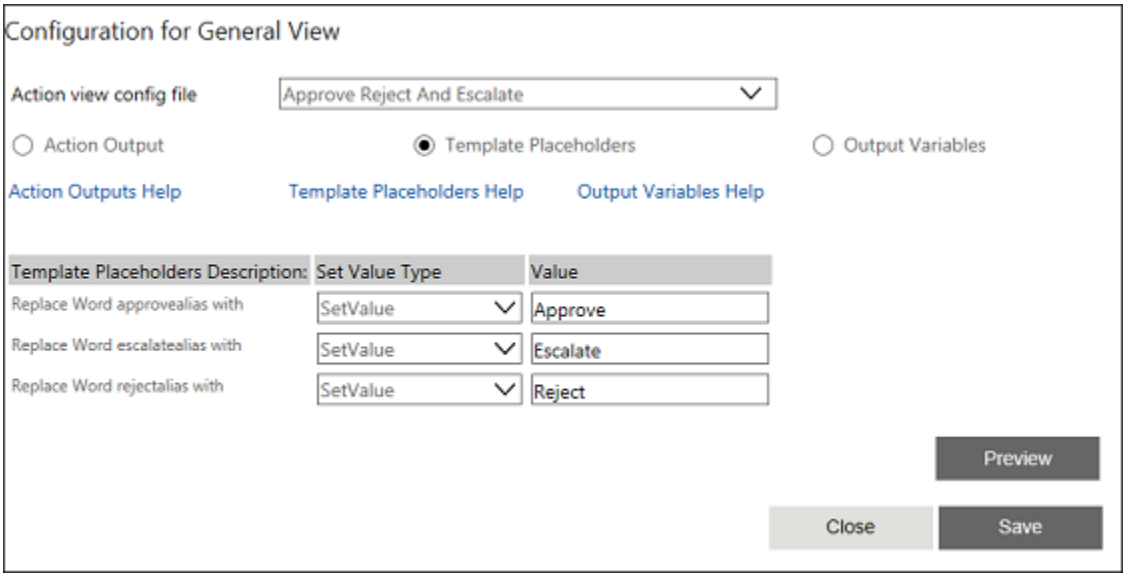


You can set the following parameters here.

- **Outputs** - This shows the output of the activity.
- **Mapped Outputs** - You can specify the outputs to map to here.
- **Completion Maker** - You can select "Yes" from this drop down to indicate that the corresponding output will mark the completion of the activity.

You can click **Save Action Outputs** to save the new settings.

The window shown below is displayed when you select the **Template Placeholders** radio button. You can specify the values to the template placeholders in the Work activity here.



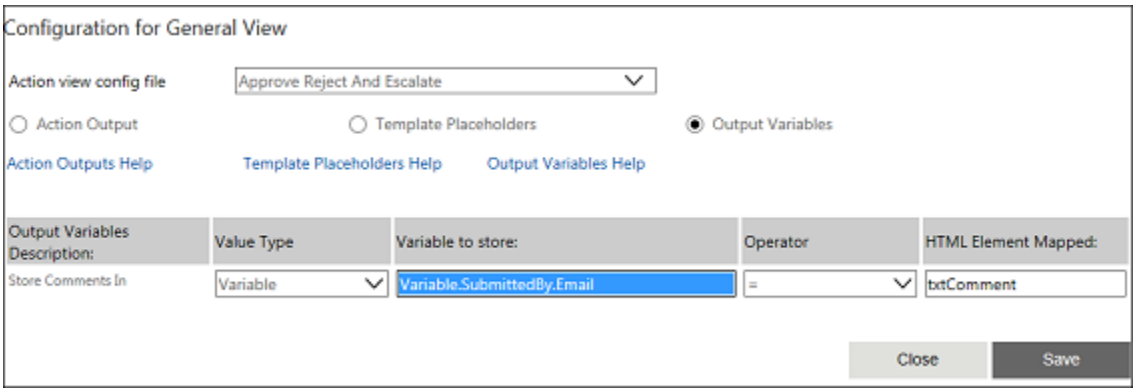
The window lists all the template placeholders configured for the activity under the Template Placeholders Description column. You can specify the value for each placeholder using the following controls.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **The Value type drop down** - You can select the type of value to assign from the options in this drop down. You can set a discrete value, variable or content here.
- **The Value text box/drop down** - You can specify the value here. If you selected "SetValue" in the previous drop down this control will be a text box. It will show a drop down otherwise, where you can select an appropriate variable or content collection.

You can click **Preview** to see a preview of the template setting. You can click Save Template Placeholders to save the settings.

The window shown below is displayed when you select the **Output Variables** radio button. You can specify the output variable and the HTML element mapped to it here



The window lists all the output variables for the activity under the Output Variables Desc column. You can specify the value for each placeholder using the following controls.

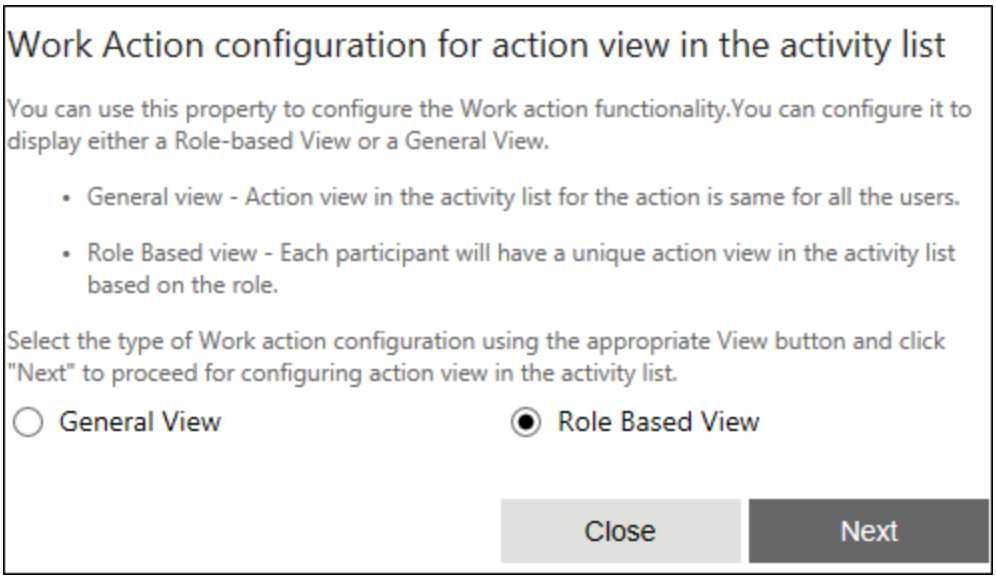
- **Value Type** - You can select the type of value to assign from the options in this drop down. You can set a variable or content here.
- **Variable to store** - You can specify the variable to store the output here. You can select an appropriate variable or content collection from this drop down.
- **Operator** - You can select an operator from this drop down.
- **HTML Element Mapped** - You can specify the HTML Element that is to be mapped to the output variable.

You can click **Save Output Variables** to save the settings.

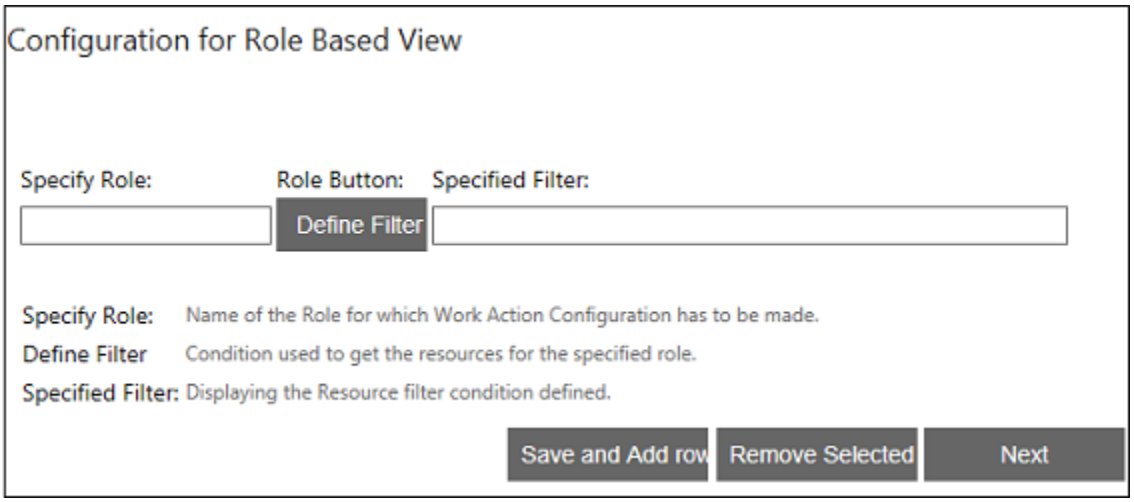
Configuration for Role Based View

The window shown below is opened when you click the **Role Based View** radio button in the main AdvanceUI Fields property window. It is used to define a role for the Work activity. It is displayed when you use the Work activity for the first time. This window has three columns in this window, which you can use to add roles.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



- **Specify Role** - You can specify the name of the new role in this field.
- **Role Button** - This column has the Define Filter button. You can click this button to open the filter definition button.
- **Specified Filter** - The field in this column displays the newly defined filter.

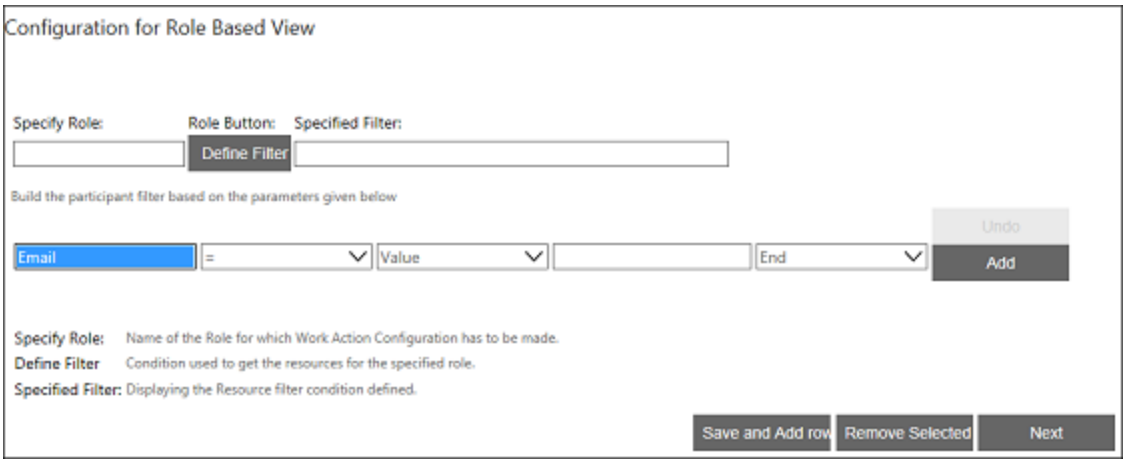


This window has three buttons.

- **Save and Add Row** - You can click this button to save the role defined in the current row and add another row to add a role.
- **Remove Selected** - You can select a row and remove it using this button.
- **Next** - You can click this button after adding the required roles for the Work activity to continue to the main window for the Role Based View.

The window shown below is displayed when you click the **Define Filter** button in the previous window. You can build a role filter condition for the new role here. The following image shows how to build a role filter condition

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a set of drop downs at the top to select the different parameters required to build an expression to define the filter. You can also find related buttons next to the drop downs.

- **The Attribute drop down** - You can select the attribute to be used to filter the participant, e.g., "AdministratorId", in this drop down.
- **The Operator drop down** - You can select the operator for the expression here. E.g., "="
- **The Value type drop down** - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- **The Value text box/drop down** - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down. If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- **The Logical operator drop down** - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the Specified Filter field in the previous window.
- **Undo** - You can click this button to remove a condition you have added to the expression.

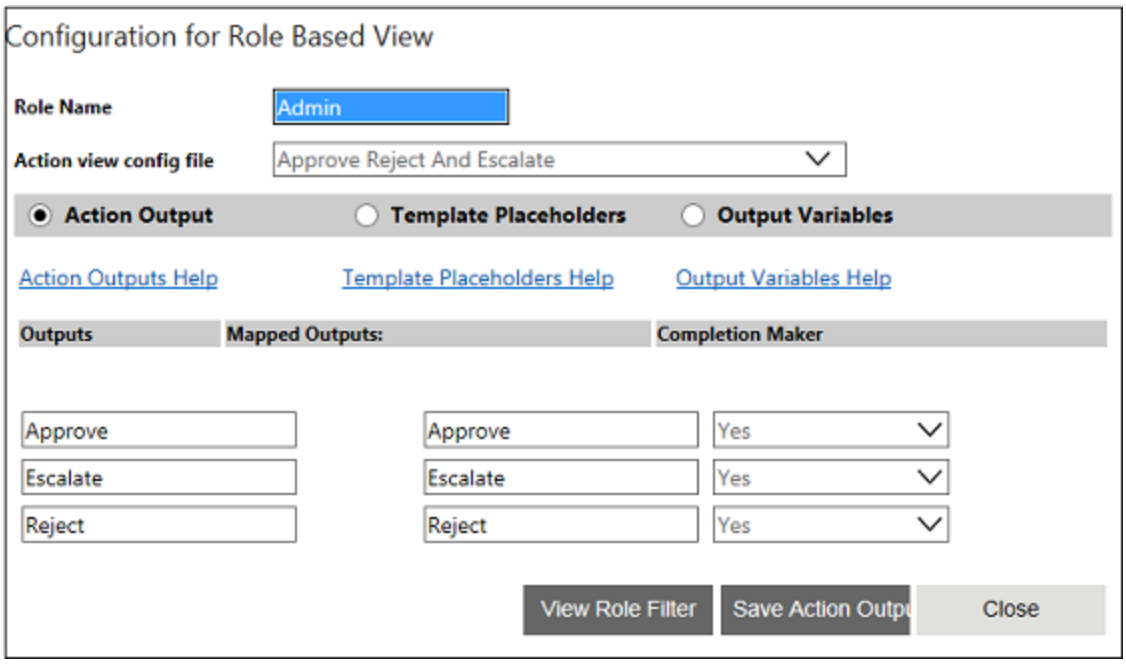
The window shown below is displayed when you click Next in the Role Definition window, if you are using the Work activity for the first time. If you are not using the activity for the first time this window will be opened when you select the Role Based View radio button in the ActivityUI property main window. You can specify the action outputs for the Work activity with the Role Based View. This window has two fields common to the General View, which are displayed at the top of all the corresponding property windows.

- **Role Name** - You can select the role for which the View you are configuring will be accessible from this drop down.
- **Action view config file Name** - You can specify the Advance UI XML configuration file in this field.

There are three radio buttons – **Action Outputs**, **Template Placeholders**, and **Output Variables** – that can be selected to display the respective property setting controls in the lower half of the window.

The window shown below is displayed when the Action Output is selected. It can be used to map the outputs of the activity with the possible outputs and specify whether the output is a task completion maker.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Action Output window for Role Based View

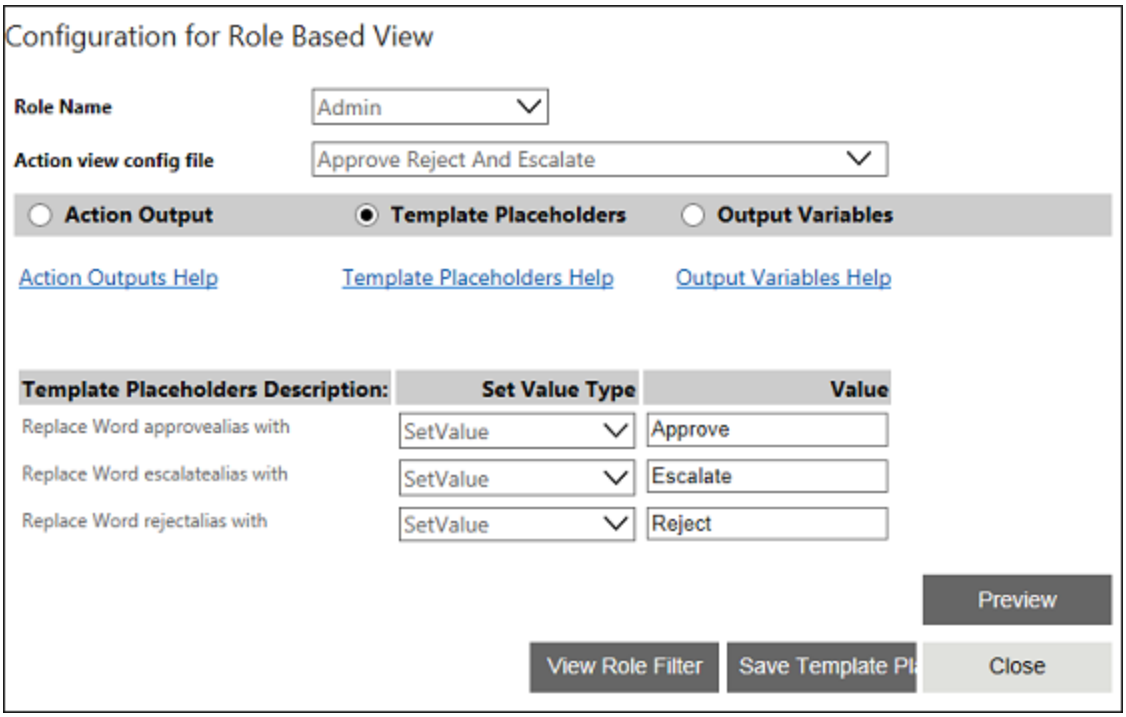
You can set the following parameters here.

- **Outputs** - This shows the output of the activity.
- **Mapped Outputs** - You can specify the outputs to map to here.
- **Completion Maker** - You can select "Yes" from this drop down to indicate that the corresponding output will mark the completion of the activity.

You can click the **Save Action Outputs** to save the new settings.

The window shown below is displayed when you select the Template Placeholders radio button. You can specify the values to the template placeholders in the Work activity here.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



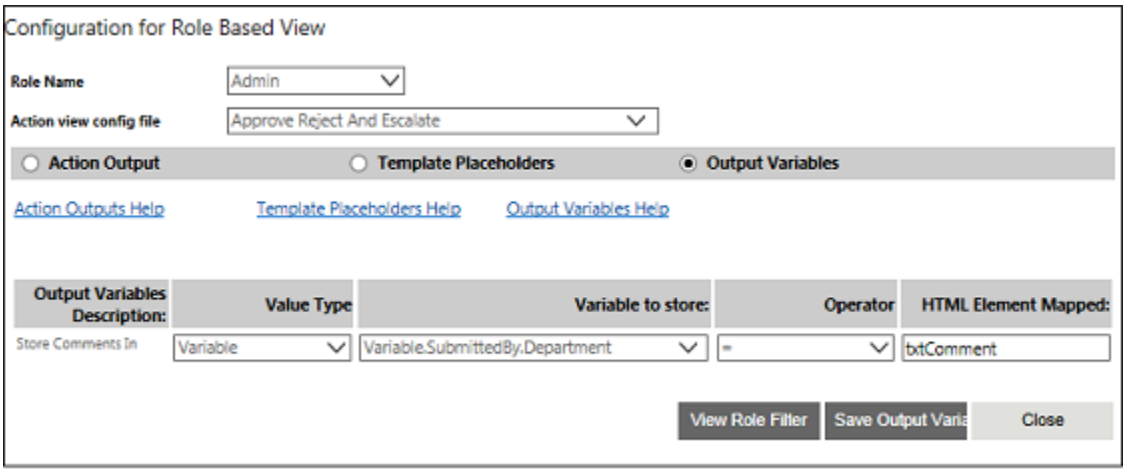
Template Placeholders window for Role Based View

The window lists all the template placeholders configured for the activity under the Template Placeholders Description column. You can specify the value for each placeholder using the following controls.

- **The Value type drop down** - You can select the type of value to assign from the options in this drop down. You can set a discrete value, variable or content here.
- **The Value text box/drop down** - You can specify the value here. If you selected "SetValue" in the previous drop down this control will be a text box. It will show a drop down otherwise, where you can select an appropriate variable or content collection.

You can click Preview to see a preview of the template setting. You can click Save Template Placeholders to save the settings.

The window shown below is displayed when you select the Output Variables radio button. You can specify the output variable and the HTML element mapped to it here.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Output Variables window for Role Based View

The window lists all the output variables for the activity under the Output Variables Desc column. You can specify the value for each placeholder using the following controls.

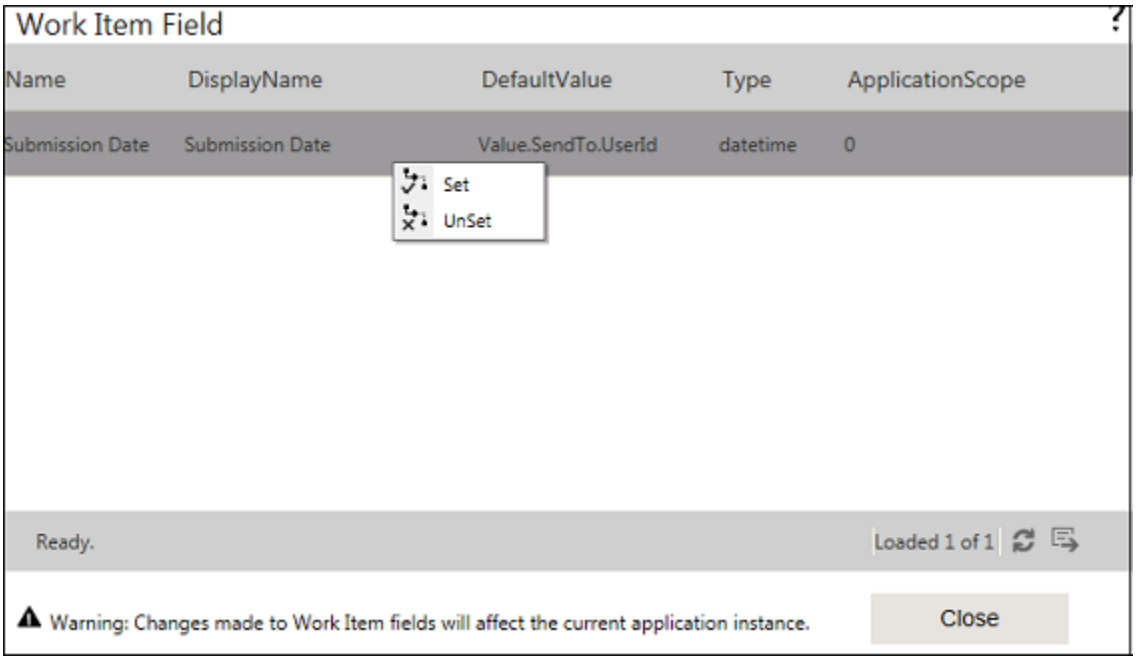
- **Value Type** - You can select the type of value to assign from the options in this drop down. You can set a variable or content here.
- **Variable to store** - You can specify the variable to store the output here. You can select an appropriate variable or content collection from this drop down.
- **Operator** - You can select an operator from this drop down.
- **HTML Element Mapped** - You can specify the HTML Element that is to be mapped to the output variable.

You can click the **Save Output Variables** to save the settings.

Work - Work Item Fields

Work Item Fields Property Window

You can set the Work Item Fields for this activity in this property window. To open this window, click the button for the 'Work Item Fields' property.



The window has a grid listing all the Work Item Fields that have been set for the process.

- Each row in the grid represents a Work Item Field. You can click a Work Item Field to select it.
- The context menu has the Set WorkItemField option, which you can use to set the selected Work Item Field for this activity. It also has the UnSet WorkItemField option to remove the Work Item Field setting.
- **Close** - You can use this button to close the window.

Note: While entering a value in the Work Item field, it is recommended to keep it less than the specified database column size. If there is a need to increase the size of the Work Item field, the user should manually

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

increase the column size in the database.

Work - Assign Actor(s)

Assign Actor(s) Property window

You can set the actors to whom the Work work item is to be sent in this property window. To open this window, click the button for the 'Assign Actor(s)' property.

See Assigning a Task to a Manager for more details.

The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

Different Methods of Assigning an Actor

- **Assigning an Actor by building an expression:**

Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

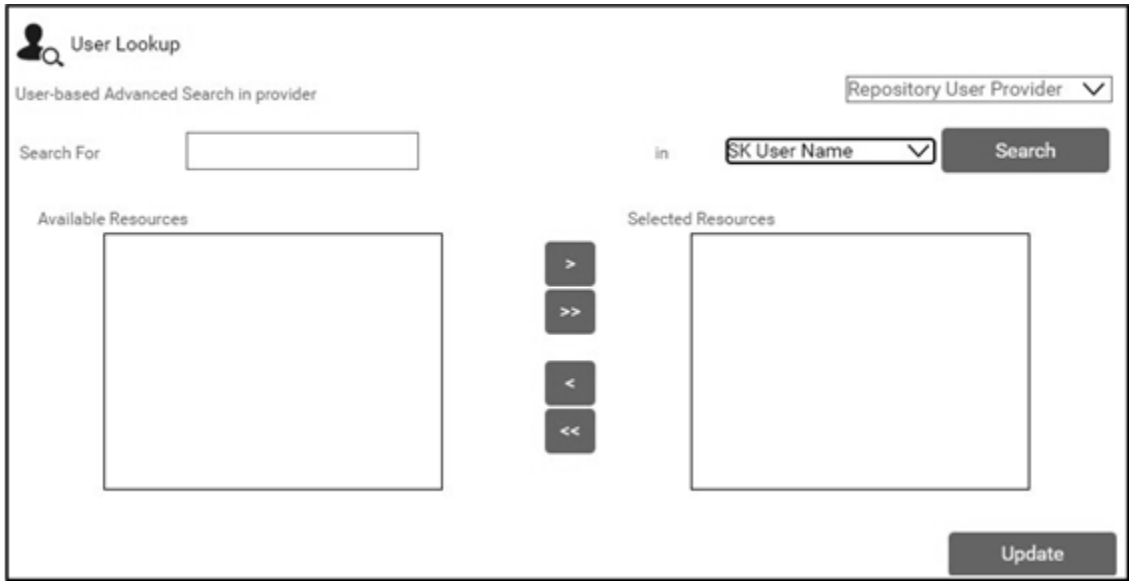
At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

- **Assigning an Actor through User Lookup**

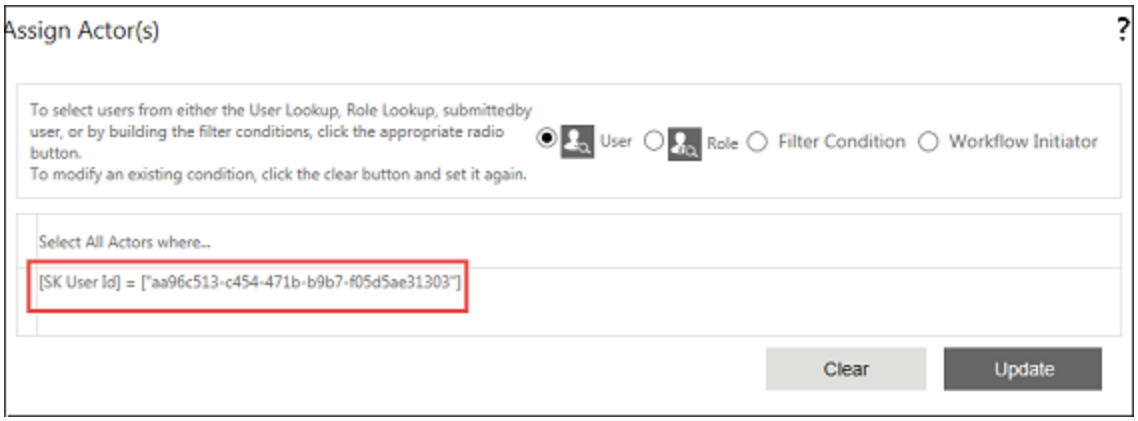
Through the User Lookup you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.
2. The **User Lookup** dialog is displayed, search and select the required actor.



3. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

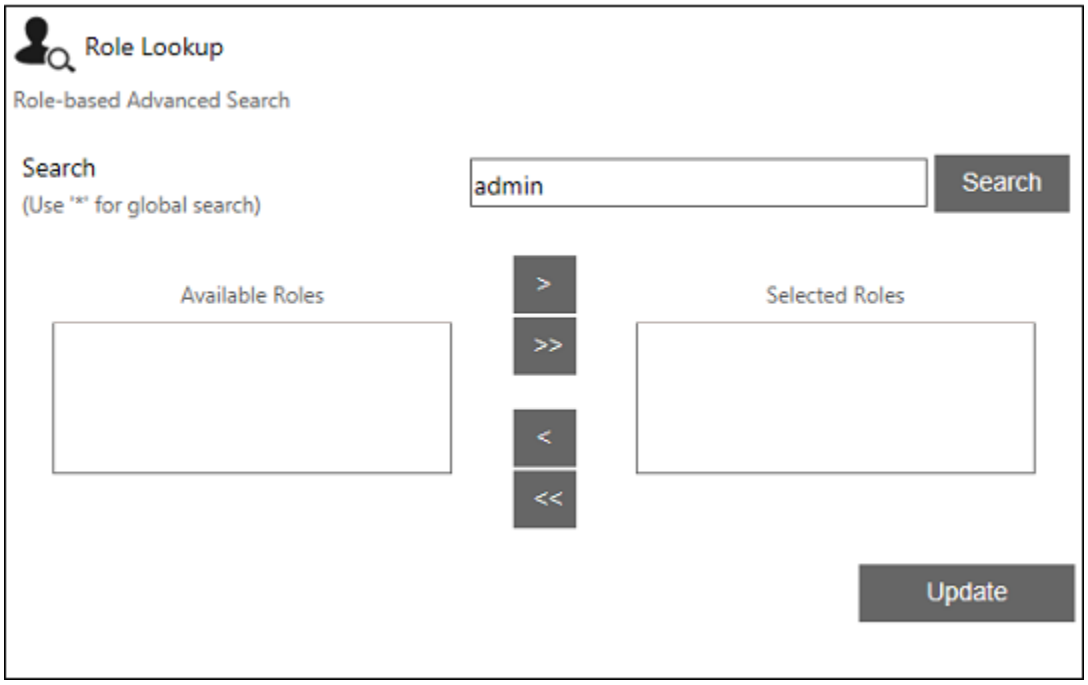


4. Click **Update** in the Assign Actor(s) window to update the selected actor(s) in the Assign Actor property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

- **Assigning an Actor through Role Lookup**

Through the Role Lookup you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

1. Select the **Role Lookup** option.
2. The **Role Lookup** dialog is displayed, search and select for the required role.



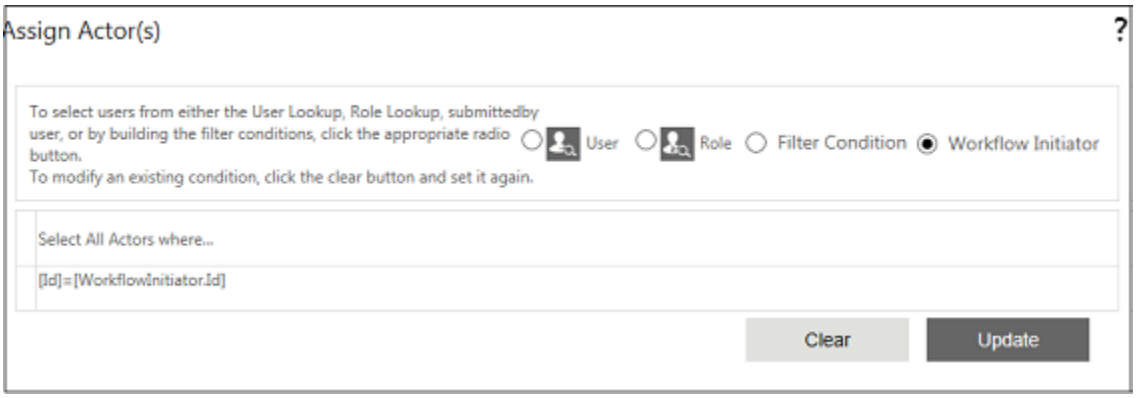
3. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click **Update** in the Assign Actor(s) window to update the **Assign Actor** property.

- **Assigning an Actor through Workflow Initiator**

Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

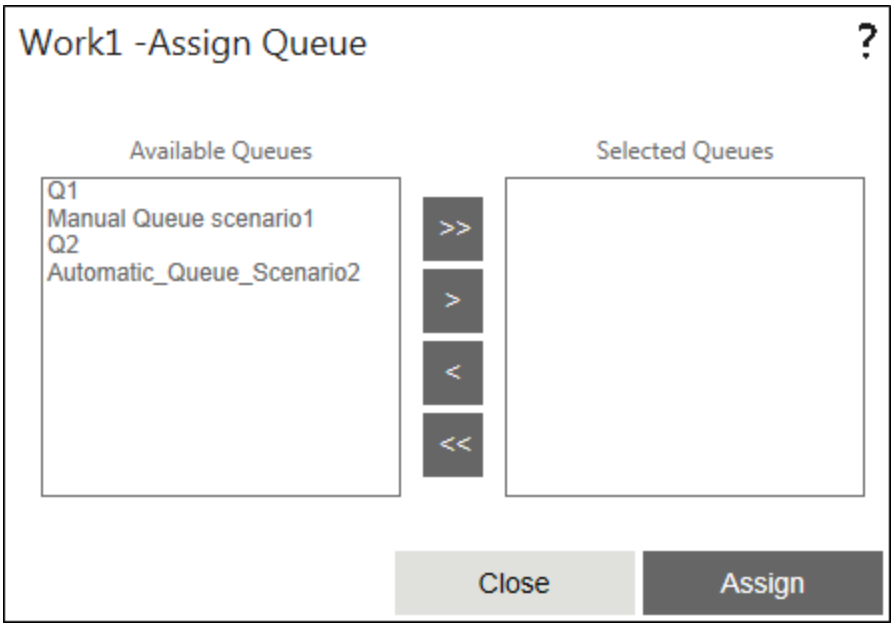


Work - Assign Queue(s)

Assign Queue(s) Property Window

You can select the queues to which the Work work item is to be sent in this property window. To open this window, click the button for the 'Assign Queue(s)' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Assign Queue(s) Properties window for Work

The window has a pair of list boxes to specify the queue(s). The **Available Queues** list shows all the available queues. You can select the required queue(s) from this list box. The **Selected Queues** list shows all the selected queues to which the activity will be assigned.

You can use the following buttons located between the list boxes to move the queues to and from the list boxes.

- [>>] - You can click this button to add all the queues in the Available Queues list to the Selected Queues list.
- [>] - You can click this button to add the selected queue(s) to the Selected Queues list.
- [<] - You can click this button to add the selected queue(s) from the Selected Queues list to the Available Queues list.
- [<<] - You can click this button to add all the queues in the Selected Queues list to the Available Queues list.

At the bottom of the window you will find the following buttons:

- **Assign** - You can click this button to assign the activity to the selected queues.
- **Close** - You can click this button to close this window.

Assigning queue system variable

To assign queues instead of setting the queue through **Assign Queue** property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the Start activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

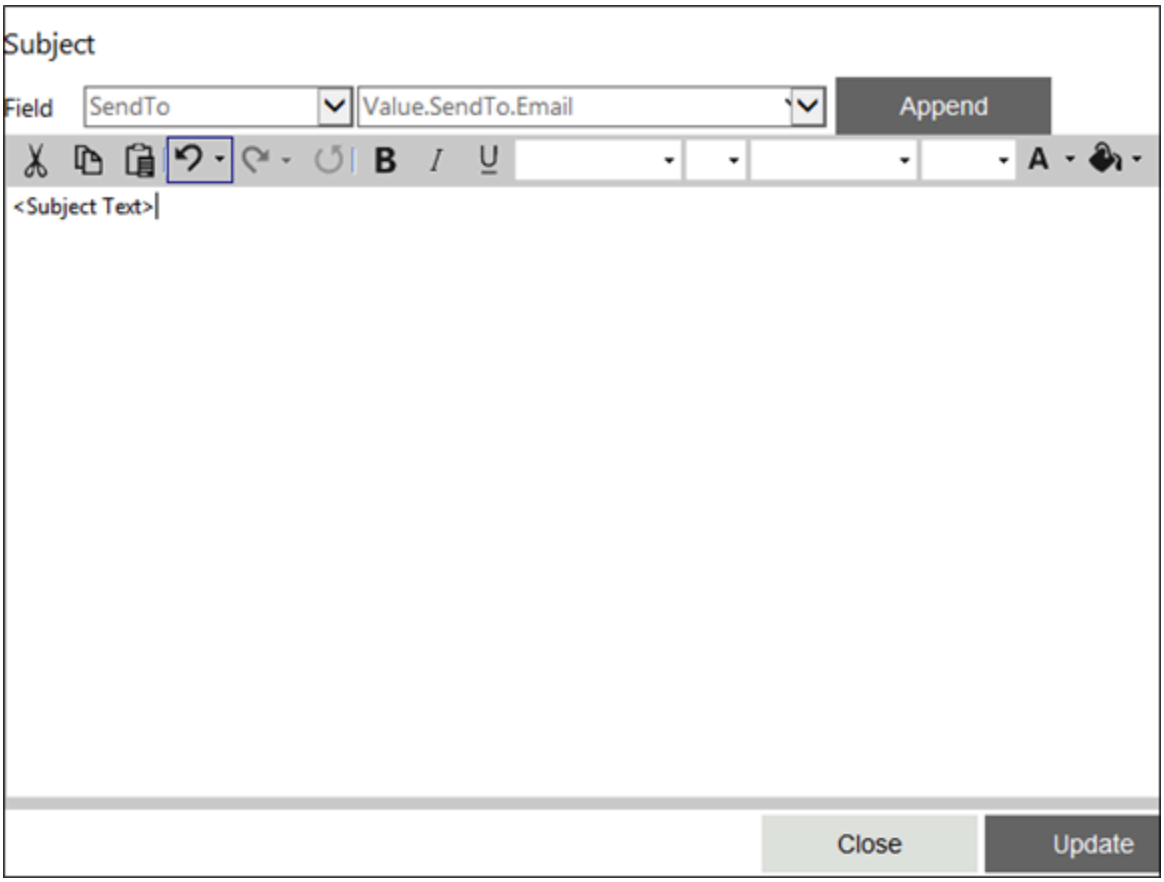
To assign multiple queues, specify the queue-ids with semicolon (;) separator. **Skelta.HWS.Queue.QueueCollection** class can be used to retrieve queue information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Work - Subject

Subject Property Window

You can specify a subject for the Task work item assignment in this property window. To open this window, click the button for the 'Subject' property.



The window has a text editor to enter the subject. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the subject. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the subject in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the subject.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the subject using a combination of discrete value and variable or content. For example, you can specify the subject as "Submitted By <%#Variable.SubmittedBy.Email%>". Here, the string "Submitted By" should be typed directly in the text editor. The second half of the subject is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the **Field** drop down and clicking **Append**.

The text tool bar above the text editor allows you to manage and format the subject. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

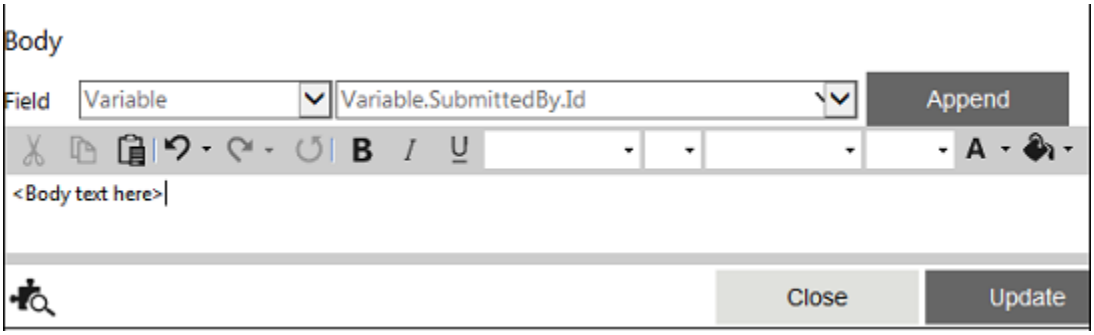
At the bottom of the window, you will find the following buttons:

- **Update** - You can click this button to save the subject.
- **Close** - You can click this button to close this window.

Work - Body

Body Property Window

You can specify a message Body for the Work work item assignment in this property window. To open this window, click the button for the 'Body' property.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The window has a text editor to enter the body text. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the body using a combination of discrete value and variable or content. For example, you can specify the body message as "Hi, Please cast your vote in the poll conducted by <%#Variable.SubmittedBy.name%>". Here, the string "Hi, Please cast your vote in the poll conducted by" must be typed directly in the text editor. The second half of the body is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the Field drop down and clicking Append.

The text tool bar above the text editor allows you to manage and format the body text. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window, you will find the following buttons:

- **Update** - You can click this button to save the body message.

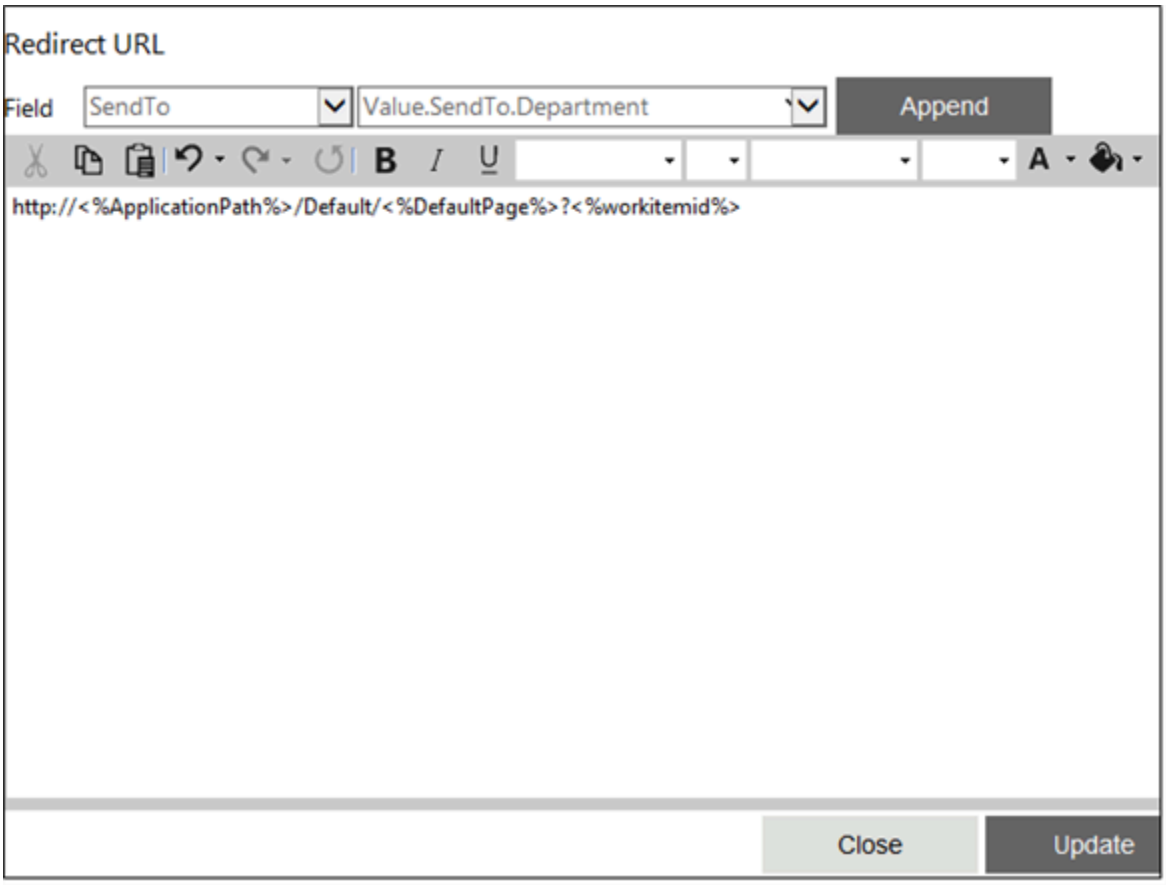
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Close** - You can click this button to close this window.

Work - Redirect URL

Redirect URL Property Window

You can specify a message Redirect URL for the Work activity in this property window. To open this window, click the button for the 'Redirect URL' property.



The window has a text editor to enter the Redirect URL. You can do this either by entering a URL directly in the text editor or by using the Field controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Redirect URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Redirect URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Redirect URL. It has the following

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the Redirect URL.
- **Close** - You can click this button to close this window.

To assign the URL of the web page, click the 'Redirect URL' button in the Properties pane for the Work activity. In the window that pops up, enter the URL. You can either type the URL in the text editor or specify it by selecting the variable or content that points to it and clicking the Append button. Click the Update button to save the URL.

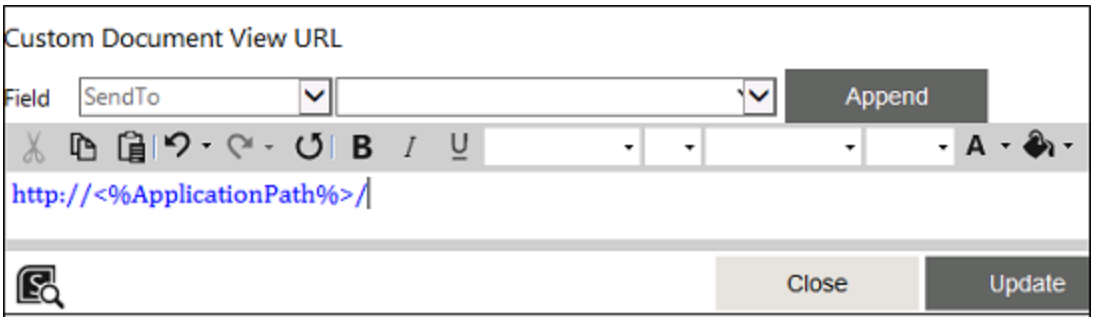
Work - Custom Document View URL

Custom Document View URL Property Window

You can specify a message Custom Document View URL for the Work activity in this property window. To open this window, click the button for the 'Custom Document View URL' property.

For more details, see Approval - Custom Document View URL

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the Custom Document View URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Custom Document View URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Custom Document View URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Custom Document View URL. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

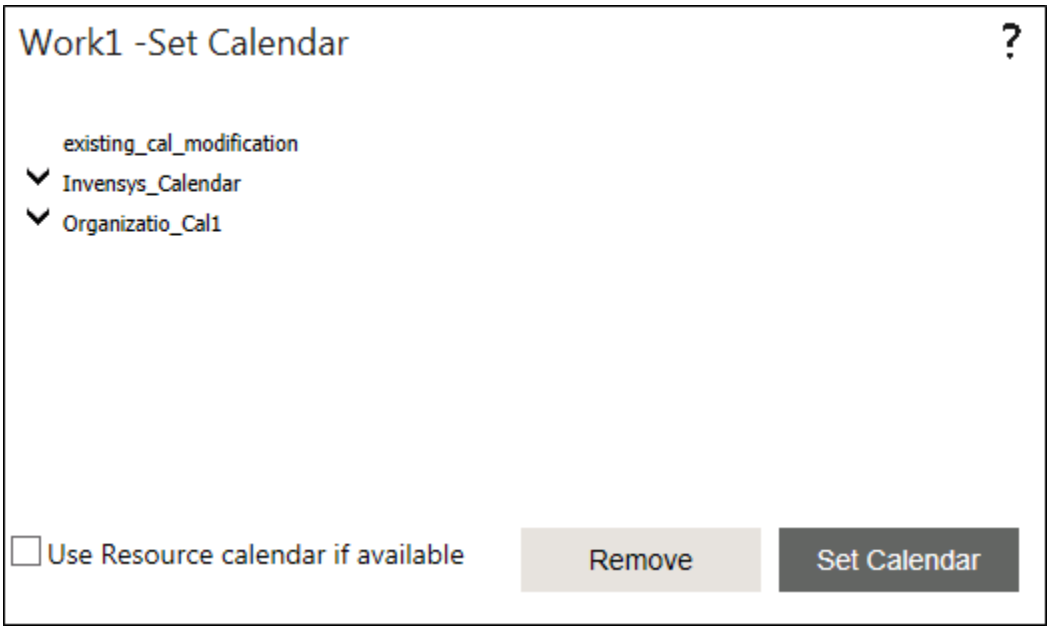
At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the Custom Document View URL.
- **Close** - You can click this button to close this window.

Work - Set Calendar for Timeout

Set Calendar for Timeout Property Window

You can set a Calendar to calculate the timeout for the Work activity in this property window. To open this window, click the button for the 'Set Calendar for Timeout' property.



Set Calendar for Timeout property window

This window lists the available calendars in a tree structure, with lower-level calendars nested within the respective top-level calendar. You can click on a calendar to select it for setting.

There are two buttons in this window.

- **No Calendar** - You can click this button to indicate that there is no calendar set for the activity.
- **Set Calendar** - You can click this button to set the selected calendar.

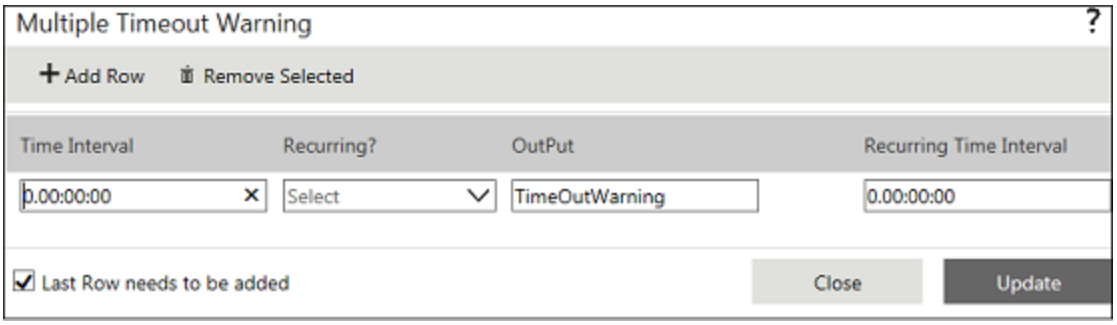
The **User Resource calendar if available** check box can be selected to enable the use of resource calendars if none are displayed in this window for selection.

Work - Multiple Timeout Warning

Multiple TimeOut Warning Property Window

You can set the Multiple Timeout Warning in this property window. To open this window, click the button for the 'Multiple TimeOut Warning' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has two tabs at the top to manage the rows of timeout settings in the grid.

- **Add Row** - You can click this tab to add the newly entered timeout setting and display a new row to the grid where you can add another timeout.
- **Remove Selected** - You can click this tab to remove the timeout setting row selected in the grid.

The grid has the following parameters that you need to specify for the new timeout setting.

- **Time Interval** - You can use this field to enter the time interval in which you want to generate a timeout warning. You must enter the time in format d.hh:mm:ss.
- **Recurring?** - You can use the drop down in this field to indicate whether the timeout is recurring or not. You can select "Yes" to set the timeout warning to recur.
- **Output** - You can enter the output message corresponding to the timeout warning here.
- **Recurring Time Interval** - You can set the time interval in which the timeout warning has to recur here. Enter the time in format d.hh:mm:ss.

There are two buttons and a check box at the bottom of the screen.

- **Update** - You can click this button to save the newly added timeout settings
- **Close** - You can click this to close the property window without saving the newly added timeout settings.
- **Last Row needs to be added** - You need to select this check box to save the last row added.

Invoke Form Activity

Activity Description

The Invoke Form Activity is basically an activity inside workflows, wherein the workflow actually invokes the form. The invoking activity is also linked to an approval process. As an example, consider the Leave Application Form. Once an employee fills out the Leave Application Form and submits it, the associated workflow is triggered and accordingly, the Form is invoked. It is sent to the reporting manager for approval. The manager also has the option to make comments and approve/reject the submitted form.

Collaboration Mode: The Invoke Form Activity is said to be in Collaboration mode when the "Individual actor's response collaboration in Output Instance XML" property is configured to collect responses from multiple users.

Note: For generating possible distinct outputs, use buttons of the following **Button Type**:
- **Submit**
- **Custom** (used for submitting the form)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Application Scenarios

Scenario 1: Opening a different form using Invoke Form activity

When a new employee joins an organization, the HR Person will fill up the employee's details and submits the form. This will go to network team to create mail id and other network requirements.

Scenario 2: Updating Form Parameters with Workflow Variable Values

When an employee submits a Leave Application form, the request will go to the Manager for approval. Manger can view the workflow variable values such as submitted user details like submitted date, user name, and user e-mail. These form parameters are updated with the workflow values while executing.

Workflow Variables for Invoke Form:

Steps to define variables for use in the Invoke Form activity

This section describes how to define variables for use in Invoke Form activities. It gives the syntax for creating the variables and typical examples for different cases.

Variables for capturing WorkItemIds

The Activity IDs for the activity can be retrieved using a variable of type array, with the following syntax:

'^'+CurrentActivity.Name+'WorkItemIds'

For example, ^ManagerFormWorkItemIds

Where 'ManagerForm' is a activity name.

Variables for capturing All Actors' Details

The details of the actor(s) to whom the approval work item gets assigned can be accessed by declaring a variable of type array with the following syntax:

'^'+CurrentActivity.Name+'ActingUsers'

For example, **^ManagerFormActingUsers**.

Where 'ManagerForm' is a activity name.

Variables for capturing Responding Actors' Details

The details of the actor(s) submitting the approval/rejection response can be accessed by declaring a variable of type resource with the following syntax:

'^'+HWSActivity.ActivityName+'RespondingUser'

For example, ^ManagerFormRespondingUser.

Where 'ManagerForm' is a activity name.

This variable stores the responded user information. If it is more than one user, it will retrieve the last user details.

Note: For single user, you can declare this variable as Resource type. If task is assigned to more than one user and to get all responded users information, then declare this variable as array.

Variables for assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

For example, if the activity name is 'ManagerForm' then declare the variable as ^ManagerForm_QueueVariable

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

in the Start activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

To assign multiple queues, specify the queue-ids with semicolon (;) separator. Skelta.HWS.Queue.QueueCollection class can be used to retrieve queue information.

Variable for Queue Acting Users

You can declare an array type variable to get updated information about the name of the actor to whom an activity gets assigned from a queue.

In the Workflow Variables, define the variable in the following format:

^+CurrentActivityName+'QueueActingUsers'

Example: **^HRFormQueueActingUsers**

HRForm is the activity name.

For example the value of the user who acts on the HRForm activity will be stored in the variable. The Approval1 task will be assigned to the same user.

Variable for storing timeout warning value

Suppose if you want to store the timeout warning value for Invoke Form activity in your workflow. The naming convention for the system variable to be declared is

^<ActivityName>ResponseByWarningTimeout

The value returned by the variable will be in UTC format. For multiple user scenarios the highest timeout value calculated for a user will be available in the variable.

Note: Multiple timeout warnings cannot be tracked using this feature.

Activity Properties

The Invoke Form activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Invoke Form activity.
The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Display Name - This property specifies the name to be displayed for the activity in the Web Work Item List.

Property Type: Optional (This property need not be set if the display name is already configured in the Actions.xml. The name entered here overrides any display name that is configured for this activity in the Actions.xml file.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Delivery Channels - This property is used to specify the delivery channels to deliver this activity to the assigned actor(s). Multiple channels can be specified giving the actor(s) different options to act on the work item.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Delivery Channels property

1. To select the Delivery Channels, click the button for the 'Delivery Channels' property to open the property window.
2. In this window, the Delivery Channels that have been configured are listed on the left along with a check-box against each channel. Click and select the check-box corresponding to the channel you wish to select. You can select multiple channels by selecting the respective check-box.
3. Click Save Channels.

See Invoke Form - Delivery Channels for a detailed description of the Delivery Channels property window.

Work Item Fields - This property is used to set the Work Item Fields to be used to display application data as well as value in variables and content in the Work items list when this activity is executed.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Work Item Fields property

To select the Work Item Fields, click the button for the 'Work Item Fields' property to open the property window.

In this window, the Work Item Fields that have been set are listed in a grid. Click on a row to select the corresponding Work Item Field.

Right-click the row, and select the "SetWorkItemField" from the context menu to set it.

See Invoke Form - Work Item Fields for a detailed description of the Work Item Fields property window.

Actors

The properties in the Actors group have been described below. You can use these properties to specify the actors who will work on the activity and related properties.

Assign Actor(s) - This property is used to specify the actor(s) who has to take up the Invoke Form activity. It is tagged with the Ignore Unavailable Actors property which in turn is tagged with the Alternate Actor Allowed property. This will be explained in detail later.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any actor(s).)

Steps to set the Assign Actor(s) property

1. To specify the actors, click on the button for the 'Assign Actor(s)' property to open the property window.
2. In this window build an expression to select the actors using the resource properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, and XMLVariables), and the value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking the Add button. This will display the expression to the text

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

area.

4. You can remove a condition already added to the expression by clicking the Undo button.
5. You can also clear an existing expression if necessary by clicking the Clear button. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click the Update button to save it.

See Invoke Form - Assign Actor(s) for a detailed description of the Assign Actor(s) property window.

See the Using XML Variables section in the About the XML Variable User Interface topic for details on how to use the XMLVariables to build the expression.

Assign Queue(s) - This property specifies the queue(s) to which the Invoke Form activity is to be assigned.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any Queue(s).)

Steps to set the Assign Queue(s) property

1. To specify the queue(s), click on the button for the 'Assign Queue(s)' property to open the property window.
2. In this window select the queue(s) from the Available Queues list box. You can select multiple queues by selecting with the <Ctrl> key pressed.
3. After selecting the required queue(s) click on the [>] button to move it to the Selected Queues list box. You can click on the [>>] button to select all the queue(s) and move them to the Selected Queues list box.
4. You can remove any queue from the selected list by selecting it and clicking on the [<] button. You can remove all the queues by clicking on the [<<] button.
5. After adding the required queue(s), click the Assign button to assign the activity to the selection
6. Click the Close button to close the window without saving the selection.

See Invoke Form - Assign Queue(s) for a detailed description of the Assign Queue(s) property window.

Min. Ownerships [% or Number] - This property, which can be specified as a number or percentage, is the minimum number of actors who should take ownership of the Approval request. This property is related to the 'Timeout warning for Ownership' and 'Timeout for Ownership' properties. To illustrate, when 'Timeout for Ownership' is reached, the activity first checks if the ownership count is less than Min.Ownerships (if it is set). If it is, the work item will be removed from all Work Item lists. If the 'Min.Ownerships' has already been satisfied, then the work item will be removed from the Work Item lists of those who have not taken ownership. If the Min.Ownerships value is 0, then the activity checks if the ownership count is less than Max.Ownerships (if it is set). If it is, the work item will be removed from all Work Item lists. Else the work item will be removed from the Work Item lists of those who have not taken ownership. If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work Item lists.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Max. Ownerships [% or Number] - This property (referred to as Max.Ack), which can be specified as a number or percentage, is the maximum number of actors who should take ownership of the Approval request. If 'Timeout for Ownership' is specified and achieved, and the 'Min.Ownerships' is also satisfied, then the activity waits for action from those who have taken ownership. If the Min.Ownerships value is set to 0, then it checks if the ownership count is less than Max.Ownerships. If it is, the work item will be removed from all Work Item lists. Else the work item will be removed from the Work Item lists of those who have not taken ownership. If both Min.Ownerships and Max.Ownerships are set to 0, then there should be at least one actor taking ownership within the set time, otherwise the work item will be removed from all Work Item lists.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Enable Take Ownership? - If this property is set to Yes, then the actor is provided with a Take Ownership option in the Work items list to take ownership of the task. If you are not required Take Ownership option in the Work items list, then set this property as No.

Note: By default, this property is set as **No**.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Enable Take Ownership? property

- Select **Yes** or **No** option from the Enable Take Ownership? drop-down list.

Re-Assign Allowed? - If this property is set then the actor is provided with a Re-Assign option. Using this the approver can re-assign the work item to another resource.

Property Type: Optional (This property needs to be set only if necessary.)

Ignore Unavailable Actors? - This property provides the following options - Yes, Yes - holidays excluded and No. If this property is set to 'No', when the Approval activity is assigned to the actor's Work items list, a check is first done to see whether the actor is available. If the actor is not available then a check is made for an alternate actor assigned to the unavailable actor. Simultaneously the value of the property 'Alternate Actor Allowed' is checked. If that is also set, then the Approval work item is assigned to this actor. If this property is set to Yes - holidays excluded, the workflow engine will ignore the fact that actors are not available if the day is an organization holiday and the output Not Enough Resources will not be generated.

Property Type: Optional (This property needs to be set only if necessary.)

Alternate Actor Allowed? - This property is set to assign a particular task to an alternate actor in the absence or unavailability of any actor.

Property Type: Optional (This property needs to be set only if necessary.)

Form Information

The properties in the Form Information group have been described below. You can use these properties to specify the form details and update the form parameters.

Form Name - This property is used to select form details, by selecting the form name and version.

Or

Use **Expression Editor** to build the expression to get the form name. This is useful if you do not know the values of the properties at the time of designing the form.

Syntax for **Expression Editor** is

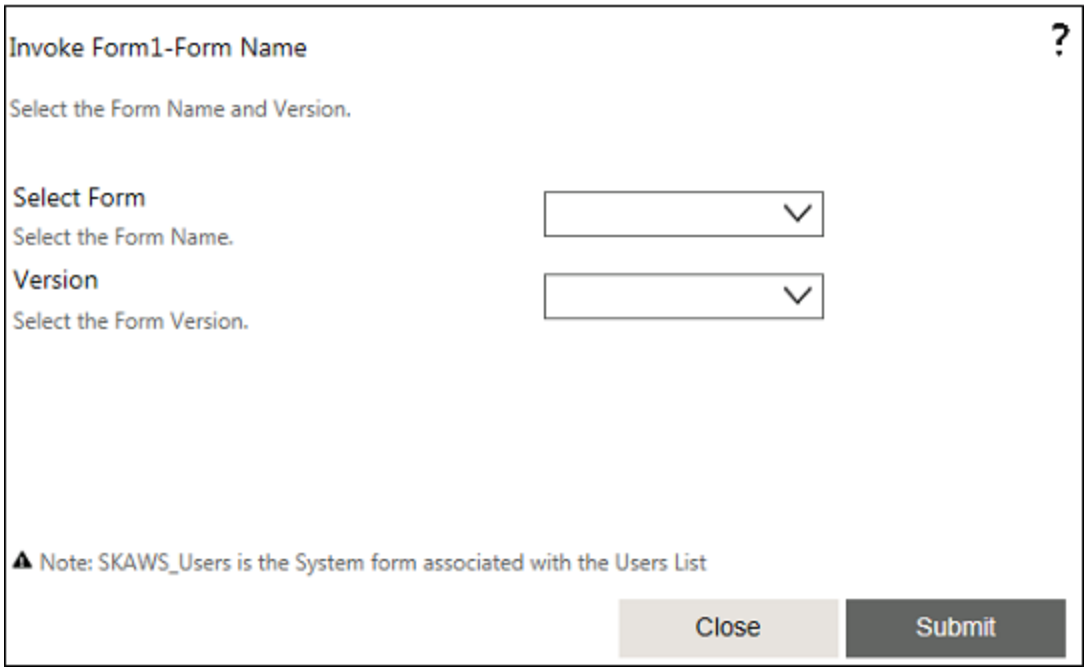
"{FormGuId,Form version}Form Name" where {FormGuId,Form version} is optional

Property Type: Mandatory

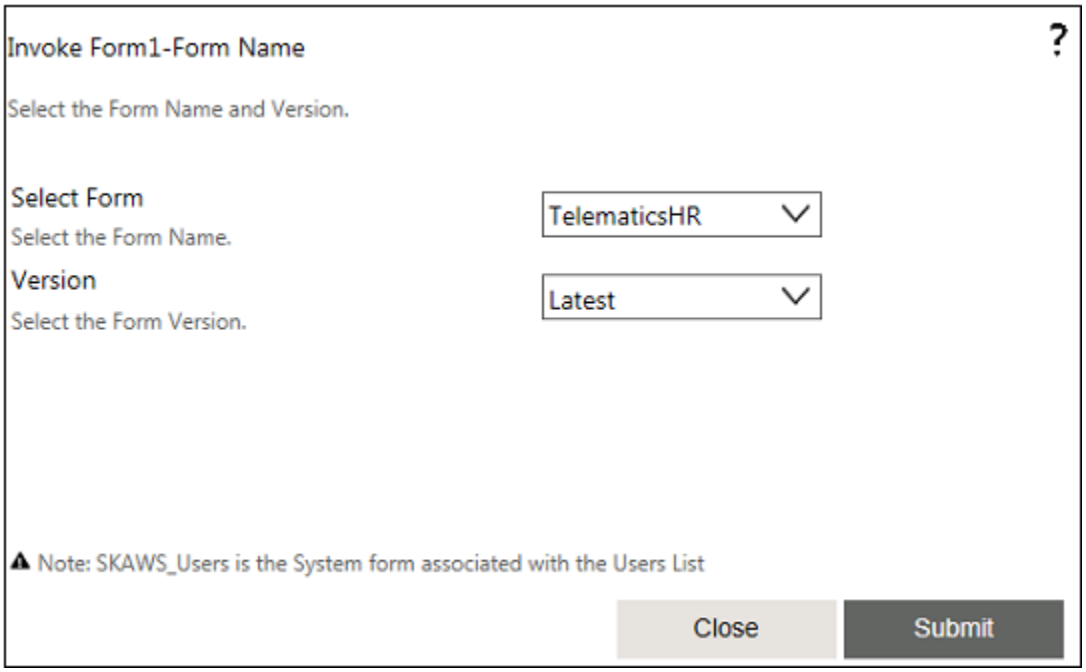
Steps to set the Form Name property

1. Click the edit icon corresponding to Form Name. The following screen is displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



2. Select a form from the Form Name drop-down list.
3. Select a form version from the Version drop-down list. By default, the latest version is displayed.



4. Click Submit, and then Close.

See Invoke Form - Form Name for a detailed description of the Form Name property window.

Input Instance XML - This property is used to display the data in the Forms which is being used in the Invoke Form activity. When the user views this Form in the work item, the data available in the selected Input Instance XML variable will be displayed, provided the form has the same schema of the selected XML Variable.

or

Use Expression Editor to build the expression to get the XML Variable name. This is useful if you do not know the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

values of the properties at the time of designing the form.

Property Type: Optional (This property needs to be set only if necessary.)

For instance:

1. To show a blank form as part of the Invoke Form activity, do not select an Input Instance XML from the Input Instance XML drop-down list. The form is then displayed with all the fields as blank.
2. If the user wants to display an existing list item data, the Input Instance XML variable selection should be of List XML type.

Update form parameters - This property is used to update the form parameter details.

Property Type: Optional (This property needs to be set only if necessary.)

Note: It is important to first select a form. For more information on selecting a form, click Steps to set the Form Name property. Once you select a form, perform the following steps to update the form parameters.

Steps to set the Update form parameters property

A parameter represents a value that is passed to a variable. The parameter value is defined when the variable is declared in the procedure. A procedure can be defined with no parameters, one parameter, or more than one. The part of the procedure definition that specifies the parameters is called the parameter list.

Here, parameters represent the form variables where the user can define while designing the form. These parameters can be used in Forms scripts, in user look up controls to build the filter expression, and as a parameter for the lookup query.

Note: Form parameters values are not stored either in form definition or in database. These values are rendered when the form is rendered.

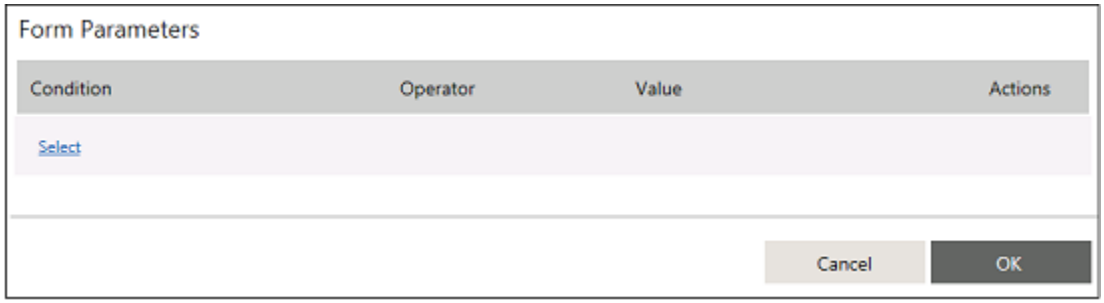
How to define parameters: To work with parameters, the form should have parameters defined. To define the form parameter, on the corresponding Forms Designer screen, click Edit properties of the form on the top. Click the Advanced tab. You can define the parameter in the Form Properties section. You can define the parameter clicking the Add Row.

How Form parameters can be used?

Form parameter can be used in Form scripts, in user look up controls to build the filter expression, and as a parameter for the lookup query. Below is the sample scenario for how parameters can be used in form scripts.

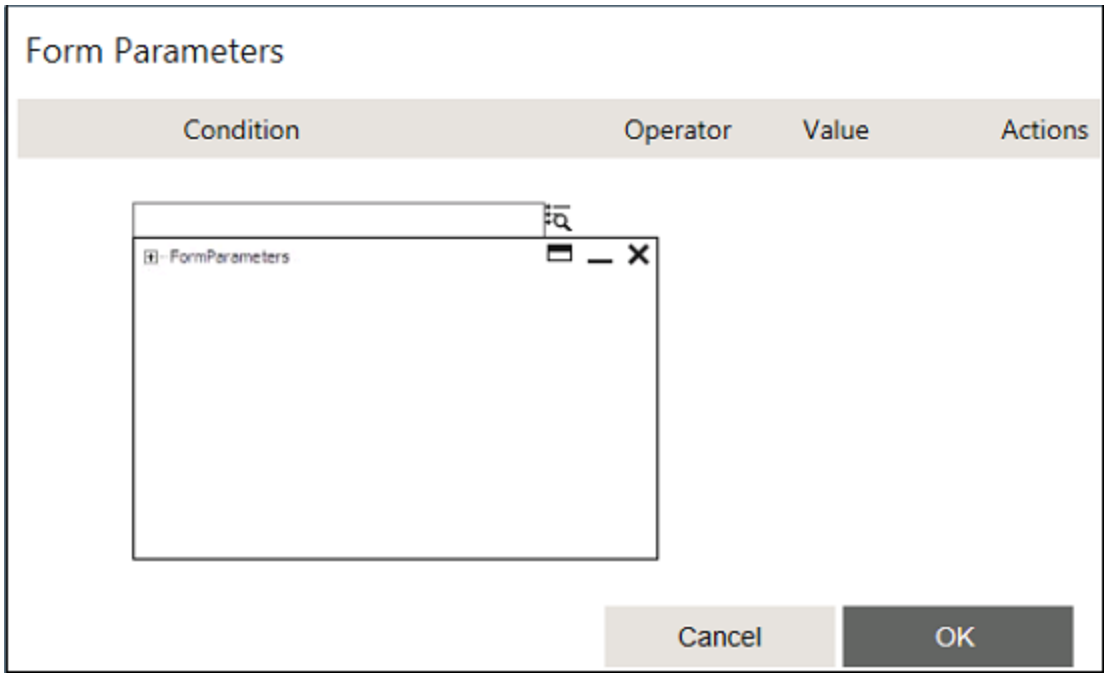
Suppose in our form we have two controls Employee id & Manager Name. Based on the Employee id entered, we can populate the Manager name. To achieve this, we need to write the script (C#) to update the Manager name value from Form parameters. This parameter value can be updated from workflow.

1. Click the edit icon corresponding to Update form parameters. The following screen is displayed.

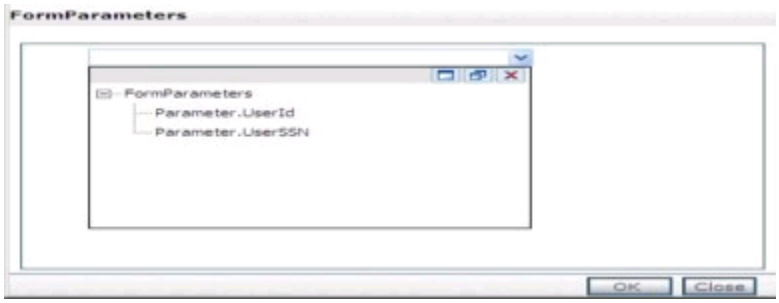


2. To select a form parameter from the drop-down list, click the drop-down. The following screen is displayed.

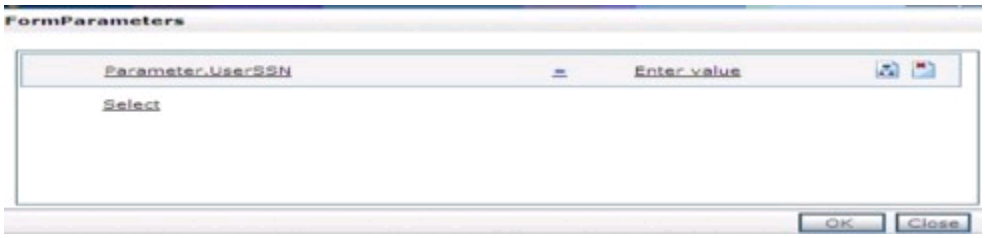
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Expand the tree. The associated parameters of the form are displayed.



4. Select the desired parameter by clicking the name. The following screen is displayed.



5. Click Enter value to display a text box. Enter the new value for the parameter in the text box.
6. Select the desired new parameter to be updated by clicking it.
7. Click OK. The new parameter is updated.

Save as Draft?

Property Type: Mandatory

Steps to set the "Save as Draft" property:

1. Click the Expression Editor to build an expression.
2. Select an option (Yes or No) from the drop-down list. Selecting Yes will allow you to save it as a draft, while

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

selecting No will not save it as a draft.

Note: This property is not available for Invoke Form activity in AVEVA Work Tasks Pro app.

Close the form on click of Save As Draft? - If this property is set as Yes, the edited form will automatically get closed on click of 'Save as Draft?' link.

Property Type: Optional (This property needs to be set only if necessary.)

Form to be opened on work item multi - select

This property enables you to specify the form which needs to be opened when multiple Invoke form work items are selected for processing. This also enables you to select multiple work items related to Invoke Form Activity and act on them from the Work items list or Inbox. The form selected opens on selection of a Work Item or multiple Work Items. On submission, the content gets updated for all the workflow instances.

You need to make sure that the form used for multi-select has the same XML node structure as used for Output Instance XML property. This ensures that the inputs provided in the form get updated to the respective workflow instances output instance XML nodes. Upon this, the update to output instance XML depends on Update output instance XML only for completion maker outputs configured for Possible Distinct Outputs property. Moreover, the behavior is overridden with copying only specific node, when the Invoke form activity is to be used in response collaboration mode .

Note: In the multi-select scenario, the inputs given to the form from the workflow using Input Instance XML property will not be populated when the form is opened.

Property Type: Optional (This property needs to be set only if necessary.)

Scenario

Consider a scenario where a manager receives many leave applications for approval in his Inbox. Instead of opening individual work items and approving or rejecting the same, the manager would like to multi select the work items and approve or reject them together. Also, rejection reasons and approval comments need to be captured for the work items.

Steps to set the Multi-select work item property:

1. Click the edit button corresponding to the Form to be opened on work item multi-select property. The **Invoke Form Multi-Select Form** opens.
2. From the **Select Form** drop-down list, select the form in which you want the multi-select property to be enabled.
3. By default, the Latest version of the form gets selected in the **Version** field.
4. Click **Submit**.

The selected form opens on selection of a work item or multiple work items through the check boxes. The check boxes are available for selection after enabling the multi – select functionality in the Inbox. On submission, the content gets updated for all the workflow instances. For more information, see the example *Selecting and Acting on Multiple Work Items Using the Enable Multi Select option* in the *Forms and Lists User Guide*.

Form to be opened to view actor responses

Property Type: Optional (This property needs to be set only if necessary.)

This property allows you to view the forms submitted to the workflow. Using this property helps you to track errors committed by users while submitting data to the workflow. If nothing is set to this property, then the Form configured for the activity will be used by default for showing the response. If your form has lot of controls and need not have to show the entire details of submission, you can override the default behavior by specifying a form for this property.

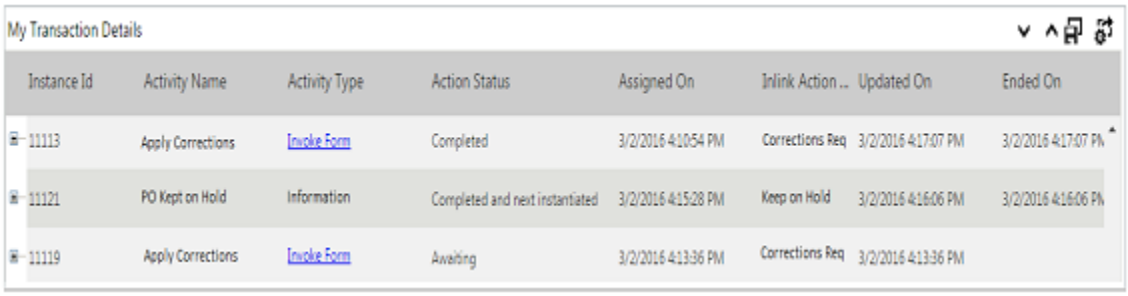
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Scenario

Scenario: The Telematics Company is a BPO service provider and uses AVEVA Work Tasks workflow in their service for data entry, verification, data correction, approval etc. During data entry, a user has entered some wrong data, but when questioned denies the entry. The verifier requires substantial proof for the data entry user. Verification inputs provided by the verifier need to be viewed later, to check if the data correction done by the data entry user is as per the input provided. In case of verification by multiple users, each user's inputs need to be viewed separately. Provision to see all the forms submitted by the user is provided to the verifier.

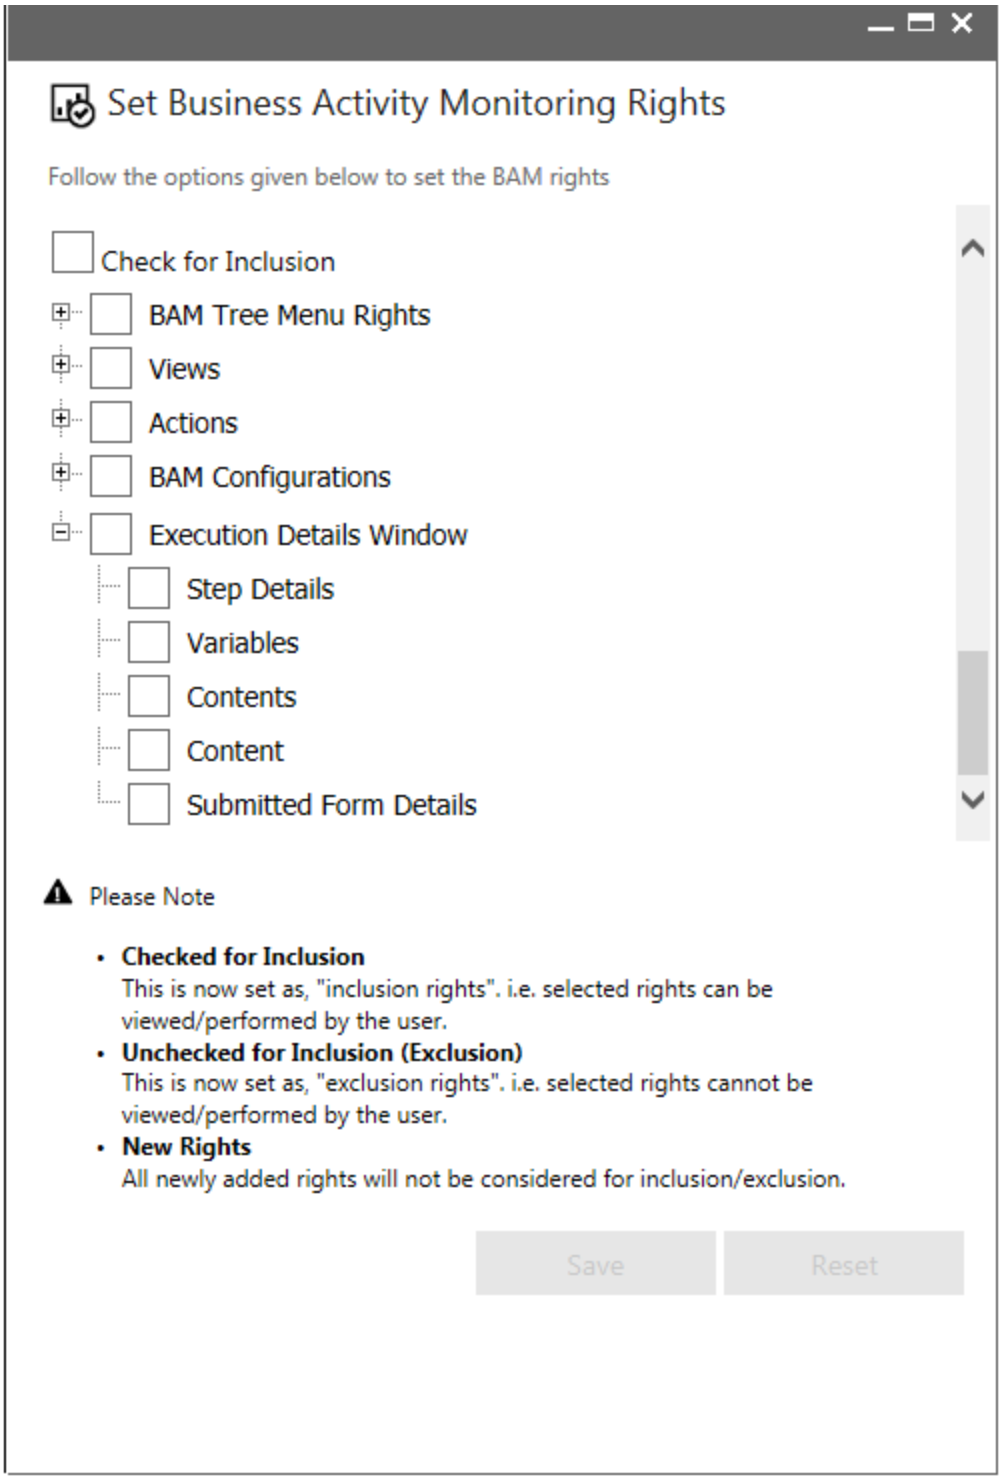
The user can view the submitted form data by clicking the Submitted Form Details tab in the activity details of Invoke Form activity under Process Execution view.

The user can also view the data from My Activities link.



Users can enable security rights to the submitted form details tab in the Set Business Activity Monitoring Rights property while generating BAM reports.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Notification Contents

The properties in the Notification Contents group have been described below. You can use these properties to specify the content used to notify actors about the activity.

Subject - This is the subject of the Approval request. The subject can be customized for each actor.

Property Type: Optional (This property need not be set. If it is not set, the default subject line from the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Actions.xml file is displayed.)

Steps to set the Subject property

1. To specify the subject, click on the button for the 'Subject' property to open the property window.
2. In this window enter the subject text directly in the text editor.
3. If you want to customize the subject you can do so using the Field controls to add resource property values. For example, to add a subject that includes the email id of the actor submitting the leave application, you can do as follows: First type in the text "Submitted By". Next select "Variable" and "Variable.SubmittedBy.Email" from the two drop downs for Field and click on the Append button. This will add the placeholder for the variable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the email id.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the subject, click the Update button to save it
7. Click the Close button to close the window without saving the subject.

See Invoke Form - Subject for a detailed description of the Subject property window.

Body - This is the actual message body of the Approval request sent to the actor(s). The message can be customized for each actor.

Property Type: Optional

Steps to set the Body property

1. To specify the message body, click on the button for the 'Body' property to open the property window.
2. In this window enter the body text directly in the text editor.
3. If you want to customize the body you can do so using the Field controls to add resource property values. For example, to add a body that includes the name of the actor submitting the leave application, you can do as follows: First type in the text "Hi, Please approve the leave application submitted by". Next select "Variable" and "Variable.SubmittedBy.name" from the two drop downs for Field and click on the Append button. This will add the placeholder for the variable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the name.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. If you want to send the form URL, click Enterprise Console Explorer. In the explorer window, select the either Local URL, Internet or Intranet URL. Click Select of the explorer window.
7. After adding the body, click the Update button to save it
8. Click the Close button to close the window without saving the body.

See Invoke Form - Body for a detailed description of the Body property window.

Template Path - This property is for specifying standard or customized mail template path. The standard template 'InvokeFormEmail.html' is available in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

[AVEVA Work Tasks Installed Path]\WorkflowElements\Default\en-US\Templates\FormEmailTemplate\ folder.

Example:

<%#WorkflowManagementInstallPath%>\WorkflowElements\Default\en-US\Templates\FormEmailTemplate\InvokeFormEmail.html

Property Type: Optional

Steps to set the Template Path property

Template Path: Locate the default template 'InvokeFormEmail.html' from the path

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Templates\FormEmailTemplate\InvokeFormEmail.html and type the same path in the Template Path property.

or

If user created a template then specify the complete path in the Template Path property.

Example: User should copy the template in Template folder which is in C drive then set the path as C:\Templates\InvokeFormEmail.html

See Invoke Form - Template Path for more information.

Close the form on click of finish? - This property is used to specify whether the form page can be closed or not when the user submits the form through email. If the value is set as No, the form page will not be closed even after the user submits the form. If the value is set as Yes, the form page will get closed after the user submits the form.

Property Type: Optional (This property needs to be set only if necessary. If it is not set, the default value is No.)

From Email Address? - This property is used to specify the email address from which notification messages will be sent for the activity.

Property Type: Optional (This property needs to be set only if necessary. If it is not set, the default value in Actions.xml will be used.)

Show Custom Document View Window - If this property is set to 'Yes', then the Custom Document View Window will be shown to actors in their Work Item Lists. Here, default value is 'No'.

For more details, see Custom Document View URL.

Property Type: Optional (This property needs to be set only if necessary.)

Priority - This property is set to indicate the priority of the approval request. Enter the values 0-33 to set as Low, 34-66 for Medium, or 67-99 for High. The default value is set to 34.

Property Type: Optional (This property needs to be set only if necessary.)

Send Notification Email - If this property is set to 'Yes', then notification emails will be sent to the actors. If it is set to 'Yes-HTML', then the emails will be sent in HTML format.

Property Type: Optional (This property needs to be set only if necessary.)

Show Email details in the Form - If this property is set to 'Yes', then the subject and body of the email will be displayed in the Work Item Invoke Form.

Property Type: Optional (This property needs to be set only if necessary.) The default value is **Yes**.

Notify if alternate actor is considered - If this property is set to 'Yes', then notification emails will be sent to the actors when an alternate actor is considered.

Property Type: Optional (This property needs to be set only if necessary.)

Redirect URL - This property is used to get the URL of the web page to redirect the client to, in the case of synchronous execution of the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Refer topic **Synchronous Execution of Forms** in the **Lists and Forms Guide** for more details.

Property Type: Optional (This property needs to be set only if necessary.)

Note: The redirection feature may not work on the Application Request Routing (ARR) server.Steps to set the Redirect URL property

1. To specify the Redirect URL, click on the button for the 'Redirect URL' property to open the property window.
2. In this window enter the Redirect URL directly in the text editor.
3. If you want to customize the Redirect URL you can do so using the Field controls to add resource property values. For example, you can add a variable or content that will hold the URL. You can do so by selecting "Variable" from the first drop down and the appropriate option from the second drop down for Field, and clicking on the Append button. This will add the placeholder for the variable in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the URL.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the Redirect URL, click the Update button to save it
7. Click the Close button to close the window without saving the Redirect URL.

See Invoke Form - Redirect URL for a detailed description of the Redirect URL property window.

Custom Document View URL - This property is used to get the URL of the page to which the custom document dlls does a post. The data posted to the page are application, workflow, executionid, executiondetailsid, and workitemid. The posted data can be retrieved as Request.Form["workitemid"].

Property Type: Optional (This property needs to be set only if necessary.)

See Invoke Form - Custom Document View URL for a detailed description of the Custom Document View URL property window.

Decision Influencers

The properties in the Decision Influencers group have been described below. You can use these properties to specify some parameters that influence the outcome of the activity.

Max Actors Required For Invoke Form Completion [% or Number] - This property is used to check what percentage or number of actors should take action for Invoke Form. Decision on the Invoke Form is taken only after the specified number or percentage of actor(s) have taken the action. The activity waits for the actors' action until the 'Timeout for activity' is reached.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Min Actors Required For Invoke Form Completion [% or Number] - This property specifies the minimum number of actors to act on the Invoke Form before the 'Timeout Warning for Activity'. If the activity limit is reached before the 'Timeout Warning for Activity' then the warning message is not shown.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Possible Distinct Outputs - This property enables you

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- To specify multiple conditions using form button and form control values and in effect set different outputs for the Invoke Form activity.
- Each output can be marked as completion maker or not. If no output is marked as completion maker, the task remains in the Inbox.
- To set whether the output instance XML is to be updated with the input data of the form for all the outputs or only for the outputs which are of type completion makers.

Property Type: Optional (This property needs to be set only if multiple outputs are required from the Invoke Form activity)

Escalation & Timeout

The properties in the Escalation & Timeout group have been described below. You can use these properties to specify escalation and timeout settings for the activity.

Set Calendar for Timeout - This property is used to specify the calendar to be used to determine activity timeouts.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to Set Calendar for Timeout

1. To specify the calendar for timeout, click on the button for the 'Set Calendar for Timeout' property to open the property window.
2. In this window select the required calendar by clicking on the calendar name in the tree structure.
3. Click the Set Calendar button to set the selected calendar.
4. You can specify that a resource calendar should be used, if available, by clicking to check the corresponding check box.

See Invoke Form - Set Calendar for Timeout for a detailed description of the Set Calendar for Timeout property window.

Minimum available time for Activity - This property is used to check the availability of an actor to whom a task must be assigned while executing the activity. The availability check for the actor is done based on the Calendar settings (Global or Resource Calendar). If the time taken to complete the task is within the value set for the **Minimum available time for Activity** property, then the task will be assigned to that actor. However, if the time taken to complete the task exceeds the value set for the **Minimum available time for Activity** property, then the task will be assigned based on the values set for the **Ignore Unavailable Actors?** and **Alternate Actor Allowed?** properties.

Property Type: Optional (This property needs to be set only if necessary.)

Timeout for Ownership - This property specifies the time until which actors are allowed to take ownership, i.e. the time until which the Approval activity will wait for actors to take ownership. If Min.Ownerships is set and is not reached, the work item is removed from all Work Item lists. If Min.Ownerships is 0, it will check if ownership count is less than Max.Ownerships. If it is, the work item is removed from all Work Item lists. Else the work item will be removed from the Work Item lists of those who have not taken ownership. The work item will remain in the Work Item list of those who have taken ownership and wait for action from them.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Timeout Warning for Ownership - This property specifies the time at which a warning is provided to an actor to take ownership of the work item assigned to him/her. If the actor does not take ownership within this time the engine is notified with a warning. Thus if 'Min.Ownerships' is set, and it is not satisfied before the given time then a warning is sent. If Min.Ownerships is 0, it will check for Max.Ownerships. If the ownership count does not reach the Max.Ownerships value within the set time, a warning is sent. If both Min.Ownerships and Max.Ownerships are not set, this property is ignored.

Property Type: Optional (This property needs to be set only if necessary.)

Understand how Ownership Properties relate to each other:

- Approval activity is assigned to the approvers in the approval list by the workflow engine. Approval activity has a default property set that at least one person has to make Take Ownership of the Approval activity.
- A drop down interface has been provided for the actor to Take Ownership. However, the actor can act on the Approval without taking ownership first, in which case ownership will be considered to be done, i.e. if the actor acts upon the Approval activity without acknowledging, then it is considered as an ownership with action taken.
- After the actor has taken ownership, a link is provided to the actor, which opens a pop up with the details of the other approvers. This is again tagged with the 'Hide Responses?' property. The link will be provided only If 'Hide Responses?' is set as 'No'. The pop up will have details like Approver name, Ownership Status, Action taken, Comments.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] then the 'Timeout Warning For Ownership' property is not considered.
- If the 'Min.Ownerships' property is set and the ownership count has reached the set limit [percentage or number] and the 'Time Out For Ownership' is also reached then the work item is removed from other approvers' Work Item list and the work item waits for action from those who have taken ownership.
- If the 'Min.Ownerships' limit is not reached for the Approval activity, and the 'Timeout Warning For Ownership' has been exceeded then the actor is notified with a warning by including an email or an information activity, with the Timeout Warning for Ownership link to it.
- If 'Timeout For Ownership' is set, if the Approval activity has not reached the minimum limit (Min.Ownerships) and the 'Time Out For Ownership' has been reached, then the work item is removed from the Work Item lists of all the approvers.
- If 'Min.Ownerships' = 0 and if 'Max.Ownerships' is set, the activity waits for actors to take ownership or action until the 'Time Out For Ownership' is reached (if this is set).
- If none of the ownership properties are set then the work item waits until the actor takes ownership or acts upon it.

Timeout Warning for Activity - This property specifies the time at which a warning is provided to an actor to take ownership of the work item assigned to him/her. If the actor does not take ownership within this time, the engine is notified with a warning. Thus if 'Min.Ownerships' is set, and it is not satisfied before the given time then a warning is sent. If Min.Ownerships is 0, it will check for Max.Ownerships. If the ownership count does not reach the Max.Ownerships value within the set time, a warning is sent. If both Min.Ownerships and Max.Ownerships are not set, this property is ignored.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Timeout for Activity - This property's value is used to decide until what time the work item should wait for user action. If properties such as Max.Ownerships, AAA, AL are set, once the property values are reached the work item is removed from the Work Item lists of all the approvers. When the timeout is reached, the following checks are made: If AL is set, when the activity count i.e. the no. of approvals or rejections (AC) < AL, then the timeout for activity is performed and the activity is removed from all Work Item lists. If AC > AL, it checks with the no. of approvals or 'decision count' (DC) and AAA. If DC >= AAA (if it is set), the work item is considered approved; otherwise, it is rejected. If AAA = 0 and if DC >= AL, the work item is considered approved; otherwise, it is rejected. If AL = 0 and AC < AAA, then the timeout for activity is performed and the work item is removed from all Work Item lists. If AL = 0 and AC > AAA, it will check with DC. If DC > AAA it is approved; otherwise, it is rejected. If AL = 0 and AAA = 0, then if DC is at least 1, then it is considered approved; otherwise, it is rejected.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Multiple TimeOut Warning - This is used to set recurring timeout warnings that will be sent to the actors who have to take action. To set multiple timeout warnings, click the 'Multiple TimeOut Warning' button in the Properties pane for the Approval activity. A new window pops up. In this window, set the interval for the recurring warning as well as the output message. You can also set the Recurring Time Interval. This can be used to set a different recurring time out after the first timeout happens. For example, if 'Time Interval' for the property is set as 7 days and 'Recurring Time Interval' is set as 2 days, then the first time out will happen after 7 days and there will be a recurring time out every second day after the seventh day (first) time out.

Property Type: Optional (This property needs to be set only if necessary. It is useful in setting escalations.)

Steps to set the Multiple TimeOut Warning property

1. To set the multiple timeout warning, click on the button for the 'Multiple TimeOut Warning' property to open the property window.
2. Enter the time interval for the timeout in the Time Interval field
3. Select "Yes" from the drop down for the Recurring? field if you want the timeout warning to recur. Select "No" otherwise.
4. Enter the output message corresponding to the timeout warning in the Output field.
5. Enter the time interval for the recurring timeout in the Recurring Time Interval field.
6. After entering the content details, click the Add Row button to add this timeout setting and display a new row for entering another timeout setting.
7. Remove rows if necessary by selecting them and clicking the Remove Selected button.
8. After specifying the timeout settings, click the Update button.

See Invoke Form - Multiple Timeout Warning for a detailed description of the Multiple TimeOut Warning property window.

Responses and Outputs

The properties in the Responses and Outputs group have been described below. You can use this property to specify the responses and outputs of the activity.

Output Instance XML - This property is used to get the data from the Forms which the user has edited from the Work item page. Depending on the type of XML variable selected in this property, the XML data is stored, provided the output instance XML has the same schema of the Form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

or

Use **Expression Editor** to build the expression to get the XML Variable name. This is useful if you do not know the values of the properties at the time of designing the form.

Property Type: Mandatory (This property must be set in order to use the data entered by the user in the workflow)

For instance:

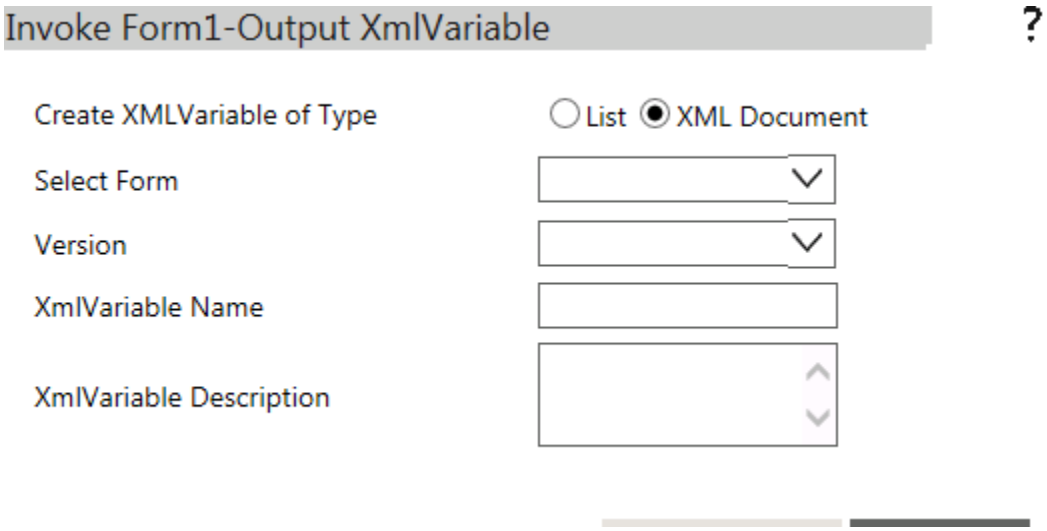
1. If the Output Instance XML is of type XML List , then the XML data received from the Form is stored in the respective List depending on the list item scope defined for the XML Variable.
   a. The list item scope should be New , if a new list item to be added with the Form data in list.
   b. The list item scope should be Current, if the list item that initiated the workflow has to be updated.
   c. The list item scope should be List Query, if a specific list item to be updated in the list.
2. If the Output Instance XML is of type XML Document, then the XML data received is stored in the workflow itself.

Display an existing list item data using Invoke Form and then store the updated Form data in a different list (destination list): An intermediate XML Variable is required for such scenarios. Use an Update Variable activity before the Invoke Form activity, to assign the Source list XML values to the Intermediate XML Variable, Then use this intermediate XML variable as Input Instance XML and destination XML List as Output Instance XML.

Note: Source, destination list, and Intermediate XML variable should have the same schema.

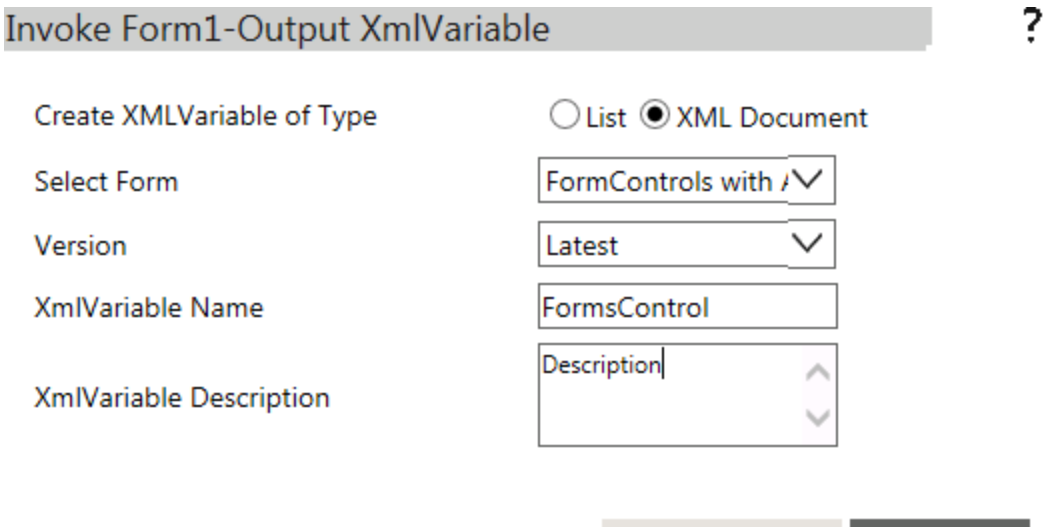
Steps to set the Output Instance XML property

1. Select an existing output XML variable from the Output Instance XML drop-down list, OR
2. Click the edit button corresponding to Create a Output Instance XML variable. The following screen is displayed.

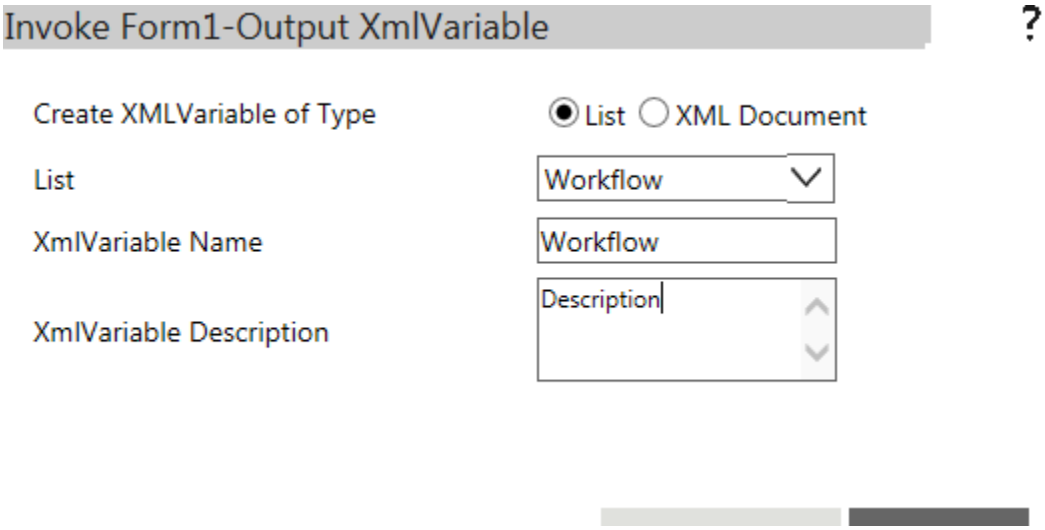


3. Select a form from the Form Name drop-down list.
4. Select a version from the Version drop-down list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Note: By default, the XML Document option is selected and the screen as shown above is displayed. If the List option is selected, the following screen is displayed. The difference, as you can notice, is that the XML Document option allows you to select a form, whereas the List option allows you to select a list.



Note: On this screen, select a list from the List drop-down.

1. Enter a name for the output XML variable in the XMLVariable Name field.
2. Enter a description for the output XML variable in the XMLVariable Description field.
3. Click Submit.
4. The output XML variable is created. The created output XML variable will be available in Start activity.

Individual actor's response collaboration in Output Instance XML

Property Type: Optional (This property needs to be set only if necessary.)

For more information, see Invoke Form - Individual Actor's Response Collaboration in Output Instance XML.

Hide Responses - If this property is set to 'No', then actors can see the responses of other actors in a group approval scenario. To view these responses that is, ownerships, approvals, or rejections, select the 'Take

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Ownership' option. This will open a new pop-up window with the responses of other actors who have taken ownership.

After the actor has taken ownership, a link is provided to the actor, which opens a pop-up window with the details of the other approvers. The link will be provided only if 'Hide Responses' property is set as 'No'. The pop-up window will have details such as Approver name, Ownership Status, Action taken, Comments.

Property Type: Optional (This property needs to be set only if necessary. It is useful in group response scenarios.)

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Miscellaneous

Redirection Enabled? - This property enables redirection. When this property is set to Yes, the workflow redirects the user to the URL in the Redirect URL property in the next activity.

Activity outputs:

The Invoke Form Activity returns the following values -

Action Completed: Displayed when the action is completed when you submit the form.

Not Enough Resources to Acknowledge: Displayed when the filter condition did not yield enough actors to whom the request can be sent.

Timeout - Acknowledge: Displayed when the specified minimum number of actors did not take ownership of the request in the given time.

Timeout - Action: Displayed when some or all of the specified actors did not perform the required activity in the given time.

Timeout Warning - Acknowledgement: Displayed when a warning is generated that the specified minimum actors have not taken ownership of the request in the given time.

Timeout Warning - Action: Displayed when a warning for timeout is generated because some or all the actors did not perform the required activity in the given time.

Note: The following outputs will return only if user assigned tasks to a queue user:

Resource Unavailable for Queue - If a queue is assigned to a task and if there are no resources available in the queue then this output will get triggered.

TimeOut for Queue Task - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting the completion of that task.

Timeout Warning -Queue - This output will get triggered when the task in the queue is not picked by any users within the queue escalation time resulting in sending a warning output. However, the task will still be sleeping.

Timeout Warning -Queue Participant - This output will get triggered when the task in the queue is picked by

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

user but still not acted on that task within the queue escalation time out settings resulting in triggering a warning output. However, the task will still be sleeping.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Note: In Inbox, navigating between items without subject is not supported for the Invoke Form activity.

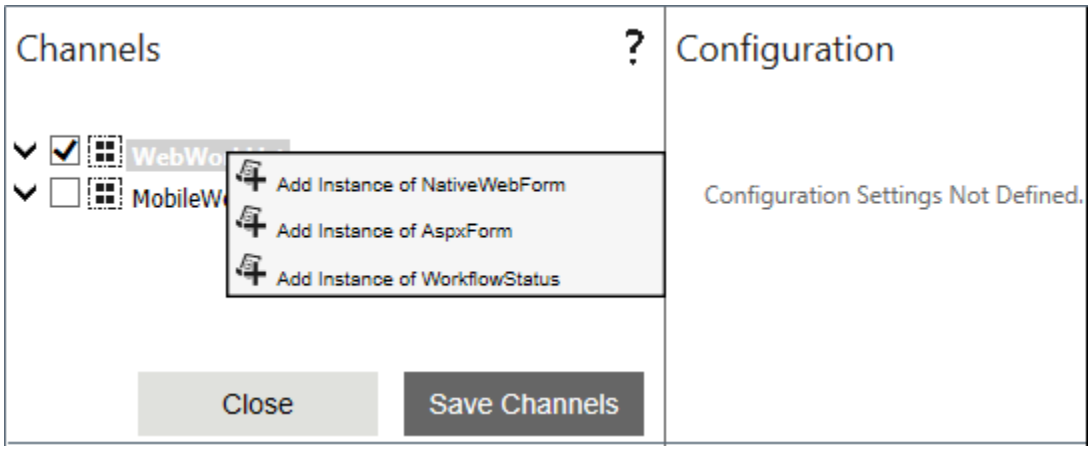
Invoke Form - Delivery Channels

Purpose

The purpose of this chapter is to describe the feature of WorkflowStatus Form of Delivery Channels property under the category Configuration of any human activity available in AVEVA Work Tasks.

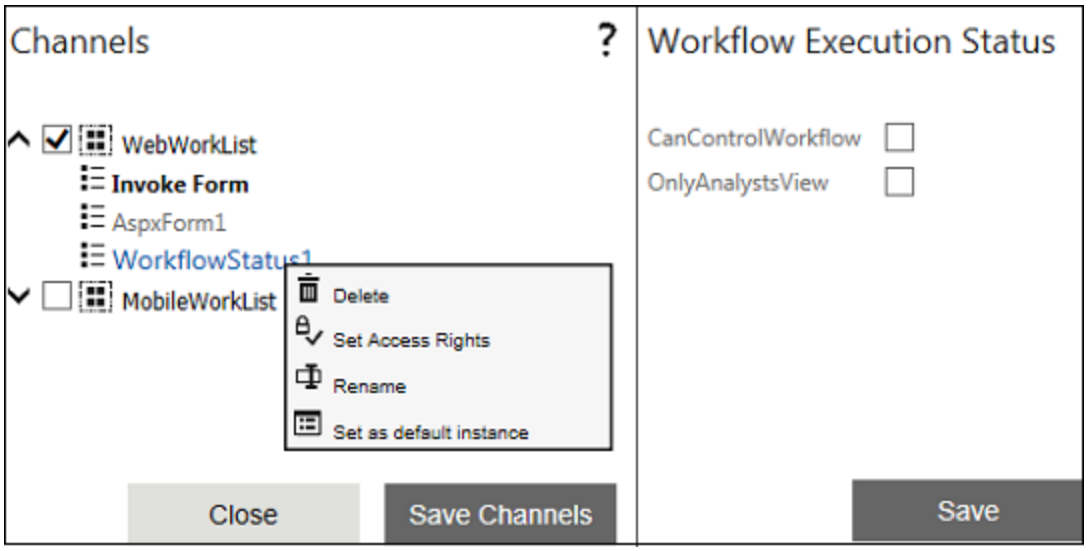
Description: This feature enables us to view the status of the workflow in the work item list in the graphical form. [Optional]

1. Select the Human Activity.
2. Click the **Delivery Channels** property. This will open a window like the one shown below.



3. Right-click on the WebWorkList to display the context menu with the **Add Instance of Workflowstatus** option.
4. Set the Properties for the Execution View Status Graphical view. Click on the **Save** button.
5. If you want to Set the workflowstatus form as the default instance you can do it by right-clicking on workflowstatus1 and selecting **the Set as default instance** option from the context menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



6. Click the **Save and Save Channels** buttons.

Output

Now, when you click on any row in the Work items list, you will find this Execution view page being displayed as the detailed view if you set it as a default instance.

Otherwise workflow status form will appear in context menu of each row in Work items list and you can open the execution view by selecting it from the context menu.

Delivery Channels - MobileWorkList

In order to deliver the work items to the mobile device, the **MobileWorkList** option in the Delivery Channel property needs to be selected. This allows mobile users to view and act upon the tasks from the Inbox that is rendered on their mobile devices.

This topic describes the steps required to configure the **MobileWorkList** option in the **Delivery Channel** property of the Invoke Form activity.

To configure 'MobileWorkList' option in the Delivery Channels Property

1. In the Process Designer, drag and drop the **Invoke Form** activity on to the design area. The activity properties pane of the selected activity appears on the right side of the design area.
2. In the **Activity Properties** pane, expand the **Configuration** node and select the **Delivery Channels** property.
3. In the **Delivery Channels** window, select the **MobileWorkList** check box in the **Channels** section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click **Save Channels**.
5. Set all the other properties and click **Publish and Test Run**.

Invoke Form - Possible Distinct Outputs

Purpose

This property of Invoke form enables you to:

1. To specify multiple conditions using form button and form control values, which in turn will set different outputs for the Invoke Form activity.
2. Each output can be marked as **Completion** maker or not. If no output is marked as completion maker, the task remains in the Inbox.
3. To set whether the output instance XML has to be updated with the input data of the form for all the outputs.

   Or

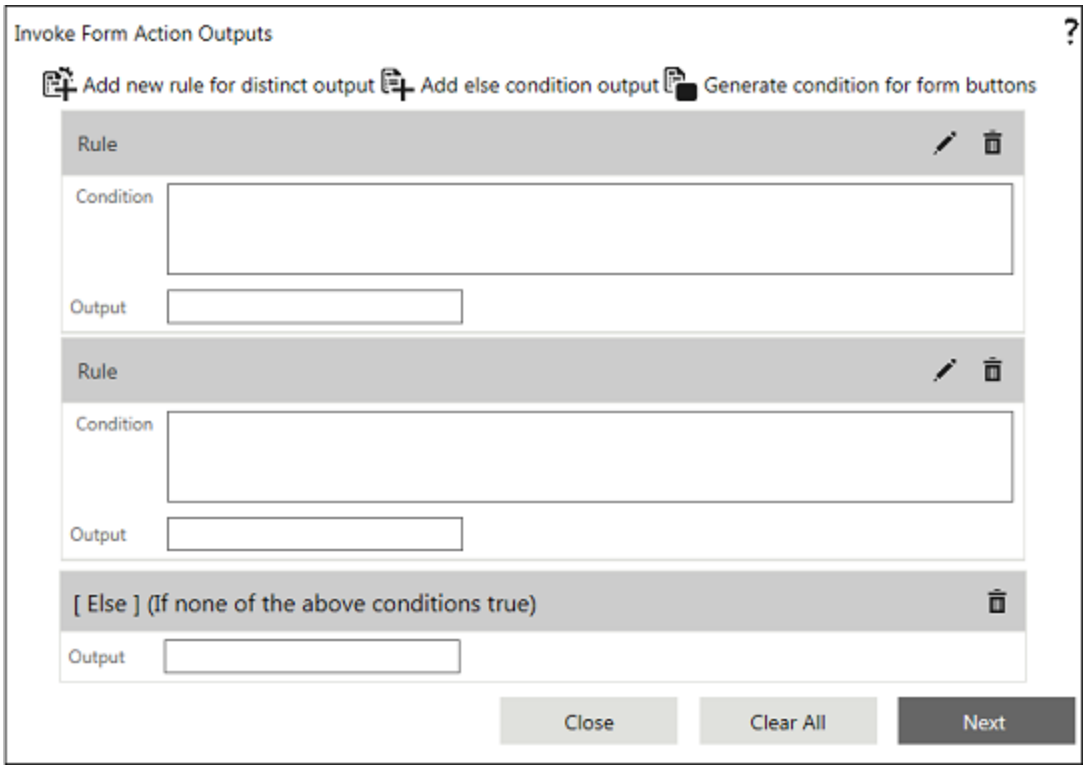
   Only for the outputs which are of type **Completion** makers.

Note: For generating possible distinct outputs, use buttons of the following **Button Type**:
- **Submit**
- **Custom** (used for submitting the form)

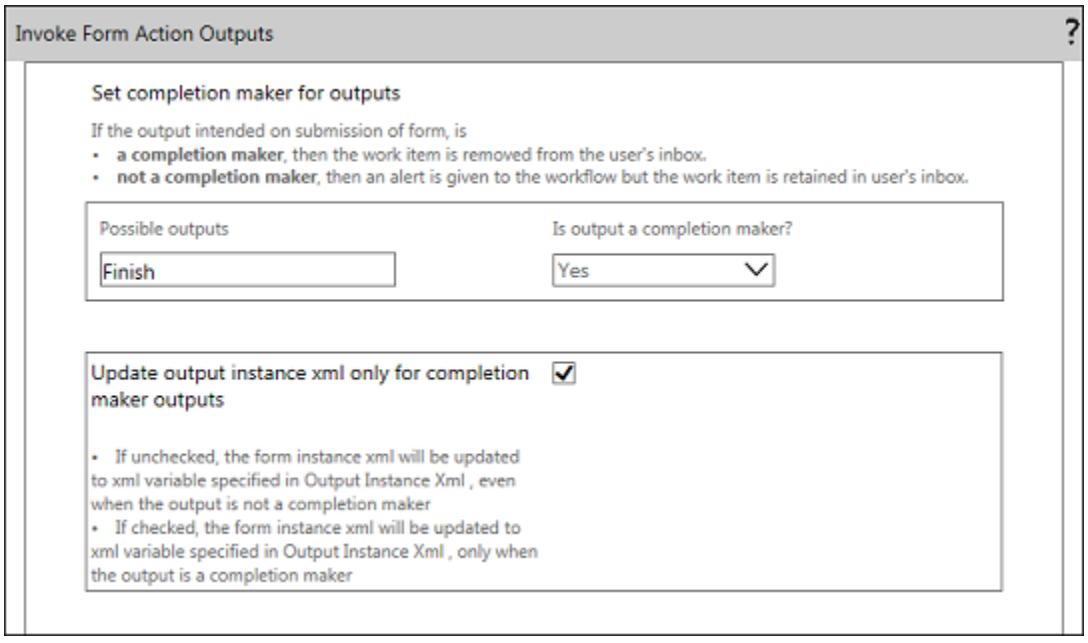
Description

- Add new rule for distinct output in the Invoke Form Action Outputs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

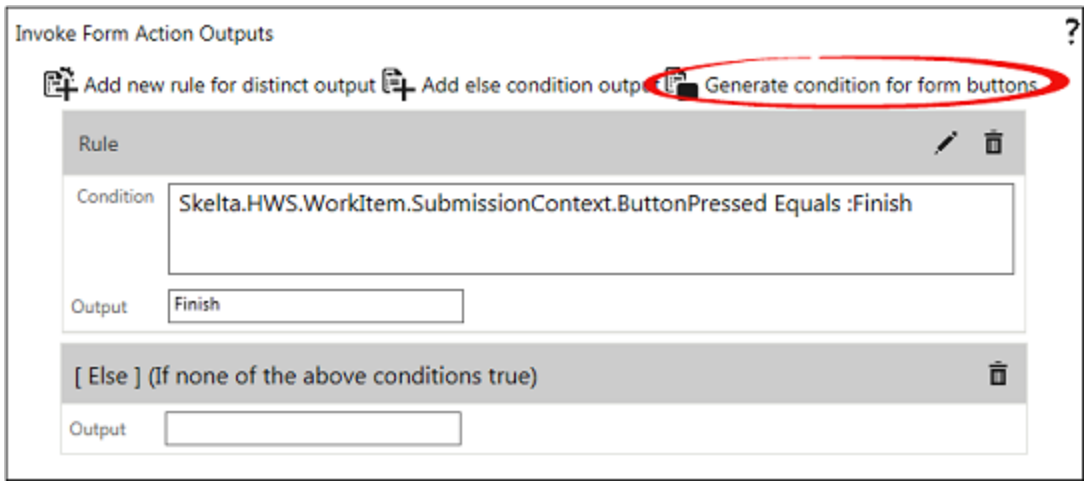


- WorkItemSubmissionContext enables you to select form submission related information. It consists of button pressed, FormsInstanceXML, RespondingUserName and WorkItemId information.

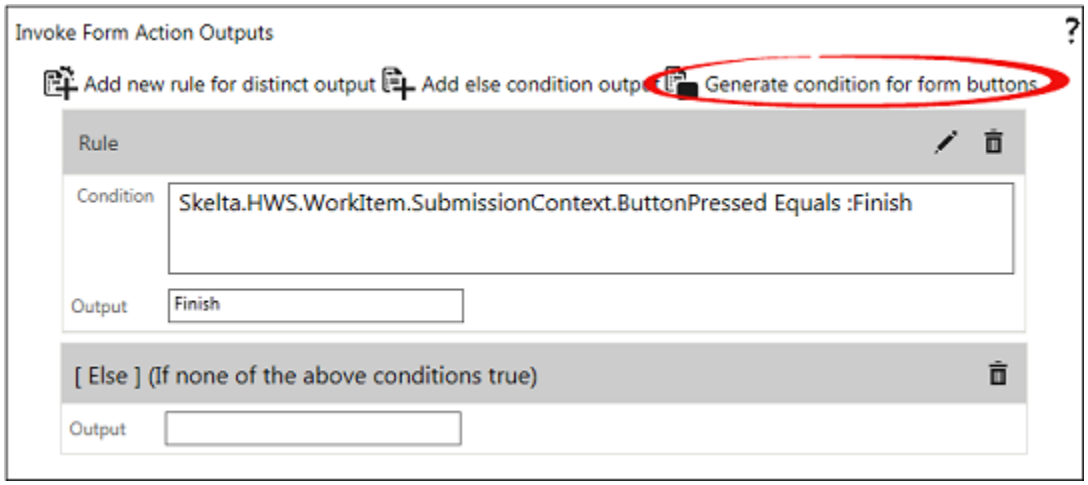


- Specify whether the output is a Completion maker or not. Also we can set whether the output instance XML has to be updated with the input data of the form for all the outputs or only for the outputs which are of type Completion makers.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



- To generate the conditions automatically for the buttons available in the form, you have the option to either use this button to generate the conditions or create the conditions on their own using form fields and button pressed text.



Invoke Form - Possible Distinct Outputs Scenario

Scenario

Telematics company allows the users in Administration Department to initiate **purchase order requisition**. The purchase orders thus requested are send for the managers approval. During the approval process the manager has options to **Approve**, **Reject**, **Apply Corrections,** or **Keep On Hold the request**.

- When the manager **approves the request**, the same is added to the AVEVA Work Tasks list that stores all the approved purchase order for further processing.
- When the manager **rejects the request**, the information is send back to the requester with valid comments for rejection.
- When the manager opts for **Apply Corrections**, the same request is send back to the requester with the comments from manager for applying required corrections before re-submitting.
- When the manager keeps the **request on hold**, the same request is retained in manager's Inbox for later

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

processing along with information being sent to the requester saying the request is kept on hold.

Requirements

1. Two users are in users list with name as Tim and John. For this scenario, John is considered as the manager of Tim.
2. Initial Form for the purchase order requisition.
3. Form to show the requested purchase order to the manager.
4. Form for the requester to make the corrections suggested by the manager.
5. List to store the approved purchase orders.
6. Approval process workflow.

Steps

1. Create Users with name John and Tim
   a. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Users**.
      The Users page appears.
   b. Add a new user with name John.
   c. Add a new user with name Tim, and set the *manager* as John.
2. Provide security rights to the users. Skip this step if security is disabled.
   a. In the **Enterprise Console**, point to the logged in user name, for example, admin, and then click **Repository Settings**.
      The Repository Settings page appears.
   b. In the **Advanced Settings** tab, click **Manage Security Group - Resource Mapping**.
      The **Security Mapping** page appears.
   c. Add a new security mapping for Tim as Contributor (from Map users tab).
   d. Add a new security mapping for John as Contributor (from Map users tab).
      Note: User search is case sensitive
3. Create Form for purchase order requisition
   a. In the **Enterprise Console**, click menu icon, and then click **Forms**.
      The Forms page appears.
   b. Create a new Workflow Initiator form and name it as *Purchase Order Requisition*.
   c. Import the form definition from the **Purchase Order Requisition_Form.xml** using the **Import** menu option in **Forms Designer.** Alternatively, use the following XML for importing:

d. Click **Finish**.

e. Select the form, and then select **Associate** from the ribbon to create association with the workflow.

The Bind window appears.

f. Select the task as **Design a new Workflow**, and then click **Next**.

4. Design the **PurchaseOrderApprovalProcess** workflow.

a. Enter the title of the Workflow as **PurchaseOrderApprovalProcess**.

b. Select **Design the Workflow now**, and then click **Finish**.

c. Using the import option from tools menu, import the workflow from **'PurchaseOrderApprovalProcess.xml**'.

      </workflow>
```

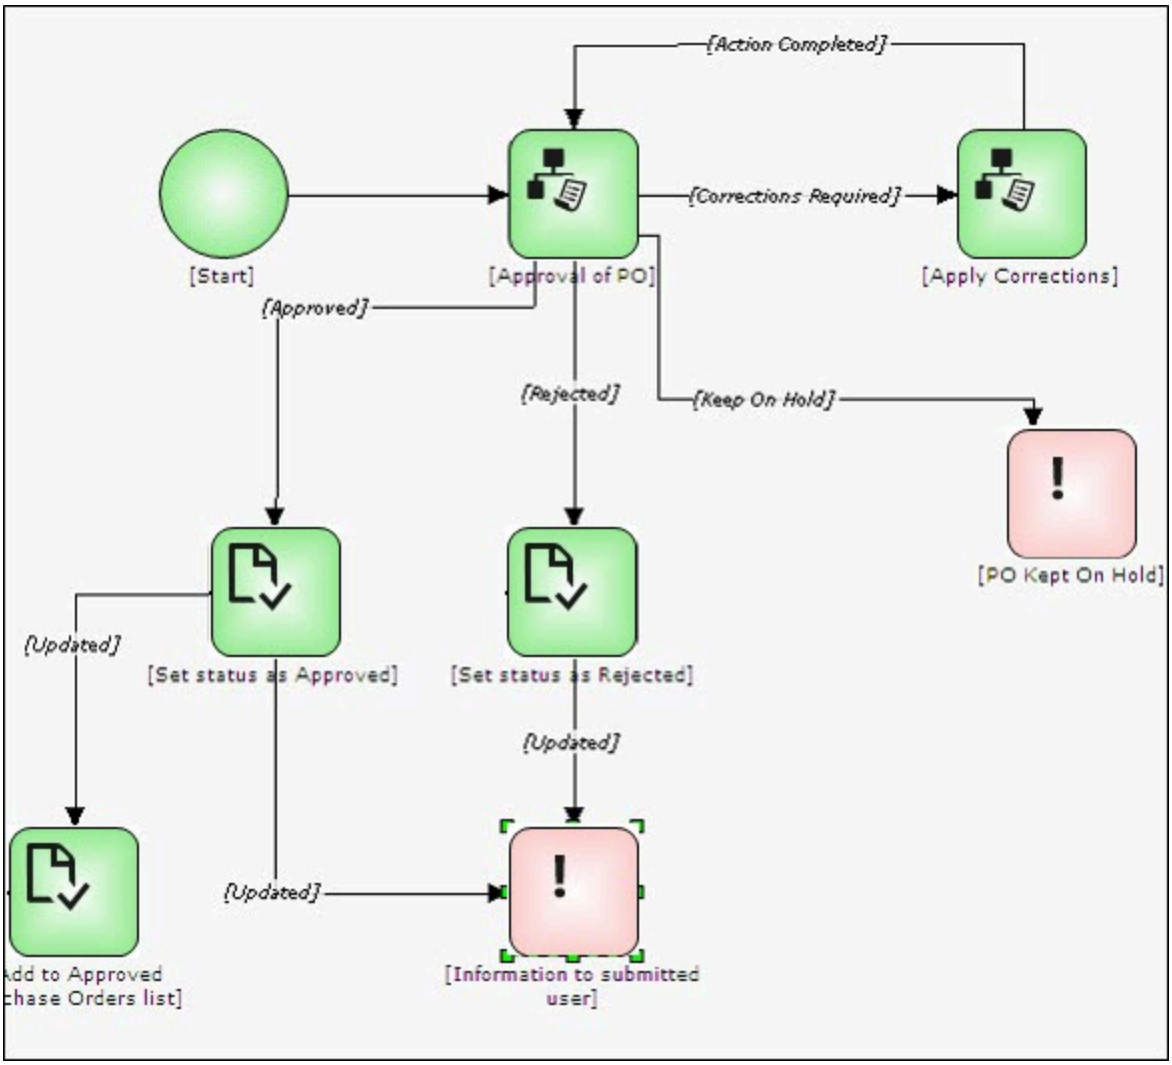
The Workflow looks as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



d. Publish the Workflow.

5. Create **Purchase Order Approval Form** for the approver.

   a. In the **Enterprise Console**, click ☰ menu icon, and then click **Forms**.

      The Forms page appears.

   b. Create a new Form named **Purchase Order Approval Form** which will be used for the approvals.

   c. Import the form definition from '**Purchase Order Approval_Form.xml**' using the **Import** menu option in **Forms Designer**, or use the following xml for importing and publish the form.

```
<BaseForm SaveButtonText="@@Finish@@" FormTitle="Purchase Order Approval Form"

d. Publish the form.

7. Create **Approved Purchase Orders** list to store the approved purchase orders.

   a. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**.

      The Manage List page appears.

   b. Create a new List named **Approved Purchase Orders**.

   c. Click **Save & Continue**.

      The **Select Table** page appears.

   d. Select the **Generic Table** option.

   e. Click **Next**.

