The original Visio process model may have had process flows that were not linked to any other event/activity. During import into the Process Designer these process flows are linked to the Start activity. An appropriate message will be displayed on the Import window, mentioning the activity name and stating that it was found unlinked in the Process Model and so it is being linked to the Start activity by default. Such process flows need to be manually linked to the appropriate point in the main process flow.

Note: Importing "Visio 2013 exported file" is not supported.

Map BPMN Events to AVEVA Work Tasks Actions

You can map BPMN End Events to AVEVA Work Tasks. The End Event represents the type of event that stops a process flow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

BPMN End Events

The End Event represents the type of event that stops a process flow. This event can have several possible results such as Message, Timer, Exception, Link, etc. It can also end the process flow without generating any result.

End Event

BPMN End Event

The End Event represents the type of event that stops a process flow. This event can have several possible results such as Message, Timer, Exception, Link, etc. It can also end the process flow without generating any result. The End Event is denoted by a circle with a thick outline. It is empty if the event does not have any result. If there are results they are represented by different symbols for each result attribute, which will be superimposed on the End Event symbol.

The handling of this event with different results during the import of a process model into AVEVA Work Tasks is described in subsequent topics in this section.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The BPMN End Event is mapped to the End Activity, which is represented by a circle with a thick outline, filled with red, with the image of a stop sign superimposed on it to denote the end.

The following mapping will be used during the conversion:

- Only the End Events without any result (without any result attributes superimposed) or with the Message result attribute (represented by an envelope) superimposed will be mapped to the End Activity.
- The End Event with the Link result attribute will be automatically handled by the Link Originator connector and converted to a physical link.
- In AVEVA Work Tasks, the End Activity will not do anything and will be treated as the logical end of the execution thread of the process. (In the case of processes running in parallel this would mean that the thread which reaches the End Activity will end.)

  Note: The End Activity is different from the Terminate Activity.

- Use of this Activity is optional and has been provided mainly for modeling purposes. Even if this activity is not placed at the end of the process thread, it will conclude if there are no further links to execute.

Validation

In AVEVA Work Tasks, outlinks (links originating from the activity) are not allowed from the End Activity.

Raise Exception

BPMN End Event with Exception

The End Event with Exception represents the type of event that stops a process flow and generates an exception as the result. It is denoted by the symbol for electric current (indicating hazard) superimposed on the End Event

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

symbol, i.e. the circle with thick outline.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The End Event with the Exception result attribute is mapped to the Raise Exception Activity, which is represented by a red circle similar to the End Activity superimposed with the symbol for electric current.

The following mapping will be used during the conversion:

- Only End Events with the Exception result attribute and no outlinks will be mapped to the Raise Exception Activity. It is important that the End Event with Exception have no outlinks to be mapped.
- On reaching this activity a named exception will be generated, which will have to be caught by the Exception Handler(s) of the workflow.

Validation

Outlinks (links originating from the activity) are not allowed from the Raise Exception Activity.

Cancel Transaction

BPMN End Event with Cancel

The End Event with Cancel represents the type of event that stops a process flow and cancels the transaction that is running at that time. It is denoted by an 'X' superimposed on the End Event symbol, i.e. the circle with thick outline.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The End Event with the Cancel result attribute is mapped to the Cancel Transaction Activity, which is represented by a red circle, similar to the End Activity, superimposed with an 'X'.

The following mapping will be used during the conversion:

- Only the End Events with the Cancel result attribute and no outlinks will be mapped to the Cancel Transaction Activity.
- On reaching this activity the current running transaction is canceled (rolled back).
- The parameter for this Activity is the transaction name.

Validation

- Outlinks (links originating from the activity) are not allowed from the Cancel Transaction Activity.
- This activity can be used only within a transaction block.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Compensate Transaction

BPMN End Event with Compensation

The End Event with Compensation represents the type of event that stops a process flow, cancels the transaction that is running at that time, generates the compensation event, and performs a full roll back. It is denoted by a left-pointing double arrowhead symbol (similar to the symbol for rewind) superimposed on the End Event symbol, i.e. the circle with thick outline.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The End Event with the Compensation result attribute is mapped to the Compensate Transaction Activity, which is represented by a red circle similar to the End Activity superimposed with a left-pointing double arrowhead symbol.

The following mapping will be used during the conversion,

- Only the End Events with the Compensation result attribute and no outlinks will be mapped to the Compensate Transaction Activity.
- On reaching this activity the current running transaction is canceled, the compensation event is generated, and full rollback is performed.

Validation

- Outlinks (links originating from the Activity) are not allowed from the Cancel Transaction Activity.
- This activity can be used only within a transaction block.

Terminate Workflow

BPMN End Event with Terminate

The End Event with Terminate represents the type of event that kills a workflow process. It is denoted by a filled circle superimposed on the End Event symbol, i.e. the circle with thick outline.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The End Event with the Terminate result attribute is mapped to the Terminate Workflow Activity, which is represented by a red circle similar to the End Activity superimposed with a solid red circle similar to the corresponding BPMN notation.

The following mapping will be used during the conversion:

- Only the End Events with the Terminate result attribute and no outlinks will be mapped to the Terminate Workflow Activity.
- Terminate Workflow action takes the Workflow ID as an optional parameter. If no ID is specified the currently executing workflow is terminated.
- If the Workflow ID is specified the corresponding workflow is killed immediately.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Validation

Outlinks (links originating from the activity) are not allowed from the Terminate Workflow Activity.

Link Source

BPMN End Event with Link

The End Event with Link represents the type of event that creates a link. It is denoted by a right-pointing arrow superimposed on the End Event symbol, i.e. the circle with thick outline.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The End Event with the Link result attribute is mapped to the Link Source Activity, which is represented by a circle similar to the End Activity but filled with yellow and superimposed with a right-pointing arrow similar to the corresponding BPMN notation.

The following mapping will be used during the conversion:

- Only the End Events with the Link result attribute and no outlinks will be mapped to the Link Source Activity.
- The Link ID is mapped to the Link Identifier parameter of the Link Source Activity, which is used by the Link Target Activity to make the connection.

Validation

- Outlinks (links originating from the activity) are not allowed from the Link Source Activity.
- Link Identifier is mandatory.

End With Message

BPMN End Event with Message

The End Event with Message represents the type of event that generates a message after ending the process flow. It is denoted by an envelope symbol superimposed on the End Event symbol, i.e. the circle with thick outline.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The End Event with the Message result attribute is mapped to the End with Message Activity, which is represented by a red circle similar to the End Activity superimposed with an envelope symbol similar to the corresponding BPMN notation. The End with Message Activity is identical to the Email Activity, and is used to end the process logically while notifying some user about the end.

The following mapping will be used during the conversion:

Only the End Events with the Message result attribute and no outlinks will be mapped to the End with Message Activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Validation

Outlinks (links originating from the activity) are not allowed from the End with Message Activity.

Multiple (Not Mapped)

BPMN End Event with Multiple results

The End Event with Multiple results represents the type of event that generates a number of results after ending the process flow. It is denoted by a six-pointed star symbol superimposed on the End Event symbol, that is the circle with thick outline.

The Multiple End Event is resolved in AVEVA Work Tasks having different results mapped to different End Events in parallel.

BPMN Intermediate Events

Intermediate Events are usually placed at the boundary of an activity. They denote the triggers that can interrupt the activity. The activity will stop executing and the process flow will be rerouted from the Event. The different types of Intermediate Event are Timer, Exceptions, Messages.

Intermediate Events Overview

BPMN Intermediate Events

Intermediate Events are usually placed at the boundary of an activity. They denote the triggers that can interrupt the activity. The activity will stop executing and the process flow will be rerouted from the Event. The different types of Intermediate Event are Timer, Exceptions, Messages. The Intermediate Event is represented by a circle with a double outline. It is empty if the event does not have any result. If there are results they are represented by different symbols for each result attribute, which will be superimposed on the Intermediate Event symbol.

On Exception

BPMN Intermediate Event with Exception

The Intermediate Event with Exception represents the type of event that interrupts a process flow when an exception occurs. It is denoted by the symbol for electric current (indicating hazard) superimposed on the Intermediate Event symbol, that is the circle with the double outline.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The Intermediate Event with the Exception trigger is mapped to the On Exception Activity, which is represented by the standard notation for Intermediate Events, that is a circle with a double outline filled with orange, with the symbol for electric current superimposed on it to denote the exception.

The following mapping will be used during the conversion:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Intermediate Event with Exception trigger will be mapped to the On Exception Activity.
- If the Target attribute is specified then the activity should not be mapped to the Wait for Exception activity; instead, it should be converted to an On Exception as the Trigger for the Link.

Validation

On Exception activity may be allowed to have no inlinks; in such a case it will be immediately executed after the Start Activity before the Start Activity proceeds to the next logical link.

Wait for Event

BPMN Intermediate Event with Message

The Intermediate Event with Message represents the type of event that interrupts a process flow when a notification/message is received. It is denoted by the envelope symbol superimposed on the Intermediate Event symbol, that is. the circle with the double outline.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The Intermediate Event with the Message trigger is mapped to the Wait for Event Activity, which is represented by the standard notation for Intermediate Events, that is a circle with a double outline filled with orange, with the envelope symbol superimposed on it.

The following mapping will be used during the conversion:

- Intermediate Event with Message trigger will be mapped to the Wait for Event Activity.
- If the Target attribute is specified then the activity should not be mapped to the Wait for Event activity; instead, it should be converted to a Link with Wait for Event as the Trigger for the event.

Validation

Wait for Event activity may be allowed to have no inlinks; in such a case it will be immediately executed after the Start Activity before the Start Activity proceeds to the next logical link.

Wait Timer

BPMN Intermediate Event with Timer

The Intermediate Event with Timer represents the type of event that interrupts the process flow at a scheduled time. It is denoted by a clock symbol superimposed on the Intermediate Event symbol, that is the circle with the double outline.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The Intermediate Event with the Timer trigger is mapped to the Wait Timer Activity, which is represented by the standard notation for Intermediate Events, that is a circle with a double outline filled with orange, with the clock

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

symbol superimposed on it.

The following mapping will be used during the conversion:

- Intermediate Event with Timer trigger will be mapped to the Wait Timer Activity.
- If the Target attribute is specified then the activity should not be mapped to the Wait Timer activity; instead, it should be converted to a Link with Wait Timer as the Trigger for the event.

Validation

Wait Timer activity may be allowed to have no inlinks; in such a case it will be immediately executed after the Start Activity before the Start Activity proceeds to the next logical link.

On Transaction Canceled

BPMN Intermediate Event with Cancel

The Intermediate Event with Cancel represents the type of event that interrupts the process flow when a transaction is canceled. It is denoted by an 'X' superimposed on the Intermediate Event symbol, that is the circle with the double outline.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The Intermediate Event with the Cancel trigger is mapped to the On Transaction Canceled Activity, which is represented by the standard notation for Intermediate Events, that is a circle with a double outline filled with orange, with an 'X' superimposed on it.

The following mapping will be used during the conversion:

- Intermediate Event with Cancel trigger will be mapped to the On Transaction Canceled Activity.
- If the Target attribute is specified then the activity should not be mapped to the On Transaction Canceled activity; instead, it should be converted to a Link with On Transaction Canceled as the Trigger for the event.

Validation

- On Transaction Canceled action may be allowed to have no inlinks; in such a case it will be immediately executed after the Start Activity before the Start Activity proceeds to the next logical link.
- On Transaction Canceled must be placed in a process that is marked as transactionable.
- On Transaction Canceled, if used as an event trigger, must be attached to a task or activity that is marked as transactionable.

On Compensation

BPMN Intermediate Event with Compensation

The Intermediate Event with Compensation represents the type of event that interrupts the process flow when a transaction compensation event is encountered. It is denoted by a left-pointing double arrowhead symbol

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

superimposed on the Intermediate Event symbol, that is the circle with the double outline.

Mapping of Visio BPMN Event to the AVEVA Work Tasks Activity

The Intermediate Event with the Compensation trigger is mapped to the On Compensation Activity, which is represented by the standard notation for Intermediate Events, that is a circle with a double outline filled with orange, with a left-pointing double arrowhead symbol superimposed on it.

The following mapping will be used during the conversion:

- Intermediate Event with Compensation trigger will be mapped to the On Compensation Activity.
- If the Target attribute is specified then the activity should not be mapped to the On Compensation activity; instead, it should be converted to a Link with On Compensation as the Trigger for the event.

Validation

- On Compensation activity may be allowed to have no inlinks; in such a case it will be immediately executed after the Start Activity before the Start Activity proceeds to the next logical link.
- On Compensation must be placed in a process that is marked as transactional.
- On Compensation, if used as an event trigger, must be attached to a task or activity that is marked as transactional.

Map BPMN Activities to AVEVA Work Tasks Activities

You can map BPMN activities to AVEVA Work Tasks activities. The BPMN Task Activity is represented by a rounded rectangle shape. It is used to denote a logical task and may not do anything at runtime.

BPMN Task

BPMN Task Activity

The BPMN Task Activity is represented by a rounded rectangle shape. It is used to denote a logical task and may not do anything at runtime. For actual execution or implementation it has to be replaced by an appropriate human activity or any other suitable action in the AVEVA Work Tasks process definition.

This action will have the following properties:

- Task Type value, which is a string property where the appropriate value could be typed
- Marker Attributes, which will be used to show appropriate markers on the task shape
  - Loop Type: One, Standard, Multiinstance
  - Adhoc Task: Yes/No
  - Compensating Task: Yes/No
- Possible Outputs, which is a grid of strings
- Force Output During Run, which determines if the output link is to be traversed during run time.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Mapping of Visio BPMN Notation to AVEVA Work Tasks Activities

- The imported BPMN Task Activity is generally converted to an appropriate action in AVEVA Work Tasks.
- The following mapping will be used during the conversion:
  - Receive Task will be converted to Host Web Service and Wait Call Activity.
  - Send Task will be converted to Call Web Service Activity.
  - User Task will be converted to Task Activity.
  - Script Task will be converted to Script Activity.
  - Manual Task will remain a BPMN Task activity within the process.
  - Reference Task will also remain a BPMN Task activity within the process.
  - Any other value will be mapped to see if a corresponding activity exists in AVEVA Work Tasks and if it does the said Activity will be created during import.
  - In case the value does not match any of the above, it will remain a BPMN Task within AVEVA Work Tasks.

Validation

No specific validations will be performed on the BPMN Task Activity in AVEVA Work Tasks.

Sub-Process

BPMN Sub-Process

The BPMN Sub-Process can be of two types -

- Expanded, which is represented by the Task symbol superimposed with its own set of process items forming a separate process flow.
- Collapsed, which is represented the Task symbol with a node symbol [+] on the lower boundary.

Mapping of Visio BPMN Notation to AVEVA Work Tasks Activities

While importing a sub-process from the Visio BPMN Modeler, it will be created as a separate process in AVEVA Work Tasks, and will be referenced to the parent process automatically.

- Sub-Processes will be treated as separate Process Definitions within AVEVA Work Tasks with a Sub-Process Marker in the Process Definition Storage and the definition.
- Sub-Processes will automatically get access to all the Variables and Content of the parent process.
- Sub-Processes cannot be invoked directly since their contextual information will be completely dependent upon the parent process.
- The Sub-Process Task will be mapped to the Workflow Activity, which will be mapping to above defined Sub-Process.
- The Sub-Process Activity will provide a way to easily jump to a sub-process view by using right-click on the properties.
- A Sub-Process will be able to return to a particular output by setting a variable called Sub Process_Output

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

and based on this it can be accessed directly within the parent process flow.

- An Expanded Sub-Process is mapped to a Workflow Activity that is assigned the name of the Sub-Process. The elements inside the sub-process are mapped to the appropriate AVEVA Work Tasks activities and a new XML process definition is created with all these elements.
- A Collapsed Sub-Process is mapped to a Workflow Activity with the name of the Sub-Process assigned to the Workflow activity.

Map Connectors

You can map connectors in AVEVA Work Tasks with a BPMN Sequence Flow. The BPMN Sequence Flow is denoted by a solid line with a terminal arrow. It represents the direction of process flow by linking other elements.

Sequence Flows

BPMN Sequence Flow

The BPMN Sequence Flow is denoted by a solid line with a terminal arrow. It represents the direction of process flow by linking other elements.

Mapping of AVEVA Work Tasks BPMN Element

The Sequence Flow is identical to the AVEVA Work Tasks Link Activity and it will be mapped to the appropriate Link Activity based on the source element and target element.

Message Logs

The following functions are available in using message logs:

- Setting the debug mode level
- Viewing message log files
- Using the logger console
- Disabling logging of strings

Set Message Log Debug Mode Level

You can specify the debug mode in **Farm Configuration Wizard**. The level of detail in the information that is shown in the Logger Console depends on the value that is set for this property. The Workflow Execution information is displayed in the Logger Console.

The debug levels are:

- Level 1 shows minimal information in the Logger Console, giving only information on the start and end of the workflow. Error messages are also shown in this mode. AVEVA Work Tasks recommends this Debug Level on production environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Level 2 shows detailed information of what is happening in the background. It will show all the messages logged from the actions.
- Level 3 shows only messages indicating whether the Activity is executed.

Log Message Categories

There are three categories of messages logged in the log files.

- **Information** – This type of message is preceded by a lower case 'i'. It indicates messages containing general information about the events being logged. Each message of this type has four parts – the event information, the module generating the event, the machine on which the event took place, and the date and time of the event.
- **Warning** – This type of message is preceded by a question mark '?'. It indicates messages containing warning notes to the users about the events being logged. The messages of this type have a structure similar to the 'Information' messages with the same four parts mentioned earlier.
- **Error** – This type of message is preceded by an exclamation mark '!'. It indicates messages containing details about errors that occur. The messages of this type have the four parts found in the other two message categories. In addition it has the 'Exception Stack Trace', which occurs before the machine name and date/time. It can be identified by the keyword 'Source' and it can be used to trace the source of the error.
- **LogConfirmation** - This displays confirmation messages and such messages are prefixed c -.

View Message Log Files

In this section you will see how to view and use the Log files created by AVEVA Work Tasks. Two types of Log files are created.

- The first type of Log file, for generic log messages, will be created in the following path:

  [AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\\Logs

  The Log files are saved in this folder using the date of logging as the filename with the format "YYYYMMDD" (there will be one Log file for each day).
- The second type of Log file is application-specific, it will log messages related to applications. These Log files are created in separate folders corresponding to each application. The folders are located in the following path:

  [AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Logs

  These log files are saved with names in the format "<application name>_YYYYMMDD".

To view the Log files

1. Browse to the location of the log files using the relevant path, that is, "\Logs" or "\Logs\<application name>" depending on the type of Log file you wish to view. Select the log file to view by looking for the date of logging.
2. Open the log file in a text editor. It will display all the events of the day using the three types of log

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

categories to identify the type of information.

Logger Console

In this section you will see how to view and use the Logger Console that is part of AVEVA Work Tasks. The Logger Console is a utility that shows a real-time log of events during the execution of AVEVA Work Tasks. It is automatically installed in the *C:\Program files\AVEVA\Work Tasks\\Bin* folder when AVEVA Work Tasks is installed.

You can also access Logger Console by selecting the **Logger** option from the App bar menu items at the top-left corner of the application window.

1. Browse to the location of the Logger Console and double-click the Logger Console executable.
2. This opens the Logger Console log in a new window. You can view the events as they occur when AVEVA Work Tasks is running.
3. The Logger Console will display the events using the three types of log categories to identify the type of information.

Option to Disable Logging of Strings

You can control the string messages getting logged into the logger files without making any change to the debug level. Suppose your debug level is set as 2 and you want to restrict some messages containing text. For Example, **"Inserting local variables"** from getting logged into the logger file without changing your current debug level. Following are the steps to achieve it.

1. Create a New Key in AVEVA Work Tasks Registry named "DoNotLogMessages" of type Multi-String value.
2. Specify the text of the messages which are to be ignored while writing to the log files.
3. Restart services.

Manage and Synchronize Threads in Engine

Overview

This section provides information on how to manage and synchronize threads in AVEVA Work Tasks Engine.

Thread

A Thread is a small set of executable instructions, which can be used to isolate a task from a process. Multiple threads are efficient way to obtain parallelism of hardware and give interactive user interaction to your applications. Threading enables your C# program to perform concurrent processing so you can do more than one operation at a time. For example, you can use threading to monitor input from the user, perform background tasks, and handle simultaneous streams of input.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

ThreadPool Class

Provides a pool of threads that can be used to post work items, process asynchronous I/O, wait on behalf of other threads, and process timers. Thread pooling enables you to use threads more efficiently by providing your application with a pool of worker threads that are managed by the system. One thread monitors the status of several wait operations queued to the thread pool. When a wait operation completes, a worker thread from the thread pool executes the corresponding callback function.

The threads in the managed thread pool are background threads. This means that a **ThreadPool** thread will not keep an application running after all foreground threads have exited.

Engine and Threads

The engine is run as a Windows Service on AVEVA Work Tasks server installed machines. Once the service is started the engine listens on a particular port waiting for requests from clients to be processed. The communication between the engine and client (Example: w3wp process) is achieved using TCP/IP communication protocol. On a request from client the engine verifies the requests and places it on to a thread pool and then gives a notification back to client on successful delivery. From then on the engine processes the request in an asynchronous fashion. This is a bit different for synchronous execution which is detailed below.

The engine adopts two modes of execution for workflow steps or activities.

1. Asynchronous mode
2. Synchronous mode

For **Asynchronous** mode, the engine uses predefined set of threads (Custom thread pool) which will run/execute the workflow steps in parallell. Based on the number of threads available the number of workflow steps which can execute will vary. The number of threads for the custom thread pool is configurable and the performance on higher thread count will vary based on the operating system and hardware configuration.

For **Synchronous** mode, the TCP/IP connection between the client and engine is placed on hold and the client gets a reply only when a logical end point is reached within the engine. So the wait period for client to get a reply from engine on successful delivery will happen only after logical end is reached.

Note: On heavy load environment, it is always advisable to use asynchronous mode of execution.

Limit In-Memory Activity/Steps Count for Repository

You can control the number of **In Memory** workflow steps that can exist for any workflow instance. **In Memory** refers to the workflow steps which execute continuously in engine. For example, a workflow activity with a loop or a workflow which does not have any waiting steps like Human Activities.

This feature can be used to stop workflow instances with infinite looping behavior. All workflow instances which cross the **In Memory** activity count will be removed and gets marked as aborted.

SKInMemoryActivityCount Table

The table SKInMemoryActivityCount with columns **Application**, **Workflow**, and **InMemoryCount** is added to Farm Configuration database for configuring the **In Memory** concurrent steps. These settings will take effect only

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

when engine is restarted.

The default **In Memory** workflow steps for any workflow instance is 500. To change the default In Memory concurrent activity count, create an entry in *SKInMemoryActivityCount* table with application name as "defaultinmemorycount".

Thread Pools at Repository Level

Use this feature to set the default number of threads which will be running in background to execute the workflow steps for a repository. The feature can be very useful in a hosted environment where there will be predefined number of threads which will carry out the activity execution for each repository. So, if a workflow within a repository has time consuming steps it is in no way going to affect the workflows running in another repository.

SKConcurrentThreadPools Table

The table SKConcurrentThreadPools with columns Application and ThreadCount is added to farm configuration database for configuring the concurrent threads for executing workflow steps for a repository. These settings will take effect only when engine is restarted.

Note: If Service Monitoring is enabled, it is mandatory to restart Client Service which, in turn, restarts the engine. Hence, there is no need to restart the engine manually.

The default repository thread pool for executing workflow steps will have 30 threads running in parallel. To change the default application thread pool size, create an entry in SKConcurrentThreadPools table with application name as "DefaultPool".

Activity Concurrency Limit

Activity concurrency limit defines the feature to control the number of Activity Instances* or Activity Type which can run in parallel. Two tables are added to Farms database for this configuration. It is mandatory to restart the engine for these configuration changes to take effect.

SKActivityTypeConcurrency table: The columns available in the table are **Application**, **ActivityType** and **Concurrency Limit**. Two levels of concurrency can be set using this configuration.

- **Application and Activity Type level**: You can control the number of activity types which will run in parallel at the same time for a repository for a step type.
  Example: Within an application there can be only 10 script activity which will run in parallel.
- **Activity Type level**: You can control the number of activity types which will run in parallel at the same time.
  Example: Across all repositories there can be only 10 script activity which will run in parallel.

SKActivityNameConcurrency table: The columns available in the table are Application, Workflow, ActivityName, and ConcurrencyLimit. One level of concurrency can be set using this configuration.

Application, Workflow and ActivityName level: You can control the number of activity names (instances) which will run parallelly at the same time for a repository within a workflow.
Example: Within an application and workflow there can be only 10 MoveCopyFolder activity which will run in parallel.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The properties which can be configured in the farm database for Workflow Engine service is:

- **maxruntimethreadsforconcurrentexecution**: Number of threads which will be used to queue up the activities which timeouts the waiting periods to execute. The timeout activities will have Pending ('P') status for the activity in SWExecutionDetails table or BAM report.
- **concurrentactivityexecutionwaittime**: The wait time for an activity to start executing in synchronous mode. It is useful only when concurrency limits are set in farm configuration database for SKActivityTypeConcurrency or SKActivityNameConcurrency tables.

```
<properties>
<property key="loadbalanced"><![CDATA[False]]></property>
<property key="loadbalanceserverport"><![CDATA[8853]]></property>
<property key="loadbalanceclientport"><![CDATA[8859]]></property>
<property key="port"><![CDATA[8855]]></property>
<property key="maxenginethreads"><![CDATA[100]]></property>
<property key="maxruntimethreadsforconcurrentexecution"><![CDATA[20]]></property>
<property key="concurrentactivityexecutionwaittime"><![CDATA[15000]]></property>
<property key="lastupdateddatetime"><![CDATA[]]></property>
<property key="serviceexe"><![CDATA[WFEngine.NET2.exe]]></property>
<property key="displayname"><![CDATA[Skelta - Workflow Engine]]></property>
</properties>
```

Note: Based on the type of workflows, load and scenario, it is advisable to configure these parameters during load testing to reach an optimum number and performance. Activity Instance* is a single step which is in executing/running stage. For example, there are 2 **MoveCopy** steps named **MoveCopy1** and **MoveCopy** 2 placed in parallel with in a workflow. After the workflow is triggered, it would be one instance of **MoveCopy1** activity and one instance of MoveCopy2 activity running at the same time. If the workflow is triggered twice it would be two instance of MoveCopy1 activity and two instance of **MoveCopy2** activity running at the same time.

Entities

Application users are the most integral part of any system. The storage type used to store this user information can vary based on the Enterprise. Examples could be SQL database or Active Directory. AVEVA Work Tasks can be used to build Human centric workflow solutions. The users required to be part of this workflow solution can exist in different data stores.

A Repository contains Workflow Definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the Repository is also defined while creating a Repository. Each Repository could potentially have its own user database, for example, one repository may connect to Active Directory, and the other may connect to theDatabases and others to Lightweight Directory Access Protocol (LDAP) or Active Directory Application Mode (ADAM).

The user integration needs to be outside the Repository boundary since users can span across multiple Repositories. AVEVA Work Tasks has the concept known as User Entity and Role Entity for managing users across different platforms.

User Entity manages all the information for the users across different Data sources. Data Source may be Active Directory, SQL providers, and so on. The Role Entity manages users in roles.

Data bridge framework is the common framework that bridges the entity item and the corresponding Data source providers. Each entity item will internally communicate with the Data bridge framework to know from which Data Source provider the entity details should be retrieved.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Basic Understanding of the Need for Data Bridge Interface

- Enterprise Console will be deployed as a central server, which can serve multiple applications simultaneously.
- Each application could potentially have its own Users Database. For example, one of the applications might be connecting to Active Directory, other might be connecting to Database, something to LDAP or ADAM.
- When AVEVA Work Tasks deals with each of these applications, it needs to ensure that users of these applications can work with AVEVA Work Tasks without any complicated configurations, and also in a secure manner which ensures only authorized functionality is available to each and every resource.
- Enterprise Console will also act as a Work Bench for all the workflow participants, hence it needs to allow user authentication from variety of sources. For example, an Application spanning internal as well as external vendors and customers, needs to have variety of database access requirements possible.
- Different applications might be using the same Authentication source, but might have different Metadata and grouping information with them. For example, the authentication source could be an active directory, but there could be five other applications that are using the same user and maintain application-specific user metadata. Hence, in reality if all the information is needed about the user it needs to be collected from across all the application as well as active directory.
- Sometimes it is expensive to query every time on the user database, so the results are cached heavily.
- The user integration is outside the Application boundary since the users can span across multiple applications.

DataBridge Provider

AVEVA Work Tasks follows a concept known as User Entity and Role Entity for managing users across different platforms.

User Entity manages all the information for the users across different data sources. Here data source may be active directory and SQL providers.

Role entity manages users in roles.

Data bridge framework is the common framework that bridges between the entity item & the corresponding data source providers. Here each entity item will internally communicate with the Data bridge framework to know from which data source provider the entity details should be retrieved.

User Entity

User Entity makes possible to use different data source providers to be used simultaneously to extend the Meta data and provide more number of unique user stores. This provider will maintain its own Universal Provider Actor table, which will map each data source provider and allow unique user ids to be stored in the mapping table while giving a unique user id which will be further used by the rest of AVEVA Work Tasks functionality.

Role Entity

Role entity allows getting all the users based on their roles. This will again communicate with the Data bridge frame work that will get the users in Roles based on the data source provider.

All the Role information will be stored in the SKVirtualRole table along with the role name and data source provider name.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

User Integration in AVEVA Work Tasks

To add users, all the user properties should be configured correctly. The configurations are done in the XML data. Here user properties are name of the user, email id, unique identifier and other user related details. Along with the user properties, the data source for users must be specified whether if the users are from the data base, active directory etc.

All the entity information is stored in the SKEntity and SKEntityDataSourceProvider tables.

SKEntity table stores all the user properties. These properties will be displayed in the UI for the user to query the resources.

SKEntityDataSourceProvider table stores the data source provider information for each of the entity item. Here all the user properties are defined and bounded to the user properties defined in the SkEntity table.

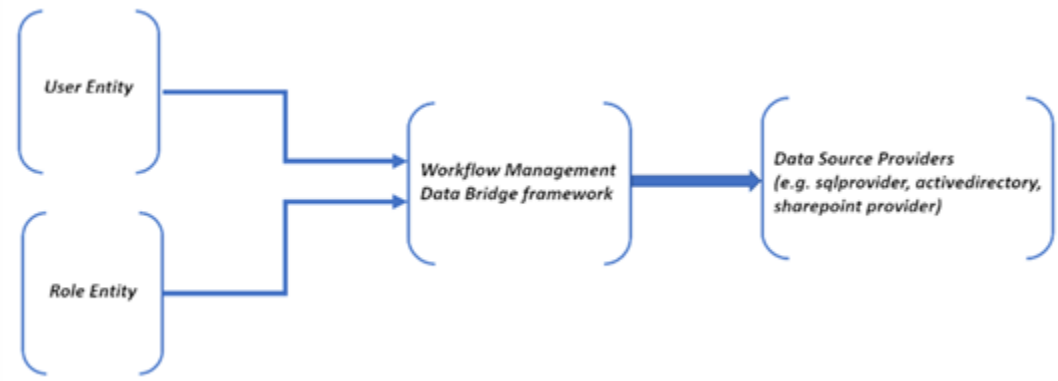
The VirtualActor table is used to map real user ids to virtual ids used by AVEVA Work Tasks.

User Entity

User Entity makes possible to use different data source providers simultaneously to extend the Meta data and provide more number of unique user stores. This provider will maintain its own Universal Provider Actor table, which will map each data source provider and allow unique user ids to be stored in the mapping table while giving a unique user id which will be further used by the rest of AVEVA Work Tasks functionality.

User Entity provider information will be stored in the **SKEntity** table. For each of this user entity, there will be unique settings that are stored in the DefinitionXml column. Along with these setting, repository name, mapping table info etc are stored. Settings for each user entity are stored in XML format. These include the user properties with details like the name of the property, its purpose, and display name. The mapping table used for storing the user information will be **SKVirtualActor** table. This table contains data related to user unique identifier, name, and email.

As shown in the image below, an entity can be mapped to different data source providers. For User Entity the providers mapped are called as user entity data source provider. The configuration for user entity data source provider is persisted in **SKEntityDataSourceProvider** table. For each of this user entity data source provider, there will be unique settings that are stored in the DefinitionXml column.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

XML Schema for User Entity and User Entity Data Source Provider

User Entity XML Schema for Definition XML

The XML Schema for user entity consists of collection of properties which defines the user. The properties defined for user entity is a clubbed collection of properties defined for the entity user data source providers.

Example

For example, let us consider the user data store to be SQL. The SQL server contains a database with table named as Users. Refer to the image below for the table columns specified which contain information regarding the user.

Table Name: Users

UserId	Name	Role	Email	Password
d51-036d0145c547	Michelle	Admin	michelle@skelta....	michelle
c6a7170a-6a35-4f79-8688-150d0ac8fe15	Kevin	Developer	kevin@skelta.com	kevin
ce24b3d0-21dc-4821-8d55-afe4c8581716	John	Developer	john@skelta.com	john
9d3eebb3-ebbe-4415-9d18-df4205af5c46	Elaine	Product Manager	elaine@skelta.com	elaine

The "UserId" column in the table contains the unique identifier value for the user. The "Name" and "Email" column contains the name & email information for the user. Let us see how the properties need to be defined in the definition XML for user entity & user entity data source for the above columns.

The User Entity Data Source Provider definition XML in **SKEntityDataSourceProvider** table will be as shown below:

```
 <dataproviders>
<provider name="authenticationuserprovider" type="Skelta List">
<properties>
<property  name="UserId"  purpose="identifier"  type="guid" />
<property  name="Name"  purpose="name"  type="string"/>
<property  name="Email"  purpose="email" type="string" />
<property  name="Role" type="string"/>
</properties>
</provider>
</dataproviders>
```

The XML nodes are **case sensitive** and should be added "as is". Please find below the description for the node and its attributes:

The **provider** node contains information about the type of data source provider used.

Attribute Name	Description
name	Defines the name of the data source provider type. This filed should match the name column value provided in SKAddInProvider table while configuring the entity data source provider. The names used for default provides shipped are given below. *Active Directory: activedirectory* *SQL Server: sqlprovider* *ASP.NET Membership: membershipprovider*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Attribute Name	Description
	AVEVA Work Tasks List : authenticationuserprovider
type	Defines the type of the provider. The value for this column can be any value which is descriptive. The default values used for the out of box providers are listed below. The default provider values should not be changed if used. *Active Directory: activedirectory* *SQL Server: sql server* *ASP.NET Membership: aspnet membership* *AVEVA Work Tasks List: Skelta List*
providerprefix	Value provided in this attribute will be prefixed to the unique identifier value when persisted in SKVirtualActor table. This value is referred only for data base operation like update or select on SKVirtualActor table and does not reflect in the UI when unique identifier value is referenced. AVEVA Work Tasks active directory provider uses this field to append domain name with the unique identifier value for AD [samAccountName is used as unique column in AD]. If this attribute is used it is assumed that the entity data source provider unique identifier column type is string. For the above sample this should not be used as the unique identifier type is Guid.
authenticationsource	Determines if the provider can be used as authentication source for logging in to EC. If set as false this provider does not get displayed for Log In option for EC.

This **property** node contains information related to the user. The property node is case sensitive. Each property represents a column/ field of the data source provider which contains the user information. For example, if the data source is SQL the property will represent table column and if it's AD the property column represents the active directory fields.

Attribute Name	Description
name	Column/ Field of the data source provider which defines a property of the user. In the above example name attribute value contains the column name of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	table which contains user information. UserId, Name, Email & Role are the columns defined in table "Users". **Note**: The name attribute value should contain only alphabets without spaces or special characters.
type	Defines the column type of the data base column / field. In the above example the UserId column is defined as guid type so the attribute type for property UserId is set as "guid".
purpose	Purpose defines the type of information available for a property (column/field). It's mandatory to configure purpose attribute for the properties. The must set purpose attributes are **identifier**: Mandatory fields required for user entity data source provider. This setting identifies the column from which the unique identifier value needs to be fetched. This setting is very critical for the data source provider configuration. The column value configured as identifier gets persisted in UserIDString or UserID or UserGUID column of SKVirtualActor table, based on the type. name: This setting identifies the column from which the name of user will be fetched. Gets persisted in Name column of SKVirtualActor table. **email**: This setting identifies the column from which the email of user will be fetched. Gets persisted in Email column of SKVirtualActor table. **groupid**: This setting identifies the column from which the groupid of user will be fetched. Does not get persisted in SKVirtualActor table. **groupname**: This setting identifies the column from which the groupname of user will be fetched. Does not get persisted in SKVirtualActor table. **manager**: This setting identifies the column from which the name of manger will be fetched. Does not get persisted in SKVirtualActor table. **password**: Used to set the column which contains password value while using forms provider. Can be used only with forms provider.
persist	Boolean flag which can be set as true/false to decide if the column value needs to be persisted in SKVirtualActor table. The default entries in SKVirtualActor table are for purpose identifier, name and email.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

persistcolumn	SKVirtualActor table contains generic columns like nvarchar1, datetime1 etc which can be used to persist custom information in the table. This attribute can be used to set the column to which the value needs to be persisted for a user. Only the generic columns should be used to persist custom info.
entitymappedproperty	Attribute used to map the user entity data source provider property to an entity property. An example will be provided below on how to map a property in user entity data source provider to entity provider.
displayname	Does not have any specific functionality and can be ignored. Was maintained for back ward compatibility in XML Schema and will be removed in future release.
suppressdn	This attribute is used only with active directory. Based on this setting the value fully qualified name returned by AD is trimmed to return exact required value. Normally used with Role and Manager property in Active Directory provider.

Note: The property field set as purpose=" identifier" should be passed as the real user id prefixed with the provider instance name & "::". For the above example the real user id for Michelle will be "<Provider Instance Name>:: e9d21049-e3cf-4f4d-9d51-036d0145c547". A sample is provided after the description section for better clarity.

The entity definition XML in SKEntity table will be as below:

```
<entity type="user">
<properties>
<property name="UserId" displayname="Id" purpose="identifier"  type="string" />
<property name="UserName"  displayname="Display Name" purpose="name"  type="string"/>
<property name="UserEmail" displayname="Email"  purpose="email" type="string"/>
<property name="Role" displayname="Designation" type="string"/>
</properties>
</entity>%%$#@@!!!*&
```

This property node contains information related to the user entity data source provider. The properties defined in entity should match the columns defined for the user entity data source provider. In the above example 2 properties (UserName, UserEmail) does not exactly match the properties defined in the sample for user entity data source provider, this will be explained after the attribute description.

The special characters (%%$#@@!!!*&) shown at the end of entity definition XML is the separation string to include multiple providers mapping XML along with entity definition XML.

Attribute Name	Description
name	Name of the column used to build filter condition for building query to filter out required users.
type	Type defines the value type, you can see that the type defined in user entity data source provider was "int" but in entity it is set as string. This is because the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	unique identifier at entity level will always have the user entity data source provider instance name prefixed, which makes it a string always.

purpose	Purpose defines the type of information available for a property. Based on the purpose set for a property the resource object provides specific info as below.
	//Gets the resource object based on the real user id.
	Workflow.NET.Resource resourceProperties = new Skelta.HWS.Actor(new ApplicationObject("RepositoryName"), "skeltalist::9F67E912-5E5B-42C5-97A0-53462374A3B3").Resource;
	//Return the property value with purpose set as identifier
	resourceProperties.Properties.Identifier;
	//Return the property value with purpose set as name
	resourceProperties.Properties.Name;
	//Return the property value with purpose set as email
	resourceProperties.Properties.Email;
	//Return the property value with purpose set as groupid
	resourceProperties.Properties.GroupID;
	//Return the property value with purpose set as groupname
	resourceProperties.Properties.GroupName;
	//Return the property value with purpose set as manager
	resourceProperties.Properties.Manager;
	
	In the example you can see the real user id getting prefixed to the instance. In the sample the user entity data source provider is AVEVA Work Tasks List and the instance name is set as "skeltalist". The unique identifier type is guid for users in AVEVA Work Tasks List.

displayname	The display name of the property which will be displayed to users while building filter condition to query users. An example of filter UI is the "To" property available for Human Activities.

In the above definition, XML 2 properties (UserName, UserEmail) does not match with the user entity data source provider columns listed. Since the names do not match the attribute "entitymappedproperty" for user entity data source provider can be used to do the mapping. This property gets used when configuring multiple providers for the same repository. The definition XML will be as below with "entitymappedproperty":

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

User Entity Data Source Provider definition XML:

```
<dataproviders>
<provider name="authenticationuserprovider" type="Skelta List">
<properties>
<property  name="UserId" purpose="identifier" type="guid" />
<property  name="Name"  purpose="name" type="string"  entitymappedproperty ="UserName" />
<property  name="Email"  purpose="email" type="string"  entitymappedproperty = "UserEmail"
/>
<property  name="Role" type="string"/>
</properties>
</provider>
</dataproviders>
```

Entity Provider definition XML:

```
<entity type="user">
<properties>
<property name="UserId" displayname="Id"  purpose="identifier"  type="string" />
<property name="UserName"  displayname="Display Name" purpose="name"  type="string"/>
<property name="UserEmail" displayname="Email"  purpose="email" type="string"/>
<property name="Role" displayname="Designation" type="string"/>
</properties>
</entity>%%$#@@!!!*&

</provider>
</dataproviders>
```

Configure Forms Provider for Authentication

You can create a Repository with Forms Provider for Authentication. Repository with Forms authentication implies that the user details are fetched from a user defined table. These details can be used for various purposes like login authentication into the Enterprise Console, assigning actors to the human activities and others.

Following are the steps that are required to create a repository with forms authentication:

1. Prerequisite - Create a table that contains the user details. The table could be in the same database that is mapped to the repository or in a different database. For example:

   ```
   Create table Users(UserIdentifier int,FirstName varchar(50),PasswordValue varchar(50),
   LastName varchar(50), Email varchar(50),ManagerId int)
   ```

2. In Central Configuration, click the link Repository Settings that is under the title Repository. Now the repository list page is displayed.
3. Click the link named "Create Repository" that is just below the repository list. Manage Repository page is displayed.
4. The Manage Repository page contains fields on the right side of it that needs to be filled. The mandatory fields that need to be configured are:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

a. Repository Data Source – Select data source listed in this drop-down. If selected data source is not listed in the drop-down then click the link "Create data source" below the drop-down to create a new data source.

b. Attach Data Source – To attach the data source, that is being used by any other repositories then check this option. Then a drop-down with all the repositories will be listed and user can select one from them.

c. Repository Name – Provide a repository name in this field.

d. Description - Provide a description for repository in this field. [optional]

e. Servers – Select server from the list box provided.

f. Resource Provider – In this drop-down, select the provider as Forms.

g. User entity Properties – Enter the XML code that identifies user properties.

The XML code consists of the main tag<properties> followed by the sub tags <property > and its attributes. The property tags are case sensitive. The property attributes should match the columns that are present in the user table newly created.

For example, the columns of the table created by executing the above sample query consists of the columns matching the property attributes in the below sample code.

Sample code

```
<properties>
<property name="UserIdentifier" type="int" purpose="identifier"
displayname="Useridentifier" />
  <property name="FirstName" type="string" purpose="name" displayname="First Name" />
  <property name="PasswordValue" type="string" purpose="password"
displayname="PasswordValue" />
  <property name="LastName" type="string" displayname="Last Name" />
  <property name="Email" type="string" displayname="Email ID" purpose="email" />
  <property name="ManagerId" type="string" displayname="ManagerId" purpose="manager"
/>
</properties>
```

5. User Provider Properties – Enter the XML code to map user properties in the provider to the user Entity Properties.

Sample code

```
<properties>
<property name="UserIdentifier" type="int" purpose="identifier"
displayname="Useridentifier" />
  <property name="FirstName" type="string" purpose="name" displayname="First Name" />
  <property name="PasswordValue" type="string" purpose="password"
displayname="PasswordValue" />
  <property name="LastName" type="string" displayname="Last Name" />
  <property name="Email" type="string" displayname="Email ID" purpose="email" />
  <property name="ManagerId" type="string" displayname="ManagerId" purpose="manager" />
</properties>
```

Data Source – Provide the connection string to the data source.

Data Table/View – In this field, specify the table that provides the user details. For example, created a table by name Users, specify the same name here. i.e Users. In case the user details has to be fetched from than one table then user can specify view in this field.

User login Property – Specify the column name of the field which has to be authenticated for login. For example: UserIdentifier

Click Test Sql Connection to check the status of the connection. If the message displayed is "Test Connection

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Succeeded" then click OK button that is at the bottom of the page.

Map Active Directory and SQL Provider

Overview of mapping between Active Directory and SQL Provider

Mapping is required, if same user exists in more than one provider to avoid duplicate entries in database.

Advantage of Mapping

1. While mapping, if user exists in more than one provider then user can login or act on the given task from any of the providers.
2. Duplication of same user from different providers can be avoided.

Scenario: Log on to the EC site using domain login and use the resource properties defined in the sqlprovider (form) in workflow design.

To set the Mapping

Identify the column which is unique for all the providers i.e. user has to identify the common column which shares the same information for the given user across the providers. In below scenario, considered email as the common column

Active directory provider properties

```
<dataproviders>
<provider name="activedirectory" type="activedirectory">
<properties>
<property name="sAMAccountName"  type="string" purpose="identifier" displayname="Account
Name" entitymappedproperty="AD userid" />
<property name="displayName" type="string" purpose="name" displayname="Resource Name"
entitymappedproperty="name" />
<property name="mail" type="string" purpose="email" displayname="Email"
entitymappedproperty="email"/>
</properties>
<Preferences>
<SearchScope>SubTree</SearchScope>
<ReferralChasing>External </ReferralChasing> <TimeOut>60</TimeOut>
<SizeLimit>0</SizeLimit>
<AuthenticationUser>skelta\kalaiyar</AuthenticationUser>
<AuthenticationPassword IsEncrypted="true"> MqXasBHPAOsX6NU+oNwPSQ==
</AuthenticationPassword>
</Preferences><LDAPServer>LDAP://</LDAPServer>
<LDAPSearchBase>DC=skelta,DC=dom </LDAPSearchBase>
<LDAPBaseFilter>(objectCategory=Person)</LDAPBaseFilter>
<DomainName>SKELTA\</DomainName>
</provider>
</dataproviders>
```

sqlprovider Properties

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
dataproviders>
<provider name="sqlprovider" type="sql server" authenticationsource="false"> <properties>
<property name="SQLuserid" type="int" purpose="identifier" />
<property name="name" type="string"  purpose="name" display="true"/>
<property name="email" type="string" purpose="email"/>
</properties>
<datasource>server=SKELTADTP112;database=TestMappingAd-SQL;Integrated
security=true</datasource>
<SourceTable>users1</SourceTable>
</provider>
</dataproviders>
```

To Map between Active directory and SQL Provider

The **'mail'** property from active directory and email property from DB has the common field to map i.e. they both have the same information for the given user mail is active directory property. email is a column in sqlprovider.

Default Instance name for ActiveDirectory is activedirectory

Default Instance name for sql is sqlprovider

```
<<mappingfields>
 <mappingfield mappedfromprovider="ActivedirectoryInstance name">
 <fields mappedtoprovider= "sql provider instance name" ><field name="mail"
mappedto="email" />
 </fields>
 </mappingfield>
 <mappingfield mappedfromprovider="sql provider instance name">
 <fields mappedtoprovider ="ActivedirectoryInstance name" ><field name="email"
mappedto="mail"/>
 </fields>
 </mappingfield>
</mappingfields>
```

Note: User can map between any number of providers and on any common columns. Provider instance name are taken from SKEntityDatasourceprovider table.

To map Active Directory Provider with SQL Provider

1. Create repository with active directory as resource provider.
2. Insert a record to SKEntityDataSourceProvider with Application set to Repository name, EntityID taken from the SKEntity table (Userentity for mapping users), Provider to sqlprovider and Instancename with any UserdefinedName.
3. Update the DefnitionXML column for the added record with appropriate resource XML data.

   Example:

   ```
   <dataproviders>
   <provider name="sqlprovider" type="sql server" authenticationsource="false">
   <properties>
   <property name="SQLuserid" type="int" purpose="identifier" />
   <property name="name" type="string"  purpose="name" display="true"/>
   <property name="email" type="string"  purpose="email" persistcolumn="Email"/>
   </properties>
   <datasource>server=SKELTADTP112;database=TestMappingAd-SQL;Integrated security=true
   </datasource>
   SourceTable>users</SourceTable>
   ```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
</provider>
</dataproviders>
```

Note: Add persistcolumn attribute for the common column in both the providers. Authenticationsource="false" at the provider level disable the login to the repository from EC site for this provider and Connection string should be changed.

4. Update DefinitionXML column of the active directory by adding persistcolumn attribute for the common property.

   Example:

```
<dataproviders>
<provider name="activedirectory" type="activedirectory">
<properties>
<property name="sAMAccountName"  type="string" purpose="identifier"
displayname="Account Name" entitymappedproperty="AD userid" />
<property name="displayName" type="string" purpose="name" displayname="Resource Name"
entitymappedproperty="name" />
<property name="mail" type="string" purpose="email"
displayname="Email" persistcolumn="Email" entitymappedproperty="email"/>
</properties>
<Preferences>
<SearchScope>SubTree</SearchScope>
<ReferralChasing>External </ReferralChasing> <TimeOut>60</TimeOut>
<SizeLimit>0</SizeLimit>
<AuthenticationUser>skelta\kalaiyar</AuthenticationUser>
<AuthenticationPassword IsEncrypted="true"> MqXasBHPAOsX6NU+oNwPSQ==
</AuthenticationPassword>
</Preferences>
<LDAPServer>LDAP://</LDAPServer>
<LDAPSearchBase>DC=skelta,DC=dom </LDAPSearchBase>
<LDAPBaseFilter>(objectCategory=Person)</LDAPBaseFilter>
<DomainName>SKELTA\</DomainName>
</provider>
</dataproviders>
```

Note: Active directory preferences should be changed.

5. Update DefinitionXml of SKEntity table for the user entity.

   Example:

```
entity type="user">
<properties>
<property name="AD userid" type="string" purpose="identifier"/>
<property name="SQLuserid" type="int" purpose="identifier"/>
<property name="name" type="string" displayname="Name" purpose="name"
display="true"/>
<property name="email" type="string" displayname= "Email ID" purpose ="email" />
</properties>
</entity>%%$#@@!!!*&
<mappingfields>
 <mappingfield mappedfromprovider="activedirectory">
<fields mappedtoprovider= "AD_SQLprovider" >
 <field name="mail" mappedto="email" />
</fields>
 </mappingfield>
 <mappingfield mappedfromprovider="AD_SQLprovider">
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<fields mappedtoprovider ="activedirectory" >
 <field name="email" mappedto="mail"/>
</fields>
 </mappingfield>
</mappingfields>
```

Note: The properties configured in DefinitionXml of SKEntity table are available to create the query for assigning the activities to the resources. mappedfromprovider and mappedtoprovider are the instance name taken from the SKEntityDataSourceProvider.

6. Create the table named "users". This is the SourceTable for sqlprovider. The sample table is given below.

```
CREATE TABLE [dbo].[users](
 [SQLuserid] [int] NULL,
 [name] [varchar](50) NULL,
 [email] [varchar](50) NULL
 ) ON [PRIMARY]
GO
```

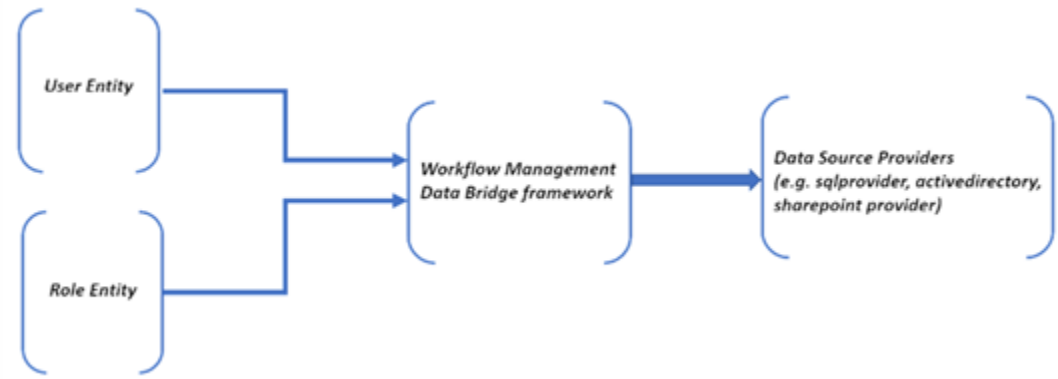
7. When the Activities are assigned to resources, it will look for the resource in both the providers and if common field found for the same, it will assign the activity to the user based on the mapped id.

When the user with common field found and if that user's details are already created in SKVirtualActor table, AVEVA Work Tasks automatically maps that user using MappedToId.

Role Entity

Role entity is used to fetch the role information for the data source provider. Role Entity provides information of roles and the associated users in the role. This will again communicate with the data bridge frame work that will get the users in Roles based on the role entity data source provider.

The mapping table used for storing the role information will be **SKVirtualRole** table. The table contains data related to role.



XML Schema Used by Role Entity Data Source Provider

A Role entity data source provider cannot exist on its own and needs to be associated always with a User entity data source provider. The reason being, the users who belong to the role have to be mapped to a user entity data source provider to be used in the system. The mapping between the role entity data source provider and user entity data source provider is achieved by maintaining the same instance name for the providers in the **SKEntityDataSourceProvider** table.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Now let us take a look at the Definition XML schema for the Role entity.

Role Entity Data Source Provider definition XML in SKEntityDataSourceProvider table will be as shown below.

```
<dataproviders>
<provider name="customsqlprovider" type="Custom Role Provider">
<properties>
<property name="Role" type="string" purpose="identifier"/>
<property name="RoleName" type="string" persist="true" persistcolumn="rolename"/>
</properties>
<datasource>
<datasource>server=localhost;database=SkeltaUsers;User Id=sa;pwd=XXX;</datasource>
<SourceTable>SqlUsers</SourceTable>
</datasource>
</provider>
</dataproviders>
```

The properties defined above are not used in any of the UI. To comply with the entity data source provider infrastructure this has been provided. One important thing to be taken care for Role entity data source provider is to ensure that the identifier value and Role Name getting persisted in SKVirtualRole database. If this is taken care by the code then there is no need for this definition XML. However the database connection string info can be useful. The type for the identifier property should be string and should always contain the Role name itself as the value. This is mandatory as the Role name itself is considered as unique identifier for the role provider. A sample for role provider value would be sqlproviderCustom::Admin (<Provider Instance Name> + "::"+ RoleName) here admin is the unique identifier value which is the role name.

Entity definition XML in SKEntity table will be as below.

<entity type="role"></entity>%%$#@@!!!*&

There are no properties defined at entity level as there is no UI, where the Role properties get listed. As the name implies the primary property provided by the Role provider is the Role name.

Synchronizing Roles of Queue Participants

When a user role is first made a participant in a queue, AVEVA Work Tasks internally stores all users with that role for allocation of work items assigned to the queue. As the resource database changes, with new users added to the role and changes in roles, the repository of users for the role need to be synchronized with the resource database. This synchronization is done based on an entry in the table SKROLEREFRESH for the resource handler.

The columns in this table are:

- **ID** - a system-generated field.
- **Resource handler** - the name of the resource handler for which the refresh setting is specified.
- **RoleRefreshInterval** - the interval specified in dd.hh:mm:ss at which the synchronization must be done.
- **IsActive** - This field must be initially set to False; This is later updated to True by the system when a Queue is created or edited.
- **TaskId** - the corresponding ID of the refresh task in the task scheduler. This field is updated by the system.
- **LastUpdatedDateTime** - The time stamp of the last update. This field is updated by the system.

When roles are refreshed, and there is a change in the users of a role that is a queue participant, all open items of users who are not longer a part of the role which the user has not taken ownership of are automatically moved back to the queue. Items that the user has taken ownership continue to stay in his work list. However, these items will no longer be considered a part of the queue. For example, a queue for processing Invoice

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Payments has the role Process Associate as a participant and John Smith as a Process Associate has 5 open items from this queue. John Smith is promoted to Manager and the role change is effected in the resource database. When the synchronization happens, John has 5 open items 3 of which has already started to process. The 2 open items that has not taken ownership of are moved back to the queue for reallocation while the 3 items that has started to process are not complete continue to stay in his work list.

Deleting Synchronization Settings

To temporarily discontinue refresh or to delete the setting, delete the entry in the table.

Entity Data Source Provider Code Samples

Introduction

In this section, you will learn:

1. How to create User and Role Entity Data source provider?
2. How to create Custom Role Provider Fetching Roles from SQL and Users from Active directory?

Create User Entity Data Source Provider

Using this API a custom User Entity Data Source Provider can be created.

Note: The Repository for which you are going to create the User Entity Data Source Provider, should have Authentication provider as "AVEVA Work Tasks List".

- **Create a table named SqlUsers**

The custom entity provider fetches the user information from a table called **SqlUsers**.

Script to create this table is provided below:

```
GO
/****** Object:  Table [dbo].[SqlUsers]  ******/
SET ANSI_NULLS ON
GO
SET QUOTED_IDENTIFIER ON
GO
CREATE TABLE [dbo].[SqlUsers](
[UserId] [uniqueidentifier] ROWGUIDCOL  NOT NULL CONSTRAINT [DF_SqlUsers_Id]  DEFAULT
(newid()),
 [Name] [nvarchar](100) NULL,
 [Role] [nvarchar](200) NULL,
 [Email] [nvarchar](75) NULL,
 [Password] [nchar](10) NULL,
 CONSTRAINT [PK_SqlUsers_1] PRIMARY KEY CLUSTERED
(
[UserId] ASC
) WITH (IGNORE_DUP_KEY = OFF) ON [PRIMARY]
) ON [PRIMARY]
```

- **Insert default users to SqlUsers Table**

Script to insert default users to SqlUsers Table:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
INSERT INTO [dbo].[SqlUsers]
 ([Name]
 ,[Role]
 ,[Email]
 ,[Password])
 VALUES
 ('Michelle','Admin','michelle@skelta.com','michelle'),
 ('kevin','Developer','kevin@skelta.com','kevin'),
 ('john','Developer','john@skelta.com','john'),
 ('Elaine','Product Manager','elaine@skelta.com','elaine')
GO
```

- **Create a dll named CustomUserEntityDataSourceProvider**

PROCEDURE

DLL REFERENCE

```
Workflow.NET.NET2
System.Transactions.dll
System.Web.dll
```

NAMESPACE USED

```
System
System.Collections.Generic
System.Text
System.Xml
System.Xml.XPath
System.Transactions
System.Data
Workflow.NET
Workflow.NET.Interfaces
Skelta.Entity
```

API INFORMATION

```
The User Entity Data Source Provider should
Inherit Skelta.Entity.DataSourceProviderBase class
```

or

```
Implement Skelta.Entity.IEntityDataSourceProvider, Skelta.Core.ISkeltaAddInProvider
Implement interface Skelta.Entity.UserEntityProvider.IUserEntityDataSourceProvider
Implement interface Skelta.Entity.IEntityAdminDataSourceProvide.
```

Skelta.Entity.DataSourceProviderBase: Base class used by the default providers, this class implements the interfaces Skelta.Entity.IEntityDataSourceProvider, Skelta.Core.ISkeltaAddInProvider. All the methods in this class are declared as virtual. The implementers should ideally implement the interfaces implemented by the base class directly. The base class is used in the sample trying to make it easier for the implementer with some of the methods already implemented with default functionality. The method which needs to be mandatorily overridden throws exception if relied on the base class. This class exposes methods for initializing the provider, fetching user information & querying users based on filters.

Skelta.Entity.UserEntityProvider.IUserEntityDataSourceProvider: Gets called during EnterpriseConsole authentication from the Log on page. This interface provides methods which gives username & password entered in the login page of EnterpriseConsole. All the user authentication code must be implemented in these methods.

Skelta.Entity.IEntityAdminDataSourceProvider: Required for setting the default administrator for a Repository.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

This administrator will have complete rights on the EC site. This administrator will be responsible for setting security and adding users to EC.

SAMPLE CODE:

```
namespace CustomUserEntityDataSourceProvider
{
/// <summary>
/// Custom entity data source  provider which queries sql database table/view returning
user information.
/// </summary>
public class UserEntityDataSourceProvider : DataSourceProviderBase,
Skelta.Entity.UserEntityProvider.IUserEntityDataSourceProvider,
Skelta.Entity.IEntityAdminDataSourceProvider
{
private string sConnectionString;
private string sDataSourceType;
private string sSourceTable;
private string sCols = "";
private Log log = null;
private string loginProperty = "";
```

```
public UserEntityDataSourceProvider() { }

/// <summary>
/// Gets called  while provider is initialized.
/// </summary>
/// <param name="settings">Definition XML configured for SKEntityDataSourceProvider
table.</param>

- **Configure Custom User Entity Data Source Provider**

Configuring custom user entity data source provider involves entries in three tables of the Repository

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Table : SKAddInProviders , Object : Skelta.Core.AddInProvider
2. Table : SKEntity, Object : Skelta.Entity.Entity
3. Table : SKEntityDataSourceProvider, Object : Skelta.Entity.DataSourceProvider

- **Add the assembly information of the user entity custom provider created, in the SKAddInProviders table**

Provider type must be **"UserDSProvider"** and name should be any unique name. The newly added provider name must be again updated in the SKEntityDataSourceProvider table.

Using API:

```
Skelta.Core.AddInProvider addInProvider = new Skelta.Core.AddInProvider(
new ApplicationObject("Sample Repository"));
addInProvider.Type = "UserDSProvider";
addInProvider.Name = "customsqlprovider";
#warning : Make sure to change the assembly  path
addInProvider.Description = "Sample Custom User Entity Data Source Provider";
addInProvider.ClassName =
 "CustomUserEntityDataSourceProvider.UserEntityDataSourceProvider";
addInProvider.AssemblyNameWithAbsoluteOrRelativePath =  @"M:\Michelle\
CustomUserEntityDataSourceProvider\
CustomUserEntityDataSourceProvider\bin\Debug\CustomUserEntityDataSourceProvider.dll";
```

addInProvider.IsGacAssembly = false;

addInProvider.IsGlobal = true;

addInProvider.IsDefault = true; // The properties IsGacAssembly, IsGlobal, IsDefault is //not currently in use. The value used in sample should be used "as is"

addInProvider.Save();

Using Script:

```
INSERT INTO SKAddInProviders VALUES (newid(),'UserDSProvider','customsqlprovider',
'Sample Custom User Entity Data Source Provider
 ','CustomUserEntityDataSourceProvider.UserEntityDataSourceProvider',
 'M:\Michelle\CustomUserEntityDataSourceProvider\CustomUserEntityDataSourceProvider\bin\
Debug\CustomUserEntityDataSourceProvider.dll',null,0,1,1,getutcdate())
```

Note: Assembly path should be changed.

Verification:

The above code creates an entry in SKAddInProviders table with type as **'UserDSProvider'**. The entry in Repository DB can be verified in database by running the query select * from SKAddInProviders Where Name='customsqlprovider'

Column Name	Value
ID	Auto Generated
Type	UserDSProvider
Name	customsqlprovider
Description	Sample Custom User Entity Data Source Provider

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Column Name	Value
ClassName	CustomUserEntityDataSourceProvider. UserEntityDataSourceProvider
Assembly	M:\Michelle\ CustomUserEntityDataSourceProvider\ CustomUserEntityDataSourceProvider\ bin\Debug \CustomUserEntityDataSourceProvider.dll
IsGacAssembly	False
Isdefault	True
IsGlobal	True
DateTime	Date time value

- Adding entry to SKEntity and SKEntityDataSourceProvider
  - Update the DefinitionXml column of SKEntity table with appropriate resource XML data for the newly created custom user entity provider that has been updated in the SKAddInProviders table.
  - Update the DefinitionXml column, Provider, Instance Name, Display Name for default entry of the List in SKEntityDataSourceProvider table with appropriate custom user entity data source provider entries.

Custom User Entity Data Source Provider Definition XML

```
<dataproviders>
<provider name="customsqlprovider" type="Custom Sql Provider">
<properties>
<property name="UserId" type="guid"  purpose="identifier" />
<property name="Name" type="string"  purpose="name"/>
<property name="Email"  type="string"  purpose="email"/>
<property name="Password" type="string"  purpose="password"/>
</properties>
<datasource>server=localhost;database=SkeltaUsers;uid=sa;pwd= XXXX</datasource>
<SourceTable>SqlUsers</SourceTable>
<loginproperty>Email</loginproperty>
</provider>
</dataproviders>
```

- "provider" node has attribute name value set as customsqlprovider as this should match the Name column entry in SKAddInProvider.
- As described in earlier sections the purpose attributes identifier, name & email are mandatory.
- Custom purpose named password is used to identify the column containing password info for authentication.
- "datasource" node contains connection string information.
- "SourceTable" node contains the table or view which contains user details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- "loginproperty" node provides information of the column which will be used as user name while logging in to Repository.

Custom Entity Definition XML

```
<entity type="user">
<properties>
<property name="UserId" type="string"  purpose="identifier" />
<property name="Name" type="string"  purpose="name"/>
<property name="Email"  type="string"  purpose="email"/>
</properties>
</entity>%%$#@@!!!*&
```

- Contains properties which are mapped to user entity definition XML properties.
- As described in earlier sections the purpose attributes identifier, name & email are mandatory.

Using API for steps 1 & 2:

```
Skelta.Core.ApplicationObject applicationObject = new Skelta.Core.ApplicationObject("Sample
Repository");
 Skelta.Entity.Entity entity = Skelta.Entity.Entity.GetEntity(applicationObject,
"UserEntity");
 string entityDefinitionXML  = "<entity type=\"user\">";
 entityDefinitionXML += "<properties>";
 entityDefinitionXML += "<property name=\"UserId\" type=\"string\"  purpose=\"identifier\"
/>";
 entityDefinitionXML += "<property name=\"Name\" type=\"string\"  purpose=\"name\"/>";
 entityDefinitionXML += "<property name=\"Email\"  type=\"string\"  purpose=\"email\"/>";
 entityDefinitionXML += "</properties>";
 entityDefinitionXML += "</entity>%%$#@@!!!*&";
 //Update default entity definition xml with matching xml for new  custom user entity data
source provider
entity.DefinitionXml = entityDefinitionXML;
entity.Save();
Skelta.Entity.DataSourceProviderCollection entityDataSourceProvider = null;
entityDataSourceProvider = new
Skelta.Entity.DataSourceProviderCollection(applicationObject,entity.Id);
 //Entity user xml need to be changed based on the custom User table
#warning : Make sure to change the connection string
 string entityDataSourceProviderDefinitionXML = "<dataproviders>";
 entityDataSourceProviderDefinitionXML += "<provider name=\"customsqlprovider\"
type=\"Custom Sql Provider\">";
 entityDataSourceProviderDefinitionXML += "<properties>";
 entityDataSourceProviderDefinitionXML += "<property name=\"UserId\" type=\"guid\"
 purpose=\"identifier\"/>";
 entityDataSourceProviderDefinitionXML += "<property name=\"Name\" type=\"string\"
 purpose=\"name\"/>";
 entityDataSourceProviderDefinitionXML += "<property name=\"Email\"  type=\"string\"
 purpose=\"email\"/>";
 entityDataSourceProviderDefinitionXML += "<property name=\"Password\" type=\"string\"
 purpose=\"password\"/>";
 entityDataSourceProviderDefinitionXML += "</properties>";
entityDataSourceProviderDefinitionXML +=
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
"<datasource>server=localhost;database=SkeltaUsers;uid=sa;pwd=XXXX</datasource>";
 entityDataSourceProviderDefinitionXML += "<SourceTable>SqlUsers</SourceTable>";
 entityDataSourceProviderDefinitionXML += "<loginproperty>Email</loginproperty>";
 entityDataSourceProviderDefinitionXML += "</provider>";
 entityDataSourceProviderDefinitionXML += "</dataproviders>";
 entityDataSourceProvider .Items[0].DefinitionXml = entityDataSourceProviderDefinitionXML;
 //Custom provider name which is added in addinprovider table
 entityDataSourceProvider .Items[0].Provider = "customsqlprovider";
 entityDataSourceProvider .Items[0].InstanceName = "sqlproviderCustom";
 entityDataSourceProvider .Items[0].DisplayName = "Custom Provider";
 entityDataSourceProvider .Items[0].Entity = entity;
 // Update skelta list entry  with the custom entry in SKEntityDataSourceProvider for user
provider entityDataSourceProvider.Items[0].Save();
```

The provider name value customsqlprovider should be same as the AddInProvider Name column value.

Using Table Entry for steps 1 & 2:

The definition XML for entity should be matching the properties for entity data source provider.

Update SKEntity Set DefinitionXML = '<entity type="user"><properties><property name="UserId" type="string" purpose="identifier" /><property name="Name" type="string" purpose="name"/><property name="Email" type="string" purpose="email"/></properties></entity>%%$#@@!!!*&%%$#@@!!!*&'

Where Name = 'UserEntity'

Make sure to update the connection string information in definition XML with the appropriate value.
The **provider** column value should be same as the name column value inserted in **SKAddInProviders** table.

Note: Also, ensure that the query given below updates the row for the AVEVA Work Tasks List User Entity Data Source Provider and not the Role Entity Data Source Provider.

```
Update SKEntityDataSourceProvider Set DefinitionXML ='<dataproviders><provider
name="customsqlprovider" type="Custom Sql Provider"><properties><property name="UserId"
 type="guid"  purpose="identifier"/><property name="Name" type="string"
 purpose="name"/><property name="Email"  type="string"  purpose="email"/><property
name="Password" type="string"
 purpose="password"/></properties><datasource>server=localhost;
database=SkeltaUsers;uid=sa;pwd=XXX</datasource><SourceTable>SqlUsers</SourceTable>
<loginproperty>Email</loginproperty></provider></dataproviders>',
DisplayName='Custom Provider', Provider='customsqlprovider',
InstanceName='sqlproviderCustom' Where DisplayName ='Skelta List' and EntityId=(Select Id
from SKEntity where Name='UserEntity')
```

Note: Connection string should be changed.

Verification:

The above code creates an entry in SKEntity table. The entry in Repository DB can be verified in database by running the query select * from SKEntity Where Name= 'UserEntity'and Application='Sample Repository'

Column Name	Value
ID	Auto generated
MappingEntityId	Null
Application	Sample Repository
Name	User Entity

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Column Name	Value
Mapping Table	SKVirtualActor
DefinitionXML	<entity type="user"><properties><property name="UserId" type="string" purpose="identifier" /><property name="Name" type="string" purpose="name"/><property name="Email" type="string" purpose="email"/></properties></entity>%%$#@@!!!*&
AddInProviderId	Default AddInProviderId
LastUpdatedDateTime	Date time value

The above code creates an entry in **SKEntityDataSourceProvider** table. The entry in Repository DB can be verified in database by running the query select * from `SKEntityDataSourceProvider Where DisplayName='Custom Provider'`

Column Name	Value
ID	Auto generated
Application	Sample Repository
Entity ID	Copy the Id Column value of SKEntity of RoleEntity row here.
DisplayName	Custom Provider
DefinitionXML	<dataproviders><provider name="customsqlprovider" type="Custom Sql Provider"><properties><property name="UserId" type="guid" purpose="identifier"/><property name="Name" type="string" purpose="name"/><property name="Email" type="string" purpose="email"/><property name="Password" type="string" purpose="password"/></properties><datasource>server=localhost;database=SkeltaUsers;uid=sa;pwd=XXX</datasource><SourceTable>SqlUsers</SourceTable><loginproperty>Email</loginproperty></provider></dataproviders>
Provider	customsqlprovider
Instance Name	sqlproviderCustom
LastUpdatedDateTime	Date time value

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Verify whether the Custom User Entity Data Source Provider is configured correctly or not

Verification:

The above code updates the entries required for configuring Custom User Entity Data Source Provider. Now, we should be able to see the provider in Repository list page. The previous entry of "List" will be updated with "Custom Provider".

If you get a message "No Provider Available" in the repository list page, cross check the Logger Console for a detailed exception for the cause.

- Check the calls made to the custom user entity data source provider.

If there is no exception then we could also create the Actor object API to check the calls made to the custom user entity data source provider.

DLL REFERENCE

Skelta.HWS

Workflow.NET.NET2

The parameters passed to the Actor object are application object & real user id. Real user id can be formed by prefixing provider instance name and special characters "::" to the unique identifier value of user. We have used UserId column value for Kevin.

	UserId	Name	Role	Email	Password
	e9d21049-e3cf-4f4d-9d51-036d0145c547	Michelle	Admin	michelle@skelta....	michelle
	c6a7170a-6a35-4f79-8688-150d0ac8fe15	Kevin	Developer	kevin@skelta.com	kevin
	ce24b3d0-21dc-4821-8d55-afe4c8581716	John	Developer	john@skelta.com	john
	9d3eebb3-ebbe-4415-9d18-df4205af5c46	Elaine	Product Manager	elaine@skelta.com	elaine

Sample code:

```
Skelta.HWS.Actor actor = new Actor(new ApplicationObject("Sample Repository"),
"sqlproviderCustom::c6a7170a-6a35-4f79-8688-150d0ac8fe15");
object identifierValue = actor.Resource.Properties.Identifier.Value;
string Name = actor.Resource.Properties.Name.Value.ToString();
string Email = actor.Resource.Properties.Email.Value.ToString();
```

The above code also creates an entry to SKVirtualActor table, this can be checked using query. Select * from `SKVirtualActor Where Name='Kevin'`

Create User and Role Entity Data Source Provider

Introduction

In this section, you will learn:

1. How to use AVEVA Work Tasks API for creating a repository from scratch and then configure the custom entity data source provider
2. How to create & configure custom user entity & role entity data source provider
3. XML schema used for the definition Xml of Entity & Entity Data Source Provider

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps To Create Custom Data Source Provider

Step 1: Create Data source for the Repository
Step 2: Create a Repository and Map the data source to the repository
Step 3: Create Custom User Entity Data Source Provider for authentication and user information
Step 4: Creating Default Admin for the Repository
Step 5: Create Custom Role Entity Data Source Provider

Step 1: Create Data Source for the Repository

The following example demonstrates the creation of a data source using a connection string. The data source created will be listed in the Enterprise Console and the repository can be created using the newly created data source.

PROCEDURE

DLL REFERENCE

Skelta.FarmConfiguration.dll

Workflow.NET.NET2.dll

NAMESPACE USED

```
Skelta.FarmConfiguration;
Skelta.FarmManager;
System.Collections.Generic;
System.Reflection;
```

Try the following code in a console application by adding the above references and name spaces:

```
//Need to handle assembly resolve event for appdomain if database used is SQL Server 2005
System.AppDomain.CurrentDomain.AssemblyResolve += new
ResolveEventHandler(CurrentDomain_AssemblyResolve);
//Build the connection string for repository data source
Skelta.FarmConfiguration.HandleSkeltaFarm.ConnectionStringDetails
connectionStringDetails = new HandleSkeltaFarm.ConnectionStringDetails();
connectionStringDetails.DataSource = "SkeltaNB30";  // System name
connectionStringDetails.DatabaseName = "RepoDatabase";
connectionStringDetails.DatabaseType = "SQL Server";
connectionStringDetails.IntegratedSecurity = false; //For SQL Server Authentication it is
 False ; For Windows Authentication it is true
connectionStringDetails.UserId = "sa";
connectionStringDetails.Password = "XXX"; //Enter correct password
HandleSkeltaFarm handlerSkeltaFarm = new HandleSkeltaFarm();
handlerSkeltaFarm.PrepareConnectionString(connectionStringDetails);
//Parameters passed are data source name & description
handlerSkeltaFarm.CreateDatasource("SkeltaDatasource", "data source created for
repository");

static System.Reflection.Assembly CurrentDomain_AssemblyResolve(object sender,
ResolveEventArgs args)
{
AssemblyName requestedName = new AssemblyName(args.Name);
if (requestedName.Name.Contains("Microsoft.SqlServer.ConnectionInfo"))
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
{
if (requestedName.Version.ToString() == "9.0.242.0")
{
throw new Exception("Can not load 9.0.242.0 dll too");
}
else
{
AssemblyName loadThis = new AssemblyName("Microsoft.SqlServer.ConnectionInfo");
loadThis.Version = new Version("9.0.242.0");
loadThis.CultureInfo = requestedName.CultureInfo;
loadThis.SetPublicKeyToken(requestedName.GetPublicKeyToken());
return Assembly.Load(loadThis);
}
}
else
{
if (requestedName.Name.Contains("Microsoft.SqlServer.Smo"))
{
if (requestedName.Version.ToString() == "9.0.242.0")
{
throw new Exception("Can not load 9.0.242.0 dll too");
}
else
{
AssemblyName loadThis = new AssemblyName("Microsoft.SqlServer.Smo");
loadThis.Version = new Version("9.0.242.0");
loadThis.CultureInfo = requestedName.CultureInfo;
loadThis.SetPublicKeyToken(requestedName.GetPublicKeyToken());
return Assembly.Load(loadThis);
}
}
else
return null;
}
}
```

Verification:

The above code creates a database named RepoDatabase. The entry in Farm DB can be verified in database by running the query Select * from SKDataSource Where Name='SkeltaDatasource'. The same can be verified in Central Config data source list page.

Step 2: Create a Repository and Map the Data Source to the Repository

The below code creates a repository entry, during creation of repository only the default data source providers can be configured. To set the custom data source provider we need to update the repository which will be done later.

PROCEDURE

The AssemblyResolve (System.AppDomain.CurrentDomain.AssemblyResolve) event, reference and namespace used in the previous example [Step 1: Create Data Source for the Repository] are required in this sample as well.

Try the following code in a console application:

```
HandleSkeltaFarm handlerSkeltaFarm = new HandleSkeltaFarm();
 HandleSkeltaFarm.RepositoryDetails repositoryDetails = new
HandleSkeltaFarm.RepositoryDetails();
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 repositoryDetails.Name = "Telematics HR Repository";
 repositoryDetails.Description = "Telematics HR Process Repository";
 repositoryDetails.DisplayName = "Telematics HR Repository";
 // Name of the data source created  in the previous step
 repositoryDetails.Datasource = "SkeltaDatasource";
 repositoryDetails.IsHidden = false;
 repositoryDetails.Sourceelements = "WORKFLOWELEMENTS\\Default";
 //Enter the email id to which exception emails must be sent.
 //These exception emails will be generated from the engine when the activity execution
fails.
 repositoryDetails.Fromemail = "admin@domain.com";
 repositoryDetails.Toemail = "admin@domain.com";
repositoryDetails.Alertuser = true;
// Select servers and repository mapping.
Dictionary<Guid, Server> serversmapped = new Dictionary<Guid, Server>();
// To select all servers/clients of current farm,
// ServerCollection servers = new ServerCollection(Farm.Local);
// To select servers only
ServerCollection servers = new ServerCollection(Farm.Local);
foreach (Server server in servers.Items)
serversmapped.Add(server.Id, server);
repositoryDetails.ServersMapped = serversmapped;
List<Guid> enterpriseConsoles = new List<Guid>();
// This code returns all EnterpriseConsole sites in the Farm.
// Ignore this part if you have not installed enterprise consoles.
WebSiteCollection websites = new WebSiteCollection("EC");
foreach (WebSite website in websites.Items)
enterpriseConsoles.Add(website.Id);
repositoryDetails.EnterpriseConsoles = enterpriseConsoles;
repositoryDetails.Provider = HandleSkeltaFarm.RepositoryProviders.SkeltaList;
handlerSkeltaFarm.RepositorySettings = repositoryDetails;
handlerSkeltaFarm.ManageRepository();
```

Verification:

The above code creates a repository named Telematics HR Repository. The entry in Farm DB can be verified in the database by running the query Select * from SKRepository Where Name=Telematics HR Repository'. The same can be verified in the Enterprise Console repository list page.

Step 3: Create Custom User Entity Data Source Provider for Authentication and User Information

Using this API a custom User Entity Data Source provider can be created.

1. Create a table named SqlUsers

   The custom entity provider fetches the user information from a table called SqlUsers.

   Script to create this table is provided below.

   ```
   GO
   /****** Object:  Table [dbo].[SqlUsers]  ******/
   SET ANSI_NULLS ON
   GO
   SET QUOTED_IDENTIFIER ON
   GO
   CREATE TABLE [dbo].[SqlUsers](
   [UserId] [uniqueidentifier] ROWGUIDCOL  NOT NULL CONSTRAINT [DF_SqlUsers_Id]  DEFAULT
   (newid()),
   ```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 [Name] [nvarchar](100) NULL,
 [Role] [nvarchar](200) NULL,
 [Email] [nvarchar](75) NULL,
 [Password] [nchar](10) NULL,
 CONSTRAINT [PK_SqlUsers_1] PRIMARY KEY CLUSTERED
(
[UserId] ASC
) WITH (IGNORE_DUP_KEY = OFF) ON [PRIMARY]
) ON [PRIMARY]
```

2. Insert default users to SqlUsers Table

   Script to insert default users to SqlUsers Table:

```
INSERT INTO [dbo].[SqlUsers]
 ([Name]
 ,[Role]
 ,[Email]
 ,[Password])
 VALUES
 ('Michelle','Admin','michelle@skelta.com','michelle'),
('kevin','Developer','kevin@skelta.com','kevin'),
 ('john','Developer','john@skelta.com','john'),
 ('Elaine','Product Manager','elaine@skelta.com','elaine')
GO
```

	UserId	Name	Role	Email	Password
▶	d51-036d0145c547	Michelle	Admin	michelle@skelta....	michelle
	c6a7170a-6a35-4f79-8688-150d0ac8fe15	Kevin	Developer	kevin@skelta.com	kevin
	ce24b3d0-21dc-4821-8d55-afe4c8581716	John	Developer	john@skelta.com	john
	9d3eebb3-ebbe-4415-9d18-df4205af5c46	Elaine	Product Manager	elaine@skelta.com	elaine

3. Create a dll named CustomUserEntityDataSourceProvider

   PROCEDURE

   DLL REFERENCE

   Workflow.NET.NET2

   System.Transactions.dll

   System.Web.dll

   NAMESPACE USED

   System

   System.Collections.Generic

   System.Text

   System.Xml

   System.Xml.XPath

   System.Transactions

   System.Data

   Workflow.NET

   Workflow.NET.Interfaces

   Skelta.Entity

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

API INFORMATION

The User Entity Data Source Provider should

Inherit Skelta.Entity.DataSourceProviderBase class

or

Implement Skelta.Entity.IEntityDataSourceProvider, Skelta.Core.ISkeltaAddInProvider

Implement interface Skelta.Entity.UserEntityProvider.IUserEntityDataSourceProvider

Implement interface Skelta.Entity.IEntityAdminDataSourceProvide.

Skelta.Entity.DataSourceProviderBase: Base class used by the default providers, this class implements the interfaces Skelta.Entity.IEntityDataSourceProvider, Skelta.Core.ISkeltaAddInProvider. All the methods in this class are declared as virtual. The implementers should ideally implement the interfaces implemented by the base class directly. The base class is used in the sample trying to make it easier for the implementer with some of the methods already implemented with default functionality. The method which needs to be mandatorily overridden throws exception if relied on the base class. This class exposes methods for initializing the provider, fetching user information & querying users based on filters.

Skelta.Entity.UserEntityProvider.IUserEntityDataSourceProvider: Gets called during EnterpriseConsole authentication from the Log on page. This interface provides methods which gives username and password entered in the login page of EnterpriseConsole. All the user authentication code must be implemented in these methods.

Skelta.Entity.IEntityAdminDataSourceProvider: Required for setting the default administrator for a Repository. This administrator will have complete rights on the EC site. This administrator will be responsible for setting security and adding users to EC.

Note: Since AVEVA Work Tasks executes activities in Transaction scope, there is a possibility for the Data Source Provider methods getting called with in a transaction. For the sample provided, there are no specific transaction scope used. The isolation level used for Transactions in AVEVA Work Tasks is read committed, so, if any other isolation level is used in the providers it could results in exceptions in Runtime. The Best practices are:

Do not use a separate transaction for querying user information.

Suppress the transaction if the user information is taken from an external object or source. Use the Transaction Scope option available in common functions for this.

```
using (System.Transactions.TransactionScope tScope =
Workflow.NET.CommonFunctions.GetSuppressedTransactionScope())
{
//Call to external object to get user information tScope.Complete();
}
```

SAMPLE CODE:

```
namespace CustomUserEntityDataSourceProvider
{
/// <summary>
/// Custom entity data source  provider which queries sql database table/view returning
user information.
/// </summary>
public class UserEntityDataSourceProvider : DataSourceProviderBase,
Skelta.Entity.UserEntityProvider.IUserEntityDataSourceProvider,
Skelta.Entity.IEntityAdminDataSourceProvider
{
private string sConnectionString;
private string sDataSourceType;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
private string sSourceTable;
private string sCols = "";
private Log log = null;
private string loginProperty = "";

public UserEntityDataSourceProvider() { }

/// <summary>
/// Gets called  while provider is initialized.
/// </summary>
/// <param name="settings">Definition XML configured for SKEntityDataSourceProvider
table.</param>

Configure Custom User Entity Data Source Provider

Configuring custom user entity data source provider involves entries in three tables of the Repository.

Table : SKAddInProviders , Object : Skelta.Core.AddInProvider

Table : SKEntity, Object : Skelta.Entity.Entity

Table : SKEntityDataSourceProvider, Object : Skelta.Entity.DataSourceProvider

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Add the assembly information of the user entity custom provider created, in the SKAddInProviders table

Provider type must be "UserDSProvider" and name should be any unique name. The newly added provider name must be again updated in the SKEntityDataSourceProvider table.

You can add an entry to SKAddInProviders table by using API or Database script. We have given both methods below, use any one of them and verify it using the query given in the verification topic

Using API

```
Skelta.Core.AddInProvider addInProvider = new Skelta.Core.AddInProvider(
new ApplicationObject("Sample Repository"));
addInProvider.Type = "UserDSProvider";
addInProvider.Name = "customsqlprovider";
#warning : Make sure to change the assembly  path
addInProvider.Description = "Sample Custom User Entity Data Source Provider";
addInProvider.ClassName =
 "CustomUserEntityDataSourceProvider.UserEntityDataSourceProvider";
addInProvider.AssemblyNameWithAbsoluteOrRelativePath =  @"M:\Michelle\
CustomUserEntityDataSourceProvider\
 CustomUserEntityDataSourceProvider\bin\Debug\CustomUserEntityDataSourceProvider.dll";
addInProvider.IsGacAssembly = false;
addInProvider.IsGlobal = true;
addInProvider.IsDefault = true; // The properties IsGacAssembly, IsGlobal, IsDefault  is
 //not currently in use. The value used in sample should be used "as is"
addInProvider.Save();
```

Using Script

```
INSERT INTO SKAddInProviders VALUES (newid(),'UserDSProvider','customsqlprovider',
'Sample Custom User Entity Data Source Provider','CustomUserEntityDataSourceProvider.
UserEntityDataSourceProvider','M:\Michelle\CustomUserEntityDataSourceProvider\
CustomUserEntityDataSourceProvider\bin\Debug\
CustomUserEntityDataSourceProvider.dll',null,0,1,1,getutcdate())
```

Note: Assembly path should be changed.

Verification

The above code creates an entry in SKAddInProviders table with type as 'UserDSProvider'.The entry in Repository DB can be verified in database by running the query select * from SKAddInProviders Where Name='customsqlprovider'

Column Name	Value
ID	Auto Generated
Type	UserDSProvider
Name	customsqlprovider
Description	Sample Custom User Entity Data Source Provider
ClassName	CustomUserEntityDataSourceProvider. UserEntityDataSourceProvider

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Column Name	Value
Assembly	M:\Michelle\ CustomUserEntityDataSourceProvider\ CustomUserEntityDataSourceProvider\ bin\Debug \CustomUserEntityDataSourceProvider.dll
IsGacAssembly	False
Isdefault	True
IsGlobal	True
LastUpdatedDataTime	Date time value

Adding entry to SKEntity and SKEntityDataSourceProvider

Steps:

Update the DefinitionXml column of SKEntity table with appropriate resource XML data for the newly created custom user entity provider that has been updated in the SKAddInProviders table.

Update the DefinitionXml column, Provider, Instance Name, Display Name for default entry of the List in SKEntityDataSourceProvider table with appropriate custom user entity data source provider entries.

To do the above steps, you can use API or Database script, both methods are given below, use any one of them.

The definition XML that has been used in the code,to update the DefinitionXml column of SKEntity and SKEntityDataSourceProvider table are given below for your reference.

Custom User Entity Data Source Provider Definition XML

```
<dataproviders>
<provider name="customsqlprovider" type="Custom Sql Provider">
<properties>
<property name="UserId" type="guid"  purpose="identifier" />
<property name="Name" type="string"  purpose="name"/>
<property name="Email"  type="string"  purpose="email"/>
<property name="Password" type="string"  purpose="password"/>
</properties>
<datasource>server=localhost;database=SkeltaUsers;uid=sa;pwd= XXXX</datasource>
<SourceTable>SqlUsers</SourceTable>
<loginproperty>Email</loginproperty>
</provider>
</dataproviders>
```

"provider" node has attribute name value set as customsqlprovider as this should match the Name column entry in SKAddInProvider.

As described in earlier sections, the purpose attributes identifier, name & email are mandatory.

Custom purpose named password is used to identify the column containing password info for authentication.

"datasource" node contains connection string information.

"SourceTable" node contains the table or view which contains user details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

"loginproperty" node provides information of the column which will be used as user name while logging in to the repository.

Custom Entity Definition XML

```
<entity type="user">
<properties>
<property name="UserId" type="string"  purpose="identifier" />
<property name="Name" type="string"  purpose="name"/>
<property name="Email"  type="string"  purpose="email"/>
</properties>
</entity>%%$#@@!!!*&
```

Contains properties which are mapped to user entity definition XML properties.

As described in earlier sections, the purpose attributes identifier, name and email are mandatory.

Using API for steps 1 & 2

```
Skelta.Core.ApplicationObject applicationObject = new Skelta.Core.ApplicationObject("Sample
Repository");
 Skelta.Entity.Entity entity = Skelta.Entity.Entity.GetEntity(applicationObject,
"UserEntity");
 string entityDefinitionXML  = "<entity type=\"user\">";
 entityDefinitionXML += "<properties>";
 entityDefinitionXML += "<property name=\"UserId\" type=\"string\"  purpose=\"identifier\"
/>";
 entityDefinitionXML += "<property name=\"Name\" type=\"string\"  purpose=\"name\"/>";
 entityDefinitionXML += "<property name=\"Email\"  type=\"string\"  purpose=\"email\"/>";
 entityDefinitionXML += "</properties>";
 entityDefinitionXML += "</entity>%%$#@@!!!*&";
 //Update default entity definition xml with matching xml for new  custom user entity data
source provider
entity.DefinitionXml = entityDefinitionXML;
entity.Save();

 Skelta.Entity.DataSourceProviderCollection entityDataSourceProvider = null;
entityDataSourceProvider = new
Skelta.Entity.DataSourceProviderCollection(applicationObject,entity.Id);
 //Entity user xml need to be changed based on the custom User table
#warning : Make sure to change the connection string
 string entityDataSourceProviderDefinitionXML = "<dataproviders>";
 entityDataSourceProviderDefinitionXML += "<provider name=\"customsqlprovider\"
type=\"Custom Sql Provider\">";
 entityDataSourceProviderDefinitionXML += "<properties>";
 entityDataSourceProviderDefinitionXML += "<property name=\"UserId\" type=\"guid\"
 purpose=\"identifier\"/>";
 entityDataSourceProviderDefinitionXML += "<property name=\"Name\" type=\"string\"
 purpose=\"name\"/>";
 entityDataSourceProviderDefinitionXML += "<property name=\"Email\"  type=\"string\"
 purpose=\"email\"/>";
 entityDataSourceProviderDefinitionXML += "<property name=\"Password\" type=\"string\"
 purpose=\"password\"/>";
 entityDataSourceProviderDefinitionXML += "</properties>";
 entityDataSourceProviderDefinitionXML +=
"<datasource>server=localhost;database=SkeltaUsers;uid=sa;pwd=XXXX</datasource>";
 entityDataSourceProviderDefinitionXML += "<SourceTable>SqlUsers</SourceTable>";
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 entityDataSourceProviderDefinitionXML += "<loginproperty>Email</loginproperty>";
 entityDataSourceProviderDefinitionXML += "</provider>";
 entityDataSourceProviderDefinitionXML += "</dataproviders>";
 entityDataSourceProvider .Items[0].DefinitionXml = entityDataSourceProviderDefinitionXML;
 //Custom provider name which is added in addinprovider table
 entityDataSourceProvider .Items[0].Provider = "customsqlprovider";
 entityDataSourceProvider .Items[0].InstanceName = "sqlproviderCustom";
 entityDataSourceProvider .Items[0].DisplayName = "Custom Provider";
 entityDataSourceProvider .Items[0].Entity = entity;
 // Update skelta list entry  with the custom entry in SKEntityDataSourceProvider for user
provider
entityDataSourceProvider.Items[0].Save();
```

The provider name value customsqlprovider should be same as the AddInProvider Name column value.

Using Table Entry for steps 1 & 2:

The definition XML for entity should be matching the properties for entity data source provider.

```
Update SKEntity Set DefinitionXML = '<entity type="user"><properties><property
name="UserId" type="string"  purpose="identifier" /><property name="Name" type="string"
 purpose="name"/><property name="Email"  type="string"
 purpose="email"/></properties></entity>%%$#@@!!!*&%%$#@@!!!*&'
Where Name = 'UserEntity'
```

Make sure to update the connection string information in definition XML with the appropriate value.
The provider column value should be the same as the name column value inserted in SKAddInProviders table.

Note: Also, ensure that the query given below updates the row for the List User Entity Data Source Provider and not the Role Entity Data Source Provider.

```
Update SKEntityDataSourceProvider Set DefinitionXML ='<dataproviders><provider
name="customsqlprovider" type="Custom Sql Provider"><properties><property name="UserId"
type="guid"  purpose="identifier"/><property name="Name" type="string"
 purpose="name"/><property name="Email"  type="string"  purpose="email"/><property
name="Password" type="string"
 purpose="password"/></properties><datasource>server=localhost;
database=SkeltaUsers;uid=sa;pwd=XXX</datasource><SourceTable>SqlUsers</SourceTable>
<loginproperty>Email</loginproperty></provider></dataproviders>',
DisplayName='Custom Provider', Provider='customsqlprovider',
InstanceName='sqlproviderCustom' Where DisplayName ='Skelta List' and EntityId=(Select Id
from SKEntity where Name='UserEntity')
```

Note: Connection string should be changed.

Verification

The above code creates an entry in SKEntity table. The entry in Repository DB can be verified in database by running the query select * from SKEntity Where Name='UserEntity'and Application='Sample Repository'

Column Name	Value
ID	Auto generated
MappingEntityId	Null
Application	Sample Repository
Name	User Entity

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Column Name	Value
Mapping Table	SKVirtualActor
DefinitionXML	<entity type="user"><properties><property name="UserId" type="string" purpose="identifier" /><property name="Name" type="string" purpose="name"/><property name="Email" type="string" purpose="email"/></properties></entity>%%$#@@!!!*&
AddInProviderId	Default AddInProviderId
LastUpdatedDateTime	Date time value

The above code creates an entry in SKEntityDataSourceProvider table. The entry in Repository DB can be verified in database by running the query select * from SKEntityDataSourceProvider Where DisplayName='Custom Provider'

Column Name	Value
ID	Auto generated
Application	Sample Repository
Entity ID	Copy the Id Column value of SKEntity of RoleEntity row here.
DisplayName	Custom Provider
DefinitionXML	<dataproviders> <provider name="customsqlprovider" type="Custom Sql Provider"><properties> <property name="UserId" type="guid" purpose="identifier"/> <property name="Name" type="string" purpose="name"/> <property name="Email" type="string" purpose="email"/> <property name="Password" type="string" purpose="password"/> </properties> <datasource>server=localhost;database=SkeltaUsers;uid=sa;pwd=XXX</datasource><SourceTable>SqlUsers</SourceTable><loginproperty>Email</loginproperty><

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Column Name	Value
	/provider></dataproviders>
Provider	customsqlprovider
Instance Name	sqlproviderCustom
LastUpdatedDateTime	Date time value

Verify whether the Custom User Entity Data Source Provider is configured correctly or not

Verification:

The above code updates the entries required for configuring Custom User Entity Data Source Provider. Now, we should be able to see the provider in Repository list page. The previous entry of "List" will be updated with "Custom Provider".

If you get a message "No Provider Available" in the repository list page, cross check the Logger Console for a detailed exception for the cause.

Check the calls made to the custom user entity data source provider.

If there is no exception then we could also create the Actor object API to check the calls made to the custom user entity data source provider.

DLL REFERENCE

Skelta.HWS

Workflow.NET.NET2

The parameters passed to the Actor object are application object & real user id. Real user id can be formed by prefixing provider instance name and special characters "::" to the unique identifier value of user. We have used UserId column value for Kevin.

	UserId	Name	Role	Email	Password
	e9d21049-e3cf-4f4d-9d51-036d0145c547	Michelle	Admin	michelle@skelta....	michelle
	c6a7170a-6a35-4f79-8688-150d0ac8fe15	Kevin	Developer	kevin@skelta.com	kevin
	ce24b3d0-21dc-4821-8d55-afe4c8581716	John	Developer	john@skelta.com	john
	9d3eebb3-ebbe-4415-9d18-df4205af5c46	Elaine	Product Manager	elaine@skelta.com	elaine

Sample code

```
Skelta.HWS.Actor actor = new Actor(new ApplicationObject("Sample Repository"),
"sqlproviderCustom::c6a7170a-6a35-4f79-8688-150d0ac8fe15");
object identifierValue = actor.Resource.Properties.Identifier.Value;
string Name = actor.Resource.Properties.Name.Value.ToString();
string Email = actor.Resource.Properties.Email.Value.ToString();
```

The above code also creates an entry to SKVirtualActor table, this can be checked using query. select * from SKVirtualActor Where Name='Kevin' .

Step 4: Create Default Admin for the Repository

The following example demonstrates the creation of default admin for the repository using API.

Create default admin for the repository:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

PROCEDURE

DLL REFERENCE

```
Skelta.CentralConfigCodeBehind.dll
Skelta.Forms.Core.dll
```

NAMESPACE USED:

```
Skelta.Forms.Core
Skelta.Forms.Core.Controls
Skelta.Repository.List
string repositoryName = "Sample Repository";
Skelta.Core.ApplicationObject applicationObject = new
Skelta.Core.ApplicationObject(repositoryName);
 //Create ListDefintion object
 Skelta.Repository.List.ListDefinition ld = new
Skelta.Repository.List.ListDefinition(applicationObject, "Security Group Mapping");
 //Create ListDatahandler object
 Skelta.Repository.List.ListDataHandler ldh = new

Skelta.Repository.Security.SecurityLevel.Repository;
 string _ApplicationName = repositoryName;
//Using entity infra to get the admin user from entity data source provider.
Skelta.Entity.Entity userEntity = Skelta.Entity.Entity.GetEntity(applicationObject,
"UserEntity");
object[] adminRealId =
((Skelta.Entity.IEntityAdminDataSourceProvider)userEntity.DataBridge.DataBridgeProviders["s
qlproviderCustom"]).GetAdministrator();
//Change the provider user details
Skelta.HWS.Actor actr = new Skelta.HWS.Actor(applicationObject, "sqlproviderCustom::" +
adminRealId[0]);
string UserId = actr.Id.ToString();
string UserName = actr.Resource.Properties.Name.Value.ToString();
//Create SecurityRightsHandler Object
Skelta.Repository.Security.SecurityRightsHandler srh = new
Skelta.Repository.Security.SecurityRightsHandler(repositoryName);
Workflow.NET.Interfaces.IDataHandler dbhandler =
Workflow.NET.Storage.DataHandlerFactory.GetDataHandler(ld.Configuration);
IDataParameter[] parametres = new IDataParameter[3];
IDataReader rdr = null;
using (dbhandler)
{
parametres[0] = dbhandler.GetParameter("@ApplicationName", _ApplicationName);
 parametres[1] = dbhandler.GetParameter("@SGId", SGID);
 parametres[2] = dbhandler.GetParameter("@UserId", new Guid(UserId));
 string strQuery = "Select * from " + ld.TableName + " Where Application=@ApplicationName
AND SecurityGroupId=@SGId AND UserId= @UserId";
 rdr = dbhandler.ExecuteReader(strQuery, parametres);
 if (rdr.Read())
 {
 if (rdr[0] != System.DBNull.Value)
IsalreadyMapped = true;
}
}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
if (rdr != null)
rdr.Close();
if (!IsalreadyMapped) //If user not configured as admin
{
using (TransactionScope TScope = Workflow.NET.CommonFunctions.GetNewTransactionScope())
{
Skelta.Repository.List.ListItem li = new Skelta.Repository.List.ListItem(ld);
ListMainForm listTableForm =
((ListMainForm)li.ListForm.Records[0].FindControlByID("_sys_sgm_form"));
((ListTextDataItem)listTableForm.FindControlByID("_sys_sgm_sgtitle")).Value =
_SecurityLevel.ToString(); //"Administrator";
 ((ListGuidDataItem)listTableForm.FindControlByID("_sys_sgm_sgid")).Value = SGID;
 ((ListGuidDataItem)listTableForm.FindControlByID("_sys_sgm_userid")).Value = UserId;
 ((ListGuidDataItem)listTableForm.FindControlByID("_sys_sgm_roleid")).Value = Guid.Empty;
 ((ListIntDataItem)listTableForm.FindControlByID("_sys_sgm_priority")).Value = 0;
 ((ListGuidDataItem)listTableForm.FindControlByID("_sys_sgm_mappedlistId")).Value =
Guid.Empty;
 ((ListGuidDataItem)listTableForm.FindControlByID("_sys_sgm_mappedlistitemid")).Value =
Guid.Empty;
 ((ListGuidDataItem)listTableForm.FindControlByID("_sys_sgm_effective_security_id")).Value
= Guid.Empty;
 ((ListGuidDataItem)listTableForm.FindControlByID("_sys_sgm_security_customization_id")).Va
lue = Guid.Empty;
li.Save(ListItemVersionStatus.Published);
TScope.Complete();
}
Skelta.CentralConfigCodeBehind.CommonFunctions commonFunctions = new
Skelta.CentralConfigCodeBehind.CommonFunctions();
commonFunctions.UpdateRespositoryPropetyCollection(repositoryName);
dbhandler = DataHandlerFactory.GetDataHandler(ld.Configuration);
using (dbhandler)
{
IDataParameter[] param = new IDataParameter[2];
param[0] = dbhandler.GetParameter("@UserId", new Guid(UserId));
param[1] = dbhandler.GetParameter("@Application", (DbType)System.Data.SqlDbType.VarChar,
50, ParameterDirection.Input, repositoryName);
dbhandler.ExecuteProcedure("USP_Update_UserId", param);
}
 }
```

Verification:

The above code created an Admin user with complete rights for the repository. The above code will also do an entry in SKVirtualActor table. The code would execute entity data source provider methods to get the required user information. Use this query to check the user entry in virtual actor table. select * from SKVirtualActor Where Name='Michelle'. The user named Michelle can now login to the EnterpriseConsole site using the email Id (since loginproperty for provider is set as Email) and check the menu.

- **Additional API to validate the API Entries**:

API to validate if entry already exists for Data Source, Repository and AddInProvider is listed below.

```
/// <summary>
/// To check if the data source to be created already exists
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
/// </summary>
/// <param name="DataSourceName">Name of the data source to be checked</param>
/// <returns></returns>
public static bool IsDataSourceExists(string DataSourceName)
{
Log SkeltaLog = new Log();
try
{
DataSourceCollection dsc = new DataSourceCollection();
if (dsc.Contains(DataSourceName))
{
return true;
}
else
{
SkeltaLog.LogInformation("Skelta on " + System.Net.Dns.GetHostName() + " does not contain "
+ DataSourceName + ".  Unable to find datasource.");
return false;
}
}
catch (Exception exception)
{
SkeltaLog.LogError(exception, "Error while getting repository details");
return false;
}
}
/// <summary>
/// To check if the repository exists.  Refer Skelta Log for Exceptions if any
/// </summary>
/// <param name="Repository"></param>
/// <returns>True if exists else false.  false even on exceptions</returns>
public static bool IsRepositoryExist(string Repository)
{
Log SkeltaLog = new Log();
try
{
RepositoryCollection rc = new RepositoryCollection();
if (rc.Contains(Repository))
{
return true;
}
else
{
return false;
}
}

return false;
}
}
/// <summary>
/// To check if the Provider with the given name for the repository exists
/// </summary>
/// <param name="RepositoryName">Name of the repository for which the configuration needs
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
to be added</param>
/// <param name="AddInProviderName">Name of the Add In Provider to be checked</param>
/// <returns>True if exists else false</returns>
public static bool IsProviderExists(string RepositoryName, string AddInProviderName)
{
Log SkeltaLog = new Log();
try
{
ApplicationObject applicationObject = new ApplicationObject(RepositoryName);
AddInProviderCollection skAddInProviderCollection = new
AddInProviderCollection(applicationObject);
return skAddInProviderCollection.Contains(AddInProviderName);
}
catch (Exception exception)
{
SkeltaLog.LogError(exception, "Error while getting provider details");
throw;
}
}
```

Step 5: Create Custom Role Entity Data Source Provider

The custom role entity provider fetches the role information from the same table "SqlUsers". The column Role in this table contains role information for a user.

The below configuration is mandatory for the Role Provider.

1. The EntityIdentifierType method should always return string as the user entity provider value type is always a string (Ex: "<Provider Instance Name>::<User Unique Identifier>").
2. The instance for User entity data source provider & Role entity data source provider should be same. The role provider does not exist by itself and is always mapped to a user provider. The users returned by the role needs to be mapped to a user provider to be used within AVEVA Work Tasks. Due to this behavior it's mandatory to have the providers having same instance name. For this sample the instance name used is "sqlproviderCustom".
3. The identifier type for Role provider is always string as the Role name itself is considered as unique identifier.

Skelta.Entity
System.Collections.Specialized
Workflow.NET.Storage
Skelta.Entity.RoleEntityProvider
System.IO
```

API Configuration

```
The Role Entity Data Source Provider should:
Inherit Skelta.Entity.DataSourceProviderBase class
```

Or

```
Implement Skelta.Entity.IEntityDataSourceProvider, Skelta.Core.ISkeltaAddInProvider
Implement interface Skelta.Entity.RoleEntityProvider.IRoleEntityDataSourceProvider
```

The only method which is accessed from IEntityDataSourceProvider for Role Provider is GetEntityItem (object entityId). Since there is no specific UI for role provider the other interface methods will be used for future release.

Skelta.Entity.RoleEntityProvider.IRoleEntityDataSourceProvider: The methods in this interface provide information related to Roles & Users related to each role.

Sample code

```
/// <summary>
/// Role entityt data source  provider.
/// </summary>
class RoleEntityDataSourceProvider : DataSourceProviderBase,
Skelta.Entity.RoleEntityProvider.IRoleEntityDataSourceProvider
{
  bool _IsConnectionValid = false;
  string _ConnectionString;
  string _ApplicationName;
  private Log logger = new Log();
#region IRoleEntityDataSourceProvider Members
  /// <summary>
  /// Repository  name.
  /// </summary>
  public string ApplicationName
{
  get
{
  return this._ApplicationName;
}
  set
{
  this._ApplicationName = value;
}
}
  /// <summary>
  /// Connection string for role provider
  /// </summary>
  public string ConnectionString
{
  get
{
  return this._ConnectionString;
}
  set
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
  this._ConnectionString = value;
}
}
  /// <summary>

- Configure Custom Role Entity Data Source Provider

Configuring custom role entity data source provider involves entries in two tables of the Repository

- Table : SKAddInProviders , Object : Skelta.Core.AddInProvider
- Table : SKEntityDataSourceProvider, Object : Skelta.Entity.DataSourceProvider

I. Adding Assembly information in SKAddInProvider table

```
API for Adding Role provider in SKAddInProvider table: Create an entry
in SKAddInProviders for the role provider.
ApplicationObject applicationObject = new ApplicationObject("Sample Repository");
 Skelta.Core.AddInProvider addInProvider = new
Skelta.Core.AddInProvider(applicationObject);
 addInProvider.Type = "Role";
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 addInProvider.Name = "customsqlroleprovider";
#warning : Make sure to change the assembly  path
 addInProvider.Description = "Sample Custom Role Entity Data Source Provider";
 addInProvider.ClassName =
"CustomUserEntityDataSourceProvider.RoleEntityDataSourceProvider";
 addInProvider.AssemblyNameWithAbsoluteOrRelativePath = @"M:\Michelle\
CustomUserEntityDataSourceProvider\CustomUserEntityDataSourceProvider\bin\Debug\
CustomUserEntityDataSourceProvider.dll";
 addInProvider.IsGacAssembly = false;
 addInProvider.IsGlobal = true;
 addInProvider.IsDefault = true; // The properties IsGacAssembly, IsGlobal, IsDefault  is
not currently in use. The value used in sample should be used "as is"
 addInProvider.Save();
```

Database script for adding Role provider in SKAddInProviders table

```
INSERT INTO SKAddInProviders VALUES (newid(),'Role','customsqlroleprovider','Sample Custom
Role Entity Data Source
Provider','CustomUserEntityDataSourceProvider.RoleEntityDataSourceProvider','M:\Michelle\
CustomUserEntityDataSourceProvider\CustomUserEntityDataSourceProvider\bin\Debug\
CustomUserEntityDataSourceProvider.dll',null,0,1,1,getutcdate())
```

Note: Assembly path should be changed.

Verification:

The above code creates an entry in SKAddInProviders table with type as Role. The entry in Repository DB can be verified in database by running the query select * from SKAddInProviders Where Name='customsqlroleprovider '

Column Name	Value
ID	Auto Generated
Type	Role
Name	customsqlroleprovider
Description	Sample Custom Role Entity Data Source
ClassName	CustomUserEntityDataSourceProvider. RoleEntityDataSourceProvider
Assembly	M:\Michelle\ CustomUserEntityDataSourceProvider\ CustomUserEntityDataSourceProvider\ bin\Debug \CustomUserEntityDataSourceProvider.dll
Settings	Null
IsGacAssembly	False
Isdefault	True
IsGlobal	True

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Column Name	Value
LastUpdatedDateTime	Date time value

II. Creating an Entry in SKEntityDataSourceProvider table

API for updating the List Role Provider with Custom Role Provider.

Update the role entry created for the list with custom role provider in SKEntityDataSourceProvider table.

```
Skelta.Entity.Entity entity = Skelta.Entity.Entity.GetEntity(applicationObject,
"RoleEntity");
Skelta.Entity.DataSourceProvider roleEntitySourceProvider = null;
roleEntitySourceProvider = new Skelta.Entity.DataSourceProvider(applicationObject,
"skeltalist");
 //Role entity definition
 string  roleProviderDefinitionXML = "";
 roleProviderDefinitionXML += "<dataproviders>";
 roleProviderDefinitionXML += "<provider name=\"customsqlprovider\" type=\"Custom Role
Provider\">";
 roleProviderDefinitionXML += "<properties>";
 roleProviderDefinitionXML += "<property name=\"Role\" type=\"string\"
purpose=\"identifier\"/>";
 roleProviderDefinitionXML += "<property name=\"RoleName\" type=\"string\" persist=\"true\"
persistcolumn=\"rolename\"/>";
 roleProviderDefinitionXML += "</properties>";
roleProviderDefinitionXML += "<datasource>server=localhost;database=SkeltaUsers;User
Id=sa;pwd=XXXX;</datasource>";
roleProviderDefinitionXML += "</provider>";
 roleProviderDefinitionXML += "</dataproviders>";
roleEntitySourceProvider.DefinitionXml = roleProviderDefinitionXML;
//Change the role provider name.
roleEntitySourceProvider.Provider = "customsqlroleprovider";
roleEntitySourceProvider.InstanceName = "sqlproviderCustom"; // Instance Name should be
same as the instance name set for the user provider.
roleEntitySourceProvider.DisplayName = "Custom Role Provider";
// adding an entry in SKEntityDataSourceProvider fro Role provider
roleEntitySourceProvider.Entity = entity;
roleEntitySourceProvider.Save();
```

Database script for updating the Skelta list Role Provider with Custom Role Provider.

Make sure to update the connection string information in the definition XML with appropriate value.
The provider column value should be same as the name column value inserted in SKAddInProviders table.

Note: Also, ensure that the query given below updates the row for the List Role Entity Data Source Provider and not the User Entity Data Source Provider.

//For Windows Authentication

```
Update SKEntityDataSourceProvider
Set
DefinitionXML =' <dataproviders><provider name="customsqlprovider" type="Custom Role
Provider"><properties><property name="Role" type="string" purpose="identifier"/><property
name="RoleName" type="string" persist="true" persistcolumn="rolename"/></properties>
<datasource>server=localhost; database=SkeltaUsers;Integrated
Security=true;</datasource></provider></dataproviders>',
DisplayName='Custom Role Provider',Provider='customsqlroleprovider',
InstanceName='sqlproviderCustom' Where InstanceName='skeltalist' and EntityId=(Select Id
from SKEntity where Name='RoleEntity')
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

//SQL SERVER Authentication

```
Update SKEntityDataSourceProvider
Set
DefinitionXML =' <dataproviders><provider name="customsqlprovider" type="Custom Role
Provider"><properties><property name="Role" type="string" purpose="identifier"/><property
name="RoleName" type="string" persist="true" persistcolumn="rolename"/></properties>
<datasource>server=localhost; database=SkeltaUsers;User
 Id=sa;pwd=XXXX;</datasource></provider></dataproviders>',
DisplayName='Custom Role Provider',Provider='customsqlroleprovider',
InstanceName='sqlproviderCustom' Where InstanceName='skeltalist' and EntityId=(Select Id
from SKEntity where Name='RoleEntity')
```

Note: Connection string should be changed.

The provider name value customsqlroleprovider should be same as the AddInProvider Name column value.

Verification:

The above code creates an entry in SKEntityDataSourceProvider table. The entry in Repository DB can be verified in database by running the query select * from SKEntityDataSourceProvider Where DisplayName='Custom Role Provider

Column Name	Value
ID	Auto generated
Application	Sample Repository
Entity ID	Copy the Id Column value of SKEntity of RoleEntity row here.
DisplayName	Custom Role Provider
DefinitionXML	<dataproviders><provider name="customsqlprovider" type="Custom Role Provider"><properties><property name="Role" type="string" purpose="identifier"/><property name="RoleName" type="string" persist="true" persistcolumn="rolename"/></properties> <datasource>server=localhost; database=SkeltaUsers;User Id=sa;pwd=XXXX;</datasource></provider></dataproviders>
Provider	customsqlroleprovider
Instance Name	sqlproviderCustom
LastUpdatedDateTime	Date Time Value

Verification:

Now we should be able to access role & respective user information from the role provider. Sample code to check role information is listed below.

```
AddInProviderCollection addInProviderCollection = new
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
AddInProviderCollection(applicationObject);
Dictionary<string, ISkeltaAddInProvider> addinProviders =
addInProviderCollection.GetProvidersForType(true, "Role");
ISkeltaRoleProvider iSkeltaRoleProvider;
//Addin provider added with  name as RoleProvider is the entity  provider and should be
 used to access the role entity data source provider.
 iSkeltaRoleProvider = (ISkeltaRoleProvider)addinProviders["RoleProvider"];
 iSkeltaRoleProvider.ApplicationName = "Sample Repository";
 string[] rolesCollection = iSkeltaRoleProvider.GetAllRoles();
 Dictionary<object,string> usersInRole =
iSkeltaRoleProvider.GetUsersInRole(rolesCollection[0]);
```

The above code displays all the roles configured.

```
Code below creates an entry in SkVirtualRole table.
//For each role, a virtual role id gets created which is used internally for reference
 with in AVEVA Work Tasks.
Skelta.Core.VirtualRole virtualRole = new VirtualRole(applicationObject);
 Guid virtualRoleId = virtualRole.GetVirtualRoleId(rolesCollection[0]);
The script below can be used to check the entries in respective tables.
select * from SKAddInProviders Where Name='customsqlprovider'
select * from SKEntityDataSourceProvider Where DisplayName='Custom Role Provider'
select * from SKVirtualRole where ResourceHandler='Sample Repository'
```

Custom Role Provider Fetching Roles from SQL and Users from Active Directory

Setup: Open a new .NET Class Library project, provide the namespace and class name for the project accordingly and add reference to "Workflow.NET.NET2.dll" from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder.

PROCEDURE

DLL REFERENCE

```
Workflow.NET.NET2
System.DirectoryServices
```

NAMESPACE USED

```
System
System.IO
System.Collections.Generic
System.Text
System.Collections
System.Collections.Specialized
System.Data
System.Xml
System.DirectoryServices
System.Security.Cryptography
System.Text.RegularExpressions
```

Sample Code

To support various type of Active Directory, you need to use appropriate APIs. Example, for RODC use ReadonlyServer authenticationType while creating instance of DirectoryEntry.

```
using Skelta.Core;
using Skelta.Entity;
using Skelta.Entity.RoleEntityProvider;

}
}
```

Table Configuration:

Roles Database:

The roles database used in this example, has a single table called Users, which uses a column "Role" to assign/ identify roles for the users.

Configuring custom roles involves entries in three tables of Skelta Repository database, namely:

1. SKAddInProviders
2. SKEntity

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. SKEntityDataSourceProvider

The order and the detailed steps of configuration is listed below:

In the SKAddInProvider insert a new record with the following field values:

Column Name	Value
ID	Auto Generated
Type	Roles
Name	Name for the Custom roles
Description	Any description / Null
ClassName	Name of the class implementing
Assembly	Path of the DLL built.
IsGacAssembly	False
Isdefault	False
LastUpdatedDateTime	Date time value

Example

```
Insert into SKAddInProviders
(Type,Name,Description,ClassName,Assembly,IsGacAssembly,Isdefault,LastUpdatedDateTime)VALUE
S('Role','NewRoles','try mapping','NewRoles.Roles','bin\NewRoles.dll','False','False','5/
12/2008 7:01:01 AM')
```

1. Open the SKEntity table. No entries are required. Copy the Entity table "Id" column value of the RoleEntity row , for the entry to be made in SKEntityDataSourceProvider table.
2. Open the SKEntityDataSourceProvider table, you will have a row with the default user provider "activedirectory". Now insert a new entry for our custom roles as defined.

Column	Value
ID	Auto generated
Application	Name of the Repository
Entity ID	Copy the Id Column value of SKEntity of RoleEntity row here.
DisplayName	Forms

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Column	Value
DefinitionXML	The definition xml should have details related to both sql provider and Active directory. for example, in the following definition xml the data source <dataproviders><provider name="sqlprovider" type="sql server"><properties><property name="role" type="string" displayname="Role" purpose="identifier"/></properties><datasource>Data Source=SKELTADTP38;Initial Catalog=DS3;Integrated Security=True</datasource><Preferences><SearchScope>SubTree</SearchScope><ReferralChasing>External</ReferralChasing><TimeOut>60</TimeOut><SizeLimit>0</SizeLimit><AuthenticationUser></AuthenticationUser><AuthenticationPassword></AuthenticationPassword></Preferences><LDAPServer>LDAP://</LDAPServer><LDAPSearchBase>DC=skelta,DC=dom</LDAPSearchBase><LDAPBaseFilter>(objectCategory=Person)</LDAPBaseFilter><DomainName>SKELTA\</DomainName></provider></dataproviders>
Provider	column must have the same name given in the "Name" column of SKAddInProviders table.
Instance Name	activedirectory

Example:

```
insert into
SKEntityDataSourceProvider(Application,EntityID,DisplayName,DefinitionXML,Provider,Instance
Name)
VALUES('ADSQLRep','69b60890-c24d-4ae5-8f03-cdd709a50d17','Forms','<dataproviders><provider
name="sqlprovider" type="sql server"><properties><property name="role" type="string"
displayname="Role" purpose="identifier"/></properties><datasource>Data
Source=SKELTADTP38;Initial Catalog=DS3;Integrated
Security=True</datasource><Preferences><SearchScope>SubTree</SearchScope><ReferralChasing>E
xternal</ReferralChasing><TimeOut>60</TimeOut><SizeLimit>0</SizeLimit><AuthenticationUser><
/AuthenticationUser><AuthenticationPassword
></AuthenticationPassword></Preferences><LDAPServer>LDAP://</LDAPServer><LDAPSearchBase>DC=
skelta,DC=dom</LDAPSearchBase><LDAPBaseFilter>(objectCategory=Person)</LDAPBaseFilter><Doma
inName>SKELTA\</DomainName></provider></dataproviders>','NewRoles','activedirectory').
```

- In the **SKEntityDatasourceProvider** table, every repository will have two entries. One with the display name "user provider name" for example, "activedirectory" and the other with the "user provider role" for example, "Active Directory role". Delete the row corresponding to the display name " Active Directory role". This is done to avoid the roles to be listed in the Enterprise Console from the active directory.

The Classes and Interfaces that need to be used to implement Custom Roles in AVEVA Work Tasks are:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. The Custom Roles Class has to be derived over "DataSourceProviderBase" part of Skelta.Entity namespace.
2. The Interface to be implemented by the Custom roles are:
   a. **IRoleEntityDataSourceProvider** – [Skelta.Entity.RoleEntityProvider]
   b. **ISkeltaAddInProvider** – [Skelta.Core]

Key Methods and Properties:

I**RoleEntityDataSourceProvider** Members

1. **public string IRoleEntityDataSourceProvider.EntityIdentifierType() -** This property returns the "identifier" type for the resources, which is "string" by default.
2. **void IRoleEntityDataSourceProvider.Initialize()** - This method is used to initialize the XML definition of the roles entity.

ISkeltaAddInProvider Members

1. **Guid ISkeltaAddInProvider.Id -** This property returns the AddInProviderId of the default role provider.
2. **void ISkeltaAddInProvider.InitializeProvider(string settings, Guid id) -** This method is used to initialize the provider.

DataSourceProviderBase Class Members

1. **public override void Initialize(string definitionXml)** - This method reads the XML definition.
2. **public override EntityItem GetEntityItem(object entityId)** - This returns the entity type, which is role and returns single property value.

After defining the methods and the properties as per the custom roles definition being used, build the project that generates <custom roles name>. DLL. This DLL needs to be now copied to the AVEVA Work Tasks bin folder.

Troubleshooting

You will get the "Object reference not set to an instance of an object" error when you try to open the Enterprise Console. One of the reason for this could be the access to the assembly path [that you have mentioned in the SKAddInProviders tables] is denied. To avoid this:

1. Copy the dll (NewRoles.dll) which you have created and put it in the folder where you have full access.
2. In SKAddInProviders table's Assembly column, update the assembly path.

Example:

1. If your dll is in C:\, then in the Assembly column of the SKAddInProviders table, update the url as C:\NewRoles.dll.
2. If your dll is in D:\Sample, then in the Assembly column of the SKAddInProviders table, update the url as D:\Sample\NewRoles.dll.

Associate Workflow to Scheduler Event

Overview

In business environment, based on a schedule, users might require triggering workflow daily at a particular time or particular day or particular month or last day of the month to launch a certain task to perform repeatedly. This can be achieved by associating Scheduler event provided by AVEVA Work Tasks in the Association page.

Example: A business process involved in the leave balance update. Assume that, this process update happens periodically on 25th of every month at 10 AM. This can be scheduled using the schedule workflow setup.

To schedule a workflow

1. Select **Workflows** from the **Enterprise Console** pull-down menu.
2. Select the workflow to be scheduled, and then click the **Associate** icon on the ribbon bar, or Create Associations in the context menu. The Association page appears.
3. Click **Scheduler** on the ribbon bar to schedule the workflow. The Scheduler association page appears.
4. Set **Start Date**, **End Date**, **Schedule Task**, and **Start Time**. You can schedule the task on a daily basis by using the Schedule Task Daily or schedule the task for reoccurrence using **Repeat Task** check box.
5. Select the option **Last day of the month(s)** to schedule the task on the last day of the selected month(s).
6. Provide **Version** of the workflow in **Workflow Details**. See Setting up a Schedule for more details.
7. Click **Attach Event** to schedule the workflow.

Set up a Schedule

The Scheduler has different options such as Start Date, End Date, Schedule Task, Start Time, Select Week Day, Monthly, Select Month, Last day of month(s), Repeat Task, and Workflow Details.

Note: No validation occurs when saving the association if the start time is earlier than the current time, requiring the user to manually enter a future date before saving.

Start Date

This option is for setting up the start date of period in which the scheduled workflow should be run.

Example: If you set Start Date as '01-04-2009' then the scheduled workflow will start getting triggered from '01-04-2009'.

End Date

This option is for setting up the end date of period in which the scheduled workflow should be stop running.

Example: If you set the End Date as '31-03-2010' then the scheduled workflow will stop running on '31-03-2010'.

Schedule Task

This option is for setting up a schedule for Daily/Weekly/Monthly basis. Workflow execution will be based on this setup also option to set the start time using the Start Time.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Daily

Set the schedule on a daily basis. On selecting Daily from the Schedule Task drop-down, the Schedule Task Daily option will be displayed. Here, specify the number of days in the Every text box to execute the task on a specified day.

Example: Every day, every 2 days or once every 5th day.

Weekly

This option is for scheduling the task on weekly basis. On select of Weekly from Schedule Task drop-down, the Schedule Task Weekly will be displayed. Here specify the week in the Every text box to execute the task on specified week. You can schedule the task on particular day of the specified week. You can select the day by clicking Select WeekDay button.

Example: Every 1st week, every 3rd week, every Wednesday of 2nd week or All days of 4th week.

Select WeekDay

On click of Select WeekDay the Select Week Day window is displayed. Here you can select day by checking the specific day or days. You can select all days by checking All option.

Monthly

This option is for scheduling the task on monthly basis. On select of **Monthly** from **Schedule Task** drop-down, the **Schedule Task Monthly** will be displayed. Here specify the month in the Every text box to execute the task on specified month. You can schedule the task on particular day of the specified month. You can select the month by clicking **Select Month**.

Select Month

On click of Select Month the Select Months window is displayed. Here you can select month by checking the specific month or months. You can select all month by checking All option.

Last day of month(s)

This option is for scheduling the task on the last day of the selected months.

Example: If you select February month, the task will be scheduled on 28th of February or 29th of February (if leap year). Similarly, if you select January month, the task will be scheduled on 31st of January.

Repeat Task

Repeat Task option is for setting up reoccurrences. Schedule can set for repeat on minute basis or hourly basis. Repeat can be such as every 1 minute/every 1 hour.

Workflow Details

Workflow details selection is for selecting a particular version of the workflow. If not selected the latest version will be considered.

Edit Scheduler Association

You can change the scheduled execution time of the workflow or any event using **Edit Scheduler Association** option.

To edit scheduler association

1. Select **Workflows** from the **Enterprise Console** pull-down menu.
2. Right-click the workflow whose schedule is to be changed, and then select **Edit Scheduler Association**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

option in the context menu. The Edit Scheduler Association page appears.

3. Set **Start Date**, **End Date**, **Schedule Task**, and **Start Time**. You can schedule the task on a daily basis by using the Schedule Task Daily or schedule the task for re-occurrence using **Repeat Task** check box.

Note: It is not recommended to give 1 minute time interval for repeat task.

4. Select the option **Last day of the month(s)** to schedule the task on the last day of the selected month(s).
5. Provide **Version** of the workflow in **Workflow Details**. See Setting up a Schedule for more details.
6. Click **Update Event** to reschedule the workflow.

Example of Scheduling Tasks Using Scheduler Event

Consider a scenario where you have already created a workflow and want to execute the workflow every day on an hourly basis during 15th June 2009 to 30th June 2009.

To achieve the same, follow the given steps:

1. Log on to the **Enterprise Console**.
2. From the **Enterprise Console** pull-down menu, select **Workflows**.
3. Design and publish a workflow.
4. Select this workflow and then select **Associate** from the ribbon bar, or select **Create Association** from the context menu.
5. Click **Scheduler** to schedule workflow to run.
6. Select **Start Date**.
7. Select **End Date**.
8. Select **Daily** from **Schedule Task** drop-down list.
9. In the **Schedule Task Daily** section, enter '1' in the **Every** text box.
10. Check **Repeat Task**. In this section, enter '1' in the **Every** text box and Hours from drop-down list.
11. In the **Workflow Details** section, select Latest from the Version drop-down list.
12. Click **Attach Event**. A confirmation window appears.
13. Click **OK**.
14. To check whether workflow is triggered or not on specified duration, select **Inbox** from the **Enterprise Console** Menu button.

Manage Work Items

In AVEVA Work Tasks, you can manage work items by forwarding them to other users, or by aborting them.

Forward Work Items to Other Users

You can forward work items to other users.

Only user who have rights to forward a work item (**Can Forward Work Item** right should be checked) to other users will be able to view this menu item.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To forward work items to other users

1. Log on to the **Enterprise Console**.
2. From the **Enterprise Console** pull-down menu, select **Tools** > **Manage Work items**. The **Manage Work items** page appears. In this page all work items will be displayed in the grid. It also displays the information about work items which are assigned to different users within the application.
3. Select the required work item(s) to forward to different user, and click **Forward**. Alternatively, select **Forward** from the context menu. The **Manage Work item(s)** window appears.
4. Select the required user from the **User Lookup** window. The selected user will be populated.

   Note: Select only one user at a time to forward work item(s).
5. Click **Forward**. The selected work item gets assigned to the selected user and same will be updated in the grid.

Abort Work Items

User can also abort (kill) the work items in the Manage Work items. To kill the work items, the logged-in user should have the permission to kill the work items. For this, the Can Kill Work Item right should be checked.

To abort (kill) the work item, follow the given steps

1. Log on to the **Enterprise Console**.
2. From the **Enterprise Console** pull-down menu, select **Tools > Manage Work items**. The **Manage Work items** page appears.

   In this page all work items will be displayed in the grid. It also displays the information about work items which are assigned to different users within the application.
3. Select the required work item(s) to abort and then click **Abort** (top right corner), or select **Abort** from the context menu.

   Note: You can select multiple work items at a time by selecting check box in the grid.
4. On click of **Abort**, a confirmation message appears.
5. Click **Yes**.

Add New Tab and Custom Logic to Process Execution View

AVEVA Work Tasks allows users to create new tab and custom logic in the Process Execution View window.

To add a new tab and custom logic to the 'Process Execution View' pop-up window, follow the steps given below:

1. Open the following aspx page:
   BPMUITemplates\Default\ProcessExecutionView\ExecutionView.aspx
2. Make the modification which are marked in bold:

```
<radTS:RadTabStrip ID="RadTabStrip1" runat="server" Skin="SkeltaTabstrip"
CssClass="TabRadTabstrip"
OnClientTabSelected="ProcessTabClick" SelectedIndex="0">
<tabs>
<radTS:Tab ID="Tab1" runat="server" Text="Analysts View"  Value="tab3"  >
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
   </radTS:Tab>
   <radTS:Tab ID="Tab2" runat="server" Text="Progress view" Value="tab2">
   </radTS:Tab>
   <radTS:Tab ID="Tab3" runat="server" Text="Execution view" Value="tab1">
   </radTS:Tab>
   //Add the below line to create a new tab called Custom View in Execution view.
   <radTS:Tab ID="Tab4" runat="server" Text="Custom view" Value="tab4">
   </radTS:Tab>
   </tabs>
   </radTS:RadTabStrip>
   </div>

   <script>
    function ProcessTabClick(sender, eventArgs)
   {
   LoadReport(eventArgs.Tab.Value.substr(3,1));
   }

   function LoadReport(name)
   {
   _skLoadedReport = name;

   var uri="";
   switch(name)
   {
   //Case 4 is added to illustrate the example of adding a custom page to the  newly
   created tab
    //For the sake of example the custom page is also given as the analyst view. Change
   this file and point to the file in which custom logic is implemented
     case "4":
   uri="<%=HttpUtility.UrlEncode(_BaseControl.GetSecuredUriParameter(Workflow.NET.Report
   .WorkflowExecutionReportTypes.AnalystsView))%>";break;
   case "3":
   uri="<%=HttpUtility.UrlEncode(_BaseControl.GetSecuredUriParameter(Workflow.NET.Report
   .WorkflowExecutionReportTypes.AnalystsView))%>";break;
   case "2":
   uri="<%=HttpUtility.UrlEncode(_BaseControl.GetSecuredUriParameter(Workflow.NET.Report
   .WorkflowExecutionReportTypes.ProgressView))%>";break;
   case "1":
   uri="<%=HttpUtility.UrlEncode(_BaseControl.GetSecuredUriParameter(Workflow.NET.Report
   .WorkflowExecutionReportTypes.ExecutionView))%>";break;
}
```

3. You can see a **Custom View** tab in the Process Execution Window.
4. In the same way, you can add a new tab in the 'BPMUITemplates\Default\ProcessExecutionView\ ExecutionDetailsWindow.aspx' page (refer to the code given below) and custom logic in new url.

```
   <div id='tabstrip1' style="width: 100%;background-color:white;">
    <radTS:RadTabStrip ID="RadTabStrip1" runat="server"
    Skin="SkeltaTabstrip"  OnClientTabSelected="ProcessTabClick" SelectedIndex="0">
    <Tabs>
   <radTS:Tab runat="server" Text="Step Details" Value="step">
   </radTS:Tab>
   <radTS:Tab runat="server" Text="Variables" Value="variable">
   </radTS:Tab>
   <radTS:Tab runat="server" Text="Contents" Value="contents">
   </radTS:Tab>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<radTS:Tab runat="server" Text="Content" Value="content">
</radTS:Tab>
//Add the below line to create a new tab called Custom View in Execution Details
view.
//change should be made in the scripts to accept the new "value" created. For the
sake of example, now the value is given same as that of "variable"
 <radTS:Tab ID="Tab1" runat="server" Text="Custom View" Value="variable">
</radTS:Tab>

</Tabs>
</radTS:RadTabStrip>
</div>
```

After adding the above mentioned code to the aspx file, a **Custom View** tab pears in the Execution details window.

Customize the 'Step Details' Window

AVEVA Work Tasks allows you to customize the 'Step Details' window.

The following customization can be done in the 'Step Details' window:

1. Hide Step Details, Variables, Contents and Content tabs.
2. Localize the Description content.
3. Customize the look and feel of this window.

Steps to hide the Step Details, Variables, Content and Contents tabs:

1. Open the following aspx page from AVEVA Work Tasks installed folder. *\Web\BPMUITemplates\Default\ProcessExecutionView\ExecutionDetailsWindow.aspx*
2. Locate the following code and set the property **visible="false"** for the required tab to be hidden. For example, to hide **Step Details** tab, set **Visible** property as **false** for this tab.

```
<div id='tabstrip1' style="width: 100%;background-color:white;">
        <radTS:RadTabStrip ID="RadTabStrip1" runat="server"  Visible="false"
    Skin="SkeltaTabstrip"   OnClientTabSelected="ProcessTabClick" SelectedIndex="0">
            <Tabs>
                <radTS:Tab runat="server" visible="false" Text="Step Details" Value="step">
                </radTS:Tab>
                <radTS:Tab runat="server" Text="Variables" Value="variable">
                </radTS:Tab>
                <radTS:Tab runat="server" Text="Contents" Value="contents">
                </radTS:Tab>
                <radTS:Tab runat="server" Text="Content" Value="content">
                </radTS:Tab>

            </Tabs>
        </radTS:RadTabStrip>
    </div>
```

3. Control the page details. If you do not want to show tab details, then control it by editing the following methods.
   a. **ProcessTabClick** - This method will open the details of the clicked node.
   b. **ShowDetails** - This method will open the 'Step Details' window.
   c. **ShowVariables** - This method will open the 'Variables', 'Contents', 'Content' windows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
function ProcessTabClick(sender, eventArgs)
{
    if( eventArgs.Tab.Value=="step" ) ShowDetails();
    if( eventArgs.Tab.Value=="variable") ShowVariables("variables");
    if( eventArgs.Tab.Value=="contents") ShowVariables("contents");
    if( eventArgs.Tab.Value=="content") ShowVariables("content");
}

function ShowDetails()
{
    var l=window.location.toString();
     l=l.replace("executiondetailswindow.aspx","executiondetails.aspx");
     document.getElementById('framecontent').src = l;
}

function ShowVariables(displayMode)
{
    var l=window.location.toString();
     l=l.replace("executiondetailswindow.aspx","ShowVariablesAndContents.aspx");
     l+="&dm="+displayMode;
     document.getElementById('framecontent').src = l;

}
```

To Localize the description content, follow the steps given below:

1. Locate the *WorkflowElements\Default\en-US\Actions\XML* folder from AVEVA Work Tasks installed folder.
2. All the step details associated with any action will be from the respective Action definition from the Actions.xml file.

Note: Before modifying, take a backup of **Actions.xml** files. While modifying the **Actions.xml**, one should not modify the placeholders declared.

In order to modify the step description, you need to change the following description in the Actions.xml

```
- <action name="Start" hidden="true" helptemplate="StartActivity1.html" helptemplatewinheight="450" helptemplatewinwidth="600">
    <description>Workflow process starting point, Holds configuration for Global Variables,Local Variables,Content Expressions
      and Workflow synchronization mode.</description>
    <image resourcename="start-action.png" />
    <handler classname="ActionStartHandler" />
  - <visual-attributes>
      <shape>circle</shape>
      <backcolor>lightgreen</backcolor>
      <imagevisible>hidden</imagevisible>
    </visual-attributes>
  - <report rendertype="xsl" xsl="ActionDescription.xsl">
      <handler class="Workflow.NET.Report.ReportHandler" assembly="Bin\Workflow.NET.ReportHandler.NET2.dll" />
    - <messages>
      - <message id="ActionStarted">
        - <![CDATA[
                                        Start Action was initiated at <script
            language='javascript'>WriteClientTime('<%#EventTime%>',1);</script>.

          ]]>
        </message>
      </messages>
    </report>
  - <properties>
    - <property name="Variables" type="grid" helpstring="Variables declared at Workflow Level. Global variables can be used to
        get/set data across actions at workflow level. Local variables can be declared by prefixing '@' symbol to the variable
        name. Local variables can be used to get/set data at action level." helptemplate="Start-Variables.html"
        helptemplatewinheight="450" helptemplatewinwidth="600">
```

To customize the look and feel of the window, follow the steps given below:

Open the *BPMUITemplates\Default\Common\StyleSheet\Global.css* from AVEVA Work Tasks installed folder to customize the look and feel of the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For more details on the css class and the images, please go through the following files:

1. BPMUITemplates\Default\ProcessExecutionView\ShowVariablesAndContents.aspx
2. BPMUITemplates\Default\ProcessExecutionView\ ExecutionDetailsWindow.aspx

Customization

The following features can be customized in AVEVA Work Tasks:

- User interface
- Font
- Work item control

Customize User Interfaces

AVEVA Work Tasks now provides a new style sheet named **Global.css**, consisting of around 100 styles which are commonly used by most of the controls.

Other user interface customization options include customizing the **Farm Configuration Wizard**, and the **Enterprise Console Menu**.

Style Sheets

Overview

Earlier, most of the controls followed styles sheets of its own and sometimes even jumbled. Some controls had even multiple style sheets under their respective folders. Adding to that, some pages had even inline styles. So, changing the style was a Herculean tasks. Also, the changes might not reflect some times, because of the multiple existence of same class.

Now, customizing the UI styles as per your choice is no more a hectic task. Not more than 100 styles to be changed to give a look as per your desire.

AVEVA Work Tasks introduced a new style sheet named Global.css consisting around 100 styles is added and is commonly used by most of the controls. Around 40 style sheet files are removed which were used by individual controls. Same is applicable to Themes folders.

New common style sheet for all controls:

1. BPMUITemplates\Default\Common\StyleSheet\Global.css
2. The following style sheets are removed:
3. BPMUITemplates\Default\BAM\Stylesheet\global.css
4. BPMUITemplates\Default\Common\StyleSheet\common.css
5. BPMUITemplates\Default\Common\StyleSheet\DecisonsStyle.css
6. BPMUITemplates\Default\Common\StyleSheet\global1.css

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. BPMUITemplates\Default\Common\StyleSheet\NewStyleforWorkitemControl.css
8. BPMUITemplates\Default\Common\StyleSheet\report.css
9. BPMUITemplates\Default\Common\StyleSheet\SchemaDefinition.css
10. BPMUITemplates\Default\Common\StyleSheet\workflowdotnet.css
11. BPMUITemplates\Default\en-US\StyleSheet\calender.css
12. BPMUITemplates\Default\en-US\StyleSheet\common.css
13. BPMUITemplates\Default\en-US\StyleSheet\global.css
14. BPMUITemplates\Default\en-US\StyleSheet\workflowdotnet.css
15. BPMUITemplates\Default\Expression\Stylesheet\pd.css
16. BPMUITemplates\Default\Expression\Stylesheet\properties.css
17. BPMUITemplates\Default\Expression\Stylesheet\StyleDefault.css
18. BPMUITemplates\Default\HWS\Stylesheet\global.css
19. BPMUITemplates\Default\ProcessExecutionView\Stylesheet\common.css
20. BPMUITemplates\Default\ProcessExecutionView\Stylesheet\global.css
21. BPMUITemplates\Default\ProcessExecutionView\Stylesheet\properties.css
22. BPMUITemplates\Default\ProcessExecutionView\Stylesheet\varandcontents.css
23. BPMUITemplates\Default\ProcessExecutionView\Stylesheet\wer.css
24. BPMUITemplates\Default\ProcessExecutionView\Stylesheet\workflowdotnet.css
25. BPMUITemplates\Default\Repository\ListControl\Styles\Style.css
26. BPMUITemplates\Default\Repository\Site\styles\ApplicationStyles.css
27. BPMUITemplates\Default\Repository\Site\styles\template-wizard.css
28. BPMUITemplates\Default\Repository\Site\styles\aquila.css
29. BPMUITemplates\Default\SOA\SOA.css
30. BPMUITemplates\Default\StyleSheet\calender.css
31. BPMUITemplates\Default\StyleSheet\common.css
32. BPMUITemplates\Default\StyleSheet\global.css
33. BPMUITemplates\Default\StyleSheet\workflowdotnet.css
34. BPMUITemplates\Default\StyleSheet\global1.css

Exceptional case:

Though most of the customization happens by changing the Global.css, some controls like Process Designer control, Forms control still refers to some of the style sheets under respective folders. You need to change the styles in the style sheets listed below for complete customization.

1. BPMUITemplates\Default\ProcessDesigner\Menu\mainmenu.css
2. BPMUITemplates\Default\ProcessDesigner\Menu\menu.css
3. BPMUITemplates\Default\ProcessDesigner\Stylesheet\global.css
4. BPMUITemplates\Default\ProcessDesigner\Stylesheet\pd.css
5. BPMUITemplates\Default\ProcessDesigner\Stylesheet\properties.css
6. BPMUITemplates\Default\ProcessDesigner\Stylesheet\SchemaDefinition.css

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. BPMUITemplates\Default\ProcessDesigner\toolbar\Graphics\Graphics.css
8. BPMUITemplates\Default\SkeltaForms\StyleSheet\Designer.css
9. BPMUITemplates\Default\SkeltaForms\StyleSheet\menustyles.css
10. BPMUITemplates\Default\SkeltaForms\StyleSheet\SkeltaForm.css

Customize Farm Configuration Wizard User Interface

The background image and other images of Farm Configuration Wizard can be changed.

To do so, add the following keys in HKEY_LOCAL_MACHINE\SOFTWARE\SkeltaSilentInstallation\

- ConfigPopUpWizardImage – For setting popup background images in the Wizard.
- ConfigWizardSmallImage – For setting the background image of main screens but note that some of the screens have a smaller top bar like the Services screen.
- ConfigWizardImage – Background image of main screens like the Welcome screen.

Customize Enterprise Console Menu

Enterprise Console menu appears on the left hand side of the enterprise console website and is used to navigate through various AVEVA Work Tasks controls.

If the Repository is mapped to themes, then take the style sheet based on themes path. The themes path is as follows:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\Default\CommonUXControls\StyleSheet\UXControls.css

If the Repository is not mapped to themes, then take the style sheet from the following path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\CommonUXControls\StyleSheet\UXControls.css

- CSS Class Used for Main Menu Style is #Menu0.
- CSS Class Used for Title is #Menu0 .menuItem .title.
- CSS Class Used for Mouse hover on the Main Menu item is #Menu0 .menuItem:hover.
- CSS Class Used for Selected item on Main menu is #Menu0 .menuItem.selected

Style Change for Submenu

- CSS Class Used for submenu style is .SubMenu.
- CSS Class Used for submenu Title is .SubMenu .menuItem .title
- CSS Class Used for submenu Description is .SubMenu .menuItem .desc
- CSS Class used for submenu MenuItem Indicator is .SubMenu .menuItem .subMenuIndicator
- CSS Class used for submenu Menu Item hover and selected is .SubMenu .menuItem:hover, .SubMenu .menuItem.selected

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Customize Fonts

The primary font used in the Enterprise Console and Central Configuration sites is the Roboto font. This font is available in *BPMUITemplates/Default/Common/Fonts*.

Perform the following steps if you have customized the default stylesheet CSS file or added a custom stylesheet CSS file.

1. Include the font face for the Roboto font in the CSS files with corresponding relative path to the downloaded Roboto fonts folder.

   Ensure that the relative path refers to the folder in which the stylesheet CSS file is available. By default, the Roboto fonts folder is available in *BPMUITemplates/Default/Common/Fonts.*

   The following sample illustrates how to include the Roboto font in the customized stylesheet file.

   ```
   @font-face {
   font-family: "Roboto";
   src: url("../../../../Common/fonts/Roboto/Roboto-Regular.ttf") format("truetype");
   }
   @font-face {
   font-family: "Roboto";
   font-weight: bold;
   font-style: italic;
   src: url("../../../../Common/fonts/Roboto/Roboto-BoldItalic.ttf") format("truetype");
   }
   @font-face {
   font-family: "Roboto";
   font-style: italic;
   src: url("../../../../Common/fonts/Roboto/Roboto-italic.ttf") format("truetype");
   }
   @font-face {
   font-family: "Roboto";
   font-weight: bold;
   src: url("../../../../Common/fonts/Roboto/Roboto-Bold.ttf") format("truetype");
   }
   ```

2. Use the Roboto font in the stylesheet classes.

   For example: `font-family: "Roboto", "Segoe UI"`

Customize Work Item Control

To customize the Work Item Control, you need to navigate to the installed Path i.e.

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\web\BPMUITemplates\Default\WorkItemList\UserControls\WorkItemControl.ascx.

There are two sections in the Work Item Control:

1. Grid Left Menu. See Customizing Left Menu Grid for more details.
2. Grid Details View. See Customizing Grid Details View for more details.

To customize Control, do the following:

1. Go to *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Common\StyleSheet*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Open the Global.css file.
3. You can customize the UI by making change in the specified styles which are present in Global.css.

Customize Left Menu Grid

The Left Menu Grid basically lists the name of the workflow which has been triggered.

To customize the Left Menu Grid of the Work item Control, follow the steps given below:

1. Open *WorkItemControl.ascx* page from the *BPMUITemplates\Default\Workitemlist\UserControls* folder.
2. You can find the Style Sheet in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\BPMUITemplates\Default\Common\StyleSheet\Global.css*
3. Search for the Web Grid, where id="grdLeftMenu". [This is the Grid Left Menu ID].

To change background Color

1. You can change the background image of the Grid Left Menu by making changes in the **FrameStyle** tag of the Grid Left Menu.
2. Make the following changes in the attribute **BackgroundImage** of the **FrameStyle** tag by changing the existing image:

```
<FrameStyle  BorderWidth="0px" BorderStyle="Solid" BackgroundImage="<%$
ReplaceTemplateExpn:default/WorkItemList/Images/title-bgNew.png%>"  ></FrameStyle>
```

To change the selected row style

1. You can change the selected rowstyle of the Grid Left Menu by making change in the SelectedRowStyle tag of the Grid Left Menu.

```
<SelectedRowStyle  CssClass="GridSelectedRowStyle">
```

2. Search for **GridSelectedRowStyle** in Global.css file and then make the following changes:

```
.GridSelectedRowStyle {
border-width:1px;
font-family:"Segoe UI", "Trebuchet MS";
font-size:8pt;
border-style:solid;
background-color:Red;
border-color:#ACA899;
color:#363636;
}
```

Customize Grid Details View

To customize the Grid Details View, search for Web Grid where id="WebGrid1". It uses two stylesheets which are in the following path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Common\StyleSheet\Global.css

The following can be customized in the Grid Details View:

- Changing Header Style and Background Image
- Changing the color of the selected row style

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Changing the background color of the Frame
- Changing footer style of the Grid Details View

To change Header Style

To change the Header style of the Grid Details View, follow the steps given below:

- Open the Global.css file. You can find it at the following location:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Common\StyleSheet\Global.css

- To change the background image of the header, change the attribute BackgroundImage in the Css Class GridHeaderStyle tag.

```
<HeaderStyle Wrap="false" Overflow="hidden" OverflowX="hidden" OverflowY="hidden"
CssClass="GridHeaderStyle"></HeaderStyle>
.GridHeaderStyle
{
font-size:8pt;
font-family:"Segoe UI", "Trebuchet MS";
border-color:#e1e1e1;
border-style:solid;
color:#363636;
background-image:url(../images/grid-title-bg.png);
height:20px;
background-color:#e3efff;
border-width:1px;
}
```

- Header color can be altered by making change in the GridHeaderStyle class in the Global.css file.

```
GridHeaderStyle
{
font-size:8pt;
font-family:"Segoe UI", "Trebuchet MS";
border-color:#e1e1e1;
border-style:solid;
color:Red;
background-image:url(../images/grid-title-bg.png);
height:20px;
background-color:#e3efff;
border-width:1px;
}
```

Changing the color of the selected row style

- To alter the color of the selected row style, you need to make change in the SelectedRowStyle tag.
- Change the color attributes in the class GridSelectedRowStyle in the Global.css file.

```
<SelectedRowStyle CssClass="GridSelectedRowStyle"></SelectedRowStyle>
.GridSelectedRowStyle {
border-width:1px;
font-family:"Segoe UI", "Trebuchet MS";
font-size:8pt;
border-style:solid;
background-color:#e1eeff;
border-color:#ACA899;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
color:#363636;
}
```

Changing the background color of the Frame

- To change the background color of the frame, change the attribute of colors in the GridFrameStyle class in Global.Css file.

```
<FrameStyle GradientType="Vertical" CssClass="GridFrameStyle"></FrameStyle>
.GridFrameStyle{
font-size:8pt;
font-family:"Segoe UI", "Trebuchet MS";
color:#363636;
border-style:solid;
border-width:1px;
border-color:#9ac6ff;
background-color:#FFFFFF;
}
```

Changing the footer style of the Grid Details View

- We can change the color of the Status bar by changing the CSSClass GridStatusBarStyle.

```
.GridStatusBarStyle
{
font-size:8pt;
font-family:"Segoe UI", "Trebuchet MS";
color:#363636;
background-color:#e4e4e4;
border-width:1px;
border-style:solid;
border-color:#ACA899;
}
```

- Change the color attributes in the GridStatusBarStyle CSSClass in the Global.Css file..

```
<StatusBarStyle CssClass="GridStatusBarStyle">
<Padding Top="2px" Left="2px" Bottom="2px" Right="2px"></Padding>
</StatusBarStyle>
```

Change Height and Width of the Grid Details View

To modify the height and width of the Grid Details View:

Change **height** and width attribute of the **table** tag. For example, change height as 50%. This will reduce the height of the grid.

```
<td vAlign="top" id="GridDetailsTD">
<table height="50%" width="100%" class="TableFont" border="0"  cellpadding="0"
cellspacing="0">
```

Change Font Style Based on the Status of the Work Item

Font Style of the item can be changed in the Work Item list based on the different status or states. You need to make changes in the global.css style sheet.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- When the task is in **Normal** state that is if there is nothing to act on that activity then all those activities fonts are kept under .WLNormal tag. For example, if it is Information activity, change background color as red.
- Do the following change in the .WLNormal tag

```
.WLNormal
{
 background-color:Red;
 font-size:7pt;
 font-family:Segoe UI,Verdana;
 font-weight:normal;
      }
```

- You can change the background color, when the task is in **Awaiting** state. For example, when the task is in **Awaiting** state, change the background color as green.
- Do the following change in the .WLAwaiting tag:

```
.WLAwaiting
{
 font-size:7pt;
 font-family:Segoe UI,Verdana;
 font-weight:300;
 background-color:Green;
}
```

- You can change the background color, when the task is in Planned state. For example, when the task is in Planned state from queue, change the background color as aqua.
- Do the following change in the .WLPlannedQueueItem tag.

```
.WLPlannedQueueItem
{
 font-size:7pt;
 font-family:Segoe UI,Verdana;
 font-weight:normal;
 background-color:Aqua;
}
```

- You can change the background color, when the task is in **Hold** state. For example, when the task is in Hold state, change the background color to Blue.
- Do the following change in the .WLHold tag.

```
.WLHold
{
 font-size:7pt;
 font-family:Verdana;
 font-weight:normal;
 background-color:Blue;
}
```

Add or Remove Images

You can add or remove images in the toolbar. These images are present in:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\web\BPMUITemplates\Default\WorkItemList\toolbar\Graphics\img path.