      The List Designer appears.

   f. Import the list definition from **Approved Purchase Orders_List.xml** using **Import** menu option in List Designer or use the following XML:

```

i. Submit and publish the form.

8. Execute and check.
   a. Log on to the **Enterprise Console** as Tim
   b. In the **Enterprise Console**, click ☰ menu icon, and then click **Fill Form**.

      The Fill Form page appears.
   c. Select the **Purchase Order Requisition** form, fill the details, and then submit the request.
   d. Go to the Inbox of John, leave a comment, and click **Apply Corrections**.

      The request is returned to Tim.

      When Tim resubmits, the changed details can be seen in John's Inbox.

      When John when keeps it on Hold, information is sent to Tim but the work item will be retained in John's Inbox.

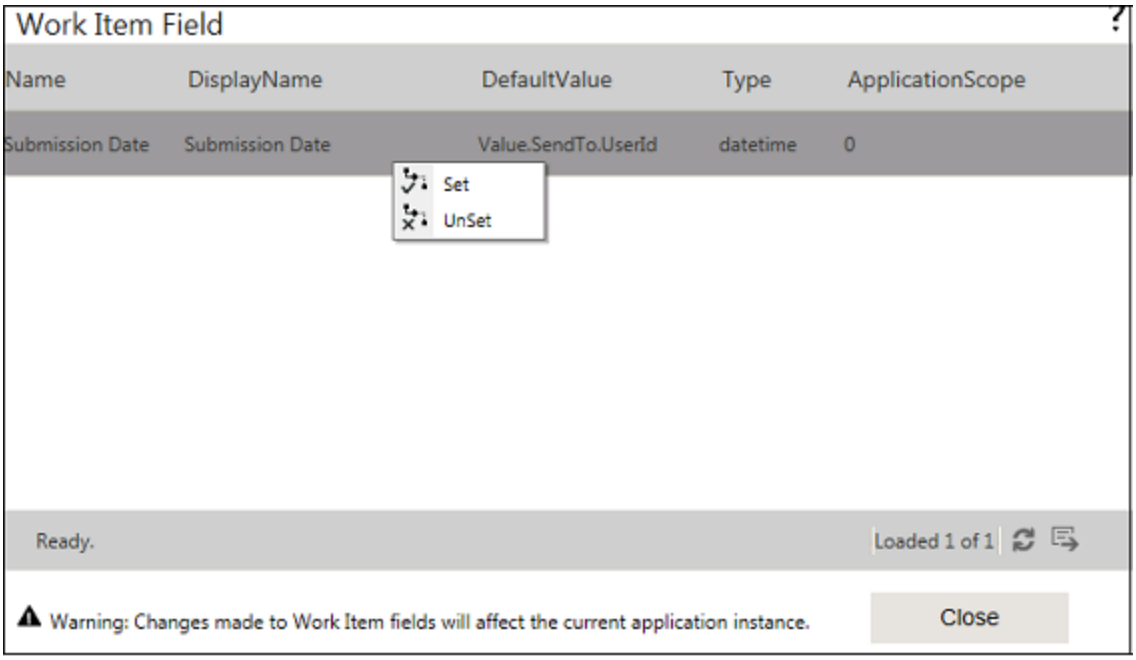
      When John Approves, the requested purchase order is added to the Approved Purchase Orders list.

Invoke Form - Work Item Fields

Purpose

You can set the Work Item Fields for this activity in this property window. To open this window, click the button for the **'Work Item Fields'** property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a grid listing all the Work Item Fields that have been set for the process.

- Each row in the grid represents a Work Item Field. You can click on a Work Item Field to select it.
- The context menu has the Set WorkItemField option, which you can use to set the selected Work Item Field for this activity. It also has the UnSet WorkItemField option to remove the Work Item Field setting.
- **Close** - You can use this button to close the window.

Note: While entering a value in the Work Item field, it is recommended to keep it less than the specified database column size. If there is a need to increase the size of the Work Item field, the user should manually increase the column size in the database.

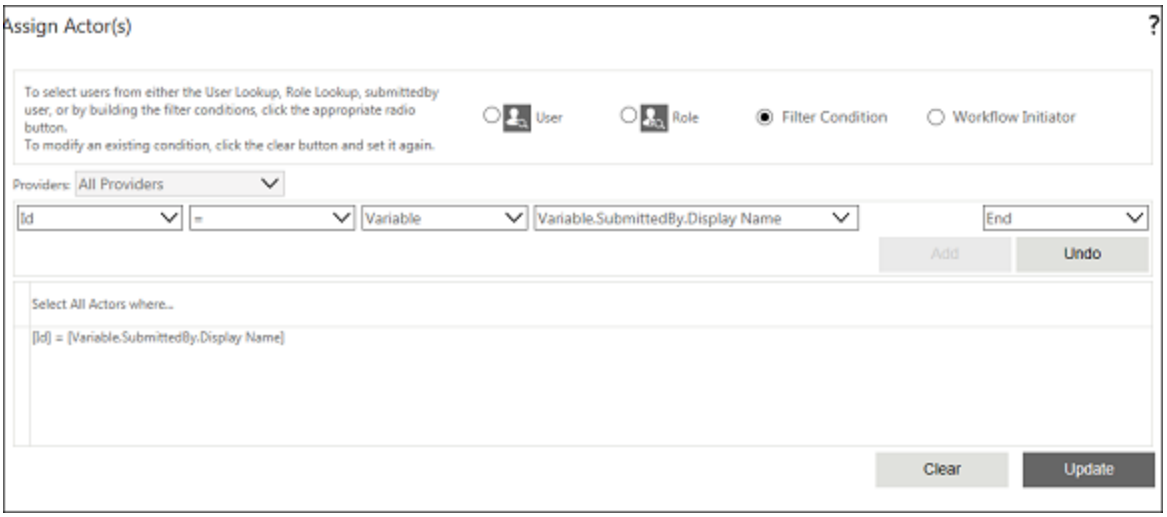
Invoke Form - Assign Actor(s)

Assign Actor(s) Property Window

You can set the actors to whom the Invoke Form work item is to be sent in this property window. To access this window, click the button in the 'Assign Actor(s)' property.

See Assigning a Task to a Manager for more details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Different Methods of Assigning an Actor

- **Assigning an Actor by building an expression:**

Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
- If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
- If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.

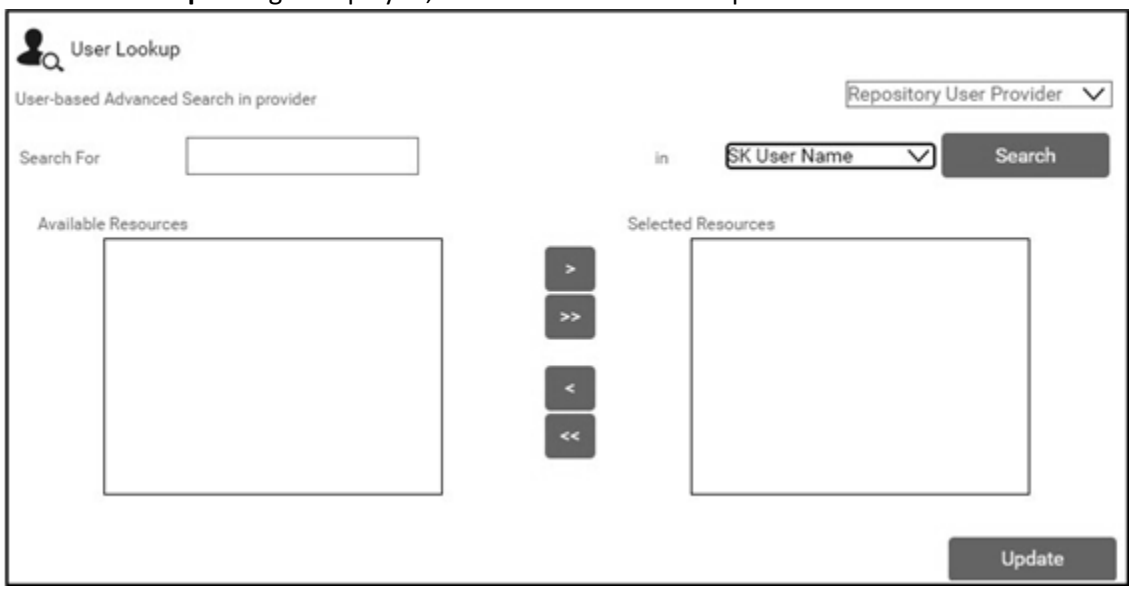
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Update** - You can click this button to save the expression that has been added to the text area.
- **Assigning an Actor through User Lookup**

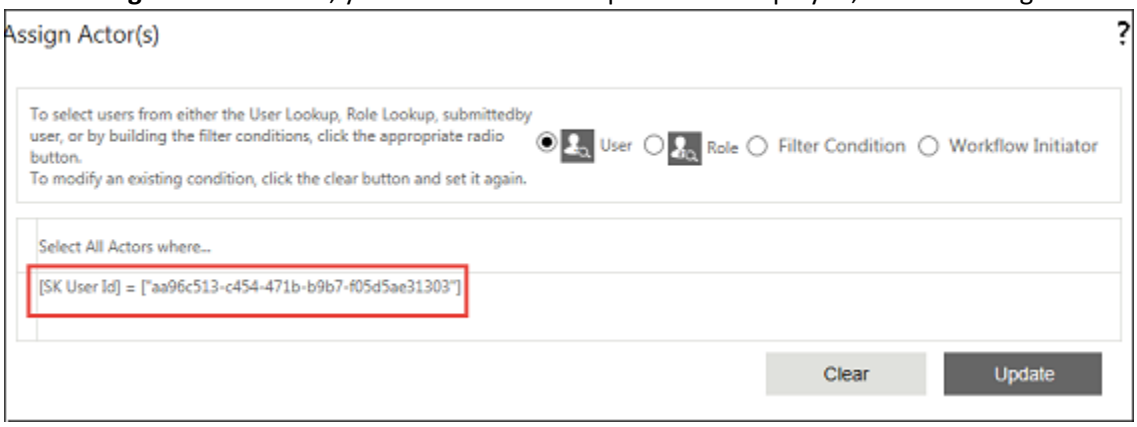
Through the User Lookup you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.

   The **User Lookup** dialog is displayed, search and select the required actor.



2. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:



3. Click **Update** in the Assign Actor(s) window to update the selected actor(s) in the **Assign Actor** property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

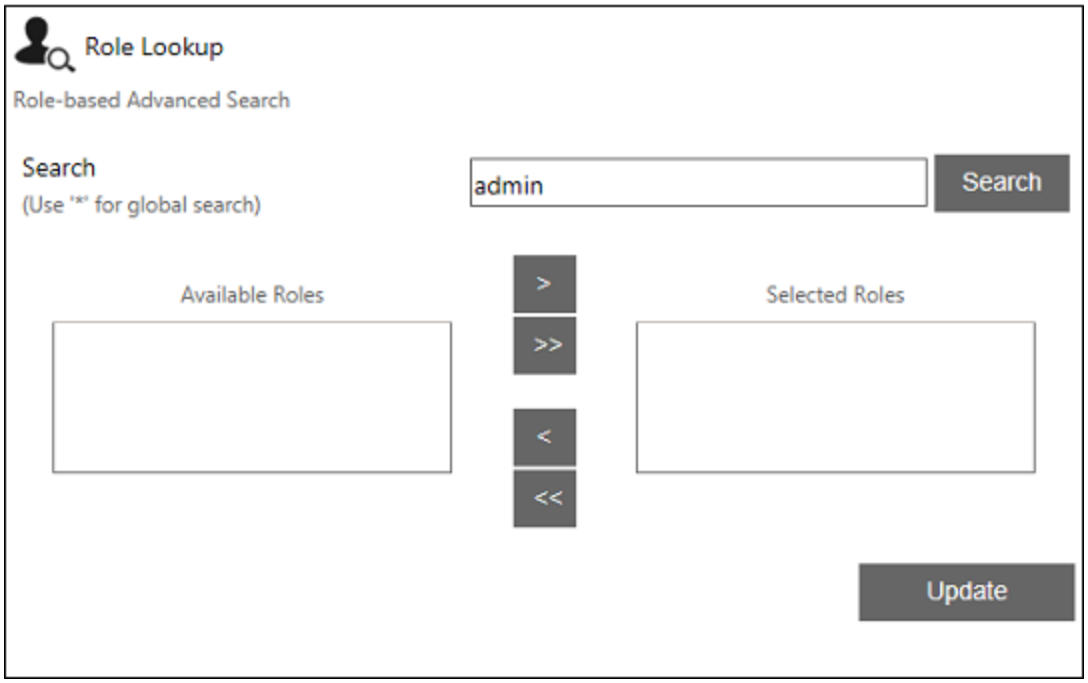
- **Assigning an Actor through Role Lookup**

Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

1. Select the **Role Lookup** option.

   The **Role Lookup** dialog is displayed, search and select for the required role.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



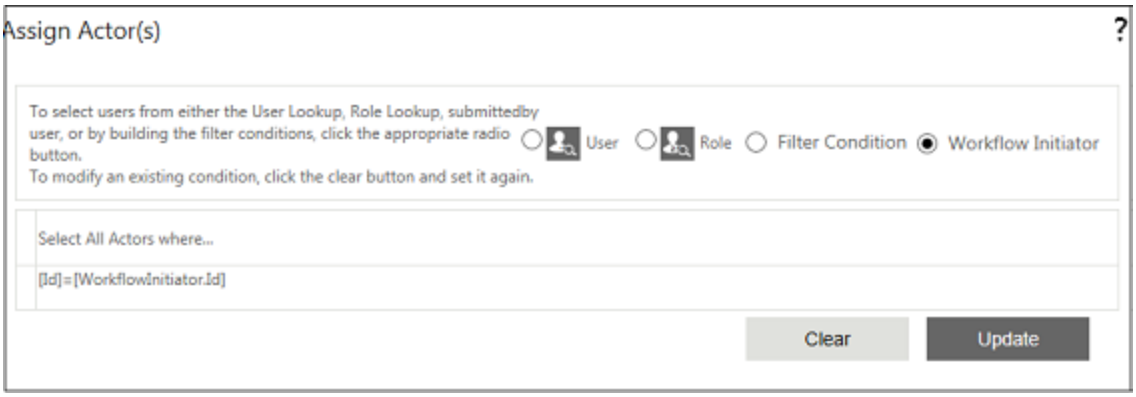
2. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

3. Click **Update** in the Assign Actor(s) window to update the **Assign Actor** property.

- **Assigning an Actor through Workflow Initiator**

Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

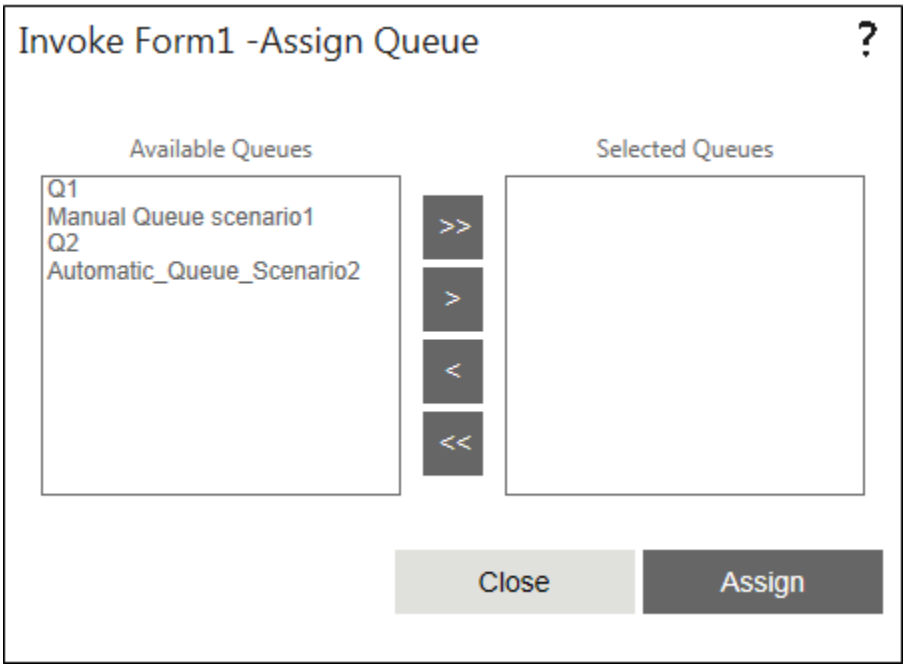
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Invoke Form - Assign Queue(s)

Assign Queue(s) Property Window

You can select the queues to which the Invoke Form work item has to be sent in this property window. To access this window, click the button in the 'Assign Queue(s)' property.



Assign Queue(s) Properties window for Invoke Form

The window has a pair of list boxes to specify the queue(s). The **Available Queues** list shows all the available queues. You can select the required queue(s) from this list box. The Selected Queues list shows all the selected queues to which the activity will be assigned.

You can use the following buttons located between the list boxes to move the queues to and from the list boxes.

- [>>] - You can click this button to add all the queues in the Available Queues list to the Selected Queues list.
- [>] - You can click this button to add the selected queue(s) in the Available Queues list to the Selected Queues list.
- [<] - You can click this button to add the selected queue(s) from the Selected Queues list to the Available

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Queues list.

- [<<] - You can click this button to add all the queues in the Selected Queues list to the Available Queues list.

At the bottom of the window you will find the following buttons:

- Assign - You can click this button to assign the activity to the selected queues.
- Close - You can click this button to close this window.

Assigning queue system variable

To assign queues instead of setting the queue through Assign Queue property, add a variable with a name prefixed by '^', with the following syntax:

"^"+ CurrentActivity.Name + "_QueueVariable".

For example, if the activity name is 'Approval1' then declare the variable as ^Approval1_QueueVariable in the **Start** activity with the Type as String. Using the "Update Variable" activity, assign the queue-id (GUID) for this variable in the workflow.

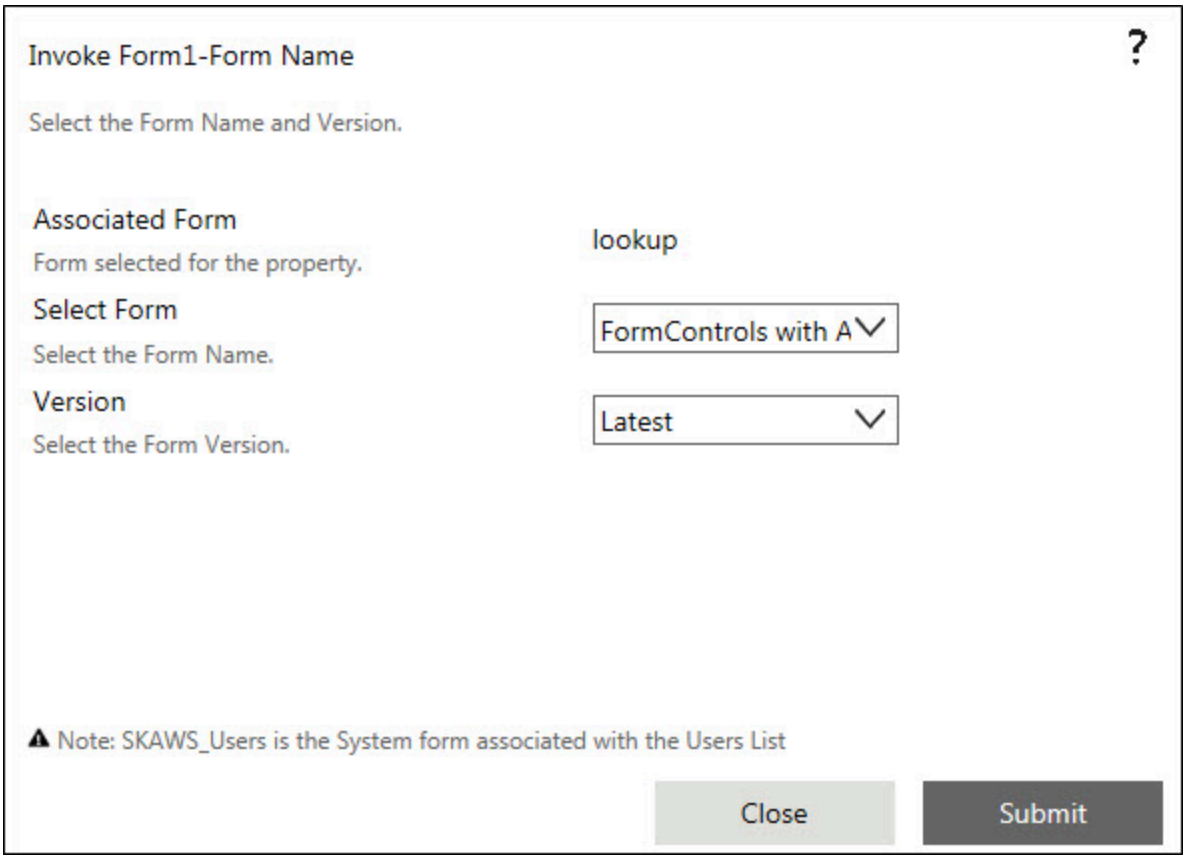
To assign multiple queues, specify the queue-ids with semicolon (;) as the separator. **Skelta.HWS.Queue.QueueCollection** class can be used to retrieve queue information.

Invoke Form - Form Name

Form Name Property Window

To open this window, click the button in the 'Form Name' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Form Name Properties window for Invoke Form

The Form Name window has the following fields:

Associated Form - Name of the associated form.

Form Name - You can select the Form name from this drop-down list. The pre-defined SKAWS_Users Form associated to the User list will also be available in this list.

Version - You can select the version from this drop-down list and default value is Latest Version.

Invoke Form - Output Instance XML

This property is used to get the data from the Forms which you have edited from the Work items page. Depending on the type of XML variable selected in this property, the XML data is stored, provided the output instance XML has the same schema of the Form.

For instance:

1. If the **Output Instance XML** is of type **XML List** , then the XML data received from the Form is stored in the respective List depending on the list item scope defined for the XML Variable.
   a. The list item scope should be New , if a new list item has to be added with the Form data in list.
   b. The list item scope should be Current, if the list item that initiated the workflow has to be updated.
   c. The list item scope should be List Query, if a specific list item has to be updated in the list.
2. If the **Output Instance XML** is of type **XML Document**, then the XML data received is stored in the workflow itself.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Scenario: Display an existing list item data using **Invoke Form** and then store the updated Form data in a different list (destination list): An intermediate XML Variable is required for such scenarios. Use an **Update Variable** activity before the **Invoke Form** activity, to assign the Source list XML values to the Intermediate XML Variable, Then use this intermediate XML variable as **Input Instance XML** and destination XML List as **Output Instance XML**.

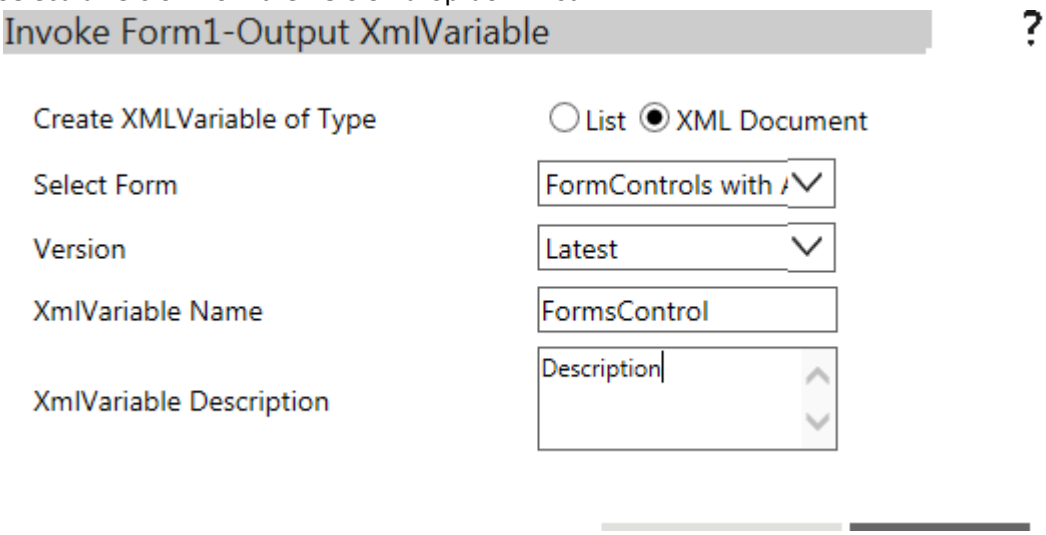
Steps to create Output Instance XML variable

1. Select an existing output XML variable from the **Output Instance XML** drop-down list, Or Click the edit button corresponding to Create a **Output Instance XML** variable.

   The following screen will be displayed.

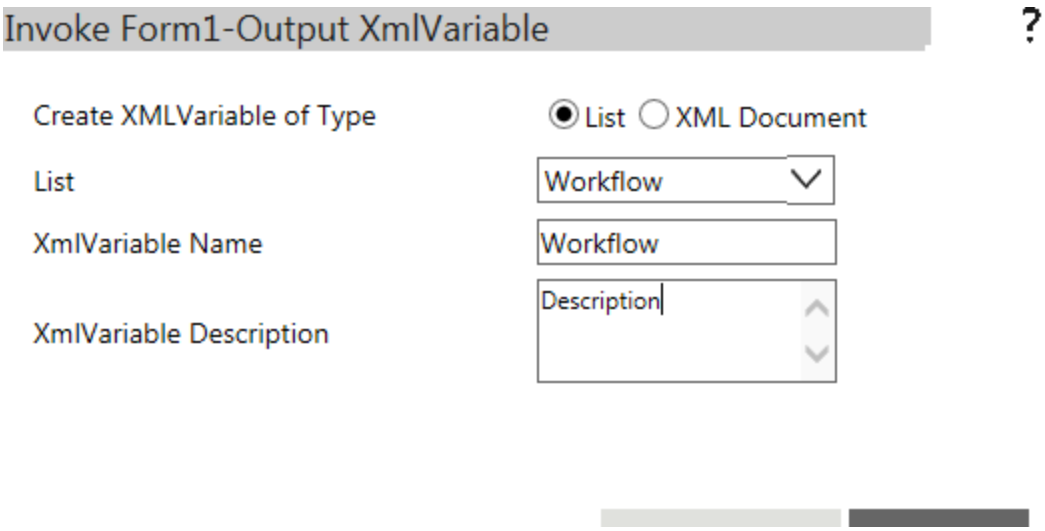
   Create a Output Instance XML Variable

2. Select a form from the **Form Name** drop-down list.
3. Select a version from the **Version** drop-down list.



Note: By default, the No option is selected and the screen as shown in the image above is displayed. If the Yes option is selected, the following screen is displayed. The difference, as you can notice, is that the No option allows you to select a form, whereas the Yes option allows you to select a list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



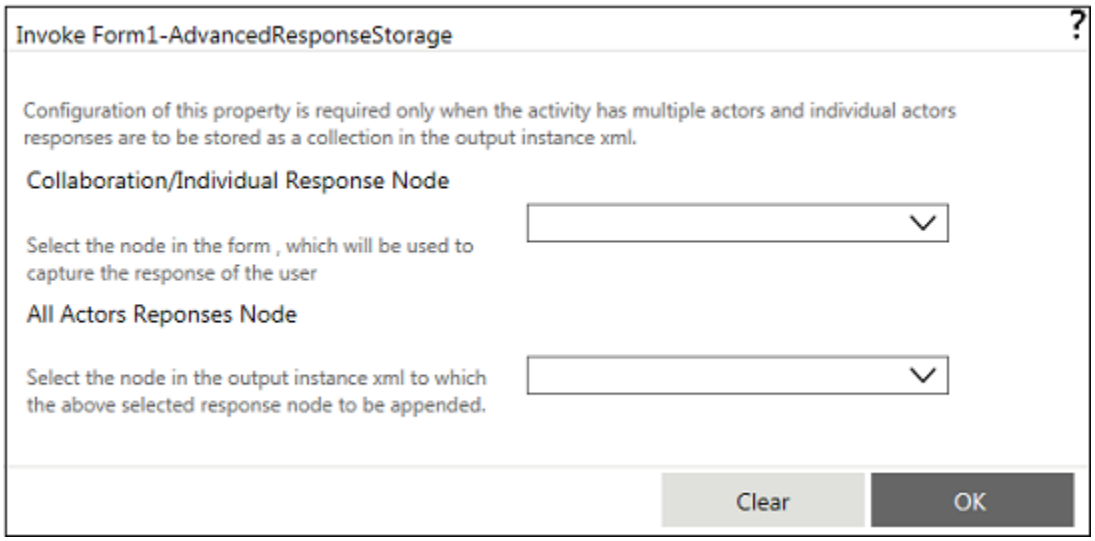
Note: On this screen, select a list from the List drop-down.

1. Enter a name for the output XML variable in the **XMLVariable** Name field.
2. Enter a description for the output XML variable in the **XMLVariable Description** field.
3. Click **Submit**.
4. The output XML variable is created. The created output XML variable will be available in Start activity.

Invoke Form - Individual Actor's Response Collaboration in Output Instance XML

You can use this property to collaborate with an individual actor's responses in the Invoke Form activity. You can configure this property only when the activity has multiple actors and you want to store the individual actor's responses as a collection in an Output Instance XML. When you use this property, the entire OutputXML is not updated. Only the nodes specified in the Collaboration/Individual Response Node is copied to the All Actors Responses Node of the Output instance XML.

The following image shows the input fields of the collaboration mode property:



If the Invoke Form Activity is not configured in collaboration mode, and if the task is assigned to multiple users, then only the submission changes made by the last user will be considered.

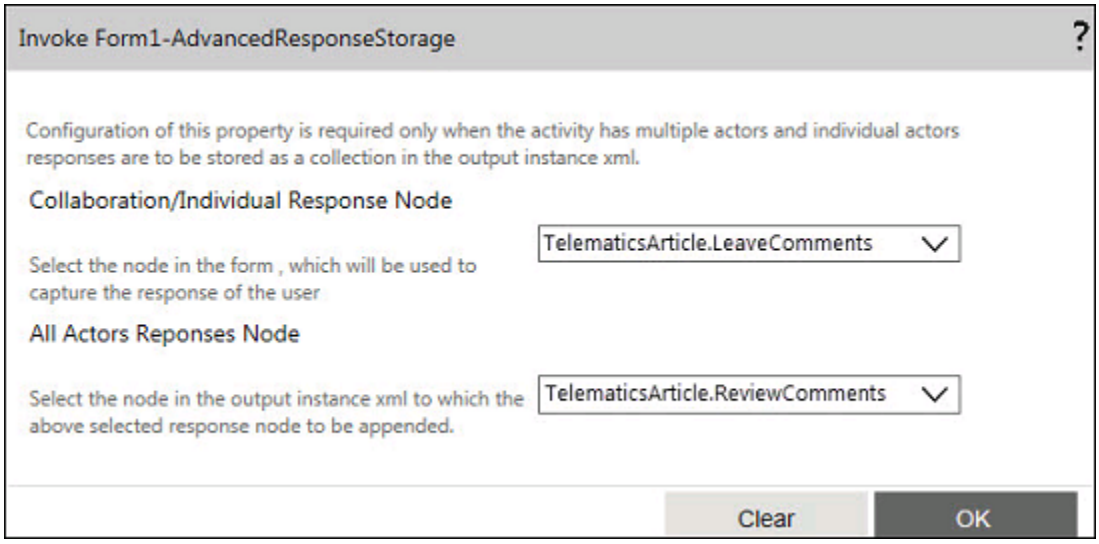
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Inputs for Collaboration/Individual Response Node and All Actors Responses Node must be either a base form or a panel form with XML node. You need to set Collaboration/Individual Response Node, which is the node used to capture the response of individual user. Also All Actors Responses Node is the node in the output instance XML to which the individual response node will be appended.

Steps to capture the Individual Actor's response collaboration in Output Instance XML

1. Click the edit button corresponding to Individual actor's response collaboration in Output Instance XML.

   The Invoke Form-AdvancedResponseStorage dialog box appears.



2. In the Collaboration/Individual Response Node, select the node in the form which will be used to capture the response of the user.
3. You can edit only the controls of the selected node. All the other controls will be read-only.
4. In the All Actors Responses Node, select the node in the output instance XML to which the above selected response node is to be appended.
5. Click OK.

Note: You can even include a User control to capture the User ID by default. This can be either visible or invisible to the end-user. To create a user control in the Form, you will have to populate the logged in user value in a form to a hidden control, so that in a workflow, a decision action can be performed based on the user who has filled the form.

Example scenario

The Telematics Company allows its employees to post articles. The articles posted can be viewed by a group of users defined in the workflow and these users can leave their comments on the article. These article viewers can also view the comments provided by others.

To achieve this, the user has to go through six steps. For each step, the respective XML file name with code is given below, which you can use.

Note:

1. In this scenario, we have used the repository with AVEVA Work Tasks List as the user provider.

2. Create XML files with the same filename as given below. Place all the files in a single folder for ease of use.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Create a list of users in the User's list with the group name 'ArticleSubscribers'.
   a. In the Enterprise Console, click the Menu button, click Settings, and then click Users. The Users page appears.
   b. Create some users with ArticleSubscribers as their role.
2. Create a List to store the submitted articles.
   a. In the Enterprise Console, click the Menu button, click Tools, and then click Manage List. The Manage List page appears.
   b. Create a new list named Telematics Article to store the submitted articles.
   c. Click on Save & Continue to go to the Select Table page.
   d. Select the Generic Table option.
   e. Click Next to go to the List Designer.
   f. Import the list definition from Telematics Article List.xml using Import menu option in the List Designer.
   g. Click Submit, to generate a default form for the list.
   h. Click Yes, to edit the default form which is generated. To change the look and feel of this default form, import the Telematics Article_ListForm.xml from Import menu option in forms designer. Now your form looks like the image given below in the forms designer.
   i. Submit and publish the form.

3. Create a Form to show the submitted article to the 'ArticleSubscribers' group, using which the users will be able to add a comment, as well as view comments given by other users.
   a. In the Enterprise Console, click the Menu button, click Tools, and then click Manage Forms. The Manage Forms page appears.
   b. Create a form named TelematicsArticlesReview.
   c. Import the form definition from TelematicsArticlesReview_Form.xml using the Import menu option in the Forms designer. If you notice, your form is again an exact copy of the Telematics Article form, but with an extra panel of 'Leave a Comment' section.
   d. You can see a tab in this form, where the first tab is to leave the comment by the Articlesubscriber group, and the second is to view the comments posted by other s in the group. If you do not need to show the others comment section, you can remove the views other's comment section.
   e. Check the mapped XML nodes (of parent and child controls) of both the 'Leave a comment' and 'Review Comments' control. Here you might have noticed that the child nodes have the same mapped XML nodes where as only for the parent it differs.
   f. To append/show a row by default for 'Leave a comment' panel, you can notice that a script is defined for the category drop down. Notice that this can also be achieved without scripting by setting the 'Rows to be added by default' as '1' and 'Allow default rows to render on XML Load?' as 'Yes' in the Advanced tab of 'Leave a comment' panel properties.
   g. Submit and Publish the form.
4. Create an Initial Form to submit the article.
   a. In the Enterprise Console, click the Menu button, click Tools, and then click Manage Forms. The Manage Forms page appears.
   b. Create a Workflow Initiator Form named Telematics Article Submission.
   c. Import the form definition from Telematics Article Submission Form.xml using the Import menu option in

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the Forms designer. You will notice that your form is an exact copy of the Telematics Article form, but without the Review comments section.

d. Submit and Publish the form.

5. Associate an Article Submission Form to the Article Review Workflow.
   a. On submission, a page related to Form Binding opens, where the user can select a task as designing a new workflow or selecting an existing one.
   b. Select Design a New Workflow and provide the workflow name as ArticleReview.
   c. Select Design this Workflow now in the next page.
   d. From the Process Designer, use the Import option from Tools menu and import the workflow from ArticleReview Workflow.xml.
   e. Publish the workflow.
6. Execute the form to see how each individual actor's responses collaborate.
   a. In the Enterprise Console, click the Menu button, and then click Fill Form. The Fill Form page appears.
   b. Select the Telematics Article Submission form, fill the details, and submit the form.
   c. Go to the Inbox of each ArticleSubscribers, leave a comment, and submit the form.
   d. You can view all user's comments under 'View Other's comments' section.

Note: In multi-user scenarios to view the response details of other users ensure that the Input Instance XML name and Output Instance XML name is same for the Invoke Form activity.

Invoke Form - Update Form Parameters

A parameter represents a value that is passed to a variable. The parameter value is defined when the variable is declared in the procedure. A procedure can be defined with no parameters, one parameter, or more than one. The part of the procedure definition that specifies the parameters is called the parameter list.

Here, parameters represent the form variables where the user can define while designing the form. These parameters can be used in Forms scripts, in user look up controls to build the filter expression, and as a parameter for the lookup query.

Note: Form parameters values are not stored either in form definition or in database. These values are rendered when the form is rendered.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

How to define parameters: To work with parameters, the Form should have parameters defined. To define the Form parameter, on the corresponding Forms Designer screen, click **Edit properties of the form** on the top. Click the **Advanced** tab. You can define the parameter in the **Form Properties** section. You can define the parameter clicking the **Add Row**.

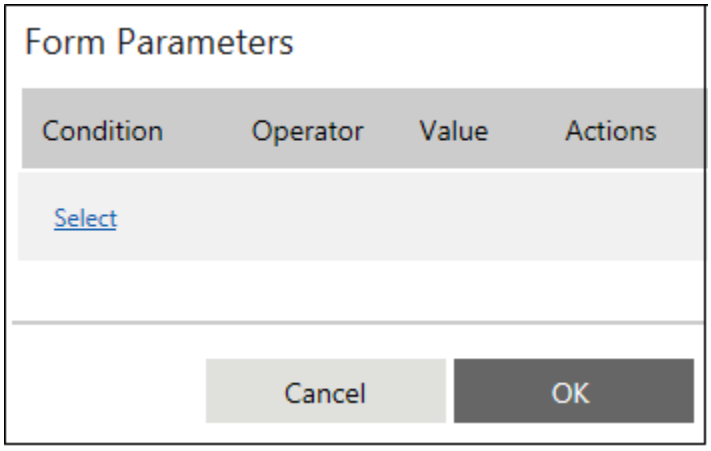
How Form parameters can be used?

Form parameter can be used in Form scripts, in user look up controls to build the filter expression, and as a parameter for the lookup query. Below is the sample scenario for how parameters can be used in form scripts.

Suppose in our form we have two controls Employee id & Manager Name. Based on the Employee id entered, we can populate the Manager name. To achieve this, we need to write the script (C#) to update the Manager name value from Form parameters. This parameter value can be updated from workflow.

Steps to set Update form parameters:

1. Click the edit button corresponding to **Update form parameters**. The following screen will be displayed.



2. To select a form parameter from the drop-down list, click the drop-down. The following screen is displayed.
3. Expand the tree by clicking on the '+' sign. The associated parameters of the form are displayed.
4. Select the desired parameter by clicking the name. The following screen will be displayed.
5. Click **Enter value** to display a text box. Enter the new value for the parameter in the text box.

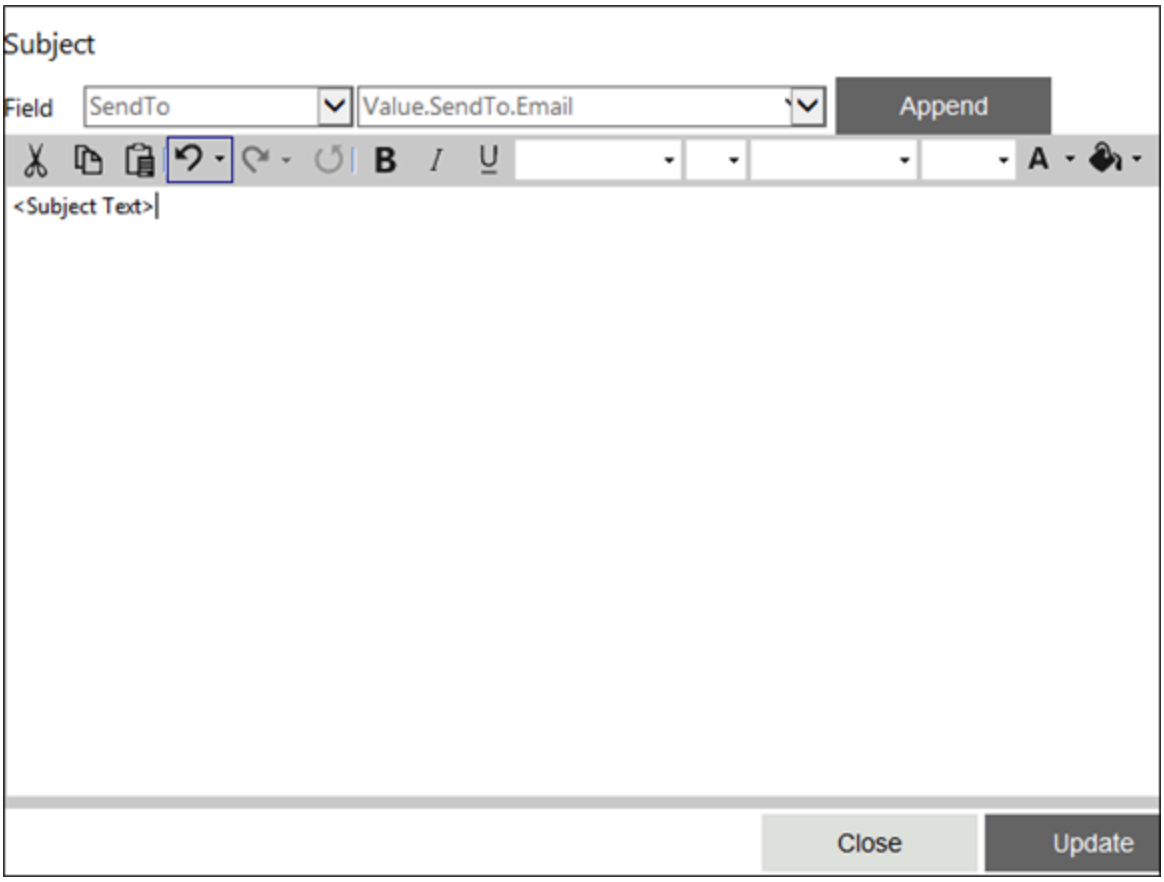
   You can also select a new value by clicking .
6. Select the desired new parameter to be updated by clicking it.
7. Click **OK**. The new parameter is updated.

Invoke Form - Subject

Subject Property Window

You can specify a subject for the Invoke Form WorkItem assignment in this property window. To access this window, click the button in the 'Subject' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the subject. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/ drop down - You can specify the actual value of the subject. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the subject in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the subject.
- **Append** - You can click on this button to add the specified value, variable or content to the text editor.

Tip: You can specify the subject using a combination of discrete value and variable or content. For example, in the image above, the subject entered is "Submitted By <%#Variable.SubmittedBy.Email%>". Here, the string "Submitted By" has been typed directly in the text editor. The second half of the subject is a placeholder, which will be replaced by the variable value during run-time. This has been added by selecting the appropriate variable option from the **Field** drop down and clicking on **Append**.

The text tool bar above the text editor allows you to manage and format the subject. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

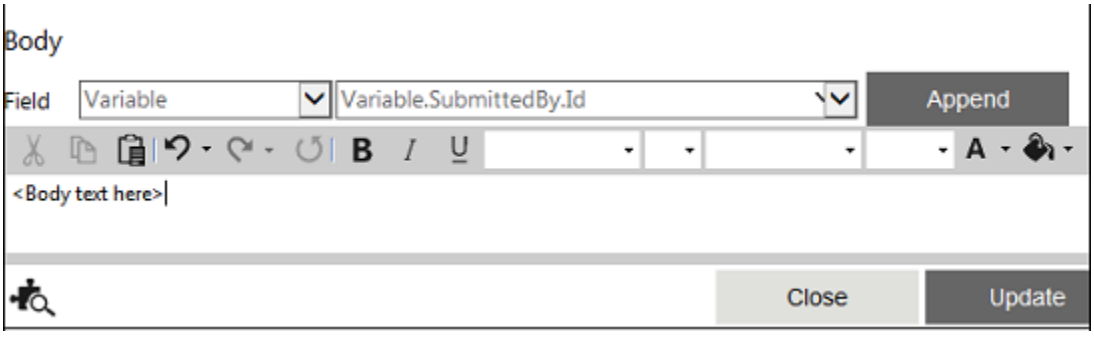
At the bottom of the window, you will find the following buttons:

- **Update** - You can click this button to save the subject.
- **Close** - You can click this button to close this window.

Invoke Form - Body

Body Property Window

You can specify a message Body for the Invoke Form work item assignment in this property window. To access this window, click the button in the 'Body' property.



The window has a text editor to enter the body text. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/ drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.

- **Append** - You can click this button to add the specified value, variable or content to the text editor.

You can specify the body using a combination of discrete value and variable or content. For example, in the image above, the body message entered is "Hi, Please approve the leave application submitted by <%#Variable.SubmittedBy.name%>". Here the string "Hi, Please approve the leave application submitted by" has been typed directly in the text editor. The second half of the body is a placeholder, which will be replaced by the variable value during run-time. This has been added by selecting the appropriate variable option from the Field drop down and clicking Append.

The text tool bar above the text editor allows you to manage and format the body text. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting and other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

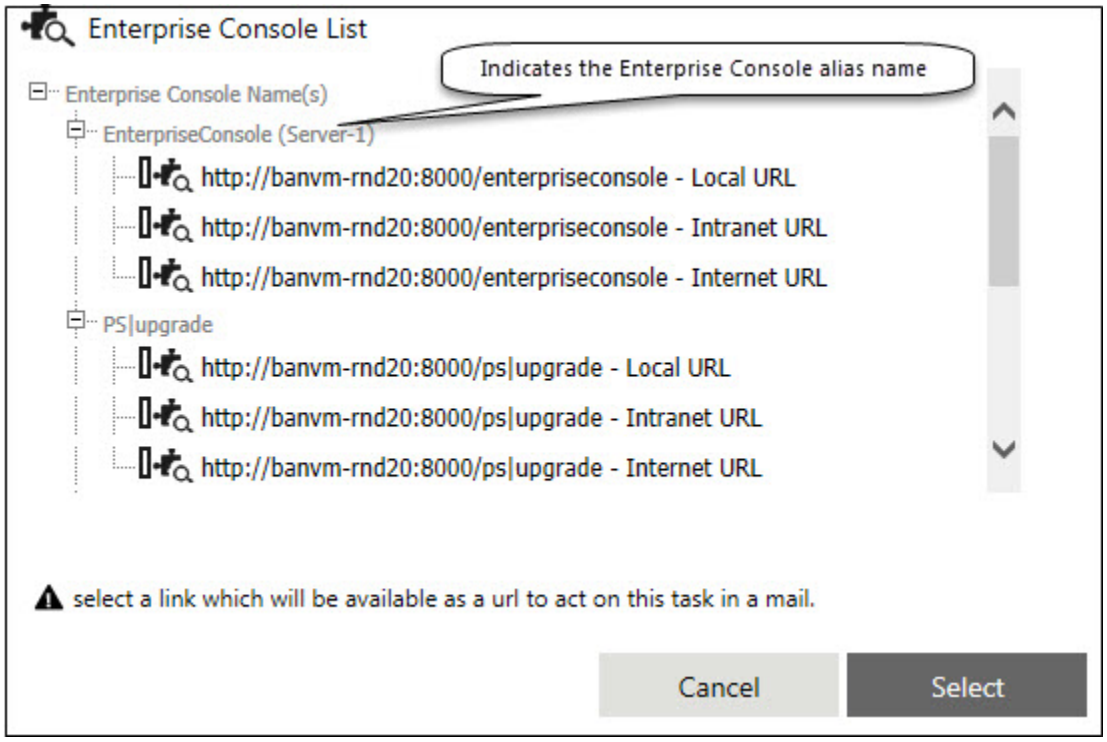
- **Update** - You can click this button to save the body message.
- **Close** - You can click this button to close this window.

To compose the body text, do the following steps:

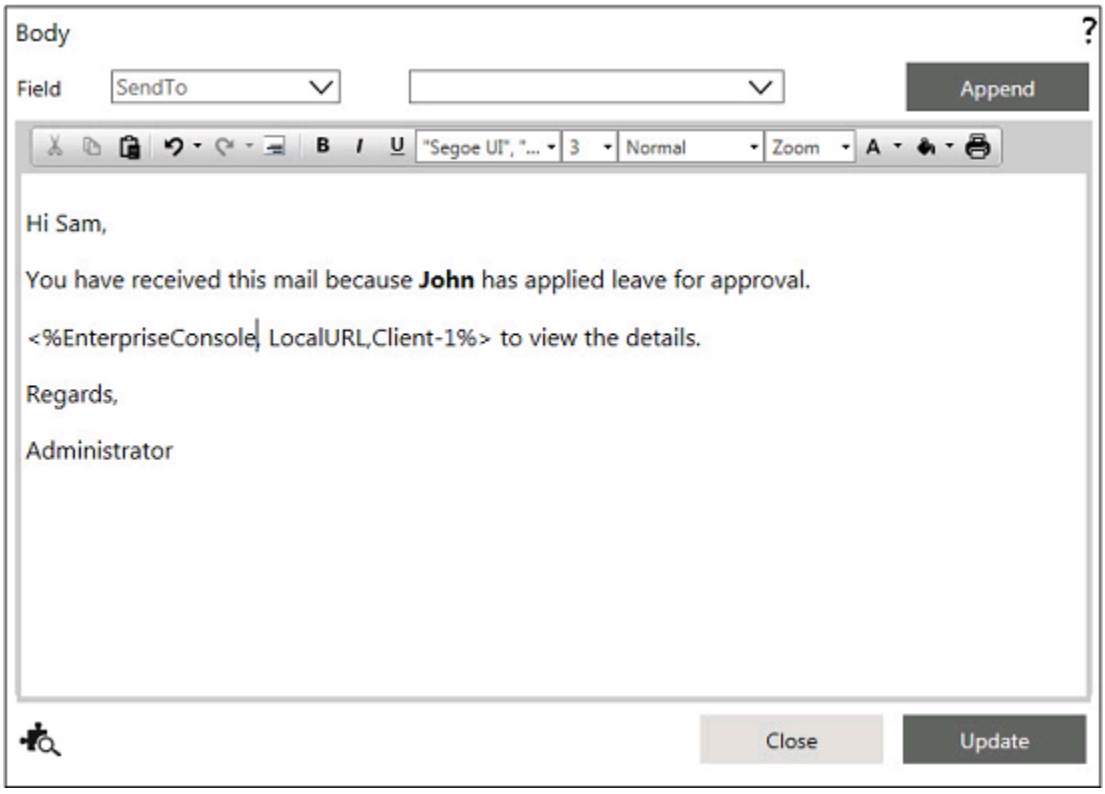
- **Body:** Click the edit icon to open the **Body** property window.
  1. Compose the body text.
  2. To get a direct link to the AVEVA Work Tasks Form as an email, click **Enterprise Console Explorer**(plug-in)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

icon to select the required URL and then click **Select** as shown in the following figure. See ResourceSet - Subject for more information.



The composed mail is shown in the following figure



The above composed mail will be displayed both in Email as well as in the Work item Details View page.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: If you do not want to display the above composed mail, Click Here text information in the Work items Details View page, then enclose the above text within "<!== ==>" as shown below.

<!==
Hi Sam,
You have received this mail because **John** has applied leave for approval.
<%EnterpriseConsole, LocalURL,Client-1%> to view the details.
Regards,
Administrator
==>

1. Click **Update** of the Body window property to save the contents.

Invoke Form - Template Path

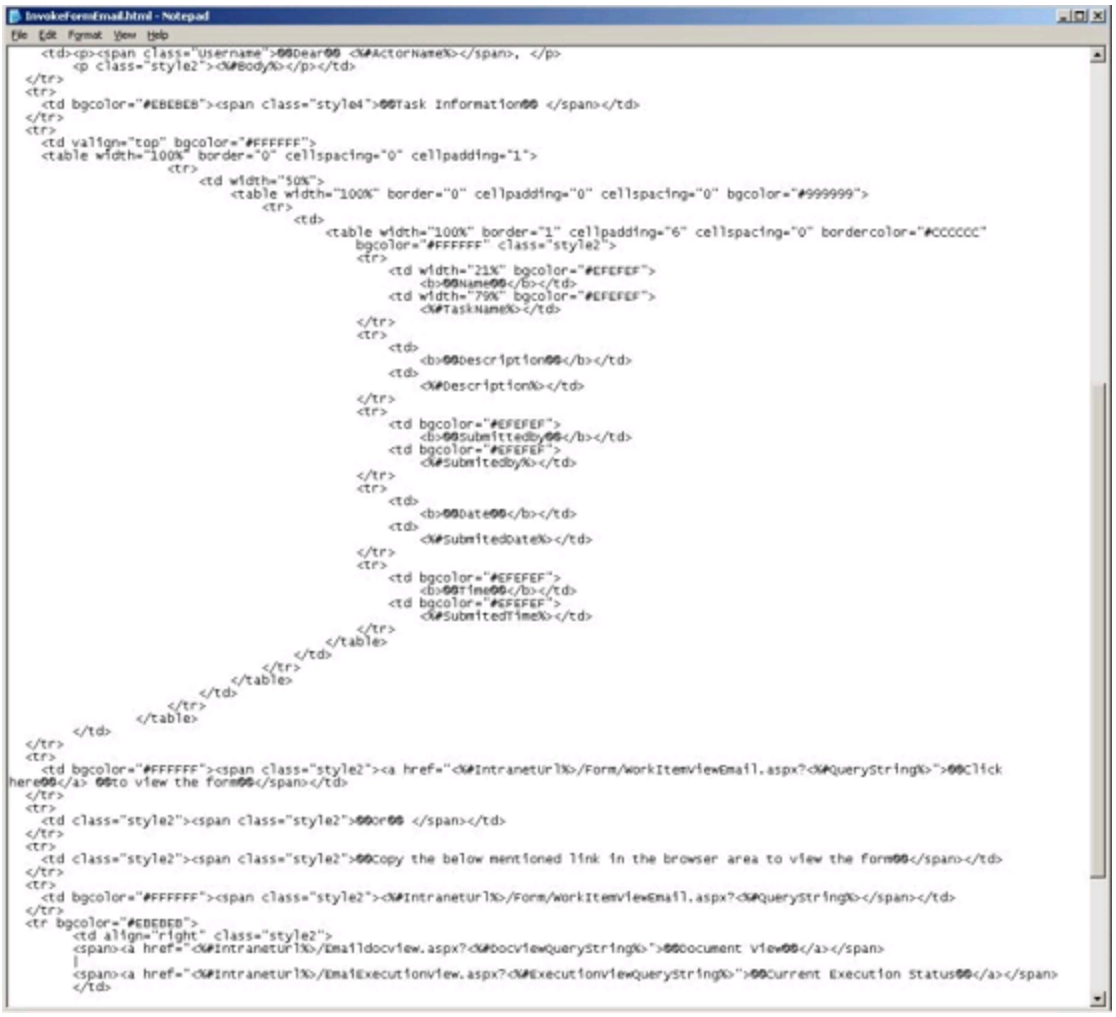
Standard Template

If you are using the template in general, then you can use the generic template which is placed in the physical path across the workflow.

The standard template is available in *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Templates\FormEmailTemplate* folder.

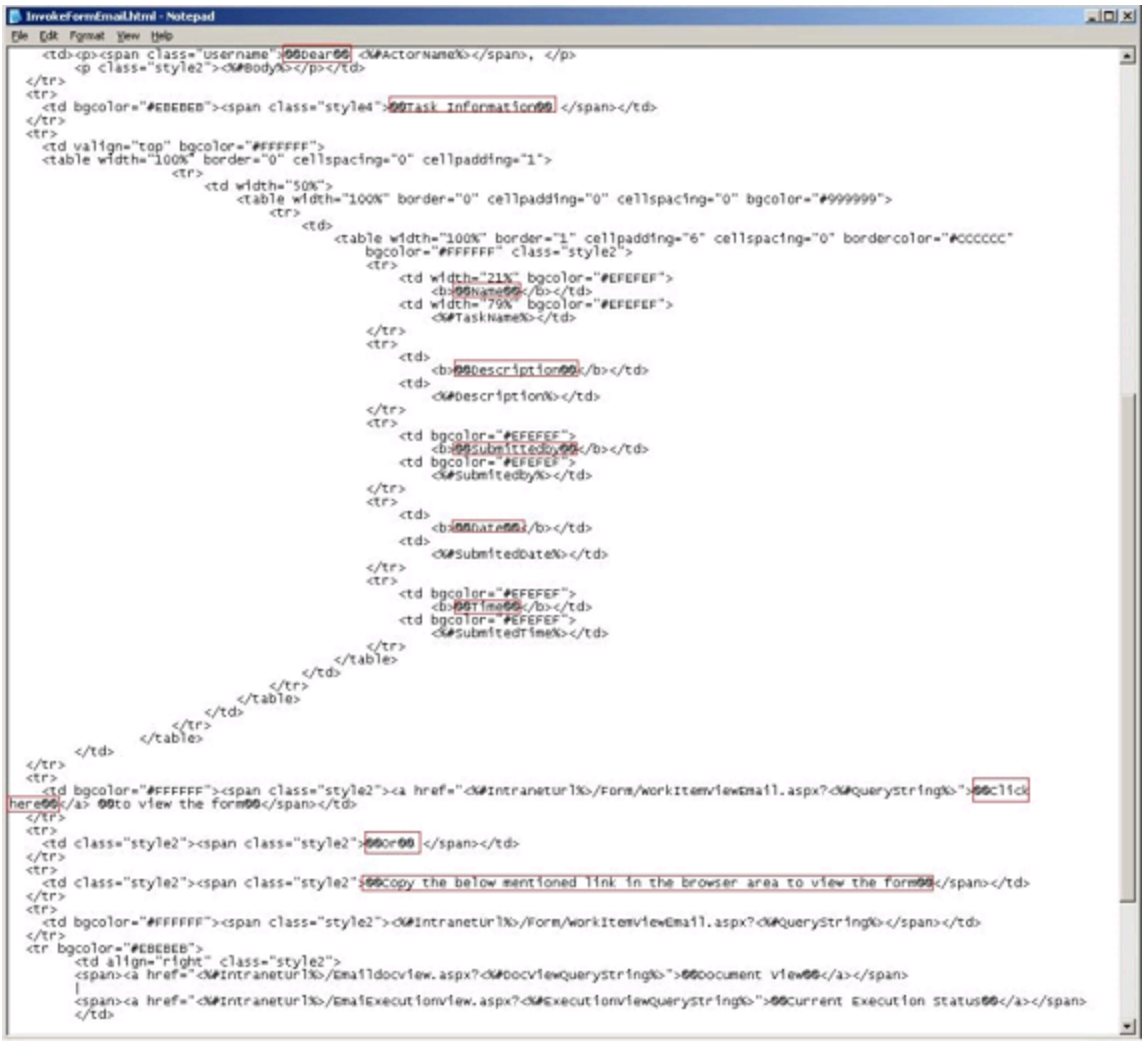
The standard template 'InvokeFormEmail.html' is shown in the figure below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The text enclosed within @@ are taken from Locales folder *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Locales\en-US* and you can customize these text. These are marked in the figure below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



To customize text within '@@', follow the steps given below:

1. Go to the following path *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Locales\en-US*
2. Open the required file and customize the required text.

Customizing Template

If you want to specify the template for different activities then you can create different templates for different activities. You can store the created templates wherever engine is running. Example: You can create a manger template for manager, Employee template for employee, leave application template for all employees and salary template etc.

Note: In an Enterprise Server scenario, if there are two servers running, then the template path will be considered for which engine has got the request.

To create a new template, there are two ways:

First Option:

Create a HTML file and place it in any place wherever the engine is running. Enter the entire path in the Template Path property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: Make sure that, while creating a template, you should use the marked text in the template in order to get the Work Items from AVEVA Work Tasks.

Second Option:

Take a copy of **'InvokeFormEmail.html'** and place it in any physical path and customize the text however you want.

The following table depicts the Placeholder which you can customize in your template:

Placeholder	Description	Example
<%#ActorName%>	Name of the user to whom the email has to be sent, using the template.	Sam
<%#Submitedby%>	Name of the user who submitted the workflow	John
<%#Body%>	The content specified in the Body property will be reflected.	Please fill a form below to process your tax declaration.
<%#TaskName%>	Activity name	Leave Application Form
<%#Description%>	Activity description	Detailed leave information of the employee
<%#SubmitedDate%>	Date when workflow was submitted	12/10/2008
<%#SubmitedTime%>	Time when workflow was submitted	04:00:24
<%#LocalUrl%>	Enterprise Console local URL to send form link as an email.	http://localhost:8000/enterpriseconsole/BPMUITemplates/Default/Email/
<%#IntranetUrl%>	Enterprise Console Intranet URL to send form link as an email.	http://machinename:8000/enterpriseconsole/BPMUITemplates/Default/Email/
<%#InternetUrl%>	Enterprise Console Internet URL to send form link as an email.	http://www.skelta.com/enterpriseconsole/BPMUITemplates/Default/Email/
<%#ApplicationPath%>	Enterprise Console path will be considered from SKAddInProviderSettings table for the respective repository. If you are not getting the mail from SMTP exchange server , you need to do some manual entry in the SKAddInProviderSettings table.	http://skeltanb24:8000/enterpriseconsole/BPMUITemplates/Default/Email/

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Placeholder	Description	Example
	In the Settings column of the SKAddInProviderSettings table, change the entry 'http://[ApplicationPath]/BPMUITemplates/Default/Email/' to your local machine name/IP address with port. Example: Change ApplicationPath to EnterpriseConsole url In the Application column of the SKAddInProviderSettings table, change the entry 'Default' to repository name. Example: Change Application to EmployeeRepo	
<%#QueryString%>	The query string which contains the Work Item information in encrypted format.	mcuri=uSR0tBXvLACdY2J-e1EPXjPewxFYxLx6G5Rg2zPgzpr8EYiyP63v6QSY0jdq26OnLOrwfy8iDwUhUUCdeEsOzKWgI4D7MF_9Y-LWRlb05T0pfbBP12oTqK0hRvyZsnCBxDeX190sSTkyt2mGY3nCDzCkVPrLMu82msEhQdm_g8HeO5SY_fWhiWgGDKjPai0O
<%#DocViewQueryString%>	Document View page details	Emaildocview.aspx?mailviewuri=nLOVXOa2m4x43xcG4kWt0Zi7gsePioiAfQsnck92w-Fr-uMXWj5scuZy-xVNkzCQhOKoFPTpRGuRQobt4kbSlJD4TXQXi6e9mDkPXOrR5UGBQiGOq88IvRJqleRkwK5PXKgWPIbdLChdMYl1Xl5IIebMMjeVsHi4KXFuiw9Maa1vp2805TjpiBAbODvy1dO6NX8oBEaoiKu1XiHUKX1Lwpd2nkCb26C_jEpvKDBKAwHvqpHWZViDFoDlKmUa8YvgHfrm3Xf-xAWy02z5IJ4WvPUe6kgQoFwLDleRfF-W6hw!
<%#ExecutionViewQueryString%>	Process Execution page details	EmaiExecutionView.aspx?mailviewuri=nLOVXOa2m4x43xcG4kWt0Zi7gsePioiAfQsnck92w-Fr-uMXWj5scuZy-xVNkzCQhOKoFPTpRGuRQobt4kbSl

Invoke Form Activity Email Template

AVEVA Work Tasks Engine accesses the approval activity's email template from the following physical path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Templates\FormEmailTemplate\InvokeFormEmail.html

This template can be modified as per the UI requirement. The mails received by the actor is based on the above mentioned mail template.

Below is the default email template text for the **InvokeFormEmail.html** file of the mail received by the actor.

InvokeFormEmail.html

```

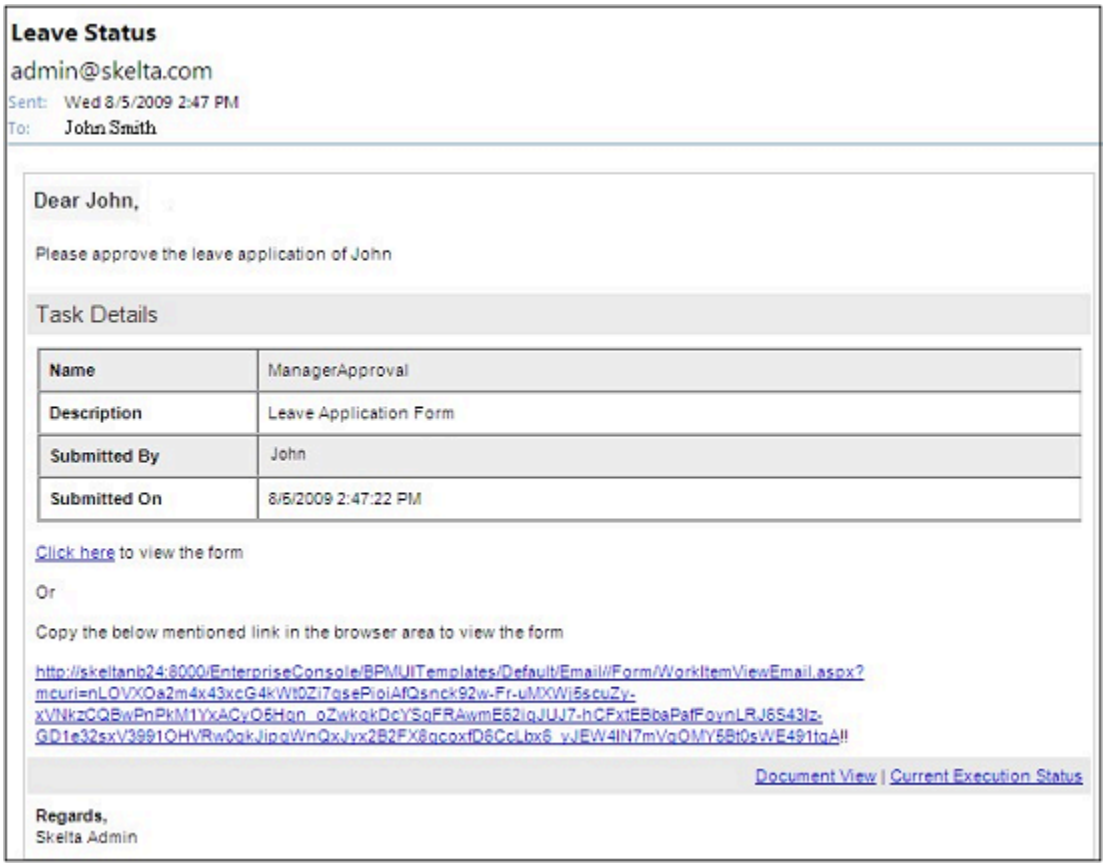
The following figure shows the Invoke Form activity Email template:



Note:

The QueryString placeholder is mandatory and should not be modified.

```
<a href="<%#IntranetUrl%>/Form/WorkItemViewEmail.aspx?<%#QueryString%>">@@Click here@@</a>
```

There are four types of placeholders. They are :

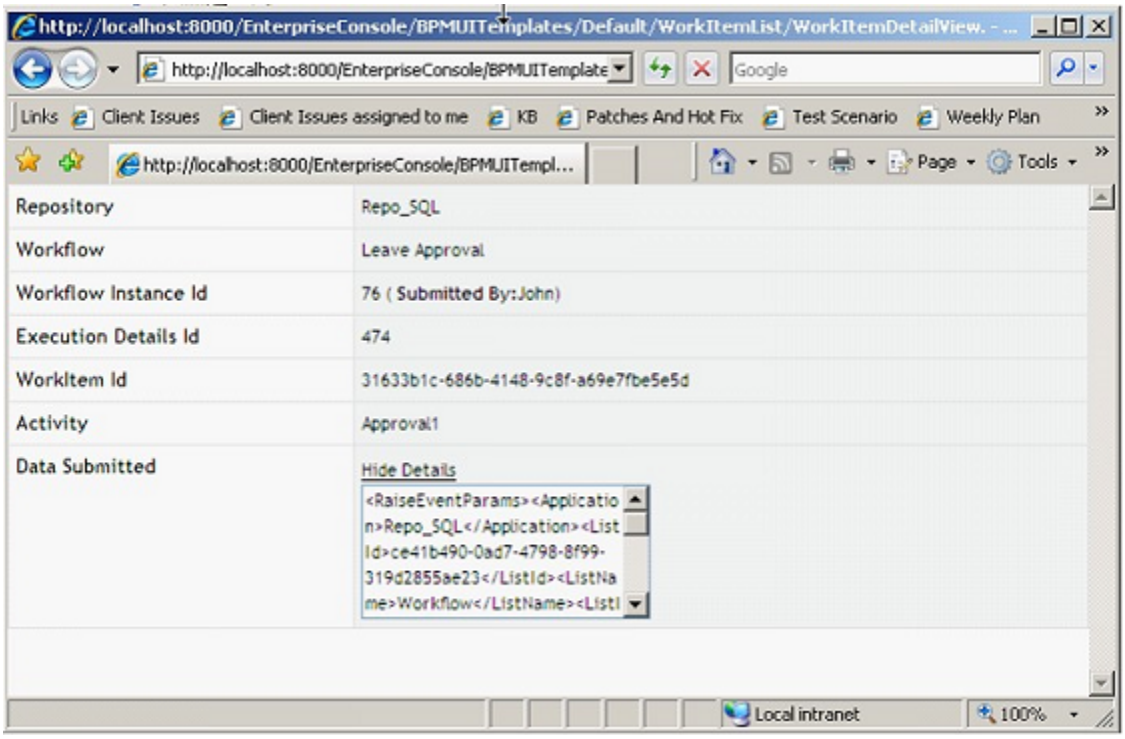
```
<%#LocalUrl%>, <%#IntranetUrl%>, <%#InternetUrl%> and <%#ApplicationPath%>.  You should use
at least any one of these placeholders based on the requirement.  By default
the <%#IntranetUrl%> is used as shown below.
<a href="<%#IntranetUrl%>/Form/WorkItemViewEmail.aspx?<%#QueryString%>">@@Click here@@</a>
```

Document View:

When you click the **Document View** link, the document view with execution details is displayed as shown in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

following figure.



Document View

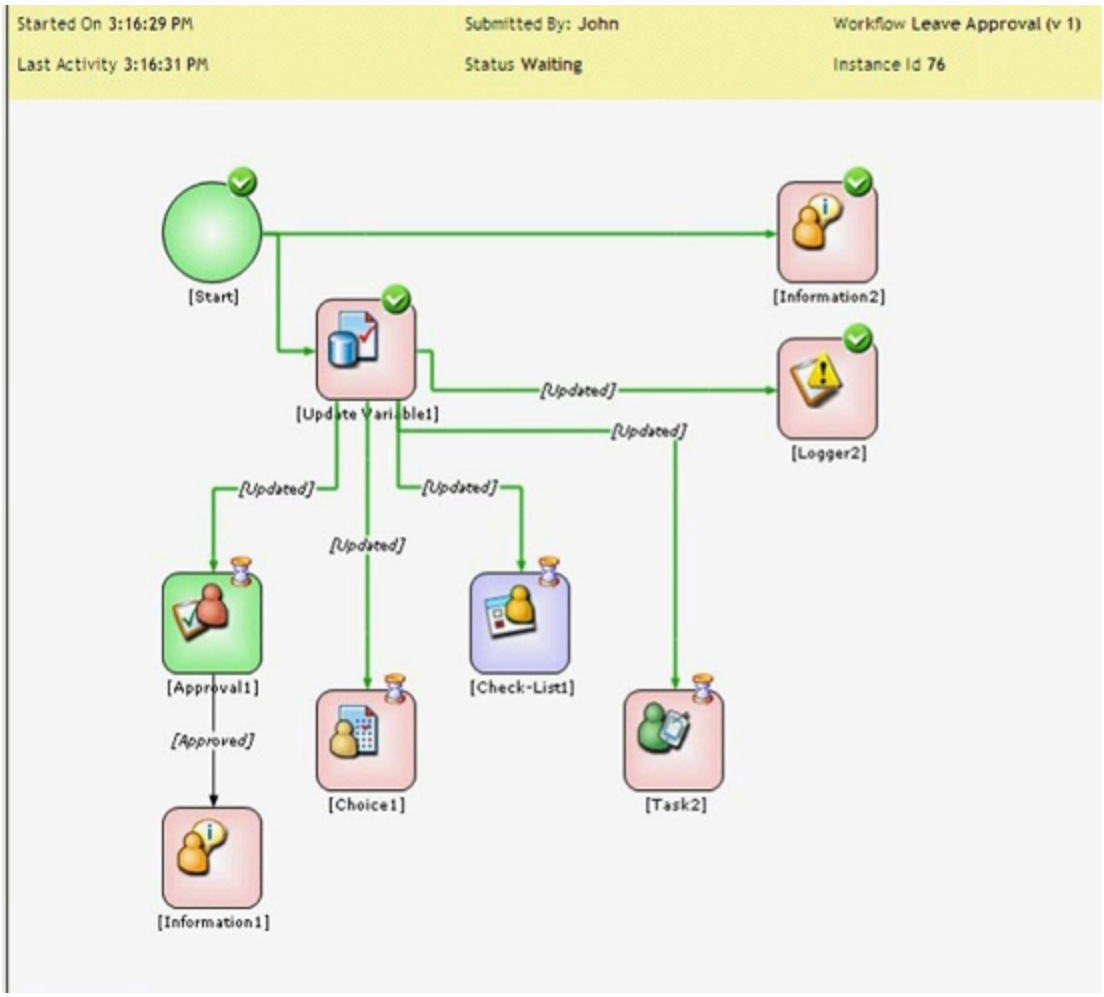
Current Execution Status:

An actor will be able to access the **Process Execution View** and their work item from an Email which is sent to the actor.

Pre-requisites:

- To access the **Process Execution View**, you have to be connected to the application server via LAN or WAN or Internet. In case, not connected to the application server, then the Process Execution View will not be accessible. When you click the **Current Execution Status** link, the **Process Execution View** of the **Analysts View** will be displayed as shown below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Use Variables in Invoke Form Activity

Email templates can be used to display the values of the variables that have been created in a workflow.

Scenario

Scenario Requirements:

Assume that, variable of type string by name '**Status**' is created in **Start** activity and its value is updated as **"Variable, status is updated".**

You want to,

1. Display the variable's value in Invoke Form email.
2. Display the variable's value after "Submitted On" row in the Task Details Table.

Scenario Solution

To display this variable's value in Invoke Form email and to display the variable's value after "Submitted On" row in the Task Details Table, the following steps need to be followed:

Steps:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Copy **InvokeFormEmail.html** file.
2. Use the **<%#Variable.**Variablename%> placeholder in the html template for viewing the variable's value. Where <Variablename> is a name of the variable. Since the variable name is "Status", the placeholder to be used is <%#Variable.Status%> where the value is to be displayed. The highlighted portion in the below code displays the position where the **<%#Variable.Status%>** placeholder is added.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w3.org/TR/

</tr>
</table>
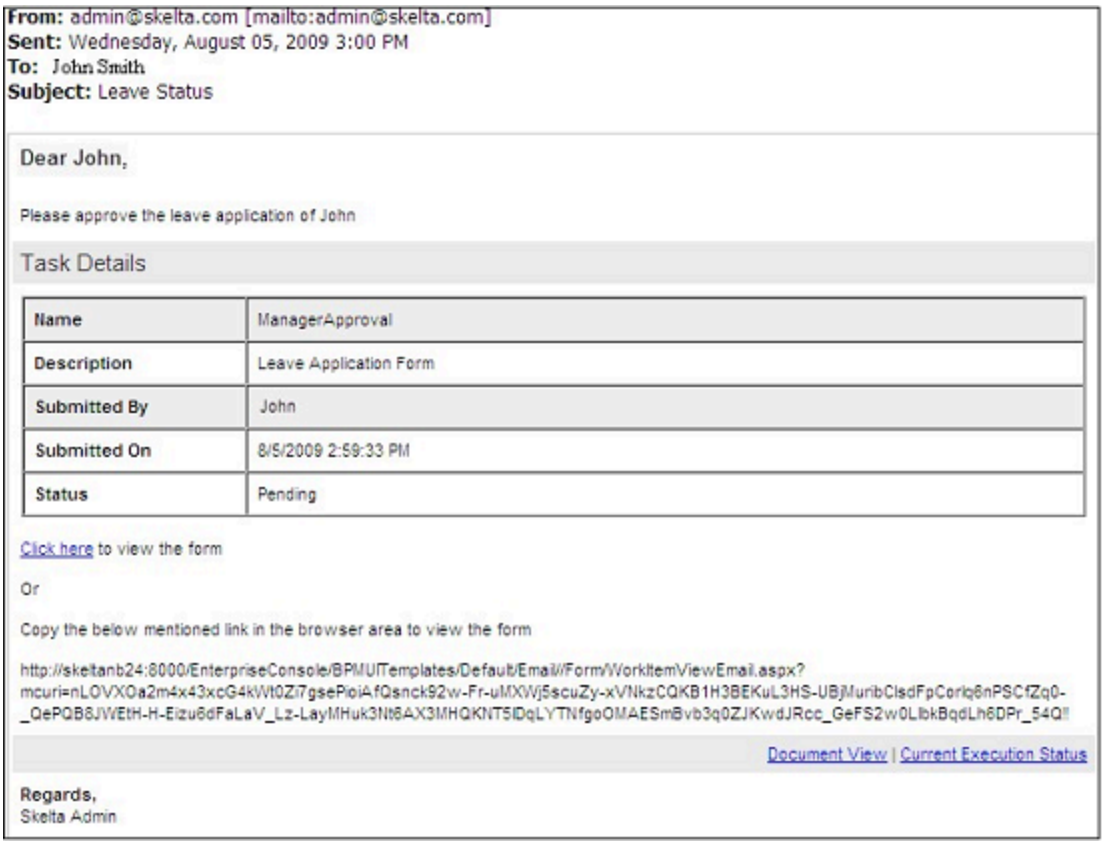
</body>
</html>
```

The actor will get the following Invoke Form email format for the above template.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Note: Out of box variables such as <%#Variable.SubmittedBy.UserId%> , <%#Variable.SubmittedBy.UserName%>, and <%#Variable.SubmittedBy.UserDisplayName%> can be used for Active Directory provider.

Use Contents in Invoke Form Activity

Email templates can be used to display the values of the contents that have been created in a workflow.

Scenario

Scenario Requirements:

Assume that, a **Content** of type number and by name 'EmployeeAge' is created in Start activity and at runtime its value is 30.

You want to:

1. Display the content's value in Invoke Form email.
2. Display the variable's value after "Submitted On" row in the Task Details Table.

Scenario Solution

To display this the content's value in Invoke Form email and to display the variable's value after "Submitted On" row in the Task Details Table, the following steps need to be followed:

Steps:

1. Copy **InvokeFormEmail.html** file.
2. Use the **<%#Variable.**Contentname%> placeholder in the html template for viewing the content's value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Where <Contentname> is a name of the content. Use the **<%#Content.EmployeeAge%>** placeholder in the html template, where the value is to be displayed. Since the Content name is "EmployeeAge", the placeholder to be used is <%#Content.EmployeeAge%>. The highlighted portion in the below code displays the position where the <%#Content.EmployeeAge%> placeholder is added.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w3.org/TR/
xhtml1/DTD/xhtml1-transitional.dtd">
<html >
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />

Use XML Variables in Invoke Form Activity

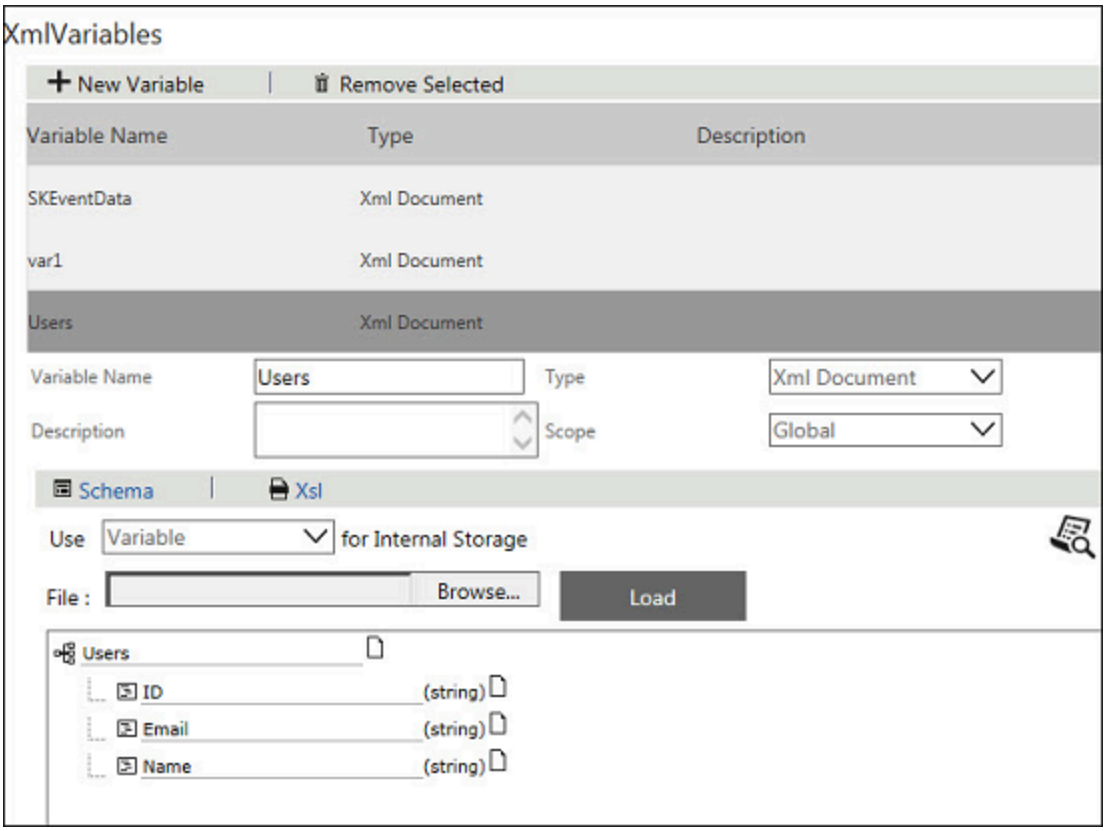
Email templates can be used to display the values of the XML variables that have been created in a workflow.

Scenario

Scenario Requirements:

Assume that, 'Users' XML Variable of type XMLDocument is created in **Start** activity and schema is as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The scenario requirement is that, during the workflow execution, you want to display the following values during the workflow execution.

1. **ID** is updated to 1029.
2. **Email** is updated to John.Smith@domain.com.
3. **Name** is updated to John.
4. Display these XML variable's value after **"Submitted On"** row in the Task Details Table.

Scenario Solution

To display the XML Variable's value in Invoke Form email and to display these variable's value after "Submitted on" row in the Task Details Table, the following steps need to be followed:

Steps:

1. Copy **InvokeFormEmail.html** file.
2. Use the **<%#XmlVariables.**variablename**%>** placeholder in the html template for viewing the XML Variable's value. Where <variablename> is a name of the XML variable.

   Since the 'Users' XML Variable contains the ID, Email, and Name, use the following XML Variables in the InvokeFormEmail.html template, where the values are to be displayed.

   ```
   <%#XmlVariables.Users.User.ID%>
   <%#XmlVariables.Users.User.Email%>
   <%#XmlVariables.Users.User.Name%>
   ```

   The highlighted portion in the below code displays the position where the above placeholders to be added.

   ```
   <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w3.org/TR/
   xhtml1/DTD/xhtml1-transitional.dtd">
   ```

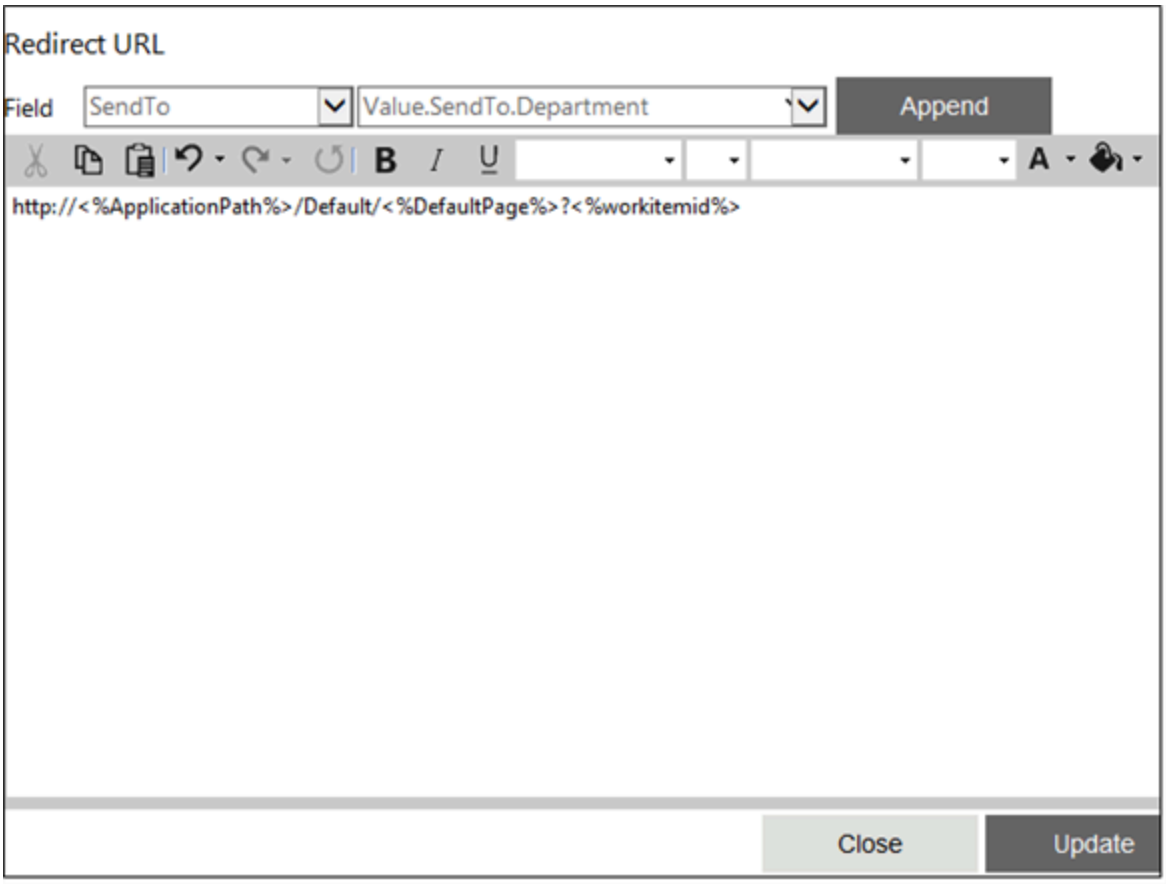
Invoke Form - Redirect URL

Redirect URL Property Window

You can specify a message Redirect URL for the Invoke Form activity in this property window. To access this window, click the button in the 'Redirect URL' property.

Note: The redirection feature may not work on the Application Request Routing (ARR) server.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the Redirect URL. You can do this either by entering a URL directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/ drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Redirect URL in this box. If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Redirect URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Redirect URL. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to redo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

It also has the following formatting and other tools –

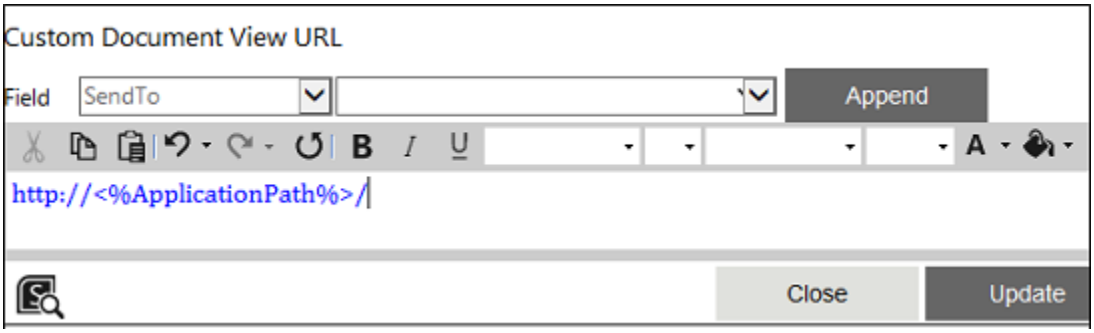
- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the Redirect URL.
- **Close** - You can click this button to close this window.

Invoke Form - Custom Document View URL

You can specify a message in the **Custom Document View URL** for the Invoke Form activity in this property window. To access this window, click the edit button for the 'Custom Document View URL' property.



The **Custom Document View URL** window has a text editor to enter the Custom Document View URL. You can either enter a URL directly in the text editor or use the following **Field** controls to enter the URL:

- **Field Type**: Select the value type. You can specify SendTo, Variable, Content, or XMLVariables.
- **Field Text**: You can specify the actual value of the Redirect URL.

  The control display depends on the option selected in the first drop-down menu. For any type selected in the first drop-down menu, there will be another drop-down menu in the second field. The second drop-down will have the variable collection, content collection, or XMLVariables collection from which you can select an appropriate option to assign the Custom Document View URL.
- **Append**: Click this button to add the specified value, variable, or content to the text editor.

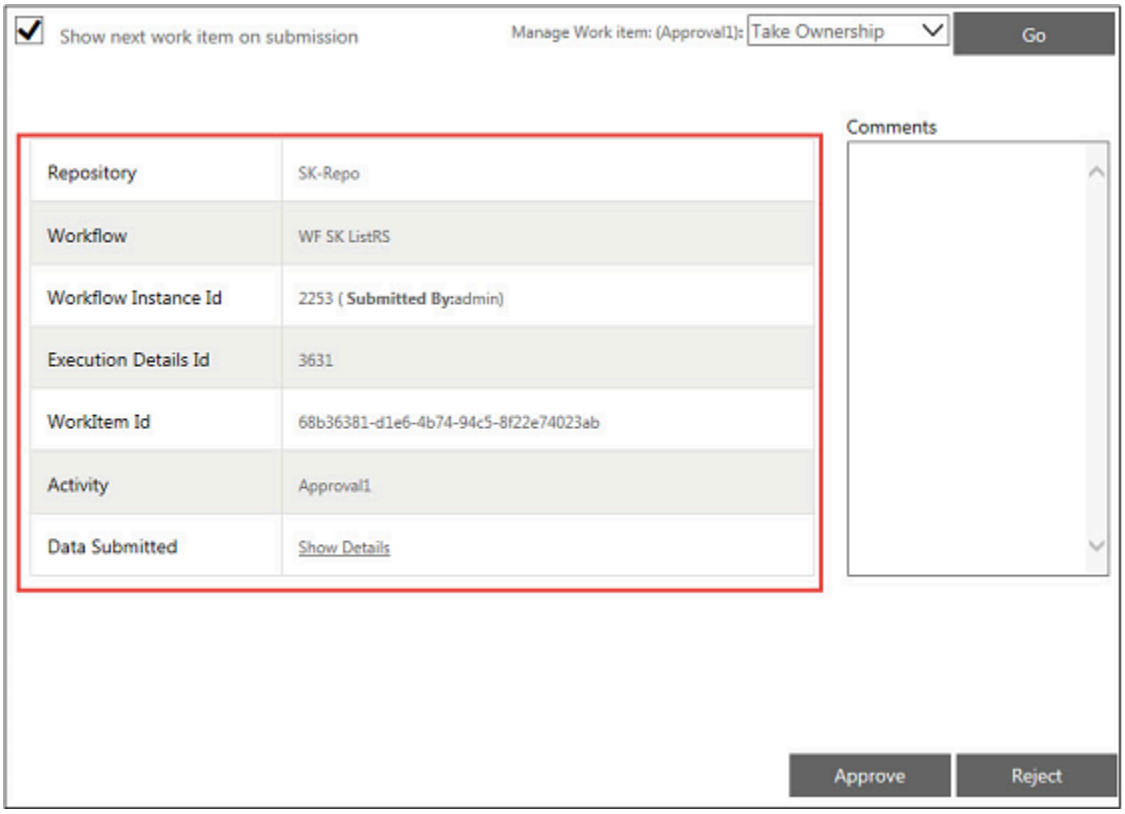
For more details, see Custom Document View URL.

Steps to set the Custom Document View URL property

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Custom Document View

Custom Document View can be viewed on the left side of the WorkItem Detail View page inside the frame as shown in the following image:



AVEVA Work Tasks allows you to provide a custom document view while using any human activities. This can be achieved by entering the proper URL for the Custom Document View URL property.

By default, the custom document view for any human resource activity normally shows the item metadata which alerted the workflow.

1. If the workflow is alerted due to a Enterprise Console event association, the document view shows the list item metadata that alerted the workflow. For example, if the workflow is alerted due to a workflow event association to a list, document view shows the list item that alerted the workflow.
2. If the workflow is alerted due to a workflow association in Forms, the document view shows the form that alerted the workflow.

You can change the document view, if required. If a URL is provided to the custom document view URL property, this is overridden with the default document view. If you want to show a different form in the Custom Document View, see *Custom Document View URL for Forms*.

Any URL can be provided to this property and it can be a URL to your custom page also.

Custom Document View URL for Forms

If the workflow is alerted due to a workflow association in forms, the document view shows the form that alerted the workflow. AVEVA Work Tasks supports the following URL with parameters. You can pass the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

parameters based on the requirement. Do not enter any internet links.

Use the following URL with respective parameters to show any forms:

http://<%ApplicationPath%>/BPMUITemplates/Default/SkeltaForms/FormDocumentView.aspx?FormName=<Form Name>&FormVersion=<Form Version>&FormInstanceXmlVariable=<Xml Variable Name>

Note: Remove the extra spaces between 'http:' and '//<%ApplicationPath%>', if any.

- FormName: Name of the form to be loaded in document view.
- FormVersion: Version of the form to be loaded. By default the latest published version will be loaded. This parameter need to be used only if a specific version has to be loaded.
- FormInstanceXMLVariable: XML variable name which is to be used for populating the form. If this parameter is not passed, SFFormData XML Variable will be considered as default.

Example:

For showing any form and populate data from XML variable, pass the following parameters in query string provided both having same XML schemas.

```
FormName=<Form Name>& FormInstanceXmlVariable=<Xml Variable Name>
```

Sample URL:

http://<%ApplicationPath%>/BPMUITemplates/Default/SkeltaForms/FormDocumentView.aspx?FormName=Leave Report&FormInstanceXmlVariable=LeaveReportxml

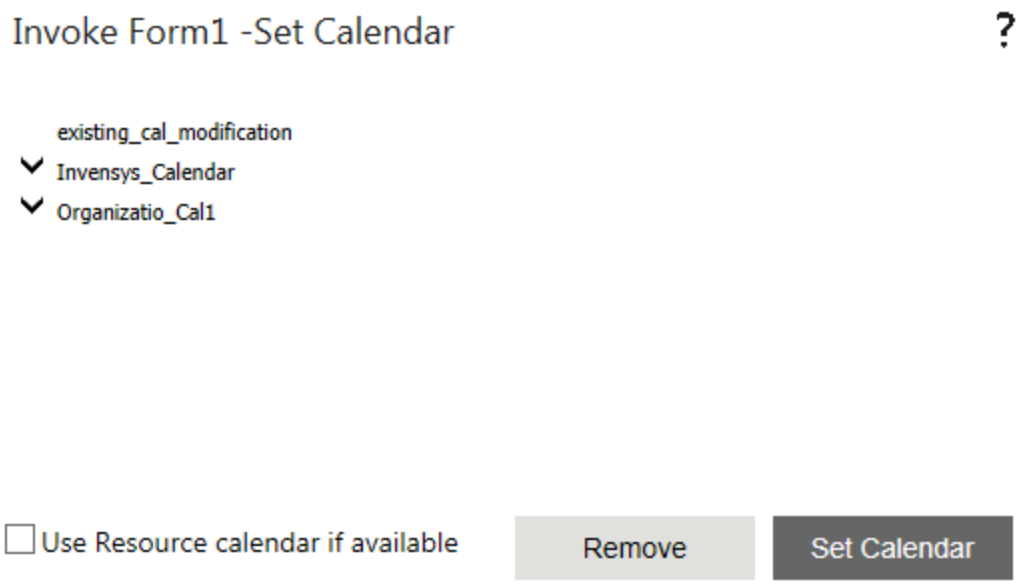
When the workflow is executed, the **Custom Document View** of the specified form populated using XML variable is displayed in the Work Item detail View page.

Invoke Form - Set Calendar for Timeout

Set Calendar for Timeout Property Window

You can set a Calendar to calculate the timeout for the Invoke Form activity in this property window. To access this window, click the button in the 'Set Calendar for Timeout' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Set Calendar for Timeout property window

This window lists the available calendars in a tree structure, with lower-level calendars nested within the respective top-level calendar. You can click on a calendar to select it for setting.

There are two buttons in this window.

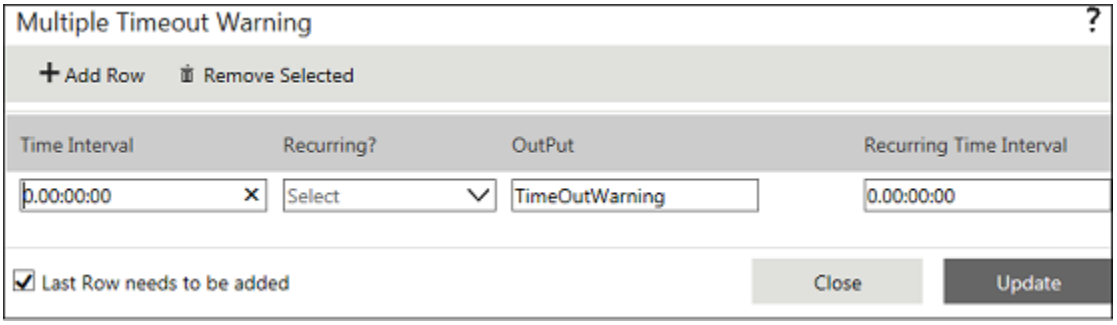
- **No Calendar** - You can click this button to indicate that there is no calendar set for the activity
- **Set Calendar** - You can click this button to set the selected calendar.

The **User Resource calendar if available** check box can be checked to enable the use of resource calendars, if none are displayed in this window for selection.

Invoke Form - Multiple Timeout Warning

Multiple TimeOut Warning Property Window

You can set the Multiple Timeout Warning in this property window. To access this window, click the button for the 'Multiple TimeOut Warning' property.



The window has two tabs at the top to manage the rows of timeout settings in the grid.

- **Add Row** - You can click this tab to add the newly entered timeout setting and display a new row to the grid

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

where you can add another timeout

- **Remove Selected** - You can click this tab to remove the timeout setting row selected in the grid.

The grid has the following parameters that you need to specify for the new timeout setting.

- **Time Interval** - You can use this field to enter the time interval in which you want to generate a timeout warning. You must enter the time in d.hh:mm:ss format.
- **Recurring?** - You can use the drop down in this field to indicate whether the timeout is recurring or not. You can select "Yes" to set the timeout warning to recur.
- **Output** - You can enter the output message corresponding to the timeout warning here.
- **Recurring Time Interval** - You can set the time interval in which the timeout warning has to recur here. Enter the time in d.hh:mm:ss format.

There are two buttons and a check box at the bottom of the screen.

- **Update** - You can click this button to save the newly added timeout settings
- **Close** - You can click this to close the property window without saving the newly added timeout settings
- **Last Row needs to be added** - You need to check this check box to save the last row added.

Invoke Form - Mail Integration Scenario

AVEVA Work Tasks provides a powerful feature to integrate the invoked form in a mail. This is useful for user to get a direct link to the Form as an email. Without logging into Enterprise Console, the user can click the link that will open Forms in a browser.

Pre-requisites

1. To configure your machine IP address for receiving emails, see Configuring Wonderware Skelta BPM Farm Configuration Wizard for Receiving Emails.
2. The **Send Notification Email** property should be set to **Yes** for this activity.

Scenario Description

Consider a scenario where the manager has to approve or reject the leave application, sent by the subordinates. Where the manager requires direct link to access this leave application form which is filled by the subordinate as an email.

Scenario Requirements

Design a form called 'Leave Form' with following controls and invoke this form using Invoke Form activity.

- Employee Name (Text Input control)
- From Date (Date Input control)
- To Date (Date Input control)
- Reason (Text Input Control)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Grid
- BaseForm
- Approve (Button)
- Reject (Button)

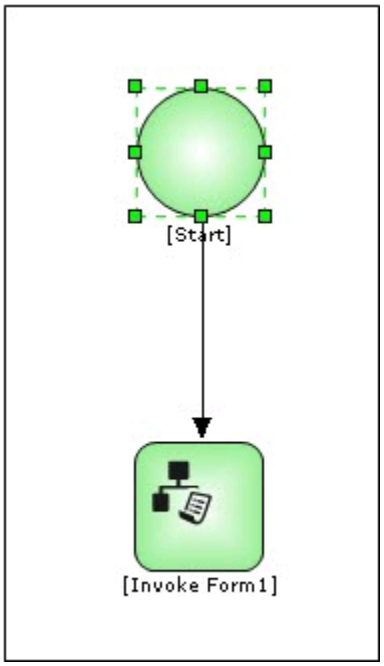
There are two ways to send notification mail:

1. Using Body property
2. Using Template Path property

Use 'Body' Property

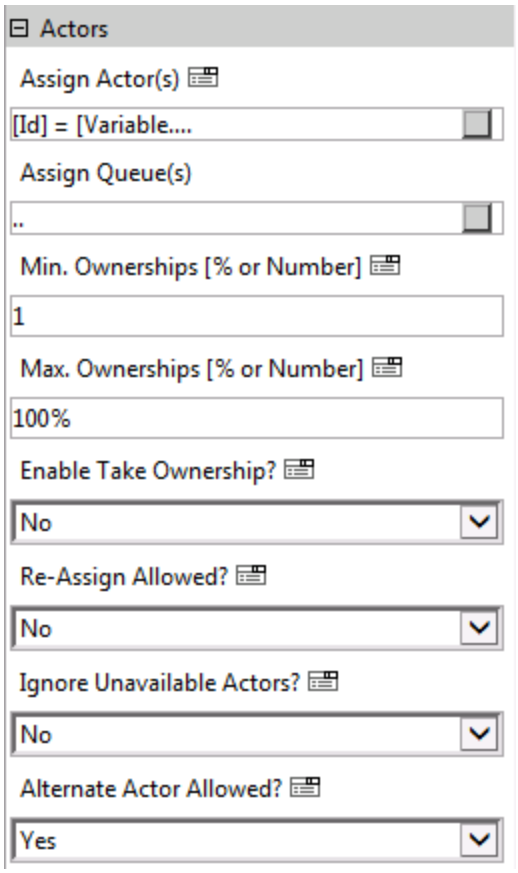
Scenario Solution:

1. Design a workflow named 'LeaveWF'.

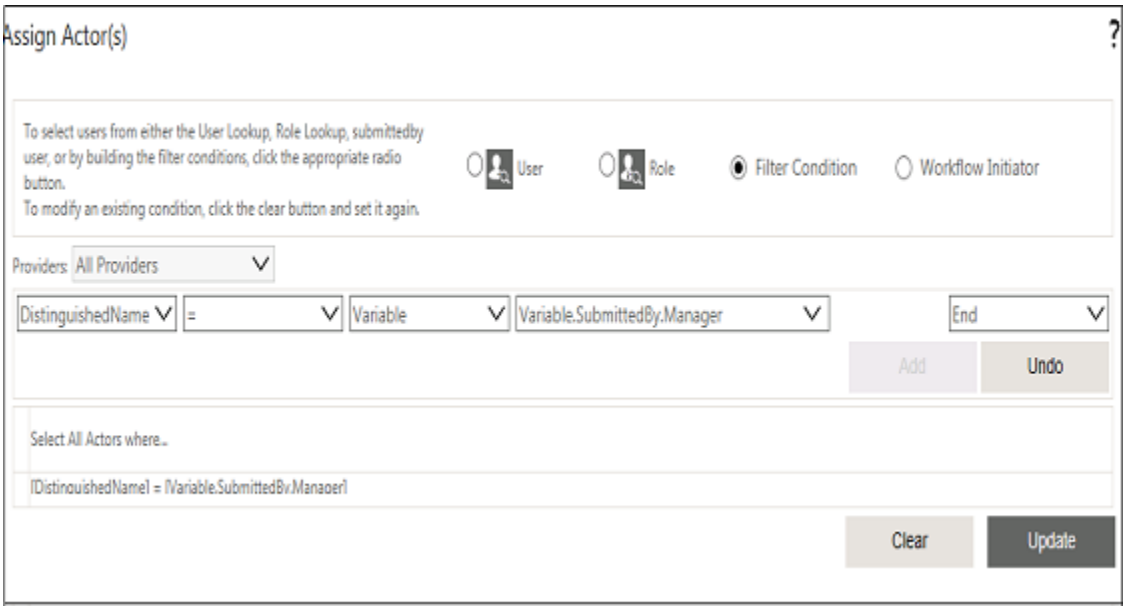


2. Right-click Invoke Form activity and then select **Activity Properties**.
3. Set the properties for **Actors** group as shown in the figure below.
   Here only required properties are explained.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



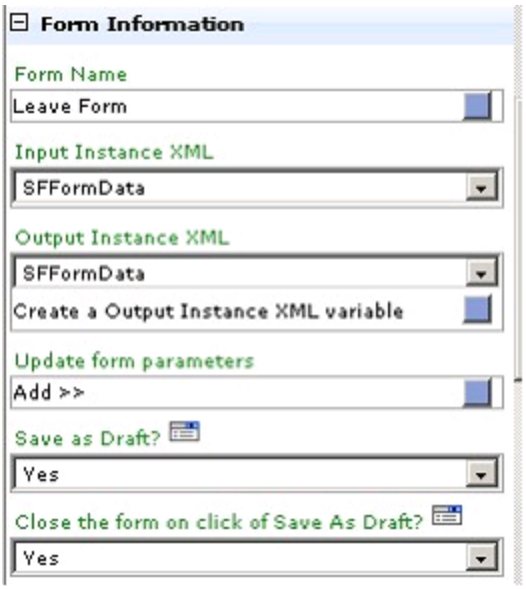
- **Assign Actor(s):** Set this property as shown in the following figure.



4. Set the properties for Form Information group as shown in the following figure.

Note: Here only required properties are explained.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

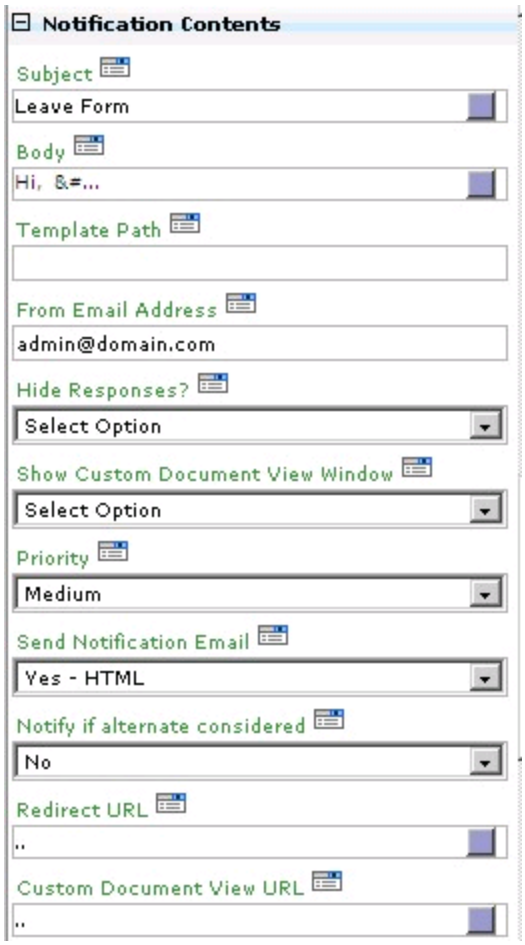


- **Form Name** : Select 'Leave Form' and its version from **Form Name** property window.
- **Input Instance XML**: Select 'SFFormData' from **Input Instance XML** drop-down list.
- **Output Instance XML**: Select 'SFFormData' from **Output Instance XML** drop-down list.
- **Save as Draft?:** Select **Yes** from **Save as Draft?** drop-down list. By setting this property as Yes, the Save As Draft option at the bottom right corner in the Form will be seen. This is useful for filling the form and saving it as draft till final submission of the form.
- **Close the form on click of Save As Draft?:** Select **Yes** from **Close the form on click of Save As Draft?** drop-down list. By setting this property as **Yes**, the Form will close on clicking the **Save As Draft** option.

5. Set the properties for **Notification Contents** group as shown in the following figure.

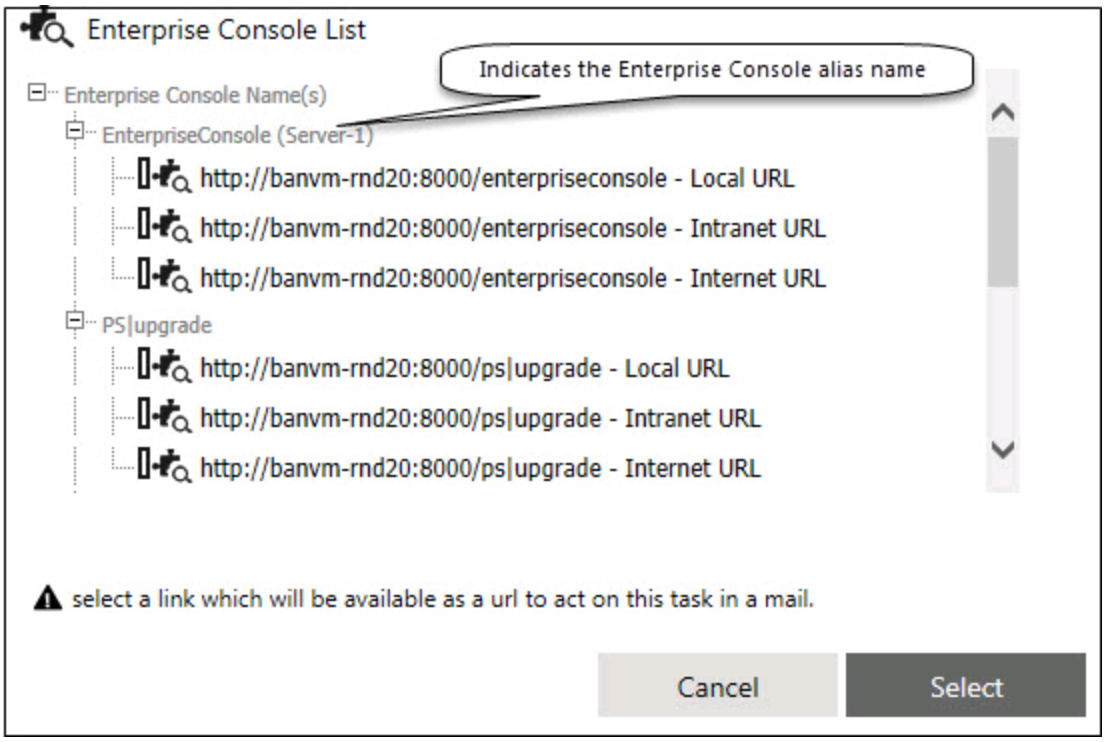
Note: Here only required properties are explained.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

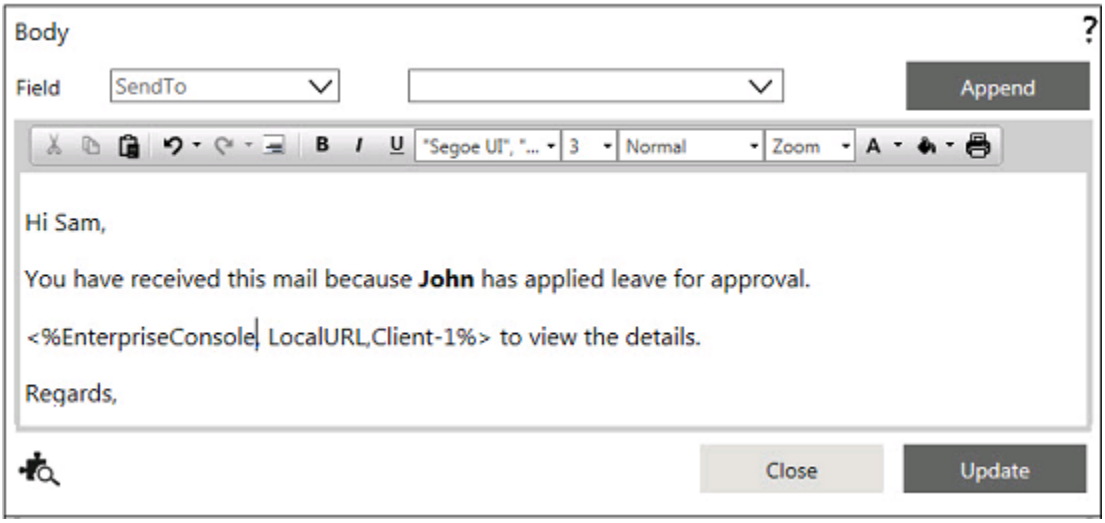


- **Subject** : Specify the appropriate subject from **Subject** property window.
- **Body**: Click the edit button in the **Body** property to open the Body property window.
  a. Compose the body text.
  b. Click **Enterprise Console Explorer**(plug-in) icon to select the URL. The following window is opened with list of Enterprise Console names. Select the Local URL and then click Select. The selected URL will be appended in the Body window wherever the cursor is pointed as <%EnterpriseConsole,LocalURL%>.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The composed mail will be as shown in the figure below.



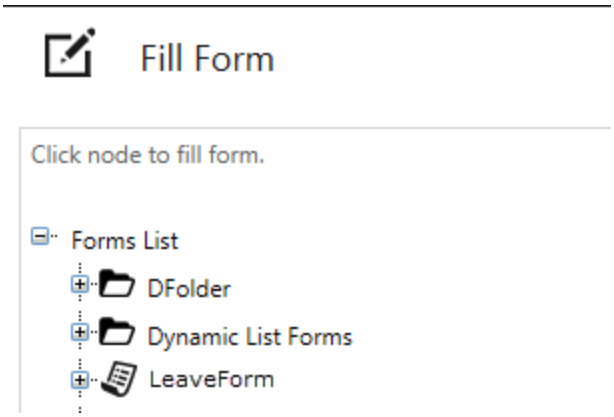
Click Update of the Body window property to save the contents.

- **Send Notification Email**: Select **Yes - HTML** option from the drop-down list.

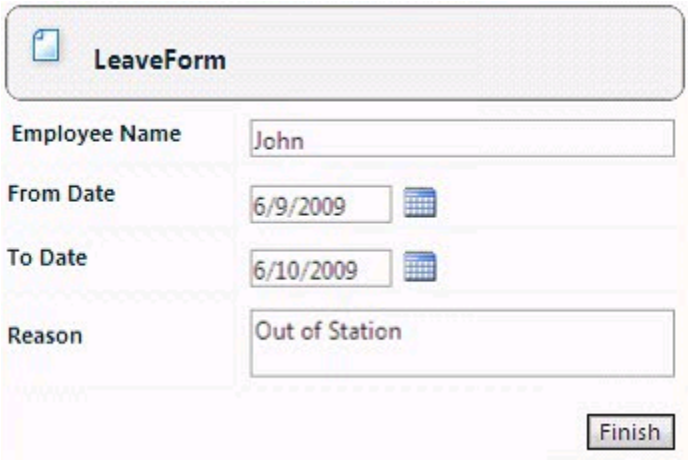
  Note: You will be able to send an email only if, this property is set as Yes - HTML or Yes. If it is Yes, then the mail will be sent as a plain text. If it is Yes- HTML, then the mail will be sent as HTML format.

6. After setting these properties, click **Save** of the **Activity Properties** window.
7. Publish the 'LeaveWF' workflow.
8. Go to **Enterprise Console > Fill Form**. The **Fill Form** window is displayed as shown in the following figure.

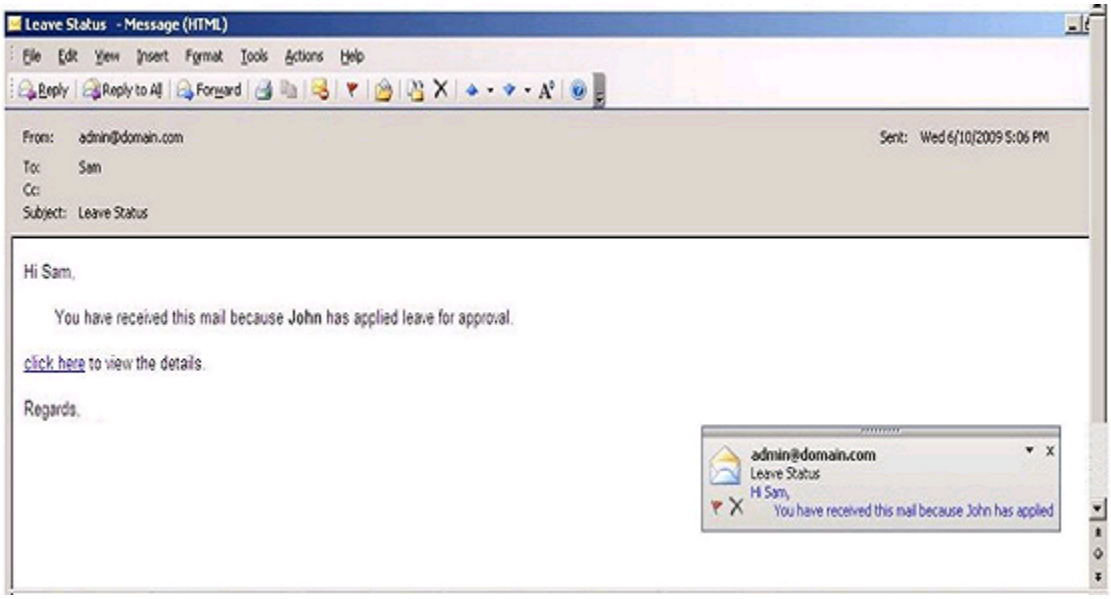
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



9. Click on the 'LeaveForm'. The 'LeaveForm' form is displayed. Fill this form and then click **Finish**.



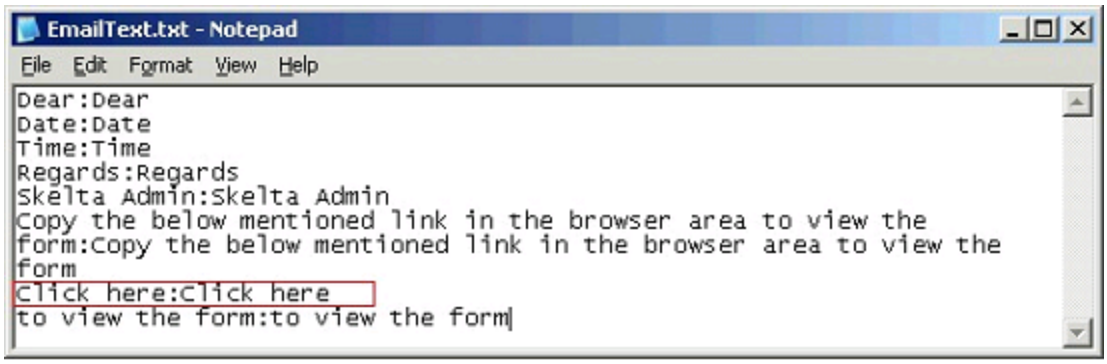
10. On filling the form, the mail will be sent to the manager for approval.



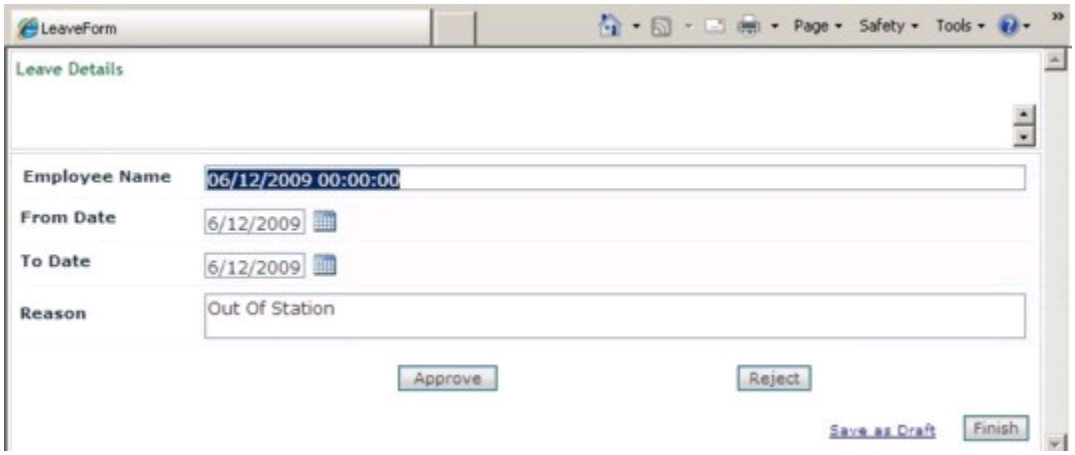
<%EnterpriseConsole,LocalURL%> text added in the Body tag is replaced with Click here hyperlink text.

Click here text can be changed from the [AVEVA Work Tasks Installed Path]\Locales\en-US\EmailText.txt to the required text.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



11. In the mail, just click on **'Click here'** link to open the form in a browser as shown in the following figure.



Conclusion: Here manager will get the direct link to the leave form which is applied by the employee and here manager can approve or reject leave application instead of logging in to the Enterprise Console.

Note: You can act on a task only first time. Next time, it will display the following message:

"Duplicate Response

Your response for the task <Activity Name> of <Date> application's <Workflow Name> workflow was recorded earlier! Workflow engine did not consider this duplicate response. "

Use 'Template Path' Property

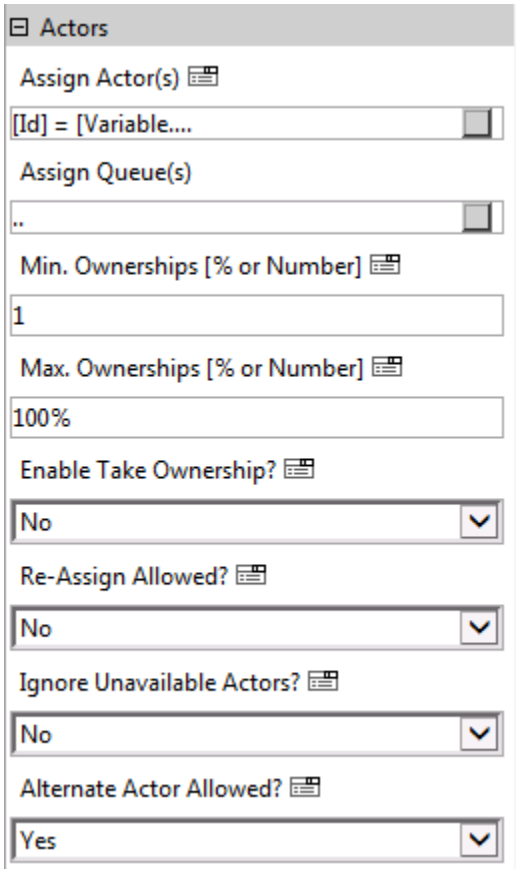
Scenario Solution:

1. Design a workflow named 'LeaveWF' as shown in the figure below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Right-click the Invoke Form activity and then select Activity Properties.
3. Set the properties for Actors group as shown in the following figure.

   Note: Only the required properties are explained here.

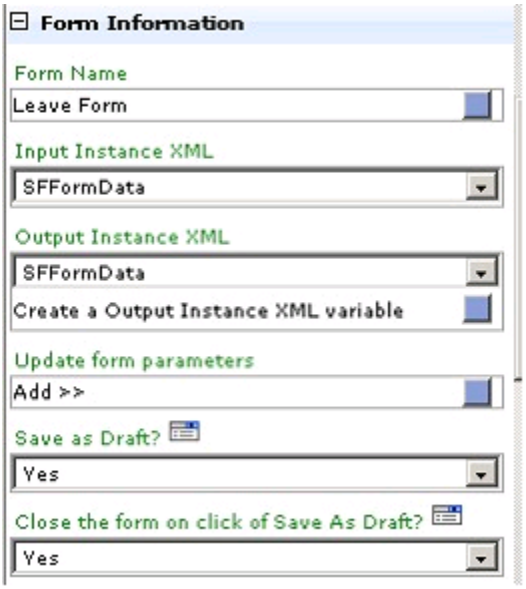


4. Assign Actor(s): Set this property to send notification mail to the manager as shown in the following figure.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Set the properties for **Form Information** group as shown in the following figure.

Note: Only the required properties are explained here.



a. **Form Name**: Select 'Leave Form' and its version from **Form Name** property window.

b. **Input Instance XML**: Select 'SFFormData' from **Input Instance XML** drop-down list.

c. **Output Instance XML**: Select 'SFFormData' from **Output Instance XML** drop-down list.

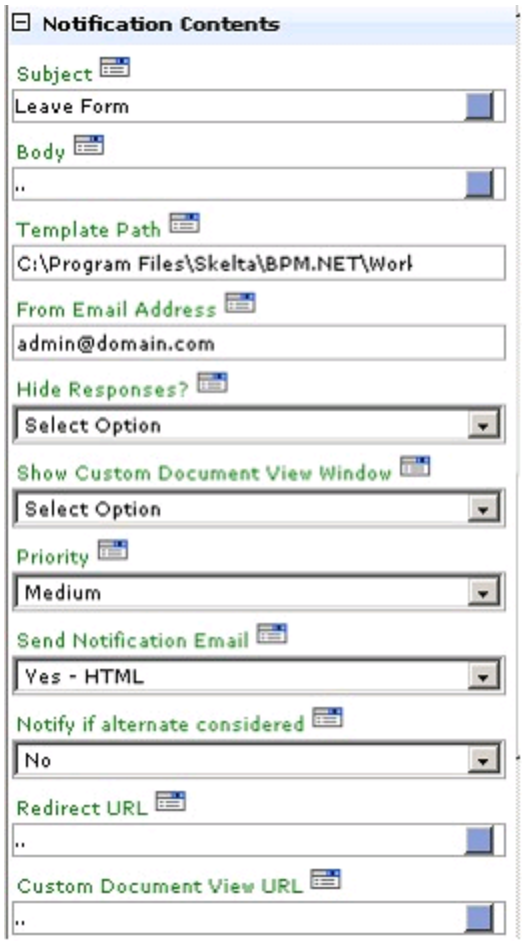
d. **Save as Draft?:** Select Yes from Save as Draft? drop-down list. By setting this property as **Yes**, the **Save As Draft** option at the bottom right corner in the Form will be provided. This is useful for filling the form and saving it as draft till final submission of the form.

e. **Close the form on click of Save As Draft?:** Select **Yes** from **Close the form on click of Save As Draft?** drop-down list. By setting this property as **Yes**, the form will close on clicking the Save As Draft option.

f. Set the properties for **Notification Contents** group as shown in the following figure.

Note: Only required properties are explained here.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



a. **Subject**: Select 'Leave Form' from Subject property window.

b. **Body**: Specified content will be used in the <%#Body%> placeholder in the template file.

c. **Template Path**: Select the 'InvokeFormEmail.html' from the path *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks*\WorkflowElements\Default\en-US\Templates\FormEmailTemplate\InvokeFormEmail.html and type the same path in the Template Path property.
Example1: *C:**Program files**AVEVA**Work Tasks*\\WorkflowElements\Default\en-US\Templates\FormEmailTemplate\InvokeFormEmail.html
Example2:<%#AVEVA Work Tasks InstallPath%>\WorkflowElements\Default\en-US\Templates\FormEmailTemplate\InvokeFormEmail.html

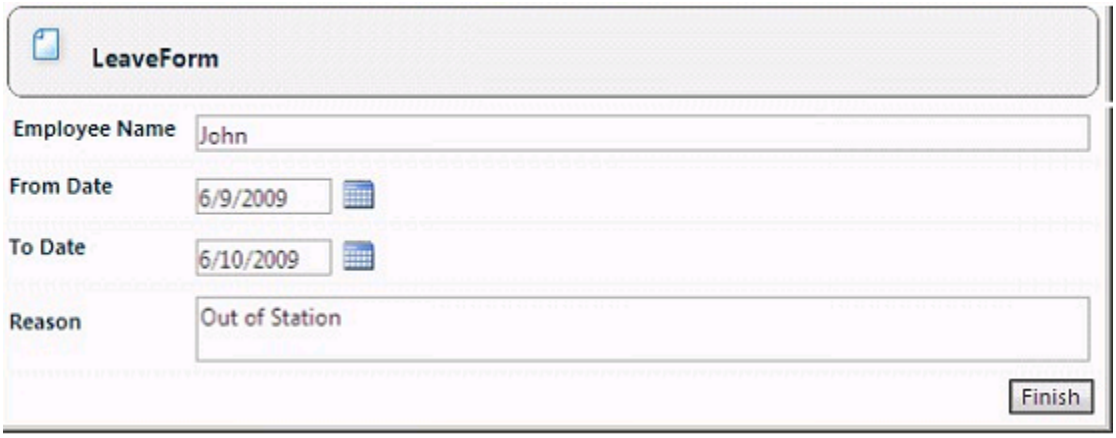
d. **Send Notification Email**: Select **Yes - HTML** option from the drop-down list.

Note: The user will be able to send an email only if this property is set as Yes - HTML.

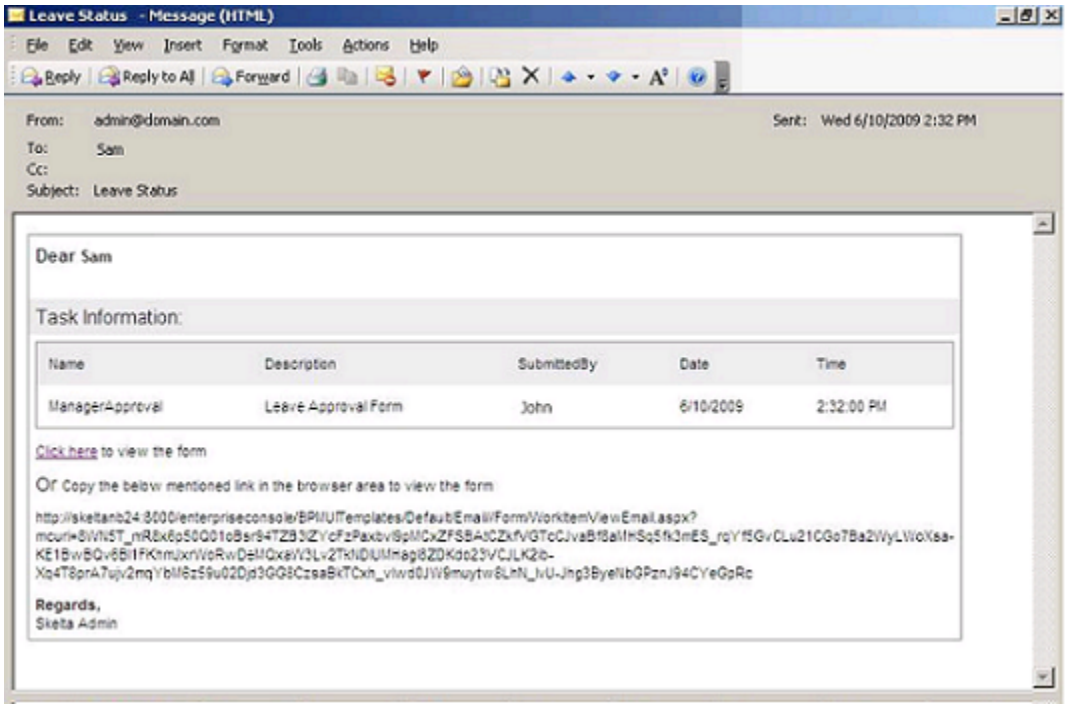
6. After setting these properties, click **Save** of the **Activity Properties** window.
7. Publish the 'LeaveWF' workflow.
8. Go to **Enterprise Console -> Fill Form**. The **Fill Form** window is displayed as shown in the following figure.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Click the 'LeaveForm'. The 'LeaveForm' form is displayed. Fill this form and click **Finish**.

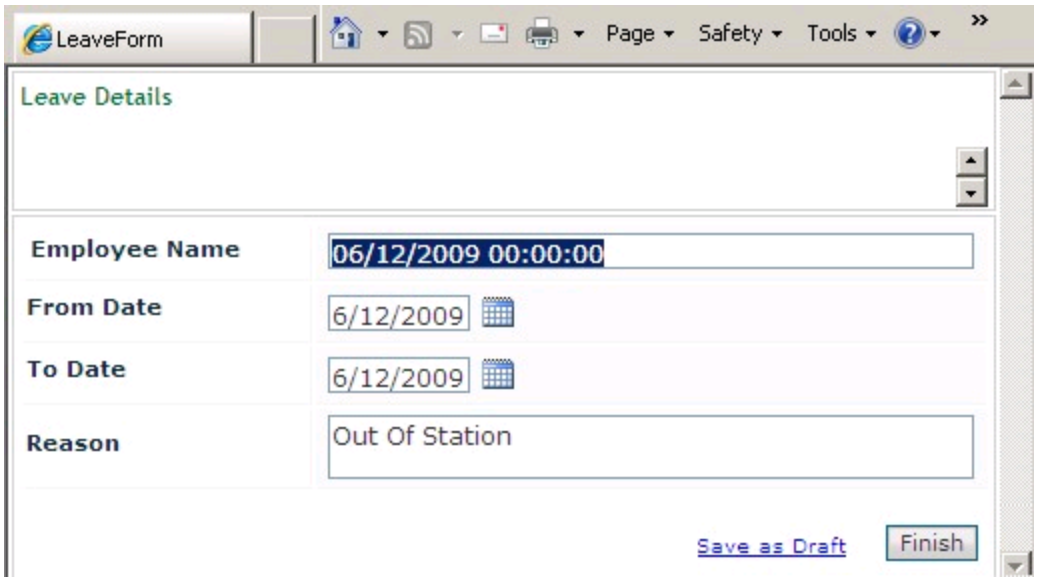


10. On filling the form, the mail will be sent to the manager for approval.



11. In the mail, just click **'Click here'** link to open the form in a browser as shown in the following figure.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Conclusion: Here, the manager will get the direct link to the leave form which is applied by the employee and here manager can approve or reject leave application instead of logging in to the Enterprise Console.

Note: The user can act on task only one time. Next time, it will display the following message:

"Duplicate Response

Your response for the task

Assign a Task to a Manager

'DistinguishedName' Property

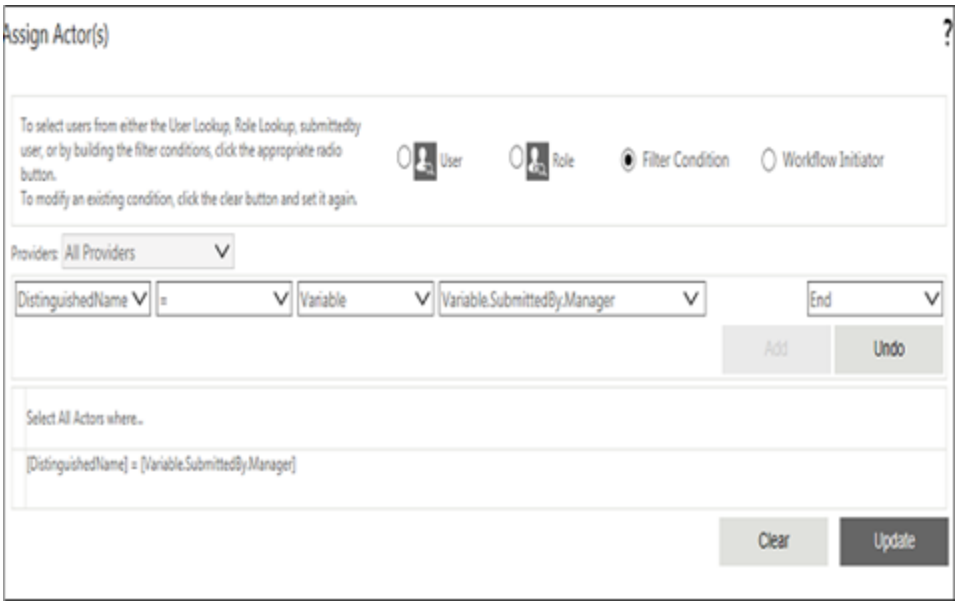
AVEVA Work Tasks returns the 'DistinguishedName' property of a user which uniquely identifies an entry in active directory for the Manager property. The property 'DistinguishedName' is added for active directory providers to query an entity or user with his DistinguishedName.

For example, the DistinguishedName value for a User Bob will be "CN=Bob,OU=HR Team,DC=Domain1,DC=dom (Note:DC will change according to the domain information)

Usage of this property: To assign a task to a manager, use this property in Assign Actor(s) property for all Human Activities as follows:

DistinguishedName = Variable.SubmittedBy.Manager'

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Enterprise Console Control (EC Plug-in)

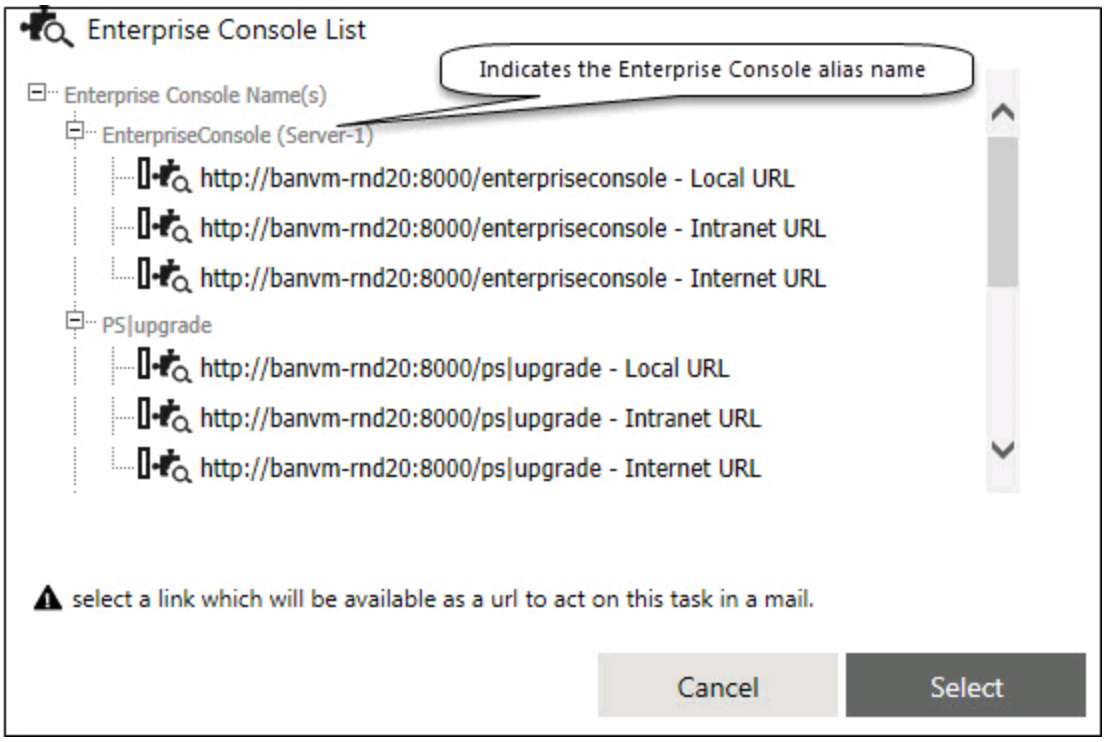
The **Body** property of all human activities has an EC plug-in. Click the **Enterprise Console Explorer** (plug-in) icon to get the required URL.

Note: This is applicable only if, **Sent Notification Email** property is set to **Yes-HTML** or **Yes**.

To compose the body text, perform the following steps:

1. **Body**: Click the **Edit** button in Body property, to open the **Body Property** window.
   a. Compose the body text.
   b. To get a direct Work Item details view link, click the **Enterprise Console Explorer** (plug-in) icon to select the required URL and then click **Select** as shown in the following figure.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



In a client-server scenario, the Enterprise Console site name is same for the client and server web site. To differentiate the Enterprise console site name of the client and the server, the **SiteAliasName** column is used in the **SKWebSite** table.

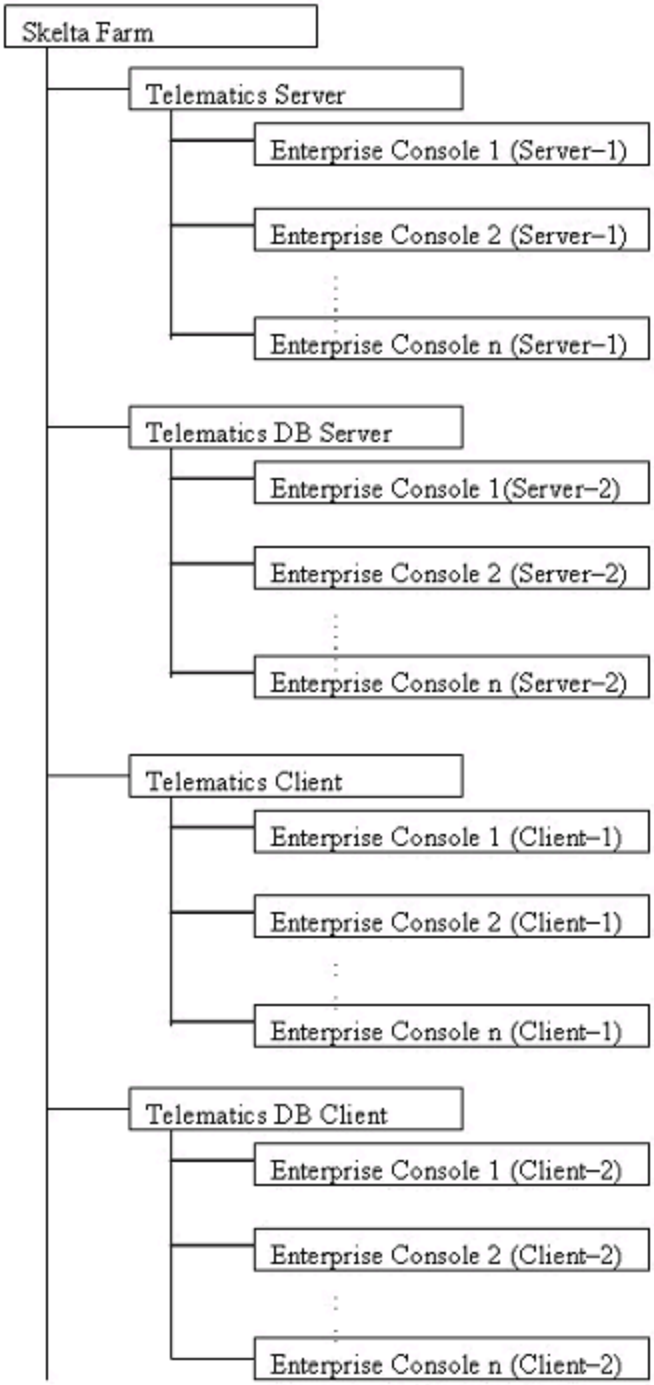
Example: Assume that there are four machines: **Telematics Server**, **Telematics DB Server**, **Telematics Client** and **Telematics DB Client**.

Telematics Server is connected to the Farm and 'n' number of Enterprise Console sites are created on the Telematics Server machine. By default the machine will be named as 'Server-1'. Telematics DB Server is connected to the Farm and 'n' number of Enterprise Console sites are created on the Telematics DB Server machine. By default the machine will be named as 'Server-2' and so on.

Telematics Client is connected to the Farm and 'n' number of Enterprise Console sites are created on the Telematics Client machine. By default the machine will be named as 'Client-1'. Telematics DB Client is connected to the Farm and 'n' number of Enterprise Console sites are created on the Telematics DB Client machine. By default the machine will be named as 'Client-2' and so on.

The pictorial diagram of the above explanation is shown below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

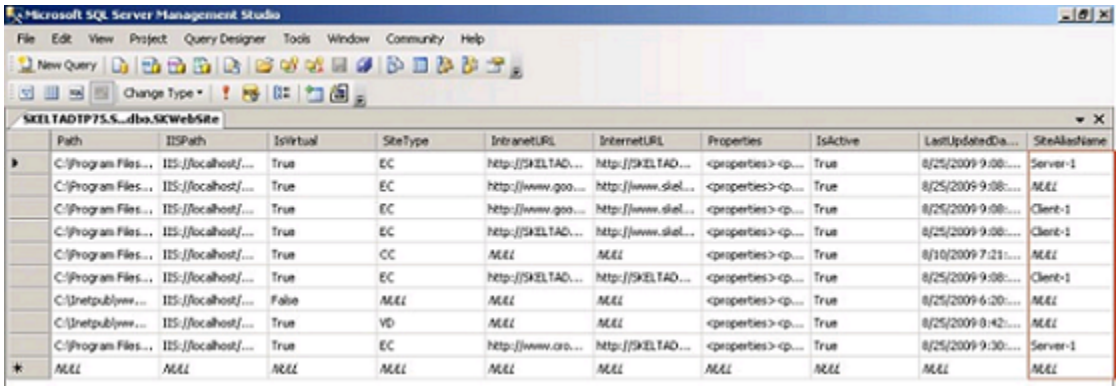


How to change Enterprise Console Alias Name?

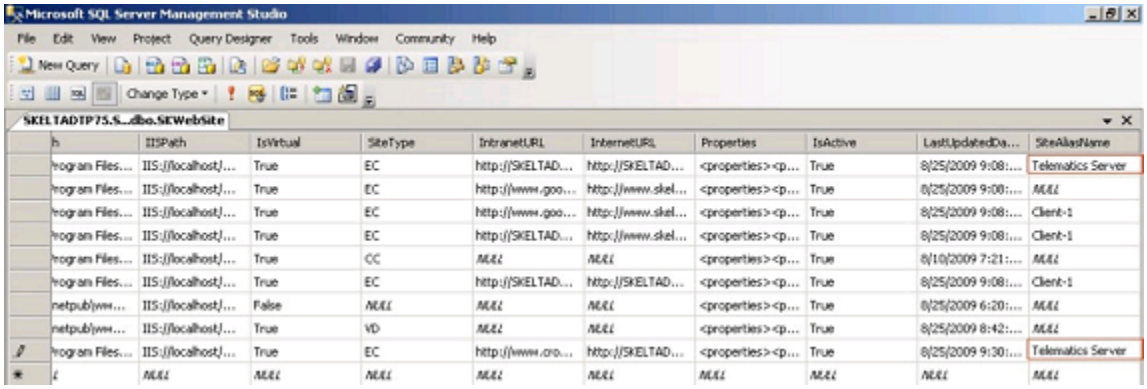
1. Go to the Farm Database.
2. Open the **SKWebSite** table.
3. Change the required Enterprise Console site alias name. Make sure that the name is unique across the machines. Example: If you want to change Enterprise Console alias name from Server-1 to Telematics Server, then you have to change the entry across the table in the SiteAliasName column to Telematics Server wherever Server-1 entry exists.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Before Changing



After changing the entry

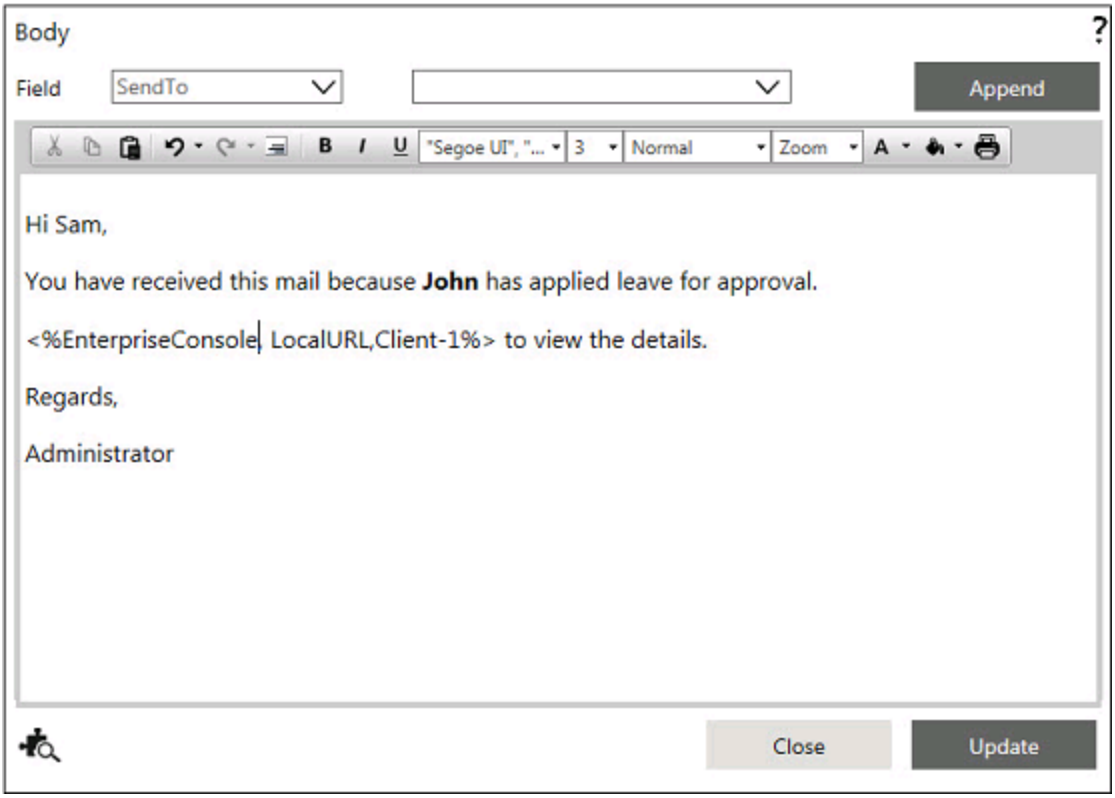


After renaming the web site name, once again you need to reconfigure the Body property wherever this placeholder has been used in a workflows.

Note: If the workflow is imported from the other machine then make sure that the Enterprise Console name should be same while selecting URL in the EC plug-in window. If it is not the same then follow the steps instructed above to change the Enterprise Console site alias name.

4. The composed mail as shown in the following figure.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



5. Click **Update** of the Body window property to save the contents.

Integration Activities

The following activities are found under Integration Activities:

- **Create-Open-Office-Document Activity**: You can create Microsoft 2010 Word and Microsoft 2013 Word documents from the workflow using the Create-Office-Document activity.
- **InvokeWebService Activity**: The Invoke-Web-Service Activity can be used to invoke a web service from the workflow.
- **Invoke Web API Activity**: You can use the Invoke Web API Activity to invoke a web API from the workflow.
- **Script Activity**: The Script Activity enables the execution of script written in languages, such as JavaScript and VBScript, from the workflow.
- **File Operations Activity**: The File Operation Activity can be used to perform file transfers from within the workflow.
- **Change Workflow Status Activity**: The Change Workflow Status Activity updates the status of the workflow in the database.
- **XML Action Activity**: The XML Action Activity can be used to assign XML data for activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create-Open-Office-Document Activity

Activity Description

You can create Microsoft 2010 Word and Microsoft 2013 Word documents from the workflow using the Create-Office-Document activity. When you include this activity in the workflow, the activity uses the selected template and creates a new document in the specified location with the relevant data.

Creating MS Office Templates

Steps to create an MS Word template

1. Open a new Word document, and save it with a relevant name.
2. Enter the required field names for each insert placeholders as shown below.
   a. Drop down the 'Insert' menu and click the 'Fields' option.
   b. In the 'insert fields' window, select 'MergeField' option from the 'Field names' list box.
   c. Enter a name for the new field and click 'OK'.

   Note: Create a merge field name without spaces in between.
3. The new fields are displayed along with the corresponding placeholders enclosed in double chevrons. The new names will be displayed as placeholders in the window corresponding to the 'SelectTemplate' property. These placeholders will be replaced by the actual values during execution of the workflow.

Workflow Variable for capturing Document Path

Create Office Document stores p hysical path information of the document in a variable of type string with the following syntax:

'^'+CurrentActivity.Name+'DocumentPath'

For example, **^CreateFileDocumentPath**.

Activity Properties

The Create-Open-Office-Document activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Create-Open-Office-Document activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Document Name - This property specifies the name of the new document.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Destination Details - This property specifies the details of the destination in which the document should be created such as the file path, the user name and password to access the document among others.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Destination Details property

1. To specify the details of the destination in which to create the new document, click on the button for the 'Destination Details' property to open the property window.
2. In this window, specify the protocol for the file transfer, for example, FTP-HTTP in the **Protocol** field.
3. Then specify the location; the pattern to use for the transfer, for example, .DOC; the User Name, Password, Domain Name, and Port Number in the respective fields.
4. After specifying all the details, click **Submit** to save the settings.

See Create-Open-Office-Document: Destination Details for a detailed description of the Destination Details property window.

Select Template - This property specifies the template to be used for creating the document.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Select Template property

1. To select the template for creating the document, click on the button for the 'Select Template' property to open the property window.
2. In this window, specify the user name, password, and domain name in the respective fields.
3. After providing the credentials click **Browse** and browse to the location of the template.
4. Select the template file and click **Import**.
5. To specify the values to the placeholders, select the placeholder and select the type of value (Value, Variable, XML Variable or Content) from the drop down. Then assign the value by selecting the appropriate option from the second drop down or in case you had selected the "Value" option in the first drop down enter the value in the field that is displayed here.
6. After choosing the values for the placeholders, click **Submit**.

See Create-Open-Office-Document: Select Template for a detailed description of the Select Template property window.

Activity outputs

The Create-Open-Office-Document Activity does not return any value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Exception Behavior

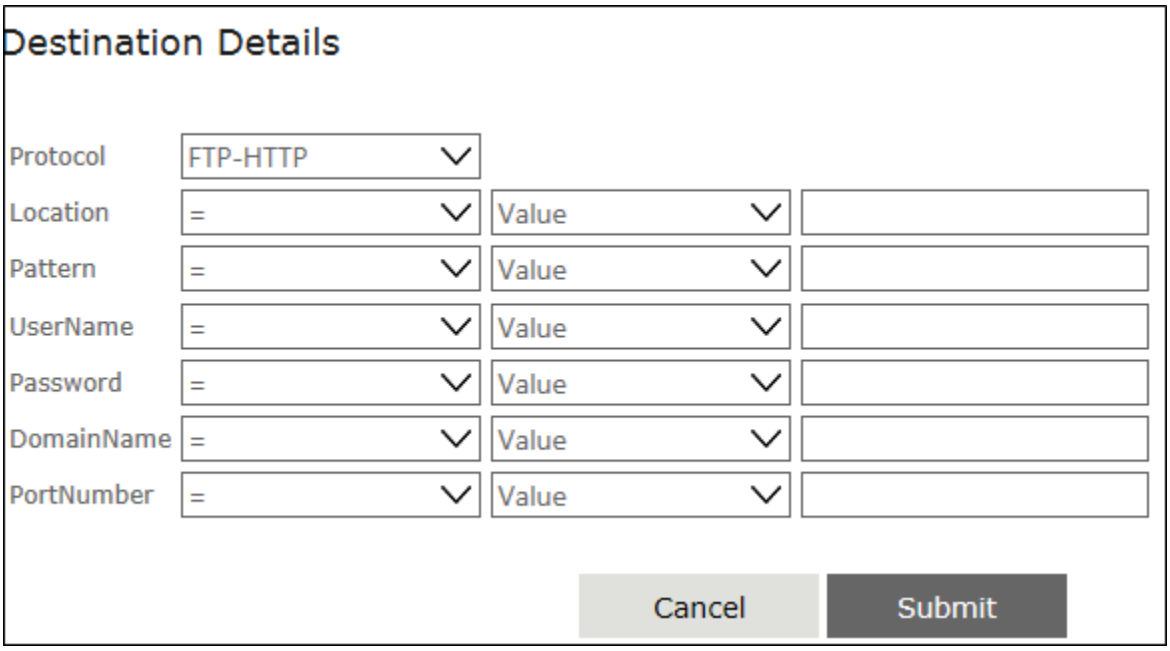
Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Create-Open-Office-Document: Destination Details

Destination Details Property window

You can specify the details of the file destination in this property window. To open this window, click the button for the 'Destination Details' property.



This window has the **Protocol** drop down where you can select the file transfer protocol. Below this drop down, it has controls to specify the following details.

- **Protocol:** If the selected protocol is FTP-HTTP, you can use FTP or HTTP protocol.

  For the HTTP protocol, you must enable the WebDAV Publishing feature for the web server. For more information about enabling the WebDAV Publishing feature, refer the Microsoft documentation.

  In the **Authentication** Feature in Internet Information Services (IIS) Manager, ensure that only **Windows Authentication** is enabled for the selected HTTP site.
- **Location**: You can specify the URI/UNC of the file or directory here.
- **Pattern**: You can specify the pattern to decide the file types to be transferred, such as *.doc,*.xls, in this field.
- **UserName**: You can specify the user name for the destination here.
- **Password**: You can specify the password for the destination here.
- **DomainName**: You can specify the domain or computer name of the destination here.
- **PortNumber**: You can specify the port number of the destination server.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

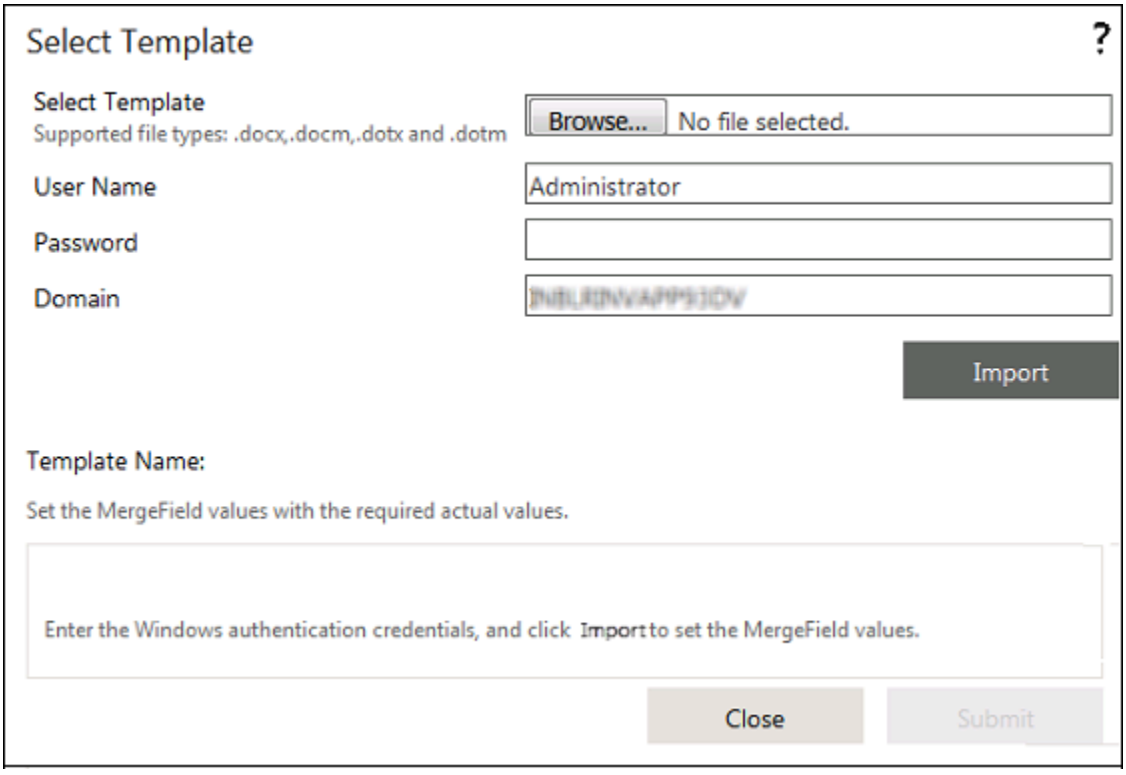
Each of the above parameter fields has the following controls.

- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the parameter in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the parameter. The control displayed depends on the option selected in the preceding drop down. If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.

Create-Open-Office-Document: Select Template

Select Template Property window

You can select the templates in this property window. To open this window, click the edit button for the **Select Template** property.

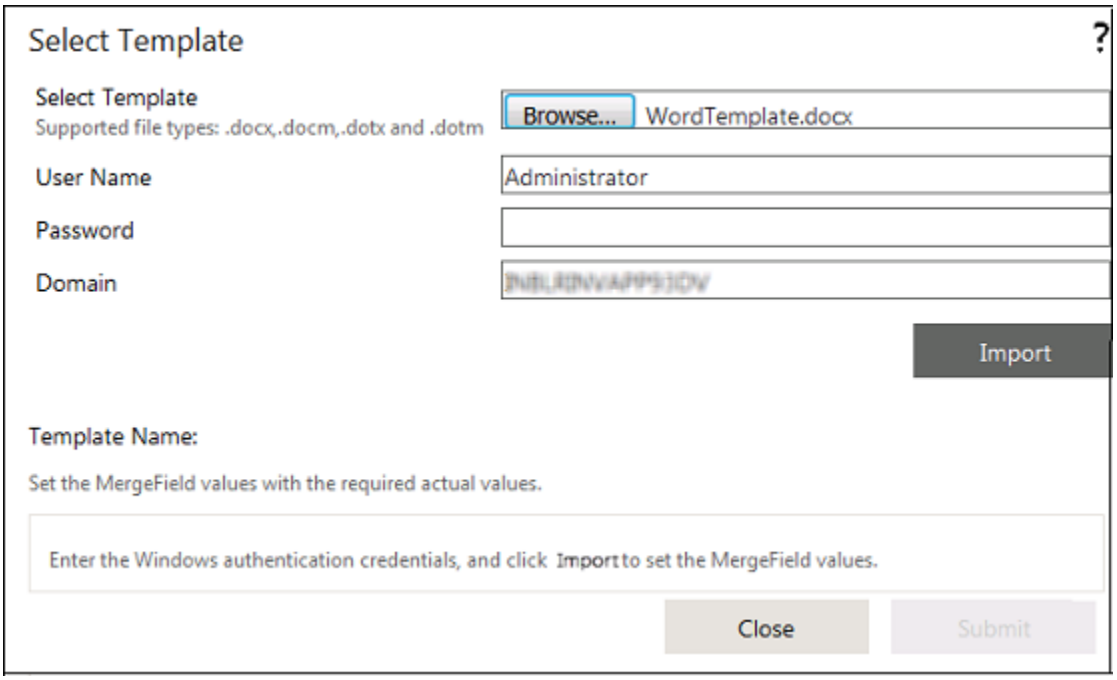


The top section of the window has the following fields to specify the login credentials and select the template.

- **Select Template:** You can enter the full path to the template here. Alternatively, click **Browse** to browse to the location of the template and select it.
- **User Name:** You can specify the user name here.
- **Password:** You can specify the password here.
- **Domain:** You can specify the domain name here.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Click **Import** to import the selected template. The imported template appears in the lower section of the dialog box.



The **Template Name** displays the name of the selected template. The place holders in the template are displayed in a grid with the following controls:

- The Placeholder name
- The Value type drop down. You can select the type of value to be assigned to the placeholder from this drop down. You can select Value, Variable, XML Variables, or Content here.
- The Value text box or drop down list. You can specify the actual value to be assigned to the placeholder here. If you select Value from the previous drop down list, a text box is displayed here, and you can enter the value directly. Otherwise, a drop down list is displayed, where you can select from the corresponding collection (Variable, XML Variable, or Content).

InvokeWebService Activity

Activity Description

The Invoke-Web-Service Activity can be used to invoke a web service from the workflow. The output of the activity can be used to determine the path of workflow execution.

Variables for capturing exception messages

The exceptions occurring in the Invoke Web Service activity can be captured by creating a system variable of type 'string'.

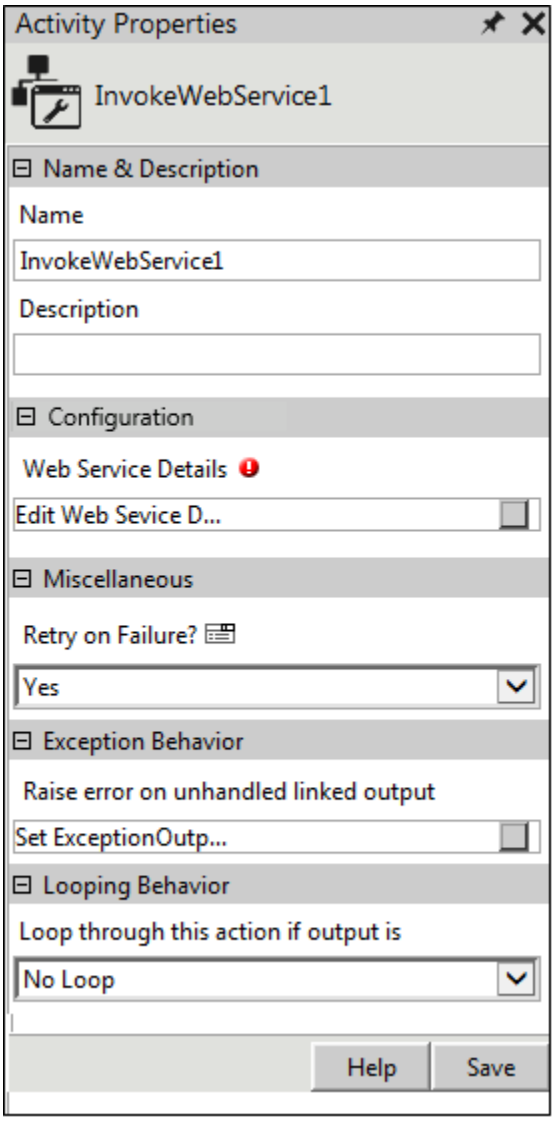
The variable name should be created in the following format:

'^'+CurrentActivity.Name+'Error'

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

The Invoke-Web-Service activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Invoke-Web-Service activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.



Name & Description

You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration

The property in the Configuration group has been described below. You can use this property to specify the web service details.

Web Service Details - The Web Service Details property allows the user to select a web service to invoke and specify the input and output details for it.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Web Service Details property

1. To add and configure Web Services, click on the button for the 'Web Service Details' property to open the Web Service List, which is the main property window.
2. This is the first window of the Web Service configuration user-interface and lists all the Web Services that have already been configured.
3. You can click the **Preview Methods** check box to preview the methods for the selected Web Service in this window.
4. Click the **Add** button in the web service listing window to add a new Web Service. This opens the window to add new Web Services. Enter the Web Service name and the WSDL URL, e.g., localhost/SkeltaWebService/WorkfllowClient.asmx?wsdl, in the respective fields in this window. Click on the **Save Web Service** button after specifying the required values here if the new Web Service does not need authentication.
5. Click on the **Authenticated** check box to select the option, if authentication is required for the web service being added. This displays authentication fields. Enter the login name, password, and domain name in the corresponding fields.
6. To bind a Web Service to the database right-click on the Web Service listing in the Web Service List window and select the Bind option from the context menu. This will display the Methods List window. If there are no public fields in the Web Service you are binding, go directly to step 8.
7. If there are any public fields in the selected web service, selecting the **Bind** option in the previous step will open the Public Fields List window listing all the public fields in the Web Service. You can edit field values by selecting the **Edit** option in the context menu for the fields list. In the web service parameter editing window that opens, click on the Serialize check box to enable serialization. Specify the value in the Value field by selecting the value type (Value, Variable, Content, XMLVariables) in the first drop down and providing the value. After specifying the value, click on the **Update Parameter Value** button to save it. Then click on the **Update** button at the bottom of the Public Fields List page to update the parameter value. After updating, click on the **Link** button to open the Web Service List window and right-click on the Web Service listing and then select Bind from the context menu. This will open the Methods List window mentioned in step 6.
8. In the Methods List window select the required method parameter(s) and bind them by clicking **Bind Parameters**.
9. In the Method Parameter listing window select parameter(s) to be updated and select the **Edit** option from the context menu. This opens the web service parameter editing window similar to the one in step 7. In this window specify the parameter values in the same way as described in step 7.
10. If you wish to specify authentication details for the web service, enter the Login Name, Password and Domain Name in the authentication fields in this window. If specified, these details will need to be used while executing the web service.
11. Select a Variable or Content Handler or XMLVariable to save the parameter values in from the **Save Output** in drop down.
12. Click on **Update** button after entering all the parameters to bind the Web Service.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

See WebService - Web Service Details for a detailed description of the Web Service Details property windows.

Miscellaneous

The property in the Miscellaneous group has been described below.

Retry on Failure? - This property allows the user to enable the activity to retry up to three times if the first attempt to connect to the web service fails. By default, it is set to **Yes**. This is useful to improve the chances of connecting to Webservices. This property can be set to **No** during development to avoid automatic retries.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

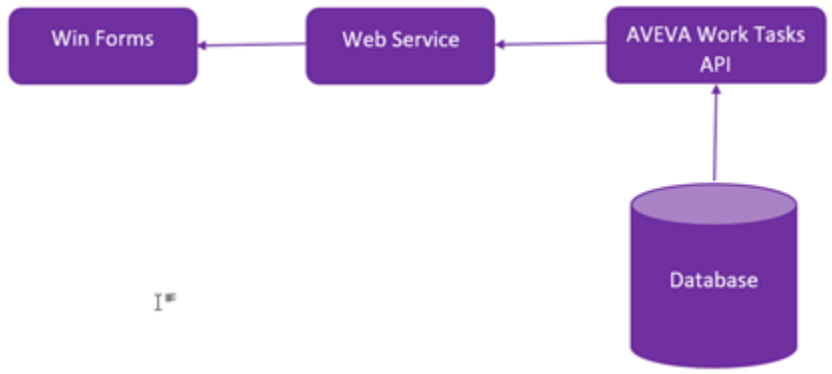
The Invoke-Web-Service Activity returns the following values -

Webservice Execution Failed: Displayed when the Web service execution has failed.

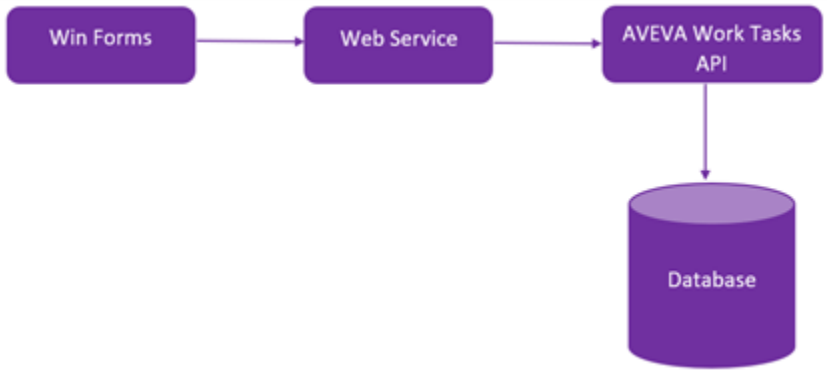
In addition to this standard return value it also returns the value specified by the user in the Return Values property as output.

The Web Service block diagram is as shown below:

Getting Work Item/Task details for an actor and rendering the same in Windows Forms



Submitting an Activity/Task via the web service and alerting the engine to execute next step in the workflow



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

Mapped Error Outputs for more details.

InvokeWebService: Web Service Details

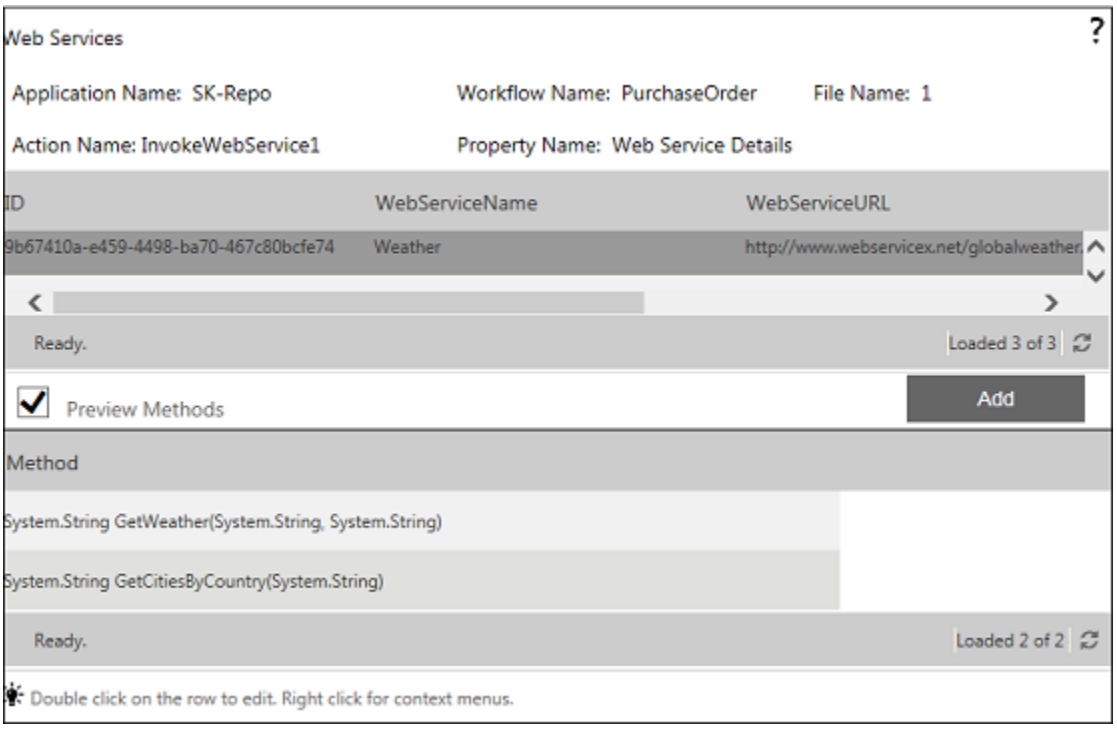
You can manage Web Services from the **Web Service Details** window.

The **Web Service Details** window lists all the web services configured for the application or workflow. The upper section of the window shows the web service details. The lower section of the window shows a preview of the methods of the selected web service if this provision is enabled.

The **Web Service Details** window has the following controls:

- **Preview Methods**: Enable the method preview display.
- **Add**: Add new web services.

The following image shows the Web Service Details window with the Preview Methods enabled:



To add a Web Service

1. Click **Add**.

   The window to add a web service appears.
2. Enter the following information:
   - **WebService Name**: Type a name for the Web Service.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **WebService URL**: Type the Web Service URL. You must enter a WSDL URL.

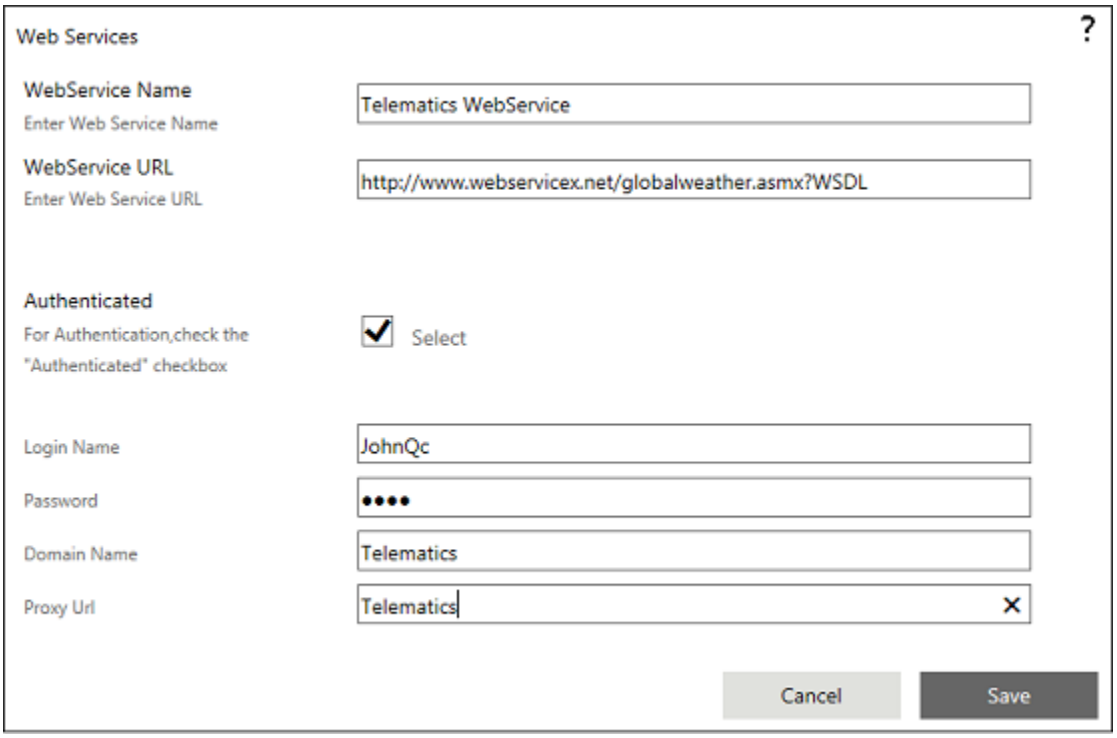
  For example: **localhost/SkeltaWebService/WorkfllowClient.asmx?wsdl**

  You can also enter an IPv6 address for the **WebService URL**. The IPv6 address must be enclosed within square brackets.
- **Authenticated**: Select if the web service requires authentication. When you select the **Authenticated** box, additional authentication fields appears.

  Enter the following information:
  - Login Name
  - Password
  - Domain Name
  - Proxy URL

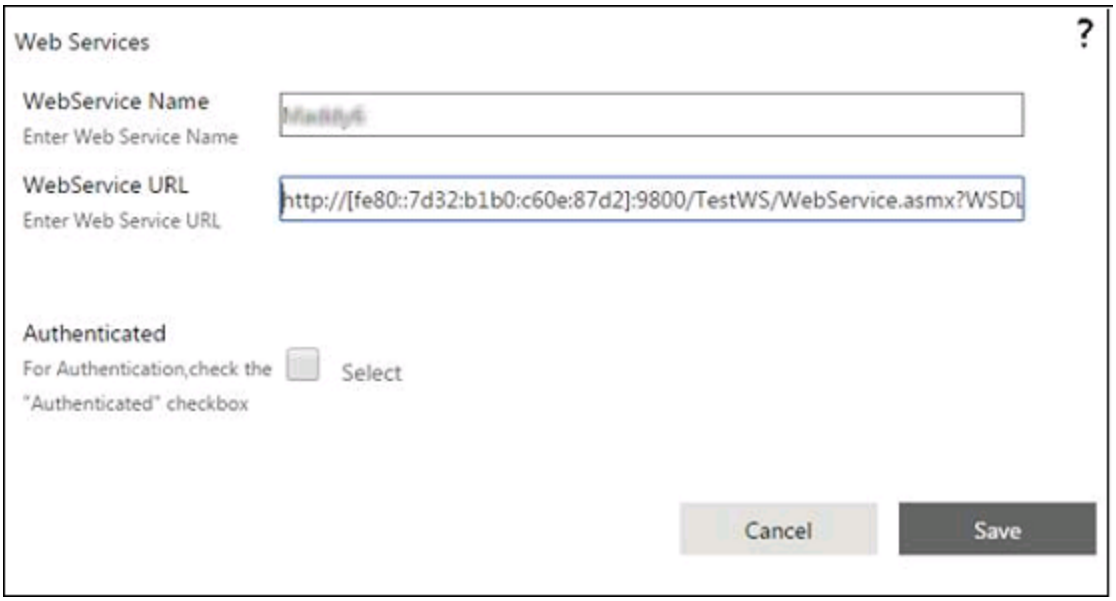
3. Click **Save**.

The following image shows a sample window for adding a web service:



The following image shows a sample window for adding a web service when the WebService URL is an IPv6 address:

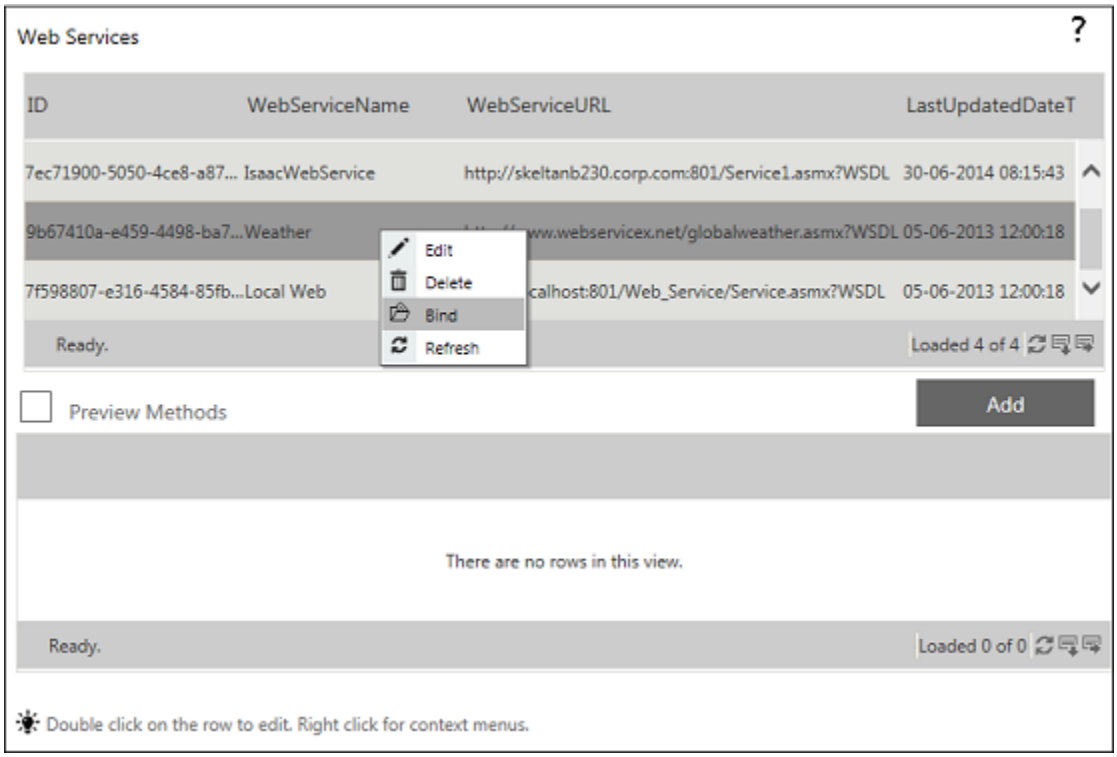
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Binding a Web Service

1. Right-click a web service.

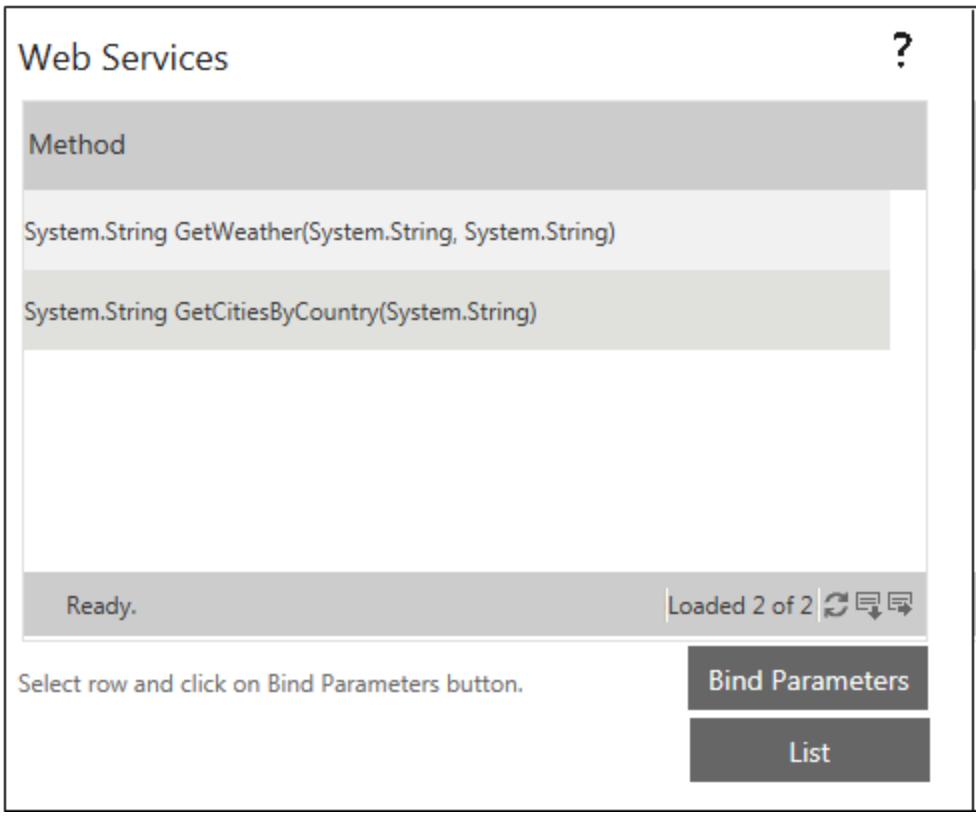
   The context menu shows **Edit**, **Delete**, **Bind**, and **Refresh** options.



2. Click **Bind** to bind the selected web service to the database.

   The **Methods** list of the web service appears in a new dialog box. This window also displays the Public Fields List window in case there are public fields in the selected web service.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Select the required method, and then click **Bind Parameters**.

   A dialog box appears that shows the details of the parameters of the selected method.

   You can click on the List button to return to the Web Services List page.
4. Select a Variable or an XML Variable to save the Web Service output in the **Save Output** in drop down.
5. If you select the **Save Output** in option as **XML Variable**, you can either use the available XML Variable or create your own XML Variable.
6. Click **Create XML Variable** to create an XML variable.

   The **Create XML Variable** dialog box appears.
7. Type the **XML Variable Name**, and then click **Create**.
8. If authentication is required, enter the Login Name, Password, and Domain Name.
9. Click Update.

Note: If the web method returns multi-level complex object, then create the XML variable in Start Activity using a sample XML schema returned by the web method. Then select this variable in the Invoke Web Service activity.

Invoke Web API Activity

Activity Description

You can use the Invoke Web API Activity to invoke a web API from the workflow. Use the output of the activity to determine the path of workflow execution.

The output is triggered based on the http Status Code returned by the activity. Alternatively, the output Status

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Code can be saved in the AVEVA Work Tasks System variable.
The variable has to be prefixed with "^" followed by "Activity Name _StatusCode". For example, if the activity name is Invoke Web API1, then variable name should be "^Invoke Web API1_StatusCode" and the data type should be "string".

The Error Message can be saved in the AVEVA Work Tasks system variable.
The variable has to be prefixed with "^" followed by "Activity Name _WebAPIErrorMessage". For example, if the activity name is Invoke Web API1, then variable name should be "^Invoke Web API1_WebAPIErrorMessage" and the data type should be "string".

The additional error information (i.e. http custom content message) can be saved in the AVEVA Work Tasks system variable.
The variable has to be prefixed with "^" followed by "Activity Name _WebAPIErrorDetails". For example, if the activity name is Invoke Web API1, then variable name should be "^Invoke Web API1_WebAPIErrorDetails" and the data type should be "string".

Note: During the execution of Web API, the error details are displayed in the "Step Details" page. These error details are fetched as-is from the "http custom content message". To display the clear and readable messages, make sure that the content for "http custom content message" is properly formatted in the Web APIs.

You can use any HTTP client to invoke your web API. In fact, you can invoke it directly from a web browser. When the Web API framework receives a request, it routes the request to an action. To determine which action to invoke, the framework uses a routing table.

Activity Properties

Specify correct values for the different properties in the Activity Properties area to configure the Invoke Web API activity.

To access the activity properties, click the Activity Properties tool in the Tool Bar or by select the appropriate option from the context menu for the Invoke Web API activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

Use the Name and Description properties to enter the the name and description for the activity. This property is optional, and can be set if required.

- **Name**: Specify a name for the activity.
- **Description**: Specifies a brief description to be displayed for the activity.

Configuration

Use the configuration properties to configure the functionality of the activity.

Configure Web API: Use this property to configure the Web API to be called. Web APIs are frameworks to build HTTP services for browsers and mobile devices.

For more information about this activity property, see Configure Web API.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Exception Behavior

Each activity has the **Raise Error on Unhandled Linked Output** property. Configure this property to raise an error if the output is not linked to the next activity in the workflow. You can also use this property to define and configure email templates and users for the exception mails. This property is optional, and can be set if required.

See Mapped Error Outputs for more details.

Looping Behavior

Use this property to specify the looping behavior of the activity. This property is optional, and can be set if required.

Loop through this action if output is: Specify the condition for looping the activity. Select any one of the following activities from the list:

- No Loop
- BadGateway(502)
- BadRequest(400)
- Error Encountered
- Forbidden(403)
- GatewayTimeout(504)
- HttpVersionNotSupported(505)
- InternalServerError(500)
- MethodNotAllowed(405)
- NotAcceptable(406)
- NotFound(404)
- NotImplemented(501)
- ProxyAuthenticationRequired(407)
- RequestTimeout(408)
- ServiceUnavailable(503)
- Successful
- Unauthorized(401)
- Unsuccessful
- UnsupportedMediaType(415)

Configure Web API

You can configure the Web APIs in the **Web API Activity Configuration** window. This window lists all the Web APIs configured for the application or workflow.

Http Method

The **Invoke Web API** activity supports the following HTTP request methods:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **GET**: The GET method retrieves information from the given server using a given URI. Requests using GET should only retrieve data and should have no other effect on the data.
- **POST**: A POST request sends data to the server, for example customer information, file upload, using HTML forms.
- **PUT**: A PUT request replaces all current representations of the target resource with the uploaded content.
- **DELETE**: A DELETE request removes all current representations of the target resource given by the URI.

Web API

Web APIs are frameworks to build HTTP services for browsers and mobile devices.

If the Web API is Windows authenticated, then the status of the Windows Authentication must be set to **Enabled** for the **EnterpriseConsole** site under **AVEVAWorkTasksSites** site in the **IIS Manager**.

If the Web API requires User Access Token authentication, provide the current logged in user's access token for authentication.

Note:
- If the repository is configured with AVEVA Identity Manager, Azure Active Directory, and AVEVA Connect, the User Access Token authentication does not work.
- If User Access Token is configured for the Web API and associated with Scheduler Event Association, the workflow fails.
- In an IDE environment, Web API with User Access Token does not work.

If the Web API requires Service to Service Access Token for authentication, you need to provide **Authority URL**, **Audience**, **Client ID**, **Client Secret**, and **Scope**.

In the **Authority URL**, provide the token end-point of the respective repository provider. For example,

- AVEVA Connect: `{authority url}/oauth/token`
- Azure Active Directory: `{authority url}/oauth2/v2.0/token`
- AVEVA Identity Manager: `{authority url}/connect/token`

Headers

Headers is used to view, add, and delete Header keys and values while configuring the Web API activity. Select the **Yes** option for **Show Header** to view, add, and delete Header keys and values. You can add Header value using Expressing Editor.

The **Headers** tab is displayed, only if the Header Key and Value is configured in the Web API resource file. You cannot add, edit, or delete the Header Keys and Values.

Note: You cannot set the **Headers** as optional i.e. the **Optional** property of the **Headers** cannot be set to **YES**. For each Header, the Key and Value are the mandatory properties.

Request URI

Request URI is a Uniform Resource Identifier and identifies the resource upon which to apply the request.

Example:

- Request URI without parameters: **api/product/1** for **http://localhost/MySite/api/product/1**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Request URI with parameters: **api/{product}/{ID}** for **http://localhost/MySite/api**

Use System Authentication

Select the **Use System Authentication** check box to use the access token of the Workflow Engine Service.

POST Data

Passing data to POST and PUT Methods

You can pass data to POST and PUT methods either through parameters or through the request body. If you pass data through request body, use the adjacent text box for the body content. If web API method uses [FromBody] attribute, select the **Yes** option for the **FromBody Attribute** property.

Content Type

You can configure the content type of the Post Data. The available options are **JSON**, **XML**, and **URL ENCODED**.

This field is displayed only when the value of **Http Method** is set to **POST** or **PUT**.

Encoding

You can configure the encoding type while configuring the Web API activity. The supported encoding types are **UTF-7**, **UTF-8**, and **UTF-16**. The **Default** encoding type is used for backward compatibility.

Output Settings

Save output type

Use the options in this field to save the return value from the Web Method so that you can use it in subsequent activities. You can save the return value as either a **Variable** or as an **XML Variable**.

Save output in

To save the output as a **Variable**, select the variable that you created in the **Start** activity. To save the output as an XML Variable, select the **XML Variable** that you created in the **Start** activity. You can also create the XML Variable using the **Create New** option. For more information on creating XML Variable, see Create XML Variable.

When you create a new XML Variable for Web API, we suggest you give sample Web API with multiple child nodes. This will add **ChildNode** node to the XML Variable structure. If the sample Web API contains only one child node, it may not add the ChildNode node to the XML Variable structure, and the nodes may not get mapped properly in the workflow.

You can also overwrite the XML Variable using the **Update XML Variable** option after modifying the Web API configuration.

Invoke Web API: Configure OpenAPI

AVEVA Work Tasks allows you to configure OpenAPI, and it is compliant with Swagger 2.0 and Swagger 3.0.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To configure the OpenAPI

1. Right-click the **Web API Activity**, and then click **Activity Properties** option. In the Activity Properties window, click **Configure Web API**.

   The **Web API Activity Configuration** window opens.
2. In the **Web API** drop-down list, select the Web API list item, which is an OpenAPI.

   This loads the OpenAPI data, which gets stored when OpenAPI list item is created using OpenAPI.
3. In the **Operation Group** dropdown list, select the operation group provided in the JSON file of the selected OpenAPI. These groups are the tags or the logical groupings of the selected OpenAPI.

   Tags are used as Operation Group. Though Tag is an optional element in the OpenAPI Specification, if available, it will be considered as Operation Group item.

   If Tags is empty/not available, then it will not list out in Operation Group, but the operation will be directly listed under All (by default) Operation Group.
4. In the **Operation** drop-down list, select the operation ID of the OpenAPI defined for the selected Operation Group in the JSON file of the selected OpenAPI.

   The OperationId is considered as Operation and will be listed out in the drop-down.

   The OperationId is an optional, unique element as per the OpenAPI Specifications. But if any of the OperationId is duplicate, then the same will be logged in the Logger.

   If the OperationId is not present, then Path_HttpMethod will be displayed as Operation under the Operation dropdown.

   Based on the Operation Group selection, the Operation will be listed in the Operation dropdown.

   If there are no Tags available for some operations, then they will appear in All Operation Group along with all other operations.

   When the Operation is selected, the HTTP methods (GET, PUT, POST, DELETE, or PATCH) and the associated parameters are retrieved from the JSON file of the selected OpenAPI.

   Note: If Operation ID is not available, the Operations Group tag is considered.
5. In the **HTTP Method**, the HTTP method is displayed when you select Operation, and this is a disabled field.
6. The **Headers** tab is displayed only if the Header Keys and Values are configured in the OpenAPI resource file. You cannot add or delete the Header Keys and Values for the OpenAPI.

   Note:
   - The **Show Header** option is available to hide/unhide the **Headers** tab in the **Web API Activity Configuration** page. Select **Yes** if you want to view, add, and delete the Header Keys and the Values, else select **No**. You can add the Value using Expression Editor.
   - You cannot set the **Optional** property of the **Header**. You cannot provide the Key, but you need to provide the Value. If the **Optional** property is **YES** and the Value is empty, the value will not be sent to the Web API and will be considered null. If the **Optional** property is **NO**, you need to provide the Value.
7. In the **Parameters** and **Body** tabs, enter the details given in the respective tables in this topic.
8. In the **Output settings**, configure the **Save output type** and **Save output in**.

   To save the output in a **Variable**, select the variable that you created in the **Start** activity. To save the output in an **XML Variable**, select the XML variable that you created in the **Start** activity. You can also create the XML variable using the **Create New** option from the **Save output in** dropdown.

   You can overwrite the XML Variable using the **Update XML Variable** option after modifying the OpenAPI configuration.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: If OpenAPI specification JSON file does not have a response for the selected Operation, then it will prompt the user as "The selected operation does not return any value."

9. Click **Save**.

   The OpenAPI gets configured.

Parameters Tab

This tab is displayed if the selected Operation has parameters.

In the Parameter's grid, the following parameters are listed:

- Path parameters: the parameters' value is part of the operation’s URL
- Query parameters: the parameters that are appended to the URL

Note: Header and Cookie parameters are not supported.

The table describes the fields available under **Parameters** tab.

Fields	Description
No	It displays the serial number of the parameter and represents its sequence.
Optional	It displays **YES** or **NO** values. **YES**, denotes that you can either enter the value for the parameter in the **Value** field or leave it blank. **NO**, denotes that you must enter the value for the parameter in the **Value** field. **Note**: For the path parameter, the Optional field is always NO, but for query parameter it can be either YES or NO.
Name	It displays the name of the parameter.
Data type	It displays the data type of the parameter. The supported data types are boolean, decimal, numeric, and string. **Note**: The OpenAPI-specific datatype formats are not validated.
Value	Enter the value to be passed for the parameter. The value is validated against the data type. The value can be hard-coded or can be passed through the Expression Editor. **Note**: The value passed using Expression Editor is not validated for the data type.

Body Tab

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

This tab is displayed if the selected Operation is POST, PUT, or PATCH.

It is used to pass PostData to the OpenAPI, and the PostData can be passed as raw format or in the form of parameters, hence two options - **Parameters** and **Raw** are available with the Radio buttons.

Both Parameters and Raw are validated based on the selection of Content Type.

Note: In the **Body** tab, it is mandatory to provide data either in the **Parameters** or the **Raw** option.

Parameters:

The request body is populated in the form of the name, data type, and the value to map individual parameters with a hard-coded value or to a dynamic value that is build-up through the Expression Editor.

The table describes the fields available under **Body** tab for **Parameters**:

Fields	Description
No	It displays the serial number of the parameter and represents its sequence.
Optional	It displays **YES** or **NO** values. **YES**, denotes that you can either enter the value for the parameter in the **Value** field or leave it blank. **NO**, denotes that you must enter the value for the parameter in the **Value** field. **Note**: For the path parameter, the Optional field is always NO, but for query parameter it can be either YES or NO.
Name	It displays the name of the parameter.
Data type	It displays the data type of the parameter. The supported data types are boolean, decimal, numeric, and string. **Note**: The OpenAPI-specific datatype formats are not validated.
Value	Enter the value to be passed for the parameter. The value is validated against the data type. The value can be hard-coded or can be passed through the Expression Editor. **Note:** The value passed using Expression Editor is not validated for the data type.

On the Body parameters, constitute the PostData, and pass it to the OpenAPI during execution.

Raw:

In this tab, you can provide raw data as PostData, either a hard-coded value or dynamic value that is built up through the Expression Editor.

The table describes the fields available under **Body** tab for **Raw** data:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Fields	Description
Post Data	Enter the value you want to pass to POST, PUT, and PATCH methods through the body. The value should be in the format based on the content type selected in the Content Type dropdown.

Note:
- For more information on PATCH method, see PATCH Method.
- Passing empty/null parameter in RAW JSON/XML format as PostData is not supported. The user needs to provide correct JSON/XML data in RAW format without null/empty values.
- During design, the value provided as raw data to pass to the POST or PUT method through the body is not retained when you change the operation (PUT or POST).

PATCH Method

The PATCH method is used to update an existing resource. It specifies only the changes and does not replace the entire resource.

The supported operations are add, remove, replace, move, and copy.

For more information on operations and the examples, see https://docs.microsoft.com/en-us/aspnet/core/web-api/jsonpatch?view=aspnetcore-3.1

You can use the PATCH method to update the configuration in Web API and Open API. For Web API, you can define the parameters only in the **Parameters** tab available based on the Request URL value. For Open API, you can define the parameters in the **Parameters** tab and **Body** tab.

Parameters Tab

Under this tab, if the Patch has any parameters, then those will be listed.

The table describes the fields available under **Parameters** tab.

Fields	Description
No	It displays the serial number of the parameter and represents its sequence.
Optional	It displays **YES** or **NO** values. **YES**, denotes that you can either enter the value for the parameter in the **Value** field or leave it blank. **NO**, denotes that you must enter the value for the parameter in the **Value** field. **Note**: For the path parameter, the Optional field is always NO, but for query parameter it can be either YES or NO.
Name	It displays the name of the parameter.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Fields	Description
Data type	It displays the data type of the parameter. The supported data types are boolean, decimal, numeric, and string. **Note**: The OpenAPI-specific datatype formats are not validated.
Value	Enter the value to be passed for the parameter. The value is validated against the data type. The value can be hard-coded or can be passed through the Expression Editor. **Note**: The value passed using Expression Editor is not validated for the data type.

Body Tab

This tab is used to pass PostData to the Web API, and the PostData can be passed as raw format or in the form of parameters, hence two options - **Parameters** and **Raw** are available with the Radio buttons.

Both **Parameters** and **Raw** are validated based on the selection of Content Type.

Note: It is mandatory to provide data either in the **Parameters** or the **Raw** option.

Parameters:

In this tab, you can specify only one PATCH operation.

The request body is populated in the form of the value, path, and op to map individual parameters with a hard-coded value or to a dynamic value that is build-up through the Expression Editor.

The table describes the fields available under **Body** tab for **Parameters**:

Fields	Description
value	Enter the property value or an object value. **Note:** The value passed using Expression Editor is not validated for the data type.
operationType	The OpenAPI specifications has this property, but is not applicable.
path	Enter the path of an array element or a property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Fields	Description
op	Enter the operation like add, remove, replace, move, or copy that you want to perform.

Raw:

In this tab, you can provide raw data as PostData, either a hard-coded value or dynamic value that is built up through the Expression Editor.

The table describes the fields available to provide **Raw** data:

Fields	Description
Post Data	Enter the operations with the property value or an object value you want to pass through the body using the PATCH method. You can specify multiple Patch operations in the JSON format.

Create XML Variable

In the Web API Activity Configuration window, use the **Create New** option in the dropdown list of **Save output in** to create a new XML Variable.

Note: The value returned from a Web API should have a valid and non-localized JSON. In the case of localized JSON, store the returned value in a String Variable instead of an XML Variable.

To create XML Variable for Generic Web API

In the Web API Activity Configuration window,

1. Enter the required data i.e. HTTP Method, Parameters (if not optional), Content Type, and Post Data.
2. Select the **XML Variable** in the **Save output type** dropdown list.
3. Select the **Create New** option in the **Save output in** dropdown list.

   The **Create Web API XML Variable** window opens.
4. Enter the name for the XML Variable. The XML Variable name with a single character is not supported.
5. Select the **Yes** check box for **Always include ChildNode in the XML schema** to add **ChildNode** under Root node to hold multiple items.

   Note: If the Web API selected for creating XML Variable returns multiple nodes, it will add the ChildNode node by default. But if you select the **Yes** checkbox and if the Web API returns even a single node, it will add the ChildNode node. This is applicable only for JSON returning Web APIs and not for XML returning Web APIs.
6. Under **Parameters** tab, enter the values to be passed against the listed parameters.
7. Click **Save**.

   Note: The Web API will be executed in the Web API server during this operation. Based on the Web API

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

functionality, there is a possibility of data update or delete.

To create XML Variable for OpenAPI:

In the Web API Activity Configuration window,

1. Select the Operation to be performed.
2. Select the **XML Variable** in the **Save output type** dropdown list.
3. Select the **Create New** option in the **Save output in** dropdown list.

   The **Create Web API XML Variable** window opens.

   Note: If the selected Operation does not have any response in the specification, it displays the message "the Operation does not return any value" and does not open the **Create Web API XML Variable** window.
4. Enter the name for the XML Variable. The XML Variable name with a single character is not supported.
5. Select the **Yes** check box for **Always include ChildNode in the XML schema** to add **ChildNode** under Root node to hold multiple items.

   Note: If the Web API selected for creating XML Variable returns multiple nodes, it will add the ChildNode node by default. But if you select the **Yes** checkbox and if the Web API returns even a single node, it will add the ChildNode node. This is applicable only for JSON returning Web APIs and not for XML returning Web APIs.
6. Click **Save**.

Note:
- The supported data types are boolean, decimal, numeric, and string.
- XML Variables without root elements are created with a root node named **root**. In earlier versions, it was **Root**. In case of upgrade and if XML Variables are updated, then correct this change in respective activities and variables. Mainly affected in Xml Variables of type Iterator, Activities like Script, Update Variable, and properties using Expression Editor.

Script Activity

Activity Description

The Script Activity enables the execution of script written in languages, such as Jscript and VBScript, from the workflow. When the Script activity is included in the workflow, the activity calls the Run method in the script. The references to the assemblies in the script are taken from the activity properties. The string value returned from the Run method of the script is assigned to the Output parameter. The Script activity executes the script and gives the return values specified in the properties. The link matching this value is picked up to continue workflow execution.

Features of Script Activity

- Compilation of the script code is made at design time to enable discovery of syntax or other errors during design.
- Loading all scripts defined through script activities as a single assembly. All script activities are compiled as a single assembly and only one assembly is loaded during workflow execution. This significantly improves performance.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- When a workflow is published, the script details are stored in the SWScriptCode table to enable identification of source code and assembly references.

  Note: Framework 4.0 has a library named System.Action and results in an ambiguity between the System.Action and Workflow.NET.Action. To avoid this ambiguity, it is recommended to name the Action class with complete namespace as 'Workflow.NET.Action' if it is used in the scripts inside script activity, while running BPM.NET 2011 SP2 in Framework 4.0.

Activity Properties

The Script activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Script activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

The following image shows the Name & Description properties of Script Activity:

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Programming

The properties in the Programming group have been described below. You can use these properties to program the script activity.

The following image shows the Programming Properties of the Script Activity:

Language - This property specifies the language of the script to be run. This property can be set to 'C#.NET', 'Jscript' or 'VBScript' depending on the scripting language required.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Code - This property specifies the code of the script to be run.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the Code property

1. To enter the code, click on the button for the 'Code' property to open the property window.
2. In this window enter the code directly in the text editor.
3. If you want to assign the code dynamically during run-time, you can do so using the **Field** controls. For example, you can add a variable or content pointing to the code from the two drop downs for **Field** and click on the **Append** button. This will add the placeholder for the variable or content in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the code.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. After adding the code, click the **Update** button to save it
7. Click the **Close** button to close the window without saving the code.

See Script - Code for a detailed description of the Code property window.

Reference - This property specifies the global objects that can be referenced in the script.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the References property

1. To specify the References, click on the button for the 'References' property to open the property window
2. In this window, enter the reference object in the **References** field
3. Next, enter the corresponding assembly path in the **Assembly Path** field
4. After entering the return value details, click the **Add Row** button to add this reference and display a new row for entering another reference
5. Remove rows if necessary by selecting them and clicking the **Remove Selected** button
6. After specifying the references, click the **Update** button.

See Script - References for a detailed description of the References property window.

Output Values

The properties in the Output Values group have been described below. You can use these properties to specify the output values for the activity.

The following image shows the Output Values Properties of the Script Activity:

Return Values - This property allows the user to specify the return values for this action. These values become the conditions for the workflow engine to pick up the next action to execute.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the Return Values property

1. To specify the Return Values, click on the button for the 'Return Values' property to open the property window
2. In this window, enter the return value in the **Return Values** field
3. After entering the return value details, click the **Add Row** button to add this return value and display a new row for entering another return value
4. Remove rows if necessary by selecting them and clicking the **Remove Selected** button
5. After specifying all the return values, click the **Update** button.

See Script: Return Values for a detailed description of the Return Values property window.

Action outputs

The Script Action does not have any standard return value. It will output the value specified by the user in the Return Values property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

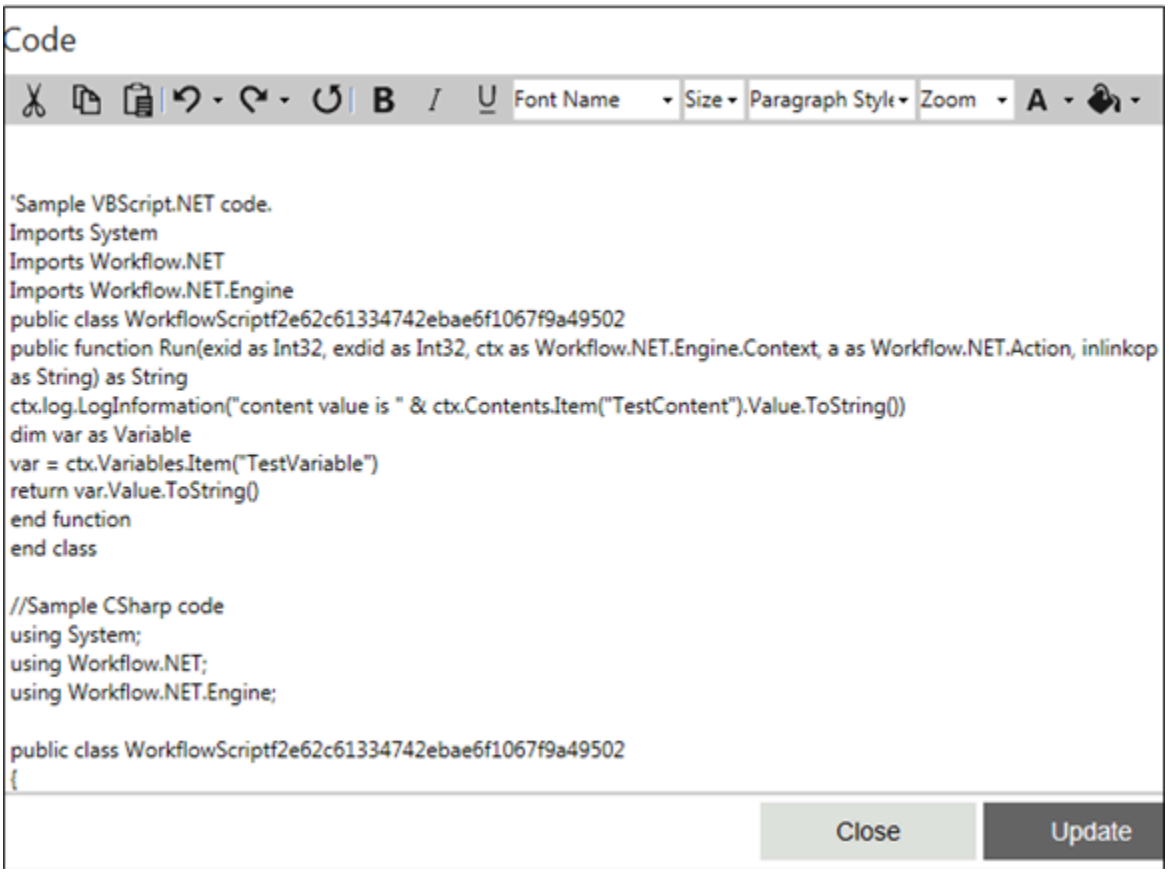
Note: In case Workflow containing Script activity is converted to Quickflow and the Script activity contains reference to any System binaries, user would need to change the assembly path.

Script: Code

Code Property Window

You can set the code of the script in the **Code** property window. To open this window, click the button for the "Code" property.

The following image shows the script **Code** property window:



The **Code** property window contains a text editor to enter the script code. You can do this either by entering a discrete value directly in the text editor. You can use the text tool bar in the text editor to manage and format the code.

The text tool bar contains the following options:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Options	Shortcut Key	Description
Cut	Ctrl+X	Cut text
Copy	Ctrl+C	Copy text
Paste	Ctrl+V	Paste copied text
Undo	Ctrl+Z	Undo the last action
Redo	Ctrl+Y	Redo an action that you undid
Repeat Last Command	F4	Repeat the last command that was executed
Bold	Ctrl+B	Make text bold
Italic	Ctrl+I	Italicize text
Underline	Ctrl+U	Underline text
Font Name	-	Select the font for the parameter
Size	-	Enter the font size
Paragraph Style	-	Select a paragraph style
Zoom	-	Zoom in and zoom out the view
Foreground Color	-	Set text color
Background Color	-	Set the background color
Print	-	Print the text

The **Code** property window also contains the following tabs:

- **Update**: Use this tab to save the parameter.
- **Close**: Use this tab to close this window.

Script: References

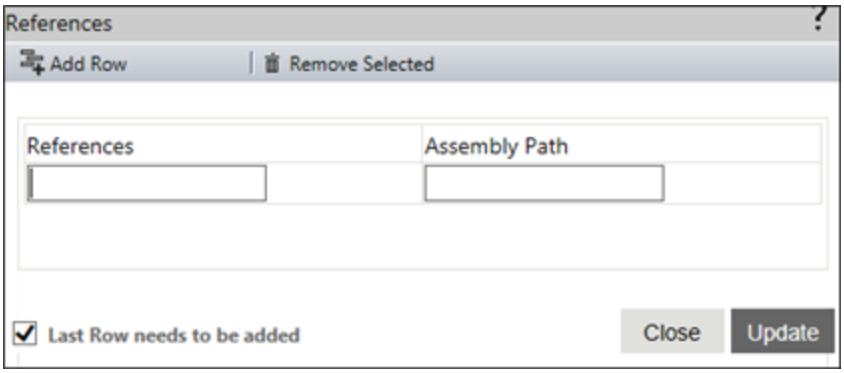
References Property Window

You can set the references for the script in the **References** property window.

To open this window, click the button for the "References" property. It displays the references in a grid. The grid contains a blank row where you can enter the parameters for new references.

The following image shows the **References** property window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

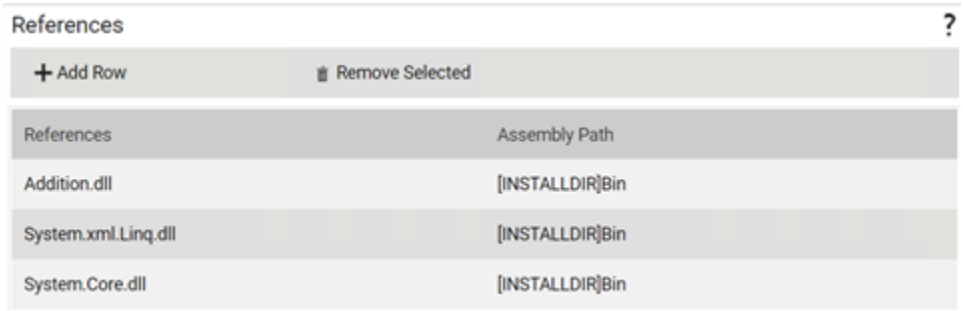


The **References** property window contains the following fields and tabs:

- **Add Row**: Use this tab to add the newly entered reference, and display a new row to the grid where you can add another reference.
- **Remove Selected**: Use this tab to remove the reference selected in the grid.
- **References**: Use this field to enter a new reference object.
- **Assembly Path**: Use this field to enter the assembly path for the new reference.
- **Update**: Use this tab to save the newly added reference(s).
- **Close**: Use this tab to close the property window without saving the newly added reference(s).
- **Last Row needs to be added**: Select this check box to save the last row added.

Enter the relative path, **[INSTALLDIR]Bin** as the assembly path to refer to the external assemblies that are referenced in script action and are available in the AVEVA Work Tasks installed Bin folder.

The following image shows the external assembly relative path:



Script: Return Values

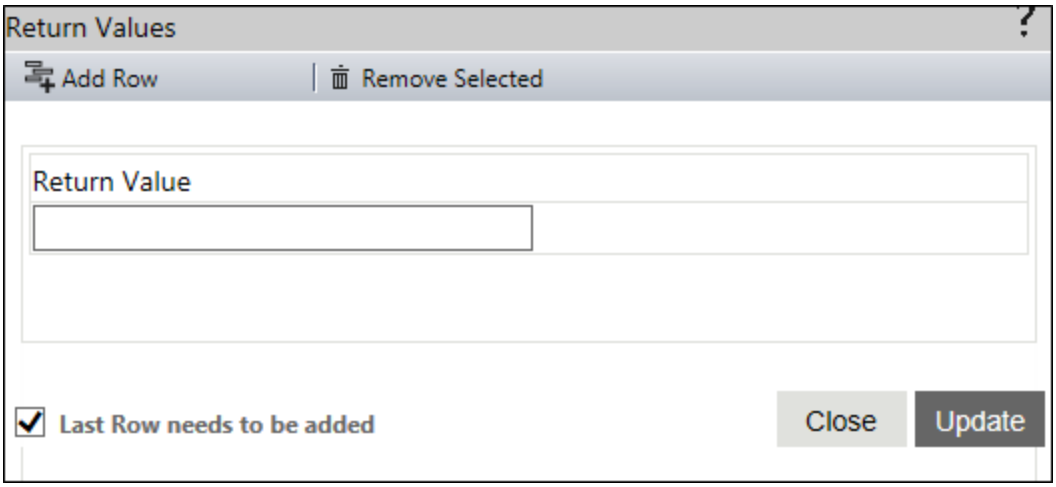
Return Values Property Window

You can set the return values for the Script in the **Return Values** property window.

To open this window, click the button for the "Return Values" property. It displays the values in a grid. The grid contains a blank row where you can enter a new return value.

The following image shows the **Return Values** property window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The **Return Values** property window contains the following fields and tabs:

- **Add Row**: Use this tab to add the newly entered return value, and display a new row to the grid where you can add another value.
- **Remove Selected**: Use this tab to remove the return value selected in the grid.
- **Return Values**: Use this field to enter the return value.
- **Update**: Use this tab to save the newly added return value(s).
- **Close**: Use this tab to close the property window without saving the newly added return value(s).
- **Last Row needs to be added**: Select this check box to save the last row added.

File Operations Activity

Activity Description

The File Operation Activity can be used to perform file transfers from within the workflow. It can be used to transfer files within local networks as well as using HTTP and FTP protocols.

File Transfers Supported

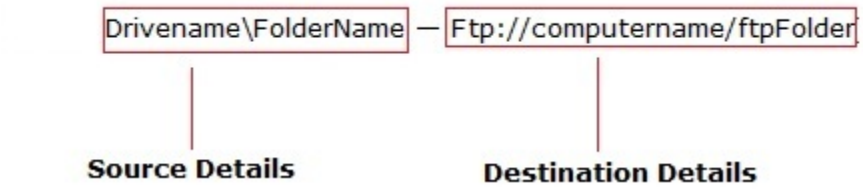
The list of supported file transfers:

- UNC — HTTP - Example: \\computername\sharename\filename — Http://computername/ WebFolder /filename
- File — HTTP - Example: \\DriveName\foldername\filename — Http://computername/ WebFolder /filename
- File — FTP - Example: \\Drivename\ftpFolder\FileName — Ftp://computername/Sharename/filename
- FTP — Filen - Example: Ftp://computername/Sharename/filename — Drivename\FolderName\
- HTTP — UNC - Example: Http://computername/WebFolder /filename — \\computername\sharename\filename
- UNC — UNC - Example: \\computername\sharename\filename — \\computername\sharename\filename
- File — File Example: \\DriveName\foldername\filename — DriveName\foldername\filename

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- UNC — HTTP (Directory Transfer) Example: \\Computername\sharename\filename — Http://ComputerName/WebFolder
- File — HTTP (Directory Transfer) Example: \\Drivename\FolderName — Http://computername/WebFolder
- File — FTP (Directory Transfer) Example: Drivename\FolderName — Ftp://computername/ftpFolder

  Note: The above examples are in the following format: Source Details — Destination Details



The File Operation activity is not supported if the Source and Destination paths are in the combinations given below:

- FTP and HTTP
- FTP and FTP
- HTTP and FTP
- HTTP and HTTP

Variable for getting the list of files that were transferred

The list of files that were transferred using the File Operations activity can be retrieved using a variable of type array, with the following syntax:

^'+CurrentActivity.Name+ 'FilesUploaded'

For example, ^TransferFileOperationFilesUploaded

Variable for getting the list of files that were not transferred

The list of files that were not transferred using the File Operations activity can be retrieved using a variable of type array, with the following syntax:

'^'+CurrentActivity.Name+ 'FilesNotUploaded'

For example, ^TransferFileOperationFilesNotUploaded

Activity Properties

The File Operation activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the File Operation activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

SourceDetails - This property allows the user to specify the details of the file source, like its location, the transfer protocol, etc.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the SourceDetails property

1. To specify the details of the file source, click on the button for the 'SourceDetails' property to open the property window.
2. In this window specify the file operation (transfer) protocol by selecting an option from the drop down for the **Protocol** field.
3. Next assign the URI/UNC of the source file or directory as the value for the **Location** field. Build an expression to assign the location details by selecting the operator, type of value (Value, Variable, Content, XMLVariables), and the value for the property from the corresponding drop downs.
4. In the same way, you can assign a search pattern to filter the type of file to be copied or transferred as the value for the **Pattern** field. For example, you can specify "*.doc" as the filter pattern. This will select only files with the extension .doc for copying or transferring.
5. You can also assign the user name and password of the source file/directory in the User Name and Password fields respectively, by following the same procedure that is used in step 3.
6. In addition, you can assign the domain name and port number of the source in the **DomainName** and **PortNumber** fields respectively, by following the same procedure that is used in step 3.
7. After adding the parameter, click **Submit** to save it.

See File Operations: Source Details for a detailed description of the Source Details property window.

DestinationDetails - This property allows the user to specify the details of the file destination.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the Destination Details property

1. To specify the details of the file destination, click the button for the 'DestinationDetails' property to open the property window.
2. In this window specify the file operation (transfer) protocol by selecting an option from the drop down for the **Protocol** field.
3. Next assign the URI/UNC of the destination file or directory as the value for the **Location** field. Build an

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

expression to assign the location details by selecting the operator, type of value (Value, Variable, Content, XMLVariables), and the value for the property from the corresponding drop downs.

4. In the same way, you can assign a search pattern to filter the type of file to be copied or transferred as the value for the **Pattern** field. For example, you can specify "*.doc" as the filter pattern. This will select only files with the extension .doc for copying or transferring.
5. You can also assign the user name and password of the source file/directory in the **User Name** and **Password** fields respectively, by following the same procedure that is used in step 3.
6. In addition, you can assign the domain name and port number of the source in the **DomainName** and **PortNumber** fields respectively, by following the same procedure that is used in step 3.
7. After adding the parameter, click **Submit** to save it.

See File Operations: Destination Details for a detailed description of the Destination Details property window.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Action outputs

The File Operations Activity returns the following values -

Successful: Displayed when the file transfer is successful.

Failure: Displayed when the file transfer is unsuccessful.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

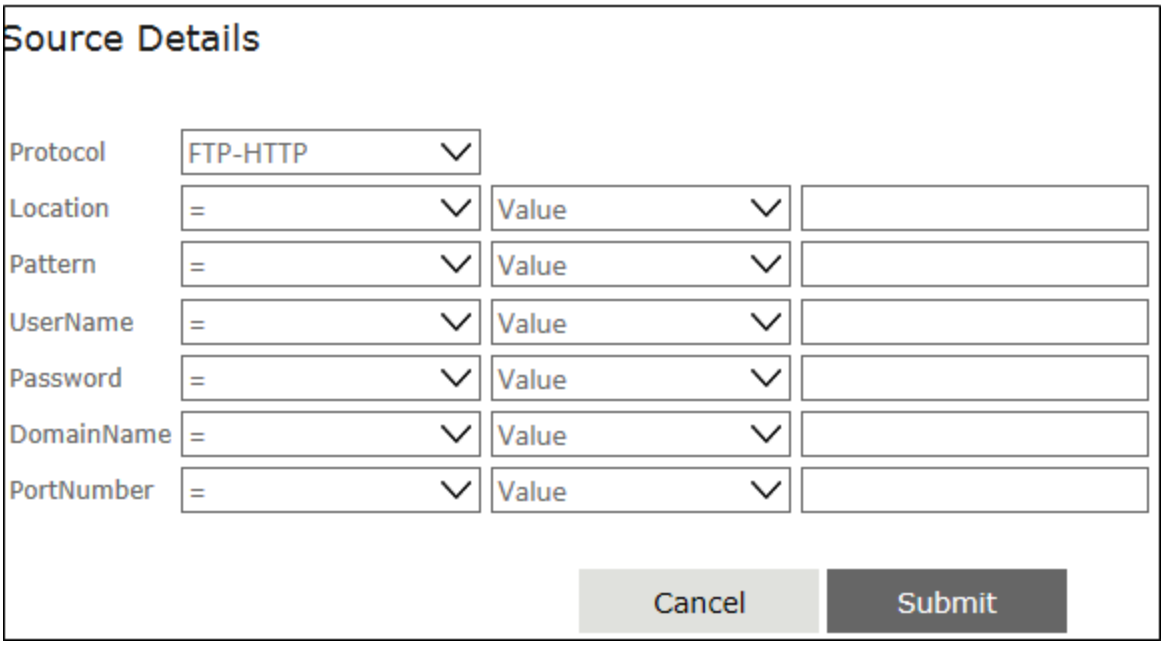
See Mapped Error Outputs for more details.

File Operations: Source Details

Source Details Property Window

You can specify the details of the file source in this property window. To open this window, click **Source Details** property. The **Source Details** property window appears as shown in the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The following table shows the fields of the **Source Details** property window:

Parameter	**Description**
Protocol	The required file transfer protocol, such as FTP-HTTP.
Location	The URI or UNC of the file or directory.
Pattern	Pattern to decide the file types to be transferred, such as *.doc,*.xls.
UserName	User name for the source.
Password	Password for the source.
Domain	Domain or machine of the source name.
PortNumber	Port number of the source server.

Each of the above parameter fields has the following controls.

- **Operator**: Select the operator for the expression from the drop-down menu. For example, "="
- **Value**: Select the type of value to assign to the parameter in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- **Value text box or drop-down menu**: Specify the actual value to assign to the parameter. The control displayed depends on the option selected in the Value column. If you select "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression. If you select "Variable", "Content", or "XMLVariables", there will be a drop-down menu instead of the field. This drop-down menu contains the variable collection, or content collection, or XMLVariables collection from which you can select an appropriate option.
- **Submit**: Click **Submit** to save the specified parameters.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

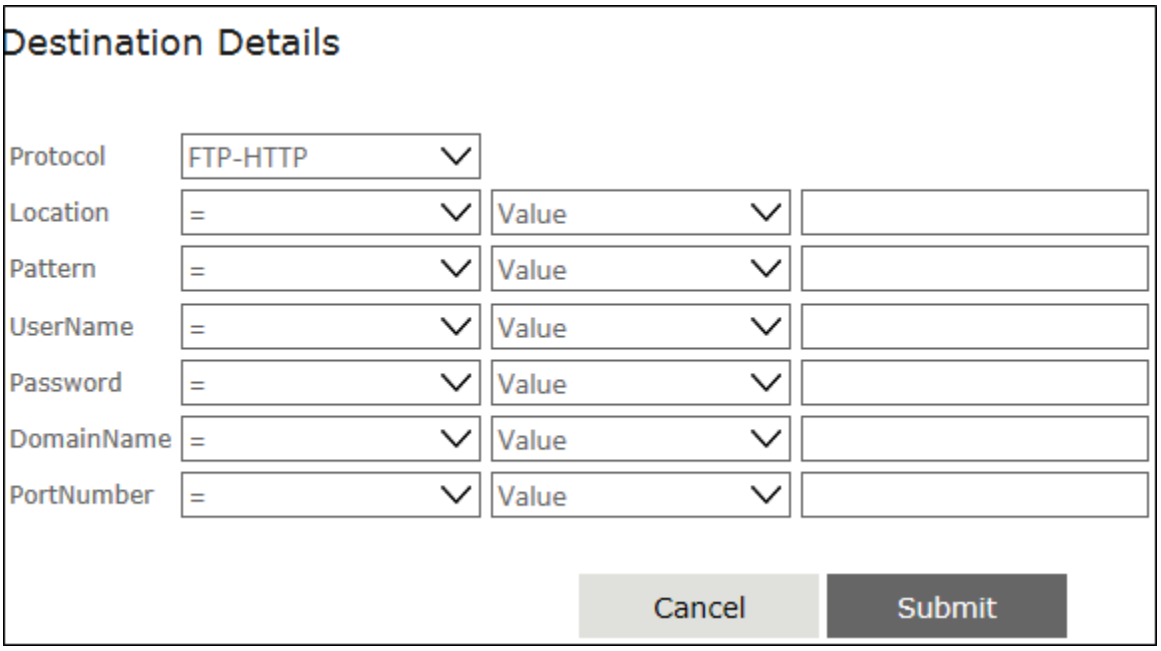
- **Cancel**: Click **Cancel** to cancel the settings and close the property window.

Note: In AVEVA Work Tasks, the validation for user credentials for FTP-HTTP is not provided. However, if a particular FTP needs authentication, then the user has to provide appropriate credentials.

File Operations: Destination Details

Destination Details Property Window

You can specify the details of the file destination in this property window. To open this window, click **Destination Details** property. The **Destination Details** property window appears as shown in the following image:



This window has the **Protocol** drop down where you can select the file transfer protocol. Below this drop down, it has controls to specify the following details.

- **Protocol** - If the selected protocol is FTP-HTTP, you can use FTP or HTTP protocol.

  For the HTTP protocol, you must enable the WebDAV Publishing feature for the web server. For more information about enabling the WebDAV Publishing feature, refer the Microsoft documentation.

  In the **Authentication** Feature in Internet Information Services (IIS) Manager, ensure that only **Windows Authentication** is enabled for the selected HTTP site.
- **Location** - You can specify the URI/UNC of the file or directory here.
- **Pattern** - You can specify the pattern to decide the file types to be transferred like *.doc,*.xls in this field.
- **UserName** - You can specify the user name for the destination here.
- **Password** - You can specify the password for the destination here.
- **Domain** - You can specify the domain/machine name of the destination here.
- **PortNumber** - You can specify the port number of the destination server.

Each of the above parameter fields has the following controls.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The Operator drop down - You can select the operator for the expression here. For example, "="
- The Value type drop down - You can select the type of value to assign to the parameter in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the parameter. The control displayed depends on the option selected in the preceding drop down. If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.

At the bottom of the window you will find the following buttons:

- **Submit** - You can click this button to save the parameters that have been specified.
- **Cancel** - You can click this button to cancel the settings and close this window.

Change Workflow Status Activity

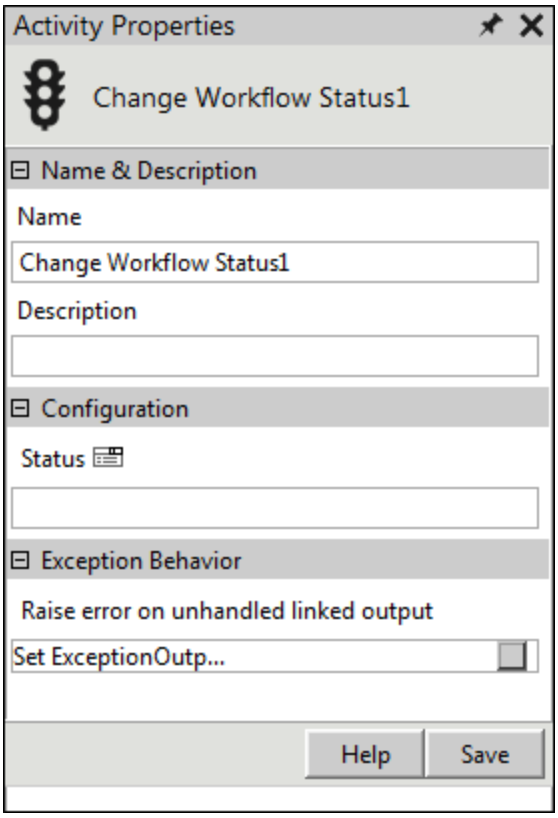
Activity Description

The Change Workflow Status Activity updates the status of the workflow in the database.

Activity Properties

The Change Workflow Status activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right-click menu for the Change Workflow Status activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Change Workflow Status Activity Properties

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Status - This property specifies the new status to be updated.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Activity outputs

The Change Workflow Status Activity does not return any value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

XML Action Activity

Activity Description

The XML Action Activity can be used to assign XML data for activity. This was possible earlier only by using Contents and Variables defined in the Start activity. The activity has been enhanced to accept XML data containing namespaces. The namespace manager that has been added to the activity handles namespaces within the XML data internally.

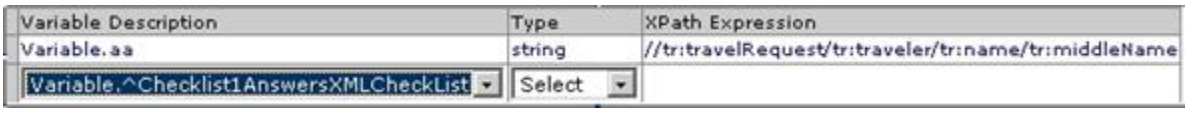
View an example of assigning XML data with namespaces to a variable

The namespaces in the following example used to illustrate the extraction of a particular data are highlighted in red.