To add a new image to the toolbar:

- Add the following line of code in LoadToolBar() method and based on the user requirement, call the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

javascript method to call the Custom page. For example, add a new Refresh image in the toolbar.

```
RadToolbarButton refreshButton = new RadToolbarButton();
refreshButton.CommandName = "Refresh";
refreshButton.ButtonImage = "refresh.png";
refreshButton.Attributes.Add("onclick", "javascript:Callrefresh('" + applicationName
+ "','" + Actor.Id + "');");
refreshButton.ToolTip = _WorkItemControl.GlobalResourceSet.GetString("Refresh");
refreshButton.ID = "tbrefreshbutton";
toolbar.Items.Add(refreshButton);
```

Remove an Image from the Toolbar

To remove an image from the toolbar:

- For example, if you want to remove the Show Queue image from the toolbar, remove the following line of code from the LoadToolBar() method:

```
RadToolbarButton showQueueButton = new RadToolbarButton();
showQueueButton.CommandName = "Show Queue";
showQueueButton.ButtonImage = "show-queue.png";
showQueueButton.Attributes.Add("onclick", "javascript:CallQueue('" + applicationName
+ "','" + Actor.Id + "');");
showQueueButton.ToolTip = _WorkItemControl.GlobalResourceSet.GetString("Show queue");
showQueueButton.ID = "tbshowqueuebutton";
toolbar.Items.Add(showQueueButton);
```

Customize User Name

To customize the user name appearing on the top-right corner, follow the steps given below:

1. If you want to change the caption work item list, search for the following line of code in the NewKeysBPM.txt locale file. This file is present in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Locales\en-US\NewKeysBPM.txt*.

```
<td align="right" width="80%"
class="LoginName"><%=_WorkItemControl.GlobalResourceSet.GetString("Workitem list
of")%> <%=CurrentLoggedUserName%>  </td>
```

2. Change the text Work Item list of to Welcome

```
<td align="right" width="80%"
class="LoginName"><%=_WorkItemControl.GlobalResourceSet.GetString("Welcome")%>
<%=CurrentLoggedUserName%>  </td>
```

Customize Document View

To enable or disable Take Ownership option from the Work Item detail view

1. To disable Take Ownership drop-down while viewing an item from the work item detail view, navigate to the path *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\web\BPMUITemplates\Default\WorkItemList\UserControls\ActivityUIDropDownControl.ascx*.
2. Search for asp:dropdownlist where ID="SelectCommonActionType" and then change Visible attribute to false

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

in the drop-down and also you can hide the Go button visibility.

```
<asp:DropDownList runat=server CssClass="select" ID="SelectCommonActionType"
Visible="false">
 </asp:DropDownList>
<input type="submit" Class="button2" name="ButtonGo" value=" <%=strbtnGo%> "
onclick="return Go_Submit()" style="visibility:hidden;"/>
```

To change the background color of the Comments section

1. To change the background color of any activity, navigate to the path *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Activities\Activity*.
   For example, Approval activity, select the ApprovalUI.htm file from the below path *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Activities\Activity\ApprovalUI.htm*
2. Change the bgcolor attribute of the TD tag to change the Comments section to the specified color.

   <TD bgcolor="#ececec" VALIGN="TOP"> // Change bgcolor="Red"

To change the Custom Default View

To change the custom default view, navigate to the CustomDocViewDefault.html page.

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Activities\Activity\CustomDocViewDefault.html and make change based on the requirements.

Themes

AVEVA Work Tasks supports **themes** that you can use to change the look and feel of the user interface. AVEVA Work Tasks provides **Default** and **Lite** themes. While creating a repository, ensure that the theme name specified in the **Theme Name** text box, in the **Manage Repository** page of the **Central Configuration**, is present in the following install path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\web\BPMUITemplates\Default\Themes

Apply Theme to the Core Product

You can apply themes to the core product by enabling the **Enable Theme** option available in the **Manage Repository** page of the **Central Configuration**.

To apply theme at repository level

1. Log on to the **Central Configuration**.
2. Click **Repository Settings**. The **Repository List** page appears.
3. Click **Add**. The **Manage Repository** page appears.
4. Enter the **Repository Name** and **Description**.
5. Check the **Enable Theme** check box. By default, the theme name is **Default**. If you want to apply **Lite** theme, then you can specify theme name as **Lite** in the **Theme Name** text box.
6. Click **OK**. The theme gets applied to the created repository.
7. To verify, log on to the **Enterprise Console**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note:

- You can also change themes by clicking on the existing repository and then enable the themes option in the **Manage Repository** page.
- Ensure that the theme name entered or created is not present in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\XMLSchemas\MappedThemes.xml* file.
- Ensure that the theme name specified in the **Theme Name** text box is present in the following install path: *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\web\BPMUITemplates\Default\Themes*
- If a repository is created with old themes supported in 2017 releases, like blue, the theme is always redirected to the **Default** theme.

Themes in Work Item Control

Work Item Control has the following two sections:

- **Grid Left Menu**: Lists the name of the workflow which is been triggered.
- **Grid Details View**: Shows the details of that item.

Work Item Control uses the following two style sheets:

- If theme is not applied, then all the css paths are considered from the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Default\Common\StyleSheet\global.css*.
- If theme is applied, then selected then the css path from the theme folder directory structure are considered.

For example, if you select **Default** theme, then Work Item Control takes the css path from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\Default\Common\StyleSheet\global.css*.

If you select the theme as Lite, then Work Item Control takes the css from the path *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\ BPMUITemplates\Default\Themes\Lite\Common\StyleSheet\ global.css*.

Apply Themes in Grid Left Menu

Grid Left Menu

For Left Grid Style, the following CSS classes are used:

- LeftGridFrameStyle
- LeftGridRowStyle
- LeftGridSelectedRowStyle

Apply Themes in Grid Details View

Grid details view in Default and Lite Theme

For Right Grid Style, the following CSS classes are used:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- GridHeaderStyle
- GridFrameStyle
- GridSelectedRowStyle

Themes in Calendar Control

Calendar Control consists of the following three main grids:

The first grid lists all the calendars that the user has created. There is a *main Calendar and Child Calendar*. The *Child Calendar inherits* from the *main Calendar*.

Header Style

Header style of the main grid of Calendar control uses the stylesheet class **GridHeaderStyle**.

If theme is not applied, then it takes all the css path from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Common\StyleSheet\global.css*.

If the theme is applied, then it takes the css path from the theme folder directory structure.

For example, if you select the Default theme, then the Calendar Control takes the css path from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\Default\Common\StyleSheet\ global.css*.

Default Theme Image

```
<HeaderStyle CssClass="GridHeaderStyle" >
</HeaderStyle>
```

Frame Style

You can set the background image of the frame style of the main page grid by making change in the background image of the frame style.

Sample Code

```
<FrameStyle GradientType="Vertical" CssClass="GridFrameStyle" >
</FrameStyle>
```

Themes in Queue Control

Queue Control consists of four WebGrids. These WebGrids are present in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\HWS\QueueControl.ascx* page in the HWS folder.

The Queue Control refers to the following stylesheet:

If theme is not applied, then it take all the css path from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Common\StyleSheet\global.css*.

If theme is selected, then it takes the css path from the theme folder directory structure.

For example, if you select the **Default** theme, then Queue Control takes the css path from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\Default\Common\StyleSheet\ global.css*.

In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Queue Management**. The **Queue Management** window appears. The window displays the list of queues in a web grid with **Id = _WebGridQueEdit**.

The following parts of the queue that can be customized:

1. Header Style
2. Frame Style

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. RadTabStrip
4. Worklist layout
5. Legend Table

Header Style

Header style of the main grid of the Calendar Control uses the stylesheet class GridHeaderStyle.

Sample Code

```
<HeaderStyle CssClass="GridHeaderStyle">
</HeaderStyle>
```

Lite Theme Image

Frame Style

You can set the background of the frame style of the main page grid by making change in the background color attribute of the GridFrameStyle.

Sample Code

```
<FrameStyle GradientType="Vertical" CssClass="GridFrameStyle">
</FrameStyle>
```

RadTabStrip

The rad tab strip with ID RadTabStrip1 consists of the following four tabs:

1. Participants
2. Settings
3. Dispatch Pattern
4. Escalation

Worklist Layout

The Worklist layout WebGrid is available in the **Queue Preference** panel of the **Settings** tab. This page is available in the following path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\WorkItemList\UserControls\WorkListLayout.ascx

Themes in Process Designer Control

The menu bar in the Process Designer can be personalized using the following procedure:

Menu Bar

The **MenuPD** refers to the following path:

- **No theme is applied**: *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\telerik\RadControls\Menu\Skins\SkeltaMenuPD*
- **Default Theme**: *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\ Default\Themes\default\telerik\RadControls\Menu\Skins\SkeltaMenuPD*

Tool Bar

The **Toolbar** refers to the following path:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **No theme is applied**: *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\telerik\RadControls\Toolbar\Skins\SkeltaToolbar*
- **Default Theme**: *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\default\telerik\RadControls*

Footer

The Footer refers to the following path:

- **No theme is applied**: *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\ProcessDesigner\Graphics\PD-footer-bg.png*
- **Default Theme**: *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\ Default\Themes\default\ProcessDesigner\Graphics\PD-footer-bg.png*

The style sheet, Pd.css is available in the following paths:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\Default\ProcessDesigner\Stylesheet\pd.css

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\Default\Common\StyleSheet\global.css

Activities Title

The style sheet classes used are sktoolboxwindow and sk_toolbox_category.

Splitter

The style sheet classes used are pdtoolboxanchor.

Change Style of New Menu in Enterprise Console

If the Repository is mapped to themes, then take the style sheet based on themes path. The themes path is as follows:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\Default\CommonUXControls\StyleSheet\UXControls.css

- CSS Class Used for Main Menu Style is #Menu0.
- CSS Class Used for Title is #Menu0 .menuItem .title.
- CSS Class Used for Mouse hover on the Main Menu item is #Menu0 .menuItem:hover.
- CSS Class Used for Selected item on Main menu is #Menu0 .menuItem.selected

Style Change for Submenu

- CSS Class Used for submenu style is .SubMenu.
- CSS Class Used for submenu Title is .SubMenu .menuItem .title
- CSS Class Used for submenu Description is .SubMenu .menuItem .desc
- CSS Class used for submenu MenuItem Indicator is .SubMenu .menuItem .subMenuIndicator
- CSS Class used for submenu Menu Item hover and selected is .SubMenu .menuItem:hover, .SubMenu .menuItem.selected

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Change Style of Action Bar in Lists

If the Repository is mapped to themes, then take the style sheet based on themes path. The themes path is as follows:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\Default\CommonUXControls\StyleSheet\UXControls.css

- CSS Class Used for ActionBar style is .actionBar.
- CSS Class Used for ActionBar Menu Item are
  - actionBar .menuItem .content .name, actionBar .menuItem:hover .icon,
  - actionBar .menuItem:hover .name, actionBar .menuItem .content .icon
- CSS Class Used for ActionBar SubMenu Item is actionBar .subMenu, .actionBar .subSubMenu

Change Style of Window

If the Repository is mapped to themes, then take the style sheet based on themes path. The themes path is as follows:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\Default\telerik\RadControls\Window\Skins\SkeltaWindow\Window.css

- CSS Class Used for Window Title is RadWTitleRow

Change Style of Buttons

If the Repository is mapped to themes, then take the style sheet based on themes path. The themes path is as follows:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\Default\Common\StyleSheet\Global.css

CSS Class Used for button classes are:

```
inputbutton
button,[buttonsecondary-skbtn="submit"]
button,[buttoninputgo-skbtn="submit"]
inputsecondarybutton
input[type="button"]:disabled
input[type="button"]:disabled:hover
input[type="submit"]:disabled
input[type="submit"]:disabled:hover
input[type="button"]:hover
input[type="submit"]:hover
```

Content Handler

Content Handler is used to access application specific data inside a workflow. Content Handlers can be used at the repository level and also at the workflow level. Use this content variable to access application values in the custom table.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Use Content Handler

Content Handler is used to access application specific data inside a workflow. Content Handlers can be used at the repository level and also at the workflow level. Using this content variable we can access application values in the custom table.

We will see the steps to implement a content handler.

- Create a table in the database with the following script.

```
USE [DBName]
GO
/****** Object:  Table [dbo].[LeaveApplications]  Script Date: 03/29/2010 20:03:58
******/
SET ANSI_NULLS ON
GO
SET QUOTED_IDENTIFIER ON
GO
CREATE TABLE [dbo].[LeaveApplications](
 [LeaveApplicationID] [int] NOT NULL,
 [UserID] [int] NULL,
 [FromDate] [datetime] NULL,
 [ToDate] [datetime] NULL,
 [NoOfDays] [int] NULL,
 [LeaveType] [int] NULL,
 [Reason] [int] NULL,
 [ApplicationDate] [int] NULL,
 CONSTRAINT [PK_LeaveApplications] PRIMARY KEY CLUSTERED
(
 [LeaveApplicationID] ASC
)WITH (PAD_INDEX  = OFF, STATISTICS_NORECOMPUTE  = OFF, IGNORE_DUP_KEY = OFF,
ALLOW_ROW_LOCKS  = ON, ALLOW_PAGE_LOCKS  = ON) ON [PRIMARY]
) ON [PRIMARY]
```

Add few rows of data for the created table.

- Steps to create **Repository level content Handler**

An entry in the SKAddInProviders table is required for the content handler. Execute the following query for the repository database.

There will be already an entry for Provider Name IContentHandler by default which we can update and use for our specific example. Updating the entry with condition, provider name = IcontentHandler is sufficient in this example. Change the database name, tablename and security settings as required in the below query.

```
update  SKAddInProviders
set [Settings]='<content><datasource type="sql
server">server=Localhost;database=TestRepo;Integrated
Security=true</datasource><tables><table name="LeaveApplications"><fields><field
name="LeaveApplicationID" type="int" canUpdate="false" identifier="true"
contentName="leaveapplicationid"/><field name="UserID" type="int" canUpdate="false"
contentName="userid" /><field name="FromDate" type="datetime" canUpdate="false"
contentName="fromdate"/><field name="ToDate" type="datetime" canUpdate="false"
contentName="todate"/><field name="NoOfDays" type="int" canUpdate="false"
contentName="noofdays"/><field name="LeaveType" type="int" canUpdate="false"
contentName="leavetype"/><field name="Reason" type="int" canUpdate="false"
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
contentName="reason"/><field name="ApplicationDate" type="int" canUpdate="false"
contentName="applicationdate"/></fields><filter><![CDATA[LeaveApplicationID=<%#Variable.Lea
veApplicationId%>]]></filter></table></tables></content>',
IsGlobal='True'
where name='IContentHandler'
```

- Steps to create Repository level content Handler when the user's database is a part of the Repository.

An entry in the SKAddInProviders table is required for the content handler. Execute the following query for the repository database.There will be already an entry for Provider Name IContentHandler by default which we can update and use for our specific example. Updating the entry with condition, provider name = IcontentHandler is sufficient in this example. Since the database is a part of the Repository, the user need not use the previous code sample, but use the sample given below. In this sample you can see that instead of the connection string, the UseRepositoryConnectionString="yes" code is used.

```
update SKAddInProviders
set [Settings]='<content UseRepositoryConnectionString="yes"><tables><table
name="LeaveApplications"><fields><field name="LeaveApplicationID" type="int"
canUpdate="false" identifier="true" contentName="leaveapplicationid"/><field name="UserID"
type="int" canUpdate="false" contentName="userid" /><field name="FromDate" type="datetime"
canUpdate="false" contentName="fromdate"/><field name="ToDate" type="datetime"
canUpdate="false" contentName="todate"/><field name="NoOfDays" type="int" canUpdate="false"
contentName="noofdays"/><field name="LeaveType" type="int" canUpdate="false"
contentName="leavetype"/><field name="Reason" type="int" canUpdate="false"
contentName="reason"/><field name="ApplicationDate" type="int" canUpdate="false"
contentName="applicationdate"/></fields><filter><![CDATA[LeaveApplicationID=<%#Variable.Lea
veApplicationId%>]]></filter></table></tables></content>',
IsGlobal='True'
where Name='IContentHandler'
```

The defined entry will be inserted in the SKAddInProviders table after the successful execution of the above query.

- Isglobal property decides whether the content handler will be available for the whole repository or not. If set to true, the handler will be available for the whole repository. If the Content handler has to be made available only for a specific workflow, then set IsGlobal Property as False and make an entry in the SKAddInProviderSettings
- Steps to create WorkFlow level content Handler

This step has to be done only if the content handler is for a specific workflow. Delete the 'settings' column entry from the Content Handler and make it "Null"

Set the IsGlobal property as false in SKAddInProviders.

Make the following entry in the SKAddInProviderSettings table. Change the reponame, workflow name and the AddInProviderID(Id of the AddInProvider in the SKAddInProviders table) from the below query as required.

```
insert into SKAddInProviderSettings
(Application,Workflow,AddInProviderID,Settings,IsDefault)
values
('RepoName','WorkFlowName','a8edae68-420f-450d-8df2-6a5b31389207','<?xml version="1.0"
encoding="utf-8" ?><content><datasource type="sql
server">server=localhost;database=TestRepo;Integrated
Security=true</datasource><tables><table name="LeaveApplications"><fields><field
name="LeaveApplicationID" type="int" canUpdate="false" identifier="true"
contentName="leaveapplicationid"/><field name="UserID" type="int" canUpdate="false"
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
contentName="userid" /><field name="FromDate" type="datetime" canUpdate="false"
contentName="fromdate"/><field name="ToDate" type="datetime" canUpdate="false"
contentName="todate"/><field name="NoOfDays" type="int" canUpdate="false"
contentName="noofdays"/><field name="LeaveType" type="int" canUpdate="false"
contentName="leavetype"/><field name="Reason" type="int" canUpdate="false"
contentName="reason"/><field name="ApplicationDate" type="int" canUpdate="false"
contentName="applicationdate"/></fields><filter><![CDATA[LeaveApplicationID=<%#Variable.Lea
veApplicationId%>]]></filter></table></tables></content>','True')
```

- Create a new workflow in the repository with a variable as the same name as of the FillterCondition set above (LeaveApplicationID in this example).

The whole XML file which can be used to import the below WF is given here. Import and make the necessary changes. Create another content variable which takes value from the client object which is calling the workflow.

//test is used here as we are using the following code to execute the workflow.

objClient.Execute(provider + "::" + virtualUserId, "<test>" + 10001 + "</test>");

10001 is one of the LeaveApplicationId in the table.

Use an update variable to set the value of the content variable to the Variable created.

Create a new Approval Activity on the "updated" link of the update activity with subject field as the from date in the Content Variable.

Publish and run the workflow using Client Object.Execute method. Pass the LeaveApplicationId along with it as shown below

objClient.Execute(provider + "::" + virtualUserId, "<test>" + 10001 + "</test>");

- Go to the Inbox and you should be able to find an Approval activity with "from date" of the leave application as subject.

The Content Handler has been successfully implemented for the default dll.

XML to Import WF which Implements Custom Content Handler

Use Custom Content Handler

AVEVA Work Tasks allows us to create custom content handlers which can be used for fetching data to workflow in custom logic.

To implements Custom Content Handler

1. Create a Class Library Project. Code for the sample custom Class Library
2. Compile and put the dll in the AVEVA Work Tasks Bin folder.
3. The entry for default content handler will be already there in the SKAddInProviders table. Rename the 'Name' field of the specific entry from 'IContentHandler' to some other name.
4. Make the following entry in the SKAddInProviders table in the repository database.

   ```
   INSERT INTO [SKAddInProviders]
   (Type,[Name],[ClassName],[Assembly],[Settings],[IsGacAssembly])
   VALUES('ContentHandler','IContentHandler','CustomContentHandler.DatabaseContentHandle
   r',bin\CustomContentHandler.dll','',0)
   ```
5. Follow the steps in Using Default Content Handler which will successfully create the Custom Content handler.

Code Sample - Custom Content Handler Class File

```
using System;
using System.Web.Caching;
using System.Collections;
using System.Xml;
using System.Xml.XPath;
using System.IO;
using System.Data;
using System.Text.RegularExpressions;
using Workflow.NET.Interfaces;
using Workflow.NET;
using Workflow.NET.Engine.Interfaces;
using Workflow.NET.Storage;
using Skelta.Core;
using Workflow.NET.Engine;
namespace CustomContentHandler
{

```

Persist Logged Exceptions to Database

When the workflow is triggered or when the user submits the activity, or when the workflow engine sends an alert about an activity, the action may fail and thus also the workflow. It becomes necessary for the users to understand the main cause for the failure of the workflow so that they can modify/handle it and thus improve the process life cycle.

In the previous version of the AVEVA Work Tasks product, exceptions were stored in the log file, logged to the Event Viewer and sending an email based on the configuration. However, to troubleshoot any issue, it was more difficult for users to track the exact exception message, based on the Execution ID (say).

To help the users to trace the exact exception message, all the exceptions and warnings can be persisted in the database. So, the users can now see all the exceptions occurred for that workflow by selecting the "View Exceptions" from the workflow item context menu. This pops up a window which lists all the exceptions occurred for that particular workflow.

Enable Exception Persistence

To enable the persistence of exceptions and warnings into the database so that all these can be viewed from **View Exceptions**, do the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Go to **Farm Configuration** wizard.
2. Click **Service Settings**. The **Service Settings** dialog box appears.
3. Click **Global Settings**, and then select Log/Transaction tab.
4. Select the correct values to enable the persistence of exceptions and warnings.

Different Views for Viewing the Exceptions

There are three view options for viewing exceptions:

- Workflow level
- Instance level exception
- Workflow action step level

Workflow Level

There are three different ways to know all the exceptions occurred.

Workflow level

Right-click the workflow item, and then select the **View Exceptions** option. The **Exception Details** page appears. This page lists all the exceptions that has occurred for the workflow and all the exceptions that has occurred for different workflow instances.

Note:
- For the Quickflows, the **Exception Details** page will not show the values for **ExecutionDetailsID** field.
- For the Quickflows containing Child Quickflows, the **Exception Details** page will not show the values for **ExecutionID** field.

Instance Level Exception

You can view the instance level exceptions from the BAM reports.

1. Go to **Enterprise Console** menu, and then click **Reports**.
   The **Business Activity Monitoring** page appears.
2. Click **Analyze**, click **Transaction**, and then click **Failed**.
   Details of **All Workflows Executed** with Errors appear on the right pane.
3. Double-click an item to open.
4. Click the **View Exceptions** tab to see all the exceptions that has occurred for the particular workflow instance.

Workflow Action Step Level

You can view the workflow action step level exceptions from the BAM reports.

1. Go to **Enterprise Console** menu, and then click Reports.
   The **Business Activity Monitoring** page appears.
2. Click **Analyze**, click **Transaction**, and then click **Failed**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Details of **All Workflows Executed with Errors** appear on the right pane.

3. Double-click an item to open.

   You can see the workflow processes from **Analyst View**, **Progress View**, or **Execution View** in the dialog box that appears.

4. Click any tab, and then double-click the failed activity.

   You can see the details of the particular activity in the dialog box that appears.

5. Click the **View Exceptions** tab to see all the exceptions that has occurred for the particular workflow instance.

AVEVA Work Tasks Pro Application

AVEVA Work Tasks Pro is a premium mobile application for AVEVA Work Tasks. It is designed for business professionals who use a mobile phone or a tablet device to access the app while on the move. AVEVA Work Tasks Pro can view and act on tasks, fill the form that initiates a process, and submit forms offline, among other capabilities.

Custom Conflict Management

For the Fill Forms submission, there is no conflict management by default. However, there is a basic conflict management for work items such as **Approval Activity** and **Invoke Form Activity**. The user can customize this by creating a conflict management component and registering the same in the **SKAddinProviders** table under the repository database.

Perform the following steps to create a custom conflict management component.

1. Create a .NET Class library project.
2. Refer the **SE.Bpm.ConflictHandler.dll**.
3. Create a class which implements the **IConflictHandler** interface. This interface has the following methods:
   - **ValidateWorkItem** – When this function is implemented, it validates the work item being submitted.
   - **ValidateFillForm** – When this function is implemented, it validates the Fill Form being submitted.
   - **ResolveWorkItem** – When this function is implemented, it resolves the work item, if there is a conflict.
   - **ResolveFillForm** – When this function is implemented, it resolves the Fill Form, if there is conflict.
   - **CanResolve** – When this property is implemented, it has a value indicating when the conflict can be resolved.
   - **CanContinue** – When this property is implemented, it has a value indicating whether the process (submission of work items or Fill Forms) can continue even if there is a conflict.
4. Build the component.
5. Place the component in a path, which is accessible to the Workflow Engine Service and Enterprise Console web application.
6. Provide the class name and the dll path in the **SKAddinProviders** table in the repository database.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Providers for Controls

AVEVA Work Tasks supports providers of different types that deliver the basic functionality for the Controls. The following list describes the providers:

- **Channel Provider**: Used to configure channels.
- **Form Provider**: Used to configure forms.
- **Push Dispatch Provider**: Used to configure the push-type (automatic) dispatch pattern in Queues.
- **Pull Dispatch Provider**: Used to configure the pull-type (automatic) dispatch pattern in Queues.
- **Work hour Provider**: Used to configure calendars.
- **XML Storage Provider**: Used to configure the XML Variables.
- **UserEntity**: Used to configure the entity provider.
- **UserDSProvider**: Used to configure the entity Data Source Provider.
- **ContentHandler**: Used to configure the Content Handler provider.
- **Wizard**: Used to configure the Wizard provider.

AVEVA Work Tasks provides ready-to-use providers, out-of-the-box for all the seven types it supports. In addition, AVEVA Work Tasks provides the infrastructure to build different types of custom providers.

Provider Type	Namespace	Interface
Role Provider	Skelta.Core Skelta.Entity	ISkeltaRoleProvider IRoleEntityProvider ISkeltaAddInProvider IRoleEntityDataSourceProvider
Channel Provider	Skelta.HWS.WorkListChannel	IWorkListChannel
Form Provider	Skelta.HWS.WorkListChannel	IWorkItemForm
Push Dispatch Provider	Skelta.HWS.Queue	IPushDispatchProvider
Pull Dispatch Provider	Skelta.HWS.Queue	IPullDispatchProvider
Work hour Provider	Skelta.HWS.Calendar	IWorkHoursProvider
XML Storage Provider	Workflow.NET.Interfaces	IXmlStorageType
User Entity	Skelta.Entity.UserEntityProvider	ISkeltaAddInProvider IEntityProvider IUserEntityProvider
UserDSProvider	Workflow.NET Skelta.Entity	IEntityDataSourceProvider IUserEntityDataSourceProvider
Contenthandler	Workflow.NET	IContentHandler

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Provider Type	Namespace	Interface
Wizard	Workflow.NET	-

Creating Custom Providers

You can create your own custom providers by implementing the respective interface along with the ISkeltaAddInProvider interface available under the Skelta.Core namespace.

The following code shows a typical implementation of a custom provider:

```
using Skelta.Core;
namespace myApp.myRoleProvider
{
public class myRoleProvider : ISkeltaRoleProvider, ISkeltaAddInProvider
{
// Implementation of ISkeltaRoleProvider Members
// Implementation of ISkeltaAddInProvider Members
}
}
```

The custom provider should be registered in the SKAddInProviders table for AVEVA Work Tasks to recognize it and offer the desired runtime functionality.

Column Name	Type	Description
Id	Guid	Unique ID of the provider.
Type	nvarchar(20)	Type identification of provider.
Name	nvarchar(100)	Provider name.
Description	nvarchar(150)	Provider description.
ClassName	nvarchar(200)	Class Name implementing the interface.
Assembly	nvarchar(500)	Assembly name with relative or complete file system path.
Settings	nvarchar(max)	Configuration settings known the provider.
IsGacAssembly	bit	Determines assembly resides in Global Assembly Cache.
IsDefault	bit	Determines if the value is default.
IsGlobal	bit	Determines if the value is global.

The settings column is used to store specific settings required for the providers functionality. That is, the provider can access the settings stored in this column and perform the desired routine. The providers ID and settings are

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

available as properties through the ISkeltaAddInProvider interface implementation.

If the provider requires settings for each application or workflow, the provider registration should also happen in the SKAddInProvidersSettings table.

Use the following query to register the Provider in the SKAddInProviders table:

```
INSERT INTO
[SKAddInProviders]([Type],[Name],[Description],[ClassName],[Assembly],[Settings],[IsGacAsse
mbly],[LastUpdatedDatetime]) VALUES (Provider,<your Provider name>,<your Provider
description>,<your project name(which contains YourProvider.cs)>,<location of your project
dll (which contains YourProvider.cs)> ,'' ,0,getdate())
```

The structure of this table supports the storing of an application or a workflow as shown below.

Column Name	Type	Description
Id	Guid	Unique ID of the settings.
Application	nvarchar(50)	Application name
Workflow	nvarchar(50)	Workflow name.
AddInProviderId	Guid	Provider ID.
Settings	nvarchar(max)	Configuration settings known to the provider.
IsDefault	bit	Determines if the value is default.

The provider infrastructure tries to look for any specific settings of the matching application or workflow, and returns the value accordingly, when the Settings property is accessed.

Option to Disable Logging of Strings

You use this feature to control the string messages that are logged into the logger files without making any change to the debug level.

Debug Level: The number of messages getting displayed in the logger console varies based on the Debug level set in the Farm Configuration Wizard.

1. Open the **Farm Configuration** Wizard.
2. Click **Next**.
3. Select **Service Settings**, and then select **Global Settings**.
4. Select **Log/Transaction** tab. Here you can select the **Debug** level from the drop-down list.

   To know more about setting debug level, see *Prerequisites* section in the *Administrator Guide*.

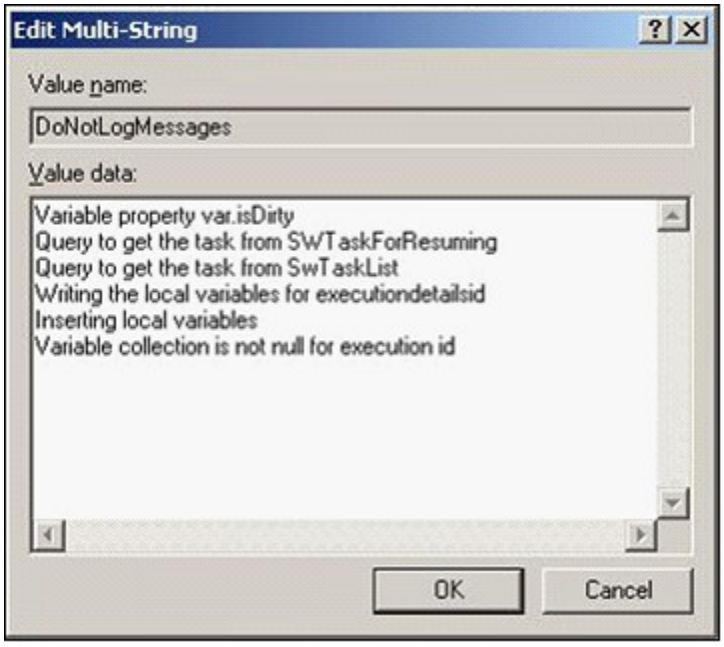
Example Scenario:

Suppose the debug level is set as 2, and you want to restrict some messages containing text, for example,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

"Inserting Local Variables" from getting logged into the logger file without changing your current debug level.

1. Create a new key in the **AVEVA Work Tasks** registry named "DoNotLogMessages" of type multi-string value.
2. Specify the text of the messages which are to be ignored while writing to the log files.



3. Restart the AVEVA Work Tasks services.

Note: These steps control the string messages logged into the AVEVA Work Tasks log files. The same messages appears in the Logger Console.

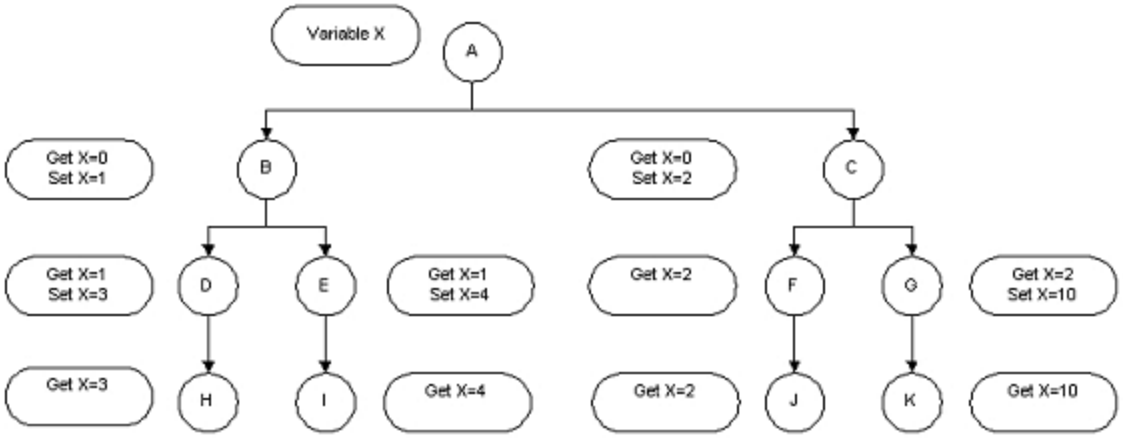
Use Local Variables

The Local Variable stores the values set by the incoming action. The values that are set for such variables are visible only to the subsequent actions.

Example Scenario:

The following image explains the use of a local variable 'X' in a workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The variable is added to the first action 'A'. Action 'A' initially sets the value of the variable 'X' to 0. The action 'B' sets a value 1 to the variable 'X' and 'C' sets a value 2. All the immediate actions after 'B' will get the value 1 from the variable 'X', while the actions after 'C' will get the value 2 from the same variable 'X'. Any changes made by any action to a Local Variable will be visible only to the actions that occur immediately after it.

Example of Local Variable Usage

Add local variable to the Start action only. Prefix the name of the local variables with '@'.

Call the Context.SaveVariables method to persist the state of the variables. A new field is added to the SWExecutionDetails table to persist the local variables.

The local variables are loaded for an action using Context.LoadLocalVariables (executionDetailsId) method.

The local variables can be accessed at run time by the actions through the Variables collection of the Context object.

Set Custom Properties for Repository Data Source

While creating a data source for repository, use the following custom settings to set properties for a connection pool.

```
encrypt=true; nableltm=true; connectionretrywaittime=30; maxconnectionretries=10;
sqlcommandtimeout=300;
```

encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

enableltm: AVEVA Work Tasks internally implements lightweight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive.

The enableltm property can be used to turn off this feature. The default value is set as **'True'**.

connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time to retry for a new connection. The default value is set as 30 seconds.

maxconnectionretries: While opening a new connection, if the database server is not available, the default

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

Note: These settings are case sensitive and should be mentioned only in lower case.

Enable Xcopy Deployment

AVEVA Work Tasks enables Xcopy deployment of dlls. Xcopy enables direct replacement of dlls by ensuring that they are not locked by the processes. Xcopy deployment is not applicable to the Windows Services, Workflow.NET.dll, Workflow.NET.Communication.dll, and Custom dlls configured for getting connection string.

Complete the following steps to enable Xcopy deployment:

1. Stop all the AVEVA Work Tasks services
2. Ensure that the custom application folders have been configured in the Repository Settings in the Central Configuration Site.
3. Reference the "Workflow.NET.Web.SkeltaXcopy.dll" from "bin" folder of the AVEVA Work Tasks installation directory.
4. Ensure that the file watcher has been configured for the application in the Repository Settings.
5. Enable AVEVA Work Tasks Xcopy in the Application_Start method in the Global.asax.cs of the application.

```
/// <summary>
/// Summary description for Global.
/// </summary>
public class Global : System.Web.HttpApplication
{
    /// <summary>
    /// Required designer variable.
    /// </summary>
    private System.ComponentModel.IContainer components = null;

    public Global()
    {
        InitializeComponent();
    }

    protected void Application_Start(Object sender, EventArgs e)
    {
        Workflow.NET.Web.SkeltaXcopy.Xcopy.Enable("Default");
    }
    protected void Session_Start(Object sender, EventArgs e)
    {

    }
```

6. After configuring Xcopy, the dlls will not be locked by the processes and can be replaced directly.
7. Restart all AVEVA Work Tasks Services.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Human Activity - Enhancement for Escalation and Time out

You can enter the time span value as:

1. "Thursday 07:30 PM"
2. "Thursday 07:30 "(Assumes AM By default)
3. "19:30 Thursday"
4. "PM 07:30 Friday" (tomorrow)
5. "21:00 Next Friday"/"07:35 PM Next Friday" (takes the Friday which comes in the next week)

Note: Always enter time in the "HH:MM" format. If the Hour is a single digit, it should be prefixed with a "0". For example, 7:30 should be entered as 07:30 and the colon ":" symbol between the hour and minutes is mandatory.

To do this, the you must create a predefined variable in the following format and update the value of this variable from Script or Update Variable Activity. Ensure that the data type of the variable is set to "string".

Syntax: ^<Action_Name(Case Sensitive**)>_<AcronymOfProperty**(Case Insensitive)>

For example, for setting the variable for Timeout for Action, it should be:
^Approval1_TFA

Different **<AcronymOfProperty>** which can be set are:

"TFA": "Timeout for Action"
"MATFA": "Minimum Time for Action"
"TWFO": "Timeout warning for Acknowledgement"
"TFO": "Timeout for Acknowledgement"
"TWFA": "Timeout warning for Action"

You do not need to specify anything in the property. At runtime, this value will be populated to the relevant property of the relevant activity.

If you specify anything in the Property explicitly, the value entered will override the variable value.

If you have a specific date-time value, then you must set the DataType of the Variable as **date**, and update the value of this variable from Script Activity or Update Variable Activity.

Modify the Number of Work Item Fields Limit Per Data Type

You can alter the number of Work Item Fields used for a Repository.

The table SKWorkItemFieldTypeCounts stores the column count for each data type (number, decimal, string, and datetime) supported by Work Item fields. The count for each data type can be varied in the column ColumnCount of this table.

Based on the SKWorkItemFieldTypeCounts table, mapping field gets filled in SKWorkItemFieldsDefinition table when you create a Work Item field from the process designer settings menu.

Consider that you want to increase the string type by one column. That is, currently you can have 18 string Work Item fields and you want to have 19 string Work Item fields. Complete the following steps to increase the string type:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

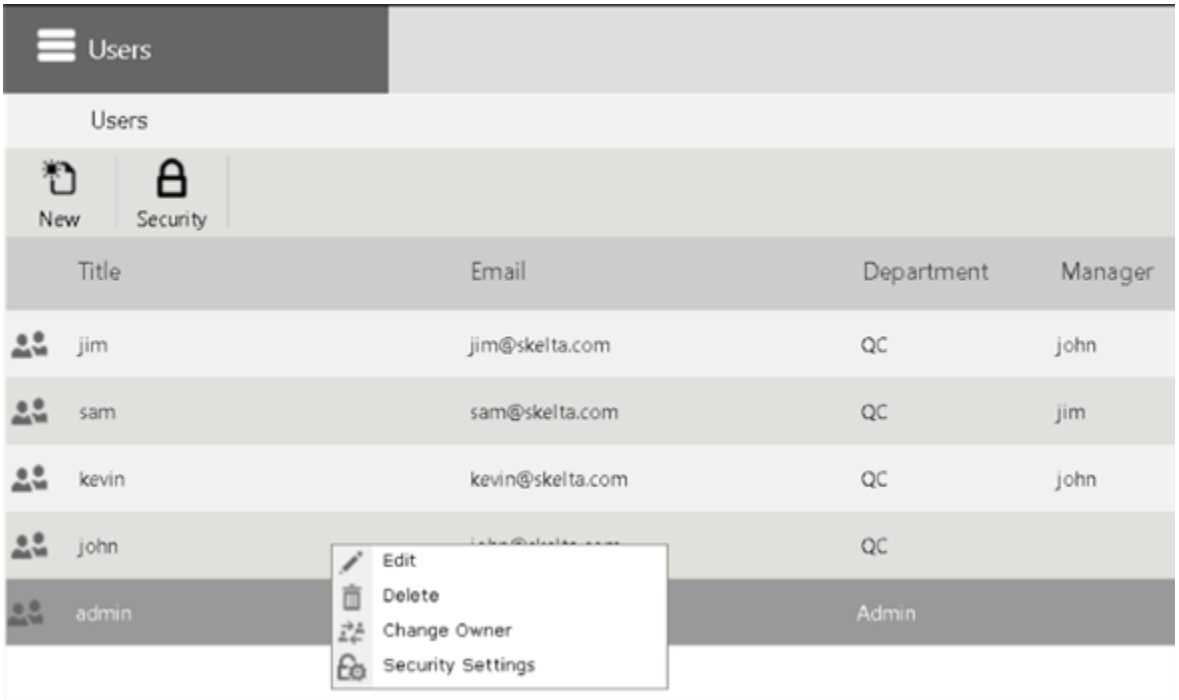
1. In SKWorkItemFieldTypeCounts table, increase the count to 19 from 18 for the string type.
2. Add the column nvarchar19 in the SKWorkItemFields table. SKWorkitemfields table contains all the runtime value details of Work Item fields used in an activity.
3. In the **Process Designer**, create a new string type Work Item field.
4. The created Work Item field can be used in activities by setting it from the Property "Set Workitemfields".

Manager Lookup for Users List

When creating a new user in the List, AVEVA Work Tasks had options for Name, Password, Description, Email, Department, and Role options. Now AVEVA Work Tasks introduced a new option to even select the **Manager** for that new user, where the **Manager Lookup** is a self lookup.

By default, the admin user is created when a new repository is created. For all the newly created user, you can select the existing users as a manager.

The following figure shows that, there are totally four users are existing at repository. Using the Manager lookup, any existing user can be assigned as manager for a user.



Redirect the Log On Page

When you log on to the **Enterprise Console**, by default, the page is redirected to the Workitemlist page.

If you want to redirect the page to another aspx page, then add the following tag needs to the Web.Config file of the Enterprise Console site:

```
<appSettings>
 <add key="redirectPageAfterLogin" value="WorkflowList.aspx"/>
</appSettings>
```

Where,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

value specifies the aspx page to which you want to be redirected after log on. The aspx page must be placed in the following SkeltaBPMUITemplates path: BPMUITemplates\Default\Repository\Site

Value can also be the url of a website.

Since **WorkflowList.aspx** page is specified as value, after log on, the page is redirected to the WorkflowList.aspx page.

You can get the Web.Config file in the following location of the AVEVA Work Tasks install path:

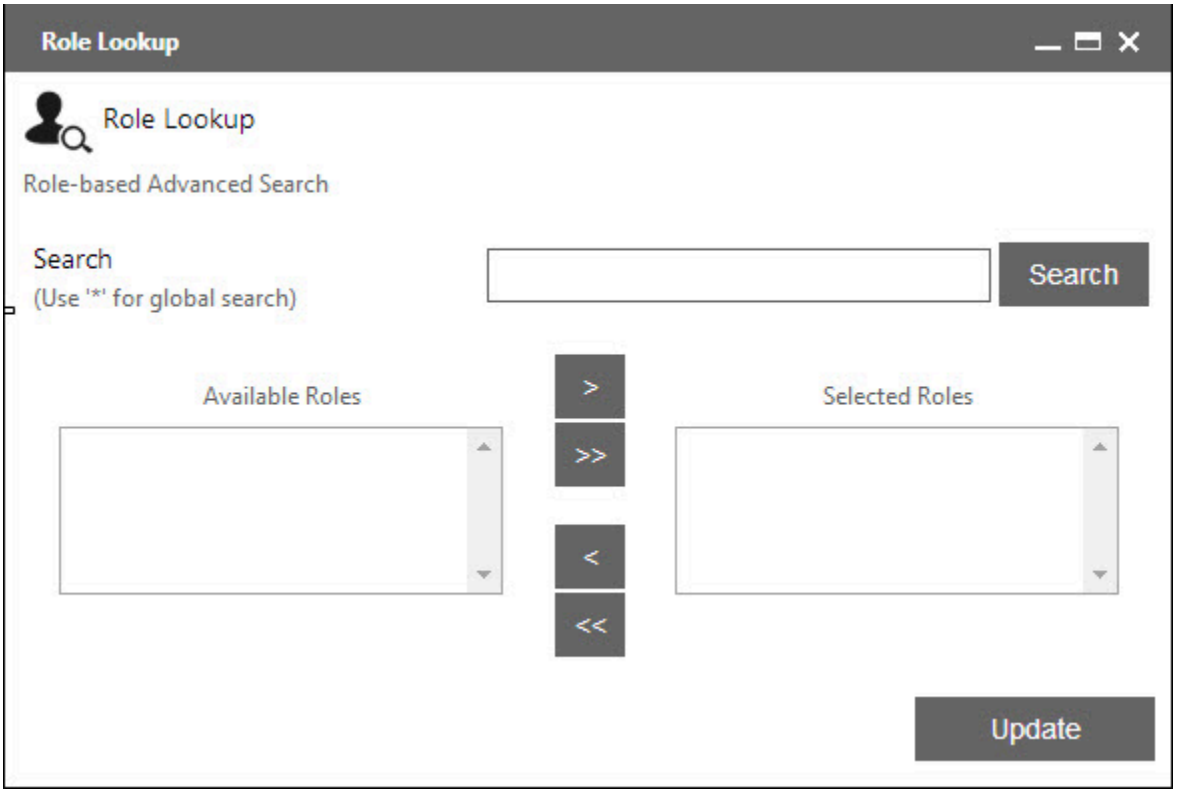
[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\EnterpriseConsole\Web.Config

About Role Lookup

A Role Lookup is used to search a required role from data source providers.

AVEVA Work Tasks provides a **Search** functionality in Role Lookup. This option is available for all data source providers. This enables to search the required role.

You can select the required provider from the provider drop-down.



Use Work Activity

AVEVA Work Tasks provides standard activities, which can be used for creating the workflows. The Work activity is one of the most powerful and flexible among them. The Work activity can be created based on user roles and without roles. The UI to configure the Work activity properties can be displayed in either a Role Based View or a General View. This reduces much of the need for creating custom activities.

The Role-based Work activity is used to provide the flexibility of showing the UI based on the user role. The Work action is configured using XML configuration files and a HTML template to render the UI in the Work Item Detail

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

view.

Work Action with General Functionality (without Role):

- Users will only be able to show the same UI in the Work Item List – based on the AdvanceUI Fields property set for the Work Activity – to all users who log in, without any control over what information they may be allowed to view or may be interested in viewing.
- Users have to select the XML file to be used to specify the configuration in the AdvanceUI Fields property. (The HTML Template file that will be using these configuration settings to render the output is also specified in this XML file.)
- Users also have to specify the possible outputs for the Activity (Action Outputs), Template Placeholders used to render the button value or drop down, and the Output Variables used to store information such as comments in workflow variables, in the AdvanceUI Fields property.

Work Action with Role Based Functionality:

- Users will be able to show a customized UI in the Work Item List – based on the AdvanceUI Fields property set for the Work Activity – to each user who logs in, based on their user role. As a result the UI can be dependent on what information they may be allowed to view or may be interested in viewing.
- Users have to specify in the AdvanceUI Fields property, which XML file is to be used to render the output for each role defined.
- Users also have to specify the possible outputs for the Action (Action Outputs), Template Placeholders used to render the button value or drop down, and the Output Variables used to store information such as comments in workflow variables, in the AdvanceUI Fields property.

The "Approve Reject and Escalate.xml" XML configuration file is shown below

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<?xml version="1.0" encoding="utf-8" ?>
- <WorkTemplate>
  <!-- HTML file name used to show the UI  -->
  <HtmlTemplate>Approve Reject And Escalate.htm</HtmlTemplate>
  <GroupUIHtmlTemplate>GroupUIApprove Reject And Escalate.htm</GroupUIHtmlTemplate>
  <!-- In this ActionOutputs Section we will specify the Possible Outputs for the Action  -->
- <ActionOutputs>
    <ActionOutput name='Approve' CompletionMaker='Yes' Alias='Approve' />
    <ActionOutput name='Reject' CompletionMaker='Yes' Alias='Reject' />
    <ActionOutput name='Escalate' CompletionMaker='Yes' Alias='Escalate' />
  </ActionOutputs>
- <!--
    In this InputVariables section we will be specifying the values for the placeholders used in the html template.
                              The default value can be specified.we can also specify the values for input variables from the
                              AdvanceUI Fields property of Work Action
  -->
- <InputVariables>
    <InputVariable name='approvealias' type='textbox' Desc='Replace Word approvealias with' valueType='Value' Defaultvalue='Approve' />
    <InputVariable name='rejectalias' type='textbox' Desc='Replace Word rejectalias with' valueType='Value' Defaultvalue='Reject' />
    <InputVariable name='escalatealias' type='textbox' Desc='Replace Word escalatealias with' valueType='Value' Defaultvalue='Escalate' />
  </InputVariables>
- <!--
    In this OutputVariables section we will be specifying the value of the HtmlElement to be stored in the
                      Workflow Variable. Name of the Output Variable should be the same as HtmlElement name
  -->
- <OutputVariables>
    <OutputVariable name='txtcomment' desc='Store Comments In' HtmlElementId='txtComment' valuestoset='Variable' operatortype='=' />
  </OutputVariables>
  <htmlelementstopersist>txtcomment</htmlelementstopersist>
</WorkTemplate>
```

Elements and attributes specified in the XML file:

Template Name: The name of the HTML file that will be used by this action to render it in the UI control is specified in the <HtmlTemplate> element.

GroupUIHtmlTemplate: This is not getting used and it is kept for Backward compatibility.

ActionOutPut Variables: The ActionOutput variables that are used to specify all the possible outcomes for the action are specified using the ActionOutput element. The attributes to be specified are described here.

- **Name**: The name of the ActionOutput variable.
- **Completion Maker:** The setting that will determine whether the action is completion maker or not.
- **Alias:** The alias name for the Output that will be displayed as the output when the action is linked in the workflow.

Input Variables: The Input Variables that are used to fill the button values, drop down values, etc., are configured using the InputVariable element. The values for the input variables are associated with workflow variables or with static values. The attributes to be specified are described here.

- **Name**: The name of the input variable that will be used as the placeholder in the HTML template.
- **Type**: The field type that is used to define whether it will be a text box or drop down.
- **Desc**: A short description of the purpose of the Variables.
- **Values**: The values to be associated with the variables; Comma separated values need to be specified in the case of drop down (Yes/No).
- **DefaultValue**: The default value for this variable; it can be static value, variable collection value, and content

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

value.

- **ValueType**: The value type that is used to define whether it will be a variable or content or static value.

Output Variables: The Output Variables that will be used to store the values from various attributes are configured using the OutputVariable elements. The attributes to be specified are described here.

- **Name:** The name of the output variable; it will be the same as the HTML Element Id.
- **Desc:** A short description of the purpose of the Variables.
- **Html Element Id**: The name of the HTML element from which the value has to be read.
- **Valuestoset:** The type to which value has to be stored (Variable/Content).

Note: When you use Input Variables for displaying the button value that will render in the UI, you need to make sure that the Input Variable value and the ActionOutput variable Alias value denoted as Mapped Outputs must be the same.

The "Approve Reject and Escalate.htm" HTML Template file is shown below:

(This template uses the parameters defined in the "Approve Reject and Escalate.xml" file to render the UI to the user.)

The part of the HTML Template where the placeholders are replaced with the input variables configured in the XML file is shown below. This template should have a hidden variable named actionOutPut, for capturing the value inside the control for alerting the action.

```
<link rel="styles" type="text/css" href="<%#VDir%>/StyleSheet/global.css">
<TABLE WIDTH="100%" height="100%" BORDER="0" CELLSPACING="1" CELLPADDING="2"
class="tablebg">
<%#errorMessage%>
<TR VALIGN="TOP">
<TD align="left" width="<%#iframewidth%>" bgcolor="<%#iframebgcolor%>">

class="inputtextarea"><%#txtcomment%></TEXTAREA>
</TD>
</TR>
<!--<TR>
<TD align="center"> </TD>
</TR>-->
</TABLE>
</TD>
</TR>
<TR class="lefttdbg">
<!--Place holder <%#approvealias%> will be replaced by the input variable approvealias
specified in the Xml Config file -->
<TD align="right" class="lefttdbg" Colspan="2">
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<input type="Submit" class="inputbutton" name="btnClickSubmit" value="<%#approvealias%>"
onclick="javascript:BtnClicked(this)">
<!--Place holder <%#rejectalias%> will be replaced by the input variable rejectalias
specified in the Xml Config file -->
<input type="Submit" class="inputbutton" name="btnClickSubmit" value="<%#rejectalias%>"
onclick="javascript:BtnClicked(this)">
<!--Place holder <%#escalatealias%> will be replaced by the input variable escalatealias
specified in the Xml Config file -->
<input type="Submit" class="inputbutton" name="btnClickSubmit" value="<%#escalatealias%>"
onclick="javascript:BtnClicked(this)">
</TD>
<input type="hidden" name="actionOutPut" value="" >
</TR>
</TABLE>
<!--
<%#ExecutingActionName%>
<%#ExecutingActionType%>
<%#ExecutionId%>
<%#ExecutionDetailsId%>
<%#ActivityId%>
<%#WorkflowName%>
<%#ApplicationName%>
<%#ActivityResource%>
<%#OnBehalfOfResource%>
-->
<Script>
function BtnClicked(clickObj)
{
document.getElementsByTagName("input")["actionOutPut"].value = clickObj.value;
}
</Script>
```

Note:The placeholder name used in the template should be the name of the input variables used in the xml file so that the placeholder value will get replaced at run time with the input variable value. In the above example, "approvealias", "rejectalias" and "escalatealias" are the input variables in the Approve Reject and Escalate.xml file.
The function "BtnClicked(clickObj)" is used to capture the output to alert the action with the output.

Steps to create an XML Configuration file for the Work Action:

Consider the example of displaying the UI shown below to the users. For this, you will need to create the XML configuration file and the HTML Template file, say WrkSendBack.xml and WrkSendBack.htm, under the "Workflowelements\Default\en-US\Actions\WorkAction" folder. This section describes the steps to create the XML file.

Specifying the start and end tags:

- The start tag and end tag for the xml file are <WorkTemplate> and </ WorkTemplate> respectively.

Specifying the HTML Template Name:

- The next node to specify is <HtmlTemplate>WrkSendBack.htm</HtmlTemplate>, where WrkSendBack.htm is the HTML Template file corresponding to this XML file. This template will also be created under the Workflowelements\Default\en-US\Actions\WorkAction folder.

Specifying Action Outputs:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The next node is <ActionOutputs></ ActionOutputs>
- Inside this node you need to specify all the possible outputs for this action as shown below
  - <ActionOutput name="Approve" CompletionMaker="Yes" Alias=""></ActionOutput>
  - <ActionOutput name="Reject" CompletionMaker="Yes" Alias=""></ActionOutput>
  - <ActionOutput name="Send Back" CompletionMaker="Yes" Alias=""></ActionOutput>
- You can specify a value in the alias attribute so that it will appear in the AdvanceUI property of Work Action for these action outputs. Alternatively, you can skip setting this attribute here and enter the values in the property.

Specifying Template Placeholders:

- The next node is <InputVariables></ InputVariables>
- Inside this node you need to specify all the input variables that you can use to fill the values in the HTML Template (WrkSendBack.htm) for this action
- For example, let us assume you need to display three buttons in the UI for this work action. The values for these buttons can be filled with the help of Input Variables, which will be used to replace the placeholders in the HTML Template file (WrkSendBack.htm). Inside the node specify the input variables for this action as shown below,
  - `<InputVariable name="approvealias" type="textbox" Desc="Replace Word approvealias with" valueType="Value" Defaultvalue="Approve"></InputVariable>`
  - `<InputVariable name="rejectalias" type="textbox" Desc="Replace Word rejectalias with" valueType="Value" Defaultvalue="Reject"></InputVariable>`
  - `<InputVariable name="sendbackalias" type="textbox" Desc="Replace Word sendbackalias with" valueType="Value" Defaultvalue="Send Back"></InputVariable>`
- You can specify a value in the alias attribute so that it will appear in the AdvanceUI property of Work Action for these action outputs. Alternatively, you can skip setting this attribute here and enter the values in the property.

Specifying Output Variables:

- The next node is <OutputVariables></ OutputVariables>
- Inside this node you need to specify all the Output Variables you will be using to map to workflow variables to store the HTML element values, if required. Specify the variables as shown below.
  - `<OutputVariable name="txtcomment" desc="Store Comments In" HtmlElementId="txtComment" valuestoset="Variable"></OutputVariable>`
- The name of the output variable and the name of the HTML Element Id should be the same.

To create a HTML Template file (WrkSendBack.htm) for the Work Action to render the UI shown in the previous section:

```
<link rel="styles" type="text/css" href="<%#VDir%>/StyleSheet/global.css">
<TABLE WIDTH="100%" Height="100%" BORDER="0" CELLSPACING="1" CELLPADDING="2"
class="lefttdbg">
<%#errorMessage%>
<TR VALIGN="TOP">
<TD align="left" width="<%#iframewidth%>" bgcolor="<%#iframebgcolor%>">
<%#iframeui%>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
</TD>
<TD class="righttdbg">
<TABLE WIDTH="100%" BORDER="0" CELLSPACING="1" CELLPADDING="5">
<TR CLASS="subtitle">
<TD align=left>
@@Comments@@
</TD>
</TR>
<TR>
<TD align=left>
<TEXTAREA name="txtcomment" cols=30 rows=6 wrap="VIRTUAL"
class="inputtextarea"><%#txtcomment%></TEXTAREA>
</TD>
</TR>
<TR>
<TD align="center"> </TD>
</TR>
</TABLE>
</TD>
</TR>
<TR class="tablebg">
<!--Place holder <%#approvealias%> will be replaced by the input variable approvealias
specified in the Xml Config file -->
<TD align=right class="lefttdbg" Colspan="2">
<input type="Submit" class="inputbutton" name="btnClickSubmit" value="<%#approvealias%>"
onclick="javascript:BtnClicked(this)">
<!--Place holder <%#rejectalias%> will be replaced by the input variable rejectalias
specified in the Xml Config file -->
<input type="Submit" class="inputbutton" name="btnClickSubmit" value="<%#rejectalias%>"
onclick="javascript:BtnClicked(this)">
<!--Place holder <%#sendbackalias%> will be replaced by the input variable sendbackalias
specified in the Xml Config file -->
<input type="Submit" class="inputbutton" name="btnClickSubmit" value="<%#sendbackalias%>"
onclick="javascript:BtnClicked(this)">
</TD>
<!-- Hidden variable used to handle for Alerting the Output.The name actionOutPut should be
same-->
<input type="hidden" name="actionOutPut" value="" >
</TR>
</Table>
<!--
<%#ExecutingActionName%>
<%#ExecutingActionType%>
<%#ExecutionId%>
<%#ExecutionDetailsId%>
<%#ActivityId%>
<%#WorkflowName%>
<%#ApplicationName%>
<%#ActivityResource%>
<%#OnBehalfOfResource%>
-->
<Script>
<!-- Script used for the logic of assigning the output to the hidden variable actionOutPut
Which will be used by the action to alert the output.-->
function BtnClicked(clickObj)
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
document.getElementsByTagName("input")["actionOutPut"].value = clickObj.value;
}
</script>
```

Note: The <%#Acknowledge%> placeholder is used to display the Read Acknowledgement.
The <%#Notes%> placeholder is used to display the notes if you specify in the action. The <IFRAME> tag is used to display the details page inside an IFrame. The <TEXTAREA> tag is used to show the comments. The "<%#approvealias%>", "<%#rejectalias%>" and "<%#sendbackalias%>" placeholders are used as the input variables in the WrkSendBack.htm file. The "actionOutPut" hidden variable is used to store the output to alert the action with. The function "BtnClicked(clickObj)" is used to capture the output to alert the action with.

To use the created xml file (WrkSendBack.xml) and HTML template (WrkSendBack.htm) in the Work Action:

1. Click the **AdvanceUI Fields** property in the **Work Activity Actions** Properties.
2. You will see the file name in the **File Name** drop down (of both General View and Role Based View).
3. Select this file name and then click **Action Outputs** or **Template Placeholders** or **Output Variables** to display the corresponding property screen; you can see the parameters configured in the xml file displayed in the property screen.
4. Enter the values in the respective property screen; then save and deploy the workflow.
5. After you execute the workflow you will find the ActivityUI rendered in the Work Item detailed window.

Auto Mapping of Active Directory Providers

If more than one Active Directory provider is mapped to one Repository then by default, mapping will happen between the active directory providers based on the **Display Name** property. If user does not want the mapping, then uncheck the Auto Mapping flag from Repository Provider Search page for the User Entity.

By default, the entry in the **Properties** column of the **SKRepository** table

<property key="AutoMapActiveDirectoryProviders"><![CDATA[True]]></property>

Steps for UnMapping

If user does not want Auto Mapping between providers, do the following:

1. Log on to the **Central Configuration**.
2. Click **Repository-Provider List**. The **Repository-Provider List** page is displayed with the list of repositories name.
3. Expand the required repository where you do not want AutoMapping between Active Directory providers.
4. Expand **UserEntity**.
5. Click the **DefinitionXML** link to open the DefinitionXML file. Deselect the **Do you want to map active directory providers** check box at first time, and do the respective operations.
6. Go to the Farm Database. Now the entry in the **Properties** column of the **SKRepository** table is

   ```
   <property key="AutoMapActiveDirectoryProviders"><![CDATA[False]]></property>
   ```

Steps for Auto Mapping

1. Log on to the **Central Configuration**.
2. Click **Repository-Provider List**. The **Repository-Provider List** page is displayed with the list of repositories

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

name.

3. Expand the required repository and UserEntity where you want AutoMapping between Active Directory providers.
4. Click the **DefinitionXML** link to open the DefinitionXML file. Select the **Do you want to map active directory providers** check box.
5. Check the **Edit the definition xml**. The **Update** button will be enabled.
6. Click **Update**.
7. Select the respective provider, and then click **DefinitionXML** link to open the DefinitionXML file.
8. Check the **Edit the definition xml**. The Update button will be enabled.
9. Clicking **Update** will map the across the active directory providers.

Notes:

- If user does not want Auto Mapping between providers, deselect the "Do you want to map active directory providers?" check box for first time and do the respective operations similar to before updating provider DefinitionXML.

- Once it is mapped, unchecking the option will not remove the existing mapping.

Customize the Log On Page

You can customize the log in page of AVEVA Work Tasks.

You can have your own log on page instead of AVEVA Work Tasks log on page. You can also use AVEVA Work Tasks product to customize your application.

Note: The code provided below is a sample for reference. You can design the Log On page according to your specific requirements.

To customize the log on page

1. Go to *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**BPMUITemplates**Default**Repository**Site* folder.
2. Create your custom allows you to customize the login page.

```
Open RepositoryList.aspx page. In that, under the  javascript function named
"SetRepositoryValues (provtext, repo, instanceName, providerName,repositoryGuid)" you
can find the below code. This is for redirecting to default log on page [Login.aspx].
var winObj = window.open('Login.aspx?_repo='+repo+' &_instanceName='+instanceName+
'&_provtext='+provtext+'&_prov='+providerName,winName,
'top=0,left=0,width='+strWidth+',height='+strHeight+',
location=0, status=1, scrollbars=0, resizable=yes');
```

   To redirect to your custom login page, update the above code by replacing Login.aspx with your custom login page name and put your login page in the *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**BPM.NET**Web**BPMUITemplates**Default**Repository**Site* folder.

   Example: If the Custom Login Page name is HRLogin.aspx, then the code will be updated as shown below.

```
var winObj = window.open('HRLogin.aspx?_ repo= '+repo+'
&_instanceName='+instanceName+'
&_provtext='+provtext+'&_prov='+providerName,winName,'top=0,left=0,width='+strWidth+'
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
   ,height='+strHeight+',location=0, status=1, scrollbars=0, resizable=yes');
```

3. Add the below code in the CS [codebehind] file of the custom login page to authenticate the user and to redirect to your home page. Add SE.Bpm.Convertors namespace in the 'Using' section of the codebehind file.

   You have to provide:

   a. Page you want to redirect (in this case it is "HRHome.aspx").

   b. Username and Password of the user (make sure the user is available in your data source).

```
      //On click of label HR, this event will occur
      protected void lbSiteAdmin_Click(object sender, EventArgs e)
      {
      // To authenticate the specific User.
      // The function takes in Username and password as parameters.
      this.CreateUserContext("HRadmin", "admin");//Username and Password values are
      //hardcoded here,you can pass these values from the login page

      string redirectPageAfterLogin = "HRHome.aspx";//specify the home page
      Response.Write("<script language='Javascript'> location.href = '" +
      redirectPageAfterLogin + "';</script>");
      }

      private void CreateUserContext(string username, string password)
      {
      string applicationname, providerinstancename, providerinstancedisplayname,
      provider = "";

      applicationname = Convert.ToString(Request.QueryString["_repo"]);
      providerinstancename = Convert.ToString(Request.QueryString["_instanceName"]);
      providerinstancedisplayname =
      Convert.ToString(Request.QueryString["_provtext"]);
      provider = Convert.ToString(Request.QueryString["_prov"]);
      Response.Cookies["_instanceName"].Value =
      HttpUtility.UrlEncode(providerinstancename).Encrypt(15);
      Response.Cookies["_repo"].Value =
      HttpUtility.UrlEncode(applicationname).Encrypt(12);
      Response.Cookies["_provtext"].Value =
      HttpUtility.UrlEncode(providerinstancedisplayname).Encrypt(14);
      Response.Cookies["_prov"].Value = HttpUtility.UrlEncode(provider).Encrypt(13);
      Response.Cookies["_userinfo"].Value =
      HttpUtility.UrlEncode(username).Encrypt(11);

      Skelta.Core.ApplicationObject application = new
      Skelta.Core.ApplicationObject(applicationname);
      Skelta.Entity.Entity userEntity = Skelta.Entity.Entity.GetEntity(application,
      "UserEntity");
      object userUniqueIdentifier =
      userEntity.DataBridge.DataBridgeProviders[providerinstancename].GetUniqueIdent
      ifier(username, password);
      //Getting user context
      Skelta.Entity.UserContext uContext = new
      Skelta.Entity.UserContext(userUniqueIdentifier,
      application, providerinstancename, "", "", false);
      }
```

4. After making changes to the pages, now login to the application [From EC site]. This will redirect to your login page. For more information on creating custom page and redirecting to your login page, refer to Create

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Custom Page.

5. Log on to your custom login page, this will redirect to the page which you had specified. In the above sample, when you click the label named HR, it will redirect to HRLogin.aspx.

Packages

You can use the **Package** feature of AVEVA Work Tasks to deploy one or more artifacts from one environment or repository to another environment or repository.

About Package

You can use the **Package** feature of AVEVA Work Tasks to deploy one or more artifacts from one environment or repository to another environment or repository. You can deploy artifacts with its associated and child artifacts and configuration state from one environment or repository to another environment or repository.

Prerequisites

- Ensure that the AVEVA Work Tasks Client Service is running while installing or uninstalling the package.
- In an environment that contains multiple servers and clients, ensure AVEVA Work Tasks Client Service is running on the machine which has the Enterprise Console site configured.

Advantages of Package

Currently, packaging and deploying one or many artifacts from one environment or repository to another is done either by exporting and importing the artifacts or by using the recovery of the task for packaging and deploying one or many artifacts from one environment or repository to another.

Export/Import feature in Package

- Export and import feature is helpful when you want to deploy a single artifact in a different environment.
- You can export and import only one artifact at a time.
- An imported artifact is not valid on the target environment, if the associated artifacts are not present.

Recovery feature in Package

You can use the recovery feature to replicate the entire repository with all the artifacts in the target environment. A choice to add only few artifacts to the target environment is not available. This option is beneficial when you want to deploy the entire repository in another environment.

A proper understanding of the **Package** interface enables you to use the various features of the interface effectively. The **Package** interface consists of the following two components:

- Package Template: Use **Package Template** to design a package, define artifacts to the template, and complete the entire process of design, build, and export the package file. When you export a packaged file, the file is saved with the extension .**awsPKG**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Manage Package: Use **Manage Package** to import packages which you exported from the **Package Template** and install the package in the target environment. You can also create a new package and export it.

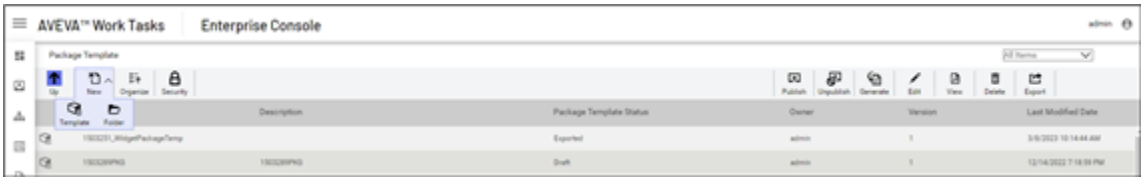
Note:
- Only Administrators have the right to install the package.
- Access to the functionalities of **Package Template** and **Manage Package** requires special user rights. The functionality might either be disabled or might not be visible if the user does not have rights to run them.
- You must reset the IIS before generating a package for the first time after installing the product.

Package Template

You can use the **Package Template** list in the source environment to create and design a package template to which you can add artifacts and update the configuration settings.

You can use the **Package Template** to complete the entire process of designing, publishing, generating, and exporting the package file. The behavior of the package at the time of installation can be pre-defined in a **Package Template**.

The following image shows the **Package Template** window:

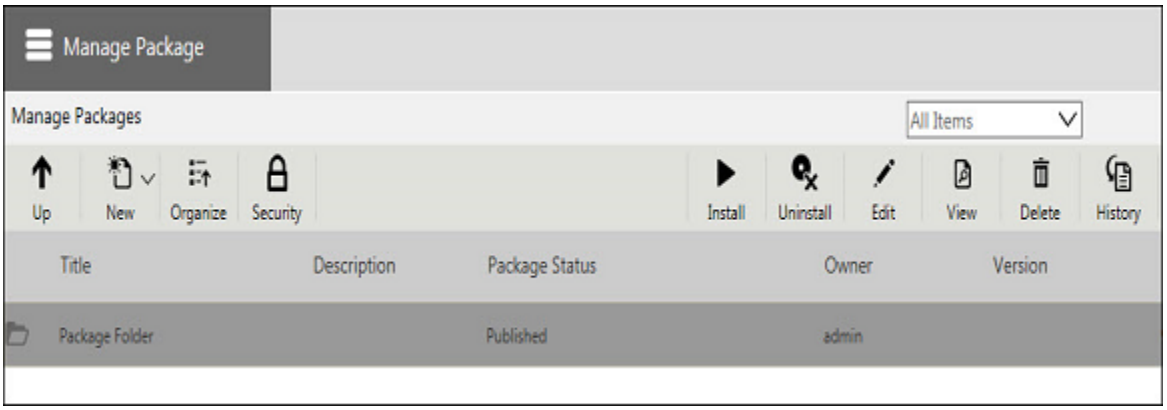


See Also: Working with Package Template

Manage Package

You can use the **Manage Package** list in the target environment to import packages that you exported from the **Package Template** of source environment, and install, update, or uninstall the package in the target environment. You can also change the pre-defined configuration that affects the behavior of package at the time of installation, update, and uninstallation.

The following image shows the **Manage Package** window:



See Also: Manage Package

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Best Practices of Packaging

The following list provides some of the best practices or guidelines which you can adhere to while packaging.

- You can create and export a package in Wonderware Skelta BPM 2014 R2 SP2 P01 and later versions and use this package in AVEVA Work Tasks.
- Before adding artifacts to the package, ensure all the artifacts that need to be added to a package are in the *Published* state.
- Identify the artifact which has the complete relationship for the project to be packaged.
  - If a navigation list item points to the main form (a form which is associated with all the other artifacts), go to the Navigation page and then add the navigation to the package.
  - If there are multiple main forms that do not have a relation among each other, add each of these forms individually to the package template. Ensure that the package template settings are same while adding each form to the package.
  - If the main form is not used in navigation, go to the Forms List page and then add the main form to the package.
  - If there is only a main workflow, then go to the Workflow List page and then add the workflow to the package.
- If you have created a project folder for forms, workflow, or any other lists, which are meant to be packaged together, then add the folder to the package for easier tracking.
- If a package is already shipped and installed, and if you add or modify some artifacts of the package, then you must create another version of the same package template and then add or modify the artifacts in the newly created version of the package template.

  Note: Custom files and scripts will not be identified as modified items.
- You can configure the common parameters for different artifacts in the Runtime Initialization Settings form before installing the package. For more information about runtime initialization settings, see Runtime Initialization Settings section in the *Developer Guide*.
- Ensure that the Runtime Initialization Settings form is a single form which does not have any association with other forms. It is recommended that you configure the artifacts (such as Forms, Workflow, Database Connection, and so on) as different tabs in the Runtime Initialization Settings form for easy configuration.
- Ensure that you install a package only during off-production.
- If you use a case-sensitive database to create a repository, you can create items with the same name in different cases. For example, a case-sensitive database considers DATABASE1 and database1 as two different items. In this case, the package will be imported as two different items. If the database is not case-sensitive, you cannot create an item with the same name.

  We recommend you not to create two different items with the same name in a case-sensitive database. If you package and import such items to a not case-sensitive database, the package gets imported as the next major version.
- Before packaging, verify whether all the custom dependent files, which are used, are identified and added to the package. If any of the custom dependent files are not added, it is recommended that you add these files to the **Additional Package Files** section in the **Package Template** tree.
- Ensure that all the custom files used are placed in the installed Skelta path.

  For example: *C:\Program files\AVEVA\Work Tasks\Bin*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note:
- The packages created in the higher versions may not work properly in the earlier versions of the product.
- If the artifacts using the custom dlls in the package are installed in the latest version of the product, make sure that the custom dlls are built with the latest version before installing the package.

Recommendations

- The appropriate target platform is used while installing packages.

  For example: If the package is created in 64-Bit, it is recommended that you install the package in 64-Bit.
- The prerequisite packages are installed before installing the required package.
- The different versions of a specific package template should use the same Runtime Initialization form.
- If you face any issues or errors while adding artifacts to the package, it is recommended that you open the **WTLogger Console** so that you can view the error messages or warnings.
- **Scenario 1:** A package that has many artifacts is already shipped and installed. Of the many artifacts, you modify only few artifacts. However, you do not want to modify the existing package template. In this scenario, it is recommended that you package and ship only the modified artifacts in a new package.
- **Scenario 2:** A package that has many artifacts is already shipped and installed. If there are changes in physical files and/or script files in the package, then you must package and ship these artifacts in a new package template.
- **Scenario 3:** A package has a workflow with many activities. If there is any modification in the workflow definition, then it is recommended to use the “Complete Rebuild” feature to obtain the latest definition of all activities. For more information about complete rebuild, refer the Complete Rebuild section.
- While adding artifacts to a package template, if some of the artifacts are not added due to some exceptions, perform one of the following:
  - Verify the exception, correct it, and then add the artifacts to the package template.
  - Verify the exception, save the package, correct the exception, and then re-add the artifacts (which have exceptions) to the same package template.

    Note: You can validate the artifacts which have exceptions. You can also proceed with the installation of the existing artifacts by saving the package template.

Test Statistics

The following table represents the test statistics for the number of artifacts, which were packaged in a single package.

Type of Artifact Packaged	Number Of Artifacts
• Workflows: 72 • Forms: 92 • Manage List: 29 • DataGrid: 33 • Navigation List: 23	323

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Type of Artifact Packaged	Number Of Artifacts
• Custom Files: 20 • Lookups: 54	
• Workflows: 120 • Forms: 124 • Manage List: 36 • DataGrid: 51 • Navigation List: 23 • Custom Files: 21 • Lookups: 120	495
• Workflows: 107 • Forms: 33 • Manage List:11 • DataGrid: 50 • Navigation List: 88 • Custom Files:30 • Lookups: 84 • Security GroupList: 616 • Report Template: 9	1028

If there are many artifacts in a package, it is recommended to split this package into multiple small packages.

Work with Package Template

You can use the Package Template list in the source environment to create and design a package template to which you can add artifacts and update the configuration settings.

You can use the Package Template list to perform the following tasks that helps you create, design, and export a package template file:

- Create package template
- Edit package template
- Publish package template
- Generate package template
- Export package template
- View package template
- Unpublish package template

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Mark package template as shipped

Actions Executable in the Ribbon Menu

The following table lists the actions that you can perform from the action bar of the Package Template list:

Actions		Description
Up		To navigate from the current folder to the parent folder. This feature is helpful when you are accessing a folder within the Package Templates and you want to navigate back to the parent folder of the Package Template List.
New	Folder	To group and categorize the package templates.
	Template	To create a new package template.
Organize		To organize the Package Templates and group it in specific folders.
Security		To define security at the List Item level.
Edit		To modify or delete the artifacts, define the target values, configuration state, and the prerequisites.
View		To view the package template in read-only mode.
Delete		To delete the selected package template.
Publish		To publish the selected package template.
Unpublish		To unpublish the selected package template.
Generate		To generate the package file. The generated package file has the .awsPKG extension.
Export		To export the packaged file to a specific folder.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Actions Executable in the Shortcut Menu

The following table lists the actions that you can perform from the shortcut menu of the Package Template list:

Shortcut menu options	Description
Edit	To modify or delete the artifacts, define the target values, configuration state, and the prerequisites.
View	To view the details of the selected package template in read only mode.
Publish	To publish a package template that is in draft status.
Unpublish	To unpublish a package template that is in published, generated, or exported status.
Generate	To generate a published package template.
Export	To export the package template file.
Mark as Shipped	To mark the package template as shipped once it is exported.
Save As	To save the package template in different versions. By default, when a package template is created it is saved as version 1.
Delete	To delete the selected package template. You can delete the package template irrespective of the status.
Show All versions	To view all the versions. This option is useful as the package template list displays only the latest published version of the package template or only the latest version of a draft when all the versions of the package template are in draft status.
Security Settings	To define security at the List Item level.

Note: Package template created in previous version of AVEVA Work Tasks must be regenerated.

Create a Package Template

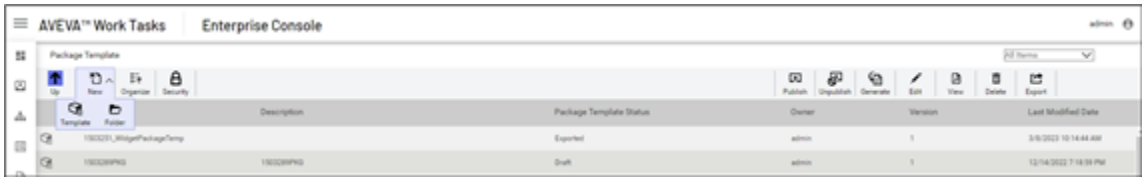
1. In the **Enterprise Console**, click menu icon, click **Package**, and then click **Package Template**.
   The **Package Template** page appears.
2. Click **New** and then, click **Template**.
   The **New Package Template** dialog box appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. In the **Title** box, type a name for the package template.
4. In the **Description** box, type a description for the package template.
5. In the **Additional Information** box, type any additional information about the package template. By default, the name of the current repository is displayed.
6. Click **Save Template**.

   A confirmation message appears.
7. Click **Close**.

   The package template is saved in the Package Template list. You can add artifacts to the package templates created. The following image shows the **Package Template** page with a few package template lists:



Note: If a package template contains the Runtime Initialization Form, then this Form will not be available when you recreate the package template in the installed machine. You have to manually add the Form to the package template. To do this, include the Runtime Initialization Form along with the original package. After creating the package template from the installed package, edit the package and select the Runtime Initialization Form.

See Also: Adding Artifacts to a Package Template

Edit a Package Template

You can edit a package template to modify the prerequisites, update the runtime initialization settings, delete artifacts, and modify the configuration of the artifacts. The package template that you want to edit must be in **Draft** state.

1. In the **Enterprise Console**, click menu icon, click **Package**, and then click **Package Template**.

   The **Package Template** page appears.
2. Select a package template that you want to edit, and then click **Edit**.

   Alternatively, right-click a package template, and then click **Edit**.

   The **Edit Package Template** dialog box appears.
3. Edit the package details.
4. Click **Save**.

   The package template reflects the changes.

Configure Package Template

The **Add to Package Template** page or the **Edit Package Template** page allows you to perform a number of actions such as, defining the prerequisites at the package template level, runtime initialization settings, and configuring properties specific to individual artifacts. In the **Add to PackageTemplate** page, you can also view the Associated and Child Artifacts.

The main components of the Add to Package Template/Edit Package Template screen are:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Prerequisites
- Runtime Initialization Settings
- Exceptions

Artifact level configurations are:

- Configuring the Artifacts
- Rebuilding the Artifacts
- Deleting the Artifacts

Package Template Level Configuration Settings

This section describes the configuration settings of a package template, such as but not limited to prerequisites, runtime initialization settings, and package files.

Prerequisites

The Prerequisite option in the **Add to Package Template** page allows you to define the prerequisites for the Package Template. If the Package Template is dependent on other Package Templates, then the dependent Package Templates can be set as prerequisites.

For example: If the 'Leave' package is dependent on the 'HR' package, then the 'HR' package can be set as a prerequisite for the installation of the 'Leave' package.

You can modify prerequisites by editing the Package Template before it is published.

To set prerequisites

1. Select and right-click the artifact that you want to package, and then click **Add to Package Template** on the shortcut menu. The **Select Package Template** page appears.
2. Select the Package Template.
3. Select **Package Template Version**, **Include Associated Artifacts**, **Include Child Artifacts**, **Include Security Artifacts**, and **Include the automatically generated SQL Script**.
4. Click **Next**. The **Add to Package Template** page appears.
5. In the **Configuration** section, click **Prerequisite**. The **Prerequisite** page appears on the right pane.
6. From the **Package Template** list, select the package template that you want to set as the prerequisite.
7. Select the version of the package template from the **Package Template Version** list. The version defaults to 1.
8. Select the **Consider Higher Versions if selected version does not exist in target environment** option. This will ensure that the higher versions of the prerequisite package template are considered while installing the package in the target environment, if the selected version is not found.

   If this option is not selected, then while installing the package in the target environment only the exact version of the prerequisite will be considered. If the selected version does not exist, the package will not be installed.
9. Click **Add Template**.
10. Repeat Steps 6-9, to add more package templates as prerequisites.

    The grid in the **Package Template** page lists out all the Package Templates which are set as prerequisites.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

11. Click **Save Settings**.

    The **Prerequisite Package Templates** grid contains the following details:

    - **Name**: This column displays the name of the Package Template that is set as a prerequisite.
    - **Version**: This column displays the version number of the prerequisite package template.
    - **Higher Versions**: This column displays either Yes or No.
        - **Yes** appears if the **Consider Higher Version** check box is selected.
        - **No** appears if the **Consider Higher Version** check box is not selected.

    Note: The **Prerequisite Package Templates** grid also appears when you select the following options:
    - **Enterprise Console > Package > Manage Package > Edit > Prerequisite**
    - **Enterprise Console > Package > Manage Package > View > Prerequisite**
    - **Enterprise Console > Package > Manage Package > Install**

12. Click **Save Template**.

    The package template settings are saved.

To delete a prerequisite package template

Perform the following to delete a package template that is set as a prerequisite.

- From the **Prerequisite Package Templates** grid in the **Prerequisite** page, click the icon in the row corresponding to the package template that you want to delete.

  The corresponding prerequisite package template is deleted successfully.

Runtime Initialization Settings

The **Runtime Initialization Settings** option in the **Add to Package Template** allows you to select a form, map the fields of a form to the properties of the artifacts. The values mapped to the artifacts are populated when the package is installed. This feature is useful when the same data has to be entered in multiple places. The following section allows you to create a form, fill a form, and map the values of the form to the properties of the artifacts.

Note: Runtime initialization is not supported for the following artifacts:
- All Event Providers such as Event Associations and Scheduler
- Report Connection, Report Templates, and Reports
- All layouts such as Global Work Item Layout and Custom Layout
- List Views
- Navigation Lists

The following sample topics provide the procedures to use the **Runtime Initialization Settings** form values in the Database Connection properties. Similarly, you can configure the runtime initialization settings for other artifacts.

Adding a database connection to package

For more information about creating a database connection and adding a database connection to a package, refer to the Creating a Database Connection and Adding Database Connection to Package Template sections respectively.

To create a Form

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. In the **Name** box, type the name for the form as **Database Connection Details**.
4. In the **Description** box, type the description for the form as **Database Connection Details**.
5. Click **Save & Continue**.

   The **Form Tasks** page appears.
6. Click **Design this form** and then click **Finish**. The **Forms Designer** page appears.
7. Drag the text input control to the canvas.
8. Edit the properties of the control and change the Name to **Server Name**.
9. Click **Apply** to save the properties.
10. Repeat steps 7 to 9 to create the following fields:
    - **Authentication Type**
    - **User Id**
    - **Password**
    - **Advanced Settings**
    - **Database Name**

    For more information about creating and designing forms, refer the *Forms* and *Forms Designer* sections in the *Forms and Lists User Guide*.

    Note: If the **Package Settings** form has a **Password** field, then its value can be set from the **Runtime Initialization Settings** by selecting one of the available password controls. Ensure to select a password controls whose **Security Mode** property is set to **Encryption** and **Persist Password** property is set to **Yes**.
11. Click **Publish** from the action bar.
12. Click **Close** on the BellyBar.
13. Close the **Forms Designer** page.

Note: Form designed for runtime initialization settings support only the text input, number, drop-down, hyperlink and password controls in Package.

To configure Runtime Initialization Settings

1. To add a DB connection to package, in the **Enterprise Console**, click menu icon, click **Settings**, and then click **Database Connection**. Right-click any existing database connection and then click **Add to Package**. The **Add to Package Template** dialog box appears.

   OR

   To edit an existing package, in the **Enterprise Console**, click menu icon, click **Package**, and then click **Package Template**. The **Package Template** page appears.

   Select the package template for which you want to configure the **Runtime Initialization Settings**, and then click **Edit**. The **Edit Package Template** dialog box appears.
2. Under **Configuration** tree on the left pane, click **Runtime Initialization Settings**. The **Runtime Initialization Settings** form appears.
3. In the **Form Name** list, select the **Database Connection Details** form.
4. In the **Form Version** list, select the version of the form that you want to use. By default, the **Form Version**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

takes the latest version.

5. Click **Next**. The selected form with all the fields appear.
6. Fill the selected form and then click **Finish**.

Note: You can fill the form while installing the package as well.

To map the Runtime Initialization Settings to the properties of the artifacts

The following steps allow you to map the properties of a Database Connection to the Runtime Initialization Settings.

1. Under **Configuration** tree on the left pane, select a Database Connection listed under the **Artifacts** section.
2. Click the **Install** tab**.**
3. Under **Connection Details > Target** section, click **No** for the property **Connect To Repository DataSource**.
4. Select the value for **Server name**.
   - In this example, the **Server Name** property can be mapped to the Server Name box of the *Database Connection Details*. When the package is installed the value of the Server Name property will be populated with the value entered in the *Database Connection Details* form selected in *Runtime Initialization Settings*.
   - Multiple selection from the list will append the value in the property.

   Note:
   - You can select the values by typing and/or selecting from the drop-down list. All the fields of *Database Connection Details form* are available for selection in the drop-down list. The value can be a combination of values entered manually and values selected from the drop-down list.

   - If a value is already available, and if you select another value from the drop-down list to be added to this value, the selected value is always appended at the end of the existing value.

   - If you enter or select a value, then the drop-down icon is changed to **+** icon. Click the **+** icon to select another value from the drop-down list. The selected value is always appended at the end of the existing value.

   - It is recommended that you do not edit the text within *<% Control Name %>*, where "Control Name" is the name of a control available in the **Runtime Initialization Settings** form. If you edit the text, then ensure that the "Control Name" is available in the **Runtime Initialization Settings** form.

   - You can select the values from the drop-down list only if the **Runtime Initialization Settings** are configured.

   - If you select another form in the **Runtime Initialization Settings**, the value is not cleared. You have to manually change the value.
5. Similarly map all the other properties (Authentication type, User ID, Advanced settings, and Database name) of the artifacts to the appropriate fields of the **Database Connection Details** form.

All the values entered in the **Runtime Initialization Settings** form will be populated to the properties of the artifacts when the package is installed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Exceptions

Exceptions are visible only if any exceptions are logged while adding artifact to the Package Template.

Additional Package Files

The **Additional Package Files** option allows you to add additional custom files and installer files to be installed in the target environment This option is available in the **Add to Package Template** and/or **Edit Package Template** pages.

To add Additional Package Files and Installer Files

1. Select and right-click the artifact that you want to package, and then click **Add to Package Template** on the shortcut menu. The **Select Package Template** page appears.
2. Select the Package Template.
3. Select **Package Template Version**, **Include Associated Artifacts**, **Include Child Artifacts**, **Include Security Artifacts**, and **Include the automatically generated SQL Script**.
4. Click **Next**. The **Add to Package Template** page appears.
5. In the **Configuration** section, click **Additional Package Files**.

   The **Additional Package Files** page appears on the right pane.
6. Select the option **Disable adding custom files to the package** as **Yes**, if you do not want to include the individual artifact's custom dependent files and additional files while generating the package.

   The custom dependent files and additional files will be visible in the Settings page. But these files will not be included while generating the package.
7. Click **+** icon to add and configure the additional package files and the installer files.

   Note: Configuring additional package files is optional. You need not configure additional package files prior to configuring the Installer Files.

   a. To configure the additional package files, enter the following details:
      a. **Source Files**: Enter the location of the package file.
      b. **Install in Global Assembly Cache**: Select **Yes** to install custom dependent files in the GAC of the target environment.

   b. To configure the installer files, enter the following details:
      a. **Installer File Path**: Enter the location of the installer file.
      b. **Command Line Parameters**: Enter the command line parameters for the installer file.
      c. **Disable Execution**: Select the check box to skip execution of the Installer File. (This option is available only in Manage Package feature.)

   For more information on configuring the Installer Files, see Configure Settings for Installer Files.
8. Click **Save Settings**.
9. Click **Save Template**.

   The package template settings are saved.

   Note: Ensure that the File Path specified is accessible to IIS_IUSRS.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configure Settings for Installer Files

The **Installer Files** has an unique set of configuration settings required to install, update, and uninstall the installer files.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window (can view and edit the configuration settings)
- **Target Environment > Manage Package** window (can only view the configuration settings)

You can define the configuration settings of the Installer Files and set the properties to take appropriate actions while installing, updating, or uninstalling the package.

You can also set the execution timeout for the Installer Files. The execution timeout can be set between 120 to 100000 seconds. The timeout set as 0 second means no timeout is set.

During package installation, if one of the installer file execution is timed out, the package installation stops. To install the package again, set the appropriate timeout to execute the timed out installer files.

As a best practice, each installer file execution should complete within 120 seconds.

During install or update of the package,

- the installer files configured are executed prior to the installation of the artifacts in the package. However, during uninstallation, the installer files are removed after the artifacts are removed/uninstalled.
- if any of the installer file execution times out, the package installation or update stops. Also the subsequent installer file is not executed and the artifacts are not installed or updated.

During uninstall, the installer files are removed after the artifacts are uninstalled/removed and if any of the installer file execution times out, the subsequent installer files are not removed.

During package template generation, the installer file certificate is validated online. So, make sure that the internet connectivity is available on the Server where package template is generated.

Note:
- The installer files which were already executed will not be rolled back, even if the next installer file execution exceeds timeout.
- The timed out installer files will be still running in the background. Make sure that the execution of the timed out installer files is completed before importing or executing any other package.
- The package can be generated only if it contains the installer files signed with valid and trusted certificate.
- Make sure that the firewall does not block the Online Certificate Status Protocol (OCSP) request. The OCSP is used for obtaining the revocation status of the digital certificate.
- For Load Balanced Server, make sure all the servers are online while installing the installer files.

Sample of the Installer File:

*msiexec.exe /i "C:\Example.msi" /qn /norestart /L*V "C:\package.log"* where,

- */i* is install option (possible options are /a for install, /x for uninstall, and /update for update)
- *%INSTALLERFILEPATH% /qn /norestart* gets added during msi execution (*%INSTALLERFILEPATH%* is the place holder for installer file location)
- */L*V "C:\package.log"* is optional

You need to enter *"C:\Example.msi* in the **Installer File Path** text box and */i %INSTALLERFILEPATH% /qn /norestart*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

gets populated in the **Command Line Parameters** text box. You can further enter */L*V "C:\package.log"* (optional) in the **Command Line Parameters** text box

Note:
- In the **Command Line Parameters** text box, */i %INSTALLERFILEPATH% /qn /norestart* is the default parameter and is automatically taken by the system even if deleted. You cannot overwrite it. The *%INSTALLERFILEPATH%* is the place holder for the location of the Installer File.
- If the Installer File is placed on the your machine desktop, the path location will not be fetched and the package cannot be generated.
- You can add only 5 rows for the Installer Files under each tabs (Install, Update, and Uninstall).

Install

Use this tab to set the configurations for Installer Files while installing the package.

- **Installer File Path**: Enter the location of the installer file. For example, *C:\Example.msi*
- **Command Line Parameters**: Enter the command line parameters for the installer file. The default parameter is */i %INSTALLERFILEPATH% /qn /norestart*
- **Disable Execution**: Select the check box to skip execution of the installer files. By default, it is unchecked.

Update

Use this tab to set the configurations for Installer Files while updating the package.

- **Installer File Path**: Enter the location of the installer file. For example, *C:\Example.msi*
- **Command Line Parameters**: Enter the command line parameters for the installer file. The default parameter is */i %INSTALLERFILEPATH% /qn /norestart REINSTALLMODE=amus*
- **Disable Execution**: Select the check box to skip execution of the installer files. By default, it is unchecked.

Uninstall

Use this tab to set the configuration of the Installer File when the package is being uninstalled from the target environment.

- **Installer File Path**: Enter the location of the installer file.
- **Command Line Parameters**: Enter the command line parameters for the installer file. The default parameter is */x %INSTALLERFILEPATH% /qn /norestart*
- **Disable Execution**: Select the check box to skip execution of the installer files. By default, it is unchecked.

The table shows the status of the package before and after the execution of the package in case of timed out execution.

Operation	**Package Status**	
Before Execution	**After Execution**	
Install	Not installed	Not installed

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Operation	Package Status	
	Installed	Installed
	Updated	Updated
	Uninstalled	Uninstalled
Uninstall	Not installed	Not applicable
	Installed	Uninstalled
	Updated	Uninstalled
	Uninstalled	Uninstalled

Additional Settings

The following are the additional configuration settings for a package template:

- Validate connections
- Validate SQL scripts
- Execute SQL scripts
- Create package template

Validate Connections

The **Validate Connections** option allows you to validate all the connections in the package. This validation can be performed before the package is installed or updated. This option is available in the **Additional Settings** pane in the **Add to Package Template** and/or **Edit Package Template** pages.

For example: If you want to install a Package that has multiple database connections, then all the database connections are validated before the package is installed.

To validate database connections

1. Select and right-click the artifact that you want to package, and then click **Add to Package Template** on the shortcut menu. The **Select Package Template** page appears.
2. Select the Package Template.
3. Select **Package Template Version**, **Include Associated Artifacts**, **Include Child Artifacts**, **Include Security Artifacts**, and **Include the automatically generated SQL Script**.
4. Click **Next**. The **Add to Package Template** page appears.
5. In the **Configuration** section, click **Additional Settings**.

   The **Additional Settings** page appears on the right pane.
6. For the **Validate Database Connections** property, select one of the following:
   - **Yes**: Select this option if all the database connections in the package must be validated before the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

package is installed or updated. The default value is **Yes**.

- **No**: Select this option if all the database connections in the package need not be validated before the package is installed or updated. Select this option only when all the database connections in the package are valid.

7. Click **Save Settings**.
8. Click **Save Template**.

   The package template settings are saved.

Validate SQL Scripts

The **Validate SQL Scripts** option allows you to validate the SQL scripts for SDL-related keywords in the package. This validation can be performed before the package is installed or updated. This option is available in the **Additional Settings** pane in the **Add to Package Template** and/or **Edit Package Template** pages.

For example: If you want to install a Package that has multiple SQL scripts, then all the SQL scripts are validated before the package is installed.

To validate SQL scripts

1. Select and right-click the artifact that you want to package, and then click **Add to Package Template** on the shortcut menu. The **Select Package Template** page appears.
2. Select the Package Template.
3. Select **Package Template Version**, **Include Associated Artifacts**, **Include Child Artifacts**, **Include Security Artifacts**, and **Include the automatically generated SQL Script**.
4. Click **Next**. The **Add to Package Template** page appears.
5. In the **Configuration** section, click **Additional Settings**.

   The **Settings** page appears on the right pane.
6. For the **Validate SQL scripts** property, select one of the following:
   - **Yes**: Select this option if all the SQL scripts in the package must be validated before the package is installed or updated. The default value is **Yes**.

     If this option is selected, then the **Validate SQL Scripts** button is enabled in the **Settings** form of each of the following artifacts, and the SQL scripts for these artifacts can be validated.

     - Database Connection
     - Database Activity
     - Custom Queue
     - Database Query Lookup
     - Procedure Lookup
     - Custom List

     If you edit the settings for an artifact and click any other tree node, the SQL script is validated. If there are no restricted keywords, settings will be cached and the focus will be moved to the newly selected tree node.

     However, if there are no restricted keywords, then the settings will not be cached. Also, you will neither be allowed to select another tree node nor save the package template.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **No**: Select this option if all the SQL scripts in the package need not be validated before the package is installed or updated. Select this option only when all the SQL scripts in the package are valid.

  If this option is selected, then the **Validate SQL Scripts** button is disabled in the **Settings** form of each of the above-mentioned artifacts, and the SQL scripts for these artifacts are not validated.

  If you edit the settings for an artifact and click any other tree node, the settings will be cached. The SQL script is not validated.

  Note: If you do not want to validate SQL scripts, then it is recommended to set the value of the **Validate SQL scripts** property to **No** while creating a package template, and then add the required artifacts to the package template.

7. In the **Settings** page, click **Save Settings** and then click **Save Template**.

   The package template settings are saved.

Execute SQL Scripts

The **Execute SQL Scripts** option allows you to execute the SQL scripts available in the package. This option is available in the **Additional Settings** pane in the **Add to Package Template** and/or **Edit Package Template** pages.

You can execute the SQL scripts for the following artifacts.

- Database Connection
- Database Activity
- Custom Queue
- Database Lookup
- Procedure Lookup
- Custom List
- Manage List

To execute SQL scripts

1. Select and right-click the artifact that you want to package, and then click **Add to Package Template** on the shortcut menu. The **Select Package Template** page appears.
2. Select the Package Template.
3. Select **Package Template Version**, **Include Associated Artifacts**, **Include Child Artifacts**, **Include Security Artifacts**, and **Include the automatically generated SQL Script**.
4. Click **Next**. The **Add to Package Template** page appears.
5. In the **Configuration** section, click **Additional Settings**.

   The **Additional Settings** page appears on the right pane.
6. For the **Execute SQL scripts** property, select one of the following:
   - **Yes**: Select this option if you want to execute all the SQL scripts in the package before installing or updating the package. The default value is **Yes**.
   - **No**: Select this option if you do not want to execute all the SQL scripts in the package before installing or updating the package.
7. In the **Settings** page, click **Save Settings,** and then click **Save Template**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The package template settings are saved.

Create Package Template

The **Create Package Template** option allows you to create package template from the **Manage Package** page. The package template with the same name as the installed package, will be created in the **Package Template** window.

Note: When you want to create package template from a package having a list item enabled with security group, the security group will not be added to the package template.

In the **Additional Settings** of the **Edit Package Template** window, there is an option to choose to display **Create Package Template** option in the shortcut menu of the **Manage Package** page.

To choose the options available in the Additional Settings

1. Select and right-click the artifact that you want to package, and then click **Add to Package Template** on the context menu.

   The **Select Package Template** page appears.
2. Select the package template.
3. Select **Package Template Version**, **Include Associated Artifacts**, **Include Child Artifacts**, **Include Security Artifacts**, and **Include the automatically generated SQL Script**.
4. Click **Next**. The **Add to Package Template** page appears.
5. In the **Configuration** section, click **Additional Settings**.

   The **Additional Settings** page appears on the right pane.
6. For the **Create Package Template** property, select one of the following:
   - **Yes**: Allows you to create package template from the **Manage Package** page.
   - **No**: The **Create Package Template** option will not be available in the shortcut menu of the **Manage Package** page.

   The default value is **No**.
7. Click **Save Settings**.
8. Click **Save Template**.

   The package template settings are saved.

The package template will be created from the manage package definition. If you make any changes in the artifacts, the changes will not be reflected in the package template. In that case, use **Rebuild** option to get the changes. The version of the artifacts varies from the original package template.

The **Rebuild** option in the tree view appears irrespective of the artifact modified or not.

While creating a package template, the latest version of artifact available in the target environment will be displayed in the tree view of the version list artifact. If the package is not rebuilt, the artifact which was installed by the package will be added to the package template. However, the tree view displays the latest version of the artifact. If you rebuild the package, the artifact version displayed in the tree view is added to the package template.

If you create an artifact with different version, after the package template is created, then the artifact version displayed in the tree view will be considered, even if you rebuild the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: The **Create Package Template** option will be available in **Manage Package** page only if the option **Create Package Templates** is selected as **Yes** under **Additional Settings** in the Source Environment.

Consider that you create a package template from **Manage Package** page with **Runtime Initialization Settings** configured. When you install the package template, the form which is configured in Runtime Initialization Settings will be installed in the target environment in **Draft** status. You need to publish the form to utilize it in the package template created from the **Manage Package** page.

Note: In case the form already exists in the target environment, another form is created with the next major version in the **Draft** status and will get updated in the Package Template.

The **Create Package Template** option will be available only for the following package status:

Package Status	Allow to Create Package Template
Installed	Yes
Updated	Yes
Uninstalled	No
Not installed	No
Not Imported	No

Artifact Level Configuration Settings

In AVEVA Work Tasks, you can configure, rebuild, or delete artifacts of a package template.

Configure the Artifacts

The **Settings** tab and the **Install**, **Update**, and **Uninstall** sub tabs in the **Package Template** page allow you to set the properties for each of the artifacts added to the Package Template. Every single artifact has its own unique properties that you can configure based on the requirement. These properties decide the behavior of the artifacts while installing, updating or uninstalling the package.

The **Associated Artifacts** and the **Child Artifacts** tab is available only if the child and associated artifacts are added to the Package template.

To configure the artifacts within the package template

1. Select the artifact that you want to package and add it to a package template. The **Add to Package Template** page appears.
2. Expand **Package Template** under the **Configuration** section and set the **Prerequisite** and **Runtime Initialization Settings**.
3. Select the artifact for which you want to configure the properties.

   All similar artifacts will be grouped under one heading. For example: All Database Connections within the Package Template will be grouped under **Database Connections**, similarly all Lookups will be grouped under the heading **Lookup Settings**. The **Settings** tab along with its **Install**, **Update**, and **Uninstall** sub tabs appears on the right side of the page. The following section gives you in-depth knowledge of the properties in each of the **Install**, **Update**, and **Uninstall** tabs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The properties of the **Database Connection** artifact is explained in the **Install**, **Update**, and **Uninstall** tabs.

Settings

Install: The settings in this tab are referred when you install the Package.

- **Connection Exists**: This property allows you to take appropriate action when the Database Connection present in the package is already present in the target environment.
  - **Install to overwrite existing Connection**: select this option if you want to use the database connection that is present in the target environment.
  - **Do not install Connection**: select this option if you want to overwrite the database connection that is present in the target environment with the one that is present in the packaged.
- **Connect To Repository Data Source**: Using this property you can choose to use the current repository's connection string or choose a different connection string.
- The **Connect To Repository Data Source** option in the **Source** section allows you to view the connection string that is used in the source environment.
- The **Connect To Repository Data Source** option in the **Target** section allows you to edit the connection string of the target environment. You can either select Yes or No.
  - **Yes**: Select this option if you want to open the database connection using the current source repository's connection string.
  - **No**: Select this option if you want to define a new connection string.

Update: The settings in this tab are referred to when the same Package is installed for the consecutive time.

- Delete Connection: Select this option if you want to delete the Connection that is present in the target environment.
  - **Yes**: Select this option to remove the Connection in the target environment. On selection of this option, the property **Connection Is Modified** appears. For more information, refer to the following table:

Connection Is Modified	Retain	Select this option if you want to retain the Connection along with the modifications, in the target environment.
	Rollback	Select this option if you want to roll back to the original state. All modifications that were done to the Connection after it was installed in the target environment will be reverted and the connection will be retained.
	Delete	Select this option if you want to delete the Connection from the target environment when uninstalling the Package.

  - **No**: Select this option if you want to retain the Connection in the target environment. On selection of this option, the property **Connection Exists** and **Associated Artifacts not present** appears. For more

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

information, refer to the following table:

Connection Exists	Use Existing Connection	Select this option if you want to use the Connection that is present in the target environment.
	Do not update Connection	Select this option if you want to overwrite the Connection that is present in the target environment with the one that is currently being packaged.
Associated Artifacts not present	Update Connection	Select this option if you want to update the Connection.
	Do not update Connection	Select this option if you want to do not want to update the Connection as associated artifacts are not present.

- **Connect To Repository Data Source**: Using this property, you can choose to use the current repository's connection string or choose a different connection string.

  Note: The **Connect To Repository Data Source** option in the **Source** section allows you to view the connection string that is used in the source environment. The **Connect To Repository Data Source** option in the **Target** section allows you to edit the connection string of the target environment.

  - In the **Target** > **Connect To Repository Data Source** section, if **Yes** is selected then the database connection will be connected using the current repository's connection string.
  - In the **Target** > **Connect To Repository Data Source** section, if **No** is selected, then you can define a new connection string. For more information about defining a new connection, see Database Connection.

Uninstall: This settings in this tab is referred to when the Package is being uninstalled in the target environment.

- Delete Connection: This property allows you to decide if you want to retain or delete the Database Connection in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option if you want to delete the Database Connection from the target environment when the Package is uninstalled.
  - **No**: Select this option if you want to retain the Database Connection in the target environment even after the Package is uninstalled.
- **Connection Is Modified**: This option allows you to decide if you want to retain, roll back to original state or delete the Database Connection in the target environment even after the Package is uninstalled.

  Note: This property is applicable only if **Delete Connection** is set to **Yes** and the connection is modified.

  - **Retain**: Select this option if you want to retain the Database Connection along with the modifications in the target environment even after the Package is uninstalled.
  - **Roll back to original State**: Select this option if you want to roll back to the original state, reverted and the connection will be retained.
  - **Delete**: Select this option if you want to delete the Database Connection from the target environment

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

when uninstalling the Package.

Associated Artifacts

The Associated Artifacts tab is disabled for Database Connection artifact as it cannot have any associated artifacts.

Child Artifacts

The Child Artifacts tab is disabled for Database Connection artifact as it cannot have any child artifacts.

Rebuild the Artifacts

You can use the **Rebuild** option available on the shortcut menu of the modified artifact to get the latest definition of the artifact in the package template. When an artifact is rebuilt, the latest definition of the artifact is packaged. Associated artifacts, child artifacts, security artifacts, and automatically generated SQL scripts are also added based on the initial configuration settings of the artifact.

Rebuild

- An **orange icon** appears near the artifact indicating that the artifact is modified after it was added to the package template.
- In the shortcut menu, the **Rebuild** option is available only if the artifact is modified after it was added to the package template.
- After the artifact is rebuilt, a **green icon** appears indicating the artifact has been updated.
- If an artifact is disabled or deleted, then a **red icon** appears near the artifact.
- When an artifact is rebuilt, if any additional associated artifacts are found it will be added to the package template. However, associated artifacts present in the package template are not deleted or overwritten. For more details, see the scenario below.
- When an artifact is rebuilt, child artifacts are not rebuilt.

To rebuild the artifacts in the Package Template

1. In the **Enterprise Console**, click menu icon, click **Package**, and then click **Package Template**.
   The Package Template page appears which displays the list of available package templates.
   For information about creating a package template, see Create a Package Template.
2. Select a package template, and click **Edit** on the action menu.
   Alternatively, right-click a package template, and then click **Edit** on the context menu.
   The Edit Package Template page appears.
3. Click Save & Continue.
   The Edit Package Template page appears.
4. Right-click an artifact with an orange icon beside it, and then click **Complete Rebuild** or **Activity Rebuild** from the shortcut menu.
   A confirmation message about the rebuild appears.
5. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Repeat the process for all artifacts that needs to be rebuilt.
7. Click **Save Template** to save all the changes made to the template.

   The artifacts will be rebuilt and the latest definition of the artifacts will be updated in the package template.

Scenario

1. Create a Database Lookup on May 25, 2012, as explained:
   a. Enter **Title** as **TelematicsDBLookup**.
   b. Give a description to the Database Lookup.
   c. Select **Database Connection** as **TelematicsProductionDB**.
   d. Enter **Query** as **Select * from SWExecute Where ID=1**.
   e. Enter **Value**, **Display Name** and save the Database Lookup.
2. Add TelematicsDBLookup to a Package Template, **TelematicsDatabasePackage**.
3. On June 01, 2012, edit **TelematicsDBLookup** as follows:
   a. Change Database Connection to **TelematicsProductionDB2**
   b. Change the query as **Select * from SWExecute**.
4. On the June 02, 2012, edit the package template **TelematicsDBLookup**.

   An orange icon appears beside **TelematicsDBLookup** indicating that the definition has been updated after the lookup was added to the Package Template.
5. To get the latest definition of the Database Lookup, right-click *TelematicsDBLookup,* and then select **Rebuild** from the shortcut menu.

   A confirmation message appears.
6. Click **OK**.

   A confirmation message about the rebuild appears.
7. Click **OK**.
8. Verify the changes in the **Package Template** page.
   - A green icon appears beside *TelematicsDBLookup* indicating that the latest definition is updated in the Package Template.
   - The associated artifact *TelematicsProductionDB2* is also added to the Package Template. However, *TelematicsProductionDB* is not removed from **Package Template** > **Artifacts** > **Database Connections** even though it is not associated to the *TelematicsProductionDB2*.
9. Click **Save Templates** to save all the changes made to the artifacts.

Note:

- When an artifact, for example, a form is added to a package template, its associated artifacts are also added to the package template. If you delete an artifact from the form, and then perform a complete rebuild on the same package template, the deleted artifact is removed from the package template. However, the associated artifacts of the deleted artifact are retained in the package template. For example, consider that a form contains a database lookup, and this form is added to the package template. Now, if the database lookup artifact is deleted from the form, and if the package template is rebuilt again, though the database lookup is removed, its associated artifacts, such as the database connection is retained in the package template.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- In the **Associated Artifacts** tab of Database Lookup **TelematicsDBLookup**, the database connection **TelematicsProductionDB** will not be listed as it is not associated to database lookup.

Delete the Artifacts

You can delete the artifacts added to a Package Template by using the **Delete** option available on the shortcut menu of the artifact within the **Package Template** page.

To delete the artifact from the Package Template

1. Access the **Package Template** page.
2. Navigate to **Configuration** > **Package Template** > **Artifacts**.
3. Right-click the artifact that you want to delete and then select Delete from the shortcut menu.
4. A confirmation message appears.
5. Click **OK**.
6. Click **Save Templates** to save the changes done.
7. The artifact is removed from **Configuration** > **Package Template** > **Artifacts**.

Save Package Template

When you add new artifacts to a package template or edit an existing package template, you have to save the package template. This will ensure that the newly added artifacts and the modified settings of the package template are saved.

You can edit the following global and/or artifact level settings:

- Global Settings
  - Prerequisite
  - Runtime Initialization Settings
  - Additional Package Files
  - Additional Settings
- Artifacts

To save Global Settings

1. If you are adding artifacts to a package template, open the **Add to Package Template** dialog box.

   Or

   If you are editing an existing package template, then open the **Edit Package Template** dialog box.
2. Edit the global settings in the required tree node.
3. Click **Save Settings**.
4. Click **Save Template**.

   The changes to the package template are saved successfully.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To save settings for artifacts

1. If you are adding artifacts to a package template, open the **Add to Package Template** dialog box.

   Or

   If you are editing an existing package template, then open the **Edit Package Template** dialog box.
2. Select the artifact for which you want to edit the settings.
3. Edit the settings.
4. Click **Save Template**.

   The changes to the artifacts are saved successfully.

   Note: If you have edited the settings for an artifact and if you click any other tree node, the changes are saved in cache. Click **Save Template** to save these changes in the database.

To validate SQL Scripts

If there is a SQL script generated for the current artifact, the SQL script will be validated when you perform either of the following:

- Click any other tree node.
- Click the **Save Template** button.

The SQL server validation is performed based on the configuration defined for the **Validate SQL scripts** option in **Additional Settings** page.

For more information about validating SQL scripts, see Validate SQL Scripts.

Note: In System Platform IDE, while configuring Data Grid, the **Column Settings** window and the **Edit Operations Settings** window may not appear as expected. Resize the windows to get the proper view.

Publish a Package Template

You must publish and generate a package template before exporting it. You cannot edit or update a package template after publishing.

To publish a package template

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, point to **Package**, and then click **Package Template**.

   The Package Template page appears.
3. Select the package template that you want to publish, and then click **Publish**.

   Alternatively, right-click the package template that you want to publish, and then select **Publish** from the short-cut menu.

   A confirmation message about successfully publishing the package template appears.
4. Click **Close**.

   The package template status of the package changes to **Published** in the Package Template page.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Unpublish a Package Template

A Package Template that has a status of Published, Generated, or Exported can be unpublished to modify the configuration settings, prerequisites, modify, delete, or add new artifacts.

To unpublish a package template

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, point to **Package**, and then click **Package Template**.

   The Package Template page appears.
3. Select the package template that you want to unpublish, and then click the **Unpublish**.

   A message about successful unpublishing of the package template appears.

   Alternatively, right-click the selected package template, and then select the **Unpublish** option from the shortcut menu. The **Unpublish** option is available on the shortcut menu only if the Package Template is published.
4. Click **OK**.

   The Package Template is unpublished and the status of the Package Template is changed to **Draft**.

Generate a Package Template

You can generate a package template to create package file that can be exported from an existing Package Template. The Generate option creates a package file with an extension **.awsPKG**.

To generate a package template

1. In the **Enterprise Console**, click menu icon, point to **Package**, and then click **Package Template**.

   The **Package Template** page appears.
2. Select the package template that you want to generate, and the click the **Generate**.

   The **Generate** dialog box appears with a message about the successful generation of the package file.

   Alternatively, you can right-click the selected package template, and then select the **Generate** option from the shortcut menu.
3. Click **OK**.

   The **.awsPKG** file for the selected package template is created. You can export this package file.

   If the artifacts present in the package are modified after it was added to the package, the **Generate** dialog box alerts the user before generating the package file.

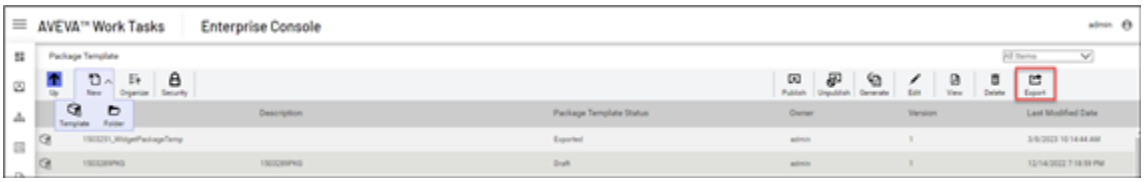
   Note: When the source file path specified in the **Package Template** is invalid or the source file is missing, the **Package Template** cannot be generated. In such cases, correct the filename or file path in the **Settings** tab of the respective artifact

Export a Package Template

Use the **Export** option to export and save the **.awsPKG** file generated from a package template to a location that

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

you want.



To export a package template file

1. In the **Enterprise Console**, click menu icon, click **Package**, and then click **Package Template**.
   The **Package Template** page appears.
2. Select the required package template, and then click the **Export** icon on the action bar.
   A confirmation message to export the package template appears.
   Alternatively, right-click the selected package template, and then select **Export** in the shortcut menu.
3. Click **OK** to export the package template, else click **Cancel**.
4. Provide the location information to save the **.awsPKG** file, and then save the file.
   A confirmation message about the successful export appears.
   The **.awsPKG** for the selected package template is saved in the specified location.

Note:

- The exported package file name format is **RepositoryName_PackageTemplateName_PackageTemplateVersion_TargetPlatform.awsPKG**.

- You can export package templates with status **Generated** or **Shipped** only.

- When you export a package template that is in **Draft** status, the system automatically publishes and generates the package template before exporting the same. Similarly, when the package template is in **Published** status, the system automatically generates the package template before exporting the same.

- You can import an exported package template from source environment to the target environment. For more information about importing a package, see Import a Package.

Mark Package Template as Shipped

You can mark exported Package Template files to "Shipped" using the **Mark as Shipped** option on the shortcut menu. This enables you to track all the package templates that were shipped. Before marking a package template as "Shipped", ensure that the package template is published, generated, and exported.

To mark a Package Template as shipped

1. In the **Enterprise Console** , click menu icon, point to **Package**, and then click **Package Template**.
   The **Package Template** page appears.
2. Right-click the selected package template, and then select the Mark as Shipped option on the shortcut menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The status of the Package Template changes to **Mark as Shipped**.

You can import a Package Template that you have exported from source environment to the target environment.

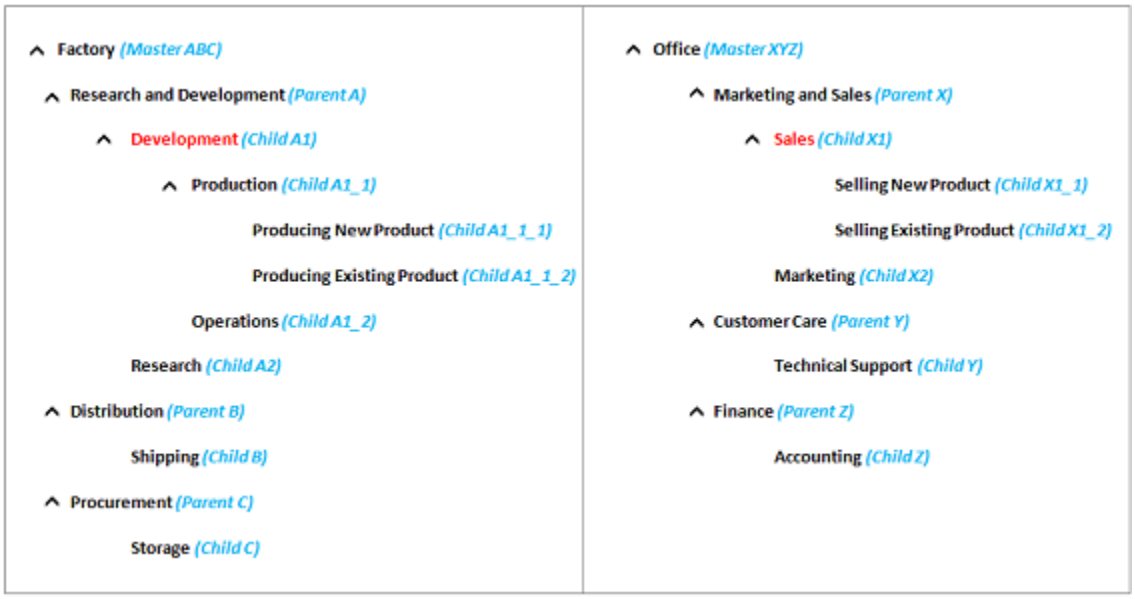
Note: You cannot edit package templates that are marked as "Shipped".

Include Associated and Child Artifacts to a List Item

When you are packaging a list item, you can include any one or both of the following:

- **Associated artifacts**: Following are considered as associated artifacts for the item to be packaged:
  - The parent item of the item to be packaged.
  - The artifacts on which the item to be packaged has a dependency upon.
- **Child Artifacts**: The direct child items/folders of the item to be packaged. If the direct child has child items, then these child items are also included in the package. Therefore, all the child items, under the item to be packaged, are included in the package.

For example: Consider the folder structures with the following hierarchy.



Let us consider that you want to package "Development", which has a dependency on "Sales".

The following table describes the various scenarios based on the selection of "Include Child Artifacts" and "Include Associated Artifacts" options.

Include Child Artifacts	Include Associated Artifacts	Folders/Artifacts selected along with "Development"
No	No	Only "Development" is selected.
No	Yes	- Factory - Research and Development - Office

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Include Child Artifacts	Include Associated Artifacts	Folders/Artifacts selected along with "Development"
		- Marketing and Sales - Sales
Yes	No	- Production - Producing New Product - Producing Existing Product - Operations
Yes	Yes	- Factory - Research and Development - Production - Producing New Product - Producing Existing Product - Operations - Office - Marketing and Sales - Sales - Selling New Product - Selling Existing Product

You can create child artifacts for the following lists. Therefore, the above scenario is applicable only to these lists.

- Workflow
- Forms
- ArchestrA Events
- Forms Controls
- Navigation List
- Assembly list
- Manage list
- Lookup
- Grid Configuration
- Reports
- Security Rights

Let us consider another example where the folder structures have the following hierarchy.

Let us consider that the artifact to be packaged is "Form A", which has a dependency on "Lookup A" and "Workflow A" and that "Workflow A" in turn has dependency on "Workflow X".

The following table describes the various scenarios based on the selection of "Include Child Artifacts" and "Include Associated Artifacts" options.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Include Child Artifacts	Include Associated Artifacts	Folders/Artifacts selected along with "Development"
No	No	Only "Form A" is selected.
No	Yes	- Main Form - Form AB - Main Lookup - Lookup AB - Lookup A - Main Workflow - Workflow AB - Workflow A - Workflow XY - Workflow X
Yes	No	- Form A1 - Form A2
Yes	Yes	- Main Form - Form AB - Form A1 - Form A2 - Main Lookup - Lookup AB - Lookup A - Lookup A1 - Lookup A1_1 - Lookup A1_2 - Lookup A2 - Main Workflow - Workflow AB - Workflow A - Workflow A1 - Workflow A2 - Workflow XY - Workflow X - Workflow X1

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Include Child Artifacts	Include Associated Artifacts	Folders/Artifacts selected along with "Development"
		- Workflow X2

To include associated and child artifacts to a List Item

1. Select and right-click the artifact that you want to package, and then click **Add to Package Template** on the shortcut menu. In the **Select Package Template** page, select the **Package Template**.

   Or

   Create a new package template. For more information about creating a package template, see Creating a Package Template.
2. In the **Include Associated Artifacts** section, perform the following:
   - Select **Yes** to package all the associated artifacts of the selected artifact. For example, for the Database Lookup example here, if you select Yes, the associated database connection is also added to the package template. The associated artifact of the database lookup is a database connection.
   - Select **No** to exclude the associated artifacts of the selected artifact. For example, for the Database Lookup example here, if you select No, the associated database connection is not added to the package template.
3. In the **Include Child Artifacts** section, perform the following:
   - Select **Yes** to package all the child artifacts of the selected artifact. Here, the child artifacts of the associated artifact is also added to the package template. For example, if Database Lookup has child lookups, the child lookup can also be packaged by selecting Yes.
   - Select **No** to exclude the child artifacts of the selected artifact from the Package Template.
4. Click **Save Template**.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Include Security Artifacts

Complete the following tasks to include the list item level security of an artifact to the package template:

Prerequisite

Enable the security settings for an artifact/list item that you want to package.

1. In the List Item page, click **Security** on the Action bar.

   Or

   In the List Item page, right-click the artifact and select **Security Settings** from the context menu.
2. In the **Security** window, go to **Advanced Settings** tab, and click **Enable List Item specific security**.

   The **Enable Security Wizard** dialog box appears.
3. Select **Security Group Customization**.
4. Publish the artifact.

For more information about enabling security at list item level, see the *Enabling Security at ListItem Level* section in the *User Guide*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To include security artifacts

1. Select and right-click the artifact that you want to package, and then click **Add to Package Template** on the shortcut menu. In the **Select Package Template** page, select the **Package Template**.

   Or

   Create a new package template. For more information about creating a package template, see Creating a Package Template.
2. In the **Include Security Artifacts** section, perform one of the following:
   - **Yes**: Select this option if you want to include the list item level security artifacts in the package template.
   - **No**: Select this option if you do not want to include the list item level security artifacts in the package template.
3. Click **Save Template**.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Include Automatically Generated SQL Script

You can include the automatically generated SQL script to the package template for the following artifacts:

- Database Lookup
- Manage List pointing to existing table
- Custom Queue
- Workflow with Database activity

To include the automatically generated SQL script

1. Select and right-click the artifact that you want to package, and then click **Add to Package Template** on the shortcut menu. In the **Select Package Template** page, select the **Package Template**.

   Or

   Create a new package template. For more information about creating a package template, see Creating a Package Template.
2. In the **Include the automatically generated SQL Script** section, perform one of the following:
   - **Yes**: Select this option if you want to include the automatically generated SQL Script for the artifact to the package template.
   - **No**: Select this option if you do not want to include the automatically generated SQL Script for the artifact to the package template.
3. Click **Next**. The **Add to Package Template** page appears.
4. In the **Configuration** section, click the artifact. The **Settings** page appears on the right pane.
5. In the **Install** tab:
   - The automatically generated SQL Script is displayed by default in the **SQL script** box, if the value of the **Include the automatically generated SQL Script** option is set to **Yes**.
   - The **SQL script** box is blank, if the value of the **Include the automatically generated SQL Script** option is set to **No**. If required, enter the SQL Script in the **SQL script** box.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Click **Save Template**.

For more information about adding artifacts to Package Template and validating SQL scripts, see Adding Artifacts to a Package Template and Validate SQL Scripts respectively.

Manage Package

You can use the **Manage Package** list in the target environment to import packages that are exported from the package template of the source environment. You can then install, update, or uninstall the package in the target environment.

Note: Consider the repository with a **Blue** theme, and a Form Link is packaged from this repository. When you install the package in the target environment with a **Lite** theme, the Form Link icon will reflect the colors representing the **Blue** theme of the source repository and not the **Lite** theme of the target repository.

Action Executables in Ribbon bar

The following table lists the icons of all the actions that you can perform from the ribbon of the **Manage Package** window:

Actions		**Description**
Up		To navigate from the current folder to the parent folder. This feature is helpful when you are accessing a folder within the package and you want to go back to the parent folder of Manage Package.
New	Import	To import a package file to the target environment. A package file has the extension **awsPKG**.
	Folder	To group and categorize the packages.
Organize		To organize the packages and group it in specific folders.
Security		To define security at the list item level.
Edit		To modify or delete the artifacts, modify the configuration of the artifacts, and the prerequisites.
View		To view the package details in read-only mode.
Delete		To delete the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Actions	Description
	You can delete packages that are in *Draft* status. You cannot delete a package after you install it.
Install	To run and install the imported package.
Uninstall	To uninstall the package.
History	To view the entries logged in history when a package is imported, installed, updated, and uninstalled.

Action Executables in Shortcut Menu

The following table lists the icons of all the actions that you can perform from the shortcut menu of the **Manage Package** window:

Options	Description
Edit	To modify or delete the artifacts, modify the target values, configuration state, and view the prerequisites.
View	To view the details of the selected package in read-only mode.
Install	To run and install the imported package.
Uninstall	To uninstall the package.
History	To view the entries logged in history when a package is imported, installed, and uninstalled.
Delete	To delete the package. You can delete packages that are in *Draft* status. You cannot delete a package after you install it.
Show All versions	To view all the versions of the selected package. This option is useful as the Manage Package list will display only the latest published version of the package.
Security Settings	To define security at the list item level.

Import a Package

You can execute and install package files that are imported to the **Manage Package** list in the target

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

environment. Use the **Import** option in the **Manage Package** list to import the **.awsPKG** file in the target environment. A package does not get imported, if any background msi runs in the target machine.

To import a package

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, point to **Package**, and then click **Manage Package**.

   The **Manage Package** page appears.
3. On the action bar, click **New**, and then click **Import**.

   The **Import Package** dialog box appears.
4. Browse to select the **Package File**.
5. Enter a description for the package file to be imported.
6. Click **Import**.

   The **Manage Package** list in the target environment displays the imported package. The status of the imported package is **Not Installed**. If you import the same package again, the package is saved with the next major version.

Manage Versions of a Package

You can create a new version of package by importing an existing package again in the **Manage Package** list of the target environment. When a package is imported again, the system prompts you to save the package as a next major version. This is beneficial if the package file has been updated with new artifacts or modifications are done to the artifacts and the configuration settings.

To save a package as next major version

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, point to **Package**, and then click **Manage Package**.

   The Manage Package window appears.
3. On the action bar, click **New**, and then click **Import**.

   The **Import Package** dialog box appears.
4. Click **Browse** to navigate to the location where the exported package file is saved.
5. Select a package file that is already imported and present in the target environment.
6. In the **Description** box, enter a description for the package file that is being imported.
7. Click **Import**.

   A confirmation message *about the package* already existing appears.
8. Click **OK**.

   A confirmation message successful package importing appears.
9. Click **OK**.

   The next major version of the package is created.

If all the versions of the package are in **Not Installed** status, the latest version appears in the Manage Package list. If one of the version is installed, then the installed version of the package appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Store Package Information for Lists

AVEVA Work Tasks Lists store package-related information for ListItems.

The following table describes the columns, which store the package-related information.

Column Name	Description
Additional Information	Displays the additional information specified while creating the package template.
Package Name (Version)	The name and version of the package.
Artifact Version	The version of the installed artifact.
Is Artifact Modified	Indicates whether the artifact is modified after package installation.

When a package created in the earlier versions is installed in the latest version, the **Additional Information** column will be blank.

These package-related columns are available for the following lists:

- Forms
- Workflows
- Database Connection
- Database Lookup
- Grid Configuration

  Note: The **Artifact Version** column is not applicable for Database Connection, Database Lookup, and Grid Configuration lists.

- In a List grid, only the **Package Name (Version)** column is displayed by default. If you want to include the other columns in the List grid, then you have to create a view, include the other columns in the list, and specify the order in which these columns must be displayed. The selected columns will be available as part of the List grid.

  For more information about creating a new view, see the *Creating a New View* topic in the *Forms and Lists User Guide*.
- Consider a ListItem which has package-related information. If you save this ListItem as next major, minor, or specific versions, then the value of the **Is Artifact Modified** column is set to **False**. The values of the other columns will be blank.
- Consider a ListItem, which was installed by a package. If you edit this ListItem, then all the package-related column values are retained. The value of the **Is Artifact Modified** column is set to **True**, indicating that the ListItem was modified after package installation.
- For ListItems installed by a package or created manually in Wonderware Skelta BPM 2017 or earlier, the column values will be blank. If you edit these ListItems, then the value of the **Is Artifact Modified** column is set to **False**.
- For manually created ListItems, the value of the **Is Artifact Modified** column is set to **False**. The values of the other columns will be blank.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The package-related columns provide the following information:

- The name of the package which installed the artifact.
- The name of the source repository of the package.
- Whether the artifact was manually modified after installation.

Scenario

For example, consider an application package named **Work Order Mgt** with version 1.0. The artifacts available in the package are listed in the following table.

Artifact Name	**Artifact Version**
WO Management Overview Form	2.0
Start Work Order Form	1.5
End Work Order Form	1.4
Pause Work Order Form	1.0

You import this package into a new repository named “Target Repository” and then install this package in the target environment.

The package-related information appears as shown in the following table.

Artifact Name	**Source Artifact Version**	**Additional Information**	**Package Name (Version)**	**Artifact Version**	**Is Artifact Modified**
WO Management Overview Form	1.0(*)	SE MES Software	Work Order Mgt (1.0)	2.0	False
Start Work Order Form	1.0(*)	SE MES Software	Work Order Mgt (1.0)	1.5	False
End Work Order Form	1.0(*)	SE MES Software	Work Order Mgt (1.0)	1.4	False
Pause Work Order Form	1.0(*)	SE MES Software	Work Order Mgt (1.0)	1.0	False

* indicates the "Latest" Form that will be used by the application.

When you save an artifact as the next version in the target environment, then the package-related information columns is displayed as blank values, as shown in the following table.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Artifact Name	Source Artifact Version	Additional Information	Package Name (Version)	Artifact Version	Is Artifact Modified
WO Management Overview Form	1.0	SE MES Software	Work Order Mgt (1.0)	2.0	False
	1.1				False
	1.2(*)				False
Start Work Order Form	1.0(*)	SE MES Software	Work Order Mgt (1.0)	1.5	False
End Work Order Form	1.0(*)	SE MES Software	Work Order Mgt (1.0)	1.4	False
Pause Work Order Form	1.0(*)	SE MES Software	Work Order Mgt (1.0)	1.0	False

* indicates the "Latest" Form that will be used by the application.

Note: The “Save artifact as next version” example is applicable only for Version Lists, such as Forms and Workflow.

When you edit any artifact in the target environment, then the value of the **Is Artifact Modified** column is set to “True” for the edited artifact, as shown in the following table.

Artifact Name	Source Artifact Version	Additional Information	Package Name (Version)	Artifact Version	Is Artifact Modified
WO Management Overview Form	1.0	SE MES Software	Work Order Mgt (1.0)	2.0	False
	1.1				False
	1.2(*)				False
	2.0	SE MES Software	Work Order Mgt (2.0)	3.0	False
Start Work Order Form	1.0	SE MES Software	Work Order Mgt (1.0)	1.5	False
	2.0(*)	SE MES Software	Work Order Mgt (2.0)	2.0	True
End Work Order Form	1.0	SE MES Software	Work Order Mgt (1.0)	1.4	False
	2.0(*)	SE MES Software	Work Order Mgt (2.0)	1.5	False
Pause Work	1.0	SE MES Software	Work Order Mgt	1.0	False

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Artifact Name	Source Artifact Version	Additional Information	Package Name (Version)	Artifact Version	Is Artifact Modified
Order Form			(1.0)		
	2.0(*)	SE MES Software	Work Order Mgt (2.0)	2.5	False

* indicates the "Latest" Form that will be used by the application.

Is Artifact Modified Column for Workflow

The **Is Artifact Modified** column is set to **True** when the workflow definition changes for a workflow, which was installed by a package.

This is applicable only when:

- The workflow is installed by the package and contains the package-related information.
- The workflow is modified for the first time.

Conditions when the Is Artifact Modified column is set to True

The **Is Artifact Modified** column is set to **True** when:

- The workflow design changes. For example: An activity is added, an existing activity is removed, property of an activity is modified, and so on.
- The workflow is edited.
- The workflow is imported.
- A task that modifies the workflow definition is selected from the Workflow Task list.
- An association for File Watcher or ArchestraA (ASB) Events, is created in the workflow.
- An ArchestraA Event is mapped from IDE to a workflow.
- An **Invoke Workflow** control is used in form.
- A form is associated to the workflow.

Note: When you create an association (for example, Scheduler), an XML variable named **WorkflowSchedulerXMLData** is created. Due to this, the workflow definition changes and the **IS Artifact Modified** column is set to **True**. However, if the workflow already contains this XML variable, then the value of the **IS Artifact Modified** column is retained as-is. This is also applicable for other associations to workflow.

Conditions when the Is Artifact Modified column is not updated

The **Is Artifact Modified** column is not updated when:

- The workflow is published or unpublished.
- The workflow is enabled or disabled.
- The workflow is locked or unlocked.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The owner of the workflow is changed.
- The security settings of the workflow are updated.
- BAM is configured.

Edit a Package

You can edit an imported package by using the **Edit** option on the action bar. You can edit the package to modify the configuration settings of the artifacts and the pre-defined behavior of the package at the time of installation.

To edit the package

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, point to **Package**, and then click **Manage Package**.

   The Manage Package page appears.
3. Select a package that you want to edit, and then click **Edit**.

   The **Edit Package** dialog box appears.

   Alternatively, you can right-click the selected package, and then select **Edit** from the shortcut menu.
4. Make the required changes such as, editing the configuration settings of the artifacts or viewing the prerequisites.
5. Click **Save**.

View Prerequisites of a Package

The **Prerequisite** option in the **Manage Package** page > **Configuration** displays the details of the packages that are required for installation prior to installing the current package. The Prerequisite option appears in the **Manage Package** page only if prerequisites are defined while designing the package template in the source environment.

Note: You cannot modify the prerequisites in the Manage Package page of a target environment.

Install a Package

Use the **Install** option in the Manage Package list to import, install, update, and uninstall the package. While running a package, you also have an option to modify the configuration settings and the pre-defined settings that determines the behavior of the installation.

Prerequisites

Before installing the package, ensure that the **Client Service** is running.

To run and install a package

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, point to **Package**, and then click **Manage Package**.

   The **Manage Package** page appears.
3. Select the package that you want to install, and then click **Install**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Alternatively, you can right-click the selected package, and then click **Install**.

The **Pre-install Validation and Configuration** page appears.

- If you have configured any Runtime Initialization settings, then the **Runtime Initialization Settings** form appears. You can update the runtime initialization values, if required. For more information about updating the runtime initialization values, see Update or modify the runtime initialization values.
- Click **Edit** to edit the configuration for any artifact, if required. For more information about editing a package, see Editing a Package Template.
- You can also reload the validation log messages for artifacts. For more information about reloading the validation messages, see the **Reloading the validation log messages for artifacts** section below.
- You can validate the log messages before proceeding with the installation. For more information about validating log messages, see Validate the log messages if present.
- The **Pre-install Validation and Configuration** page shows the count for **Errors**, **Warnings**, **Information**, and **All**. Click a category of message to view its related information. For example: If you want to view the warning messages, click **Warnings**.
- If the prerequisites of the package are not installed, the **Prerequisites** page appears which lists out all the prerequisites along with its status. To proceed with the installation, all the packages which are set as prerequisites must be installed.

Note:
- At this stage of the installation process (when the **Install** option is selected), if the artifact present in the package is already present in the target environment, a backup of the artifact as present in the target environment is taken.

4. Click **Install Package**.

   The **Package Installation** page appears.

   The progress of the package installation is displayed in the progress bar.

   After the package installation is complete, the status of each artifact and installer files (if applicable) is displayed.

   If there were any errors/warnings during the installation of any artifact, then the count of the errors, warnings, and information appears in this page.
5. Click the **Errors** / **Warnings** option to view the details.
6. Click **Close**.

   For more information about package history, see View Package History.

   The status of the package is updated as **Installed**.

Note:

- A package can be installed, updated, or uninstalled only by a repository administrator who is having the **Can Install** rights.

- If you package a form with custom controls, then you must install the custom control files (DLL files) in the target environment before installing the package.

Reload the validation log messages for artifacts

When you select an artifact and edit it before installing the package, the updated messages are displayed only for that artifact. However, if you edit other artifacts while editing the selected artifact, then the messages are

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

updated only for the selected artifact, and not for the other artifacts.

For example: Consider a scenario where “Package1” consists of three artifacts namely Database Connection, Grid Configuration, and Lookup Settings.

- Scenario 1: You select the Database Connection artifact and click **Edit**, and then you save the settings and the package. In this scenario, the updated messages for Database Connections are displayed and the Database Connection artifact is reloaded.
- Scenario 2: You select the Database Connection artifact and click **Edit**. You also edit some of the settings for the Grid Configuration and Lookup Settings artifacts in the respective **Settings** tab, along with the settings for Database Connection. After you save the settings and the package, only the updated messages for Database Connections are displayed. The messages related to Grid Configuration and Lookup Settings artifacts will be displayed in the **Pre-install Validation and Configuration** page, only after clicking **Reload**.

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, point to **Package**, and then click **Manage Package**.

   The **Manage Package** page appears.
3. Select the package that you want to install, and then click **Install**.

   Alternatively, you can right-click the selected package, and then click **Install**.

   The **Pre-install Validation and Configuration** page appears.
4. Click **Edit** to modify the settings of artifacts.
5. After all the changes are done for the artifacts, click **Save** to save the package.
6. Click **Reload**.

   The updated messages are displayed for all the edited artifacts and these artifacts are reloaded.

Configure the Package

Ensure to fulfill the installation prerequisites for the package for a successful configuration.

Package Installation - Prerequisites

While installing a package, if the prerequisites defined for the package are not installed, the **Package Installation** page appears. This page displays the list of all the packages which are set as prerequisites, along with the version number and the status.

Column Name	Description
Name	Name of the package which is set as prerequisite.
Version	The version of the package template as in the source environment.
Higher Version	Displays either Yes or No. • **Yes** appears if the option *Consider higher version if selected version does not exist in target*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Column Name	Description
	environment is selected, while designing the package template. • **No** appears if the option *Consider higher version if selected version does not exist in target environment* is not selected, while designing the package template.
Status	This column displays the following different statues: • **Installed**: This status appears when the prerequisite is installed in the target environment. • **Updated**: This status appears when the prerequisite is updated in the target environment. • **Uninstalled**: This status appears when the prerequisite is uninstalled in the target environment. • **Not Installed**: This status appears when the prerequisite is imported to the target environment but not installed. • **Not Imported**: This status appears when the prerequisite is not imported to the target environment.

Runtime Initialization Values

The **Runtime Initialization Values** is the first screen that appears while installing the package, wherein you need to enter the runtime initialization values if it not already entered while designing the package template or edit the existing values. This page does not appear if the Prerequisites of the package are not installed.

In this screen, you can edit the existing values if present or enter the required values. Click **Next** to proceed with the package installation.

Additional Package Files

While configuring the package, you can view the additional custom files and the installer files to be installed in the target environment.

Click **Additional Package Files** on the configuration tree view at the left hand side of the Add to Package Template window. The settings form appears where you can view the additional custom files and the installer files.

View Validation Log

The **Package Configuration** screen displays all the exceptions and validations found while installing the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The exceptions and validation messages are displayed in a grid and each line item of the grid represents an exception encountered due to which an artifact was not installed or a validation message which indicates the artifact was successfully installed.

You can validate the exceptions by clicking the **Edit** button available for every single line item in the **Package Configurations** grid.

To validate the exceptions

Consider that you have several exceptions to validate.

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, click **Package**, and then click **Manage Package**.

   The **Manage Package** page appears.
3. Select the package that you want to install, and then click **Install**.

   The **Package Configuration** page appears.

   Before installation, all the artifacts are validated based on the settings configured in the **Settings** form.

   The relevant messages are displayed in the **Package Configurations** grid.

   Note: All these validations are performed by the Client service.

View Package History

You can view the history of a package using the **History** option. An entry is logged in package history when a package is imported, installed, and uninstalled. The **Package History** page automatically appears when the package installation or uninstall is in progress. The records are displayed in reverse chronological order.

To view the history of a package

1. Log on to the Enterprise Console.
2. On the **Enterprise Console** menu, point to **Package**, and then click **Manage Package**.

   The Manage Package page appears.
3. Select the package and click **History**.

   The **Package History** dialog box appears where you can view, export, and filter the data.

   Alternatively, you can right-click the selected package, and then select **History** on the shortcut menu.

Package History Features

- **Filtering Data**: You can filter the data in the Package History dialog box by enabling the **Filter Bar**.

  To enable the filter bar, right-click the column label, and then select **Filter Bar** on the shortcut menu. A new row with the filters is added under the column header using which you can filter the data. Data filter functionality in the Package History dialog box is similar to *Filtering Data in Work Item List*.
- **Sort Data:** You can sort data in the Package History dialog box using the **Sort** option available on the shortcut menu of column headers. The columns having numerical value or value in the form of date and time are sorted in the ascending order on selection of A-Z. On selection of Z-A, the values are sorted in descending order.
- **Export**: You can export the data in the Package History dialog box to a html, excel, pdf, xml, tiff, and text

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

format using the **Export** feature.

- **View more records**: The grid in the Package History dialog box displays only 50 records. To view next 50 records, click the **View more records** icon available in the lower-right corner of the window.
- **Error Counts**: The Package History dialog box shows the count for **Errors**, **Warnings**, **Information**, and **All**. Click an error count to see the related messages.

Upgrade Scenarios

After the product is upgraded, you might come across the following observations, while opening any existing package:

- For database connection artifact in a package, the password specified before the upgrade, is not retained. You have to manually enter the password again in the Package Settings form.
- For the artifacts such as Manage List, Custom List, Database Lookup, Queue, or Database Activity, SQL scripts are not available for the existing package. To resolve this issue, you have to open the package and rebuild the artifact or create a new package template.
- For report template path, the **Resolving Template Path** grid is not displayed. To resolve this issue, you have to open the package and rebuild the artifact or create a new package template.
- If some lists and/or items are modified during upgrade, some artifacts might be marked as modified in the existing packages.

Uninstall a Package

An installed package can be uninstalled using the **Uninstall** option. When a package is uninstalled, all the artifacts with the associated and child artifacts will be uninstalled from the target environment and all configuration settings that were done will be reverted.

Prerequisite

Before uninstalling the package, ensure that the Client Service is running.

To uninstall a Package

1. Log on to the Enterprise Console.
2. On the **Enterprise Console** menu, point to **Package**, and then click **Manage Package**.
   The **Manage Package** window appears.
3. Select the package that you want to uninstall, and then click **Uninstall**.

   Alternatively, you can right-click the selected package, and then click **Uninstall**.

   The **Pre-uninstall Validation and Configuration** page appears.
   - You can edit the configuration for any artifact in the **Pre-uninstall Validation and Configuration** page, if required. For more information about editing a package, see Editing a Package Template.
   - You can also reload the validation log messages for artifacts. For more information about reloading the validation messages, see the **Reloading the validation log messages for artifacts** section below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- You can validate the log messages before proceeding with the uninstallation. For more information about validating log messages, see Validate the log messages if present.
- The **Pre-uninstall Validation and Configuration** page shows the count for **Errors**, **Warnings**, **Information**, and **All**. Click a category of message to view its related information. For example: If you want to view the warning messages, click **Warnings**.

4. Click **Uninstall**.

   The **Package Uninstallation** screen appears when the uninstall is in progress.

   The progress of the package uninstallation is displayed in the progress bar.

   After the package uninstallation is complete, the status of each artifact and installer files (if applicable) is displayed.

   If there were any errors/warnings during the uninstallation of any artifact, then the count of the errors, warnings, and information appears in this page.

5. Click **Close**.

The artifacts in the package are deleted. The status of the package is updated as **Uninstalled**.

Note:
- While uninstalling the package all the artifacts may not be deleted, if a backup of the artifact is present in the target environment.
- If you are uninstalling an artifact which has multiple versions, then all the versions of the artifact will be uninstalled. However, the artifact will be considered as only one artifact. For example: If you are uninstalling a Workflow artifact which has versions 1 and 2, then both the versions will be uninstalled. However, the Workflow artifact will be considered as only one artifact.

Reload the validation log messages for artifacts

When you select an artifact and edit it before uninstalling the package, the updated messages are displayed only for that artifact. However, if you edit other artifacts while editing the selected artifact, then the messages are updated only for the selected artifact, and not for the other artifacts.

For example: Consider a scenario where “Package1” consists of three artifacts namely Database Connection, Grid Configuration, and Lookup Settings.

- Scenario 1: You select the Database Connection artifact and click **Edit**, and then you save the settings and the template. In this scenario, the updated messages for Database Connections are displayed and the Database Connection artifact is reloaded.
- Scenario 2: You select the Database Connection artifact and click **Edit**. You also edit some of the settings for the Grid Configuration and Lookup Settings artifacts in the respective **Settings** tab, along with the settings for Database Connection. After you save the settings and the package, only the updated messages for Database Connections are displayed. The messages related to Grid Configuration and Lookup Settings artifacts will be displayed in the **Pre-uninstall Validation and Configuration** page, only after clicking **Reload**.

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, point to **Package**, and then click **Manage Package**.

   The **Manage Package** page appears.

3. Select the package that you want to uninstall, and then click **UnInstall**.

   Alternatively, you can right-click the selected package, and then click **UnInstall**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Pre-uninstall Validation and Configuration** page appears.

4. Click **Edit** to modify the settings of artifacts.
5. After all the changes are done for the artifacts, click **Save Settings** and then click **Save** to save the package.
6. Click **Reload**.

   The updated messages are displayed for all the edited artifacts and these artifacts are reloaded.

Delete a Package

You can delete a package from the target environment if the package is not installed. Packages once installed, updated or uninstalled cannot be deleted.

To delete a package

1. Log on to the Enterprise Console.
2. On the **Enterprise Console** menu, point to **Package**, and then click **Manage Package**.
   The **Manage Package** window appears.
3. Select a package and then click the **Delete** icon on the ribbon.

   Or

   Right-click the selected package and then select **Delete** from the shortcut menu.

   The Package will be deleted.

Note: For installed packages, **Delete** option will not be available on the shortcut menu.

Migration of Packages

A package exported in Wonderware Skelta BPM 2014 R2 SP2 P01 and above versions, can now be seamlessly imported and installed in the latest version of AVEVA Work Tasks.

When a package containing:

- Custom DLLs, is built with lower version of Skelta DLL, the custom DLLs must be rebuilt manually.
- Form and Embed Form, which has an Image/Hyperlink control with a different control ID, is migrated, the form along with the embed form will be migrated successfully.
- Database Connection is migrated, the Database Connection proceeds seamlessly, without any password encryption.
- Forms and Grid Configurations that are modified before the upgrade are not marked as modified in the package template after migration of the same.

Remotely Managing Packages using Console Application

A user with Administrator privileges can export, import, install, or uninstall packages using the **WWSKBPMRemotePackageManager** Console Application. You can also remotely export, import, install, or uninstall packages using the **WWSKBPMRemotePackageManagerConfig.xml** file.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Remotely Export, Import, Install, or Uninstall Packages using Console Application

A user with **Administrator** privileges can export, import, install, or uninstall packages using the **WWSKBPMRemotePackageManager** Console Application.

1. Open the Command Prompt in the Administrative mode.
2. Enter the path for the folder, where the Remote Package Manager files are available, and then press **Enter**.
3. On the Command Prompt, type **WWSKBPMRemotePackageManager.exe**.
4. Pass one of the values for the following command line arguments:
   - **To export a package from the repository**
     WWSKBPMRemotePackageManager.exe /export
   - **To import a package into the repository**
     WWSKBPMRemotePackageManager.exe /import
   - **To install a package from the repository**
     WWSKBPMRemotePackageManager.exe /install
   - **To uninstall a package from the repository**
     WWSKBPMRemotePackageManager.exe /uninstall
5. Press **Enter**.

   The package is exported, imported, installed, or uninstalled remotely depending on the value passed for the command line argument.

Note:
- The values for all the related parameters such as package name, repository name, and so on will be considered from the **WWSKBPMRemotePackageManagerConfig.xml** file.
- Ensure that the folder to which the package must be exported is a shared folder.

Restricting Export, Import, Install, or Uninstall operations on remote machines (Optional)

You can update the IP addresses of the remote machines. Only the machines whose IP addresses are included in the tag (explained below), will be allowed to execute the **WWSKBPMRemotePackageManager.exe**. All the other remote machines will be restricted from executing this exe.

To update remote machine IP addresses in the Farm DB

1. Access the Farm DB.
2. Execute the following query

```
Select Properties from SKService where Name = 'SkeltaGlobalSettings'
```

3. Copy the value in the **Properties** to a Notepad.
4. Add the **<property key="validremotepackageclientiplist"><![CDATA[xxxx.xxxx.xxxx.xxxx]]></property>** tag as shown below.