```
<tr:travelRequest xmlns:xhtml="http://www.w3.org/1999/xhtml" xmlns:xsi="http://www.w3.org/
2001/XMLSchema-instance" <tr:travelRequest xmlns:xhtml="http://www.w3.org/1999/xhtml"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
<tr:description></tr:description>
<tr:date xsi:nil="true"></tr:date>
<tr:traveler>
<tr:name>
<tr:prefix></tr:prefix>
<tr:givenName>guru</tr:givenName>
<tr:middleName>nayak</tr:middleName>
<tr:surname></tr:surname>
<tr:suffix></tr:suffix>
<tr:singleName></tr:singleName>
</tr:name>
</tr:traveler>
</tr:travelRequest>
```

The XPath expression to retrieve the middle name and assign it to a workflow variable 'aa' is given below. The image shown below illustrates the actual setting of the variable with this XML data.

// tr:travelRequest/ tr:traveler/ tr:name/ tr:middleName



Application Scenarios

The XML Action can be used with other activities to retrieve required XML data by defining XPath expressions. For example, it can be used with the Checklist activity to retrieve the Answers to Checklist Questions.

The XPath expressions for retrieving answers to Checklist Questions

The XML Activity can be used with the Checklist Activity to retrieve the Answers to the Checklist Questions. The XML data format for the Checklist Activity to be declared in the Start activity is '^'+ activity name +

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

'AnswersXMLCheckList' , e.g. '^Checklist1AnswersXMLCheckList'.

The XPath expressions to retrieve the Answers from the Checklist XML string are given below:

XPath with attribute:

```
//checklist/question[@name="RADIO"]/answer
//checklist/question[@name="DROPDOWN"]/answer
//checklist/question[@name="TEXTBOX"]/answer
//checklist/question[@name="MEMO"]/answer
//checklist/question[@name="CHECKBOX"]/answer
```

Activity Properties

The XML Activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the tool bar or by selecting the appropriate option from the right click menu for the XML Activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Input Values

The properties in the Input Values group have been described below. You can use these properties to specify the input values for the activity.

Get Variable - This property allows the user to specify the variable that holds the XML string. This variable is defined in the Start activity.

Property Type: Optional (This property supports backward compatibility.)

Get Data - This property allows the user to pass the XML data. This data can be passed in one of two forms: (1) XML String, or (2) XML File (where the complete path of the XML file is specified).

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Get Data property

1. To specify the XML data, click the button for the 'Get Data' property to open the property window.
2. In this window enter the XML data directly in the text editor. You can either specify the file path to an XML file here or enter the XML data directly.
3. If you want to assign the parameter dynamically during run-time, you can do so using the **Field** controls. For example, you can add a variable or content pointing to the XML data from the two drop downs for **Field** and click on the **Append** button. This will add the placeholder for the variable or content in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the XML data.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

undo and redo changes, zoom in and zoom out the view as well as print the text.

5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the XML data, click **Update** to save it.
7. Click to close the window without saving the XML data.

See XML Action: Get Data for a detailed description of the Get Data property window.

Output Values

The properties in the Output Values group have been described below. You can use these properties to specify output values for the activity.

Set Variables - This property allows the user to set the XPath to retrieve the required XML attribute from the XML string that is set in the Get Variable property.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Set Variable property

1. To set the XML data to selected variables, click the button for the 'Set Variables' property to open the property window.
2. In this window, select the variable from the drop down for the **Variable Description** field.
3. Next select the variable type from the **Type** drop down.
4. Specify the XPath Expression for the XML data to be assigned to the selected variable in the **XPath Expression** field.
5. After entering the details, click **Add Row** to add this variable setting and display a new row for assigning XML data to another variable.
6. Remove rows if necessary by selecting them and clicking **Remove Selected**.
7. After setting the XML data to the variables, click **Update**.

See XML Action: Set Variables for a detailed description of the Set Variables property window.

Configuration

The property Assign Empty Node Values in the Configuration group has been described below. You can use this property to configure the functionality of the activity.

Assign Empty Node Values

This property allows the user to choose whether the XML node value can be updated with an empty value or not.

If this property is set as "Yes", then the variables can be updated with the "Empty" node values and the activity will complete with a "Successful" output.

If this property is set as "No", then the variables will not be updated with the "Empty" node values and the activity will complete with an "UnSuccessful" output.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The XML Action Activity returns the following values -

Successful: Displayed when the activity is successful in retrieving the attribute from the XPath expression.

Unsuccessful: Displayed when the activity is unsuccessful in retrieving the attribute from the XPath expression.

Exception Behavior

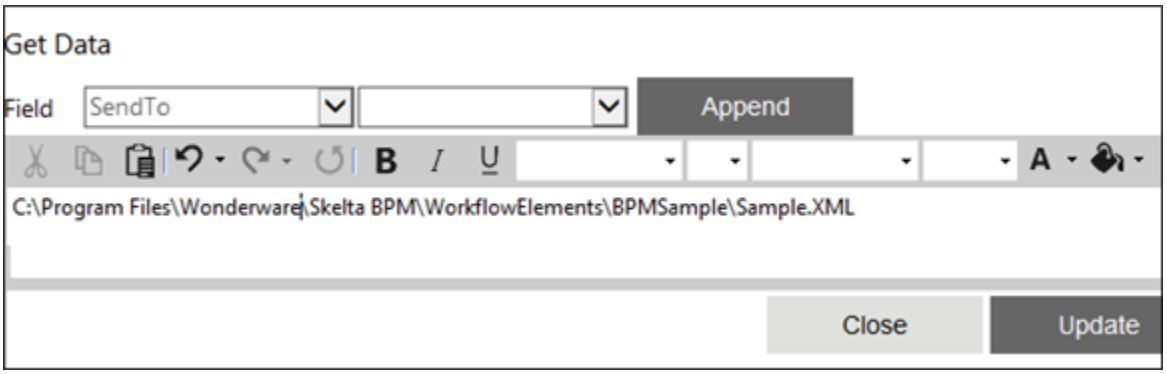
Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

XML Action: Get Data

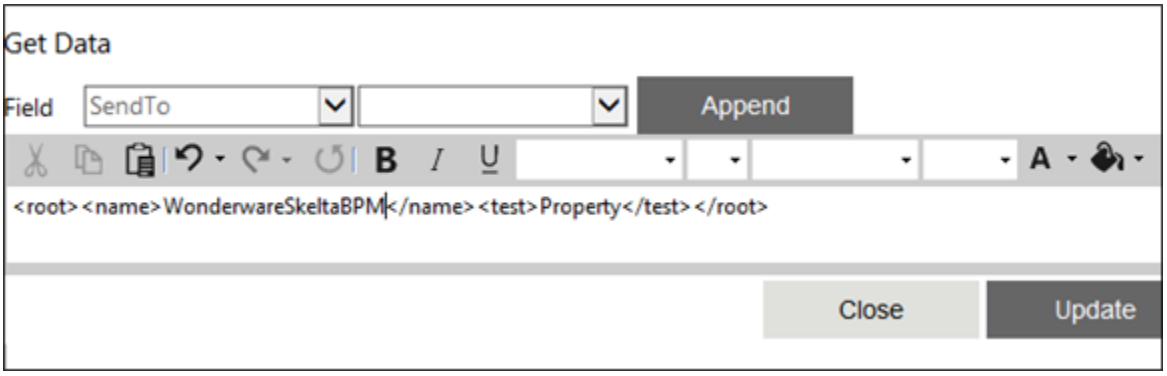
Get Data Property window

You can set the XML data in this property window. To open this window, click the button for the 'Get Data' property.

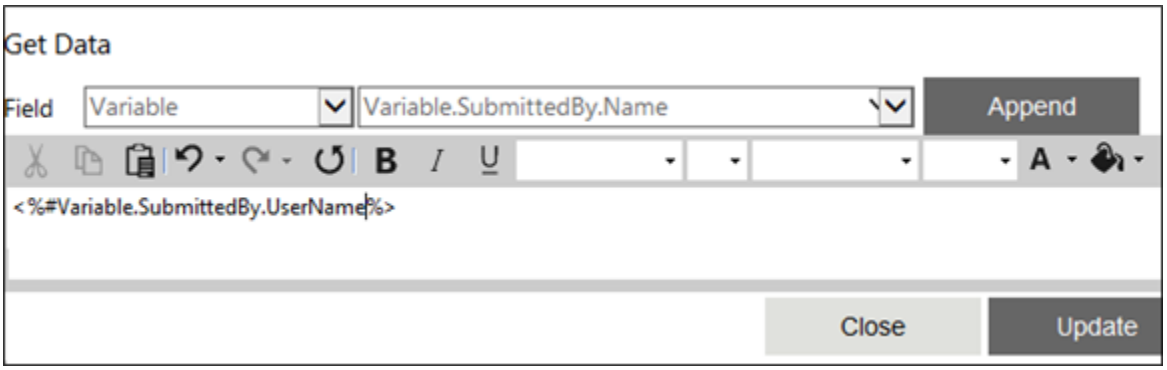


© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Get Data property - XML file path



Get Data property - XML data



Get Data property - XML data through variable

The window has a text editor to enter the XML data. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value or XML Variable here.
- The Value text box/drop down - You can specify the actual XML data. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the XML data in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the XML data.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the XML data details. It has the following text tools –

- **Cut (Ctrl+X)** - to cut text
- **Copy (Ctrl+C)** - to copy text

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Paste (Ctrl+V)** - to paste text
- **Undo (Ctrl+Z)** - to undo the last action
- **Redo (Ctrl+Y)** - to undo the last action
- **Repeat Last Command (F4)** - to repeat the last command that was executed

It also has the following formatting & other tools –

- **Bold (Ctrl+B)** - to make text bold
- **Italic (Ctrl+I)** - to italicize text
- **Underline (Ctrl+U)** - to underline text
- **Font Name** - to select the font for the XML data
- **Size** - to specify the font size
- **Paragraph Style** - to select a paragraph style
- **Zoom** - to zoom in and zoom out the view
- **Foreground Color** - to set text color
- **Background Color** - to set the background color
- **Print** - to print the text

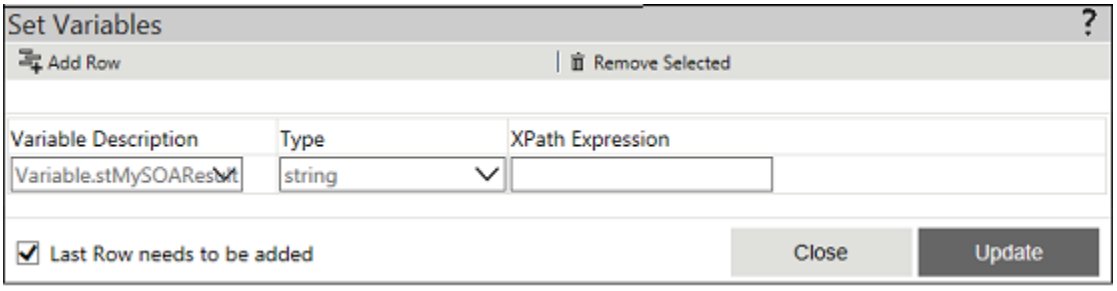
At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the XML data.
- **Close** - You can click this button to close this window.

XML Action: Set Variables

Set Variables Property window

You can set Xpath expressions to workflow variables in this property window. To open this window, click the button for the 'Set Variables' property. It displays the settings for the variables in a grid, which also has a blank row where you can enter the settings for a new variable.



The window has two tabs at the top to manage the rows of variable settings in the grid.

- **Add Row** - You can click this tab to add the newly entered variable settings and display a new row to the grid where you can add another variable settings.
- **Remove Selected** - You can click this tab to remove the variable selected in the grid.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The grid has the following parameters that you need to specify for the new variable.

- **Variable Description** - You can select the variable to which to assign the XML data from the drop down for this field.
- **Type** - You can select the variable type from this drop down.
- **XPath Expression** - You can use this field to enter the XPath Expression for the XML data to be assigned to the selected variable.

There are two buttons and a check box at the bottom of the screen.

- **Update** - You can click this button to save the newly added variable settings.
- **Close** - You can click this to close the property window without saving the newly added variable settings.
- **Last Row needs to be added** - You need to select this check box to save the last row added.

Engine Activities

The following activities are found under Engine Activities:

- **End Activity Execution Activity**: This activity enables the user to end or terminate the execution of an activity in a workflow.
- **End Child Workflow Execution Activity**: This activity enables the user to end a child workflow from the parent workflow.
- **BlockingOutput Activity**: This activity facilitates synchronous execution of workflow activities other than human activities with an active form.
- **Database Activity**: The database activity enables execution of queries, stored procedures, and functions from the workflow.
- **Decision Activity**: The Decision Activity can be used to insert a decision in the workflow.
- **ForEach-Loop Activity**: The ForEach Loop Activity is used to loop an activity through a collection within an XMLIterator Variable.
- **For-Loop Activity**: The For-Loop Activity can be used to start a loop within a workflow.
- **Logger Activity**: The Logger Activity can be used to log messages like information, warnings, and errors to the logger console from the workflow.
- **Loop Execution Step Entry Activity**: The user can use this activity if an instance level association between the End Activity Execution activity and the activity to be ended is required.
- **Next Loop Activity**: The Next Loop activity can be used as the terminal activity in a loop initiated using a For-Loop Activity.
- **Resource Variable Activity**: The Resource Variable Activity can be used to identify an actor to perform a workflow activity, through a variable.
- **Rule Activity**: The Rule Activity allows complex rules or expressions to be built into the workflow.
- **Workflow Activity**: The Workflow Activity enables the execution of a second workflow from a workflow.
- **Update Variable Activity**: The Update Variable Activity can be used to update the value of Variables and XmlVariable that can be used in the subsequent activities.
- **Update Parent Variables Activity**: The Update Parent variables activity can be used to update a workflow

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

variable from a second workflow, provided both workflows belong in the same repository.

- **Synchronize Activity**: The Synchronize Activity synchronizes the execution of different activities.
- **Set Workflow Output Variable**: The Set Workflow Output Variable activity can be used to set the output of the parent workflow from the child workflow.
- **XML Navigator**: The XML Navigator is used to either locate or navigate to a specific record in a collection within an XMLIterator Variable.

End Activity Execution Activity

Activity Description

This activity enables the user to end or terminate the execution of an activity in a workflow. The user can end an activity present either in the same (parent) workflow or the child workflow which is associated to the parent workflow.

Application Scenario

Consider a workflow with a 'Wait For Event' activity and an 'Approval' activity. The Wait For Event activity is executed only when a new list item is added, otherwise the activity will be in a waiting state. This scenario, however, requires that if the user executes the approval activity, the workflow need not wait for the execution of the Wait For Event activity and hence end the activity. In such scenarios, the End Activity Execution activity can be used. This activity helps the user to ensure that a workflow completes without any activity in waiting state.

Refer to the User Scenarios given in the *User Guide* for a detailed understanding of this activity.

Activity Properties

The End Activity Execution activity has to be configured by specifying appropriate values for different properties in the **Activity Properties** pane. This pane can be accessed by clicking on the Activity Properties tool in the **Tool Bar** or by selecting the Activity Properties option from the context menu of End Activity Execution activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the **Name & Description** group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property is to be used to specify a name for the activity.

Property Type: Mandatory (This property must be set.)

Description - This property can be used to specify a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in this group have been described below. You can use these properties to configure the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

functionality of the activity.

Activity Details - This property is used to specify the activity that is to ended and the workflow in which the activity is used.

Property Type: Mandatory (This property must be set to end the activity in a workflow.)

See End Activity Execution: Activity Details for a more detailed understanding of its properties.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Looping Behavior

The property in the **Looping Behavior** group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop-down field.

Property Type: Optional (This property needs to be set only if necessary.)

End Activity Execution: Activity Details

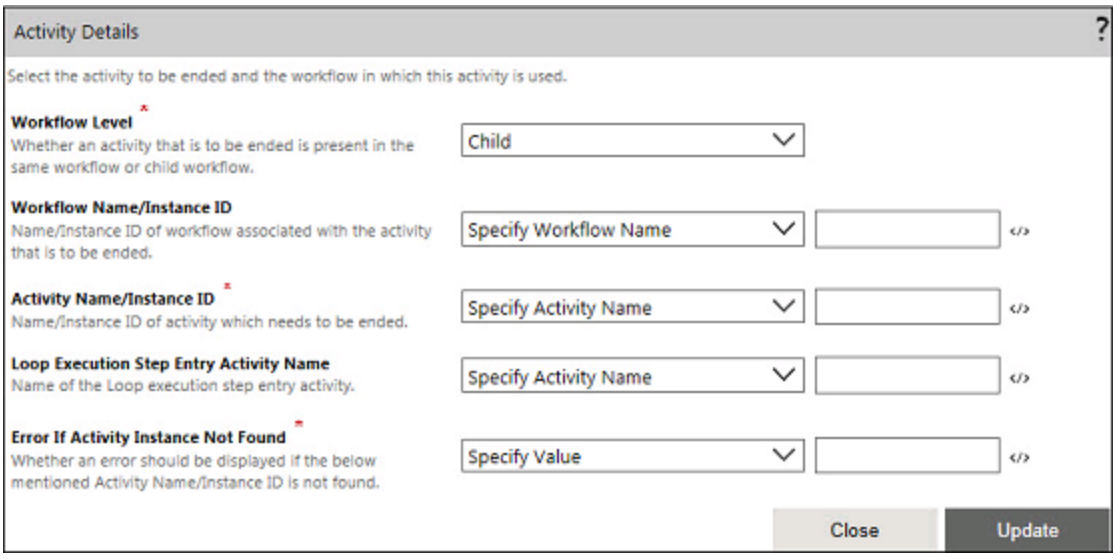
Activity Details property window

This topic gives you a detailed understanding of the **Activity Details** properties. The Activity Details properties are used to specify

- the workflow in which the activity to be ended is used.
- the activity which needs to be ended.
- the error that needs to be displayed if the activity that is to be ended is not found.
- the loop execution step entry activity to monitor the instances that are to be ended.

To open the **Activity Details** window, click the Activity Details button.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



This window has the following properties:

- **Workflow Level**: This property helps you to select the workflow level in which the activity to be ended is present. You can select either the parent workflow level or the child workflow level in which the activity to be ended is present.
- **Self:** You can select this option if the activity to be ended is present in the parent/same workflow.
- **Child**: You can select this option if the activity to be ended is present in a child workflow.
- **Specify Workflow Level**: If you do not know the workflow level, then you can use this option to specify the workflow level and type the workflow level in the adjacent field. Alternatively, you can use the expression editor, by clicking the icon , to select a variable assigned to the required workflow level. During runtime, this variable value is used to know the workflow level. You can assign the 'Self' or 'Child' values to a variable which will be used to know the value of this property.
- To know more about using expression editor, see Using Expression Editor to Build Expressions for Properties topic in *User Guide* section.
- **Workflow Name/Instance ID**: This property helps you to select the workflow name or its instance ID in which the activity to be ended is present. This option is enabled only if you have selected the 'Child' workflow level option.

You can select the activity name from the drop-down field. Alternatively, you can either select the **Specify Workflow Name** or the **Specify Workflow Execution ID** option.

- **Specify Workflow Name**: Select this option to specify the workflow name and type the workflow name in the adjacent field. Alternatively, you can click the expression editor icon and select a variable referring to the required workflow name in the expression editor window.
- **Specify Workflow Execution Instance ID**: If you do not know the workflow name, then select this option to specify the workflow execution ID and type the execution ID in the adjacent field. Alternatively, you can click the expression editor icon and select a variable referring to the required workflow execution instance ID in the expression editor window.
- **Activity Name/Instance ID**: This property helps the user to select the activity name or the instance ID of the activity to be ended. Alternatively, you can either select the Specify Activity Name or Specify Activity Execution ID option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Specify Activity Name**: Select this option to specify the activity name and type the activity name in the adjacent field. Alternatively, you can click the expression editor icon and select a variable assigned to the required activity in the expression editor window.

  Note: If the parent activity is associated with multiple versions of the child workflows that have the same name, all the activities added to these child workflows are listed in this field.

- **Specify Instance ID**: Select this option to specify the activity instance ID and type the ID in the adjacent field. Alternatively, you can click the expression editor icon and select the instance ID assigned to the required activity in the expression editor window.
- **Error If Activity Instance Not Found**: This property helps you to set the output of this activity as "Error encountered" or "Successful" when the workflow to be ended has already been executed or is yet to be executed.

Property Type: Mandatory (This property must be set to end the workflow.)

Yes: If this value is assigned, then the End Activity Execution activity gives an output as "Error encountered" whenever the instance of the activity that is to be executed is not found. In other words, if the activity execution is not yet started or is already completed, then this error is encountered.

No: If this value is assigned, then the End Activity Execution activity will give the output as "Successful".

Specify Value: This option can be used during the runtime execution of the workflow. You can assign the 'Yes' or 'No' values to a variable which will be used to know the value of this property. Alternatively, you can click the expression editor icon and select a variable assigned to the workflow in the expression editor window.

Loop Execution Step Entry Activity: You can use this property to specify the name of the Loop Execution Step Entry activity to which the activity to be ended is associated. This property is required if an instance level of association between the End Activity Execution activity and the activity to be ended is required. If this is not set, the End Activity Execution activity ends all the instances of the activity that is to be ended. This property is mainly used when the For Loop and For-Each-Loop activities are used in a workflow.

Specify Activity Name: Select this option and type the Loop Execution Step Entry activity name in the adjacent field. Alternatively, you can click the expression editor icon and select a variable referring to the required activity in the expression editor window.

End Child Workflow Execution Activity

Activity Description

This activity enables the user to end a child workflow from the parent workflow.

Application Scenario

Consider a scenario where a child workflow is associated to the parent workflow. The parent workflow has an "Approval Activity". On the other hand, the child workflow contains a "Wait for Event" activity which is set to execute when a list item is deleted. This scenario, however, requires that if the user executes the approval activity in the parent workflow, the workflow need not wait for the completion of the child workflow which has the wait for event activity waiting to be executed. In such a scenario, the End Child Workflow Execution activity can be used to end the child workflow. This activity helps the user ensure that the parent workflow completes without any child workflow waiting for execution.

Refer to User Scenarios given in the *User Guide* for a detailed understanding of this activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

The End Child Workflow Execution activity has to be configured by specifying appropriate values for different properties in the **Activity Properties** pane. This pane can be accessed by clicking on the Activity Properties tool in the **Tool Bar** or by selecting the Activity Properties option from the context menu of End Child Workflow Execution activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property is to be used to specify a name for the activity.

Property Type: Mandatory (This property must be set.)

Description - This property can be used to specify a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in this group have been described below. You can use these properties to configure the functionality of this activity.

Workflow Details - This property is used to specify the workflow which needs to be ended. The user has an option to either set this property or the Specify workflow execution ID property.

Property Type: Mandatory (This property must be set to end the workflow.)

See End Child Workflow: Workflow Details for a more detailed understanding of its properties.

Specify workflow execution ID - This property is used to specify the workflow execution ID of the child workflow. The user has an option to either set this property or the Workflow Details property.

Property Type: Mandatory (This property must be set to end the workflow.)

Steps to set Specify Workflow Execution ID

1. To specify this property, type the child workflow execution ID in the field. Alternatively, click the expression editor icon and select a variable assigned to the child workflow in the expression editor window.

Specify Loop Execution Step Entry - This property is used to specify the name of the loop execution step entry activity used in the parent workflow.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set Select loop execution step entry

1. To specify this property, type the name of the loop execution step entry activity used in the parent workflow. Alternatively, click the expression editor icon and select a variable assigned to the child workflow in the expression editor window.

Error If Activity Instance Not Found: This property helps you to set the output of this activity as "Error encountered" or "Successful" when the workflow to be ended has already been executed or is yet to be executed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Mandatory (This property must be set to end the workflow.)

Yes: If this value is assigned, then the End Child Workflow Execution activity gives an output as "Error encountered" whenever the instance of the child workflow that is to be executed is not found. In other words, if the child workflow execution is not yet started or is already completed, then this error is encountered.

No: If this value is assigned, then the End Child Workflow Execution activity will give the output as "Successful".

Specify Value: This option can be used during the runtime execution of the workflow. You can assign the 'Yes' or 'No' values to a variable which will be used to know the value of this property. Alternatively, you can click the expression editor icon and select a variable assigned to the workflow in the expression editor window.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Looping Behavior

The property in the **Looping Behavior** group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop-down field.

Property Type: Optional (This property needs to be set only if necessary.)

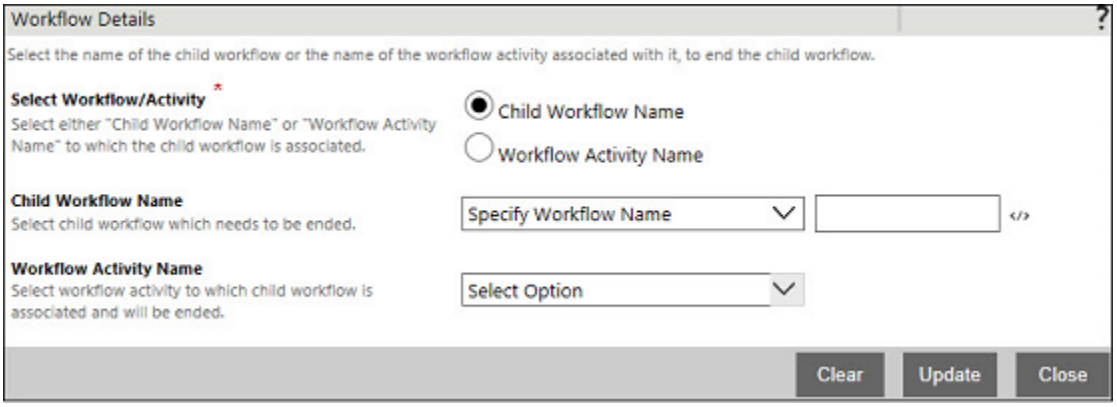
End Child Workflow: Workflow Details

Workflow Details property window

This topic gives you a detailed understanding of the **Workflow Details** properties. The Workflow Details properties are used to specify

- the child workflow to be ended.
- the workflow activity to which the child workflow that is to be ended is associated.

To open the **Workflow Details** window, click the Workflow Details edit button.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

This window has the following properties:

Select Workflow/Activity: Select the name of the child workflow that is to be ended or the name of the activity that is associated to the child workflow. Select the **Child Workflow Name** or **Workflow Activity Name** radio button.

Property Type: Mandatory (This property must be set.)

- **Child Workflow Name**: Select the name of the child workflow that needs to be ended from the drop-down list. This option is enabled when you have selected the **Child Workflow Name** radio button in the **Select Workflow/Activity** property.

  Note: You can view the child workflow in the drop-down list only if you have configured the child workflow in the Workflow activity.
- **Specify Workflow Name**: Select this option and type the name of the child workflow in the adjacent field. Alternatively, you can click the expression editor icon and select a variable assigned to the child workflow in the expression editor window.
- **Workflow Activity Name**: Select the name of the workflow activity used in the parent workflow, to which the child workflow is associated. The workflow activity name can be selected from the drop-down list. This option is enabled when you have selected the Workflow Activity Name radio button in the **Select Workflow/Activity** property.
- **Specify Activity Name**: Select this option and type the name of the workflow activity to which the child workflow is associated, in the adjacent field. Alternatively, you can click the expression editor icon and select a variable assigned to the workflow activity in the expression editor window.

BlockingOutput Activity

Activity Description

This activity facilitates synchronous execution of workflow activities other than human activities with an active form.

This is typically used in forms, whose fields need to be updated based on the output of multiple workflow activities of the same workflow, executed one after the other, without closing the form.

Activity Properties

The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

Specify the Output to be returned to the application that calls this workflow when this activity is encountered.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down. The looping option for this activity is Completed.

Property Type: Optional (This property needs to be set only if necessary.)

Note:
- When you use the BlockingOutput activity for returning the blocking output value, ensure that all the activities being executed before this activity, do not have sleeping behavior. For example: There should not be any activities, such as human or scheduler activities, which go to the sleep mode. However, Workflow activity with some specific settings can be included before this activity. For more information about the Workflow activity, see Workflow Activity.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Database Activity

Activity Description

The database activity enables execution of queries, stored procedures, and functions from the workflow. The database activity establishes connection with the database server and retrieves or updates data in the database. The activity gets the schema of the database table to an XML variable according to the query, stored procedures, or functions passed.

Application Scenario

Consider a scenario where a manager wants to send appraisal forms to all the employees. The manager can add the database activity with a query to select the email address column from the Employee Database. The Output XML will have the schema based on the query and this XML variable can used to assign employees to whom the appraisal forms are to be sent. When the workflow is initiated, the query in the database activity will be executed and all the employees will receive the appraisal form in their Inbox.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

The Database activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Database activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Note: Every time you input a value for a property, ensure to save the data. Click the **Save** button on the **Activity Properties** window. You need to save the property so that the subsequent properties in the activity can inherit the required information.

Name & Description

You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

You can use these properties to configure the functionality of the activity.

Database Connection

Database connection property is used to get the connection to the Database Server. You can use this property to select the Database connection (which has been configured in **Enterprise Console > Settings > Database Connections**).

Property Type: Mandatory (This property must be set if the activity has to establish connection with the database server.)

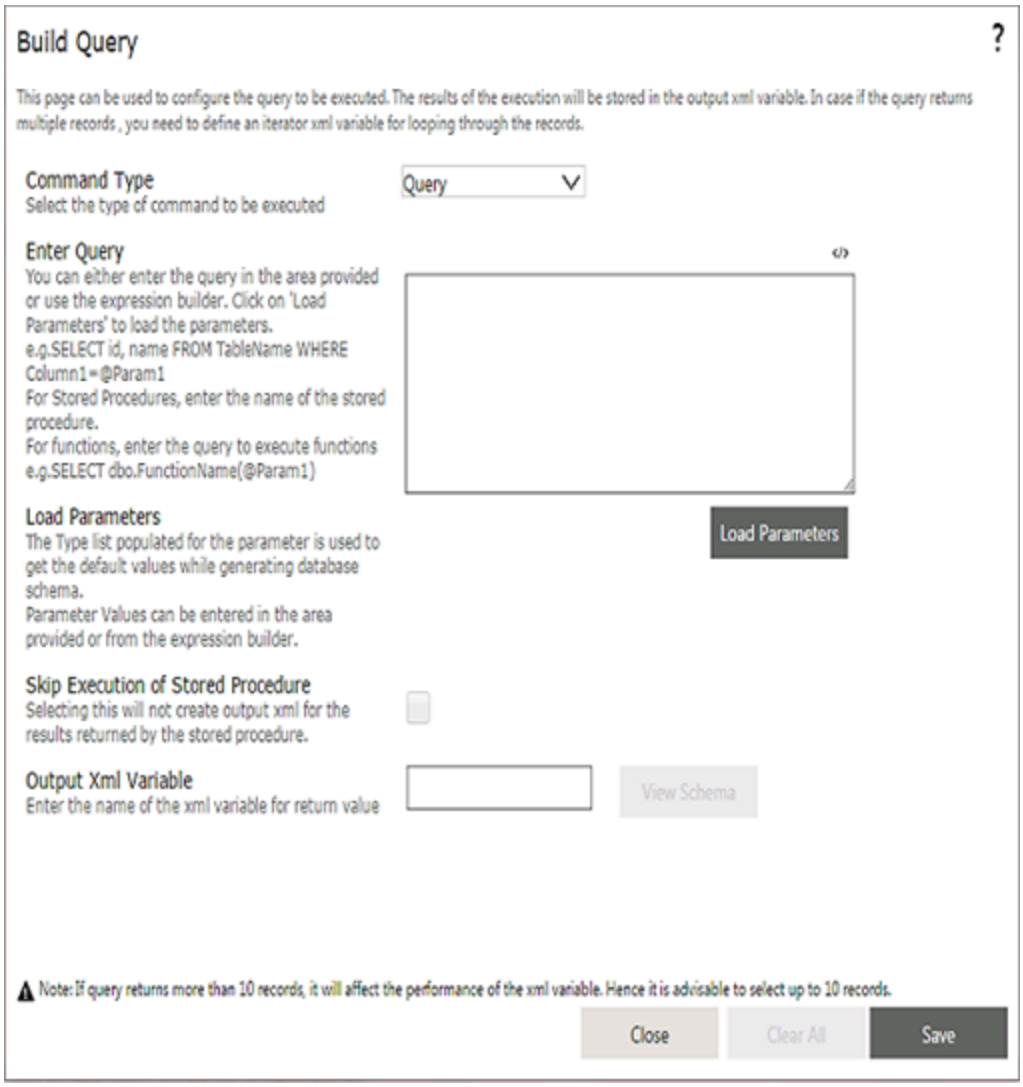
Query Builder

To enter the query, click the **Query Builder** property to open the property window.

In this window, set the following properties:

1. Command Type
2. Query
3. Output XML variable

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Command Type: The command types that can be selected

- Query
- Stored Procedure
- Functions

Enter Query: As the Command Type is selected, you can enter a query, Stored Procedure, or Function.

Note: The **Expression Editor <>** icon is displayed only for the **Command Type "Query ",** as the expressions set cannot be evaluated in design time for stored procedures and functions.

Query: Query can be entered in the text box or from the Expression Builder.

For example, the query can be "**Select * from EmployeeTable**" and if the query is to be passed with parameters then the query will be **"Select * from EmployeeTable where EmployeeID=@Id**". Here @Id is the parameter. When you click on "Load Parameters", it will load the parameters within the query. In the Value field you can pass the value for the parameter.

Query with 'Order By', 'Group By' keywords are supported.

The following Parameter values can be saved with empty values:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

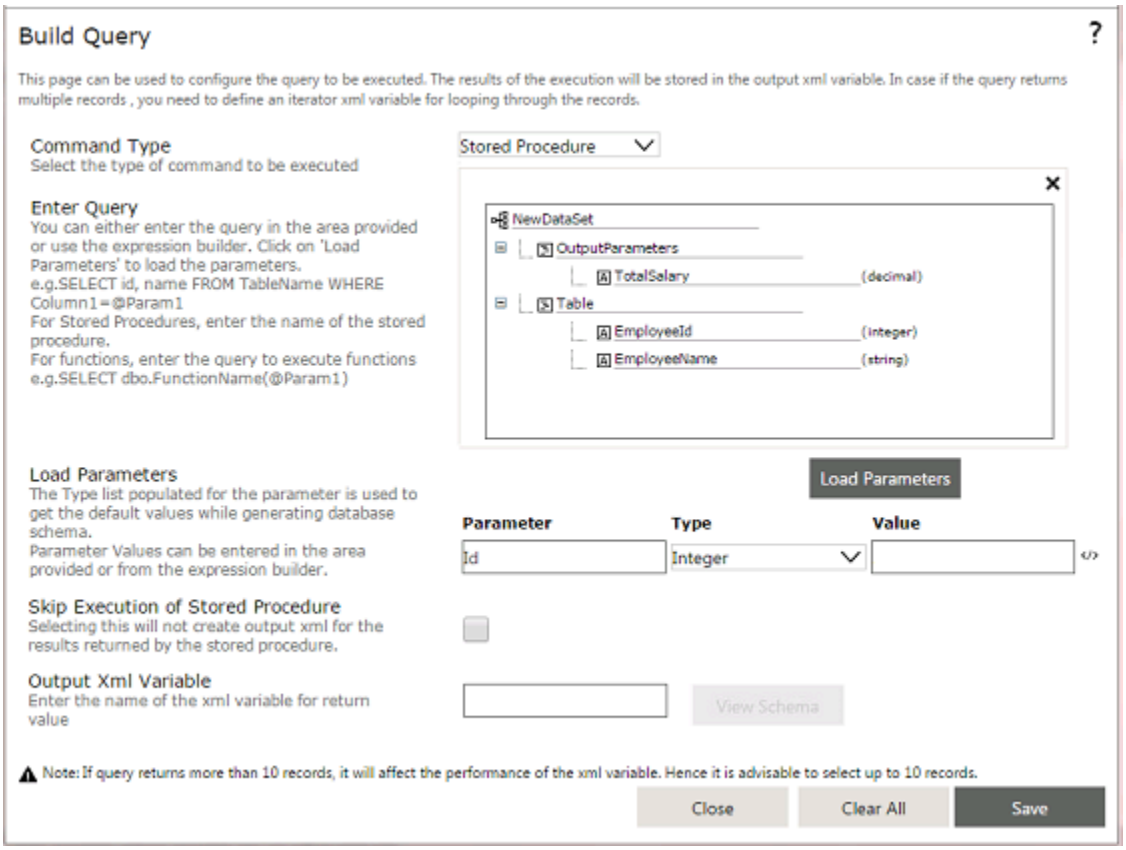
- Name: Displays the name of the parameter.
- Type: Select the Parameter type from the drop-down list. This type helps you to execute the query with internally defined default values only while generating the database schema. The appropriate Type needs to be selected for the Query and Functions. For stored procedures the Types will be automatically selected.
- Value: Type the value of the parameter.

Parameter helps you retrieving values from the database where the value is null or empty.

If the query is to retrieve values from the database we have to specify the Output XML variable name. For more information, see the table *Database Activity*.

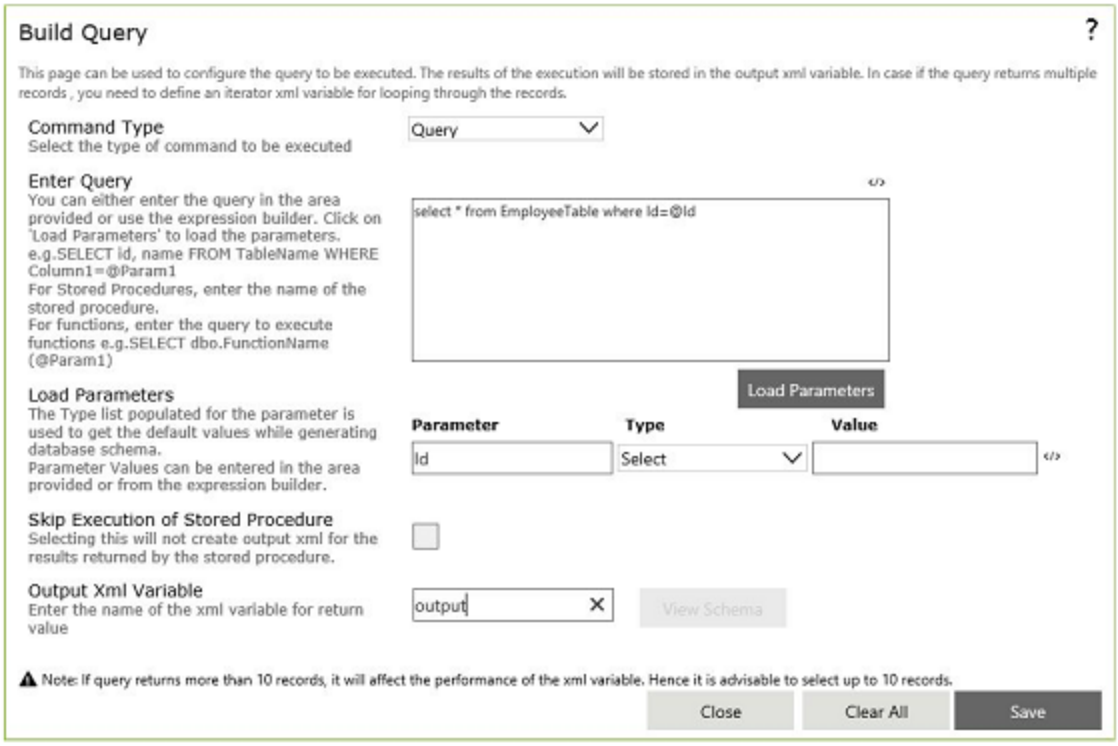
Multiple queries are not supported. If multiple queries are used, XML variable will carry the result of the last query written.

Click on **'View Schema'** to view the schema of the output XML variable "outXML"



XML variable used in one activity cannot be reused within other database activities.

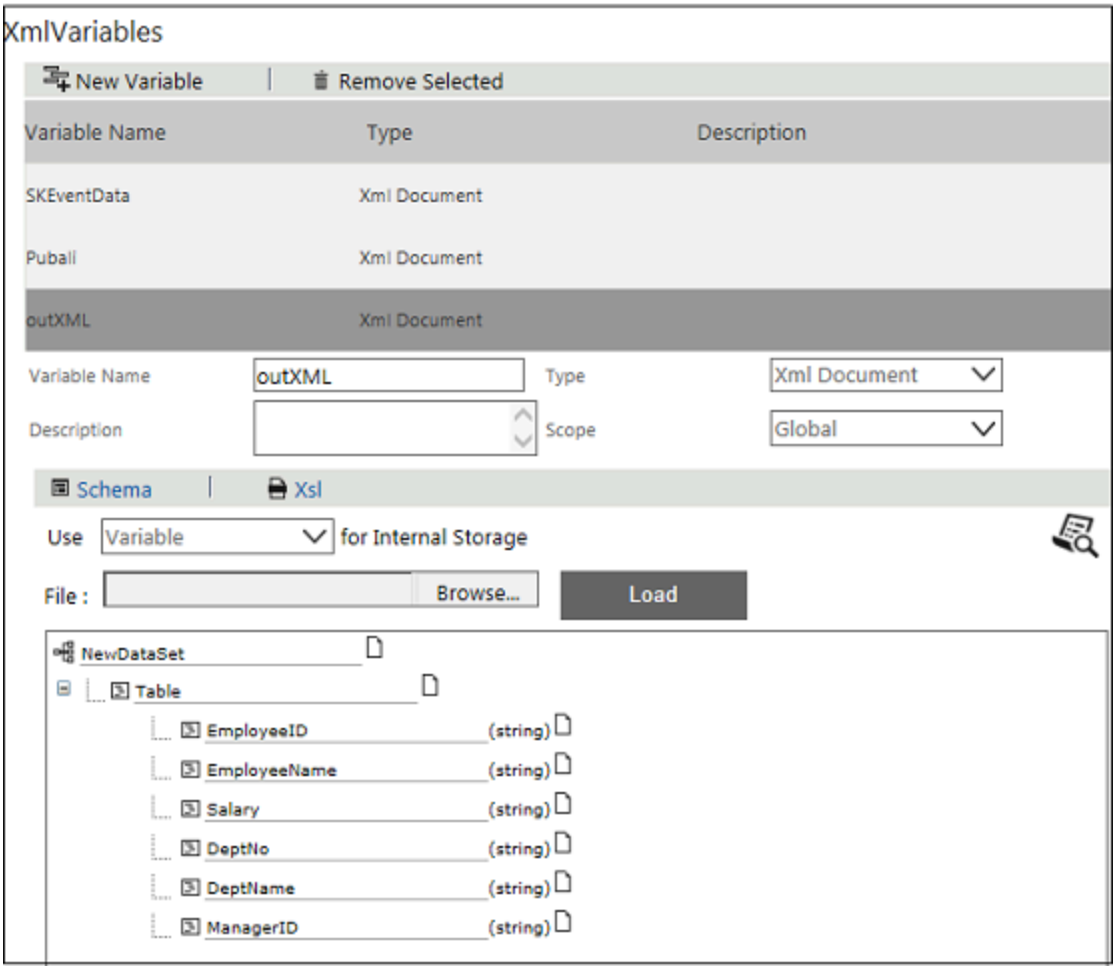
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



If the output schema containing return values have been modified after the property is saved, open the Query Builder property and click Save. The Schema will get updated with the latest values. Click **View Schema** to see the updated changes.

This XML Variable "outXML" will be added in the **Start > XML Variables** as shown below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Parameter values cannot update data types like 'image', 'blob' and 'unique identifier' from XML variables or variables.

Stored Procedure

Stored procedures can be executed by simply specifying the name of the Stored Procedure (provided there is a stored procedure created in your database server). On the click of "Load Parameters" it will load the parameters present in the Stored Procedure. If you want to retrieve values on executing the Stored Procedure you can specify the name of the XML variable. If return values from the stored procedure are stored in output parameters, the activity will load the XML schema with the output parameters.

To discover the output XML schema, system internally executes stored procedure with parameter values as empty string or null. If a stored procedure has validations on parameter or data integrity constraints, you cannot configure a stored procedure.

If a stored procedure returns the values for return Result Set and output parameters, then both the values will be available in the XML variable.

Note: If there are multiple Return Result Sets, then only the first return Result Set will be considered.

- **Skip Execution of Stored Procedure**: To avoid the execution of stored procedure to get the output xml schema, select this check box so that you can configure stored procedure with parameter validation or data integrity constraints.

Note:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- It is recommended to use proper parameter values/variables that has appropriate values at runtime to execute the stored procedure.
- To execute a stored procedure, which expects default values for execution, you can create a wrapper stored procedure with the same parameter. You can then call the actual stored procedure with default values passed to the stored procedure if the parameter values are empty or null.

Functions

Functions are executed in the same way as executed in the database server, for e.g. "select dbo.FunctionName". If the function contains parameters you should specify the exact parameters. For e.g. "select dbo.FunctionName(@param1, @param2)" (provided there is the function created in your database server). If you want to retrieve values on executing the function you can specify the name of the XML variable. If return values from the function are stored in output parameters, the activity will load the XML schema with the output parameters.

Note:
- Table valued functions are not supported.
- To execute a function in the Oracle environment, add **from dual** after the function name.
For example: select MYFUNCTION('SK-Fresh', 'FN') from dual

Output XML Variable for return value:

Output XML variable will have the schema of the table as per the query entered. If the query is "Select * from EmployeeData" then the XML variable will have all the columns as nodes in the schema which can be looped through and used in the subsequent activities. Output XML Variable name should be unique, it cannot be repeated.

Note: To create an XML Iterator of the output XML Variable the node selected should always be the "Table" node.

Capture runtime exceptions in a variable

You can create a variable with the name **^<ActivityName>Error** in the **Start** activity. The exception message will be available in the variable if an exception occurs.

For example: For an activity named as "DBAct1", you have to create a variable with name as **^DBAct1Error** in the **Start** activity.

For more information on creating variables, see Start - Variables.

Capture returned records count in a variable

You can create a variable with the name **"^"** + **CurrentAction.Name** + **"ResultRowsCount"** in the Start activity. The total number of records will be returned based on the query stored in the variable.

For example: For an activity named **DBActivity**, you have to create variable with name as **^DBActivityResultRowsCount** in the **Start** activity.

For more information on creating variables, see Start - Variables

Property Type: Mandatory (This property must be set if the activity is to retrieving any value from the database (i.e. if query is of "select" type, else this field will be optional because it will not load any schema for 'insert', 'update' or 'delete' type of query)

Retry Connections: This property allows setting the maximum retries if a Database goes Offline at run time. By default the value set will be 1.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if necessary.)

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down. The looping option for this activity is Completed.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Database Activity returns the following values:

Successful: Displayed when the query is executed.

Unsuccessful: Displayed when the query execution is unsuccessful.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details

The following table shows the SQL database types and their corresponding parameter types for a database activity:

SQL Database Type	Database Activity Parameter Type
bigint	Integer
binary	Byte
bit	Boolean
char	String
date	Date
datetime	DateTime
datetime2	DateTime
datetimeoffset	DateTime
decimal	Decimal
float	Double
int	Integer
money	Currency

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SQL Database Type	Database Activity Parameter Type
nchar	String
numeric	Decimal
nvarchar	String
real	Single
smalldatetime	DateTime
smallint	Integer
smallmoney	Currency
sql_variant	Object
time	Time
timestamp	Binary
tinyint	Byte
uniqueidentifier	Guid
varbinary	Binary
xml	Xml

Decision Activity

Activity Description

The Decision Activity can be used to insert a decision in the workflow. The output of the activity can be used to determine the path of workflow execution.

Activity Properties

The Decision activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking the Activity Properties tool in the tool bar or by selecting the appropriate option from the right click menu for the Decision activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The property in the Configuration group has been described below. You can use this property to specify the decisions.

Decisions - The Decisions property allows the user to create complex rules to control the execution path of the workflow. In contrast to the Rule action, which only allowed a True/False kind of decision, the Decision property can be used to rules with multiple outputs based on the condition specified.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Decisions property

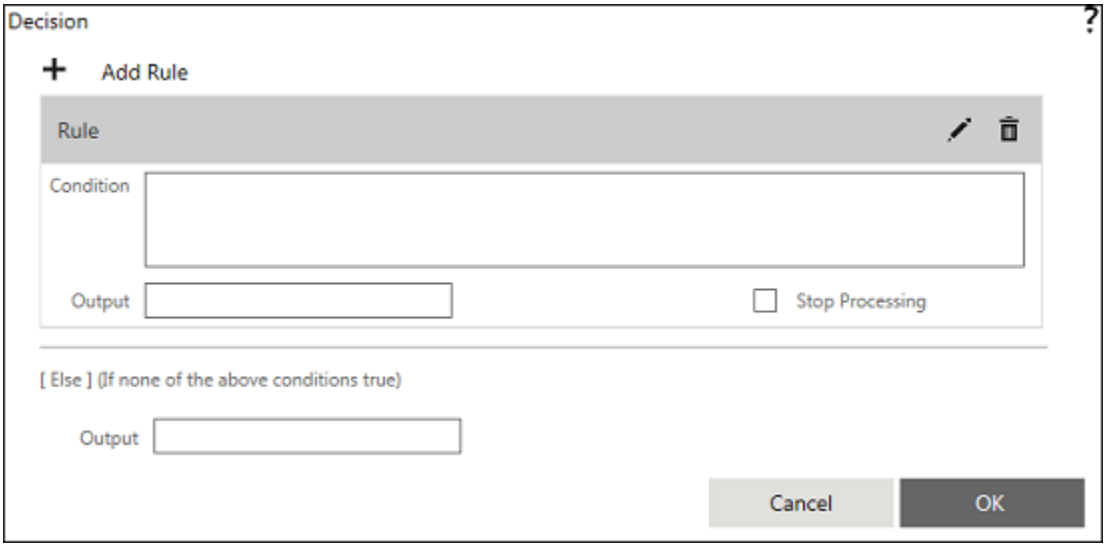
See Decision: Decisions for a detailed description of the Decision property window.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected. See Mapped Error Outputs for more details.

Decision: Decisions

You can create conditions for the decision action in this property window. To open this window, click the edit button for the 'Decisions' property. The following window shows the **Decision** property window:



This **Decision** window has the following controls to specify the condition for a rule:

- **Add Rule**: Click **Add Rule** to add a new set of the above controls for adding another rule.
- **Condition**: Specify the expression for the condition in this text area.

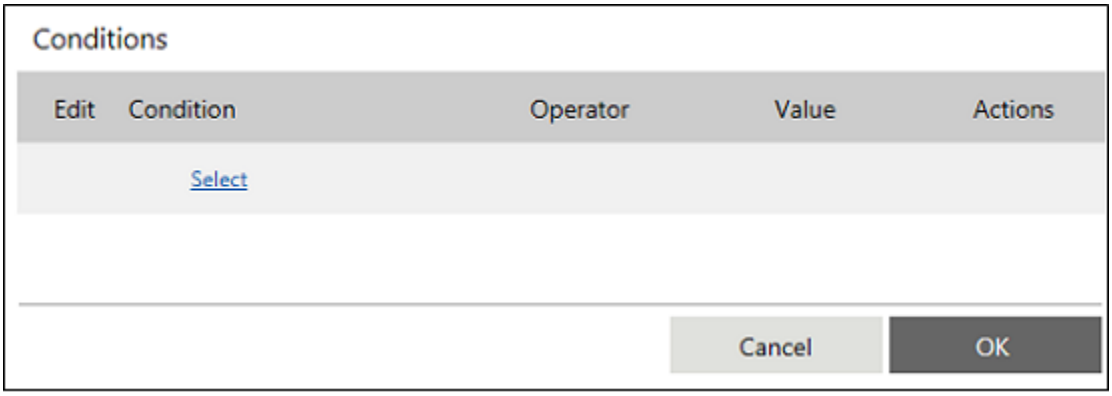
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Condition icon** : Click the condition icon to open the Condition window to build the condition expression.
- **Output**: Specify the output for the rule in this text box.
- **Stop Processing**: Select this check-box to enable the process to be stopped when this rule is "true".

The window also has the **Output** text box to specify the output for the exception, that is when none of the rule conditions are true, in the [**Else**] (**If none of the above conditions true**) field.

Condition window

You can build expressions for the rule condition in this window, which is opened when you click the Condition icon in the Decisions property window. This window has the Select link, which you can use to specify the left hand side of the expression. On mouse-over this link opens a combo, with a collection of objects that you can specify for the left hand side of the expression. The window has the **OK** button at the bottom to save the new expression. The **Cancel** option allows you to cancel the expression and return to the property window.



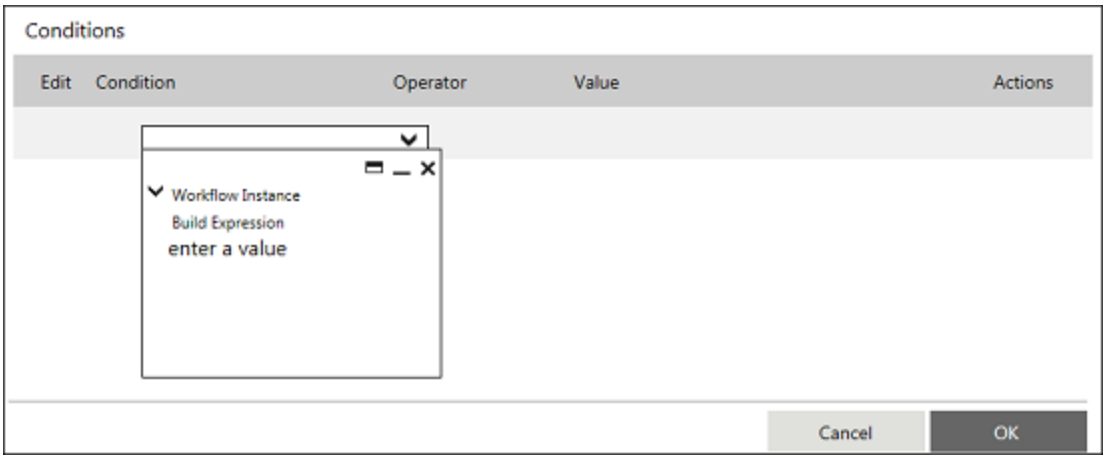
Building an Expression for the Decision Condition

To illustrate the process of selecting an object for the right hand side of the expression, let us consider an XML Variable with "Employee" as a node and "FirstName" as an element under it. Specify this as the object for the left hand side of the expression. From the mouse over drop down, scroll down till you see the XML Variables node. Expand this node and the "Employee" node under it. Select the "FirstName" option.

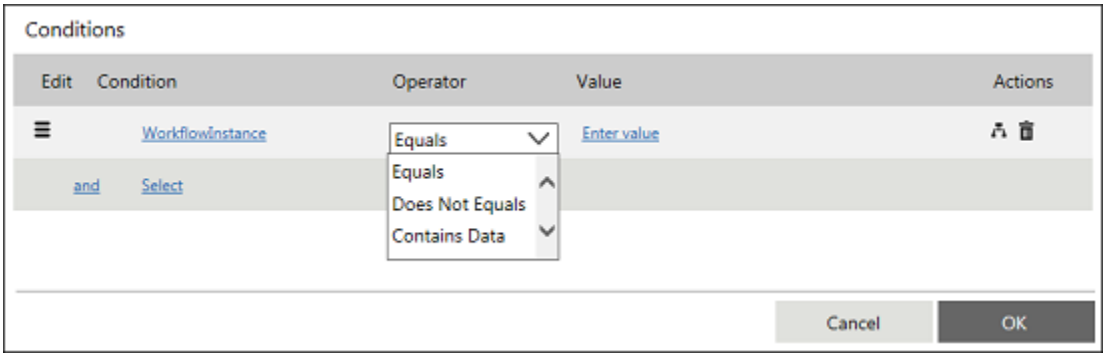
Note: The C# code is not directly supported in the Expression editor for the Decision activity. If you want to return any value from the C# code, refer to the Returning Value from the C# Code topic.

The following window shows how to set an object for the left hand side of the expression:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

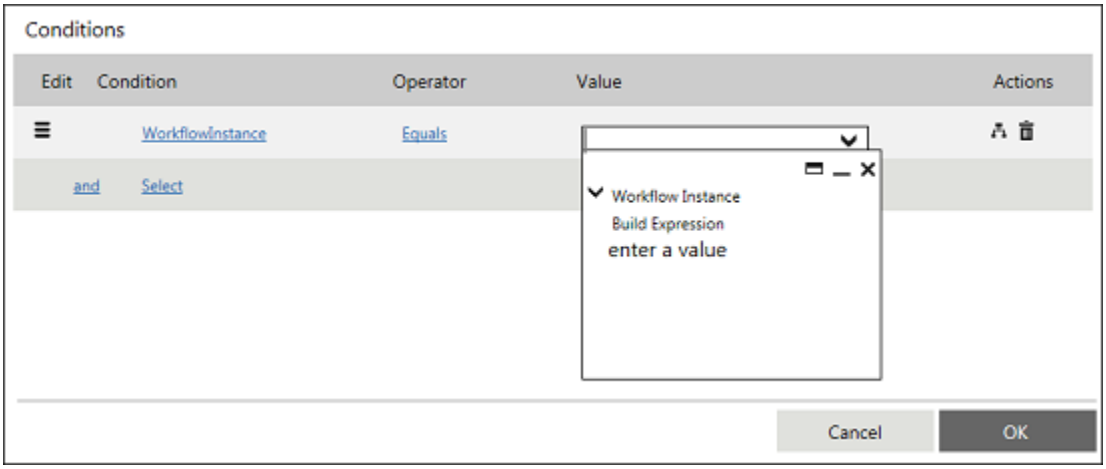


This will display the operator combo with operators corresponding to the data type of the selected object. In this case, the data type being string, the operators are string operators, shown in the image below. Select "Equals" as the operator.



Operators combo with string operators

The default control to specify the object for the right hand side of the expression, which is a text box, is displayed at the right hand side of the row, as shown in the image below. You can specify a matching value in this text box. As the object selected is First Name, specify "John" here.



Default control for specifying the right hand side of the expression

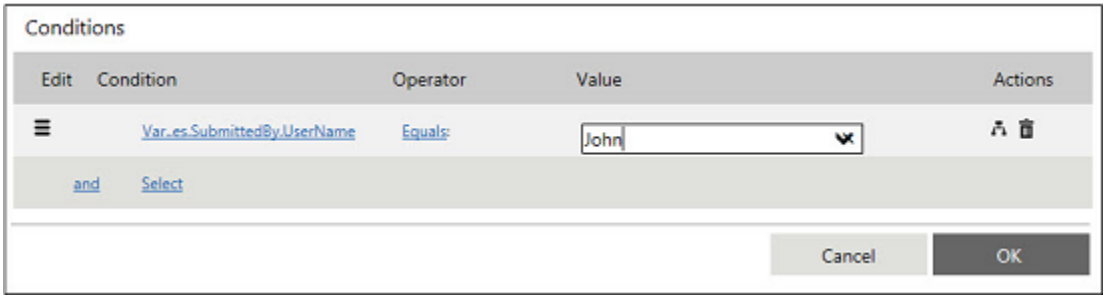
This will complete the first expression and the settings will be displayed as shown below. You can mouse over any link to edit the value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using the Expression mode icon

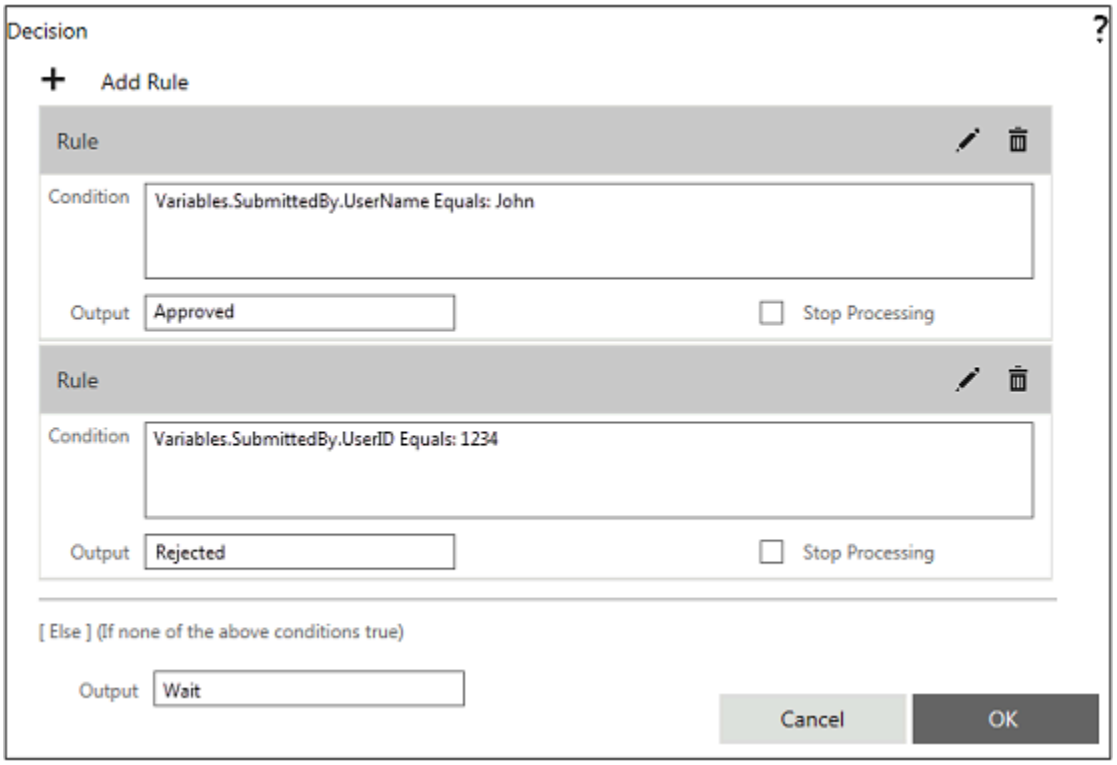
Click the Expression mode icon, , to change the default text box to the Expression mode. In the Expression mode, you can select an object from the combo for the right hand side of the expression.

Consider that the left hand side of the expression is VirtualUserID. You can assign the Variables.SubmittedBy.UserId as the value for the right hand side.



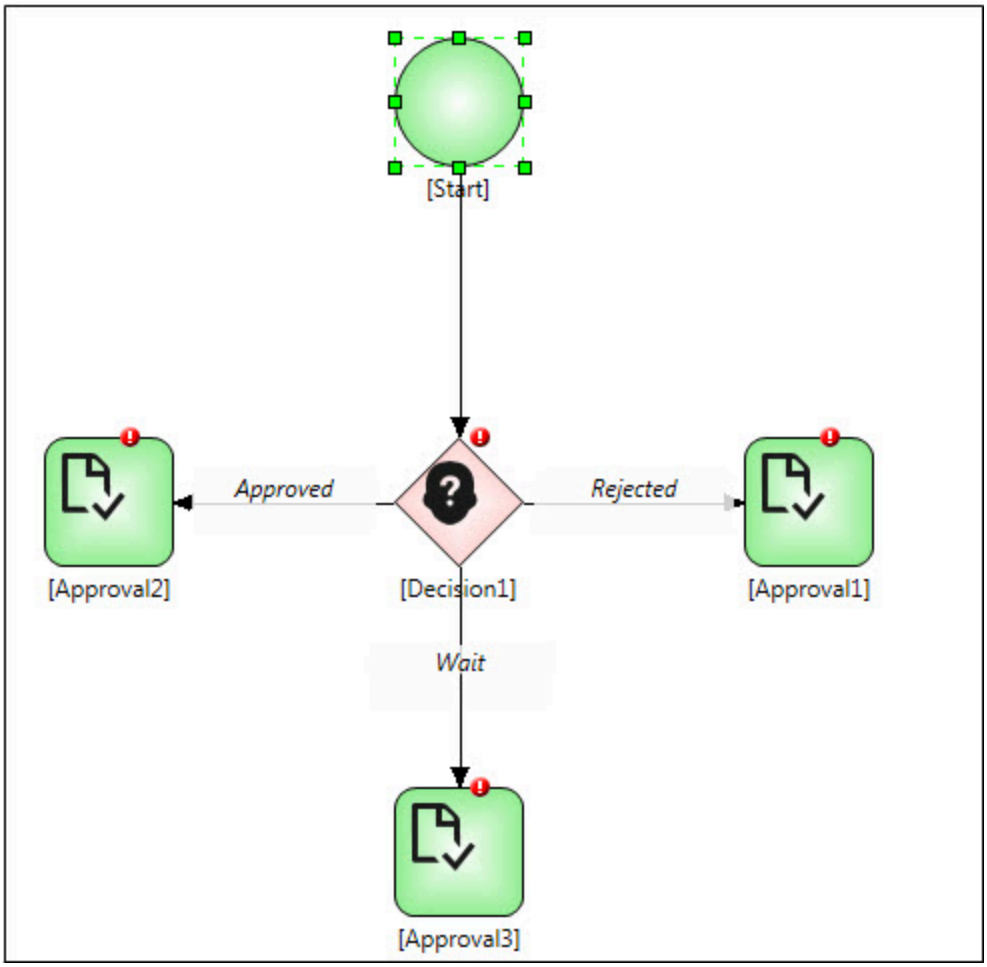
You can select "Build Expression" in the Expression mode combo to open the Expression Editor and build an expression instead of specifying an object on either side of the expression. You can select "Enter a value" in the right hand side combo to return to the default mode, that is, the text box.

Click **OK** to save the expression and return to the **Decision** property window. The following image shows the window with Decision conditions added:



The Decision activity would be typically used in a workflow as shown below, with each decision output determining a different path for workflow execution.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Decision activity in a typical workflow

Returning Value from the C# Code

You must follow the following steps to return any value from the C# code:

1. Declare a variable in the start activity.
2. Initialize the variable in Start activity or using update variable using the C# code.
3. This variable can be used in the Decision activity.

Note: In Decision Activity, when you specify a value for comparing numeric, date, time, or date, time type of variables, you must specify the value in Invariant format.

ForEach-Loop Activity

Activity Description

The ForEach Loop Activity is used to loop an activity through a collection within an XMLIterator Variable. It allows repeated execution of an activity or group of activities. It must always be used along with the Next Loop Activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

The properties of the ForEach Loop activity can be configured in the Activity Properties window for that activity.

To access Activity Properties, do one of the following:

- Click **Activity Properties** in the **Process Designer Tool Bar**
- Right-click and select **Activity Properties**

Activity Properties for this activity are organized under:

Name & Description

Specify the name and description for the activity in this group.

Name - Enter the name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - Enter a brief description for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The Configuration group has a single property for selection of the XMLIterator Variable to be looped through.

XMLIterator - Select the XML Iterator variable to be looped through. All XMLIterator variables as declared in Start activity are available for selection.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Execution - Select **Serial** if the activity has to be looped through each item in a collection in sequence. An activity will be created for an item only after completion of the activity for the preceding item. Select **Parallel** to simultaneously create activities involving each item. This field defaults to **Serial**. Also see Example of Serial Execution.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down. The looping option for this activity is Completed.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Exception Behavior

These options of Wonderware Skelta BPM 2009 have now been integrated with Raise Error on Unhandled Linked Output in the latest version of the product.

Property Type: By default is set as **NO**

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Activity outputs:

The ForEach Loop Activity returns the following values -

Step: Displayed to indicate the loop step

Loop End: Displayed when the end of the loop is reached

Example of XMLIterator Variable in ForEach Loop

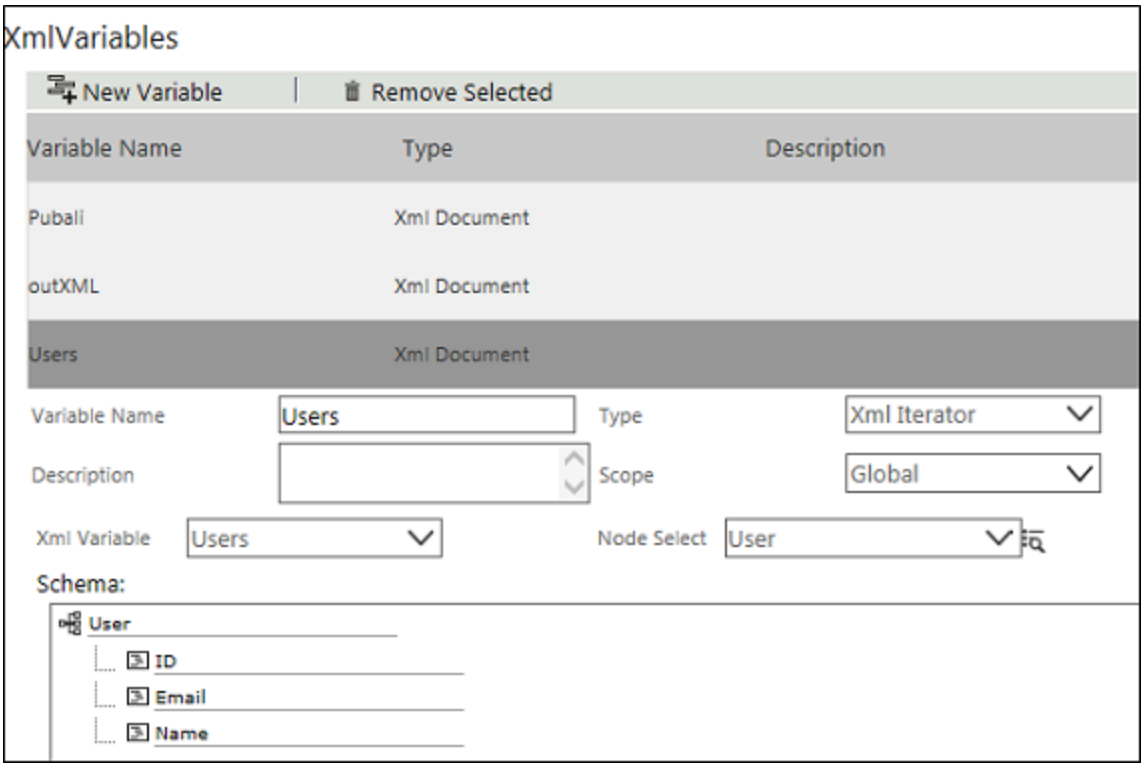
In this example, the XMLIterator Variable is used to get approval from all managers in the Managers.XML file containing the list of all users who are managers.

Managers.XML file