```
Update SKService set Properties = '<properties><property>……..</property><property
key="validremotepackageclientiplist"><![CDATA[xxxx.xxxx.xxxx.xxxx]]></property></prop
erties>' where Name = 'SkeltaGlobalSettings'
```

Note:
- Ensure that you add this tag before the closing **</properties>** tag.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The **WWSKBPMRemotePackageManager** will verify whether the **<property key="validremotepackageclientiplist"><![CDATA[xxxx.xxxx.xxxx.xxxx]]></property>** tag is available in the **Properties** of the **AVEVAWorkTasksGlobalSettings** record in the **SKService** table. If the tag is available, then only the remote machine IP addresses present in the tag are allowed to execute the **WWSKBPMRemotePackageManager.exe**.

- You can add multiple IPV4 and/or IPV6 IP addresses by using ';' as a separator. For example: *[fe80::8d01:b4f8:489:f4c8%12;fe80::8d01:b4f8:489:f4c8%19;10.13.88.100;10.13.88.101]*

- Ensure that you specify only machine IP addresses.

5. Add the IP addresses of the remote machines.
6. Execute the query in the Farm DB.
7. Restart the **Client Service**.

Configure WWSKBPMRemotePackageManager Using XML

You can remotely export, import, install, or uninstall packages using the **WWSKBPMRemotePackageManagerConfig.xml** file.

Consider the following scenario:

- *Server1* is the server on which AVEVA Work Tasks is installed
- *Machine1* is the client machine on which AVEVA Work Tasks is not installed

You can remotely export, import, install, or uninstall packages to/from the Server1 or Machine1 by using the **WWSKBPMRemotePackageManagerConfig** console application.

1. Browse to the folder where the Remote Package Manager files (WorkTasks.Pacakge.Remote.dll, AVEVAWorkTasksRemotePackageManager.exe, and WWSKBPMRemotePackageManagerConfig.xml) are available.
2. Open the **WWSKBPMRemotePackageManagerConfig.xml** file.
3. In the XML file, pass the values for the mandatory parameters listed in the following table.

Settings Category	Node	Description
Export	RepositoryName	Enter the name of the source repository from which the package must be exported.
	Server	Enter the name of the source server.
	ServerPort	Enter the port number. This is the port number used for listening by the WWSKBPM client service. The default value is **8863**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	UserId	Enter the user ID in the **instancename::Identifier Column** format. For example: If the repository provider is Active Directory, then enter the authentication as **activedirectory: SHELBYLAB\skuser1**. If the repository provider is AVEVA Work Tasks List, then enter the authentication as **worktaskslist: : GUID**.
	Name	Enter the name of the package that must be exported from the repository. Ensure that the package is published and generated.
	Version	Enter the version of the package that must be exported from the repository
	PhysicalPath	Enter the shared physical path of the client machine. For example: If the AWSPkg file is present in the Packages folder in "Machine1", then enter the path as *Machine1\Packages*. Ensure the following: • The folder where the Remote Package Manager files are available is a shared folder. • The AVEVA Work Tasks admin has the *Read/Write* permission for the network folder.
Import	RepositoryName	Enter the name of the target repository to which the package must be exported.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	Server	Enter the name of the target server.
	ServerPort	Enter the port number. This is the port number used for listening by the AVEVAWorkTasks client service. The default value is **8863**.
	UserId	Enter the user ID in the **instancename::Identifier Column** format. For example: If the repository provider is Active Directory, then enter the authentication as **activedirectory: SHELBYLAB\skuser1**. If the repository provider is AVEVA Work Tasks List, then enter the authentication as **worktaskslist: : GUID**.
	Name	Enter the name of the package that must be imported to the repository.
	Description	Enter the description for the package.
	Parent	Enter the GUID of the parent list item or folder.
	PhysicalPath	Enter the shared physical path of the client machine. For example: If the AWSPkg file is present in the Packages folder in "Machine1" (where AVEVA Work Tasks is not installed), then enter the path as *Machine1\Packages*. Ensure the following: • The folder where the Remote Package Manager files are available is a shared folder. • The AVEVA Work Tasks admin

	Version	Enter the version of the package that must be installed.
Uninstall	RepositoryName	Enter the name of the repository from which the package must be uninstalled.
	Server	Enter the name of the server from which the package must be uninstalled.
	ServerPort	Enter the port number. This is the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		port number used for listening by the WWSKBPM client service. The default value is **8863**.
	UserId	Enter the user ID in the **instancename::Identifier Column** format. For example: If the repository provider is Active Directory, then enter the authentication as **activedirectory: SHELBYLAB\skuser1**. If the repository provider is AVEVA Work Tasks List, then enter the authentication as **worktaskslist : : GUID**.
	Name	Enter the name of the package that must be uninstalled.
	Version	Enter the version of the package that must be uninstalled.

4. Save the XML file.
5. Run the **WWSKBPMRemotePackageManager.exe**.

   For more information about any errors during these operations, refer the **WTLogger Console**.

Import, Install, or Uninstall Packages using Console Application

You can import, install, or uninstall packages using the **AVEVAWorkTasksPackageManager** Console Application.

1. Open the Command Prompt in the Administrative mode.
2. Enter the path for the "Bin" folder, which is available in the path where the product is installed, and then press **Enter**.

   For example: CD <Install Path>\Bin
3. On the Command Prompt, type **AVEVAWorkTasksPackageManager.exe**.
4. Pass one of the values for the following command line arguments:
   - **To import a package into the repository**

     AVEVAWorkTasksPackageManager.exe /import
   - **To install a package from the repository**

     AVEVAWorkTasksPackageManager.exe /install

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **To uninstall a package from the repository**

  AVEVAWorkTasksPackageManager.exe /uninstall

5. Press **Enter**.

   The package is imported, installed, or uninstalled depending on the value passed for the command line argument.

   Note: The values for all the related parameters such as package name, repository name, and so on will be considered from the **WWSKBPMPackageManagerConfig.xml** file.

Configure WWSKBPMPackageManager Using XML

You can import, install, or uninstall packages using the **WWSKBPMPackageManagerConfig.xml** file.

1. Browse to the "Bin" folder, which is available in the path where the product is installed.
2. Open the **WWSKBPMPackageManagerConfig.xml** file.
3. In the XML file, pass the values for the mandatory parameters listed in the following table.

Settings Category	Node	Description
Import Package Settings	Repository Name	Enter the name of the repository to which the package must be imported.
Import Package Settings > Package	Name	Enter the name of the package that must be imported into the repository.
	Description	Enter the description for the package.
	Parent	Enter the name of the parent folder for the package to be imported.
	Physical Path	Enter the physical path where the package must be imported.
Install Package Settings	Repository Name	Enter the name of the repository to which the package must be imported.
	LoggedInUserID	Enter the ID of the logged in user.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
Install Package Settings > Package	Name	Enter the name of the package that must be installed.
	Version	Enter the version of the package that must be installed.
Uninstall Package Settings	Repository Name	Enter the name of the repository from which the package must be uninstalled.
	LoggedInUserID	Enter the ID of the logged in user.
Uninstall Package Settings > Package	Name	Enter the name of the package that must be uninstalled from the repository.
	Version	Enter the version of the package that must be uninstalled from the repository

4. Save the XML file.
5. Run the **AVEVAWorkTasksPackageManager.exe**.

Add Artifacts to a Package Template

You can add an item to a package template using the **Add to Package Template** shortcut menu.

Note: You can package only published artifacts. Thus, the **Add to Package Template** option is available only for the published items.

In this illustration, Database Lookup is used as an example of list items artifact.

1. Log on to the Enterprise Console.
2. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Lookup Settings**.
   The **Lookup Settings** list appears.
3. Select the Database Lookup that you want to package.
4. Right-click the Database Lookup and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.
5. Select an existing package template from the **Package Template** list. Package templates in the **Draft** status appear in the **Package Template** list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

OR

Create a new package template by performing the following:

a. Select **Create Package Template** from the **Package Template** drop-down list. The **New Package Template** page appears.
b. Enter the title and description for the package template in the **Title** and **Description** fields respectively.
c. In the **Target Platform** section, select either **32-bit** or **64-bit** based on the machine where the package needs to be installed.
d. Click **Save Template**. The **Package Template** list is updated with the newly created package template.

6. In the **Package Template Version** drop-down list, select the version of the package template. By default, the version is updated as **1**.
7. In the **Include Associated Artifacts** section:
   - Select **Yes** to package all the associated artifacts of the selected artifact. For example, for the Database Lookup example here, if you select **Yes**, the associated database connection is also added to the package template. *The associated artifact of the database lookup* is a database connection.
   - Select **No** to exclude the associated artifacts of the selected artifact. For example, for the Database Lookup example here, if you select **No**, the associated database connection is not added to the package template.
8. In the **Include Child Artifacts** section:
   - Select **Yes** to package all the child artifacts of the selected artifact. Here, the child artifacts of the associated artifact is also added to the package template. For example, if Database Lookup has child lookups, the child lookup can also be packaged by selecting **Yes**.
   - Select **No** to exclude the child artifacts of the selected artifact from the Package Template.
9. In the **Include Security Artifacts** section:
   - Select **Yes** to package all the security rights of the selected artifact.
   - Select **No** to exclude the security rights of the selected artifact from the Package Template.

Note: You can see the **Include Security Artifacts** option only if you enable the security group customization of the artifact at the List Item level.

10. In the **Include the automatically generated SQL Script** section:
    - Select **Yes** to include the automatically generated SQL Script for the artifact to the package template.
    - Select **No** to exclude the automatically generated SQL Script for the artifact to the package template.

Note: The **Include the automatically generated SQL Script** option is available only for Lookup Settings, Manage List pointing to existing table, Queue, and Workflow with Database activity.

11. Click **Next**.

    The **Add to Package Template** page appears. On the left pane, you can see the artifact Database Lookup. You can make all required changes to the configuration settings and prerequisites.

12. Click **Save Template**.

    The Database Lookup along with the configuration settings and prerequisites is saved to the Package Template.

Note: When you select the **Include Associated Artifacts** option as **Yes** while adding an item (or artifact) to a Package Template, the associated artifacts are added to the package template. You can then view the associated artifacts of the item in the tree view of a Package. If you select the **Include Associated Artifacts** option as **No**, the associated artifacts are not added to the package template. Then, you cannot see

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the associated artifacts in the tree view of a Package. This condition holds good for both the **Include Child Artifacts** and **Include Security Artifacts** options as well. In the case, when you do not have any child artifact, selecting the **Include Child Artifacts** option as **Yes** or **No** does not make any difference.

Configure a Package Template

ArchestrA Events

You can package and deploy the ArchestrA Events along with its associated artifacts and child artifacts from one environment or repository to another environment or repository.

To add ArchestrA Events to Package Template

1. Log on to the Enterprise Console.
2. On the menu, point to **Tools**, and then click **ArchestrA Events**.

   The **ArchestrA Events** window appears.
3. Select the list item that you want to package.
4. Right-click the list item and then click **Add to Package Template**.

   The **Add to Package Template** window appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of the ArchestrA Events in the Add to Package Template window. The left side of the configuration window displays the package template and its configurations. You can set the configuration properties of the ArchestrA Events package in the Settings tab form on the right side of the Add to Package Template window.
5. Configure the required settings.
6. Click **Save Template** to save the configured settings.

Configuration Settings for ArchestrA Events

The **ArchestrA Events** has an unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Associated Artifacts
- Child Artifacts

Settings Tab

You can use the properties in the **Settings** tab to take appropriate actions to install, update, or uninstall a package.

Install

Use this tab to set the configurations for installing the package.

- **ArchestrA Event Exists**: Select this property to take appropriate action when the ArchestrA events in the package is already present in the target environment.
  - **Do not install ArchestrA Event**: Select this option to use the ArchestrA Events, present in the target environment.
  - **Install to overwrite the existing ArchestrA Event**: Select this option to overwrite the ArchestrA Events, present in the target environment with the packaged ArchestrA event.

    During the package installation, backup will be taken before overwriting the existing artifact.

Update

Use the settings in this tab to update an installed package.

- **Delete ArchestrA Events**: Select this property to delete or retain the ArchestrA events that is present in the target environment.
  - **Yes**: Select this option to delete the ArchestrA Events, that was installed by the package.

    ArchestrA Event is modified: Select this option to retain, roll back the ArchestrA Events to original state, or delete the ArchestrA Events from the target environment even after the package is updated. This property is applicable only if **Delete ArchestrA Events** is set to *Yes* and the ArchestrA Events is modified.
    - **Retain**: Select this option to retain the ArchestrA Events along with the modifications in the target environment.
    - **Rollback to original state**: Select this option to roll back the artifact to the backup taken. All modifications that were done to the ArchestrA Events after it was installed in the target environment will be reverted. However, the ArchestrA Events will remain in the target environment.
    - **Delete**: Select this option to delete the ArchestrA Events from the target environment.
  - **No**: Select this option to retain the ArchestrA Events in the target environment.

    ArchestrA Event exists: Select this property to take appropriate action when the ArchestrA Events that is being installed, is present in the target environment.
    - **Do not install ArchestrA Event**: Select this option to use the ArchestrA Events, present in the target environment.
    - **Install to overwrite existing ArchestrA Event**: Select this option to overwrite the ArchestrA Event, present in the target environment with the packaged ArchestrA Event.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete ArchestrA Event**: Select this property to retain or delete the ArchestrA Events from the target environment even after the package is uninstalled.
  - **Yes**: Select this option to delete the ArchestrA Events from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the ArchestrA Events in the target environment even after the package is uninstalled.
- **ArchestrA Event is modified**: Select this option to retain, roll back the ArchestrA Events to original state, or delete the ArchestrA Events from the target environment even after the package is uninstalled. This property is displayed only if **Delete ArchestrA Event** is set to *Yes*. However, if **Delete ArchestrA Event** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the ArchestrA Events along with the modifications in the target environment.
  - **Rollback to original state**: Select this option to roll back to the artifact to the backup taken. All modifications that were done to the ArchestrA Events after it was installed in the target environment will be reverted. However, the ArchestrA Events will remain in the target environment.
  - **Delete**: Select this option to delete the ArchestrA Events from the target environment.

Associated Artifacts Tab

ArchestrA Events can include the following associated artifacts:

- Parent Folder
- Parent ArchestrA Event

Child Artifacts for Tab

ArchestrA Events can include the following child artifacts:

- Child ArchestrA Event
- Folder

Include Child Item

For more information, see Include Child Item.

Security Artifacts for ArchestrA Events

You can enable the security settings of the ArchestrA Events that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

BAM

You can package and deploy the BAM configuration associated with workflow from one environment or repository to another environment or repository. The BAM events that can be associated with the workflow are Overdue Analysis, KPI Analysis, and KPIs.

Note: You can rebuild Overdue Analysis, KPI Analysis, and KPIs associated with the workflow but cannot rebuild the Basic Configuration associated with the workflow.

To add BAM to Package Template

1. Log on to the Enterprise Console.
2. Create a workflow and configure the workflow with BAM configuration using the **BAM Configuration** option. For more information, see Associate Workflow with Enterprise Console Events and Access BAM Configuration
3. Save BAM configuration associated with the workflow and publish the workflow.
4. Right-click the workflow and then click **Add to Package Template**.

   The **Add to Package Template** window appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of the BAM in the Add to Package Template window. The left side of the configuration window displays the package template and its configurations. You can set the configuration properties of the workflow configured with BAM on the right side of the Add to Package Template window.
5. Configure the required settings.
6. Click **Save Template** to save the configured settings.

Configuration Settings for BAM associated with Workflow

The **BAM** has an unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Child Artifacts

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Tab

You can use the properties in the **Settings** tab to take appropriate actions to install, update, or uninstall a package.

Install

Use this tab to set the configurations for installing the package.

- **BAM Exists**: Select this property to take appropriate action when the BAM in the package is already present in the target environment.
  - **Overwrite existing BAM**: Select this option to overwrite the BAM, present in the target environment with the packaged BAM.

    During the package installation, backup will be taken before overwriting the existing artifact.
  - **Use existing BAM**: Select this option to use the BAM, present in the target environment.

Update

Use the settings in this tab to update an installed package.

- **Delete BAM Settings**: Select this property to delete or retain the BAM settings that is present in the target environment.
  - **Yes**: Select this option to delete the BAM, that was installed by the package.

    If BAM Settings are modified after installation: Select this option to retain, roll back the BAM settings to original state, or delete the BAM settings from the target environment even after the package is updated. This property is applicable only if **Delete BAM** is set to *Yes* and the BAM setting is modified.
    - **Retain**: Select this option to retain the BAM settings along with the modifications in the target environment.
    - **Rollback to original state**: Select this option to roll back the artifact to the backup taken. All modifications that were done to the BAM settings after it was installed in the target environment will be reverted. However, the BAM settings will remain in the target environment.
    - **Delete**: Select this option to delete the BAM settings from the target environment.
  - **No**: Select this option to retain the BAM settings in the target environment.

    BAM exists: Select this property to take appropriate action when the BAM that is being installed is present in the target environment.
    - **Overwrite existing BAM**: Select this option to overwrite the BAM settings present in the target environment with the packaged BAM.
    - **Use existing BAM**: Select this option to use the BAM settings present in the target environment.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete BAM Settings**: Select this property to retain or delete the BAM settings from the target environment

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

even after the package is uninstalled.

- **Yes**: Select this option to delete the BAM settings from the target environment when the package is uninstalled.
- **No**: Select this option to retain the BAM settings in the target environment even after the package is uninstalled.

- **If BAM Settings are modified after installation**: Select this option to retain, roll back the BAM settings to original state, or delete the BAM settings from the target environment even after the package is uninstalled. This property is displayed only if **Delete BAM Settings** is set to *Yes*. However, if **Delete BAM** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the BAM settings along with the modifications in the target environment.
  - **Rollback to original state**: Select this option to roll back to the artifact to the backup taken. All modifications that were done to the BAM settings after it was installed in the target environment will be reverted. However, the BAM settings will remain in the target environment.
  - **Delete**: Select this option to delete the BAM settings from the target environment.

Associated Artifacts Tab

BAM can include the following associated artifacts:

- Parent Folder
- Parent Workflow

Child Artifacts for Tab

BAM can include the following child artifacts:

- Child Workflow
- Folder

Include Child Item

For more information, see Include Child Item.

Security Artifacts for BAM

You can enable the security settings of the BAM that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

Calendar

You can package and deploy an organization Calendar from one environment or repository to another environment or repository using the package feature in AVEVA Work Tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To add Calendar to Package Template

1. Log on to the Enterprise Console.
2. On the menu, point to **Settings**, and then click **Calendar**.
   The **Calendar Control** window appears.
3. Select the calendar that you want to package.
   If you want to create a calendar, see "Chapter: About Calendar" in the *User Guide*.
4. In the new **Calendar Control** window for the calendar that you opened, click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Configuration Settings for Calendar

The **Calendar** has an unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment** > **Package Template** window
- **Target Environment** > **Manage Package** window

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Child Artifacts

Settings Tab

You can use the properties in the **Settings** tab to take appropriate actions to install, update, or uninstall a package.

Install

Use this tab to set the configurations for installing the package.

- **Calendar Exists**: Select this property to take appropriate action when the calendar in the package is already present in the target environment.
  - **Do not install calendar**: Select this option to use the calendar, present in the target environment.
  - **Install to overwrite the existing calendar**: Select this option to overwrite the calendar, present in the target environment with the packaged calendar. During the package installation, backup will be taken before overwriting the existing artifact.
- **Associated Artifacts Not Present**: Select this property to take appropriate action when the associated

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

artifacts of the calendar are not present in the target environment.

- **Install calendar**: Select this option to install the calendar, even if the associated artifacts are not present in the target environment.
- **Do not install calendar**: Select this option, if you do not want to install the calendar as its associated artifacts are not present in the target environment.

Update

Use the settings in this tab to update an installed package.

- **Delete Calendar**: Select this property to delete the calendar that was installed by the package.
  - **Yes**: Select this option to remove the calendar from the target environment.

    If Calendar Modified After Installation: Select this property if calendar was present prior to package installation or the calendar installed by the package is modified.
    - **Retain**: Select this option to retain the calendar along with the modifications in the target environment even after the package is updated.
    - **Rollback to original state**: Select this option to roll back the artifact to the backup taken. All modifications that were done to the calendar after it was installed in the target environment will be reverted. However, the calendar will be retained in the target environment.
    - **Delete**: Select this option to delete the calendar from the target environment.
  - **No**: Select this option to retain the calendar in the target environment.

    Calendar Exists: Select this property to take appropriate action when the calendar that is being installed is present in the target environment.
    - **Do not install calendar**: Select this option to use the calendar that is present in the target environment.
    - **Install to overwrite existing calendar**: Select this option to overwrite the calendar present in the target environment with the packaged calendar.

      Associated Artifacts Not Present: Select this property if associated artifact is not present in the target environment
    - **Update calendar**: Select this option to update the calendar.
    - **Do not update calendar**: Select this option if you do not want to update the calendar as associated artifacts are not present.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete Calendar**: Select this property to retain or delete the calendar from the target environment even after uninstalling the package.
  - **Yes**: Select this option to delete the calendar from the target environment when the package is uninstalled.

    If Calendar Modified After Installation: Select this option to retain, roll back the calendar to original state, or delete the calendar from the target environment even after the package is uninstalled. This property is displayed only if **Delete Calendar** is set to *Yes*. However, if **Delete Calendar** is set to *No*, this

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

property is not displayed.

- **Retain**: Select this option to retain the calendar along with the modifications in the target environment.
- **Rollback to original state**: Select this option to roll back to the backup taken. All modifications that were done to the calendar after it was installed in the target environment will be reverted. However, the calendar will remain in the target environment.
- **Delete**: Select this option to delete the calendar from the target environment.

- **No**: Select this option to retain the calendar in the target environment after uninstalling the package.

Associated Artifacts Tab

By default, a calendar does not have any associated artifact.

While creating a calendar, if you inherit another calendar into it, then the inherited calendar appear as the associated artifact of the calendar.

Child Artifacts Tab

Calendar does not have any child artifact.

Database Connection

You can package and deploy a Database Connection from one environment or repository to another environment or repository using the package feature in AVEVA Work Tasks.

Note:The Database connection configured with **Database Type** as **Oracle** and **Connection Type** as **Connection provider** is not supported.

To add Database Connection to Package Template

1. Log on to the Enterprise Console.
2. On the menu, point to **Settings**, and then click **Database Connections**.

   The Connection List window appears.
3. Select the database connection that you want to package.
4. Right-click the database connection and then click **Add to Package Template**.

   The Add to Package Template dialog box appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of a Database Connection in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the Database Connection package in the **Settings** form on the right side of the Add to Package Template window.

Runtime Initialization Settings

You can configure runtime initialization settings for database connections. For more information about

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration Settings for Database Connection

The **Database Connection** has an unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment** > **Package Template** window
- **Target Environment** > **Manage Package** window

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Child Artifacts

Settings Tab

You can define the properties in the **Settings** tab to take appropriate actions to install, update, or uninstall a package.

Install

Use this tab to set the configurations for installing the package.

- **Connection Exists**: Select this property to take appropriate action when the database connection in the package is already present in the target environment.
  - **Do not install connection**: Select this option to use the database connection, present in the target environment.
  - **Install to overwrite the existing connection**: Select this option to overwrite the database connection in the target environment with the one that is present in the package. During the package installation, backup will be taken before overwriting the existing artifact.

Update

Use the settings in this tab to update an installed package.

- **Delete connection**: Use this property to delete the database connection present in the target environment.
  - **Yes**: Select this option to remove the database connection from the target environment.

    Connection is modified: Select this option to retain, roll back to original state, or delete the database connection in the target environment even after the package is updated. This property is applicable only

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

if **Delete connection** is set to *Yes* and the database connection is modified.

- **Retain**: Select this option to retain the database connection with the modifications in the target environment even after the uninstalling the package.
- **Rollback to original state**: Select this option to rollback the database connection to the original state. All modifications done to the database connection after installation in the target environment will be rolled back. However, the database connection will be retained in the target environment.
- **Delete**: Select this option to delete the database connection from the target environment while updating the package.

- **No**: Select this option to retain the database connection in the target environment.

  Connection exists: Select this option to take appropriate action when the database connection that is being installed is present in the target environment.

  - **Do not install connection**: Select this option if you do not want to update the database connection as associated artifacts are not present.
  - **Install to overwrite existing connection**: Select this option to overwrite the database connection present in the target environment with the one that is currently being packaged.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete connection**: Select this property to retain or delete the database connection in the target environment after you uninstall the package.
  - **Yes**: Select this option to delete the database connection from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the database connection in the target environment even after the package is uninstalled.
- **Connection is modified**: Select this property to retain, rollback, or delete the database connection in the target environment after uninstalling the package. This property is displayed only if **Delete connection** is set to *Yes*. However, if **Delete connection** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the database connection with the modifications in the target environment even after the package is uninstalled.
  - **Rollback to original state**: Select this option to rollback the database connection to the original state. All modifications that were done to the connection after it was installed in the target environment will be reverted. However, the connection will be retained in the target environment.
  - **Delete**: Select this option to delete the database connection from the target environment when uninstalling the package.

Connection Details

Use the **Connect to Repository DataSource** settings to choose between an existing repository connection string or a different connection string.

Source:

- Use the **Connect to Repository DataSource** option in the **Source** to view the connection string that is used in the source environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Target:

- Use the **Connect to Repository DataSource** option in the **Target** to edit the connection string of the target environment.
  - Select *Yes* to use the connection string of the current repository to connect to the database connection.
  - Select *No* to define a new connection string.

Field	Description
Database type	Select SQL Server.
Connection type	Select either Connection string or Connection provider.

If Connection type is Connection string

Field	Description
Server name	Enter the name of the data source server.
Authentication type	Provide information on the process used to validate a user. Both Windows and Microsoft SQL Server authentication process is supported. If Database type is Microsoft SQL Server, then authentication type can be either Microsoft SQL Server or Windows.
User Id	Enter the Microsoft SQL Server user ID for Microsoft SQL Server type of authentication. For Windows Authentication, **User Id** is disabled.
Password	Enter the Microsoft SQL Server password for Microsoft SQL Server type of authentication. For Windows Authentication, **Password** is disabled.
Advanced settings	(Optional). You can enter any additional connection information, such as connection timeout. For example, Connection Timeout = 20 While creating a data source for a repository, use the following custom settings to set properties for connection pool: `encrypt=true; nableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;` where, • **encrypt:** Ensures secure communication between

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption. • **enableltm**: Internally light weight transaction mode is implemented by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction distribution is reduced to a great extent. With this feature the transaction is controlled from being escalated to a distributed transaction which is very expensive. The above property can be used to turn off this feature. The default value is set as *True*. • **connectionretrywaittime**: While opening a new connection, if the database server is not available, the default behavior is to retry the connection. This setting can be used to set the wait time to retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds. • **maxconnectionretries**: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite. • **sqlcommandtimeout:** Sets the wait time before terminating the attempt to execute an SQL command and generating an error. The default value is set as 300. **Note:** These settings are case sensitive and should be mentioned only in lower case.
Database	Enter the name of the database.

If Connection Type is Connection Provider

Field	Description
Assembly path	Enter the path of the connection dll. In a client-server environment, the dll must be present on the machine that hosts the Enterprise Console site. All requests of install and uninstall are sent to the host

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
	site.
Param	Specify the parameters required by the connection dll.
SQL script	Enter the SQL script in the query window. The SQL script written in the query window can be packaged from one SQL server machine and can be installed in another SQL server machine only. Oracle is not supported. The **Validate SQL script** button validates the script for the usage of the restricted SQL commands, but does not validate syntax of the SQL query in the script. Ensure to enter an error free SQL script. The following SQL commands are restricted: • Delete • Truncate • Drop • Update • Create User • Grant • Revoke • Execute
Attach SQL script	Use this button to upload a SQL script. You can attach files of .sql type only. By default, the **Attach SQL script** button is invisible. Click the **Attach SQL script file** check box to see it. The SQL scripts are executed in sequence. First the script in the SQL script query window is executed followed by the attached SQL script. Even if the script execution in the SQL script query window fails, the attached SQL script continues to execute. You can attach only one script per database connection. Maximum size of the attached file is restricted to 10 mb.

Note:

If the SQL script is executed successfully , then the following message appears in the **Package History** dialog box. *The SQL script is executed successfully.*

If the SQL script execution fails, then the following message appears:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The SQL script execution failed.

If you click the message, the **Message Details** page appears, where you can view the message details.

See Also: SQL Script Generation and Execution

Associated Artifacts of Database Connection

Database Connection does not have any associated artifact.

Child Artifacts of Database Connection

Database Connection does not have any child artifact.

Security Artifacts of Database Connection

You can enable the security settings of the database connection that you want to include in the package.

For more information about including security artifacts, see Include Security Artifacts.

Event Associations

You can package and deploy the Event Associations with its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

You can package and deploy the Event Associations of the following types:

- Scheduler
- Enterprise Console
- File Watcher
- System Platform Events
- Event Associations of Type Logic App
- Event Associations of Type Message Queue

Event Associations of Type Scheduler

You can package and deploy the Event Associations of type Scheduler and its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add Event Associations of type Scheduler to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click ☰ menu icon, and then click **Workflows**. The **Workflows** window appears.
3. Select a Workflow with an event association of type scheduler associated to it.
4. Right-click the workflow, and then select **View Association**. All associations of the selected workflow appear.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Right-click **Event Associations of type Scheduler** that you want to package, and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Runtime Initialization Settings

You can configure runtime initialization settings for Event Associations of type Scheduler. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration Settings for Event Associations of type Scheduler

The Event Associations of type Scheduler has a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the Settings tab to define the configuration settings. The Associated Artifacts tab displays the associated artifacts of the Event Association of type Scheduler definition. The Child Artifacts tab displays child artifacts of the Event Association of type Scheduler definition.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Security Artifacts

Settings Tab

You can use the properties of the Settings tab to take appropriate actions to install, update, or uninstall the package.

Behavior of Event Associations of type Scheduler while installing, updating or uninstalling the package:

- You cannot overwrite an already existing item.
- You can delete or uninstall an Event Associations of type Scheduler only if it was installed by the Package.

Install

You can use to the settings in this tab when install the package. When installing the package, if the Event Scheduler dates are invalid, then the package will not be installed. Edit the dates and install the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Workflow Version**: This displays the version of Workflow to which Event Association of type Scheduler is mapped for Scheduling in the Source environment. It also allows you to specify the version of Workflow to which Event Association of type Scheduler should be mapped in the Target environment.
  - **Source**: Displays the version of Workflow in the source environment to which the Event Association of type Scheduler is mapped.

    Target: Enter the version of the workflow:

    Specify the version of the Workflow to which you want to map the Event Association of type Scheduler in target environment.

    If you do not specify the Workflow version in the Target environment, the Workflow version from the Source environment will be considered while installing the package.

    Note:
    - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is not present in the target environment, then the Event Association will not be installed.
    - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is in Draft status, then the Event Association of type Scheduler will be installed and mapped to the latest version of the workflow.

- **Scheduler Event Association Settings**: This displays the settings of the Event Association of type Scheduler in the Source environment and it also allows you to specify the settings of the Event Association of type Scheduler in the Target environment.
  - **Start Date**
    - **Source**: Displays the start date of the Event Association of type Scheduler in the source environment.
    - **Target**: Select the start date of the scheduler on which you want the event to be triggered.

      If you do not use the date picker, ensure that the date is in the MM\dd\yyyy format.
  - **End Date**
    - **Source**: Displays the end date of the Event Association of type Scheduler in the source environment.
    - **Target**: Select the end date of the scheduler on which you want the event to be triggered.

      If you do not use the date picker, ensure that the date is in the MM\dd\yyyy format.
  - **Start Time**
    - **Source**: Displays the start time of the Event Association of type Scheduler in the source environment.
    - **Target**: Select the start time of the scheduler on which you want the event to be triggered.

      If you do not use the date picker, ensure that the time is in any one of the following formats:

      hh:mm:tt

      hh:mm tt

      h:mm:tt

      h:mm tt

      Note: Ensure that you follow the following guidelines while installing the Event Associations of type scheduler package in the target environment:
      - Start date, Start time, and End date should be in valid format.
      - Start date should be less than or equal to End date respectively.
      - End date should be greater than or equal to current date.
      - When Start date and End Date is the current date, the start time should be greater than the current

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

time.
- Enter null in the target start and end date to run the event daily.

Update

You can use the settings in this tab when you install the same Package for the consecutive time.

- **Delete Event Association**: Select this option to delete the Event Association that is present in the target environment.
  - **Yes**: Select this option to remove the Event Association in the target environment.
  - **No**: Select this option to retain the Event Association in the target environment or install the Event Association if it is not present in the target environment.

  Note: The settings configured in the **Workflow Version** and **Scheduler Event Association Settings** grids are common for the **Install** and **Update** tabs.

Uninstall

You can refer to the settings in this tab when you uninstall the Package from the target environment.

- **Delete Event Association**: This property allows you to retain or delete the Event Association of the type Scheduler in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to delete the Event Association from the target environment when the Package is uninstalled.
  - **No**: Select this option to retain the Event Association in the target environment even after the Package is uninstalled.

Click **Save Event Association Settings**.

Note: You cannot uninstall individual versions, when uninstalling a package. All the versions will be uninstalled and a message is logged for every single version that is uninstalled.

Associated Artifacts Tab

The **Associated Artifacts** tab displays all the associated artifacts of the selected Event Associations of type Scheduler definition.

Event Associations of type Scheduler has the following associated artifacts: Workflow

Child Artifacts Tab

Event Associations of type Scheduler does not have any child artifact.

Security Artifacts Tab

The Security Artifacts tab displays the security artifacts of an Event Associations of type Scheduler, if any.

You can enable the security settings of the Event Associations of type Scheduler that you want to include in the package.
For more information about including security artifacts, see Include Security Artifacts.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Event Associations of Type Enterprise Console

You can package and deploy the Event Associations of type Enterprise Console and its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add Event Associations of Type Enterprise Console to Package Template

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, click **Workflows**. The **Workflows** window appears.
3. Select a Workflow with an event association of type enterprise console associated to it.
4. Right-click the workflow, and then select **View Association**. All associations of the selected workflow appears.
5. Right-click Event Associations of type enterprise console that you want to package, and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Note: If you create an Event Association of type Enterprise Console for a dynamic list item and if you delete the list item, then you cannot add the Enterprise Console Event Association to the package template.

Package Template Tree View

In the Package Template tree view, the Event Association of type Enterprise Console appears in the following format:

Format in the tree view in case of List level

<Workflow Name_EC_Event Name_Type_List Name>

Here,

Workflow Name: Name of the workflow to which the Enterprise Console event is associated

EC: Name of the Event Provider, in this case it is the Enterprise Console

Event Names: On Create, On Delete, On Publish, On Unpublish, and On Version Change

Type: List

List Name: Name of the list which is associated to the workflow

The same information is also seen in the Configuration Settings.

Format in the tree view in case of List item level

<**Workflow Name_EC_Event Name_Type_List Name_List item Name/Unique Values**>

Here,

Workflow Name: Name of the workflow to which the Enterprise Console event is associated

EC: Name of the Event Provider, in this case it is the Enterprise Console

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Event Names: On Create, On Delete, On Publish, On Unpublish, and On Version Change

Type: List or List Item.

List Name: Name of the list in which the associated list item is present

List Item Name/Unique Values: Default value of the list item or the Unique field values of the list items. If the list item has multiple unique values defined, then each of the value is displayed separated by (_).

The same information is also seen in the Configuration Settings.

Associated Artifacts for Event Associations of Type Enterprise Console

Event Associations of type Enterprise Console has the following associated artifacts:

- Workflow
- Dynamic List (if the dynamic list is selected as the list name while creating Enterprise Console Event Association. Users list is also considered as a dynamic list.)

In case of Enterprise Console Event Association of list item level, along with the above two associated artifact, the following additional artifacts are identified:

- List items of the Standard list
- List item of Dynamic list (these items will not be listed as an individual artifact in the package template tree view)

Dynamic List item which is associated to Enterprise Console at list item level Event Association will not appear in the Package template as an individual artifact even though it is identified as an associated artifact for the Event Association. However, the same will be listed in the Associated Artifacts tab as an associated artifact of Enterprise Console at list item level Event Association. This occurs since Dynamic list item is not a packageable artifact. Therefore, to install Enterprise Console at list item level Event Association, the dynamic list item should be available in the target environment.

Enterprise Console Event Association at list item level, will package the following items if "include associated artifacts" is set to true in package template:

- DB connection or Connection List
- Lookup list
- Forms Data Grid View
- Grid Configuration
- Report Connection
- Report Template
- Reports
- FileWatcher List
- Form Controls
- Navigation details
- DB connection
- Lookup list
- List Views

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Forms List
- Assembly List
- Folder List
- Security Right
- Security Group

Enterprise Console Event Association package will identify the items of following lists as associated artifacts and will not add to package template. However, in target if the item with the same title or default field value is available in the same list, then event association will be installed by mapping to the identified list item.

- Manage Package
- Package Template
- Impersonation Users
- Initiate form
- External Connections
- Users
- List-Form Association List

Enterprise Console Event association package is not supported for the following list items:

- Deleted Items
- Event Providers
- Security Group Resource mapping
- Event Association

Child Artifacts for Event Associations of Type Enterprise Console

Event Associations of type Enterprise Console does not have any child artifact.

Security Artifacts for Event Associations of Type Enterprise Console

You can enable the security settings of the grid view that you want to include in the package.
For more information about including security artifacts, see Include Security Artifacts.

Configuration settings for Event Associations of Type Enterprise Console

The Event Associations of type Enterprise Console has an unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the Settings tab to define the configuration settings. The **Associated Artifacts** tab displays the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

associated artifacts of the Event Association of type Enterprise Console definition. The **Child Artifacts** tab displays child artifacts of the Event Association of type Enterprise Console definition.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Security Artifacts

Settings Tab

The properties in this tab allows you to take appropriate actions while installing, updating, or uninstalling the Package.

Behavior of Event Associations of type Enterprise Console while installing, updating or uninstalling the package:

- You cannot overwrite an already existing item.
- You can delete or uninstall an Event Associations of type Enterprise Console only if it was installed by the Package.

Install

The settings in this tab is referred to when installing the Package. When installing the package, if the Event Enterprise Console dates are invalid, then the package will not be installed. Edit the dates and install the package.

- **Workflow Version**: This displays the version of the Workflow to which Event Association of type Enterprise Console is mapped in the Source environment and it also allows you to specify the version of Workflow to which Event Association of type Enterprise Console should be mapped in the Target environment.

  Source: Displays the version of Workflow in the source environment to which the Event Association of type Enterprise Console is mapped.

  Target: Enter the version of the workflow.

  - Specify the version of the Workflow to which you want to map the Event Association of type Enterprise Console in target environment.
  - If you do not specify the Workflow version in the Target environment, the Workflow version from the Source environment will be considered while installing the package.

  If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is not present in the target environment, then the Event Association will not be installed.

  If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is in Draft status, then the Event Association of type Enterprise Console will be installed and mapped to the latest version of the workflow.
- **Enterprise Console Event Association Settings**: This displays the settings of the Event Association of type Enterprise Console in the Source environment and it also allows you to specify the settings of the Event Association of type Enterprise Console in the Target environment.

  Source

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Effective From**: Displays the date from when the Event should be triggered in the source environment.
- **Effective To**: Displays the date till when the Event should be triggered in the source environment.

Target

- **Effective From**: Select the date from when the Event should be triggered in the target environment.

  If you are not using the date picker ensure that the date is in the MM\dd\yyyy format.
- **Effective To**: Select the date till when the Event should be triggered in the target environment.

  If you are not using the date picker ensure that the date is in the MM\dd\yyyy format.

Note: Ensure that you follow the following guidelines while packaging the Event Associations of type Enterprise Console in the target environment:

- Effective From and Effective To should be in a valid format.
- Effective From should be less than or equal to Effective To respectively.
- Effective To should be greater than or equal to current date.
- Effective From and Effective To can be 'Null'. However, you cannot have either one of them as 'Null'.

If you want to leave the dates as blank, then enter **Null** in the Effective From and Effective To fields in the Target section.

Update

The settings in this tab is referred to when the same Package is installed for the consecutive time.

- **Delete Event Association**: Select this option to delete the Event Association that is present in the target environment.
  - **Yes**: Select this option to remove the Event Association in the target environment.
  - **No**: Select this option to retain the Event Association in the target environment, or install the Event Association if it is not present in the target environment.
- **Workflow Version**: This displays the version of Workflow to which Event Association of type Enterprise Console is mapped in the Source environment and it also allows you to specify the version of Workflow to which Event Association of type Enterprise Console should be mapped in the Target environment:

  Source: Displays the version of Workflow in the source environment to which the Event Association of type Enterprise Console is mapped.

  Target: Enter the version of the workflow:
  - Specify the version of the Workflow to which you want to map the Event Association of type Enterprise Console in target environment.
  - If you do not specify the Workflow version in the Target environment, the Workflow version from the Source environment will be considered while installing the package.

    If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is not present in the target environment, then the Event Association will not be installed.

    If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is in Draft status, then the Event Association of type Enterprise Console will be installed and mapped to the latest version of the workflow.
- **Enterprise Console Event Association Settings**: This displays the settings of the Event Association of the type Enterprise Console in the Source environment and also allows you to specify the settings of the Event

Association of the type Enterprise Console in the Target environment while updating the Package.

Source

- **Effective From**: Displays the date from when the Event should be triggered in the source environment.
- **Effective To**: Displays the date till when the Event should be triggered in the source environment.

Target

- **Effective From**: Update the date from when the Event should be triggered in the target environment.

  If you are not using the date picker ensure that the date is in the MM\dd\yyyy format.
- **Effective To**: Update the date till when the Event should be triggered in the target environment.

  If you are not using the date picker ensure that the date is in the MM\dd\yyyy format.

Uninstall

This settings in this tab is referred to when the Package is being uninstalled in the target environment.

- **Delete Event Association**: This property allows you to retain or delete the Event Association of the type Enterprise Console in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to delete the Event Association from the target environment when the Package is uninstalled.
  - **No**: Select this option to retain the Event Association in the target environment even after the Package is uninstalled.

Click **Save Event Association Settings**.

Associated Artifacts Tab

The Associated Artifacts tab displays all the associated artifacts of the selected Event Associations of type Enterprise Console definition.

Child Artifacts Tab

Event Associations of type Enterprise Console does not have any child artifact.

Security Artifacts Tab

The Security Artifacts tab displays the security artifacts of an Event Associations of type Enterprise Console, if any.

Event Associations of Type File Watcher

You can package and deploy the Event Associations of type File Watcher along with its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To add Event Association of Type File Watcher to Package Template

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, click **Workflows**. The **Workflows** window appears.
3. Select a Workflow with an event association of type file watcher associated to it.
4. Right-click the workflow, and then select **View Association**. All associations of the selected workflow appear.
5. Right-click Event Associations of type file watcher that you want to package, and then click **Add to Package Template**.
   The **Add to Package Template** window appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

In the Package Template tree view, the File Watcher Event Association will appear in the following format:

<**Workflow Name_Provider Name_Event Name_Path_File Name/Pattern**>

Here,

- **Workflow Name**: Name of the workflow to which the file watcher is associated
- **Provider Name**: Name of the file watcher
- **Event Names**: Created, deleted, changed, or renamed
- **Path**: Physical path of the file watcher in the source environment
- **File Name/Pattern**: Extension of the file or a name of the file. For example, .txt or .doc file.

Configuration Settings for Event Association of Type File Watcher

The Event Associations of type File Watcher has a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the Settings tab to define the configuration settings. The Associated Artifacts tab displays the associated artifacts of the Event Association of type File Watcher definition. The Child Artifacts tab displays child artifacts of the Event Association of type File Watcher definition.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Security Artifacts

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Tab

The properties in this tab allow you to take appropriate actions while installing, updating, or uninstalling the Package.

Behavior of File Watcher Event Association while installing, updating or uninstalling the package:

- You cannot overwrite an already existing item.
- You can delete or uninstall a File Watcher Event Association only if it was installed by the Package.

Install

The settings in this tab are referred to when installing the Package. When installing the package, if the Event File Watcher dates are invalid, then the package will not be installed. Edit the dates and install the package.

- **Workflow Version**: This displays the version of the Workflow to which Event Association of type File Watcher is mapped in the Source environment and it also allows you to specify the version of Workflow to which Event Association of type File Watcher should be mapped in the Target environment.
  - **Source**: Displays the version of Workflow in the source environment to which the Event Association of type File Watcher is mapped.
  - **Target**: Enter the version of the workflow:
    - Specify the version of the Workflow to which you want to map the Event Association of type File Watcher in target environment.
    - If you do not specify the Workflow version in the Target environment, the Workflow version from the Source environment will be considered while installing the package.

      Note:
      - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is not present in the target environment, then the Event Association will not be installed.
      - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is in Draft status, then the Event Association of type File Watcher will be installed and mapped to the
      latest version of the workflow.

- **File Watcher Event Association Settings**: This displays the settings of the Event Association of type File Watcher in the Source environment and it also allows you to specify the settings of the Event Association of type File Watcher in the Target environment.
  - **Source**
    - **Event Folder**: Displays the physical path of File Watcher in the source environment.
    - **Effective From**: Displays the date from when the Event should be triggered in the source environment.
    - **Effective To**: Displays the date till when the Event should be triggered in the source environment.
  - **Target**
    - **Event Folder**: Enter the physical path of the File Watcher in the target environment. If this field is left blank then the physical path for the target environment will be the same as the path specified in source environment.

      Note: Ensure that the path specified in this field and the path specified in the Physical Path of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

associated File Watcher configuration settings is the same. If it is not, then the File watcher Event Association will not be mapped to the File Watcher.

- **Effective From**: Select the date from when the Event should be triggered in the target environment.

  If you are not using the date picker ensure that the date is in the MM\dd\yyyy format.
- **Effective To**: Select the date till when the Event should be triggered in the target environment.

  If you are not using the date picker ensure that the date is in the MM\dd\yyyy format.

Note:

- Ensure that you follow the following guidelines while packaging the File Watcher Event Association in the target environment:
- Effective From and Effective To should be in a valid format.
- Effective From should be less than or equal to Effective To respectively.
- Effective To should be greater than or equal to current date.
- Effective From and Effective To can be 'Null'. However, you cannot have either one of them as 'Null'.
- If you want to leave the dates as blank, then you have to enter 'Null' in the Effective From and Effective To fields in the Target section.

Update

The settings in this tab are referred to when the same Package is installed for the consecutive time.

- **Delete Event Association**: Select this option to delete the Event Association that is present in the target environment.
  - **Yes**: Select this option to remove the Event Association in the target environment.
  - **No**: Select this option to retain the Event Association in the target environment or install the Event Association if it is not present in the target environment.
- **Workflow Version**: This displays the version of Workflow to which Event Association of type File Watcher is mapped in the Source environment and it also allows you to specify the version of Workflow to which Event Association of type File Watcher should be mapped in the Target environment.
  - **Source**: Displays the version of Workflow in the source environment to which the Event Association of type File Watcher is mapped.
  - **Target**: Enter the version of the workflow:

    Specify the version of the Workflow to which you want to map the Event Association of type File Watcher in target environment.

    If you do not specify the Workflow version in the Target environment, the Workflow version from the Source environment will be considered while installing the package.

    Note:
    - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is not present in the target environment, then the Event Association will not be installed.
    - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is in Draft status, then the Event Association of type File Watcher will be installed and mapped to the latest version of the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **File Watcher Event Association Settings**: This displays the settings of the Event Association of the type File Watcher in the Source environment and also allows you to specify the settings of the Event Association of the type File Watcher in the Target environment while updating the Package.
  - **Source**
    - **Event Folder**: Displays the physical path of File Watcher in the source environment.
    - **Effective From**: Displays the date from when the Event should be triggered in the source environment.
    - **Effective To**: Displays the date till when the Event should be triggered in the source environment.
  - **Target**
    - **Event Folder**: Enter the physical path of the File Watcher in the target environment. If this field is left blank then the physical path for the target environment will be the same as the path specified in source environment.
    - **Effective From**: Update the date from when the Event should be triggered in the target environment.

      If you are not using the date picker ensure that the date is in the MM\dd\yyyy format.
    - **Effective To**: Update the date till when the Event should be triggered in the target environment.

      If you are not using the date picker ensure that the date is in the MM\dd\yyyy format.

Uninstall

The settings in this tab are referred to when the Package is being uninstalled in the target environment.

- **Delete Event Association**: This property allows you to retain or delete the Event Association of the type File Watcher in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to delete the Event Association from the target environment when the Package is uninstalled.
  - **No**: Select this option to retain the Event Association in the target environment even after the Package is uninstalled.

Click **Save Event Association Settings**.

Note: You cannot uninstall individual versions, when uninstalling a package. All the version will be uninstalled and a message is logged for every single version that is uninstalled.

Associated Artifacts

The **Associated Artifacts** tab displays all the associated artifacts of the selected Event Association of type File Watcher definition.

File Watcher Event Association has the following associated artifacts:

- Workflow
- File Watcher: While installing the package we will verify if the file watcher with the same path as specified in the configuration settings is available in the target environment. If available, then the File Watcher Event Association will be installed by mapping to the identified (one with the same path) file watcher. If it is not available then the File Watcher Event Association will not be installed.
  If the File Watcher title is same and path is different than the one specified in the configuration settings of the File Watcher Event Association, then the File Watcher Event Association will not be installed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Child Artifacts

Event Association of type File Watcher does not have any child artifact.

Security Artifacts

The **Security Artifacts** tab displays the security artifacts of an Event Association of type File Watcher, if any.

You can enable the security settings of the grid view that you want to include in the package.
For more information about including security artifacts, see Include Security Artifacts.

Event Associations of Type System Platform Events

You can package and deploy the Event Associations of type System Platform Events along with workflow and its associations, from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

Consider the following scenario where:

- An environment is set up with System Platform and AVEVA Work Tasks.
- A WorkflowGateway object is configured and the repository is provisioned.
- An object in System Platform has an event and this event is associated with a workflow in AVEVA Work Tasks.

When this System Platform event is triggered, the associated workflow is executed.

To make the above scenario work in the target environment, perform the following in the source and target environments.

Source Environment

- Export the object and its dependent objects from System Platform.
- Package the Workflow with System Platform Events in AVEVA Work Tasks , and then export the package.

Target Environment

- Import the object and its dependent objects to System Platform.

Note:
- Ensure that the WorkflowGateway object name is same in the target environment.
- You can map multiple event associations for the same workflow. If you package workflows with multiple System Platform Event Associations and install this package in the target environment, then only the first event association mapping will be retained. You have to manually map all the other event associations for the same workflow after the package is installed.

- Import the package to AVEVA Work Tasks and then install the package.

  For more information about importing a package, see Importing a Package.

Adding Event Associations of type System Platform Events to Package Template

To package Event Associations through Workflows

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, and then click **Workflows**. The **Workflows** window appears.
3. Right-click the workflow, and then click **Add to Package Template**. The **Add to Package Template** dialog box appears.
4. In the **Include Associated Artifacts** section, select **Yes**.
5. Click **Save Template**.
   The System Platform events along with the workflow are included in the package.

To package Workflows through Event Association

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, and then click **Workflows**. The **Workflows** window appears.
3. Select a Workflow with an event association of type System Platform Events.
4. Right-click the workflow, and then select **View Association**. All associations of the selected workflow appear.
5. Right-click **Event Associations of type System Platform Events** that you want to package, and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Runtime Initialization Settings

You can configure runtime initialization settings for Event Associations of type System Platform Events. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration Settings for Event Associations of type System Platform Events

The Event Associations of type System Platform have a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the Settings tab to define the configuration settings. The **Associated Artifacts** tab displays the associated artifacts of the Event Association of type System Platform Events definition. The **Child Artifacts** tab displays child artifacts of the Event Association of type System Platform Events definition.

The Package Template configuration window contains the following tabs:

- Settings

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Install
- Update
- Uninstall

- Associated Artifacts
- Security Artifacts

Settings Tab

You can use the properties of the Settings tab to take appropriate actions to install, update, or uninstall the package.

Behavior of Event Associations of type System Platform Events while installing, updating or uninstalling the package:

- You cannot overwrite an already existing item.
- You can delete or uninstall an Event Associations of type System Platform Event only if it was installed by the Package.

Install

You can use the settings in this tab while installing the package.

- The following event association details are displayed:
  - **Type**: The type of event. In this scenario, the type is displayed as **ArchestrA**.
  - **Define in Object**: The System Platform object to which this event is associated.
  - **Event**: The name of the event.
  - **Workflow**: The workflow associated to the event.
- **Workflow Version**: This displays the version of Workflow to which Event Association of type System Platform Events is mapped in the Source environment. It also allows you to specify the version of Workflow to which Event Association of type System Platform should be mapped in the Target environment.
  - **Source**: Displays the version of Workflow in the source environment to which the Event Association of type System Platform Events is mapped.

    Target: Enter the version of the workflow:

    Specify the version of the Workflow to which you want to map the Event Association of type System Platform Events in target environment.

    If you do not specify the Workflow version in the Target environment, the Workflow version from the Source environment will be considered while installing the package.

    Note:
    - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is not present in the target environment, then the Event Association will not be installed.
    - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is in Draft status, then the Event Association of type System Platform Events will be installed and mapped to the latest version of the workflow.

- **Galaxy Configuration Settings**: This displays the galaxy configuration settings in the Source environment and

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

it also allows you to specify the galaxy configuration settings of the Event Association of type System Platform Events in the target environment.

- **Unique Environment Name**
  - **Source**: Displays the unique environment name in the source environment.
  - **Target**: Enter or select the unique environment name in the target environment.
- **Galaxy Name**
  - **Source**: Displays the galaxy name in the source environment.
  - **Target**: Select the galaxy name in the target environment.

Update

You can refer to the settings in this tab when you install the same Package for the consecutive time.

- **Delete Event Association**: Select this option to delete the Event Association that is present in the target environment.
  - **Yes**: Select this option to remove the Event Association in the target environment.
  - **No**: Select this option to retain the Event Association in the target environment or to install the Event Association if it is not present in the target environment.

  Note: The settings configured in the **Workflow Version** and **Galaxy Configuration Settings** grids are common for the **Install** and **Update** tabs.

Uninstall

You can refer to the settings in this tab when you uninstall the Package from the target environment.

- **Delete Event Association**: This property allows you to retain or delete the Event Association of the type System Platform Events in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to delete the Event Association from the target environment when the Package is uninstalled.
  - **No**: Select this option to retain the Event Association in the target environment even after the Package is uninstalled.

Click **Save Event Association Settings**.

Note: You cannot uninstall individual versions, when uninstalling a package. All the versions will be uninstalled and a message is logged for every single version that is uninstalled.

Associated Artifacts Tab

The **Associated Artifacts** tab displays all the associated artifacts of the selected Event Associations of type System Platform Events definition.

Event Associations of type System Platform Events has the following associated artifacts: Workflow

Child Artifacts Tab

Event Associations of type System Platform Events does not have any child artifact.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Security Artifacts Tab

The Security Artifacts tab displays the security artifacts of an Event Associations of type System Platform Events, if any.

You can enable the security settings of the Event Associations of type System Platform Events that you want to include in the package.
For more information about including security artifacts, see Include Security Artifacts.

Event Associations of Type Logic App

You can package and deploy the Event Associations of type Logic App along with its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add Event Association of Type Logic App to Package Template

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, click **Workflows**. The **Workflows** window appears.
3. Select a Workflow with an event association of type Logic App.
4. Right-click the workflow, and then select **View Association**. All associations of the selected workflow appear.
5. Right-click Event Associations of type Logic App that you want to package, and then click **Add to Package Template**.
   The **Add to Package Template** window appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

In the Package Template tree view, the Logic App Event Association will appear in the following format:

<**LogicAppAssociation_Workflow Name**>

Here,

- **LogicAppAssociation**: Name of the Logic App Association
- **Workflow Name**: Name of the workflow to which the Logic App is associated

Configuration Settings for Event Association of Type Logic App

The Event Associations of type Logic App has a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the Settings tab to define the configuration settings. The Associated Artifacts tab displays the associated artifacts of the Event Association of type Logic App definition. The Child Artifacts tab displays child artifacts of the Event Association of type Logic App definition.

The Package Template configuration window contains the following tabs:

- Settings

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Security Artifacts

Settings Tab

The properties in this tab allow you to take appropriate actions while installing, updating, or uninstalling the Package.

Behavior of Logic App Event Association while installing, updating or uninstalling the package:

- You cannot overwrite an already existing item.
- You can delete or uninstall a Logic App Event Association only if it was installed by the Package.

Install

The settings in this tab are referred to when installing the Package.

- **Workflow Version**: This displays the version of the Workflow to which Event Association of type Logic App is mapped in the Source environment and it also allows you to specify the version of Workflow to which Event Association of type Logic App should be mapped in the Target environment.
  - **Source**: Displays the version of Workflow in the source environment to which the Event Association of type Logic App is mapped.
  - **Target**: Enter the version of the workflow:
    - Specify the version of the Workflow to which you want to map the Event Association of type Logic App in target environment.
    - If you do not specify the Workflow version in the Target environment, the Workflow version from the Source environment will be considered while installing the package.

      Note:
      - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is not present in the target environment, then the Event Association will not be installed.
      - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is in Draft status, then the Event Association of type Logic App will be installed and mapped to the latest version of the workflow.

- **Logic App Event Association Settings**: This displays the settings of the Event Association of type Logic App in the Source environment and it also allows you to specify the settings of the Event Association of type Logic App in the Target environment.
  - **Source**
    - **Enterprise Console**: Displays the name of the Enterprise Console site with the Server name in the Source environment.
    - **Logic App URI**: Displays the automatically generated URI based on the selected Enterprise Console site in the Source environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Logic App Alert Key**: Displays the automatically generated value of the alert key.
- **Authorization Token**: Displays the automatically generated authorization token based on the selected Enterprise Console site in the Source environment.
- **Workflow Version**: Displays the version of the Workflow to which Event Association of type Logic App is mapped in the Source environment.

- **Target**
  - **Enterprise Console**: Enter the name of the Enterprise Console site with the Server name or select the Enterprise Console site that is fetched by run time initialization control in the Target environment.
  - **Logic App URI**: Enter the automatically generated URI of the selected Enterprise Console site or select the URI generated by run time initialization control in the Target environment.
  - **Logic App Alert Key**: Enter the automatically generated value of the Logic App alert key or select the key generated by run time initialization control in the Target environment.
  - **Authorization Token**: Enter the automatically generated authorization token of the selected Enterprise Console site or select the token generated by run time initialization control in the Target environment.
  - **Workflow Version**: Enter the version of the Workflow to which Event Association of type Logic App is mapped in the Target environment.

Update

The settings in this tab are referred to when the same Package is installed for the consecutive time.

- **Delete Event Association**: Select this option to delete the Event Association that is present in the target environment.
  - **Yes**: Select this option to remove the Event Association in the target environment.
  - **No**: Select this option to retain the Event Association in the target environment or install the Event Association if it is not present in the target environment.
- **Workflow Version**: This displays the version of Workflow to which Event Association of type Logic App is mapped in the Source environment and it also allows you to specify the version of Workflow to which Event Association of type Logic App should be mapped in the Target environment.
  - **Source**: Displays the version of Workflow in the source environment to which the Event Association of type Logic App is mapped.
  - **Target**: Enter the version of the workflow:

    Specify the version of the Workflow to which you want to map the Event Association of type Logic App in target environment.

    If you do not specify the Workflow version in the Target environment, the Workflow version from the Source environment will be considered while installing the package.

    Note:
    - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is not present in the target environment, then the Event Association will not be installed.
    - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is in Draft status, then the Event Association of type Logic App will be installed and mapped to the latest version of the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Logic App Event Association Settings**: This displays the settings of the Event Association of the type Logic App in the Source environment and also allows you to specify the settings of the Event Association of the type Logic App in the Target environment while updating the Package.
  - **Source**
    - **Enterprise Console**: Displays the name of the Enterprise Console site with the Server name in the Source environment.
  - **Target**
    - **Enterprise Console**: Enter the name of the Enterprise Console site with the Server name or select the Enterprise Console site that is fetched by run time initialization control in the Target environment. If this field is left blank then the name of Enterprise Console site for the target environment will be the same as the name of Enterprise Console site in source environment.

Uninstall

The settings in this tab are referred to when the Package is being uninstalled in the target environment.

- **Delete Event Association**: This property allows you to retain or delete the Event Association of the type Logic App in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to delete the Event Association from the target environment when the Package is uninstalled.
  - **No**: Select this option to retain the Event Association in the target environment even after the Package is uninstalled.

Click **Save Event Association Settings**.

Note: You cannot uninstall individual versions, when uninstalling a package. All the version will be uninstalled and a message is logged for every single version that is uninstalled.

Associated Artifacts

The **Associated Artifacts** tab displays all the associated artifacts of the selected Event Association of type Logic App definition.

Logic App Event Association has the following associated artifacts:

- Workflow
- Logic App: While installing the package we will verify if the Logic App with the same path as specified in the configuration settings is available in the target environment. If available, then the Logic App Event Association will be installed by mapping to the identified (one with the same path) Logic App. If it is not available then the Logic App Event Association will not be installed.
  If the Logic App title is same and path is different from the one specified in the configuration settings of the Logic App Event Association, then the Logic App Event Association will not be installed.

Child Artifacts

Event Association of type Logic App does not have any child artifact.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Security Artifacts

The **Security Artifacts** tab displays the security artifacts of an Event Association of type Logic App, if any.

You can enable the security settings of the grid view that you want to include in the package.
For more information about including security artifacts, see Include Security Artifacts.

Event Associations of Type Message Queue

You can package and deploy the Event Associations of type Message Queue along with its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add Event Association of Type Message Queue to Package Template

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, click **Workflows**. The **Workflows** window appears.
3. Select a Workflow with an event association of type Message Queue.
4. Right-click the workflow, and then select **View Association**. All associations of the selected workflow appear.
5. Right-click Event Associations of type Message Queue that you want to package, and then click **Add to Package Template**.
   The **Add to Package Template** window appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

In the Package Template tree view, the Message Queue Event Association will appear in the following format:

<**Message Queue_Workflow Name**>

Here,

- **Message Queue_Workflow Name**: Name of the Message Queue Association

Configuration Settings for Event Association of Type Message Queue

The Event Associations of type Message Queue has a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the Settings tab to define the configuration settings. The Associated Artifacts tab displays the associated artifacts of the Event Association of type Message Queue definition. The Child Artifacts tab displays child artifacts of the Event Association of type Message Queue definition.

The Package Template configuration window contains the following tabs:

- Settings

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Security Artifacts

Settings Tab

The properties in this tab allow you to take appropriate actions while installing, updating, or uninstalling the Package.

Behavior of Message Queue Event Association while installing, updating or uninstalling the package:

- You cannot overwrite an already existing item.
- You can delete or uninstall a Message Queue Event Association only if it was installed by the Package.

Install

The settings in this tab are referred to when installing the Package.

- **Workflow Version**: This displays the version of the Workflow to which Event Association of type Message Queue is mapped in the Source environment and it also allows you to specify the version of Workflow to which Event Association of type Message Queue should be mapped in the Target environment.
  - **Source**: Displays the version of Workflow in the source environment to which the Event Association of type Message Queue is mapped.
  - **Target**: Enter the version of the workflow:
    - Specify the version of the Workflow to which you want to map the Event Association of type Message Queue in target environment.
    - If you do not specify the Workflow version in the Target environment, the Workflow version from the Source environment will be considered while installing the package.

      Note:
      - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is not present in the target environment, then the Event Association will not be installed.
      - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is in Draft status, then the Event Association of type Message Queue will be installed and mapped to the latest version of the workflow.

- **Message Queue Event Association Settings**: This displays the settings of the Event Association of type Message Queue in the Source environment and it also allows you to specify the settings of the Event Association of type Message Queue in the Target environment.
  - **Source**
    - **Workflow Version**: Displays the version of the Workflow to which Event Association of type Message Queue is mapped in the Source environment.
  - **Target**
    - **Workflow Version**: Enter the version of the Workflow to which Event Association of type Message

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Queue is mapped in the Target environment.

Update

The settings in this tab are referred to when the same Package is installed for the consecutive time.

- **Delete Event Association**: Select this option to delete the Event Association that is present in the target environment.
  - **Yes**: Select this option to remove the Event Association in the target environment.
  - **No**: Select this option to retain the Event Association in the target environment or install the Event Association if it is not present in the target environment.
- **Workflow Version**: This displays the version of Workflow to which Event Association of type Message Queue is mapped in the Source environment and it also allows you to specify the version of Workflow to which Event Association of type Message Queue should be mapped in the Target environment.
  - **Source**: Displays the version of Workflow in the source environment to which the Event Association of type Message Queue is mapped.
  - **Target**: Enter the version of the workflow:

    Specify the version of the Workflow to which you want to map the Event Association of type Message Queue in target environment.

    If you do not specify the Workflow version in the Target environment, the Workflow version from the Source environment will be considered while installing the package.

    Note:
    - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is not present in the target environment, then the Event Association will not be installed.
    - If the version of the workflow that is considered while installing the package (based on the two conditions specified above) is in Draft status, then the Event Association of type Message Queue will be installed and mapped to the latest version of the workflow.

- **Message Queue Event Association Settings**: This displays the settings of the Event Association of the type Message Queue in the Source environment and also allows you to specify the settings of the Event Association of the type Message Queue in the Target environment while updating the Package.
  - **Source**
    - **Workflow Version**: Displays the version of the Workflow to which Event Association of type Message Queue is mapped in the Source environment.
  - **Target**
    - **Workflow Version**: Enter the version of the Workflow to which Event Association of type Message
    - Queue is mapped in the Target environment.

Uninstall

The settings in this tab are referred to when the Package is being uninstalled in the target environment.

- **Delete Event Association**: This property allows you to retain or delete the Event Association of the type Message Queue in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to delete the Event Association from the target environment when the Package is uninstalled.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **No**: Select this option to retain the Event Association in the target environment even after the Package is uninstalled.

Note: You cannot uninstall individual versions, when uninstalling a package. All the version will be uninstalled and a message is logged for every single version that is uninstalled.

Associated Artifacts

The **Associated Artifacts** tab displays all the associated artifacts of the selected Event Association of type Message Queue definition.

Message Queue Event Association has the following associated artifacts:

- Workflow
- Message Queue Connection: While installing the package we will verify if the Message Queue with the same path as specified in the configuration settings is available in the target environment. If available, then the Message Queue Event Association will be installed by mapping to the identified (one with the same path) Message Queue. If it is not available then the Message Queue Event Association will not be installed.
  If the Message Queue title is same and path is different from the one specified in the configuration settings of the Message Queue Event Association, then the Message Queue Event Association will not be installed.

Child Artifacts

Event Association of type Message Queue does not have any child artifact.

Security Artifacts

The **Security Artifacts** tab displays the security artifacts of an Event Association of type Message Queue, if any.

You can enable the security settings of the grid view that you want to include in the package.
For more information about including security artifacts, see Include Security Artifacts.

Event Association of Type BAM

You can package and deploy the Event Associations of type BAM along with its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add Event Association of Type BAM to Package Template

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, click **Workflows**. The **Workflows** window appears.
3. Select a Workflow with an event association of type BAM associated to it.
4. Right-click the workflow, and then select **View Association**. All associations of the selected workflow appear.
5. Right-click Event Associations of type BAM that you want to package, and then click **Add to Package Template**.
   The **Add to Package Template** window appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

In the Package Template tree view, the BAM Event Association will appear in the following format:

<**Workflow Name_Associated Event Name_Associated Event Type**>

Here,

- **Workflow Name**: Name of the workflow to which BAM is associated
- **Associated Event Name**: Name of the BAM event associated
- **Associated Event Type**: Name of the BAM event type i.e. Overdue Analysis or KPI

Configuration Settings for Event Association of Type BAM

The Event Associations of type BAM has a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the Settings tab to define the configuration settings. The Associated Artifacts tab displays the associated artifacts of the Event Association of type BAM definition. The Child Artifacts tab displays child artifacts of the Event Association of type BAM definition.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Security Artifacts

Settings Tab

The properties in this tab allow you to take appropriate actions while installing, updating, or uninstalling the Package.

Behavior of BAM Event Association while installing, updating, or uninstalling the package:

- You cannot overwrite an already existing item.
- You can delete or uninstall a BAM Event Association only if it was installed by the Package.

Install

The settings in this tab are referred to when installing the Package. When installing the package, if the Event BAM dates are invalid, then the package will not be installed. Edit the dates and install the package.

- The following event association details are displayed:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Type**: The type of event. In this scenario, type is Overdue Analysis or KPI.
- **Associated Workflow**: The workflow associated to the BAM event type.
- **Workflow**: The workflow associated to the event.

- **BAM Event Association Settings**: This displays the settings of the Event Association of type BAM in the Source environment and it also allows you to specify the settings of the Event Association of type BAM in the Target environment.
  - **Source**
    - **Effective From**: Displays the date from when the Event should be triggered in the source environment.
    - **Effective To**: Displays the date till when the Event should be triggered in the source environment.
  - **Target**
    - **Effective From**: Select the date from when the Event should be triggered in the target environment.

      If you are not using the date picker ensure that the date is in the MM\dd\yyyy format.
    - **Effective To**: Select the date till when the Event should be triggered in the target environment.

      If you are not using the date picker ensure that the date is in the MM\dd\yyyy format.

      Note:
      Ensure that you follow the following guidelines while packaging the BAM Event Association in the target environment:
      - Effective From and Effective To should be in a valid format.
      - Effective From should be less than or equal to Effective To respectively.
      - Effective To should be greater than or equal to current date.
      - Effective From and Effective To can be 'Null'. However, you cannot have either one of them as 'Null'.
      - If you want to leave the dates as blank, then you have to enter 'Null' in the Effective From and Effective To fields in the Target section.

Update

The settings in this tab are referred to when the same Package is installed for the consecutive time.

- **Delete Event Association**: Select this option to delete the Event Association that is present in the target environment.
  - **Yes**: Select this option to remove the Event Association in the target environment.
  - **No**: Select this option to retain the Event Association in the target environment or install the Event Association if it is not present in the target environment. By default, **No** is selected.

Uninstall

The settings in this tab are referred to when the Package is being uninstalled in the target environment.

- **Delete Event Association**: This property allows you to retain or delete the Event Association of the type BAM in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to delete the Event Association from the target environment when the Package is uninstalled. By default, **Yes** is selected.
  - **No**: Select this option to retain the Event Association in the target environment even after the Package is uninstalled.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Click **Save Event Association Settings**.

Note: You cannot uninstall individual versions, when uninstalling a package. All the version will be uninstalled and a message is logged for every single version that is uninstalled.

Associated Artifacts

The **Associated Artifacts** tab displays all the associated artifacts of the selected Event Association of type BAM definition.

BAM Event Association has the following associated artifacts:

- Workflow
- BAM

Child Artifacts

Event Association of type BAM does not have any child artifact.

Security Artifacts

The **Security Artifacts** tab displays the security artifacts of an Event Association of type BAM, if any.

You can enable the security settings of the grid view that you want to include in the package.
For more information about including security artifacts, see Include Security Artifacts.

File Watcher

You can package and deploy the File Watcher along with its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add File Watcher to a Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **File Watcher**.
   The **FileWatcher List** window appears.
3. Select the file watcher list that you want to package.
4. Right-click the file watcher list, and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Runtime Initialization Settings

You can configure runtime initialization settings for the File Watcher. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration settings for File Watcher

The **File Watcher** has a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment** > **Package Template** window
- **Target Environment** > **Manage Package** window

You can use the **Settings** tab to define the configuration settings. The File Watcher does not have any associated artifact or child artifact. So, the **Associated Artifacts** and **Child Artifacts** tab are not enabled.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Security Artifacts

Settings Tab

The properties in this tab allow you to take appropriate actions while installing, updating, or uninstalling the Package.

Install

The settings in this tab are referred to when installing the Package.

- **File Watcher exists**: Select this property to take appropriate action when the File Watcher that is being installed is present in the target environment.
  - **Do not install File Watcher**: Select this option to use the File Watcher that is present in the target environment.
  - **Install to overwrite existing File Watcher**: Select this option to overwrite the File Watcher that is present in the target environment with the one that present in the package.
- **Physical Path**: This displays the path of the File Watcher in the Source environment and it also allows you to specify path of the File Watcher in the Target environment:
  - **Source**: Displays the path of the File Watcher in the Source environment.
  - **Target**: Specify the path of the File Watcher in the target environment. If it is left blank, then the source path will be considered.

Update

The settings in this tab are referred to when the same Package is installed for the consecutive time.

- **Delete File Watcher**: Select this option to delete the File Watcher that is present in the target environment.
  - **Yes**: Select this option to remove the File Watcher in the target environment.
  - **No**: Select this option to retain the File Watcher in the target environment.
- **File Watcher exists**: Select this option to take appropriate action when the File Watcher that is being

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

installed is present in the target environment.

- **Do not install File Watcher**: Select this option if you want to use the File Watcher that is present in the target environment.
- **Install to overwrite existing File Watcher**: Select this option if you want to overwrite the File Watcher that is present in the target environment with the one that present in the package.

- **File Watcher Is Modified**: Select this option to retain, roll back to original state, or delete the File Watcher in the target environment even after the Package is updated. This property is applicable only if **Delete File Watcher** is set to *Yes* and if the File Watcher is modified.
  - **Retain**: Select this option to retain the File Watcher along with the modifications in the target environment even after the Package is updated.
  - **Roll back to original State**: Select this option to roll back to the original state. All modifications that were done to the File Watcher after it was installed in the target environment will be reverted. However, the File Watcher will be retained in the target environment.
  - **Delete**: Select this option to delete the File Watcher from the target environment when updating the Package.

Uninstall

The settings in this tab are referred to when the Package is being uninstalled in the target environment.

- **Delete File Watcher**: Select this option to retain or delete the File Watcher in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to delete the File Watcher from the target environment when the Package is uninstalled.
  - **No**: Select this option to retain the File Watcher in the target environment even after the Package is uninstalled.
- **File Watcher Is Modified**: This option allows you to decide if you want to retain, roll back to original state or delete the File Watcher in the target environment even after the Package is uninstalled. This property is displayed only if **Delete File Watcher** is set to *Yes*. However, if **Delete File Watcher** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the File Watcher along with the modifications in the target environment even after the Package is uninstalled.
  - **Roll back to original State**: Select this option to roll back to the original state. All modifications that were done to the File Watcher after it was installed in the target environment will be reverted. However, the File Watcher will be retained in the target environment.
  - **Delete**: Select this option to delete the File Watcher from the target environment when uninstalling the Package.

Associated Artifacts Tab

File Watcher does not have any associated artifact.

Child Artifacts Tab

File Watcher does not have any child artifact.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Security Artifacts Tab

The Security Artifacts tab displays the security artifacts of a file watcher, if any.

You can enable the security settings of the file watcher that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

Resolve Physical Path of File Watcher

You can edit the physical path of the File Watcher in the target environment.

- If a File Watcher with the same name already exists in the target environment but with a different path, the File Watcher will not be installed and the following warning message appears:

  File Watcher already exists with a different physical path and cannot be updated.

  You can resolve the warning message by changing the path of the File Watcher in the package to the same path as in the target environment.
- If a File Watcher with a different name but same physical path as the one in the package is already present in the package, then the File Watcher will not be installed and the following warning message appears:

  A file watcher with the same physical path is already configured: <physical path>.

  You can resolve the warning message by changing the physical path in the package. Ensure that the new path is not configured for another File Watcher.

The **Physical Path** grid contains the following settings, which are required to resolve the physical path of the File Watcher.

- **Source**: Displays the physical path value of the File Watcher in the source environment.
- **Target**: Enter the physical path value of the File Watcher in the target environment. If you do not specify any value, then the value specified in the source is considered.

Folder

You can package and deploy **Folder** along with its associated and child artifacts from one environment or repository to another environment or repository.

Configuration Settings for Folder

The **Folder** has a unique set of configuration settings required to install, update, and uninstall the package. You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template > Edit**
- **Target Environment > Manage Package > Edit**

Settings Tab

You can define the configuration settings of the Folder artifact in the **Settings** tab. Set the options in this tab to take appropriate actions while installing, updating, or uninstalling the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Install

Use this tab to set the configurations for installing the package.

- **Parent folder is not present**: Select this property to take appropriate action when the parent folder is not present in the target environment.
  - **Install folder**: Select this option to install this folder in target environment even if the parent folder is not present.
  - **Do not install folder**: Select this option if you do not want to install the folder as the parent folder is not present in the target environment.

Update

Use the settings in this tab to update an installed package.

- **Parent folder is not present**: Select this property to take appropriate action when the parent folder is not present in the target environment.
  - **Update folder**: Select this option to update the folder in target environment even if the parent folder is not present.
  - **Do not update folder**: Select this option if you do not want to update the folder as the parent folder is not present in the target environment.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete folder** : Use this property to decide if you want to delete the folder or retain it when uninstalling the package.
  - **Yes**: Select this option to delete this folder after uninstalling the package.
  - **No**: Select this option to retain this folder after uninstalling the package.

    Note: The Folder in a package does not have the **Rollback** and **Overwrite** options like other artifacts.

Associated Artifacts of Folder

The **Associated Artifacts** tab displays all the associated artifacts of the selected folder.

Folder can include the following associated artifacts:

- Parent Folder
- Parent ListItem

Child Artifacts of Folder

The **Child Artifacts** tab displays all the child artifacts of the selected folder.

Folder can include the following child artifacts:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Child Folder
- Child ListItem

Include Child Item

For more information, see Include Child Item.

Security Artifacts of Folder

The **Security Artifacts** tab displays all the security artifacts of the selected folder.

You can enable the security settings of the folder that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

Child Folder

You can package and deploy a child folder along with its associated and child artifact from one environment or repository to another environment or repository.

Configuration Settings for Child Folder

The **Child Folder** has an unique set of configuration settings required to install, update, and uninstall the package. You can view and edit the configuration settings from one of the following windows:

- Source Environment > Package Template window
- Target Environment > Manage Package window

Settings tab

You can define the configuration settings of the **Child Folder** artifact in the **Settings** tab. Set the properties in this tab to take appropriate actions while installing, updating, or uninstalling the package.

Install and Update

Use this tab to set the configurations for installing and updating the package.

Parent item is not present: Use this property to take appropriate action when the parent item is not present in the target environment.

- **Install folder**: Select this option to install the child folder in target environment even if the parent item is not present.
- **Do not install folder**: Select this option to install the child folder as the parent item is not present in the target environment.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Delete folder : Use this property to decide if you want to delete the child folder or retain it when uninstalling the package.

- **Yes**: Select this option to delete the child folder after uninstalling the package.
- **No**: Select this option to retain the child folder after uninstalling the package.

Forms

You can package and deploy Forms with its associated and child artifacts from one environment or repository to another environment or repository.

You can also package custom js, CSS, images, and widgets as associated files to the Form and install them in the target environment. If you are packaging custom CSS, images, and widgets from the Default theme, you need to install it in the Default theme in the target environment to work as expected.

Forms

You can package and deploy Forms with its associated and child artifacts from one environment or repository to another environment or repository.

The Overwrite option available in the **Form Exists** property overwrites the existing Form Definition of the workflow in the target environment with the latest while installing or updating the package even if the latest Form version is in Draft state. When you overwrite the Form Definition for the first time, it gets backed up. But if you roll back, then the backed-up Form definition gets replaced with an existing Form definition.

The locked Forms will also get overwritten.

You can also package custom js, CSS, images, and widgets as associated files to the Form and install them in the target environment. If you are packaging custom CSS, images, and widgets from the Default theme, you need to install it in the Default theme in the target environment to work as expected.

The js file will not be copied to the target machine while installing the package. You need to manually copy it in **\BPMUITemplates\Default\NextGenForms\custom\js**

To add Forms to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, and then click **Forms**.

   The **Forms** window appears.
3. Select the form that you want to package.
4. Right-click on the form, and then click **Add to Package Template**.

   The **Add to Package Template** dialog box appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of Forms in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the Forms package in the Settings form on the right side of the Add to Package Template window.

The status of the forms or folders created through the Forms page will be in *Draft* status. To add a form or a

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

folder to a package template, you must first publish the form or the folder. Also ensure the form that you want to package is not disabled.

You can package and install a form to the target environment even if it is in a locked state, but in the target environment the locked state of the installed form is not retained.

Runtime Initialization Settings

You can configure runtime initialization settings for forms. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration Settings for Forms

Forms has a unique set of configuration settings required to install, update, and uninstall the package. You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

Settings

You can define the configuration settings of Forms artifact in the **Settings** tab. Set the properties in this tab to take appropriate actions while installing, updating, or uninstalling the package.

Note: The **Control Id** field displays the complete position of the control in the form. For example: If the control with Id "H3" is used within a panel form with Id "P1", then the **Control Id** will be displayed as "P1.H3".

In the package template, an orange icon will appear for the Forms prompting you to rebuild it when the form is published, unpublished, or edited after it is added to the package template. Similarly, in the target environment if the form installed by the package is published, unpublished or edited, then while uninstalling the package the forms settings will be retained.

When a form in the package template is modified, ensure to perform a rebuild on the particular form. You can right-click the form from the left hand side configuration tree view in the package template, and click **Complete Rebuild** or **Control Rebuild** to rebuild the form.

- **Complete Rebuild**: Click **Complete Rebuild** to rebuild the particular form artifact in the package template. During complete rebuild, the install, update, or uninstall settings do not change. However, the settings done to resolve any control properties in the target section of the **Settings** form get cleared.
- **Control Rebuild**: Click **Control Rebuild** to rebuild only a modified form artifact. All settings done to resolve any control property in the target section of the **Settings** form does not get changed. Only the new values of the modified control get updated in the package. However, if you want to rename a control in the form, use the **Complete Rebuild** option.

Install

Use this tab to set the configurations for installing the package.

- **Inherit Artifact Type Settings:** Use this property to define whether the settings inherited from the artifact type or the settings configured at the artifact-level must be considered.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Yes**: Select this option if the form must inherit the settings configured for the artifact type. If this option is selected, then the artifact type settings take precedence.
- **No**: Select this option if the form must consider the settings configured at the artifact-level.The following options are available:

Property	Description
Install Form as Draft	Use this property to install the form. • **Yes**: Select this option to install the form in the *Draft* status in the target environment. • **No**: Select this option to install the form in the *Published* status in the target environment.
Form Exists	Use this property to take appropriate action when the forms in the package is already present in the target environment. Existing forms will not be overwritten, hence you can choose to install it with a different version. • **Install as next major version**: Select this option to install the forms as a next major version. • **Install as next minor version**: Select this option to install the forms as a next minor version. • **Install as next version**: Select this option to install the form as a next version. • **Overwrite latest (published) version**: Select this option to overwrite the latest published version of form in the target environment. An existing Form Definition gets replaced with the Form Definition contained in this package. • **Do not install**: Select this option if you do not want to install the form, as it is already present in the target environment.

- **Associated Artifacts Not Present**: Use this property to take appropriate action when the associated artifacts of the forms are not present in the target environment.
  - **Install as draft**: Select this option to install the forms in the *Draft* status, even if the associated artifacts are not present in the target environment.
  - **Do not install**: Select this option if you do not want to install the forms as its associated artifacts are not present.
- **Workflow Version**: See Forms Association for information.
- **Custom Widgets**: Use this property to use the custom widgets as the associated artifact in the form in the target environment.

  In **<Install path>\BPMUITemplates\Default\NextGenForms\custom\Widgets**, the following folders get created in the target environment when you install the package having custom widgets in a form:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Progress
- BaseGrid
- Grid1

Note: Consider, the latest published form exists in the target environment, and the **Overwrite latest (published) version** option is selected. During package installation, the backup of the existing form is taken and stored in the database. And, the form in the target environment is overwritten with the packaged source definition.

During Overwrite, the form name and the description does not get updated in the artifact **Package Name (Version)** column.

Update

Use the settings in this tab to update an installed package.

- **Delete Form**: Use this property to delete the form that is present in the target environment.
  - **Yes**: Select this option to remove the form from the target environment.

    Form is modified: Use this option to retain or delete the form in the target environment even after the package is updated. This property is applicable only if **Delete Forms** is set to *Yes* and the form is modified.
    - **Retain**: Select this option to retain the form along with the modifications, in the target environment.
    - **Rollback to original state**: Select this option to roll back the artifact to the backup taken. All modifications that were done to the Form after it was installed in the target environment will be reverted. However, the Form will remain in the target environment
    - **Delete**: Select this option to delete the form from the target environment.
  - **No**: Select this option to retain the form in the target environment. On selection of this option, the **Install Forms as draft**, **Forms exist**, and **Associated artifacts not present** options appear.

    Only when the **Delete Form** option is set to **No**, the **Inherit Artifact Type Settings** option is enabled.
- **Inherit Artifact Type Settings:** Use this property to define whether the settings inherited from the artifact type or the settings configured at the artifact-level must be considered.
  - **Yes**: Select this option if the form must inherit the settings configured for the artifact type. If this option is selected, then the artifact type settings take precedence.
  - **No**: Select this option if the form must consider the settings configured at the artifact-level. The following options are available:

Property	Description
Install Form as Draft	Use this property to install the form. • **Yes**: Select this option to install the form in the *Draft* status in the target environment. • **No**: Select this option to install the form in the *Published* status in the target environment.
Form Exists	Use this property to take appropriate action when the forms in the package is already present in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	target environment. Existing forms will not be overwritten, hence you can choose to install it with a different version. • **Install as next major version**: Select this option to install the forms as a next major version. • **Install as next minor version**: Select this option to install the forms as a next minor version. You can install the form as a next minor version up to 12 times only. • **Install as next version**: Select this option to install the form as a next version. • **Overwrite latest (published) version**: Select this option to overwrite the latest published version of form in the target environment. An existing Form Definition gets replaced with the Form Definition contained in this package. • **Do not install**: Select this option if you do not want to install the form, as it is already present in the target environment.

- **Associated Artifacts Not Present**: Use this property to take appropriate action when the associated artifacts of the forms are not present in the target environment.
  - **Update as draft**: Select this option to update the forms in draft status, even if the associated artifacts are not present in the target environment.
  - **Do not update**: Select this option if you do not want to update the forms as its associated artifacts are not present.
- **Custom Widgets**: Use this property to use the custom widgets as the associated artifact in the form in the target environment.

  In **<Install path>\BPMUITemplates\Default\NextGenForms\custom\Widgets**, the following folders get updated in the target environment when you update the package having form with custom widgets:

  - Progress
  - BaseGrid
  - Grid1

  Note: Consider, the latest published form exists in the target environment, and the **Overwrite latest (published) version** option is selected. During package update, the backup of the existing form is not be taken if available; and taken if not available. And, the form in the target environment is overwritten with the packaged source definition.

  During Overwrite, the form name and the description does not get updated in the artifact **Package Name (Version)** column.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete Forms**: Use this property to retain or delete the forms in the target environment even after the package is uninstalled. If the forms is a dynamic form and it is associated to a list, then you cannot delete the dynamic form until the list is deleted.
  - **Yes**: Select this option to remove the form from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the form in the target environment even after the package is uninstalled.
- **Form is modified**: Use this property to retain or delete the forms in the target environment even after the package is uninstalled. This property is displayed only if **Delete Forms** is set to *Yes*. However, if **Delete Forms** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the form along with the modifications even after the package is uninstalled.
  - **Rollback to original state**: Select this option to roll back the artifact to the backup taken. All modifications that were done to the Form after it was installed in the target environment will be reverted. However, the Form will remain in the target environment
  - **Delete**: Select this option to delete the form from the target environment.

Note:
- During package uninstall, with the **Rollback to original state** option selected, the overwritten from definition is replaced with backup data, and the backup from the database gets deleted.
- During rollback, the form name and the description does not get updated in the artifact **Package Name (Version)** column.
- When you uninstall the package, the folders **Progress**, **BaseGrid**, and **Grid1** does not get deleted from the target machine.

Associated Artifacts of Forms

The **Associated Artifacts** tab displays all the associated artifacts of the selected forms.

The following artifacts can appear as **Associated Artifacts** if you are using any one of the following artifacts while designing the forms:

- Parent Folder
- Lookup
- SOA Assembly
- Data Grid Configuration
- Data Grid View
- Report Viewer with the Embed and Pop-up option
- Report Viewer with the Export option
- Invoke Workflow
- Associated Workflow
- Container Control

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Forms Tree Control
- MQTT Connection

When you set the **Include Associated Artifacts** option to **Yes**, while adding the form to a package template, then the associated artifacts are added to the package template, and it also allows you to view the associated artifacts of the form in the tree view of the package. If you set the **Include Associated Artifacts** option to **No**, then the associated artifacts are not added to the package template, and are also not visible in the tree view of the package.

Note: If a SOA Assembly is registered through a Web Service and a physical path (dll), by default the Web Service is a static method and the physical path can be a static or non- static method. While packaging forms that does not use SOA Assembly, by default the static objects of the registered SOA Assembly is considered as an associated artifact.

Child Artifacts of Forms

The **Child Artifacts** tab displays all the child forms or folders that are published.

Forms can include the following child artifacts:

- Folder
- Child Form

Include Child Item

For more information, see Include Child Item.

The child item can also be another folder. When you add the child item, all the associated artifacts, child artifacts, and security artifacts of the child item also gets added to the package template. You can add up to top three levels of child item. To know more about adding a folder as child item, see Child Folder.

Security Artifacts

The **Security Artifacts** tab displays all the security artifacts of Forms, if any. You can enable the security settings of the forms that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

Forms Settings Grid

This section is applicable only when you have Forms with **Hyperlink** or **Image** controls.

While installing, the package does not validate the images of the forms control in the target repository or environment. You can take appropriate action using the **Forms Settings Grid** property when forms include controls such as hyperlink or images. You can use the **Forms Settings Grid** to make any correction to the source property value by providing the correct information in the given target property value during the design or install time. If you do not specify the target property in the **Forms Settings Grid** during design time, you can specify the settings during the install time in the target properties or else it will take the values specified in the source property value during installation.

- For more information about control settings of a hyperlink, see Resolving Hyperlink.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- For more information about control settings of an image, see Resolving Image.

Resolving Version Details for Invoke Workflow

During package installation, you can resolve the version details of Invoke Workflow artifacts.

For more information about resolving version details of Invoke Workflow, see Resolving Invoke Workflow.

Rebuild Scenario

When you rebuild a form that was edited after adding it to the package template, the package template retains the old data in the settings form, but considers only the latest record. This does not affect the functionality of the forms that is rebuilt. For example, consider a form that contains a Hyperlink control which points to an employee URL. After adding the forms to the package template, consider that the Hyperlink control is modified to customer URL. When you rebuild forms, the Settings form will contain the employee URL but upon installation, will consider the customer URL.

Pop-Up control will always point to the latest version of the form.

Resolve Action Bar Settings

Action Bar Dependent Files

This section is applicable only when you have Forms with the **Action Bar** enabled.

When you package and install a Form with Action Bar, the Custom Style Sheet and images used in the Action Bar within the Form are identified by the package and added to the package template.

You can use the **Action Bar Dependent Files** grid to define the target path where you want to place the image files for the Action Bar. Ensure that the path mentioned in the **Target Value** field is relative.

Note: Ensure that you include the image files and the corresponding hover image files along with it.

Resolve Action Bar settings

During package installation, if the form contains an **Action Bar** control, you can define the target property values in the **Action Bar Settings** section of the **Settings** window.

The following table provides information about the settings available for Forms with an **Action Bar** item:

Field Name	Description
Action Bar Item	Name that identifies the Action Bar item.
Source Value	Path of the source property. The **Source Value** displays the source path of the image files and the corresponding hover image files.
Target Value	Path of the target property. The **Target Value** displays the target path of the image files and the corresponding hover image files.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Resolve Print Forms Details

While installing a package or while adding a form to a package template, if the form contains a Button control of Button Type "Print", you can edit the version details of the associated Print Forms. You can define the target property values in the **Associated Print Forms Details** section of the **Settings** window.

Field Name	Description
Forms Name	Name that identifies the form.
Source Version	The version of the form selected in the **Button** control of **Button Type "Print"**.
Target Version	The version of the form, which will be used in the **Button** control of **Button Type "Print",** during installation. Ensure that this version of the form is available in the target environment.

In the **Associated Print Forms Details** section, you can enter the version of the associated form to which the current control should be mapped.

- If you do not edit the **Target Version** field and retain the default value as "Latest", then the latest version of the associated form is mapped to the Print Form in the target environment.
- If the **Target version** field is left blank, then the source version of the associated form present in the target environment is mapped to the current form. If the source version is not present in the target environment, then the latest version of the associated form is mapped to the current version in the target environment.
- If the **Target version** of the form is not present in the target environment, then the latest version of the associated form is mapped to the Print Form in the target environment.
- You can use the **Associated Print Forms Details** property to specify the version of the associated form to which the current form should be mapped in the target environment.
- The **Associated Print Forms Details** property is only to specify the target version of the associated form to which the current form should be mapped. The configuration of the associated form is done separately from the package template as it is added as an individual artifact.

Resolve Navigate Form Details

While adding a form to a package template or while installing a package, if the form contains a Button control of Button Type "Navigate", you can edit the version details of the form to which you have navigate to. You can define the target property values in the **Associated Forms with Navigate Button** section of the **Settings** window.

Field Name	Description
Button Id	The ID of the button in the form.
Button Name	The name of the button in the form.
Forms Name	Name of the form that is selected in the **Navigate To Form** property of the **Button** control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description
Source Version	The version of the form selected in the **Button** control of **Button Type "Navigate"**.
Target Version	The version of the form, which will be used in the **Button** control of **Button Type "Navigate",** during installation. Ensure that this version of the form is available in the target environment.

- In the **Associated Forms with Navigate Button** section, you can enter the version of the associated form to which the current control should be mapped.
- If you do not edit the **Target Version** field and retain the default value as "Latest", then the latest version of the associated form is mapped to the form to be navigated to in the target environment.
- If the **Target version** field is left blank, then the source version of the associated form present in the target environment is mapped to the current form. If the source version is not present in the target environment, then the latest version of the associated form is mapped to the current version in the target environment.
- If the **Target version** of the form is not present in the target environment, then the latest version of the associated form is mapped to the form to be navigated to in the target environment.
- You can use the **Associated Forms with Navigate Button** property to specify the version of the associated form to which the current form should be mapped in the target environment.
- The **Associated Forms with Navigate Button** property is only to specify the target version of the associated form to which the current form should be mapped. The configuration of the associated form is done separately from the package template as it is added as an individual artifact.

Configure Artifact Type Settings for Forms

You can set the status in which all the Form artifacts in a package must be installed or updated in the target environment.

Configure artifact type settings for Forms in the following tabs:

- **Install**

  Use this tab to set the configurations for installing the package.
- **Update**

  Use the settings in this tab to update an installed package.

Artifact Type Settings

1. In the **Enterprise Console**, click menu icon, click **Package**, and then click **Package Template**.

   The **Package Template** page appears.
2. To edit an existing package, in the **Package Template** page, select the package template, and then click **Edit**. The **Edit Package Template** dialog box appears.
3. In the **Configuration** tree on the left pane, click **Forms** under **Artifacts**. The **Settings** form with the **Artifact**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Type Settings section appears.

4. For the **Install Forms as Draft** property, select one of the following:
   - **Yes**: Select this option to install all Form artifacts in the package in *Draft* status in the target environment.
   - **No**: Select this option to install all Form artifacts in the package in *Published* status in the target environment.

     The status of the Forms in a package is set based on the value defined.
5. Use the **Forms Exist** property to take appropriate action when the forms in the package is already present in the target environment. Existing forms will not be overwritten, hence you can choose to install it with a different version. Select one of the following:
   - **Install as next major version**: Select this option to install all Form artifacts in the package as next major version.
   - **Install as next minor version**: Select this option to install all Form artifacts in the package as next minor version.
   - **Install as next version**: Select this option to install all Form artifacts in the package as a next version.
   - **Overwrite latest (published) version**: Select this option to overwrite the latest published version of Form in the target environment. An existing Form Definition gets replaced with the Form Definition contained in this package.
   - **Do not install**: Select this option if you do not want to install the Form artifacts, as they are already present in the target environment.

     Note: You can also configure these settings while installing the package using the **Manage Package** page.

Resolve Custom Dependent Files for Forms

When you package Forms, the custom style sheet files are automatically identified and appear as custom dependent files. The Source Files field displays the physical path of this files in the source environment. When the package is installed, this file is copied to the installed path of the target environment.

This is a read-only file which cannot be edited or deleted.

Note: If the source environment is in a particular theme and the css is packaged in that theme, the css will be copied in the target environment to the path of the source theme. You have to manually copy the css from the source theme folder to the respective theme folder of the target environment .

For more information on configuring custom style sheet, see section *Customizing Forms Using Custom Styles* of *Forms and Lists User Guide.*

Resolve Invoke Workflow

During package installation or while adding forms to a package template, if the forms contain **Invoke Workflow** control, you can edit the version details of the workflow that is selected in this control. You can correct the source property values and define the target property values in the **Invoke Workflow details** section of the **Settings** window.

The following table provides information about the settings available for a Form with a Invoke Workflow control:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description
Workflow Name	Name that identifies the workflow.
Source Version	The version of the workflow selected in the **Invoke Workflow** control.
Target Version	The version of the workflow, which will be used in the **Invoke Workflow** control in the form, during installation. Ensure that this version of the workflow is available in the target environment.

- If you do not edit the **Target Version** field and retain the default value as "Latest", then the latest version of the associated workflow is mapped to the control in the form in the target environment.
- If the **Target version** field is left blank, then the source version of the associated workflow present in the target environment is mapped to the current control in the form. If the source version is not present in the target environment, then the latest version of the associated workflow is mapped to the current version in the target environment.
- If the **Target version** of the workflow is not present in the target environment, then the latest version of the associated workflow is mapped to the control in the form in the target environment.
- In **Invoke Workflow details** section, the **Workflow Name** property is not available in the configuration settings if the workflow name is configured using expression editor.
- The **Invoke Workflow details** property is only to specify the target version of the associated workflow to which the current control should be mapped. The configuration of the associated workflow is done separately from the package template as it is added as an individual artifact.

Resolve Image

During package installation, if the form contains an **Image** control, you can correct the source property values and define the target property values in the **Forms Settings Grid** section of the **Settings** window.

The following table provides information about the settings available for Forms with an **Image** control:

Field Name	Description
Control Id	Reference identification code for the control. This value is automatically generated and cannot be changed.
Control Name	Name that identifies the control. This value is also used for the label of the control. If a form contains a hyperlink, the **Control Name** field displays the tag name of the hyperlink.
Property Name	Name of the property. If a form contains an image, the **Property Name** field displays the image location.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description
Source Value	Path of the source property. If a form contains an image, the **Source Value** displays the source path of the image.
Target Value	Path of the target property. If a form contains an image, the **Target Value** displays the target path of the image.

Resolve Hyperlink

During package installation, if the forms contain a **Hyperlink** control, you can correct the source property values and define the target property values in the **Forms Settings Grid** section of the **Settings** window.

The following table provides information about the settings available for a Form with a Hyperlink control:

Field Name	Description
Control Id	Reference identification code for the control. This value is automatically generated and cannot be changed.
Control Name	Name that identifies the control. This value is also used for the label of the control. If a form contains a hyperlink, the **Control Name** field displays the tag name of the hyperlink.
Property Name	Name of the property. If a form contains a hyperlink, the **Property Name** field displays the property name as *NavigateURL*.
Source Value	Path of the source property. If a form contains a hyperlink, the **Source Value** field displays the source URL that you can navigate to.
Target Value	Path of the target property. If a form contains a hyperlink, the **Target Value** field displays the proposed URL that you want to navigate to.

Forms Association

You can package and deploy a form with its associated artifacts such as workflow (for Fill Form) from one environment or repository to another environment or repository using the **Package** feature in AVEVA Work Tasks.

When a form (associated to a workflow) is packaged, the following options are displayed in the **Associated**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Workflow details section under the **Settings** window. The **Associated Workflow details** section is displayed only in the **Install** and the **Update** tabs. For other options, see Forms.

Workflow Version

Field	Description
Bound to Workflow	Displays the name of the workflow to which the form is associated.
Source Version	Displays the version of workflow in the source environment to which the form is associated.
Target Version	Enter the version of the workflow: • Specify the version of the workflow to which you want to associate the form in target environment. • If you do not specify the version of the workflow, then the latest version of the workflow is considered. **Note:** If the version of the workflow that is specified while installing the package is not present in the target environment, then the next minor version of the latest version of the workflow in the target environment is considered.

Example

Consider the following scenario:

Source Environment

- Form1 is associated to Workflow1.
- Workflow1 has versions 1, 2, 3 and 4 with version 1 published and versions 2, 3, and 4 in draft status.

Package Template

- Form1 associated to version 4 of Workflow1.
- Target version is not specified.

Target Environment

- Workflow1.
- Workflow1 has versions 1, 2, 3 and 4 with version 1 published and versions 2, 3, and 4 in draft status.

When the package is installed in the target environment, Form1 is created and version 1.1 of Workflow1 is created in Draft status as only version 1 of Workflow1 is published. Form1 is associated to version 1 of Workflow1 and not version 1.1 of Workflow1 as the version is in Draft status. You must publish the desired version of the workflow if you want the form to automatically associate to the latest version (that is the last

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

published version) of the of workflow.

When the package is uninstalled from the target environment, the version 1.1 of Workflow1 is removed. However, Form1 is not removed as Form1 is associated to the next latest version of Workflow1.

Form Controls

You can package and deploy the Form Controls along with its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add Form Controls to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Form Controls**.
   The **Form Controls** window appears.
3. Select the Form Controls that you want to package.
4. Right-click the form controls and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Runtime Initialization Settings

You can configure runtime initialization settings for form controls registered through GAC. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration settings for Form Controls

The **Form Controls** has a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the **Settings** tab to define the configuration settings. The **Associated Artifacts** tab displays the associated artifacts of the **Form Controls** definition. The **Child Artifacts** tab displays child artifacts of the **Form Controls** definition.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Child Artifacts
- Security Artifacts

Settings Tab

You can use the properties in this tab to take appropriate actions to install, update, or uninstall the package.

Install

The settings in this tab are referred to when installing the Package.

- **Form Control exists**: Select this property to take appropriate action when the Form Controls which is installed is present in the target environment
  - **Do not install Form Control**: Select this option to use the Form Controls which is present in the target environment
  - **Install to overwrite existing Form Control**: Select this option to overwrite the Forms Control which is present in the target environment with the one that is currently being packaged
- **Associated artifacts not present**: Select this property to take appropriate action when the associated artifacts of the Form Control is not present in the target environment.
  - **Install Form Control**: Select this option to install the Forms Control, even if the associated artifacts are not present in the target environment.
  - **Do not install Form Control**: Select this option if you do not want to install the Forms Control as its associated artifacts are not present.

Update

The settings in this tab are referred to when the same Package is installed for the consecutive time.

- **Delete Form Control**: Select this option to delete the Forms Control which is present in the target environment
  - **Yes**: Select this option to remove the **Form Controls** in the target environment. On selection of this option, the **Form Control Is Modified** option appears.

    Form Control Is Modified: Select this option to retain, roll back to original state, or delete the Forms Control in the target environment even after the Package is updated. This property is applicable only if **Delete Forms Control** is set to *Yes* and if the Form Control is modified.
    - **Retain**: Select this option to retain the Forms Control along with the modifications, in the target environment even after the Package is updated.
    - **Rollback to original state**: Select this option to roll back to the original state. All modifications that were done to the Forms Control after it was installed in the target environment will be reverted. However, the Forms Control will be retained in the target environment.
    - **Delete**: Select this option to delete the Forms Control from the target environment when updating the Package.
  - **No**: Select this option to retain the Form Control in the target environment. On selection of this option, the **Form Control Exists** option appears.

    Form Control exists: Select this property to take appropriate action when the Form Control definition present in the package is already present in the target environment.
    - **Do not install Form Control**: Select this option to use the Forms Control which is present in the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Install to overwrite existing Form Control**: Select this option to overwrite the Forms Control, which is present in the target environment with the one that is currently being packaged.

  Associated artifacts not present: Select this property to take appropriate action when the associated artifacts of the Form Control are not present in the target environment.
- **Update Form Control**: Select this option to update the Forms Control.
- **Do not update Form Control**: Select this option if you do not want to update the Forms Control as the associated artifacts are not present.

Uninstall

The settings in this tab are referred to when the Package is being uninstalled in the target environment.

- **Delete Form Control**: Select this property to retain or delete the Forms Control in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to remove the Forms Control from the target environment when the Package is uninstalled.
  - **No**: Select this option to retain the Forms Control in the target environment even after the Package is uninstalled.
- **Forms Control Is Modified**: Select this option to decide if you want to retain, roll back to original state or delete the Forms Control in the target environment even after the Package is uninstalled. This property is displayed only if **Delete Form Control** is set to *Yes*. However, if **Delete Form Control** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the Forms Control along with the modifications, in the target environment even after the Package is uninstalled.
  - **Rollback to original state**: Select this option to roll back to the original state. All modifications that were done to the Forms Control after it was installed in the target environment will be reverted. However, the Forms Control will be retained in the target environment.
  - **Delete**: Select this option to delete the Forms Control from the target environment when uninstalling the Package.

Associated Artifacts for Form Controls

This tab displays all the associated artifacts of the selected Form Controls artifact.

The following artifact can appear as an Associated Artifact, if you are using any one of the following artifacts while designing the Forms Control:

- SOA Folder

Child Artifacts for Form Controls

Form Controls does not have any child artifact.

Security Artifacts for Form Controls

The Security Artifacts tab displays the security artifacts of form controls, if any.

You can enable the security settings of the form controls that you want to include in the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For more information about including security artifacts, see Include Security Artifacts.

Note: If a **Form Control** is consumed inside a form, you cannot modify or delete the **Form Control**. To modify or delete the **Form Control**, you have to first modify or delete all its associated artifacts.

Resolve Custom Dependent Files for Form Controls

The configuration settings for Form Controls differ based on how the Form Controls are registered. Form Controls can be registered through Global Assembly Cache (GAC) or physical path.

Register Form Controls from Global Assembly Cache

The **Source Version** field displays the version of the form control in the source environment. In the **Target** field, you can specify the version of the Form Controls that you want to use in target environment. The source version is considered while installing the package if you do not specify the target version.

You can also package the identified custom dependent files which can be installed while installing the package in the target environment. The **Source Files** field displays the physical assembly path of the Form Controls in the source environment.

Under **Install in Global Assembly Cache**, click **Yes** to install the Form Controls and custom dependent files in the GAC of the target environment. Click **Add Record** to add multiple rows to install additional files in the target environment.

Register Form Controls from a Physical Path

The **Custom assembly name source** field displays the physical path of the Form Controls in the source environment. You can also package the identified custom dependent files which can be installed while installing the package in the target environment. Click **Add Record** to add multiple rows to install additional files in the target environment. In the **Custom assembly name source** field, enter the source file path of the custom dependent files.

If the source folder is relative to the AVEVA Work Tasks installed path, and the folder does not exist in the target environment, then a new folder is created and the files are copied to it. For example, if the path of the file, rating.dll, is *C:\Program files\AVEVA\Work Tasks\\FormsCustom Control\rating.dll*, then a new folder named **FormsCustom Control** is created in the target machine and rating.dll is copied to it.

If the source folder is not relative to the AVEVA Work Tasks installed path, then the files are copied to the *C:\Program files\AVEVA\Work Tasks\\bin* folder. For example, if the path of the file, rating.dll, is **C:\FormsCustom Control\rating.dll**, then **rating.dll** is copied to *C:\Program files\AVEVA\Work Tasks\\bin* folder in the target machine.

The **Install in Global Assembly Cache** field is optional and is used to install the Form controls and custom dependent files in the GAC of the target environment.

Note: Click the icon in the row corresponding to a custom dependent file, which should not be added to the package template.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Global Work Item Layout

You can package and deploy both the Global Work Item Layout and Custom Work Item Layout from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add Global Work Item Layout to Package Template

1. Navigate to **Global Work Item layout**.
2. Select a Layout. You can either select a Global Layout or a Custom Layout which is saved.
3. Click **Add to Package Template**. The **Add to Package Template** page appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

In the Package Template the custom package template appears along with the name of the custom layout.

Associated Artifacts for Work Item Layout

Work Item Layout does not have any associated artifact.

Child Artifacts for Work Item Layout

Work Item Layout does not have any child artifact.

Configuration Settings for Work Item Layout

The Work Item Layout has a unique set of configuration settings required for installing, updating, and uninstalling the Package. You can edit and view the configuration settings from the Source Environment > Package Template screen or Target Environment > Manage Package screen. The Settings tab of the Work Item Layout artifact allows you to define the configuration settings. The Associated and Child Artifacts tab are not enabled as it cannot have Associated and Child Artifacts.

- Settings
- Associated Artifacts
- Child Artifacts

Settings Tab: You can use the properties in this tab to take appropriate actions while installing, updating, or uninstalling the Package.

Install: The settings in this tab is referred to when installing the Package.

- **Work Item Layout Exists**: Select this property to take appropriate action when the Work Item Layout which is being installed is present in the target environment
  - **Do not install Work Item Layout**: Select this option to use the Work Item Layout which is present in the target environment.
  - **Install to overwrite existing Work Item Layout**: Select this option to overwrite the Work Item Layout which is present in the target environment with the one that is currently being packaged.
- Work Item fields are not packaged when packaging Work item layout, hence if the work item fields are not available in the target environment, then on installing the package the following message appears 'Work

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Item field(s) is missing: <Field Name>'. This can be resolved by creating the required work item fields in the target environment.

- If the data type of the work item field in source and target environment do not match, then on installing the package the work item layout definition will be updated with the data type and values of the work item field as in the target environment. In this scenario a message 'Work item field(s) is of different type' appears.

Update: You can use the settings in this tab when the same package is installed for the consecutive time.

- **Delete Work Item Layout**: Select this option to delete the Work Item Layout which is present in the target environment
  - **Yes**: Select this option to remove the Work Item Layout in the target environment. On selection of this option, the Work Item Layout Modified property appears.
  - **Work Item Layout Is Modified**
    - **Retain**: Select this option to retain the Work Item Layout along with the modifications, in the target environment even after the Package is uninstalled
    - **Rollback**: Select this option to roll back to the original state. All modifications that were done to the Work Item Layout after it was installed in the target environment will be reverted. However, the Work Item Layout will be retained in the target environment.
    - **Delete**: Select this option to delete the Work Item Layout from the target environment when uninstalling the Package.
  - **No**: Select this option to retain the Work Item Layout in the target environment. On selection of this option, the Work Item Layout Exists property appears that you can configure.
  - **Work Item Layout Exists**
    - **Use Existing Work Item Layout**: Select this option to use the Work Item Layout which is present in the target environment
    - **Do not update Work Item Layout**: Select this option to overwrite the Work Item Layout which is present in the target environment with the one that is currently being packaged.

Uninstall: You can use the settings in this tab when the package is being uninstalled in the target environment.

- **Delete Work Item Layout**: Select this property to retain or delete the Work Item Layout in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to delete the Work Item Layout from the target environment when the Package is uninstalled.
  - **No**: Select this option to retain the Work Item Layout in the target environment even after the Package is uninstalled.
- **Work Item Layout Is Modified**: Select this option to decide if you want to retain, roll back to original state or delete the Work Item Layout in the target environment even after the Package is uninstalled. This property is displayed only if **Delete Work Item Layout** is set to *Yes*. However, if **Delete Work Item Layout** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the Work Item Layout along with the modifications in the target environment even after the Package is uninstalled.
  - **Roll back to original State**: Select this option to roll back to the original state. All modifications that were done to the Work Item Layout after it was installed in the target environment will be reverted. However, the Work Item Layout will be retained in the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Delete**: Select this option to delete the Work Item Layout from the target environment when uninstalling the Package.

Associated Artifacts

Work Item Layout does not have any associated artifacts.

Child Artifacts

Work Item Layout does not have any child artifacts.

Grid Configuration

You can package and deploy the Grid Configuration along with its associated artifacts and child artifacts from one environment or repository to another environment or repository.

To add Grid Configuration to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, click **Settings**, click **Data Grid**, and then click **Grid Configuration**.

   The **Grid Configuration** window appears.
3. Select the grid configuration that you want to package.
4. Right-click the grid configuration and then click **Add to Package Template**.

   The **Add to Package Template** window appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of the grid configuration in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the grid configuration package in the Settings form on the right side of the Add to Package Template window.
5. Configure the required settings.
6. Click **Save Template** to save the configured settings.

Configuration Settings for Grid Configuration

The **Grid Configuration** has an unique set of configuration settings required to install, update, and uninstall the package. You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Tab

You can define the configuration settings of the grid configuration artifact in the Settings tab. Set the properties in this tab to take appropriate actions while installing, updating, or uninstalling the package.

Install

Use this tab to set the configurations for installing the package.

- **Grid Configuration Exists**: Select this property to take appropriate action when the Grid Configuration to be installed is present in the target environment.
  - **Do not install Grid Configuration**: Select this option to use the Grid Configuration which is present in the target environment.
  - **Install to overwrite existing Grid Configuration**: Select this option to overwrite the Grid Configuration present in the target environment with the one that you packaged.
- **Associated Artifacts Not Present**: Select this property to take appropriate action when the associated artifacts of the Grid Configuration are not present in the target environment.
  - **Install Grid Configuration**: Select this option to install the Grid Configuration, even if the associated artifacts are not present in the target environment.
  - **Do not install Grid Configuration**:Select this option if you do not want to install the Grid Configuration as its associated artifacts are not present in the target environment.

Note: In case of a List Lookup, ensure that the Columns in the List Lookup matches the target environment before you install the Data Grid Configuration package to the target environment. If you try to install the Data Grid Configuration package in the target environment without matching the Columns, the package installs the Data Grid Configuration with the following warning message:

Either Tables or Columns are missing. Verify your Database or List

Besides this, you might also get the same warning message if you use a repository which is a case-sensitive database and the queries or columns in the target environment do not match as it is written in the source environment.

You can resolve this error by correcting the Column details in the target environment. After correction, you must reconfigure the Data Grid Configuration item including the Advance Settings and Relations again. To configure the Data Grid Configuration item, you can access the item from the Enterprise Console menu or run the package again.

Update

Use the settings in this tab to update an installed package.

- **Delete Grid Configuration**: Select this property to delete or retain an existing Grid Configuration which is present in the target environment.
  - **Yes**: Select this option to remove the Grid Configuration from the target environment.

    Grid Configuration is modified: Select this option to retain, roll back to original state, or delete the Grid

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration in the target environment even after the package is updated. This property is applicable only if **Delete Grid Configuration** is set to *Yes* and the grid configuration is modified.

- **Retain**: Select this option to retain the Grid Configuration along with the modifications in the target environment even after the package is updated.
- **Rollback to original state**: Select this option to roll back to the original state. All modifications that were done to the Grid Configuration after it was installed in the target environment will be reverted. However, the Grid Configuration will be retained in the target environment.
- **Delete**: Select this option to delete the Grid Configuration from the target environment when updating the package.

- **No**: Select this option to retain the Grid Configuration in the target environment.

  Grid Configuration exists: Select this option to take appropriate action when the Grid Configuration that is being installed is present in the target environment.

  - **Do not install Grid Configuration**: Select this option to use the existing Grid Configuration which is present in the target environment.
  - **Install to overwrite existing Grid Configuration**: Select this option to overwrite the existing Grid Configuration which is present in the target environment with the one that is currently being packaged.

    Associated Artifacts not present: Select this option to take appropriate action if associated artifact is not present in the target environment.
  - **Update Grid Configuration**: Select this option to update the Grid Configuration.
  - **Do not update Grid Configuration**: Select this option if you do not want to update the Grid Configuration as associated artifacts are not present.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete Grid Configuration**: Select this property to retain or delete the Grid Configuration in the target environment even after the package is uninstalled.
  - **Yes**: Select this option to remove the Grid Configuration from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the Grid Configuration in the target environment even after the package is uninstalled.
- **Grid Configuration is modified**: Select this property to retain, rollback, or delete the Grid Configuration from the target environment even after the package is uninstalled. This property is displayed only if **Delete Grid Configuration** is set to *Yes*. However, if **Delete Grid Configuration** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the Grid Configuration with the modifications in the target environment even after the package is uninstalled.
  - **Rollback to original state**: Select this option to rollback to the original state. All modifications that were done to the Grid Configuration after it was installed in the target environment will be reverted. However, the Grid Configuration will be retained in the target environment.
  - **Delete**: Select this option to delete the Grid Configuration from the target environment when uninstalling the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Associated Artifacts of Grid Configuration

The **Associated Artifacts** tab displays all the associated artifacts of the selected Grid Configuration artifact.

Grid configuration can include the following associated artifacts:

- Parent Folder
- Lookup

Child Artifacts of Grid Configuration

The **Child Artifacts** tab displays all the child artifacts of the selected Grid Configuration artifact.

Grid configuration can include the following child artifacts:

- Folder
- Child Grid Configuration

Include Child Item

For more information, see Include Child Item.

Security Artifacts of Grid Configuration

The **Security Artifacts** tab displays all the security artifacts of the selected Grid Configuration artifact. You can enable the security settings of the grid configuration that you want to include in the package.

For more information about including security artifacts, see Include Security Artifacts.

Logic App Connections

You can package and deploy a Logic App Connection from one environment or repository to another environment or repository using the package feature in AVEVA Work Tasks.

To add Logic App Connection to Package Template

1. Log on to the **Enterprise Console**.
2. On the menu, point to **Tools**, and then click **Logic App Connections**.

   The **Logic App Connection** List window appears.
3. Select the Logic App connection that you want to package.
4. Right-click the Logic App connection and then click **Add to Package Template**.

   The Add to Package Template dialog box appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of a Logic App Connection in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

configuration properties of the Logic App Connection package in the **Settings** form on the right side of the Add to Package Template window.

Runtime Initialization Settings

You can configure runtime initialization settings for Logic App connections. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration Settings for Logic App Connection

The **Logic App Connection** has an unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment** > **Package Template** window
- **Target Environment** > **Manage Package** window

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Child Artifacts

Settings Tab

You can define the properties in the **Settings** tab to take appropriate actions to install, update, or uninstall a package.

Install

Use this tab to set the configurations for installing the package.

- **Connection Exists**: Select this property to take appropriate action when the Logic App connection in the package is already present in the target environment.
  - **Do not install connection**: Select this option to use the Logic App connection, present in the target environment.
  - **Install to overwrite the existing connection**: Select this option to overwrite the Logic App connection in the target environment with the one that is present in the package. During the package installation, backup will be taken before overwriting the existing artifact.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Update

Use the settings in this tab to update an installed package.

- **Delete connection**: Use this property to delete the Logic App connection present in the target environment.
  - **Yes**: Select this option to remove the Logic App connection from the target environment.

    Connection is modified: Select this option to retain, roll back to original state, or delete the Logic App connection in the target environment even after the package is updated. This property is applicable only if **Delete connection** is set to *Yes* and the Logic App connection is modified.
    - **Retain**: Select this option to retain the Logic App connection with the modifications in the target environment even after the uninstalling the package.
    - **Rollback to original state**: Select this option to rollback the Logic App connection to the original state. All modifications done to the Logic App connection after installation in the target environment will be rolled back. However, the Logic App connection will be retained in the target environment.
    - **Delete**: Select this option to delete the Logic App connection from the target environment while updating the package.
  - **No**: Select this option to retain the Logic App connection in the target environment.

    Connection exists: Select this option to take appropriate action when the Logic App connection that is being installed is present in the target environment.
    - **Do not install connection**: Select this option if you do not want to update the Logic App connection as associated artifacts are not present.
    - **Install to overwrite existing connection**: Select this option to overwrite the Logic App connection present in the target environment with the one that is currently being packaged.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete connection**: Select this property to retain or delete the Logic App connection in the target environment after you uninstall the package.
  - **Yes**: Select this option to delete the Logic App connection from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the Logic App connection in the target environment even after the package is uninstalled.
- **Connection is modified**: Select this property to retain, rollback, or delete the Logic App connection in the target environment after uninstalling the package. This property is displayed only if **Delete connection** is set to *Yes*. However, if **Delete connection** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the Logic App connection with the modifications in the target environment even after the package is uninstalled.
  - **Rollback to original state**: Select this option to rollback the Logic App connection to the original state. All modifications that were done to the connection after it was installed in the target environment will be reverted. However, the connection will be retained in the target environment.
  - **Delete**: Select this option to delete the Logic App connection from the target environment when uninstalling the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Connection Details

Field	Description
Connection String	Connection string for Logic App connection.

Associated Artifacts of Logic App Connection

Folder can be the associated artifact.

Child Artifacts of Logic App Connection

Logic App connection can be the child artifact for the folder.

Security Artifacts of Logic App Connection

You can enable the security settings of the Logic App connection that you want to include in the package.

For more information about including security artifacts, see Include Security Artifacts.

Lookup Settings

You can package and deploy Database Lookup and List Lookup along with its associated and child artifact from one environment or repository to another environment or repository.

To add Lookup Settings to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Lookup Settings**.

   The **Lookup List** window appears.
3. Select the lookup item that you want to package.
4. Right-click the lookup, and then click **Add to Package Template**.

   The **Add to Package Template** window appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of lookup in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the lookup package in the **Settings** form on the right side of the Add to Package Template window.

   When you select the **Include Associated Artifacts** option as *Yes* while adding the lookup to a package template, the associated artifacts are added to the package template. You can then view the associated artifacts of a lookup in the tree view of a package. If you select the **Include Associated Artifacts** option as *No*, the associated artifacts are not added to the package template. Then, you cannot see the associated artifacts in the tree view of a package. This condition holds good for both the **Include Child Artifacts** and **Include Security Artifacts** options as well.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

When you select the **Include the automatically generated SQL Script** option as *Yes* while adding the lookup to a package template, the automatically generated SQL script is included in the package template. If you select the **Include the automatically generated SQL Script** option as *No*, the automatically generated SQL script is not included in the package template.

Configuration settings for Lookup

Lookup has a unique set of configuration settings required to install, update, and uninstall the package. You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

Settings Tab

You can define the configuration settings of a lookup artifact in the **Settings** tab. Set the properties in this tab to take appropriate actions while installing, updating, or uninstalling the package.

Install

You can use this tab to set the configurations for installing the package. When you install a package containing a lookup using stored procedure, you must create stored procedure with the same name.

- **Lookup exists**: Use this property to take appropriate action when the lookup which is installed is present in the target environment.
  - **Do not install Lookup**: Select this option to use the lookup which is present in the target environment.
  - **Install to overwrite existing Lookup**: Select this option to overwrite the lookup which is present in the target environment with the one that is currently being packaged.
- **Associated artifacts not present**: Use this property to take appropriate action when the associated artifacts of the lookup is not present in the target environment.
  - **Install Lookup**: Select this option to install the lookup, even if the associated artifacts are not present in the target environment.
  - **Do not install Lookup**: Select this option if you do not want to install the lookup as its associated artifacts are not present.
- **SQL script**: When a lookup contains a query or a procedure, while adding the lookup to the package template, a script is generated and populated in the SQL script text area. While installing the package in the target environment, the SQL script is run first and then the package is installed.

  If the lookup contains a *query*, the script will be generated for the tables in the query. Parent tables and child tables are not considered. Such a query will contain the following information:
  - Table structure of the tables in the query, with field name, data types, and their order
  - Keys - primary key and foreign key
  - Constraints - default or check, and so on
  - Index

    If the lookup contains a *procedure*, a script for the procedure is generated. However, objects such as

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

tables or views used by the procedure are not generated. All such objects must be available in the target environment before package installation.

The following points are not considered while generating the SQL script:

- User defined types
- Table partitioning
- Views
- Triggers
- Functions
- Synonyms
- Parent and child tables
- Query against views and functions

If you need any of the unsupported objects, then you can choose to do one of the following:

- Write and run the script manually in SQL Server
- Write and append the script to the SQL script text area

The auto-generated script contains a pre-condition statement which checks for the existing tables in the target environment. If the table exists in the target environment, the SQL script does not run. If the table does not exist in the target environment, the SQL script runs and creates the table, and adds the keys, index, constraints as defined in the source environment.

Ensure that the object names used in the source repository does not conflict with the destination repository. If any of the objects (name of a table, key, constraint, or index) exists in the target environment, then the script execution will fail. This will be recorded in **Package History** page after the package installation.

As the script is auto-generated, we recommend not to modify the script. If you want to add your own piece of code sample to the script, you can either add it at the start of the script or append it to the end of the script. Do not add or edit the existing script.

Generating scripts for Oracle database is not supported. The SQL script text box will not be visible when the database in source environment is Oracle.

Update

Use the settings in this tab to update an installed package.

- **Delete Lookup**: Select this property to delete the lookup which is present in the target environment.
  - **Yes**: Select this option to remove the lookup from the target environment.

    Lookup is modified: Use this option to retain or delete the lookup in the target environment even after the package is updated. This property is applicable only if **Delete Lookup** is set to *Yes* and the lookup is modified.
    - **Retain**: Select this option to retain the lookup along with the modifications, in the target environment even after the package is uninstalled.
    - **Rollback to original state**: Select this option to rollback the lookup to the original state. All modifications that were done to the lookup after it was installed in the target environment will be reverted. However, the lookup will be retained in the target environment.
    - **Delete**: Select this option to delete the Lookup from the target environment when uninstalling the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

package.

- **No**: Select this option to retain the lookup in the target environment.

  Lookup exists Select this option to take appropriate action when the lookup that is being installed is present in the target environment.

  - **Do not install Lookup**: Select this option to use the lookup which is present in the target environment.
  - **Install to overwrite existing Lookup**: Select this option to overwrite the lookup which is present in the target environment with the one that is currently being packaged.

    Associated artifacts not present: Select this option to take appropriate action when the associated artifacts of the lookup is not present in the target environment.
  - **Update Lookup:** Select this option to update the lookup.
  - **Do not update Lookup**: Select this option if do not want to update the lookup as associated artifacts are not present.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete Lookup**: Select this property to retain or delete the lookup in the target environment even after the package is uninstalled.
  - **Yes**: Select this option to remove the lookup from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the lookup in the target environment even after the package is uninstalled.
- **Lookup is modified**: Use this property to retain, rollback to original state, or delete the lookup in the target environment even after the package is uninstalled. This property is displayed only if **Delete Lookup** is set to *Yes*. However, if **Delete Lookup** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the lookup along with the modifications, in the target environment even after the package is uninstalled.
  - **Rollback to original state**: Select this option to rollback to the original state. All modifications that were done to the lookup after it was installed in the target environment will be reverted. However, the lookup will be retained in the target environment.
  - **Delete**: Select this option to delete the lookup from the target environment when uninstalling the package.

Note:

- The SQL script does not run when the package is installed in update mode.

- Changes made to the package through SQL scripts will not be reverted during package uninstallation.

- Database Lookup script will be executed against the target database specified in **Database connection** artifact which is an associated artifact for the Lookup.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Associated Artifacts of Lookup

The Associated Artifacts tab displays all the associated artifacts of the selected lookup.

The following artifacts can appear as an associated artifact, if you are using any one of the following artifacts while designing the lookup:

- Parent Folder
- Database Connection (Query, Stored Procedure)
- Manage List
- Web API List

Child Artifacts of Lookup

Lookup does not have any child artifact.

Include Child Item

For more information, see Include Child Item.

Security Artifacts of Lookup

The Security Artifacts tab displays all the security artifacts of lookup, if any.

You can enable the security settings of the lookup that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

Note:

- Along with a Manage List containing Lookup display value, the list items will be packaged and installed in the target environment. The lookup display value will be blank in case the lookup display value in target environment does not match the lookup in the source environment.

- If a stored procedure used within the product is already existing in the target machine, then the user has to handle the stored procedure before installing the package

Lookup Example Scenarios

Scenario 1: Defining the uninstall properties for the lookup where the lookup is modified after it is installed in the target environment

Consider the following:

- A database lookup, *TelematicsDBLookup*
- The database lookup contains a query, **Select * from SWExecute**
- In the target environment, the query **Select * from SWExecute** is modified to **Select * from SWExecute Where ID=1**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To define the uninstall properties

1. Add the database lookup, *TelematicsDBLookup* to the package template, *TelematicsDBKLookupPackage*.
2. In the Package Template window, select *TelematicsDBLookup***,** go to the **Settings** page, and then click the **Uninstall** tab.
3. Define the **Uninstall** properties as the following:

   Lookup is modified: Use this property to retain, rollback the database lookup to the original state, or delete the database lookup in the target environment after the package is uninstalled.

   - **Retain**: Select this option to retain *TelematicsDBLookup* along with the modifications, that is, retain the modified query **Select * from SWExecute Where ID=1** in the target environment even after the package is uninstalled.
   - **Rollback to original state**: Select this option to rollback the database lookup to the original state, that is, revert the modifications and update the query as **Select * from SWExecute,** and retain the database lookup in the target environment even after the package is uninstalled.
   - **Delete**: Select this option to delete *TelematicsDBLookup* from the target environment while uninstalling the package.

Scenario 2:Defining the uninstall properties for a lookup where the lookup was already present in the target environment before installing the package

Consider the following:

- A database lookup, *TelematicsDBLookup2*, is already present in the target environment
- Description of *TelematicsDBLookup2* is *Lookup for Telematics2*
- The same database lookup, *TelematicsDBLookup*, with description as *Database Lookup for Telematics2* is being added the package template

1. Add the database lookup, *TelematicsDBLookup2*, with the description as *Database Lookup for Telematics2* to the package template, *TelematicsDBKLookupPackage2*.
2. In the **Package Template** window, select *TelematicsDBLookup2* and go to the **Settings** page, and then click the **Uninstall** tab.
3. Define the uninstall properties as following:
   - **Retain**: Select this option to retain *TelematicsDBLookup* with the updated description *Database Lookup for Telematics2* in the target environment even after the package is uninstalled.
   - **Rollback to original state**: Select this option to rollback to the original state, that is, retain the original lookup *TelematicsDBLookup2* with description as *Lookup for Telematics2* which was present in the target environment before installing the package.
   - **Delete**: Select this option to delete *TelematicsDBLookup* from the target environment when uninstalling the package.

Manage List

You can package and deploy the Manage List along with its associated artifacts and child artifacts from one environment or repository to another environment or repository. After installation, ensure that you refresh the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Enterprise Console site to add list items to the installed list.

When you package a Manage List, the list items get added to the package. However, while packaging a folder containing list items, the **Description** of the folder does not get packaged.

To add Manage List to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**.

   The **Manage List** window appears.
3. Select the Manage List that you want to package.
4. Right-click the manage list artifact and then click **Add to Package Template**.

   The **Add to Package Template** dialog box appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of the Manage List in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the Manage List package in the Settings form on the right side of the Add to Package Template window.
5. Configure the required settings.
6. Click **Save Template** to save the configured settings.

Configuration Settings for Manage List

The **Manage List** has an unique set of configuration settings required to install, update, and uninstall the package. You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

Settings

You can define the configuration settings of the Manage List artifact in the Settings tab. Set the properties in this tab to take appropriate actions while installing, updating, or uninstalling the package.

Install

Use this tab to set the configurations for installing the package.

- **Manage List exists**: Use this property take appropriate action when the Manage List definition present in the package is already present in the target environment.
  - **Install to overwrite existing Manage List**: Select this option to overwrite the Manage List definition that is present in the target environment with the one in the package.
  - **Do not install Manage List**: Select this option to use the Manage List definition that is present in the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Associated artifacts not present**: Use this property to take appropriate action when the associated artifacts of the Manage List definitions are not present in the target environment.
  - **Install Manage List**: Select this option to install the Manage List definition, even if the associated artifacts are not present in the target environment.
  - **Do not install Manage List**: Select this option to install the Manage List definition as its associated artifacts are not present.
- **Install all List items**: Use this property to take appropriate action when list items are included in the package.
  - **Yes**: Select this option to install the list items of Manage List.
  - **No**: Select this option if you do not want to install the list items of Manage List.

  Note: The default value is **No**. However, if you want to package list items, select **Yes**, and then generate and export the package.
- **SQL script**: When a Manage List contains an existing custom list, while adding the Manage List to the package template, a script is generated and populated in the SQL script text area. While installing the package in the target environment, the SQL script is run first and then the package is installed.

  The auto-generated script contains the the following:
  - Table structure, with field name, data types, and their order
  - Keys - primary key and foreign key
  - Constraints - default or check, and so on
  - Index
  - Child list and all the previously mentioned related scripts

    The following points are not considered while generating the SQL script:
  - User defined types
  - Table partitioning
  - Parent list
  - Views
  - Triggers
  - Functions
  - Synonyms

    If you need any of the unsupported objects, then you can choose to do one of the following:
  - Write and run the script manually in SQL Server
  - Write and append the script to the SQL script text area

    The auto-generated script contains a pre-condition statement which checks for the existing tables in the target environment. If the table exists in the target environment, the SQL script does not run. If the table does not exist in the target environment, the SQL script runs and creates the table, and adds the keys, index, constraints as defined in the source environment.

    Ensure that the object names used in the source repository does not conflict with the destination repository. If any of the objects (name of a table, key, constraint, or index) exists in the target environment, then the script execution will fail. This will be recorded in **Package History** page after the package installation.

    Similar scripts are also generated for all the child list items of the existing custom list. However, if a child list is being packaged, the SQL script will be generated only for that list and its child items. No SQL script

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

will be generated for the parent of the current list item being packaged.

As the script is auto-generated, we recommend not to modify the script. If you want to add your own piece of code sample to the script, you can either add it at the start of the script or append it to the end of the script. Do not add or edit the existing script.

Note:

- If the list exists in the target environment, the list items will not be installed.

- In the case of List items, ensure that the Table schema in the List matches in the target environment before you install the Manage List package to the target environment. If you install the Manage List package in the target environment without matching the schema, the package will install the List with the following warning:

You cannot create the list items. Either the Table schema is missing or not matching. Verify your Database.

Besides this, you might also get the same warning if you use a repository which is a case-sensitive database and the queries or columns in the target environment do not match as it is written in the source environment. You can resolve this issue by correcting the Table Schema details in the target environment.

- When you select the **Include the automatically generated SQL Script** option as *Yes* while adding the Manage List to a package template, the automatically generated SQL script is included in the package template. If you select the **Include the automatically generated SQL Script** option as *No*, the automatically generated SQL script is not included in the package template.

See Also: SQL Script Generation and Execution

Update

Use the settings in this tab to update an installed package.

- **Delete Manage List**: Use this property to delete or retain an existing Manage List definition that is present in the target environment.
  - **Yes**: Select this option to remove the Manage List definition in the target environment.

    Manage List is modified: Use this option to retain, rollback to original state, or delete the Manage List in the target environment even after the package is updated. This property is applicable only if **Delete Manage List** is set to *Yes* and the Manage List is modified.
    - **Retain**: Select this option to retain the Manage List definition along with the modifications, in the target environment even after the Package is updated.
    - **Rollback to original state**: Select this option to rollback to the original state. All modifications that were done to the Manage List definition after it was installed in the target environment will be reverted. However, the Manage List definition will be retained in the target environment.
    - **Delete**: Select this option to delete the Manage List definition from the target environment when updating the package.
  - **No**: Select this option if you want to retain the Manage List definition in the target environment.

    Manage List exists: Use this option to take appropriate action when the Manage List that is being installed is present in the target environment.
    - **Use existing Manage List**: Select this option to use the Manage List definition that is present in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

target environment.

- **Do not update Manage List**: Select this option to overwrite the Manage List definition that is present in the target environment with the one present in the package.

  Associated artifacts not present: Use this option to take appropriate action if associated artifact is not present in the target environment.
- **Update Manage List**: Select this option to update the Manage List definition.
- **Do not update Manage List**: Select this option if you do not want to update the Manage List definition as associated artifacts are not present.

Note:

- Update and uninstall of list items is not supported.

- While updating a list item through package updation, if you overwrite the schema of the existing list in the target environment through package, the existing list items will get corrupted.

- The SQL script does not run when the package is installed in update mode.

- Changes made to the package through SQL scripts will not be reverted during package uninstallation.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete Manage List**: Use this property to decide if you want to retain or delete the Manage List definition in the target environment even after the package is uninstalled.
  - **Yes**: Select this option to remove the Manage List definition from the target environment when the package is uninstalled
  - **No**: Select this option to retain the Manage List definition in the target environment even after the package is uninstalled
- **Manage List is modified**: Use this property to retain, rollback to original state, or delete the Manage List definition in the target environment even after the package is uninstalled. This property is displayed only if **Delete Manage List** is set to *Yes*. However, if **Delete Manage List** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the Manage List definition along with the modifications in the target environment even after the package is uninstalled.
  - **Rollback to original state**: Select this option to rollback to the original state. All modifications that were done to the Manage List definition after it was installed in the target environment will be reverted. However, the Manage List definition will be retained in the target environment.
  - **Delete**: Select this option to delete the Manage List definition from the target environment when uninstalling the package.

Associated Artifacts of Manage List

The **Associated Artifacts** tab displays all the associated artifacts of the selected Manage List definition.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Manage List can include the following Associated Artifacts:

- Parent Folder
- Lookup
- Form
- Attachments. You can have *n* number of attachments.

Child Artifacts of Manage List

The **Child Artifacts** tab displays all the child artifacts of the Manage List definition.

Manage List can include the following child artifacts:

- Folder
- Child Manage List

Include Child Item

For more information, see Include Child Item.

Security Artifacts of Manage List

The Security Artifacts tab displays the security artifacts of a manage list definition, if any. You can enable the security settings of the manage list that you want to include in the package.

For more information about including security artifacts, see Include Security Artifacts.

Note:

- Manual uninstallation of forms may be required when uninstalling packages in certain scenarios. For example, a package with a form associated to a generic list is created in the source repository and then installed, reinstalled, and uninstalled from the target repository as follows:

Installation: Package is imported and installed. The associated form (version 1) and the generic list (version 1) are created.

Reinstallation: Same package is installed again with the default settings. The next minor version of the associated form (version 1.1) is created but the list (version 1) is not overwritten.

Uninstallation: Package is uninstalled. The minor version of the associated form (version 1.1) and the generic list (version 1) are removed but the previously associated version of the form (version 1) is retained.

- For a custom Manage List definition packaged with particular Manage List item types and installed, while uninstalling only the list items installed through the package will be uninstalled. Any list item created for the Manage List after installing the package will not be uninstalled during package uninstallation.

- Along with a Manage List containing User Lookup, the list items will be packaged and installed in the target environment. The user lookup field will be blank in case the user provider in target environment does not match the user provider in the source environment. For example, if you select a user in user lookup from active

---

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

directory provider and install in the target repository with AVEVA Work Tasks list provider, the List items will be installed , but the user lookup field will remain blank. In this case, if the user lookup field is mandatory, the list item will not be installed as it cannot be left blank.

- Update and uninstall for List items are not supported through package. During uninstall, the Manage List even though marked for deletion will not be deleted as List items cannot be deleted through package.

Manage View

You can package and deploy the Manage View definition from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks. The Manage View artifacts installed will be listed in the tree view and displays the name of the List View along with the artifact name in the parenthesis.

You can package the available views for the following artifacts:

- Workflows
- SOA Assembly
- SOA Folder
- Manage Forms
- Users
- Form Controls
- Report Connection
- Report Templates
- Grid Configuration
- Grid View
- Reports
- File Watcher
- Manage Package
- Package Template
- Lookup Settings
- Manage View
- Database Connections
- Deleted List Items
- Impersonation User
- External Connections

To add Manage View to Package Template

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, point to **Tools**, and then click **Manage Views**.
   The **Manage Views** window appears.
3. Select the List View that you want to package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Right-click the List View and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Note: Ensure that the List Views are in Published state in order to add the selected List Views to a package template.

Configuration Settings for Manage View

The **Manage View** has a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template > Edit**
- **Target Environment > Manage Package > Edit**

You can use the **Settings** tab to define the configuration settings. The **Associated Artifacts** and the **Child Artifacts** tabs are not available as Manage View does not contain any associated or child artifacts.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Security Artifacts

Settings

The properties in this tab allow you to take appropriate actions while installing, updating, or uninstalling the Package.

Note: In the case of List view, ensure that the Table is present in the target environment before you install the List View package in the target environment. When you are installing the List view package in the target environment, if the table is not present in the target environment, the following message appears: **You cannot view the list items**. **The table is missing**. **Verify your Database**. Besides this, you may also get the above error message if you are using a repository which is a case-sensitive database and the queries/columns in the target environment do not match as it is written in the source environment. You can resolve this issue by correcting the Table Name or creating the table in the target environment.

Install

The settings in this tab are referred to when installing the Package.

- **List View Exists**: This property allows you to take appropriate action when the List View definition present in the package is already present in the target environment.
  - **Do not install List view**: Select this option if you want to use the List View definition that is present in the target environment.
  - **Install to overwrite existing List View**: Select this option if you want to overwrite the List View definition that is present in the target environment with the one in the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Default List View**: This property allows you to specify default list view in the target environment. This will create a new default list view or overwrite an existing default list view.
  - **Yes**: Select this option to create the List View as the default List View in the target environment. If an existing List View is already available in the target environment, the selected List View will replace the existing one as default in the target environment.
  - **No**: Select this option if you do not want to specify the default List View definition in the target environment.
- **Associated Artifacts Not Present**: Use this property to take appropriate action when the associated artifacts of the List View are not present in the target environment.
  - **Install List View**: Select this option to install the List View in the Draft status, even if the associated artifacts are not present in the target environment.
  - **Do not install List View**: Select this option if you do not want to install the List View as its associated artifacts are not present.

Update

The settings in this tab are referred to when the same Package is installed for the consecutive time.

- **Delete List View**: Select this option if you want to delete the List View definition that is present in the target environment.
  - **Yes**: Select this option to remove the List View definition in the target environment. On selection of this option, the **List View Is Modified** option appears.

    List View Is Modified: Use this option to retain or delete the List View in the target environment even after the package is updated. This property is applicable only if **Delete List View** is set to *Yes* and the List View is modified.
    - **Retain**: Select this option if you want to retain the List View definition along with the modifications, in the target environment even after the Package is updated.
    - **Rollback**: Select this option if you want to roll back to the original state. All modifications that were done to the List View definition after it was installed in the target environment will be reverted. However, the List View definition will be retained in the target environment.
    - **Delete**: Select this option if you want to delete the List View definition from the target environment when updating the Package.
  - **No**: Select this option if you want to retain the List View definition in the target environment. On selection of this option, the **List View Exists** option appears.

    List View Exists: This property allows you to take appropriate action when the List View definition present in the package is already present in the target environment.
    - **Do not install List View**: Select this option if you want to use the List View definition that is present in the target environment
    - **Install to overwrite existing List View**: Select this option if you want to overwrite the List View definition that is present in the target environment with the one present in the Package.
- **Default List View**: This property allows you to specify default list view in the target environment. This will create a new default list view or overwrite an existing default list view.
  - **Yes**: Select this option to create the List View as default in the target environment. If an existing list view is already available in the target environment, the selected List View will replace the existing one as default in the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **No**: Select this option if you do not want to specify the Package List View as default List View definition in the target environment.

- **Associated Artifacts Not Present**: Use this property to take appropriate action when the associated artifacts of the List View are not present in the target environment.
  - **Install List View**: Select this option to update the List View in the Draft status, even if the associated artifacts are not present in the target environment.
  - **Do not install List View**: Select this option if you do not want to update the List View as its associated artifacts are not present.

Uninstall

The settings in this tab are referred to when the Package is being uninstalled in the target environment.

- **Delete List View**: This property allows you to decide if you want to retain or delete the List View definition in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option if you want to remove the List View definition from the target environment when the Package is uninstalled.
  - **No**: Select this option if you want to retain the List View definition in the target environment even after the Package is uninstalled.
- **List View Is Modified**: This option allows you to decide if you want to retain, roll back to original state or delete the List View definition in the target environment even after the Package is uninstalled. This property is displayed only if **Delete List View** is set to *Yes.* However, if **Delete List View** is set to *No*, this property is not displayed.
  - **Retain**: Select this option if you want to retain the List View definition along with the modifications, in the target environment even after the Package is uninstalled.
  - **Roll back to original State**: Select this option if you want to roll back to the original state. All modifications that were done to the List View definition after it was installed in the target environment will be reverted. However, the List View definition will be retained in the target environment.
  - **Delete**: Select this option if you want to delete the List View definition from the target environment when uninstalling the Package.

Note: Consider a scenario when a "Default list view" of Manage Package List that is installed in the target environment is packaged, and the same List View is selected to view the Manage Package List items. In this scenario, if you uninstall the package that had installed the Default List View, then the package will be uninstalled successfully. However, an exception occurs when the **Package History** page is closed. This exception occurs because the List View that you are using to view the list items, gets deleted when the package is uninstalled.

Associated Artifacts tab

This tab is not available as the List View does not have any associated artifact.

Child Artifacts tab

This tab is not available as the List View does not have any child artifact.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Security Artifacts tab

The Security Artifacts tab displays the security artifacts of a List View, if any.

You can enable the security settings of the manage view that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

Message Queue Connections

You can package and deploy a Message Queue Connection from one environment or repository to another environment or repository using the package feature in AVEVA Work Tasks.

To add Message Queue Connection to Package Template

1. Log on to the **Enterprise Console**.
2. On the menu, point to **Tools**, and then click **Message Queue Connections**.

   The **Message Queue** Connection List window appears.
3. Select the Message Queue Connection that you want to package.
4. Right-click the Message Queue Connection and then click **Add to Package Template**.

   The Add to Package Template dialog box appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of a Message Queue Connection in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the Message Queue Connection package in the **Settings** form on the right side of the Add to Package Template window.

Runtime Initialization Settings

You can configure runtime initialization settings for Message Queue Connections. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration Settings for Message Queue Connection

The **Message Queue Connection** has an unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment** > **Package Template** window
- **Target Environment** > **Manage Package** window

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

    - Uninstall
- Associated Artifacts
- Child Artifacts

Settings Tab

You can define the properties in the **Settings** tab to take appropriate actions to install, update, or uninstall a package.

Install

Use this tab to set the configurations for installing the package.

- **Connection Exists**: Select this property to take appropriate action when the Message Queue Connection in the package is already present in the target environment.
    - **Do not install connection**: Select this option to use the Message Queue Connection, present in the target environment.
    - **Install to overwrite the existing connection**: Select this option to overwrite the Message Queue Connection in the target environment with the one that is present in the package. During the package installation, backup will be taken before overwriting the existing artifact.

Update

Use the settings in this tab to update an installed package.

- **Delete connection**: Use this property to delete the Message Queue Connection present in the target environment.
    - **Yes**: Select this option to remove the Message Queue Connection from the target environment.

      Connection is modified: Select this option to retain, roll back to original state, or delete the Message Queue Connection in the target environment even after the package is updated. This property is applicable only if **Delete connection** is set to *Yes* and the Message Queue Connection is modified.
        - **Retain**: Select this option to retain the Message Queue Connection with the modifications in the target environment even after the uninstalling the package.
        - **Rollback to original state**: Select this option to rollback the Message Queue Connection to the original state. All modifications done to the Message Queue Connection after installation in the target environment will be rolled back. However, the Message Queue Connection will be retained in the target environment.
        - **Delete**: Select this option to delete the Message Queue Connection from the target environment while updating the package.
    - **No**: Select this option to retain the Message Queue Connection in the target environment.

      Connection exists: Select this option to take appropriate action when the Message Queue Connection that is being installed is present in the target environment.
        - **Do not install connection**: Select this option if you do not want to update the Message Queue Connection as associated artifacts are not present.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Install to overwrite existing connection**: Select this option to overwrite the Message Queue Connection present in the target environment with the one that is currently being packaged.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete connection**: Select this property to retain or delete the Message Queue Connection in the target environment after you uninstall the package.
  - **Yes**: Select this option to delete the Message Queue Connection from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the Message Queue Connection in the target environment even after the package is uninstalled.
- **Connection is modified**: Select this property to retain, rollback, or delete the Message Queue Connection in the target environment after uninstalling the package. This property is displayed only if **Delete connection** is set to *Yes*. However, if **Delete connection** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the Message Queue Connection with the modifications in the target environment even after the package is uninstalled.
  - **Rollback to original state**: Select this option to rollback the Message Queue Connection to the original state. All modifications that were done to the connection after it was installed in the target environment will be reverted. However, the connection will be retained in the target environment.
  - **Delete**: Select this option to delete the Message Queue Connection from the target environment when uninstalling the package.

Connection Details

Use the **Connect to Repository DataSource** settings to choose between an existing repository connection string or a different connection string.

Source:

Field	Description
User Name	Displays the use name with which the connection is configured .
Password	Displays the password in encrypted format.
Additional Settings	Displays the Message Queue connection additional settings.
Queue Name	Displays the name of the Queue.

Target:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
User Name	Enter the user name with which you want to configure connection.
Password	Enter the password.
Additional Settings	Enter the Message Queue connection additional settings.
Queue Name	Enter the name of the Queue.

Associated Artifacts of Message Queue Connection

Message Queue Connection does not have any associated artifact.

Child Artifacts of Message Queue Connection

Message Queue Connection does not have any child artifact.

Security Artifacts of Message Queue Connection

You can enable the security settings of the Message Queue Connection that you want to include in the package.

For more information about including security artifacts, see Include Security Artifacts.

Note: Restart the Workflow Engine service to utilize the Message Queue Connection installed through package.

MQTT Connections

You can package and deploy a MQTT Connection from one environment or repository to another environment or repository using the package feature in AVEVA Work Tasks.

To add MQTT Connection to Package Template

1. Log on to the **Enterprise Console**.
2. On the menu, point to **Tools**, and then click **MQTT Connections**.

   The **MQTT** Connection List window appears.
3. Select the MQTT Connection that you want to package.
4. Right-click the MQTT Connection and then click **Add to Package Template**.

   The Add to Package Template dialog box appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of a MQTT Connection in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the MQTT Connection package in the **Settings** form on the right side of the Add to Package Template window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Runtime Initialization Settings

You can configure runtime initialization settings for MQTT Connections. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration Settings for MQTT Connection

The **MQTT Connection** has an unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment** > **Package Template** window
- **Target Environment** > **Manage Package** window

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Child Artifacts

Settings Tab

You can define the properties in the **Settings** tab to take appropriate actions to install, update, or uninstall a package.

Install

Use this tab to set the configurations for installing the package.

- **Connection Exists**: Select this property to take appropriate action when the MQTT Connection in the package is already present in the target environment.
  - **Do not install connection**: Select this option to use the MQTT Connection, present in the target environment.
  - **Install to overwrite the existing connection**: Select this option to overwrite the MQTT Connection in the target environment with the one that is present in the package. During the package installation, backup will be taken before overwriting the existing artifact.

Update

Use the settings in this tab to update an installed package.

- **Delete connection**: Use this property to delete the MQTT Connection present in the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Yes**: Select this option to remove the MQTT Connection from the target environment.

  Connection is modified: Select this option to retain, roll back to original state, or delete the MQTT Connection in the target environment even after the package is updated. This property is applicable only if **Delete connection** is set to *Yes* and the MQTT Connection is modified.

  - **Retain**: Select this option to retain the MQTT Connection with the modifications in the target environment even after the uninstalling the package.
  - **Rollback to original state**: Select this option to rollback the MQTT Connection to the original state. All modifications done to the MQTT Connection after installation in the target environment will be rolled back. However, the MQTT Connection will be retained in the target environment.
  - **Delete**: Select this option to delete the MQTT Connection from the target environment while updating the package.
- **No**: Select this option to retain the MQTT Connection in the target environment.

  Connection exists: Select this option to take appropriate action when the MQTT Connection that is being installed is present in the target environment.

  - **Do not install connection**: Select this option if you do not want to update the MQTT Connection as associated artifacts are not present.
  - **Install to overwrite existing connection**: Select this option to overwrite the MQTT Connection present in the target environment with the one that is currently being packaged.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete connection**: Select this property to retain or delete the MQTT Connection in the target environment after you uninstall the package.
  - **Yes**: Select this option to delete the MQTT Connection from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the MQTT Connection in the target environment even after the package is uninstalled.
- **Connection is modified**: Select this property to retain, rollback, or delete the MQTT Connection in the target environment after uninstalling the package. This property is displayed only if **Delete connection** is set to *Yes*. However, if **Delete connection** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the MQTT Connection with the modifications in the target environment even after the package is uninstalled.
  - **Rollback to original state**: Select this option to rollback the MQTT Connection to the original state. All modifications that were done to the connection after it was installed in the target environment will be reverted. However, the connection will be retained in the target environment.
  - **Delete**: Select this option to delete the MQTT Connection from the target environment when uninstalling the package.

Connection Details

Use the **Connect to Repository DataSource** settings to choose between an existing repository connection string or a different connection string.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Source:

Field	Description
Server Name	Displays the name of the MQTT Server.
Port	Displays the Port number of the Web Socket protocol in the MQTT server.
User Name	Displays the User Name for the MQTT Connection. **Note:** User Name is not available if **Anonymous** is set to **Yes** while configuring MQTT Connection.
Password	Displays the Password for the MQTT Connection. **Note:** Password is not available if **Anonymous** is set to **Yes** while configuring MQTT Connection.

Target:

Field	**Description**
Server Name	Enter the name of the MQTT Server.
Port	Enter the Port number of the Web Socket protocol in the MQTT server.
User Name	Enter the User Name for the MQTT Connection. **Note:** User Name is not available if **Anonymous** is set to **Yes** while configuring MQTT Connection.
Password	Enter the Password for the MQTT Connection. **Note:** Password is not available if **Anonymous** is set to **Yes** while configuring MQTT Connection.

Associated Artifacts of MQTT Connection

MQTT Connection does not have any associated artifact.

Child Artifacts of MQTT Connection

MQTT Connection does not have any child artifact.

Security Artifacts of MQTT Connection

You can enable the security settings of the MQTT Connection that you want to include in the package.

For more information about including security artifacts, see Include Security Artifacts.

Note: Restart the Workflow Engine service to utilize the MQTT Connection installed through package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Navigation List

You can package and deploy the Navigation List item along with its associated and child artifact from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

After install, ensure that you refresh the Enterprise Console site to view the installed links.

You can package Navigation lists of type Navigation Link, List Link, and Form Link. For all these three types of links, you can update the source path of the icon. Additionally, for the Navigation Link, you can also update the name of the page to which you want to navigate to.

You can also package folders. For more information about adding folders to package template, see Folders.

To add Navigation List to Package Template

1. Log on to the **Enterprise Console**.
2. Click the <**User**> icon, and then click **Repository Settings**. The **Repository Settings** page appears.
3. Click the **Advanced Settings** tab, and then click **Manage Navigation List**. The **Navigation List** page appears.
4. Select the Navigation List that you want to package.
5. Right-click the Navigation List and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Configuration Settings for Navigation List

The **Navigation List** has a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template > Edit**
- **Target Environment > Manage Package List > Edit**

You can use the **Settings** tab to define the configuration settings. The **Associated Artifacts** tab displays the associated artifacts of the **Navigation List** item. The **Child Artifacts** tab displays child artifacts of the **Navigation List** item.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Child Artifacts
- Security Artifacts

Settings tab

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The properties in this tab allow you to take appropriate actions while installing, updating, or uninstalling the Package.

Install

The settings in this tab are referred to when installing the Package.

- **Navigation Link Exists**: This property allows you to take appropriate action when the Navigation List item present in the package is already present in the target environment
  - **Do Not Install Navigation Link**: Select this option if you want to use the Navigation List item that is present in the target environment.
  - **Install to overwrite existing Navigation Link**: Select this option if you want to overwrite the Navigation List item that is present in the target environment with the one in the package.
- **Associated Artifacts Not Present**: This property allows you to take appropriate action when the associated artifacts of the Navigation List items are not present in the target environment.
  - **Install Navigation Link**: Select this option if you want to install the Navigation List item, even if the associated artifacts are not present in the target environment.
  - **Do Not Install Navigation Link**: Select this option if you do not want to install the Navigation List item as its associated artifacts are not present.

Update

The settings in this tab are referred to when the same Package is installed for the consecutive time.

- **Delete Navigation Link**: Select this option if you want to delete the Navigation List item that is present in the target environment.
  - **Yes**: Select this option to remove the Navigation List item in the target environment. On selection of this option, the **Navigation Link Is Modified** option appears as shown in the following table.

    Navigation Link Is Modified: Use this option to retain or delete the Navigation Link in the target environment even after the package is updated. This property is applicable only if **Delete Navigation Link** is set to *Yes* and the Navigation Link is modified.
    - **Retain**: Select this option if you want to retain the Navigation List item along with the modifications, in the target environment even after the Package is updated.
    - **Rollback to original state**: Select this option if you want to roll back to the original state. All modifications that were done to the Navigation List item after it was installed in the target environment will be reverted. However, the Navigation List item will be retained in the target environment.
    - **Delete**: Select this option if you want to delete the Navigation List item from the target environment when updating the Package.
  - **No**: Select this option if you want to retain the Navigation List item in the target environment. On selection of this option, the Navigation Link Exists and the Associated Artifacts not present options appear.

    Navigation Link Exists: This property allows you to take appropriate action when the Navigation Link definition present in the package is already present in the target environment.
    - **Do Not Install Navigation Link**: Select this option if you want to use the Navigation Link definition that is present in the target environment.
    - **Install to overwrite existing Navigation Link**: Select this option if you want to overwrite the Navigation Link definition that is present in the target environment with the one present in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Package.

Associated Artifacts Not Present: Use this property to take appropriate action when the associated artifacts of the Navigation Link are not present in the target environment.

- **Update Navigation Link**: Select this option to update the Navigation Link in the Draft status, even if the associated artifacts are not present in the target environment.
- **Do not update Navigation Link**: Select this option if you do not want to update the Navigation List items as its associated artifacts are not present.

Uninstall

The settings in this tab are referred to when the Package is being uninstalled in the target environment.

- **Delete Navigation Link**: This property allows you to decide if you want to retain or delete the Navigation List in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option if you want to remove the Navigation List from the target environment when the Package is uninstalled.
  - **No**: Select this option if you want to retain the Navigation List in the target environment even after the Package is uninstalled.
- **Navigation Link Is Modified**: This option allows you to decide if you want to retain, roll back to original state or delete the Navigation List item in the target environment even after the Package is uninstalled. This property is displayed only if **Delete Navigation Link** is set to *Yes*. However, if **Delete Navigation Link** is set to *No*, this property is not displayed.
  - **Retain**: Select this option if you want to retain the Navigation List item along with the modifications, in the target environment even after the Package is uninstalled.
  - **Roll back to original State**: Select this option if you want to roll back to the original state. All modifications that were done to the Navigation List item after it was installed in the target environment will be reverted. However, the Navigation List item will be retained in the target environment.
  - **Delete**: Select this option if you want to delete the Navigation List item from the target environment when uninstalling the Package.

Scenario

Consider a scenario where a package with many artifacts, including Navigation List items, is installed.

- While installing a package which has customized menu structure, ensure that the **Install to overwrite existing Navigation Link** option is selected.
- If you want to revert the customized menu structure to the original menu structure, ensure that **Rollback to original state** option in the **Uninstall** tab is set for all the artifacts in the Navigation List items.

Associated Artifacts for Navigation List Item

This tab displays all the associated artifacts of the selected Navigation List item.

Navigation List can include the following Associated Artifacts:

- Parent Folder
- List

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Form
- Parent Navigation List item

Child Artifacts for Navigation List Item

This tab displays all the child artifacts of the Navigation List item.

Navigation List Item can include the following child artifacts:

- Folder
- Child Navigation List Item

Security Artifacts for Navigation List Item

The Security Artifacts tab displays the security artifacts of a Navigation List, if any.

You can enable the security settings of the navigation list item that you want to include in the package.

For more information about including security artifacts, see Include Security Artifacts.

Navigation List Folders

For a Navigation List, you can package and deploy **Folder** along with its associated and child artifacts from one environment or repository to another environment or repository.

Configuration Settings for Folder

The **Folder** has a unique set of configuration settings required to install, update, and uninstall the package. You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template > Edit**
- **Target Environment > Manage Package List > Edit**

Settings Tab

You can define the configuration settings of the Folder artifact in the **Settings** tab. Set the options in this tab to take appropriate actions while installing, updating, or uninstalling the package.

Install

Use this tab to set the configurations for installing the package.

- **Parent item is not present**: Select this property to take appropriate action when the parent item is not present in the target environment.
  - **Install folder**: Select this option to install this folder in target environment even if the parent folder is not present.
  - **Do not install folder**: Select this option if you do not want to install the folder, as the parent folder is not present in the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Folder exists**: Select this property to take appropriate action when the folder in the package is present in the target environment.
  - **Do not install folder**: Select this option if you do not want to overwrite the existing folder in the target environment with the folder in the package.
  - **Install to overwrite existing folder**: Select this option to overwrite the existing folder in the target environment with the folder in the package. A backup of the existing folder is taken before overwriting the folder.

    If this option is selected and if the folder in the package is present in the target environment, only then the **Parent item is not present** option is considered.

Update

Use the settings in this tab to update an installed package.

- **Parent folder is not present**: Select this property to take appropriate action when the parent folder is not present in the target environment.
  - **Update folder**: Select this option to update the folder in target environment even if the parent folder is not present.
  - **Do not update folder**: Select this option if you do not want to update the folder, as the parent folder is not present in the target environment.
- **Folder exists**: Use this property to take appropriate action when the folder being packaged is present in the target environment.
  - **Do not install folder**: Select this option if you do not want to overwrite the existing folder in the target environment with the folder in the package.
  - **Install to overwrite existing folder**: Select this option to overwrite the existing folder in the target environment with the folder in the package. A backup of the existing folder is taken before overwriting the folder.

    If this option is selected and if the folder in the package is present in the target environment, only then the **Parent item is not present** option is considered.

Installation and Update Scenarios

Consider that the folder to be packaged is "Folder X", which is available under "Folder A" in the source environment. The target environment contains "Folder X", which is available under "Folder B". However, "Folder A" does not exist in the target environment.

- *Scenario 1*: While adding "Folder X" to the package template, if the value for the **Include Associated Artifact** option is set as **Yes**, then "Folder X" will be added along with "Folder A", to the package template. If the **Install to overwrite existing folder** option is selected, then the following changes take place in the target environment, after the package is installed or updated:
  - "Folder A" is installed
  - "Folder X" is overwritten and moved from "Folder B" to "Folder A".
- *Scenario 2*: While adding "Folder X" to the package template, if the value for the **Include Associated Artifact** option is set as **No**, then only "Folder X" will be added to the package template. If the **Install to overwrite existing folder** option and the **Install folder** option under **Parent item is not present** option are selected,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

then after the package is installed or updated, "Folder X" is overwritten and moved from "Folder B" to the root level.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete folder**: Select this property to decide if you want to delete the folder or retain it when uninstalling the package.
  - **Yes**: Select this option to delete this folder after uninstalling the package.
  - **No**: Select this option to retain this folder after uninstalling the package.
- **If folder modified after installation**: Select this option to retain, rollback to original state, or delete the Navigation List Folder in the target environment. This property is displayed only if **Delete folder** is set to *Yes*. However, if **Delete Folder** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the Navigation List Folder definition along with the modifications in the target environment, even after the Package is uninstalled.
  - **Rollback to original state**: Select this option to roll back to the original state. All modifications that were done to the Navigation List Folder definition after it was installed in the target environment will be reverted. However, the Navigation List Folder definition will be retained in the target environment.

    If this option is selected, then the following changes take place in the target environment:
    - The folder definition is rolled back to the definition that was available before the installation.
    - The folder will not be rolled back to its original location. However, if you want to roll back the folder to its original location, use the **Organize** option from the Ribbon bar.
  - **Delete**: Select this option to delete the Navigation List Folder definition from the target environment.

Scenario

Consider a scenario where a package with many artifacts, including Navigation List folders, is installed.

- While installing a package which has customized menu structure, ensure that the **Install to overwrite existing folder** option is selected.
- If you want to revert the customized menu structure to the original menu structure, ensure that **Rollback to original state** option in the **Uninstall** tab is set for all the artifacts in the Navigation List folders.

Associated Artifacts of Folder

The **Associated Artifacts** tab displays all the associated artifacts of the selected folder.

Folder can include the following associated artifacts:

- Parent Folder
- Parent ListItem

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Child Artifacts of Folder

The **Child Artifacts** tab displays all the child artifacts of the selected folder.

Folder can include the following child artifacts:

- Child Folder
- Child ListItem

Include Child Item

For more information, see Include Child Item.

Security Artifacts of Folder

The **Security Artifacts** tab displays all the security artifacts of the selected folder.

You can enable the security settings of the folder that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

Resolve Custom Dependent Files for Navigation Links

Configure Navigation Links

When you package Navigation Links the image, aspx page, and aspx.cs files are automatically identified and appear as custom dependent files. The **Source Files** field displays the physical path of these files in the source environment. When the package is installed, these files are copied to the installed path of the target environment.

Click **Add row** to add multiple rows to install additional files in the target environment. In the **Source Files** field, enter the source file path of the custom dependent files.

If the source folder is relative to the AVEVA Work Tasks installed path, and the folder does not exist in the target environment then a new folder is created and the files are copied to it. If the source folder is not relative to the AVEVA Work Tasks installed path then the files are copied to the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\bin* folder.

The **Install in Global Assembly Cache** field is optional and is used to install the custom dependent files in the GAC of the target environment.

Queue Management

You can package and deploy a queue along with its associated and child artifacts from one environment or repository to another environment or repository.

Users are not be added to the queue. When the queue is installed, the user installing the queue will become the owner of the queue. When the queue is installed, the role will be added to the queue only if the role name matches in any of the target providers.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To add Queue Management to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Queue Management**.

   The **Queue Management** window appears.
3. Right-click on a queue, and then click **Add to Package Template**.

   The **Add to Package Template** window appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of queue in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the queue package in the **Settings** form on the right side of the Add to Package Template window.

   When you select the **Include Associated Artifacts** option as *Yes* while adding the queue to a package template, the associated artifacts are added to the package template. You can then view the associated artifacts of a queue in the tree view of a package. If you select the **Include Associated Artifacts** option as *No*, the associated artifacts are not added to the package template. Then, you cannot see the associated artifacts in the tree view of a package. This condition holds good for both the **Include Child Artifacts** and **Include Security Artifacts** options as well.

   When you select the **Include the automatically generated SQL Script** option as *Yes* while adding the queue to a package template, the automatically generated SQL script is included in the package template. If you select the **Include the automatically generated SQL Script** option as *No*, the automatically generated SQL script is not included in the package template.

Runtime Initialization Settings

You can configure runtime initialization settings for queues. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration settings for Queue

Queue has a unique set of configuration settings required to install, update, and uninstall the package. You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template > Edit**
- **Target Environment > Manage Package > Edit**

Settings

You can define the configuration settings of a queue artifact in the **Settings** tab. Set the properties in this tab to take appropriate actions while installing, updating, or uninstalling the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Install

Use this tab to set the configurations for installing the package.

- **Queue exists**: Use this property to take appropriate action when the Queue to be installed is present in the target environment.
  - **Overwrite existing Queue**: Select this option to overwrite the Queue present in the target environment with the one that you packaged.
  - **Use existing Queue**: Select this option to use the Queue which is present in the target environment.
- **SQL script**: When a queue contains a custom dispatch pattern, while adding the queue to the package template, a script is generated and populated in the SQL script text area. While installing the script in the target environment, the SQL script is run first to make necessary database entry related to the custom dispatch provider, so that the queue with the custom dispatch provider works without any manual intervention.

  If a default dispatch pattern is configured, then the SQL scripts are not generated. However, if a custom dispatch pattern is configured, then the SQL scripts are generated based on the PUSH and/or PULL patterns.

  See Also: SQL Script Generation and Execution

Update

Use the settings in this tab to update an installed package.

- **Delete Queue**: Use this property to delete the Queue present in the target environment.
  - **Yes**: Select this option to remove the Queue from the target environment.

    If Queue is modified after installation: Use this option to retain, delete, or rollback to original state the queue in the target environment even after the package is updated. This property is applicable only if **Delete Queue** is set to *Yes* and the queue is modified.
    - **Retain**: Select this option to retain the Queue along with the modifications, in the target environment even after the package is updated.
    - **Rollback to original state**: Select this option if you want to rollback to the original state. All modifications that were done to the Queue after it was installed in the target environment will be reverted. However, the Queue is retained in the target environment.
    - **Delete**: Select this option if you want to delete the Queue from the target environment when updating the package.
  - **No**: Select this option to retain the Queue in the target environment.

    Queue exists: Use this option to take appropriate action when the queue that is being installed is present in the target environment.
    - **Overwrite existing Queue**: Select this option to overwrite the Queue that is present in the target environment with the one present in the package.
    - **Use existing Queue**: Select this option to use the Queue that is present in the target environment.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Delete Queue**: Use this property to decide if you want to retain or delete the Queue in the target environment after you uninstall the package.
  - **Yes**: Select this option to delete the Queue from the target environment while uninstalling the package.
  - **No**: Select this option to retain the Queue in the target environment after uninstalling the package.
- **If Queue is modified after installation**: Use this property to decide if you want to retain, rollback, or delete the Queue in the target environment after uninstalling the package. This property is displayed only if **Delete Queue** is set to *Yes.* However, However, if **Delete Queue** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the Queue with the modifications in the target environment after uninstalling the package.
  - **Rollback to original state**: Select this option to rollback to the original state. All modifications that were done to the Queue after the installation in the target environment is. However, the Queue is retained in the target environment.
  - **Delete**: Select this option to delete the Queue from the target environment when uninstalling the package.

Note:

- The SQL script does not run when the package is installed in update mode.

- Changes made to the package through SQL scripts will not be reverted during package uninstallation.

Associated Artifacts of Queue

The Associated Artifacts tab displays all the associated artifacts of the selected Queue.

The following artifacts can appear as Associated Artifacts, if you are using any one of the following artifacts while designing the queue:

- Workflow
- Work Item Field
- Work Item Layout
- Queue

Child Artifacts

Queue does not have any child artifact.

Note: Packaging of **Users** (that is, participants of type Users) are not supported.

Resolve Associated Workflows for Queue

You can package and deploy a queue with its associated workflows from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

When a queue (associated to a workflow) is packaged, the following options are displayed in the **Associated Workflow Details** section under the **Settings** window. The **Associated Workflow Details** section is displayed only in the **Install** and the **Update** tabs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Workflow Name	Displays the name of the workflow to which the queue is associated.
Source Version	Displays the version of workflow in the source environment to which the queue is associated.
Target Version	Enter the version of the workflow: • Specify the version of the workflow to which you want to associate the queue in the target environment. • If you do not specify the version of the workflow, then the latest version of the workflow is considered. **Note:** If the version of the workflow that is specified while installing the package is not present in the target environment, then the next minor version of the latest version of the workflow in the target environment is considered.

Resolve Custom Dependent Files for Queue

You can package Queue with custom dispatch pattern provider and the dependent files from the source environment to the target. The package will identify dispatch provider assembly registered in the SKAddInProviders table in the repository database.

The **Source Files** field displays the physical assembly path of the queue custom dispatch provider files in the source environment. Click **Add row** to add multiple rows to install additional files in the target environment. In the **Source Files** field, enter the source file path of the custom dependent files.

You must ensure the target repository database contains an entry for custom dispatch provider in the SKAddinProviders table, before you install a package containing the custom dispatch provider.

The **Install in Global Assembly Cache** field is optional and is used to install the custom dependent files in the Global Assembly Cache of the target environment. Check the **Install in Global Assembly Cache** box, if you want to install the files in the Global Assembly Cache of the target environment.

Reports

You can package and deploy the Report artifact along with its associated and child artifacts from one environment or repository to another environment or repository.

While installing the Report artifacts, it is possible that you can find n number of different reports with same title in the Reports list. The package module identifies a unique Report based on the **UniqueReportValue** column value of the repository database and installs it to the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Limitations of the Form Reports

The Form Reports artifact has some behavior limitations. Make sure that you adhere to the following guidelines while installing a Form Reports to a package:

- The Report you want to package must not contain any semicolon (;) in its name.
- Report does not exceed 10 MB of file size.

  You cannot import a package file size exceeding 10 MB to **Manage Package** list. Hence, you must not add any single report file or more than one report file that exceeds 10 MB file size in a single package. In such cases, we recommend to package each report file in a separate package template.

To add Reports to Package Template

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, point to **Settings**, point to **Reporting Service**, and then click **Reports**.

   The Reports page appears.
3. Select the report that you want to package.
4. Right-click the report, and then click **Add to Package Template**.

   The **Add to Package Template** dialog box appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Configuration Settings for Reports

Reports has an unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the **Settings** tab to define the configuration settings. The **Associated Artifacts** tab displays the associated artifacts of the **Reports** definition. The **Child Artifacts** tab displays child artifacts of the **Reports** definition.

Settings Tab

The properties in this tab allows you to take appropriate actions while installing, updating, or uninstalling the Package.

Install

The settings in this tab is referred to when installing the Package.

- **Report Exists**: This property allows you to take appropriate action when the Report that you are installing is already present in the target environment.
  - **Do not install Report**: Select this option if you want to use the existing report which is present in the target environment.
  - **Install to overwrite existing Report**: Select this option if you want to overwrite the Report which is present in the target environment with the one that is currently being packaged.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Source**: This property allows you to specify the source type of the Report or update the source type in the target environment if it is not present in the target environment.
- **Source**: This option displays the source type of the Report that you want to package.
- **Target**: This option allows you to modify or add the source type of the Report that you want to use in the target environment.

Update

The settings in this tab is referred to when the same Package is installed for the consecutive time.

- **Delete Report**: Select this option if you want to delete an existing Report which is present in the target environment.
  - **Yes**: Select this option to remove the Report in the target environment and the **Report Is Modified** option appears.

    Report Is Modified

    - **Retain**: Select this option if you want to retain the Report along with the modifications, in the target environment even after the Package is updated.
    - **Rollback to original state**: Select this option if you want to roll back to the original state. All modifications that were done to the Report after it was installed in the target environment will be reverted. However, the Report will be retained in the target environment.
    - **Delete**: Select this option if you want to delete the Report from the target environment when updating the Package.
  - **No**: Select this option if you want to retain the Report in the target environment and the **Report Exists** option appears.

    Report Exists

    - **Do not install Report**: Select this option if you want to use the existing Report which is present in the target environment. By default, the Do not install Report option is selected.
    - **Install to overwrite existing Report**: Select this option if you want to overwrite the existing Report which is present in the target environment with the one that is currently being packaged.

      Source

    - **Source**: Displays the source of the Report.
    - **Target**: Click to update the source of the Report in the Target environment.

Uninstall

This settings in this tab allows you to define the Package behavior when the Package is being uninstalled in the target environment.

- **Delete Report**: This property allows you to define whether you want to retain, rollback, or delete the Report in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to delete the Report from the target environment when the Package is uninstalled.
  - **No**: Select this option to retain the Report in the target environment even after the Package is uninstalled.
- **Report Is Modified**: Select this option to retain, rollback, or delete the Report in the target environment even after the Package is uninstalled. This property is displayed only if **Delete Report** is set to *Yes*. However, if

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Delete Report is set to *No*, this property is not displayed.

- **Retain**: Select this option to retain the Report along with the modifications, in the target environment even after the Package is uninstalled.
- **Roll back to original State**: Select this option to roll back to the original state. All modifications that were done to the Report after it was installed in the target environment will be reverted. However, the Report will be retained in the target environment.
- **Delete**: Select this option to delete the Report from the target environment when uninstalling the Package.

Associated Artifacts for Reports

This tab displays all the available associated artifacts of the selected Reports artifact.

Report can include the following associated artifacts:

- Parent Report
- Parent Folder: You cannot install a Folder which is disabled but it will allow you to install, update, or uninstall the Reports within it by validating the **UniqueReportValue**.

Child Artifacts for Reports

If a Report contains a child artifact, the Child Artifacts tab displays all the child artifacts of the selected Report artifact. Otherwise, the Child Artifacts tab is disabled.

Report can include the following Child Artifacts:

- Folder
- Child Reports

Include Child Item

For more information, see Include Child Item.

Security Artifacts for Reports

The Security Artifacts tab displays the security artifacts of a Report, if any.

You can enable the security settings of the reports that you want to include in the package.

For more information about including security artifacts, see Include Security Artifacts.

Note: When a report reference variable is assigned to report viewer artifacts then the report artifact will not be added automatically. The report artifact should be added manually.

Report Connections

You can package and deploy the Report Connection artifact from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To add Report Connections to Package Template

1. Log on to the **Enterprise Console**.
2. On the **Enterprise Console** menu, point to **Settings**, point to **Reporting Service**, and then click **Report Connections**. The **Report Connections** window appears.
3. Select the report connection that you want to package.
4. Right-click the report connection and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Runtime Initialization Settings

You can configure runtime initialization settings for Report Connections. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration Settings for Report Connections

The **Report Connections** has a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template > Edit**
- **Target Environment > Manage Package > Edit**

You can use the **Settings** tab to define the configuration settings. The **Associated Artifacts** and **Child Artifacts** tab are not available as **Report Connections** does not contain any associated or child artifacts.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Security Artifacts

Settings

The properties in this tab allow you to take appropriate actions while installing, updating, or uninstalling the Package.

Install

The settings in this tab are referred to when installing the Package.

- **Report Connection Exists**: This property allows you to take appropriate action when the Report Connection that you are installing is already present in the target environment:
  - **Do not install Report Connection**: Select this option if you want to use the report connection which is present in the target environment

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Install to overwrite existing Report Connection**: Select this option if you want to overwrite the report connection, which is present in the target environment with the one that is currently being packaged

- **Report Connection Details**:
  - **Source**: This section allows you to view the following connection details information that you have used in the source environment.
    - **URI**: Displays the URI of the report server.
    - **Authentication Type > Anonymous Access**: Displays whether the URI mentioned-above is configured anonymously. If this option is selected, it means that SQL Server Reporting Service is being accessed as anonymous user.
    - **User Name**: Displays the name of the user to access the report server URI.
    - **Password**: Displays the password in encrypted format. This password is used to authenticate the user credentials to access the report server.
    - **Domain**: Displays the name of the domain in which the above-mentioned user exists.
    - **Default Path**: Displays the default report template path. This information is required to locate a specific group of report templates that have been deployed in the reporting server. For example: /ArchestrA Reports/Historian.
  - **Target**: This section allows you to specify the following connection details information that you may use in the target environment.
    - **URI**: Enter the URI of the target report server.
    - **Authentication Type > Anonymous Access**: Specify whether the URI mentioned-above is configured anonymously. If this option is selected, it means that SQL Server Reporting Service is being accessed as anonymous user.
    - **User Name**: Enter the name of the user to access the report server URI.
    - **Password**: Enter the password. This password is used to authenticate the user credentials to access the report server.
    - **Domain**: Enter the name of the domain in which the above-mentioned user exists.
    - **Default Path**: Enter the default report template path. This information is required to locate a specific group of report templates that have been deployed in the reporting server. For example: /ArchestrA Reports/Historian.

      Note:

      You can specify the **Report Connection Details > Target** either during design-time or during installation. In case you do not specify the target details during design time, you can specify the target details during the install time in the **Report Connection Details > Target** section or else it will take the values specified in the **Report Connection Details > Source** section value during installation.

Update

The settings in this tab are referred to when the same Package is installed for the consecutive time.

- **Delete Report Connection**: Select this option if you want to delete an existing report connection which is present in the target environment.
  - **Yes**: Select this option to remove the report connection in the target environment. On selection of this option, the **Report Connection Is Modified** option appears as shown in the following table:

    Report Connection is Modified: Use this option to retain, delete, or rollback to original state the Report

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Connection in the target environment even after the package is updated. This property is applicable only if **Delete Report Connection** is set to *Yes* and the report connection is modified.

- **Retain**: Select this option to retain the Report Connection along with the modifications, in the target environment even after the package is updated.
- **Rollback to original state**: Select this option if you want to rollback to the original state. All modifications that were done to the Report Connection after it was installed in the target environment will be reverted. However, the Report Connection will be retained in the target environment.
- **Delete**: Select this option if you want to delete the Report Connection from the target environment when updating the package.

- **No**: Select this option if you want to retain the Report Connection in the target environment. On selection of this option, the **Report Connection Exists** option appears.

  Report Connection Exists: Use this option to take appropriate action when the Report Connection is present in the target environment.

  - **Do Not Install Report Connection**: Select this option if you want to use the existing Report Connection which is present in the target environment.
  - **Install to overwrite existing Report Connection**: Select this option if you want to overwrite the existing Report Connection which is present in the target environment with the one that is currently being packaged.

- **Report Connection Details**:
  - **Source**: This section allows you to view the following connection details information that you have used in the source environment.
    - **URI**: Displays the URI of the report server.
    - **Authentication Type > Anonymous Access**: Displays whether the URI mentioned-above is configured anonymously. If this option is selected, it means that SQL Server Reporting Service is being accessed as anonymous user.
    - **User Name**: Displays the name of the user to access the report server URI.
    - **Password**: Displays the password in encrypted format. This password is used to authenticate the user credentials to access the report server.
    - **Domain**: Displays the name of the domain in which the above-mentioned user exists.
    - **Default Path**: Displays the default report template path. This information is required to locate a specific group of report templates that have been deployed in the reporting server. For example: /ArchestrA Reports/Historian.
  - **Target**: This section allows you to specify the following connection details information that you may use in the target environment.
    - **URI**: Enter the URI of the target report server.
    - **Authentication Type > Anonymous Access**: Specify whether the URI mentioned-above is configured anonymously. If this option is selected, it means that SQL Server Reporting Service is being accessed as anonymous user.
    - **User Name**: Enter the name of the user to access the report server URI.
    - **Password**: Enter the password. This password is used to authenticate the user credentials to access the report server.
    - **Domain**: Enter the name of the domain in which the above-mentioned user exists.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Default Path**: Enter the default report template path. This information is required to locate a specific group of report templates that have been deployed in the reporting server. For example: /ArchestrA Reports/Historian.

Uninstall: The settings in this tab allow you to define the Package behavior when the Package is being uninstalled in the target environment.

- **Delete Report Connection**: This property allows you to define whether you want to retain or delete the report connection in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option if you want to delete the report connection from the target environment when the Package is uninstalled.
  - **No**: Select this option if you want to retain the report connection in the target environment even after the Package is uninstalled.
- **Report Connection Is Modified**: This option allows you to decide if you want to retain, roll back to original state or delete the report connection in the target environment even after the Package is uninstalled. This property is displayed only if **Delete Report Connection** is set to *Yes*. However, if **Delete Report Connection** is set to *No*, this property is not displayed.
  - **Retain**: Select this option if you want to retain the report connection along with the modifications in the target environment even after the Package is uninstalled.
  - **Roll back to original State**: Select this option if you want to roll back to the original state. All modifications that were done to the connection after it was installed in the target environment will be reverted. However, the report connection will be retained in the target environment.
  - **Delete**: Select this option if you want to delete the report connection from the target environment when uninstalling the Package.

Associated Artifacts

Report Connection does not have any associated artifacts.

Child Artifacts

Report Connection does not have any child artifacts.

Security Artifacts

The Security Artifacts tab displays the security artifacts of report connections, if any.

You can enable the security settings of the report connections that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

Report Templates

You can package and deploy the Report Templates artifact from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add Report Templates to Package Template

Complete the following tasks to add a report template to a package template:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, point to **Settings**, point to **Reporting Service**, and then click **Report Templates**. The **Report Templates** window appears.
3. Select the report template that you want to package.
4. Right-click the report template and then click **Add to Package Template**. The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Runtime Initialization Settings

You can configure runtime initialization settings for Report Templates. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration settings for Report Templates

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template > Edit**
- **Target Environment > Manage Package > Edit**

Settings

You can use the **Settings** tab to define the configuration settings. Set the properties in this tab to take appropriate actions while installing, updating, or uninstalling the package.

Install

Use this tab to set the configurations for installing the package.

- **Report Template Exists**: This property allows you to take appropriate action when the Report Templates that you are installing is already present in the target environment:
  - **Do Not Install Report Template**: Select this option if you want to use the report template which is present in the target environment.
  - **Install to overwrite existing Report Template**: Select this option if you want to overwrite the report template which is present in the target environment with the one that is currently being packaged.
- **Associated Artifacts Not Present**: This property allows you to take appropriate action when the associated artifacts of the Report Template is not present in the target environment.
  - **Install Report Template**: Select this option if you want to install the Report Template, even if the associated artifacts are not present in the target environment.
  - **Do Not Install Report Template**: Select this option if you do not want to install the Report Template as its associated artifacts are not present.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Update

Use the settings in this tab to update an installed package.

- **Delete Report Template**: Select this option if you want to delete the Report Template which exists in the target environment.
  - **Yes**: Select this option to remove the Report Template in the target environment. On selection of this option, the **Report Template Is Modified** option appears.