```
<Managers>
 <Users>
<User id=1>
 <Name>John</name>
 </User>
<User id=2>
 <Name>Jim</name>
</User>
<User id=3>
 <Name>Victor</name>
</User>
<User id=4>
 <Name>Andy</name>
</User>
 </Users>
</ Managers >
```

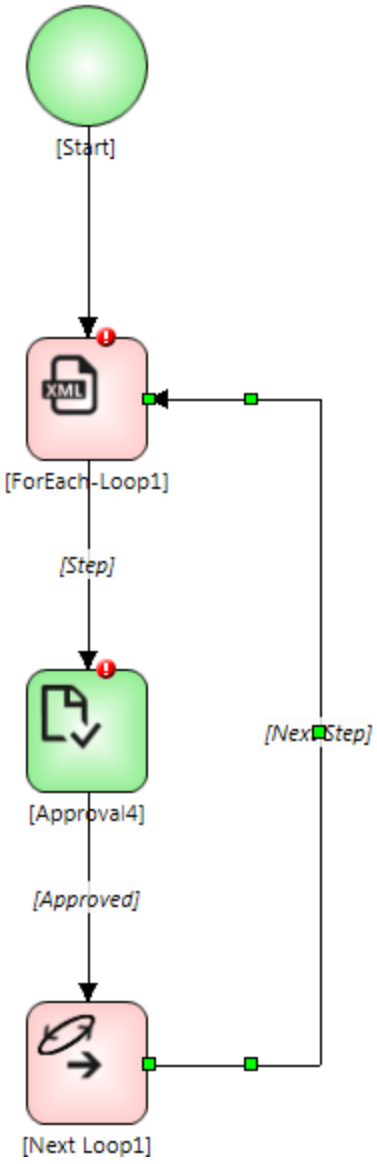
Step 1: XMLIterator Variable is defined for users. The node Users holds the collection of managers.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

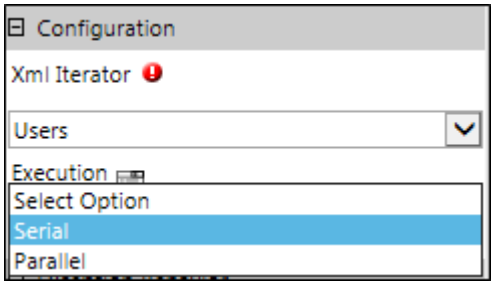


Step 2: The Approval activity is set within a ForEach Loop activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

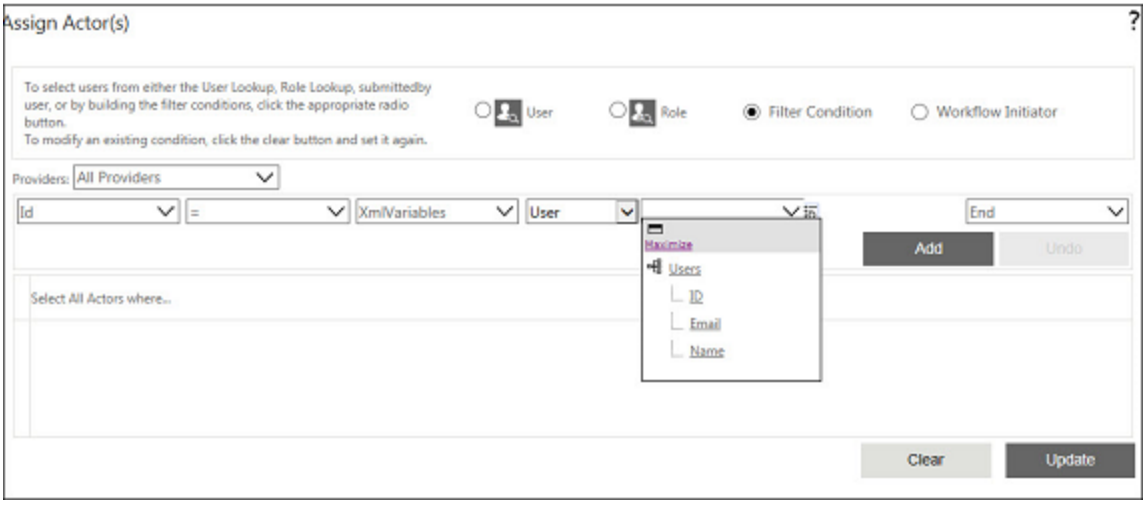


Step 3: The XMLIterator Variable Users is defined in XMLIterator field of ForEach Loop properties. The Execution type is set to Parallel as the approval is to be processed simultaneously by all approvers.



Step 4: The XMLIterator Variable Users is specified in the condition for selecting actors for the approval.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Actor Selection for Approval Activity

Output: When the above workflow is invoked, Workflow Engine resolves "XMLVariables.user.users.ID". It gets the ID of each manager and assigns the task to that manager.

Capture looping count in a variable

You can create a variable with the name **"^" + CurrentAction.Name + "LoopCount"** in the **Start** activity. The total number of times the ForEach-Loop is executed will be returned in the variable.

For example: For an activity named **LoopActivity**, you have to create variable with name as **^LoopActivityLoopCount** in the **Start** activity.

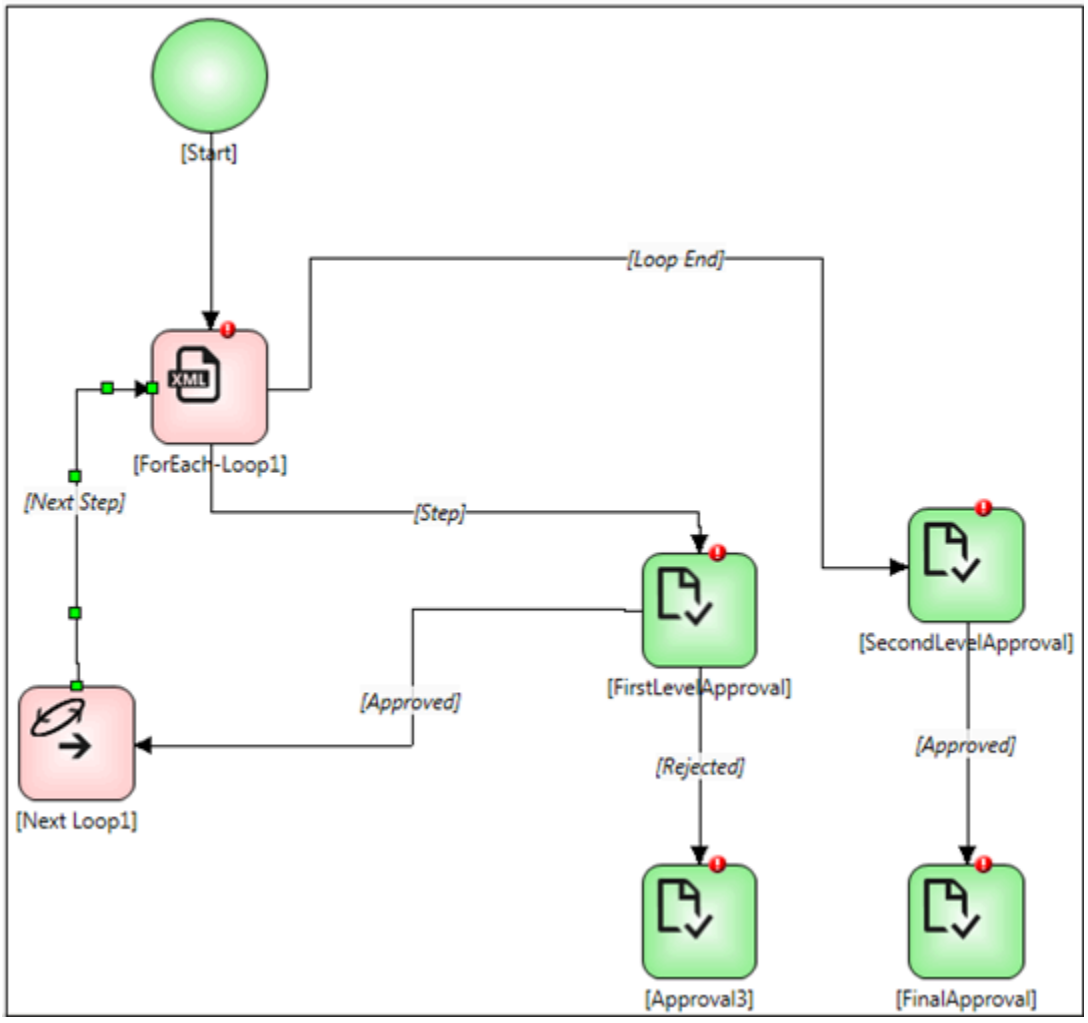
For more information on creating variables, see Start - Variables

Example of Serial Execution

To expedite processing of purchase orders, every line item in an order is forwarded to a different user for first level verification of item availability, price et cetera. The complete order can be processed only if all line items are approved. The line items are forwarded for approval sequentially. If any item is not approved, then the document is forwarded to the manager for approval. This process is depicted in the following figure.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Process Example for Serial Execution



For-Loop Activity

Action Description

The For-Loop Activity can be used to start a loop within a workflow. It is useful for repeated execution of an activity or group of activities. It must always be used along with the Next Loop Activity.

Activity Properties

The For-Loop activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the For-Loop activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Loop Variable - This property allows the user to specify the variable to use as the counter for the loop. It can be selected from the drop down for this property. These variables should have been declared in the Start activity.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Loop Count - This property allows the user to specify the loop count, which will determine the number of iterations of the loop.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the Loop Count property

1. To specify the loop count, click on the button for the 'Loop Count' property to open the property window.
2. In this window, enter the count value directly in the text editor.
3. If you want to assign the loop count dynamically during run-time, you can do so using the **Field** controls. For example, you can add a variable or content pointing to the loop count from the two drop downs for **Field** and click on the **Append** button. This will add the placeholder for the variable or content in the text editor. At run-time this placeholder will be replaced by the corresponding value, that is the loop count.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After specifying the count, click the Update button.
7. Click the Close button to close the window without saving the parameter.

See For - Loop Count for a detailed description of the Loop Count property window.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity outputs:

The For-Loop Activity returns the following values -

Step: Displayed to indicate the loop step

Loop End: Displayed when the end of the loop is reached

Variable Not Found: Displayed when the specified variable is not found

Invalid Count: Displayed when there is an invalid loop count

Exception Behavior

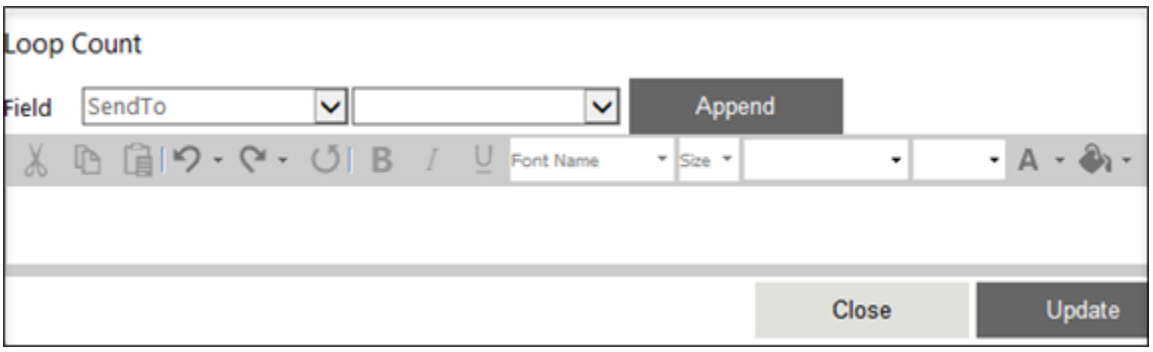
Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

For - Loop Count

Loop Count Property window

You can set the loop count that will be used to determine the iterations of the loop in this property window. To open this window, click the button for the 'Loop Count' property.



The window has a text editor to enter the loop count. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value or XML Variable here.
- The Value text box/drop down - You can specify the actual value of the loop count. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the loop count in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the loop count.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the loop count details. It has the following text tools –

- Cut (Ctrl+X) - to cut text

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the loop count
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the loop count
- **Close** - You can click this button to close this window

Logger Activity

Activity description

The Logger Activity can be used to log messages like information, warnings, and errors to the logger console from the workflow.

Activity Properties

The Logger activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Logger activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

LogType - This property allows the user to select the type of message to be logged. The drop down lists the following options: Information, Warning, and Error.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

LogMessage - This property allows the user to specify the message to be logged.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Log Message property

See Log - Log Message for a detailed description of the Log Message property window.

Activity outputs:

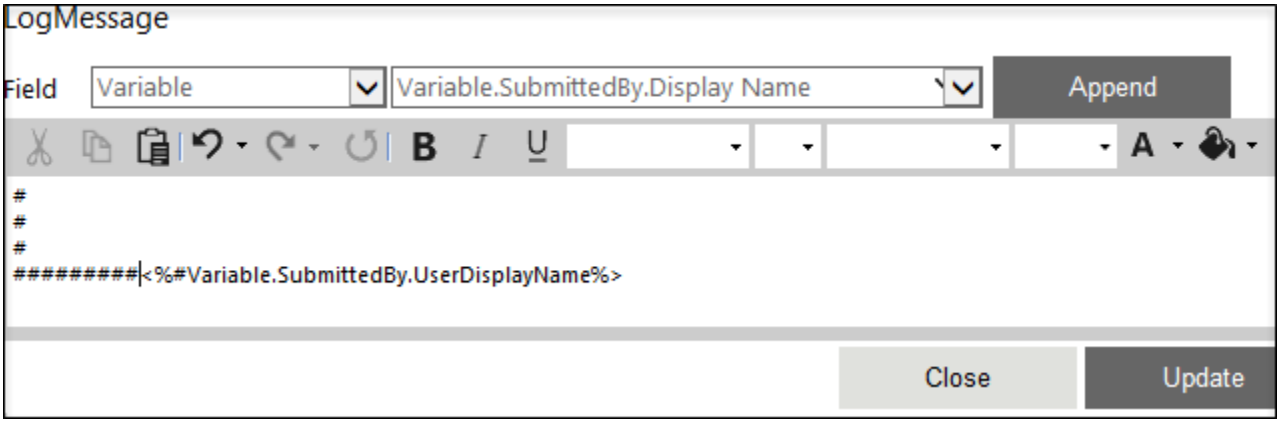
The Logger Activity does not return any value.

Example for a Logger:

Step 1: In the Activity Properties of the Logger1, select LogType as Information, and click Save button of Activity Properties.

Step 2: Log Message - Select the field as **Variable** in the first drop-down. In the second drop-down, select the Variable.SubmittedBy.DisplayName, and then click **Append**.

Step 3: The entry would be as this: <%#Variable.SubmittedBy.DisplayName%>. The '#' Symbol is just for quick identification of data in the Logger.



Note: Before publishing the workflow, start the AVEVA Work Tasks Logger Console.

Output

In the logger, you can see the contents of the variable Variable.SubmittedBy.UserName with the '#' symbols.

In the below figure you can see the name Administrator at the end of the # symbols.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Exception Behavior

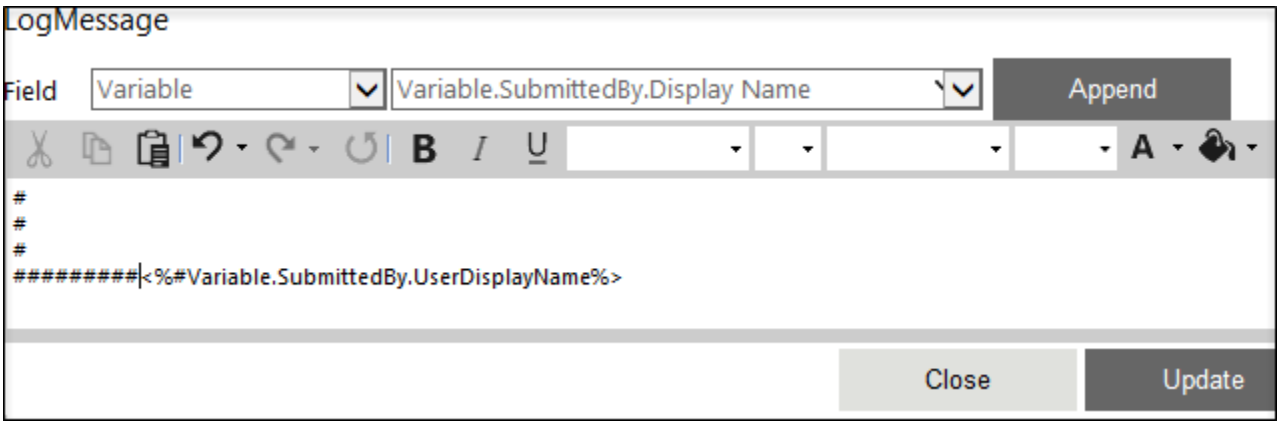
Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Log - Log Message

Log Message Property window

You can specify the Log Message, which should be logged to the Log Console from the workflow, in this property window. To open this window, click the button for the 'Log Message' property.



The window has a text editor to enter the Log Message. You can do this either by entering a discrete value directly in the text editor or by using the Field controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value or XML Variable here.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The Value text box/drop down - You can specify the actual value of the Log Message. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Log Message in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Log Message.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Log Message details. It has the following text tools –

- **Cut (Ctrl+X)** - to cut text
- **Copy (Ctrl+C)** - to copy text
- **Paste (Ctrl+V)** - to paste text
- **Undo (Ctrl+Z)** - to undo the last action
- **Redo (Ctrl+Y)** - to undo the last action
- **Repeat Last Command (F4)** - to repeat the last command that was executed

It also has the following formatting & other tools –

- **Bold (Ctrl+B)** - to make text bold
- **Italic (Ctrl+I)** - to italicize text
- **Underline (Ctrl+U)** - to underline text
- **Font Name** - to select the font for the Log Message
- **Size** - to specify the font size
- **Paragraph Style** - to select a paragraph style
- **Zoom** - to zoom in and zoom out the view
- **Foreground Color** - to set text color
- **Background Color** - to set the background color
- **Print** - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the Log Message
- **Close** - You can click this button to close this window

Loop Execution Step Entry Activity

Activity Description

The user can use this activity if an instance level association between the End Activity Execution activity and the activity to be ended is required. If this activity is not used, the End Activity Execution activity ends all the instances of the activity that is to be ended. This activity has to be used when the For Loop and For-Each-Loop activities are used in a workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Scenario

Consider a scenario where a ForEach-Loop activity is linked to a Wait-For-Event activity and an Approval activity. There is a parallel execution of each instance of Wait-For-Event activity that is associated to an instance of Approval activity. With the ForEach-Loop activity running in parallel execution mode, multiple instances of Wait-For-Event activity and Approval activity are created. In such a scenario, the Loop Execution Step Entry activity can be used to establish an instance level association between the End Activity Execution activity and the activity to be ended, thereby controlling the instances to be ended. Loop Execution Step Entry activity has to be placed in such a way that it is the parent activity for Wait-for-event and approval activity.

See the User Scenarios of End Activity Execution activity and End Child Workflow Execution activity for a detailed understanding of this activity.

Activity Properties

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property is to be used to specify a name for the activity.

Property Type: Mandatory (This property must be set.)

Description - This property can be used to specify a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop-down field.

Property Type: Optional (This property needs to be set only if necessary.)

Next Loop Activity

Activity Description

The Next Loop activity can be used as the terminal activity in a loop initiated using a For-Loop Activity. It will check if the count value has been reached. If the value has not been reached it will increment the 'Loop Variable' set in the For-Loop Activity and repeat the execution of the activities in the loop.

Activity Properties

The Next Loop activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

tool bar or by selecting the appropriate option from the right click menu for the Next Loop activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop-down.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Next Loop activity returns the following value -

Next Step: Displayed to indicate the next step in the loop

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Resource Variable Activity

Activity description

The Resource Variable Activity can be used to identify an actor to perform a workflow activity, through a variable. It sets the resource properties to a variable. If the variable type is set as 'resource' then the resource property is set to the variable. If variable is set as 'string' then the actor IDs are assigned to variable. The activity gives the output "Activity Executed" which is the output condition to be set to link this activity to the next. This activity can also be used to assign the next activity based on actor workload to the person with the lightest load, in order to properly balance workload.

Activity Properties

The Resource Variable activity has to be configured by specifying appropriate values for the different properties

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Resource Variable activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Assign Resource - This property allows the user to select the variable to which the resource properties will be set. The variables will have to be created in the properties for the Start activity. The variables can be one of the three types - String, Array or Resource. String variables take one UserID at a time, while Arrays take in a number of UserIDs pointing to different resources. Resource variables will take the complete resource properties.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Enable Workload Balancing - This property allows the user to set the Enable Workload Balancing property by selecting from the drop down. Setting this property value to Yes, enables workload balancing. This ensures that the task assignment will be done taking workload balancing into consideration.

Property Type: Optional (This property needs to be set only if required.)

MaxUsers Count - This property allows the user to specify the maximum number of actors who will be considered for task assignment. This property is related to the previous property. If workload balancing is set to Yes, then this property needs to be set to a value greater than 1, in order for workload balancing to be performed.

Property Type: Optional (This property needs to be set only if required.)

Actors

The property in the Actors group has been described below. You can use this property to specify the actors who will work on the activity.

Actors - This property specifies the actor(s) who are to be assigned to the variable using the ResourceVariable activity.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Actors property

1. To specify the actors, click on the button for the 'Actors' property to open the property window.
2. In this window, build an expression to select the actors using the actors properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.

3. Add the condition to the expression by clicking **Add**. This will display the expression in the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Resource Variable - Actors for a detailed description of the Actors property window.

See the Using XML Variables section in the About the XML Variable User Interface topic for details on how to use the XMLVariables to build the expression.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Resource Variable Activity returns the following values -

Not Enough Resources: Displayed when filter Condition did not yield enough resources

Activity Executed: Displayed when the Resource variable is set successfully

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

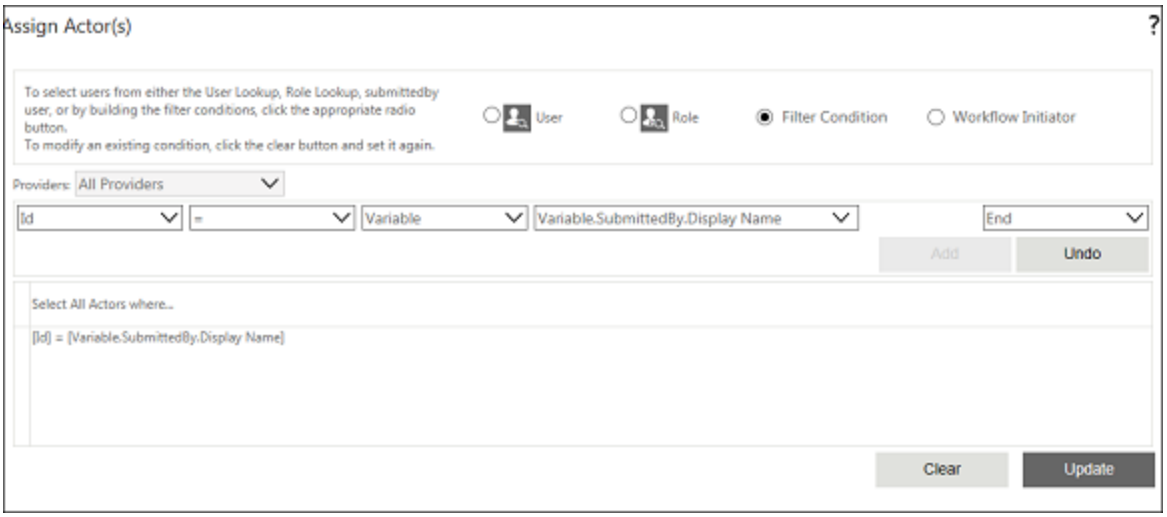
See Mapped Error Outputs for more details.

Resource Variable - Actors

Actors Property window

You can set the actors to whom the Resource Variable work item is to be sent in this property window. To open this window, click the button for the 'Actors' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

Different Methods of Assigning an Actor

- Assigning an Actor by building an expression:

Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

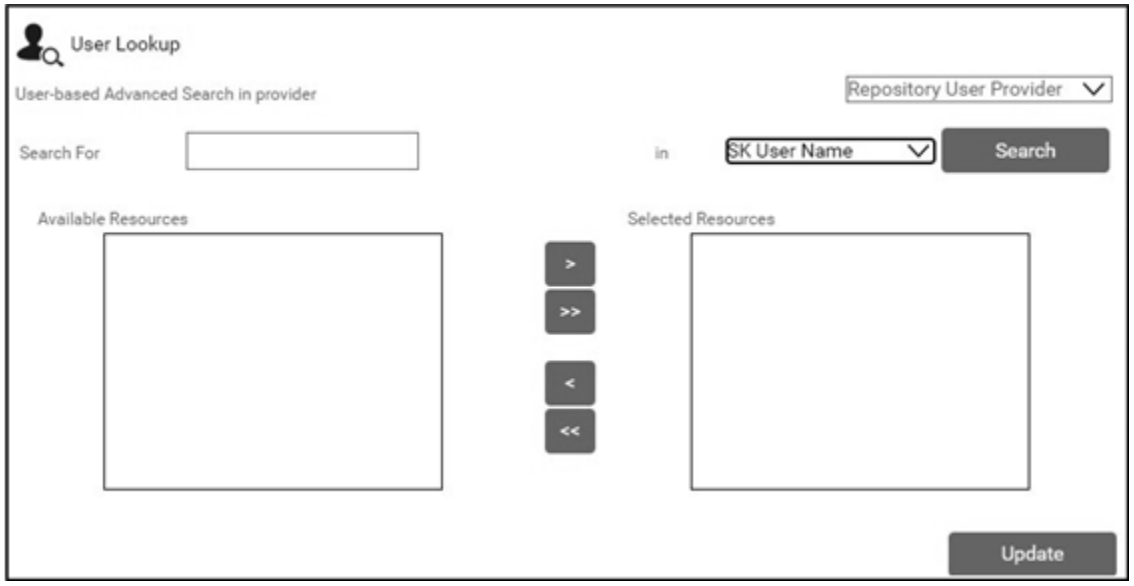
At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

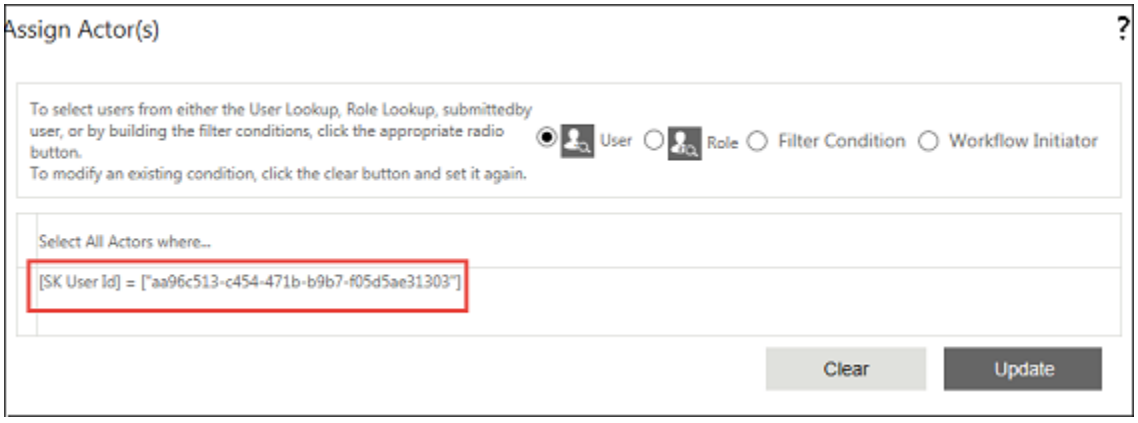
- Assigning an Actor through User Lookup

Through the **User Lookup** you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.
2. The **User Lookup** dialog is displayed, search and select the required actor.



3. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window. In the **Assign Actor** window, you will see that an expression is displayed, see the following image:



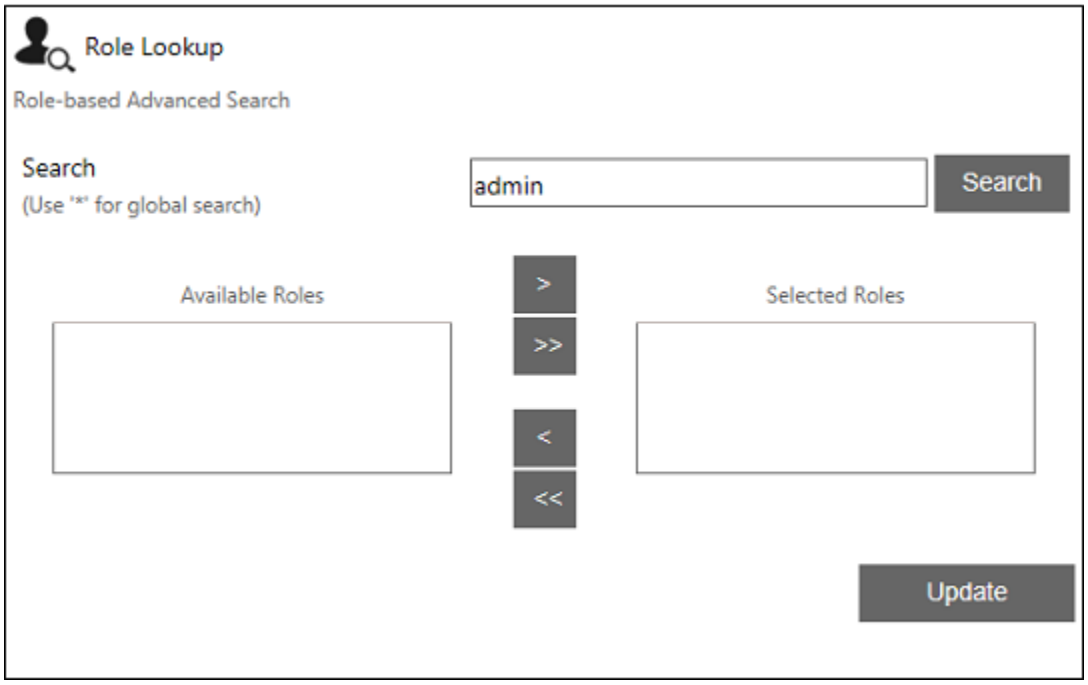
4. Click **Update** in the Assign Actor(s) window to update the selected actor(s) in the **Assign Actor** property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

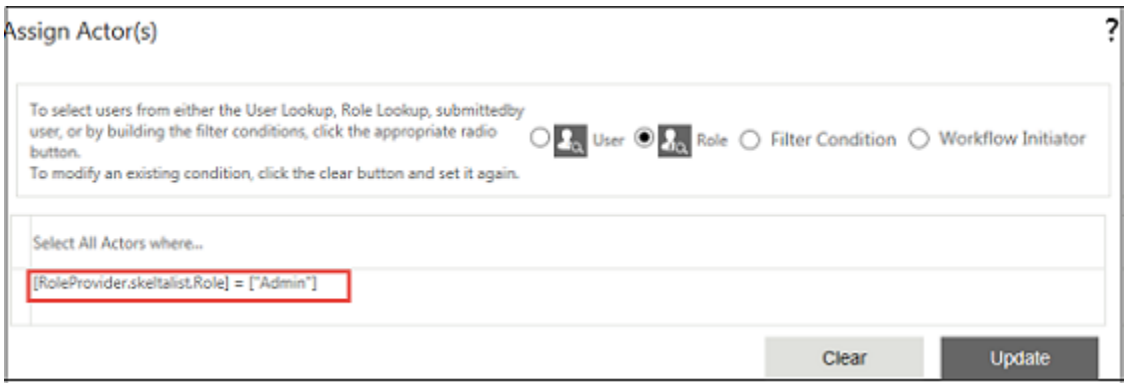
- Assigning an Actor through Role Lookup

Through the Role Lookup you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

1. Select the **Role Lookup** option.
   The **Role Lookup** dialog is displayed, search and select for the required role.



2. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, see the following image:
3.

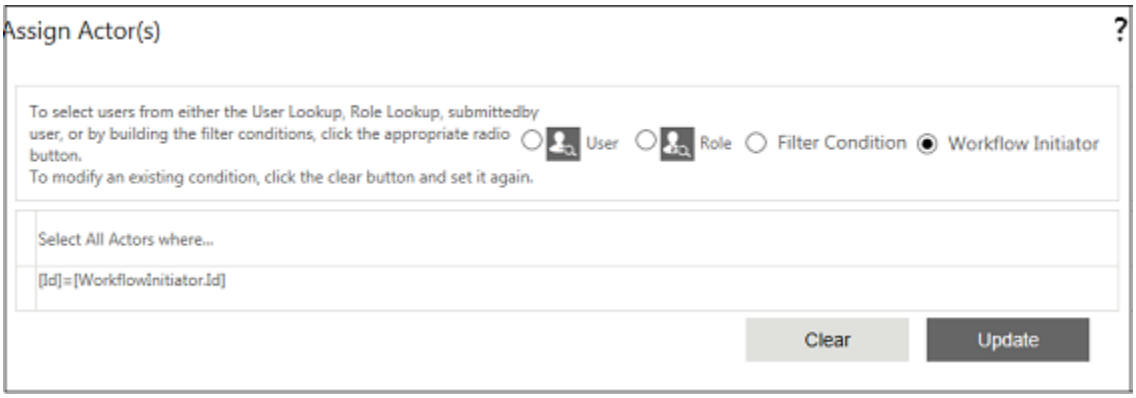


4. Click **Update** in the Assign Actor(s) window to update the Assign Actor property.

- Assigning an Actor through Workflow Initiator

Selecting the **Workflow** Initiator allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, see the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Rule Activity

Activity description

The Rule Activity allows complex rules or expressions to be built into the workflow. The expression will either result in 'true' or 'false'. The workflow engine evaluates the expression and assigns the result (true/false) to the output. The engine determines the path of the workflow from the output.

Activity Properties

The Rule activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the tool bar or by selecting the appropriate option from the right click menu for the Rule activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The property in the Configuration group has been described below. You can use this property to specify the decisions.

Condition - This property allows the user to frame complex expressions for the workflow execution. The expression results either in 'true' or 'false'. The workflow engine, after evaluating the expression and getting the result, decides on the path for the activity, as per the process design.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the Condition property

1. To specify the condition for the Rule activity, click the button for the 'Condition' property to open the property window.
2. In this window, build a complex expression for the rule using the fields provided. Select a type of value (Variable, Content, XMLVariables) from the first drop down list, then select the corresponding value from the second drop down. This forms the left-hand side of the rule condition expression. Next, select the operator for the condition from the third drop down. Finally, select the type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the respective drop downs to add the right-hand side of the rule condition expression. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression in the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Rule - Condition for a detailed description of the Condition property window.

See the Using XML Variables section in the About the XML Variable User Interface topic for details on how to use the XMLVariables to build the expression.

Activity outputs

The Rule Activity returns the following values -

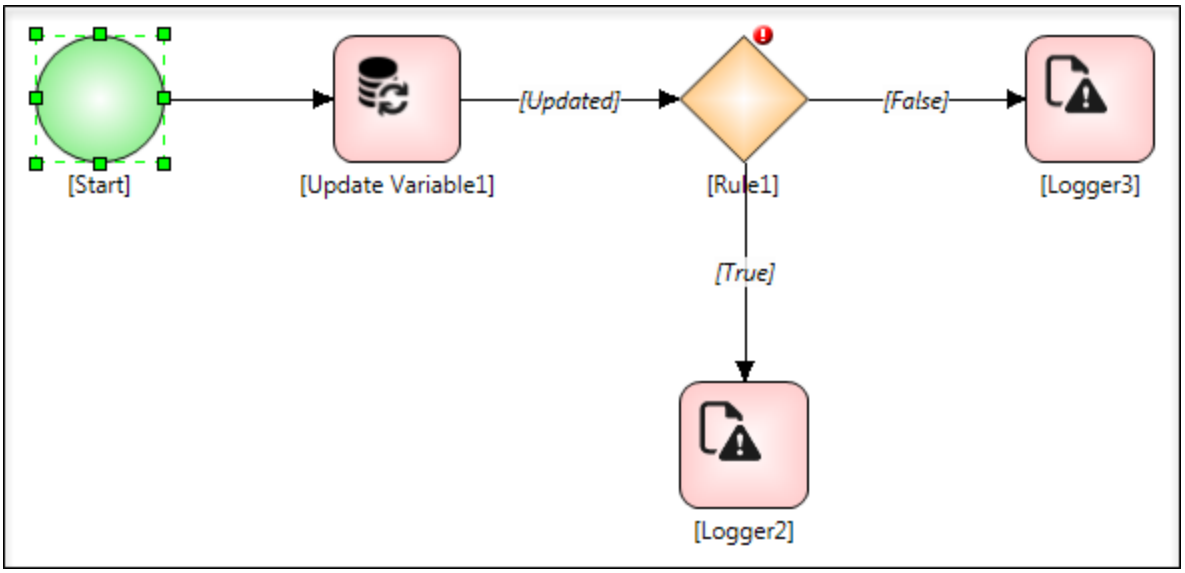
True: Displayed when the rule condition is true

False: Displayed when the rule condition is false

Example for a Rule Activity:

Step 1: Design a workflow as shown in the following figure.

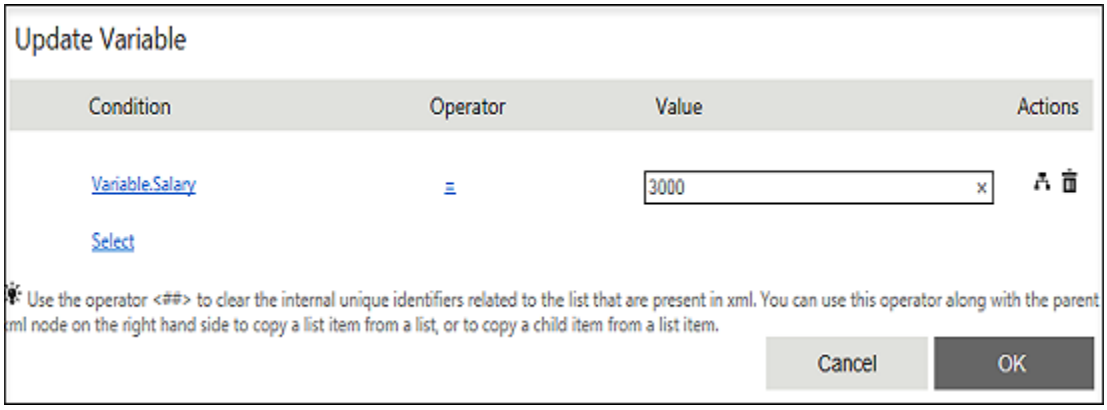
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Step 2: In the Start Activity declare a variable Salary.

Step 3: In the 'Set Variable' property of Update variable activity, perform the following actions:

- In the first drop-down, select Variable.Salary.
- Type a value. For Example, 3000.
- Click **OK**.



Step 4: In the Condition property of Rule Activity, perform the following actions:

- In the first drop-down, select Variable.Salary.
- Second drop-down, select '>' .
- Third drop-down, select 'Value'.
- In the adjacent text box, enter a variable. For Example, 2000.
- In the last drop-down, select AND.
- Click **Add**.
- Once again, in the first drop-down, select Variable.Salary.
- Second drop-down, select '<'.
- Third drop-down, select 'Value'.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- In the adjacent text box, enter a variable. For Example, 6000.
- In the last drop-down, select END.
- Click **Add**.
- Click **Update**. The entry would look as the following:

[Variable.Salary]>2000 And Variable.Salary<6000

Step 5: On the link connecting the right logger, select False and display an error message.

Step 6: On the link connecting the left logger, select True and display the value of the variable.Salary.

Output: The Variable.Salary will be updated to 3000, and in the rule condition the condition will be checked. The rule activity will return true and execute the logger at the bottom of the rule activity displaying the value of the variable Salary in the Logger Console.

Exception Behavior

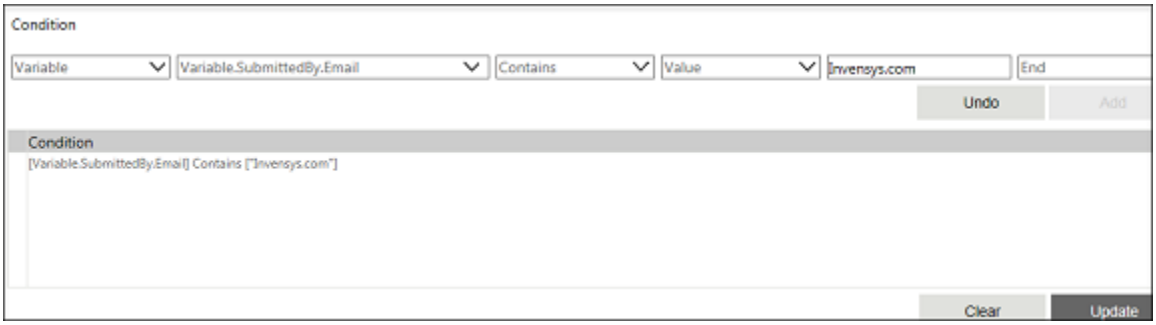
Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Rule - Condition

Condition Property window

You can set the condition corresponding to the Rule activity in this property window. To open this window, click the button for the **'Condition'** property.



The window has a set of drop downs at the top to select the different parameters required to build an expression for the condition. You can also find related buttons next to the drop downs.

- The first Value type drop down - You can select the type of value that will form the left-hand side the rule condition expression, in this drop down. You can select "Variable", "Content", or "XMLVariables" from this

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

drop down.

- The first Value drop down - You can specify the actual value corresponding to the value type selected in the preceding drop down. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Operator drop down - You can select the operator for the expression here. E.g., "=", "<=", "IN", "Contains".
- The second Value type drop down - You can select the type of value to be matched with the value specified in the left-hand side of the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/ drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down. If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

Workflow Activity

Activity description

In AVEVA Work Tasks, a workflow can be called from another workflow provided both workflows belong to the same repository. In this case, the calling workflow is termed as **Parent Workflow** and the workflow to be called is termed as **Child Workflow**.

The Workflow Activity enables the execution of a second (child) workflow from a (parent) workflow. The Workflow Activity can be used to call a child workflow from a parent workflow. The **Variables for the child workflow** property and **XMLVariables for the child workflow** property enable parent workflow to pass variable and XML variable information to the child workflow respectively.

Activity Properties

The Workflow Activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the workflow activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Repository - This property specifies the application or repository name that has the workflow to be run. The child workflow should belong to the same repository of the parent workflow. The repository property of a child workflow is exposed for backward compatibility.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Workflow - This property specifies the workflow to execute. This is an editable combo, which drops down a list with the names of all available workflows for the specified application. You can select one of the workflows as the child workflow. Alternatively, you can enter a name in the field to create a new child workflow. Now when, you right-click the workflow activity icon and select the "Open Sub Process" option, a new Process Designer window will be opened with the Application name and Workflow name specified here. You can create the new sub-process in this window.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Version - This property specifies the version only if any specific version of the (child) workflow to be executed. Leave this as blank, if the latest published version of (child) workflow has to be executed.

Property Type: Optional (This property needs to be set only if required.)

Contents for ChildWorkflow - This property specifies the content to be passed on to the workflow. Build the content to be passed to the child workflow, if required.

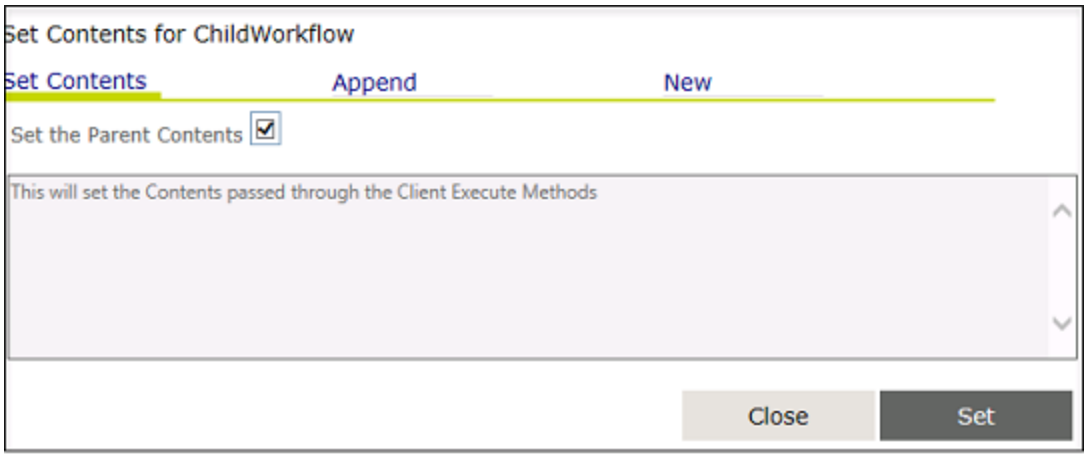
Property Type: Optional (This property needs to be set only if required.)Use one of the following options to specify the content to be passed:

- Set the contents to be passed as same as Parent Contents
- Append some more contents to the parent workflow contents
- New workflow contents

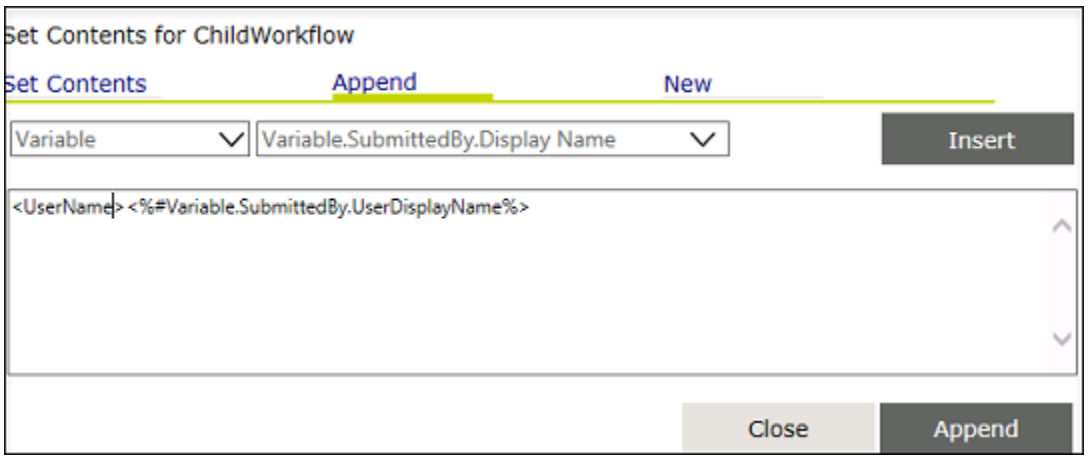
Steps to set the Contents for ChildWorkflow property

1. To specify the contents to be passed to the child workflow, click the button for the 'Contents for ChildWorkflow' property to open the property window.
2. In the Set Contents for ChildWorkflow dialog box, the Set Contents tab is selected by default and the corresponding window appears.
3. Click the Set the Parent Contents check box to pass the parent contents XML to the child workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

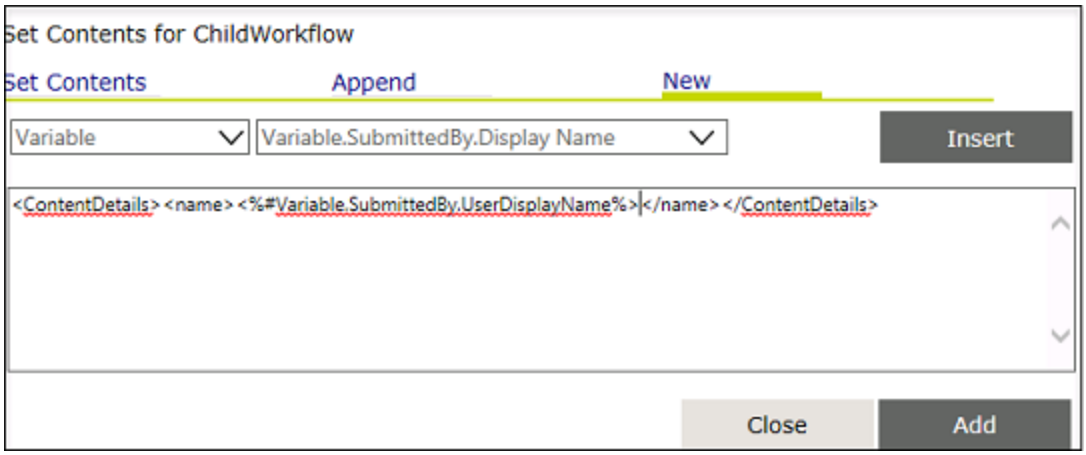


4. Click the Set button to set this property.
5. Alternatively, you can append XML content to the parent workflow contents and pass them to the child workflow. To do this, click Append to open the corresponding window.
6. Select a type of value (Variable or Content) and the corresponding value collection from the respective drop-down and then click Insert to add the selection to the text area.



7. Add more XML contents if necessary. After adding all the values, click **Append** to save the setting.
8. Third options to build complete XML content and can pass these contents to child workflow. To do this, click the New tab to open the corresponding window.
9. In this window, select a type of value (Variable or Content) and the corresponding value collection from the respective drop-down and then click Insert to add the selection to the text area.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



10. After specifying the new content, click **Add** to save the settings.

See Workflow - Contents for ChildWorkflow for a detailed description of the Contents for ChildWorkflow property window.

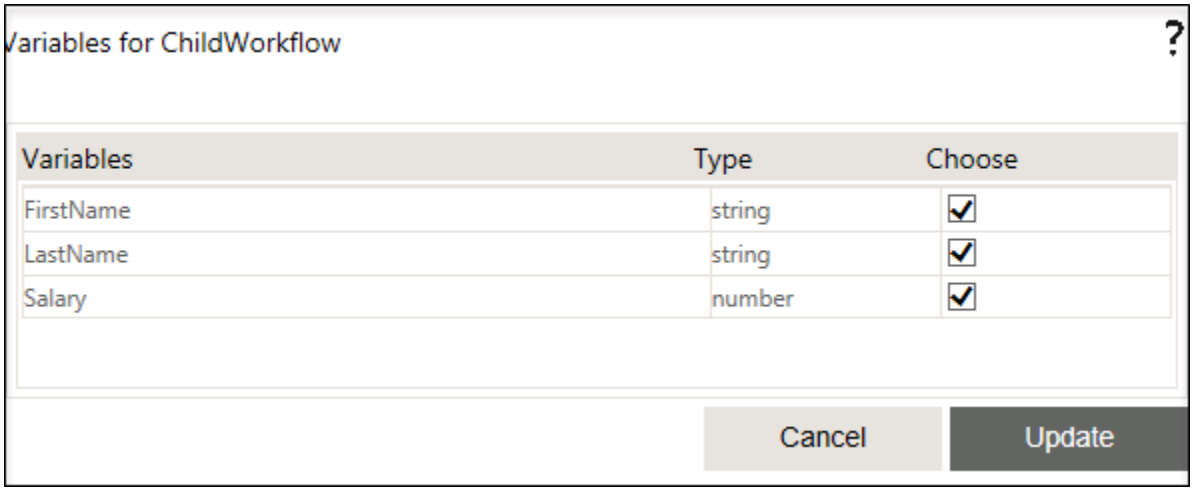
See the Using XML Variables section in the About the XML Variable User Interface topic for details on how to use the XMLVariables to build the expression.

Variables for ChildWorkflow - This property specifies the variables to be passed on to the workflow. This window shows the list of variables defined for the current (parent) workflow. Select the variables that need to be passed to the child workflow.

Property Type: Optional (This property needs to be set only if required.)

Steps to set the Variables for ChildWorkflow property

1. To specify the variables to be passed to the child workflow, click the button for the 'Variables for ChildWorkflow' property to open the property window.
2. In the Variables for ChildWorkflow window, select the required variables to be passed to the child workflow.



3. After specifying the data click the Update button.

Note: These variables are expected to exist in the child workflow. Make sure to define variables with same name and type as defined in parent workflow.

See Workflow - Variables for ChildWorkflow for a detailed description of the Variables for ChildWorkflow property window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

XMLVariables for ChildWorkflow - This property specifies the XML variables to be passed on to the child workflow. This window shows the list of XML variables defined for the current (parent) workflow. Select the XML variables that need to be passed to the child workflow.

Property Type: Optional (This property needs to be set only if required.)

Steps to set the XMLVariables for ChildWorkflow property

1. To specify the XML variables to be passed to the child workflow, click the button for the 'XMLVariables for ChildWorkflow' property to open the property window.
2. In the XMLVariables for ChildWorkflow window, choose the required variables to be passed to the child workflow.
3. Click the **Update** button.

Note:
- These XML variables are expected to exist in the child workflow. Make sure to define XML variables with same name and type as defined in parent workflow.

- To work with any XML variables or resource activities, SKEventData XML variables must be passed in the child workflow, where SKEventData contains some events information related to parent workflow which needs to be passed to child workflow. If SKEventData variable is not created, user can create XML variable of type XMLDocument with the same name 'SKEventData' by locating the 'SKEventData.xml' from the following path:*[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks*\Web\BPMUITemplates\Default\XMLSchemas.

See Workflow - Workflow - XmlVariables for ChildWorkflow for a detailed description of the XMLVariables for ChildWorkflow property window.

Wait for the child workflow? - This property determines whether the parent workflow should wait for the child workflow to complete.

Property Type: Optional (This property needs to be set only if required.)

Execution mode - This property determines whether the child workflow should be executed synchronously i.e., whether the child workflow can redirect the client to some URL.

Property Type: Optional (This property needs to be set only if required.)

Control child workflow? - This property determines whether the workflow control actions like pause, resume, and abort that are performed on the parent workflow should also be applied to the child workflow.

Property Type: Optional (This property needs to be set only if required.)

Note: Both properties namely Wait for the child workflow? and Control child workflow? should be set as No, if you do not want the parent workflow to wait till child workflow completes the execution.

Is Blocking Output Supported? - This property can be used along with the BlockingOutput activity.

The Workflow activity is a sleeping activity. The BlockingOutput activity may not return the expected results if any sleeping activity is executed before it. Use the **Is Blocking Output Supported?** property to overcome this behavior.

By default, the value for this property is set to **No**. Set the value to **Yes** if you want to use this property with the BlockingOutput activity. You can also set the value for this property through the Expression Editor.

Along with this property, set the values for the following properties as mentioned below.

- Set the value of **Wait for the child workflow?** to **No**.
- Set the value of **Execution mode** to **Synchronous**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Set the value of **Control child workflow?** to **No**.

Property Type: Optional (This property needs to be set only if required.)

Note: Consider a scenario where the **Set Workflow Variable Out** activity is used in the child workflow and then the return values are specified in the parent workflow. In this scenario, the BlockingOutput activity will not work.

Output Values

The property in the Output Values has been described below. You can use this property to specify the output values of the activity.

Return Values - This property can be used to add all the possible output values from the child workflow, for conditional routing. The child workflow should set a value to the 'ParentWorkflowOutput' variable. This variable will hold the output value from the child workflow. The value of the 'Wait for the child workflow?' property should be set to 'Yes'.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Return Values property

1. To specify the Return Values, click the button for the 'Return Values' property to open the property window.
2. In this window, enter the return value in the Return Values field.
3. After entering the return value details, click Add Row to add this return value and display a new row for entering another return value.
4. Remove rows if necessary by selecting them and clicking Remove Selected.
5. After specifying all the return values, click Update.

See Workflow - Return Values for a detailed description of the Return Values property window.

Activity outputs

The Workflow Activity does not have any standard return value. It will output the value specified by the user in the Return Values property.

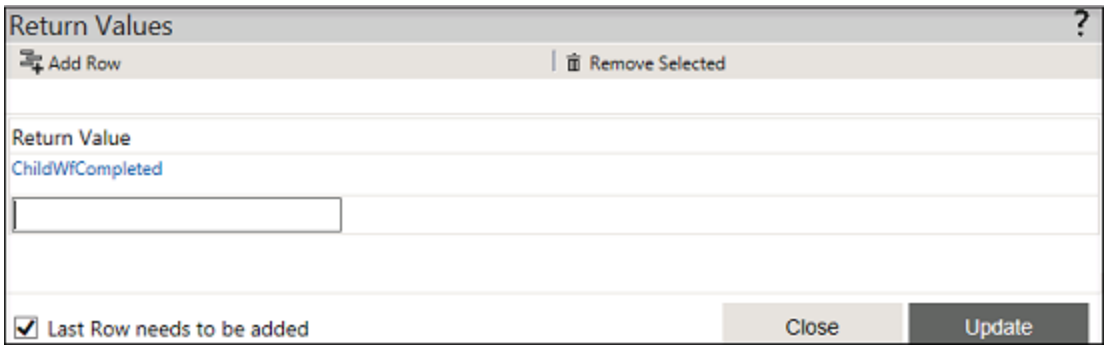
Example for a Workflow Activity

Configuring Parent Workflow to wait till Child Workflow Completes Execution

Steps to be followed for Parent Workflow configuration:

1. Set Wait for the child workflow property as Yes to wait for the child workflow to complete the execution.
2. Use Return Value property to set the routing condition after completion of child workflow. Example: ChildWfCompleted.

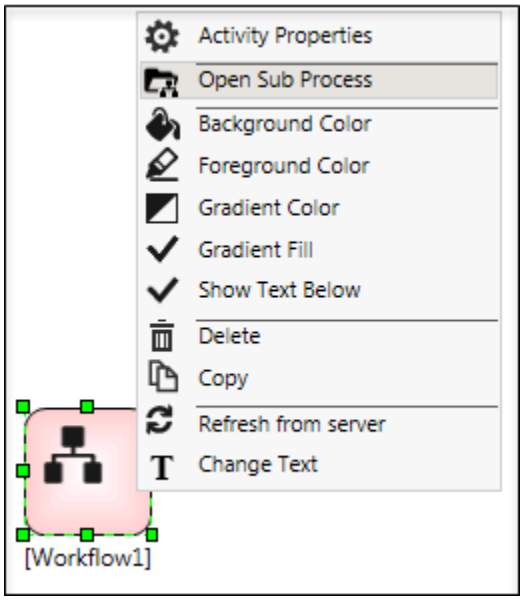
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



This will dynamically create a link output named 'ChildWfCompleted' for the activity. Once the child workflow complete its execution, it returns back to the parent workflow with the return value specified in the child workflow (In this case, child workflow should return 'ChildWfCompleted' value) and then it will continue with further execution.

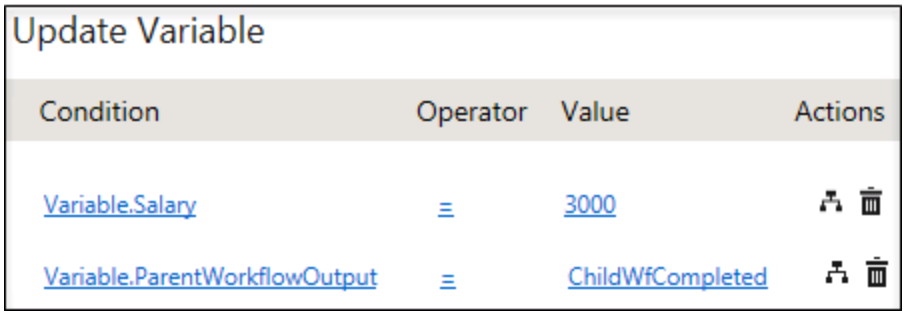
Steps to be followed for Child Workflow configuration:

1. Right-click the workflow activity to open child workflow using the context menu item Open Sub Process.



2. Declare a variable named 'ParentWorkflowOutput' of type string in the child workflow Start action.
3. Use Update Variable action to set the variable 'ParentWorkflowOutput' value as 'ChildWfCompleted' (This value should be same as the value for the Return Values property in parent workflow action properties).
4. The Update variable action to update the parent workflow output should be placed after the logical conclusion of child workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



After configuring child workflow, follow the steps given below:

1. Go back to the parent and set routing condition based on the output 'ChildWfCompleted'
   a. Parent workflow goes to sleep mode after the child is executed.
   b. Child completes execution with Update Variable as the last action.
   c. Once the child completes execution, the value set in Update variable is given as output for the workflow action in parent.

Note: If the child workflow needs to update any of the parent workflow variables, it is a must for Parent workflow to wait for the child workflow to complete.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Workflow - Contents for ChildWorkflow

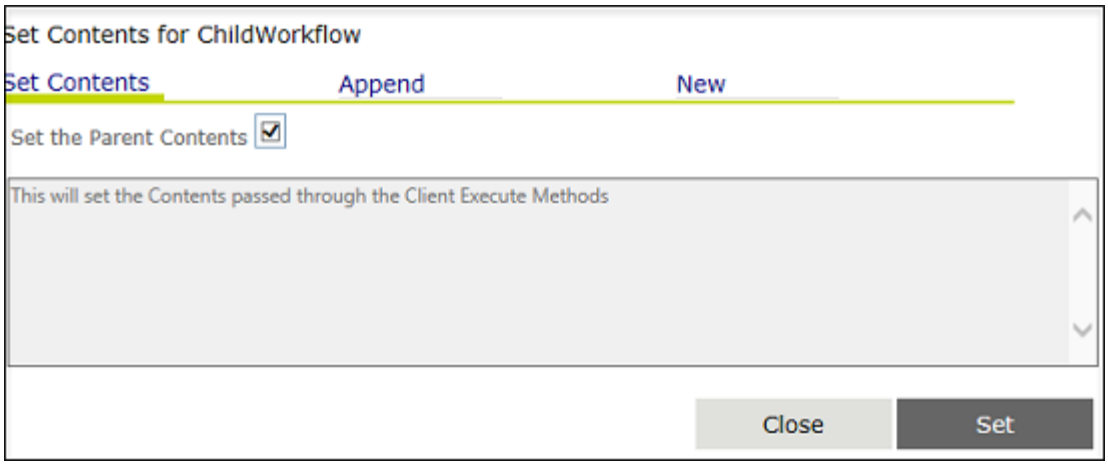
Contents for ChildWorkflow Property window

You can specify the contents to be passed to the child workflow in this property window. To open this window, click the button for the 'Contents for ChildWorkflow' property.

The window has three tabs – **Set Contents**, **Append**, and **New** – to specify the contents to be passed to the child workflow. Each tab opens the corresponding window to specify the content to set.

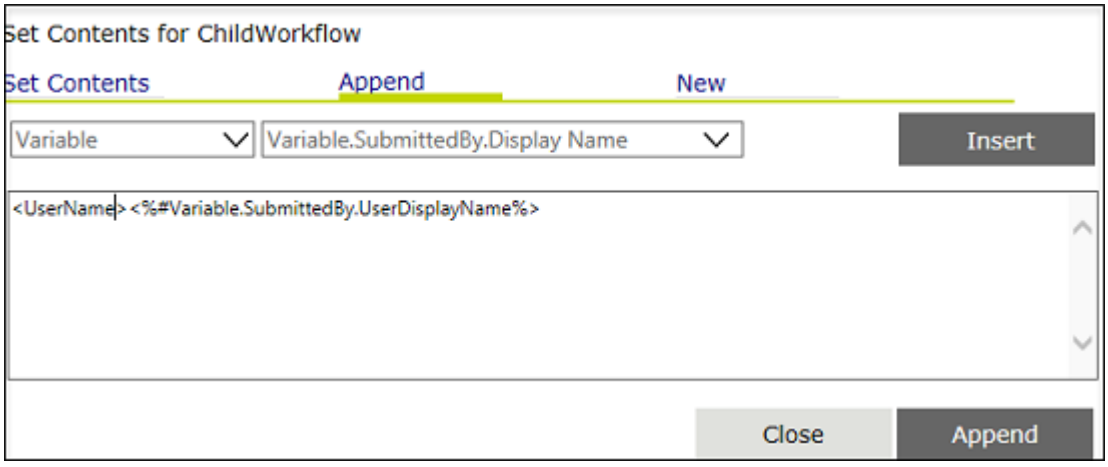
The following image shows the **Set Contents** tab of the **Contents for ChildWorkflow** property dialog box:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window shown above is displayed when the **Set Contents** tab is clicked. It is the default selection and is opened when this property window is launched. You can pass the contents that are passed through the Client. Execute Method to the child workflow in this window. You can click the **Set the Parent Contents** check box to do this. You can click **Set** to set the parent variables.

The following image shows the **Append** tab of the **Contents for ChildWorkflow** property dialog box:

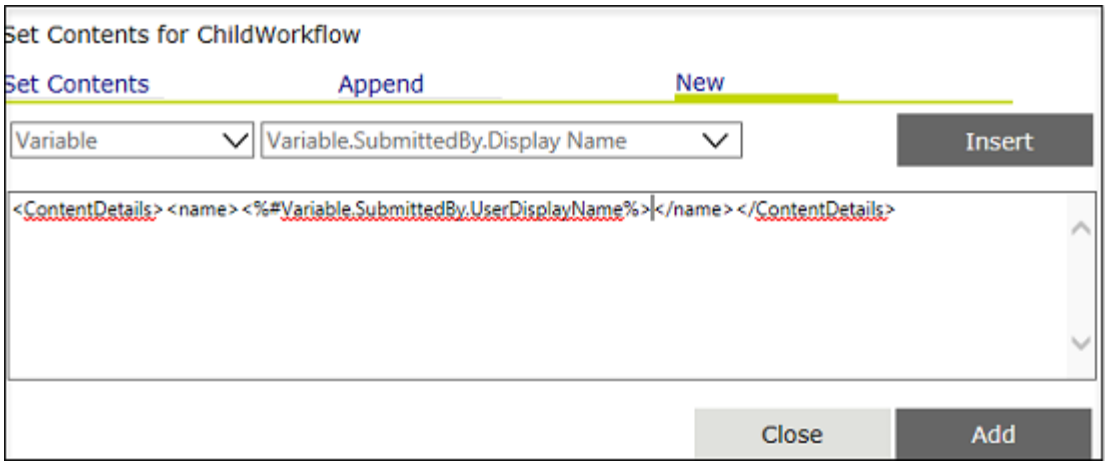


The window shown above is displayed when the **Append** tab is clicked. You can append values to the parent workflow contents in this window. This window has two drop downs for selecting the value type (Variable or Content) and the value respectively (Variable or Content collection). After specifying the values, you can click the **Insert** button to add it to the text area.

Click **Append** to append all the specified values to the parent workflow contents being passed to the child workflow.

The following image shows the **New** tab of the **Contents for ChildWorkflow** property dialog box:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window shown above is displayed when the **New** tab is clicked. You can add new content values to be passed to the child workflow in this window. This window has the value type (Variable or Content) and value (Variable or Content collection) drop downs for selecting the respective options. After specifying the values, you can click **Insert** to add it to the text area.

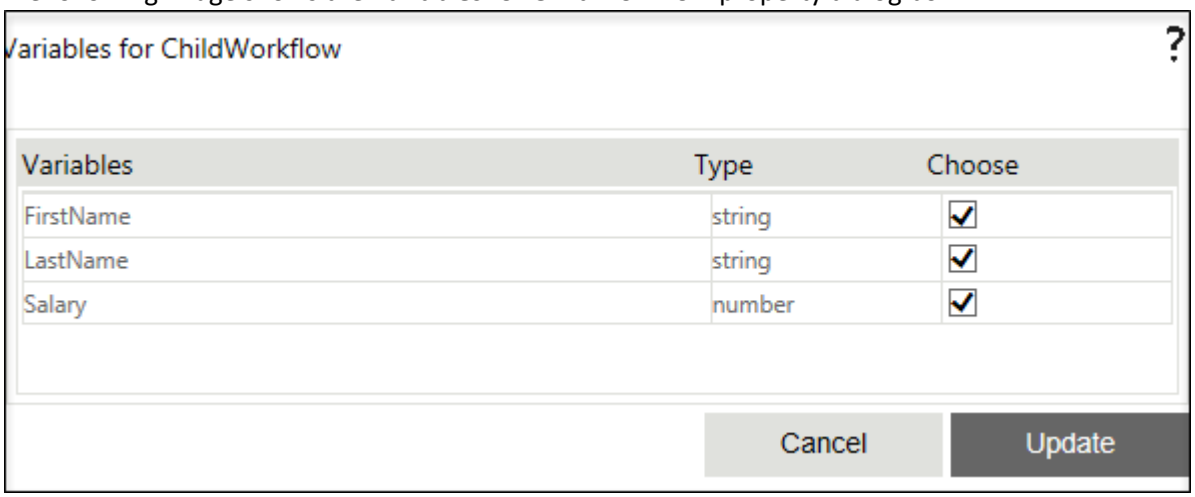
You can click **Add** to add all the specified values to be passed to the child workflow.

Workflow - Variables for ChildWorkflow

Variables for ChildWorkflow Property window

You can specify the variables to be passed to the child workflow in this property window. To open this window, click the button for the 'Variables for ChildWorkflow' property.

The following image shows the **Variables for ChildWorkflow** property dialog box:



The window has a grid that lists the parent workflow variables that can be passed to the child workflow. It has the following columns – **Variables**, **Type**, and **Choose**. You can click the **Choose** check box to select the variable. You can click **Update** to set selected the variables to be passed.

Note: You can create a local variable (that is, variables prefixed with '@', for example, @EmpId) which can be passed to the child workflow. For the child workflow to get this variable value, it should have a variable with the same name but without the '@'. For example, if a parent workflow has a local variable '@EmpId', then the child workflow should have a variable 'EmpId' to get its value.

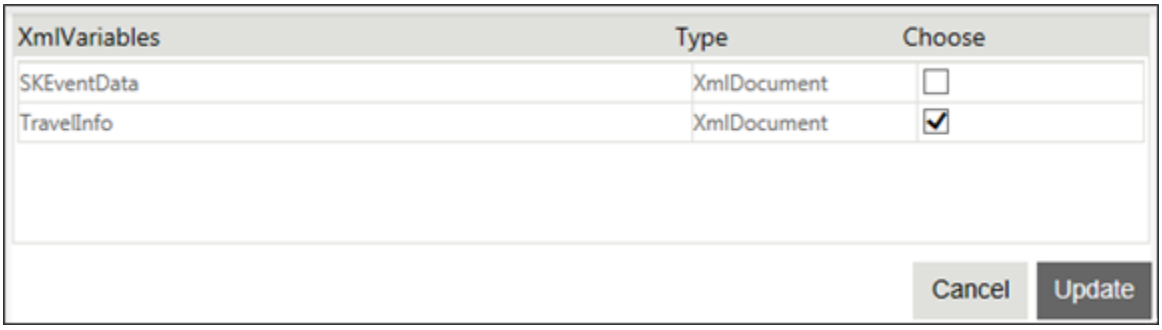
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Workflow - XmlVariables for ChildWorkflow

XmlVariables for ChildWorkflow Property window

You can specify the XmlVariables to be passed to the child workflow in this property window. To open this window, click the button for the 'XmlVariables for ChildWorkflow' property.

The following image shows the **XmlVariables for ChildWorkflow** property dialog box:



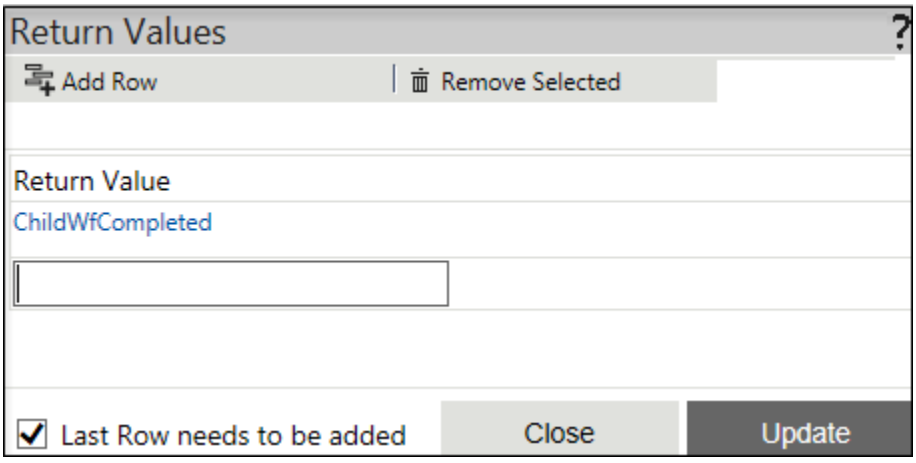
The window has a grid that lists the parent workflow XMLvariables that can be passed to the child workflow. It has the following columns –**XmlVariables**, **Type**, and **Choose**. You can click the **Choose** check box to select the XmlVariable(s). You can click Update to set selected the XmlVariable(s) to be passed.

Note: For **XMLVariables** of type **XMLDocument** the **Internal Storage** should be the same for both the parent and the child workflow.

Workflow - Return Values

Return Values Property window

You can set the return values for the child workflow in this property window. To open this window, click the button for the 'Return Values' property. It displays the values in a grid, which also has a blank row where you can enter a new return value.



The window has two tabs at the top to manage the rows of return values in the grid.

- **Add Row** - You can click this tab to add the newly entered return value and display a new row to the grid where you can add another value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Remove Selected** - You can click this tab to remove the return value selected in the grid.

The grid has the following parameters that you need to specify for the new return value.

- **Return Value** - You can use this field to enter the return value.

There are two buttons and a check box at the bottom of the screen.

- **Update** - You can click this button to save the newly added return value(s)
- **Close** - You can click this to close the property window without saving the newly added return value(s)
- **Last Row needs to be added** - You need to select this check box to save the last row added.

How to Pass Variables/Contents from Parent Workflow to Child Workflow?

The Workflow Activity enables the execution of a second (child) workflow from a (parent) workflow. The workflow activity can be used to call a child workflow from a parent workflow. The **Variables for the child workflow** property and **XMLVariables for the child workflow** property enable parent workflow to pass variable and XML variable information to the child workflow respectively.

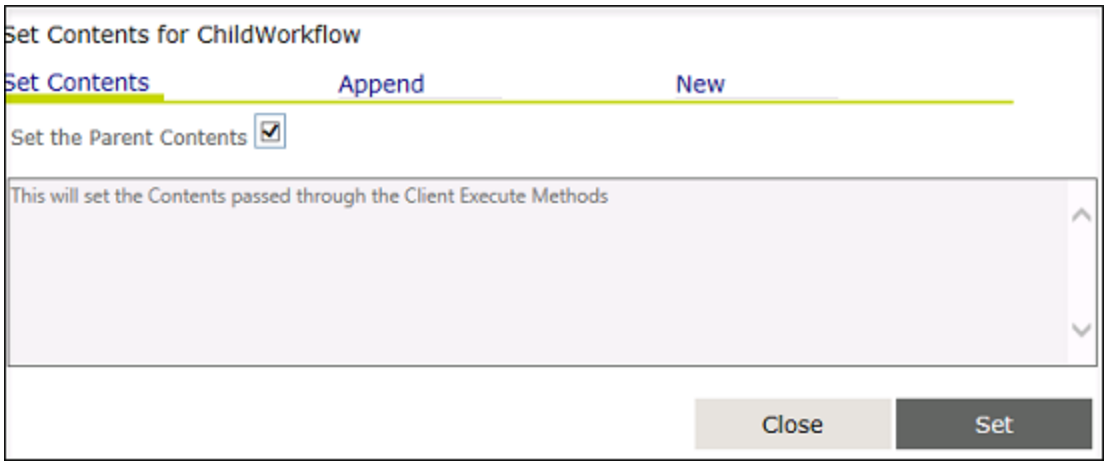
To pass variables or contents from parent workflow to child workflow, follow the steps given below:

1. In the parent workflow, right-click **Workflow Activity**, and then select **Activity Properties**.
2. Enter the repository name for **Repository** property. The child workflow should belong to the same repository of the parent workflow. The repository property of a child workflow is exposed for backward compatibility.
3. Enter the name of the workflow to be executed in the **Workflow** property.
4. Enter the version only if any specific version of the (child) workflow to be executed in the Version property. Leave this as blank, if the latest published version of (child) workflow has to be executed.
5. Build the content to be passed to the child workflow, if required in the **Contents for ChildWorkflow** property. Use one of the following options to specify the content to be passed:
   - Set the contents to be passed as same as Parent Contents
   - Append some more contents to the parent workflow contents
   - New workflow contents

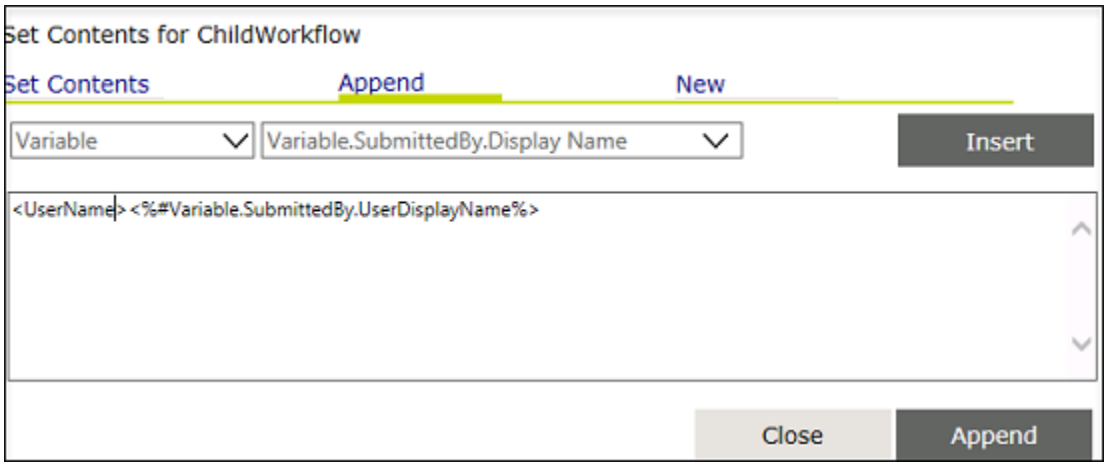
To set the Contents for ChildWorkflow property

1. To specify the contents to be passed to the child workflow, click the button for the 'Contents for ChildWorkflow' property to open the property window.
2. In the **Set Contents** window, the **Set Contents** tab is selected by default and the corresponding window is displayed.
3. Click the **Set the Parent Contents** check box to pass the parent contents XML to the child workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

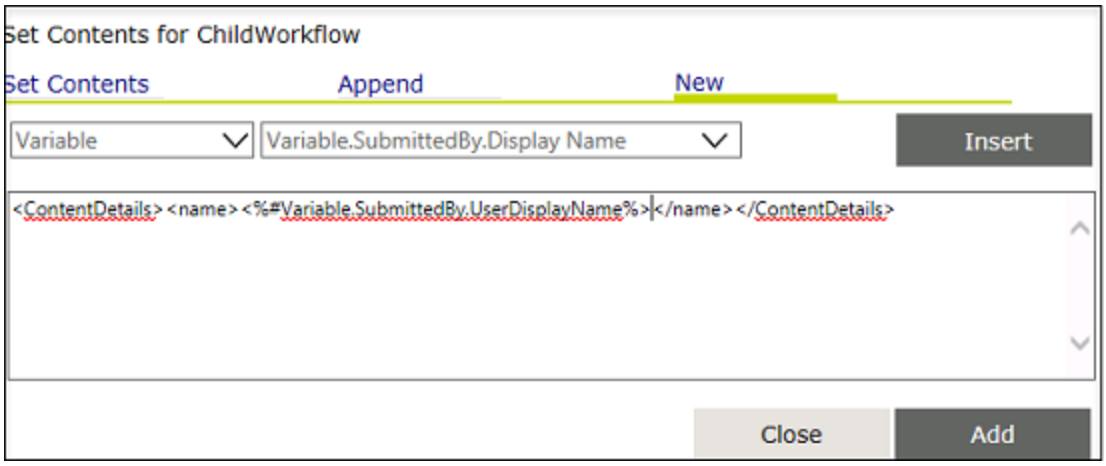


4. Click **Set** to set this property.
5. Alternatively, you can append XML content to the parent workflow contents and pass them to the child workflow. To do this, click **Append** to open the corresponding window.
6. Select a type of value (Variable or Content) and the corresponding value collection from the respective drop-down and click **Insert** to add the selection to the text area



7. Add more XML contents if necessary. After adding all the values, click Append to save the setting.
8. Third options to build complete XML content and can pass these contents to child workflow. To do this, click New to open the corresponding window.
9. In this window, select a type of value (Variable or Content) and the corresponding value collection from the respective drop-down and click the Insert button to add the selection to the text area.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

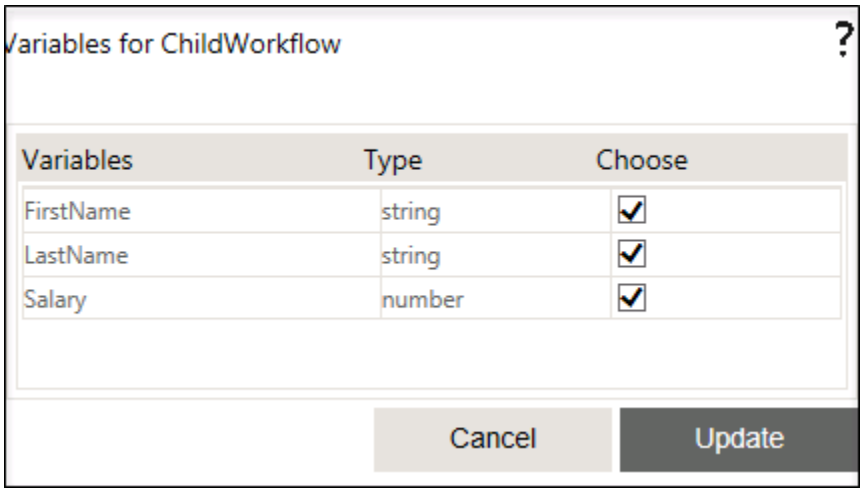


10. After specifying the new content, click Add button to save the settings.

Select the variables that need to be passed to the child workflow from Variables for ChildWorkflow property.

To set the Variables for ChildWorkflow property

1. To specify the variables to be passed to the child workflow, click the button for the 'Variables for ChildWorkflow' property to open the property window.
2. In the **Variables for ChildWorkflow** window, select the required variables to be passed to the child workflow.



3. After specifying the data, click Update.

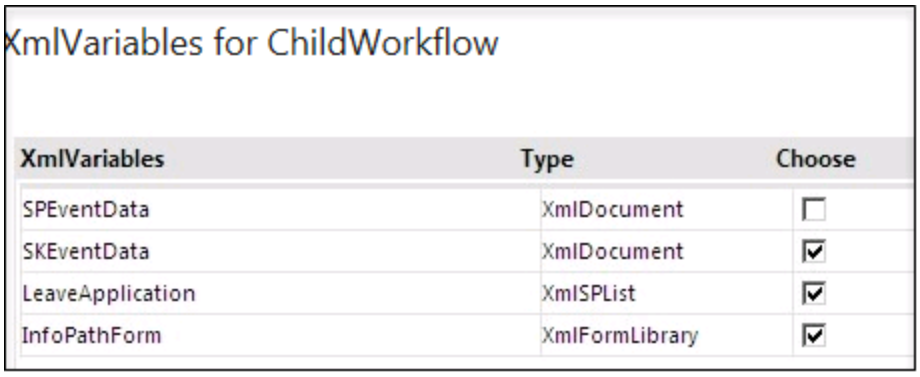
Note: These variables are expected to exist in the child workflow. Make sure to define variables with same name and type as defined in parent workflow.

Select the XML variables that need to be passed to the child workflow from XMLVariables for ChildWorkflow property.

To set the XMLVariables for ChildWorkflow property

1. To specify the XML variables to be passed to the child workflow, click the button for the **'XMLVariables for ChildWorkflow'** property to open the property window.
2. In the **XMLVariables for ChildWorkflow** window, choose the required variables to be passed to the child workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click the Update button.

Note: These XML variables are expected to exist in the child workflow. Make sure to define XML variables with same name and type as defined in parent workflow.
To work with any XML variables or resource activities, SKEventData XML variables must be passed in the child workflow, where SKEventData contains some events information related to parent workflow which needs to be passed to child workflow. If SKEventData variable is not created, user can create XML variable of type XMLDocument with the same name 'SKEventData' by locating the 'SKEventData.xml' from the following path: *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks*\Web\BPMUITemplates\Default\XMLSchemas.

Configuring Parent Workflow to wait till Child Workflow Completes Execution

To configure Parent Workflow

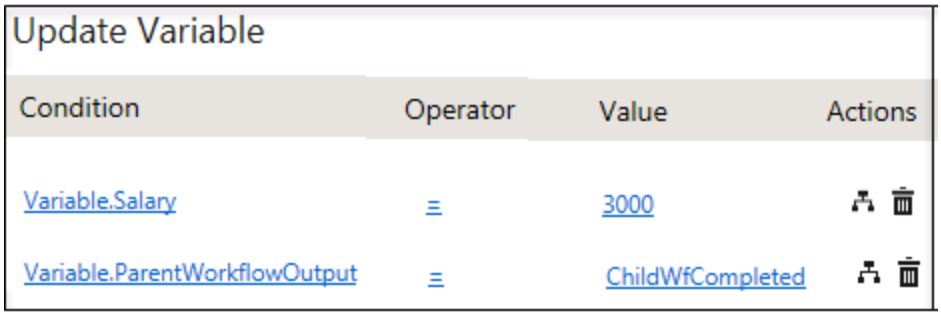
1. Set Wait for the child workflow? property as Yes to wait for the child workflow to complete the execution.
2. Use Return Values property to set the routing condition after completion of child workflow. Example: 'ChildWfCompleted'.

This will dynamically create a link output named 'ChildWfCompleted' for the activity. Once the child workflow complete its execution, it returns back to the parent workflow with the return value specified in the child workflow (In this case, child workflow should return 'ChildWfCompleted' value) and then it will continue with further execution.

To configure Child Workflow

1. Right-click the workflow activity to open child workflow using the context menu item Open Sub Process.
2. Declare a variable named 'ParentWorkflowOutput' of type string in the child workflow Start activity.
3. Use **Update Variable** activity to set the variable 'ParentWorkflowOutput' value as 'ChildWfCompleted' (This value should be same as the value for the Return Values property in parent workflow action properties).
4. The **Update Variable** activity to update the parent workflow output should be placed after the logical conclusion of child workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



After configuring child workflow, do the following steps:

1. Go back to the parent and set routing condition based on the output 'ChildWfCompleted'.
2. Parent workflow goes to sleep mode after the child is executed.
3. Child completes execution with Update Variable as the last action.
4. Once the child completes execution, the value set in Update variable is given as output for the workflow action in parent.

   Note: If the child workflow needs to update any of the parent workflow variables, it is a must for parent workflow to wait for the child workflow to complete.
5. Select **Asynchronous** from **Execution mode** drop-down list.
6. Select **Yes** from **Control child workflow?** drop-down.

Get Execution ID of the Child Workflow

You can get Execution ID of the Child Workflow from the Parent Workflow as follows.

To access Execution ID of the Child Workfow

1. Create a variable in the parent workflow with a name such as **"ChildWFExecutionId" + <<Child Workflow Action Name>>**.

   For example: **ChildWFExecutionIdWorkflow1**
2. Access the variable **<%#Variable.ChildWFExecutionIdWorkflow1%>**.

   The variable will return the value of the Child Workflow Execution ID.

Update Variable Activity

Activity description

The Update Variable Activity can be used to update the value of Variables and XmlVariable that can be used in the subsequent activities. Using this activity, the variable for For-Loop activity can also be initialized.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

The Update Variable activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking the Activity Properties tool in the tool bar or by selecting the appropriate option from the right-click menu for the Update Variable activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Exception Behavior

These options of Wonderware Skelta BPM 2009 have now been integrated with **Raise Error on Unhandled Linked Output** in the latest version of the product.

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The property in the Configuration group has been described below. You can use these properties to configure the functionality of the activity.

Set Variable - This property allows the user to specify the values for existing Variables or XMLVariables.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

See Variables for updating Variables.

See Forms Xml Variables to work with Forms XMLVariables.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity outputs

The UpdateVariableValue Activity returns the following values -

Updated: Displayed when the Variable or XMLVariable is updated

Not Updated: Displayed when the Variable or XMLVariable is not updated

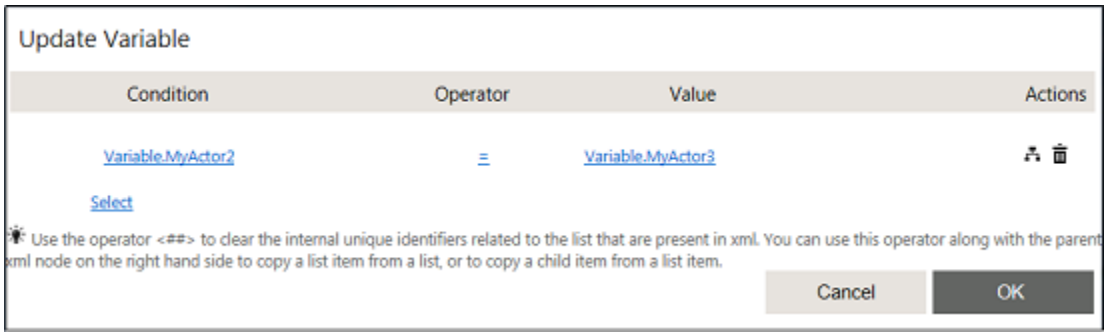
Variables

You can select the variables or XMLvariables and set the values to them in this property window. To open this window, click the button for the 'Set Variable' property.

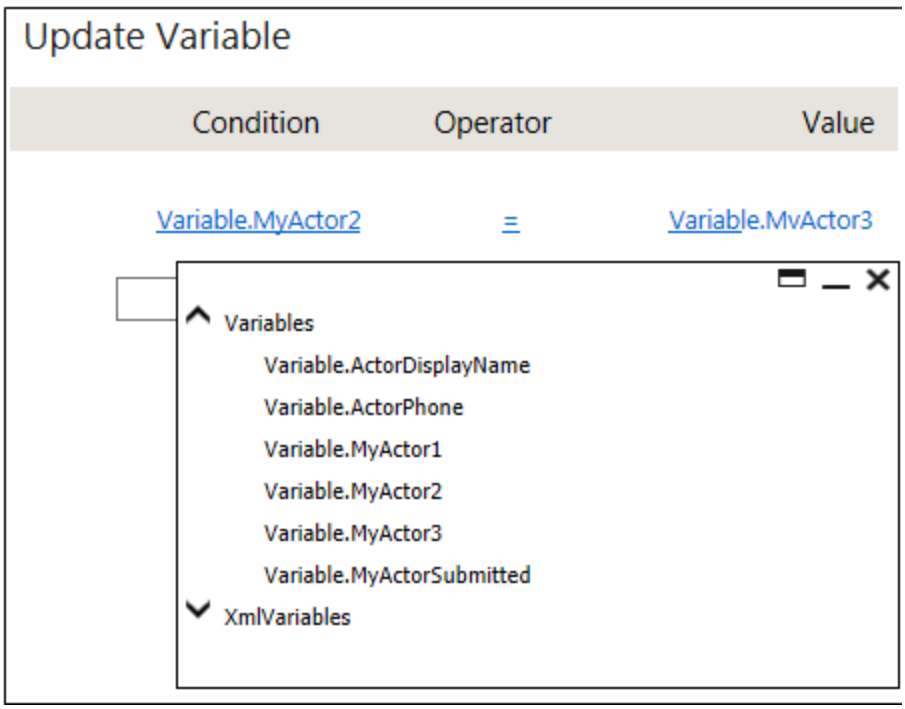
The following window shows the Update Variable Property window:

Steps to update a variable:To assign values to variables, click the button for the 'Set Variable' property to open the property window.

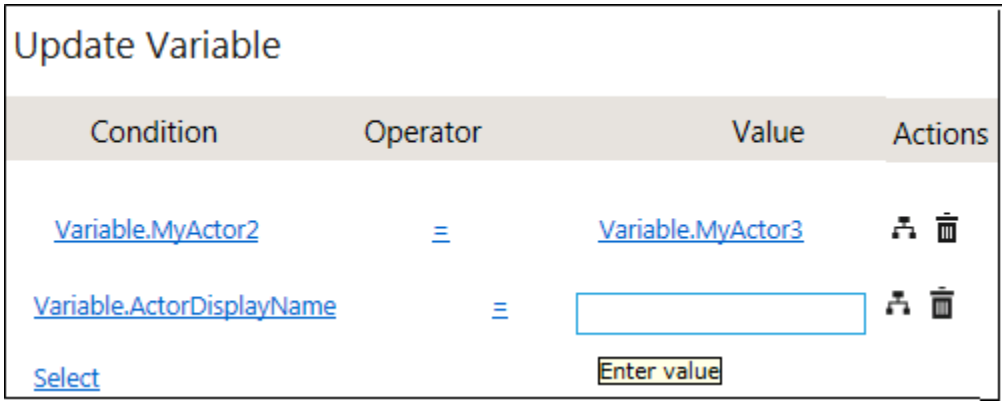
1. In this window, select the variable to which you want to assign or update the value.
2. Depending on your selection on the left hand side, the value can be specified directly in a text box, or as options in a drop down. You can select a variable collection, content collection, XML Variables collection, or build an expression. In the case of Variables, you will need to select the specific XML element from the schema. For example, select 'Name' on the left hand side.



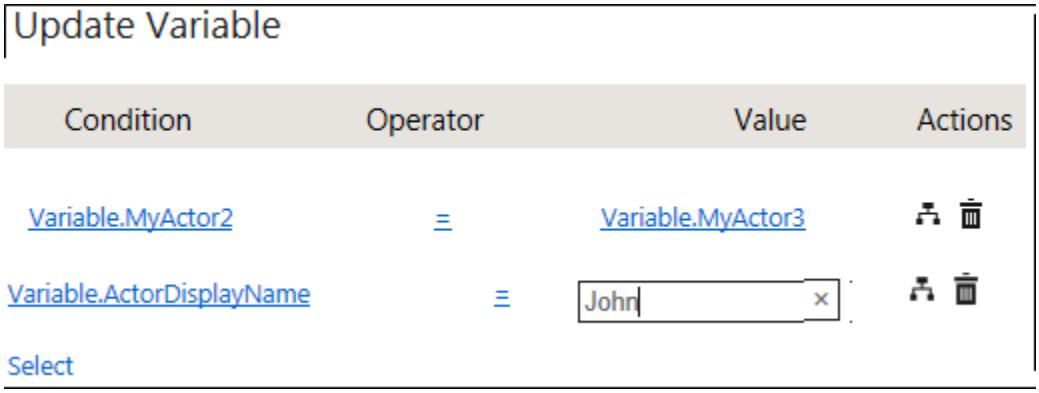
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. After selecting variable, the following screen is displayed to enter the value.



4. Enter the value for the variable in the text box. For example, enter name as 'John' as shown in the following figure.
The window shown in the image below is used to Update the Variables and their values.



5. If you want to create more variables, then click on Select to add variables.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. After setting the value for the variables, click **OK** button to save the settings.

   Note: Follow the same steps for updating XMLVariable.

See Forms Xml Variablesfor more information.

Note: For number data types, the minimum and maximum values are not validated. Enter only valid numeric values for number data types.
For numeric, DateTime, Date, or Time data types, ensure that the respective value is based on the culture set. You can enter the input or use the Date and Time picker to enter the required date and time.
Date.CurrentDate is not supported. Use the tree view option to pick the required date and time.
The time format supports long data type to enable you to enter seconds.

Forms Xml Variables

Updating the list item that alerted the workflow

AVEVA Work Tasks allows you to update the list item that alerted the workflow using XML List type XML variable. Update Variable activity can be used to add or update an item to the list. To update an item you need to select the scope as Current from Choose the List Item to Work on options. You can also use **List Navigator Activity** to set the scope.

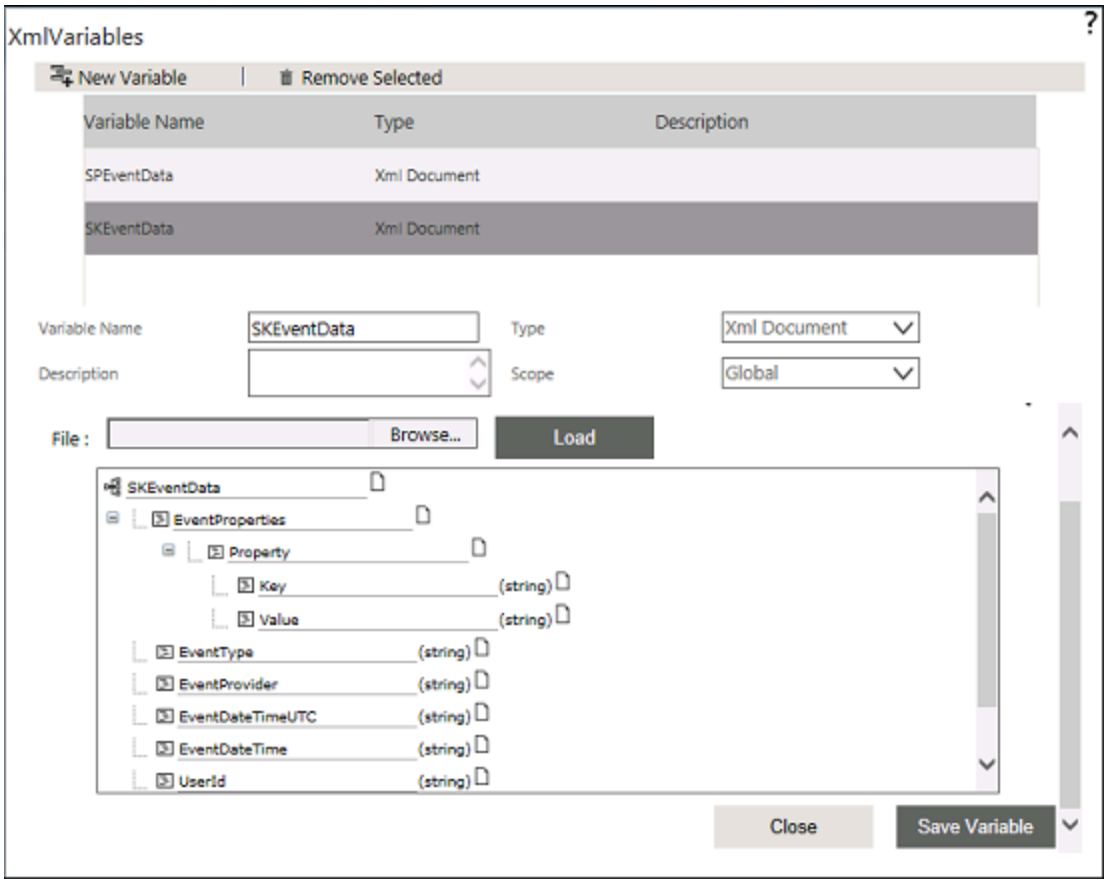
Assume that you have created a list called **Purchase Orders** with the following fields and alerted the workflow.

- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price
  - Item Total
- Total Purchase amount

Now you want to update an item in the same list. Follow the procedure.

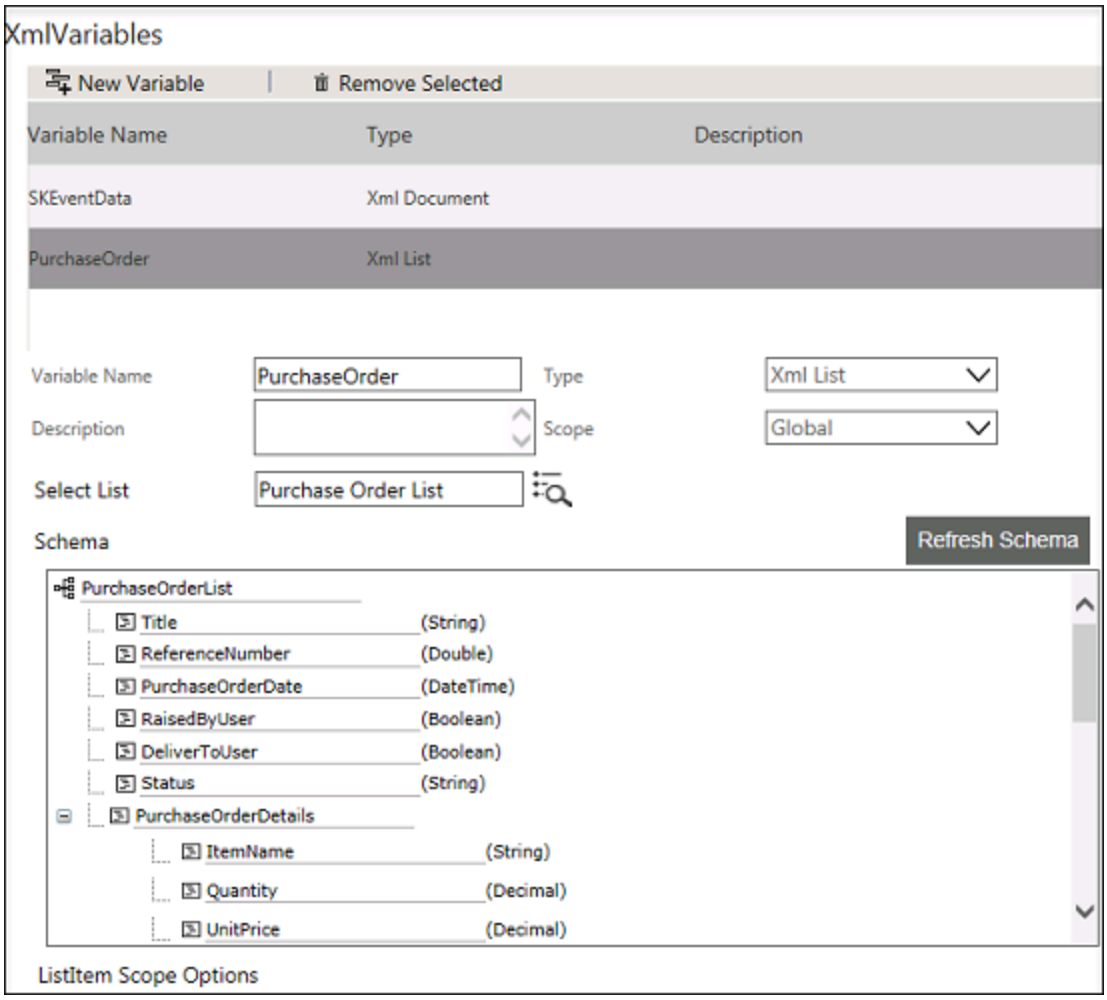
1. Log on to the **Enterprise Console** and go to workflow designer page.
   You need to create an **XML List** type XML variable for the **Purchase Orders** list. If the variable is not created, follow the below mentioned procedure to create.
2. Click the edit icon in the **XMLVariables** property from the **Start Activity** Properties. The following screen appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click **New Variable** to add a new variable.
4. Enter the variable name as **PurchaseOrder**.
5. Select **XML List** as **Type** from the drop-down list.
6. Enter the List name or click the icon to select the list. In this case select **Purchase Order List**.
7. Select the scope **Current** option from the **Choose the ListItem to work on** options to point to an item in the **Purchase Order List**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

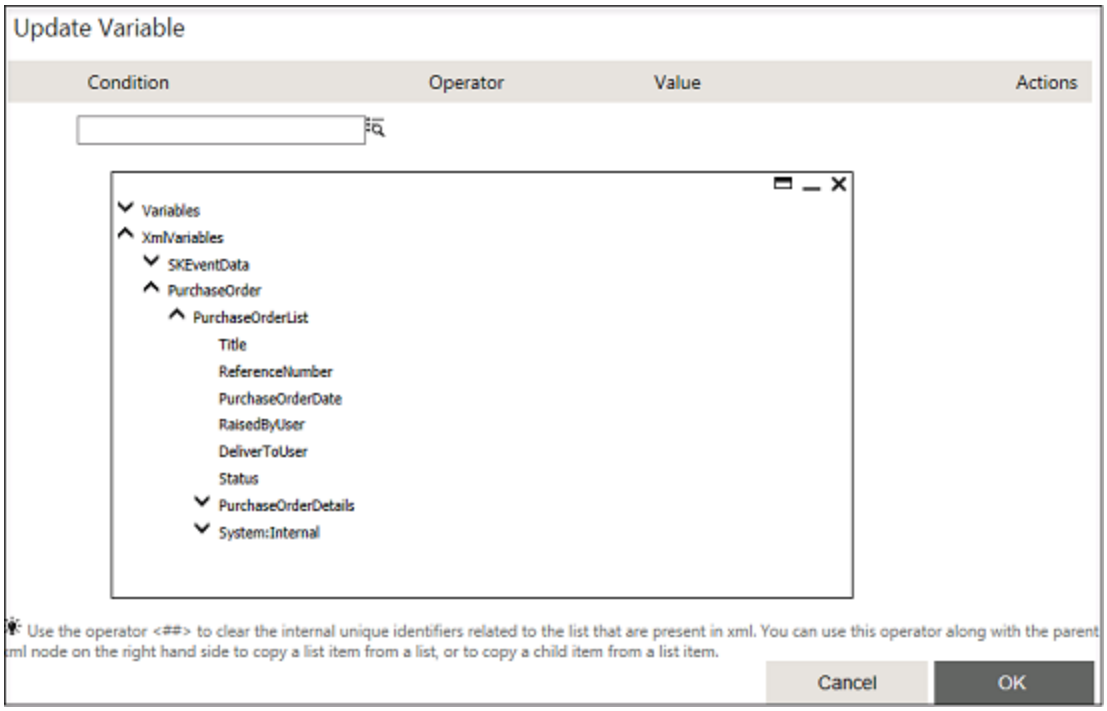


8. Now you can see the XML nodes in a tree-view that are mapped to the controls while creating the list.
9. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window.

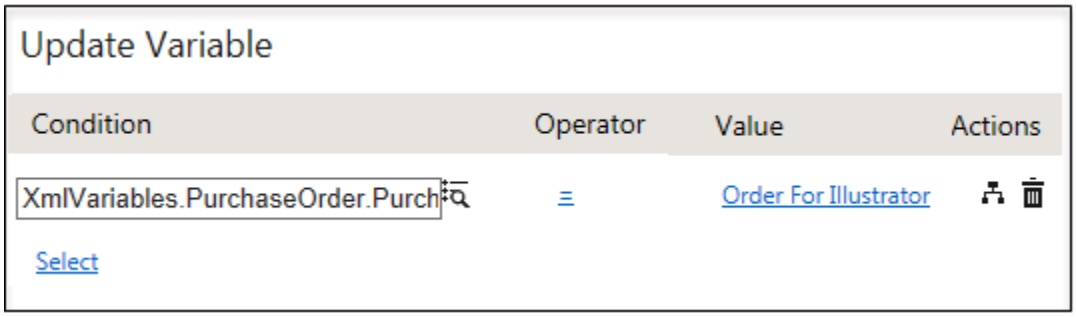
Note: If you set the scope as New while creating the XML List type XML variable, you can change it in to Current using List Navigator activity.

10. Drag and drop the **Update Variable** activity to update an item in the list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



11. Click the edit icon in the **Set Variables** property.
12. Click the **Select** link and select the respective field of the **XML List** type XML Variable created for the list (in this case **PurchaseOrder**). The fields displayed in the tree-view are representing the XML nodes of the controls in the list.
13. Select a field for that you want set the value from the tree-view. Then enter the value for the field in the right-hand side text box or click to set the value.
14. If you want to set the value, select **enter a value** from the tree-view, and then enter the value. Also you can select variables or contents or any XMLvariables nodes directly by selecting the respective node from the tree-view. If you want to combine multiple node values, you can build an expression by selecting **Build Expression**.



15. The same way you can set the value for other fields that you want to update. In this case, you are only updating the field 'Title' which has the value 'Order for Illustrator'.
16. Click **OK**. When you execute this workflow, the item get updated based on the value that you have set.

Note: For number data types, the minimum and maximum values are not validated. Enter only valid numeric values for number data types. For numeric, DateTime, Date, or Time data types, ensure that the respective value is based on the culture set.
You can enter the input or use the Date and Time picker to enter the required date and time.
Date.CurrentDate is not supported. Use the tree view option to pick the required date and time.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The time format supports long data type to enable you to enter seconds.

Update Parent Variables Activity

Activity description

In AVEVA Work Tasks, a parent workflow variable can be updated from a child workflow provided both child and parent workflow belong to the same repository. This can be achieved by using Update Parent variables activity.

Activity Properties

The Update Parent Variables activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right-click menu for the Update Parent Variables activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

Use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

Use these properties to configure the functionality of the activity.

Parent Workflow Application Name - This property specifies the name of the application to which the parent workflow belongs. You can specify the application name directly here or click on the icon to open the Expression Builder and build an expression for the application name.

The parent workflow should belong to the same repository of the child workflow. This property of a child workflow is exposed for backward compatibility.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Parent Workflow Name - This property specifies the name of the parent workflow. You can specify the workflow name directly here or click on the icon to open the Expression Builder and build an expression for the workflow name.

The parent workflow should belong to the same repository of the child workflow.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

List Parent Variables - This property specifies the parent workflow variables to be updated. Click on the edit icon to open the

'List Parent Variables' property window.

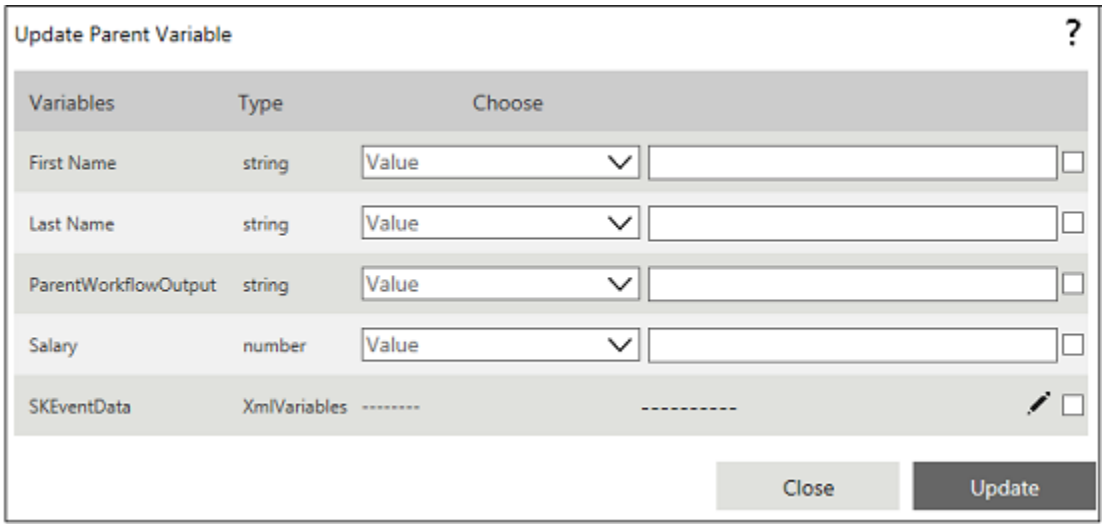
Property Type: Mandatory (This property must be set if the activity is to be executed.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Set the List Parent Variables property

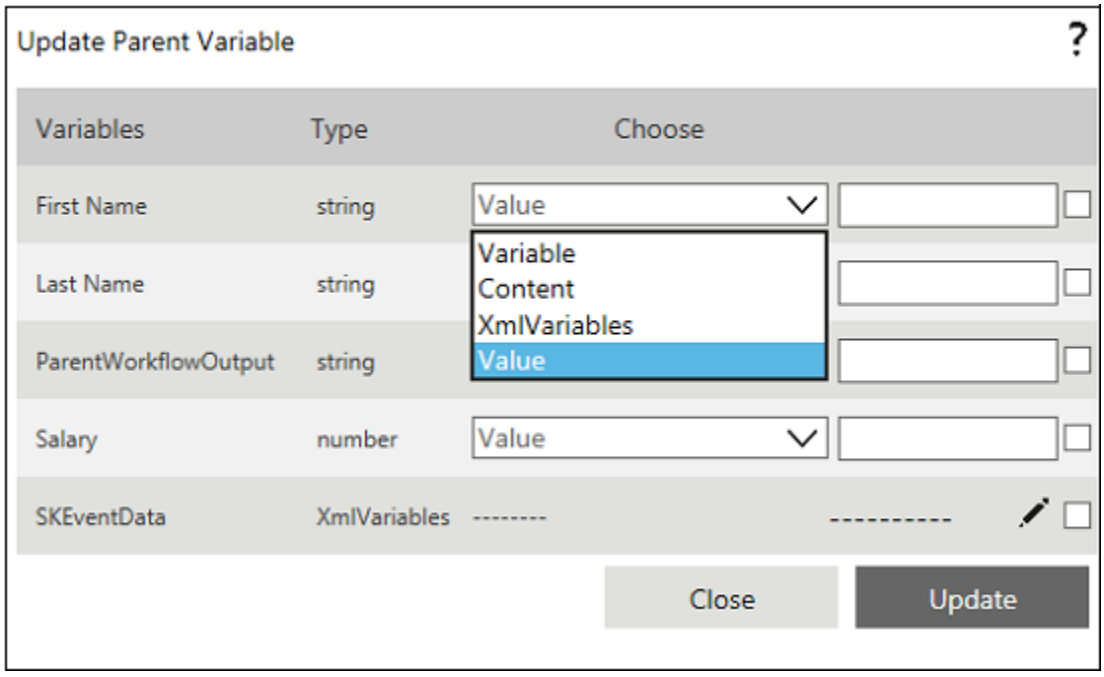
To update the value of variable:

1. Click the edit button of the **List Parent Variables** property. The **Update Parent Variables** window appears. Specify the parent workflow variables in this window.
2. Select the check box of the respective parent variable.



3. Choose the option using which the parent variable to be updated. The parent variable values can be updated using the Value, Variable, Content, or XML Variable of the child workflow.
4. Depending on the choice, select the respective options or node, and then click **Update** to save.

Note: The value can also be hardcoded using the Value option as shown in the following image.



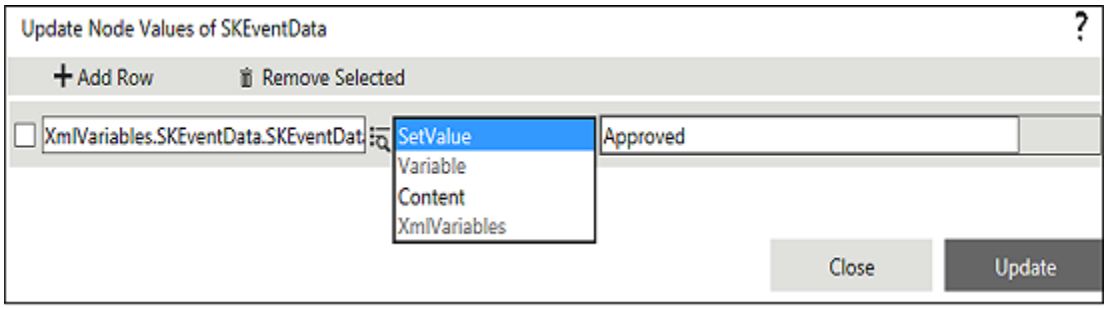
5. After selecting and assigning values to the variables, click **Update** to save.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To set the value of XML Variable

1. Select the check box of the respective parent variable.
2. Clicking the icon on the left hand side of the check box opens the window to specify the node to be updated of the respective parent XMLVariable.
3. Select the node to be updated from the tree view.
4. Choose the option using which the parent XML variable node to be updated. The parent XML variable node value can be updated from the variable, content or XML variable of the child workflow.
5. Depending on the choice select the respective option/node from the RHS.

Note: The value can also be hardcoded using the SetValue option as shown in the following figure.



6. You can specify multiple nodes for updating by using the **Add Row** option.
7. In order to remove any node that is set from updating, select the respective entry by selecting the check box in the left hand side and click **Remove Selected**.

See Update Parent Variables - List Parent Variables for a detailed description of the List Parent Variables property window.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

- Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs: The Update Parent Variables Activity returns the output value set in the Set Workflow Output property.

Exception Behavior

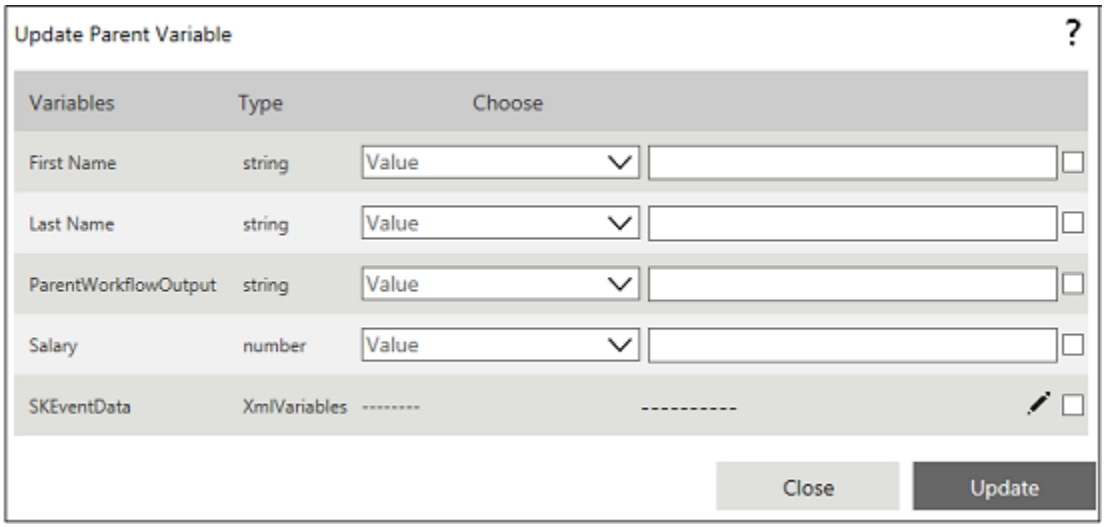
Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Update Parent Variables - List Parent Variables

You can set the List Parent Variables for this activity in the Update Parent Variable property window.



Update Parent Variable property window

The **Update Parent Variable** property window has a grid that lists all the variables belonging to the parent workflow which are specified in the Parent Workflow Name property. Each row in the grid represents a parent workflow variable, showing the variable name and type under the respective columns. The window also contains the following controls to specify the value to update the variable with:

- The Value type drop-down menu: Select the type of value to be assigned to the parent variable. Values that you can specify are Variable, Content, Value, or XMLVariables.
- The Value text box/drop-down menu: Specify the actual value to assign to the parent variable. The control displayed depends on the option selected in the Value type drop-down menu. If you select "Value", a text box appears. You can enter a discrete value in this box to complete the expression. If you select "Variable", "Content", or "XMLVariables", a drop-down menu appears in this field. This drop-down menu contains variable collection, content collection, or XMLVariables collection from which you can select an appropriate option.
- The check box: Select this check box to update the value of the corresponding parent variable at the workflow execution time.
- To set values for an XML Variable, click the icon, and then enter the required values in the **Update Node Values** window. For more information, see How to Update a Parent Workflow Variable from a Child Workflow?.

Note:
- For number data types, the minimum and maximum values are not validated. Enter only valid numeric values for number data types. For numeric, DateTime, Date, or Time data types, ensure that the respective value is based on the culture set. You can enter the input or use the Date and Time picker to enter the required date and time. The time format supports long data type to enable you to enter seconds. If you enter a valid value for a numeric, date, time, or datetime data type, and if you enter unwanted strings after the valid values, then while submitting the values, the extra strings at the end are truncated. For example, for a DateTime value entered as 01/31/2015 10:11:12ababa, then ababa is truncated by default.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Only single instance of Update Parent Variables activity can be used in child workflow.

How to Update a Parent Workflow Variable from a Child Workflow?

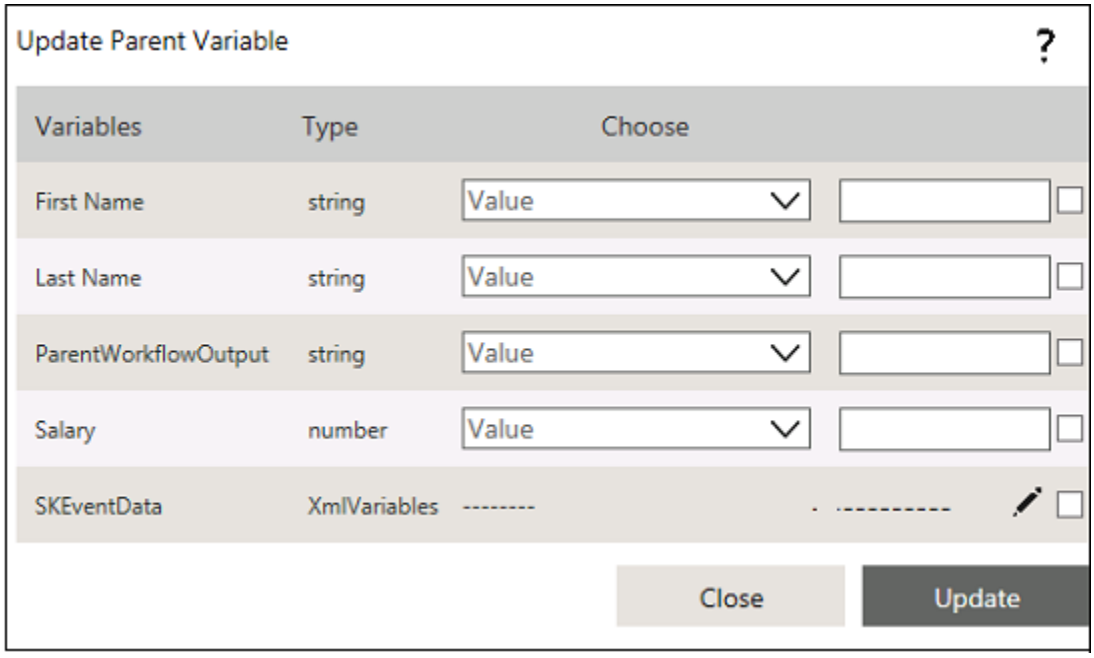
1. In AVEVA Work Tasks, a parent workflow variable can be updated from a child workflow provided both child and parent workflow belong to the same repository. This can be achieved by using **Update Parent Variables** activity.

To update parent workflow from a child workflow, do the following steps:

1. Right-click **Update Parent Variables Activity** and select **Activity Properties**.
2. Enter the parent workflow's repository name in the **Parent Workflow Application Name** property. The parent workflow should belong to the same repository of the child workflow. This property of the Update Parent Variable activity is exposed for backward compatibility.
3. Enter the parent workflow name in the **Parent Workflow Name** property. The parent workflow should belong to the same repository of the child workflow.
4. Click **List Parent Variables** property to update the variables in the parent workflow.

To update the value of variable

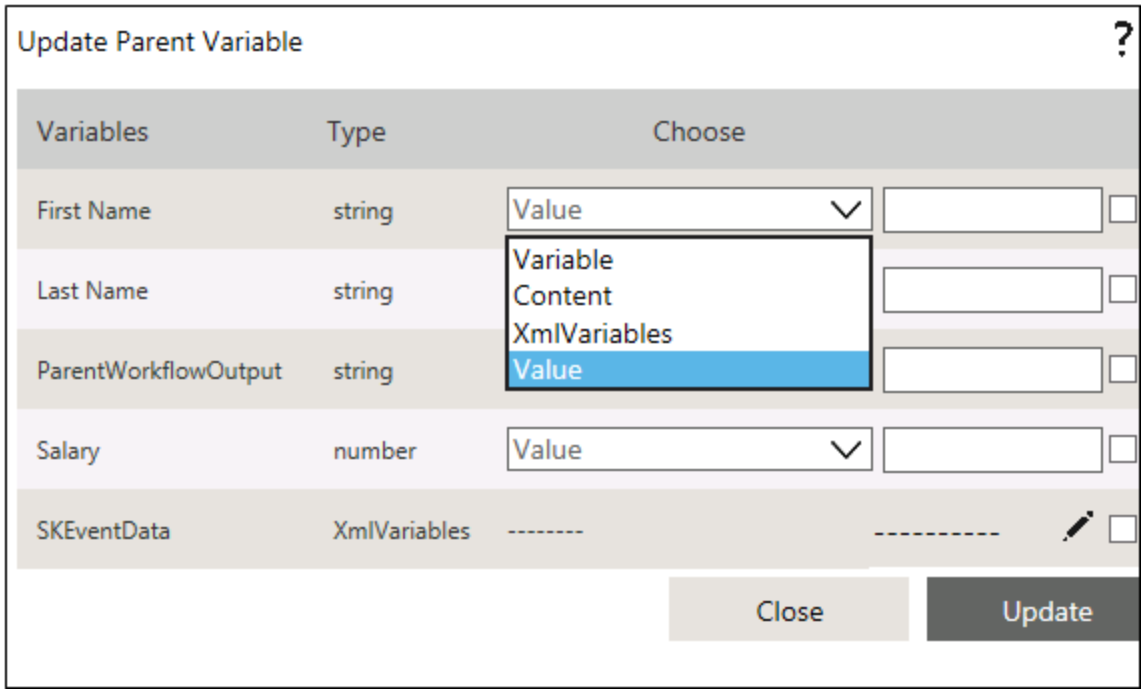
1. To specify the parent workflow variables, click the button for the **'List Parent Variables'** property to open the property window.
2. In the **Update Parent Variables** window, select the check box of the respective parent variable.



3. Choose the specific option from the list using which the parent variable to be updated. The parent variable value can be updated from the Value, Variable, Content, or XML Variable of the child workflow.
4. Depending on the choice, select the respective text box/options/node from the RHS and click **Update** to save.

   Note: The value can also be hard coded using the Value option as shown in the following figure.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

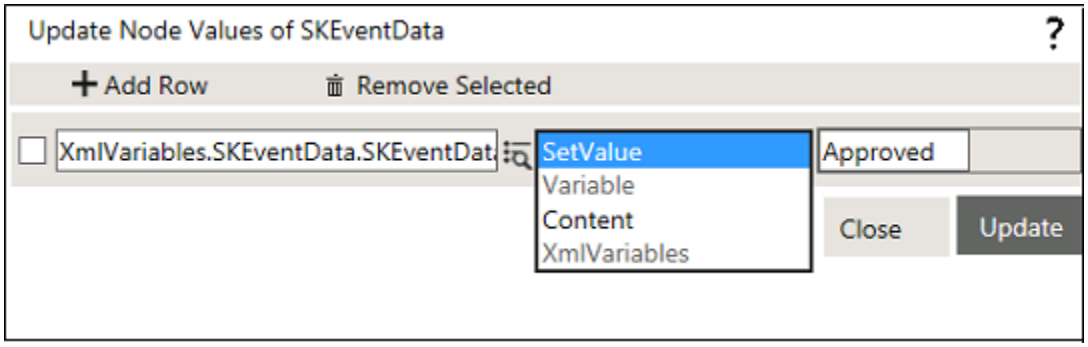


5. After selecting and assigning values to the variables, click Update to save.

To set the value of XML Variable

1. Select the check box of the respective parent variable.
2. Click the icon on the left hand side of the check box. The **Update Node Values** window appears. Specify the node to be updated for the respective parent XML Variable.
3. Select the node to be updated from the tree view.
4. Choose the option using which the parent XML variable node to be updated. The parent XML variable node value can be updated from the SetValue, Variable, Content, or XMLVariable of the child workflow. Depending on the choice, select the respective value/options/node from the RHS.

Note: The value can also be hard coded using the SetValue option as shown in the following figure.



5. You can specify multiple nodes for updating by using the **Add Row** option.
6. To remove any node that is set from updating, click the respective check box of the entry to be deleted, and then click **Remove Selected**.

Synchronize Activity

Activity description

The Synchronize Activity synchronizes the execution of different activities. The engine does not proceed with the execution of further actions until all the actions leading to this activity are completed.

Activity Properties

The Synchronize activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Synchronize activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

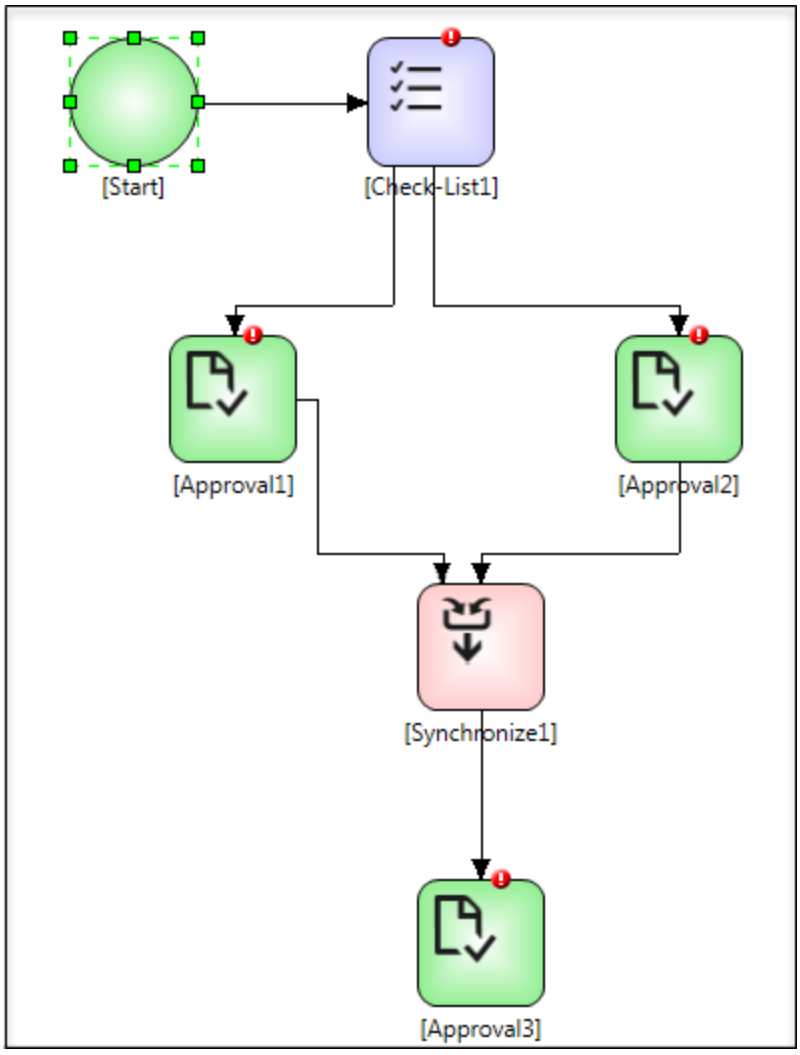
Activity outputs

The Synchronize Activity does not return any value.

Example for a Synchronize Activity:

Suppose an Employee applies for leave, then his leave has to be approved by two managers. When the leave is approved by both the managers, employee should get the information. In the following workflow, a checklist connected to approvals. The two approvals are connected to synchronize activity. Only when the output of both the approvals is approved the information will go to the applied user.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Set Workflow Output Variable

Activity description

The Set Workflow Output Variable activity can be used to set the output of the parent workflow from the child workflow.

Note: Alphanumeric, space, and dot are the only supported characters for workflow output variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

The Set Workflow Output Variable activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the tool bar or by selecting the appropriate option from the right-click menu for the Set Workflow output variable activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

You can use this property to configure the functionality of the activity.

Set Workflow Output - This property specifies the output of the workflow. You can specify the output value directly here or click the icon to open the Expression Builder and build an expression for the output.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

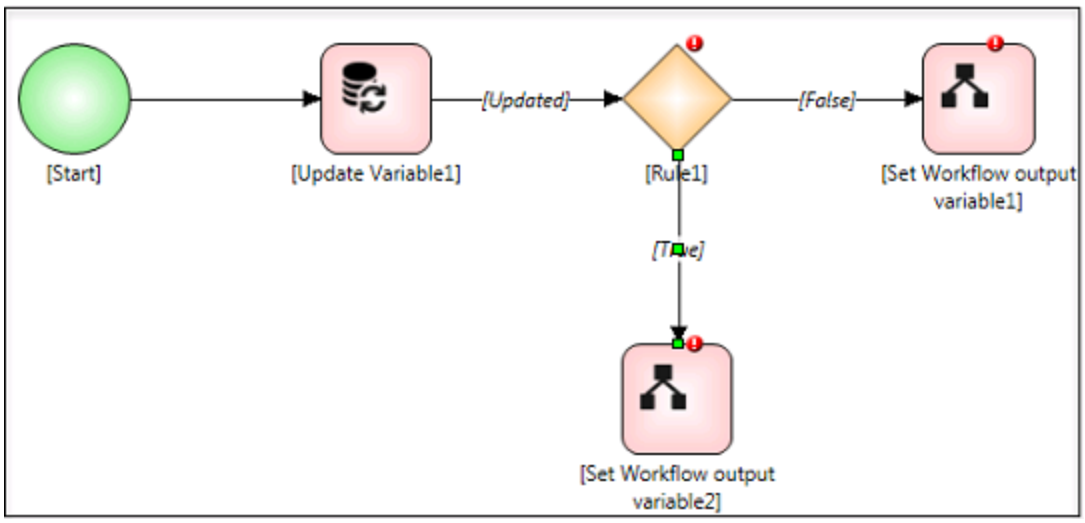
Activity outputs

The Set Workflow output variable Activity returns the output value set in the Set Workflow Output property.

Example for setting Workflow Output Variable

1. Design a workflow as shown in the below figure and name it as ChildWF.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

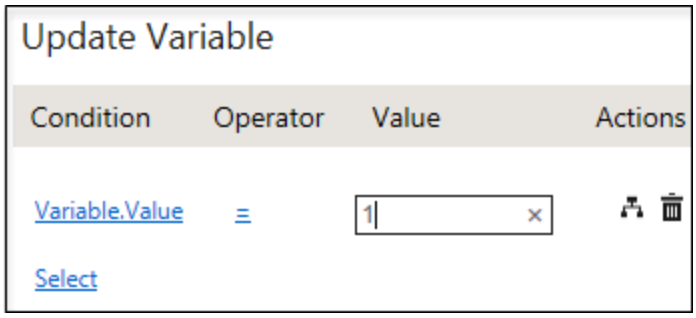


2. Perform the following actions:
   a. In the Start Activity, declare two variables Value and ParentWorkflowOutput as String.

Note: The user must declare a same variable name in the child workflow which was declared for the Parent workflow. In the above example, user must declare by the name "ParentWorkflowOutput" of type "String" in the child workflow.

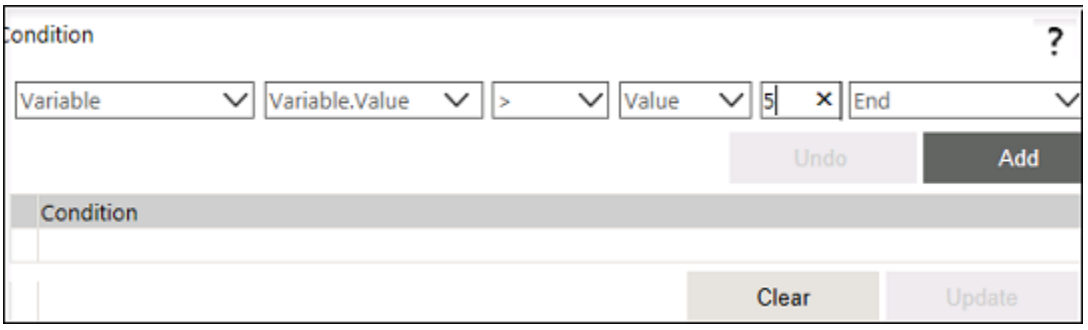
   a. In the Set Variable property of Update Variable set the value of variable Value as 1 as shown in the figure.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



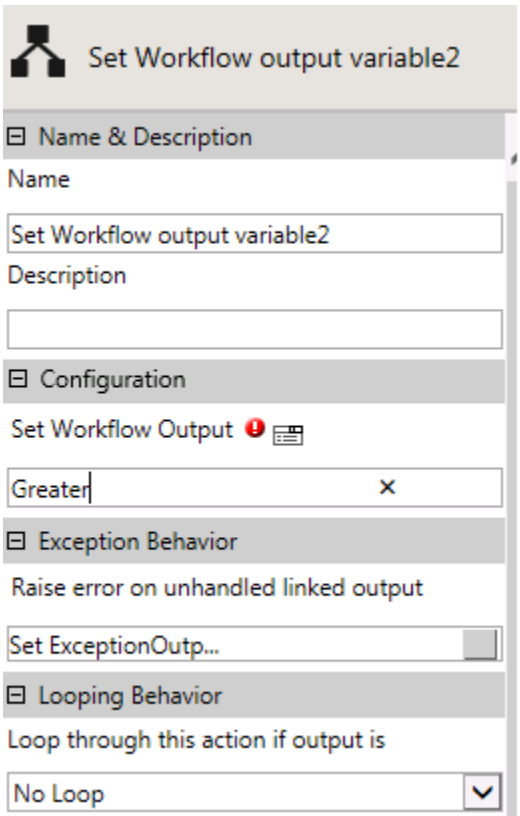
b. On the link connecting Update Variable and Rule activity set the output as Updated.

c. In the Configuration property of Rule, set the condition [Variable.Value]>["5"] as shown in the below figure.



d. On the link connecting Rule and SetWorkflowOutputVariable2 Activity set TRUE.

e. In the Set workflow output property of SetWorkflowOutputVariable2 Activity set it as Greater as shown in the following figure.

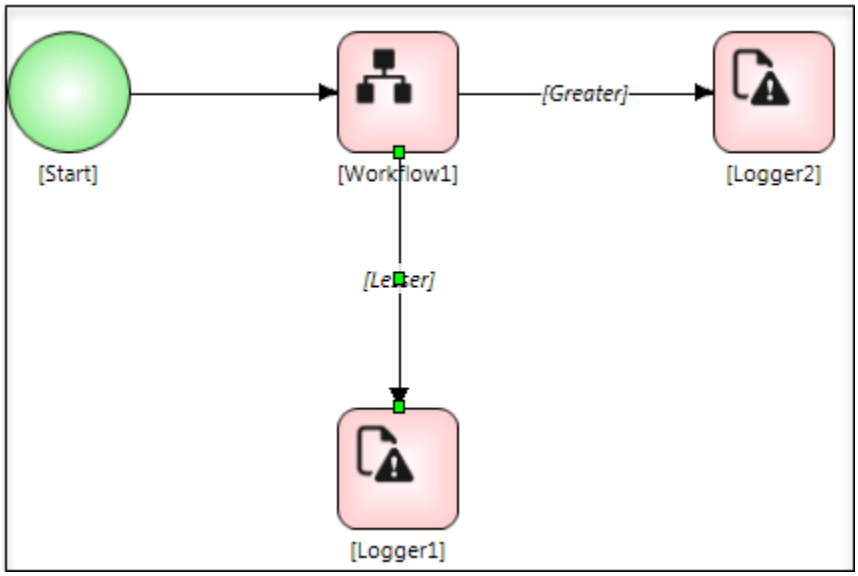


© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

f. On the link connecting Rule and SetWorkflowOutputVariable1 Activity set FALSE.

g. In the Set workflow output property of SetWorkflowOutputVariable1 Activity set it as Lesser as shown in the following figure.

3. Design a workflow as shown in the below figure and name it as ParentWorkflow.



4. Perform the following actions:

1. In the Repository property of Workflow Activity, enter Repository Name. For Example: SamRep.
2. In the Workflow property of Workflow Activity, select Previously created Workflow Name. For Example: ChildWorkflow.
3. In the Wait for the Child Workflow property, select "YES".
4. In the Execution Mode property, select "Asynchronous".
5. In the Return Values property of Workflow Activity:
   - Click Add Row and enter as "Greater"
   - Click Add Row and enter as "Lesser"
   - Click Update to save and click Close to close the window.
6. In the property LogType of Logger1, select Information.
7. In the Log Message of Logger1, enter as the following:

   '################ Lesser'
8. In the link connecting Logger1 and Workflow Activity1 set Lesser as output.
9. In the property LogType of Logger2, select Information.
10. In the Log Message of Logger2, enter as the following:

    '################ Greater'
11. In the link connecting Logger2 and Workflow Activity1, set Greater as output.

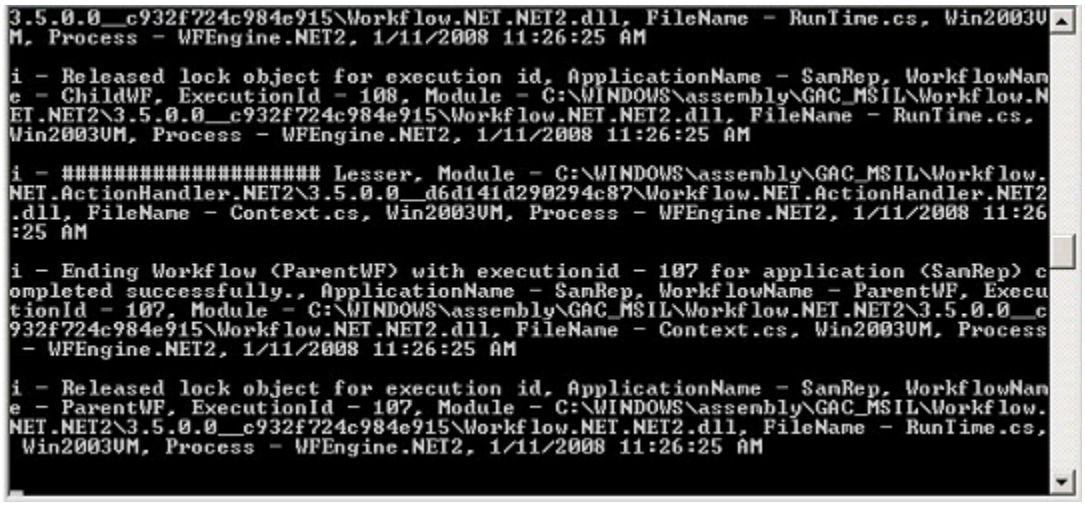
Summary : When you publish the parent workflow, the child workflow is also triggered and the path selected after the Rule activity is stored in the variable "ParentWorklfowOutput". The output of child workflow can be traced in the parent workflow.

Output: The ParentWF is published, and the workflow1 Activity invokes the ChildWF. Value of the variable Value

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

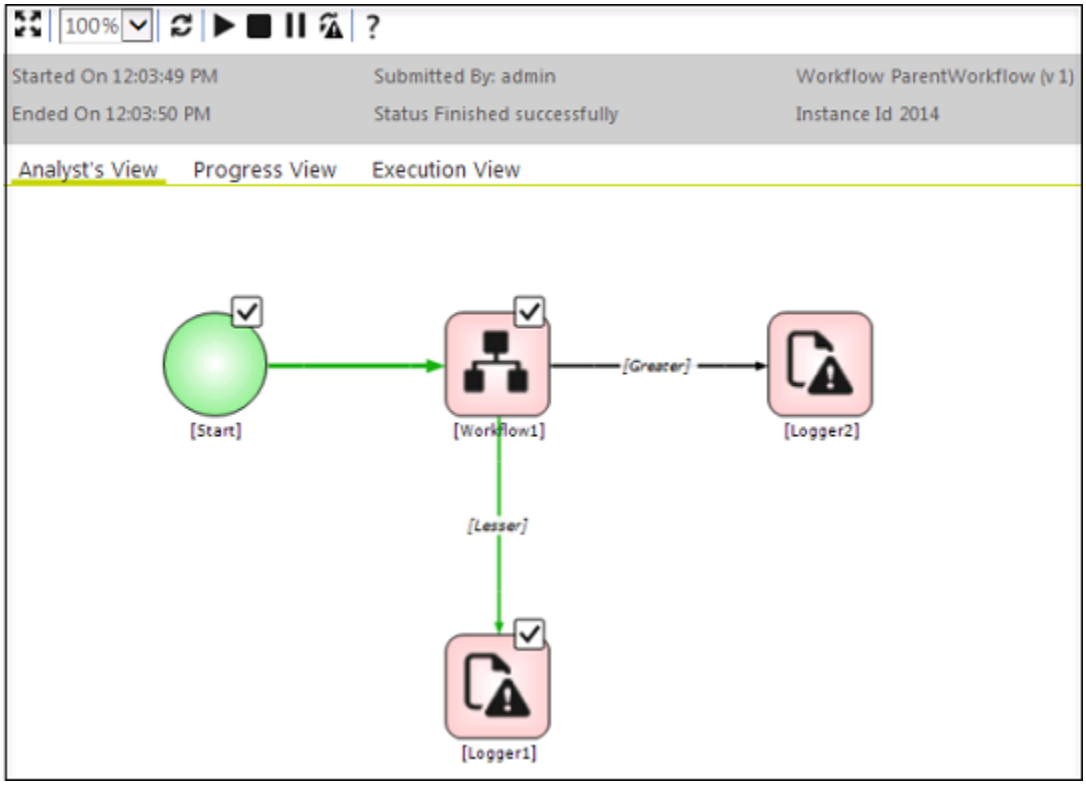
is set to 1 in Update Variable Activity.

Since the value of Variable value is less then five, the rule activity output is False. so the Set Workflow Output Variable2 is executed and the control is passed to the ParentWF. The value updated in Parent Workflow variable is Lesser and hence the output of the Workflow Activity is Lesser and the Logger1 is executed.



Start Activity in BAM

Parent Workflow in BAM:



Child Workflow in BAM

XML Navigator

Activity description

The XML Navigator is used to either locate or navigate to a specific record in a collection within an XMLIterator Variable. This activity enables identification of a specific record for execution of an activity or group of activities.

See also *Example of XML Navigator Activity*

Activity Properties

The properties of the XML Navigator activity can be configured in the Activity Properties window for that activity.

To access Activity Properties, do one of the following:

- Click Activity Properties in the Process Designer tool bar
- Right-click and select Activity Properties

Activity Properties for this activity are organized under:

Name & Description

Specify the name and description for the activity in this group.

Name - Enter the name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - Enter a brief description for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration

The Configuration group has properties for selection of the XMLIterator Variable to be looped through.

XMLIterator - Select the XML Iterator variable to be navigated. All XMLIterator variables as declared in Start activity are available for selection.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Create New Node - This field defaults to No. Select Yes to create a new blank node at the specified location.

Property Type: Optional (This property needs to be set only if necessary.)

Location - This field identifies the location to be navigated to. It defaults to First. The options are:

First: Navigates to the first record in the collection.

Last: Navigates to the last record in the collection.

Next: Navigates to the next record based on the current location.

Previous: Navigates to the previous record based on current location.

Index: Navigates to the record identified in the Index field.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Index - Enter the index number of the record to navigate to. This field is mandatory if the Location field is set to Index.

Property Type: Optional (This property needs to be set only if necessary.)

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs

The XML Navigator Activity returns the following values -

No more records: Indicates that all records have been looped through

Record Found: Indicates that a record is found in the collection

Index out of bounds: Indicates that the index entry specified in the location does not exist

Example for XML Navigator

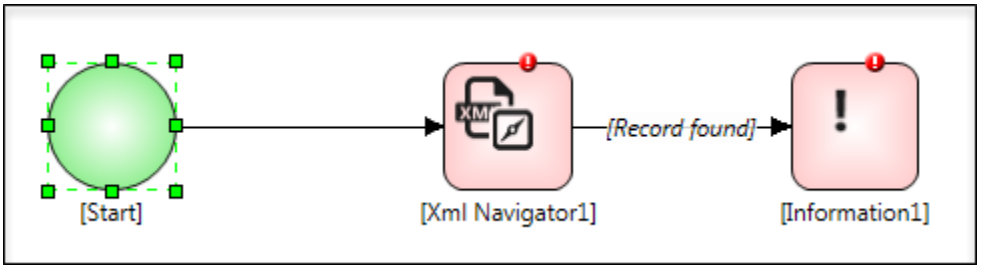
Consider already an XML file called Sample.XML is exists. The contents of it are as shown below.

```
<?xml version="1.0" encoding="utf-8"?>
<root>
<Item>
<itemdID>I001</itemdID>
<desc>some stuff1</desc>
<qty>10.20</qty>
</Item>
<Item>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

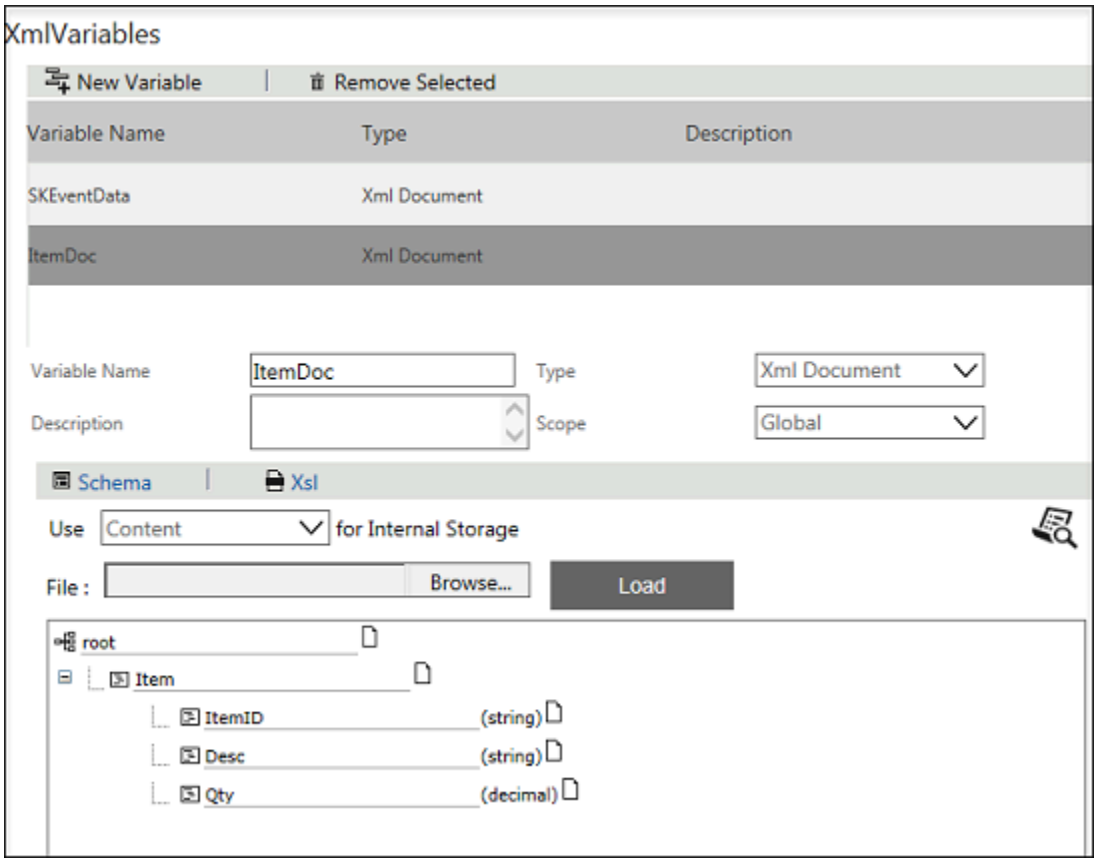
```
<itemdID>I002</itemdID>
<desc>some other stuff2</desc>
<qty>20.20</qty>
</Item>
<Item>
<itemdID>I003</itemdID>
<desc>some more stuff3</desc>
<qty>30.20</qty>
</Item>
</root>
```

Step 1: Design a Workflow as shown in the below figure.



Step 2: In the Start Activity, declare two XML Variables.

1. Click the New Variable link. Under Schema enter the following details:
   Variable Name: ItemDoc, Type: XML Document and Scope: Global
   Use Content for internal storage and browse the above created Sample.XML file and load it.