    Report Template is Modified: Use this option to retain, delete, or rollback to original state the Report Template in the target environment even after the package is updated. This property is applicable only if **Delete Report Template** is set to *Yes* and the report template is modified.
    - **Retain**: Select this option to retain the Report Template along with the modifications, in the target environment even after the package is updated.
    - **Rollback to original state**: Select this option if you want to rollback to the original state. All modifications that were done to the Report Template after it was installed in the target environment will be reverted. However, the Report Template will be retained in the target environment.
    - **Delete**: Select this option if you want to delete the Report Template from the target environment when updating the package.
  - **No**: Select this option if you want to retain the Report Template in the target environment. On selection of this option, the **Report Template Exists** and the **Associated Artifacts not present** options appear.

    Report Template Exists: Use this option to take appropriate action when the Report Template is present in the target environment.
    - **Do Not Install Report Template**: Select this option if you want to use the existing Report Template which is present in the target environment.
    - **Install to overwrite existing Report Template**: Select this option if you want to overwrite the existing Report Template which is present in the target environment with the one that is currently being packaged.

  Associated Artifacts not present: Use this property to take appropriate action when the associated artifacts of the Report Template are not present in the target environment.
- **Install Report Template**: Select this option if you want to update the Report Template.
- **Do Not Install Report Template**: Select this option if you do not want to update the Report Template as associated artifacts are not present.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete Report Template**: This property allows you to define whether you want to retain or delete the Report Template in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option if you want to delete the Report Template from the target environment when the Package is uninstalled.
  - **No**: Select this option if you want to retain the Report Template in the target environment even after the Package is uninstalled.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Report Template Is Modified**: This option allows you to decide if you want to retain, roll back to original state or delete the Report Template in the target environment even after the Package is uninstalled. This property is displayed only if **Delete Report Template** is set to *Yes*. However, if **Delete Report Template** is set to *No*, this property is not displayed.
  - **Retain**: Select this option if you want to retain the Report Template along with the modifications in the target environment even after the Package is uninstalled.
  - **Roll back to original State**: Select this option if you want to roll back to the original state. All modifications that were done to the template after it was installed in the target environment will be reverted. However, the Report Template will be retained in the target environment.
  - **Delete**: Select this option if you want to delete the Report Template from the target environment when uninstalling the Package.

Associated Artifacts

This tab displays all the associated artifacts of the selected Report Template artifact.

Report Templates can include "Report Connection" as an associated artifact.

Note: When you select the **Include Associated Artifacts** option as **Yes** while adding the Report Template to a Package Template, the associated artifacts are added to the package template and it also allows you to view the associated artifacts of a Report Template in the tree view of a Package. If you select the **Include Associated Artifacts** option as **No**, the associated artifacts are not added to the package template and are also not visible in the tree view of a Package.

Child Artifacts

This tab is not available as the Report Template artifact does not have any child artifacts.

Security Artifacts

The **Security Artifacts** tab displays the security artifacts of report templates, if any.

You can enable the security settings of the report templates that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

Resolve Report Template Path

The report template path is required to locate a specific group of report templates that have been deployed in the reporting server. You can edit the path of the template file in the target environment.

For example: */ArchestrA Reports/Historian*.

The **Report template path** grid contains the following settings, which are required to resolve the report template path:

Field Name	Description
Source	Displays the report template path value in the source environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Target	Enter the report template path value in the target environment. If you do not specify any value, then the value specified in the source is considered. Ensure to provide a valid report template path that contains the valid files.

Security Group

You can package and deploy a Security Group definition and its associated artifacts from one environment or repository to another environment or repository using the package feature in AVEVA Work Tasks.

You can package the security group from the following three levels:

- Repository level
- List level
- List item level

Repository Level

In repository level, you can only overwrite the standard security group. You cannot create or delete the standard security group.

You can create, overwrite, or delete a custom security group at the repository level. Deleting a custom security group at repository level also deletes the security group at all lists and list items level.

List Level

At list level, you cannot create or delete security groups. You can only overwrite the security groups at list level.

- Security Group Customization - At list level, security groups are not available by default. Enable the security group customization first, which makes a copy of all the security groups and makes available at list level. After you enable the security group customization, you can overwrite the security groups at list level.
- Remove Security Group Customization - If there is no need of a separate definition for any of the security groups at list level, then you can remove the security group customization. That is, the definition of all the security groups are removed from the list level, but the security group exists at repository level, which is effective in the current list as well.

List Item Level

At List Item Level, you can select and package individual security group. When installing or updating the package in the target environment, the package checks whether the security group customization is enabled at the list item level.

Notes:

- You cannot create or delete a security group at List Level or List Item level. Thus, the Resource Mapping is identified option is not available in both the List Level and List Item Level Security Group Configuration Settings.
- You cannot package a standard Security Right as an associated artifact.
- Web part page will not be packaged with the security group as an associated artifact. It will just provide a reference to the web part page in the target environment. After the security group is installed, if the web

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

part page is present in the target environment then the security group is linked to it.

- A list item from a dynamic list, such as Employee list can be edited or viewed using different forms or form versions based on the security rights given to the logged in user.
- For an existing Security Group, you can get a backup of the artifact that is available in the target environment.

Security Group - Repository Level

You can package and deploy the repository level Security Group definition along with its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add Repository Level Security Group to Package Template

Complete the following tasks to add security group definition to package template:

1. Log on to the **Enterprise Console**.
2. Click **Repository Settings**.
   The **Repository Settings** window appears.
3. On the **Advanced Settings** tab, click **Manage Security Groups**.
4. Right-click the Security Group that you want to package, and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

Associated Artifacts for Security Group Definition

The Security Group at repository level can have the following associated artifacts:

- Custom Security Right
- Workflow
- Form Link

Child Artifacts for Security Group Definition

The Security Group at repository level does not have any child artifact.

Configuration Settings for Security Group

The Manage Security Group definition has an unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the Settings tab of the Manage Security Group definition artifact to define the configuration settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Associated Artifacts tab displays the associated artifacts of the Manage Security Group definition.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Child Artifacts

Settings tab

You can use the properties in the Settings tab to take appropriate actions to install, update, or uninstall the package.

Install

You can refer to the configuration settings in the **Install** tab to install the package.

- **Security Group Exists**: Select this property to take appropriate action when the Security Group definition specified in the package is already present in the target environment.
  - **Do not install Security Group**: Select this option to use the Security Group definition that is present in the target environment.
  - **Install to overwrite existing Security Group**: Select this option to overwrite the Security Group definition that is present in the target environment with the one in the package.

    By default, Install to overwrite existing Security Group is selected, since the security group will be available in the target environment and on installing the package it will be overwritten. If the security group is not available in the target environment then prior to installing the package the security group will be enabled, hence the security group will be overwritten.
- **Associated Artifacts Not Present**: This property allows you to take appropriate action when the associated artifacts of the Security Group is not present in the target environment.
  - **Install Security Group**: Select this option to install the Security Group, even if the associated artifacts are not present in the target environment.
  - **Do not install Security Group**: Select this option if you do not want to install the Security Group artifact as its associated artifacts are not present.

Update

You can refer to the settings in this tab to install the same package for the consecutive time.

Delete Security Group: Select this option to delete the Security Group definition that is present in the target environment.

- **Yes**: Select Yes to remove the Security Group definition in the target environment. When you select Yes, the **Security Group is Modified** and **Resource Mapping is Identified** options appear.

  Security Group is Modified

  - **Retain**: Select this option to retain the Security Group definition along with the modifications, in the target environment even after the Package is updated.
  - **Rollback to Original State**: Select this option to roll back to the original state. All modifications that were

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

done to the Security Group definition after it was installed in the target environment will be reverted. However, the Security Group definition will be retained in the target environment.

- **Delete**: Select this option to delete the Security Group definition from the target environment when updating the Package.

Resource Mapping is Identified

- **Retain**: Select this option to retain the Resource Mapping definition in the target environment when updating the Package.
- **Delete**: Select this option to delete the Resource Mapping definition from the target environment when updating the Package.

- **No**: Select No if you want to retain the Security Group definition in the target environment.
When you select No, the **Security Group Exists** option appears.

  Security Group Exists

  - **Do not install Security Group**: Select this option to use the Security Group definition that is present in the target environment.
  - **Install to overwrite existing Security Group**: Select this option to overwrite the Security Group that is present in the target environment with the one present in the package.

  Associated Artifacts not present

  - **Update Security Group**: Select this option to update the Security Group even though no associated artifacts are present.
  - **Do not update Security Group**: Select this option if you do not want to update the Security Group when the associated artifacts are not present.

Uninstall

You can refer to the following settings in the Uninstall tab to uninstall a package from a target environment:

- **Delete Security Group**: Select this property to retain or delete the Security Group definition in the target environment even after the Package is uninstalled.
  - **Yes**: Select Yes to remove the Security Group definition from the target environment when the Package is uninstalled. When you select Yes, the **Security Group is Modified** and **Resource Mapping is Identified** options appear:

    Security Group is Modified

    - **Retain**: Select this option to retain the Security Group definition along with the modifications, in the target environment even after the Package is uninstalled.
    - **Rollback to Original State**: Select this option to roll back to the original state. All modifications that were done to the Security Group definition after it was installed in the target environment will be reverted. However, the Security Group definition will be retained in the target environment.
    - **Delete**: Select this option to delete the Security Group definition from the target environment when uninstalling the Package.

      Resource Mapping is Identified

    - **Retain**: Select this option to retain the Resource Mapping definition in the target environment when uninstalling the Package.
    - **Delete**: Select this option to delete the Resource Mapping definition from the target environment when uninstalling the Package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **No**: Select No to retain the Security Group definition in the target environment even after the Package is uninstalled.

When you select Yes in the Delete Security Group option while doing the Update or Uninstall, the following scenarios are possible:

Installation Type	Security Group is Modified Status	Security Group is Modified Option	Resource Mapping is Identified	Result
New Security Group	If Security Group is not modified.	Select the Retain option.	If no Resource Mapping is identified. Or If you select Delete option for Resource Mapping is Identified.	Security Group artifact is deleted along with the Resource Mapping from the target environment.

Associated Artifacts Tab

The Associated Artifacts tab displays all the associated artifacts of the selected Security Group definition.

If a form link with the same name is present in the target environment and it is not overwritten, then the security right might not work as expected if the form link in the target environment is of a different type and different mode.

Child Artifacts Tab

The Security Group at repository level does not have any child artifact.

Security Group - List Level

You can package and deploy the list level Security Group definition and its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add List Level Security Group to Package Template

Complete the following tasks to add security group definition to package template:

1. Go to the List which contains the security group that you want to package. For example, Workflow List.
2. Click **Security** on the ribbon bar.
   The security settings window opens.
3. Click **Advanced Settings** tab.
4. Click **Customize Security Group** for this List.
   The security group list at list level window appears.
5. Select the **Security Group** that you want to package.
6. Right-click and then select **Add to Package Template**.
   The **Add to Package Template** dialog box appears with the List Level Security Group.
   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

The following shows the tree view format of the list level security group, for example, **Add to Package Template**: <**Security Group Name - List - List name**>:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Associated Artifacts for Security Group Definition

A List Level Security Group can have the following Associated Artifacts:

- Repository Level Security Group
- List Specific Custom Security Right
- Workflow
- Form Link
- Dynamic Lists
- Form

Child Artifacts for Security Group Definition

Security Group does not have any child artifacts.

Configuration Settings for Security Group

The Manage Security Group definition has an unique set of configuration settings required for installing, updating, and uninstalling the Package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the Settings tab of the **Manage Security Group** definition artifact to define the configuration settings. The **Associated Artifacts** tab displays the associated artifacts of the **Manage Security Group** definition.

The Package Template configuration window contains the following tabs:

- Settings
- Associated Artifacts
- Child Artifacts

Settings Tab

You can use the properties in the Settings tab to take appropriate actions to install, update, or uninstall the package.

Install:

While installing the security group, the package checks whether the security group customization is enabled the list level. If the security group customization is not enabled, then the package first enables the security group customization. Then the package overwrites the security group definition. If the security group customization is already enabled, then the package overwrites the security group.

The configuration settings in the Install tab is referred to when installing the package.

- **Security Group Exists**: This property allows you to take appropriate action when the Security Group definition specified in the package is already present in the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Do not install Security Group**: Select this option to use the Security Group definition that is present in the target environment.
- **Install to overwrite existing Security Group**: Select this option to overwrite the Security Group definition that is present in the target environment with the one in the package.

  By default, Install to overwrite existing Security Group is selected, since the security group will be available in the target environment and on installing the package it will be overwritten. If the security group is not available in the target environment then prior to installing the package the security group will be enabled, hence the security group will be overwritten.

- **Associated Artifacts Not Present**: This property allows you to take appropriate action when the associated artifacts of the Security Group is not present in the target environment.
  - **Install Security Group**: Select this option to install the Security Group, even if the associated artifacts are not present in the target environment.
  - **Do not install Security Group**: Select this option if you do not want to install the Security Group artifact as its associated artifacts are not present.

Update

The settings in this tab is referred to when the same Package is installed for the consecutive time.

- **Delete Security Group**: Select this option to delete the Security Group definition that is present in the target environment.
  - **Yes**: Select this option to remove the Security Group definition in the target environment. On selection of this option, the Security Group is Modified option appears.

    Security Group is Modified

    - **Retain**: Select this option to retain the Security Group definition along with the modifications, in the target environment even after the Package is updated.
    - **Rollback to Original State**: Select this option to roll back to the original state. All modifications that were done to the Security Group definition after it was installed in the target environment will be reverted. However, the Security Group definition will be retained in the target environment.
    - **Delete**: Select this option to delete the Security Group definition from the target environment when updating the Package.
  - **No**: Select this option to retain the Security Group definition in the target environment. On selection of this option, the Security Group Exists option appears as shown in the following table:

    Security Group Exists

    - **Do not install Security Group**: Select this option to use the Security Group definition that is present in the target environment.
    - **Install to overwrite existing Security Group**: Select this option to overwrite the Security Group that is present in the target environment with the one present in the package.

      Associated Artifacts not present

    - **Update Security Group**: Select this option to update the Security Group even though no associated artifacts are present.
    - **Do not update Security Group**: Select this option if you do not want to update the Security Group when the associated artifacts are not present.

Uninstall

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

You can refer to the following settings in the Uninstall tab to uninstall a package from a target environment:

- **Delete Security Group**: Select this property to retain or delete the Security Group definition in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option to remove the Security Group definition from the target environment when the Package is uninstalled.

    When you select Yes, the Security Group is Modified option appears as shown in the following table:

    Security Group is Modified

    - **Retain**: Select this option to retain the Security Group definition along with the modifications in the target environment even after the Package is uninstalled.
    - **Rollback to Original State**: Select this option to roll back the Security Group to the original state. All modifications that were done to the Security Group definition after it was installed in the target environment will be reverted. However, the Security Group definition will be retained in the target environment.
    - **Delete**: Select this option to delete the Security Group definition from the target environment while uninstalling the package.
  - **No**: Select this option if you want to retain the Security Group definition in the target environment even after the Package is uninstalled.

Remove Security Group Customization at List Level

While uninstalling the security group at list level, the security group artifact checks whether the security group customization is enabled by the current security group artifact.

- If not, then uninstall rolls back the security group definition to the original state, but does not remove the security group customization as it was not enabled by it.
- Otherwise, the security group artifact checks whether any other security group is modified at the list level.
  - If yes, then uninstall does not remove the security group customization, but rolls back the security group definition to the original state.
  - Otherwise, uninstall removes the security group customization.
- Consider that a custom security group is packaged at list level and a repository level security group is an associated artifact. While installing, both the security groups are installed. While uninstalling, select the "Delete" option for the repository level security group and "Retain" option for the list level security group. Then, the list level security group artifact is uninstalled or retained first, followed by the repository level security group artifact which is deleted while uninstalling. As the repository level security group is deleted, it removes the complete definition of the security group from all the levels.
  - Thus, the list level security group gets uninstalled, though the delete option is to "Retain" the security group. However, the security group customization is retained.
  - The security group customization cannot be removed by the package, even if you uninstall the package again. So it is advisable to select the "Delete" option for list level security group. If you select the "Delete" option for repository level security group, irrespective of the option that is selected for list level security group, the security group as a whole is deleted.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Associated Artifacts

This tab displays all the associated artifacts of the selected Security Group definition.

If a Form link with the same name is already present in the target environment and it is not overwritten, then the security right might not work as expected if the form link in the target environment is of a different type and different mode, and if the mode is Pop-Up.

If the Security Group at repository level is not available in the target environment, then the security group at list level will not be installed.

Child Artifacts

Security Group does not have any child artifacts.

Security Artifacts

The Security Artifacts tab displays the security artifacts of a database connection, if any.

Security Group - List Item Level

You can package and deploy the list item level Security Group definition and its associated artifacts from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add List Item Level Security Group to Package Template

Complete the following tasks to add list item level security group definition to package template:

1. Go to the List Item which contains the security group that you want to package. For example, Workflow List.
2. Right-click a list item, and then click **Security Settings** in the context-menu.
   The security settings window opens.
3. Click **Advanced Settings** tab.
4. Click **Customize Security Group** for this List Item.
   The security group list at list item level window appears.
5. Right-click the Security Group that you want to package, and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears with the List Item Level Security Group.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

The following shows the tree view format of the list item level security group, for example, **Add to Package Template**: <**Security Group Name - List Item - List Name/List Item Name**>:

Associated Artifacts for Security Group Definition

A List Item Level Security Group can have the following Associated Artifacts:

- Repository Level Security Group
- List Specific Custom Security Right
- Workflow

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Form Link
- Dynamic Lists
- Form
- List Item

For information about whether a list item can be packaged or not, see Packageable Artifacts.

If the Security Group at repository level is not available in the target environment, then the security group at list item level will not be installed.

In a dynamic list, you cannot package a list item, but you can package security group of the list item. Thus, when you package the security group of the list item, the dynamic list is identified as the associated artifact of the security group. The list item, however, does not become an associated artifact of the security group. It is recommended that you package the dynamic list and the security group of the list item in two different packages. In this case, when you install the package in target environment, install the package that contains the dynamic list first. Then manually create the list item of the dynamic list, and run the package that contains the security group of the list item.

On the other hand, if you package both the dynamic list and the security group of the dynamic list item in one package, you have to install the package twice. When you install the package for the first time, the dynamic list gets installed, while it cannot install the security group as the list item is not available in the dynamic list. Create the required list item in the dynamic list manually and install the package again.

Child Artifacts for Security Group Definition

A List Item Level Security Group does not have any child artifact.

Security Artifacts for Security Group Definition

You can enable the security settings of the Security Group that you want to include in the package.
For more information about including security artifacts, see Include Security Artifacts.

Configuration Settings for Security Group

The Manage Security Group definition has an unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the Settings tab of the Manage Security Group definition artifact to define the configuration settings. The Associated Artifacts tab displays the associated artifacts of the Manage Security Group definition.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Uninstall
- Associated Artifacts
- Child Artifacts

Settings Tab

You can use the properties in the Settings tab to take appropriate actions to install, update, or uninstall a package.

Install

During List Item Level security group installation, the package checks whether the security group customization is enabled at the list item level. If the security group customization is not enabled, then the package first enables the security group customization. Then the package overwrites the security group definition. If the security group customization is already enabled, then the package overwrites the security group.

The configuration settings in the **Install** tab is referred to when installing the package.

- **Security Group Exists**: Select this property to take appropriate action when the Security Group definition specified in the package is already present in the target environment.
  - **Do not install Security Group**: Select this option to use the Security Group definition that is present in the target environment.
  - **Install to overwrite existing Security Group**: Select this option to overwrite the Security Group definition that is present in the target environment with the one in the package.

    By default, Install to overwrite existing Security Group is selected, since the security group will be available in the target environment and on installing the package it will be overwritten. If the security group is not available in the target environment then prior to installing the package the security group will be enabled, hence the security group will be overwritten.
- **Associated Artifacts Not Present**: Select this property to take appropriate action when the associated artifacts of the Security Group is not present in the target environment.
  - **Install Security Group**: Select this option to install the Security Group, even if the associated artifacts are not present in the target environment.
  - **Do not install Security Group**: Select this option if you do not want to install the Security Group artifact as its associated artifacts are not present.

Update

The settings in this tab is referred to when the same package is installed for the consecutive time.

- **Delete Security Group**: Select this option to delete the Security Group definition that is present in the target environment.
  - **Yes**: Select this option to remove the Security Group definition in the target environment. On selection of this option, the Security Group is Modified option appears:

    Security Group is Modified

    - **Retain**: Select this option to retain the Security Group definition along with the modifications, in the target environment even after the Package is updated.
    - **Rollback to Original State**: Select this option to roll back to the original state. All modifications that were done to the Security Group definition after it was installed in the target environment will be reverted. However, the Security Group definition will be retained in the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Delete**: Select this option to delete the Security Group definition from the target environment when updating the Package.

- **No**: Select this option to retain the Security Group definition in the target environment. On selection of this option, the **Security Group Exists** option appears.

  Security Group Exists

  - **Do not install Security Group**: Select this option to use the Security Group definition that is present in the target environment.
  - **Install to overwrite existing Security Group**: Select this option to overwrite the Security Group definition that is present in the target environment with the one present in the package.

    Associated Artifacts not present

  - **Update Security Group**: Select this option to update the Security Group definition even though no associated artifacts are present.
  - **Do not update Security Group**: Select this option if you do not want to update the Security Group definition when the associated artifacts are not present.

Uninstall

You can refer to the following settings in the Uninstall tab to uninstall a package from a target environment:

- **Delete Security Group**: This property allows you to decide if you want to retain or delete the Security Group definition in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option if you want to remove the Security Group definition from the target environment when the Package is uninstalled.

    When you select **Yes**, the **Security Group is Modified** option appears.

    Security Group is Modified

    - **Retain**: Select this option to retain the Security Group definition along with the modifications in the target environment even after the Package is uninstalled.
    - **Rollback to Original State**: Select this option to roll back the Security Group to the original state. All modifications that were done to the Security Group definition after it was installed in the target environment will be reverted. However, the Security Group definition will be retained in the target environment.
    - **Delete**: Select this option to delete the Security Group definition from the target environment while uninstalling the package.
  - **No**: Select this option to retain the Security Group definition in the target environment even after the Package is uninstalled.

Remove Security Group Customization at List Item Level

While uninstalling the security group at list item level, the security group artifact checks whether the security group customization is enabled by the current security group artifact.

- If not, then uninstall rolls back the security group definition to the original state, but does not remove the security group customization as it was not enabled by it.
- Otherwise, the security group artifact checks whether any other security group is modified at the list item level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

    - If yes, then uninstall does not remove the security group customization, but rolls back the security group definition to the original state.
    - Otherwise, uninstall removes the security group customization.
- Consider that a custom security group is packaged at list item level and a repository level security group is an associated artifact. While installing, both the security groups are installed. While uninstalling, select the "Delete" option for the repository level security group and "Retain" option for the list item level security group. Then, the list item level security group artifact is uninstalled or retained first, followed by the repository level security group artifact which is deleted while uninstalling. As the repository level security group is deleted, it removes the complete definition of the security group from all the levels.
    - Thus, the list item level security group gets uninstalled, though the delete option is to "Retain" the security group. However, the security group customization is retained.
    - The security group customization cannot be removed by the package, even if you uninstall the package again. So it is advisable to select the "Delete" option for list item level security group. If you select the "Delete" option for repository level security group, irrespective of the option that is selected for list item level security group, the security group as a whole is deleted.

You can package the list item level security group from the following lists:

- Dynamic list with default field
- Dynamic list with unique field
- Reports with duplicate names
- Manage ListViews
- Security Rights with different scopes

Associated Artifacts tab

The Associated Artifacts tab displays all the associated artifacts of the selected Security Group definition.

Child Artifacts tab

The Security Group at List Item level does not have any child artifact.

Security Artifacts

The Security Artifacts tab displays the security artifacts of a database connection, if any.

Security Group with Forms as Associated Artifacts

When you package a Security Group which is associated to a form when the options **Can Edit** or **Can View Item Details** selected, the associated form gets packaged.

In the **Mapping of Security Right with Form** grid, you must specify the version of the form in target environment to which you want to map the security right.

- If you do not edit the Target version field and retain the default value as "Latest", then the latest version of the form will be mapped to security group in the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- If you do not specify the target version, the security group will be mapped to the source version of the form in the target environment. If the source version of the form is not present, then the latest version of the form will be mapped to the security group.
- If the target version of the form is not present in the target environment, then the latest version of the form will be mapped to the security group in the target environment.

Security Group with Workflow as Associated Artifacts

When you package a Security Group which is associated to a workflow when the options **requires approval** or **requires approval with prompt** selected, the associated workflow also gets packaged.

In the **Mapping of Security Right with Workflow** grid, you must specify the version of the workflow in target environment to which you want to map the security right.

- If you do not edit the **Target version** field and retain the default value as "Latest", then the latest version of the workflow will be mapped to security group in the target environment.
- If you do not specify the target version, the security group will be mapped to the source version of the workflow in the target environment. If the source version of the workflow is not present, then the latest version of the workflow will be mapped to the security group.
- If the target version of the workflow is not present in the target environment, then the latest version of the workflow will be mapped to the security group in the target environment.

Security Right

You can package and deploy the Security Right definition along with its associated and child artifact from one environment or repository to another environment or repository using the Package feature in AVEVA Work Tasks.

To add Security Right to Package Template

To add security right definition to package template:

1. Navigate to the **Repository Settings** > **Advance Settings** > **Manage Security Rights**.
2. Select the Security Rights that you want to package.
3. Right-click and then select **Add to Package Template** from the shortcut menu. The **Add to Package Template** screen appears. For more information on adding artifacts to Package Template, see **Adding Artifacts to a Package Template**.

   Note: You cannot add standard Security Rights to the Package Template.

Associated Artifacts for Security Right definition

Security Right can have the following Associated Artifacts:

- Dynamic Lists
- Parent Custom Security Right

  Note: If Parent Security Right is a standard Security Right then it cannot be packaged as an associated artifact.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Child Artifacts for Security Right definition

Security Right can have the following Child Artifacts:

- Custom Security Right
- Configuration settings for Security Right

The Manage Security Rights definition has an unique set of configuration settings required for installing, updating, and uninstalling the Package. The configuration settings can be edited and viewed from the **Source Environment** > **Package Template** screen or **Target Environment** > **Manage Package** screen. The **Settings** tab of the Manage Security Rights definition artifact allows you to define the configuration settings. The Associated and Child Artifacts tab displays the associated and child artifacts of the Manage Security Rights definition respectively.

- Settings
- Associated Artifacts
- Child Artifacts

Settings tab: The properties in this tab allows you to take appropriate actions while installing, updating, or uninstalling the Package.

Install: The settings in this tab is referred to when installing the Package.

- **Security Rights Exists**: This property allows you to take appropriate action when the Security Rights definition specified in the package is already present in the target environment.
  - **Do not install Security Right**: Select this option if you want to use the Security Right definition that is present in the target environment.
  - **Install to overwrite existing Security Right**: Select this option if you want to overwrite the Security Right definition that is present in the target environment with the one in the package.
- **Associated Artifacts Not Present**: This property allows you to take appropriate action when the associated artifacts of the Security Right is not present in the target environment.
  - **Install Security Right**: Select this option if you want to install the Security Rights artifact, even if the associated artifacts are not present in the target environment.
  - **Do not install Security Right**: Select this option if you do not want to install the Security Rights artifact as its associated artifacts are not present.
- **Update**: The settings in this tab is referred to when the same Package is installed for the consecutive time.
- **Delete Security Right**: Select this option if you want to delete the Security Right definition that is present in the target environment.
  - **Yes**: Select this option to remove the Security Right definition in the target environment. On selection of this option, the Security Right Is Modified option appears.

    Security Right is Modified

    - **Retain**: Select this option to retain the Security Right definition along with the modifications, in the target environment even after the Package is updated.
    - **Rollback**: Select this option to roll back to the original state. All modifications that were done to the Security Right definition after it was installed in the target environment will be reverted. However, the Security Right definition will be retained in the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Delete**: Select this option to delete the Security Right definition from the target environment when updating the Package.

- **No**: Select this option to retain the Security Right definition in the target environment. On selection of this option, the Security Right Exists option appears.

  Security Right Exists

  - **Do not install Security Right**: Select this option to use the Security Right definition that is present in the target environment.
  - **Install to overwrite existing Security Right**: Select this option to overwrite the Security Right that is present in the target environment with the one present in the package.

    Associated Artifacts not present

  - **Update Security Right**: Select this option to update the Security Rights even though no associated artifacts are present.
  - **Do not update Security Right**: Select this option if you do not want to update the Security Right artifact as associated artifacts are not present.

    Note: If the Security Right exists in target repository while installing or updating the package then you cannot overwrite the security right definition if any one of the following items values are modified:

- Title
- Right Code
- Scope of the Right
- Value for the Right
- Follower-specific value for the Right
- Is this Right applicable to its Follower items?

Changing the type of any of the above-mentioned rights may result in any of the following:

1. Loss of data
2. Compromise of security
3. Enforcement of wrong privileges.

For example: Consider a right called "CanDoTask" is of "AllowDisallow,RequiresApproval" type of right, and the "Security Workflow" is selected for a particular security group (Say xyz), then when a user, who belongs to the "xyz" security group, logs on and tries to perform the particular task (CanDoTask) then the "Security Workflow" will be triggered and it will be available in approver's (say manager's) Inbox. Once the approver approves the Work Item the particular task will be done based on its approval; if the approver rejects then the task will not be allowed to be completed as it is rejected by the approver.

In this scenario, if you try to modify the type of "CanDoTask" right to "AllowDisallow" then the privilege and grant or deny the right to the users is enforced, which is not right.

Uninstall: This settings in this tab is referred to when the Package is being uninstalled in the target environment.

- **Delete Security Right**: This property allows you to decide if you want to retain or delete the Security Right definition in the target environment even after the Package is uninstalled.
  - **Yes**: Select this option if you want to remove the Security Right definition from the target environment

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

when the Package is uninstalled.

- **No**: Select this option if you want to retain the Security Right definition in the target environment even after the Package is uninstalled.

- **Security Right is Modified**: This option allows you to decide if you want to retain, roll back to original state or delete the Security Right definition in the target environment even after the Package is uninstalled. This property is displayed only if **Delete Security Right** is set to *Yes*. However, if **Delete Security Right** is set to *No*, this property is not displayed.
  - **Retain**: Select this option if you want to retain the Security Right definition along with the modifications, in the target environment even after the Package is uninstalled.
  - **Roll back to original State**: Select this option if you want to roll back to the original state. All modifications that were done to the Security Right definition after it was installed in the target environment will be reverted. However, the Security Right definition will be retained in the target environment.
  - **Delete**: Select this option if you want to delete the Security Right definition from the target environment when uninstalling the Package.

Associated Artifacts

This tab displays all the associated artifacts of the selected Security Right definition.

Child Artifacts

This tab displays all the child artifacts of the Security Right definition.

SOA Assembly

You can package and deploy the SOA Folder along with its associated and child artifact from one environment or repository to another environment or repository.

To add SOA Folder to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **SOA Assembly**.

   The Assembly List window appears.
3. Select the assembly list that you want to package.
4. Right-click the assembly list item and then click **Add to Package Template**.

   The **Add to Package Template** window appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of the SOA Assembly in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the SOA Assembly package in the Settings form on the right side of the Add to Package Template window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Configure the required settings.
6. Click **Save Template** to save the configured settings.

Note: If the SOA Assembly is registered in Framework 4.0, ensure that Client-Service is also configured in Framework 4.0.

Runtime Initialization Settings

You can configure runtime initialization settings for SOA Assembly. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration settings for SOA Assembly

The SOA Assembly has an unique set of configuration settings required for installing, updating, and uninstalling the package. You can edit and view the configuration settings in one of the following two ways:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

The configuration settings for the SOA Assembly differs based on how the SOA Assemblies are registered. SOA Assemblies can be registered from GAC, Web Service, or Physical Path. For more information, see Resolve Custom Dependent Files for SOA Assembly.

Settings tab

You can define the configuration settings of the SOA Assembly artifact in the **Settings** tab. Set the properties in this tab to take appropriate actions while installing, updating, or uninstalling the package.

Install

Use this tab to set the configurations for installing the package.

- **SOA Assembly Exists**: Use this property to take appropriate action when the SOA Assembly that is being installed is present in the target environment.
  - **Do not install SOA Assembly**: Select this option to use the SOA Assembly that is present in the target environment.
  - **Install to overwrite existing SOA Assembly**: Select this option to overwrite the SOA Assembly that is present in the target environment with the one that present in the package.

Update

Use the settings in this tab to update an installed package.

- **Delete SOA Assembly**: Use this property to delete or retain the SOA Assembly that is present in the target environment.
  - **Yes**: Select this option to remove the SOA Assembly from the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If SOA Assembly modified after installation: Use this option to retain, roll back to original state, or delete the SOA Assembly in the target environment even after the Package is updated. This property is applicable only if **Delete SOA Assembly** is set to *Yes* and the SOA Assembly is modified.

- **Retain**: Select this option if you want to retain the SOA Assembly along with the modifications in the target environment even after the package is updated.
- **Rollback to original state**: Select this option to roll back to the original state. All modifications that were done to the SOA Assembly after it was installed in the target environment will be reverted. However, the SOA Assembly will be retained in the target environment.
- **Delete**: Select this option to delete the SOA Assembly from the target environment when updating the package.

- **No**: Select this option to retain the SOA Assembly in the target environment.

  SOA Assembly exists: Use this option to take appropriate action when the SOA Assembly that is being installed is present in the target environment.

  - **Do not install SOA Assembly**: Select this option to use the SOA Assembly that is present in the target environment.
  - **Install to overwrite existing SOA Assembly**: Select this option to overwrite the SOA Assembly that is present in the target environment with the one that present in the package.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete SOA Assembly**: Use this property to retain or delete the SOA Assembly in the target environment even after the package is uninstalled.
  - **Yes**: Select this option to delete the SOA Assembly from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the SOA Assembly in the target environment even after the package is uninstalled.
- **If SOA Assembly modified after installation**: Use this property to retain, roll back to original state, or delete the SOA Assembly in the target environment even after the package is uninstalled. This property is displayed only if **Delete SOA Assembly** is set to *Yes*. However, if **Delete SOA Assembly** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the SOA Assembly along with the modifications in the target environment even after the package is uninstalled.
  - **Rollback to original state**: Select this option to rollback to the original state. All modifications that were done to the SOA Assembly after it was installed in the target environment will be reverted. However, the SOA Assembly will be retained in the target environment.
  - **Delete**: Select this option to delete the SOA Assembly from the target environment when uninstalling the package

Resolving Associated Workflow of SOA Assembly

The **Associated Workflow Details** grid in the Settings Form contains the following fields:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description
Workflow Name	Displays the name of the associated workflow.
Source Version	Displays the source version of the associated workflow. You can use the same values for the target, or change the values as required.
Target Version	Displays the target version of the associated workflow. You can use the same values as that in the source, or change the values as required.

Associated Artifacts of SOA Assembly

The **Associated Artifacts** tab displays all the associated artifacts of the selected SOA Assembly artifact.

SOA Assembly can include the following associated Artifacts:

- Parent Folder
- SOA Folder

When you select the **Include Associated Artifacts** option as **Yes** while adding the SOA Assembly to a Package Template, the associated artifacts are added to the package template. You can then view the associated artifacts of the SOA Assembly in the tree view of a package. If you select the **Include Associated Artifacts** option as **No**, the associated artifacts are not added to the package template and are also not visible in the tree view of a package.

Child Artifacts of SOA Assembly

The **Child Artifacts** tab displays all the child artifacts of the selected SOA Assembly artifact.

SOA Assembly can include the following child artifacts:

- Folder
- Child SOA Assembly

When you select the **Include Child Artifacts** option as **Yes** while adding the SOA Assembly to a Package Template, the child artifacts are added to the package template. You can then view the child artifacts of the SOA Assembly in the tree view of a package. If you select the **Include Child Artifacts** option as **No**, the child artifacts are not added to the package template and are also not visible in the tree view of a package.

Include Child Item

For more information, see Include Child Item.

Security Artifacts of SOA Assembly

The **Security Artifacts** tab displays all the security artifacts of the selected SOA Assembly artifact. You can enable

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the security settings of the SOA assembly that you want to include in the package.

For more information about including security artifacts, see Include Security Artifacts.

Resolve Custom Dependent Files for SOA Assembly

The configuration settings for the AVEVA Work Tasks Object Access (SOA) assembly differs based on how the SOA assemblies are registered. SOA assemblies can be registered through Global Assembly Cache (GAC), Web Service, or physical path.

Register SOA Assembly from Global Assembly Cache

The **Source Version** field displays the version of SOA Assembly in the source environment. In the **Target Version** field, you can specify the version of SOA Assembly that you want to use in the target environment. If you do not specify the target version, the source version is considered while installing the package. The SOA Assembly from Global Assembly Cache gets installed in the GAC folder.

You can also package the identified custom dependent files which can be installed while installing the package in the target environment. In the **Source Files** box, in the **Custom Dependent File** section, enter the source file path of the files. Click **Add row** to add multiple rows to install additional files in the target environment.

Register SOA Assembly from a Physical Path

The **Source Physical Path** field displays the physical path of SOA Assembly in the source environment. You can also package the identified custom dependent files which can be installed while installing the package in the target environment. Click **Add row** to add multiple rows to install additional files in the target environment. Enter the source physical path of the dependent files.

If the source folder is relative to the AVEVA Work Tasks installed path, and the folder does not exist in the target environment, then a new folder is created and the files are copied to it. For example, if the path of the file, *rating.dll*, is *C:\Program files\AVEVA\Work Tasks\\Web\BPMUITemplates\CustomFolder\rating.dll***,** then a new folder named **CustomFolder** is created in the target machine and *rating.dll* is copied to it.

If the source folder is not relative to the AVEVA Work Tasks installed path, then the files are copied to the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\bin* folder. For example, if the path of the file, *rating.dll*, is **E:\SOA99\ rating.dll**, then **rating.dll** is copied to *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\bin* folder in the target machine.

The **Install in Global Assembly Cache** field is optional and is used to install the SOA assembly and custom dependent files in the GAC of the target environment. Check the **Install in Global Assembly Cache** box, if you want to install the files in the GAC of the target environment.

Click **Delete Custom File** icon to delete the selected row. The dependent files will not be added to the package template.

Register SOA Assembly from Web Service

When SOA Assembly is registered from Web Service, you must specify the **Web Target Details.** The **Web Source Details** field displays the Web Service values in the source environment.

If you select **Authentication Type** as **Anonymous** in the Source environment, then enter only the Web service URL in the **Web Target Details** field. In the target environment, if the web service requires Windows

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

authentication, then you can change the **Authentication Type** to **Windows** and enter the user name, password, and domain information.

Note:

- You must clear the cache if you have changed the user name and password after registering a SOA Assembly from Web. Otherwise, SOA Assembly will consider the old credentials for authentication and it will not validate.

- Consider that in any repository, you have created a SOA Web Service for any activity. When you configure a workflow for the activity, and add the workflow to the package template, the SOA web service also gets packaged as
an associated artifact. Even though the SOA web service is not configured for the workflow, it still gets added to the package as it is configured for the activity.

SOA Folder

You can package and deploy the SOA Folder along with its associated and child artifact from one environment or repository to another environment or repository.

To add SOA Folder to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **SOA Folder**.
   The **Folder List** window appears.
3. Select the folder list that you want to package.
4. Right-click the folder list item and then click **Add to Package Template**.
   The **Add to Package Template** window appears.
   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.
   You can set the configuration properties of the SOA Folder in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the SOA Folder package in the Settings form on the right side of the Add to Package Template window.
5. Configure the required settings.
6. Click **Save Template** to save the configured settings.

Configuration Settings for SOA Folder

The SOA Folder has an unique set of configuration settings required for installing, updating, and uninstalling the package. You can edit and view the configuration settings in one of the following two ways:

- Source Environment > Package Template screen
- Target Environment > Manage Package screen

You can define the configuration settings of the SOA Folder artifact in the **Settings** tab. Set the properties in this

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

tab to take appropriate actions while installing, updating, or uninstalling the package.

Install

Use this tab to set the configurations for installing the package.

- **SOA folder exists**: Use this property to take appropriate action when the SOA folder in the package is already present in the target environment.
  - **Do not install SOA folder**: Select this option to use the SOA folder that is present in the target environment.
  - **Install to overwrite the existing SOA folder**: Select this option to overwrite the SOA folder that is present in the target environment with the one in the package.
- **Folder Path Configuration**: Use this property to view the path of SOA folder in the target environment.
  - **Source Physical Path**: This is a read-only field that displays the physical path of the SOA folder in the source environment.
  - **Target Physical Path**: This is a read-only field that displays the physical path of SOA folder in the target environment. If this field is blank, then the physical path in the target environment will be the same as the path specified in source environment.

Update

Use the settings in this tab to update an installed package.

- **Delete SOA folder**: Use this property to delete or retain the SOA folder that is present in the target environment.
  - **Yes**: Select this option to remove the SOA folder from the target environment.

    SOA folder is modified: Use this option to retain, roll back the SOA folder to original state, or delete the SOA folder from the target environment even after the package is updated. This property is applicable only if **Delete SOA folder** is set to *Yes* and the SOA folder is modified.
    - **Retain**: Select this option to retain the SOA folder along with the modifications in the target environment.
    - **Rollback to original state**: Select this option to roll back to the original state. All modifications that were done to the SOA folder after it was installed in the target environment will be reverted. However, the SOA folder will be retained in the target environment.
    - **Delete**: Select this option to delete the SOA Folder from the target environment.
  - **No**: Select this option to retain the SOA folder in the target environment.

    SOA folder exists: Use this property to take appropriate action when the SOA folder that is being installed is present in the target environment.
    - **Do not install SOA Folder**: Select this option to use the SOA folder that is present in the target environment.
    - **Install to overwrite existing SOA Folder**: Select this option to overwrite the SOA folder that is present in the target environment with the one that is in the package.
- **Folder Path Configuration**: Use this property to set the path of SOA folder in the target environment.
  - **Source Physical Path**: This is a read-only field that displays the physical path of SOA folder in the source

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

environment.

- **Target Physical Path**: This is a read-only field that displays the physical path of SOA folder in the target environment.

  If the source folder is relative to the AVEVA Work Tasks installed path, then the **Target Physical Path** points to the same relative path in the Target environment. If the folder does not exist, ensure to create the folder before installing the package. If the source folder is not relative to the AVEVA Work Tasks installed path, then the **Target Physical Path** points to the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\bin* folder.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete SOA folder**: Use this property to retain or delete the SOA folder from the target environment even after the package is uninstalled.
  - **Yes**: Select this option to delete the SOA folder from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the SOA folder in the target environment even after the package is uninstalled.
- **SOA folder is modified**: Use this option to retain, roll back the SOA folder to original state, or delete the SOA folder from the target environment even after the package is uninstalled. This property is displayed only if **Delete SOA folder** is set to *Yes*. However, if **Delete SOA folder** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the SOA folder along with the modifications in the target environment.
  - **Rollback to original state**: Select this option to roll back to the original state. All modifications that were done to the SOA folder after it was installed in the target environment will be reverted. However, the SOA folder will be retained in the target environment.
  - **Delete**: Select this option to delete the SOA folder from the target environment.

Associated Artifacts for SOA Folder

SOA Folder does not have any associated artifacts.

Child Artifacts for SOA Folder

SOA Folder does not have any child artifacts.

Security Artifacts for SOA Folder

You can enable the security settings of the SOA folder that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Web API

You can package and deploy a Web API along with its associated artifacts from one environment or repository to another environment or repository.

Adding Web API to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, click **Settings** and then click **Web API**.

   The Web API window appears.
3. Right-click on a Web API, and then click **Add to Package Template**.

   The **Add to Package Template** dialog box appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of the Web API in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the Web API package in the **Settings** form on the right side of the **Add to Package Template** window.
4. Configure the required settings.
5. Click **Save Template** to save the configured settings.

Runtime Initialization Settings

You can configure runtime initialization settings for Web APIs. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration Settings for Web API

The **Web API** has a unique set of configuration settings required to install, update, and uninstall the package. You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

Settings

You can define the configuration settings of the Web API artifact in the Settings tab. Set the properties in this tab to take appropriate actions while installing, updating, or uninstalling the package.

Install

Use this tab to set the configurations for installing the package.

- **Web API exists**: Use this property to take appropriate action when the Web API that is being installed is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

present in the target environment.

- **Do not install Web API**: Select this option to use the Web API that is present in the target environment.
- **Install to overwrite existing Web API**: Select this option to overwrite the Web API that is present in the target environment with the one that present in the package.

- **Web API Configuration**: Displays the URL of the Web API in the source environment and it also allows you to specify the URL of the Web API in the target environment:
  - **Source Base Address**: Displays the URL of the Web API in the source environment
  - **Target Base Address**: Specify the URL of the Web API in the target environment. If it is left blank, then the source base address will be considered.
  - **Source Authentication Mode**: Displays one of the following authentication mode options in the source environment:
    - **No Authentication**: If the Web API does not require authentication.
    - **Windows**: If the Web API is Windows authenticated.
    - **User Access Token**: If the Web API requires the currently logged-in user's access token.
    - **Basic Authentication**: If the Web API requires basic authentication. Displays the user name with domain and the password.
    - **Certificate**: If the Web API requires certificate authentication. Displays the certificate store location and the thumbprint.
    - **Service to Service Access Token**: If the Web API requires Service to Service Access Token.
  - **Target Authentication Mode**: Select one of the following authentication mode options in the target environment:
    - **No Authentication**: If the Web API does not require authentication.
    - **Windows**: If the Web API is Windows authenticated.
    - **User Access Token**: If the Web API requires the currently logged-in user's access token.
    - **Basic Authentication**: If the Web API requires basic authentication. Provide the user name with domain and the password.
    - **Certificate**: If the Web API requires certificate authentication. Provide the certificate store location and the thumbprint. For more information on certificate-based authentication, see Web API Certificate-based Authentication.

      Note: The thumbprint should not contain any spaces. In some machines, the characters in thumbprint should be in upper case.
    - **Service to Service Access Token**: If the Web API requires Service to Service Access Token. Provide **Authority URL**, **Audience**, **Client ID**, **Client Secret**, and **Scope** to get the access token.

      In the **Authority URL**, provide the token end-point of the respective repository provider. For example,
      AVEVA Connect: `{authority url}/oauth/token`
      Azure Active Directory: `{authority url}/oauth2/v2.0/token`
      AVEVA Identity Manager: `{authority url}/connect/token`

Update

Use the settings in this tab to update an installed package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Delete Web API**: Use this property to delete or retain an existing Web API that is present in the target environment.
  - **Yes**: Select this option to remove the Web API from the target environment.

    Web API is modified: Use this option to retain, rollback to original state, or delete the Web API in the target environment even after the package is updated. This property is applicable only if the **Delete Web API** is set to *Yes* and the Web API is modified.
    - **Retain**: Select this option to retain the Web API along with the modifications in the target environment even after the package is updated.
    - **Rollback to original state**: Select this option to rollback to the original state. All modifications that were done to the Web API after it was installed in the target environment will be reverted. However, the Web API will be retained in the target environment.
    - **Delete**: Select this option to delete the Web API from the target environment when updating the package.
  - **No**: Select this option if you want to retain the Web API in the target environment.

    Web API exists: Use this property to take appropriate action when the Web API that is being installed is present in the target environment.
  - **Do not install Web API**: Select this option to use the Web API that is present in the target environment.
  - **Install to overwrite existing Web API**: Select this option to overwrite the Web API that is present in the target environment with the one that present in the package.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete Web API**: Use this property to decide if you want to retain or delete the Web API in the target environment even after the package is uninstalled.
  - **Yes**: Select this option to delete the Web API from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the Web API in the target environment even after the package is uninstalled.
- **Web API is modified**: Use this property to retain, rollback to original state, or delete the Web API in the target environment even after the package is uninstalled. This property is displayed only if **Delete Web API** is set to *Yes*. However, if **Delete Web API** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the Web API along with the modifications in the target environment even after the package is uninstalled.
  - **Rollback to original state**: Select this option to rollback to the original state. All modifications that were done to the Web API after it was installed in the target environment will be reverted. However, the Web API will be retained in the target environment.
  - **Delete**: Select this option to delete the Web API from the target environment when uninstalling the package

Associated Artifacts of Web API

Web API can have Web API Source as the associated artifact.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Child Artifacts of Web API

Web API does not have any child artifacts.

Security Artifacts of Web API

You can enable the security settings of the Web APIs that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

Web API Source

You can package and deploy a Web API Source from one environment or repository to another environment or repository.

To add Web API Source to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, click **Settings** and then click **Web API Source**.
3. Right-click on a Web API Source, and then click **Add to Package Template**.

   The **Add to Package Template** dialog box appears.

   For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

   You can set the configuration properties of the Web API Source in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the Web API Source package in the **Settings** form on the right side of the **Add to Package Template** window.
4. Configure the required settings.
5. Click **Save Template** to save the configured settings.

Configuration Settings for Web API Source

The **Web API Source** has a unique set of configuration settings required to install, update, and uninstall the package. You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

Settings

You can define the configuration settings of the Web API Source artifact in the Settings tab. Set the properties in this tab to take appropriate actions while installing, updating, or uninstalling the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Install

Use this tab to set the configurations for installing the package.

- **Web API Source listitem exists**: Use this property to take appropriate action when the Web API Source that is being installed is present in the target environment.
  - **Do not install Web API Source listitem**: Select this option to use the Web API Source listitem that is present in the target environment.
  - **Install to overwrite the existing Web API Source listitem**: Select this option to overwrite the Web API Source listitem that is present in the target environment with the one that is present in the package.
- **Web API Configuration**: Displays the Base Address and Swagger URL configured in the source environment. It also allows you to specify the Base Address and Swagger URL in the target environment.

  Note: Web API Source is the associated artifact of Web API. If you change the Swagger URL of Web API Source in the target environment, you need to reselect the **Source** in Web API List Item to get the updated Swagger URL in the target environment.

Update

Use the settings in this tab to update an installed package.

- **Delete Web API Source listitem**: Use this property to delete or retain an existing Web API Source listitem that is present in the target environment.
  - **Yes**: Select this option to remove the Web API Source listitem from the target environment.
  - **No**: Select this option if you want to retain the Web API Source listitem in the target environment.
- **Web API Source listitem exists**: Use this property to take appropriate action when the Web API Source listitem that is being installed is present in the target environment.
  - **Do not install Web API Source listitem**: Select this option to use the Web API Source listitem that is present in the target environment.
  - **Install to overwrite existing Web API Source listitem**: Select this option to overwrite the Web API Source listitem that is present in the target environment with the one that is present in the package.
- **Web API Configuration**: Displays the Base Address and Swagger URL configured in the source environment. It also allows you to specify the Base Address and Swagger URL in the target environment.

  Note: Web API Source is the associated artifact of Web API. If you change the Swagger URL of Web API Source in the target environment, you need to reselect the **Source** in Web API List Item to get the updated Swagger URL in the target environment.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete Web API Source listitem**: Use this property to decide if you want to retain or delete the Web API Source listitem in the target environment even after the package is uninstalled.
  - **Yes**: Select this option to delete the Web API Source listitem from the target environment when the package is uninstalled.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **No**: Select this option to retain the Web API Source listitem in the target environment even after the package is uninstalled.

- **Web API Source listitem is modified**: Use this property to retain, rollback to original state, or delete the Web API Source listitem in the target environment even after the package is uninstalled. This property is displayed only if **Delete Web API Source listitem** is set to *Yes*. However, if **Delete Web API Source listitem** is set to *No*, this property is not displayed.
  - **Retain**: Select this option to retain the Web API Source listitem along with the modifications in the target environment even after the package is uninstalled.
  - **Rollback to original state**: Select this option to rollback to the original state. All modifications that were done to the Web API Source listitem after it was installed in the target environment will be reverted. However, the Web API Source will be retained in the target environment.
  - **Delete**: Select this option to delete the Web API Source listitem from the target environment when uninstalling the package

Associated Artifacts of Web API Source

Web API Source does not have any associated artifacts.

Child Artifacts of Web API Source

Web API Source does not have any child artifacts.

Security Artifacts of Web API Source

You can enable the security settings of the Web API Sources that you want to include in the package. For more information about including security artifacts, see Include Security Artifacts.

Workflows

You can package and deploy the workflow definition with its associated and child artifact from one environment or repository to another environment or repository.

To add a workflow to a package template, you must first publish the workflow. Ensure that the workflow that you want to package is not disabled.

You can resolve workflow activities by editing the database and also identifying the associated artifacts while installing the package. This is done to ensure that the workflow is run without any errors. For more information, see Resolving Workflow Activities.

To add Workflows to Package Template

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, and then click **Workflows**.
   The **Workflows** page appears.
3. Select the workflow that you want to package.
4. Right-click the workflow, and then click **Add to Package Template**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Add to Package Template window appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

You can set the configuration properties of the workflow in the Add to Package Template window. The left side of the configuration window shows the package template and its configurations. You can set the configuration properties of the workflow package in the **Settings** form on the right side of the Add to Package Template window.

Runtime Initialization Settings

You can configure runtime initialization settings for workflows. For more information about configuring runtime initialization settings, see Runtime Initialization Settings.

Configuration Settings for Workflows

Workflows have a unique set of configuration settings required to install, update, and uninstall the package. You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

Settings

You can define the configuration settings of Workflows artifact in the **Settings** tab. Set the properties in this tab to take appropriate actions while installing, updating, or uninstalling the package.

Install

Use this tab to set the configurations for installing the package.

- **Inherit Artifact Type Settings:** Use this property to define whether the settings inherited from the artifact type or the settings configured at the artifact-level must be considered.
  - **Yes**: Select this option if the workflow must inherit the settings configured for the artifact type. If this option is selected, then the artifact type settings take precedence.

    No: Select this option if the workflow must consider the settings configured at the artifact-level. The following options are available:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Install Workflow as Draft	Use this property to install the Workflow. • **Yes**: Select this option to install the Workflow in the Draft status in the target environment. • **No**: Select this option to install the Workflow in the Published status in the target environment.
Workflow Exists	Use this property to take appropriate action when the Workflow definition specified in the package is already present in the target environment. • **Install as next major version**: Select this option to install the Workflow as a next major version. • **Install as next minor version**: Select this option to install the Workflow as a next minor version. You can install the Workflow as a next minor version up to 12 times only. • **Install as next version**: Select this option to install the Workflow as a next version. • **Overwrite latest (published) version**: Select this option to overwrite the latest published version of workflow in the target environment. An existing Workflow Definition gets replaced with the Workflow Definition contained in this package. • **Do not install**: Select this option if you do not want to install the Workflow, as it is already present in the target environment.

- **Running Workflow Instance**: Use this property if you want to kill the running workflow instance or do not want to overwrite the workflow. You can also pause and resume the running workflow instance. This property is available only when you select the **Overwrite latest (published) version** option for **Workflow Exists** property.
  - **Kill**: Select this option to kill the running workflow instance.
  - **Pause and Resume**: Select this option to pause, overwrite, and resume the running workflow instance in the target environment.
- **Associated Artifacts Not Present**: Use this property to take appropriate action when the associated artifacts of the Workflow are not present in the target environment.

  This property is not applicable for the associated artifact of the type Event Association. The artifact will be installed even if the Event Association is unavailable in the target environment.
  - **Install as draft**: Select this option to install the Workflow in the *Draft* status, even if the associated artifacts are not present in the target environment.
  - **Do not install**: Select this option if you do not want to install the Workflow as its associated artifacts are

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

not present.

Note: Consider, the latest published workflow exists in the target environment, and the **Overwrite latest (published) version** option is selected. During package installation, the backup of the existing workflow is taken and stored in the database. And, the workflow in the target environment is overwritten with the packaged source definition.

During Overwrite, the package name and the description does not get updated in the artifact **Package Name (Version)** column.

For Pause, Resume, and Kill scenarios, the workflow needs to be published manually to get the latest workflow definition.

Consider the running instances of the workflow waiting for the user activity. If you rename those activities and overwrite the workflow while installing the running workflow instance through the package with the **Pause and Resume** option selected, the workflow will not get resumed.

Update

Use the settings in this to update an installed package.

- **Delete Workflow**: Use this property to delete the Workflow that is present in the target environment.
  - **Yes**: Select this option to remove the Workflow from the target environment.

    Workflow is modified: Use this option to retain or delete the workflow in the target environment even after the package is updated. This property is applicable only if **Delete Workflow** is set to *Yes* and the workflow is modified.
    - **Retain**: Select this option to retain the Workflow along with the modifications, in the target environment.
    - **Rollback to original state**: Select this option to rollback the Workflow to the original state if you have made any modifications in the target environment. You can kill, pause, or resume the running workflow instance.

      - **Kill**: Select this option to kill the running workflow instance.

      - **Pause and Resume**: Select this option to pause, rollback, and resume the running workflow instance in the target environment.
    - **Delete**: Select this option to delete the Workflow from the target environment.
  - **No**: Select this option to retain the Workflow in the target environment. When you select *No*, the **Install Workflow as draft**, **Workflow exists** and **Associated artifacts not present** options appear.

    Only when the **Delete Workflow** option is set to **No**, the **Inherit Artifact Type Settings** option is enabled.
- **Inherit Artifact Type Settings:** Use this property to define whether the settings inherited from the artifact type or the settings configured at the artifact-level must be considered.
  - **Yes**: Select this option if the workflow must inherit the settings configured for the artifact type. If this option is selected, then the artifact type settings take precedence.
  - **No**: Select this option if the workflow must consider the settings configured at the artifact-level. The following options are available:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Install Workflow as Draft	Use this property to install the Workflow. • **Yes**: Select this option to install the Workflow in the Draft status in the target environment. • **No**: Select this option to install the Workflow in the Published status in the target environment.
Workflow Exists	Use this property to take appropriate action when the Workflow definition specified in the package is already present in the target environment. • **Install as next major version**: Select this option to install the Workflow as a next major version. • **Install as next minor version**: Select this option to install the Workflow as a next minor version. You can install the Workflow as a next minor version up to 12 times only. • **Install as next version**: Select this option to install the Workflow as a next version. • **Overwrite latest (published) version**: Select this option to overwrite the latest published version of workflow in the target environment. An existing Workflow Definition gets replaced with the Workflow Definition contained in this package. • **Do not install**: Select this option if you do not want to install the Workflow, as it is already present in the target environment.

- **Running Workflow Instance**: Use this property if you want to kill the running workflow instance or do not want to overwrite the workflow. You can also pause and resume the running workflow instance. This property is available when you select the **Overwrite latest (published) version** option for **Workflow Exists** property.
  - **Kill**: Select this option to kill the running workflow instance.
  - **Pause and Resume**: Select this option to pause, overwrite, and resume the running workflow instance in the target environment.
- **Associated artifacts not present:** Use this property to take appropriate action when the associated artifacts of the Workflow are not present in the target environment.

  This property is not applicable for the associated artifact of the type Event Association. The artifact will be installed even if the Event Association is unavailable in the target environment.
  - **Install as draft:** Select this option to install the Workflow in *Draft* status, even if the associated artifacts are not present in the target environment.
  - **Do not install:** Select this option if you do not want to install the Workflow as its associated artifacts are not present.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: Consider, the latest published workflow exists in the target environment, and the **Overwrite latest (published) version** option is selected. During package update, the backup of the existing workflow is not be taken if available; and taken if not available. And, the workflow in the target environment is overwritten with the packaged source definition.

During Overwrite, the package name and the description does not get updated in the artifact **Package Name (Version)** column.

Uninstall

Use this tab to configure the settings when the package is being uninstalled from the target environment.

- **Delete Workflow**: Use this property to retain or delete the Workflow in the target environment even after the package is uninstalled..
  - **Yes**: Select this option to remove the Workflow from the target environment when the package is uninstalled.
  - **No**: Select this option to retain the Workflow in the target environment even after the package is uninstalled.
- **Workflow is modified**: Use this property to retain or delete the Workflow in the target environment even after the package is uninstalled. This property is displayed only if **Delete Workflow** is set to **Yes**. However, if **Delete Workflow** is set to **No**, this property is not displayed.
  - **Retain**: Select this option to retain the Workflow along with the modifications even after the package is uninstalled.
  - **Rollback to original state**: Select this option to rollback the Workflow to the original state if any modifications are made in the target environment.
  - **Delete**: Select this option to delete the Workflow from the target environment.
- **Running Workflow Instance**: Use this property if you want to kill the running workflow instance or do not want to overwrite the workflow. You can also pause and resume the running workflow instance. This property is available when you select the **Rollback to original state** option for **Workflow is modified** property.
  - **Kill**: Select this option to kill the running workflow instance.
  - **Pause and Resume**: Select this option to pause, rollback, and resume the running workflow instance in the target environment.

    Note:
    - During package uninstall, with the **Rollback to original state** option selected, the overwritten workflow definition is replaced with backup data, and the backup from the database gets deleted.
    - During rollback, the package name and the description does not get updated in the artifact **Package Name (Version)** column.

Associated Artifacts of Workflows Definition

The **Associated Artifacts** tab displays all the associated artifacts of a selected Workflow.

When you set the **Include Associated Artifacts** option to **Yes**, while adding the workflow to a package template, then the associated artifacts are added to the package template, and it also allows you to view the associated artifacts of the workflow in the tree view of the package. If you set the **Include Associated Artifacts** option to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

No, then the associated artifacts are not added to the package template, and are also not visible in the tree view of the package. This condition is also applicable for the **Include Child Artifacts** and **Include Security Artifacts** options.

A workflow can have the following associated artifacts:

- Parent Folder
- Workflows
- Calendar
- SOA Assembly
- SOA Folder
- Database Connection
- Forms
- Event Associations
  - Scheduler
  - Enterprise Console
  - File Watcher
- Web API
- Queue
- Analyst's Process Model
- Work Item Field
- Logic App Connection
- Message Queue Connection

You can import and export a workflow with event associations from one repository to another repository. During install, when the associated artifact is of type **Event Association**, workflow artifact does not validate whether **Event Association** is available or not, as Event Association cannot exist without workflow. While installing the package, you must ensure that the event association is available in the same package or in a different package, so that it is installed and associated to the workflow.

Note:

- The **Analyst's Process Model** will not appear as an associated artifact when the value for the **Analyst's Process Model Filename for Execution View** is set through the **Expression Editor** as the value is resolved only during run-time.

- If a SOA Assembly is registered through a Web Service and a physical path (dll), by default the Web Service is a static method and the physical path can be a static or non- static method. While packaging workflows that does not use SOA Assembly, by default the static objects of the registered SOA Assembly is considered as an associated artifact.

- When you package a workflow that is associated from Form, the Form does not appear as associated artifact of the workflow.

- When you package a Workflow, the Work Item Fields mentioned below are also packaged, and the Work Item Fields are displayed in the tree view of the package and the **Associated Artifacts** tab of the selected workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- All the Work Item Fields at the workflow level
- The application level Work Item Fields, which are used in that specific workflow

Identifying Event Association as Associated Artifact

Consider that you want to package a workflow, *Telematics* of version 2. While adding to package template, the package identifies **Event Association** as associated artifact based on the following conditions:

- Event Association mapped to version 2 of Telematics workflow.
- Event Association mapped to latest version of Telematics workflow (version 2 of the workflow "Telematics" is the latest version).

Child Artifacts for Workflows

The **Child Artifacts** tab displays all the child artifacts of the Workflow.

A workflow can have another workflow as its child artifact.

- Workflow

Include Child Item

For more information, see Include Child Item.

Security Artifacts

The **Security Artifacts** tab displays the security artifacts of a workflow, if any. For more information about including security artifacts, see Include Security Artifacts.

Activity Rebuild and Complete Rebuild

In the package template, an orange icon, , appears for the workflow which denotes that the workflow needs to be rebuilt as the workflow is published, unpublished, or edited after it is added to the package template. Similarly, in the target environment if the workflow installed by the package is published, unpublished, or edited, then while uninstalling the package, the workflow settings will be retained.

When a workflow in the package template is modified, ensure to perform a rebuild on the particular workflow. You can right-click the workflow from the left hand side configuration tree view in the package template, and click **Complete Rebuild** or **Activity Rebuild** to rebuild the workflow.

- **Complete Rebuild**: Click **Complete Rebuild** to rebuild the particular workflow artifact in the package template. During complete rebuild, the install, update, or uninstall settings do not change. However, the settings done to resolve any activity properties in the target section of the **Settings** form get cleared.
- **Activity Rebuild**: Click **Activity Rebuild** to rebuild only a modified workflow artifact. All settings done to resolve any activity property in the target section of the **Settings** form does not get changed. Only the new values of the modified activity get updated in the package. However, if you want to rename an activity in the workflow, use the **Complete Rebuild** option. Any changes in the property of a workflow do not get updated in the package unless the activity name is modified.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: Consider a scenario where a workflow 'Workflow1' having associated artifact 'List 1' is added to package template. If this workflow is rebuilt after modifying and changing the associated artifact to 'List 2', then 'List 2' will be added to the package template as the associated artifact. However, 'List 1' will not be deleted form the package template. If required, you can manually delete 'List1' from the package template.

The same behavior is applicable for other artifacts.

When an artifact, for example, a workflow is added to a package template, its associated artifacts are also added to the package template. If you delete an artifact from the workflow, and then perform a complete rebuild on the same package template, the deleted artifact is removed from the target environment. However, the associated artifacts of the deleted artifact are retained in the target environment. For example, consider that a workflow contains a form, and this workflow is added to the package template. While installing the package template, the associated artifacts of the form, such as the associated database lookup also get installed in the target environment. Now, if the form artifact is deleted from the workflow, and if the package template is rebuilt again, though the form is removed, its associated artifacts, such as the database lookup is retained in the target environment.

For information about resolving workflow activities, see Resolve Workflow Activities.

Configure Artifact Type Settings for Workflow

You can set the status in which all the workflow artifacts in a package must be installed or updated in the target environment.

To configure artifact type settings for Workflow in the following tabs:

- **Install**

  Use this tab to set the configurations for installing the package.
- **Update**

  Use the settings in this tab to update an installed package.

Artifact Type Settings

1. In the **Enterprise Console**, click menu icon, click **Package**, and then click **Package Template**.

   The **Package Template** page appears.
2. To edit an existing package, in the **Package Template** page, select the package template, and then click **Edit**. The **Edit Package Template** dialog box appears.
3. In the **Configuration** tree on the left pane, click **Workflows** under **Artifacts**. The **Settings** form with the **Artifact Type Settings** section appears.
4. For the **Install Workflows as Draft** property, select one of the following:
   - **Yes**: Select this option to install all Workflow artifacts in the package in *Draft* status in the target environment.
   - **No**: Select this option to install all Workflow artifacts in the package in *Published* status in the target environment.

     The status of the Workflow in a package is set based on the value defined.
5. Use the **Workflows Exist** property to take appropriate action when the Workflow definition specified in the package is already present in the target environment. Select one of the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Install as next major version**: Select this option to install all Workflow artifacts in the package as next major version.
- **Install as next minor version**: Select this option to install all Workflow artifacts in the package as next minor version.
- **Install as next version**: Select this option to install all Workflow artifacts in the package as next version.
- **Do not install**: Select this option if you do not want to install the Workflow artifacts, as they are already present in the target environment.

Note: You can also configure these settings while installing the package using the **Manage Package** page.

Resolve Workflow Activities

You can resolve workflow activities while installing the package. This is done to ensure that the workflow is executed without any errors.

During workflow installation, the values entered in the target fields of the **Settings** form are considered for installation. If values are not entered for the target fields, the values of the source fields are considered.

Note that a package does not resolve the values of those properties for which expression editor is used. You might have to manually define the value in the target environment or copy the required artifacts.

Rebuild Scenario

When you rebuild a workflow that was edited after adding it to the package template, the package template retains the old data in the settings form, but considers only the latest record. This does not affect the functionality of the workflow that is rebuilt. For example, consider a workflow that contains an Invoke Form activity which points to an employee list. After adding the workflow to the package template, consider that the invoke form activity is modified to customer list. When you rebuild workflow, the Settings form will contain both the employee list and customer list, but will consider only the customer list.

Workflow Activities Resolved

The following table shows the properties of the activities that are resolved:

Categories	Activity	Resolved Properties	Comments
-	Start Activity	SOA Object Instances	SOA Assembly and SOA Folder are identified as associated artifacts. If the SOA Object is used in any of the expression editor across workflow, then the same will be resolved.
		Exception Template	For more information, see Resolving User or Role Based Exception Template.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Categories	Activity	Resolved Properties	Comments
		XML Variables	For more information, see Resolving XML Variables.
Human Activities	Task Activity	Task Type	-
	All Human Activities	Custom Document View URL	Resolve URLs or paths specified in the workflow. For more information, see Resolving Custom Document View URL.
		Redirect URL	Resolve the redirect URLs or redirect paths specified in the workflow. For more information, see Resolving Redirect URL.
		Delivery Channels	For more information, see Resolving Delivery Channels.
		Set Calendar for Timeout	The calendar of type Organization is identified as an associated artifact. The Resource Calendar is not considered as an associated artifact. You must ensure that if the workflow uses any resource calendar, the resource calendar is available in the target environment.
	Invoke Form Activity	Form	Identified as an associated Form.
		Version	In the target environment, if multiple versions of the form are present, then the latest published version of the associated form is considered. For more information, see Mapping the Version

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Categories	Activity	Resolved Properties	Comments
			of the Associated Form.
		Template Path	For more information, see Resolving Template Path.
Engine Activities	Update Parent Variables	Parent Workflow Application Name	-
		Parent Workflow Name	Identified as an associated workflow. In the target environment, if multiple versions of the workflow are present, then the latest published version of the workflow is considered.
	Workflow Activity	Repository	-
		Workflow	Identified as an associated workflow.
		Version	In the target environment, if multiple versions of the workflow are present, then the latest published version of the workflow is considered. For more information, see Mapping the Version of the Associated Workflow to the Parent Workflow.
	Database Activity	Database Connection	Database Connection is identified as associated artifact. For all the Command Types of a Database Connection, the target database must have all the required tables and stored procedures. While installing, the package references only the tables

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Categories	Activity	Resolved Properties	Comments
			and stored procedures. Ensure that you have created all the required tables and stored procedures in the target environment.
Communication Activities	Wait for Email Activity	Attachment Save Location	For more information, see Resolving File Details.
Integration Activities	InvokeWebService Activity	WebService Details	For more information, see Resolving Web Service Configurations.
	File Operations Activity	• Source Details • Destination Details	For more information, see Resolving File Details.
	Create-Open-Office Document Activity	Destination Details	For more information, see Resolving File Details.
	Script Activity	References property	Resolve the assembly file path in the target environment. For more information, see Resolving Script Activity References.
List Activities	List Navigator	List Name or ID	Identified as an associated List.
	Wait For Event	List ID	Identified as an associated List.
Report Activities	Report Generator	Report Template	Identified as an associated Report Template. The corresponding Report Connection will be added as an associated artifact for the report template.
MES Activities	MES XML Command Activity	• Unique Environment Name • Middleware Machine Name	For more information, see Resolve MES XML Command Activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Categories	Activity	Resolved Properties	Comments
Logic App	Wait for Logic App Alert Activity	• Enterprise Console • URL • Authorization Token	For more information, see Resolve Wait For Logic App Alert
Logic App	Call Logic App Activity	Logic App Connection	Logic App Connection is identified as associated artifact. For more information, see Resolve Call Logic App Connection
Message Queue	SendMQData Activity WaitForMQData Activity	Message Queue Connection	Message Queue Connection is identified as associated artifact.

Map the Version of the Associated Workflow to the Parent Workflow

When you package a workflow containing a Workflow activity which is in turn associated to other workflows, you can change the configuration settings of the current workflow in the **Associated Workflow Details** grid that appears towards the lower section of the settings form.

In the **Associated Workflow Details** grid, you can specify the version of the associated workflow to which the current workflow should be mapped. In this grid, you can specify the version of the associated workflow to which the current workflow should be mapped in the target environment. However, the Associated Workflow Details grid will not be available in the configuration settings of the current workflow, if Workflow Activity expression editor is used to define the Workflow property.

You use the Associated Workflow Details grid to specify only the target version of the associated workflow to which the current workflow should be mapped. The configuration of the associated workflow is done separately from the package temple as it is added as an individual artifact.

The **Associated Workflow Details** grid contains the following fields:

- **Workflow Name**: Displays the name of the associated workflow.
- **Source Version**: Displays the source version of the associated workflow. You can use the same values for the target, or change the values as required.
- **Target Version**: Displays the target version of the associated workflow. You can use the same values as that in the source, or change the values as required.

  In case you do not edit the **Target version** field and retain the default value 'Latest', then the latest version of the associated workflow will be mapped to the current version in the target environment.

  If the **Target version** is left blank, then the source version of the associated workflow present in the target environment will mapped to the current workflow. If the source version is not present in the target environment, then the latest version of the associated workflow will be mapped to the current version in the target environment.

  If the **Target version** of the workflow is not present in the target environment, then the latest version of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

associated workflow will be mapped to the current version in the target environment.

Scenario where duplicate messages are logged in history for an artifact:

While installing or uninstalling a workflow containing a workflow activity, you might see duplicate log messages in history. This occurs if the workflow in the workflow activity is also a child workflow of the workflow being packaged.

In case of installation, the child workflow gets installed first and then the parent workflow is installed, and the following messages are logged in history:

- When the child workflow is installed, the following message is logged:

  Associated artifacts not present and installed as draft: <Name of the parent workflow>
- Later when the parent workflow is installed, the following message is logged:

  Workflow installed successfully.

  While uninstalling, the parent workflow gets uninstalled first and then the child workflow is uninstalled.
- When the parent workflow is uninstalled, the following message is logged:

  Workflow not uninstalled as child artifact(s) are present.
- Later after the child workflow is uninstalled, the parent workflow is again uninstalled and the following message is logged:

  Workflow uninstalled successfully.

Map the Version of the Associated Form

While installing a package, if the workflow contains an Invoke Form activity, you can change the configuration settings in the **Associated Form Details** grid to map the version of the associated form to the current workflow in the target environment.

You use the Associated Form Details grid to specify the version of the associated form to which the current workflow should be mapped in the target environment. In this grid, the Form Name property is not available in the configuration settings if the form name is configured using expression editor. You use the Associated Form Details grid to specify only the target version of the associated form to which the current form should be mapped. The configuration of the associated form is done separately from the package template as it is added as an individual artifact.

In the **Associated Form Details** grid, you can enter the version of the associated form to which the current form should be mapped. The **Associated Form Details** grid contains the following fields:

- **Form Name**: Displays the associated form name.
- **Source Version**: Displays the source version of the associated form. You can use the same values for the target, or change the values as required.
- **Target Version**: Displays the target version of the associated form. You can use the same values as that in source, or change the values as required.

  If you do not edit the **Target Version** field and retain the default value as "Latest", then the latest version of the associated form is mapped to the Invoke Form activity in the target environment.

  If the **Target version** field is left blank, then the source version of the associated form present in the target environment is mapped to the current form. If the source version is not present in the target environment,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

then the latest version of the associated form is mapped to the current version in the target environment.

If the **Target version** of the form is not present in the target environment, then the latest version of the associated form is mapped to the Invoke Form activity in the target environment.

Resolve Web Service Configurations

While installing a package or adding a workflow to package template, if the workflow activity contains InvokeWebService, you can edit the URL and credentials in the target.

If you have several InvokeWebService activities in the same workflow and if all the activities use one Web Service details, then the package identifies the Web Service as a single one and rectifies it accordingly.

If the workflow activity contains InvokeWebService activity, the **Edit WebService(s) used in workflow grid** to configure the URL and credentials in the target appears towards the lower section of the settings form.

The **WebService Details** grid contains the following fields:

- **Web Service Name:** This is the name of the web service.
- **Edit WebService Details:** This option enables you to edit the web service details.
- **Web Service ID:** This is a Read-only field and displays the ID for the respective web service. The ID is unique for each web service.

To edit Web Service Details

1. Click the **Edit WebService Details** button to configure the web service details. The WebService Details grid replaces the settings form.

   The WebService Details grid contains the following fields:

   Web service URL Credentials

   - **Web Service URL**: Type the Web Service URL. You must enter a WSDL URL. You can also enter an IPv6 address for the WebService URL. The IPv6 address must be enclosed within square brackets.
   - **Authentication Type:** Choose one of the authentication types, Windows or Anonymous.
     - **Windows**

       - User Name

       - Password

       - Domain Name

       - Proxy URL
     - **Anonymous**

       Bind Parameters Credentials
   - **Authentication Type:** Choose one of the authentication types, Windows or Anonymous.
     - **Windows**

       - User Name

       - Password

       - Domain Name
     - **Anonymous**

The **Source** fields displays the Web Service values in the source environment. You can use the same Web Service

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

credentials for the target, or change the values as required.

If you select **Anonymous** authentication type in the Source environment, then in the Target you need to enter only the Web service URL. In the target environment if web service requires windows authentication, then you can change the Authentication type to **Windows** mode and enter the **Log on Name**, **Password**, and **Domain Name**.

Note:
- When you first install a package that contains InvokeWebService activity, entries are made into the database. When you update the package subsequently, the **Web service URL Credentials** will not be updated in the database. Therefore, the updated credentials will not be available in the InvokeWebService activity. However, the credentials entered while installing package for the first time will be considered.

- When you uninstall a package that contains **InvokeWebService** activity, the database entries for **InvokeWebService** activity are not uninstalled.

Resolve File Details

While installing a package or adding a workflow to package template, if the workflow activity contains File Operations, Create-Open-Office document, and Wait for Email activities, you can edit the details of each file.

If the workflow activity contains File Operations, Create-Open-Office document, and Wait for Email activities, the **File Details** grid to configure the details of each file appears towards the lower section of the settings form. Use the **Edit File Location** button against each activity name.

The File Details grid contains the following fields:

- **Activity Name**: Displays the name of the activity that contains any of the File Operations, Create-Open-Office document, or Wait for Email activities.
- **Property Name**: Displays the property name. For example, Source Details, Destination Details, Attachment Save Location.
- **Location**: Displays the configured location of the file. Use the **Edit File Location** button to configure the target location of a file.

  Click **Edit File Location** for the file that you want to change. The File Details page appears replacing the package **Settings** form.

  The File Details page contains the following fields:

  - The **Source** fields display the values in the source environment. You can use the same values or credentials for the target, or change the values as required.
  - If you select **File** mode as the **Protocol** type in the source environment, then in the target environment you do not need to enter the user credentials. In the target environment, if file details require **FTP-HTTP** mode as the **Protocol** type, then you can change the **Protocol** type to **FTP-HTTP** mode and enter the **Location**, **Pattern**, **User name**, **Password**, **Domain name**, and **Port number**.
  - The **Port number** is independent of authentication type. If the target **Port number** is not specified, package considers the source **Port number**.
  - Click **Save Settings** to save the configuration. The **File Details** page closes, and the package **Settings** form appears.

    Note: Package does not validate the file details specified in the target fields. Ensure to provide valid inputs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Resolve Custom Document View URL

While installing a package, if the workflow activity contains a **Custom Document View URL** property, you can change the URL or path in the target. If the workflow contains a custom document view URL, the **Resolve Activity Properties** grid to configure the details of the URL in the target environment appears towards the lower section of the settings form.

The **Resolve Activity Properties** grid contains the following fields:

- **Activity Name**: Displays the name of the activity that contains the custom document view URL.
- **Property Name**: Displays the property name. For example, Custom Document View URL.
- **Source Value**: Displays the URL or path values in the source environment. You can use the same values for the target, or change the values as required.
- **Target Value**: Displays the URL or path values in the target environment. You can use the same values as that in the source, or change the values as required. You can select multiple properties with the same URL.

  You must not change the form definition. Consider that a form is an associated artifact of a custom URL. When you install the package, the target version of the form might not be same as the source version. You must manually specify the target version. For example, you have a form with two versions, v1 and v2. While installing form v2, the target version of the form might be v1 or vx, based on the availability of the form version in the target.

  You can also enter the URL of any customized .aspx page. Ensure the validity of the custom URL as the URL is not validated while installing package.

  If you create multiple activities using the same URL, ensure that you enter the same URL in the Source URL or Target URL field. Even a small change in the URL will list the activities in different rows.

Resolve Redirect URL

While installing a package, if the workflow activity contains a Redirect URL property, you can change the URL or path in the target environment. If the workflow contains a redirect URL property, the **Resolve Activity Properties** grid to configure the details of the redirect URL in the target environment appears towards the lower section of the settings form.

The grid contains the following fields:

- **Activity Name**: Displays the name of the activity that contains the Redirect URL.
- **Property Name**: Displays the property name. For example, Redirect URL.
- **Source Value**: Displays the URL or path values in the source environment. You can use the same values for the target, or change the values as required.
- **Target Value**: Displays the URL or path values in the target environment. You can use the same values as that in the source, or change the values as required. You can select multiple properties with the same URL.

  You must not change the form definition. Consider that a form is an associated artifact of a custom URL. When you install the package, the target version of the form might not be same as the source version. You must manually specify the target version. For example, you have a form with two versions, v1 and v2. While installing form v2, the target version of the form might be v1 or vx, based on the availability of the form version in the target.

  You can also enter the URL of any customized .aspx page. Ensure the validity of the custom URL as the URL is not validated while installing package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If you create multiple activities using the same URL, ensure that you enter the same URL in the Source URL or Target URL field. Even a small change in the URL will list the activities in different rows.

Resolve Template Path

While installing a package, if the workflow contains an Invoke Form activity, you can change the configuration settings of the **Template Path** property of the Invoke Form activity in the **Resolve Activity Properties** grid that appears towards the lower section of the settings form. In this grid, you can edit the path of the template file in both the source and the target environment.

The **Resolve Activity Properties** grid contains the following fields:

- **Activity Name**: Displays the name of the activity that contains the Template Path to be configured.
- **Property Name**: Displays the property name. For example, Template Path.
- **Source Value**: Displays the path values in the source environment. You can use the same values for the target, or change the values as required.
- **Target Value**: Displays the path values in the target environment. You can use the same values as that in the source, or change the values as required. Ensure to provide a valid template path that contains the valid files.

Resolve Workflows with Database Activity

When a workflow contains a database activity, the **Database Activity** grid displays the auto generated SQL scripts for the database activity. The SQL script can be a query, a function, or a procedure. If the workflow contains multiple database activities, multiple scripts are generated based on the associated artifact (for example, a database connection) of the database activity. While installing the package in the target environment, the SQL script is run first and then the package is installed.

While adding the Workflow with Database Activity to a package template, if you select the **Include the automatically generated SQL Script** option as *Yes*, the automatically generated SQL script is included in the package template. If you select the **Include the automatically generated SQL Script** option as *No*, the automatically generated SQL script is not included in the package template.

Use the **Install** tab or the **Update** tab in the **Settings** form to set the configurations for the Database Activity.

The **Database Activity** grid contains the following fields:

- **Activity Name**: Displays the database activity name.
- **SQL script**: Displays the auto-generated SQL script for the particular database activity.

  The SQL script can be a query, a function, or a procedure. You can append any additional scripts at the end of the auto-generated SQL script. The SQL script in the query window can be packaged from one SQL server machine and can be installed in another SQL server machine only.

  Note: The query generated using the Expression Editor is not considered while generating the SQL Script automatically.
- **Validate SQL script**: Validates the script for the usage of the restricted SQL commands, but does not validate syntax of the SQL query in the script. Ensure to enter error free SQL script.

  The following SQL commands are restricted:
  - Delete
  - Truncate

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Drop
- Update
- Create User
- Grant
- Revoke
- Execute

If the database activity contains a *query*, the script will be generated for the tables in the query. Parent tables and child tables are not considered. Such a query will contain the following information:

- Table structure of the tables in the query, with field name, data types, and their order
- Keys - primary key and foreign key
- Constraints - default or check, and so on
- Index

If the database activity contains a *procedure*, a script is generated for the procedure. However, objects such as tables or views used by the procedure are not generated. All such objects must be available in the target environment before package installation.

If the database activity contains a *function*, a script is generated for the procedure. If the function contains parameters you should specify the exact parameters.

The following points are not considered while generating the SQL script:

- User defined types
- Table partitioning
- Views
- Triggers
- Functions
- Synonyms
- Parent and child tables
- Query against views and functions

If you need any of the unsupported objects, then you can choose to do one of the following:

- Write and run the script manually in SQL Server
- Write and append the script to the SQL script text area

The auto-generated script contains a pre-condition statement which checks for the existing tables in the target environment. If the table exists in the target environment, the SQL script does not run. If the table does not exist in the target environment, the SQL script runs and creates the table, and adds the keys, index, and constraints as defined in the source environment.

Ensure that the object names used in the source repository does not conflict with the destination repository. If any of the objects (name of a table, key, constraint, or index) exists in the target environment, then the script execution will fail. This will be recorded in **Package History** page after the package installation.

As the script is auto-generated, we recommend not to modify the script. If you want to add your own piece of code sample to the script, you can either add it at the start of the script or append it to the end of the script. Do not add or edit the existing script.

Generating scripts for Oracle database is not supported. The SQL script text box will not be visible when

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the database in source environment is Oracle.

Note:
- If the SQL script is executed successfully, then the following message appears in the **Package History** dialog box:
The SQL script is executed successfully.

- If the SQL script execution fails, then the following message appears:
The SQL script execution failed.

- If you click the message, the **Message Details** window appears, where you can view the message details.

See Also: SQL Script Generation and Execution

Resolve Script Activity References

While adding a workflow to a package template, if the workflow contains Script Activity, the **Resolve Assembly Path** grid appears in the workflow settings form.

While installing a package, you can use the **Resolve Assembly Path** grid to resolve the assembly file path in the target environment.

The custom assembly files (DLLs) referenced in the workflow are automatically identified and appear in the package settings form.

The **Resolve Assembly Path** grid contains the following fields:

- **Assembly Name [Action Name]**: Displays the assemblies used in a workflow and the actions in which the assemblies are referenced. If one or more DLLs reference the same path, then the DLLs are displayed as comma separated list with their respective action name in the **Assembly Name [Action Name]** fie.
- **Source Assembly Path**: Displays the referenced DLL paths in the source environment.
- **Target Assembly Path**: Displays the referenced DLL paths in the target environment. The DLLs are copied to the same path in the target environment, as mentioned in the **Source Assembly Path**. To copy the DLLs to a different location in the target environment, enter the path in the **Target Assembly Path**.

  You can also specify the target assembly path of your choice in the **Target Assembly Path** field. In this case, ensure that the target assembly path you specify is valid and the files exist in it before you install the package. If the files do not exist in the path, then manually copy the files to the target environment .

  If the target assembly path is not valid or the files do not exist in it, then the workflow is installed in draft status (with the invalid assembly path) and you will not be able to publish the workflow. The following message appears in the pre-install validation:

  Files referenced in script activity do not exist (Workflow cannot be published) : <target assembly path\DLL name>

While entering the assembly path, ensure to follow the scripting guidelines as mentioned in Script - References topic.

While packaging a workflow with script activity, the package recognizes the DLLs or assemblies referenced in the script activity. However, these DLLs or assemblies are not packaged. Add these assemblies to the **Additional Package Files** to package the assemblies also in the package template. Using the additional package files, you can also install the assemblies referenced in the script activity along with the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Resolve Custom Dependent Files for Script Activity

You can install additional files in the target environment.When the package is installed, these files are copied to the installed path of the target environment. In the **Source Files** field, enter the source file path of these files.

Click **Add row** to add multiple rows to install additional files in the target environment.

If the source folder is relative to the AVEVA Work Tasks installed path, and the folder does not exist in the target environment then a new folder is created and the files are copied to it. If the source folder is not relative to the AVEVA Work Tasks installed path then the files are copied to the *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**bin* folder.

The **Install in Global Assembly Cache** field is optional and is used to install the custom dependent files in the Global Assembly Cache of the target environment. Check the **Install in Global Assembly Cache** box, if you want to install the files in the Global Assembly Cache of the target environment.

Note: At present, you must manually add the DLLs referenced in the Script Activity to the package using the **Additional Package Files** option under the configuration tree view at the left hand side of the **Add to Package Template** window.

Resolve User or Role Based Exception Template

While installing a package, if the Start activity contains Exception Template property, the following error message appears:

User or Role Based Exception Template Does Not Exist

In a start activity, consider that you have configured an exception with exception template for a workflow in the source environment. When you try to install the package in the target environment, an exception message appears in the logger if the exception template is not available in the target environment.

Create the required exception files in the following path of the target environment and install the package:

*[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**WorkflowElements**Default**en-US**Templates**ExceptionTemplate*\

Resolve Delivery Channels

While installing a package or adding workflow to a package template, if the workflow activity contains any Human Activity, you can edit the details of the delivery channels. In such cases, the **Resolve Activity Properties** grid to configure the details of the delivery channels in the target environment appears towards the lower section of the settings form.

The **Resolve Activity Properties** grid contains the following fields:

- **Activity Name**: Displays the name of the activity that contains the human activity.
- **Property Name**: Displays the property name.
- **Source Value**: Displays the URL or path values in the source environment. You can use the same values for the target, or change the values as required.
- **Target Value**: Enter the URL or path values in the target environment. You can use the same values as that in the source, or change the values as required. You can select multiple properties with the same URL.

You cannot package the user or role access rights.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

When you add an instance of AspxForm to a Work Item List control, provide valid URI in the **Aspx File Relative Uri** field. Package does not validate any relative URI of the ASPX file.

While installing a package, if the workflow activity contains a Custom Document View URL property, you can change the URL or path in the target. If the workflow contains a custom document view URL, the Resolve Activity Properties grid to configure the details of the URL in the target environment appears towards the lower section of the settings form.

Resolve XML Variables

While installing a package or adding a workflow to the package template, if you create Xml variables from the Start activity, the **Xml Forms Data Grid** and the **Xml List** variable types are resolved.

Xml Forms Data Grid

While creating an XML variable of type XML Forms Data Grid, the data grid is identified as an associated artifact.

Xml List

While creating an XML variable of type XML List, only the list created using **Manage List** option is identified as an associated artifact.

The following XML variables do not require corrections:

- Xml Iterator
- Xml List Iterator
- Xml Document

Resolve Custom Activities

When you package a workflow with a custom activity, the DLL, image, and help files automatically identified appear as dependent files. For other files, manually add them by clicking on **Add Row**. These files are copied to the installed path of the target environment when the package is installed.

If the workflow activity contains a custom activity, the **Custom Activities File Details** grid to configure the details of each file appears towards the lower section of the settings form. Use the **Edit File Location** button to configure the file details. The **Custom Activities File Details** grid replaces the settings form.

The **Custom Activities File Details** grid contains the following fields:

- **Source**: The **Source** fields display the values in the source environment.
- **Install in Global Assembly Cache:** The **Install in Global Assembly Cache** field is optional and is used to install the signed DLL in the GAC. When you install the package, clear the **Install in Global Assembly Cache** check box if the signed DLL is not required in the GAC.
- Click **Add Custom Activities File Details +** to add a new row for adding additional files which will be installed in the target environment. When you add a new row to include a signed DLL that is required in the GAC, select the **Install in Global Assembly Cache** check box.
- Click the **Delete Custom Activities File Details** icon to deleted the selected row. The dependent files will not be installed in the target environment.

Note:

- When you install a package with workflow containing custom activities again (that is in **Update** mode) but with

---

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

modifications to custom activity files, the modifications are not reflected in the target environment. In such cases, create a new Package Template and then install the same.

- When you uninstall a package with workflow containing custom activities, the custom activity files will not be removed.

- When you generate a package with workflow containing custom activities, the context-sensitive help for the properties (not the activity) will not be included in the Package Template. In such cases, manually add (using **Add Row** property) the context-sensitive help files, if required.

- The files available to add using the **Add Row** property must be relative to the AVEVA Work Tasks installation path as you cannot add files outside of the installation path.

- If the absolute path mentioned in action.xml is the installed path then the files are copied in the target environment.

- If the absolute path mentioned in action.xml is not the installed path then the files are not copied in the target environment. The files are copied to the Global Assembly Cache. You must manually copy the files to the path mentioned in the action.xml.

To correct custom activity during package design or install, see Correct Custom Activities.

Correct Custom Activities

When you design or install a package for custom activity with workflow, follow the steps given below if you need to correct the custom activity in the target environment.

1. Run the following SQL query in the SKAddInProviders table for the target repository database.