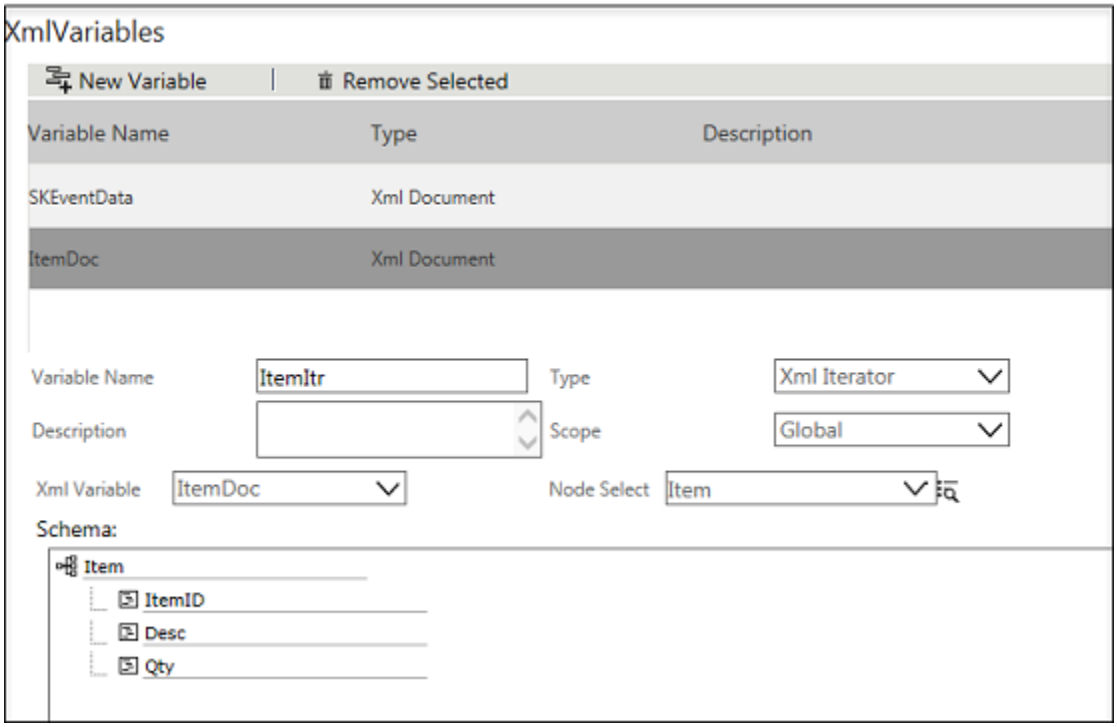


© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Click the **New Variable** link. Under Schema, enter the following details:

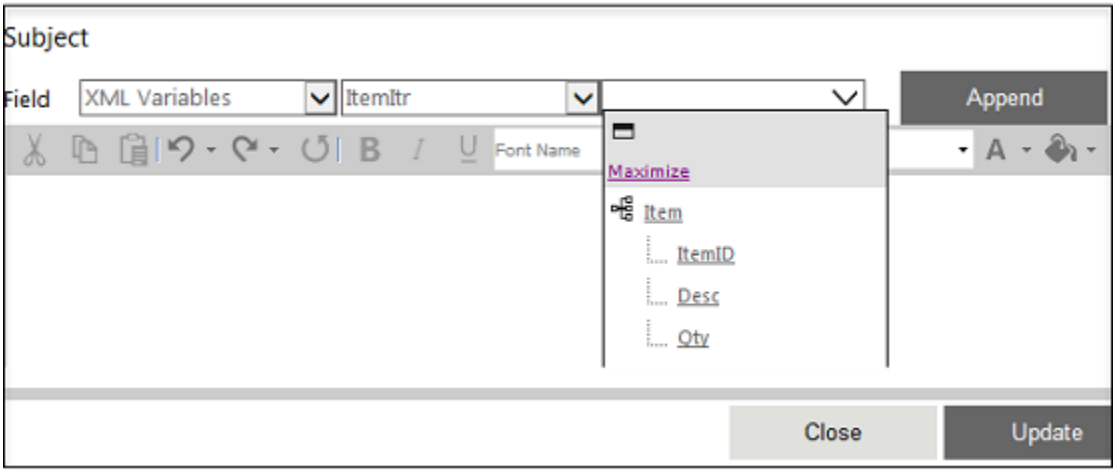
   Variable Name: ItemItr,
   Type: XML Iterator,
   Scope: Global,
   XML Variable: ItemDoc
   Node Select: Item

3. Click **Save Variable** and close the window



Step 3: In the location property of XML Navigator Activity, select "Last". For the XML Iterator property, select the Iterator created that is, ItemItr. In the Information Activity, the ItemItr is displayed in Subject column of the work item.

Step 4: Click the Subject property of Information activity, following window will open.



Select XML Variable form the first drop-down. In the second drop-down, select the Iterator created, that is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

ItemItr. In the third drop-down, select the Item ID from the tree displayed. Click **Append**, and then click **Update**.

Step 5: On the link connecting XML Navigator Activity and Information Activity, select "Record Found".

Output

The item ID will be displayed in the Subject Column of the Information in work item.

Scheduler Activities

The following activities are found under Scheduler Activities:

- **Set Custom Timer Activity**: The Set Custom Timer Activity can be used to schedule the execution of multiple tasks at specified times, set using the corresponding workflow variable.
- **Control Custom Timer Activity**: The Control Custom Timer Activity can be used to control a Set Custom Timer activity in the workflow dynamically.
- **Scheduler Activity**: The Scheduler Activity can be used to schedule a task at a specified time, set on the basis of weekly, daily as well as hourly schedules.
- **Time Trigger Activity**: The Time Trigger Activity can be used to put on hold workflow execution.

Control Custom Timer Activity

Activity Description

The Control Custom Timer Activity can be used to control a Set Custom Timer activity in the workflow dynamically. There can be multiple Control Custom Timer activities controlling a single Set Custom Timer activity at different stages of the workflow process.

Action Properties

The Control Custom Timer activity has to be configured by specifying appropriate values for the different properties in the Action Properties area. The Action Properties can be accessed by clicking on the Action Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Control Custom Timer activity. The Action Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the

functionality of the activity.

Action Name - This property allows the user to specify the name of the Set Custom Timer activity to be controlled.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Action Output - This property allows the user to specify the output of the Control Custom Timer activity. The drop down has three options – Pause, Resume, and Stop – to respectively pause, resume or stop the Set Custom Timer activity being controlled.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Note: When you pause an activity, the activity is paused, but the status of the activity does not change.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Control Custom Timer Activity returns the following values -

Successful: Displayed when the activity is successful in controlling the specified Set Custom Timer activity.

UnSuccessful: Displayed when the activity is unsuccessful in controlling the specified Set Custom Timer activity.

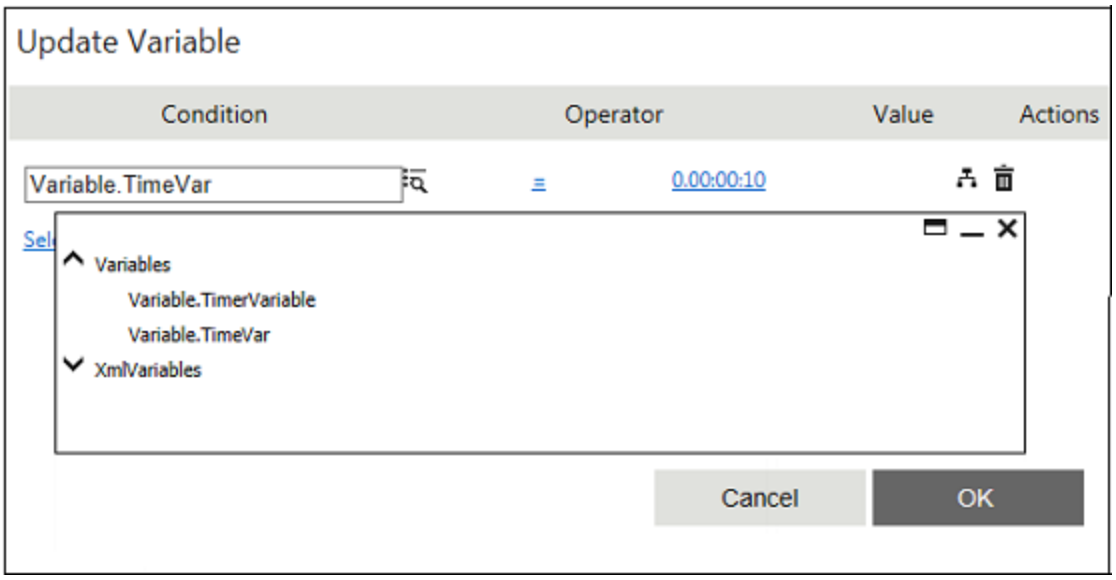
Example:

To control a Set Custom Timer activity in the workflow (See the workflow given below)

Step 1: In Start, declare "timevar" as String type.

Step 2: In **Update Variable**, assign specific value to "timevar" string.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

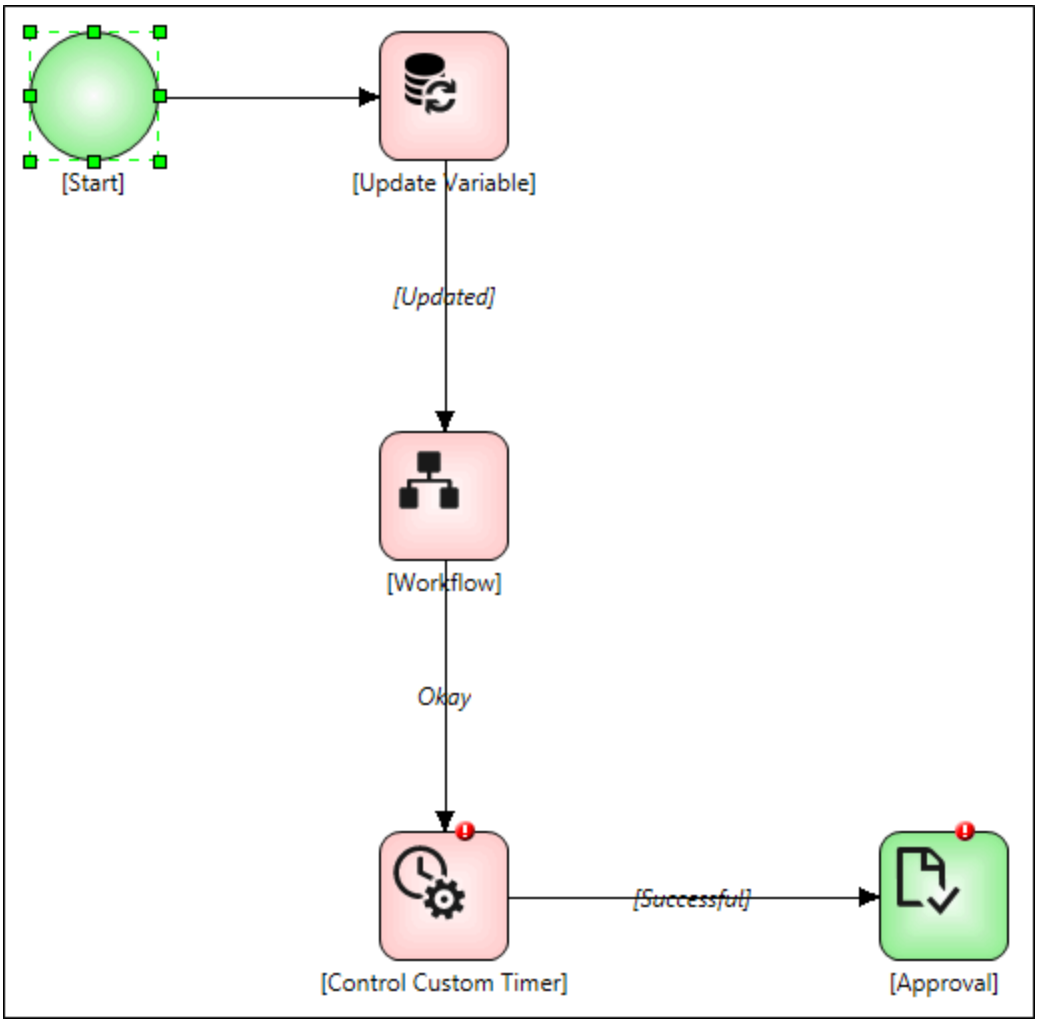


Step 3: In **Set Customer Timer activity** used to **schedule** the execution of tasks at specified times, set using the corresponding workflow variable.

Step 4: In **ControlCustomTimer** you can set the name of the **Set Custom Timer** activity to be controlled in Action Name (Here SkeltaWF is Set Custom Timer) and in Action Output you can Resume the workflow.

Output

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Note: The **Pause** and **Resume** functionality of Workflow is not supported in this activity.

Set Custom Timer Activity

Activity Description

The Set Custom Timer Activity can be used to schedule the execution of multiple tasks at specified times, set using the corresponding workflow variable. This workflow variable with the format '^[CustomTimerSetActionName]ExecutionDetailsId', is to be defined in the Start activity for each Set Custom Timer activity used in the workflow. The scheduling can be made recurring or non-recurring. The output of the activity can be linked to the next activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

The Set Custom Timer activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the tool bar or by selecting the appropriate option from the right-click menu for the Set Custom Timer activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Schedule Time - The Schedule Time property allows the user to specify the time setting for scheduling the specific workflow action.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the Schedule Time property

1. To specify the schedule time, click the button for the 'Schedule Time' property to open the property window.
2. In this window, select the variable with the schedule time setting from the **Variable Description** drop down.
3. If the schedule is to recur, specify "Yes" in the **Recurring?** drop down.
4. Specify the output of this activity in the **Output** field.
5. After entering the details, click **Add Row** to add this schedule time setting and display a new row.
6. Remove rows if necessary by selecting them and clicking the **Remove Selected** button.
7. After setting the XML data to the variables, click **Update**.

See Set Custom Timer: Schedule Time for a detailed description of the Schedule Time property window.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity outputs:

The Set Custom Timer Activity returns the following values -

Paused: Displayed when the controlled activity is paused

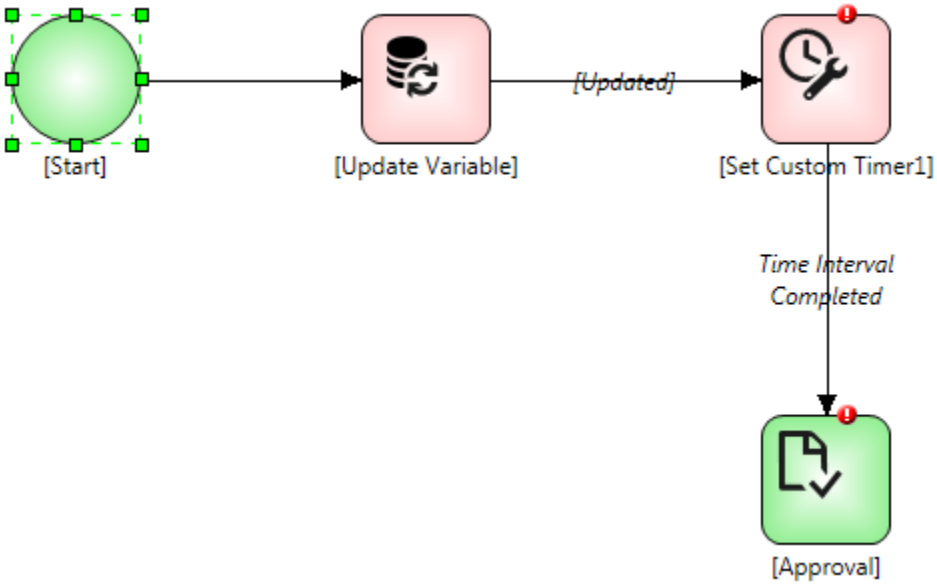
Resumed: Displayed when the controlled activity is resumed

Stopped: Displayed when the controlled activity is stopped

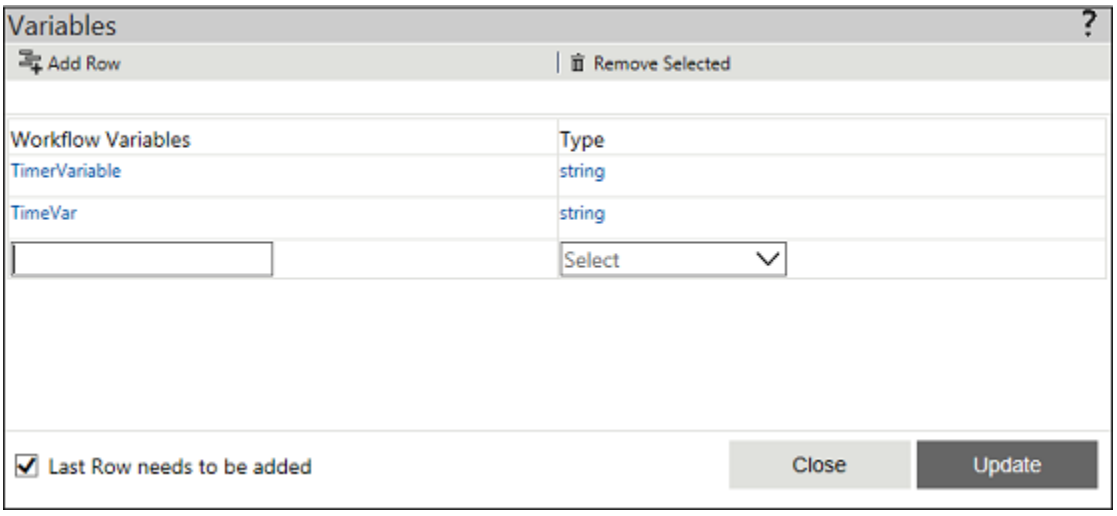
In addition to these standard return values it also returns the scheduled time as output.

Example for a setting Custom Timer Activity:

Step 1: Design a workflow as shown below.



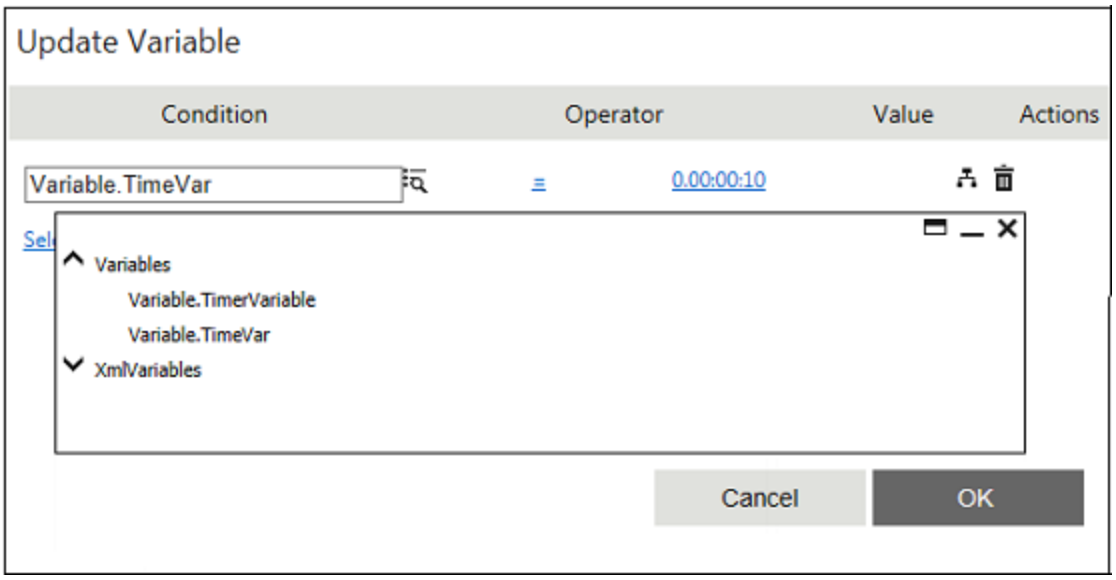
Step 2: Declare a variable of type String in the Start activity. For example, TimerVariable as shown in the below figure.



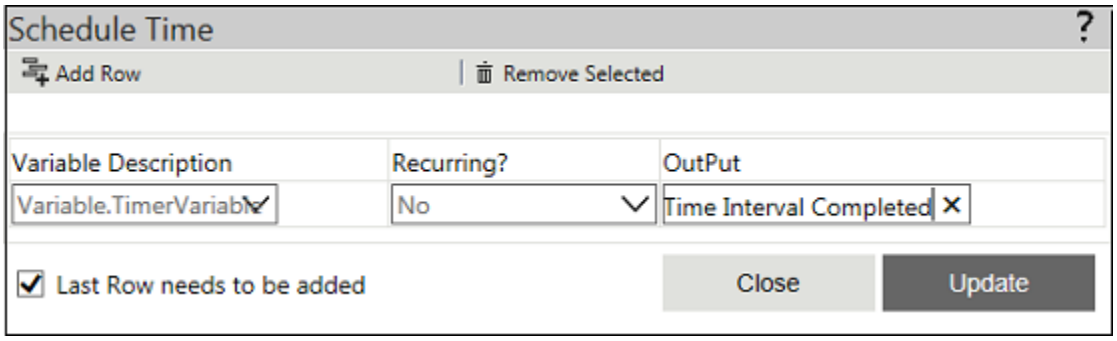
Step 3: This variable is updated using the engine activity "Update Variable ".

For example, Timer Variable = 0.00:00:10 means 10 seconds.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Step 4: On successful updating of the variable, set custom timer activity.



When there is a schedule time over the information is sent to the assigned actor.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details

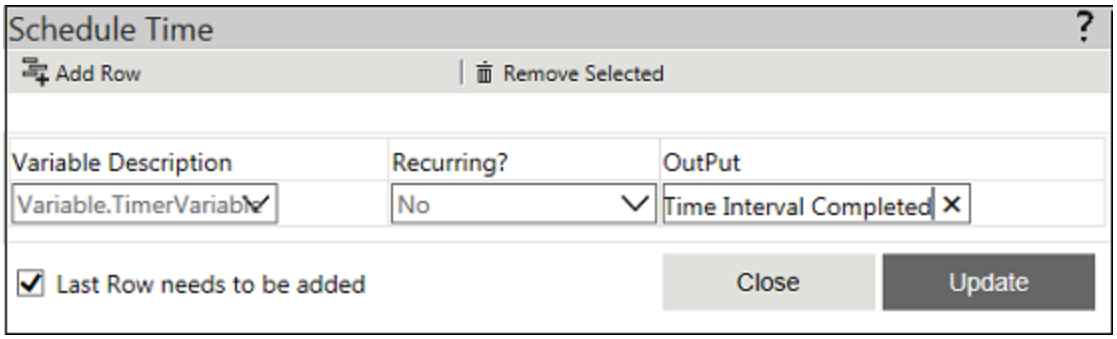
Note: The **Pause** and **Resume** functionality of Workflow is not supported in this activity.

Set Custom Timer: Schedule Time

Schedule Time Property window

You can set the schedule time property for the Set Custom Timer activity, used to execute some other activity, in this property window. To open this window, click the button for the 'Schedule Time' property. The time is assigned to workflow variables in this window. It displays the settings for the variables in a grid, which also has a blank row where you can enter the settings for a new variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Schedule Time property

The window has two tabs at the top to manage the rows of schedule settings in the grid.

- **Add Row** - You can click this tab to add the newly entered schedule settings and display a new row to the grid where you can add another schedule setting
- **Remove Selected** - You can click this tab to remove the schedule setting selected in the grid.

The grid has the following parameters that you need to specify for the new schedule.

- **Variable Description** - You can select the workflow variable, which holds the schedule time for the execution of the specified workflow activity, from the drop down for this field.
- **Recurring?** - You can select "Yes" in this drop down to indicate that the schedule is recurring.
- **Output** - You can enter the output message for this activity in this field.

There are two buttons and a check box at the bottom of the screen.

- **Update** - You can click this button to save the newly added schedule settings.
- **Close** - You can click this to close the property window without saving the newly added schedule settings.
- **Last Row needs to be added** - You need to select this check box to save the last row added.

Scheduler Activity

Activity Description

The Scheduler Activity can be used to schedule a task at a specified time, set on the basis of weekly, daily as well as hourly schedules. The output of the activity can be linked to the next activity. There is an option to set the recurrence count so that the user can restrict the number of recurrences.

Activity Properties

The Scheduler activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the tool bar or by selecting the appropriate option from the right click menu for the Scheduler activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Scheduler Details - The Scheduler Details property allows the user to specify the time settings for scheduling the specific workflow activity.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Scheduler Details property

1. To specify the Scheduler Details, click the button for the 'Scheduler Details' property to open the property window.
2. Click on one of the three tabs - **Weekly**, **Time Span**, and **Date Criteria** - to set the corresponding property value.
3. By default, the first tab, i.e. **Weekly**, is selected and the corresponding user interface is shown. You can specify the weekly schedule settings here.
4. Select the day of the week on which the activity is to be scheduled from the Time drop down.
5. Next specify the time at which the scheduled activity should be executed on the selected day in the **hh:mm:ss** field in the "hh:mm:ss" format.
6. Now, click the **Recurring?** check box to schedule the activity to recur.
7. If it is to recur more than once, specify the count in the **Recurrence Factor/Count** field.
   - If the count is set to '0' then the activity keeps on recurring.
   - If it is set to '2' the activity ends after the second recurrence.
   - If it is set to '1' or 'NO' the activity recurs only once.
8. If the **Time Span** tab is clicked, it displays the corresponding user interface. You can specify a time span for the execution of the activity here.
9. Enter the time interval of the schedule in the first field, in the "d.hh:mm:ss" format, where "d" denotes the number of days the schedule is set for while the time setting denotes the number of hours, minutes, or seconds. For example, if this value is set as 0.00:30:00, the activity will be executed every 30 minutes. If it is set as 1.00:30:00, the activity will be executed every 1 day and 30 minutes or 24 hours and 30 minutes.
10. Click the **Recurring?** check box to schedule the activity to recur.
11. If it is to recur more than once, specify the count in the **Recurrence Factor/Count** field.
12. If the **Date Criteria** tab is clicked, it displays the corresponding user interface. You can specify a date based schedule here.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

13. Here, the date value can be selected using Content or Variable collection or by entering discrete values.
14. After specifying the value you must select one of two options - "Initiate before" or "Initiate after" - from the next drop down and then specify the time interval in number of days in the field provided.
15. After making all the schedule settings, click **Update** to save the settings.

See Scheduler: Scheduler Details for a detailed description of the Scheduler Details property window.

Output Path - The Output Path property allows the user to specify the output path that can be used to link to the next activity, and can be treated as the output of the Scheduler activity.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

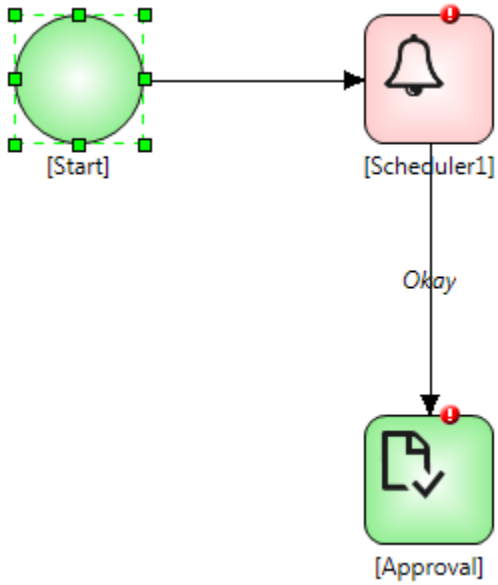
Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Scheduler Activity does not have any standard return value. It will output the value specified by the user in the Output Path property.

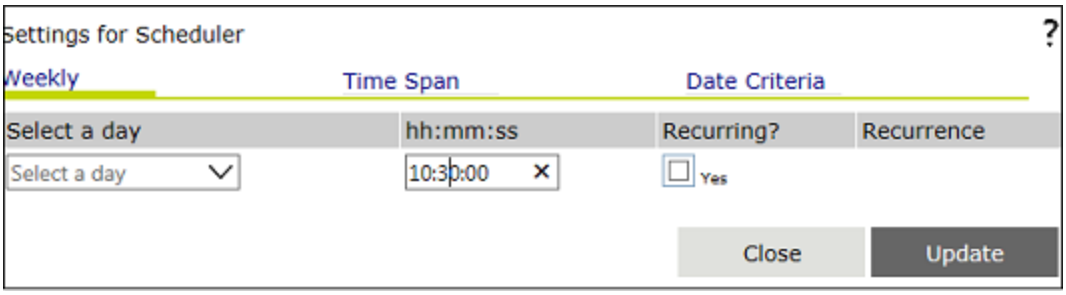
Example for scheduling an activity on every Monday at 10.30 a.m:

Step 1: Design a workflow as shown in figure.



Step 2: Click the 'Scheduler Details' property and select Scheduler Details, following image appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Step 3: Select a day and set the time and click on the **Update** button to save the settings.

Step 4: Set the value for Output Path.

Step 5: Set Actor for approval.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

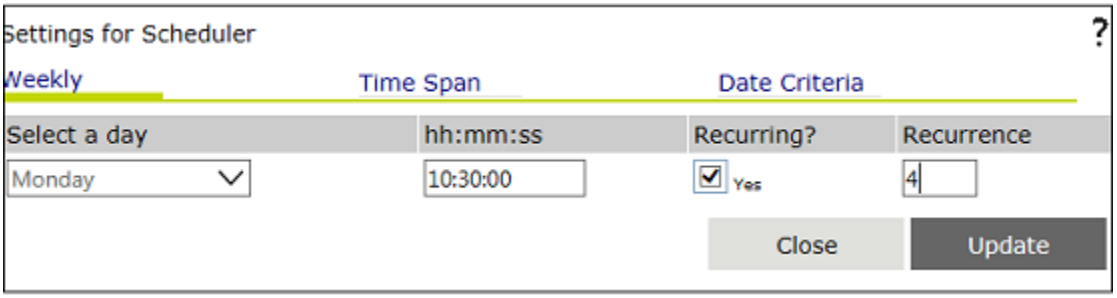
Note: The **Pause** and **Resume** functionality of Workflow is not supported in this activity.

Scheduler: Scheduler Details

You can set the Scheduler Details settings in this property window. To open this window, click the button for the 'Scheduler Details' property. It has three tabs - **Weekly**, **Time Span**, and **Date Criteria** - to set the corresponding property value.

Weekly settings

By default, the first tab, i.e. **Weekly**, is selected. The user interface corresponding to this tab is shown in the image below. You can specify the weekly schedule settings here.



Weekly Settings for Scheduler Details property

This window has the following parameters for setting the weekly schedule.

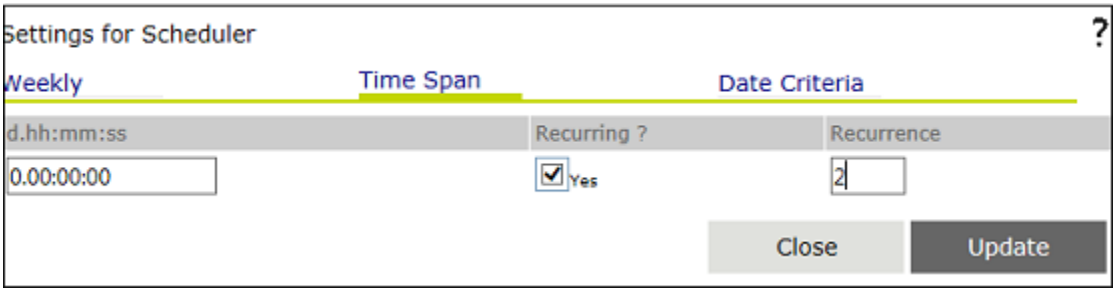
- **Select a day** - You can select the day of the week on which the activity is to be scheduled from the drop down for this field.
- **hh:mm:ss** - You can specify the time at which the scheduled activity should be executed on the selected day in this field in the "hh:mm:ss" format.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Recurring ?** - You can select this check box to schedule the activity to recur. This will enable the next field.
- **Recurrence** - If the schedule is to recur more than once, you must specify the count in this field.

Time Span settings

If the **Time Span** tab is clicked, it displays the user interface shown in the image below. You can specify a time span for the schedule here.



Time Span Settings for Scheduler Details property

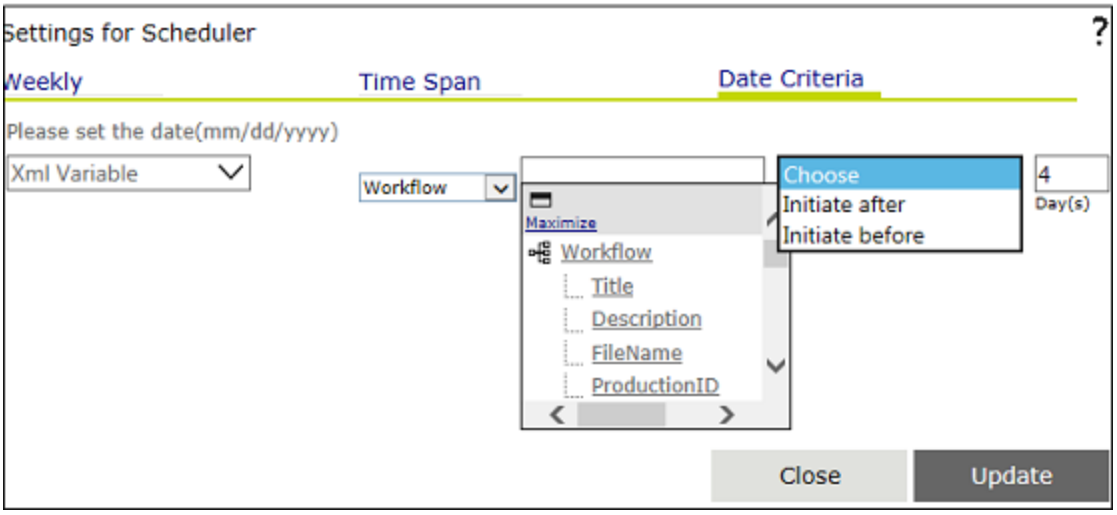
This window has the following parameters for setting the time span schedule.

- **d.hh:mm:ss** - You can enter the time interval of the schedule in this field, in the "d.hh:mm:ss" format, where "d" denotes the number of days the schedule is set for while the time setting denotes the number of hours, minutes, or seconds. For example, if this value is set as 0.00:30:00, the activity will be executed every 30 minutes. If it is set as 1.00:30:00, the activity will be executed every 1 day and 30 minutes or 24 hours and 30 minutes.
- **Recurring?** - You can select this check box to schedule the activity to recur. This will enable the next field.
- **Recurrence** - If the schedule is to recur more than once, you must specify the count in this field.

Date Criteria settings

If the **Date Criteria** tab is clicked, it displays the user interface shown in the image below. Here, you can specify a date-based schedule.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



This window has the following controls for setting the date criteria schedule.

- The XML Variable drop down - You can select the XML variable from the list.
- The XVAR drop down - You can select the date value from this list.
- The schedule criteria drop down - You can select one of two options in this drop down - "Initiate before" or "Initiate after".
- The time interval field - You can specify the time interval in number of days in this field.

Update - Click this option to save the newly added schedule settings.

Close - Click this option to close the property window without saving the newly added schedule settings.

Reschedule Failed Tasks

You can reschedule failed tasks using the taskscheduler service. By default, this feature is disabled. You need to manually enable this feature by modifying the farm database, as per configuration shown below:

Open the farm database and edit the SKService table.

Update the Properties field of the record corresponding to the task scheduler with the code shown below:

Select Properties from SKService where Name='SkeltaTaskScheduler2'

```
<properties>
<property key="loadbalanced"> <![CDATA[False]]></property>
<property key="loadbalanceserverport"><![CDATA[8853]]></property>
<property key="loadbalanceclientport"><![CDATA[8860]]></property>
<property key="port"><![CDATA[8856]]></property>
<property key="fileWatcher"><![CDATA[]]></property>
<property key="maxThreads"><![CDATA[25]]></property>
<property key="serviceexe"><![CDATA[TaskSked.NET2.exe]]></property>
<property key="displayname"><![CDATA[Skelta - Task Scheduler]]></property>
<property key="enableReScheduling"><![CDATA[true]]></property>
<property key="lastUpdatedDateTime"><![CDATA[]]></property>
<property key="retryCount"><![CDATA[]]></property>
<propertykey="noOfrecordsforreshedulingTasks"><![CDATA[]]></property>
<property key="rescheduletimeinterval"><![CDATA[]]></property>
<property key=" repositories"><![CDATA[]]></property>
</properties>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration details

- enableReScheduling : If this property key is missing or if it is set to False, the rescheduling feature is disabled. By default, this property will not be added. You need to manually add this property and set it to True to reschedule the failed tasks.
- LastUpdatedDateTime: If this property is configured, only the failed tasks whose LastUpdatedDateTime is greater than configured are fetched for rescheduling. By default this value is null and all the failed tasks will fetched if rescheduling is enabled.
- retryCount: This property sets the number of times that the failed tasks should be rescheduled. The default value is three.
- noOfrecordsforreshedulingTasks: This property sets the total number of failed records to be fetched for rescheduling. The default value is 15.
- rescheduletimeinterval: This property sets the time period for which the task scheduler service tries to fetch and reschedule the failed tasks. The default value is 10 minutes.

  Note: 0.00:20:00 indicates that the interval is configured for 20 minutes. This value should always be greater than the fetch interval time.
- repositories: This property performs rescheduling only for the specific repositories. By default, this property value is empty, and all the repositories will be considered for rescheduling if this feature is enabled.

Time Trigger Activity

Activity Description:

The Time Trigger Activity can be used to put on hold workflow execution. It is useful in ensuring the execution of certain activities at specific times. Conditional routing can be performed for different timeouts. Multiple non-recurring timeouts can be scheduled using this activity.

Activity Properties:

The Time Trigger activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the tool bar or by selecting the appropriate option from the right click menu for the Time Trigger activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Timer Trigger - This property allows the user to specify the timeout(s) for triggering activities in the workflow. This will induce a delay in the execution of the affected activities.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Timer Trigger property

1. To specify the timer trigger, click on the button for the 'Timer Trigger' property to open the property window.
2. In this window, enter the time interval for the timer trigger in the **Time Interval** field.
3. Specify the output of this activity in the **Output** field.
4. After entering the details, click **Add Row** to add this timer trigger setting and display a new row.
5. Remove rows if necessary by selecting them and clicking **Remove Selected**.
6. After setting the timer trigger settings, click **Update**.

See Time Trigger: Timer Trigger for a detailed description of the Timer Trigger property window.

Activity outputs:

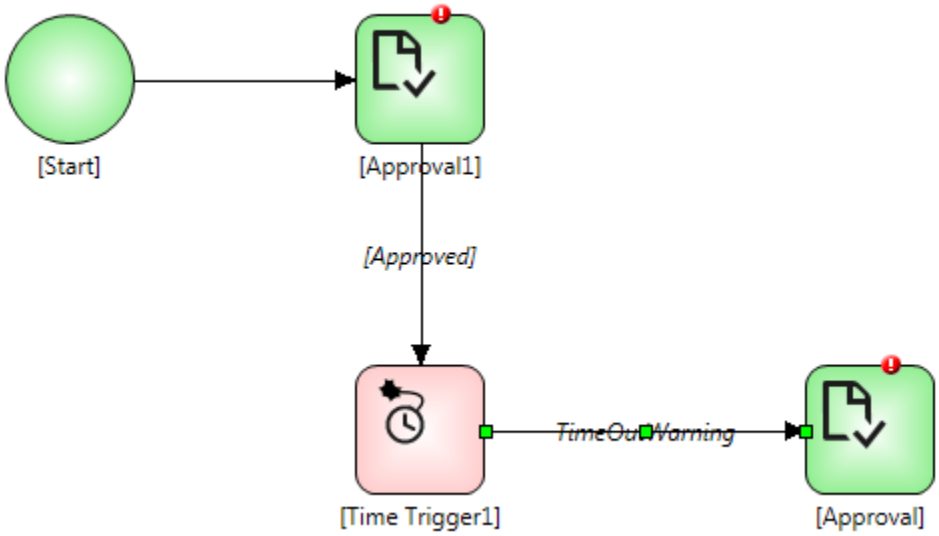
The Time Trigger Activity does not have any standard return value. It will output the value specified by the user in the **Time**

Trigger property.

Example for Time Trigger Activity

To hold workflow execution from Approver1 to Approver2, Use Time Trigger Activity for particular time.

Step 1: Design a workflow as shown in the figure below.



Step 2: Select the Time Trigger Property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Step 3: Set the Time Interval and specify the output value in output field.

Step 4: Click Update button to save changes.

Exception Behavior

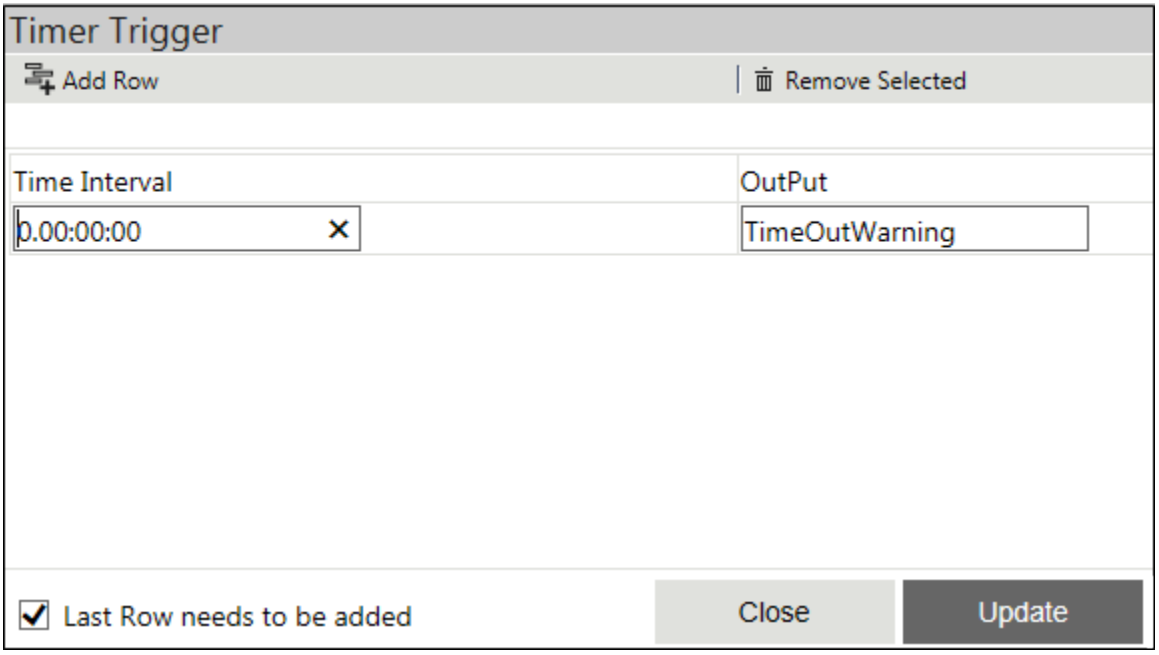
Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Note: The **Pause** and **Resume** functionality of Workflow is not supported in this activity.

Time Trigger: Timer Trigger

You can set the Timer Trigger settings in this property window. To open this window, click the button for the 'Timer Trigger' property. It displays the timer settings in a grid, which also has a blank row where you can enter the settings for new timer trigger.



The window has two tabs at the top to manage the rows of timer trigger settings in the grid.

- **Add Row** - You can click this tab to add the newly entered settings and display a new row to the grid where you can add another setting.
- **Remove Selected** - You can click this tab to remove the timer trigger settings selected in the grid.

The grid has the following parameters that you need to specify for the new timer trigger setting.

- **Time Interval** - You can use this field to set the time interval for the timer trigger.
- **Output** - You can enter the output message for this activity in this field.

There are two buttons and a check box at the bottom of the screen.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Update** - You can click this button to save the newly added timer trigger settings
- **Close** - You can click this to close the property window without saving the newly added timer trigger settings
- **Last Row needs to be added** - You need to select this check box to save the last row added.

Communication Activities

There are two main types of Communication activities:

- Notification Activity: The Notification Activity is incorporated in the workflow process design to send notifications to actors in the form of email.
- AVEVA Work Tasks Pro Push Notification Activity: The AVEVA Work Tasks Pro Push Notification activity is used to send notifications to the AVEVA Work Tasks Pro application.

Email Activity

Activity description

The Email Activity can be used to send an email to a selected set of actors. The actors(s) can be selected by building a query. The workflow engine evaluates this query and sends an email to all the actors resulting from the query. If no actor is selected the email will be sent to all the actors. The subject and body of the email can be customized by appending the resource properties available.

Adding Email attachments using Contents and Variables:

Steps to add Email attachments using Workflow Variables:

To set email attachments using variable, prefix the variable name with "^[ActivityName]".

For example, for the activity named "EmailNotification", name the variable as "^EmailNotificationattachments". Set the value for the variable with physical paths to the file. Use semi-colon as separator to set multiple files.

Steps to add Email attachments using Contents:

To send file attachments with the email, add a content with a name prefixed by the activity name followed by attachments. For example, if a file attachment has to be sent along with an email from an activity named 'EmailNotification', add a content with 'EmailNotificationattachments' as its name. The XPath expression should select the nodes which contain the path for the files to be attached. For example, //fileattachments.

Note:
- Supported file types for attachment include .au, .avi, .bas, .bmp, .cda, .cdr, .chf, .dic, .doc, .docx, .dot, .drw, .dwg, .dxf, .eml, .eps, .gif, .gz, .htm, .html, .ico, .img, .jpeg, .jpg, .ldb, .log, .mid, .midi, .mov, .movie, .mp1, .mp2, .mp3, .mpeg, .mpg, .msg, .nws, .obd, .oft, .pcl, .pcx, .pdd, .pdf, .pic, .pot, .pps, .ppt, .pptx, .pub, .qbb, .qbw, .qdb, .ra, .shtml, .snd, .text, .tga, .tif, .tsv, .ttf, .txt, .uu, .vir, .wb2, .wbk, .wiz, .wk4, .wks, .wpd, .xlk, .xls, .xlsx, and.xlt.

- If the XPath Expression represents an Attachment control node in the Form XML Variable, then the attachment would be added to the Email only if the Attachment value is as per the Attachment control in the form with the properties **Storage Type** as **Database** and **Security Mode** as **Encryption**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

The Email activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Email activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to specify the content of the notification.

To Resource - This property specifies the resource(s) to whom the email is to be sent.

Property Type: Mandatory (This property must be set if the action is to be assigned to any resource(s).)

Steps to set the To property

1. To specify the actors to receive the email, click the button for the 'To' property to open the property window.
2. In this window, build an expression to select the actors using the actors properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Email: ToResource for a detailed description of the To property window.

See the Using XML Variables section in the About XML Variables topic for details on how to use the XMLVariables to build the expression.

To Email Address - This property is used to send an email to a user who is not a part of the resource provider. To send an email at an address that is a part of the resource provider the ToResource property is used.

Scenario

XYZ organization is one of the leading product development companies. Every new feature or product released

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

needs to be notified to all customers. John Smith is one among the them.

The Email activity can be used for this. The **To Email Address** property should be set to John Smith's email address. Whenever the new feature or product is released, the workflow gets trigged to send an email to John Smith.

Features of the To Email Address Property:

The following are the features of the To Email Address property:

- It is possible to send an email at any email address using the Expression Builder or directly entering the email address in the field.
- It is possible to use the variables, XML variables and content, or any expression to set the email address to the property.

Configuration

To configure **To Email Address**, complete the following steps:

1. Right-click **Email Activity** to go to the **Activity Properties**.
2. Set the **To Email Address** property to send email to the resource who is not a part of the resource provider.

Note: If both **ToResource** and **To Email Address** values are set then the **ToResource** property is considered for sending the email.

BCC - This property specifies the resource(s) email id to which a copy of the email is to be sent as a Blind Carbon Copy. To specify the email recipient type the email id directly into the field.

Property Type: Optional (This property needs to be set only if required.)

BCCResource - This property specifies the resource(s) to whom a copy of the email is to be sent as a Blind Carbon Copy. To select the resource(s) click the button against 'BCCResource' in the Properties pane of the Process Designer. In the window that pops up, build the condition for selecting the resource(s) and click Update button.

Property Type: Optional (This property needs to be set only if required.)

Steps to set the BCCResource property

1. To specify the actors who will receive the email as BCC, click the button for the 'BCCResource' property to open the property window.
2. In this window, build an expression to select the actors using the actors properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Email: BCC Resource for a detailed description of the BCCResource property window.

See the Using XML Variables section in the About XML Variables topic for details on how to use the XMLVariables

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

to build the expression.

CC - This property specifies the resource(s) email id to which a copy of the email is to be sent as a Carbon Copy. To specify the email recipient type the email id directly into the field.

Property Type: Optional (This property needs to be set only if required.)

CCResource - This property specifies the resource(s) to whom a copy of the email is to be sent as a Carbon Copy. To select the resource(s) click the button against 'CCResource' in the Properties pane of the Process Designer. In the window that pops up, build the condition for selecting the resource(s) and click Update.

Property Type: Optional (This property needs to be set only if required.)

Steps to set the CCResource property

1. To specify the actors who will receive the email as CC, click the button for the 'CCResource' property to open the property window.
2. In this window, build an expression to select the actors using the actors properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Email: CCResource for a detailed description of the CCResource property window.

See the Using XML Variables section in the About XML Variables topic for details on how to use the XMLVariables to build the expression.

Subject - This property specifies the subject of the email. The subject can be customized for each resource.

Property Type: Optional (This property need not be set. If it is not set, the default subject line from the Actions.xml file is displayed.)

Steps to set the Subject property

1. To specify the subject, click the button for the 'Subject' property to open the property window.
2. In this window, enter the subject text directly in the text editor.
3. If you want to customize the subject you can do so using the Field controls to add resource property values. For example, to add a subject that includes the email id of the actor submitting the approval request, you can do as follows: Type in the text "Expense Statement of ". Select "Variable" and "Variable.SubmittedBy.Email" from the two drop downs for Field and click Append. This will add the placeholder for the variable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the email id.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the subject, click **Update** to save it.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. Click **Close** to close the window without saving the subject.

See Email: Subject for a detailed description of the Subject property window.

Body - This is the actual content of the email sent to the resource(s). The body can be customized for each resource.

Property Type: Mandatory (This property needs to be set.)

Steps to set the Body property

1. To specify the message body, click the button for the 'Body' property to open the property window.
2. In this window, enter the body text directly in the text editor.
3. If you want to personalize the body you can do so using the **Field** controls to add resource property values. For example, to add a body that includes the name of the actor submitting the approval request, you can do as follows: Type in the text "Hello". Select "Variable" and "Variable.SubmittedBy.name" from the two drop downs for **Field** and click **Append**. This will add the placeholder for the variable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the name, resulting in a personalized salutation. Type in a message in the next line to complete the message body.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the body, click **Update** to save it.
7. Click **Close** to close the window without saving the body.

See Email: Body for a detailed description of the Body property window.

Send only one copy to CC/BCC recipients - This property specifies whether to send multiple copies of the Email to CC/BCC recipients. The default setting is 'No'. This property is useful in case there are multiple recipients specified in the 'To' property and only one (or a number less than specified in the 'To' property) recipient in the CC or BCC property. If this properties is set to 'Yes', and there are 5 recipients specified in the 'To' property and one in the CC property, then the CC recipient will receive 5 copies of the same email.

Property Type: Optional (This property needs to be set only if necessary.)

Mail Format - This property specifies the format of the Email. If the value 'HTML' is selected, then the Email will be in the HTML format. If the value 'TEXT' is selected, then the Email will be in plain text format.

Property Type: Optional (This property needs to be set only if necessary.)

Attach Reports

This property is used to configure report to be sent as an email attachment.

Property Type: Optional (This property needs to be set only if necessary.)

The following image shows the Attach Reports property:

Steps to set the Attach Reports Property

1. To specify the **Attach Report** property, click the edit icon to open the property window. The **Attachment Configuration** dialog box appears.
2. In the **Attach Report** property, you can attach a report by selecting the **Report Reference Variable** through the Expression Editor. Alternatively, you can get the Report by clicking the **Report** icon and selecting the required report from the Reports list screen. To attach multiple reports, click **Add** to add new rows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Click **Submit**.

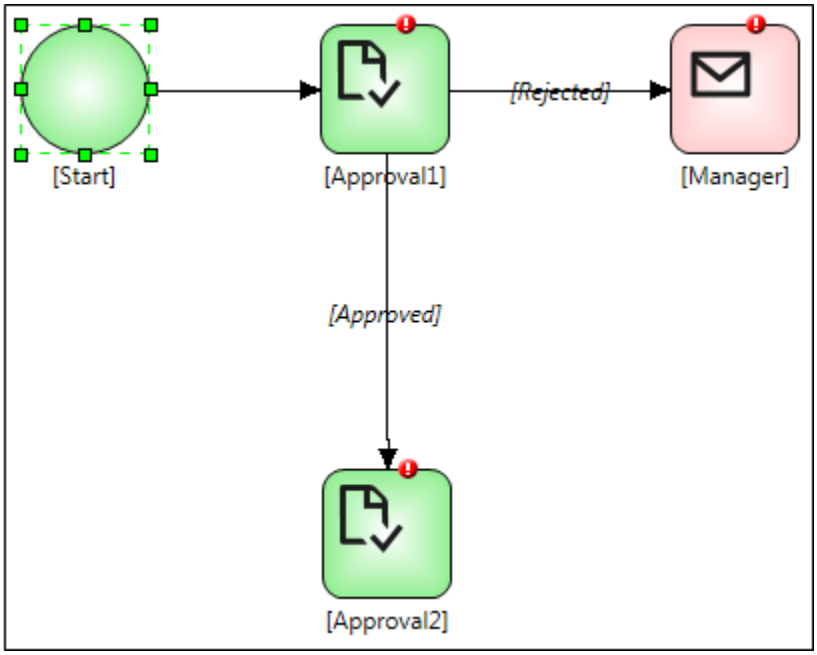
See Email: Attach Reports for a detailed description of this property.

Activity outputs:

The Email Activity does not return any value.

Example for Email Activity

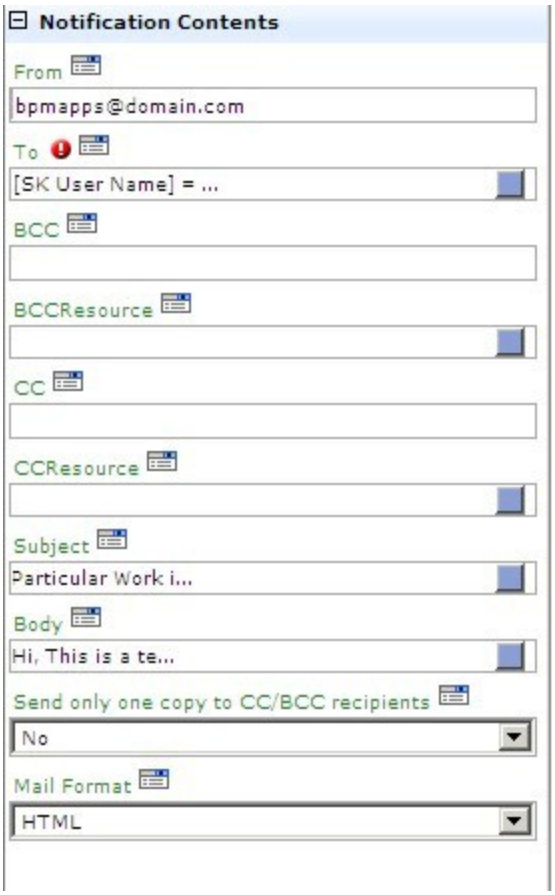
In the following workflow, if a Approver rejects the mail will send to Manager.



Approver 1: If approver1 Rejected a mail, it will send to Manager. If approver1 Approved a mail, it will go for the next Approver, that is Approver2.

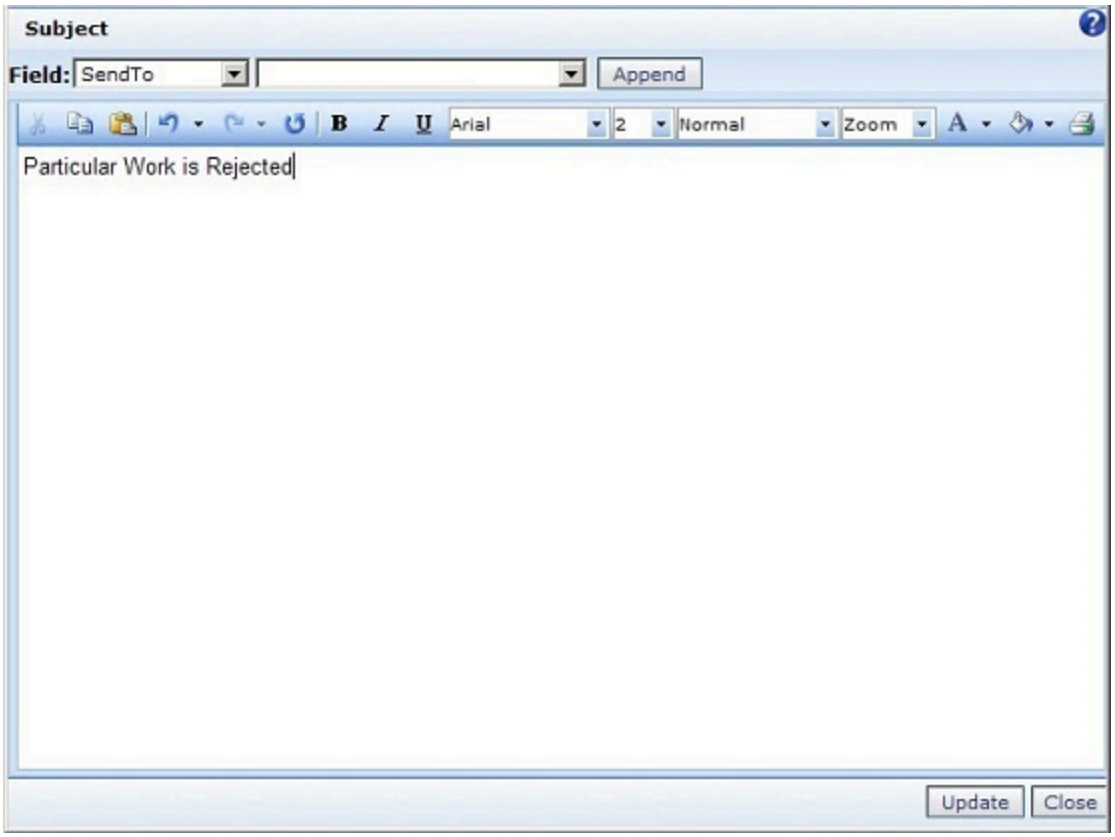
Manager: In Email activity, specifies the resource(s) to whom the email is to be sent in **To** property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

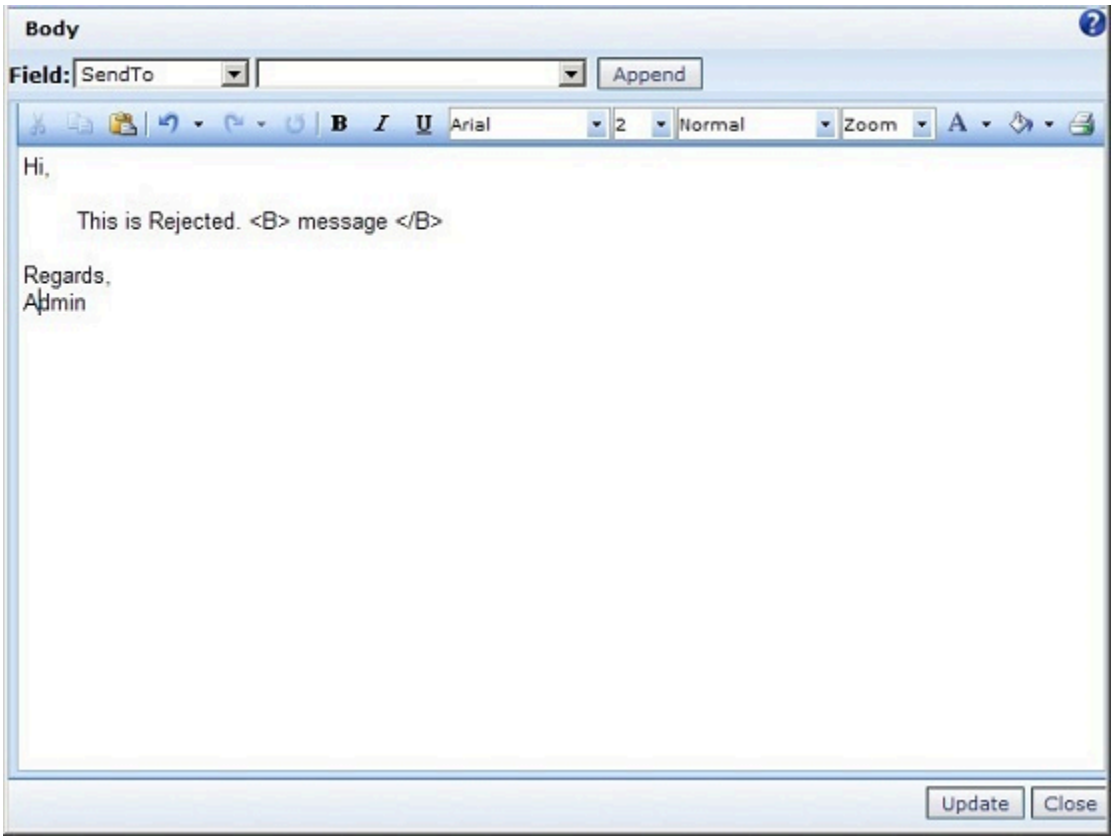


Subject: In this property, specify the subject for the email. After adding the subject, click Update to save it.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Body: This is the actual content of the email sent to the resource(s). After adding the body, click Update to save it.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Email: ToResource

You can set the actors to whom the Email is to be sent in this property window. To open this window, click the button for the 'ToResource' property.

The following image shows the 'ToResource' property dialog box:

The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

Different Methods of Assigning an Actor

- **Assigning an Actor by building an expression:**

  Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

  - The Providers drop-down: You can select the required provider from the Providers drop-down.The Attribute drop down: You can select the attribute to be used to identify the actor. For example, "AdministratorId", in this drop down.The Operator drop down: You can select the operator for the expression here. For example, "="
  - The Value type drop down: You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The Value text box or drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression

At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

- **Assigning an Actor through User Lookup**
  Through the **User Lookup** you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup
  1. Select the **User Lookup** option.
     The **User Lookup** dialog is displayed, search and select the required actor.

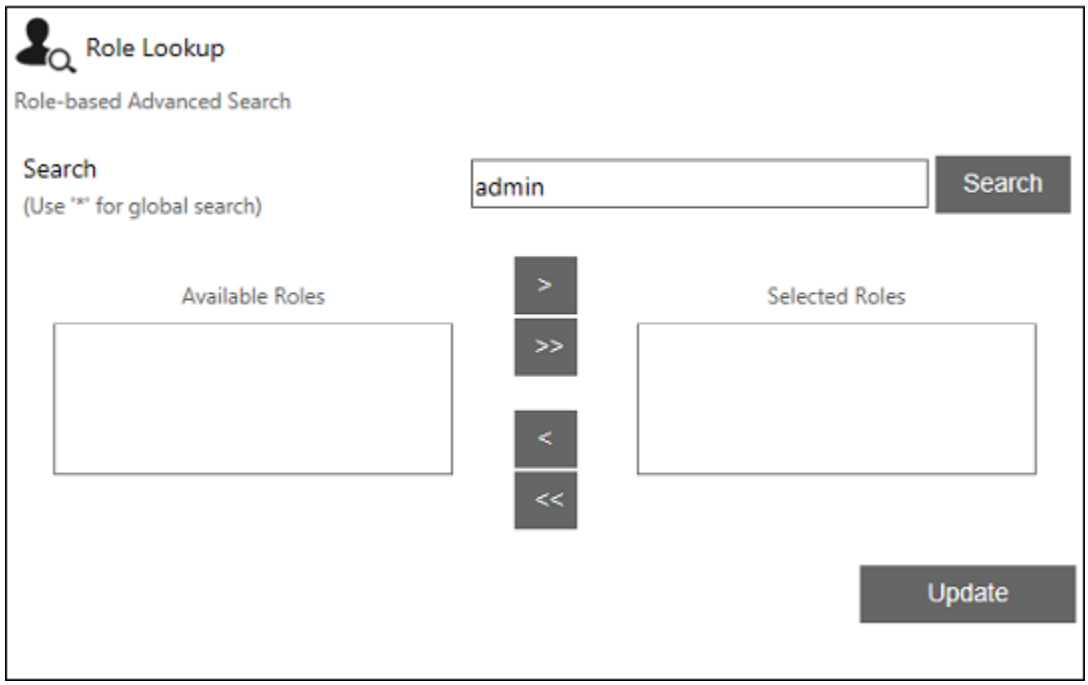
  2. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
     In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Click **Update** in the Assign Actor(s) window to update the selected actor(s) in the **Assign Actor** property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

   Assigning an Actor through Role Lookup
   Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

4. Select the **Role Lookup** option.
5. The **Role Lookup** dialog is displayed, search and select for the required role.

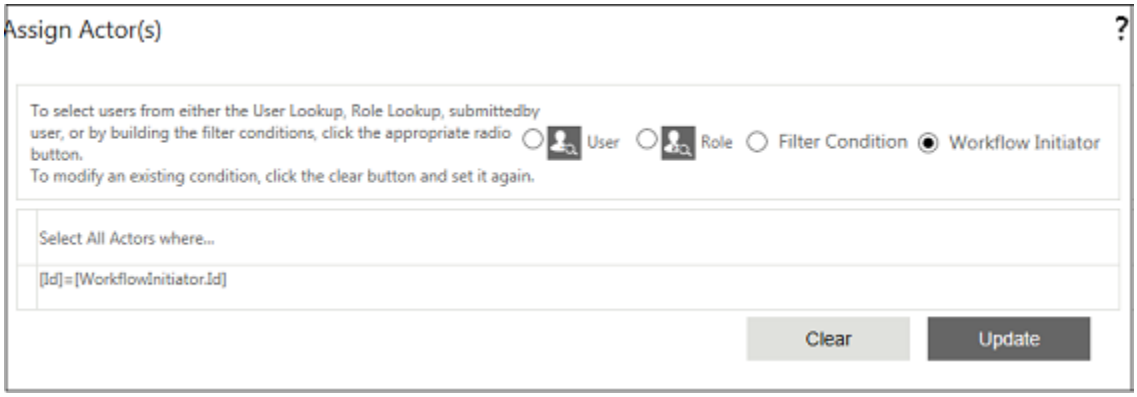


6. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. Click **Update** in the Assign Actor(s) window to update the **Assign Actor** property.

- **Assigning an Actor through Workflow Initiator**
  Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

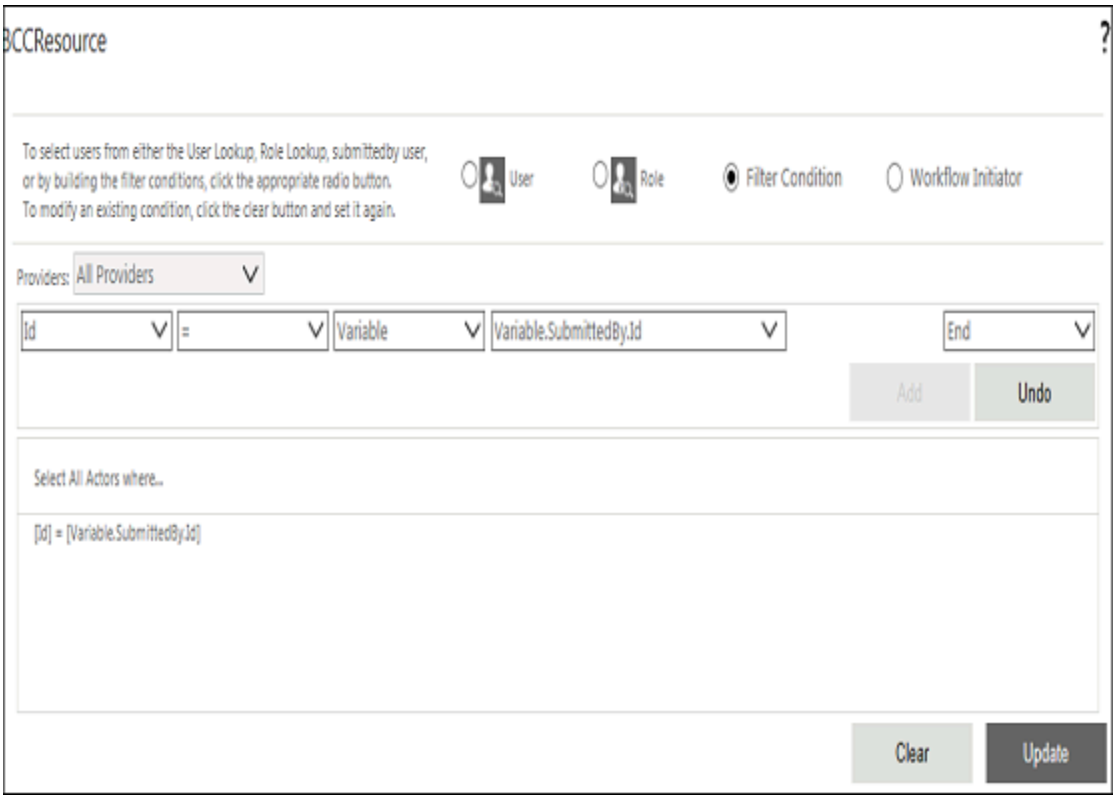


Email: BCC Resource

You can set the actors to whom the Email is to be sent as BCC in this property window. To open this window, click the button for the 'BCCResource' property.

The following image shows the BCCResource property dialog box:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

Different Methods of Assigning an Actor

- **Assigning an Actor by building an expression:**

  Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

  - The Providers drop-down- You can select the required provider from the Providers drop-down.
  - The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
  - The Operator drop down - You can select the operator for the expression here. E.g., "="
  - The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
  - The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
    - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
    - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

collection from which you can select an appropriate option.

- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

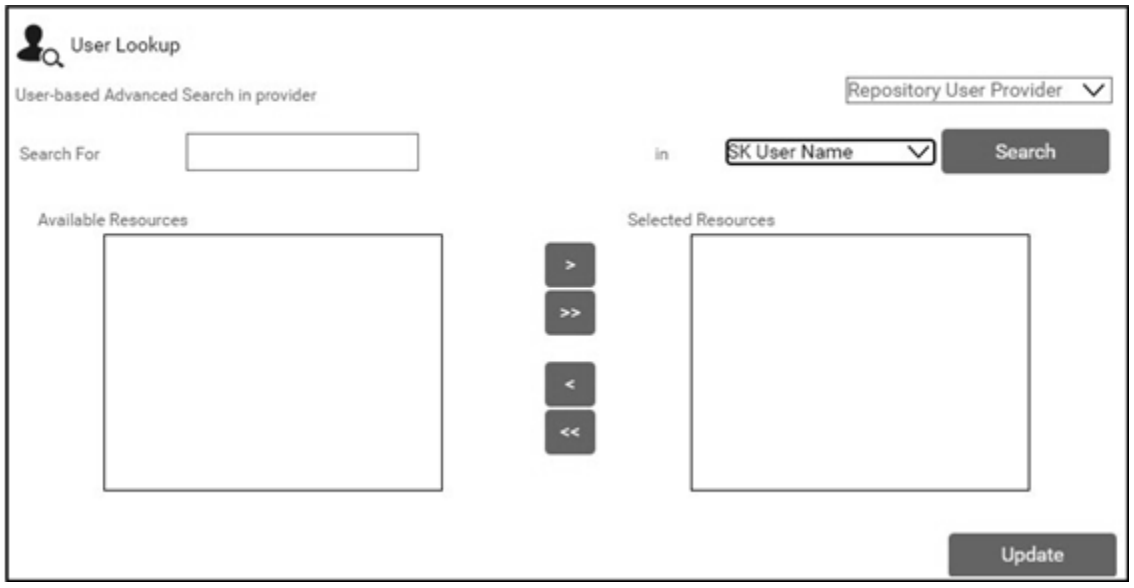
At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

Assigning an Actor through User Lookup

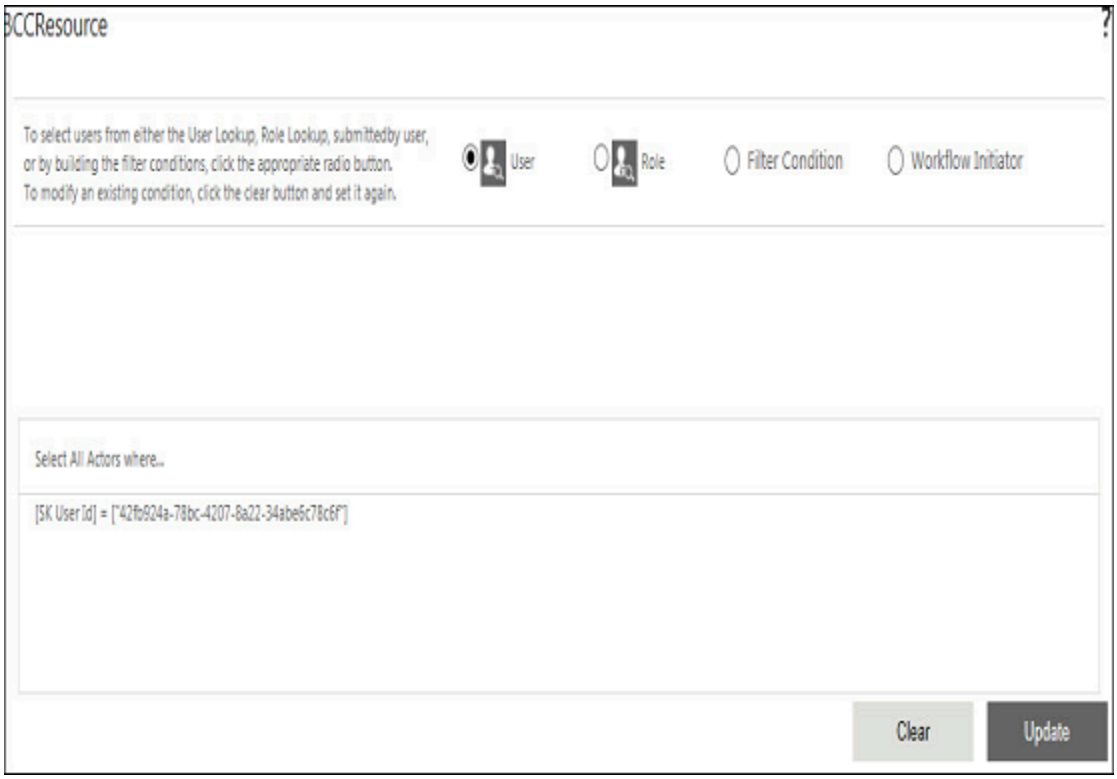
Through the **User Lookup** you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.
2. The **User Lookup** dialog is displayed, search and select the required actor.



3. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



4. Click **Update** in the Assign Actor(s) window to update the selected actor(s) in the **Assign Actor** property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

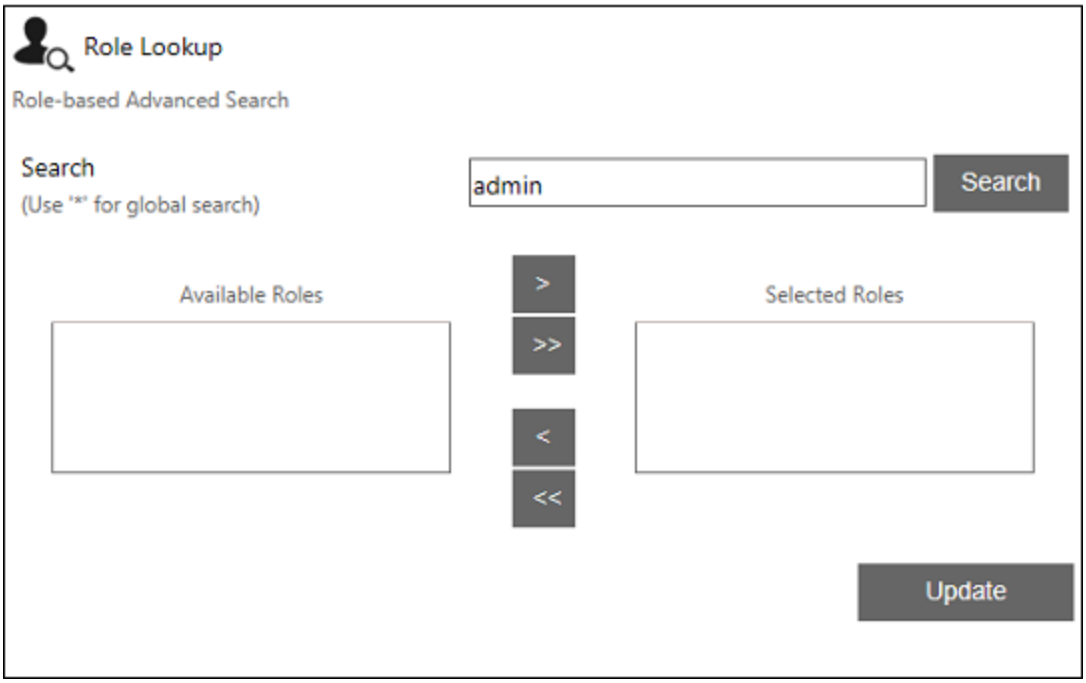
- **Assigning an Actor through Role Lookup**

  Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

  1. Select the **Role Lookup** option.

     The **Role Lookup** dialog is displayed, search and select for the required role.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



2. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

3. Click **Update** in the Assign Actor(s) window to update the **Assign Actor** property.

- Assigning an Actor through Workflow Initiator

  Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor

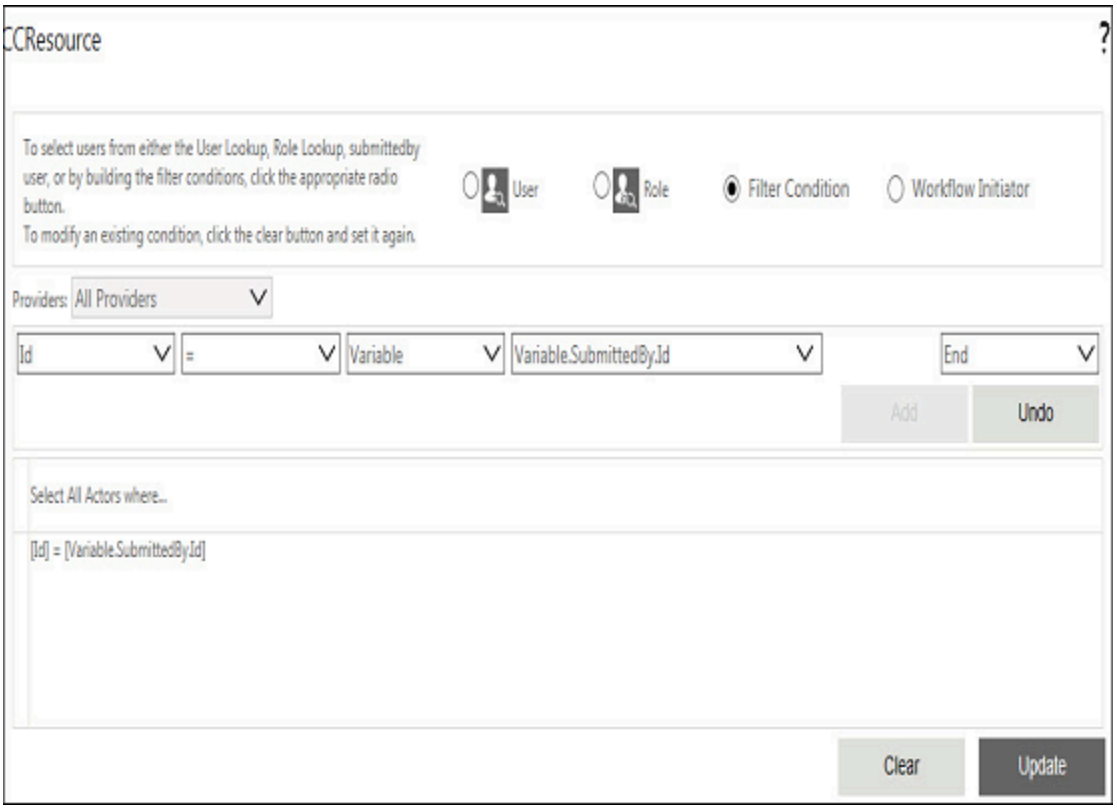
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

window, refer the image below:

Email: CCResource

You can set the actors to whom the Email is to be sent as CC in this property window. To open this window, click the button for the 'CCResource' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

Different Methods of Assigning an Actor

- **Assigning an Actor by building an expression:**

Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.

- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

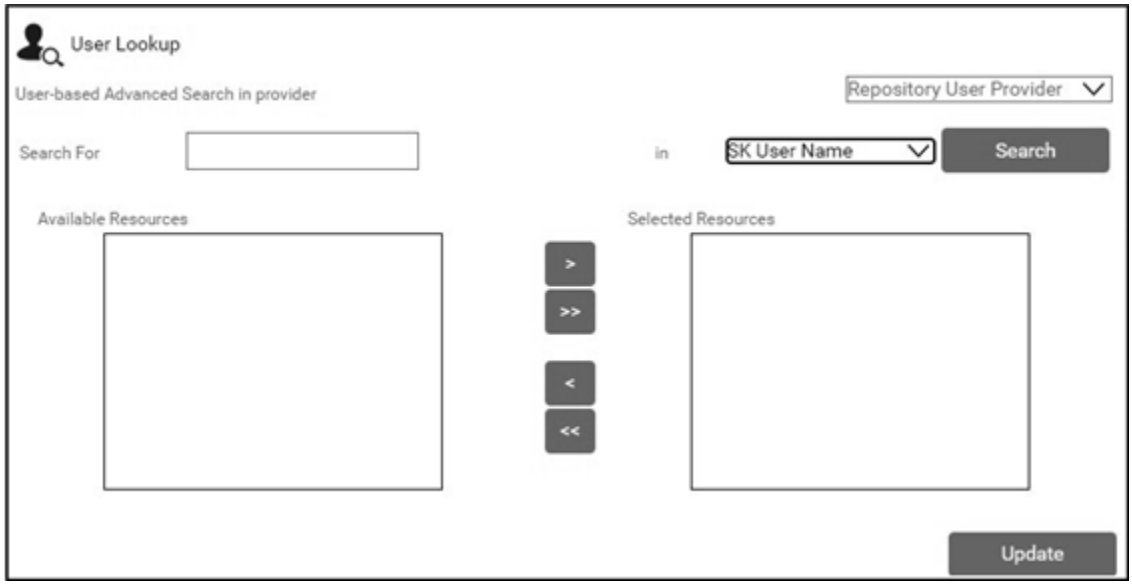
At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

- **Assigning an Actor through User Lookup**

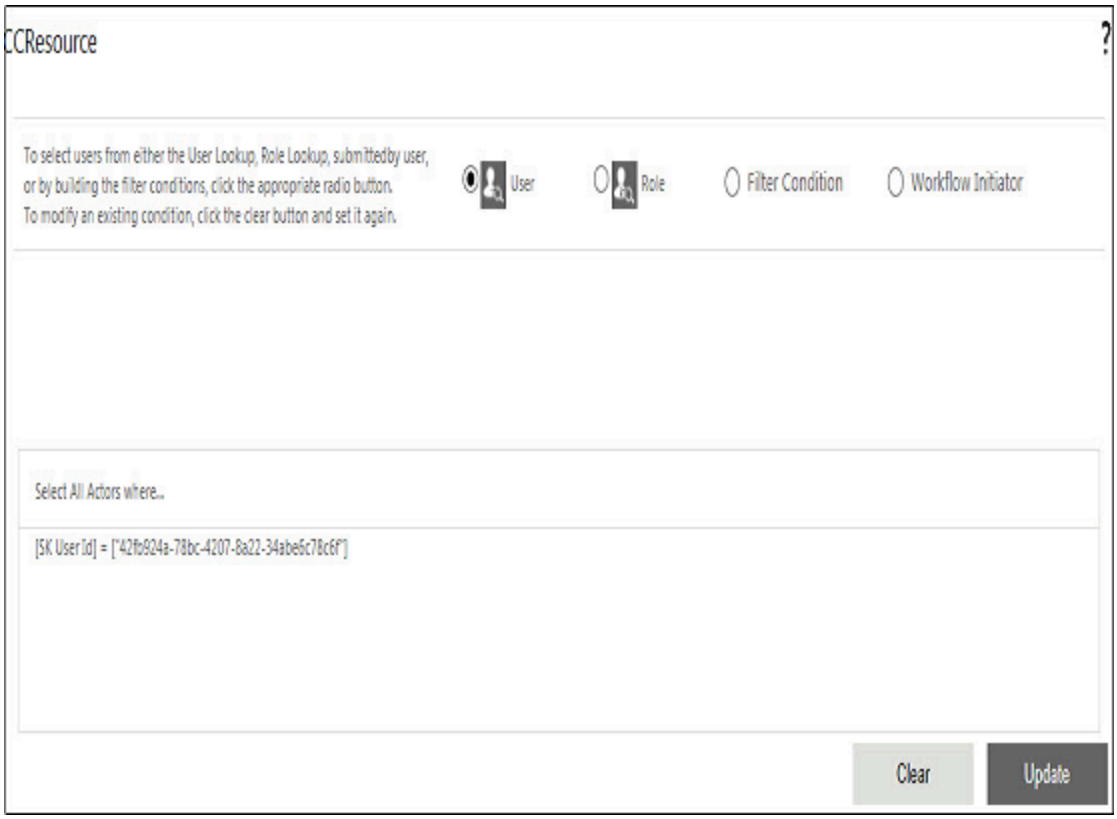
Through the **User Lookup** you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.
   The **User Lookup** dialog is displayed, search and select the required actor.



2. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click **Update** in the Assign Actor(s) window to update the selected actor(s) in the **Assign Actor** property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

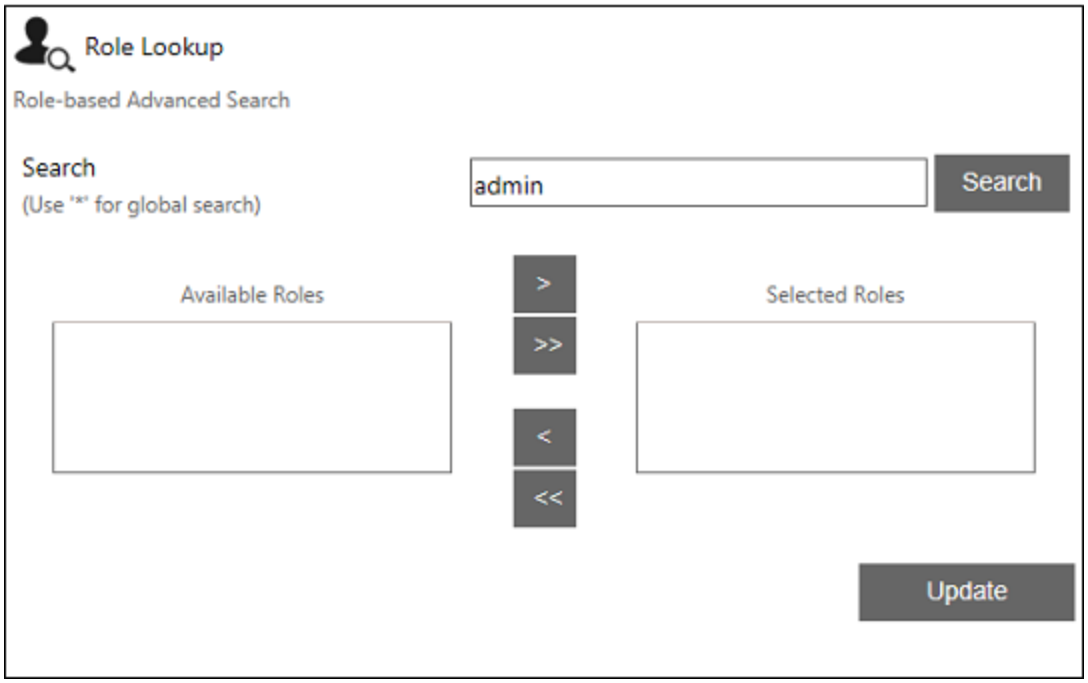
- **Assigning an Actor through Role Lookup**

Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

1. Select the **Role Lookup** option.

   The **Role Lookup** dialog is displayed, search and select for the required role.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



2. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

3. Click **Update** in the Assign Actor(s) window to update the **Assign Actor** property.

- **Assigning an Actor through Workflow Initiator**

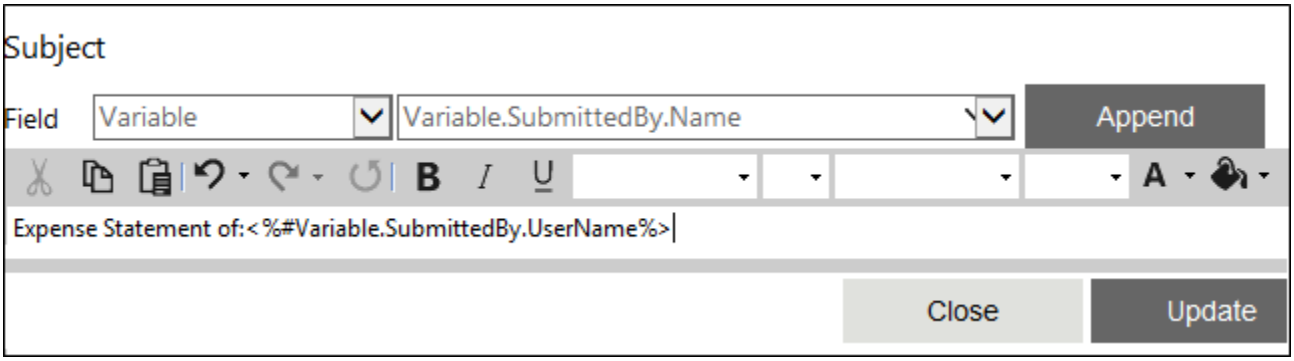
Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Email: Subject

Subject Property window

You can specify a subject for the Email in this property window. To open this window, click the button for the 'Subject' property.



The window has a text editor to enter the subject. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the subject. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the subject in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the subject.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the subject using a combination of discrete value and variable or content. For example, you can specify the subject as "Expense Statement of <%#Variable.SubmittedBy.Email%>". Here the string "Expense Statement of" should be typed directly in the text editor. The second half of the subject is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the **Field** drop down and clicking **Append**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The text tool bar above the text editor allows you to manage and format the subject. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

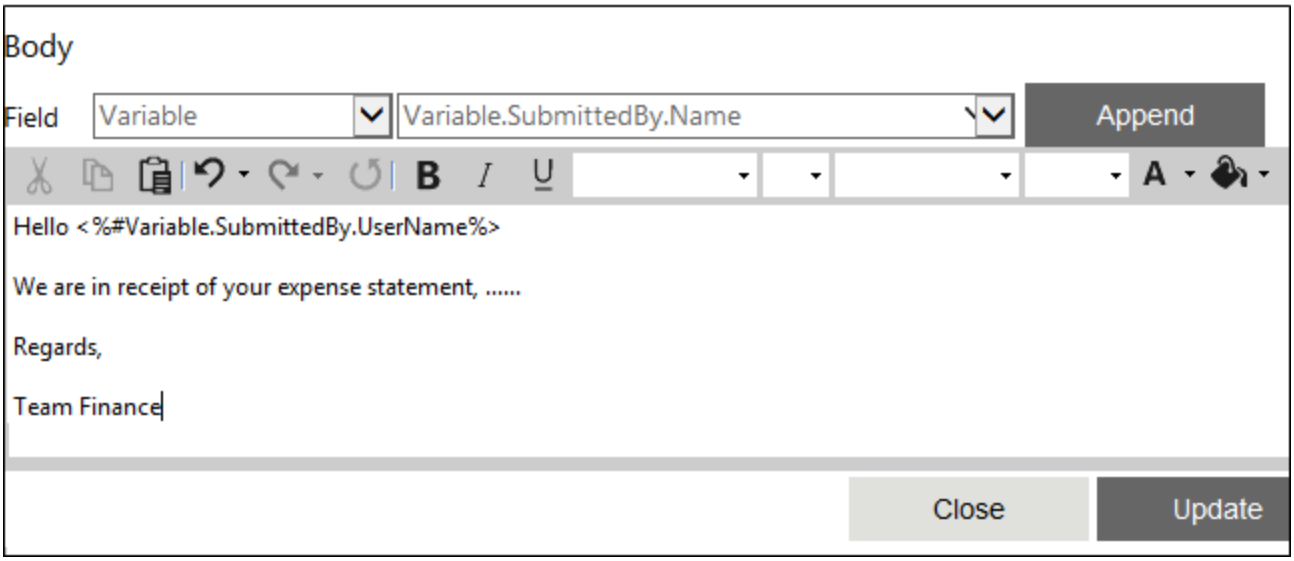
- **Update** - You can click this button to save the subject.
- **Close** - You can click this button to close this window.

Email: Body

You can specify a message Body for the Email in this property window. To open this window, click the button for the 'Body' property.

The following image shows the Email Body property dialog box:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the body text. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/ drop down - You can specify the actual value of the message body. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the body text in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the body.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the body using a combination of discrete value and variable or content. This helps in personalizing the email body for each actor. For example, you can specify the salutation line in the message body as "Hello <%#Variable.SubmittedBy.name%>,". Here, the string "Hello" must be typed directly in the text editor. The second half of the salutation is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the Field drop down and clicking Append. The rest of the message body can be typed in the editor. This will result in the same email message going to different actors with their respective names in the salutation line.

The text tool bar above the text editor allows you to manage and format the body text. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

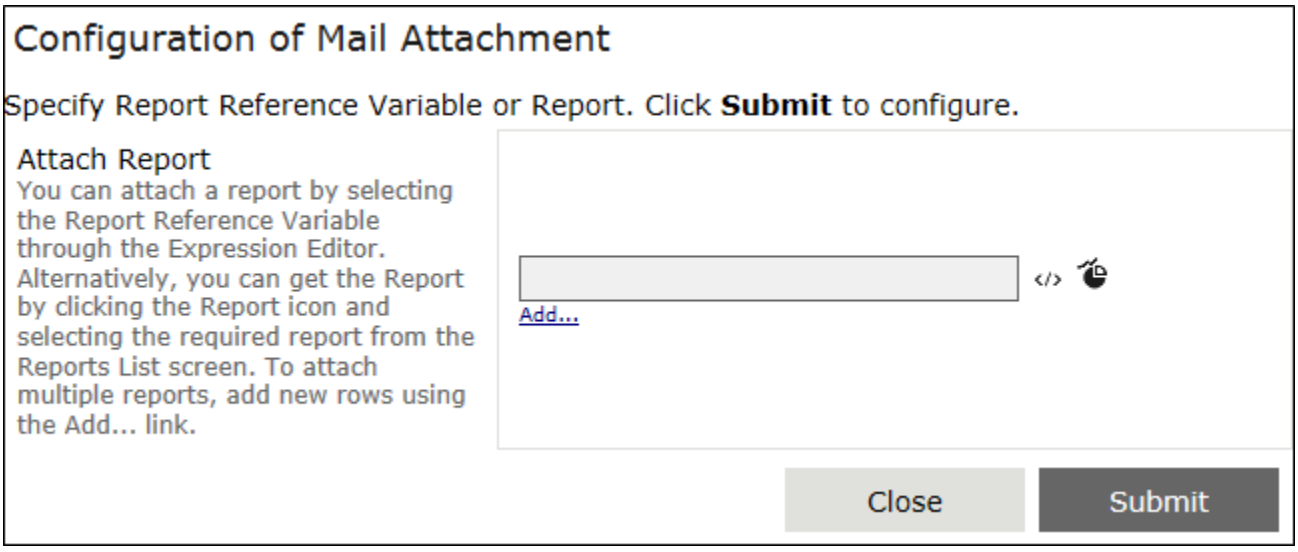
At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the message body.
- **Close** - You can click this button to close this window.

Email: Attach Reports

You can configure the **Attach Reports** property for the email activity in this property window.

In the following **Attachment Configuration** property window, you can configure the Report attachments that you want to mail:



Attach Report

You can use the **Attach Report** property to attach a report generated by the **Report Generator** activity within the workflow or to select a report from the list of generated Reports. You can attach a Report by selecting the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

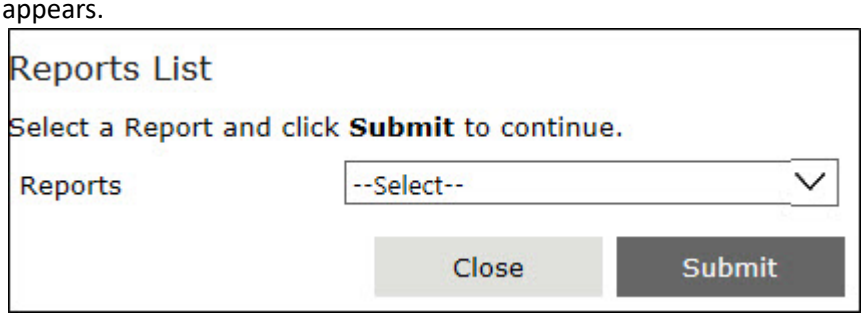
required Report Reference Variable through the Expression Editor. Alternatively, you can select the report from the Reports List screen which contains already generated reports.

Note: There must be at least one **Report Generator** activity before an Email activity in the workflow to select the Report Reference Variable (using Expression Editor) as Attachment.

The Report Reference Variable is generated while configuring the Report Generator activity. By default, the report reference variable will be the **[Template Name]_[activity Name].** For more information on Report reference Variable, see Configure Report Template.

Complete the following tasks to configure an email attachment:

1. Click the edit button for the **Attachment** property.
2. In the **Attach Report** text box, you can either use the expression editor to get the variable of the report or use the Reports List to select the report.
3. To get the variable, click the **Expression Editor** icon to select the required Report Reference Variable.
4. In the **Expression Editor** window, select the required variable.
5. Click **OK** to save variable.
6. Click **Close**. The variable appears in the Attach Report text box.
7. To select the Report from the Reports List window, click the Reports List icon. The Reports List dialog box appears.



8. In the **Reports List** dialog box, select the required Report, and then click **Submit**. This window will close automatically.
9. Click **Close** to close the configuration window.

Configure Communication Activities

This section provides information to configure communication activities. A standard GSM Modem device, such as GSM Commercial Modem 81GC connected to the server is a prerequisite for sending and receiving SMS from AVEVA Work Tasks.

Prerequisites

A standard GSM Modem device, such as GSM Commercial Modem 81GC connected to the server is a prerequisite for sending and receiving SMS from AVEVA Work Tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configure Farm Configuration Wizard for Receiving Emails

To configure the AVEVA Work Tasks Communication Service for processing emails, you must set attributes. The properties can be set from the Farm Configuration wizard by clicking the Settings image next to **Communication Service**.

On clicking icon, the **Communication Service Settings** window is displayed.

Communication Server

Under the **Communication Server** tab, you need to configure the following fields:

1. **Listener IP Address** - The IP Address of the Service.
2. **Port** - The Port assigned to the Service.
3. **Wait Task Handler Path** - The Assembly path for handling timeout task & handler for received email (this is used for customization).
4. **Wait Task Handler Class** - The Class name for handling timeout task & handler for received email (this is used for customization).
5. **Block mail Addresses** - The Communication Service will not process mails coming from these addresses like abc@dom1.com.

Enterprise Server

Under the **Enterprise Server settings** section of the **Communication Server** tab, you need to configure the following fields:

1. **Load Balanced** - This field is used to set load balancing for AVEVA Work Tasks. This field is enabled only for the Load Balanced Server installation. To enable load balancing set the Load Balanced value to true.
2. **Load Balanced Server Port** - This field denotes the port number used by Enterprise Server. This value must be modified if the default port value is in use.
3. **Load Balanced Client Port** - This field is used to enter the port number for the Client.

Mail Server

Mail Server configuration is moved to Central Configuration. To configure mail server, see Mail Server Setting.

Supporting Matrix POP3 Service

Assume that, there are two POP3 service providers are running. By default, the first POP3 service is being used. If this POP3 service is stopped and can not be restarted then use the alternate Matrix POP3 service which is running.

To do so, the machine name/IP address of the machine where the Matrix POP3 service is running needs to be provided in the **POP Mail Host** field of the Mail Server tab of the **Farm Configuration wizard** window.

Configure Farm Configuration Wizard for Receiving SMS

The AVEVA Work Tasks Communication Service Settings will check the Phone device periodically for SMSs.

To configure the Farm Configuration Wizard for receiving SMS, you must set SMS Receiver attributes for the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

following fields:

1. **Enable SMS Receiver**
   This is for enabling & disabling periodic checking of the device for SMS. If this is set to "True", the Notification Engine will check for SMS and if "False", the check is disabled.
2. **SMS Time Interval**
   The periodic Time interval for checking SMSs in the Device. Specify it in a time span (e.g. 0.00:01:30 = 1 minute 30 secs). It will delete the SMS from device based on the time interval.
3. **Wait Task Handler Path**
   The Assembly path for handling timeout action & warning.
4. **Wait Task Handler Class**
   The Class name for handling timeout action & warning.
5. **Provider Configuration**
   This is used to enter service-provider-specific details for receiving SMS. Currently details for one provider – GSM – have been given. If you are using any other service, you can add your provider details here.
   Name - Name of the provider. The supporting providers are GSM, Email Provider, and SMS pattern match.
   Assembly - Enter the required dll file path.
   Class - Class Name.
   Device - Name of the device that is connected to the COM port.

   Note: Under each Connection Type, apart from their configuration details, two compulsory nodes – SMSMessengerAssembly & SMSMessengerClass – have to be specified. This is the class which sends SMS for each provider. This class should implement ISMSSender interface.

Configure Farm Configuration Wizard for Sending SMS

The SendSMS Activity can be configured to send SMSs by making the following **SMS Config** settings in the Configuration Wizard:

1. **Resource Fields**

   This is for mapping resource fields(Users Properties) for sending SMS. There are three fields. They are Email, MobilePhoneProvider, and SMSNumber are mapped to the table.

   Email - Mail id of the user. This field will take input from Users Properties of specified field in this field.

   MobilePhoneProvider - Service Provider. This field will take input from Users Properties of specified field in this field.

   SMS Number - Number of cell in which SMS to be sent. This field will take input from Users Properties of specified field in this field.

   Example: For the List, the Email, MobilePhoneProvider, and SMSNumber will take input from Email, Mobile Phone Provider and SMS Number respectively from the User properties.
2. **SMS Sending Connection Types**

   Currently three Connection Types are supported:

   GSM - You can send a SMS through a direct GSM modem or GSM phone.

   EmailProvider - You can send a SMS by specifying connection types.

   SMSPatternMatch - Each service provider has their SMS pattern to identify easily.

   Example: Hutch - Hutch number starts from 9886.*

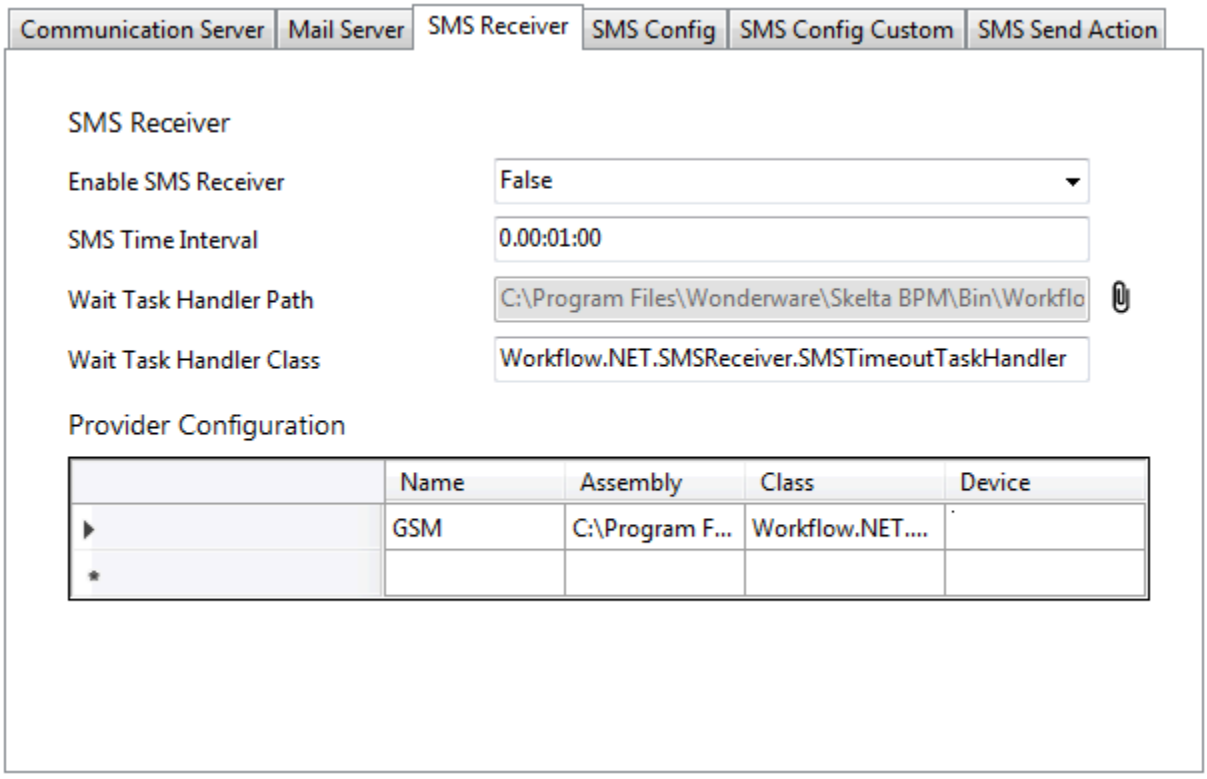
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Airtel - Airtel number starts from 9845.*, 9980.* etc.

Provider Configuration

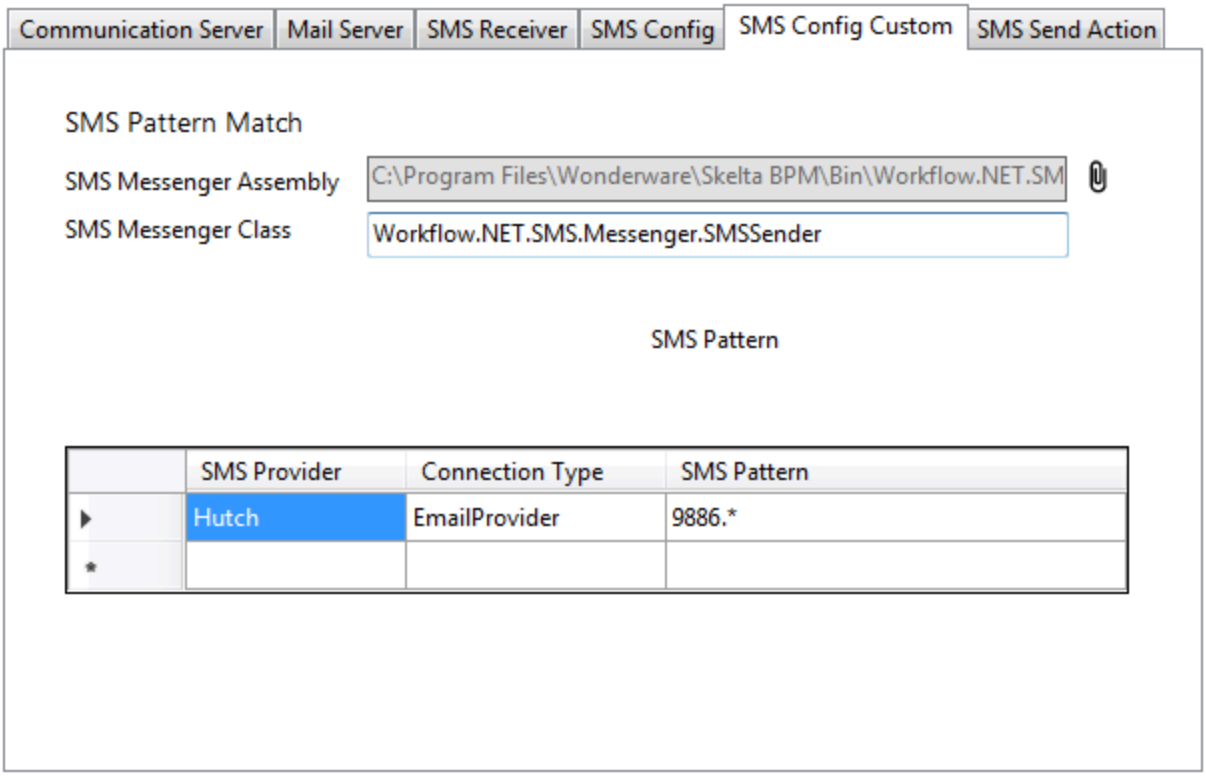
This is for Connection Type specific configuration settings. If you are using a provider other than the default provider specified here, you will have to add the details here. Currently three Connection Types are supported – SMSPatternMatch, GSM, and EmailProvider. Under each Connection Type, apart from their configuration details, two compulsory nodes – SMSMessengerAssembly & SMSMessengerClass – have to be specified. This is the class which sends SMS for each provider. This class should implement ISMSSender interface.

The following are some examples for setting ProviderConfiguration:



Note: As an alternative, "Nokia 6310i Modem" can be replaced by "COM 1", provided the Nokia phone is connected on COM1.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



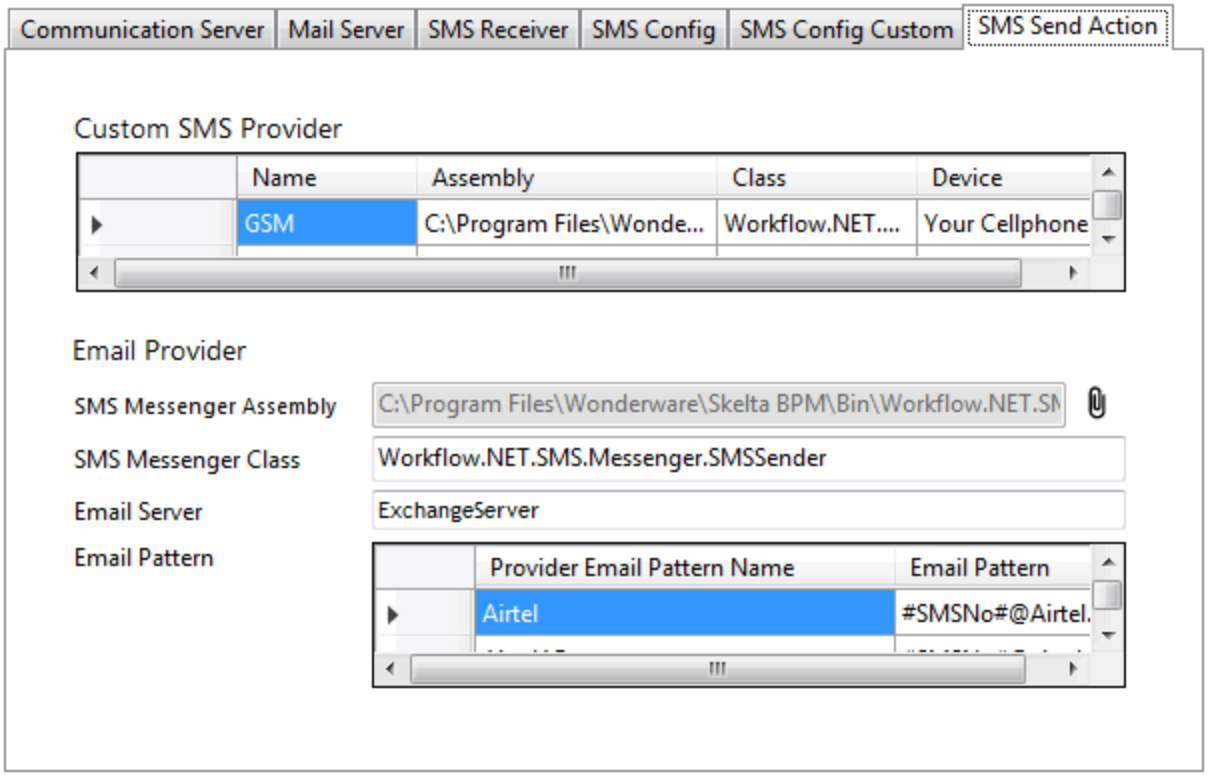
Here are some details about values in the above example:

DeviceSettings - 8 databits, no parity, 1 stopbit

Provider Type - Standard TAP provider

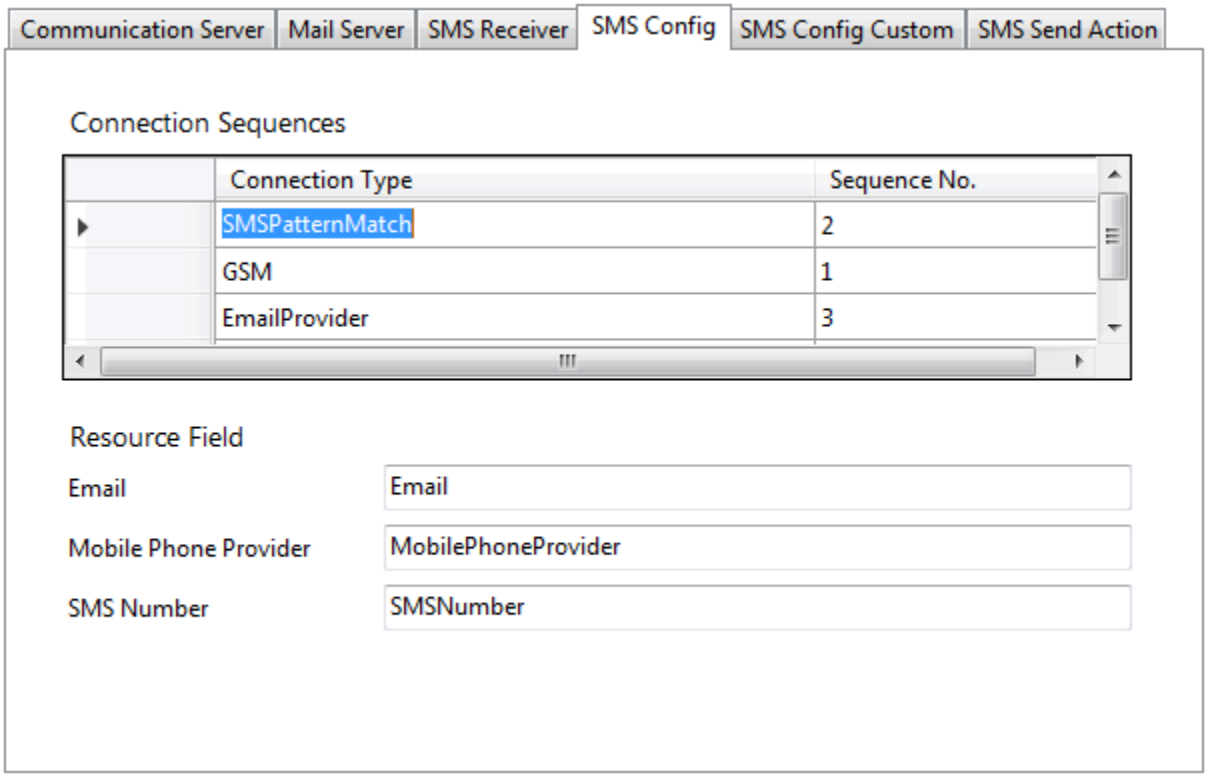
You can specify '0' for UCP Provider, '2' for TAP provider, 'no request' for LineFeed and '3' for TAP provider, 'no request' for EOT.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. **Connection Sequences**

   This is the sequence in which the AVEVA Work Tasks Engine will choose the provider for sending SMS. For Example:



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Engine will try to send SMS using GSM Provider. If this fails, then it will try sending the SMS using other providers in this order: SMSPatternMatch and EmailProvider.

Provider	Priority
GSM	1
SMSPatternMatch	2
EmailProvider	3

SendSMS and WaitForSMS

The SMS Send and Receive actions communicate either through a serial port, Bluetooth connection, infrared port or any TAPI compliant device. When using the COM port directly, device properties must be setup properly before you can start to send or receive messages. When using TAPI, these settings are controlled by the TAPI telephone driver, and should be configured through the TAPI settings as described below:

- Open the Windows Control Panel;
- Double-click on 'Phone and Modem Options' and select the 'Modems' tab;
- Select the preferred modem and click on 'Properties'; from here, you can change the settings.

To select a TAPI device in the toolkit's object, you must assign the Device member:

- Device - the literal TAPI device string, for instance: 'Standard 9600 Modem'.

If you prefer not to use TAPI, you must assign COM port properties through the following member variables:

- Device - the actual COM port device, formatted as COM x, where x represents the COM port number;
- DeviceHwFlowControl - hardware flow control is used to regulate commands from PC to device and visa versa; default: On;
- DeviceSwFlowControl - software flow control is used to regulate data from device to device; default: Off;
- DeviceSpeed - the speed to be used to communicate with modem or GSM phone; default: 0 (which means that factory defaults are used for modem communications);
- DeviceSettings - the number of databits, paritybits and stopbits; default: 8 databits, no parity, 1 stopbit;
- DeviceInitString - the modem initialization string is used to initialize the modem; default value: "" (which means a generic initialization string will be used).

Before you can actually send an SMS or Pager message, the Toolkit needs to know a bit more about the sender, recipient and the actual message. Therefore, you must assign the following properties:

- Sender - the phone number of the sender of the message; only digits are allowed. The sender address will be displayed on the recipient's mobile phone. If not assigned, 00000000000 will be used as sender address;
- Recipient - the phone number of the recipient of the message; if not specified, the message cannot be sent;
- MessageText - the actual message body, containing any character. Maximum message length is 160 characters when using normal (non-Unicode) text. When Unicode is used, you can only send 70 characters;

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Dial-in number of the SMS/Paging service provider (not required if you send a message through a directly connected GSM phone).

If you send through an SMSC provider, you must tell the component which provider protocol you are going to use:

- ProviderType - the type of protocol requested by the provider. You can choose: UCP or TAP.

Important: Sending an SMS through a service provider requires special knowledge of the protocol and provider requirements of your equipment. A provider requires its own speed (1200 bps is most common, but also 300 and 2400 are also often required), data format (7 databits, no parity, 1 stopbit or 8 databits, even parity and 1 stopbit) and provider type (UCP or TAP).

Supported Phone Models

The following table depicts the supported phones by AVEVA Work Tasks:

Brand	Type	Send	Receive	Comments
Ericsson	Z520	Yes	Yes	
	Z525	Yes	Yes	
	Z530	Yes	Yes	
	Z550	Yes	Yes

Disable Reply Email for Invalid Emails

Reply emails for invalid emails can be disabled. If any invalid email comes to the notification engine, an automated reply – **"System could not process your mail. Some of the keywords not found in your mail to process it. Please reply to the original message again."** will be send to the From address with the same subject. This action has been made configurable now. User can disable this reply if required.

This can be achieved by adding a registry string value called **SendReplyForInvalidMail** under **HKEY_LOCAL_MACHINE\SOFTWARE\AVEVA\WorkTasks** and set its value data as **NO**.

Notification Activity

Activity description:

The Notification Activity is incorporated in the workflow process design to send notifications to actors, in the form of email and SMS. The messages can be customized for each actor by appending the resource properties to the message.

Activity Properties:

The Notification activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Notification activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Notification Type - The Notification type can be selected from the drop down list provided for this property. Notifications can be sent in the form of email or SMS to cell phones. The 'All' option is provided to send messages through all media.

Property Type: Mandatory (This property must be set if the action is to be assigned to any resource(s).)

Actors

The property in the Actors group has been described below. You can use this property to specify the content of the notification.

ToResource- This property specifies the resource(s) to which the notification is to be sent.

Property Type: Mandatory (This property must be set if the action is to be assigned to any resource(s).)

Steps to set the To property

1. To specify the actors to receive the Notification message, click the button for the 'To' property to open the property window.
2. In this window, build an expression to select the actors using the actors properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop- down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Notification - ToResource for a detailed description of the To property window.

See the Using XML Variables section in the About XML Variables topic for details on how to use the XMLVariables to build the expression.

Notification Contents

The properties in the Notification Contents group have been described below. You can use these properties to specify the content of the notification.

From Email Address - This property specifies the email address from which the email notifications will be sent. If the Notification type is of the form 'All' or 'Email' then this property must be set. If it is not set, then the email notifications will not be sent.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if the notification type selected in the corresponding property is either 'All' or 'Email'.)

Message - This is the actual content of the notification sent to the resource(s). The notification can be customized for each resource.

Property Type: Optional (This property needs to be set only if required.)

Steps to set the Message property

1. To specify the Notification message, click the button for the 'Message' property to open the property window.
2. In this window, enter the message text directly in the text editor.
3. If you want to personalize the message you can do so using the **Field** controls to add resource property values. For example, to add a message that includes the name of the actor submitting the approval request, you can do as follows: First type in the text "Hello". Next select "Variable" and "Variable.SubmittedBy.name" from the two drop downs for **Field** and click **Append**. This will add the placeholder for the variable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the name, resulting in a personalized salutation. Type in a message in the next line to complete the message body.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the message, click **Update** to save it.
7. Click the **Close** button to close the window without saving the message.

See Notification: ToResource for a detailed description of the Message property window.

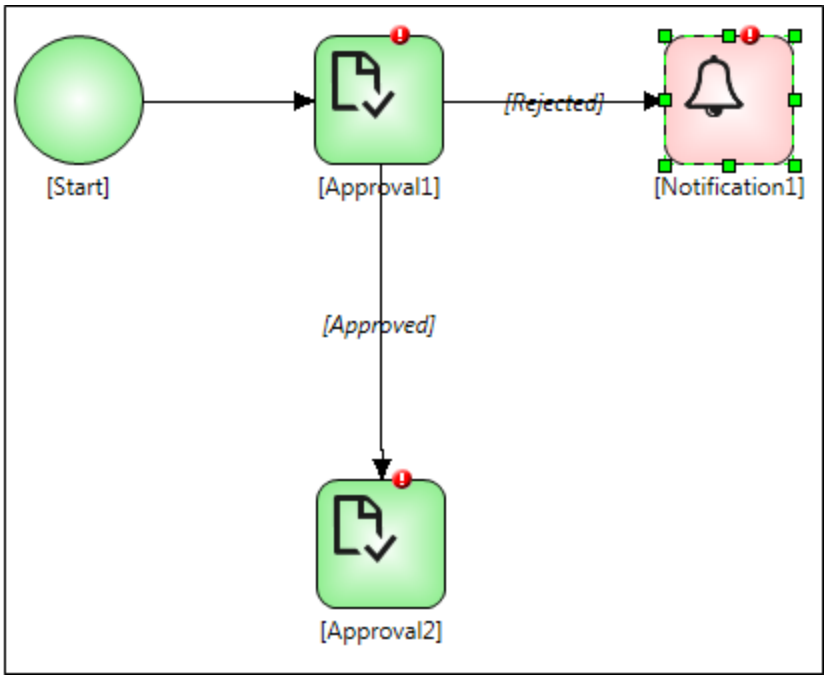
Activity outputs:

The Notification Activity does not return any value.

Example for Notification Activity

In an organization, whenever Approver1 rejects a Notification send to Manager, if manager approves it will go for next Approver, as shown in below workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



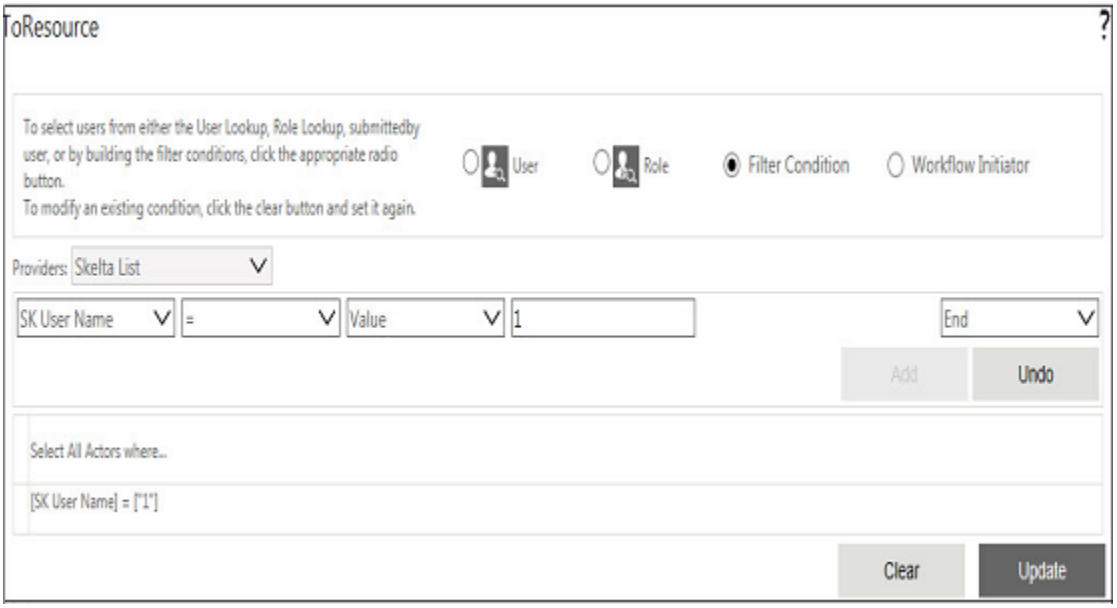
Whenever a workflow triggers a Request, it will send to Approval1. If Approval1 rejects, a Notification will send to Assign actor.

Settings For Notification Activity:

Notifications can be sent in the form of **Email** or **SMS** to cell phones.

Step 1: Select **Notification Type** as **Email** type from the drop down to send notification.

Step 2: Click **ToResource** property to specify the resource(s) to which the notification has to be sent.



Step 3: Select specified Actor and click **Update** to save the changes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Notification: ToResource

You can set the actors to whom the Notification is to be sent in this property window. To open this window, click the button for the 'To' property.

The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

Different Methods of Assigning an Actor

- **Assigning an Actor by building an expression**:

  Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.
- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

displayed depends on the option selected in the preceding drop down.

- If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
- If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.

- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

- **Assigning an Actor through User Lookup**
  Through the **User Lookup** you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup
  - Select the **User Lookup** option.
  - The **User Lookup** dialog is displayed, search and select the required actor.

  - Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
    In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Click **Update** in the Assign Actor(s) window to update the selected actor(s) in **Assign Actor** property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

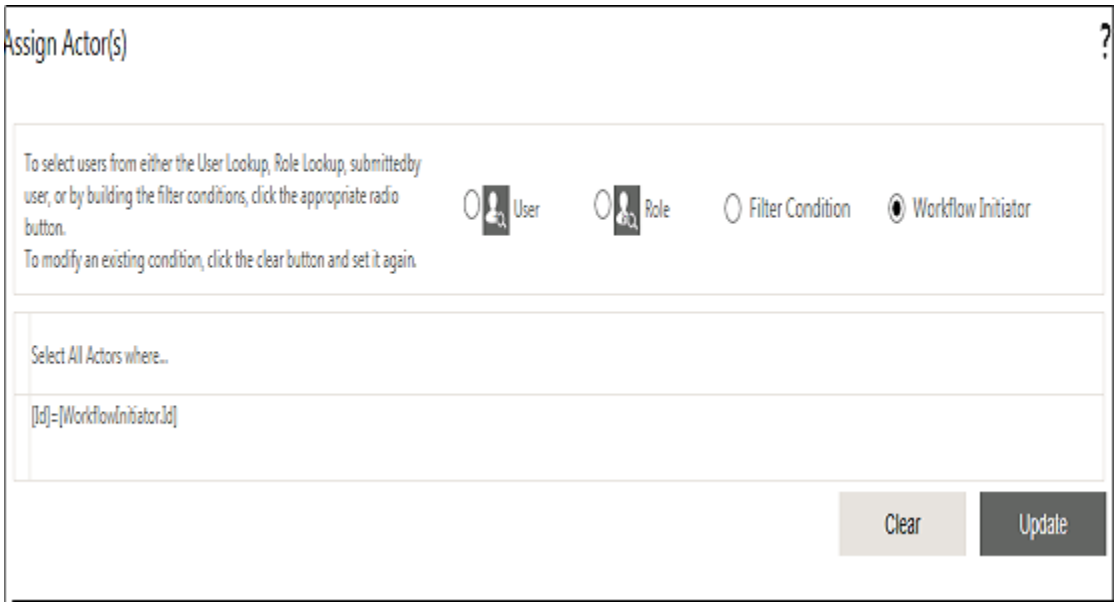
- **Assigning an Actor through Role Lookup**
  Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup
  - Select the **Role Lookup** option.
  - The **Role Lookup** dialog is displayed, search and select for the required role.

  - Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
    In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Click **Update** in the Assign Actor(s) window to update the Assign Actor property.

- **Assigning an Actor through Workflow Initiator**
  Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

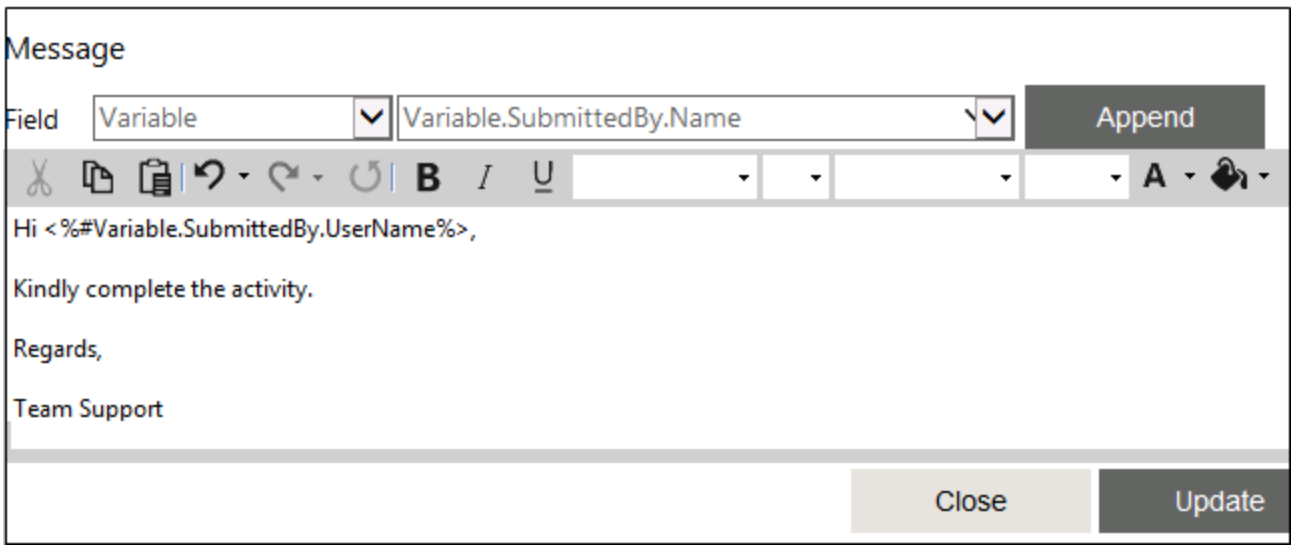


Notification: ToResource

Message Property window

You can specify a message for the Notification in this property window. To open this window, click the button for the 'Message' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the Notification message text. You can do this either by entering a discrete value directly in the text editor or by using the **Fi**eld controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the message. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the message text in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Notification message.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the Notification message using a combination of discrete value and variable or content. This helps in personalizing the message for each actor. For example, you can specify the salutation line in the message as "Hello <%#Variable.SubmittedBy.name%>,". Here, the string "Hello" must be typed directly in the text editor. The second half of the salutation is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the **Field** drop down and clicking **Append**. The rest of the message can be typed in the editor. This will result in the same message going to different actors with their respective names in the salutation line.

The text tool bar above the text editor allows you to manage and format the Notification message text. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the message
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window, you will find the following buttons:

- **Update** - You can click this button to save the message.
- **Close** - You can click this button to close this window.

Send SMS Activity

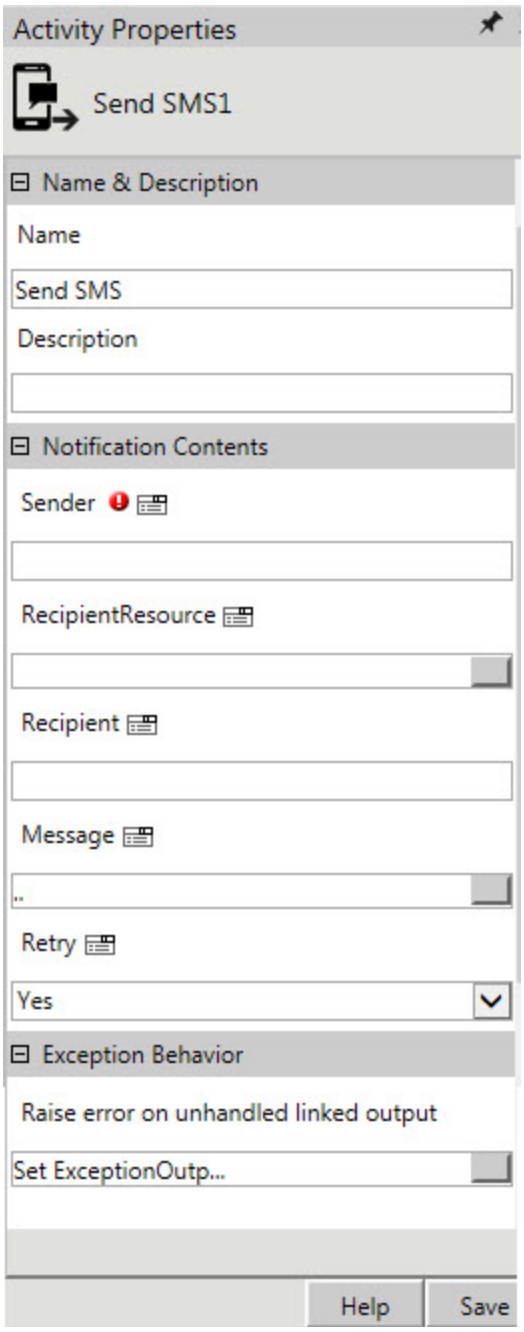
Activity description:

The SendSMS Activity can be used to send SMS to a selected number of actor(s) and/or to a specified phone number. The actor(s) can be selected by building a query. The workflow engine evaluates this query and sends an SMS to all the actors resulting from the query.

Activity Properties:

The SendSMS activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the tool bar or by selecting the appropriate option from the right-click menu for the SendSMS activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Note: In scenarios where different resource providers like Active Directory, Forms, List and ASP.NET Membership are used for different repositories, the resource fields like Email-Id, Mobile Provider, and Mobile No used for SMS configurations should have same field name across all resource providers. For example, let's say fields like Email, Mobile phone provider and SMS Number is used in Active Director provider as Email-Id, Mobile Provider, and Mobile No respectively, then In Forms provider/SkeltaList provider/ASP.NET membership provider also should have these fields like Email-Id, Mobile Provider, and Mobile No to support SMS functionality.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Notification Contents

The properties in the Notification Contents group have been described below. You can use these properties to specify the content of the notification.

Sender - This property is used to set the sender's phone number.

Property Type: Optional (This property needs to be set only if required.)

RecipientResource - This property is used to build a query for selecting the resources for sending SMS. The phone number of the resource will be taken from the resource table. The phone number fields should be configured in the CommunicationConfig.xml.

Property Type: Mandatory (This property alternates with the 'Recipient' property. One of these properties must be set if the SMS is to be sent to any resource(s).)

Steps to set the RecipientResource property

1. To specify the actors to receive the SMS, click on the button for the 'RecipientResource' property to open the property window.
2. In this window build an expression to select the actors using the resource properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Send SMS: RecipientResource for a detailed description of the RecipientResource property window.

Recipient - This property is used to specify any Phone Number for sending the SMS.

Property Type: Mandatory (This property alternates with the 'RecipientResource' property. One of these properties must be set if the SMS is to be sent to any resource(s).)

Message - This property is used to enter the message of the SMS.

Property Type: Mandatory (This property needs to be set.)

Steps to set the Message property

1. To specify the message, click the button for the 'Message' property to open the property window.
2. In this window, enter the message text directly in the text editor.
3. If you want to customize the message you can do so using the **Field** controls to add resource property values.
4. Click **Append** add the expression to the text editor.
5. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

undo and redo changes, zoom in and zoom out the view as well as print the text.

6. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
7. After adding the subject, click **Update** to save it.
8. Click **Close** to close the window without saving the message.

See Send SMS: Message for a detailed description of the Message property window.

Retry - This property allows the user to enable the activity to retry up to three times if the first attempt to execute fails. By default it is set to "Yes."

Property Type: Optional (This property needs to be set.)

Activity outputs:

The SendSMS Activity does not return any value.

Exception Behavior

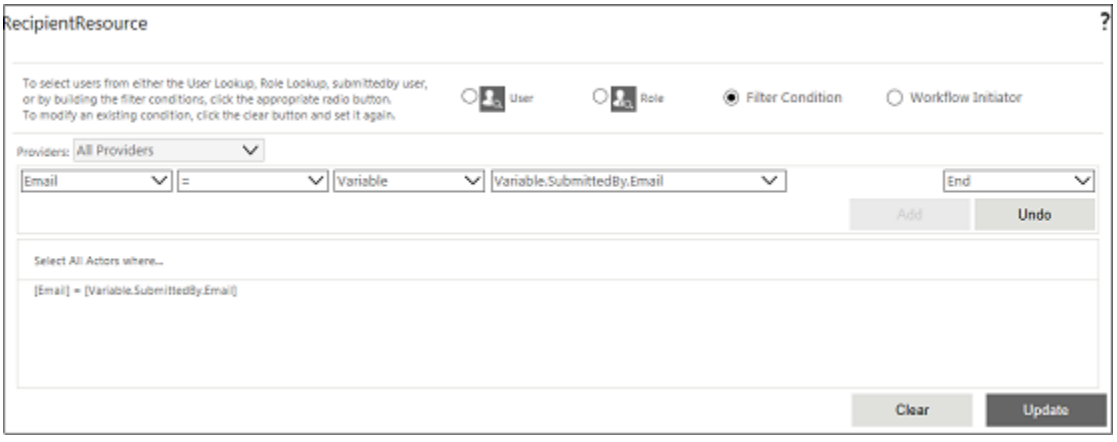
Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Note: Setting value for Set Variables and Contents from SMS property in Wait for SMS activity, through XML variable is not supported.

Send SMS: RecipientResource

You can set the actors to whom the SMS is to be sent in this property window. To open this window, click the button for the 'RecipientResource' property.



The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Different Methods of Assigning an Actor

- **Assigning an Actor by building an expression:**

Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.

- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

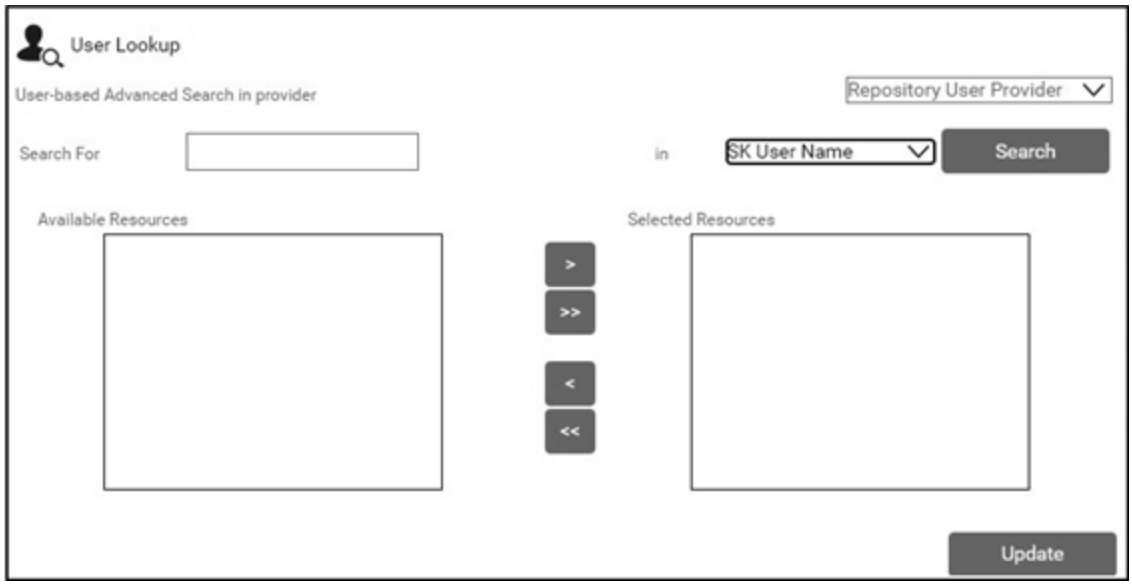
- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

- **Assigning an Actor through User Lookup**

Through the User Lookup you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup

1. Select the **User Lookup** option.
2. The **User Lookup** dialog is displayed, search and select the required actor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.

   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

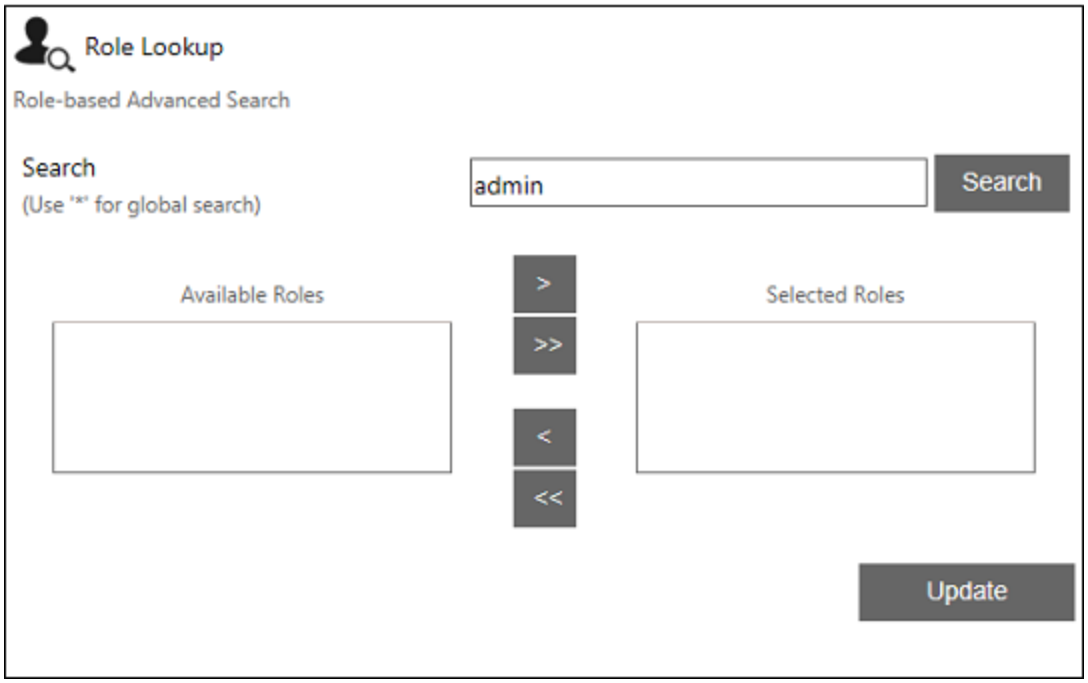
4. Click **Update** in the Assign Actor(s) window to update the selected actor(s) in the **Assign Actor** property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

- **Assigning an Actor through Role Lookup**

Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup

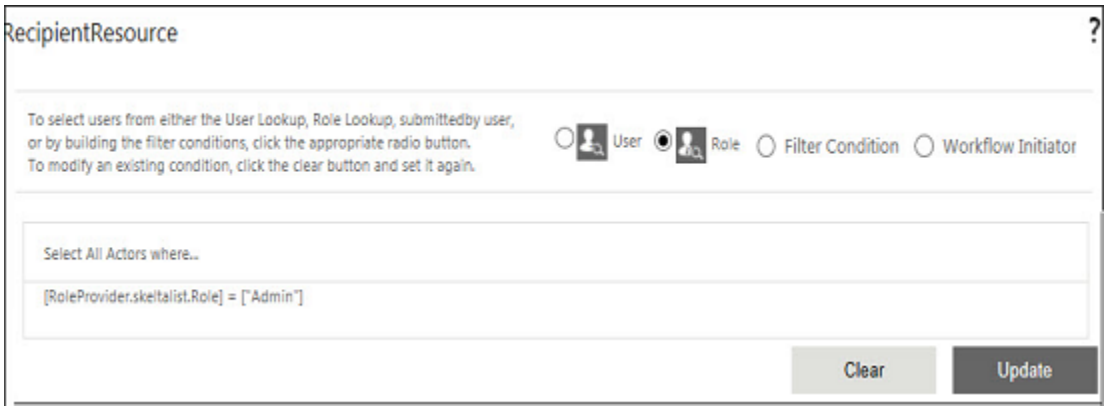
1. Select the **Role Lookup** option.
2. The **Role Lookup** dialog is displayed, search and select for the required role.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.

   In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:



4. Click **Update** in the Assign Actor(s) window to update the Assign Actor property.

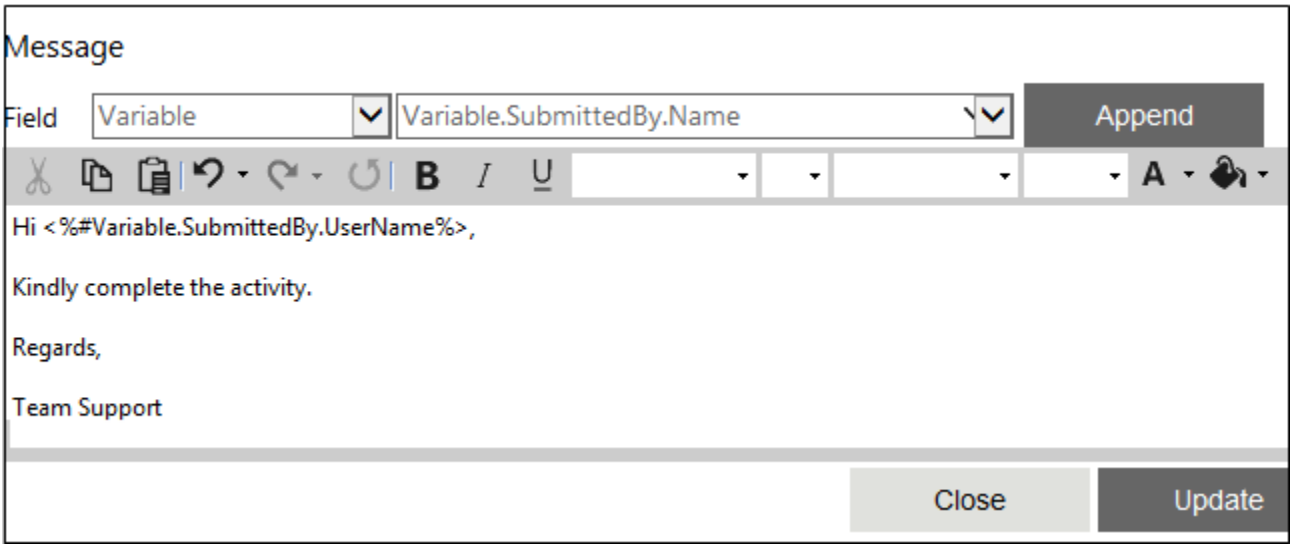
- **Assigning an Actor through Workflow Initiator**

  Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Send SMS: Message

You can specify a message for the SMS in this property window. To open this window, click the button for the 'Message' property.



The window has a text editor to enter the message text. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the message. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the message text in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the message.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The text tool bar above the text editor allows you to manage and format the message text. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the body
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the message.
- **Close** - You can click this button to close this window.

Wait for Email Activity

Activity description:

The Wait for Email Activity can be used to wait for a number of emails for a particular time period, both of which can be set in the activity's properties. It can also be used to filter incoming mails using specific conditions set in the properties. It can store emails (completely or partially) into specified variables. Options to save attachments, including the location to save, can also be specified. Depending on different property settings the activity will give different outputs.

See Localizing the response sent for an invalid email to the Communication Engine for more information on localizing an email.

Variables for capturing EmailIds

To get Email Id of the last received mail, use the AVEVA Work Tasks System variable. The variable name has to be prefixed with **"@"+CurrActivity.Name + "^MailID".**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For example, If activity name is Waitforemail1, then variable name should be "@ Waitforemail1^MailID".

Note: The use of AVEVA Work Tasks System variable CurrActivity.Name + "^EMailID" has been retained to ensure backward compatibility. For example, If activity name is Waitforemail1, then variable name should be "Waitforemail1^EMailID".

Activity Properties:

The Wait for Email activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Wait for Email activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Filter Expression - This property is used to filter the incoming email. It will add an email filter. On execution, the SMTP Notification Engine will be notified about the newly added filter so that it will search for this pattern in the next email.

Property Type: Mandatory (This property must be set if the action is to be assigned to any resource(s).)

Steps to set the Filter Expression property

1. To set the condition to filter the incoming emails, click the button for the 'Filter Expression' property to open the property window.
2. In this window build an expression to set the filter. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression in the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

See Wait for Email: Filter Expression for a detailed description of the Filter Expression property window.

Valid for Emails - This property is used to specify the number of emails for which the action should wait. It indicates that the action should wait till the specified number of emails are received.

Property Type: Optional (This property needs to be set only if required.)

Set Variables And Contents from Email - This property is used for assigning the email partly/ fully to a variable or content.

Property Type: Optional (This property needs to be set only if required.)

Steps to set the Set Variables And Contents from Email property

1. To set the filtered email can be to variables and contents, click the button for the 'Set Variables And Contents from Email' property to open the property window.
2. In this window, first select the variable from the **Variable** drop down.
3. Next specify the **search criteria** in the Search criteria field. You can either enter the regular expression directly or click on the **Generate RegExp for Selected Row** button to generate a regular expression.
4. If you click the **Generate RegExp for Selected Row** button it displays a set of fields and buttons at the bottom of the property window.
5. Specify the start string for the regular expression in the **Start String** field and **Start** and **End** delimiters in the corresponding text boxes of the **Delimiters** fields.
6. After specifying these values, click **Generate** to generate the regular expression.
7. Click **Hide** to hide these fields.
8. Specify where to search in by selecting an appropriate option from the Search in drop down. You can set the action to search in the entire email, the subject, and the attachments among other options.
9. Specify the name of a group to which the variable should belong in the **Set variable in the named group** field.
10. Click the **New row** tab to add the current search expression and display a blank row to add another expression.
11. If you need to remove any search expressions, you can select them and click **Remove selected**.
12. After specifying all the search parameters, click **Update** to save the new settings.

See Wait for Email: Set Variables And Contents from Email from Email for a detailed description of the Set Variables And Contents from Email property window.

Attachment Save Options - This property is used for setting the attachment saving options. The mail attachments can saved according to specified options. Filter attachments to save by searching for a string in the file name or file content.

Note:
- Attaching an email message as an attachment is not supported.
- Supported file types for attachment include .au,.avi,.bas,.bmp,.cdr,.drw,.dwg,.dxf,.eml,.eps,.gif,.ico,.img,.jpeg,.jpg,.log,.mid,.midi,.mov,.movie,.mp1,.mp2,.mp3,.mpeg, and .txt.

Property Type: Mandatory (This property needs to be set.)

Steps to set the Attachment Save Options property

1. To specify the attachment save options, click the button for the 'Attachment Save Options' property to open the property window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Select the save option from the first drop down.
   a. If you select "All Files", it will save all the attachment files
   b. If you select "File Names" or "File Contents", it will save either the specified files or the specified contents of the attachment file. This will display the corresponding fields/drop downs to specify the parameters.
3. Select the type of value (Value, Variable, Content) from the second drop down, and specify the corresponding value for the property from the next text box (if "Value" is selected) or drop down.
4. Click **Update** to save the new option.

Note: In user specified location, you have to append the mail id i.e, if user specified location is "C:\SkeltaMailAttachments\", then actual location will be "C:\SkeltaMailAttachments\<mailId>" .

Example

Location : c:\Temp\

Actual: c:\Temp\123 –(123 is last mailid)

Location : c:\Temp

Actual: c:\Temp123 –(123 is last mailid)

See Wait for Email: Attachment Save Options for a detailed description of the Attachment Save Options property window.

Attachment Save Location - This property is used to specify the location in which to save the attachments.

Property Type: Optional (This property needs to be set only if necessary.)

Steps to set the Attachment Save Location property

1. To specify the location to save the attachment, click the button for the 'Attachment Save Location' property to open the property window.
2. Select the protocol to be used to save the file in the location from the 'Protocol' property.
3. Specify the path of the location in the Location property. Build an expression to assign the location details by selecting the operator, type of value (Value, Variable, Content, XMLVariables), and the value for the property from the corresponding drop downs.
4. In the same way, you can assign a search pattern to filter the type of file to be copied or transferred as the value for the **Pattern** field. For example, you can specify "*.doc" as the filter pattern. This will select only files with the extension .doc for copying or transferring.
5. You can also assign the user name and password of the source file/directory in the **User Name** and **Password** fields respectively, by following the same procedure that is used in step 3.
6. In addition, you can assign the domain name and port number of the source in the **DomainName** and **PortNumber** fields respectively, by following the same procedure that is used in step 3.
7. After adding the parameter, click **Submit** to save it.

See Wait for Email: Attachment Save Location for a detailed description of the Attachment Save Location property window.

Escalation & Timeout

The properties in the Escalation & Timeout group have been described below. You can use these properties to specify escalation and timeout settings for the activity.

Timeout Warning - This property is used for setting the Timeout warning.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if required.)

Timeout for Action - This property is used for setting timeouts for this action. If specified, the action will be timed out after the specified time span.

Property Type: Optional (This property needs to be set only if required.)

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Wait for Email Activity returns the following values -

Timeout Warning: Displayed when a warning for timeout is to be generated

Email Received(Waiting): Displayed when an email matching the specified filter condition is received

Timeout: Displayed when the activity has timed out

Blank Output: Displayed when the activity is complete

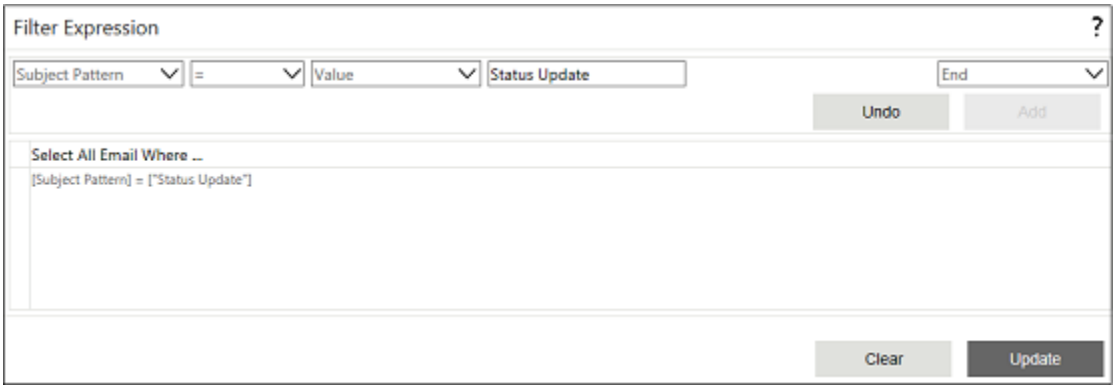
Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Wait for Email: Filter Expression

You can set the filter expression to filter the incoming email in this property window. To open this window, click the button for the **'Filter Expression'** property.



The window has a set of drop downs at the top to select the different parameters required to build the filter expression. You can also find related buttons next to the drop downs.

- The Attribute drop down - You can select the attribute to be used to filter the email, e.g., "Subject Pattern",

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

in this drop down.

- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down. If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click on this button to add the new expression to the text area.
- **Undo** - You can click on this button to remove a condition you have added to the expression.

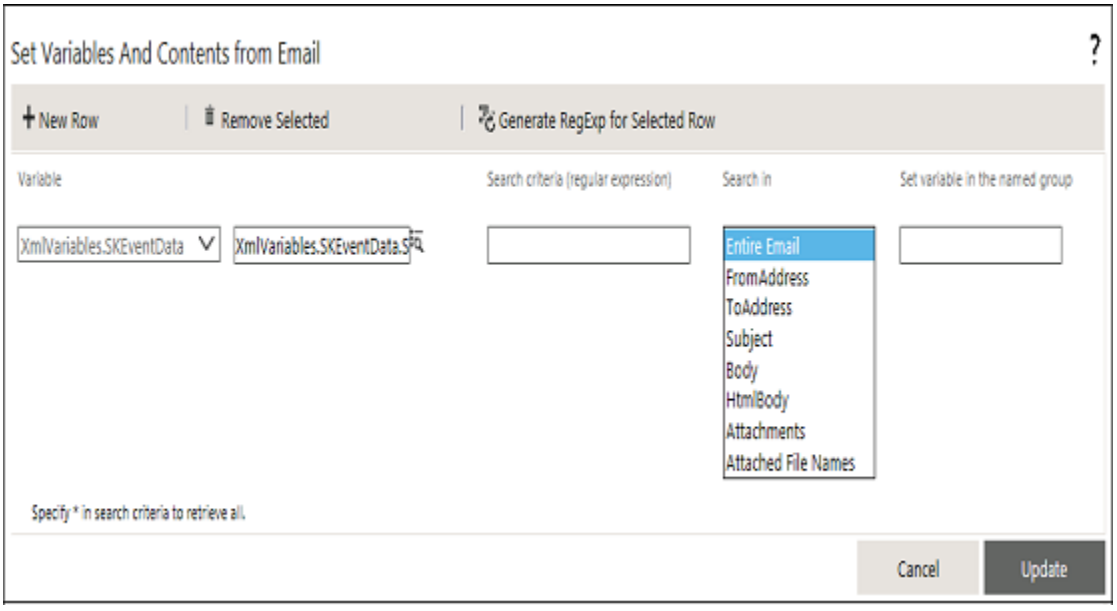
At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

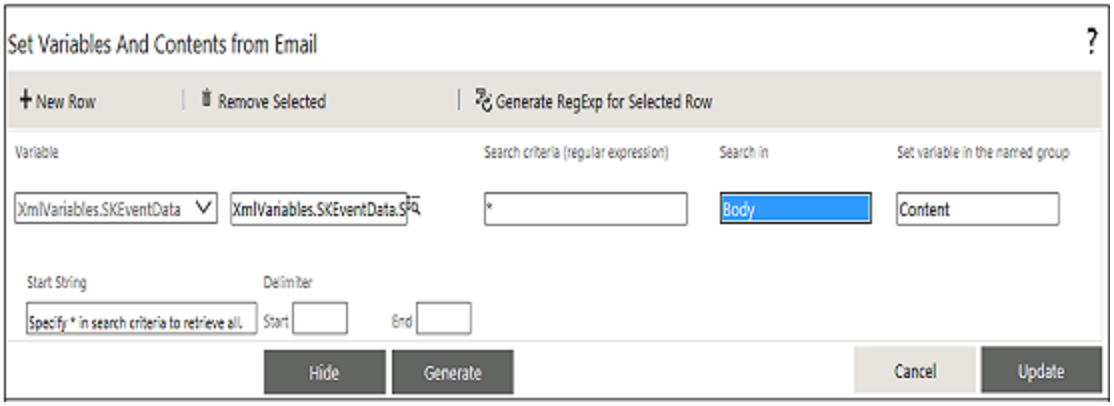
Wait for Email: Set Variables And Contents from Email

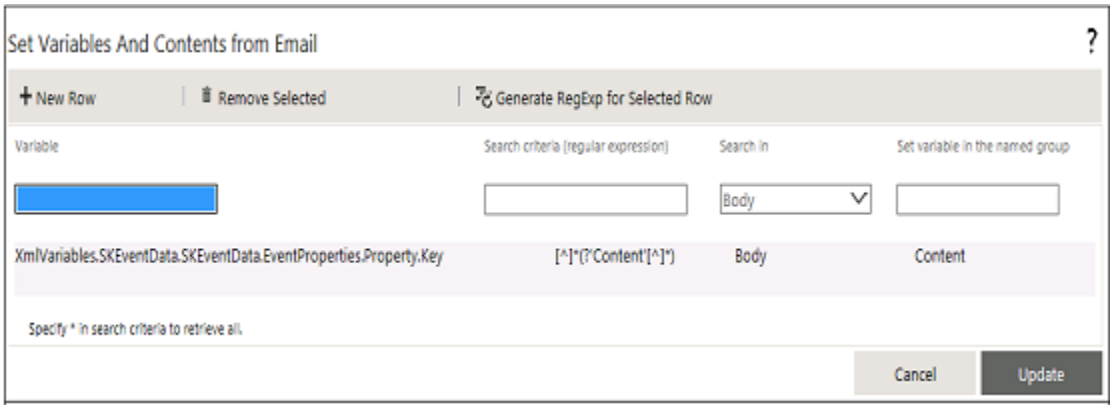
Set Variables And Contents from Email Property window

You can set the filter expression to filter the incoming email in this property window. To open this window, click the button for the 'Set Variables And Contents from Email' property.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.





The window has two tabs at the top to manage the rows of variable settings in the grid.

- **New Row** - You can click this tab to add the newly entered variable/content settings and display a new row to the grid where you can add another setting
- **Remove Selected** - You can click this tab to remove the variable/content selected in the grid
- **Generate RegExp for Selected Row** - You can click this tab to generate a regular expression for the search criteria. This displays the fields shown in the bottom half of the property window image. These fields are described later in the topic.

The grid has the following parameters that you need to specify for the new variable.

- **Variable** - You can select the variable, to which you wish to assign the data in the attachment, from the drop down for this field.
- **Search criteria (regular expression)** - You can enter a regular expression in this field to be used to search the email for data to be assigned to the variable/ content. Alternatively, you can click on the Generate RegExp for Selected Row tab to generate a regular expression.
- **Search in** - You can specify which part of the email should be searched by selecting an appropriate option from the drop down for this field. You can set the activity to search in the entire email, the subject, and the attachments among other options.
- **Set variable in the named group** - You can enter the name of a group, to which you can add the variable as a member, in this field.

Tip: You can specify "*" in the Search Criteria field to retrieve all the data.

When you click on the Generate RegExp for Selected Row it displays the following controls to generate the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

regular expression.

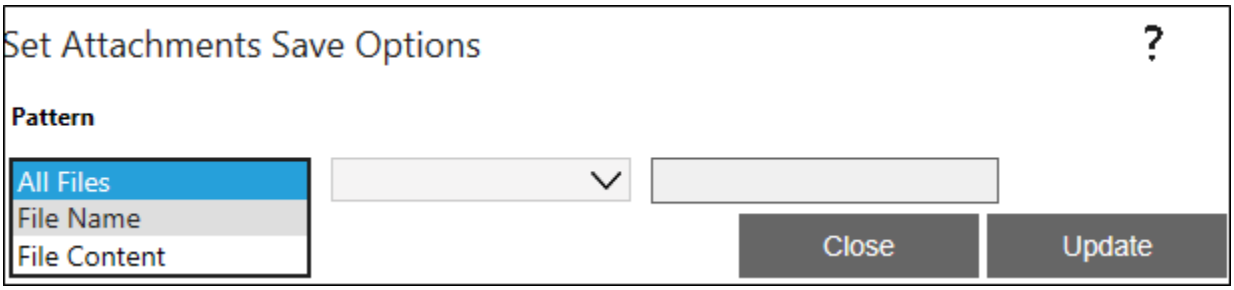
- **Start String** - You can specify the start string for the regular expression in this field.
- **Delimiter** - Start - You can enter the start delimiter for the regular expression in this field.
- **Delimiter** - End - You can enter the end delimiter for the regular expression in this field.
- **Generate** - You can click this button, after specifying the above values, to generate the regular expression.
- **Hide** - You can click this button to hide these fields.

There are two buttons at the bottom of the screen.

- **Update** - You can click this button to save the newly added variable/content settings.
- **Cancel** - You can click this to close the property window without saving the newly added settings.

Wait for Email: Attachment Save Options

You can set the options to save the email attachments in this property window. To open this window, click the button for the 'Attachment Save Options' property.



In user specified location, you have to append the mail id i.e, if user specified location is "C:\SkeltaMailAttachements\", then actual location will be "C:\SkeltaMailAttachements\<mailId>" .

Example

Location : c:\Temp\

Actual: c:\Temp\123 –(123 is last mailid)

This window has the following fields to specify the pattern to save attachments.

- The attachment drop-down field can be used to specify the attachment option by selecting the appropriate property from the drop-down field. You can choose to save all attachment files, specific files or file contents.
- The value type drop-down field can be used to specify the value type to assign to the option selected in the attachment drop-down field.
- The value text box/ drop-down field can be used to specify the pattern which matches with the "File Name" or "File Content" property selected in the attachment drop-down field. The control displayed here depends on the option selected in the value drop-down field. If you select "Value", a text box is displayed here, where you can enter the pattern directly. If you select Variable or Content, then a drop-down is displayed with a list of related collections. You can select the appropriate option from this drop-down field.

There are two buttons at the bottom of the screen.

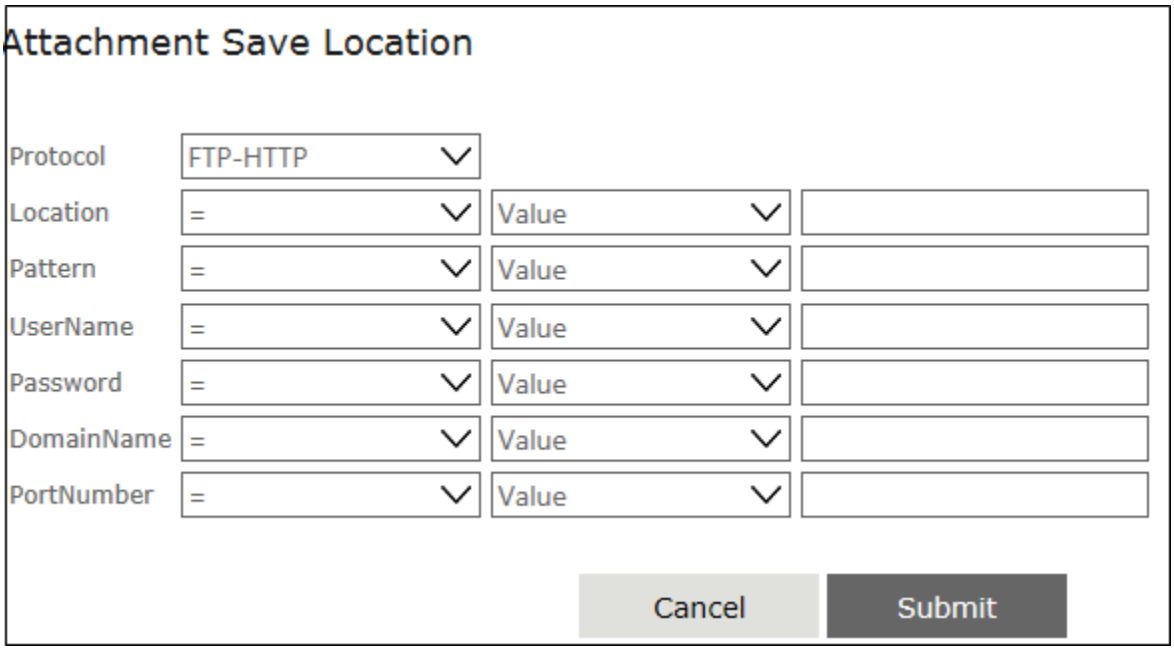
- **Update** - You can click this button to save the newly added pattern settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Close** - You can click this to close the property window without saving the newly added settings.

Wait for Email: Attachment Save Location

You can specify the details of the location to which the email attachment should be stored in this property window. To open this window, click the button for the **'Attachment Save Location'** property.



This window has the **Protocol** drop down where you can select the file transfer protocol.

Note: Email attachments can be stored only in *File* and *FTP* paths.

Below the **Protocol** drop down, it has controls to specify the following details.

- **Location** - You can specify the URI/UNC of the file or directory here.
- **Pattern** - You can specify the pattern to decide the file types to be saved like *.doc,*.xls, etc. in this field.
- **UserName** - You can specify the user name for the attachment save location here.
- **Password** - You can specify the password for the attachment save location here.
- **Domain** - You can specify the domain/machine of the attachment save location here.
- **PortNumber** - You can specify the port number of the attachment save location server.

Each of the above parameter fields has the following controls.

- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the parameter in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the parameter. The control displayed depends on the option selected in the preceding drop down. If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

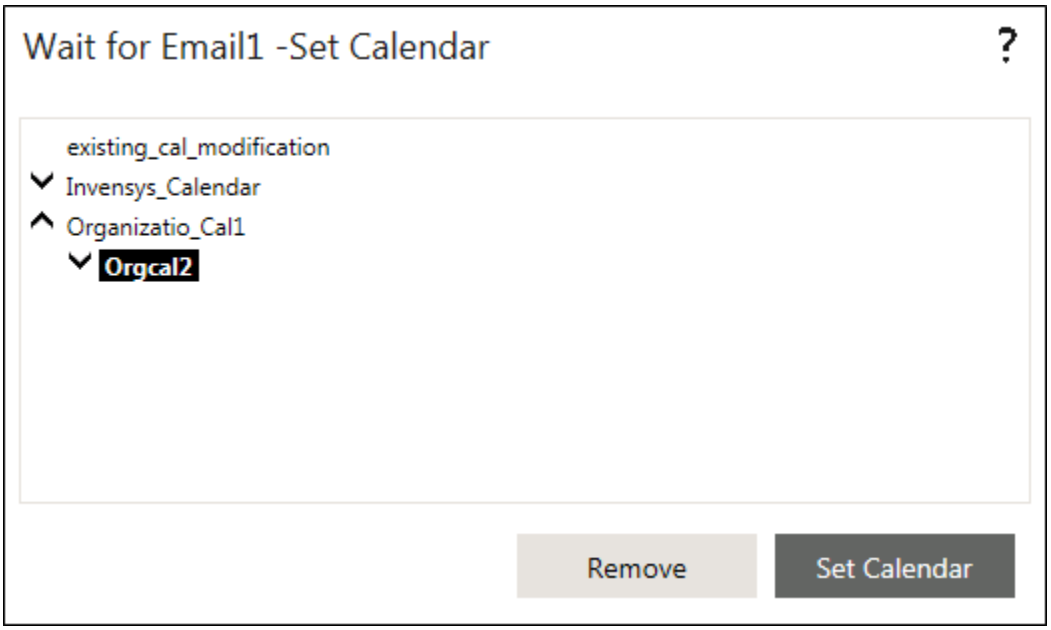
At the bottom of the window you will find the following buttons:

- **Submit** - You can click this button to save the parameters that have been specified.
- **Cancel** - You can click this button to cancel the settings and close this window.

Wait for Email: Set Variables And Contents from Email

Set Calendar for Timeout Property Window

You can set a Calendar to calculate the timeout for the Wait for Email activity in this property window. To access this window, click the button for the 'Set Calendar for Timeout' property.



This window lists the available calendars in a tree structure, with lower-level calendars nested within the respective top-level calendar. You can click a calendar to select it for setting.

There are two buttons in this window:

- **Set Calendar**: Set the selected calendar.
- **Remove**: Remove the selected calendar.

Wait for SMS Activity

Activity description:

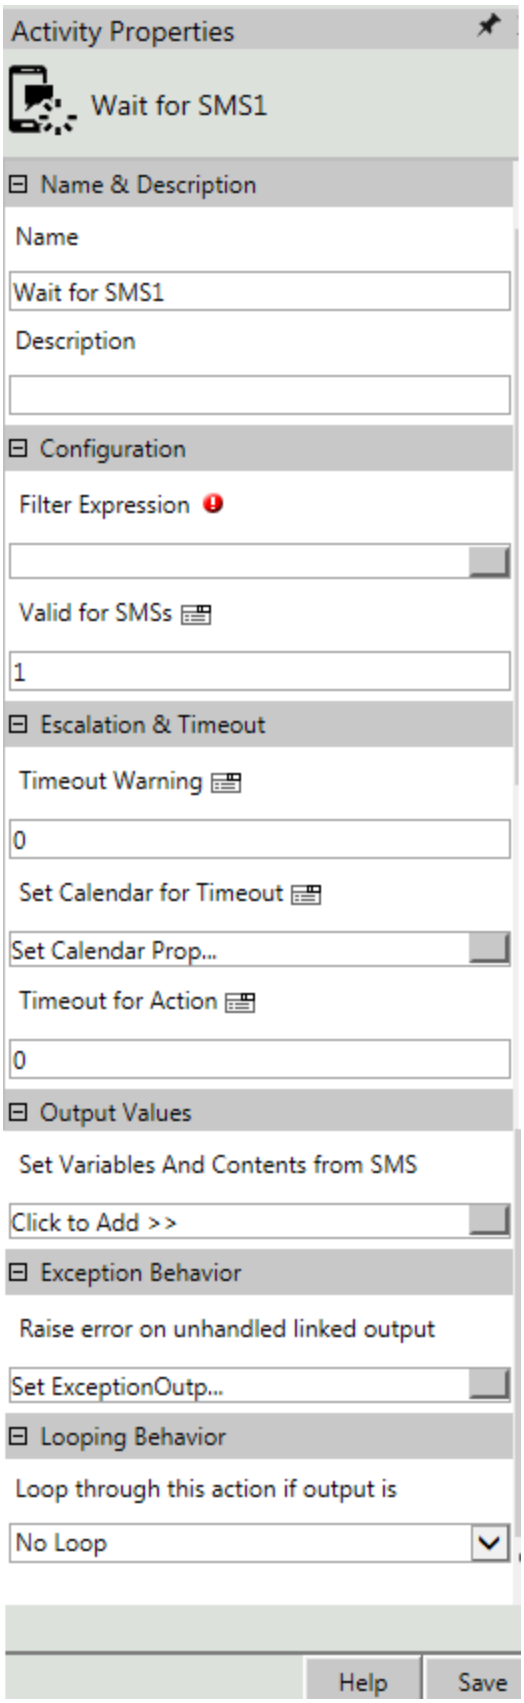
The Wait for SMS Activity can be used to wait for a number of SMSs for a particular time period, both of which can be set in the activity's properties. It can store SMSs (completely or partially) into specified variables. Depending on different property settings the activity will give different outputs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties:

The Wait for SMS activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the tool bar or by selecting the appropriate option from the right click menu for the Wait for SMS activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Filter Expression - This property is used to filter the incoming SMS. It will add an SMS filter. On execution, the SMTP Notification Engine will be notified about the newly added filter so that it will search for this pattern in the next SMS.

Property Type: Mandatory (This property must be set if the activity is to be assigned to any resource(s).)

Steps to set the Filter Expression property

1. To set the condition to filter the incoming SMS, click the button for the 'Filter Expression' property to open the property window.
2. In this window, build an expression to set the filter. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression in the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Wait for SMS: Filter Expression for a detailed description of the Filter Expression property window.

Valid for SMSs - This property is used to specify the number of SMSs for which the activity should wait. It indicates that the activity should wait till the specified number of SMSs are received.

Property Type: Optional (This property needs to be set only if required.)

Escalation & Timeout

The properties in the Escalation & Timeout group have been described below. You can use these properties to specify escalation and timeout settings for the activity.

Timeout Warning - This property is used for setting the Timeout warning.

Property Type: Optional (This property needs to be set only if required.)

Timeout for Action - This property is used for setting timeouts for this activity. If specified, the activity will be timed out after the specified time span.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if required.)

Output Values

The properties in the Output Values group have been described below. You can use these properties to specify the input values for the activity.

Set Variables And Contents from SMS - This property is used for assigning the SMS partly/fully to a variable or content.

Property Type: Optional (This property needs to be set only if required.)

Steps to set the Set Variables And Contents from SMS property

1. To set the filtered email can be to variables and contents, click the button for the 'Set Variables And Contents from Email' property to open the property window.
2. In this window, first select the variable from the **Variable** drop down.
3. Next specify the search criteria in the **Search criteria** field. You can either enter the regular expression directly or click on the **Generate RegExp for Selected Row** button to generate a regular expression.
4. If you click the **Generate RegExp for Selected Row** button it displays a set of fields and buttons at the bottom of the property window.
5. Specify the start string for the regular expression in the **Start String** field and **Start** and **End** delimiters in the corresponding text boxes of the **Delimiters** fields.
6. After specifying these values, click **Generate** to generate the regular expression.
7. Click **Hide** to hide these fields.
8. Specify where to search in by selecting an appropriate option from the **Search in** drop down. You can set the action to search in the entire email, the subject, and the attachments among other options.
9. Specify the name of a group to which the variable should belong in the **Set variable in the named group** field.
10. Click the **New row** tab to add the current search expression and display a blank row to add another expression.
11. If you need to remove any search expressions, you can select them and click **Remove selected**.
12. After specifying all the search parameters, click **Update** to save the new settings.

See Wait for SMS: Set Variables and Contents from SMS for a detailed description of the Set Variables And Contents from SMS property window.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Wait for SMS Activity returns the following values -

Timeout Warning: Displayed when a warning for timeout is to be generated.

Email Received(Waiting): Displayed when an SMS matching the specified filter condition is received

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Timeout: Displayed when the activity has timed out

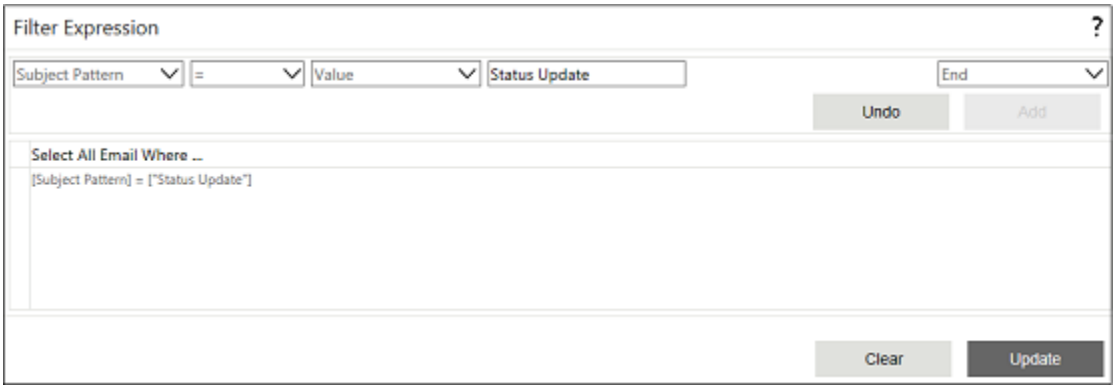
Exception Behavior

Each activity has the **Raise Error on Unhandled Linked Output** property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Wait for SMS: Filter Expression

You can set the filter expression to filter the incoming SMS in this property window. To open this window, click the button for the 'Filter Expression' property.



The window has a set of drop downs at the top to select the different parameters required to build the filter expression. You can also find related buttons next to the drop downs.

- The Attribute drop down - You can select the attribute to be used to filter the SMS, e.g., "Subject Pattern", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down. If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

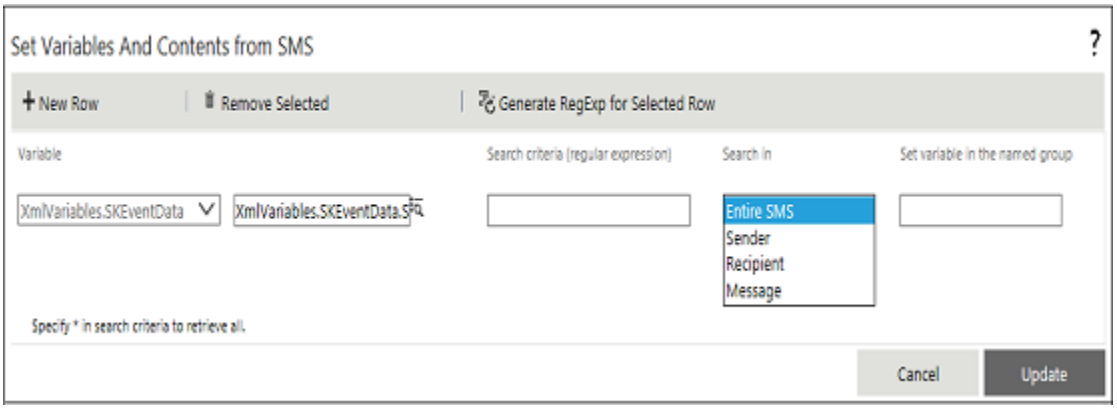
to build a new expression.

- **Update** - You can click this button to save the expression that has been added to the text area.

Wait for SMS: Set Variables and Contents from SMS

Set Variables And Contents from SMS Property window

You can set the filter expression to filter the incoming SMS in this property window. To open this window, click the button for the **'Set Variables And Contents from SMS'** property.



The window has two tabs at the top to manage the rows of variable settings in the grid.

- **New Row** - You can click this tab to add the newly entered variable/content settings and display a new row to the grid where you can add another setting.
- **Remove Selected** - You can click on this tab to remove the variable/content selected in the grid.
- **Generate RegExp for Selected Row** - You can click on this tab to generate a regular expression for the search criteria. This displays the fields shown in the bottom half of the property window image. These fields are described later in the topic.

The grid has the following parameters that you need to specify for the new variable.

- **Variable** - You can select the variable, to which you wish to assign the data in the attachment, from the drop down for this field.
- **Search criteria (regular expression)** - You can enter a regular expression in this field to be used to search the SMS for data to be assigned to the variable/ content. Alternatively, you can click on the **Generate RegExp for Selected Row** tab to generate a regular expression.
- **Search in** - You can specify which part of the SMS should be searched by selecting an appropriate option from the drop down for this field. You can set the activity to search in the entire SMS, Sender, Recipient, and the Message.
- **Set variable in the named group** - You can enter the name of a group, to which you can add the variable as a member, in this field.

Tip: You can specify "*" in the Search Criteria field to retrieve all the data.

When you click on the **Generate RegExp for Selected Row** it displays the following controls to generate the regular expression.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Start String** - You can specify the start string for the regular expression in this field.
- **Delimiter** - **Start** - You can enter the start delimiter for the regular expression in this field.
- **Delimiter - End** - You can enter the end delimiter for the regular expression in this field.
- **Generate** - You can click this button, after specifying the above values, to generate the regular expression.
- **Hide** - You can click this button to hide these fields.

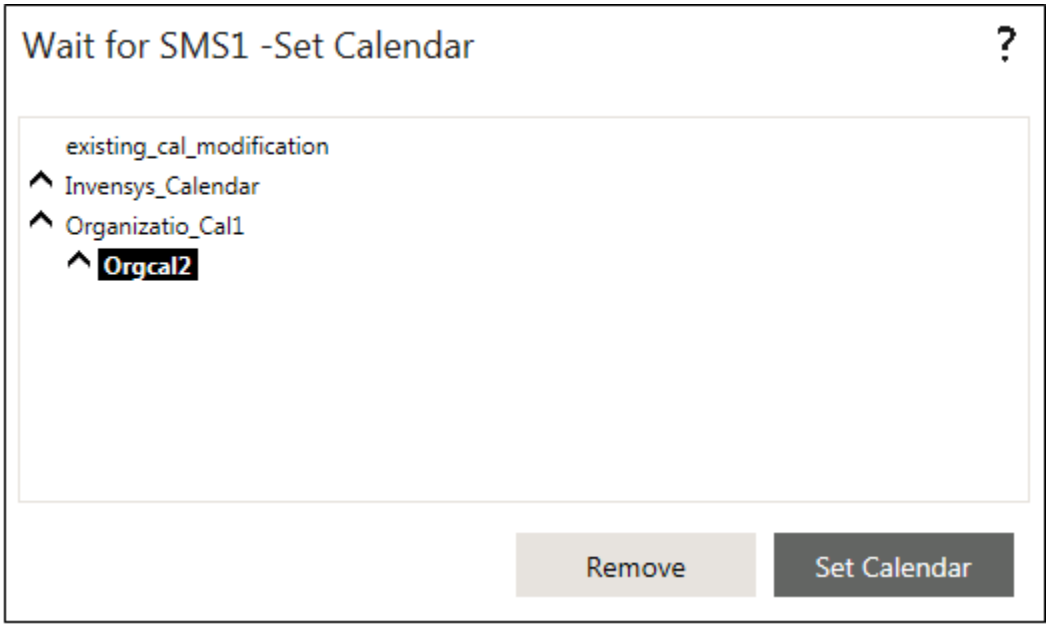
There are two buttons at the bottom of the screen.

- **Update** - You can click this button to save the newly added variable/ content settings.
- **Cancel** - You can click this to close the property window without saving the newly added settings.

Wait for SMS: Set Calendar for Timeout

Set Calendar for Timeout Property Window

You can set a Calendar to calculate the timeout for the Wait for SMS activity in this property window. To access this window, click the button for the 'Set Calendar for Timeout' property.



This window lists the available calendars in a tree structure, with lower-level calendars nested within the respective top-level calendar. You can click a calendar to select it for setting.

There are two buttons in this window:

- **Set Calendar**: Set the selected calendar.
- **Remove**: Remove the selected calendar

AVEVA Work Tasks Pro Push Notification Activity

Activity Description

The AVEVA Work Tasks Pro Push Notification activity is used to send notifications to the AVEVA Work Tasks Pro application. When this activity is added and configured in a workflow along with other activities which need human interaction, a notification is sent to the actor intimating the actor that action is required on the assigned task.

Activity Properties

Name and Description

The properties in the Name & Description are used to specify the name and description for the activity.

Name: This property is used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description: This property is used to specify a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group allows you to configure the functionality of the activity.

Recipient Resource: This property is used to configure the resources who have to receive the notification. A maximum of 16 resources can be configured as recipients to receive notification. If more than 16 resources are configured, then the 16 active resources will receive the notifications.

You can also build an expression to configure the recipient, this expression will be evaluated at runtime and the recipient will be configured.

Property Type: Mandatory (This property needs be set to add the recipients.)

For more information on Recipient Resource, see Configure Recipient Resource.

Notification Type: This property allows you to configure custom notification type based on the device and operating system used.

Property Type: Mandatory (This property needs to be set to configure the type of notification specific to a device.)

For more information on Notification Type Setting, see Setting Notification Type.

Message: This property allows you to configure the content of the notification message.

You can also build an expression to configure the notification message. The message will be updated dynamically at runtime.

Property Type: Mandatory (This property must be set to configure the content of the notification.)

Retry on Failure?: When this property is set to **Yes** and the notification is not sent, attempts to re-send the notification will be made based on the value defined in the Retry Count property.

By default it is set to **Yes**.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Retry Count: Number of re-tries that needs to be attempted to send the notification. The value specified for this property should be from 1 to 10 only.

Property Type: Optional (This property needs to be set only if necessary.)

Activity output is successful: This property lets you decide when the activity is successful. The available options are **If notification is sent to at least one device** and **If notification is sent to all devices**.

- When **If notification is sent to at least one device** is selected, the activity will be successful only when the notification is sent to at least one device.
- When **If notification is sent to all devices** is selected, the activity will be successful only when the notification is sent to all the devices

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property. Selecting one of the property shows all the default mapped error outputs that are configured in red with the respective check boxes selected.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Reference Topics

- Set Notification Type
- Mapped Error Outputs
- AVEVA Work Tasks Pro Push Notification Activity Scenarios

Configure Recipient Resource

The **Recipient Resource** property allows you to configure the users who have to receive the notification. A maximum of 16 resources can be configured as recipients to receive notification. If more than 16 resources are configured, then the 16 active resources will receive the notifications.

Different Methods of Assigning an Recipient Resource

Assigning an Recipient by building an expression:

Filter Condition is the default option that is selected when the Recipient Resource is accessed. This option allows you to build an expression to identify the Recipient. The section below explains how you can choose different parameters required to build and expression.

- The Providers list - You can select the required provider from the Providers list.
- The Attribute list - You can select the attribute to be used to identify the Recipient. For example, "AdministratorId", in this list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The Operator list - You can select the operator for the expression here. E.g., "="
- The Value type list - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/list - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding list.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a list instead of the field. This list will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator list - You can select logical operators from this list to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

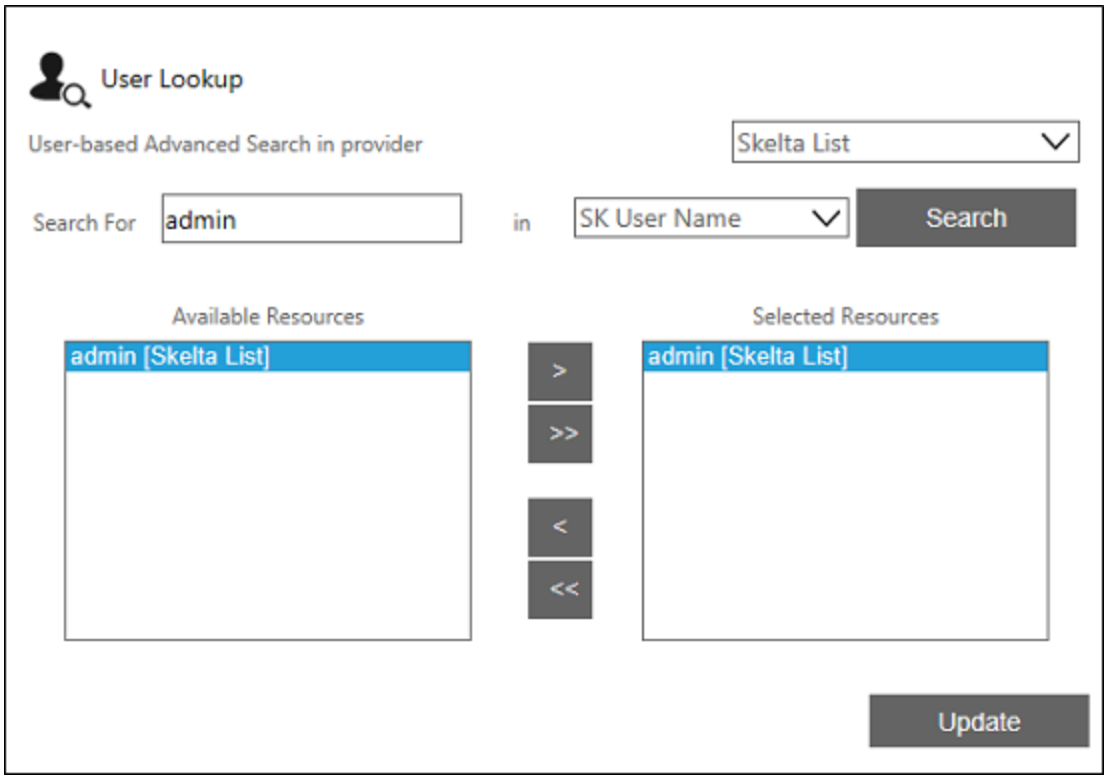
- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

Assign an Recipient Resource through User Lookup

Through the **User Lookup** you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an Recipient Resource through User Lookup

1. Select the **User Lookup** option. The **User Lookup** dialog is displayed.
2. Search and select the required user.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



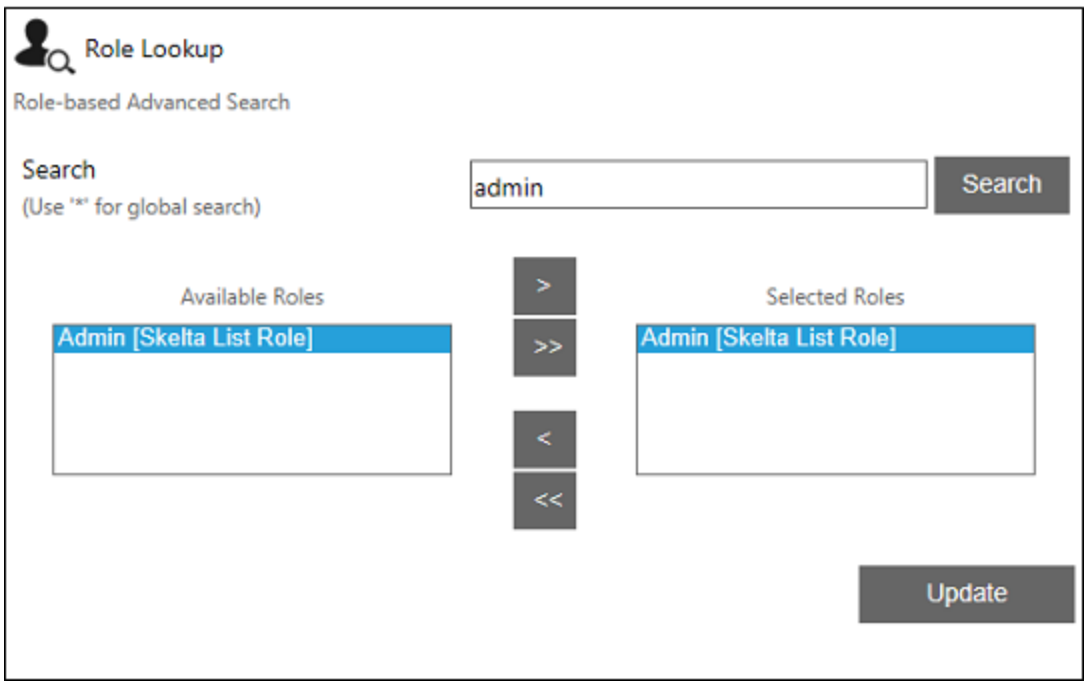
3. Click **Update** in the **User Lookup** dialog. In **Recipient Resource**, you will see that an expression is displayed.
4. Click **Update** in **Recipient Resource** to update the selected user in the **Recipient Resource** property.

Assign an Recipient Resource through Role Lookup

Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area.

1. Select the **Role Lookup** option. The **Role Lookup** dialog is displayed.
2. Search and select for the required role.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click **Update** in the **Role Lookup** dialog and verify the Recipient Resource. In **Recipient Resource**, you will see that an expression is displayed.
4. Click **Update** in **Recipient Resource** to update the **Recipient Resource** property.

Assign an Recipient Resource through Workflow Initiator

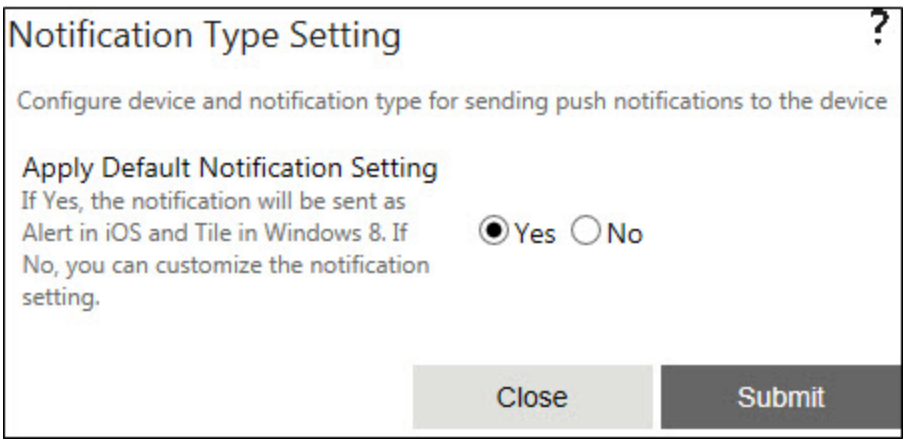
Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Recipient Resource.

Set Notification Type

In **AVEVA Work Tasks Pro Push Notification Activity**, you can configure different types of notification based on the device being used. You can choose to continue with the default notification type or customize the notification type.

To use the default notification type, set the option **'Apply Default Notification Setting'** as **Yes**. Default notification for iOS is **Alert** and for Windows 8.1 it is **Tile**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Configuring Custom Notification Type

1. Click the edit icon in **Notification Type** property. The **Notification Type Setting** is displayed.
2. Select **No** for the option **'Apply Default Notification Setting'**. The option of **Device and Notification Type** is now available for selection.

   The default selection for the option **'Apply Default Setting'** is **Yes**.
3. Select the operating system used on your device and then select the **Notification Type**.
   - iOS operating system, supports only the default notification specific to iOS.
   - For Windows 8.1 operating system, the available notification types are **Tile** and **Toast**
     - When **Tile** is selected the notifications are displayed on tile of the application
     - When **Toast** is selected the notifications are displayed as pop-up notifications

Note: Push Notification activity will continue to execute successfully even after unregistering for notification from the **Farm Configuration Wizard**. In such cases, unpublish the workflow, unregister for notification from the **Farm Configuration Wizard**, and then republish the workflow.

AVEVA Work Tasks Pro Push Notification Activity Scenarios

Activity in waiting state

The activity will be in waiting state, when the first attempt to send notification fails and the property **Retry on Failure** is set to **Yes**.

When the first attempt by the activity to send the notification fails, an entry is made into the database. This entry is read by the **ArchestrA Mobile Notification Service** which in turn attempts to re-send the notification based on the value entered in the **Retry Count** property.

The activity will be completed only after all the attempts to retry the notifications are made.

Activity output is successful when Recipient Resource is inactive/blocked/not logged in

When multiple recipient resources are configured in the AVEVA Work Tasks Pro Push Notification Activity and one or more recipient is inactive/blocked/not logged in, the activity will be considered as successful if the notification is sent to all other active recipients.

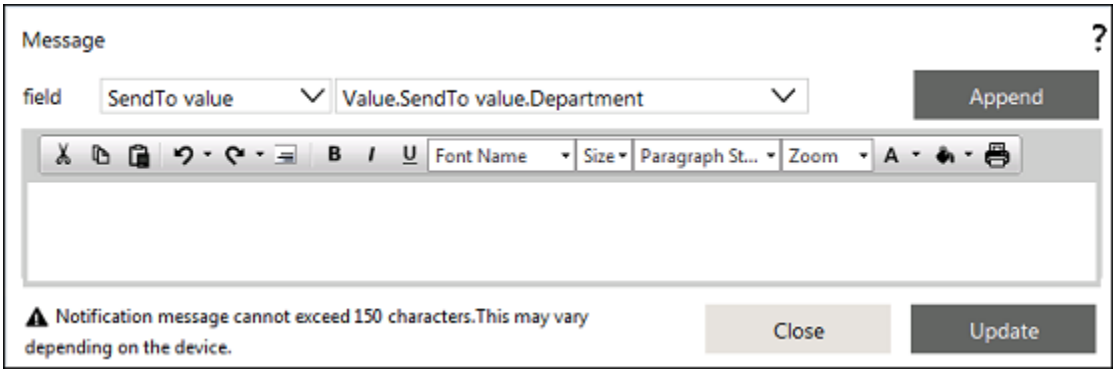
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Unsuccessful activity output scenarios:

- First attempt to send notification fails and **Retry on Failure** is set to **No**.
- When **Retry on Failure** is set to **Yes** and **Activity is successful** is set to **If notification is sent to at least one device:** If notification is not sent to any device even after consecutive attempts to resend notification based on the value specified in **Retry Count**.
- When **Retry on Failure** is set to **Yes** and **Activity is successful** is set to **If notification is sent to all devices:** If notification is not sent to one or more devices even after consecutive attempts to resend the notification based on the value specified in **Retry Count**.

Configure Notification Message

Use the **Message** property to configure the content of the notification message.



You can also build an expression to configure the notification message. The message will be updated dynamically at runtime.

For iOS devices, the notification message can have a maximum of 150 characters. In Windows 8.1 devices, if the notification message exceeds 208 characters, then the notification message is truncated. In both iOS and Windows 8.1 devices, the notification message is displayed in plain text, hence all html tags are removed.

BPMN Elements

The following activities are found under BPMN Elements:

- **Placeholder**: The Placeholder Activity is used as a placeholder for the BPMN events.
- **Gateway Placeholder**: The Gateway Placeholder Activity is used as a placeholder for the ccccN Gateway event.
- **Group Box**: The Group Box Activity is used as a marker for activity groups.
- **Intermediate Event Placeholder**: The Intermediate Event Placeholder Activity is used as a placeholder for the BPMN Intermediate events.
- **Lane**: The Lane Activity is used to create a swim-lane in the process model.
- **Pool**: The Pool Activity is used to create a Pool in the process model.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Gateway Placeholder

Activity description

The Gateway Placeholder Activity is used as a placeholder for the ccccN Gateway event.

Activity Properties

The Gateway Placeholder activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the context menu for the Gateway Placeholder activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Gateway Placeholder Activity does not return any value.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Group Box

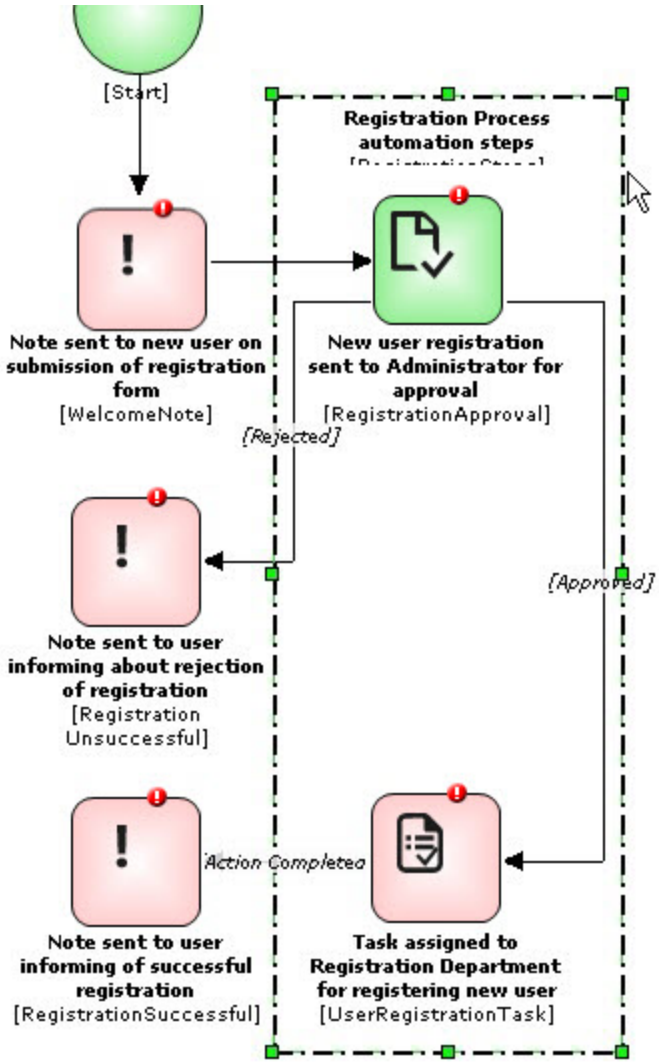
Activity description

The Group Box Activity is used as a marker for activity groups.

Application Scenarios

The Group Box activity is a useful tool for process modeling. It can be placed around a set of activities in the process to denote a group of related activities. This helps to streamline the process diagram. In the image shown below the Group Box identifies the registration processing steps in the diagram.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Sample Group Box

Activity Properties

The Group Box activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking the Activity Properties tool in the tool bar or by selecting the appropriate option from the context menu for the Group Box activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Group Box Activity does not return any value.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Intermediate Event Placeholder

Activity description

The Intermediate Event Placeholder Activity is used as a placeholder for the BPMN Intermediate events.

Activity Properties

The Intermediate Event Placeholder activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the tool bar or by selecting the appropriate option from the context menu for the Intermediate Event Placeholder activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Intermediate Event Placeholder Activity does not return any value.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

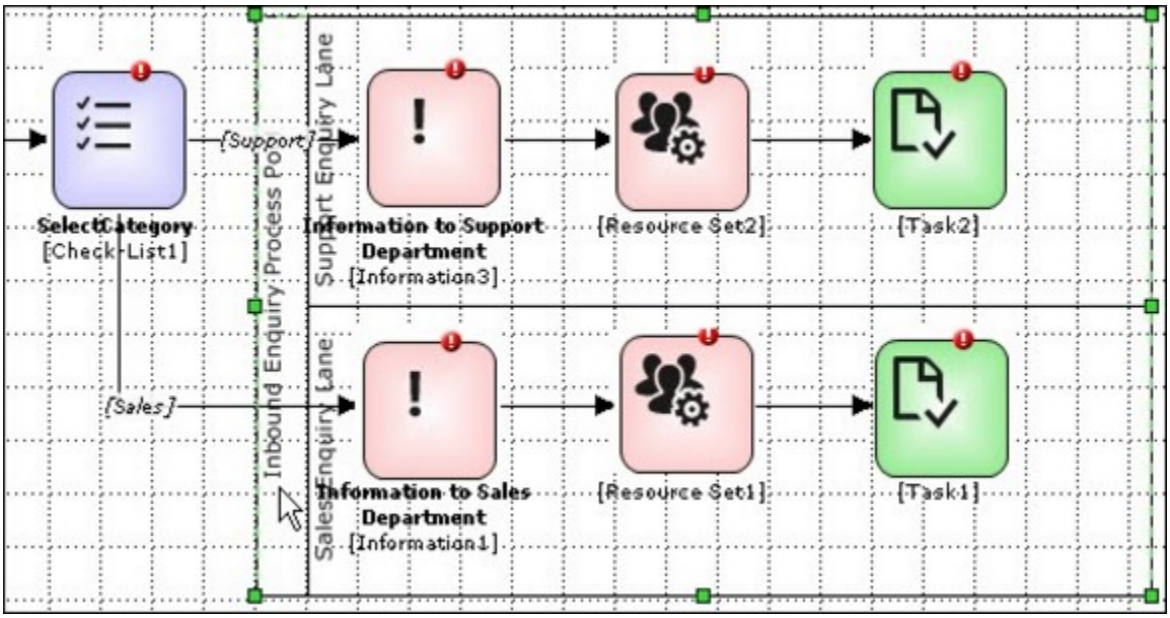
Lane

Activity description

The Lane Activity is used to create a swim-lane in the process model.

Application Scenarios

The Lane activity is a useful tool for process modeling. It can be placed around a set of activities in the process to denote a swim-lane in a process execution pool. This helps to streamline the process diagram. In the image shown below there are two lanes representing two types of enquiries handled in the process, i.e. Support Enquiry and Sales Enquiry.



Sample Lanes in a Pool

Activity Properties

The Lane activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking the Activity Properties tool in the tool bar or by selecting the appropriate option from the context menu for the Lane activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Lane Activity does not return any value.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Placeholder

Activity description

The Placeholder Activity is used as a placeholder for the BPMN events.

Activity Properties

The Placeholder activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking the Activity Properties tool in the tool bar or by selecting the appropriate option from the context menu for the Placeholder activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Miscellaneous

The properties in the Miscellaneous group have been described below. You can use these properties to specify the web service details.

Action Output - This property allows the user to specify the action output(s) for the BPMN Placeholder activity.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Action Outputs property

1. To specify the action output, click button for the 'Action Output' property to open the property window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. In this window, enter the action output value in the **Output String** field.
3. After entering the details, click **Add Row** to add this action output setting and display a new row.
4. Remove rows if necessary by selecting them and clicking **Remove Selected**.
5. After setting the action output settings, click **Update**.

See Placeholder - Action Outputs for a detailed description of the Action Outputs property window.

Activity outputs:

The Intermediate Event Placeholder Activity does not return any value.

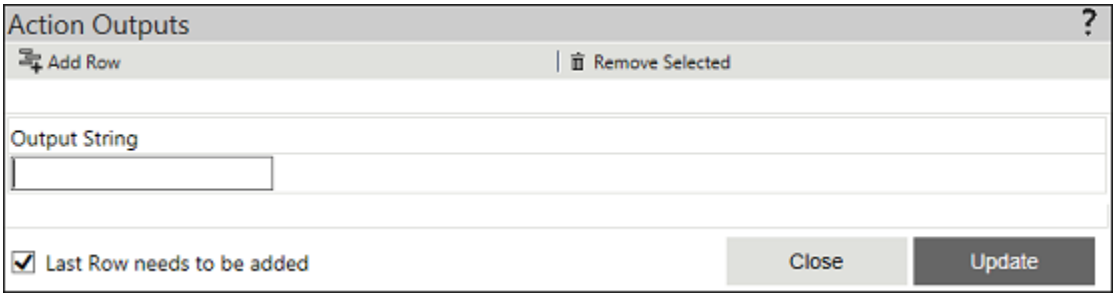
Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Placeholder: Action Outputs

You can set the Action Outputs settings in this property window. To open this window, click the button for the 'Action Outputs' property. It displays the timer settings in a grid, which also has a blank row where you can enter the settings for new Action Outputs.



The window has two tabs at the top to manage the rows of Action Outputs settings in the grid.

- **Add Row** - You can click this tab to add the newly entered settings and display a new row to the grid where you can add another setting.
- **Remove Selected** - You can click this tab to remove the Action Outputs settings selected in the grid.

The grid has the following parameters that you need to specify for the new Action Outputs setting.

- **Action Outputs** - You can enter the output message for this activity in this field.

There are two buttons and a check box at the bottom of the screen.

- **Update** - You can click this button to save the newly added Action Outputs settings.
- **Close** - You can click this to close the property window without saving the newly added Action Outputs settings.
- **Last Row needs to be added** - You need to select this check box to save the last row added.

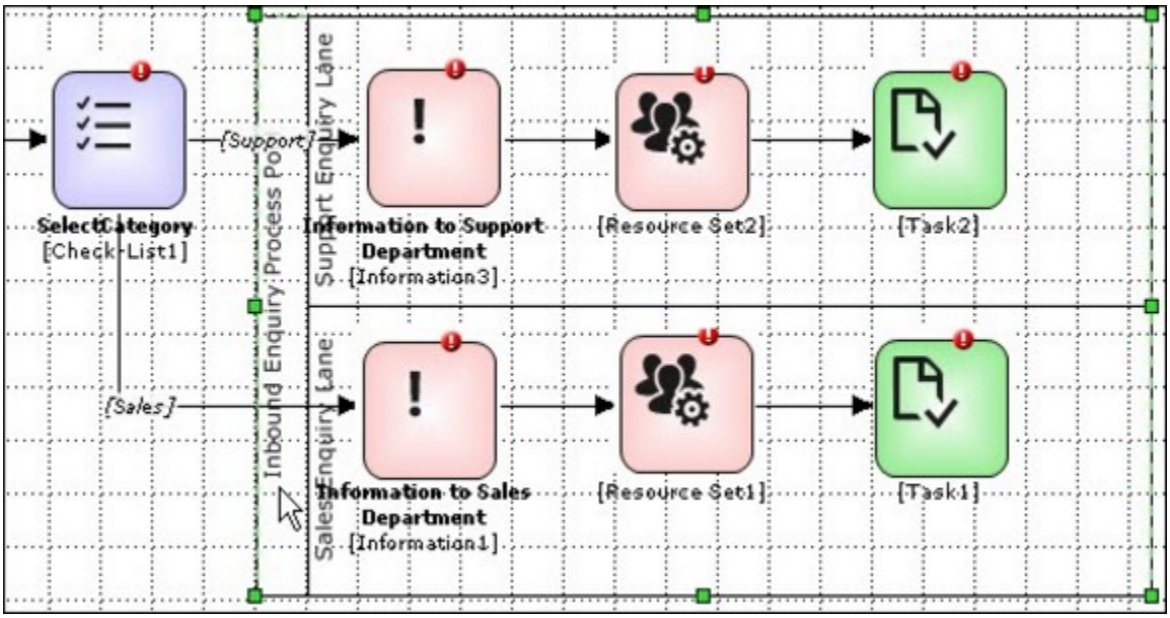
Pool

Activity description

The Pool Activity is used to create a Pool in the process model.

Application Scenarios

The Pool activity is a useful tool for process modeling. It can be placed around a set of activities in the process to denote a process execution pool. This helps to streamline the process diagram. In the image shown below, the Pool represents the enquiry handling process with two swim-lanes representing the two types of enquiries handled in the process, i.e. Support Enquiry and Sales Enquiry.



Sample Pool

Activity Properties

The Pool activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the context menu for the Pool activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Pool Activity does not return any value.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

List Activities

There are two activities under List Activities:

- **List Navigator Activity**: The List Navigator activity is used to change the scope of the XML List XML variable during the workflow execution.
- **Wait for Event Activity**: The Wait for Event Activity is used to wait for list events and list item events like creating workflows, publishing workflows, creating users etc.

List Navigator Activity

Activity Description

The List Navigator activity is used to change the scope of the XML List XML variable during the workflow execution.

Usage Scenario

Telematics Project Managers can submit ad hoc requests for list of overdue tasks assigned to all team members. The request triggers a workflow that goes through every item in the Task List to build a report of tasks with overdue status.

Activity Properties

The List Navigator activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking the Activity Properties tool in the tool bar or by selecting the appropriate option from the right-click menu for the List Navigator activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Display Name - This property specifies the name to be displayed for the activity in the Web Work Item List.

Property Type: Optional (This property need not be set if the display name is already configured in the Actions.xml. The name entered here overrides any display name that is configured for this activity in the Actions.xml file.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

XMLVariable of List Type - This property is used to select the XML variable of List type (XML List).

Property Type: Mandatory

Steps to set the XMLVariable of List Type

Select an XML variable from the XMLVariable of List Type drop-down list.

See XML List Navigator Activity - XMLVariable of List Type for a detailed description of the XMLVariable of List Type property window

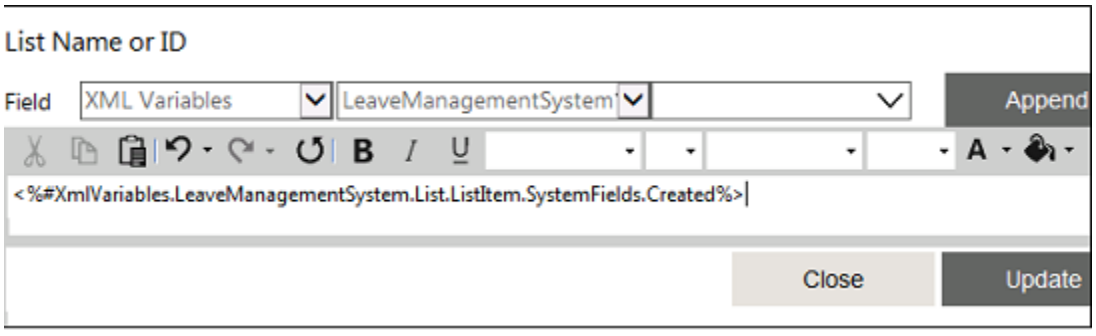
.

List Name or ID - This property is used to specify the list name.

Property Type: Optional

Steps to set the List Name

1. To specify the list name, click edit button for the 'ListName' property to open the property window.
2. In this window, enter the list name directly in the text editor.
3. If you want to customize the list name, you can do so using the **Field** controls to add workflow property values. For example, to select the XMLVariable. you can do as follows: Select "XML Variables". Select the XML variable from where you want to fetch the list name and then select respective node which is expected to have the values from the drop downs for **Field** and click **Append**. This will add the placeholder for the XMLvariable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the list name.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the list name, click **Update** to save it.
7. Click **Close** to close the window without saving the list name.
8. Click **Save** to save the XML variable in the **Activity Properties** window.

See List Navigator: List Name or ID for a detailed description of the List Name property window.

Folder Name - Enter the folder name.

Property Type: Optional (This property needs to be set only if necessary.)

Scope - This property allows you to change the scope of the XML variable during the workflow execution.

Property Type: Optional

Steps to set the Scope

1. Select the option from the **Scope** drop-down list.
2. If **Current** option is selected, you can fetch the current item which was alerted in the workflow.
3. If **New** option is selected, you can add new item to the list.
4. If **List Query** option is selected, you can build the list query to fetch the items.

List Query - This property is used to build the query for the list.

Property Type: Optional

Steps to set the List Query

1. To build the list, click the edit button for the 'List Query' property to open the property window.
2. You can also enter the query directly in the text editor.

   Note: While building query to fetch the items, you need to specify the table name with column name in a Where clause. For example, SKEUsers.Title="AVEVAWorkTasks";
3. You can also build the query using dynamic Query builder.
4. Click the query builder icon to build the query. See List Navigator Activity - Query Builder for a detailed description of the List Query builder window.
5. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
6. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
7. After adding the list name, click **Update** to save it.
8. Click **Close** to close the window without saving the query.
9. Click **Save** to save the XML variable in the **Activity Properties** window.

See List Navigator: List Query for a detailed description of the List Query property window.

Note:
- For executing the List Query following user information is considered for security:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

-- If the Workitem Context is available for the List Item, it will consider the workitemactorid as the user id.
-- If the Workitem Context user id is unavailable, then the System user configured for the Repository is considered.
-- If the System user is not configured for the Repository, then it will consider the currently logged-in user id.
- Make sure the user has administrator rights in the AVEVA

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The List Navigator Activity returns the following values -

Action completed: Triggers this output when action is completed.

List Item Not Found: This output will be given for the activity, when the list query specified does not return any items.

Note: Enable Errors Encountered Output property of **List Navigator** should be set as No to capture this output.

Exception Behavior

These options of Wonderware Skelta BPM 2009 have now been integrated with **Raise Error on Unhandled Linked Output** and **Exception Email Template Configuration** in the latest version of the product.

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Outputs for more details.

Property Type: Optional (This property needs to be set only if necessary.)

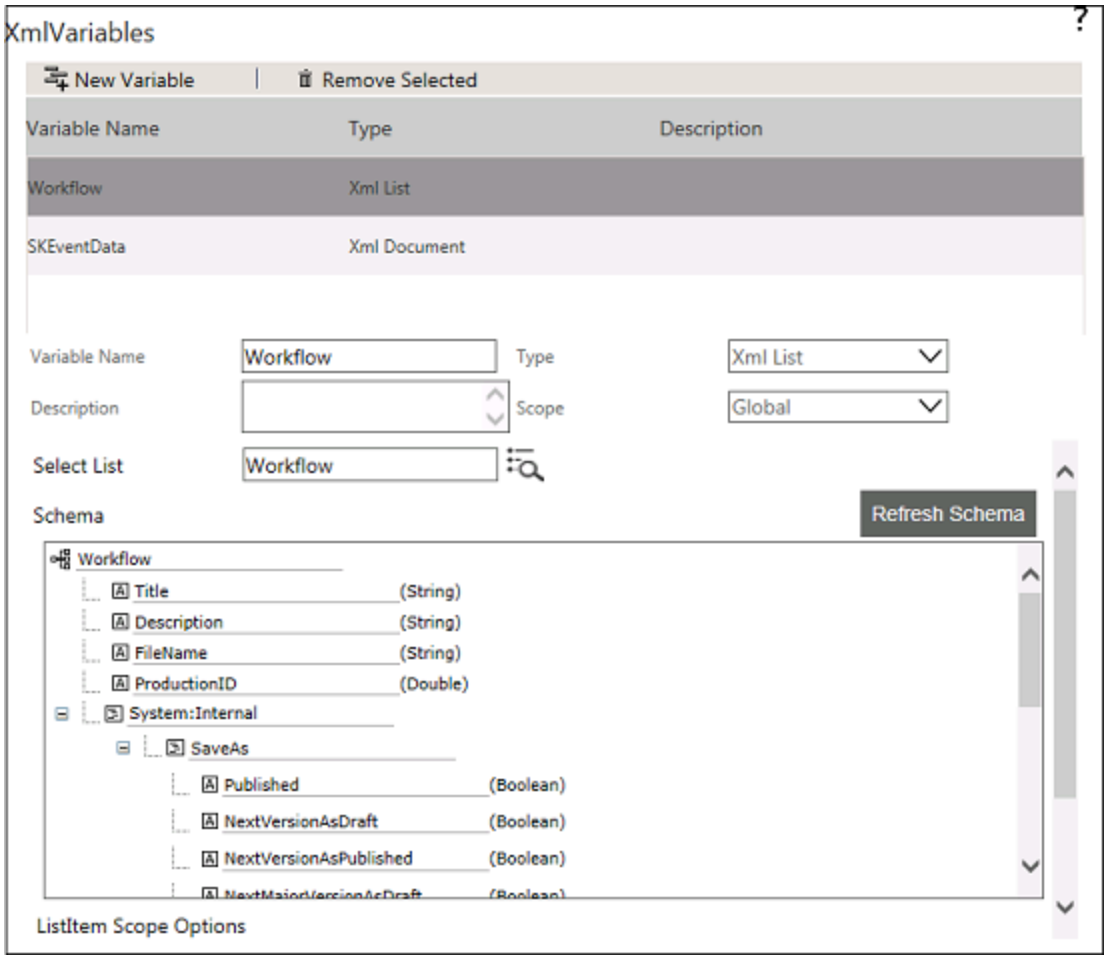
XML List Navigator Activity - XMLVariable of List Type

XML Variable of List type can be configured in the Start activity through the XML Variable property. XMLVariable of List typed can be mapped to any list schema i.e. either to lists provided out of the box or to lists created dynamically using create list option, to perform retrieval of data of a list item.

To get XMLVariable of List Type in the drop-down list, do the following steps:

1. Log on to the **Enterprise Console**.
2. Select **Workflows** from the Enterprise Console menu.
3. Click **New**, and then click **List** to design a list workflow.
4. Create the workflow.
5. In the Process Designer, open **Activity Properties** of the **Start** activity.
6. Click **xmlVariables** property to configure XML Variable of List type. The following screen appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



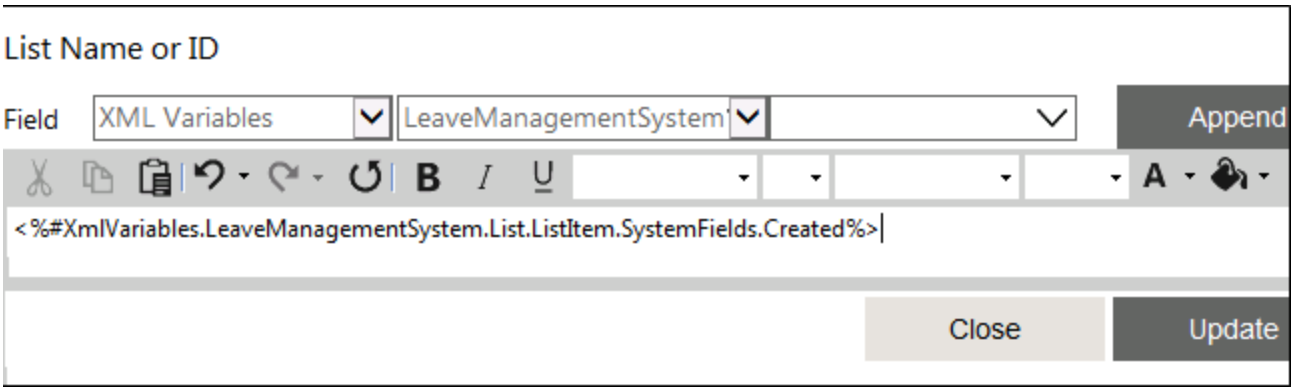
7. Click **New Variable** to create a XMLVariable of type XML List.
8. Enter variable name in the **Variable Name** textbox.
9. Select **XML List** from the Type drop-down list.
10. Enter the List name or click the icon to select the list.
11. Select **Current** option to work on current item which alerted the workflow or Select **New** option to add new item to the list.
12. Click Save Variable to save the created XML variable of List type.
13. Now Right-click on List Navigator activity and select the **Activity Properties**.
14. The above created XML variables will be listed in the XMLVariable of List Type. Now you can select the required **XML variable from the XMLVariable of List Type** drop-down list.

Note: The XML List XML variable can have work on following scopes
Current - This scope allows you to fetch the current item which was alerted in the workflow.
New - This scope allows you to add new item to the list.
List Query - This scope allows you to fetch items as per the query.

List Navigator: List Name or ID

You can specify a list name for the list in this property window. To open this window, click the edit button for the 'List Name' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the list name. You can do this either by entering a discrete value directly in the text editor or by using the Field controls at the top of the window. These controls are described below:

- The List value type drop down - You can select the type of list value here. You can specify SendTo, Variable, Content, or XMLVariables here.
- The Value text box/drop down - You can specify the actual name of the list. You can select the list name from the drop-down list.
- **Append** - You can click this button to add the specified list variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the list name or ID. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

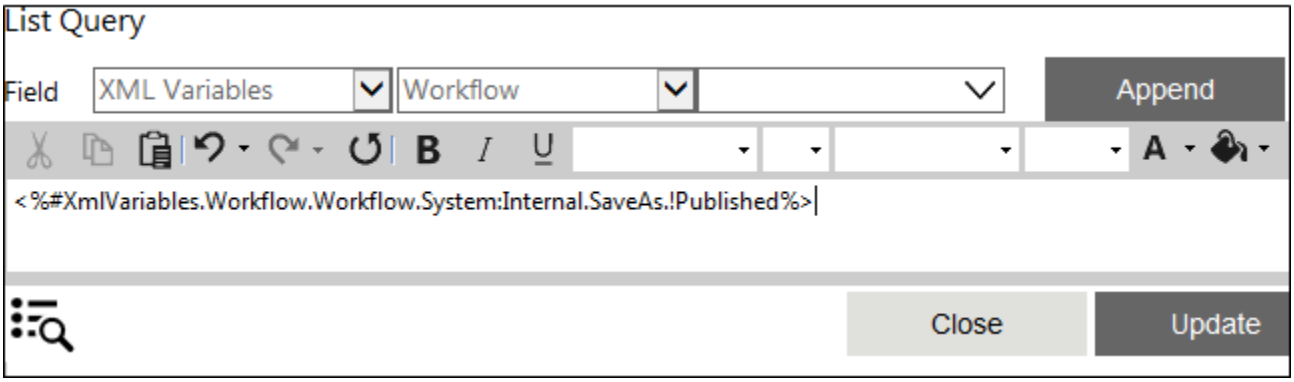
At the bottom of the window you will find the following buttons:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Update** - You can click this button to save the list name or ID
- **Close** - You can click this button to close this window

List Navigator: List Query

You can build query for the list in this property window. To open this window, click the edit button for the 'List Query' property.



The window has a text editor to build the query for the list. You can do this either by entering a discrete value directly in the text editor or by using the Field controls at the top of the window. These controls are described below:

- The List value type drop down - You can select the type of list value here. You can specify SendTo, Variable, Content, or XMLVariables here.
- The Value text box/drop down - You can specify the actual name of the list. You can select the list name from the drop-down list.
- **Append** - You can click this button to add the specified list variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the list name or ID. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

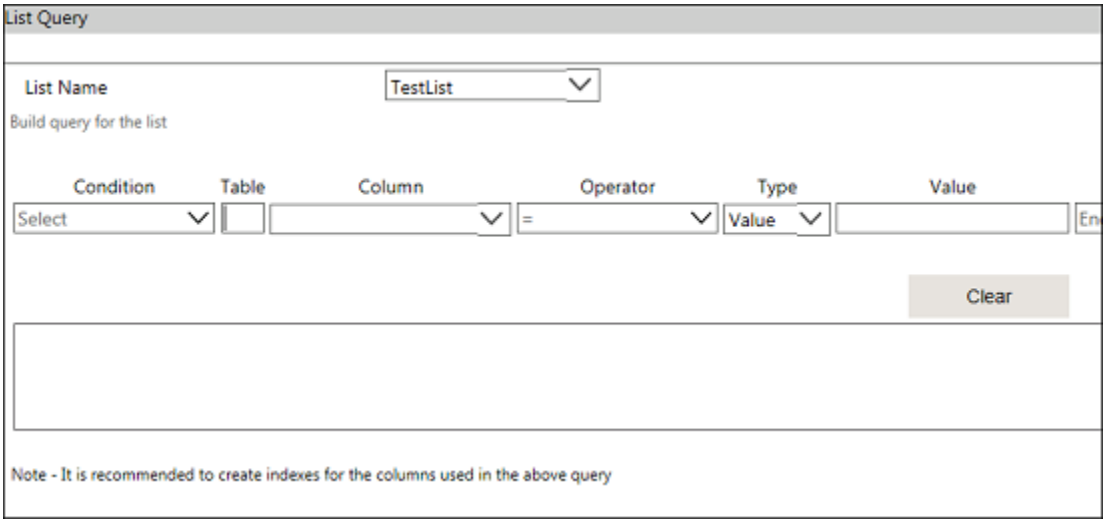
At the bottom of the window you will find the following buttons:

- **Query Builder**- You can click the query builder icon to build the query. See List Navigator: Query Builder for building query. To replace or change the existing query, delete the existing query, and then click on the **Query Builder** icon to enter the new query.
- **Update** - You can click this button to save the list name or ID.
- **Close** - You can click this button to close this window.

List Navigator: Query Builder

You can build query in this window.

To open this window, click the icon for the 'List Query' property.



The following are the field values for List Query window:

- **List Name** - Select the list from List Name drop-down list.
- **Table** - By clicking on this textbox, a pop up allows you to select the corresponding table for query. The respective table name will display in the pop up window based on the list selected by the user.
- **Column** - You can select this drop-down list to select the column or field of the corresponding list.
- **Operator** - You can select this drop-down list to select an operator (either one of =,>, <,>=, <=, <>, IN, Not IN, Like) to build the query.
- **Type** - You can select this drop-down list to select a type. The value is automatically displayed in the textbox.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

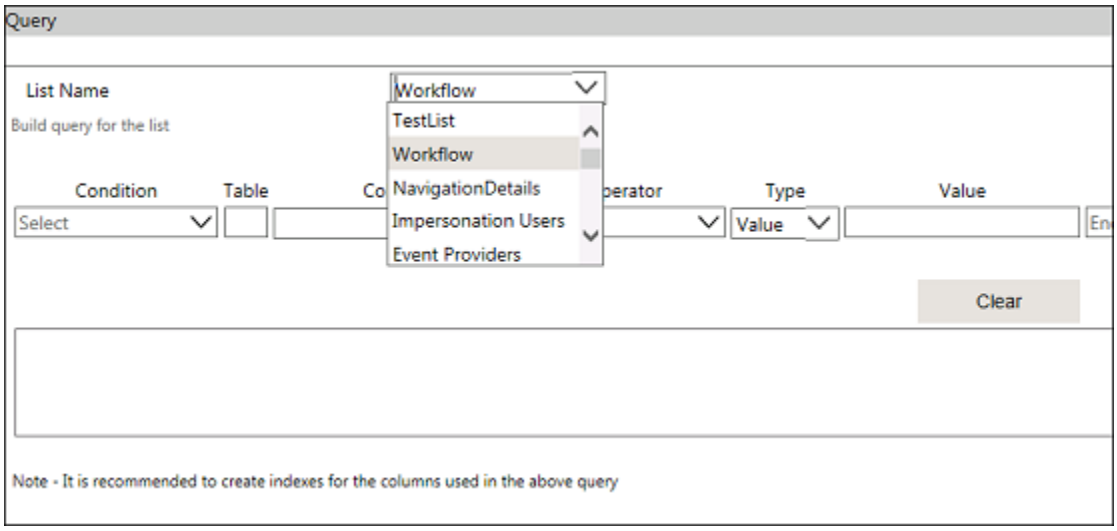
- **Condition** - You can select this drop-down list to select the condition [either of End, And, Or, '),' '('].
- **Add** - You can click this button to add a query in the field.
- **Clear** - You can click this button to clear the query contents.
- **OK** - You can click this button to save this query.
- **Close** - You can click this button to close this window.

Example:

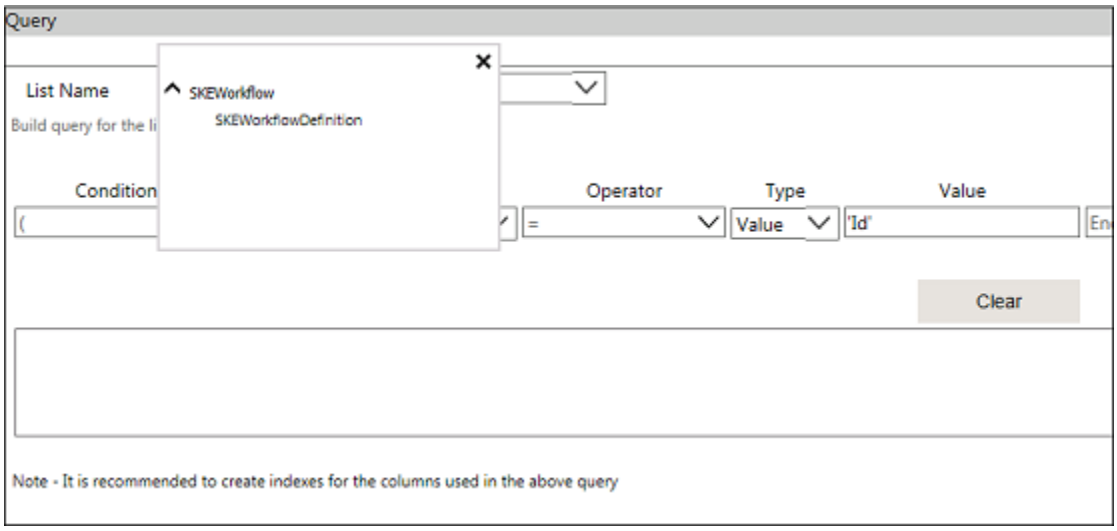
Retrieve the records whose title is starts from 'C' and 'B' in Product Categories list.

The following steps to be performed:

1. Click the icon to build the query for the list 'Product Categories'.
2. Select a list name from the **List Name** drop-down list.

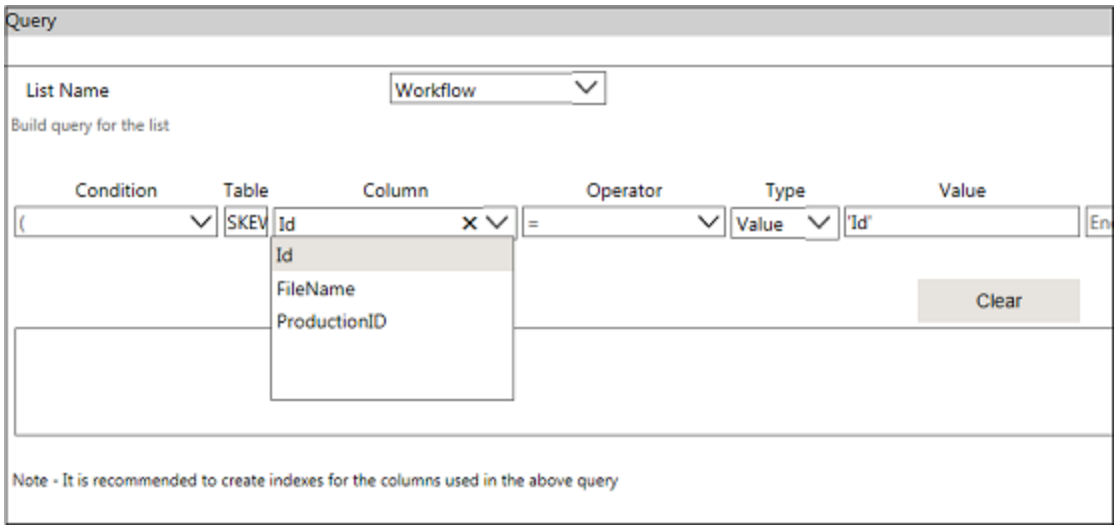


3. Click on **Table**, the pop up window allows to select the table from the available list.

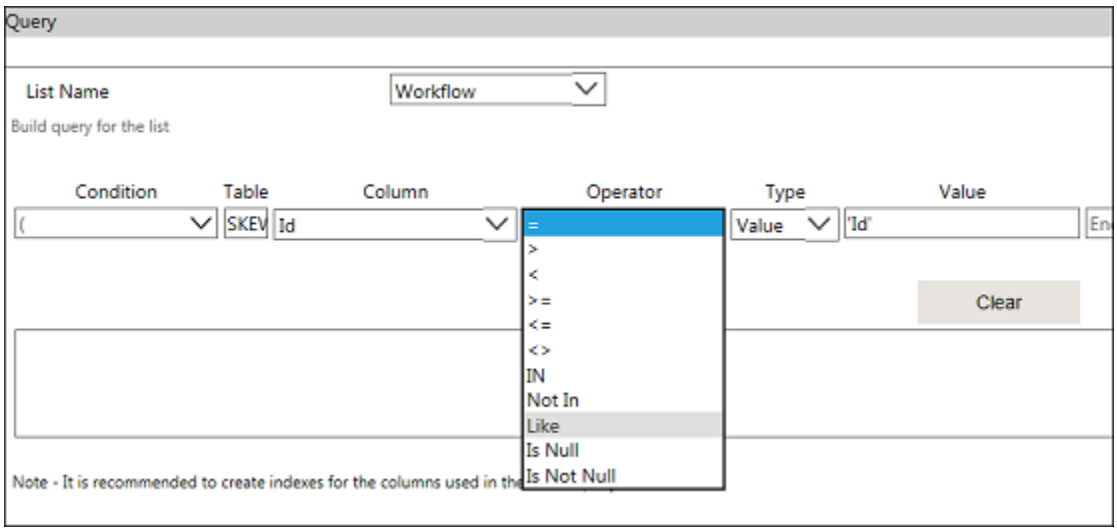


4. Select the table name. The table name appears in the textbox.
5. Select the column name from the **Column** drop-down list.

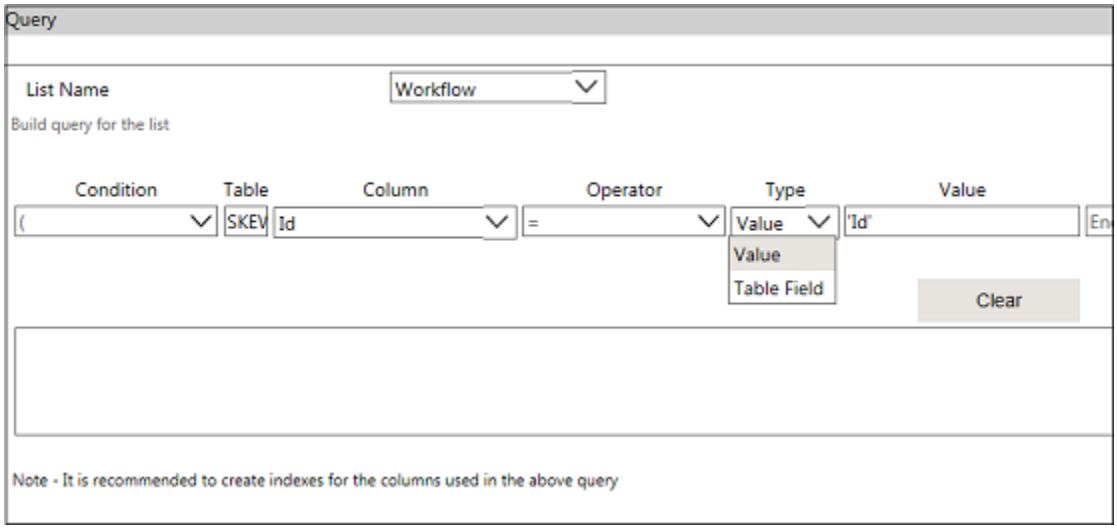
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



6. Select an operator from **Operator** drop-down list.



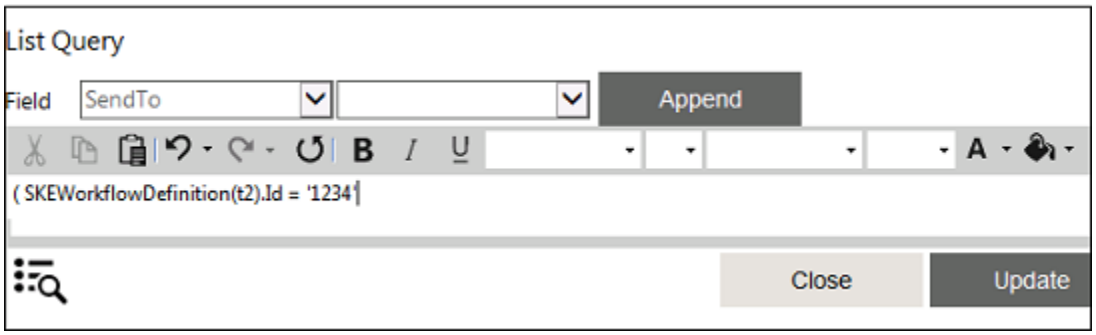
7. Select a type from the Type drop-down list.



8. Type a value in the **Value** textbox.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Select a condition operator from the **Condition** drop-down list.
10. Click **Add** to add the condition in textfield.
11. Repeat the steps if required.
12. Click **OK** to save the query. The build query appears in the List Query window.



13. You can replace the value for the query, with variables. To replace, select the text/value to be replaced and then select the respective field.
14. Click **Update**.
15. Click **Save** in the **Activity Properties** window of the List Navigator activity.

Note: If the query returns more than one item of list for the XML variable, then you must have XML variable of type XML List Iterator for the list to loop through.

Wait for Event Activity

Activity Description

The Wait for Event Activity is used to wait for list events and list item events like creating workflows, publishing workflows, creating users etc. This activity waits for one or more event and once the event is triggered, the workflow proceeds. When the activity is waiting for an event it can be paused,resumed or killed through process execution view.

Activity Properties

The Wait for Event activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking the Activity Properties tool in the tool bar or by selecting the appropriate option from the right-click menu for the Wait for Event activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if necessary.)

Display Name - This property specifies the name to be displayed for the activity.

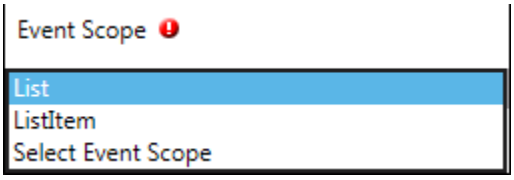
Property Type: Optional (This property need not be set if the display name is already configured in the Actions.xml. The name entered here overrides any display name that is configured for this activity in the Actions.xml file.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Event Scope - This property is used to select the scope to which event association is required. Available options are - List and ListItem.

Property Type: Mandatory



Event Scope Explanation:

1. List: Select this scope option only when List Id is required.
2. List Item: Select this scope option when List Id and Listitem Id is required.

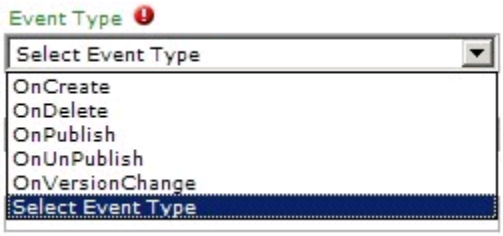
Steps to select the Event Scope property

1. Select scope from the Event Scope drop-down list.
2. If you select List as event scope, then you need to specify only list name.
3. If you select ListItem as event scope, then you need to specify list name and list item under the list.
4. Click Save in the Activity Properties window.

Event Type - This property is used to select the event type. Items should change depending on Event Scope property selection.

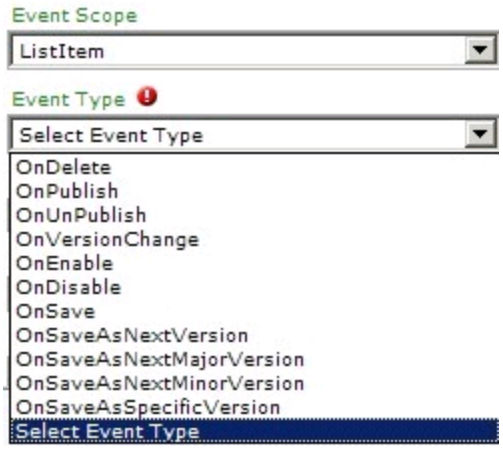
Property Type: Mandatory

If you select Event Scope property as List, then the following are the available event types:



If you select Event Scope property as ListItem, then the following are the available event types:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The options shown for Event type are dependent on Event Scope property selection.

Note:

The following Event types are not supported:

- OnSaveAsNextVersion
- OnSaveAsNextMajorVersion
- OnSaveAsNextMinorVersion
- OnSaveAsSpecificVersion

Steps for selecting Event Type property

1. Select event type from the Event Type drop-down list.
2. Click Save in the Activity Properties window.

List ID - This property is for taking list name or list item to which the event to be associated and waited. List ID property window displays the items depending on the Event Scope property selection. If you select Event Scope property as 'List', then the List ID property window will ask only List name to select. If you select Event Scope property as 'ListItem', then the List ID property window will ask List name as well as ListItem name.

Property Type: Mandatory

Note: The options shown for List ID are dependent on Event Scope property selection.

Steps to set the List ID property

1. To select the List ID property, click the edit button for the 'List ID' property to open the property window.
2. If you select List as event scope, then select list name from the List Name drop-down list.
3. If you select ListItem as event scope, select list name from the List Name drop-down list and select list item from the ListItem drop-down list.
4. Click Save in the Activity Properties window.

See Wait for Event: List ID for a detailed description of the List ID property window.

List Item ID - This property displays the list item id which was selected in List ID property.

Note: List Item ID are dependent on Event Scope property selection.

No of Events - This property is used to execute the wait for event activity by specified number of events. If you

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

specified No Of Events as '0' then this activity will wait for 'n' number of times. If you specified No Of Events as '4' then this activity will wait for four times and next time it will not wait for the event.

Property Type: Optional

Steps for specifying No Of Events property

To select the No Of Events property, click the edit button for the 'No Of Events' property to open the property window.

1. You can directly type in the text editor.
2. Or you can specify the No of Events by using field controls and then click Append.
3. Click Update.
4. Click Save in the Activity Properties window.

See Wait for Event for a detailed description of the No Of Events property window.

Effective From - This property is used to specify the effective from date for the association, i.e the date starting from which the activity will wait for the events. If left blank, the activity will wait for events starting from the day the association is created.

Property Type: Optional

Steps to set Effective From property

1. To select the Effective From property, click the edit button for the Effective Form property to open the property window.
2. You can directly type in the text editor, or you can specify the date by using field controls and then click Append.
3. Click Update.
4. Click Save in the Activity Properties window.

See Wait for Event: Effective From From for a detailed description of the Effective From window.

Effective To - This property is used to set the Effective To Date. Enter the effective to date for the association, i.e the date till which the activity will wait for the events. If left blank, it will be wait till the activity is paused/killed or the workflow is aborted.

Property Type: Optional

Steps to set Effective To property

1. To select the Effective To property, click the edit button for the Effective To property to open the property window.
2. You can directly type in the text editor, or you can specify the date by using field controls and then click Append.
3. Click Update.
4. Click Save in the Activity Properties window.

See Wait for Event: Effective To for a detailed description of the Effective To window.

Output Values

Event XML Data Variable. - This property is used to capture the Output details of the wait for event activity.

Property Type: Optional (This property needs to be set only if necessary).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

See Wait for Event: Workflow Event Data XML Variable for details on Event XML Data Variable and the output details.

Looping Behavior

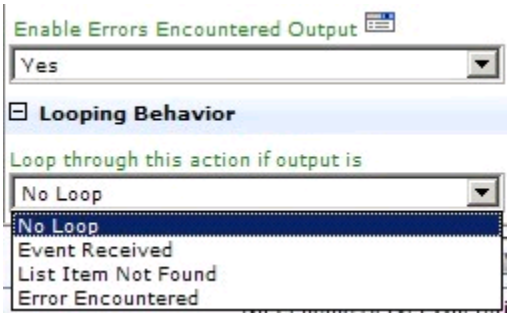
The properties in the Looping Behavior group have been described below. You can use these properties to specify the looping Behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down. Available options are - Event Received and List Item Not Found.

Property Type: Optional

If you select Enable Errors Encountered Output property as No, then the following are the available outputs:

If you select Enable Errors Encountered Output property as Yes, then the following are the available outputs:



Note: The options shown for Looping through this action if output is are dependent on Enable Errors Encountered Output property selection.

Activity outputs:

The Wait For Event Activity returns the following values -

Event Received: Displayed when the event is received.

List Item Not Found: Displayed when the list item is not found.

Error Encountered: Displayed when an error encountered.

Action Completed: Displayed when no event is received.

Exception Behavior

These options of Wonderware Skelta BPM 2009 have now been integrated with Raise Error on Unhandled Linked Output and Exception Email Template Configuration in the latest version of the product.

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

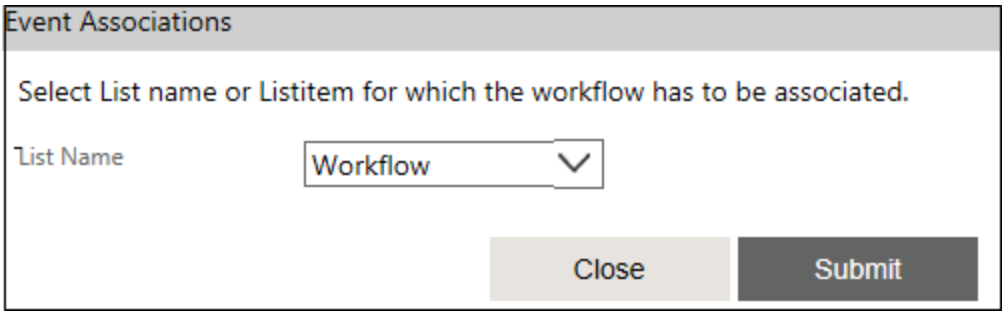
See Mapped Error Outputs for more details.

Property Type: Optional (This property needs to be set only if necessary.)

Wait for Event: List ID

You can select the list name and list item for which the workflow has to be associated in this property window. To open this window, click the edit button for the 'List ID' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has following fields:

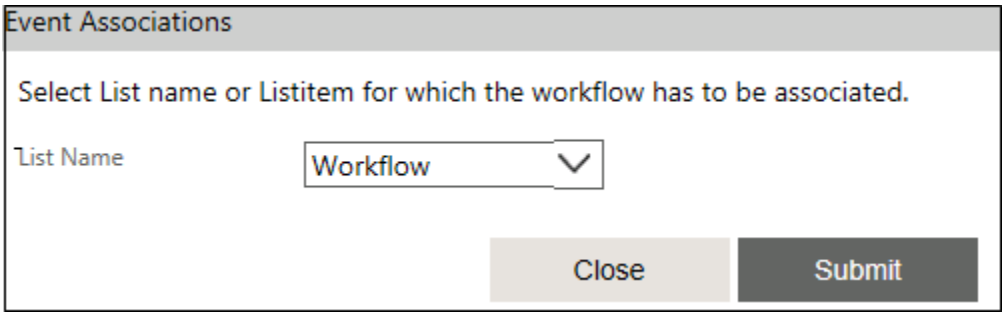
List Name - This allows you to select list name from the drop-down list.

Submit - Clicking this will save the List ID and List Item ID in the respective properties.

Close - Clicking this will close the window.

To set the List ID or List Item ID:

1. Select event scope as 'List', if you want only List Id.
2. Click **Save** in the **Activity Properties** window.
3. Click the edit button to open the List ID property window. The following screen is displayed.



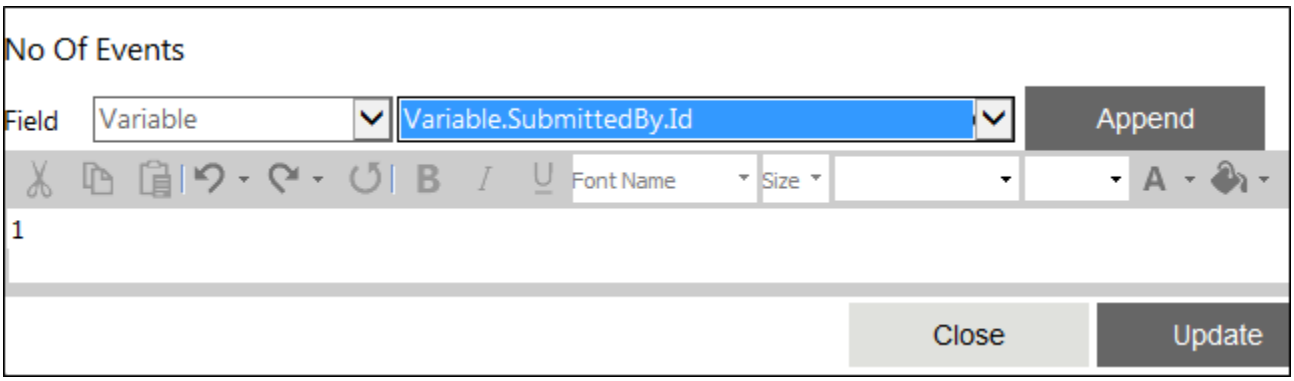
4. Select list name from the drop-down list.
5. Click **Submit** to display list id of the selected list in the List ID property.
6. The List Id in the **List ID** fields respectively.
7. Select event scope as 'ListItem', if you want both List Id and List Item Id.
8. Click **Save** in the **Activity Properties** window.
9. Click the edit button to open the List ID property window.
10. Select list name from the drop-down list. For example, select Users from the List Name.
11. After selecting list name, List Item field will be displayed.
12. Select List item from the **List item** drop-down list. For example, select 'George' user from the available users.
13. Click **Submit**.
14. The List Id and List Item Id will be displayed in the **List ID** and **List Item ID** fields respectively.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Wait for Event: No of Events

You can specify number of events for which the workflow has to be associated in this property window. To open this window, click the edit button for the 'No of Events' property.

This property is used to execute the wait for event activity by specified number of events. If you specified **No Of Events** as '0' then this activity will wait for 'n' number of times. If you specified **No Of Events** as '4' then this activity will wait for four times and next time it will not wait for the event.



The window has a text editor to enter the number of events. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The value type drop down - You can select the type of value here. You can specify SendTo, Variable, Content, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Custom Document View URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Custom Document View URL.
- **Append** - You can click this button to add the specified variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the number of events specified.
- **Close** - You can click this button to close this window.

Wait for Event: Effective From

You can specify effective from date for the association in this property window. If left blank, the date on which the association was created will be considered as the start date to wait for an event. To open this window, click the edit button for the 'Effective From' property.

Note: You can also specify the time in the text editor. The time entered can be in either 24 hour or 12 hour format. If time is entered in 12 hour format then AM/PM has to be specified.

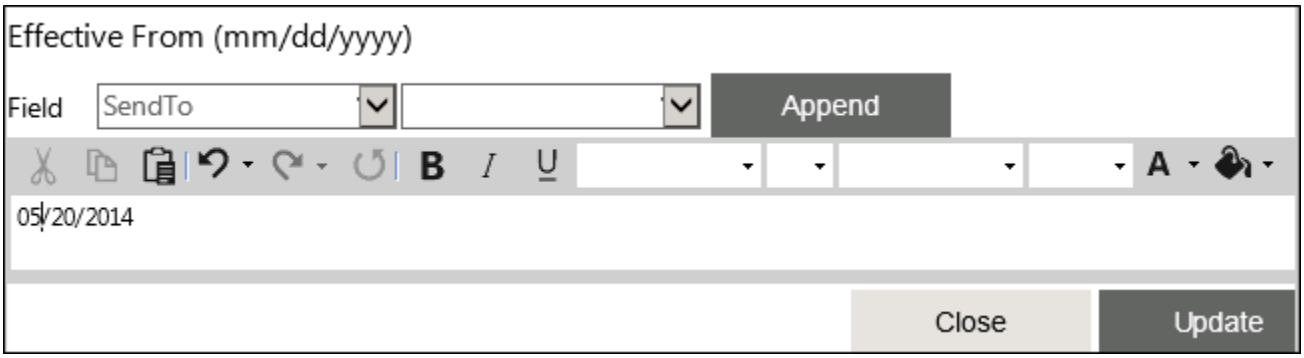
Example:

Date and time in 24 hour format

08/18/2010 22:30:00

Date and time in 12 hour format

08/18/2010 10:30:00 PM



The window has a text editor to enter the date. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The value type drop down - You can select the type of value here. You can specify SendTo, Variable, Content, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Custom Document View URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Custom Document View URL.

- **Append** - You can click on this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window, you will find the following buttons:

- **Update** - You can click this button to save the date specified.
- **Close** - You can click this button to close this window.

Wait for Event: Effective To

You can specify effective to date for the association in this property window. If left blank, will be valid always. To open this window, click the edit button for the 'Effective To' property.

Functionality

The activity will wait for events starting from the Date and Time specified in the Effective From field till the Date and Time specified in this field.

- If only date is specified in the Effective To field and time is not specified, then the activity will wait till the end of the day specified in Effective To field.
- If both date and time is not specified in the Effective To field, then the activity will continue to wait for an

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

event always, starting from the the Date and Time specified in the Effective From field.

Illustration 1

- Effective From field is 08/10/2010 00:00:00
- Effective To field is 08/18/2010 22:00:00

The activity will wait for events starting at 00:00:00 hours on 10th August 2010 till 22 hours (10:00 pm) on 18th August 2010.

Illustration 2

- Effective From field is 08/10/2010 00:00:00
- Effective To field is 08/18/2010

The activity will wait for events starting at 00:00:00 hours on 10th August 2010 till 23:59 hours (11:59 pm) on 18th August 2010.

Illustration 3

- Effective From field is 08/10/2010 00:00:00
- Effective To field is blank

The activity will continue to wait for events starting at 00:00:00 hours on 10th August 2010 till the workflow is aborted or activity is paused or killed.

Note: You can also specify the time in the text editor. The time entered can be in either 24 hour or 12 hour format. If time is entered in 12 hour format then AM/PM has to be specified.

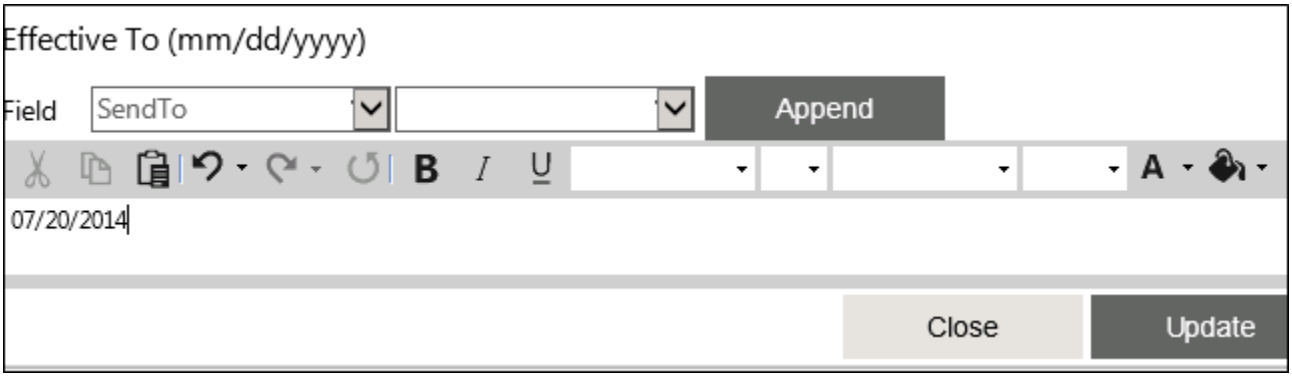
Example:

Date and time in 24 hour format

08/18/2010 22:30:00

Date and time in 12 hour format

08/18/2010 10:30:00 PM



The window has a text editor to enter the date. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The value type drop down - You can select the type of value here. You can specify SendTo, Variable, Content, or XMLVariables here.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The Value text box/drop down - You can specify the actual value of the Redirect URL. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Custom Document View URL in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Custom Document View URL.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the subject
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window, you will find the following buttons:

- **Update** - You can click this button to save the date specified.
- **Close** - You can click this button to close this window.

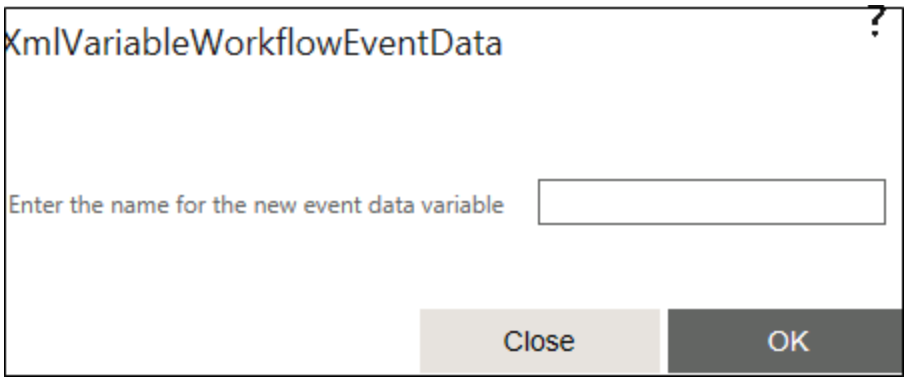
Wait for Event: Workflow Event Data XML Variable

You can create a new event variable in this property window. To open this window, click the edit button for the 'Event XML Data Variable' property.

To create event data XML variable:

1. To open this window, click create a new variable for event data edit button.
2. Enter the variable name in the text box.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click **OK**.
4. Click **Save** in the **Activity Properties** window.

Security Activities

There are two activities under Security Activities:

- **Cancel Approval Workflow**: The Cancel Approval Workflow activity is responsible for the canceling of an operation, and the terminating of the workflow instance.
- **Security Instruction Handler**: The Security Instruction Handler activity is responsible for the completion of an operation.

Cancel Approval Workflow

Activity Description

Cancel Approval Workflow activity is responsible for the canceling an operation (Save As, Delete, Disable, Enable, Publish) and terminating the workflow instance, if while setting the rights for a specific security group, user has selected the option as **"Requires Approval**" or "**Requires Approval with Prompt**" for that operation.

If the Request for approval is rejected or is terminated due to some reason, **Cancel Approval Workflow activity** is responsible for rolling back the operation.

Scenario

Consider a scenario, where while setting the security rights for Administrator, **Can Publish Item** right has been set as **Requires Approval** with the selected workflow as **Security Approval Workflow**.

Security Approval workflow ensures that Publish operation completes successfully only after approval from the concerned person. But if the request is rejected by the approver, then Security Approval workflow uses Cancel Approval Workflow activity internally to terminate the request.

For more details, see *Security Approval Workflow*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

The Cancel Approval Workflow activity has to be configured by specifying appropriate values for the different properties in the Action Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Approval activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

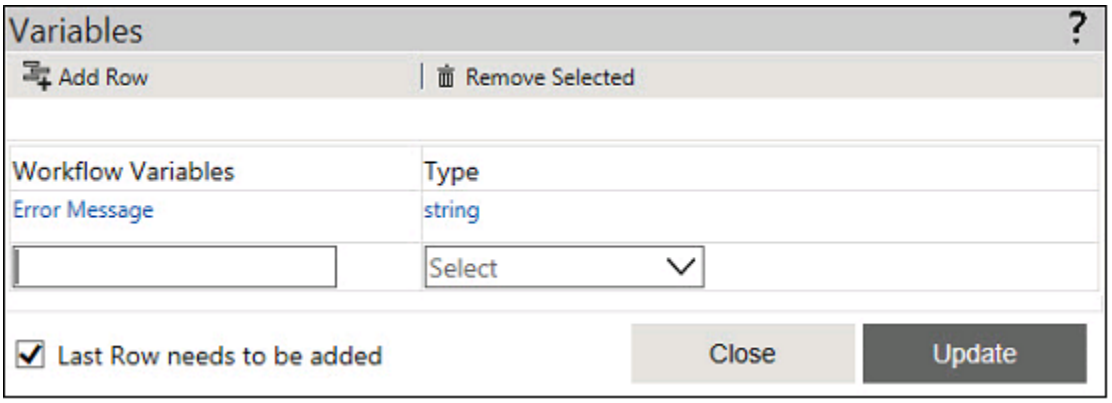
Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Note: The user needs to create a variable with the name **"Error Message"** in the Start activity of the workflow which is using the Cancel Approval Workflow activity. This variable is used to capture any errors which have might occur during the process of cancelation of the various operations (Save As, Delete, Disable, Enable, Publish).



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Security Instruction Handler

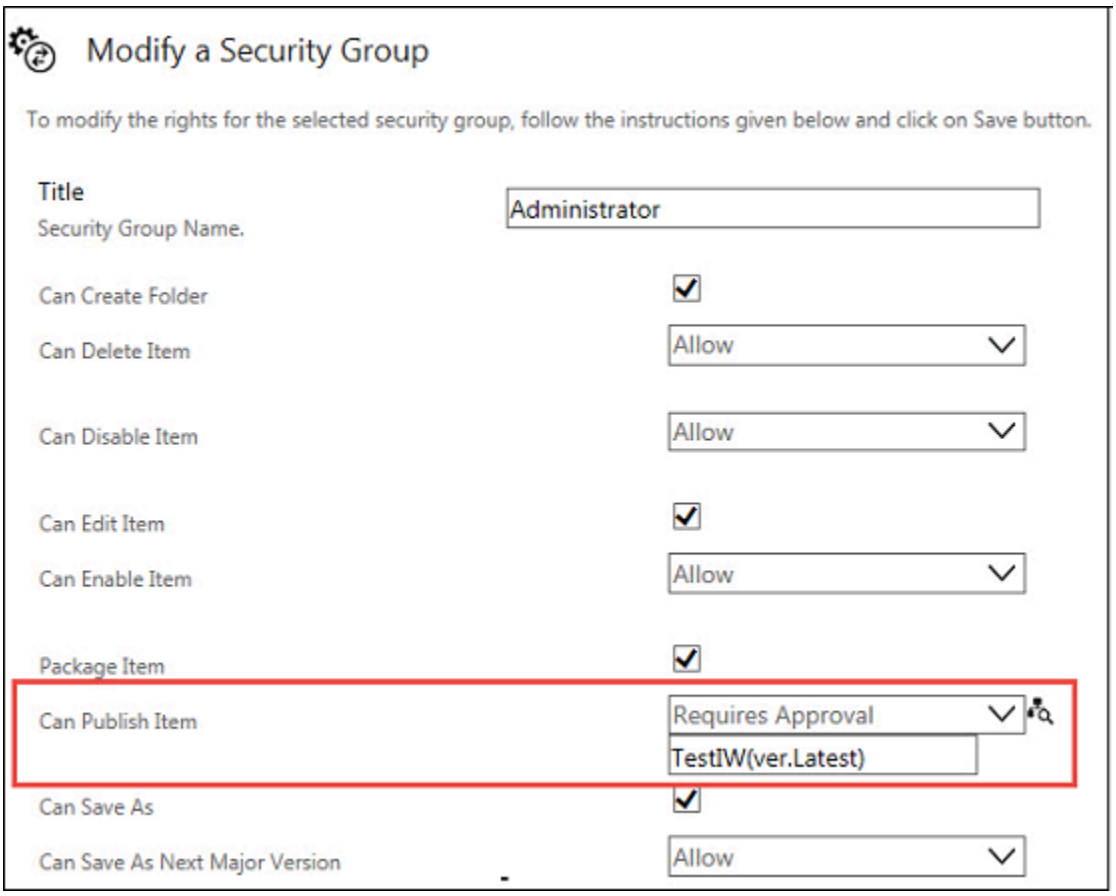
Activity Description

Security Instruction Handler activity is responsible for the completion of an operation (Say, Delete, Disable, Enable, Publish), if while setting the rights for a specific security group, user has selected the option as "Requires Approval" or "Requires Approval with Prompt" for that operation.

Scenario

Consider a scenario, where while setting the security rights for Administrator, **Can Publish Item** right has been set as **Requires Approval**, with the selected workflow as **Security Approval Workflow**.

Security Approval workflow ensures that the Publish operation completes successfully only after approval from the concerned person. Security Approval workflow internally uses Security Instruction Handler Activity to complete the Publish operation after the approval has been given.



Activity Properties

The Security Instruction Handler activity has to be configured by specifying appropriate values for the different properties in the Action Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Approval activity. The Activity Properties are organized under the following groups of related properties. The properties

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Miscellaneous

Error Description

This property is not being used currently. It is being reserved for future use.

Property Type: Optional (This property needs to be set only if necessary.)

Exception Behavior

The property in the Exception Behavior group has been described below. You can use these properties to raise exceptions if the output is not linked to the next activity in the workflow and also define and configure email templates and users for the exception mails.

Raise Error on Unhandled Linked Output? – This property can be configured to raise an error if the output is not linked to the next activity in the workflow.

Property type: Optional (This property needs to be set only if necessary)

See Mapped Error Output for more details.

Looping Behavior

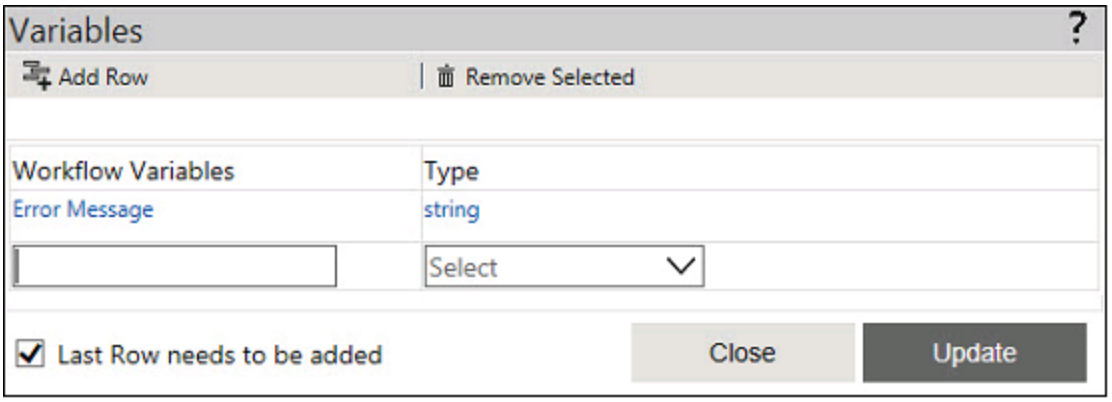
The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional (This property needs to be set only if necessary.)

Note: The user needs to add a variable with the name "Error Message" in the Start activity of the workflow which is using the Security Instruction Handler activity. This variable is used to capture any errors which have might occur during the process of completion of the various operations (Say, Delete, Disable, Enable, Publish).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Report Activities

This section provides information on the Report Generator Activity.

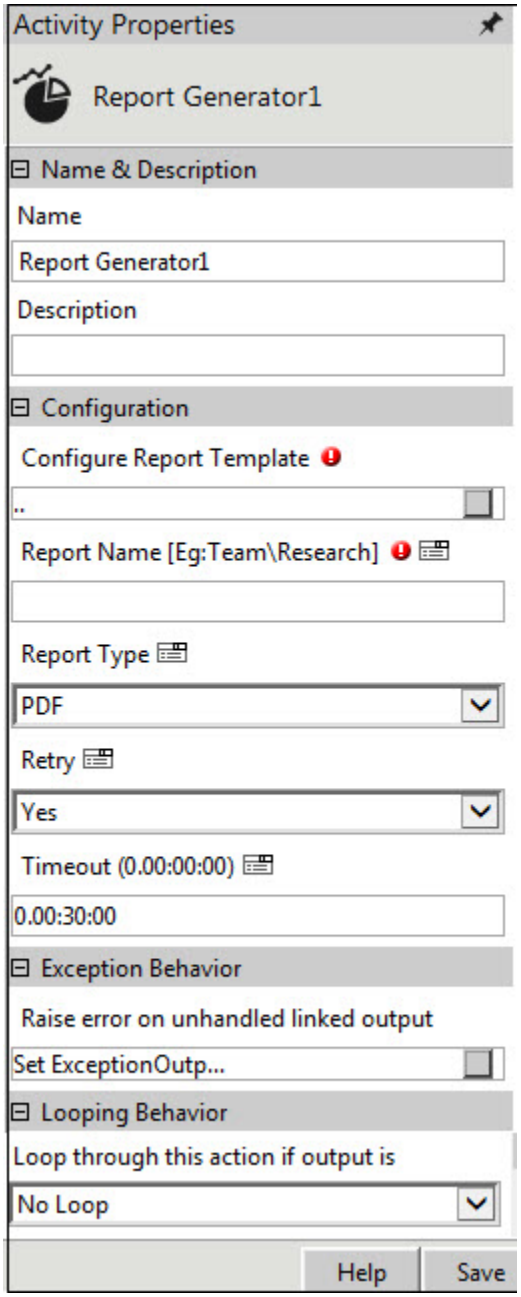
Report Generator Activity

Activity Description

You use the Report Generator activity to run a report template and save the report in the Reports list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties



Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property is to be used to specify a name for the activity.

Property Type: Mandatory (This property must be set.)

Description - This property can be used to specify a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration

The properties in this group have been described below. You can use these properties to configure the functionality of this activity.

Configure Report Template - This property is to be used to configure the Report Template from the list of available report templates.

Property Type: Mandatory (This property must be set for the configuration.)

Steps to set the Configure Report Template Property

1. To specify the **Configure Report Template** properties, click the edit button of the property and the property window opens.
2. Select the required report template from the **Report Template** drop-down field. All the parameters related to the selected report template will be listed in the Parameters field.
3. Select the required **Parameters**.
4. Select the "Generate Report Reference Variable automatically" option to populate the variable in the Report Reference Variable field.
5. Alternatively, select the "Create Report Reference Variable manually" option to create the variable manually.
6. Click **Submit**.

See Configure Report Template for a more detailed understanding of its properties.

Report Name - This property is used to specify a name for the report to be generated.

User can also pass the folder path in this field. For example, Team\Research\GroupPeriodReport. Here the root level folder name is Team under which the *Research* folder will be the destination for saving the report "GroupPeriodReport". If the given path is not present, then the Report Generator activity will create the required folders.

Property Type: Mandatory (This property must be set for the report to display a name.)

The default name for the selected Report Template is:

[Selected Report Template Name]_#workflow#_#year#_#month#_#day#_#hour#_#minutes#

The default name is a combination of the name of the selected Report Template Name and the place holders. The following table shows the place holders supported for the report name:

Place holders	Format	Description
#day#	dd	It will replace with the current day.
#month#	MM	It will replace with the current month.
#year#	yyyy	It will replace with the current year.
#hour#	HH	It will replace with the current hour.
#minutes#	mm	It will replace with the current minutes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Place holders	Format	Description
#seconds#	ss	It will replace with the current seconds.
#application#		It will replace with the repository name.
#workflow#		It will replace with the workflow name.
#activity#		It will replace with the current activity name.
#executionid#		It will replace with the workflow execution ID.
#executiondetailsid#		It will replace with the execution details ID.

Report Type - This property is used to select the type of the report to be exported from the reporting server.

Property Type: Optional

Default type is PDF. Other supported types are MS Excel and Image.

Retry - This property is used to specify if the activity must retry to connect to the reporting service.

Property Type: Optional

Yes: This is the default value. If you select Yes, the activity retries three times to connect to the SQL Server Reporting Service, if the web service does not respond at the first attempt.

No: If you select No, the activity does not retry to connect to the web service.

Timeout - This property is used to specify the web service (SQL Server Reporting Service) time out. By default, the timeout is 30 minutes. Use this property to modify the timeout.

Property Type: Optional

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Looping Behavior

The property in the **Looping Behavior** group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop-down field.

Property Type: Optional (This property needs to be set only if necessary.)

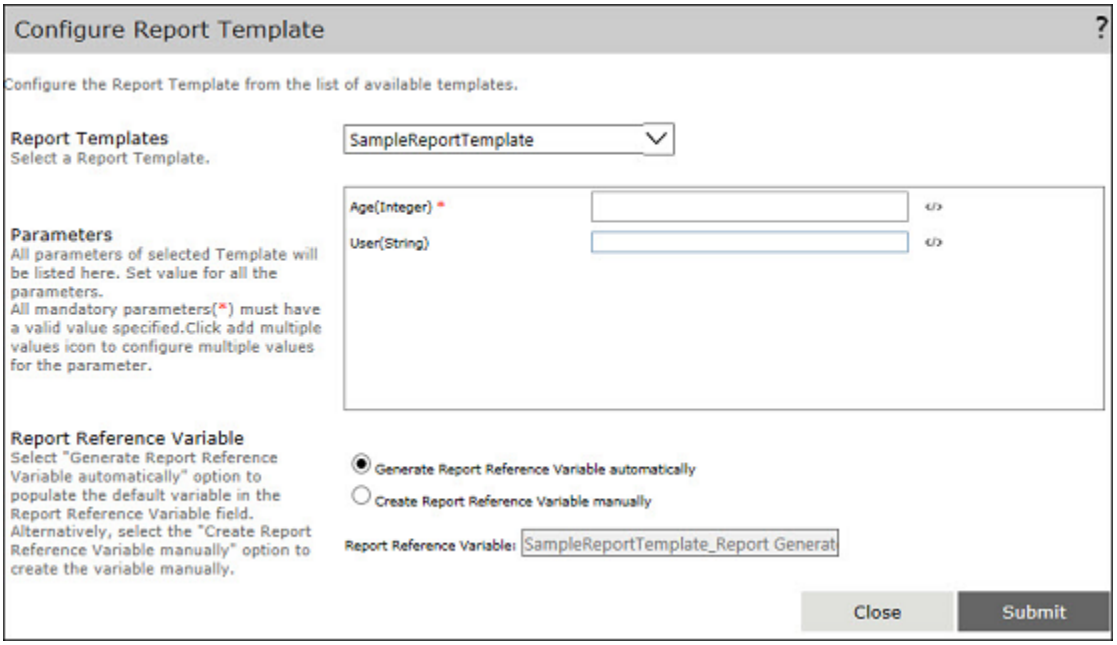
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configure Report Template

You can use the **Configure Report Template** properties to perform the following tasks:

- Select the required Report Template from the list of available report templates.
- Set the value for the parameters for the selected report template.
- Generate the report reference variable or create the report reference variable manually.

To open the **Configure Report Template** window, click the **Configure Report Template** edit button.



The **Configure Report Template** window has the following properties:

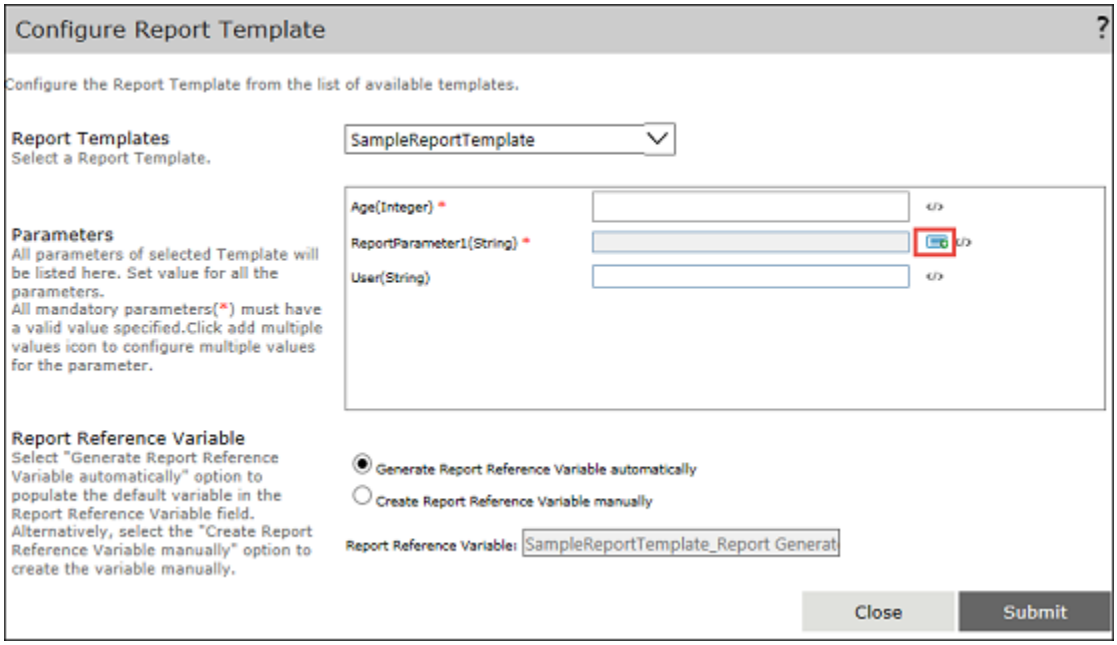
- **Report Template:** You can use this property to select the required report template from the list of available report templates. The available report templates are populated from the Report Template list.
- **Parameters:** You can use this property to set the values for the selected report template parameters. On selecting the required Report Template, the parameters defined for this particular report template appears. The user can type the value of the parameter in the respective parameter fields or use the expression editor to define the same.
- **Report Reference Variable:** You can use this property to generate a report reference variable. This default report reference variable is [Report_Template Name]_[activity Name]. You can automatically or manually generate this variable.
  This variable will be used while attaching the report to a mail channel in various Human activities within the same workflow.
- **Generate Report Reference Variable automatically:** When you select this option, you can generate the default variable in the Report Reference Variable field. You cannot edit the variable in the Report Reference Variable field.
- **Create Report Reference Variable manually:** When you select this option, you can change the name of the variable that is populated in the Report Reference Variable field. The default variable populated is same in both the options.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Multiple Value Parameter Configuration

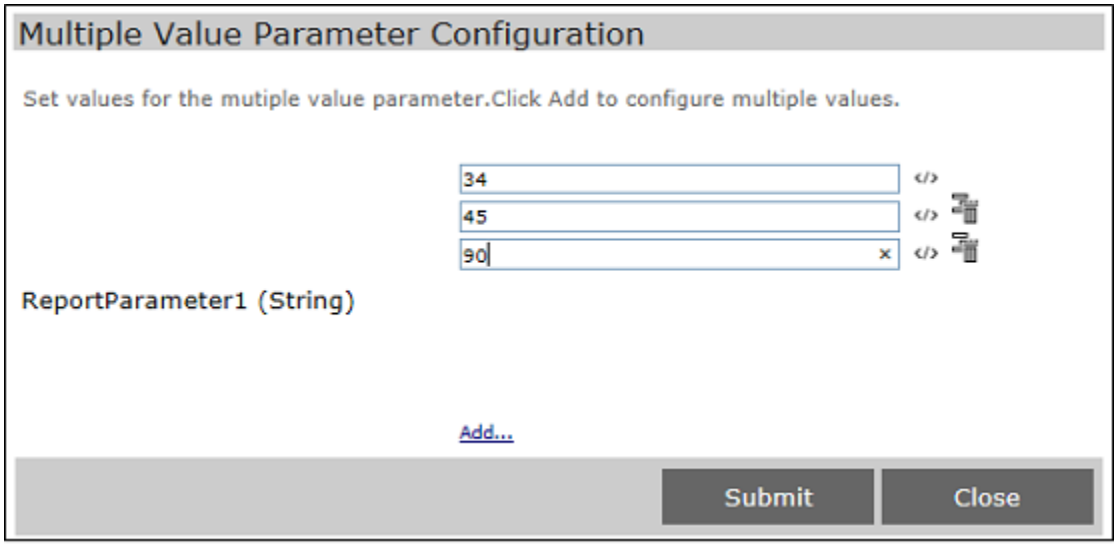
You can configure multiple values for the parameters. To configure multiple values for a parameter, complete the following steps:

1. In the **Configure Report Template** dialog box, select the template from the list of templates available in the **Report Templates** field.
2. Click the multi-value icon as shown in the following image:



3. The **Multiple Value Parameter Configuration** dialog box appears. The dialog box displays the parameter name and the data type of the parameter.

   For example, the following image shows the parameter with the name ReportParameter1 of the type Integer:

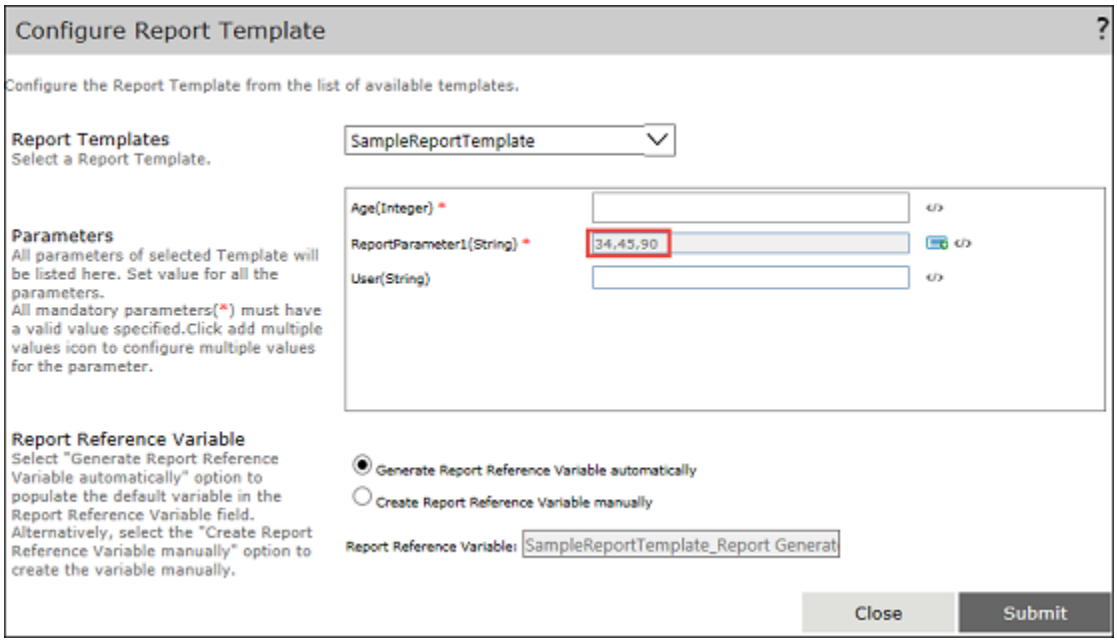


4. You can add multiple values to the parameter. To add multiple values, click Add... and then enter the values in each new row.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Click **Submit**.

   You can now see that the multiple values that you have entered appears as comma separated list in the *ReportParameter1TestMultiValue* field of the **Configure Report Template** dialog box as shown in the following image:

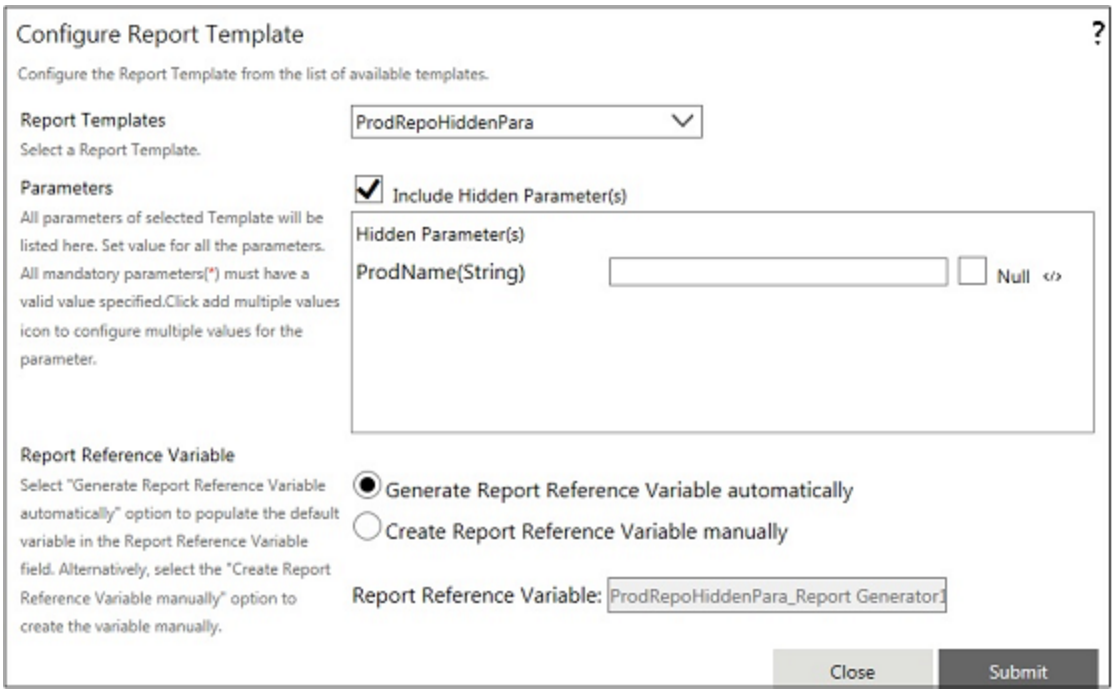


Note: To assign values to a date-time parameter, use a variable and assign a value to the variable, such as YYYY-MM-DDTHH:MM:SS.0000000. You cannot directly assign a hard coded date-time value from the expression editor.

Hidden Parameters Configuration

By default, you can see only the unhidden parameters in this section. You can check the I**nclude Hidden Parameters** option to view all the hidden parameters, as shown in the following image:

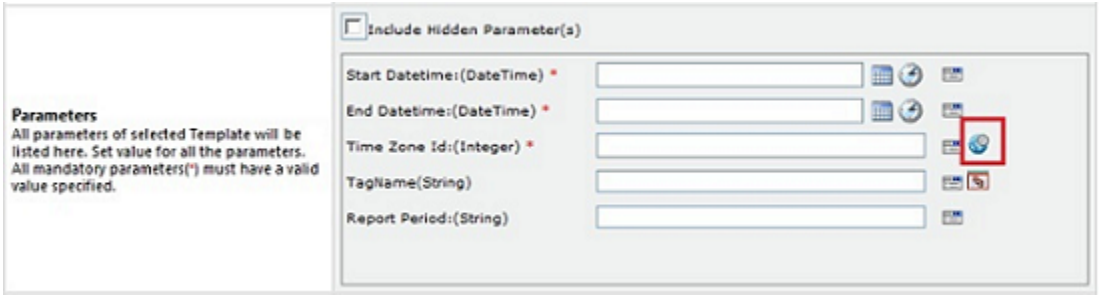
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Among the parameters displayed here, the Time Zone ID and the TagName parameters have specific icons, Time Zone and Historian Tag, displayed against them. Users should note that it is a prerequisite to have a Historian Connection established before selecting a Time Zone or a Historian Tag. For more information on how to establish a Historian Connection, see Create a Historian Connection.

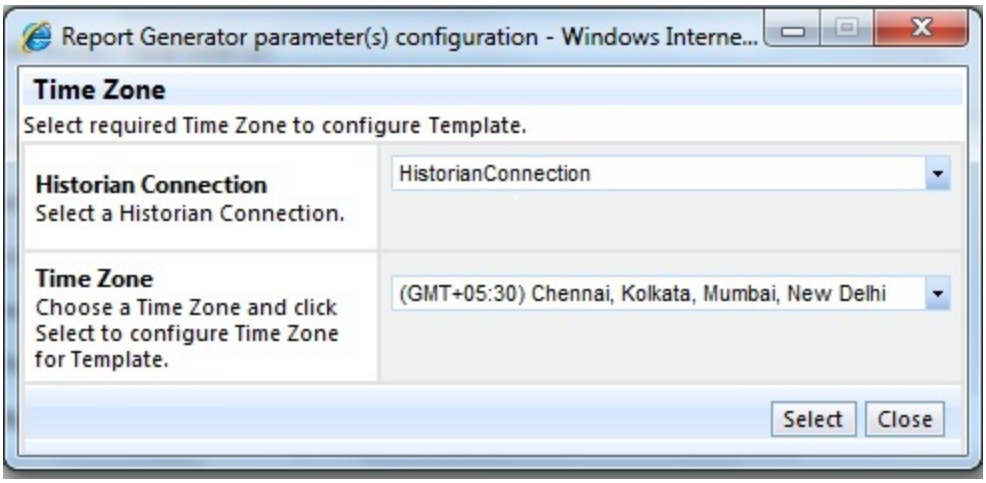
Time Zone Configuration

If a report parameter name is the Time Zone ID, then the Time Zone icon is displayed for that particular parameter as shown in the following image:



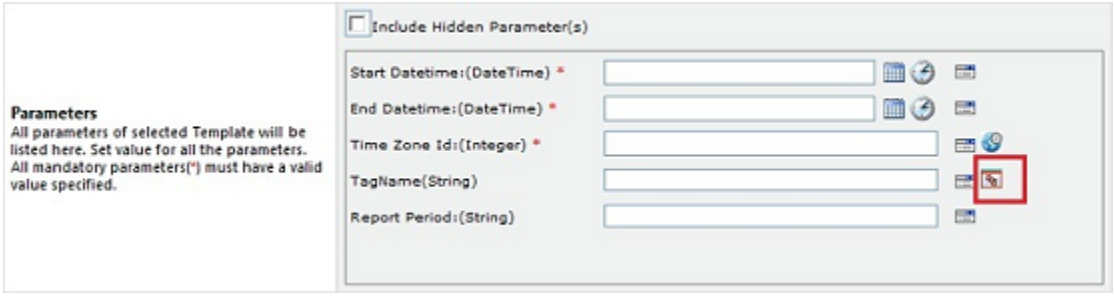
On clicking the Time Zone icon, the Time Zone dialog box appears. Here, you can select the required **Historian Connection**.When you select a connection, different time zones are populated in the Time Zone drop-down list. You can select an appropriate time zone and click **Select**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

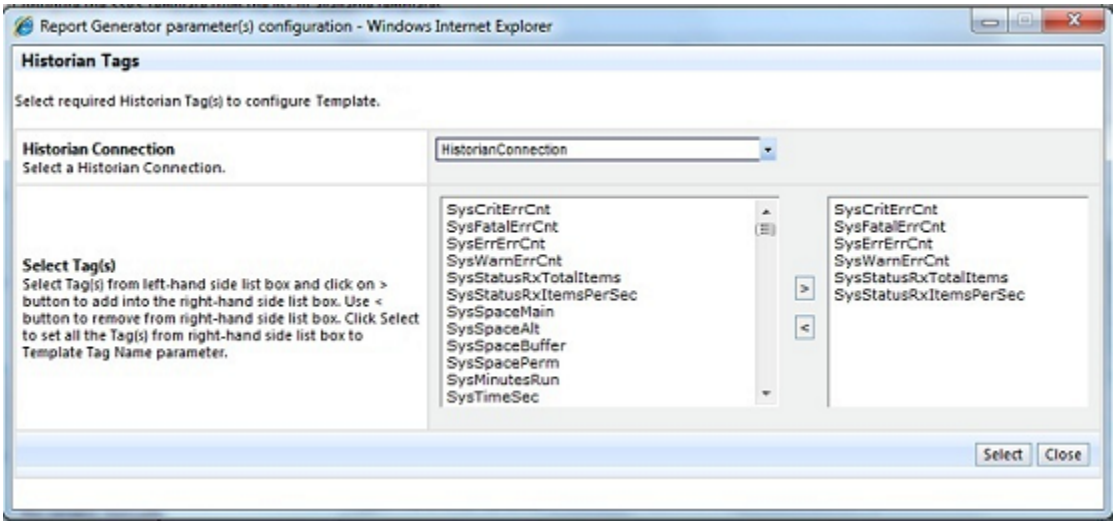


Historian Tag Configuration

If a report parameter name is TagName, then the Historian Tag icon is displayed for that particular parameter as shown in the following image:



On clicking the **Historian Tag** icon, the Historian Tags dialog box appears. Here, you can select the required **Historian Connection**. When you select a connection, all the Historian tags are displayed on the left-hand side list box of **Select Tag(s)** section.



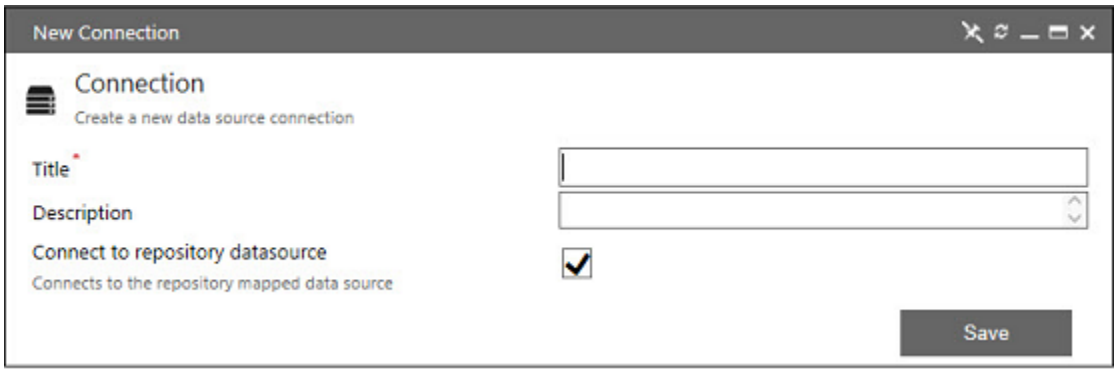
Select the required tags, click the > button to move the tags to the right-hand side of the **Select Tag(s)** section, and click **Select**. If you want to remove any tag from the right-hand side list box, then you must select the tag(s) and click the **<** button. The tag will be placed on the left-hand side list box.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

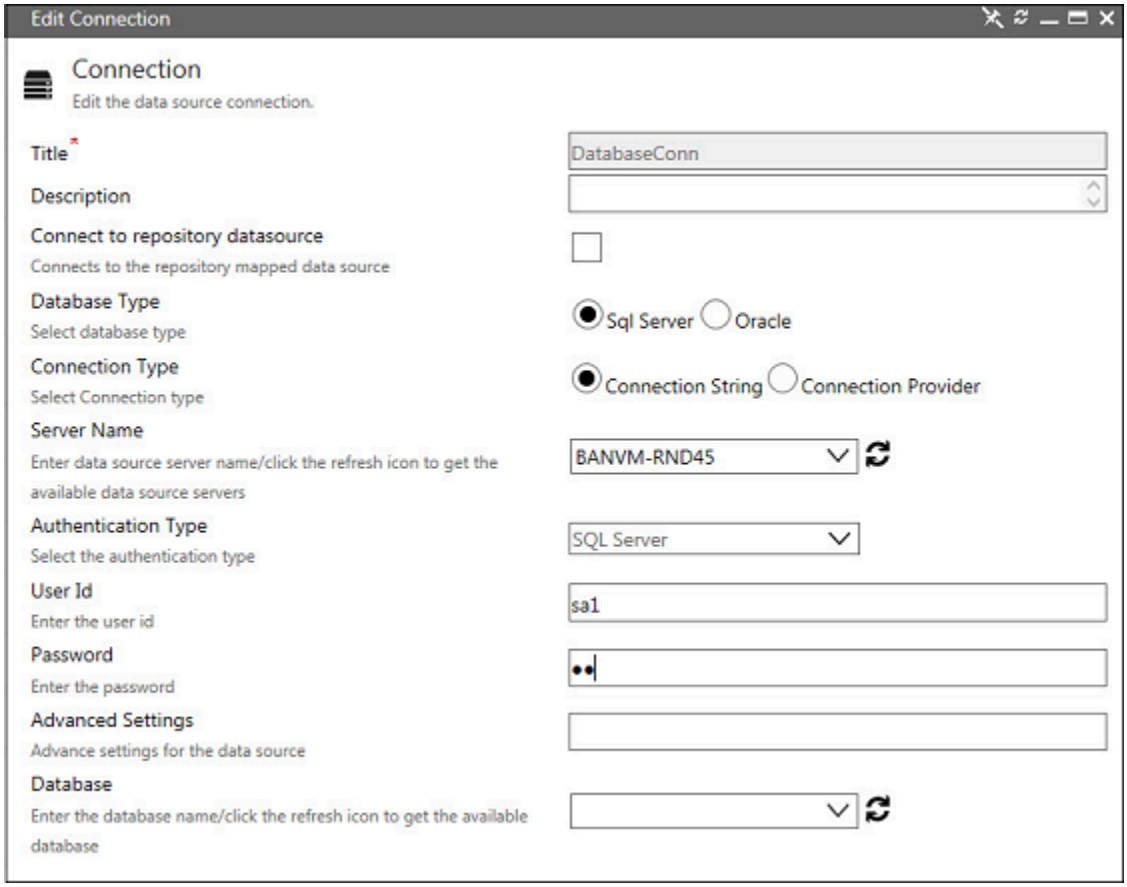
Create a Historian Connection

You can configure the Historian Connection information in the Database Connections Settings in the Enterprise Console.

1. On the **Enterprise Console**, select **Settings**, and then click **Database Connections**. The Database Connection page appears. This page lists the **Connection List**.
2. Click **New**. The **New Connection** dialog box appears.

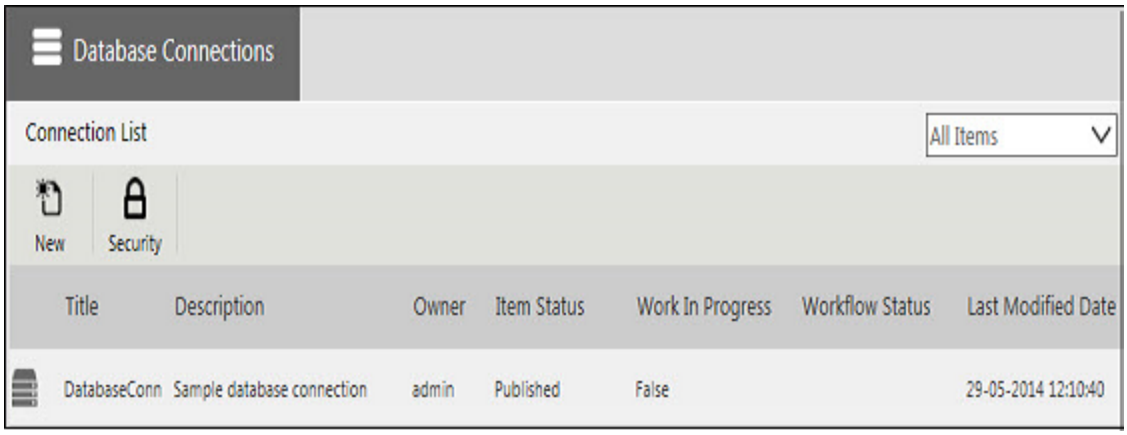


3. Enter the details as shown in the image given below:



4. Then click **Save**. The database connection is saved and will appear in the Connection List page.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



SOA Activities

This section provides information on the SOA Execute activity.

SOA Execute Activity

Under the SOA Execute activity, you can:

- Execute methods with the out parameters in SOA.
- Retrieve multiple records from the database using SOA.
- Iterate a collection object.
- Design a workflow.

Execute Methods with Out Parameters in SOA

Use Out Parameter in SOA

Out Parameter: The out parameter can be used to return more than one value in the same variable passed as a parameter of the method. Any changes made to the parameter will be reflected in the variable.

If an Assembly has a method with the Out Parameter, then you can make use of the Out Parameter to update the variables or for building the Expression through SOA.

To execute the methods with Out Parameter in SOA, follow the steps given below:

1. Prepare an Assembly with the following code.

```
using System;
using System.Collections.Generic;
using System.Text;

namespace FinalTest
{
public class SOAOutParameter
{
private int _a;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
private int _b;
public int A
{
get
{
return _a;
}
set
{
_a = value;
}
}

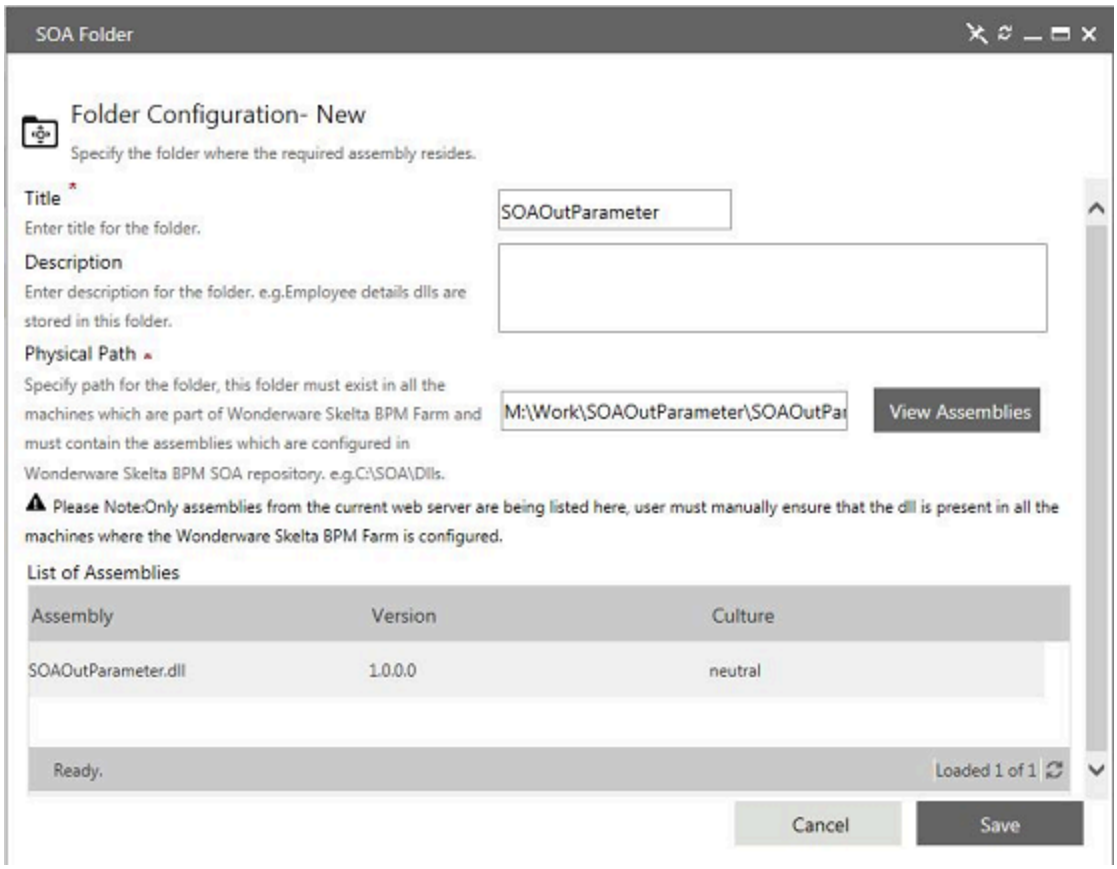
public int B
{
get
{
return _b;
}
set
{
_b = value;
}
}

public SOAOutParameter(int a, int b)
{
this.A = a;
this.B = b;
}

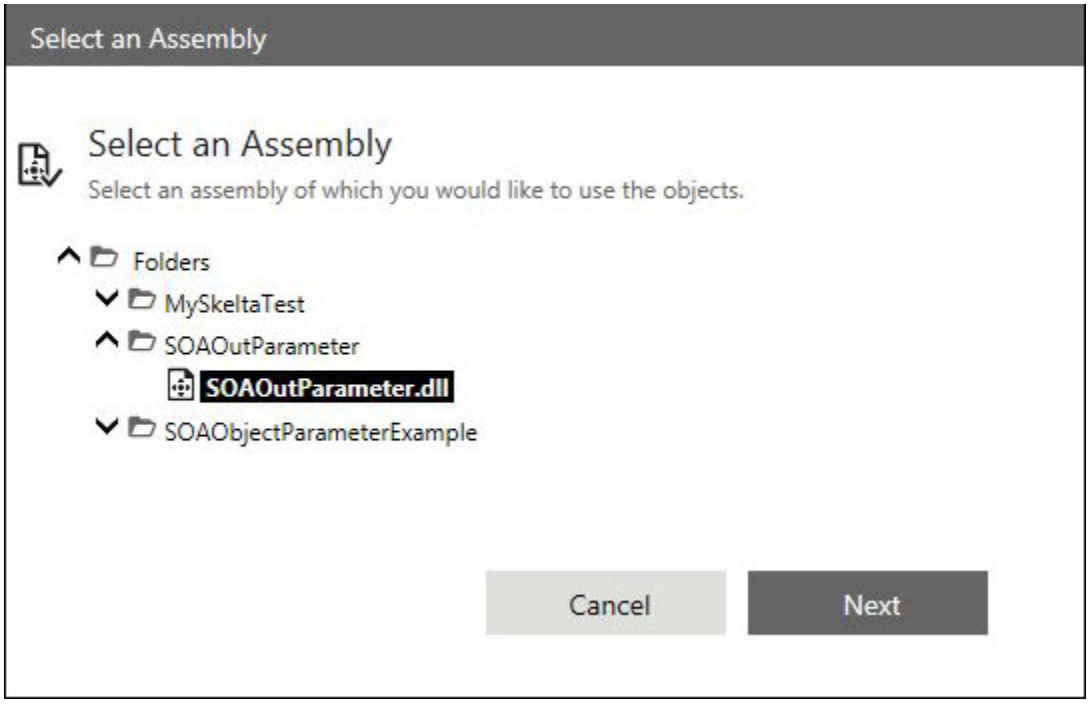
public void AddTwoNumbers(out int Result)
{
Result = this.A + this.B;
}
}
}
```

2. You have to register the assembly in SOA Assembly to use members of the assembly in the workflow.
3. To register a assembly, select **Settings > SOA Folder > New Assembly Folder** from the **Enterprise Console** pull-down menu. Register an assembly called 'SOAOutParameter'.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

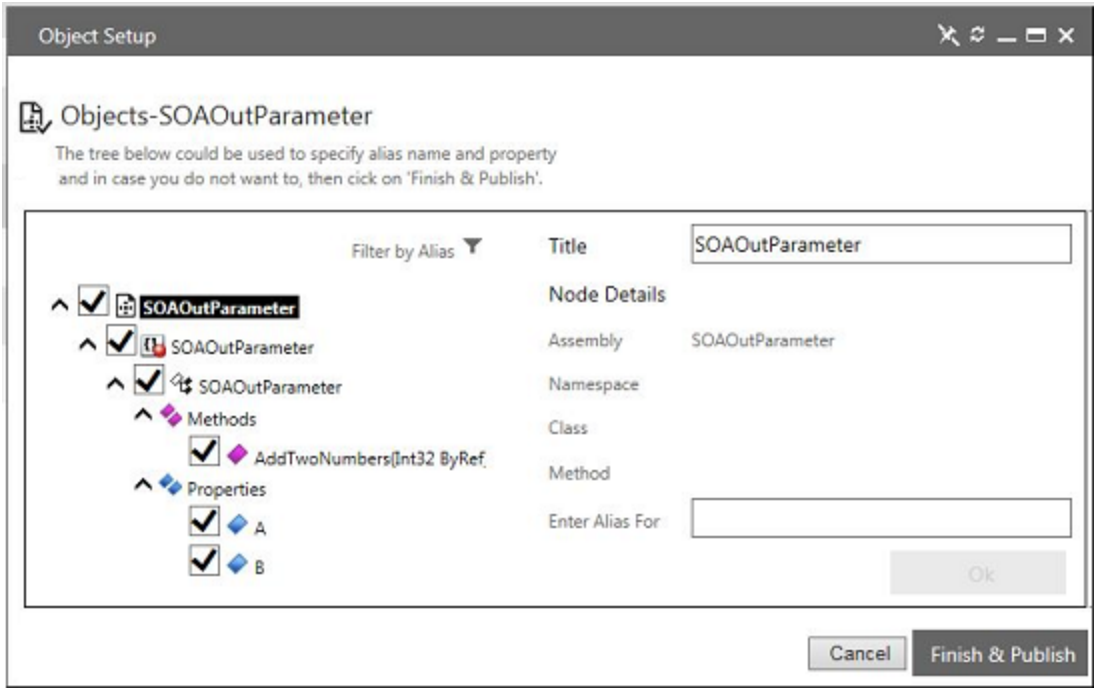


4. Click **Save**. Now the SOAOutParameter assembly has been registered as shown below.
5. Select **Tools > SOA Assembly > From Assembly Folder** from the **Enterprise Console** pull-down menu. Expand SOAOutParameter and select dll and click **Next**.



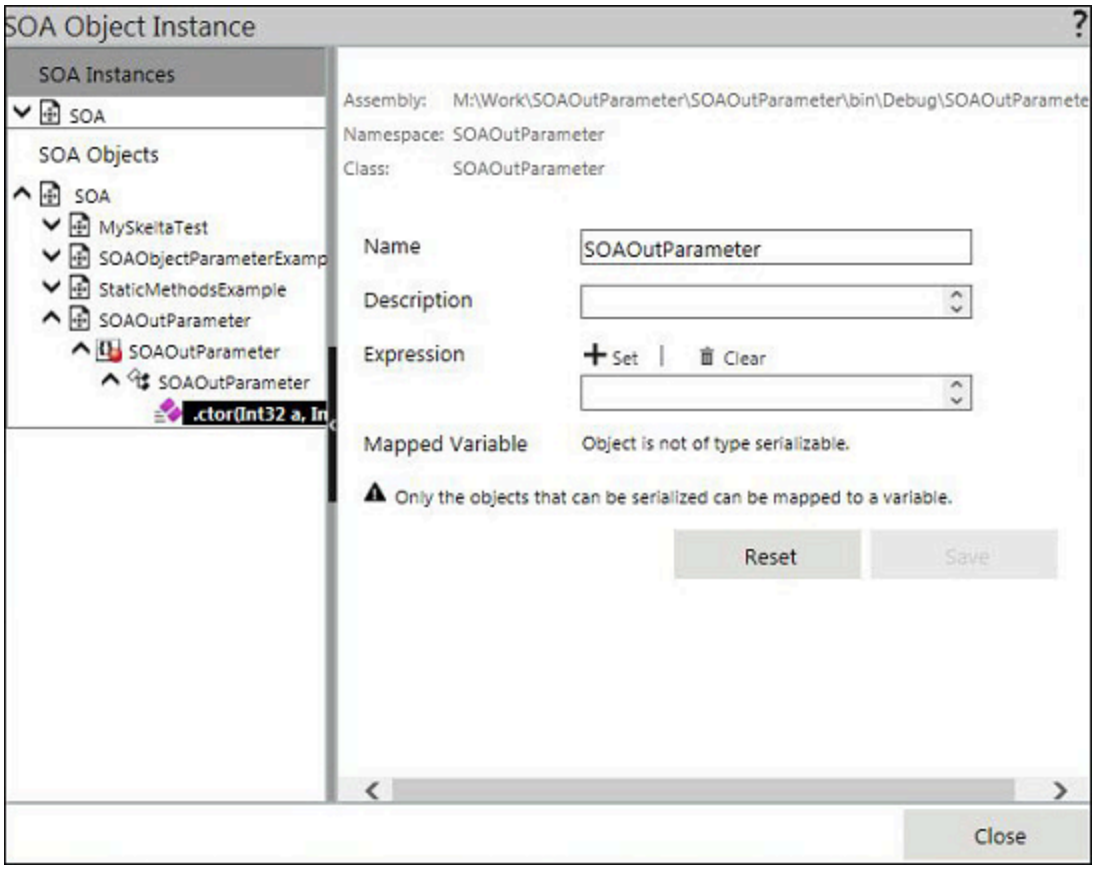
6. The **Object Setup** screen is displayed. Expand all class, methods and properties as shown below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



7. Click Finish & Publish to save the assembly. This will be listed in the Assembly List as shown below.
8. You need to create an instance for the class to use the members of the class. To make use of the static members, there is no need to create any instance. Static members can be directly used in the Expression Editor.
9. To create an instance, you first need to design a workflow.
10. Right-click the Start Activity and then select Activity Properties.
11. Select the SOA Object Instances property.
12. The SOA Object Instance screen is displayed. SOAOutParameter is the Assembly, under that SOAOutParameter as NameSpace, under that SOAOutParameter as Class and under that .ctor(Int32 a, Int32 b) is the constructor as shown in the following figure.

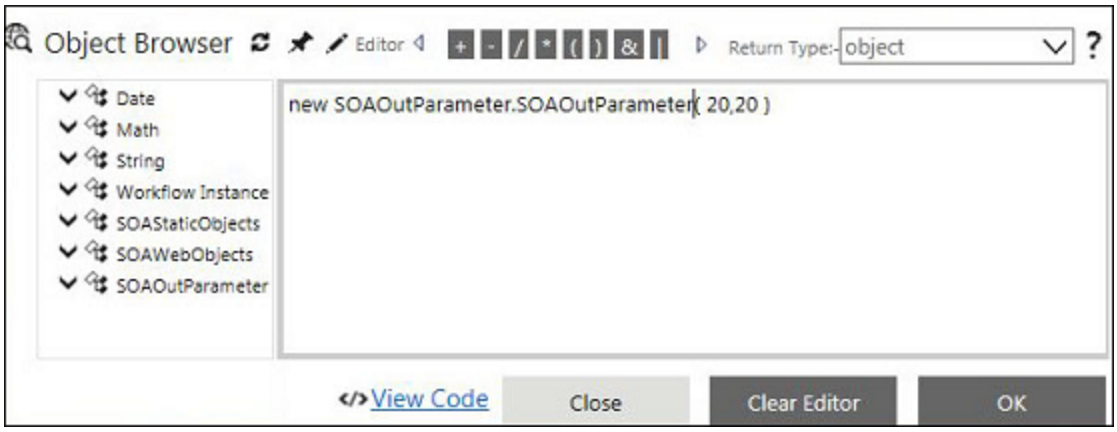
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



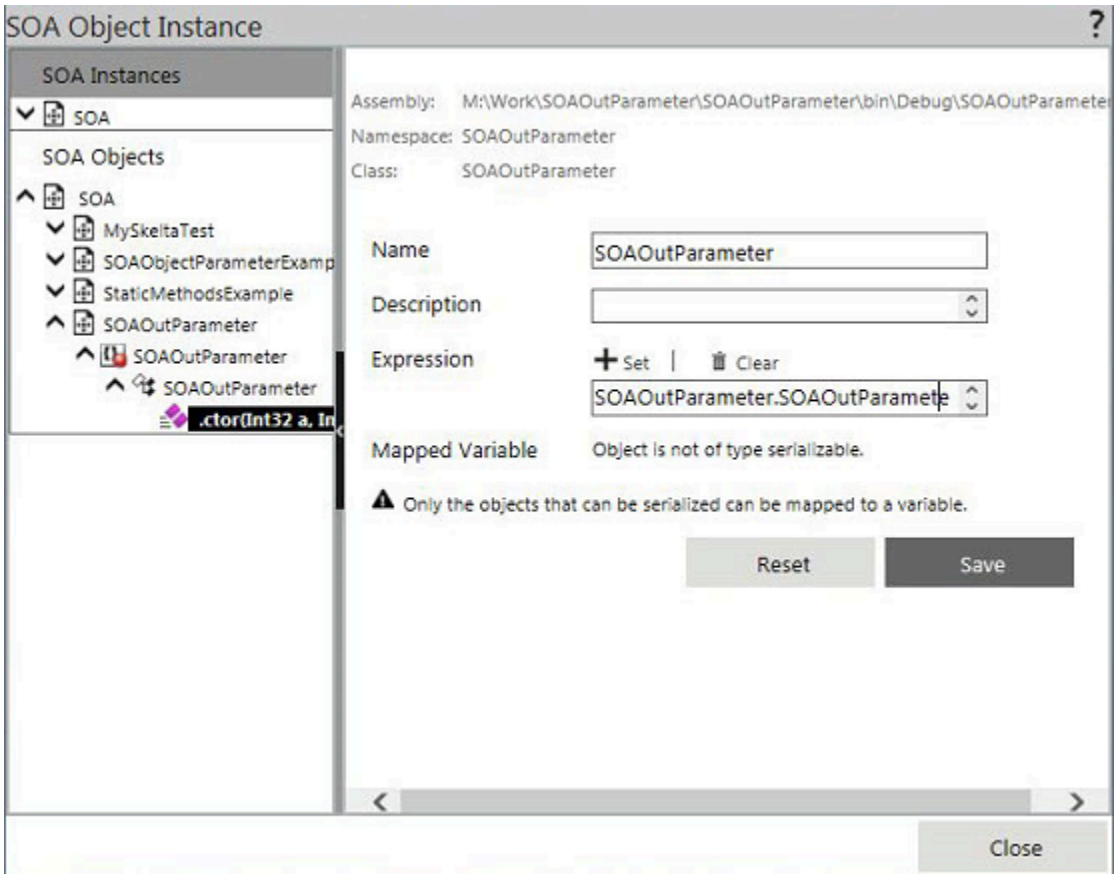
13. Click the Constructor and then click Set to set the constructor values. The Constructor will be displayed in the Expression Editor.

14. Pass the parameter value to the Constructor. For example, pass (20, 20) as the parameter for the Add Method. Click Save.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

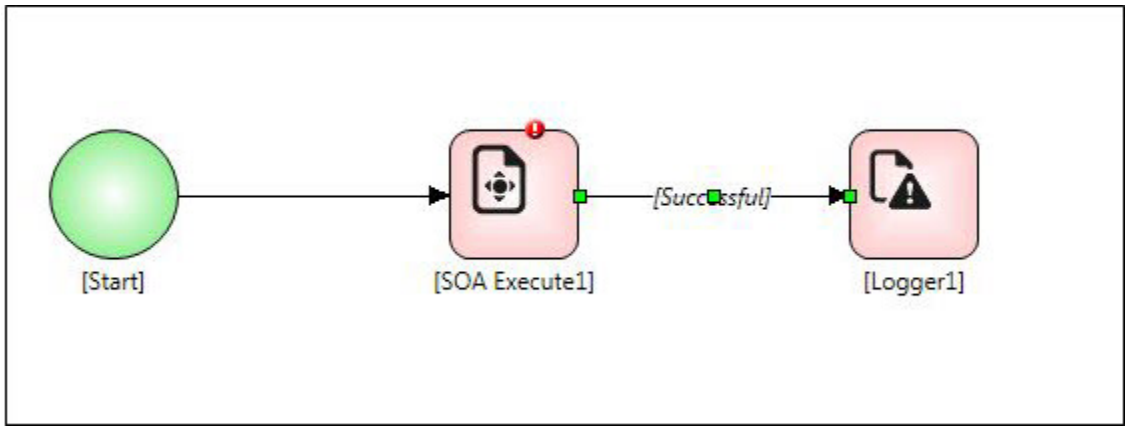


15. Click Save in the Activity Properties window.

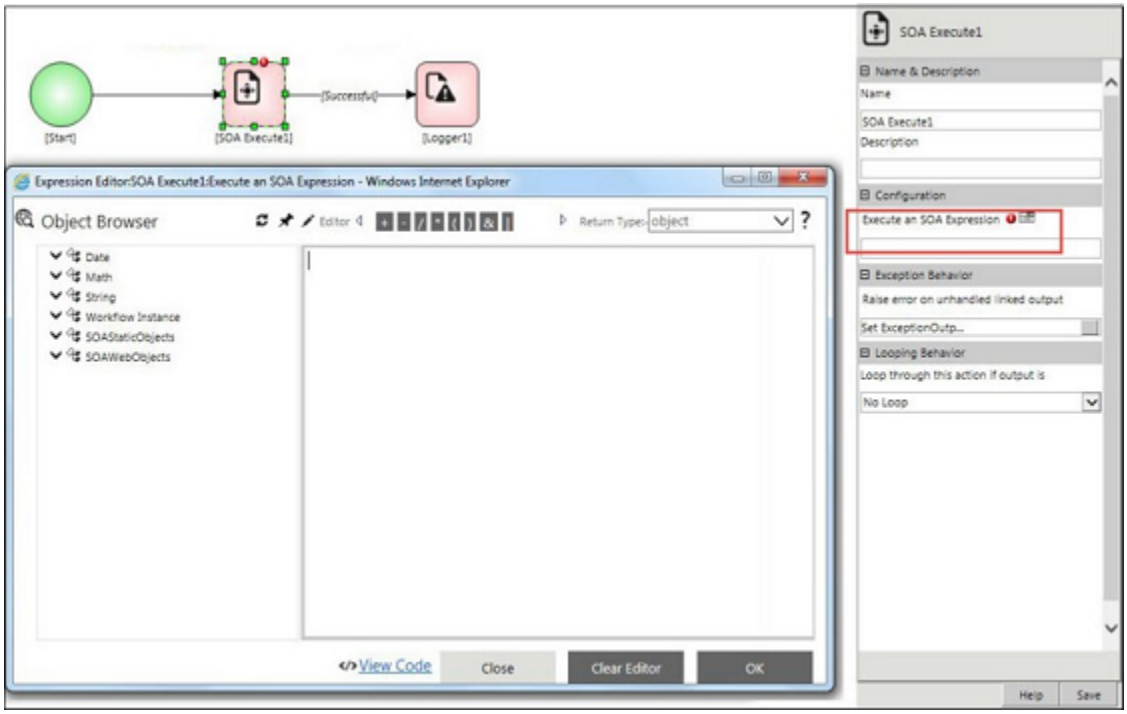


© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

16. Make use of SOAExecute activity to execute the method and update the Variable 'varResult'.



17. Right-click the SOA Execute activity and select Activity Properties.
18. Select Execute an SOA Expression property to build the expression.

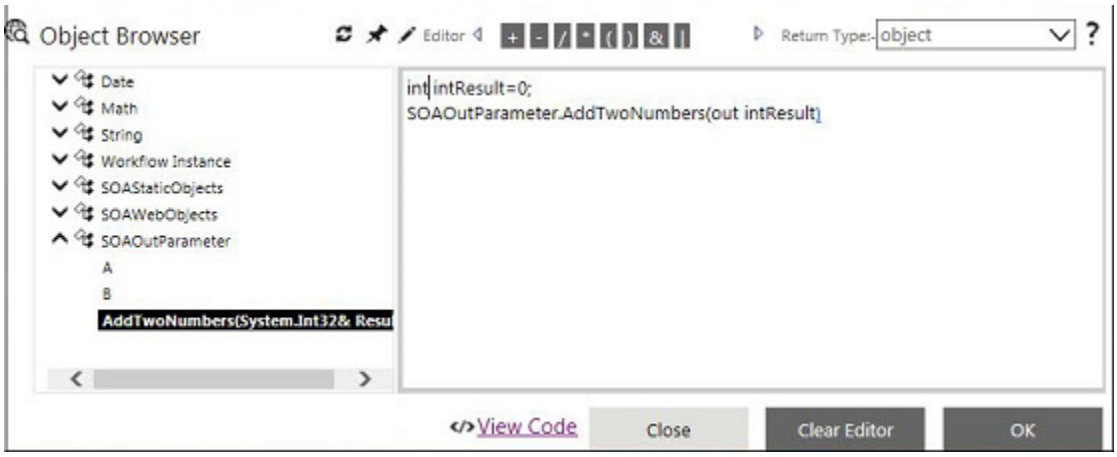


19. Click the AddTwoNumbers method to bring it into the Expression Editor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

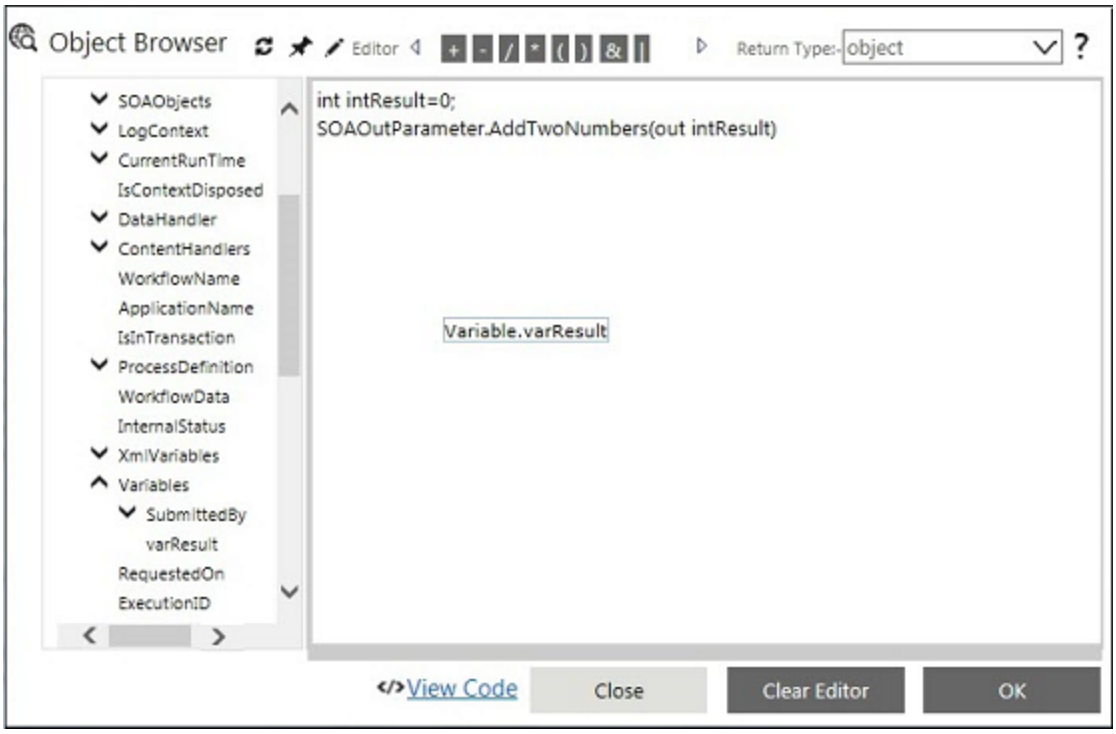
20. AddTwoNumbers is of Void as return type and expects integer as parameter with out keyword.

21. Declare a variable called intResult with value as '0'. Pass 'intResult' as parameter to AddTwoNumbers method with 'out' keyword, as shown in the following figure.

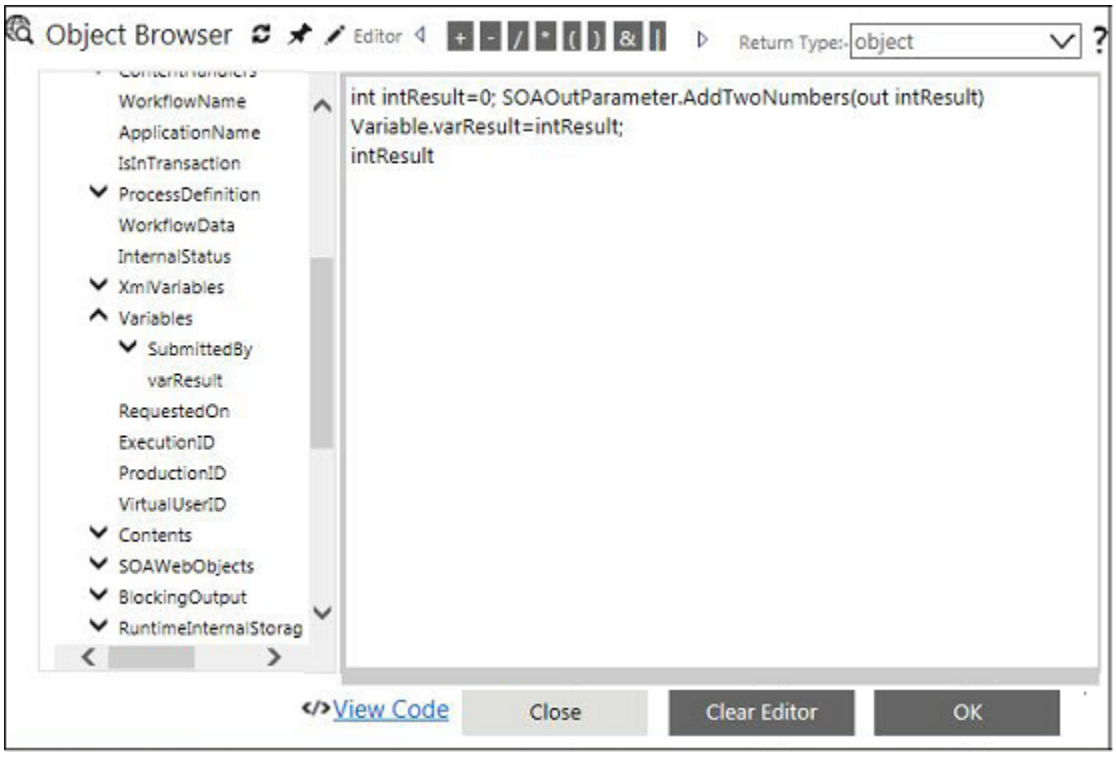


22. Drag and drop the Variable to be updated with the out return value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



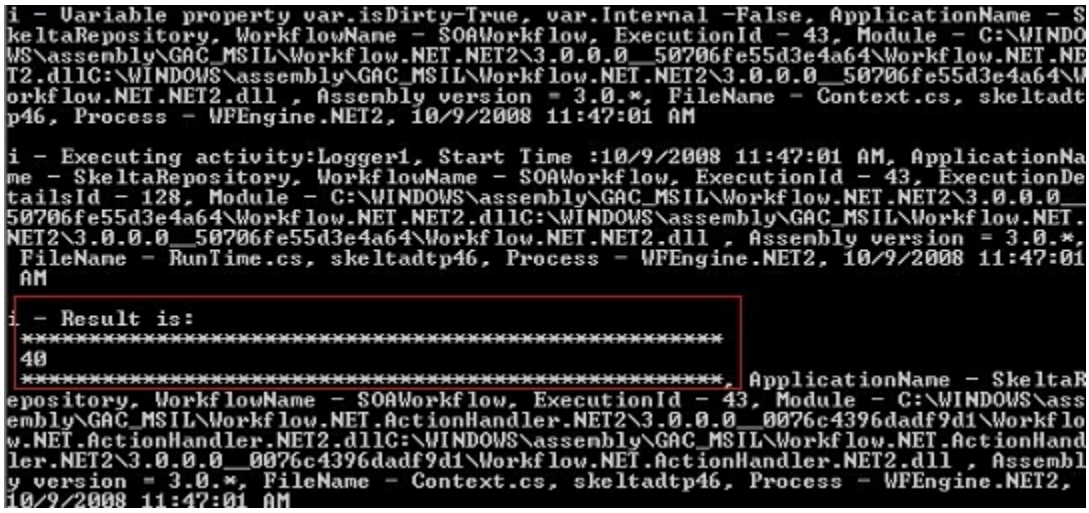
23. Here the variable to be updated is 'intResult'.



24. Click **OK** and then click **Save** in the Activity Properties window.
25. Display the value in the logger using Logger activity. Right-click the Logger activity and select Activity Properties. Select LogMessage property and then type the logger message in the Logger Message window.
26. Select LogMessage property and then type the logger message in the Logger Message window.
27. Click Update and then click Save in the Activity Properties window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

28. Execute the workflow. The method will be executed at run time and the out parameter will be updated to the Variable.



Retrieve Multiple Records from Database Using SOA

This example illustrates, how to get the multiple records from database by using SOA.

Assume that the following are the database details:

Column Name	Data Type	Allow Nulls
Id	uniqueidentifier	☐
FirstName	nvarchar(50)	☑
MiddleName	nvarchar(50)	☑
LastName	nvarchar(50)	☑
Designation	nvarchar(50)	☑
Address	nvarchar(500)	☑
Salary	decimal(18, 2)	☑
DateOfJoining	datetime	☑
		☐

The following is the SQL script:

```
USE [EmployeeDetails]
GO
/****** Object:  Table [dbo].[Employee]  Script Date: 10/09/2008 14:56:15 ******/
SET ANSI_NULLS ON
GO
SET QUOTED_IDENTIFIER ON
GO
CREATE TABLE [dbo].[Employee](
 [Id] [uniqueidentifier] NULL,
 [FirstName] [nvarchar](50) COLLATE SQL_Latin1_General_CP1_CI_AS NULL,
 [MiddleName] [nvarchar](50) COLLATE SQL_Latin1_General_CP1_CI_AS NULL,
 [LastName] [nvarchar](50) COLLATE SQL_Latin1_General_CP1_CI_AS NULL,
 [Designation] [nvarchar](50) COLLATE SQL_Latin1_General_CP1_CI_AS NULL,
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 [Address] [nvarchar](500) COLLATE SQL_Latin1_General_CP1_CI_AS NULL,
 [Salary] [decimal](18, 2) NULL,
 [DateOfJoining] [datetime] NULL
) ON [PRIMARY]
```

Assume that there are three records in the Employee Table of EmployeeDetails Database.

To get the multiple records from database through SOA, follow the steps given below:

1. Prepare an Assembly with the following sample code for getting multiple records.

```
using System;
using System.Collections.Generic;
using System.Text;
using System.Data;
using System.Data.SqlClient;

namespace EmployeeDetails
{
public class Employee
{
private string _connectionString = string.Empty;
public string ConnectionString
{
get
{
return _connectionString;
}
set
{
_connectionString = value;
}
}

private string _tableName = string.Empty;
public string TableName
{
get
{
return _tableName;
}
set
{
_tableName = value;
}
}

public Employee(string server, string database, string tablename)
{
this.ConnectionString = "server=" + server + ";database=" + database + ";Integrated
Security=true;pooling=false;";
this.TableName = tablename;
}

public string GetEmployeeDetails()
{
string connectionString = this.ConnectionString;
string strQry = @"SELECT * FROM " + this.TableName;
```

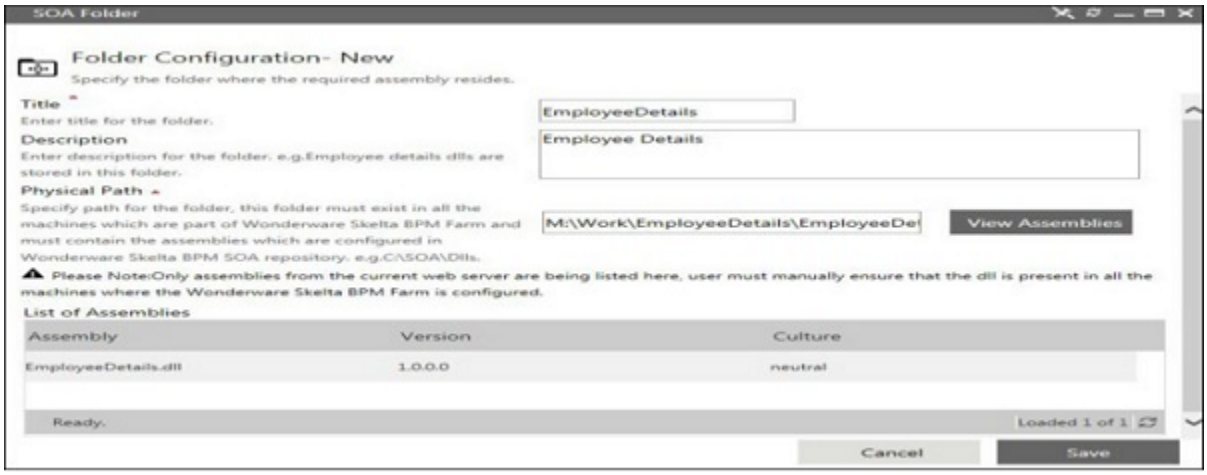
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
SqlConnection connection = new SqlConnection(connectionString);
SqlDataAdapter sqlDataAdapter = new SqlDataAdapter();
sqlDataAdapter.SelectCommand = new SqlCommand(strQry, connection);
connection.Open();
DataSet dataSet = new DataSet();
sqlDataAdapter.Fill(dataSet, this.TableName);
connection.Close();
return dataSet.GetXml();
}

public string GetEmployeeSchema()
{
string connectionString = this.ConnectionString;
string strQry = @"SELECT * FROM " + this.TableName;
SqlConnection connection = new SqlConnection(connectionString);
SqlDataAdapter sqlDataAdapter = new SqlDataAdapter();
sqlDataAdapter.SelectCommand = new SqlCommand(strQry, connection);
connection.Open();
DataSet dataSet = new DataSet();
sqlDataAdapter.Fill(dataSet, this.TableName);
connection.Close();
return dataSet.GetXmlSchema();
}
}
}
```

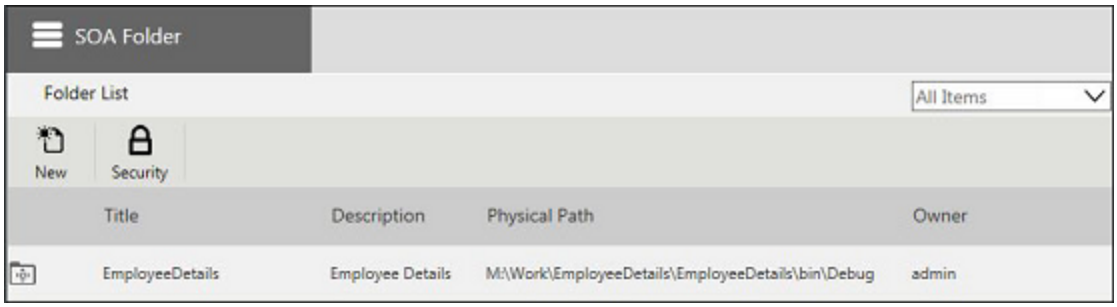
The above code having two methods. One method is to get the Database Schema and other method is to get the raw XML. By passing the Server, Database and the Table name to the constructor it will create the object by that you can access the data from the database.

2. You have to register the assembly in SOA Assembly.
3. To register a assembly, select **Settings ® SOA Folder ® New Assembly Folder** from the **Enterprise Console** pull-down menu. Register a assembly called 'EmployeeDetails'.

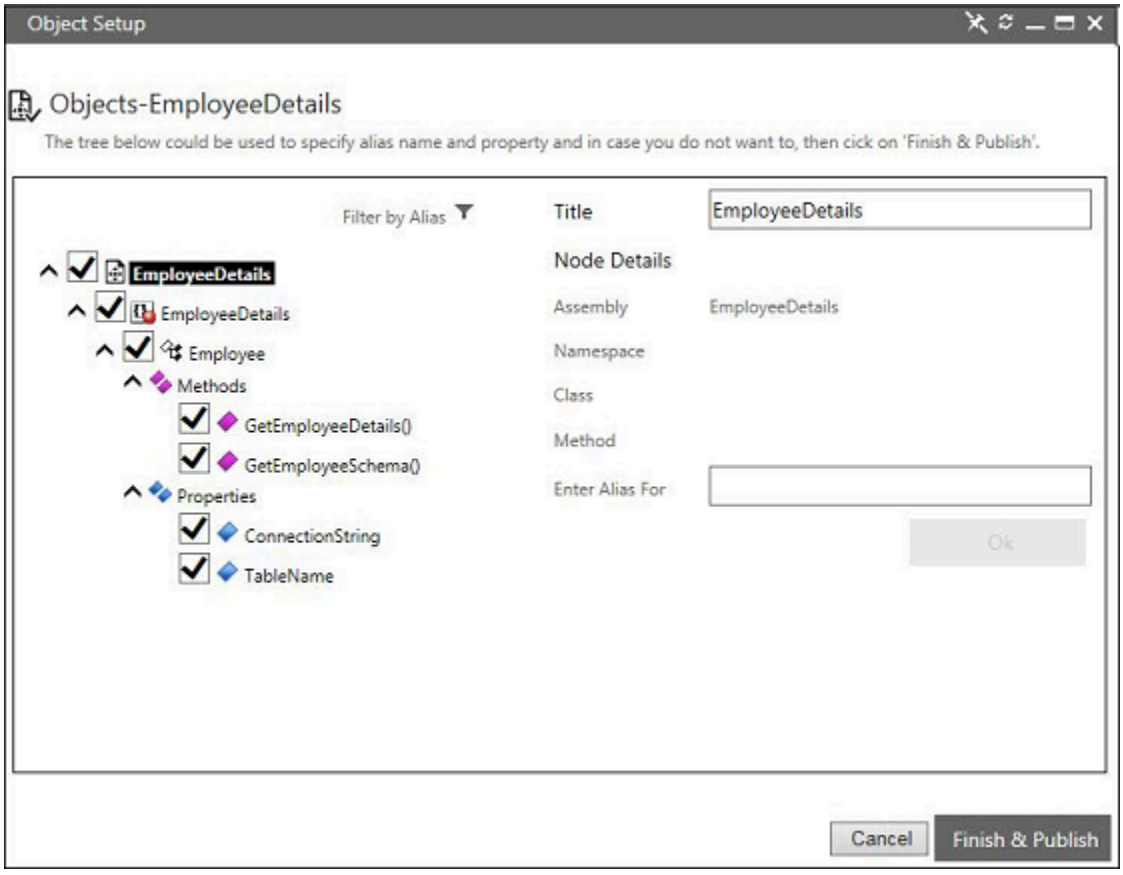


4. Click **Save**. Now the EmployeeDetails assembly has been registered as shown below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

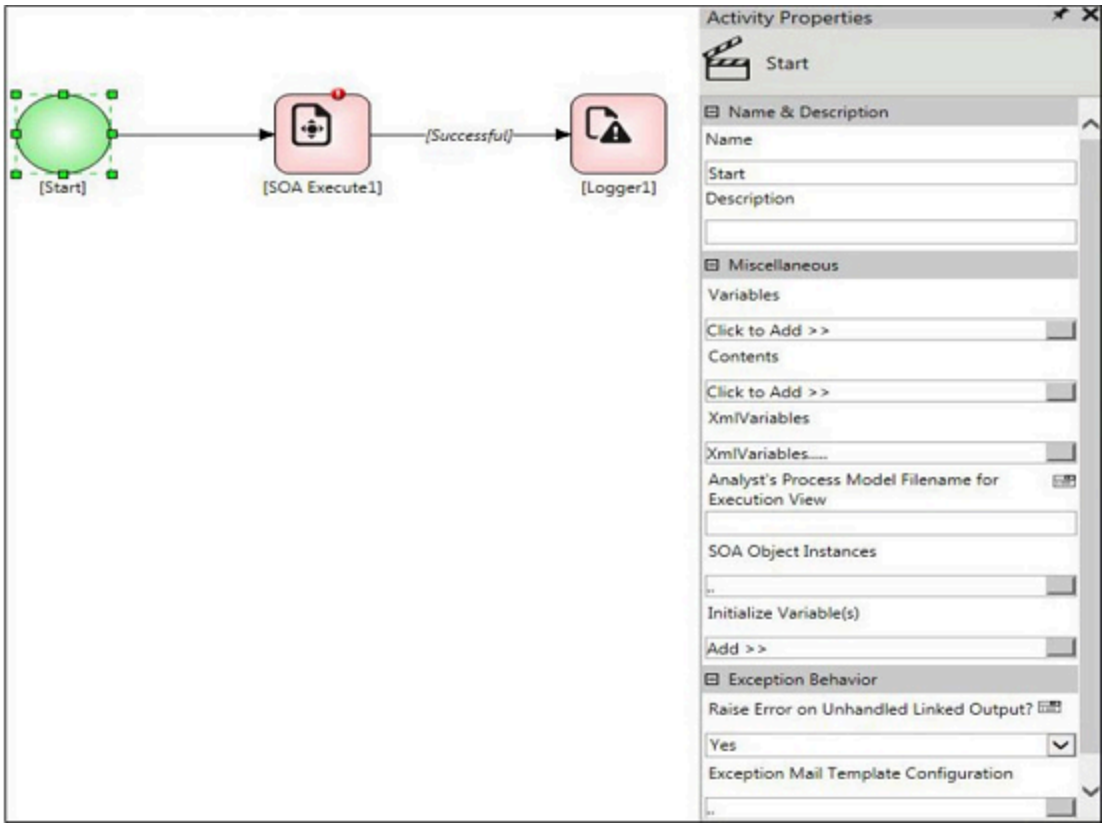


5. Select **Tools > SOA Assembly > From Assembly Folder** from the **Enterprise Console** pull-down menu. Expand EmployeeDetails and select dll and then click Next.
6. The **Object Setup** screen is displayed. Expand all class, methods and properties as shown below.

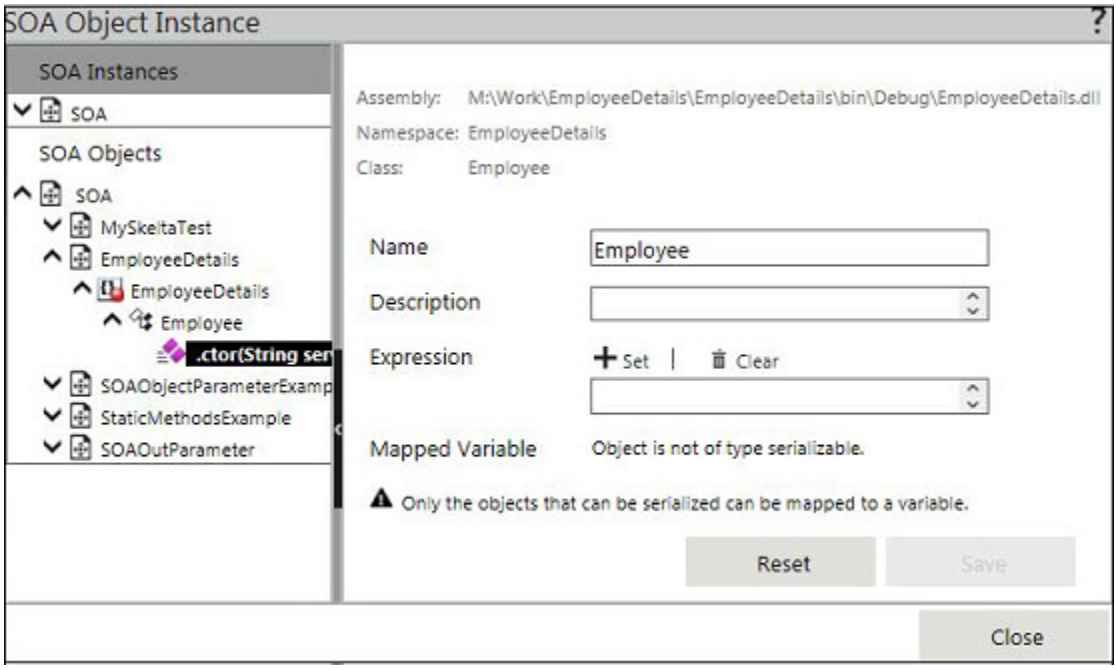


7. Click Finish & Publish to save the assembly. This will be listed in the Assembly List.
8. Design a workflow called 'Employee Details' as shown below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

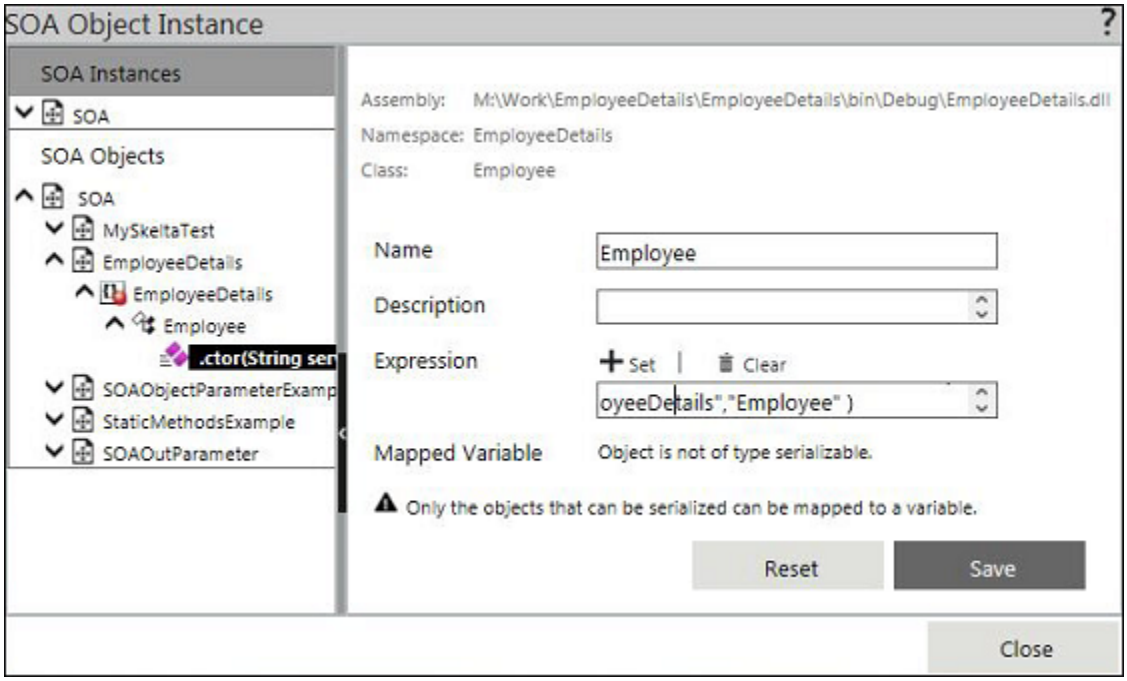


9. Right-click the Start Activity and then select Activity Properties.
10. Select the SOA Object Instances property.
11. The SOA Object Instance screen is displayed. Drag and drop the constructor of the class in SOA Property editor. Here, the constructor takes three parameters with Server name, Database name, and Table name.



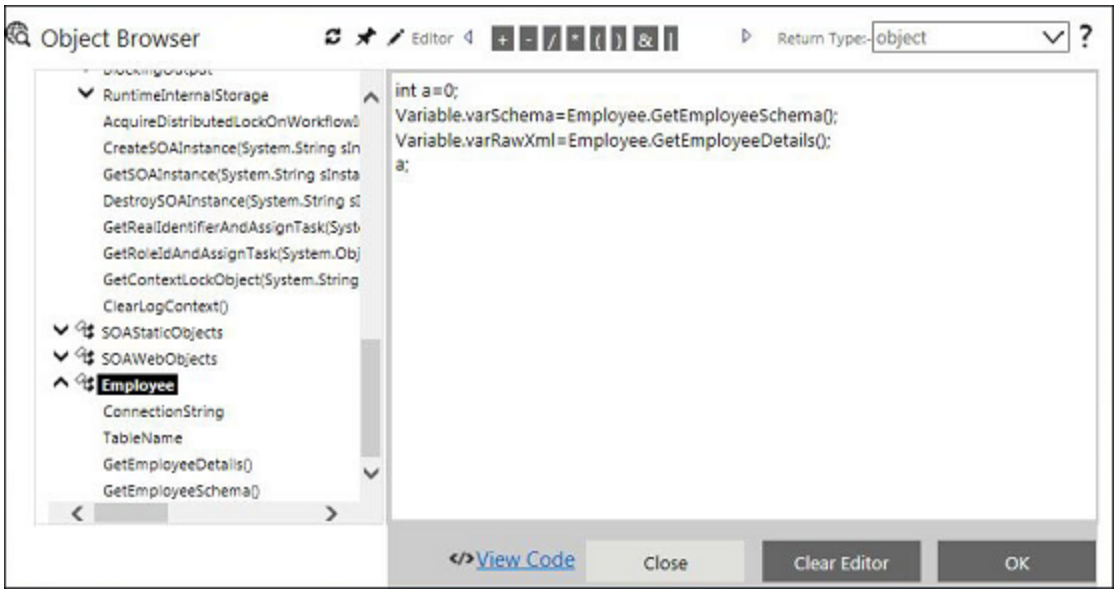
12. Pass the parameter to the constructor. Save the constructor. After saving the instance details, all the members of the class will be listed in the Expression Editor.

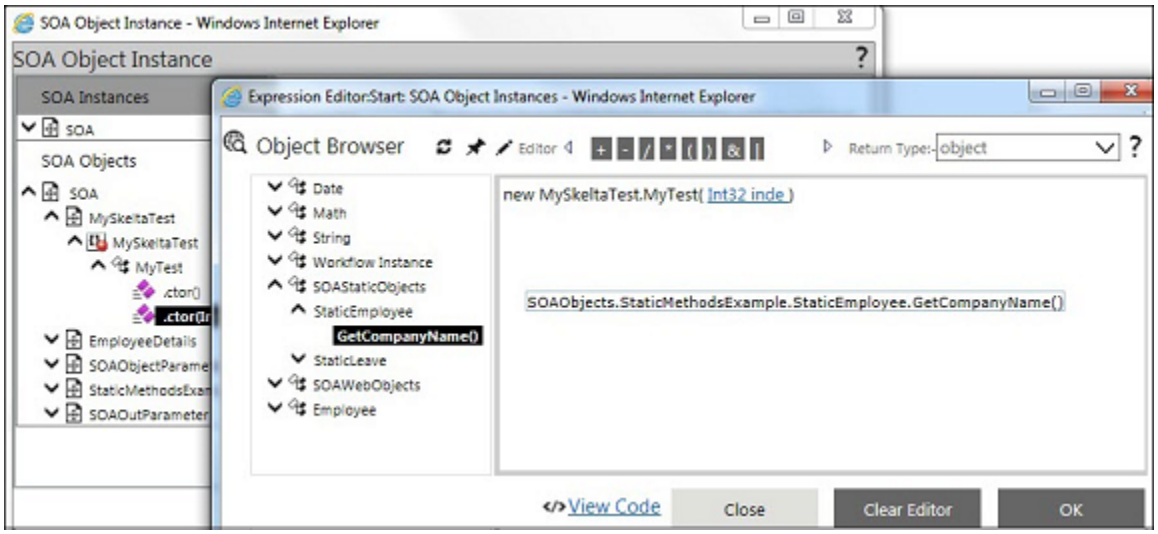
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

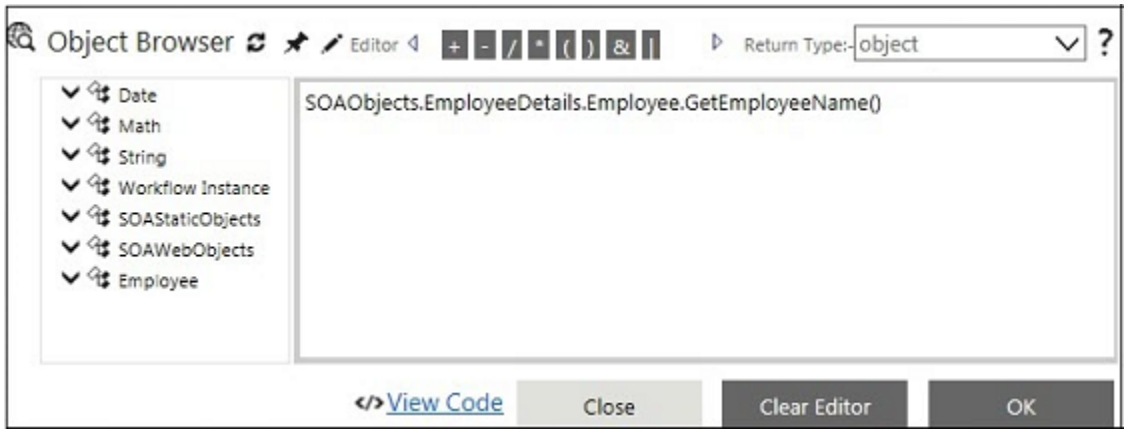


13. Click Save in the Activity Properties window.
14. Make use of the SOAExecute activity to execute the method and update the Variable with the Schema and the Raw XML details.
15. Right-click the SOA Execute activity and select Activity Properties.
16. Select Execute an SOA Expression property to build the expression.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.





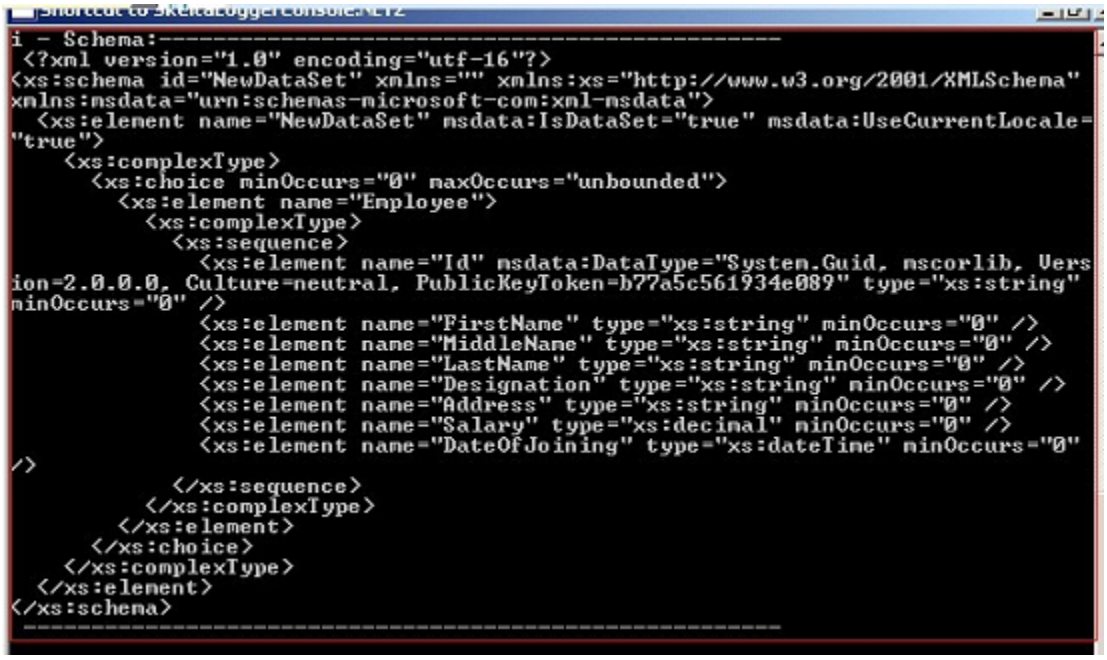


17. Click OK and then click Save in the Activity Properties window.
18. Display the value in the logger using Logger activity. Right-click the Logger activity and then select Activity

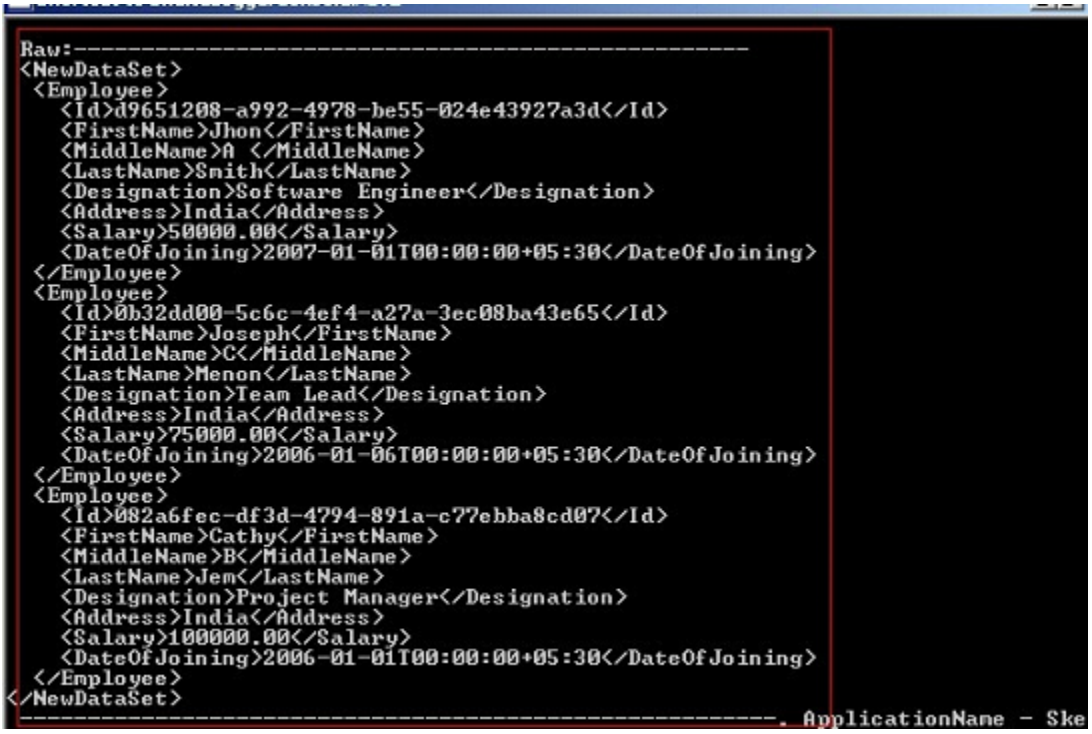
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Properties.

19. Select LogMessage property and then type the logger message in the Logger Message window.
20. Execute the workflow.
21. The following figure shows the logger with the Schema XML.



22. The following figure shows the logger with the Raw XML:



Note: You can even create an XML Variable with the Schema XML and you can bind the data with the Raw XML.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

How to Iterate Collection Object?

This example illustrates how to iterate a collection object. It is possible to persist an object's state in a long running workflow by using variables of type **Object**. In some scenarios, complex objects may be a collection of other complex objects. Here, one may be required to iterate through the collection to get the desired object.

For example, EmployeeCollection object returned from a WCF Service contains collection of an employee object. To get all the information of an employee, you are required to iterate through the employee collection.

This can be done by collective use of some AVEVA Work Tasks activities as described below. It shows how one can iterate through the collection object in a workflow. This enhances the capability of holding the collection object in variables of Object type and iterating through the collection for using the items in the collection object.

Scenario

Employee collection object, which is returned from WCF Service, is to be iterated for displaying employee information.

Steps to design the scenario

- Create a class with Employee object collection.

  Note: You can make use of an existing class to achieve the scenario.

Employee class: Holds the employee information.

EmployeeCollection class: Holds the Employee object collection i.e., collection of employee information.

Note: Only the objects that can be serialized are persisted in long running workflows. Objects that need to be stored in the variables should be marked as Serializable.

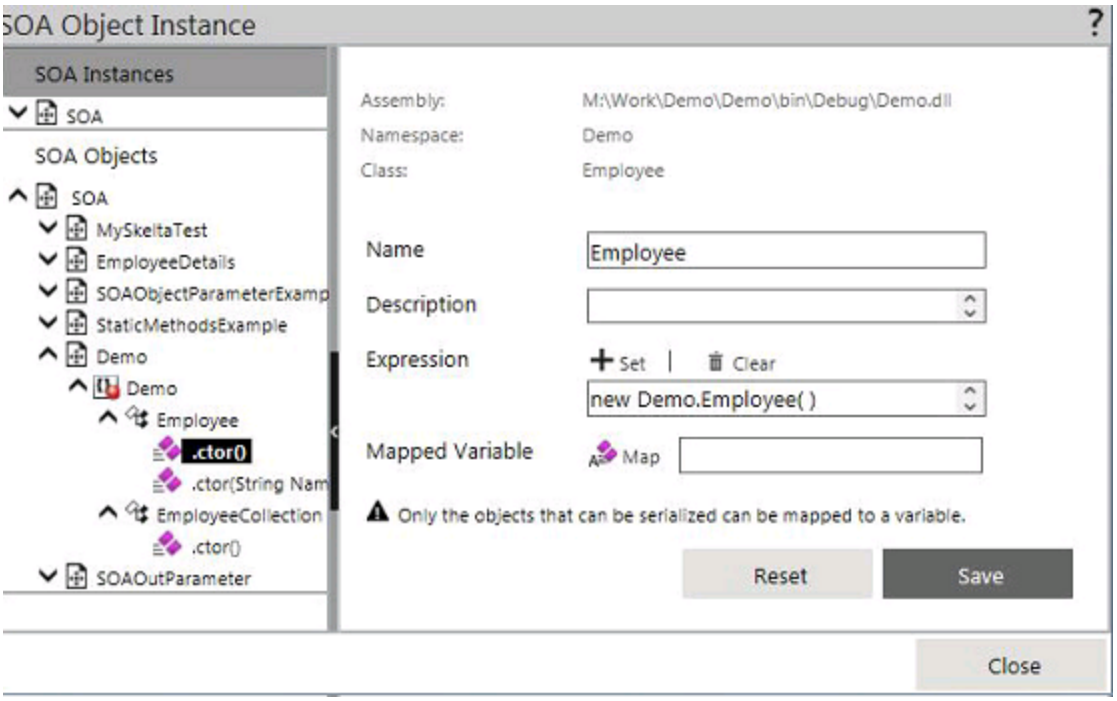
```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
namespace Demo
{
[Serializable]
public class Employee
{
string _name = string.Empty;
int _age = 0;
string _employeeId = string.Empty;
public string Name
{
get {return _name ;}
set { _name = value;}
}
public int Age
{
get { return _age; }
set { _age = value; }
}
public string EmployeeId
{
get { return _employeeId; }
set { _employeeId = value; }
}
public Employee()
```

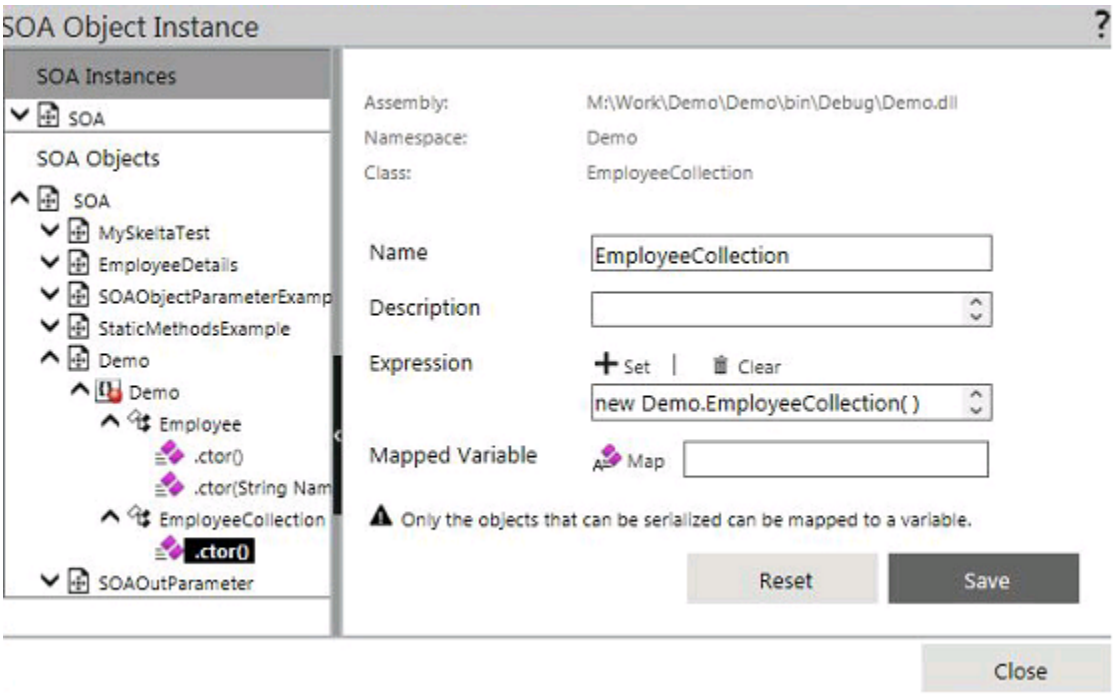
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
{
}
public Employee(string Name, int Age, string EmployeeId)
{
this._employeeId = EmployeeId;
this._age = Age;
this._name = Name;
}
public Employee GetEmployee()
{
return this;
}
}
[Serializable]
public class EmployeeCollection
{
List<Employee> employeeList = new List<Employee>();
public EmployeeCollection()
{
this.employeeList.Add(new Employee("Kevin",30,"SK001"));
this.employeeList.Add(new Employee("Albert",30,"SK002"));
this.employeeList.Add(new Employee("Jim",30,"SK003"));
this.employeeList.Add(new Employee("Jo",30,"SK004"));
this.employeeList.Add(new Employee("Roger",30,"SK005"));
this.employeeList.Add(new Employee("John",30,"SK006"));
}
public List<Employee> GetEmployees()
{
return this.employeeList;
}
}
}
}
```

- Use the code given above to create an assembly.
- Place the assembly in SOA folder, and register the assembly in SOA Assemblies.
- Create object instances for **Employee** and **EmployeeCollection** class in the SOA property editor.

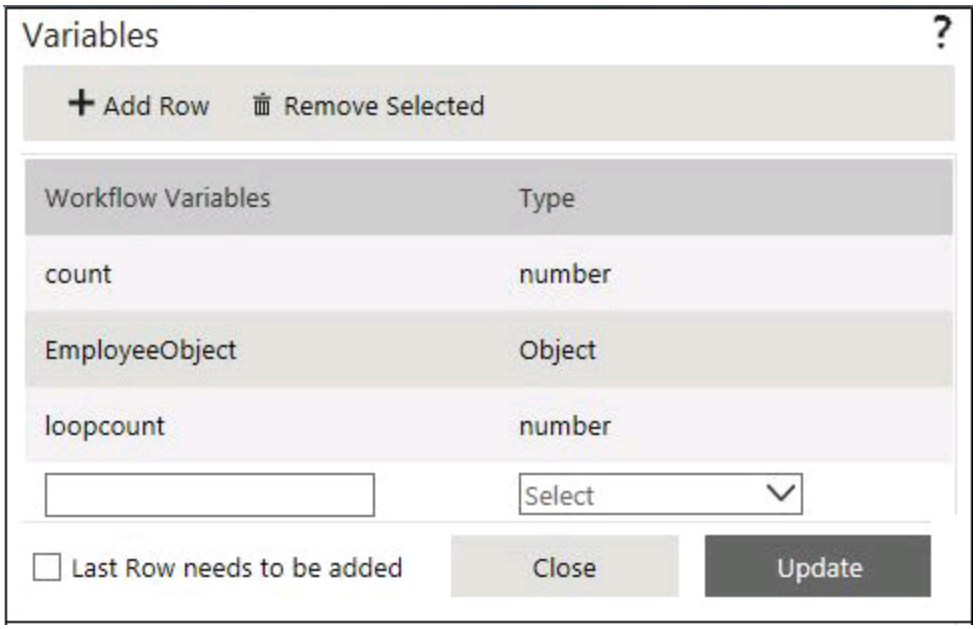
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.





- Create variables in the Start action.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Variable description

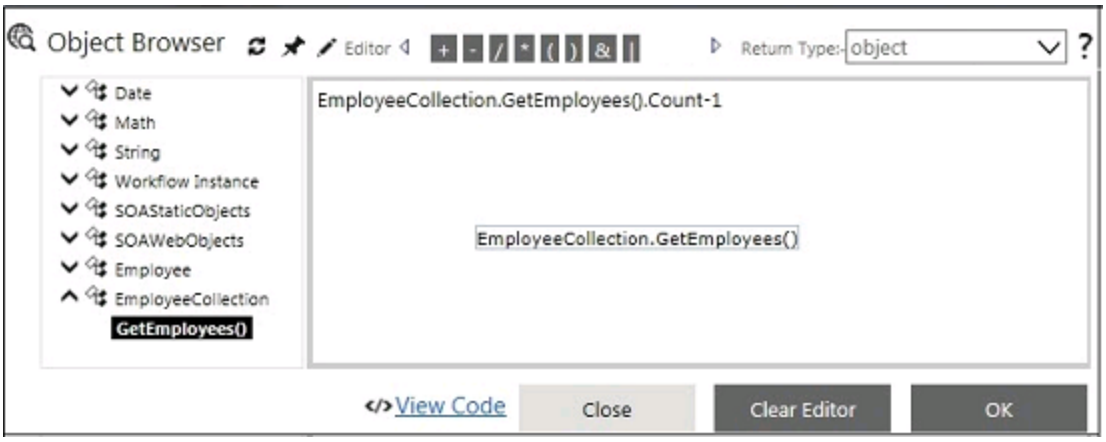
- **count**: To keep track of the iteration
- **EmployeeObject**: To store the employee details
- **loopcount**: Total number of times the loop needs to be executed

- Add an **Update Variable** activity next to the **Start** activity. This activity is used to update the **loopcount** variable for the total number of times the **EmployeeCollection** object is to be iterated.
- 
Total count can be derived from the **EmployeeCollection** object listed in the expression editor. As the GetEmployees() method returns the collection, you can get the total count of the collection from here.

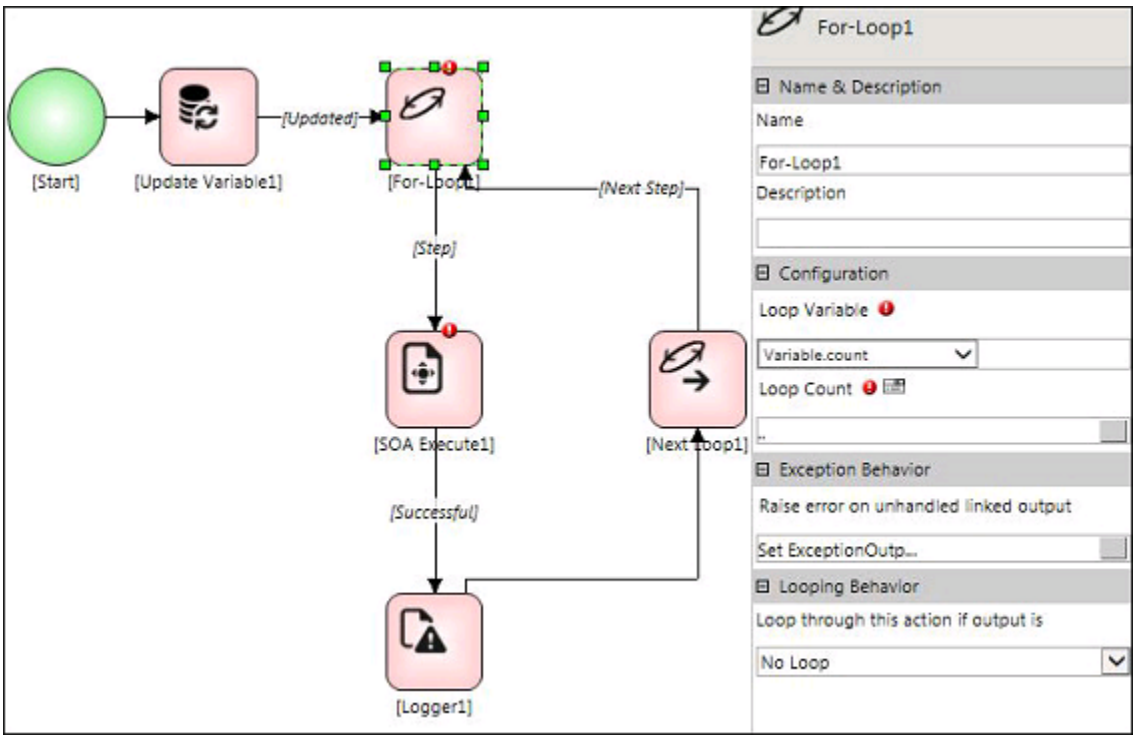
Sample Code

```
EmployeeCollection.GetEmployees().Count - 1; //Get the actual count of the items in the collection object. Subtracting one from it will give the actual loop count required.
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

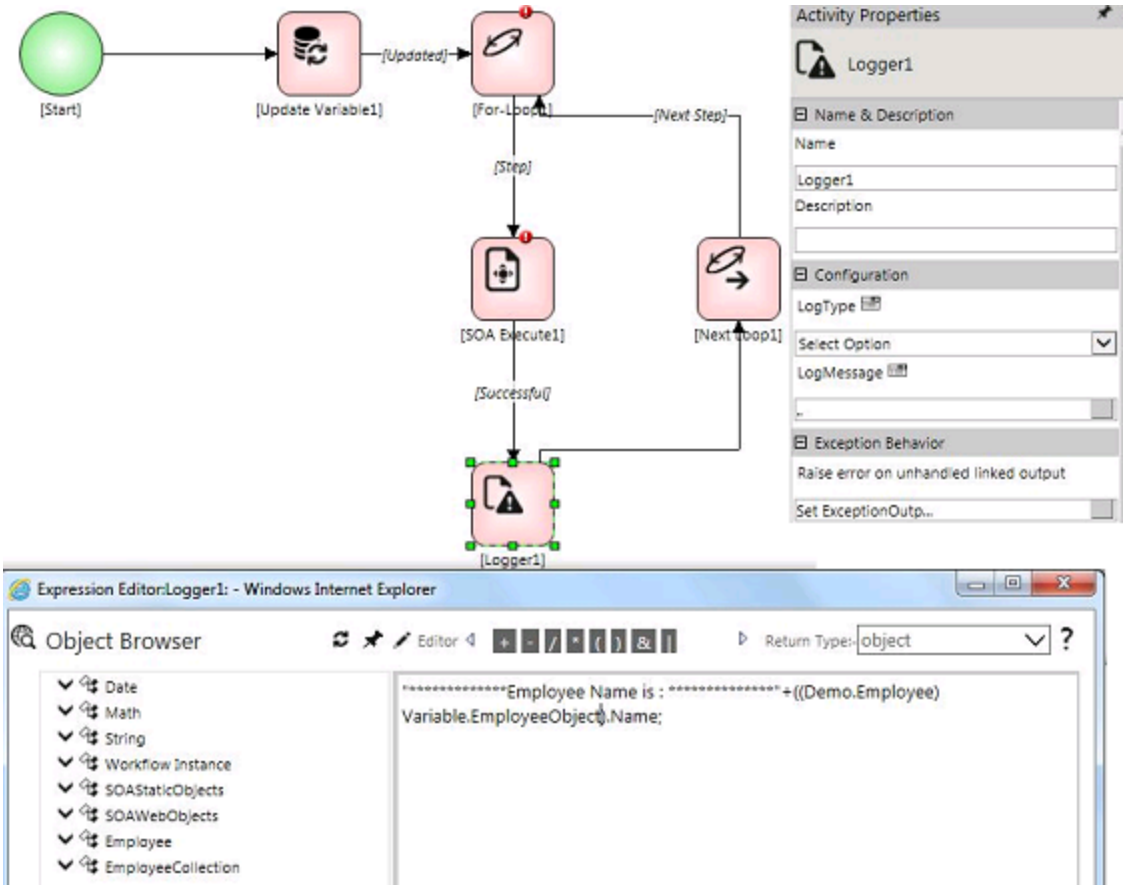


- Drag and drop the For-Loop activity from the Engine activities.



- Drag and drop the Logger activity next to the SOA Execute activity. This is done to display the employee information each time when the object is updated to the variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Sample code

```
((Demo.Employee)Variable.EmployeeObject).Name;
```

Variable EmployeeObject holds the employee information. In order to get the property of the object we need to type cast to the proper object type. i.e., the Employee object, Demo.Employee.

- Place the **Next Loop** activity to iterate through the next item in the collection.
- Execute the workflow.
- During execution, the workflow gets the EmployeeCollection object and iterates through the items, and prints the employee name in the logger.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using this, it is possible to persist complex objects in the workflow and iterate through the collection object to get an item from it.

How to Design a Workflow?

The below example shows how the user can design a AVEVA Work Tasks Workflow.

1. Drag and drop the 'SOA Execute' Activity next to the Start Activity to instantiate the 'Product' object. This will save the object in the mapped variable, so that it is possible to obtain the object from the variable the next

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

time.

Expression for SOA Execute Action: [Instantiate Product Object]

```
//Variable to hold the total quantity
Variable.TotalQuantity = 10;
//Product code
Product.Code;
```

Note: Invoking of the class is not always required. This is to show that the object state gets stored in the variable whenever you invoke the object for the first time.

2. Use 'SOA Execute' to calculate the total amount to be paid for the given quantity.

   Expression for SOA Execute Activity, GetAmount:

```
 //Total amount to be paid is calculated and stored in the 'TotalAmount' variable.
 Variable.TotalAmount =
 Convert.ToInt32(OrderLine.GetAmount((Product.Product)Variable.ProductObject,
 Convert.ToInt32(Variable.TotalQuantity)));
 // 'Variable.ProductObject' is the mapped variable for the 'Product' instance. When the
product object is instantiated for the first time, it automatically stores the object in
the variable. So, in this step we can directly get the 'Product' object from the
variable. We need to explicitly type cast the object to its appropriate
type. (Product.Product)Variable.ProductObject
```

ArchestrA Events

This section provides information on the ArchestrA Wait for Event activity.

ArchestrA Wait for Event

Activity Description

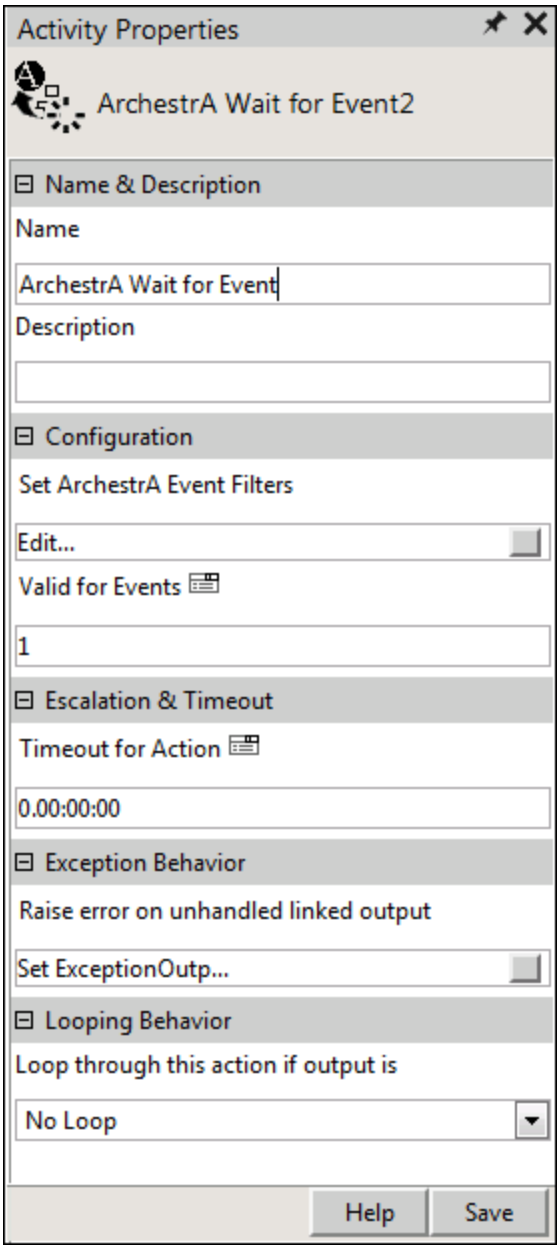
Use the ArchestrA Wait for Event activity to wait for a number of events from ArchestrA Event Services platform for a particular time period, and then consume the events in a defined workflow. You can set the number of events and the time period in the properties of that activity. It can store the event context details in the specified XML variables.

Activity Properties

Enter appropriate values in the **Activity Properties** area to configure the ArchestrA Wait for Event activity. Click the **Activity Properties** icon in the tool bar or select the appropriate option from the right-click menu for the activity.

The following image shows the **Activity Properties** window of the ArchestrA Wait for Event activity:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Name & Description

Use the name and description properties to specify the name and description for the activity.

- **Name**: Use this property to enter a name for the activity.
  Property Type: Mandatory.
- **Description**: Use this property to enter a brief description to be displayed for the activity.
  Property Type: Optional. Set this property only if required.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration

Use these properties to configure the functionality of the activity.

- **Set ArchestrA Event Filters**: Use this property to filter the ArchestrA events. Whenever an event occurs, it will check this filter, and if a match is found, the activity will be alerted.

  Property Type: Mandatory

  For more information, see Set ArchestrA Event Filters.

- **Valid for Events**: Use this property to specify the number of events for which the activity should wait. It indicates that the activity should wait till the specified number of events are received.

  Default Value: The default value is 0 which means that the Archestra Wait for Events activity waits for infinite occurrences of the events, and the workflow does not proceed to the next step in the flow. However, the workflow ends only if there is an exception in the workflow.

  Property Type: Optional. Set this property only if required. If not set, the default value is considered.

Escalation & Timeout

Use this property to specify escalation and timeout settings for the activity.

- **Timeout for Action**: Use this property to set timeouts for this activity. If specified, the activity will be timed out after the specified time span.

  Default Value: 0

  Format: d.hh:mm:ss, where "d" denotes the number of days the schedule is set for, and the time setting denotes the number of hours, minutes, and seconds.

  Property Type: Optional. Set this property only if required.

Exception Behavior

Each activity has the **Raise error on unhandled linked output** property. Click on this to see the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Looping Behavior

Use this property to specify the looping behavior of the activity.

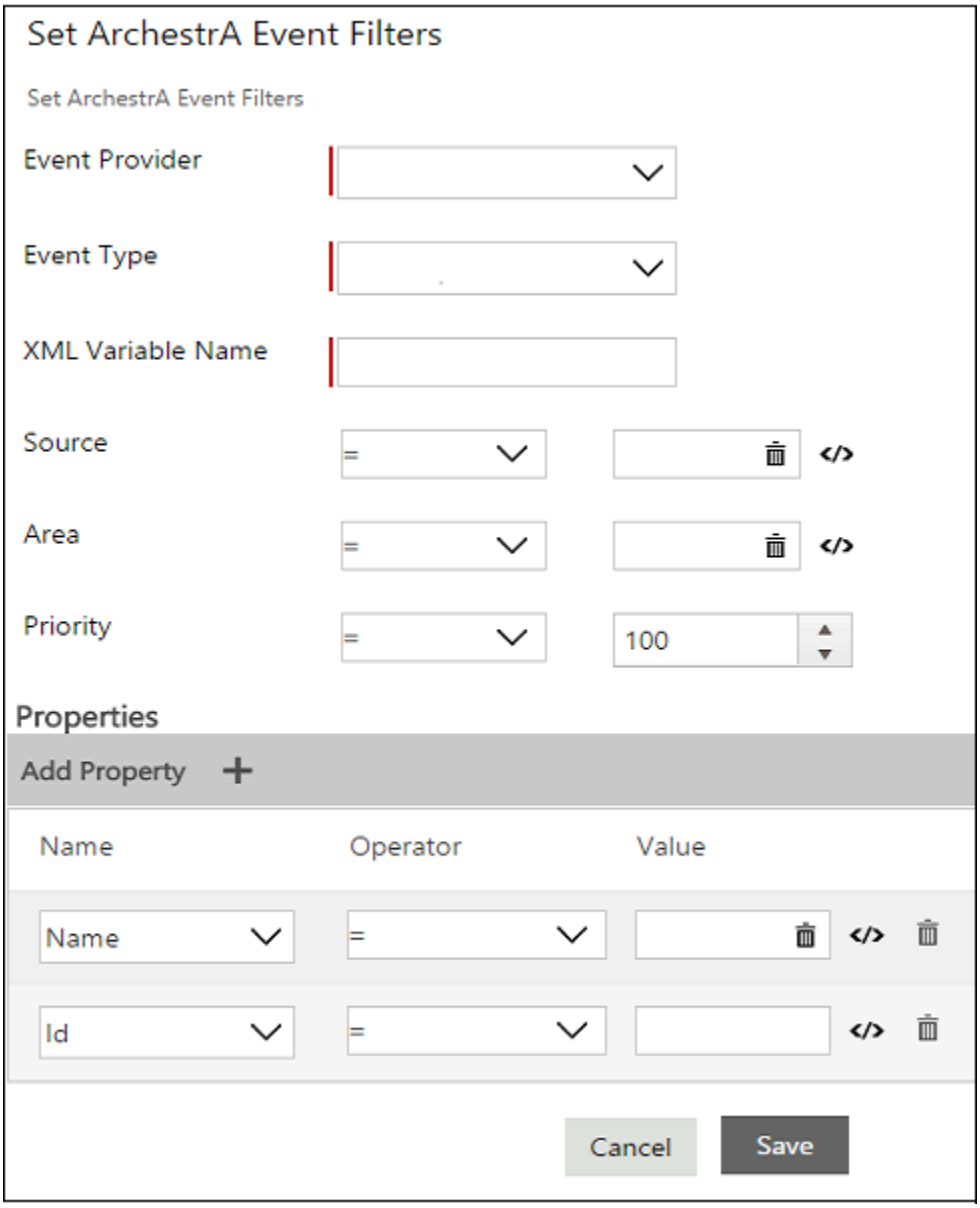
- **Loop through this action if output is**: Use this property to specify the condition for looping the activity by selecting an activity output from the drop down. Available options are as follows:
  - **No Loop**
  - **Action Completed**: This output is displayed when the activity has timed out.
  - **Event Received**: This output is displayed when an ArchestrA event matching the specified filter condition is received.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Set ArchestrA Event Filters

Use this property to filter the ArchestrA events. Whenever an event occurs, it will check this filter, and if a match is found, the activity will be alerted.

The following image shows the Set ArchestrA Event Filters properties window:



Enter the following details:

- **Event Provider**: Select the name of the event provider from which you want to poll for new events. The Event Provider field is mandatory.

  Based on the data available in the ArchestrA Event main list, the Event Provider list is populated. You can add other event providers to this main list, if required.

  Example of Event Providers are InBatch Server or Avantis.

  To go to the ArchestrA Event main list, click the **Menu** button, click **Tools**, and then click **ArchestrA Events**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The ArchestrA Events page appears which displays the available main list. For more information, see *Use the product > Enterprise Console > ArchestrA Events*.

- **Event Type**: Select the Event Type of the Event Provider.

  It is the type of event which defines the properties of the event.

  For InBatch Server, Batch is an event, and possible values for Batch events are such as, BatchId, BatchSize, CampaignId, EventCode, EventCodeName, and LotId.

  Based on the data available in the ArchestrA Event main list, the Event Type list is populated for the selected Event Provider. You can add other event types for the event provider, if required. You can view the properties of the event type in the Properties grid towards the lower section of the Set ArchestrA Event Filter window.

- **XML Variable Name**: Enter the XML variable name for storing event context. When an event occurs, this XML variable will be populated with event context data and it is used later in the flow of the process. The XML variable name must be unique for every ArchestrA Wait for Event activity. When you create an XML variable, the related schema for the XML variable is created automatically.

  If an ArchestrA Wait for Event activity is deleted from a workflow, the associated XML variable is retained. However, we recommend to not use the same XML variable for another ArchestrA Wait for Event activity as the XML variable properties gets overwritten with every workflow execution which will lead to unexpected behavior of the workflow. So, if there are multiple ArchestrA Wait for Event activity in a workflow, each activity will have their own XML variable.

- **Source**: Type the Source property name of the event provider. It is the name of the event provider sending the event. For example, for a Batch event, BatchMngr is the source.

  Select the appropriate operator from the operator drop-down list.

  Click the </> icon to define an expression in the Expression Editor.

  For more information about Expression Editor, see *User Guide > Process Designer > Setting Activity and Link Properties > Using the Expression Editor*.

  Note: If you have defined an expression, then the 🗑 icon is displayed. Click this icon if you want to remove the defined expression.

- **Area**: Type the Area of the event provider. Areas provide a key organizational role in grouping alarm information and assigning it to users who use alarm and event clients to monitor their Areas of responsibility.

  The Area object plays a key role in alarm and event distribution. All objects belong to an Area. Areas can contain sub-Areas. Alarm and event clients are configured to subscribe to a set of Areas.

  Click the </> icon to define an expression in the Expression Editor.

  For more information about Expression Editor, see *User Guide> Process Designer > Setting Activity and Link Properties > Using the Expression Editor*.

  Note: If you have defined an expression, then the 🗑 icon is displayed. Click this icon if you want to remove the defined expression.

- **Priority**: Type the priority for each designated event provider.

  Priority, which is an integer value from 1 to 999 indicating the severity of the alarm which raises an event. An alarm priority of 1 is most urgent and 999 least urgent.

- **Properties**: Based on the Event Type that you enter, select values in the Properties section. For example, for

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

a Batch event type, BatchServer is a property of the data type String. The Properties field is optional.

Based on the data available in the ArchestrA Event main list, the properties of the Event Type list is populated. You can add other properties of the event type, if required.

Click the </> icon corresponding to a property, to define an expression for that property in the Expression Editor.

For more information about Expression Editor, see *User Guide > Process Designer > Setting Activity and Link Properties > Using the Expression Editor*.

Note: If you have defined an expression, then the 🗑 icon is displayed. Click this icon if you want to remove the defined expression.

Limitations:

- The *Between* operator is not supported for **Priority** and **Properties**.
- The data type of the operators are not validated. Ensure to provide valid values to the property data type.
- While creating a filter condition, duplicate properties are not supported.
- The OR condition is not supported while creating a filter condition.

Message Queue Activities

This section provides information on the SendMQData activity. This activity is used to publish messages to Message Queue.

SendMQData

Activity Description

Use SendMQData activity to publish message to Message Queue.

Activity Properties

To use SendMQData activity, follow the given steps:

1. In the **Process Designer** window, select **Message Queue** from the **Activities** drop-down list.
2. Drag and drop the **SendMQData** activity on the **Process Designer** window.
3. Right-click the **SendMQData** activity and then select **Activity Properties**.

Name & Description

Use the name and description properties to specify the name and description for the activity.

- **Name**: Use this property to enter a name for the activity.

  Property Type: Mandatory.
- **Description**: Use this property to enter a brief description to be displayed for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional. Set this property only if required.

Configuration

Use these properties to configure the functionality of the activity.

- **Message Queue Connection**: Use this property to configure Message Queue connection. For more information, see Configuring Message Queue Connection.

  Property Type: Mandatory

Exception Behavior

Each activity has the **Raise Error on Unhandled Linked Output** property, on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down. The looping option for this activity is Completed.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The SendMQData activity returns the following values:

Successful: Displayed when the activity publishes the message to Message Queue.

Unsuccessful: Displayed when the activity fails to publish the message to Message Queue.

Configuring Message Queue Connection

Use Message Queue Connection Settings property to configure connections to Message Queue.

Based on the **Connection** type, **Message Name** and **Message Type** input fields are visible/invisible.

In case of **WM Object** connection type, these input fields are visible to the user, so that the user can pass this information. In case of other connection types, these fields are not needed, hence they are invisible.

1. Select the name of the Message Queue connection from the Connection list. Connections with Connection Type selected as Send would be listed in the list.
2. Select the Binding type for the Connection.

   The following fields appear based on the Binding Type selected for the Connection.

Binding Type for Connection	Field Name	Description
WM Object	Message Name	Enter the Message name or click

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Binding Type for Connection	Field Name	Description
		the Expression Editor Icon to define an expression in the Expression Editor.
	Message Type	Enter the Message type or click the Expression Editor Icon to define an expression in the Expression Editor.
	Message Details	Enter the message in string format.
XML	Message Details	Enter the message in XML format.
JSON	Message Details	Enter the message in JSON format.

For more information about Expression Editor, see *User Guide > Process Designer > Setting Activity and Link Properties > Using the Expression Editor*.

Note:
- It is recommended to use Expression Editor to enter or copy multi-line text in 'Message Details' of SendMQData Activity rather than directly copying into the input field.

- In Expression Editor the text has to be enclosed within double quotes " ".

WaitForMQData

Activity Description

Use the WaitForMQData activity to wait for a number of messages from Message Queue for a particular time period, and then consume the messages in a defined workflow. You can set the number of messages and the time period in the properties of that activity. It can store the message details in the specified XML variables.

Activity Properties

To use WaitForMQData Activity, follow the given steps:

1. In the **Process Designer** window, select **Message Queue** from the Activities drop-down list.
2. Drag and drop the **WaitForMQData** activity on the Process Designer window.
3. Right-click the **WaitForMQData** activity and then select Activity Properties.

Name & Description

Use the name and description properties to specify the name and description for the activity.

- **Name**: Use this property to enter a name for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Mandatory.

- **Description**: Use this property to enter a brief description to be displayed for the activity.

  Property Type: Optional. Set this property only if required.

Configuration

Use these properties to configure the functionality of the activity.

- **Set Message Queue Filters**: Use this property to filter the messages. Whenever a message is received, it will check this filter, and if a match is found, the activity will be alerted.

  Property Type: Mandatory

  For more information, see Set Message Queue Filters.
- **Valid for Events**: Use this property to specify the number of messages for which the activity should wait. It indicates that the activity should wait till the specified number of messages are received.

  Default Value: The default value is 1 which means that the WaitForMQData activity waits for one message. For infinite number of messages, enter 0 in the **Valid for Events** property.

  Property Type: Optional. Set this property only if required. If not set, the default value is considered.

Exception Behavior

Each activity has the **Raise error on unhandled linked output** property. Click on this to see the default configured mapped error outputs in red with their check boxes selected.

See Mapped Error Output for more details.

Looping Behavior

Use this property to specify the looping behavior of the activity.

- **Loop through this action if output is**: Use this property to specify the condition for looping the activity by selecting an activity output from the drop down. Available options are as follows:
  - **No Loop**
  - **Action Completed**: This output is displayed when the activity has timed out.
  - **Event Received**: This output is displayed when a Message Queue connection matching the specified filter condition is received.

Set Message Queue Filters

Use this property to filter the messages. Whenever a message occurs, it will check this filter, and if a match is found, the activity will be alerted.

1. Select the name of the Message Queue connection from the Connection list. Connections with Connection Type selected as Receive would be listed in the list.
2. Select the Binding type for the Connection.

   The following fields appear based on the Binding Type selected for the Connection.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Binding Type for Connection	Field Name	Description
WM Object	Message Type	Enter the message type that needs to be listened from Message Queue or Click the Expression Editor Icon to define an expression in the Expression Editor.
XML	XPath	Enter the XPath for the XML Message or Click the Expression Editor Icon to define an expression in the Expression Editor.
	XPath Value	Enter the XPath Value for the XML Message or Click the Expression Editor Icon to define an expression in the Expression Editor.
	XML Schema	Enter the XML Schema for the XML Message or Click the Expression Editor Icon to define an expression in the Expression Editor.
JSON	JSON Path	Enter the JSON Path for the JSON Message or Click the Expression Editor Icon to define an expression in the Expression Editor.
	JSON Path Value	Enter the JSON Path Value for the JSON Message or Click the Expression Editor Icon to define an expression in the Expression Editor.
	JSON Sample	Enter the sample for the JSON Message or Click the Expression Editor Icon to define an expression in the Expression Editor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For more information about Expression Editor, see *User Guide > Process Designer > Setting Activity and Link Properties > Using the Expression Editor*.

3. **XML Variable Name**: Enter the xml variable name.

   XML variable is created with this name and is populated with the data after the message is received

Logic App Activities

This section provides information on the Call Logic App activity. This activity is used to call Logic App Workflows.

Call Logic App Activity

Activity Description

Use Call Logic App activity to call Logic App Workflows.

Activity Properties

To use Call Logic App activity, follow the given steps:

1. In the **Process Designer** window, select **Call Logic App** activity.
2. Drag and drop the **Call Logic App** activity on the **Process Designer** window.
3. Right-click the **Call Logic App** activity and then select **Activity Properties**.

Name & Description

Use the name and description properties to specify the name and description for the activity.

- **Name**: Use this property to enter a name for the activity.

  Property Type: Mandatory.
- **Description**: Use this property to enter a brief description to be displayed for the activity.

  Property Type: Optional. Set this property only if required.

Configuration

Use these properties to configure the functionality of the activity.

- **Logic App Connection and Data**: Use this property to get connections to Logic Apps and pass data, if required.

  Property Type: Mandatory

Exception Behavior

Each activity has the **Raise Error on Unhandled Linked Output** property on click of which, it shows all the default

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

configured mapped error outputs in red with their check boxes selected

See Mapped Error Output for more details.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down. The looping option for this activity is Completed.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs

The Call Logic App activity returns the following values:

Successful: Displayed when the connection execution is successful.

Unsuccessful: Displayed when the connection execution is unsuccessful.

Configuring Logic App Connection and Data

Use Logic App Connection and Data property to configure connections to Logic Apps and pass data.

To configure Logic App connection and pass data

1. Create a Logic App Connection. For more information, see Logic App Connections.
2. In the **Logic App Connection and Data** window, select a **Logic App Connection** created earlier.
3. Enter a variable for **Variable Name**.

   This variable stores the Logic App Alert Key.
4. Get the custom JSON schema from the Logic App to pass relevant data.

   For example:

```
{
"type": "object",
"properties": {
"id": {
"type": "number"
},
"machine": {
"type": "string"
},
"status": {
"type": "boolean"
}
}
}
```

5. Click **Add Logic App Data** to add a row of data.
6. Enter **Name** and select **Data Type** obtained from the custom JSON schema, and then enter a **Value**.

   For example:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name: id

Data Type: Number

Value: 9876

Note:
- The JSON keys are case-sensitive.
- The supported data types are Boolean, Number, and String.
- Click **Expression Builder** to generate value from an expression, if required.
- Single level JSON structure is supported.

7. Repeat **Steps 4 to 5** to enter the required data.
8. Click **Save**, and then click **Close**.

Note:
- The data is not validated. Ensure name and data type are as specified in the custom JSON schema, and the value matches the data type.
-- In case of duplicate names, value passed is only for the first match.
-- In case of names from the standard JSON schema (e.g., ApplicationName), value passed will overwrite the default data.

Standard JSON Schema

Logic Apps must include the following standard JSON schema to interact with AVEVA Work Tasks.

```
{
"properties": {
"ApplicationName": {
"type": "string"
},
"ExecutionDetailsId": {
"type": "integer"
},
"ExecutionId": {
"type": "integer"
},
"LogicAppAlertKey": {
"type": "string"
},
"WorkflowName": {
"type": "string"
},
"UserName": {
"type": "string"
}
},
"type": "object"
}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Wait for Logic App Alert Activity

Activity Description

Use Wait for Logic App Alert activity to wait for an alert from the Logic App based on the alert key filter.

Activity Properties

To use Wait for Logic App Alert activity, follow the given steps:

1. In the **Process Designer** window, select **Call Logic App** activity.
2. Drag and drop the **Wait for Logic App Alert** activity on the **Process Designer** window.
3. Right-click the **Wait for Logic App Alert** activity and then select **Activity Properties**.

Name & Description

Use the name and description properties to specify the name and description for the activity.

- **Name**: Use this property to enter a name for the activity.

  Property Type: Mandatory.
- **Description**: Use this property to enter a brief description to be displayed for the activity.

  Property Type: Optional. Set this property only if required.

Configuration

Use these properties to configure the functionality of the activity.

- **Logic App Alert Filter**: Use this property to set the alert key along with the Web API URL to post from the Logic App.

  Property Type: Mandatory

  In the Logic App Alter Filter window, configure these as follows:
  - **Enterprise Console**: Select an Enterprise Console site. The list shows Enterprise Console sites to which repositories are mapped, and for which Azure Service Bus (with Shared Access Signatures) are configured.
  - **URI**: The URI is automatically generated based on the selected Enterprise Console.
  - **Authorization Token**: The authorization token is automatically generated based on the selected Enterprise Console.
  - **Logic App Alert Key**: Enter a value for the alert key or click **Expression Builder** to generate value from an expression, if required.
- **Valid for Alert**: Use this property to set the number of alerts from the Logic App. If the value is set to **0**, then there is no limit for the number of alerts from the Logic App.

  Property Type: Mandatory
- **Logic App Output XML**: Use this property to set the XML variable to post from the Logic App.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional

In the Logic App Output XML window, configure these as follows:

- **Logic App JSON Data**: Enter the JSON schema to be passed from the Logic App.
- **Logic App XML Schema**: After entering the JSON schema for **Logic App JSON Data**, click **Get XML Schema** to auto generate the XML schema.
- **Output XML Variable Name** : Enter a name for the XML variable. Upon saving, this variable will hold the schema.

Exception Behavior

Each activity has the **Raise Error on Unhandled Linked Output** property on click of which, it shows all the default configured mapped error outputs in red with their check boxes selected

See Mapped Error Output for more details.

Looping Behavior

The property in the Looping Behavior group has been described below. You can use this property to specify the looping behavior of the activity.

Loop through this action if output is - This property is used to specify the condition for looping the activity by selecting an activity output from the drop down. The looping option for this activity is Completed.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs:

The Wait for Logic App Alert activity returns the following values:

- If the Valid for Alert property is set to/or is 0, then after receiving an alert from the Logic App, the output will be Alert Received, and the activity will be in sleep state.
- If the Valid for Alert property is set to/or is 1, then after receiving an alert from the Logic App, the output will both Alert Received and Action Completed, and the activity will be in completed state.
- If the Valid for Alert property is set to/or is more than 1, then after receiving an alert from the Logic App, the output will Alert Received, and the activity will be in sleep state.

Note: While posting alert from the Logic app, ensure the following are part of the HTTP request:
- **URI** as generated based on the selected Enterprise Console.
- **Authorization Token**, as generated based on the selected Enterprise Console, is in the header.
- **ApplicationName** and **LogicAppAlertKey** in JSON schema are in the body.

Design and Execute Workflows

This section shows how to design and execute a workflow in AVEVA Work Tasks.

- Create a New Workflow Process
- Execute the Workflow

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create a New Workflow Process

To create a new workflow process

1. Drag the **Process Designer** control from the toolbox onto the Web Form's Designer surface.
2. In the **Properties** area, enter the new application name in the **ApplicationName** property field.
3. Enter the new workflow name in the **WorkflowName** property field.
4. Browse to the Web Form in which the **Process Designer** control is embedded.
5. This displays the Process Designer screen.
6. In the Process Designer screen, add the content and variables to the **Start** activity of the workflow. These will be visible in the content and variables collection for the other activities.
7. Select the **Human Activities** option in the activities to open the corresponding group.
8. From the **Human Activities** group, click the activities to be added to the workflow process. The icon corresponding to the activity is displayed on the Design Mosaic. For example, you can click the **Approval** option. This will display the Approval icon in addition to the Start icon (where n is the Approval number).

   Note: By default the Process Designer screen shows the Start activity icon on the Design Mosaic.
9. Click the **Approval1** activity. Drag the connector line to the Start activity and click on it to link the two activities.
10. Select the **Approval1** activity and set the properties in the corresponding fields in the Properties area.
11. Click **Save** to save the newly entered properties.
12. For details on setting the properties for different activities, refer to the corresponding topic under Activities.
13. Repeat steps 6 to 10 to add more activities as needed.
14. Click **Publish** in the tool bar to save and deploy the newly created workflow.
15. Now click the **Start** button in the Web Form toolbar or press

    Note: By default the Process Designer screen shows the start activity icon on the Design Mosaic.

Execute the Workflow

A workflow can be executed asynchronously, or synchronously using the **Redirection Enabled Property** in Process Designer.

- Execute Workflows Asynchronously
- Use Redirection Enabled Property for Synchronous Execution

List of Internal Status Codes

This topic lists the different Internal Status codes assigned in AVEVA Work Tasks workflows. The status codes are listed in three groups corresponding to workflows, activities, and work items.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Status assigned to a Workflow

EP = Execution Pending
FE = Finished with Errors
FN = Finished successfully
FR = Failed and Retrying the workflow executed with error
EX = Executing
PA = Paused
AB = Aborted
SL = Awaiting

Runtime assigned to Activities

P = Execution Pending
E = Action Executing
S = Sleep
C = Execution Completed
Z = Next Action initiated
K = Action Killed
U = Action Paused

Status assigned to Work Items

AW = Awaiting for actor to act
OW = Ownership taken
CO = Completed
UN = Unallocated
CL = Closed
QR = Queue Removed
QT = Queue Timeout
QC = Queue Closed
AL = Allocated
RH = Release Hold
AC = Closed as min/max ownership count satisfied
CR = Created
WC = Closed as decision was taken based on properties
TO = Timeout and Work Item closed
ID = Of type Information in Deleted State
HO = Hold
IO = Of type Information

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

CS = Change Status and Save

PA = Paused

AB = Killed

Execute Workflows

The workflow can be executed from any application. The **Client** class executes the workflow. Select the **Execute ()** method of the **Client** object depending on whether the latest version of the workflow has to be executed or a specific version of the workflow has to be executed.

In this section, you will see how to execute a workflow. Workflows can be executed either Asynchronously or Synchronously. This section has descriptions of both execution methods.

You can execute a workflow using the Workflow.NET.Engine.Client API.

public Client(string ApplicationName, string WorkflowName)

Note: By default the Client.Execute method executes the latest version of the workflow. To execute a particular version, specify the corresponding Version number as shown in the following example. Example: public int Execute(int Version, object UserID, string Data)

Execute Workflows Asynchronously

1. Execute(object UserId,string Data)

   The workflow can be executed by passing the UseridString and the XML data to the Execute method.

   Example:

   ```
   string xmlcontent = "<Expense><Amount>2000</Amount></Expense>";
   Client objClient = new Client("MyRep", "MyWF");
   int ExecutionID =objClient.Execute("activedirectory::Bob ",xmlcontent);
   objClient.Close();
   ```

2. Execute(int version, object UserId,string Data)

   The version of the workflow can be specified in this method along with the UseridString and the XML data.

3. Execute(object UserId,string Data,VariablesCollection variable)

   The variables used in the workflow can be assigned values using this method. The values are passed using the variables collection object.

   Example:

   ```
   string xmlcontent = "<Expense><Amount>2000</Amount></Expense>";
   VariablesCollection varCol = new VariablesCollection();
   varCol.Add("varPrice", "Number",1);
   varCol.Add("varTotal", "Number",2);
   Client objClient = new Client("MyRep", "MyWF");int ExecutionID =
    objClient.Execute("activedirectory::Bob ", xmlcontent,varCol);
   objClient.Close();
   ```

4. Execute(string versionStamp, object UserId,string Data)

   The specified version of the workflow can be executed by passing the version of the workflow that is already existing. The version can be created by right clicking on the work flow in the workflowlist (in the enterprise Console) and select save as option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example:

```
string xmlcontent = "<Expense><Amount>2000</Amount></Expense>";
VariablesCollection varCol = new VariablesCollection();
varCol.Add("varPrice", "Number",1);
varCol.Add("varPrice", "Number",2);
Client objClient = new Client("MyRep", "MyWF");
int ExecutionID = objClient.Execute("2","activedirectory::Bob ", xmlcontent);
objClient.Close();
```

5. Execute(int version,object UserId,string Data,VariablesCollection variable)

   The variables used in the workflow can be assigned values using this method.

6. Execute(string versionStamp, int version,object UserId,string Data,VariablesCollection variable)

   The variables used in the workflow can be assigned values using this method. The values are passed using the variables collection object. VersionStamp parameter is the version of the workflow that is already created. Version of the workflow can be created by right clicking on the work flow in the workflowlist and select save as option.

   Example:

```
string xmlcontent = "<Expense><Amount>2000</Amount></Expense>";
VariablesCollection varCol = new VariablesCollection();
varCol.Add("varPrice", "Number",1);
varCol.Add("varPrice", "Number",2);
Client objClient = new Client("MyRep", "MyWF");
int ExecutionID = objClient.Execute("2","activedirectory::Bob ", xmlcontent, varCol);
objClient.Close();
```

Use Redirection Enabled Property for Synchronous Execution

Workflows can also be executed synchronously using the Redirection Enabled Property in Human Activities in Process Designer.

Example scenarios for synchronous execution

When a customer submits a support request online, the request is analyzed for product, severity and other criteria and the request number and estimated days for resolution are displayed to the customer. This requires the AVEVA Work Tasks engine to return values to the client. For a sample implementation, see the example below.

In a vendor invoice approval process, after approval by the Manager, the invoice status is changed to Awaiting entry in ERP. The Manager needs to be able to see the current status after submission of the approval without refreshing the page with the list of invoices. In this case, the Redirection Enabled property is used with the Information activity to display information on current invoice status to the manager.

In an online Customer Survey, survey questions are successively displayed based on responses to previous questions.

A company uses a different payroll application for each country in which it operates. When an employee submits a request for details of balances in the retirement funds, the system validates the employee code and based on country of employment forwards the request details to the payroll application for that country and redirects the employee to the employee account page in the payroll application for the employee's country.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Enable redirection

To enable redirection from activity 1 to activity 2:

- Set the "Redirection Enabled?" property in Activity 1 as Yes.
- In Activity 2 set the "Redirect URL" property.
- If the redirection needs to happen to the work item list of the user assigned to activity 1, enter the URL as http://<%ApplicationPath%>/Default/<%DefaultPage%>?<%workitemid%>.

Example:

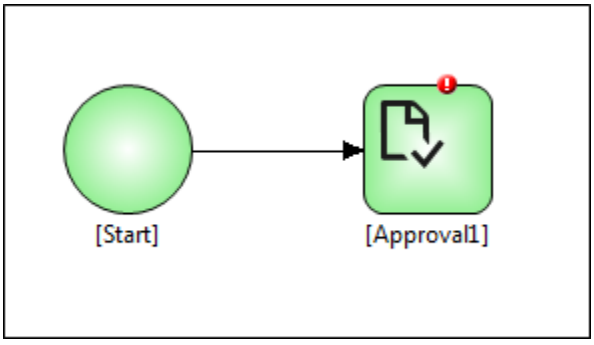
Redirecting from Client after Synchronous execution is performed (Engine sends a URL to client after the activity is executed)

Description

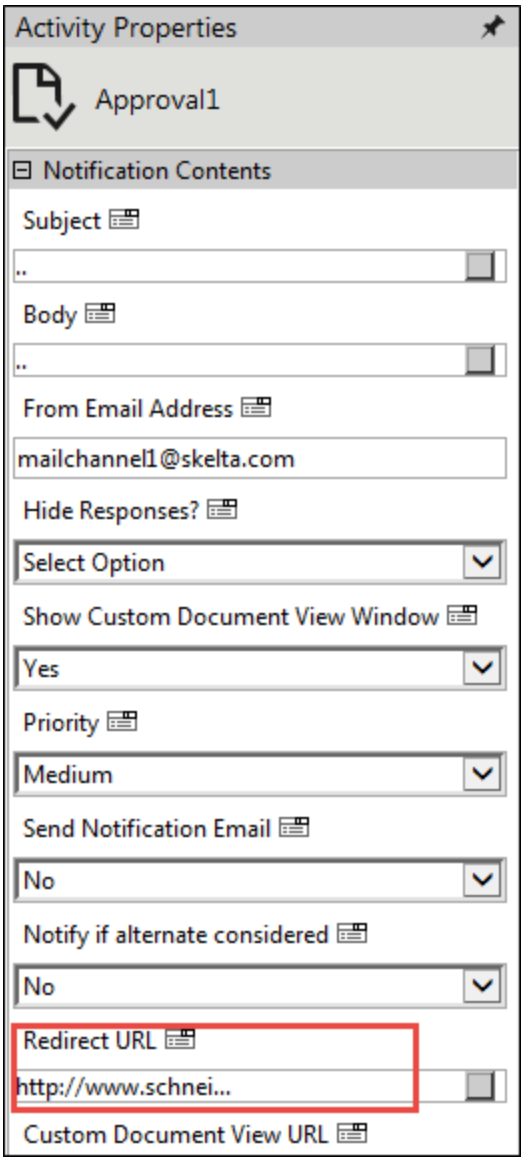
- The workflow is invoked from the code using ExecuteBlocking method.
- The workflow consists of an activity whose RedirectURL property is configured.

The client waits for the activity to execute, gets the url to be redirected from engine, and redirects to the specified link in the Redirection URL property of th activity.

Workflow Design



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Activity Properties

Redirect Url Property

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SampleCode

```
Workflow.NET.Engine.Client cl = new Workflow.NET.Engine.Client("Application", "Workflow");
Workflow.NET.Engine.SynchronousActionData syncData = new
Workflow.NET.Engine.SynchronousActionData(false, this.Context);
string url = "";
cl.ExecuteBlocking("activedirectory::bob", "<content></content>", syncData, true, out url);
cl.Close();
```

Enable Human-Workflow Interaction

This section focuses on:

- Human workflow services
- Using ASPX Form as the Detailed View Page of Work Item List Control
- Email and Microsoft Office Outlook Integration

Human Workflow Services

The **Channels** enable workflows to make available work items assigned to users through different media. Channels can be defined for specific media types, which are called Channel Types in AVEVA Work Tasks. Human Workflow Services (HWS) Activities in AVEVA Work Tasks announce their support for different Channels.

The **Forms** enable Actors to act on Work Items using one of the supported Channel Types. Forms can announce their support for multiple Channel Types.

About Channels

The **Channels** enable workflows to make available work items assigned to users through different media. Channels can be defined for specific media types, which are called **Channel Types** in AVEVA Work Tasks. Channel Types include **Web**, **Windows Forms**, **Email**, **PDA**, **Voice**, and **SMS** among others. Each Channel will support only one Channel Type.

Human Workflow Services (HWS) Activities in AVEVA Work Tasks announce their support for different Channels. For instance, some Activities will not support some of the Channels. Depending on the Channel selected, the Work Item corresponding to the Activity gets delivered to the Actor on the associated Channel Type. For example, if a Channel defined for the **Email Channel** Type is specified for an Activity, then the corresponding Work Item will get delivered to the Actor by email. The user can perform the necessary action by responding to the email appropriately. This is useful in situations where managers who have approval authority are away from their desk or are traveling. If more than one Channel is specified then the work item will get delivered on all the related Channel Types (by Email, on the PDA). This allows Actors to access and respond to Work Items from almost anywhere.

AVEVA Work Tasks provides the **Web Worklist Channel** and **Mail Channel** as the default channels. Developers can create their own channels using the **IChannelProvider** interface.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

About Forms

The **Forms** enable Actors to act on Work Items using one of the supported Channel Types. Forms can announce their support for multiple Channel Types. They are used to render the user interface for all the supported Channel Types, in which the Actor can act on the Work Item assigned to them.

The standard user interface – AVEVA Work Tasks Web Work Item List Form – for displaying Work Items supports the **Web Channel** Type. Other forms can be developed using the **IFormProvider** interface for different Channel Types.

Some of the forms that can be defined are custom ASPX forms that can be used to capture additional user inputs that the standard user interface cannot capture. These forms will correspond to the default Work Tasks Web Worklist Channel. Some of the forms that are possible for the AVEVA Work Tasks Mail Channel, which is the other default Channel, are HTML Forms, Plain Text Form, and Outlook Form.

Create Channels and Forms

New channels can be created using the Channel Provider. You can implement the methods of the IChannelProvider interface to create the custom channel. Similarly you can create new forms using the Form Provider. You need to implement the methods of the IFormProvider interface.

See Sample Implementation of Custom Work ItemForm for a sample implementation.

Use Channels and Forms

All Human Workflow Services (HWS) activities in AVEVA Work Tasks have a property named Set Channel. The user can specify the Channel and the associated form using this property. The property first lists all the Channels that are supported. Users can select the desired Channel from this list. Now the property lists all the Forms supported. You can select one or all Forms. If all Forms are selected then the activity will be delivered on all the Channel Types, which are associated with the different forms.

AVEVA Work Tasks allows Actors to personalize the Channels that are used to deliver Work Items to them by setting their Channel preferences using the Work Item List control (formerly called the Activity List). For example, an Actor who is traveling can choose to receive work items via email only. The Actor can turn off this setting on return.

Run-time Behavior of Channels and Forms

If a HWS Activity configured for Channels and Forms gets executed as part of a workflow process, the workflow engine delivers the corresponding Work Item on all the associated Forms. When the assigned Actor performs the necessary action in any one Form, the workflow engine announces this to all other Channels. These Channels will then take the appropriate compensation action(s). For example, if the Actor responds using the Skelta Web Work Item List Form, then the workflow engine announces this to the other Channels. When a Work Item has already been acted on by the Actor in one Form and does so again from another Form, the workflow engine can detect this redundant response and notify the Actor accordingly. It will display a message such as, "This is an invalid response as you have already taken the required action."

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Set Access Rights for Form Instances

Access rights can be set for the individual instances of Forms. This is useful to restrict access to certain Forms to specific users or roles. For example, a leave application form can be accessed by all employees in an organization. However, a leave report form could be restricted to managers.

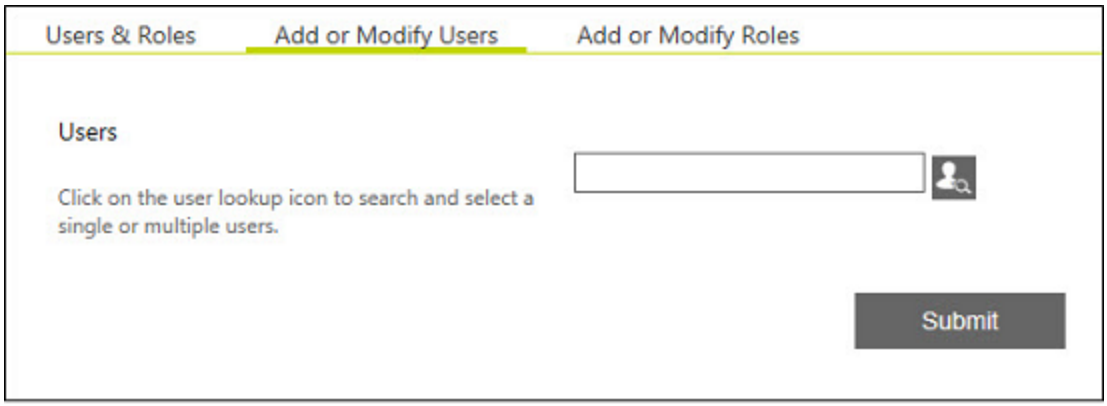
To set access rights

You can set access rights to Forms from the **Delivery Channel** property window. To set the property:

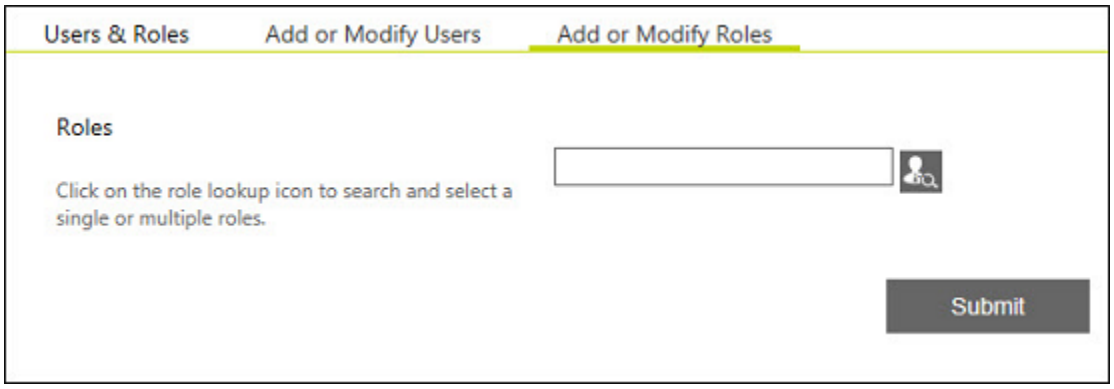
1. Right click the Form, as shown in the image below.
2. From the context menu, select **Set Access Rights** option.
3. This opens the blank Set Access Rights window shown below. This window has three tabs – **Users & Roles**, **Add or Modify Users**, **Add or Modify Roles** – which can be used to set access rights.
   - You can view the users and roles given access to the form from the view corresponding to the **Users & Roles** tab.
   - You can add users to the list of users permitted to access the form or modify this list from the view corresponding to the **Add or Modify Users** tab.
   - You can add users to the list of users permitted to access the form or modify this list from the view corresponding to the **Add or Modify Roles** tab.

   The **Users & Roles** tab is selected by default. It has the **Users** list on the left and the **Roles** list on the right. Each list has a corresponding permissions drop down located above the list box. You can select Grant Access to give the users/roles in the list permission to access the form. Alternatively, you can select **Deny Access** to deny access to the users in the list. The **Save Users & Roles** button can be used to save the permission settings.
4. Click the **Add or Modify Users** tab to open the corresponding view, shown below before adding any resources.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

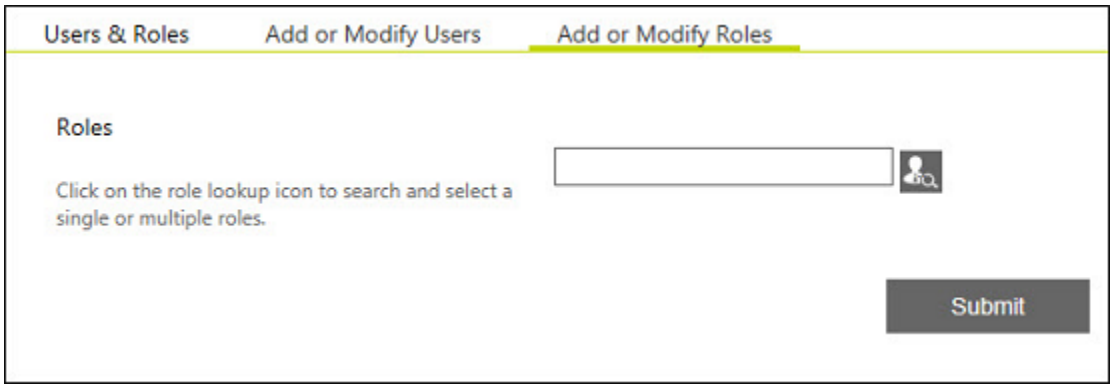


Click the **User Lookup** icon seen next to the **Select users** field. User Lookup screen appears. In this window, select the required provider from the provider drop-down. Enter a search pattern in the **Search For** field and specify the attribute in which to search for in the drop down provided. Click the **Search** button to search for the specified pattern. The resources matching the search pattern are listed in the **Available Resources** list. You can select a resource from this list and click the [>] button to move it to the **Selected Resources** list. You can move all the resources in the first list to the second by clicking the [>>] button. The window will appear as in the image shown below after resource selection. Click **Update**.



You can remove a resource from the **Selected Resources** list by selecting it and clicking on the [<] button. You can also remove all resources in this list by clicking on the [**<<**] button. After selecting the resources click on the **Submit** button to save the selection.

5. Click the **Add or Modify Roles** tab to open the corresponding view, shown below before adding any resources.

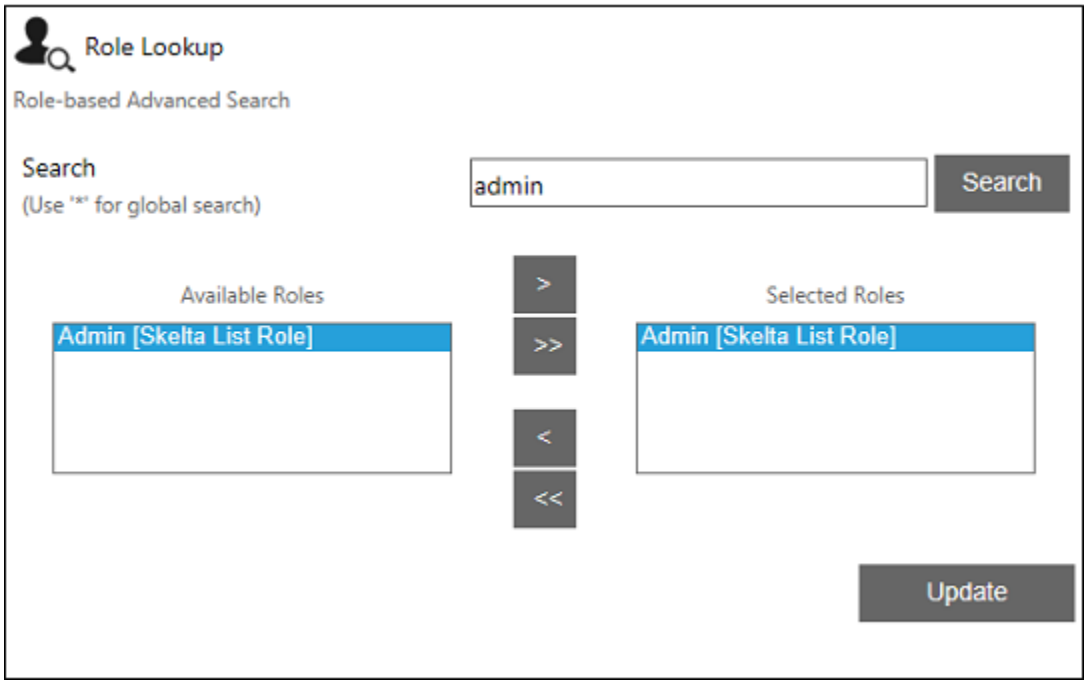


Click the **Role Lookup** icon seen next to the **Select roles** field. Role Lookup screen appears. In this window, select the required provider from the provider drop-down. Also, note that the role provider drop-down only

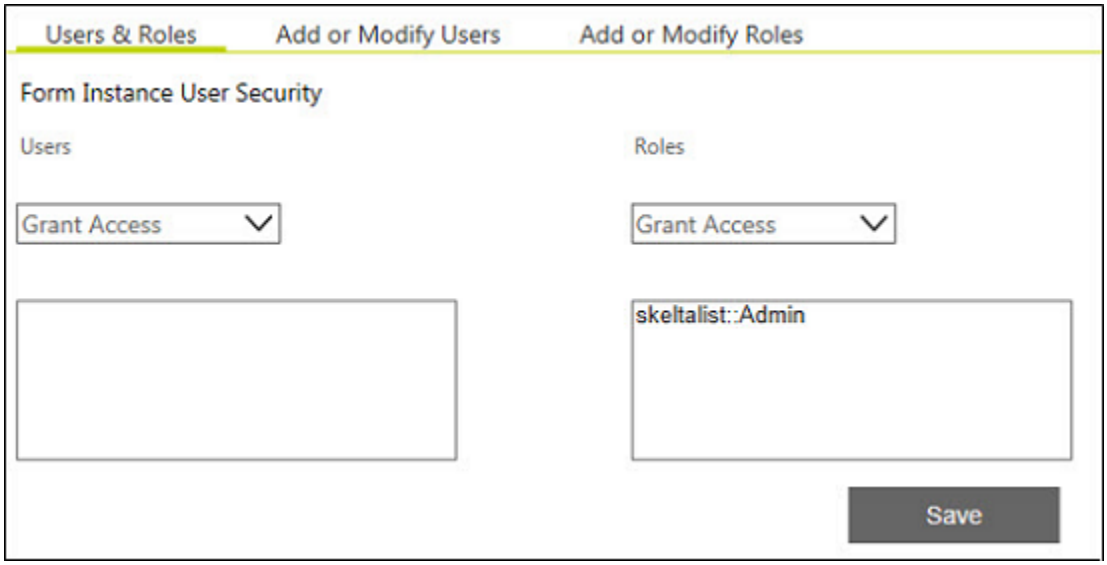
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

appears when the respository has more than one provider.

Enter a search pattern in the **Search** field. Click the **Search** button. The roles matching the search pattern are listed in the Available Roles list. You can select a role from this list and click the [>] button to move it to the **Selected Roles** list. You can move all the roles in the first list to the second by clicking the [**>>**] button. The window will appear as in the image shown below after the role selection. Click **Update** and then click **Submit**.



6. After adding the required users and roles, click the **Users & Roles** tab again to open the corresponding view, which will appear as shown below.



7. You can click **Save Users & Roles** to save the selection.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

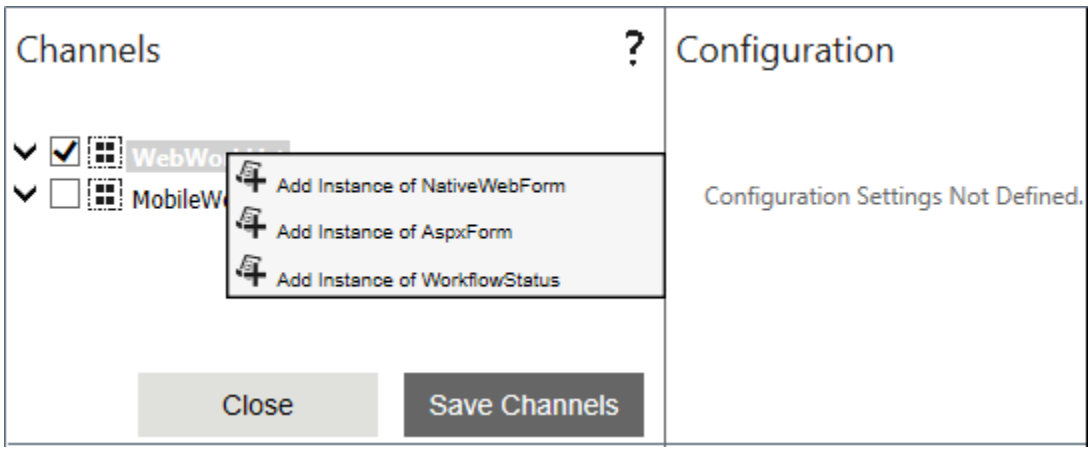
Use ASPX Form as the Detailed View Page of Work Item List Control

You can configure an ASPX form as the detailed view page of the Work Item List Control.

Complete the following steps to configure the ASPX form as the detailed view page:

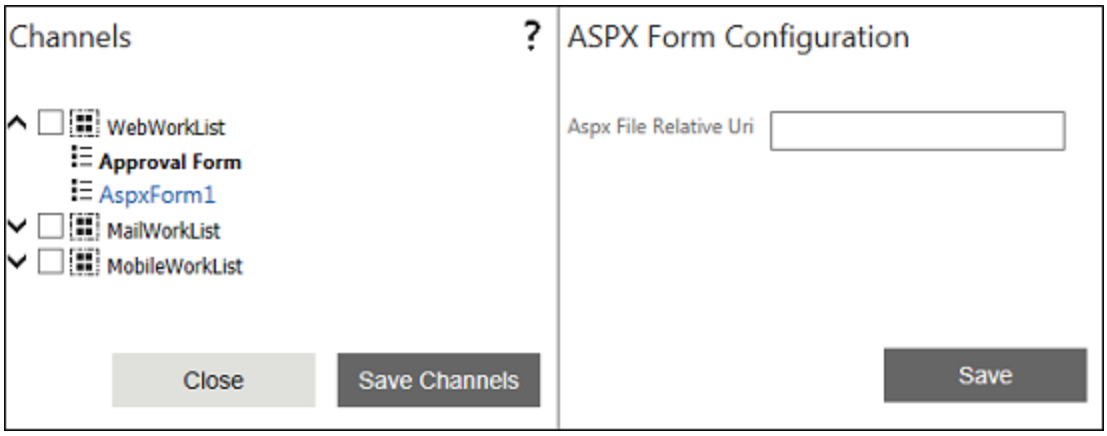
1. Select the human activity.
2. Click the **Delivery Channels** property.
3. The **Channels** dialog box appears as shown in the following image:

4. Right-click **WebWorkList** to display the context menu with the **Add Instance of AspxForm** option as shown in the following image:

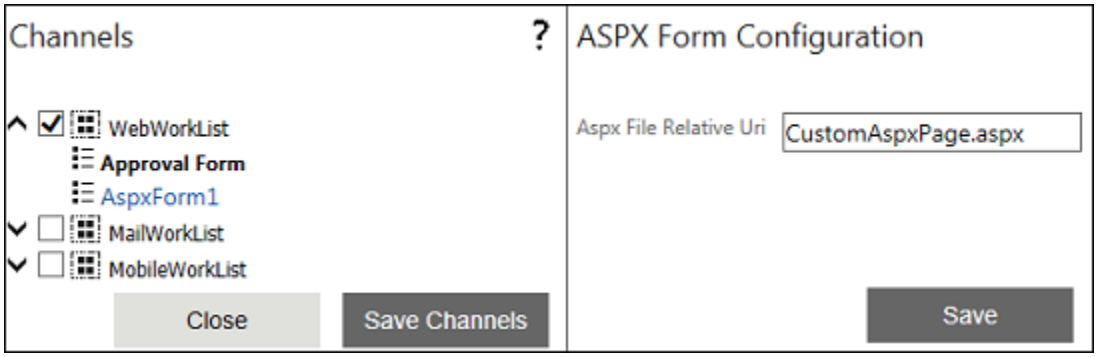


5. Click **Add Instance of AspxForm**.
   The **ASPX Form Configuration** view appears on the left side of the Channels dialog box.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



6. Specify the URL of the ASPX form as shown in the following image:

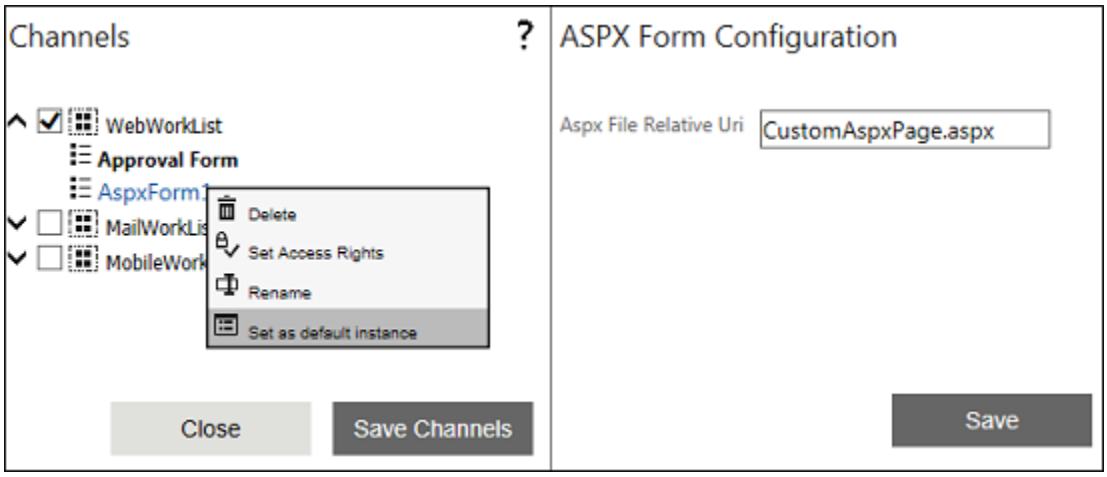


You can specify both relative and absolute URL in the text box.

If you are accessing the Work Item List Control from the Enterprise Console site, then the CustomAspxPageDefault.aspx page must be available in the BPMUITemplates\Default\Repository\Site folder.

Note: Ensure that the name of the custom form does not have the special characters, double-quotes and semicolon.

7. Right-Click *Aspxform1*. Choose **Set as default instance** to set the Aspxform1 as the default instance.



8. Click the **Save** and **Save Channels** buttons. Now, when you click any row in the Work Item List, you can see the aspx page being displayed as the detailed view.

Note: You must save the URL to rename the custom form. If you do not see the changes in the renamed

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

custom form, then close and reopen the window.

Email and Microsoft Office Outlook Integration

The **Mail Channel** allows Human Activities like Approval and Checklist to be sent by email to the intended recipient(s) who can perform the necessary action from the Inbox of email clients like Microsoft Office Outlook. The Human Activities have to be configured to enable this functionality.

Introduction to Sending Activities by Email

The Mail Channel allows Human Activities like Approval and Checklist to be sent by email to the intended recipient(s) who can perform the necessary action from the Inbox of email clients like Microsoft Office Outlook. The Human Activities have to be configured to enable this functionality. The topics in this section describe the steps required to make these configurations.

Configuring the Activities

In the Activity Properties section of the Process Designer, click on the Configuration node to expand it. This node has the **Delivery Channels** property, which you can use to set the medium through which the activity will be delivered to the recipient(s). You can select "MailWorkList" or "WebWorkList" or both from the pop up window for this property.

- If MailWorkList is selected the Activity is sent only to the recipient's email Inbox. In this case, the actor can view the work item and respond as required without leaving their email Inbox.
- If WebWorkList is selected the Activity is sent only to the recipient's Work items list Inbox. This means that the actor will have to open the Work Item List to view the activity and respond.
- If both channels are selected the activity will be sent to the Work items list as well as by email. In this case, the actor can respond to the work item email delivered to the email Inbox. They will also be able to view and respond to work items from the Work items list.

Action Response from Email clients

There are three methods in which the actors can respond to the work item assigned to them through the email channel:

1. Offline
2. Online
3. Microsoft Office Outlook

These methods are described below.

Offline: This method is useful when users are not directly connected to the Internet. For example, when you are using a laptop computer. In this method, actors can type in their comments and their choice of response within the square brackets provided against the respective field. For instance, if an Approval activity is received in the email, and you have chosen to approve, then you can reply to the email with your response. In your reply you can type your comments against the Comments field and "Approve" against the Action field. The response will

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

be sent when the email client next sends out the emails.

Online: This method can be used when users are connected to the Internet. In the body of the email there is an online section, where users can type in their comment and specify their response using the controls provided. For example, there will be two buttons - Approve and Reject - in the Approval Activity email. You can click on the preferred button. In the case of Checklist emails, after specifying the values, you can click on the Submit button that is available to submit your response. In both cases the response will be sent immediately.

Microsoft Office Outlook: This method is exclusively for users having Microsoft Office Outlook as their email client. In this method you can right click on the work item email in the Inbox and select the appropriate response from the context menu. For example, if it is an Approval activity then the context menu will show two options - Approve and Reject - from which the user can select one. This feature can be enabled in Microsoft Office Outlook by installing a utility that is provided along with AVEVA Work Tasks.

Configure Activities to be Sent by Email

To configure the Email Channel for Human Activities

In the Activity Properties section for Human Activities, carry out the following steps:

1. Click the Configuration node to expand it. This node has the delivery channel configuration property among others.
2. In this property group, click the button for the **Delivery Channels** property to open the corresponding window.
3. In this window, select the "MailWorkItem" channel by clicking the corresponding checklist, and click the Save Channels button.
4. After configuring all other Approval properties, click the **Save** button to save the settings. Now when the workflow is deployed and the activity is executed the corresponding work item will be sent to the recipient's email Inbox.

- See Approval - Delivery Channels for a description of the Delivery Channel property window for the Approval Activity
- See CheckList - Delivery Channels for a description of the Delivery Channel property window for the CheckList Activity
- See Choice - Delivery Channels for a description of the Delivery Channel property window for the Choice Activity
- See Info - Delivery Channels for a description of the Delivery Channel property window for the Information Activity
- See ResourceSet - Delivery Channels for a description of the Delivery Channel property window for the ResourceSet Activity
- See Task - Delivery Channels for a description of the Delivery Channel property window for the Task Activity

Date Format in Email Template

The date format of the **Submitted On** field in the Mail Channel email will be based on the actor's culture instead of the culture configured on the notification engine server. For example, if the culture set for the actor is English (United Kingdom) then the date format will be DDMMYYYY.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Integration with Microsoft Office Outlook

Activities configured to be sent by the mail channel allow users to act on these activities from Microsoft Office Outlook Inbox. This requires that the user machine has the **AVEVA Work Tasks Add-in for Microsoft Office Outlook** installed. See the *Administrator Guide* for information about installing this add-in.

Respond to Approval Activities from Email

Approval or Rejection from Email

When the Approval Activity in the workflow is executed it is received in the recipients' email Inbox.

You can respond to the assigned action using one of the following methods:

- Without using AVEVA Work Tasks Add-in for Microsoft Office Outlook
- Using AVEVA Work Tasks Add-in for Microsoft Office Outlook

Without using AVEVA Work Tasks Add-in for Microsoft Office Outlook:

There are two ways to act on the task:

- Acting on the task by Email
- Acting on the task through web-based

To act on the task by Email

In the body of the email carry out the following steps:

1. Click **Reply** to reply to the email.
2. Type in your comments in the square brackets provided for User Input against the Comments field.
3. Type in your choice of response within the square brackets provided against the Action field. If you choose to approve the request, type "Approve" here. If you do not wish to approve, type "Reject".
4. After specifying you response in the email, click **Send** to send it.

To act on the task through web-based

Pre-requisites:

- To access the Work items, you must be connected to the application server through LAN or WAN or Internet. If you are not connected to the application server, then the Work items list will not be accessible.
- Configure repository database to view work items from email before clicking View Work Item and act on it, or else the user will not be able to access the Work items list page.

Steps:

1. Click the **View Work Item and act on it** link. The Work items list page is displayed.
2. Click the work item and then act on that task.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To use AVEVA Work Tasks Add-in for Microsoft Office Outlook

Steps:

1. Right-click the Approval email in the Microsoft Office Outlook Inbox to display the menu. Alternatively, you can right-click the preview pane showing the email to view the menu.
2. Go to the **AVEVA Work Tasks** option in either of the menus and select "Approve" if you wish to approve. Select "Reject" if you wish to reject the request. This will submit the response immediately.

Document View:

When you click the **Document View** link, the document view with execution details is displayed.

Current Execution Status:

An actor will be able to access the Process Execution View and work items from an Email which is sent to the actor by the respective human activity.

Pre-requisites:

- To access the **Process Execution View**, the user has to be connected to the application server via LAN or WAN or Internet. In case, the user is not connected to the application server, then the **Process Execution View** will not be accessible.
- Configure the repository database for viewing the **Process Execution View** window before clicking **Current Execution Status** or else the user will not be able to access the Process Execution View window.

When you click the **Current Execution Status** link, the **Process Execution View** of the **Analysts View** is displayed.

Respond to Checklist Activities from Email

Checklist from Email

When the Checklist Action in the workflow is executed it is received in the recipients' email inbox.

You can respond to the assigned action using one of the following methods:

- Without using AVEVA Work Tasks Add-in for Microsoft Office Outlook
- Using AVEVA Work Tasks Add-in for Microsoft Office Outlook

Without using AVEVA Work Tasks Add-in for Microsoft Office Outlook

There are two ways to act on the task:

- Acting on the task by Email
- Acting on the task through web based

To act on the task by Email

In the body of the email carry out the following steps:

1. Click **Reply** to reply to the email.
2. Type in your inputs in the square brackets provided for User Input against the different checklist fields.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. After specifying you inputs in the email, click **Send** to send it.

To act on the task through web based

Pre-requisites:

- To access the **Work items**, the user has to be connected to the application server through LAN or WAN or Internet. In case the user is not connected to the application server, then the **Work items list** will not be accessible.
- Configure the repository database for viewing work items from email, before clicking **View Work Item and act on it** or else the user will not be able to access the Work items list page.

Steps:

1. Click the **View Work Item and act on it** link. The Work items list page is displayed.
2. Click the work item and then act on that task.

To use AVEVA Work Tasks Add-in for Microsoft Office Outlook:

Steps:

- Right-click the Check-List email in the Microsoft Office Outlook Inbox to display the menu. Alternatively, you can right-click the preview pane showing the email to view the menu shown below.

Document View:

When you click the **Document View** link, the document view with execution details is displayed as shown below.

Current Execution Status:

An actor will be able to access the **Process Execution View** and work items from an Email which is sent to the actor by the respective human activity.

Pre-requisites:

- To access the **Process Execution View**, the user has to be connected to the application server via LAN or WAN or Internet. In case the user is not connected to the application server, then the **Process Execution View** will not be accessible.
- Configure repository database for viewing **Process Execution View** window before clicking **Current Execution Status** or else the user will not be able to access the Process Execution View window.

When you click the **Current Execution Status** link, the **Process Execution View** of the **Analysts View** is displayed.

Respond to Choice Activities from Email

Choice from Email

When the Choice Activity in the workflow is executed it is received in the recipients' email inbox.

You can respond to the assigned action using one of the following methods:

- Without using AVEVA Work Tasks Add-in for Microsoft Office Outlook
- Using AVEVA Work Tasks Add-in for Microsoft Office Outlook

Execution Status or else the user will not be able to access the Process Execution View window.

When you click the **Current Execution Status** link, the **Process Execution View** of the **Analysts View** is displayed.

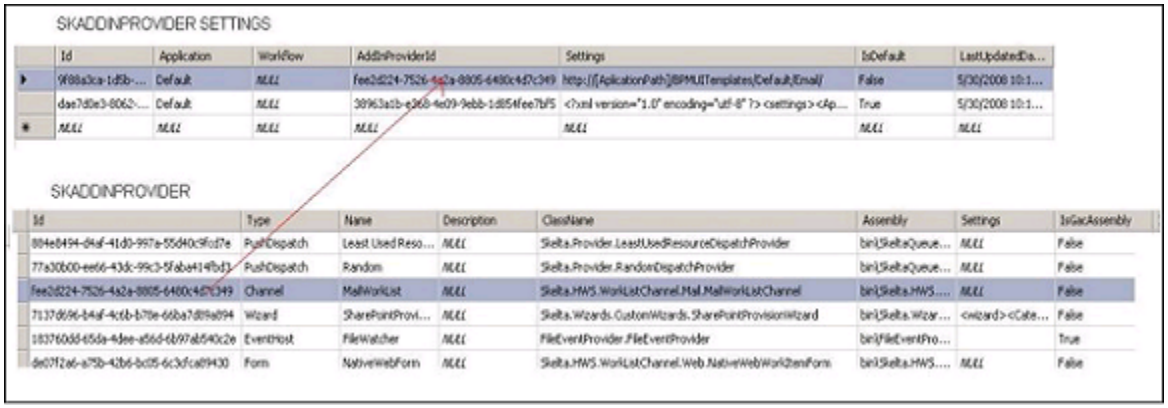
Task Response:

When you submit your response to the Task email using any of the above methods you will receive a confirmation email.

Configure Repository Database to View Process Execution View, Document View, and Work Items View from Email

Steps:

1. Go to Repository Database.
2. Open **SKAddInProviderSettings** table.
3. Set **Application** and **Workflow** columns if the **AddinProviderID** in **SKAddInProviderSettings** table should be the ID present in **SKAddInProviders** table whose **Type** column data is *Channel* and **Name** column data is *MailWorkList*.



For example, if the application is *Repo*, workflow is *WF,* and the application URL is **http://localhost:8000/EnterpriseConsole/BPMUITemplates/Default/Email/,** then the entries in the **SKAddInProvidersSettings** table is as shown in the following image:

Note:
- For each workflow, a separate (Follow step 3) entry should be added in the **SKAddInProviderSettings** table.
- If a workflow is not configured for a mail channel, then the system considers the first entry of the repository, which could be an entry configured for another workflow.

The following image shows the Document View, Current Execution View Status, and Work Item view:

Note: Restart the Workflow Engine service after making changes to the Repository Database configuration.

Support Variables, Contents, and XML Variables in Email Templates

The following are the Activity Email Templates found in the Email and Microsoft Outlook integration:

- Approval Activity Email Template
- Choice Activity Email Template
- Check-list Activity Email Template
- Task Activity Email Template
- Information Activity Email Template

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Approval Activity Email Template

AVEVA Work Tasks Engine accesses the approval activity's email template from the following physical path:

```
AVEVA\AVEVA Work Tasks\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\
ApprovalEmail.html
```

This template can be modified by the user as per their UI requirement. The mails received by the actor is based on the above mentioned mail template.

The following is a default email template text for the **ApprovalEmail.html** file:

ApprovalEmail.html

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.subject {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.style8 {
 color: #FF3300;
 font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight: bold; }
-->
</style>
</head>

<body>
<form id='Form1' action='<%#EmailURL%>' method='post' >
<table width="700" border="0" align="left" cellpadding="0" cellspacing="1"
bgcolor="#CCCCCC">
<tr>
<td valign="top"><table width="100%" border="0" cellpadding="5" bgcolor="#FFFFFF">
<tr>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<td><span class="Username"><%#locSalutation%> <strong><%#ActorName%></strong></span>,
<p class="style2"><%#locMailDescription%></p></td></tr>
<tr>
<td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>

Use Variables in the Approval Email Template

Email templates can be used to display the values of the variables that have been created in a workflow.

Consider that a variable of type string by name **'Status'** is created in **Start** activity and its value is updated as **"Variable, status is updated".** User wants to do the following:

1. Display the variable's value in Approval email.
2. Display the variable's value after **Submitted** on row in the **Task Details** Table.

Solution

To display this variable's value in Approval email and to display the variable's value after Submitted on row in the Task Details Table:

Steps:

1. Copy **ApprovalEmail.html** file.
2. Use the **<%#Variable.Variablename%>** placeholder in the html template for viewing the variable's value, where <Variablename> is a name of the variable.

   Since the variable name is "Status", the placeholder to be used is <%#Variable.Status%> where the value is to be displayed. The highlighted portion in the following code displays the position where the **<%#Variable.Status%>** placeholder is added.

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}

3. The actor will get the approval email in the defined format for the above template.

Note: Out of box variables such as <%#Variable.SubmittedBy.UserId%>, <%#Variable.SubmittedBy.UserName%>, and <%#Variable.SubmittedBy.UserDisplayName%> can be used for Active Directory provider.

Use Contents in the Approval Email Template

Email templates can be used to display the values of the contents that have been created in a workflow.

Consider that a Content of type number and by name 'EmployeeAge' is created in the Start activity and at runtime its value is 21. User wants to do the following:

1. Display the content's value in Approval email.
2. Display the variable's value after Submitted on row in the Task Details Table.

Solution

To display the content's value in Approval email and to display the variable's value after **Submitted** on row in the **Task Details** Table:

Steps:

1. Copy **AprovalEmail.html** file.
2. Use the **<%#Variable.Contentname%>** placeholder in the html template for viewing the content's value where <Contentname> is a name of the content.

   Use the **<%#Content.EmployeeAge%>** placeholder in the html template, where the value is to be displayed. Since the Content name is "EmployeeAge", the placeholder to be used is <%#Content.EmployeeAge%>. The highlighted portion in the below code displays the position where the <%#Content.EmployeeAge%> placeholder is added.

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">

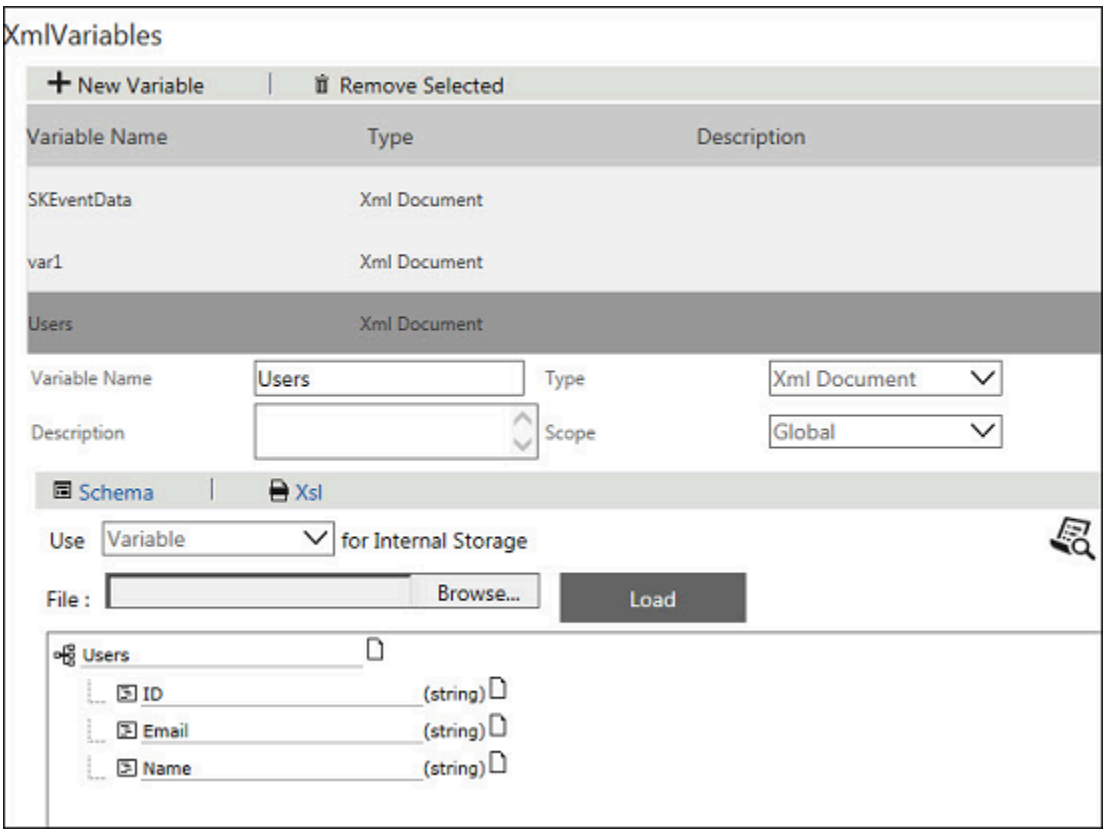
Use XML Variables in the Approval Email Template

Email templates can be used to display the values of the XML variables that have been created in a workflow.

Consider that 'Users' XML Variable of type XMLDocument is created in the **Start** activity and schema is as follows:



The scenario requirement is that during the workflow execution, the user wants to display the following values during the workflow execution:

1. **ID** is updated to 1029.
2. **Email** is updated to John.Smith@domain.com
3. **Name** is updated to John.
4. Display these XML variable's value after **Submitted** on row in the Task Details Table.

Solution

To display this the XML Variable's value in Approval email and to display these variable's value after "Submitted on" row in the Task Details Table:

Steps:

1. Copy **AprovalEmail.html** file.
2. Use the **<%#XmlVariables.variablename%>** placeholder in the html template for viewing the XML Variable's value. Where <variablename> is a name of the XML variable.

   Since the 'Users' XML Variable contents the ID, Email and Name, use the following XML Variables in the AprovalEmail.html template, where the values are to be displayed.

   ```
   <%#XmlVariables.Users.User.ID%>
   ```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<%#XmlVariables.Users.User.Email%>
<%#XmlVariables.Users.User.Name%>
```

The highlighted portion in the below code displays the position where the above placeholders to be added.

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {

1. The actor will get the mail in the defined format for the above template.

Choice Activity Email Template

AVEVA Work Tasks Engine accesses the Choice activity's email template from the physical path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\Choice.html

This template can be modified by the user as per their UI requirement. The mails received by the actor is based on the above mentioned mail template.

The following is default email template text for the **Choice.html** file:

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 font-weight: Bold;
 color: #333333;
}
.subject {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.style8 {
 color: #FF3300;
 font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight: bold; }
-->
</style>
</head>

<body>
<form id='Form1' action='<%#EmailURL%>' method='post' >
<table width="700" border="0" align="left" cellpadding="0" cellspacing="1"
bgcolor="#CCCCCC">
<tr>
<td valign="top"><table width="100%" border="0" cellpadding="5" bgcolor="#FFFFFF">

<tr>
<td><span class="Username"><%#locSalutation%> <strong><%#ActorName%></strong></span>,
<p class="style2"><%#locMailDescription%></p></td></tr>
<tr>
<td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
</tr>

<!-- Appropriate sender details can be passed to the mail by using the sender detail
contents as follows
A few are listed below
<%#Value.SendTo.UserDisplayName%>
<%#Value.SendTo.UserEmail%>
<%#Value.SendTo.UserId%>

Contents declared in Start Activity can also be used in a similar way.

XML Variables can also be used.

Variables defined in Start Activity can also be used pass the values to the mail.

Pre-defined variables can also be used.
A few are listed below.
<%#Variable.SubmittedBy.UserId%>
<%#Variable.SubmittedBy.UserName%>
<%#Variable.SubmittedBy.UserDisplayName%>

To make use of localization, Create a Key and its value
in WorkflowManagementInstalledFolder/Locales/en-US/EmailTemplate.txt
and use the key in this html.
EG: Let EmailUserDefinedName be the Localization key in WorkflowManagementInstalledFolder/
Locales/en-US/EmailTemplate.txt
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Use the above key in html as @@EmailUserDefinedName@@ to get its localized value.

```
         TO TRY OUT THE ABOVE POINTS, JUST UNCOMMENT THE NEXT COMMENTED PORTION OF CODE.

<td class="style2" width='30%' bgcolor='#FFFFFF'>[  ]</td>
<td class="style2" bgcolor='#FFFFFF'><%#locEnter%>:[<%#action%>]</td>
</tr>
</table>
```

4. Complete content

```
<td class="style2" width="95%"><span
class="style8"><strong><%#locEmailSecurityWarning%></strong></span><br />
Workflow:{<%#ApplicationName%>:<%#EmailGUID%>:<%#WorkflowName%>}{WorkflowResourceActi
vityMail#3.5}{WorkflowFollowUp:<%#SkeltaFollowUpValue%>}{WorkflowReminderTime:<%#Skel
taReminderTimeValue%>}</td>
```

Use Variables in Choice Email Template

Email templates can be used to display the values of the variables that have been created in a workflow.

Consider that a variable of type string by name 'Status' is created in the Start activity and its value is updated as Variable, status is updated. User wants to do the following:

1. Display the variable's value in Choice email.
2. Display the variable's value after Submitted on row in the Task Details Table.

Solution

To display this variable's value in Choice email and to display the variable's value after Submitted on row in the Task Details Table:

Steps:

1. Copy **Choice.html** file.
2. Use the **<%#Variable.Variablename%>** placeholder in the html template for viewing the variable's value where <Variablename> is a name of the variable.

   Since the variable name is "Status", the placeholder to be used is <%#Variable.Status%> where the value is to be displayed. The highlighted portion in the below code displays the position where the **<%#Variable.Status%>** placeholder is added.

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
```

vityMail#3.5}{WorkflowFollowUp:<%#SkeltaFollowUpValue%>}{WorkflowReminderTime:<%#Skel
taReminderTimeValue%>}</td>
</tr>
</table></td>
</tr>
</table></td>
</tr>
</table>
</form>
</body>
</html>
```

1. The actor will get the Choice email in the defined format for the above template.

Note: Out of box variables such as <%#Variable.SubmittedBy.UserId%> , <%#Variable.SubmittedBy.UserName%>, and <%#Variable.SubmittedBy.UserDisplayName%> can be used for Active Directory provider.

Use Contents in Choice Email Template

Email templates can be used to display the values of the contents that have been created in a workflow.

Consider that a **Content** of type number and by name 'EmployeeAge' is created in the **Start** activity and at runtime its value is 21.

User wants to do the following:

1. Display the content's value in Choice email.
2. Display the variable's value after **"Submitted on"** row in the **Task Details** Table.

Solution

To display this the content's value in Choice email and to display the variable's value after "Submitted on" row in the Task Details Table:

Steps:

1. Copy **Choice.html** file.
2. Use the **<%#Variable.Contentname%>** placeholder in the html template for viewing the content's value where <Contentname> is a name of the content.

   Use the **<%#Content.EmployeeAge%>** placeholder in the html template, where the value is to be displayed. Since the Content name is "EmployeeAge", the placeholder to be used is <%#Content.EmployeeAge%>. The highlighted portion in the below code displays the position where the <%#Content.EmployeeAge%> placeholder is added.

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.subject {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.style8 {
 color: #FF3300;
 font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight:
bold; }
-->
</style>
</head>

<body>
<form id='Form1' action='<%#EmailURL%>' method='post' >
<table width="700" border="0" align="left" cellpadding="0" cellspacing="1"
bgcolor="#CCCCCC">
<tr>
<td valign="top"><table width="100%" border="0" cellpadding="5" bgcolor="#FFFFFF">

<tr>
<td><span
class="Username"><%#locSalutation%> <strong><%#ActorName%></strong></span>,
<p class="style2"><%#locMailDescription%></p></td></tr>
<tr>
<td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
</tr>

<!-- Appropriate sender details can be passed to the mail by using the sender detail
contents as follows
A few are listed below
<%#Value.SendTo.UserDisplayName%>
<%#Value.SendTo.UserEmail%>
<%#Value.SendTo.UserId%>

Contents declared in Start Activity can also be used in a similar way.

XML Variables can also be used.
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
Variables defined in Start Activity can also be used pass the values to the mail.

Pre-defined variables can also be used.
A few are listed below.
<%#Variable.SubmittedBy.UserId%>
<%#Variable.SubmittedBy.UserName%>
<%#Variable.SubmittedBy.UserDisplayName%>

To make use of localization, Create a Key and its value
in WorkflowManagementInstalledFolder/Locales/en-US/EmailTemplate.txt
and use the key in this html.
EG: Let EmailUserDefinedName be the Localization key
in WorkflowManagementInstalledFolder/Locales/en-US/EmailTemplate.txt
Use the above key in html as @@EmailUserDefinedName@@ to get its localized value.

TO TRY OUT THE ABOVE POINTS, JUST UNCOMMENT THE NEXT COMMENTED PORTION OF CODE.
-->

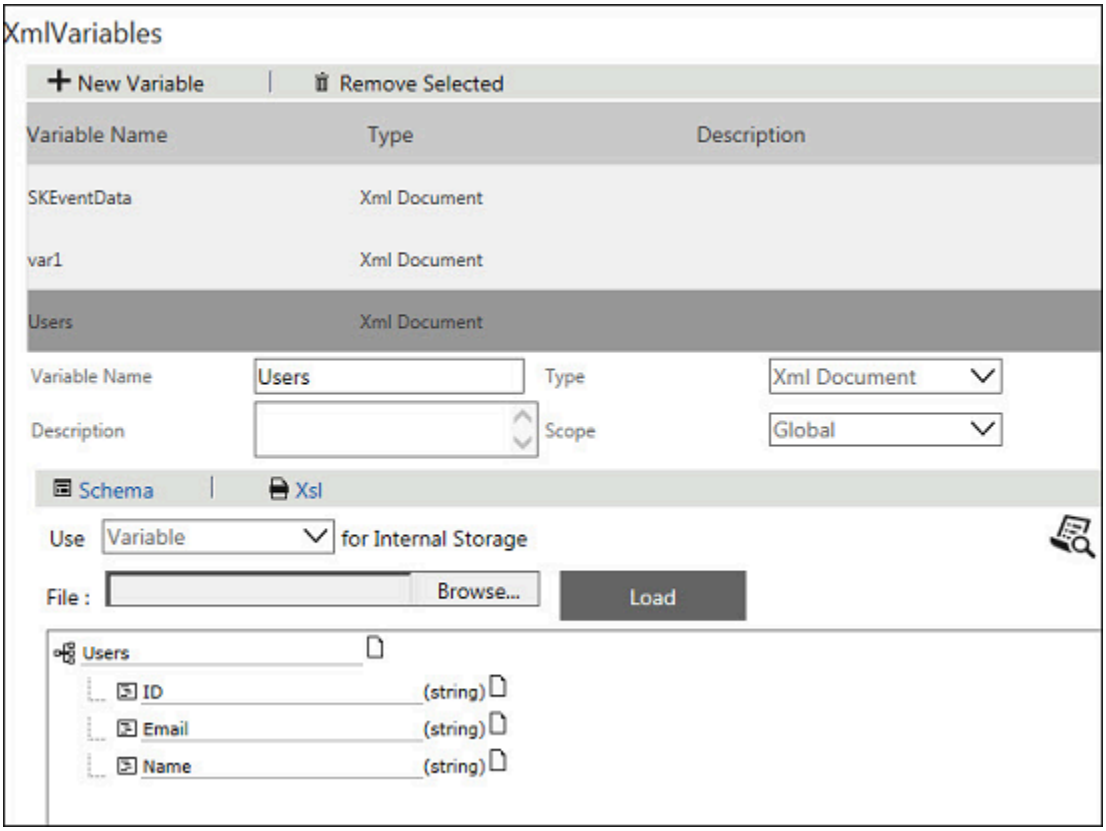
</html>
```

3. The actor will get the mail in the defined format for the above template.

Use XML Variables in Choice Email Template

Email templates can be used to display the values of the XML variables that have been created in a workflow.

Consider that 'Users' XML Variable of type XMLDocument is created in the **Start** activity and the schema is as follows:



The scenario requirement is that during the workflow execution, the user wants to display the following values during the workflow execution:

1. ID is updated to 1029.
2. Email is updated to John.Smith@domain.com
3. Name is updated to John.
4. Display this XML variable's value after Submitted on row in the Task Details table.

Solution

To display this XML Variable's value in Choice email and to display this variable's value after "Submitted on" row in the Task Details Table, the following steps need to be followed:

Steps:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Copy **Choice.html** file.
2. Use the <%#XmlVariables.variablename%> placeholder in the html template for viewing the XML Variable's value. Where <variablename> is a name of the XML variable.

   Since the 'Users' XML Variable contents the ID, Email and Name, use the following XML Variables in the Choice.html template, where the values are to be displayed.

```
<%#XmlVariables.Users.User.ID%>
<%#XmlVariables.Users.User.Email%>
<%#XmlVariables.Users.User.Name%>
The highlighted portion in the below code displays the position where the above
placeholders to be added.
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.subject {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.style8 {
 color: #FF3300;
 font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight:
bold; }
-->
</style>
</head>

<body>
<form id='Form1' action='<%#EmailURL%>' method='post' >
<table width="700" border="0" align="left" cellpadding="0" cellspacing="1"
bgcolor="#CCCCCC">
<tr>
<td valign="top"><table width="100%" border="0" cellpadding="5" bgcolor="#FFFFFF">
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<tr>
<td><span
class="Username"><%#locSalutation%> <strong><%#ActorName%></strong></span>,
<p class="style2"><%#locMailDescription%></p></td></tr>
<tr>
<td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
</tr>

<!-- Appropriate sender details can be passed to the mail by using the sender detail
contents as follows
A few are listed below
<%#Value.SendTo.UserDisplayName%>
<%#Value.SendTo.UserEmail%>
<%#Value.SendTo.UserId%>

Contents declared in Start Activity can also be used in a similar way.

XML Variables can also be used.

Variables defined in Start Activity can also be used pass the values to the mail.

Pre-defined variables can also be used.
A few are listed below.
<%#Variable.SubmittedBy.UserId%>
<%#Variable.SubmittedBy.UserName%>
<%#Variable.SubmittedBy.UserDisplayName%>

To make use of localization, Create a Key and its value
in WorkflowManagementInstalledFolder/Locales/en-US/EmailTemplate.txt
and use the key in this html.
EG: Let EmailUserDefinedName be the Localization key
in WorkflowManagementInstalledFolder/Locales/en-US/EmailTemplate.txt
Use the above key in html as @@EmailUserDefinedName@@ to get its localized value.

TO TRY OUT THE ABOVE POINTS, JUST UNCOMMENT THE NEXT COMMENTED PORTION OF CODE.

```

1. The actor will get the mail in the defined format for the above template.

Check-List Activity Email Template

AVEVA Work Tasks Engine accesses the Checklist activity's email template from the physical path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\CheckListEmail.html

This template can be modified by the user as per their UI requirement. The mails received by the actor is based on the above mentioned mail template.

The following is default email template text for the CheckListEmail.html file:

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.subject {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.style8 {
 color: #FF3300;
 font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight: bold; }
-->
</style>
</head>

<body>
<table width="700" border="0" align="left" cellpadding="0" cellspacing="1"
bgcolor="#CCCCCC">
<tr>
<td valign="top"><table width="100%" border="0" cellpadding="5" bgcolor="#FFFFFF">

<tr>
<td><span class="Username"><%#locSalutation%> <strong><%#ActorName%></strong> </span>,
<p class="style2"><%#locMailDescription%></p></td></tr>

<tr>
<td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
</tr>
<tr>
<td bgcolor="#EBEBEB" class="style4"><%#locResponseOptions%></td>
</tr>
<tr>
<td>
<table width="100%" border="0" cellpadding="4" cellspacing="0" class="style2">
<tr>
<td><a <%#workitemView%>><%#locRespondByWeb%></a></td>
</tr>
<tr>
<td><a <%#docview%>><%#locDocViewURLText%></a></td>
</tr>
<tr>
<td ><a <%#executionView%>><%#locExecutionViewURLText%></a></td>
</tr>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
</table>
</td>
</tr>
<tr>
<td bgcolor="#EBEBEB" class="style4" style="height:10%"></td>
</tr>
<tr>
<td bgcolor="#FFFFFF" class="style2"><%#locSignature%></td>
</tr>
</table>
</td>
</tr>
</table>
</body>
</html>
```

Note: While modifying the Check-List email template the following placeholders should not be modified, as these are necessary for the Skelta engine to process the mails that are received from the actors.

1. Email URL

   ```
   <form id='Form1' action='<%#EmailURL%>' method='post'>
   ```

2. Notes

   ```
   <td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
   ```

3. Complete content

   ```
   <table border='0' align='center' cellpadding='5' cellspacing='1' bgcolor='#EBEBEB'
   class="style2" style="width: 100%; height: 25px;">
   <tr bgcolor='#EBEBEB' class="style2">
   <td  bgcolor='#EBEBEB' class="style2"><strong><%#locColumnName%></strong></td>
   <td  bgcolor='#EBEBEB' class="style2"><strong><%#locUserInputs%></strong></td>
   <td  bgcolor='#EBEBEB' class="style2"><strong><%#locValidInputs%></strong></td>
   </tr> <%#InputPlaceHolderString%>
    </table>
   ```

4. Complete content

   ```
   <td width="95%" class="style2"><span
   class="style8"><strong><%#locEmailSecurityWarning%></strong></span><br />
   Workflow:{<%#ApplicationName%>:<%#EmailGUID%>:<%#WorkflowName%>}{WorkflowResourceActi
   vityMail#3.5}{WorkflowFollowUp:<%#SkeltaFollowUpValue%>}{WorkflowReminderTime:<%#Skel
   taReminderTimeValue%>}</td>
   ```

Use Variables in Check-List Email Template

Email templates can be used to display the values of the variables that have been created in a workflow.

Consider that a variable of type string by name 'Status' is created in the Start activity and its value is updated as "Variable, status is updated".

User wants to do the following:

1. Display the variable's value in Check-List email.
2. Display the variable's value after "Submitted on" row in the Task Details Table.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Solution

To display this variable's value in Check-List email and to display the variable's value after "Submitted on" row in the Task Details Table, the following steps need to be followed:

Steps:

1. Copy CheckListEmail.html file.
2. Use the <%#Variable.Variablename%> placeholder in the html template for viewing the variable's value where <Variablename> is a name of the variable.

   Since the variable name is "Status", the placeholder to be used is <%#Variable.Status%> where the value is to be displayed. The highlighted portion in the below code displays the position where the <%#Variable.Status%> placeholder is added.

```
<html >
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.subject {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.style8 {
 color: #FF3300;
 font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight:
bold; }
-->
</style>
</head>

<body>
<form id='Form1' action='<%#EmailURL%>' method='post' >
<table width="700" border="0" align="left" cellpadding="0" cellspacing="1"
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
bgcolor="#CCCCCC">
<tr>
<td valign="top"><table width="100%" border="0" cellpadding="5" bgcolor="#FFFFFF">
<tr>
<td><span
class="Username"><%#locSalutation%> <strong><%#ActorName%></strong></span>,
<p class="style2"><%#locMailDescription%></p></td></tr>
<tr>
<td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
</tr>

<!-- Appropriate sender details can be passed to the mail by using the sender detail
contents as follows
A few are listed below
<%#Value.SendTo.UserDisplayName%>
<%#Value.SendTo.UserEmail%>
<%#Value.SendTo.UserId%>

Contents declared in Start Activity can also be used in a similar way.

XML Variables can also be used.

Variables defined in Start Activity can also be used pass the values to the mail.

Pre-defined variables can also be used.
A few are listed below.
<%#Variable.SubmittedBy.UserId%>
<%#Variable.SubmittedBy.UserName%>
<%#Variable.SubmittedBy.UserDisplayName%>

To make use of localization, Create a Key and its value
in WorkflowManagementInstalledFolder/Locales/en-US/EmailTemplate.txt
and use the key in this html.
EG: Let EmailUserDefinedName be the Localization key
in WorkflowManagementInstalledFolder/Locales/en-US/EmailTemplate.txt
Use the above key in html as @@EmailUserDefinedName@@ to get its localized value.

TO TRY OUT THE ABOVE POINTS, JUST UNCOMMENT THE NEXT COMMENTED PORTION OF CODE.

3. The actor will get the Check-List email in the defined format for the above template.

Note: Out of box variables such as <%#Variable.SubmittedBy.UserId%> , <%#Variable.SubmittedBy.UserName%>, and <%#Variable.SubmittedBy.UserDisplayName%> can be used for Active Directory provider.

Use Contents in Check-List Email Template

Email templates can be used to display the values of the contents that have been created in a workflow.

Consider that a **Content** of type number and by name 'EmployeeAge' is created in **Start** activity and at runtime its value is 21.

User wants to do the following:

1. Display the content's value in Check-List email.
2. Display the variable's value after "**Submitted on"** row in the **Task Details** table.

Solution

To display this the content's value in Check-List email and to display the variable's value after "Submitted on" row in the Task Details Table, the following steps need to be followed:

Steps:

1. Copy **CheckListEmail.html** file.
2. Use the **<%#Variable.**Contentname%> placeholder in the html template for viewing the content's value. Where <Contentname> is a name of the content.

   Use the **<%#Content.EmployeeAge%>** placeholder in the html template, where the value is to be displayed. Since the Content name is "EmployeeAge", the placeholder to be used is <%#Content.EmployeeAge%>. The highlighted portion in the below code displays the position where the <%#Content.EmployeeAge%> placeholder is added.

```
<html >
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
font-family: Arial, Helvetica, sans-serif;
font-size: 11px;
}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
.style4 {
font-family: Arial, Helvetica, sans-serif;
font-size: 15px;
font-weight: Normal;
color: #333333;
}
.Username {
font-family: Arial, Helvetica, sans-serif;
font-size: 13px;
font-weight: Bold;
color: #333333;
}
.subject {
font-family: Arial, Helvetica, sans-serif;
font-size: 13px;
font-weight: Bold;
color: #333333;
}
.style8 {
color: #FF3300;
font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight:
bold; }
-->
</style>
</head>
<body>
<form id='Form1' action='<%#EmailURL%>' method='post' >
<table width="700" border="0" align="left" cellpadding="0" cellspacing="1"
bgcolor="#CCCCCC">
<tr>
<td valign="top"><table width="100%" border="0" cellpadding="5" bgcolor="#FFFFFF"> d
<tr>
<td><span
class="Username"><%#locSalutation%> <strong><%#ActorName%></strong></span>,

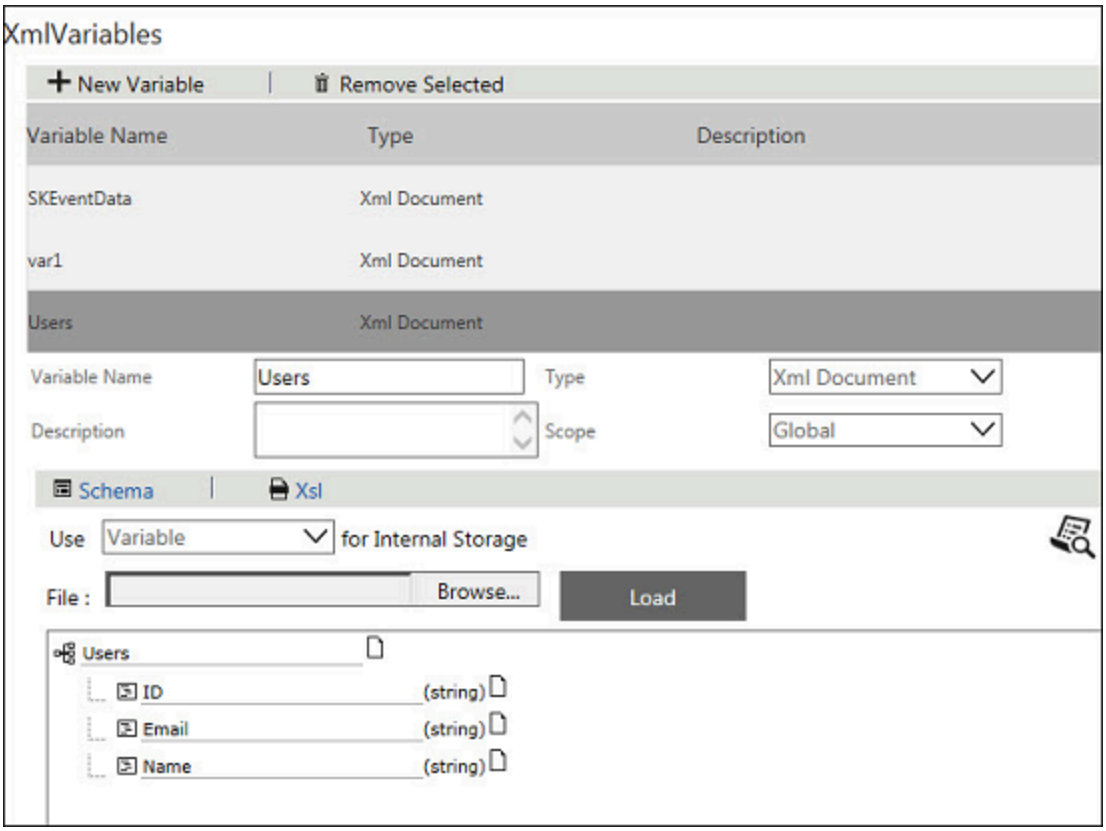
The actor will get the mail in the defined format for the above template.

Use XML Variables in Check-List Email Template

Email templates can be used to display the values of the XML variables that have been created in a workflow.

Consider that 'Users' XML Variable of type XML Document is created in the **Start** activity and schema is as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The scenario requirement is that, during the workflow execution,

User wants to display the following values during the workflow execution

1. **ID** is updated to 1029.
2. **Email** is updated to John.Smith@domain.com
3. **Name** is updated to John.
4. Display these XML variable's value after "Submitted on" row in the Task Details table.

Solution

To display this the XML Variable's value in Check-List email and to display these variable's value after "Submitted on" row in the Task Details Table:

Steps:

1. Copy **CheckListEmail.html** file.
2. Use the **<%#XmlVariables.variablename%>** placeholder in the html template for viewing the XML Variable's value. Where <variablename> is a name of the XML variable.

   Since the 'Users' XML Variable contents the ID, Email and Name, use the following XML Variables in the CheckListEmail.html template, where the values are to be displayed.

   ```
   <%#XmlVariables.Users.User.ID%>
   <%#XmlVariables.Users.User.Email%>
   <%#XmlVariables.Users.User.Name%>
   ```

   The highlighted portion in the below code displays the position where the above placeholders to be added.

3. The actor will get the mail in the defined format for the above template.

Task Activity Email Template

AVEVA Work Tasks Engine accesses the Task activity's email template from the physical path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\TaskEmail.html

This template can be modified by the user as per their UI requirement. The mails received by the actor is based on the above mentioned mail template.

The following is default email template text for the **TaskEmail.html** file:

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.subject {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.style8 {
 color: #FF3300;
 font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight: bold; }
-->
</style>
</head>
```

```

Use Variables in Task Email Template

Email templates can be used to display the values of the variables that have been created in a workflow.

Consider that a variable of type string by name **'Status'** is created in the **Start** activity and its value is updated as **"Variable, status is updated"**.

User wants to do the following:

1. Display the variable's value in Task email.
2. Display the variable's value after "Submitted on" row in the Task Details table.

Solution

To display this variable's value in Task email and to display the variable's value after "Submitted on" row in the Task Details Table:

Steps:

1. Copy TaskEmail.html file.
2. Use the <%#Variable.Variablename%> placeholder in the html template for viewing the variable's value where <Variablename> is a name of the variable.

   Since the variable name is "Status", the placeholder to be used is <%#Variable.Status%> where the value is to be displayed. The highlighted portion in the below code displays the position where the <%#Variable.Status%> placeholder is added.

3. The actor will get the Task email in the defined format for the above template

Note: Out of box variables such as <%#Variable.SubmittedBy.UserId%> , <%#Variable.SubmittedBy.UserName%>, and <%#Variable.SubmittedBy.UserDisplayName%> can be used for Active Directory provider.

Use Contents in Task Email Template

Email templates can be used to display the values of the contents that have been created in a workflow.

Consider that a Content of type number and by name 'EmployeeAge' is created in the Start activity and at runtime its value is 21.

User wants to do the following:

1. Display the content's value in Task email.
2. Display the variable's value after **"Submitted on"** row in the **Task Details** Table.

Scenario Solution

To display this the content's value in Task email and to display the variable's value after **"Submitted on"** row in the **Task Details** table:

Steps:

1. Copy **TaskEmail.html** file.
2. Use the **<%#Variable.Contentname%>** placeholder in the html template for viewing the content's value where <Contentname> is a name of the content.

   Use the <%#Content.EmployeeAge%> placeholder in the html template, where the value is to be displayed. Since the Content name is "EmployeeAge", the placeholder to be used is <%#Content.EmployeeAge%>. The

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

highlighted portion in the below code displays the position where the <%#Content.EmployeeAge%> placeholder is added.

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.subject {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.style8 {
 color: #FF3300;
 font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight:
bold; }
-->
</style>
</head>
<body>
<form id='Form1' action='<%#EmailURL%>' method='post' >
<table width="700" border="0" align="left" cellpadding="0" cellspacing="1"

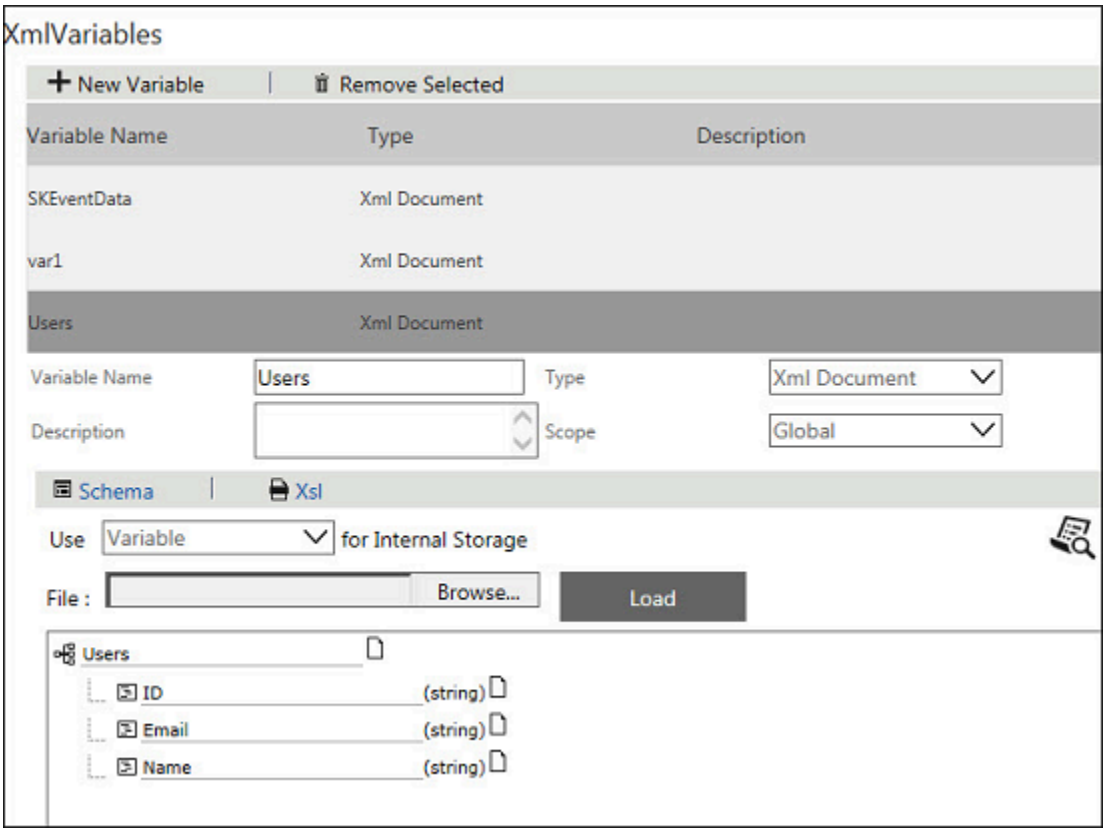
3. The actor will get the mail in the defined format for the above template.

Use XML Variables in Task Email Template

Email templates can be used to display the values of the XML variables that have been created in a workflow. Consider that 'Users' XML Variable of type XMLDocument is created in the **Start** activity and schema is as follows:



The scenario requirement is that during the workflow execution, the user wants to display the following values

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

during the workflow execution.

1. **ID** is updated to 1029.
2. **Email** is updated to John.Smith@domain.com
3. **Name** is updated to John.
4. Display these XML variables' value after **"Submitted on"** row in the **Task Details** Table.

Solution

To display this the XML Variable's value in Task email and to display these variable's value after "Submitted on" row in the Task Details Table:

Steps:

1. Copy TaskEmail.html file.
2. Use the **<%#XmlVariables.variablename%>** placeholder in the html template for viewing the XML Variable's value where <variablename> is a name of the XML variable.

   Since the 'Users' XML Variable contents the ID, Email and Name, use the following XML Variables in the TaskEmail.html template, where the values are to be displayed.

   ```
   <%#XmlVariables.Users.User.ID%>
   <%#XmlVariables.Users.User.Email%>
   <%#XmlVariables.Users.User.Name%>
   ```

   The highlighted portion in the below code displays the position where the above placeholders to be added

   ```
   <html>
   <head>
   <meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
   <title>Mailer</title>
   <style type="text/css">

3. The actor will get the mail in the defined format for the above template.

Information Activity Email Template

AVEVA Work Tasks Engine accesses the Information activity's email template from the physical path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\Information.html

This template can be modified by the user as per their UI requirement. The mails received by the actor is based on the above mentioned mail template.

The following is default email template text for the **Information.html** file:

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.subject {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.style8 {
 color: #FF3300;
 font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight: bold; }
-->
</style>
</head>

<body>
<table width="700" border="0" align="left" cellpadding="0" cellspacing="1"
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
bgcolor="#CCCCCC">
<tr>
<td valign="top"><table width="100%" border="0" cellpadding="5" bgcolor="#FFFFFF">

<tr>
<td><span class="Username"><%#locSalutation%> <strong><%#ActorName%></strong> </span>,
<p class="style2"><%#locMailDescription%></p></td></tr>

<tr>
<td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
</tr>
<tr>
<td bgcolor="#EBEBEB" class="style4"><%#locResponseOptions%></td>
</tr>
<tr>
<td>
<table width="100%" border="0" cellpadding="4" cellspacing="0" class="style2">
<tr>
<td><a <%#workitemView%>><%#locRespondByWeb%></a></td>
</tr>
<tr>
<td><a <%#docview%>><%#locDocViewURLText%></a></td>
</tr>
<tr>
<td ><a <%#executionView%>><%#locExecutionViewURLText%></a></td>
</tr>
</table>
</td>
</tr>
<tr>
<td bgcolor="#EBEBEB" class="style4" style="height:10%"></td>
</tr>
<tr>
<td bgcolor="#FFFFFF" class="style2"><%#locSignature%></td>
</tr>
</table>
</td>
</tr>
</table>
</body>
</html>
```

Note: While modifying the Task email template the following placeholders should not be modified, as these are necessary for the engine to process the mails that are received from the actors.

1. Notes

   ```
   <td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
   ```

Use Variables in Information Email Template

Email templates can be used to display the values of the variables that have been created in a workflow.

Consider that a variable of type string by name **'Status'** is created in the **Start** activity and its value is updated as

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

"Variable, status is updated".

User wants to do the following:

1. Display the variable's value in Information email.
2. Display the variable's value after **"Submitted on"** row in the **Task Details** Table.

Solution

To display this variable's value in Information email and to display the variable's value after "Submitted on" row in the Task Details Table:

Steps:

1. Copy **Information.html** file.
2. Use the **<%#Variable.Variablename%>** placeholder in the html template for viewing the variable's value, where <Variablename> is a name of the variable.

   Since the variable name is "Status", the placeholder to be used is <%#Variable.Status%> where the value is to be displayed. The highlighted portion in the below code displays the position where the <%#Variable.Status%> placeholder is added.

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.subject {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.style8 {
 color: #FF3300;
 font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight:
bold; }
```

</body>
</html>
```

1. The actor will get the Information email in the defined format for the above template.

Note: Out of box variables such as <%#Variable.SubmittedBy.UserId%>, <%#Variable.SubmittedBy.UserName%>, and <%#Variable.SubmittedBy.UserDisplayName%> can be used for Active Directory provider.

Use Contents in Information Email Template

Email templates can be used to display the values of the contents that have been created in a workflow.

Consider that a **Content** of type number and by name 'EmployeeAge' is created in the **Start** activity and at runtime its value is 21.

User wants to do the following:

1. Display the content's value in Information email.
2. Display the variable's value after "Submitted on" row in the Task Details Table.

Solution

To display this the content's value in Information email and to display the variable's value after "Submitted on" row in the Task Details Table:

Steps:

1. Copy **Information.html** file.
2. Use the **<%#Variable.Contentname%>** placeholder in the html template for viewing the content's value, where <Contentname> is a name of the content.

   Use the **<%#Content.EmployeeAge%>** placeholder in the html template, where the value is to be displayed. Since the Content name is "EmployeeAge", the placeholder to be used is <%#Content.EmployeeAge%>. The highlighted portion in the below code displays the position where the <%#Content.EmployeeAge%> placeholder is added.

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Mailer</title>
<style type="text/css">
<!--
.style2 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 11px;
}
.style4 {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 15px;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 font-weight: Normal;
 color: #333333;
}
.Username {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.subject {
 font-family: Arial, Helvetica, sans-serif;
 font-size: 13px;
 font-weight: Bold;
 color: #333333;
}
.style8 {
 color: #FF3300;
 font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight:
bold; }
-->
</style>
</head>

<body>
<table width="700" border="0" align="left" cellpadding="0" cellspacing="1"
bgcolor="#CCCCCC">
<tr>
<td valign="top"><table width="100%" border="0" cellpadding="5" bgcolor="#FFFFFF">

<tr>
<td><span class="Username"><%#locSalutation%> <strong><%#ActorName%></strong>
</span>,
<p class="style2"><%#locMailDescription%></p></td></tr>

<tr>
<td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
</tr>
<tr>
<td bgcolor="#EBEBEB" class="style4"><%#locResponseOptions%></td>
</tr>
<tr>
<td>
<table width="100%" border="1" cellpadding="6" cellspacing="0" bordercolor="#CCCCCC"
bgcolor="#FFFFFF" class="style2">
 <tr width="21%" bgcolor="#EFEFEF">
 <td>
 <b>Employee Age</b></td>
 <td width="79%" bgcolor="#EFEFEF">
<%#Content.EmployeeAge%></td>
</tr>
</table>
</td>
</tr>
<tr>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<td>
<table width="100%" border="0" cellpadding="4" cellspacing="0" class="style2">
<tr>
<td><a <%#workitemView%>><%#locRespondByWeb%></a></td>
</tr>
<tr>
<td><a <%#docview%>><%#locDocViewURLText%></a></td>
</tr>
<tr>
<td ><a <%#executionView%>><%#locExecutionViewURLText%></a></td>
</tr>
</table>
</td>
</tr>
<tr>
<td bgcolor="#EBEBEB" class="style4" style="height:10%"></td>
</tr>
<tr>
<td bgcolor="#FFFFFF" class="style2"><%#locSignature%></td>
</tr>
</table>
</td>
</tr>
</table>
</body>
</html>
```

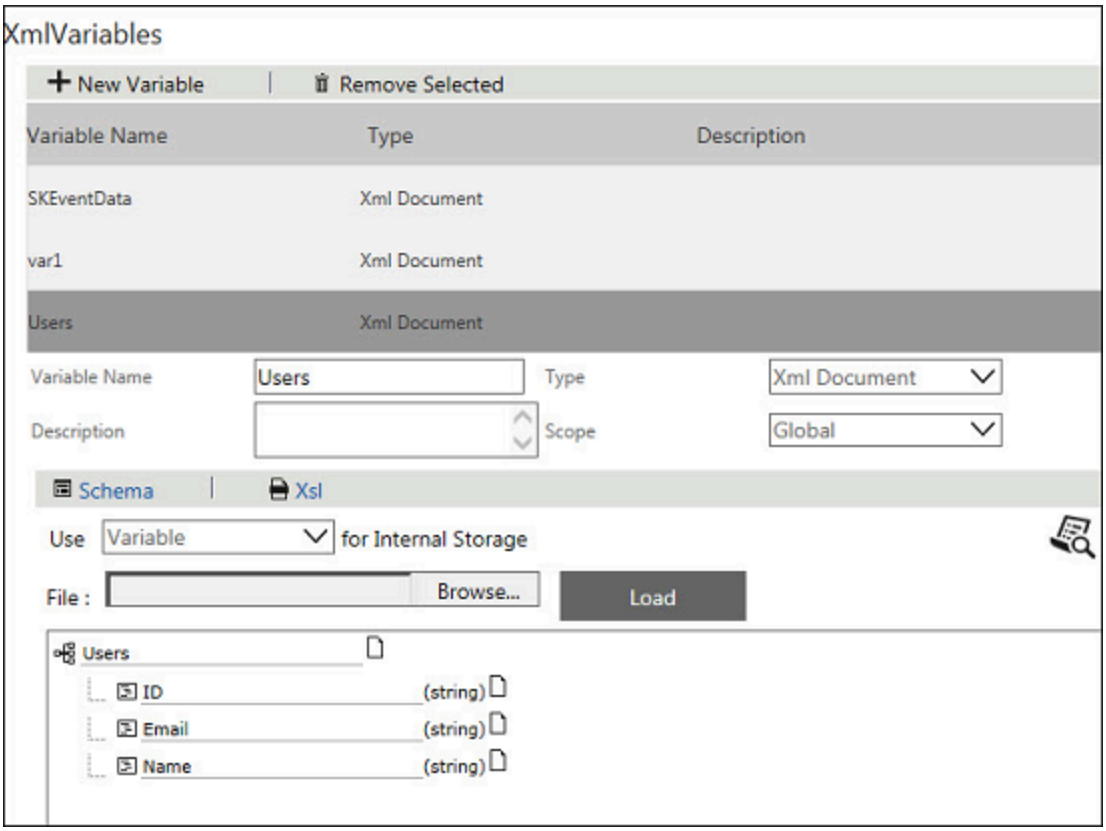
3. The actor will get the mail in the defined format for the above template.

Use XML Variables in Information Email Template

Email templates can be used to display the values of the XML variables that have been created in a workflow.

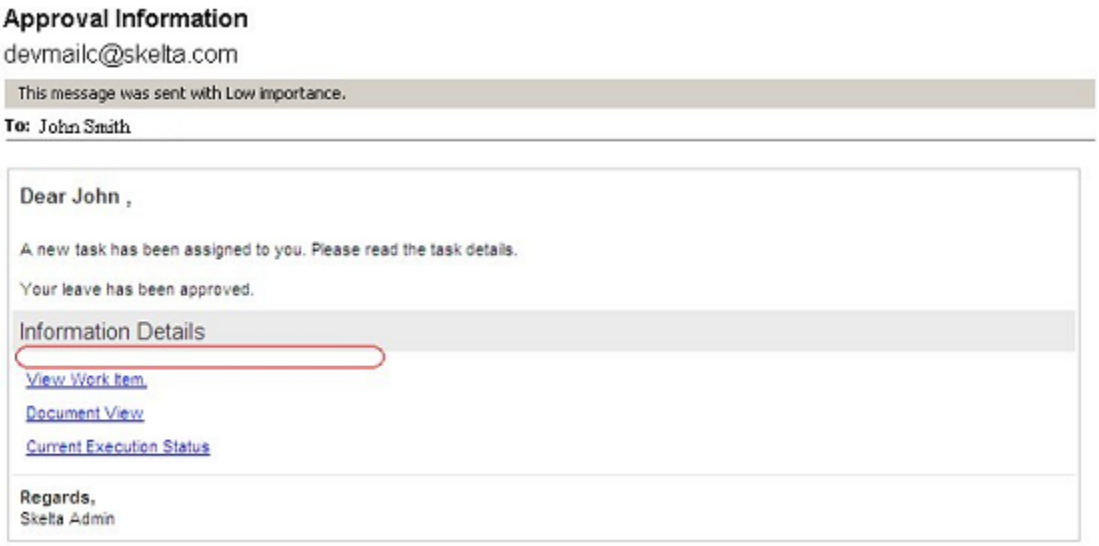
Consider that 'Users' XML Variable of type XMLDocument is created in the **Start** activity and schema is as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The scenario requirement is that during the workflow execution, the user wants to display the following values during the workflow execution:

1. **ID** is updated to 1029.
2. **Email** is updated to John.Smith@domain.com
3. **Name** is updated to John.
4. Display these XML variable's value after **"Submitted on"** row in the **Task Details** Table.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Solution

To display this the XML Variable's value in Information email and to display these variable's value after **"Submitted on"** row in the **Task Details** Table:

Steps:

1. Copy **Information.html** file.
2. Use the **<%#XmlVariables.variablename%>** placeholder in the html template for viewing the XML Variable's value, where <variablename> is a name of the XML variable.

   Since the 'Users' XML Variable contents the ID, Email and Name, use the following XML Variables in the Information.html template, where the values are to be displayed.

   ```
   <%#XmlVariables.Users.User.ID%>
   <%#XmlVariables.Users.User.Email%>
   <%#XmlVariables.Users.User.Name%>
   ```

   The highlighted portion in the below code displays the position where the above placeholders to be added.

   ```
   <html>
   <head>
   <meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
   <title>Mailer</title>
   <style type="text/css">
   <!--
   .style2 {
    font-family: Arial, Helvetica, sans-serif;
    font-size: 11px;
   }
   .style4 {
    font-family: Arial, Helvetica, sans-serif;
    font-size: 15px;
    font-weight: Normal;
    color: #333333;
   }
   .Username {
    font-family: Arial, Helvetica, sans-serif;
    font-size: 13px;
    font-weight: Bold;
    color: #333333;
   }
   .subject {
    font-family: Arial, Helvetica, sans-serif;
    font-size: 13px;
    font-weight: Bold;
    color: #333333;
   }
   .style8 {
    color: #FF3300;
    font-weight: bold;
   }
   .style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight:
   bold; }
   -->
   </style>
   </head>
   ```

</table>
</body>
</html>
```

1. The actor will get the mail in the defined format for the above template.

Different Email Template for Different Activity in a Workflow

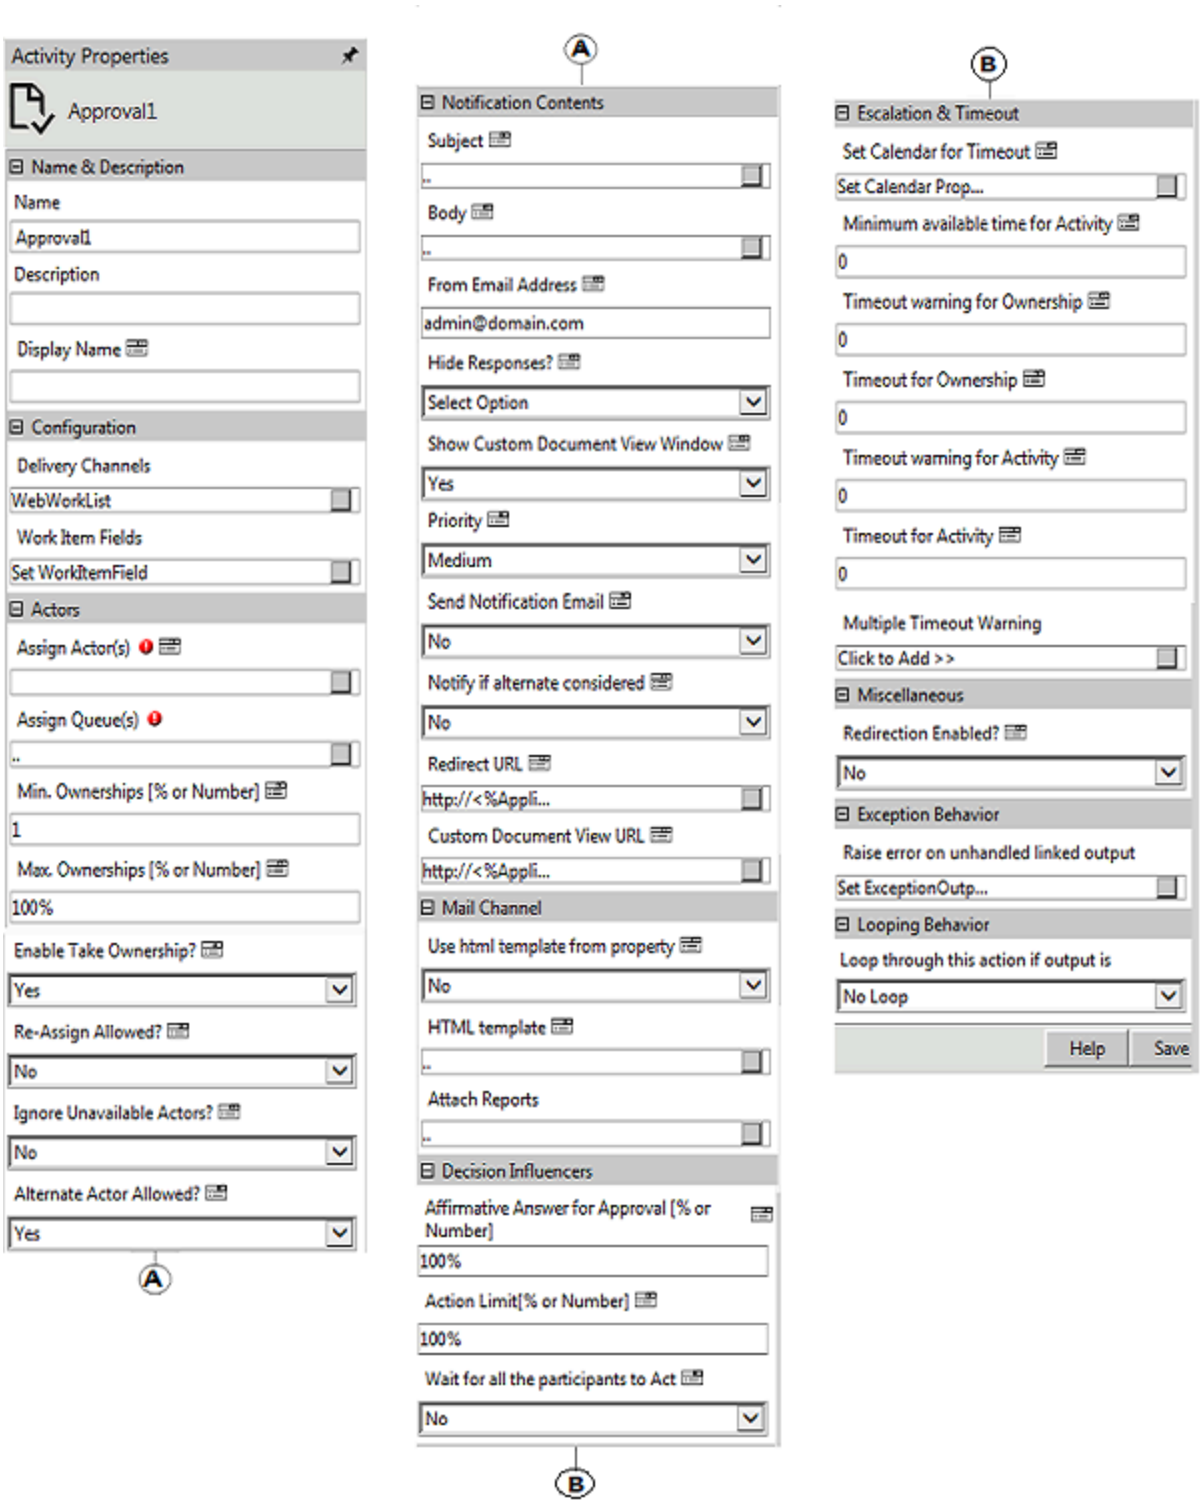
Each Human activity like Approval, Choice, Checklist and Task Activity can have its own email template that will be sent to an actor.

Example:

Let us assume that a workflow has two **Approval** activities and the mail format sent from Approval Activity1 is different from that of Approval Activity2.

To achieve the same, AVEVA Work Tasks introduced a category **Mail Channel** in the Activity Properties of the Human activity, to have different formats for different activities.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Use 'HTML Template' Property of Approval Activity

You can use the html email template that is present in the physical folder *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks*\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\ ApprovalEmail.html in the 'HTML Template' property of Approval activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Complete the following steps to customize the ApprovalEmail.html.

1. Right-click the Approval activity and then select Activity Properties.
2. Under Mail Channel group, set the Use html template from property to Yes.
3. Under Mail Channel group, click the HTML template edit icon. The HTML template window is displayed.
4. Go to *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks*\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\ApprovalEmail.html path and take a copy of the default html template file of approval activity and make the necessary changes to the copied file.

   Note: While modifying the Approval email template the following place holders should not be modified, as these are necessary for the engine to process the mails that are received from the actors.

   a. Email URL

   ```
   <form id='Form1' action='<%#EmailURL%>' method='post' >
   ```

   b. Notes

   ```
   <td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
   ```

   c. Complete content

   ```
   <table width='95%' border='0' align='center' bgcolor='#EBEBEB' cellpadding='5'
   cellspacing='1' style="width: 100%; height: 25px;">
   <tr>
   <td class="style2" width='30%' bgcolor='#EBEBEB'>
   <strong><%#locColumnName%></strong></td>
   <td class="style2" width='30%' bgcolor='#EBEBEB'>
   <strong><%#locUserInputs%></strong></td>
   <td class="style2" bgcolor='#EBEBEB'>
   <strong><%#locValidInputs%></strong></td>
   </tr>
   <tr valign="top">
   <td class="style2" bgcolor='#FFFFFF' width="10%"><%#locComments%>:</td>
   <td class="style2" bgcolor='#FFFFFF'
   width="10%">[     ]</td>
   <td class="style2" bgcolor='#FFFFFF' width="20%" >[<%#locFreeText%>]</td>
   </tr>
   <tr valign="top">
   <td class="style2" bgcolor='#FFFFFF' width="10%"><%#locTakeAction%>:</td>
   <td class="style2" bgcolor='#FFFFFF'
   width="10%">[     ]</td>
   <td class="style2" bgcolor='#FFFFFF' width="20%"
   ><%#locEnter%>:[<%#locApproveAction%>,<%#locRejectAction%>]</td>
   </tr>
   </table>
   ```

   d. Complete content

   ```
   <td class="style2" width="95%"><span
   class="style8"><strong><%#locEmailSecurityWarning%></strong></span><br />
   Workflow:{<%#ApplicationName%>:<%#EmailGUID%>:<%#WorkflowName%>}{WorkflowResou
   rceActivityMail#3.5}{WorkflowFollowUp:<%#SkeltaFollowUpValue%>}{WorkflowRemind
   erTime:<%#SkeltaReminderTimeValue%>}</td>
   ```

5. Replace only the following placeholders in the copied html template as per the table below. This is because the place holders which is in ' <%# %>' format will not support in customized html format.

   Note: Make sure that only the following specified place holders are replaced. Do not replace any other place holders.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Keyword	Replace with
<%#EmailURL%>	[%#EmailURL%]
<%#locSalutation%>	[%#locSalutation%]
<%#ActorName%>	[%#ActorName%]
<%#locMailDescription%>	[%#locMailDescription%]

```
font-weight: Bold;
color: #333333;
}
.subject {
font-family: Arial, Helvetica, sans-serif;
font-size: 13px;
font-weight: Bold;
color: #333333;
}
.style8 {
color: #FF3300;
font-weight: bold;
}
.style9 {font-family: Arial, Helvetica, sans-serif; font-size: 11px; font-weight:
bold; }
-->
</style>
</head>
<body>
<form id='Form1' action='[%#EmailURL%]' method='post' >
<table width="700" border="0" align="left" cellpadding="0" cellspacing="1"
bgcolor="#CCCCCC">
<tr>
<td valign="top"><table width="100%" border="0" cellpadding="5" bgcolor="#FFFFFF">
<tr>
<td><span
class="Username">[%#locSalutation%] <strong>[%#ActorName%]</strong></span>,
<p class="style2">[%#locMailDescription%]</p></td></tr>
<tr>
<td bgcolor="#FFFFFF" class="style2">[%#Notes%] </td>
</tr>
<!-- Appropriate sender details can be passed to the mail by using the sender detail
contents as follows
A few are listed below
[%#Value.SendTo.UserDisplayName%]
[%#Value.SendTo.UserEmail%]
[%#Value.SendTo.UserId%]
Contents declared in Start Activity can also be used in a similar way.
XML Variables can also be used.
Variables defined in Start Activity can also be used pass the values to the mail.
Pre-defined variables can also be used.
A few are listed below.
[%#Variable.SubmittedBy.UserId%]
[%#Variable.SubmittedBy.UserName%]
[%#Variable.SubmittedBy.UserDisplayName%]
To make use of localization, Create a Key and its value in
WorkflowManagementInstalledFolder/Locales/en-US/EmailTemplate.txt
and use the key in this html.
EG: Let EmailUserDefinedName be the Localization key in
WorkflowManagementInstalledFolder/Locales/en-US/EmailTemplate.txt
Use the above key in html as @@EmailUserDefinedName@@ to get its localized value.
TO TRY OUT THE ABOVE POINTS, JUST UNCOMMENT THE NEXT COMMENTED PORTION OF CODE.
-->

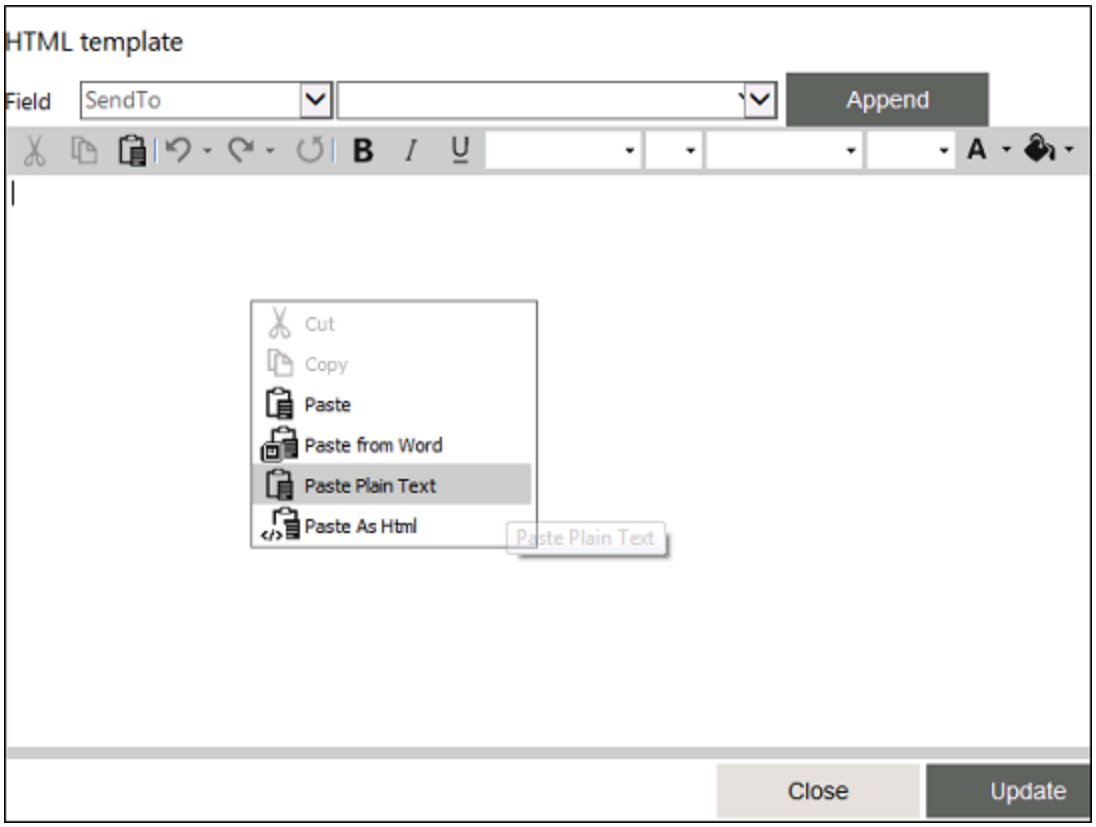
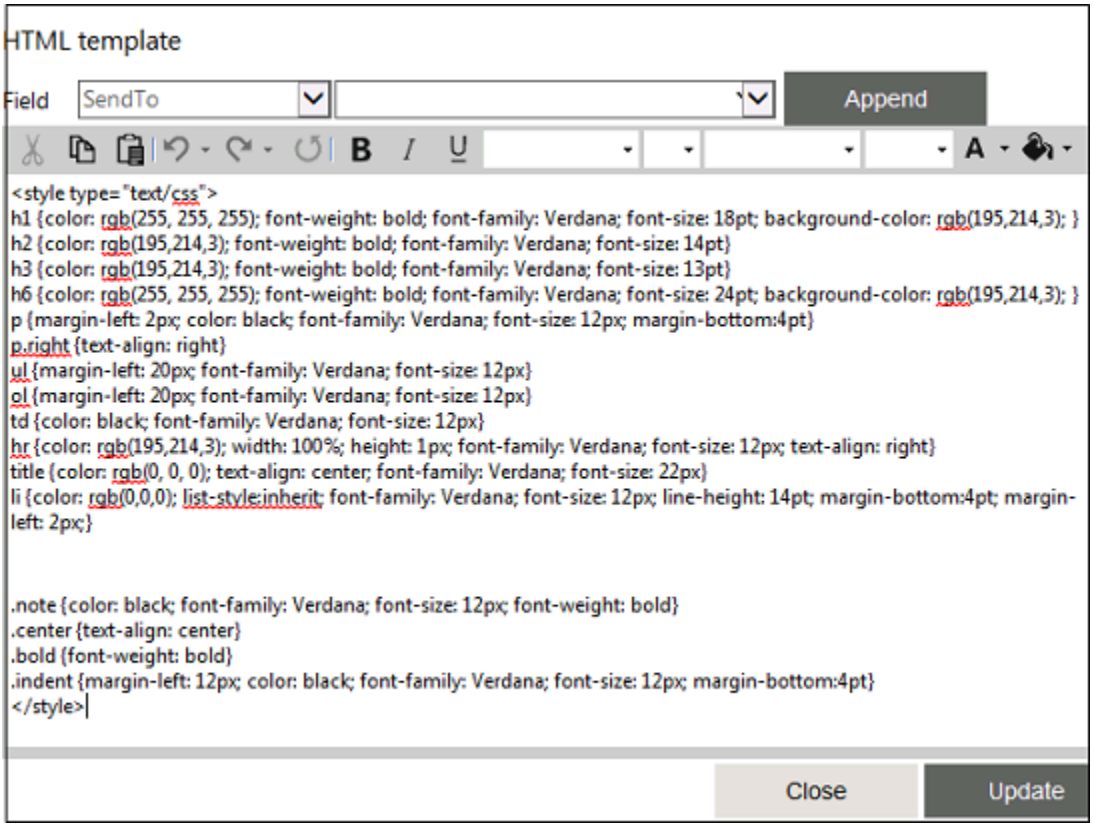
7. Copy the modified code (In this case, the above code) and paste into the HTML template window as Paste Plain Text and click Update.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



8. The following code shows after pasting the code



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Variables, Contents, and XML Variables can also be inserted into the html text wherever necessary by just selecting it from the drop-down provided in the HTML template window and appending it wherever necessary.

Use 'HTML Template' Property of Choice Activity

You can use the html email template that is present in the physical folder *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks*\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\Choice.html in the 'HTML Template' property of Choice activity.

Complete the following steps to customize the Choice.html.

1. Right-click the Choice activity and select Activity Properties.
2. Under Mail Channel group, set the Use html template from property to Yes.
3. Under Mail Channel group, click the HTML template edit icon.
4. Go to *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks*\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\Choice.html path and take a copy of the default html template file of Choice activity and make the necessary changes to the copied file.

   Note: While modifying the Choice email template the following place holders should not be modified as these are necessary for the engine to process the mails that are received from the actors.

   a. Email URL

   ```
   <form id='Form1' action='<%#EmailURL%>' method='post' >
   ```

   b. Notes

   ```
   <td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
   ```

   c. Complete content

   ```
   <table width='95%' border='0' align='center' bgcolor='#EBEBEB' cellpadding='5'
   cellspacing='1' style="width: 100%; height: 25px;">
   <tr>
   <td class="style2" width='30%' bgcolor='#EBEBEB'>
   <strong><%#locColumnName%></strong></td>
   <td class="style2" width='30%' bgcolor='#EBEBEB'>
   <strong><%#locUserInputs%></strong></td>
   <td class="style2" bgcolor='#EBEBEB'>
   <strong><%#locValidInputs%></strong></td>
   </tr>
   <tr valign="top">
   <td class="style2" width='30%' bgcolor='#FFFFFF'><%#locComments%>:</td>
   <td class="style2" width='30%' bgcolor='#FFFFFF'>[  ]</td>
   <td class="style2" bgcolor='#FFFFFF'>[<%#locFreeText%>]</td>
   </tr>
   <tr valign="top">
   <td class="style2" width='30%' bgcolor='#FFFFFF'><%#locTakeAction%>:</td>
   <td class="style2" width='30%' bgcolor='#FFFFFF'>[  ]</td>
   <td class="style2" bgcolor='#FFFFFF'><%#locEnter%>:[<%#action%>]</td>
   </tr>
   </table>
   ```

   d. Complete content

   ```
   <td class="style2" width="95%"><span
   class="style8"><strong><%#locEmailSecurityWarning%></strong></span><br />
   Workflow:{<%#ApplicationName%>:<%#EmailGUID%>:<%#WorkflowName%>}{WorkflowResou
   ```

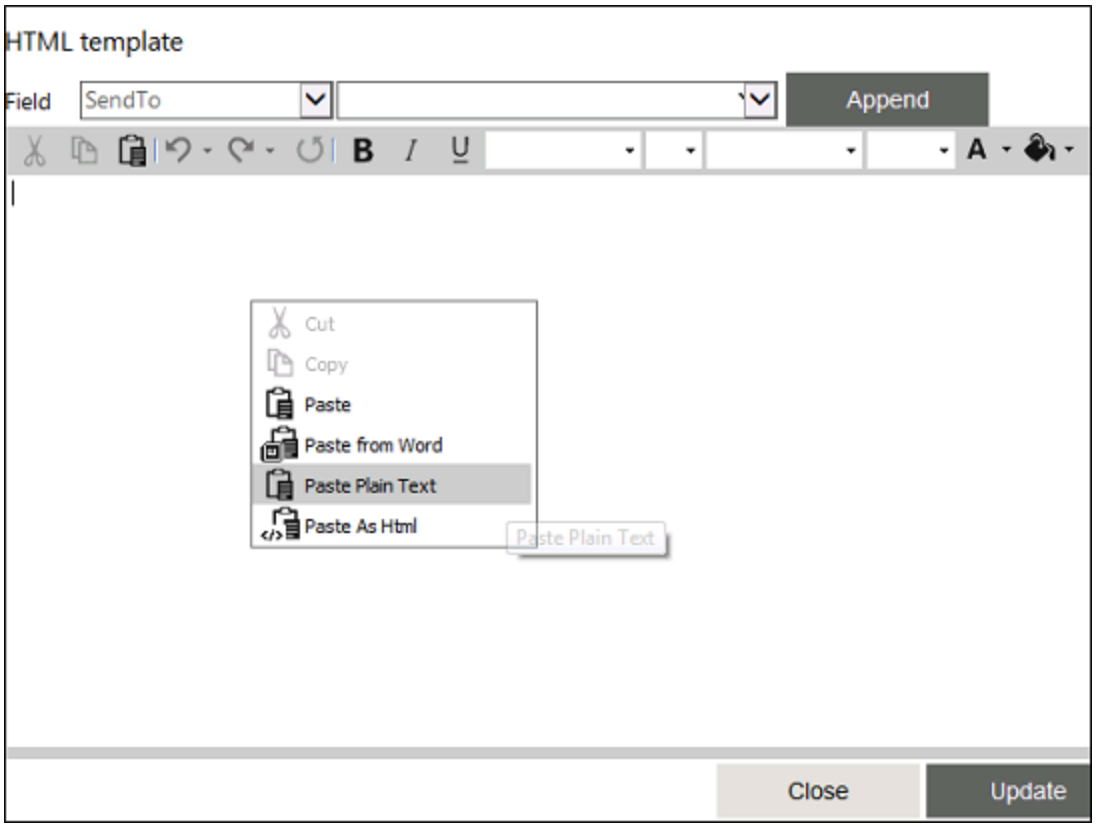
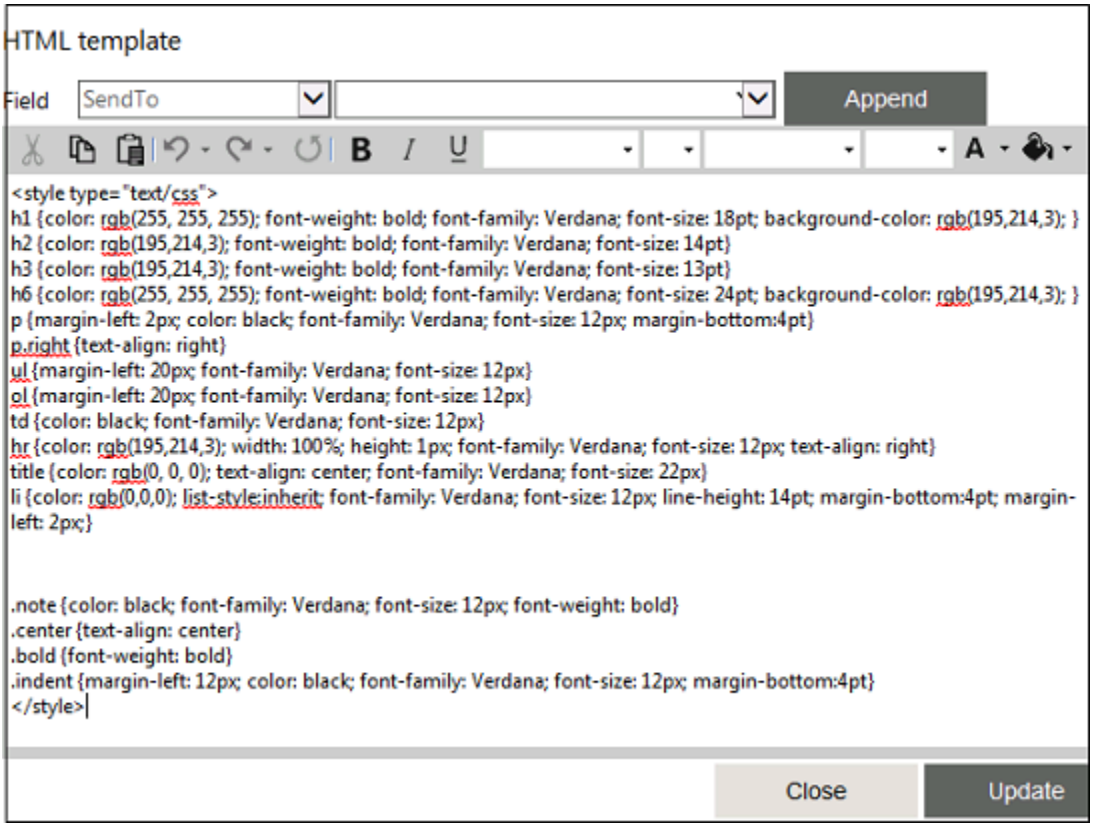
7. Copy the modified code (In this case, the above code) and paste into the HTML template window as Paste Plain Text and click Update.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



8. The following code shows after pasting the code.



Variables, Contents, and XML Variables can also be inserted into the html text wherever necessary by just

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

selecting it from the drop-down provided in the HTML template window and appending it wherever necessary.

Use 'HTML Template' Property of Checklist Activity

You can use the html email template that is present in the physical folder *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks*\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\CheckListEmail.html in the 'HTML Template' property of CheckList activity.

Complete the following steps to customize the CheckListEmail.html.

1. Right-click the Check-List activity and then select Activity Properties.
2. Under Mail Channel group, set the Use html template from property to Yes.
3. Under Mail Channel group, click HTML template edit icon.
4. Go to *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks*\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\CheckListEmail.html path and take a copy of the default html template file of Check-List activity and make the necessary changes to the copied file.

   Note: While modifying the Check-List email template the following place holders should not be modified as these are necessary for the engine to process the mails that are received from the actors.

   a. Email URL

   ```
   <form id='Form1' action='<%#EmailURL%>' method='post'>
   ```

   b. Notes

   ```
   <td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
   ```

   c. Complete content

   ```
   <table border='0' align='center' cellpadding='5' cellspacing='1'
   bgcolor='#EBEBEB' class="style2" style="width: 100%; height: 25px;">
   <tr bgcolor='#EBEBEB' class="style2">
   <td bgcolor='#EBEBEB' class="style2"><strong><%#locColumnName%></strong></td>
   <td bgcolor='#EBEBEB' class="style2"><strong><%#locUserInputs%></strong></td>
   <td bgcolor='#EBEBEB' class="style2"><strong><%#locValidInputs%></strong></td>
   </tr> <%#InputPlaceHolderString%>
   </table>
   ```

   d. Complete content

   ```
   <td width="95%" class="style2"><span
   class="style8"><strong><%#locEmailSecurityWarning%></strong></span><br
   />Workflow:{<%#ApplicationName%>:<%#EmailGUID%>:<%#WorkflowName%>}{WorkflowRes
   ourceActivityMail#3.5}{WorkflowFollowUp:<%#SkeltaFollowUpValue%>}{WorkflowRemi
   nderTime:<%#SkeltaReminderTimeValue%>}</td>
   ```

5. Replace only the following place holders in the copied html template as per the table below. This is because the place holders which is in ' <%# %>' format will not support in customized html format.

   Note: Make sure that only the following specified place holders are replaced. Do not replace any other place holders.

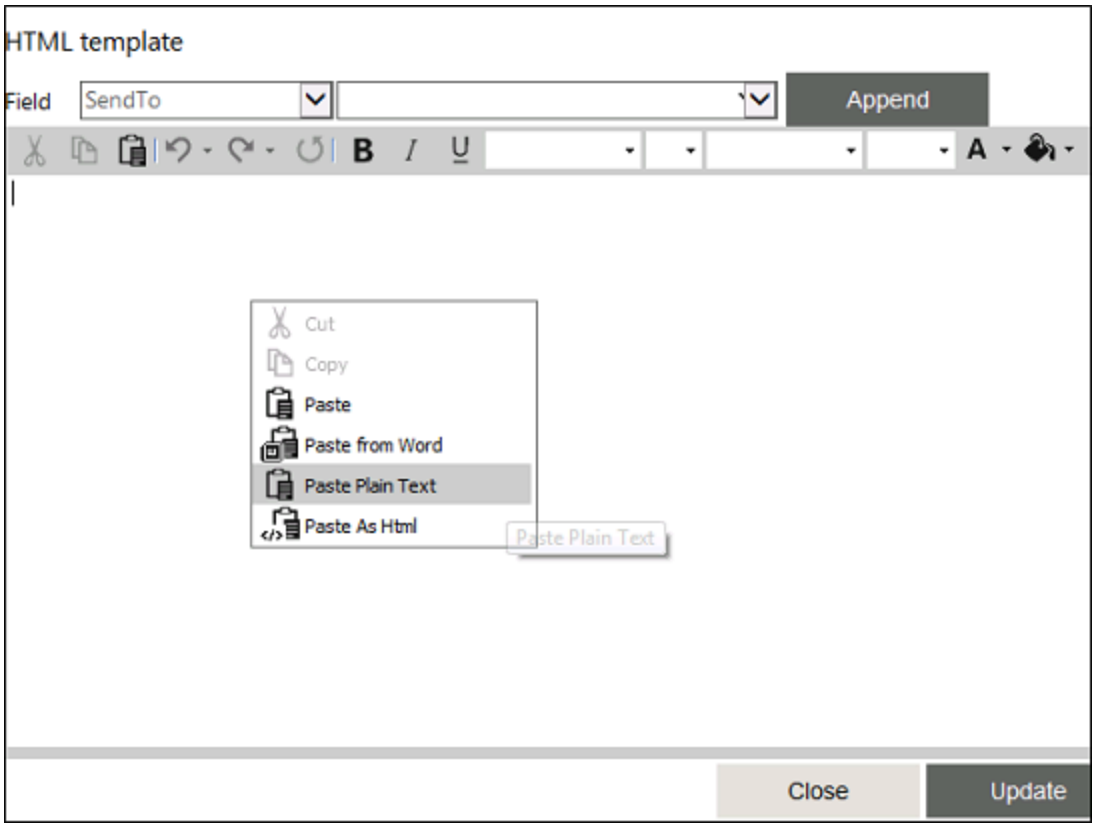
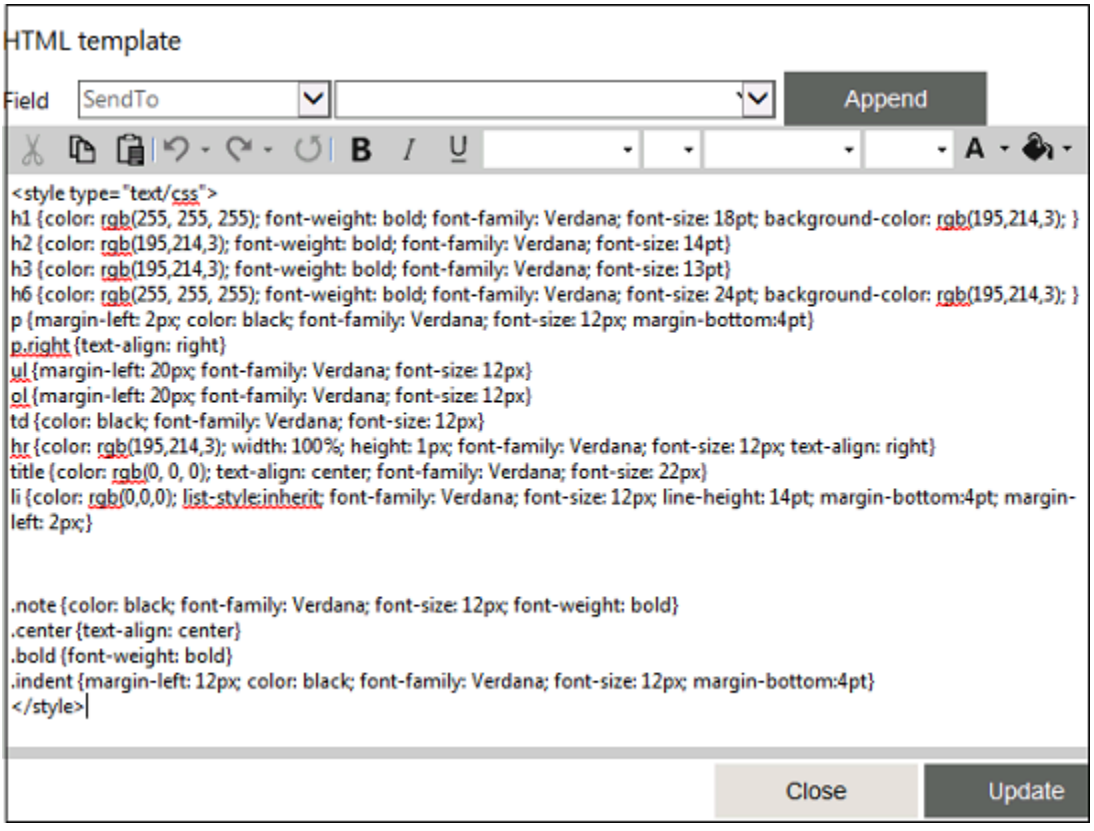
7. Copy the modified code (In this case, the above code) and paste into the HTML template window as Paste Plain Text and click Update.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



8. The following code shows after pasting the code.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Variables, Contents, and XML Variables can also be inserted into the html text wherever necessary by just selecting it from the drop-down provided in the HTML template window and appending it wherever necessary.

Use 'HTML Template' Property of Task Activity

You can use the html email template that is present in the physical folder *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks*\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\TaskEmail.html in the 'HTML Template' property of CheckList activity.

Complete the following steps to customize the the Task.html:

1. Right-click Task activity and then select Activity Properties.
2. Under Mail Channel group, set the Use html template from property to Yes.
3. Under Mail Channel group, click HTML template edit icon.
4. Go to *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks*\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\TaskEmail.html path and take a copy of the default html template file of Task activity and make the necessary changes to the copied file.

   Note: While modifying the Task email template the following place holders should not be modified as these are necessary for the engine to process the mails that are received from the actors.

   a. Email URL

   ```
   <form id='Form1' action='<%#EmailURL%>' method='post' >
   ```

   b. Notes

   ```
   <td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
   ```

   c. Complete content

   ```
   <table width='95%' border='0' align='center' cellpadding='5' cellspacing='1'
   bgcolor='#EBEBEB' id="TABLE1" style="width: 100%; height: 25px;">
   <tr class="style2" bgcolor='#EBEBEB'>

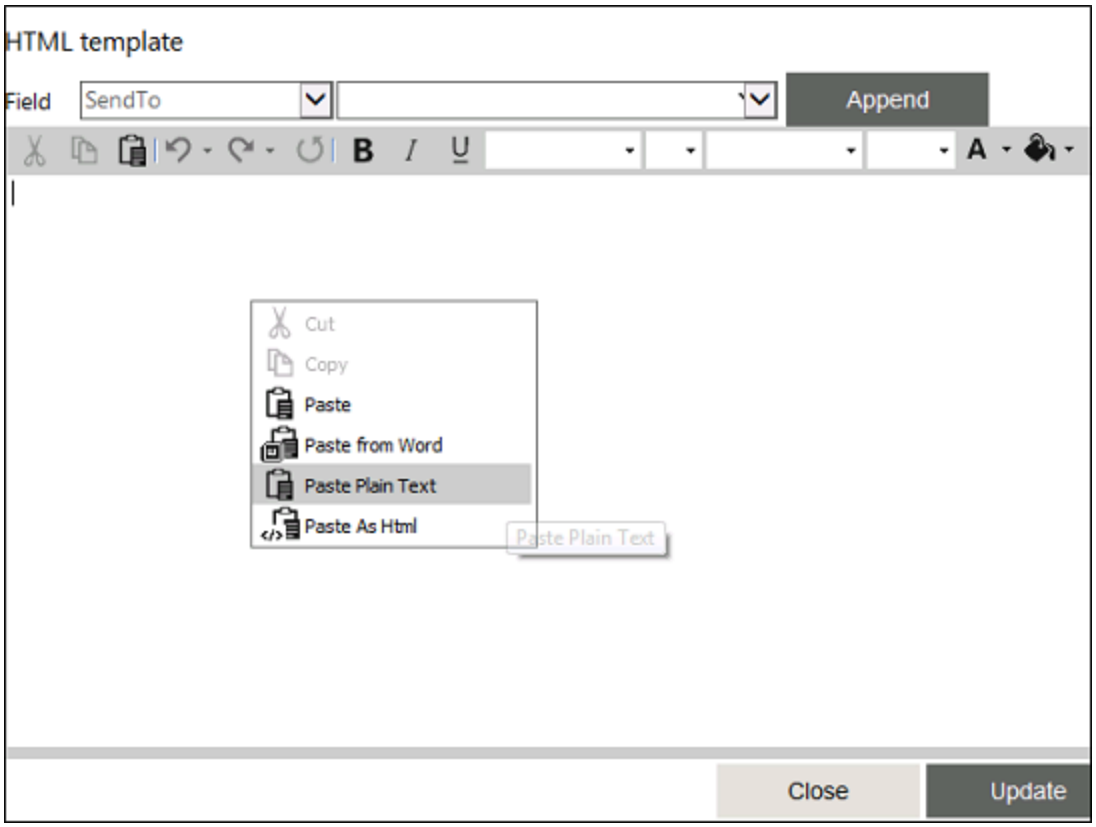
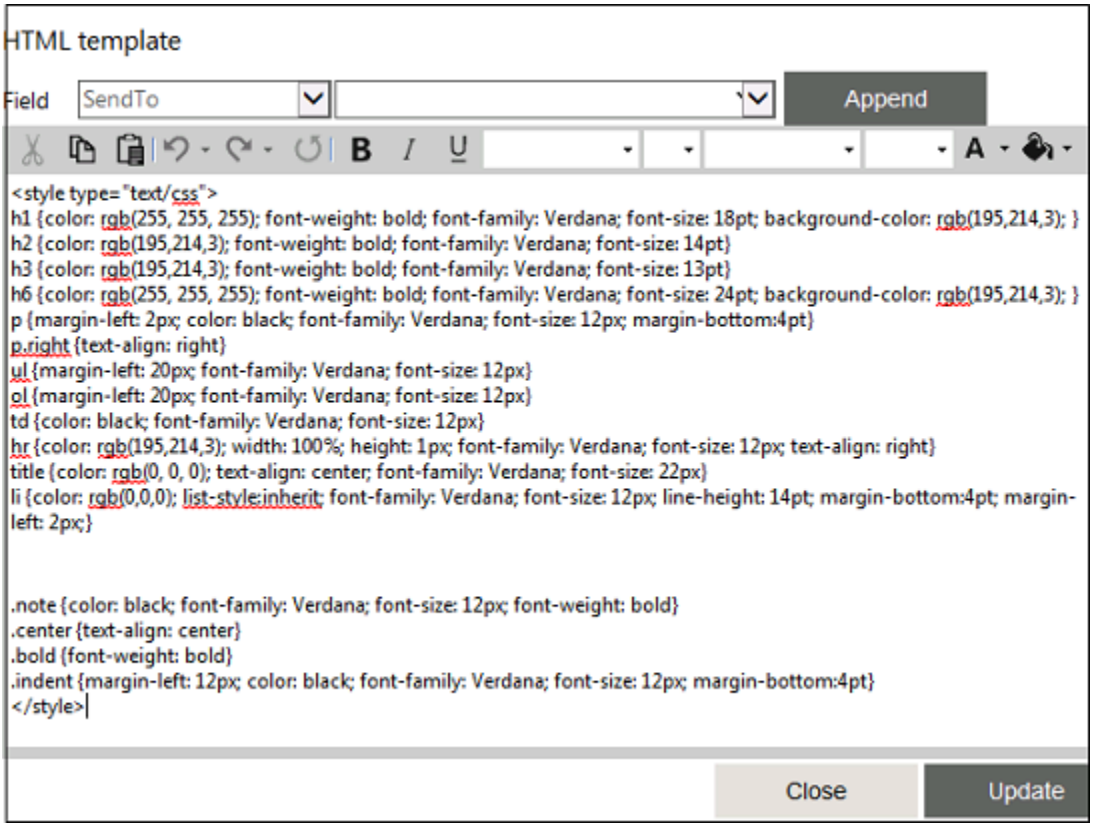
7. Copy the modified code (In this case, the above code) and paste into the HTML template window as Paste Plain Text and click Update.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



8. The following code shows after pasting the code.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Variables, Contents, and XML Variables can also be inserted into the html text wherever necessary by just selecting it from the drop-down provided in the HTML template window and appending it wherever necessary.

Use 'HTML Template' Property of Information Activity

You can use the html email template that is present in the physical folder *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks*\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\Information.html in the 'HTML Template' property of CheckList activity.

Complete the following steps to customize the Task.html.

1. Right-click the **Information** activity and then select **Activity Properties.**
2. Under **Mail Channel** group, set the **Use html template from property to Yes**.
3. Under **Mail Channel** group, click the **HTML template** edit icon.
4. Go to *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks*\WorkflowElements\Default\en-US\Templates\OutlookEmailTemplate\Information.html path and take a copy of the default html template file of Information activity. Make the necessary changes to the copied file.

   Note: While modifying the Information email template the following place holders should not be modified as these are necessary for the engine to process the mails that are received from the actors.

   a. Notes

   ```
   <td bgcolor="#FFFFFF" class="style2"><%#Notes%> </td>
   ```

5. Replace only the following place holders in the copied html template as per the table below. This is because the place holders which is in ' <%# %>' format will not support in customized html format.

   Note: Make sure that only the following specified place holders are replaced. Do not replace any other place holders.

Keyword	Replace with
<%#locSalutation%>	[%#locSalutation%]
<%#ActorName%>	[%#ActorName%]
<%#locMailDescription%>	[%#locMailDescription%]
<%#Notes%>	[%#Notes%]
<%#locResponseOptions%>	[%#locResponseOptions%]
<%#locRespondByWeb%>	[%#locRespondByWeb%]
<%#workitemView%>	[%#workitemView%]

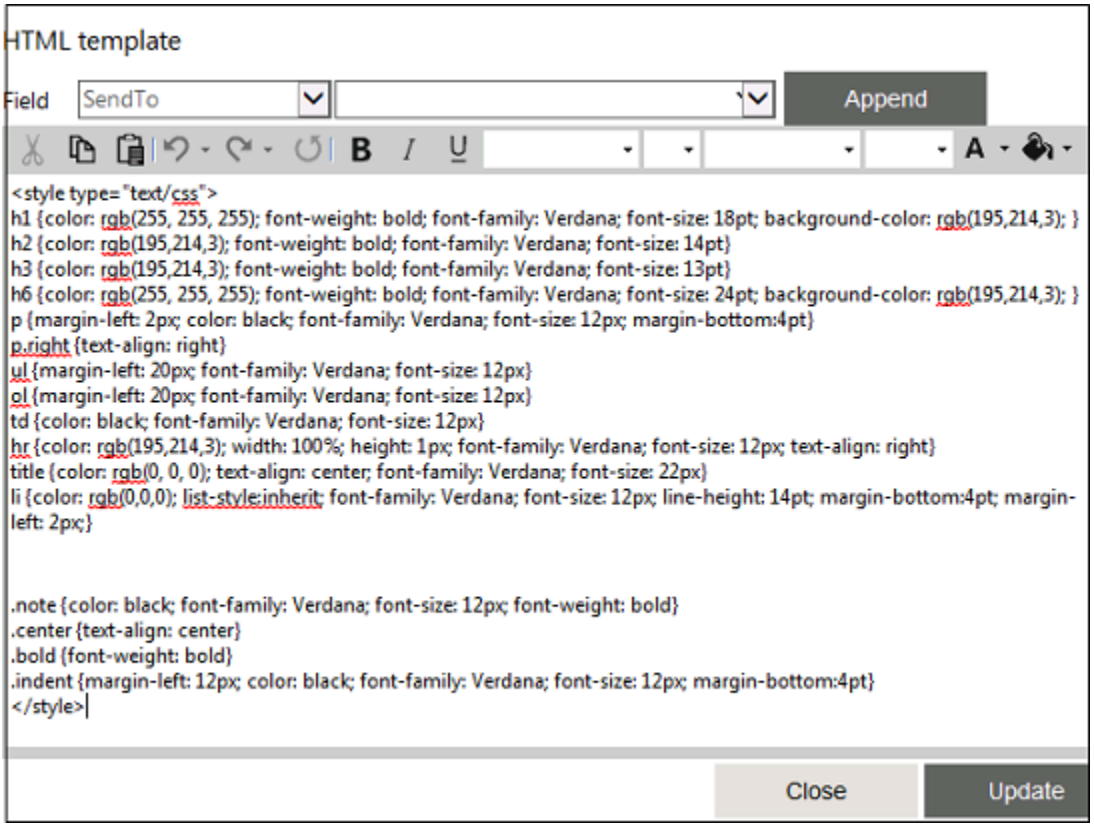
The following code shows after pasting the code.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Add-in for Microsoft Office Outlook

Activities configured to be sent by the mail channel allow users to act on these activities from Microsoft Office Outlook Inbox. This requires that the user machine has the **AVEVA Work Tasks Add-in for Microsoft Office Outlook** installed.

See *WorkTasksAdministrativGuide* for information about installing **AVEVA Work Tasks Add-in for Microsoft Office Outlook**.

Context Menu Options

AVEVA Work Tasks Context Menu displays context-sensitive menu options for:

- Approval Activity
- CheckList Activity
- Choice Activity
- Task Activity

Note:
- The Context-menu is not available in Microsoft Office Outlook 2013.
- The Context menu of the Task Activity does not show the options available.

Approval Activity

1. Select the AVEVA Work Tasks mail which has the Approval activity from the Microsoft Office Outlook Inbox.
2. Right-click the mail to get the context menu.
3. If the mail is not AVEVA Work Tasks mail, then the user will not get any context menu.
4. Approval email options are **Approve** and **Reject**.
5. When a reply is made, the mail icon changes to reply icon to notify the user that the mail is already replied.
6. Once the mail is sent, the workflow engine will generate a confirmation mail.
7. If an approval mail is sent again, a duplicate confirmation mail is received.

   Note:
   - Approval mail actions can be localized.
   - In *[AVEVA Work Tasks Installed Path]*\AVEVA*Work Tasks*\Locales\en-US\EmailTemplate.txt file, change the value for Email_ApproveActivity:Approve and Email_RejectActivity:Reject. This will reflect in the approval mail option1, context menu, and ribbon bar.

Checklist Activity

1. Select the AVEVA Work Tasks mail which has the CheckList Activity from the Microsoft Office Outlook Inbox.
2. Right-click the mail to get the context menu.
3. If the mail is not AVEVA Work Tasks mail then the user will not get any context menu.
4. The option displayed in the context menu for this activity is **View CheckList**.
5. Click **View CheckList**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **CheckList Form** opens.

6. Enter checklist options.
7. Click **Submit**.
8. Once the mail is replied, the mail icon changes to reply icon to notify the user that the mail is already replied.
9. When the mail is sent, the workflow engine will generate a confirmation mail.

Choice Activity

1. Select the AVEVA Work Tasks mail which has the Choice activity from Microsoft Office Outlook Inbox.
2. Right-click the mail to get the context menu.
3. If the mail is not a AVEVA Work Tasks mail then the user will not get any context menu.
4. The Choice activity mail options are **No** and **Yes**.
5. Once the mail is replied, the mail icon changes to reply icon to notify the user that the mail is already replied.
6. When the mail is sent, the workflow engine will generate a confirmation mail,

Task Activity

Functionality of the Workflow.NET.Outlook Client for the Task activity is as follows:

1. Select the AVEVA Work Tasks mail which has the Task activity from the Microsoft Office Outlook inbox.
2. Right-click the mail to get the context menu.
3. If the mail is not AVEVA Work Tasks mail then the user will not get any context menu.
4. In this context menu, the user gets options according to the activity for which the user receives the mail.
5. Once the mail is replied, the mail icon changes to reply icon to notify the user that the mail is already replied.
6. When the mail is sent, the workflow engine will generate a confirmation mail.

Microsoft Office Outlook Follow up

The Microsoft Office Outlook Follow Up functionality helps the user to mark a mail as follow up. It is used to set reminders to perform tasks at the required time.

Details of the Workflow.NET.Outlook Follow Up are as follows:

1. Set this follow up while selecting the channel through the **Channel Selection** page.
2. Specify the time for the reminder.
3. When the user gets any mail marked for follow up, it will be flagged under task list in Microsoft Office Outlook. Until the time set for follow up is met, the mail will be in the due task list itself.
4. There is a limitation to set up reminder time.
5. Reminder should always be given in minutes. Even if the user gives the reminder in seconds, it will be converted to minutes. For Example: If the user sets 0.00:00:20 as reminder time and the mail receiving time is 10.00.00, then the reminder time will be 10.01.00
6. The reminder time specified by the user will be added to the mail receiving time to calculate the actual reminder time.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. The reminder time can also be snoozed to the user's convenience.

Ribbon Bar Options

The functions of the context menu are also available by using the AVEVA Work Tasks ribbon bar. The ribbon bar has been configured for Approval, CheckList, Choice, and Task mail items.

Approval Activity

The ribbon bar for approval activity has the same options as in the context menu.

View CheckList Activity

The ribbon bar for the View CheckList activity has the same options as in the context menu.

Choice Activity

The ribbon bar for the Choice activity has the same options as in the context menu.

Task Activity

The ribbon bar for Task activity has the same options as in the context menu. Select the task status from the drop down list and submit.

Database

AVEVA Work Tasks uses the following two databases:

- Farm Database in which Farm Configuration settings are stored.
- Repository Database with tables pertaining to each repository.

Note:
The recommended collation for the databases is:
SQL_Latin1_General_CP1_CI_AS

The Farm and Repository databases support case sensitive collation:
SQL_Latin1_General_CP1_CS_AS

Use Database Scripts to create Database Tables

A database script is automatically created for the SQL Server database when AVEVA Work Tasks is installed. This is located in the corresponding folder in *C:\Program files\AVEVA\Work Tasks\DatabaseScripts* folder. You need to run the script corresponding to the database in your installation before you can use AVEVA Work Tasks.

To create the Database Tables

1. Browse to the DatabaseScripts folder corresponding to the SQLServer database. Ensure that the Database script, Workflow.NET.sql is available.
2. In SQL Server, open the Query Analyzer.
3. In the Query Analyzer, open the script and run it.

   This creates the SQL Server database tables required by AVEVA Work Tasks.

Advanced Features

This section describes the advanced features of AVEVA Work Tasks, which include but are not limited to:

- Events Framework
- Importing BPMN Process Models from Microsoft Visio
- Using Message Logs
- Managing and Synchronizing Threads in Engine
- Entities

Events Framework

Why Event Framework?

Automate different business scenarios which have events incorporated. Some of these scenarios are:

- Waiting for a document to get updated
- On creation of a document
- On receiving an email
- On receiving a SMS

Event Framework allows users to create their own event provider which optionally can be hosted inside the Engine. It has different interfaces which will help to handle different event scenarios very easily.

Event Framework Components

The following are the main components of Event Framework.

EventProviders

This is the main component of Event Framework. These are the component which is handling a specific event. Users need to create different event providers to handle their events. All event providers need to implement an interface called IEventClientServiceProvider

There are two types of Event Providers First type is hosted inside the Engine. To create these kind of providers you need to implement an additional interface called IEventServiceProvider. If your event provider handles load balancing you need to implement another interface called IEventSupportsLoadBalancing

EventPorts

EventPorts can be considered as an endpoint for EventProviders. For example, for a wait for email event provider, need to get email from different sources like POP3 or forwarding from an Exchange server etc. Each of these sources can implement as EventPorts. For a file watcher event provider, there will be different EventPorts which are watching different Folders.

The user can use IEventPort interface to implement EventPort.

EventBinding

This client side component is responsible for consuming events and alert workflow. You need to create an

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

EventBinding for each interested events.

EventBindings are stored in SKEventBinding table.

EventParameter

This is the correlation parameter which filters events and its interested EventBindings. Every Event Provider has a set of EventParameters. Using these parameters, it will filter eventbindings interested to the specific provider events.

EventItem

This is an event message container component.

The Event Framework is designed to support any type of events such as, file system event provider, share point event provider, email event provider. The following are the interfaces and class for the implementation of the Framework. These interfaces and classes implemented in file event provider class file.

Interfaces and Classes

The following are the interfaces and classes used in the Event Framework. All the interfaces need to be implemented in the event service class files.

Interfaces:

- IEventPort:- This interface represents a port used by the event service provider

Properties:-

portname

port guid

event name

port xml string

Port generally contains the information about event listener. For e.g. Incase it is FileSystemEventProvider, the port contains name of directories which file system event provider is going to monitor.

- **IEventClientServiceProvider**:- This interface need to be implemented in the event handler class file and returns a new event port and set its values. The read only property Event name is hard coded in each event provider.

Methods	**Functionality**
GetNewEventPort()	Returns new empty port object
LoadEventPort()	Creates new port and set its values.
GetAllEventParameters()	Returns all event parameters which would be available whenever an event is raised by the event service provider. This is useful to give event notification to appropriate consumer.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Methods	Functionality
IsEventValidForTheTarget()	Changes the event message before it reaches the work flow engine. This is like additional preprocessing on the event message before it delivered.

- **IEventServiceProvider**:- This interface will start the events and need to be implemented in the event handler class file.

Methods	Functionality
StartListeningPort()	Starts listening to a specified port
StopListeningPort()	Stops listening to a specified port
RefreshListeningPort()	Refreshes the port to which it is listening.

Classes:

- **EventBinding**:- This class file is used to set the event parameters such as event name, Portguid, Application name etc. and saving to the SKEventbinding table. This file is inherited from Skelta.Core.DS.SingleTableObject class file. This base class has the method save for saving the data to the event binding table. This converts the parameters as in XML format and save the data to the event binding table. After raising the events, the specified record is deleted from the table by calling the delete method.
- **EventBindingCollection**:- This will retrieve the matching event item record from the eventbinding table. This generates the select query and set all sql parameters and retrieve the corresponding event record.
- **EventItem**:- This class file is used to create a new event object. Here the parameters are event provider name, event port, event parameters and event message.
- **EventParameter**:- This class file holds parameters used for correlation between an event and an eventbinding.
- **EventServiceManager**:- Methods of this class will be called from the engine to start the events, stop the events etc. This file called the StartListeningPort method which is implemented in the event handler class file. This contains other important methods such as GetAllEventProviders and GetAllEventPorts. First will retrieve the event providers from the table and second will retrieve the event ports from the table.
- **EventServicePort**:- This class file will set event service port details and save to the SKEventServicePorts table. This class file inherited from the Skelta.Core.DS.SingleTableObject file. This base class facilitated the saving option and represents a particular port record.
- **EventServicePortCollection**:- This will retrieve the event port details for a specific event type. This retrieves collection of ports for the event from the table SKEventServiceports table.

Event Framework Components

The following table describes the main components of AVEVA Work Tasks Event Framework

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Event Framework Components	Description
EventProviders	This is the main component of Event Framework. This component is used to handling specific events. You need to create different event providers to handle your events. All event providers need to implement an interface called IEventClientServiceProvider. There are two types of event providers. First type is hosted inside the Engine. You need to implement additional interfaces as follows: • IEventServiceProvider for creating event providers. • IEventSupportsLoadBalancing, if your event provider handles load balancing.
EventPorts	EventPorts can be considered as an endpoint for EventProviders. For example, for a wait for email event provider email need to be received from different sources such as POP3, or forwarding from Exchange Server. In each of this source EventPorts can be implemented. For a file watcher event provider, there will be different EventPorts which are watching different Folders. User can use IEventPort interface to implement EventPort.
EventBinding	This client side component is responsible for consuming events and alert workflow. You need to create an EventBinding for each interested events. EventBindings are stored in SKEventBinding table.
EventParameter	This is the correlation parameter which filters events and its interested EventBindings. Every event provider has a set of EventParameters. Using these parameters, it will filter eventbindings interested to the specific provider events.
EventItem	This is an event message container component. The Event Framework is designed to support any type of events such as file system event provider, share point event provider, email event provider, and so on.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Events Framework Interfaces and Classes

The following table 1 and table 2 describe the interfaces and classes used in the event Framework. All the interfaces need to be implemented in the event service class files.

Interfaces

Table 1 - Interfaces

Interface	Description
IEventPort	This interface represents a port used by the event service provider and contains portname, port guid, event name and port XML string. Port generally contains the information about event listener. For example, in case it is FileSystemEventProvider, the port contains name of directories which file system event provider is going to monitor.
IEventClientServiceProvider	This interface needs to be implemented in the event handler class file to return a new event port and set its values. It has the methods such as GetNewEventPort,LoadEventPort, GetAllEventParameters, and so on. The read only property event name is hard coded in each event provider. GetNewEventPort method is used to return new empty port object. LoadEventPort method creates new port and set its values. GetAllEventParameters method returns all event parameters which will be available whenever an event is raised by the event service provider. This is useful to give event notification to appropriate consumer. IsEventValidForTheTarget method is useful to change the event message before it reaches the workflow engine. This is like additional preprocessing on the event message before it delivered.
I**EventServiceProvider**	This interface will start the events and need to be implemented in the event handler class file. This has the methods such as StartListeningPort, StopListeningPort, RefreshListeningPort, and so on.

Classes

Table 2 - Classes

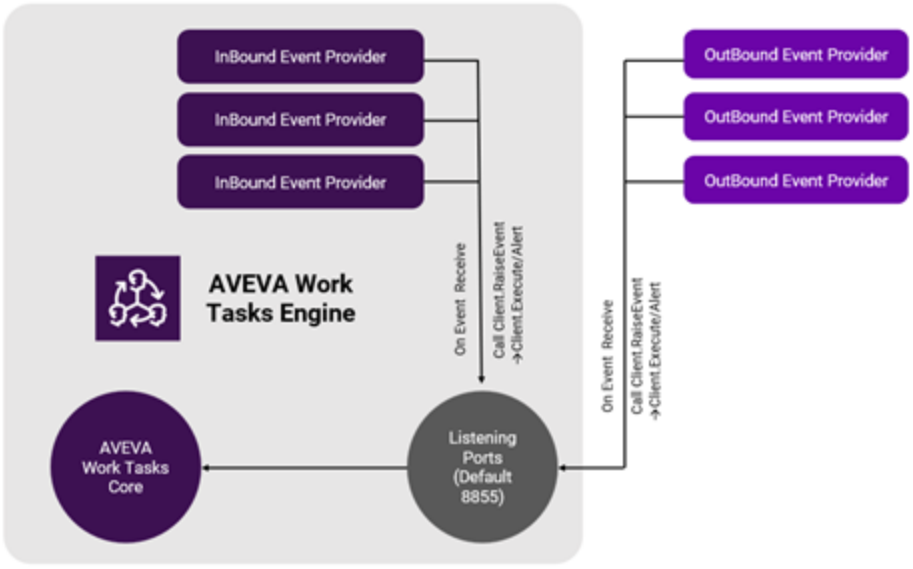
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Class	Description
EventBinding	This class file is used to set the event parameters (event name, Portguid, Application name, and so on) and saving to the SKEventbinding table. This file inherited from Skelta.Core.DS.SingleTableObject class file. This base class has the method save for saving the data to the event binding table. This converts the parameters in XML format and make the saving the data to the event binding table. After raising the events the specified record is deleted from the table by calling the delete method.
EventBindingCollection	This will retrieve the matching event item record from the eventbinding table. This generates the selected query and set all SQL parameters, and retrieves the corresponding event record.
EventItem	This class file is used to create a new event object. Here the parameters are event provider name, event port, event parameters and event message.
EventParameter	This class file holds parameters used for correlation between an event and an eventbinding.
EventServiceManager	This will be called from the Engine to start the events or stop the events. This file called the StartListeningPort method which is implemented in the event handler class file. This contains other important methods such as GetAllEventProviders and GetAllEventPorts. It will retrieve the event providers from the table, and then retrieve the event ports from the table.
EventServicePort	This class file will set event service port details and save to the SKEventServicePorts table. This class file is inherited from the Skelta.Core.DS.SingleTableObject file. This base class facilitates the saving option and represents a particular port record.
EventServicePortCollection	This will retrieve the event port details for a specific event type. This retrieves collection of ports for the event from the table SKEventServiceports table.

Event Provider Architecture

The following figure shows the event provider architecture:

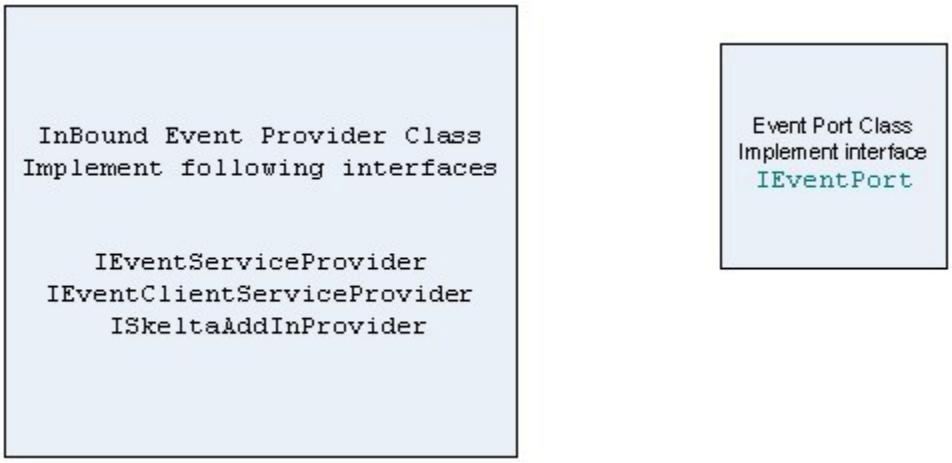
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Inbound Event Provider

Inbound event providers are loaded inside the Engine itself and will wait for events. All event providers configured in SKAddInProviders table with type 'EventHost' are loaded in the Engine and all Event Ports of each provider will be started listening for events. When an event receives, each event provider should call Client.RaiseEvent method.

The following figure shows the Inbound event provider Class and Interfaces:



Outbound Event Provider

Outbound event providers are not loaded inside the Engine. These providers are handling events using their own environment. These kinds of providers are configured in SKAddInProviders table with type 'Event'. Receiving events are responsibility of provider not the Engine. On receiving events, each event provider should call Client.RaiseEvent method.

The following figure shows the Outbound event provider Class and Interfaces:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Link Event Binding and Provider

- Each Provider will have specific set of parameter.
- Each parameter should have a specific mapping field in SKEventBinding table.
- Once an event occurs, the provider parameter values are set by the Provider. This is provider's responsibility.
- These parameters are matched with SKEventBinding collection, matching EventBindings are filtered. This filter can be done inside Client.RaiseEvent method.
- Each matching event binding will process individually.
  - If BindingType property set for workflow, it will execute a new workflow by getting other EventBinding properties.
  - If BindingType property is set for activity, it will alert a waiting activity by getting other properties.

Use Default Event Providers

AVEVA Work Tasks by default provides the following Event Providers:

- Enterprise Console
- BAM
- FileWatcher
- Scheduler

This means that events from the following providers can be used for triggering a Workflow or an Activity by associating these events to the required task. Ensure that FileEventProvider.dll file is available in the bin folder for the following example.

Step 1: Set Folder for File Watcher Event Provider.

To associate to a File Watcher event, first we have to create/set a folder to which file watcher should listen to. For this, go to **Enterprise Console** > **Settings** > **File Watcher**. In the newly opened page, click **New**. The **Add Folder** page appears.

Enter a name for the new File Watcher and specify the physical path of the folder which has to be watched for

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

events. Change the other default settings if necessary and click **Save**. This will successfully create a new File Watcher.

Step 2: Associate workflow with a specific File Watcher Event.

For this example, associate a workflow called **"Test"** to the File Watcher event raised from the specific folder.

Go to **Enterprise Console** > **Workflows**. Right-click the workflow which should be alerted on the File Watcher Event and click **Create Associations**. The **Create Associations** page appears.

Choose one of the file events and the physical folder which has already been configured. Click **Attach Event** which will successfully attach the workflow to the specific event.

A new entry will be made automatically in the **"SKEventBindings"** table in Repository Database which hold the Event Information.

Another entry is made automatically in the **SKEEventAssociations** table which hold information about associated events.

When **"View all Association"** option is clicked, data is retried from the **SKEEventAssociations** table.

The workflow **"Test"** will start execution automatically whenever any new file is created in the specified folder.

Add a Custom Event Provider

AVEVA Work Tasks allows creation of custom event providers using its Event Framework. Using this framework any custom event raised can be used to trigger a workflow or an activity.

Steps to Create Custom Event Provider

AVEVA Work Tasks allows creation of custom event providers using its Event Framework. Using this framework any custom event raised can be used to trigger a workflow or an activity.

Step 1: Creating the Class Library Project

Open a new Class Library type project and name it as you want to name the custom event provider. For this example we will be using **"SkeltaSampleEventProvider"** as the project name, and this should create a namespace of the same name. Please refer to Code Sample to see code implementation.

1. Add reference to Workflow.NET.NET2.dll
2. Add the following to the project:

```
using Skelta.Events.Interfaces;
using Skelta.Core;
using Workflow.NET;
using Skelta.Events;
using Workflow.NET.Engine;
using System.Collections;
```

3. Create a new class for EventPort which implements the interface IEventPort. The IEventPort interface has the following properties.

Properties	Description
string EventName	Get Event Provider name specific to provider.
Guid PortGuid	Id used Internally to identify the port

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Properties	Description
string PortName	Name used to represent the port internally
string PortXmlString	Port level custom logic can be persisted inside this XML string.

4. Create another class in the same file for EventProvider which implements the interfaces
    - **IEventClientServiceProvider**

The **IEventClientServiceProvider** interface has the following properties and methods.

Properties	Description
string EventName	The name of the event can be hard coded in class implementation.
string ListBigIcon	Path of the image file to be displayed in event association page for the custom activity.
string ListSmallIcon	Path of the image file to be displayed in event association page for the custom activity.
Methods	Description
bool EventBindingAdding(EventBinding eventBinding)	This method will get called while adding an eventbinding of the particular provider type. The code to be executed while adding an event binding should be written here.
bool EventBindingDeleting(EventBinding eventBinding)	This method will get called while deleting an eventbinding of this provider type. The code to be executed while deleting an event binding should be written here.
EventBindingUpdating(EventBinding eventBinding)	This method will get called while Updating an eventbinding of this provider type. The code to be executed while Updating an event binding should be written here.
EventParameter[] GetAllEventParameters(IEventPort port)	This method gives all correlation parameters used for filtering event bindings when an event occurs.
string GetEventBindingNameForDisplay(EventBinding eventBinding)	This method will give name for the Event Binding for displaying purpose.
IEventPort GetNewEventPort()	Will return new port specific to the provider.
List<EventProvisionFormDetails> GetProvisionForms(EventProvisionFormType provisionType)	Used to render forms for association. Returns list of EventProvisionFormDetails which can be used for rendering Event association page. (This is the page

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Properties	Description
	which should appear when we are trying to associate a workflow with the Custom Created Event Provider. On the page we should specify the details of the event on which workflow has to be triggered). See the code Samples for more details.
bool IsEventValidForTheTarget(EventItem eventItem, EventBinding eventBinding, VariablesCollection varCollection)	This method will be called from Engine after filtering the eventbindings for specific events. If it returns true then this eventbinding should be considered for executing/alerting workflow. Users business logic can be implemented here. For Activity type eventbindings, variables can be updated here.
IEventPort LoadEventPort(Guid id, string portName, string portXml)	Used internally to get a specific event port.

- **IEventServiceProvider**

Note: This interface should be implemented only if EventProvider is going to be hosted inside the Engine. If the EventProvider is going to be hosted outside, the region "OnEventReceived" in the sample code file should be shifted to the custom implemented Event receiving class.

The **IEventServiceProvider** interface has the following methods:

Methods	Description
Dictionary<string, IEventPort> GetListeningEventPorts()	Returns all the listening Event Ports.
void Initialize()	This method is called to initialize the provider before starting it.
bool IsGlobal()	returns true if the provider is global else returns false. This method is used internally.
object OnClientMessage(string methodName, object message)	-
void OnStop()	-
void RefreshListeningPort(IEventPort eventPort)	This method is from Engine for re-starting an eventport.
void StartListeningPort(IEventPort eventPort)	Method is called for starting an EventPort
void StopListeningPort(IEventPort eventPort)	Method is called for Stopping an EventPort

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **ISkeltaAddInProvider**

Properties	Description
Guid Id	Unique is for the Add in provider
string Settings	Contains the settings for the add in provider
Methods	Description
void InitializeProvider(string settings, Guid id)	Initializes the ad

Note: To implement load Balancing, the interface IEventSupportsLoadBalancing also has to be implemented. Implementing this interface is completely optional and depends on the requirement. The interface has the following definition.

IEventSupportsLoadBalancing	
Methods	**Description**
void OnMachineAdded(string machineName)	Implement this method to specify what has to done when a new machine is added. it takes the new machine name added as its parameter.
void OnMachineDown(string machineName)	Implement this method to specify how load should be distributed when any of the machine is down.

1. Strong name the dll and build the project.
2. Register the dll in the GAC and one copy in the AVEVA Work Tasks bin folder.

Step 2: Add the new Event provider to the Repository

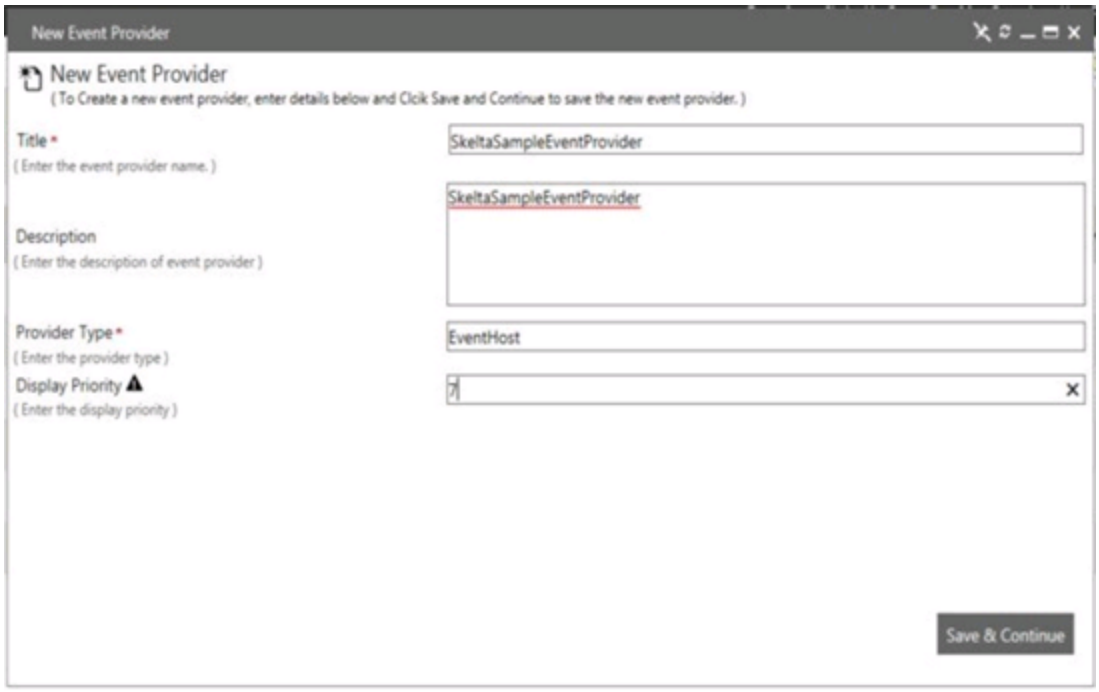
1. Go to Repository Settings from the top right menu bar.
2. Go to the Advanced Settings tab and click Manage Event Providers.
3. Click **New** in the Event Provider page and enter the details for the new Event Provider.

   The **Title** should besSame as that of the Event Provider being created.

   Provider Type should be given as **EventHost** if the event provider is going to hosted inside the Engine, or as Event if the Provider is going to be hosted externally.

   Display priority is the order in which the icon is going to be displayed on the top menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



4. Click **Save & Continue** which will successfully add a new event provider. A new entry will be made in the **SKEEventProviders** table for the Custom event provider.
5. Execute the following Query for the Repository database.

```
INSERT INTO SKAddInProviders (Type,[Name],ClassName,[Assembly],Settings,IsGacAssembly)
VALUES
('EventHost','SkeltaSampleEventProvider','SkeltaSampleEventProvider.EngineHostedProvider
','bin\SkeltaSampleEventProvider.dll','',1)
```

Here,

- **Type**- The field which decides the provider is hosted inside the Engine or externally.
- **Name**- Name of the provider being created
- **ClassName**- Namespace.Classname of the class in the class library file
- **Assembly**- Location of the dll created
- **Settings**- Settings for the provider, if any
- **IsGacAssembly**- Represents whether dll is registered in the GAC or not

A row will be added to the **AddInProviders** table. A new Event Provider has been added in the repository with name SkeltaSampleEventProvider.

Step 3: Verification

We can verify whether it has been correctly added by following the below procedure.

1. Go to the list of workflows.
2. Right-click any workflow.
3. Click **Create Associations** which would lead to a new page from where we can associate to different event providers.
4. With the list of default Event providers, the newly added event provider icon is also displayed.

Code Sample - Files for File Watcher Event Binding Page

When creating a custom event provider, there should be an interface from which we should be able to associate to the event and set the properties.

For any custom Event Provider we are creating, we should design a similar page which can accept the settings for that provider and should be able to update into the database (SKEventBindings, SKEEventAssociations)

Here, we have given the sample page for creating **FileWatcher event association** page, which can be used as a reference to create a new aspx file with similar functionality.

The newly created code files for filewatcher is added in the folder.

Default\Plugins\FileWatcher\EventProvider

and Images in

Default\Plugins\FileWatcher\Images folder

In the class Library for Custom event provider, under the implementation of **EventClientServiceProvider** in function **GetProvisionForms()** we have to set the details of the page url that we have created above(for event binding) for the **EventProvisionFormDetail** object created.

The following aspx file is the interface from where association can be set for the file watcher event:

```
<%@ Page Language="C#" AutoEventWireup="true"
Inherits="Skelta.Repository.Web.CodeBehind.AssociateFileWatcher" %>
<%@ Register Assembly="RadTabStrip.Net2" Namespace="Telerik.WebControls" TagPrefix="radTS"
%>
<%@ Register TagPrefix="radCln" Namespace="Telerik.WebControls" Assembly="RadCalendar.Net2"
%>
<%@ Register Assembly="Skelta.Repository.Web" Namespace="Skelta.Repository.Web.Lookup"
TagPrefix="cc1" %>
<%@ Register Assembly="RadWindow.Net2" Namespace="Telerik.WebControls" TagPrefix="radW" %>
<%@ Register Assembly="RadComboBox.Net2" Namespace="Telerik.WebControls" TagPrefix="radC"
%>
<link href="<%=cssPath%>Common/StyleSheet/Global.css" rel="stylesheet" type="text/css" />
<html >
<head runat="server" id="Head1">
<title>Associate to File Watcher</title>
</head>
<body>
<form id="form1" runat="server">
<div>
<table cellpadding="0" cellspacing="1" border="0" width="98%" align="center">
<tr>
<td class="pagetitle ">
<img src="../Images/filewatcher-icon.png" hspace="1" align="absmiddle"
/><%=GetLangSpecText("ec_filewatcher_titlename")%>
</td>
</tr>
<tr>
<br />

Create File Watcher Initiated Workflow or Custom Workflow

AVEVA Work Tasks allows users to create Custom event provider initiated workflows. To implement it, first a custom event provider should be created.

After successfully creating a Custom Event Provider, we will see the steps for how to create an option for FileWatcher initiated WorkFlow.

Step 1:

1. Place an image icon under *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**BPMUITemplates**Default**Repository**ListControl**images**icons-ribbon* folder. This icon will be displayed in the ribbon bar for associating with custom event provider.
2. Add an entry in the *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**BPMUITemplates**Default**Repository**ListControl**WorkflowRibbonBar.ascx* page as shown below.

   The following code should be added to the location where other event based workflow icons are defined (like Forms initiated WF). Find out the exact location and add the below code with the other similar kind of TDs.

   ```
   <td height="25" align="left">
    <span><a href="javascript:ExecuteAction('_sys_newfilewatcherworkflow')"
   class="sectionitem">
    <img alt="<%=GetLangSpecText("ec_rbn_wf_bamworkflow_alttext")%>"
   src="<%=templateThemeDirectory%>Repository/ListControl/images/icons-ribbon/custom.PNG"
   width="23" height="23" align="absmiddle" border="0" />
    <%=GetLangSpecText("Customworkflow") %>
    </a></span>
   </td>
   ```

   The above code will display the icon for the custom initiated workflow and it is linked to a javascript function.

   If you check the WorkFlow list now, we can see that a new icon has been added to the ribbon bar.

   The functionality for the new icon will be implemented in the following steps.
3. Create a workflow form aspx page in *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**BPMUITemplates**Default**Plugins**FileWatcher**Workflow* directory. That aspx name can be specified in the function coming up in the next step.
4. To add a List Definition execute the following code by creating a project which has reference to the Workflow.net.dll and has the following using statements.
   - using Skelta.Repository.List;
   - using Skelta.Repository.List.Action;

     Given below is the complete code file to get the function executed. The function InsertFileWatcherWorkflow() adds the list definition. This function accepts repository name as its parameter.

     ```
     using System;
     using System.Collections.Generic;
     using System.ComponentModel;
     using System.Data;
     using System.Drawing;
     using System.Text;
     using System.Windows.Forms;

After all the steps to create the custom event provider initiated workflow are completed, verify the functionality

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

by clicking the custom icon in the top menu. This should pop-up a new window where we can create a workflow. As we have illustrated with the filewatcher example, our custom event provider is file watcher only.

Click **Save & Continue** which will lead to the Process Designer where we can design the workflow. Publish the newly created workflow and try generating the event (creating a .doc file in this case) that is set to trigger the workflow.

Code Sample - File Watcher Initiated Workflow

The below is the Aspx file for the File Watcher initiated WorkFlow

```
<%@ Page Language="C#" AutoEventWireup="true"

Import BPMN Process Models from Microsoft Visio

The Business Process Modeling Notation (BPMN) is a published standard that enables standardization in the notations used for business process modeling.

Overview of Visio Process Import

BPMN Compatibility

The Business Process Modeling Notation (BPMN) is a published standard that enables standardization in the notations used for business process modeling. It defines a comprehensive set of notations for different elements in a process model such as actions, events and links. This in turn makes it possible for business process models

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

created in one BPM application to be used in another, provided both applications support, and are compatible with BPMN standards.

Support for Process Models created using IT Pearls BPMN Stencil for Microsoft Visio

The IT Pearls BPMN Stencil for Microsoft Visio from ITP-Commerce adds process modeling functionality to Visio. Business Analysts can use this familiar tool to model their business processes and export them as XML files, which in turn can be used in applications that automate those processes. AVEVA Work Tasks has a provision to import and integrate the process models exported from Visio and execute them.

Import of XML file Exported from Microsoft Visio

The import functionality (found in the Process Designer's Settings menu) has a new option to import Visio Process Designs in addition to the earlier option to import existing Processes. Selecting this option displays the open file dialog box. You can select the Visio process file here and import it. AVEVA Work Tasks will map the BPMN events and activities to corresponding activities and recreate the process design. In case the Visio event or activity does not have a corresponding activity then it will be retained in the redrawn process design as a BPMN event or activity.

There is only UI provided for conversion of Visio workflow to AVEVA Work Tasks. AVEVA Work Tasks provides API, which gives the entire structure of workflow definition within AVEVA Work Tasks. These APIs can be used to import workflow definition built in other tool after converting the same to AVEVA Work Tasks understandable format.

Note: From Visio, you cannot import workflow XML which is generated by AVEVA Work Tasks. The XML generated by AVEVA Work Tasks is native which can be easily understood. The third party tool is required to convert the same to Visio to understand the format.

Realigning the Imported Process Model

The imported process will have to be realigned to ensure that it reflects the source Visio process model. The Realign Activity is available to enable this process. You can execute this Activity to automatically realign the imported process design.

Handling Unlinked Process Flows in the Visio Process Model