```
INSERT INTO SKAddInProviders (Type,[Name],ClassName,Assembly) VALUES
('PackageWorkflow','SampleApproval','SampleApprovalActivity.SampleApprovalCorrection'
,'bin\SampleApprovalActivity.dll')
--'SampleApproval' is the name of the custom activity.
--'SampleApprovalActivity.SampleApprovalCorrection' is the namespace of the custom
activity.
--'SampleApprovalActivity.dll' is the DLL in the BIN path of the target environment.
```

2. Implement **IWorkflowCorrection** interface in your custom activity by referring to the following DLLs, if you want to correct the custom activity in the target environment.

```
Skelta.Package.AdvancedPackageObjects;
Skelta.Forms.Core;
```

Example

```
SampleApprovalCorrection.cs
using Skelta.Package.AdvancedPackageObjects;
using Skelta.Package.Common;
using Skelta.Repository.List;
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
using System.Xml;
using Workflow.NET;
namespace SampleApprovalActivity
{
public class SampleApprovalCorrection: IWorkflowCorrection
{
public Skelta.Package.Common.WorkflowResponseObject
GetAssociatedObjects(Skelta.Repository.List.IListItem item,
Skelta.Forms.Core.Controls.BaseForm settingsForm, string settingsFormXml,
Workflow.NET.IAction action)
{
// Employee is the list name.
string listName = "Employee";
var responseObject = new WorkflowResponseObject();
var associatedListItemObjectsList = new List<CommonLib.PackageObjectInfo>();
// Access list item related information from the property of the activity. For example,
the list item name.
string listItemName = GetValueFromProperty(action);
if (!string.IsNullOrEmpty(listItemName))
{
var repositoryName = item.List.Application.ApplicationName;
var listDataHandler = new ListDataHandler(repositoryName, listName);
IListItem associatedListItem = listDataHandler.GetListItem(listItemName);
if (associatedListItem != null)
{
var objectInfo = this.GetBasicInfoOfListItem(associatedListItem);
if (!associatedListItemObjectsList.Contains(objectInfo))
{
associatedListItemObjectsList.Add(objectInfo);
}
}
}
else
{
throw new ArgumentException("ListItem cannot be null.");
}
responseObject.SettingsFormXml = settingsFormXml;
responseObject.AssociatedObjects = associatedListItemObjectsList;
return responseObject;
}
public Skelta.Package.Common.WorkflowResponseObject
PreinstallValidate(Skelta.Package.Deploy.IManagePackage package, string repositoryName,
Skelta.Package.Common.CommonLib.PackageObjectInfo selfDetails,
Skelta.Forms.Core.Controls.BaseForm settingsForm, string settingsFormXml, string
activityDefinition, string actionName)
{
throw new NotImplementedException();
}
public Skelta.Package.Common.WorkflowResponseObject
UpdateActivityDefinition(Skelta.Package.Deploy.IManagePackage package, string
repositoryName, Skelta.Package.Common.CommonLib.PackageObjectInfo selfDetails,
Skelta.Forms.Core.Controls.BaseForm settingsForm, string settingsFormXml, string

xmlMaindoc.SelectSingleNode("//properties//property[@name='" + propertyName +
"']").InnerText = "83bef27b-987f-46c1-a7b6-7da52f6a7462"; //// correct the guid based on
your requirement
}
catch (Exception ex)
{
log.LogError(ex, "Error while resolving Custom Activity Correction property " +
selfDetails.Name, repositoryName);
}
responseObj.CorrectedActivityXml = xmlMaindoc.InnerXml;
return responseObj;
}
// Access list item related information from the property of the activity. For example,
the list item name.
private static string GetValueFromProperty(IAction action)
{
string dataValue = string.Empty;
if (action != null && action.Properties.Contains("configCustomActivity"))
{
// configCustomActivity is the property name.
Workflow.NET.Property customActivityProperty =
action.Properties["configCustomActivity"];
if (!string.IsNullOrEmpty(customActivityProperty.Value.ToString()))
{
dataValue = (customActivityProperty.PropertyHandler).Value;
}
}
return dataValue;
}
// Method to get the basic information about the list item.
private CommonLib.PackageObjectInfo GetBasicInfoOfListItem(IListItem listItem)
{
var packageObjectInfo = new CommonLib.PackageObjectInfo();
packageObjectInfo.Name = listItem.Title;
packageObjectInfo.Id = listItem.Id;
packageObjectInfo.Type = listItem.List.Name;
packageObjectInfo.Version = string.Empty;
packageObjectInfo.ItemType = CommonLib.GetActualItemType(listItem.List.Name,
listItem.ItemType);
packageObjectInfo.IsFolder = listItem.IsFolder;
if (!listItem.ParentItemId.Equals(Guid.Empty))
{
packageObjectInfo.ParentItem = listItem.ParentItem.Title;
}
else
{
packageObjectInfo.ParentItem = string.Empty;
}
return packageObjectInfo;
```

```
    }
    }
    }
```

Note:
- If custom activities are not created using AVEVA Work Tasks 2023 or later versions, then ensure you follow the steps given above to create DLLs for modifying custom activities.
- If you add a custom XML file for a custom activity, then ensure you remove the category data from the **action.xml** file.

Resolve MES XML Command Activity

While installing a package, if the workflow activity contains an **MES XML Command Activity**, you can change the **Unique Environment Name** and **Middleware Machine Name** properties in the target environment. If the workflow contains an **MES XML Command Activity**, the **Resolve Activity Properties** grid to configure the details of the **Unique Environment Name** and **Middleware Machine Name** properties in the target environment appears towards the lower section of the settings form.

The **Resolve Activity Properties** grid contains the following fields:

- **Activity Name**: Displays the name of the MES XML Command activity.
- **Property Name**: Displays the property name. For example, Unique Environment Name or Middleware Machine Name.
- **Source Value**: Displays the Unique Environment Name or Middleware Machine Name values in the source environment. You can use the same values for the target, or change the values as required.
- **Target Value**: Enter the target values for Unique Environment Name and Middleware Machine Name in the target environment. You can also select these values from the Runtime Initialization Settings form. If you want to use the values as specified in the source, then leave this field blank.

Note:
- Ensure that AVEVA Work Tasks Extension for MES is installed in the target environment.

Resolve Wait for MES Event Activity

While installing a package, if the workflow activity contains a **Wait for MES Event Activity**, you can change the **Unique Environment Name** and **Middleware Machine Name** properties in the target environment. If the workflow contains a **Wait for MES Event Activity**, the **Resolve Activity Properties** grid to configure the details of the **Unique Environment Name** and **Middleware Machine Name** properties in the target environment appears towards the lower section of the settings form.

The **Resolve Activity Properties** grid contains the following fields:

- **Activity Name**: Displays the name of the Wait for MES Event activity.
- **Property Name**: Displays the property name. For example, Unique Environment Name or Middleware Machine Name.
- **Source Value**: Displays the Unique Environment Name or Middleware Machine Name values in the source environment. You can use the same values for the target, or change the values as required.
- **Target Value**: Enter the target values for Unique Environment Name and Middleware Machine Name in the target environment. You can also select these values from the Runtime Initialization Settings form. If you

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

want to use the values as specified in the source, then leave this field blank.

Note: Ensure that AVEVA Work Tasks Extension for MES is installed in the target environment.

Resolve Start MES Transaction Activity

While installing a package, if the workflow activity contains a **Start MES Transaction Activity**, you can change the **Unique Environment Name** and **Middleware Machine Name** properties in the target environment. If the workflow contains a **Start MES Transaction Activity**, the **Resolve Activity Properties** grid to configure the details of the **Unique Environment Name** and **Middleware Machine Name** properties in the target environment appears towards the lower section of the settings form.

The **Resolve Activity Properties** grid contains the following fields:

- **Activity Name**: Displays the name of the Start MES Transaction Activity.
- **Property Name**: Displays the property name. For example, Unique Environment Name or Middleware Machine Name.
- **Source Value**: Displays the Unique Environment Name or Middleware Machine Name values in the source environment. You can use the same values for the target, or change the values as required.
- **Target Value**: Enter the target values for Unique Environment Name and Middleware Machine Name in the target environment. You can also select these values from the Runtime Initialization Settings form. If you want to use the values as specified in the source, then leave this field blank.

Note:
- Ensure that AVEVA Work Tasks Extension for MES is installed in the target environment.
- When packages are upgraded from AVEVA Work Tasks 2023 to AVEVA Work Tasks 2023 SP1, the workflows with transaction activities must be added again to the package template.
- For existing packages, whose transaction activities were configured earlier, the activity properties will not be automatically resolved. These activities will be displayed as custom activities, but their package functionalities will remain the same.

Resolve Commit MES Transaction Activity

While installing a package, if the workflow activity contains a **Commit MES Transaction Activity**, you can change the **Unique Environment Name** and **Middleware Machine Name** properties in the target environment. If the workflow contains a **Commit MES Transaction Activity**, the **Resolve Activity Properties** grid to configure the details of the **Unique Environment Name** and **Middleware Machine Name** properties in the target environment appears towards the lower section of the settings form.

The **Resolve Activity Properties** grid contains the following fields:

- **Activity Name**: Displays the name of the Commit MES Transaction Activity.
- **Property Name**: Displays the property name. For example, Unique Environment Name or Middleware Machine Name.
- **Source Value**: Displays the Unique Environment Name or Middleware Machine Name values in the source environment. You can use the same values for the target, or change the values as required.
- **Target Value**: Enter the target values for Unique Environment Name and Middleware Machine Name in the target environment. You can also select these values from the Runtime Initialization Settings form. If you

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

want to use the values as specified in the source, then leave this field blank.

Note:
- Ensure that AVEVA Work Tasks Extension for MES is installed in the target environment.
- When packages are upgraded from AVEVA Work Tasks 2023 to AVEVA Work Tasks 2023 SP1, the workflows with transaction activities must be added again to the package template.
- For existing packages, whose transaction activities were configured earlier, the activity properties will not be automatically resolved. These activities will be displayed as custom activities, but their package functionalities will remain the same.

Resolve Rollback MES Transaction Activity

While installing a package, if the workflow activity contains a **Rollback MES Transaction Activity**, you can change the **Unique Environment Name** and **Middleware Machine Name** properties in the target environment. If the workflow contains a **Rollback MES Transaction Activity**, the **Resolve Activity Properties** grid to configure the details of the **Unique Environment Name** and **Middleware Machine Name** properties in the target environment appears towards the lower section of the settings form.

The **Resolve Activity Properties** grid contains the following fields:

- **Activity Name**: Displays the name of the Rollback MES Transaction Activity.
- **Property Name**: Displays the property name. For example, Unique Environment Name or Middleware Machine Name.
- **Source Value**: Displays the Unique Environment Name or Middleware Machine Name values in the source environment. You can use the same values for the target, or change the values as required.
- **Target Value**: Enter the target values for Unique Environment Name and Middleware Machine Name in the target environment. You can also select these values from the Runtime Initialization Settings form. If you want to use the values as specified in the source, then leave this field blank.

Note:
- Ensure that AVEVA Work Tasks Extension for MES is installed in the target environment.
- When packages are upgraded from AVEVA Work Tasks 2023 to AVEVA Work Tasks 2023 SP1, the workflows with transaction activities must be added again to the package template.
- For existing packages, whose transaction activities were configured earlier, the activity properties will not be automatically resolved. These activities will be displayed as custom activities, but their package functionalities will remain the same.

Resolve ArchestrA Activities

Resolving ArchestrA Wait For Event Activity

While installing a package, if the workflow activity contains an **ArchestrA Wait For Event Activity**, you can change the **Unique Environment Name** and **Galaxy Name** properties in the target environment. If the workflow contains an **ArchestrA Wait for Event Activity**, the **Resolve Activity Properties** grid to configure the details of the **Unique Environment Name** and **Galaxy Name** properties in the target environment appears towards the lower section of the settings form.

The **Resolve Activity Properties** grid contains the following fields:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Activity Name**: Displays the name of the ArchestrA Wait for Event activity.
- **Property Name**: Displays the property name. For example, Unique Environment Name or Galaxy Name.
- **Source Value**: Displays the Unique Environment Name or Galaxy Name values in the source environment. You can use the same values for the target, or change the values as required.
- **Target Value**: Enter the target values for Unique Environment Name and Galaxy Name in the target environment. You can also select these values from the Runtime Initialization Settings form. If you want to use the values as specified in the source, then leave this field blank.

Resolving AttributeReadWrite Activity

While installing a package, if the workflow activity contains an **AttributeReadWrite Activity**, you can change the following properties in the target environment.

- **Unique Environment Name**
- **authenticationusername**
- **authenticationuserpassword**
- **verifierusername**
- **verifieruserpassword**

If the workflow contains an **AttributeReadWrite Activity**, the **Resolve Activity Properties** grid to configure the details of the aforementioned properties in the target environment appears towards the lower section of the settings form. The values in the **Resolve Activity Properties** grid are displayed for the activity based on the **Attribute Operation Configuration** of the **AttributeReadWrite** activity in the workflow.

The **Resolve Activity Properties** grid contains the following fields:

- **Activity Name**: Displays the name of the AttributeReadWrite activity.
- **Property Name**: Displays the property name for the aforementioned properties.
- **Source Value**: Displays the values for the aforementioned properties in the source environment. You can use the same values for the target, or change the values as required.
- **Target Value**: Enter the target values for the aforementioned properties in the target environment. You can also select these values from the Runtime Initialization Settings form. If you want to use the values as specified in the source, then leave this field blank.

Note:
- The value entered for the **authenticationusername** property is the user account used to write the values to ArchestrA Object attributes.
Based on the **Write** type of the attribute, the user credential information varies as listed below:
- **FreeAccess**: The user account does not require any additional authentication information.
- **Operate**: The credentials of the user who is performing the 'Write' operation.
- **SecuredWrite**: The credentials of the user who is performing the secured 'Write' operation.
- **VerifiedWrite**: The credentials of the user who is performing the 'Write' operation and also the credentials of the user's supervisor.
- For the **Read** operation, the credential fields are not displayed.
- For the **ArchestrA Wait For Event Activity**, ensure that the values for event name and the object name are same in the source and target environments.
- For the **AttributeReadWrite Activity**, ensure that the values for object name, attribute name, and attribute

---

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

types are same in the source and target environments.
- ArchestrA events will not be included as a part of the package. You have to manually associate the workflow with the ArchestrA events, so that these events will be packaged along with the workflow.
- If you pass the values for the **Unique Environment Name** and **Relative Reference Object** properties at runtime through ArchestrA events by associating the workflow to the ArchestrA event in the source environment, then ensure that you perform the same in the target environment.

Resolve Wait For Logic App Alert

While installing a package, if the workflow activity contains a Wait For Logic App Alert activity, you can edit the details for each activity in the target environment. Use the **Logic App Alert Filter** grid to configure the details of the Logic App Alert activities in the target environment that appears towards the lower section of the settings form.

The grid contains the following fields:

- **Logic App Alert Filter**: Use this property to set the alert key along with the Web API URL to post from the Logic App.

  Property Type: Mandatory

  In the Logic App Alert Filter window, configure these as follows:

  - **Source**
    - **Enterprise Console**: Displays the name of the Enterprise Console site with the Server name in the Source environment.
    - **URL**: Displays the source URL, which is used by Logic App to post the data to the workflow.
    - **Authorization Token**: Displays the source Authorization Token, which is used by Logic App to pass as authorization header while posting the data using URL.
  - **Target**
    - **Enterprise Console**: Enter the name of the Enterprise Console site with the Server name in the Target environment.
    - **URL**: Enter the URL, which is used by Logic App to post the data to the workflow.
    - **Authorization Token**: Enter the Authorization Token, which is used by Logic App to pass as authorization header while posting the data using URL.

      Note: The URL and Authorization token are generated based on the selected Enterprise Console site. Hence, it is mandatory to provide target values for Enterprise Console, URL, and Authorization token fields. If you want to use the values as specified in the source, then leave these fields blank.

Resolve Call Logic App Connection

While installing a package, if the workflow activity contains a Call Logic App activity, you can change the Logic App Connection in the target environment. Use the **Resolve Activity Properties** grid to configure the details of the Logic App Connection in the target environment that appears towards the lower section of the settings form.

The grid contains the following fields:

- **Activity Name**: Displays the name of the Call Logic App Activity.
- **Property Name**: Displays the Logic App Connection field name of Logic App Connection and Data property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Source Value**: Displays the name of the Logic App Connection used in Call Logic App activity.
- **Target Value**: Enter the name of the Logic App Connection which you want to link in the target environment.

Note: The displayed property name is the Logic App Connection field name of Logic App Connection and Data property of Call Logic App activity.

Work Item Field

You can package and deploy the Work Item Field from one environment or repository to another environment or repository using the package feature in AVEVA Work Tasks.

Note: Consider, the work item fields already exist in the target environment. When installing a package having work item fields created in the earlier versions of the product, the existing work item fields in the target machine get swapped. To avoid swap the work item fields, create the new package and install it on the target machine.

To add Work Item Field to Package Template

1. In the **Process Designer for Workflow** window, point to **Settings**, and then click **Work Item Fields**.
   The **Work Item Field** dialog box appears.
2. Right-click the work item field that you want to package, and then click **Add to Package Template**.
   The **Add to Package Template** dialog box appears.

For more information about adding artifacts to Package Template, see Adding Artifacts to a Package Template.

The naming convention of the **Work Item Field** at workflow level is Work Item Field name(Workflow name).

If you change an existing Work Item Field that is already added to the package template, you can rebuild the data in the package template.

Configuration Settings for Work Item Field

The Work Item Field has a unique set of configuration settings required to install, update, and uninstall the package.

You can view and edit the configuration settings from one of the following windows:

- **Source Environment > Package Template** window
- **Target Environment > Manage Package** window

You can use the **Settings** tab to define the configuration settings. The **Associated Artifacts** tab displays the associated artifacts of the **Work Item Field** definition. The **Child Artifacts** tab displays child artifacts of the Work Item Field definition.

The Package Template configuration window contains the following tabs:

- Settings
  - Install
  - Update
  - Uninstall
- Associated Artifacts
- Child Artifacts

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings tab

You can use the properties in the **Settings** tab to take appropriate actions to install, update, or uninstall a package.

Install

The configuration settings in the Install tab are referred to when installing the package.

- **Work Item Field Exists**: This property allows you to take appropriate action when the Work Item Field to be installed is present in the target environment.
  - **Do not Install Work Item Field**: Select this option if you want to use the Work Item Field which is present in the target environment.
  - **Install to overwrite existing Work Item Field**: Select this option if you want to overwrite the Work Item Field is present in the target environment with the one that you packaged.
- **Associated Artifacts Not Present**: This property allows you to take appropriate action when the associated artifacts of the Work Item Field is not present in the target environment.
  - **Install Work Item Field**: Select this option if you want to install the Work Item Field even if the associated artifacts are not present in the target environment.
  - **Do not install Work Item Field**: Select this option if you do not want to install the Work Item Field as its associated artifacts are not present.

Update

The settings in this tab are referred to when the same package is installed for the consecutive time.

- **Delete Work Item Field**: Select this option if you want to delete the Work Item Field that is present in the target environment.
  - **Yes**: Select this option to remove the Work Item Field in the target environment. On selection of this option, the **Work Item Field Is Modified** property appears.

    Work Item Field is modified: Use this property to retain or delete the Work Item in the target environment even after the package is uninstalled. This property is applicable only if **Delete Work Item Field** is set to *Yes* and the Work Item Filed is modified.
    - **Retain**: Select this option if you want to retain the Work Item Field along with the modifications, in the target environment even after the package is updated.
    - **Rollback to Original State**: Select this option if you want to roll back to the original state. All modifications that were done to the Work Item Field after it was installed in the target environment will be reverted. However, the Work Item Field will be retained in the target environment.
    - **Delete**: Select this option if you want to delete the Work Item Field from the target environment when updating the package.
  - **No**: Select this option if you want to retain the Work Item Field in the target environment. On selection of this option, the **Work Item Field Exists** option appears.

    Work Item Field Exists: Use this property to take appropriate action when the Work Item Field definition specified in the package is already present in the target environment.
    - **Do not Install Work Item Field**: Select this option if you want to use the Work Item Field that is present in the target environment.
    - **Install to overwrite existing Work Item Field**: Select this option if you want to overwrite the Work Item Field that is present in the target environment with the one present in the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Associated Artifacts Not Present: This property allows you to take appropriate action when the associated artifacts of the Work Item Field is not present in the target environment.

- **Install Work Item Field**: Select this option if you want to update the Work Item Field even if the associated artifacts are not present in the target environment.
- **Do not install Work Item Field**: Select this option if you do not want to update the Work Item Field as its associated artifacts are not present.

Uninstall

You can refer to the following settings in the Uninstall tab to uninstall a Work Item Field:

- **Delete Work Item Field**: You can use this property to decide if you want to retain or delete the Work Item Field in the target environment after you uninstall the package.
  - **Yes**: Select this option if you want to delete the Work Item Field from the target environment while uninstalling the package.
  - **No**: Select this option if you want to retain the Work Item Field in the target environment after uninstalling the package.
- **Work Item Field Is Modified**: You can use this property to decide if you want to retain, roll back, or delete the Work Item Field in the target environment after uninstalling the package. This property is displayed only if **Delete Work Item Field** is set to *Yes*. However, if **Delete Work Item Field** is set to *No*, this property is not displayed.
  - **Retain**: Select this option if you want to retain the Work Item Field with the modifications in the target environment after uninstalling the package.
  - **Rollback to original State**: Select this option if you want to roll back to the original state. All modifications that were done to the Work Item Field after it installation in the target environment will be reverted. However, the Work Item Field will be retained in the target environment.
  - **Delete**: Select this option if you want to delete the Work Item Field from the target environment when uninstalling the package.

Associated Artifacts tab

The Associated Artifacts tab displays all the associated artifacts of the selected Work Item Field.

The Work Item Field can have the following associated artifacts:

- Workflow

  The Work Item Field at workflow level considers the workflow as an associated artifact. When you package the Work Item field, the associated workflow cannot be packaged as the workflow is in draft state. You must manually package the workflow, install the workflow in target, and then install the Work Item Field.

Child Artifacts tab

Work Item Field does not have any child artifact.

Note: If the Workflow is already added to the package, it automatically takes the Work Item Field. So before installing the package, it is recommended to add the Work Item Field to the package before adding the Workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Include Child Item

If a folder is added to the package template, a child item in that folder is also added to the package template based on the **Include Child Item** option selected by the user in the Package Template window. If a child item is added to the folder after adding the folder to the package template, the child item will not be added automatically to the package template. You must then add the child item manually to the package template containing the folder. You can right-click the folder from the left hand side tree view in the package template, and click **Include Child Item** to add the child item.

To add a child item, right-click an item for which you want to add child item and then select **Show Child Item**. Click **New** and then create a child item.

The child item can also be another folder. When you add the child item, all the associated artifacts, child artifacts, and security artifacts of the child item also gets added to the package template. You can add up to top three levels of child item.

Consider that the **Include Child Artifacts** is selected as **No** while creating new package template. If you right-click on the folder and select **Include Child Item** option, then the child items get added to the package template. Similarly, associated artifacts for the child item gets added on including child item for folder even though the **Include Associated Artifacts** is selected as **No** while creating the package template.

File Distribution

The following list describes the behavior of the custom file distribution in a package module:

Note: The dll files having names starting with *SE.BPM.*, *SE.TOKENPROVIDER*, *WORKTASKS*, *WORKFLOW*, *XMLRESOURCEHANDLER.NET2* will not be included while creating the package.

- While installing the package, if the target environment contains files that are not versioned then these may not be overwritten.
- When you uninstall a package containing custom dependent files, the files will not be removed.
- When you generate a package with workflow containing custom activities, the context-sensitive help for the properties (not the activity) will not be included in the package template. In such cases, manually add (using **Add Row** property) the context-sensitive help files, if required.
- The files available to add using the **Add Row** property must be relative to the AVEVA Work Tasks installation path as you cannot add files outside of the AVEVA Work Tasks installation path.
- We recommend to package custom files from AVEVA Work Tasks relative path. When you package the custom files from a non-relative path of AVEVA Work Tasks, all package files get installed in the *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**BIN* folder.
  - While installing the package containing custom dependent files, if the source folder is relative to the AVEVA Work Tasks installed path, and the folder does not exist in the target machine, then a new folder is created and the file is copied to it. For example, if the path of the *CustomEmployee.dll* file is *C:**Program files**AVEVA**Work Tasks**Custom Folder**CustomEmployee.dll***,** then a folder named *Custom Folder* is created in the target machine and *CustomEmployee.dll* is copied to it.
  - While installing the package containing custom dependent files, if the source folder is not relative to the AVEVA Work Tasks installed path then the files are copied to *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**BIN* folder. For example, if the path of the file *CustomEmployee.dll* is *C:**Custom Folder**CustomEmployee.dll***,** then *CustomEmployee.dll* is copied to the *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**BIN* folder in the target machine.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Only strong-named assemblies can be installed into the GAC. Ensure that you select the GAC option accordingly for packages.

Note: As the installation path for AVEVA Work Tasks 2023 SP1 is different, the existing packages in the repository having custom files pointing to old path may not work as expected when the product is upgraded.

SQL Script Generation and Execution

When a package contains a Manage List with an existing custom list, a database lookup, a queue, or a database activity, while configuring the package template in source environment, a related script is auto generated and populated in the SQL script text area. You do not need to write the script or run the script manually. While installing the package in the target environment, the SQL script is run first and then the package is installed. The SQL script does not execute during updation or uninstallation of package.

You can also add customized script to the auto-generated SQL script. We recommend to add the customized scripts either at the start or at the end of the auto-generated SQL script.

In artifacts such as Database Connection, the SQL scripts are not auto-generated. You can add a SQL script, if required.

If a list exists in the target environment, the list items are not installed or tables are not updated. For example, consider that a list is created and packaged in the source environment. While packaging, the relevant SQL script is auto-generated. When this package is installed in the target environment, the SQL script is executed and the relevant tables are created. If new fields are added to the list tables in the source environment, and a new package is generated, the auto-generated SQL script is also updated with the new information. While installing (or updating) the new package in the target environment, the package verifies if the object is available in the target environment. As the list object exists from the previous installation, the newly auto-generated SQL script does not execute, but a success message appears. Though the list gets updated, the relevant tables does not get updated. You must ensure to update the tables in the target environment based on the modifications done.

Two objects with the same name, irrespective of their types, cannot exist in the target environment during package installation. Consider that a table, *Department* exists in the package template. While installing the package in the target environment, the auto-generated SQL script executes if the target environment does not contain a table with the same name, *Department*. However, if the target environment contains another object type, such as an index with the same name, *Department,* the auto-generated SQL script executes, but returns an exception.

If a package template exists in an upgraded environment, then its existing artifacts does not contain any auto generated script. In such case, you must create a new package with the existing artifacts. However, if you want to use the existing package, use the **Complete Rebuild** option to rebuild the package template. The **Complete Rebuild** option generates the script for the selected and supported artifact. So the same will be executed during the installation in the target environment . The rebuild option appears only after you modify an artifact in the existing package template.

In an upgraded environment, consider that a package is already installed in the target environment. Now, consider that a database lookup (or any other supported artifact) is added to the package and a package template is created in the source environment. Now, while updating the package in the target environment, though the package template contains the auto-generated SQL script, the script will not be executed. To overcome this behavior, you can do one of the following:

1. Add the new artifact to a new package template in the source environment, and then install it in the target environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. If the artifact is added to the existing package template, then execute the SQL script manually in the target environment.
3. Uninstall the package from the target environment and install it again with the added artifacts (not recommended).

Note:
- The following keywords are restricted. Hence, only these keywords can be validated as part of "Validate SQL Script".
- Delete
-Truncate
- Drop
- Update
- Create User
- Grant
- Revoke
- Execute

- The keyword "Alter" is restricted for DB Connection and Queue.

See Also:

- Queue
- Manage List
- Database Connection
- Lookup
- Database Activity in Workflows

Package in a Distributed Environment

Consider the following points when working in a distributed environment:

- Before installing a package with custom actions, the AVEVA Work Tasks client service should be running in all the servers which are connected to each other.
- In a distributed environment, you must ensure all the computers (servers and clients) belong to a 64-bit platform before you install a package that includes custom files.
- Ensure that the firewall allows communication on port 8863 to ensure that files or packages can be installed in the client computers.

Troubleshoot Packages

1. This installation will be aborted as another instance of the same package is being installed.

Probable Cause: This error might occur when you try to install a package, which is being installed by another user.

Solution: It is recommended to wait till the package installation is complete, before installing the same package, if required.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. When packaging artifacts, the scripts are not packaged.

Solution: Match the schema in the source and target environment match.

If the schema is invalid in the target environment, ensure that you edit the schema prior to installing the package.

3. When packaging artifacts, the physical files are not packaged.

Solution: Copy all the .aspx page, images files and all dependant files from the source environment to the package environment before installing package.

4. An artifact that was not installed by package gets when uninstalling Package.

Scenario:This behavior occurs, in case you install and uninstall an artifact through the package. After uninstalling the package create an artifact in target environment with the same name as the one uninstalled by the package. Later, when you uninstall this artifact which was manually created through package, the artifact gets uninstalled. Refer to the following illustration:

Illustration:

1. Create an artifact **[Artifact-1]** and add it to a package **[Package-1].**
2. Publish, generate, and export **[Package-1],** in the source environment.
3. Import the .awspkg file of **[Package-1],** in the target environment.
4. Install **[Package-1].** The artifact [**Artifact-1]** will be installed successfully.
5. Uninstall **[Package-1**]. **[Artifact-1**] will be uninstalled.
6. Create a new artifact **[Artifact-1]** and give it the same name as the artifact that was uninstalled by [**Package-1].**
7. Verify the behavior of the newly created artifact and package, when you try to update or uninstall **[Package-1].**
8. Update **[Package-1**]. An alert appears, intimating you that the artifact [Artifact-1] cannot be updated.

   [Workflow-1] was not updated as it is not the one installed by package, but the one created in step f.

   Now, verify the behavior of the artifact and package when [**Package-1]** is uninstalled.
9. Uninstall **[Package-1], [Artifact-1**] gets uninstalled.

   Probable Cause

   This occurs as the Package was uninstalled earlier and a backup of the artifact was taken. From the next consecutive attempt to uninstall, the artifacts will be deleted.

5. Error *Cannot delete the selected item. Error while loading the Assembly* appears when deleting a Forms Control installed through package, even though the dll file was copied to the specified path.

Cause

This error occurs if the Forms Control was installed through a package and the assembly dll is not present in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

specified path.

This error will reoccur even after you manually copy the required dll to the specified path in the target environment.

Solution

1. Copy the required dll from source environment to the target environment.
2. Perform an **IIS** reset.
3. Clear the temp folder and the cookies
4. Restart all AVEVA Work Tasks Services engine.
5. Uninstall the package to delete the forms control.

6. Event Association is deleted, even though Do not uninstall is selected in Package Configuration.

Probable Cause:

This occurs if the associated workflow is deleted.

Even a File Watcher Event Association that was not installed by the package will be deleted, if it is associated to the workflow that is being uninstalled or deleted.

Event Association with Enterprise Console at List item Level

1. While trying to uninstall an associated package item, the following message appears:

Enterprise Console Event Association will be retained.

Analysis:

Consider that you delete an associated item after installation. You then create the item manually with the same configuration as the associated item that was installed with the package. If you try to uninstall the manually created item, you get the message that the Enterprise Console Event Association will be retained.

2. While trying to uninstall a package item, the following message appears:

Enterprise Console Event Association will not be uninstalled as it was not installed by current package.

Analysis:

Consider that an Event Association exists in the target. When you update the package, the Event Association does not get overwritten. So, when you try to uninstall the updated package, the Event Association item does not get uninstalled as it is not a part of the updated package.

3. While trying to install a package item, the following message appears:

Event Association already exists and cannot be updated.

Solution:

This message appears for event associations of all types, namely Scheduler, Enterprise Console, and File Watcher. The message appears when an item with the same configuration already exists in the target. The overwrite

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

options is not applicable for an Event Association.

If you want to install the association in the package, or use the latest event association of the package, delete the event association in the target, and run the package again.

4. While trying to update a package item of the type ListItem, the following message appears:

Invalid Enterprise Console Event Association exists. Delete the invalid Enterprise Console Event Association and run the package again.

Analysis:

This message appears only if the Enterprise Console Event Association is installed by the current package, and if the Enterprise Console Event Association is of type *ListItem*.

For example, consider that you create an Enterprise Console Event Association and associate it to a form called "Employee". Package the association and install the package in the target environment with the associated form. Now, delete the associated form, "Employee", and run the package again in update mode. You can see a message that an invalid Enterprise Console Event Association already exists and it has to be deleted.

Solution:

This message appears when an associated list item is deleted without removing the event association. Delete the existing event association manually, and run the package again.

Packageable Artifacts

You can package the following list of items:

- ArchestrA Events
- Calendar
- Workflows
- BAM
- Queue Management
- Database Connection
- Logic App Connection
- Message Queue Connections
- MQTT Connections
- Event Associations
  - Event Associations of Type Scheduler
  - Event Associations of Type Enterprise Console
  - Event Associations of Type File Watcher
  - Event Associations of Type System Platform Events
  - Event Associations of Type Logic App
  - Event Associations of Type Message Queue
- File Watcher
- Folder

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Forms
- Forms Association
- Form Controls
- Global Work Item Layout
- Lookup Settings
- Manage List
- Manage View
- Navigation List
- Queue Management
- Reports
- Report Connections
- Report Templates
- Security Group
  - Security Group - Repository Level
  - Security Group - List Level
  - Security Group - List Item Level
  - Security Group with Forms as Associated Artifacts
  - Security Group with Workflow as Associated Artifacts
- Security Right
- SOA Assembly
- SOA Folder
- Web API
- Web API Source
- Work Item Field

Following are not supported for packaging:

- ArchestrA Services Event Association
- Business Activity Monitoring (BAM)
- Users

Localization

Globalization is the process of making a product multi-lingual. It involves two phases -**Internationalization** and **Localization**.

Internationalization refers to the Design phase in software development in which the software is designed to enable its use in non-US locales. In this phase, all language-related aspects of the program are separated from the code, and are embedded in **PII** (Program Integrated Information) files.

Localization relates to the implementation phase and is the process of adapting an internationalized product to a specific language, script, cultural, and coded character set environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

AVEVA Work Tasks has been designed to facilitate localization. The **AVEVA Work Tasks Localization Guide** provides instructions to localize AVEVA Work Tasks.

Scope of Localization

You can localize all the user interfaces, messages, and all features of AVEVA Work Tasks except for the following:

1. Names of database tables and database columns
2. Engine alert messages
3. Script related messages
4. Help files
5. Features other than button names and Expression Builder tree view in the Expression Editor window
6. The font style selection option in Text Editor window for elements such as, Subject and Body
7. Any license related error messages
8. The Lookup dropdown item, " ___ out of ____ ".
9. In certain cases AVEVA Work Tasks uses inbuilt ASP functions, such as alert, webpart, or file explorer dialogs to display messages and settings. These ASP functions are browser dependent. In such cases, the button text or the property text might appear in the default browser language. Check your browser documentation for localizing the browser language settings.

Steps to Localize AVEVA Work Tasks

To localize AVEVA Work Tasks for cultures other than English (US), do the following:

1. Install your edition of AVEVA Work Tasks and activate the license by following the steps described in the *Administrator Guide*.
2. For AVEVA Work Tasks to work on an operating system with a different locale, the UI Culture for the application must be changed. Specify the following Globalization setting in the Web.Config file present in the Virtual Directory path of each site, corresponding to the application. By default, the Web.Config file is present in the following path:
   [AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\EnterpriseConsole
   If you create your own Enterprise Console, you can find the Web.Config file in the **Web** folder of your Enterprise Console.

   For example, if you are changing the culture to French, add the following entry within the **<system.web>** tag in the **web.config** file of the **Enterprise Console** site, with the **uiCulture** tag as **fr-FR**.

   ```
   <globalization culture="fr-FR" uiCulture="fr-FR" requestEncoding="utf-8"
   responseEncoding="utf-8"/>
   ```

   For more information, see the *Installing AVEVA Work Tasks Locales for Brazilian Portuguese* section in the *Administrator Guide*.
3. To achieve localization in other languages, refer http://msdn2.microsoft.com/en- us/library/ms533052.aspx for respective language codes. In case of English culture other than English (US), specify the appropriate English UICulture. For example, if your culture is English (Australian), specify the UICulture as "en-AU".

   Language Codes

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The following table 1 lists all the possible language codes used to specify various system settings.

Table 1 - Language Codes

af	Afrikaans	sq	Albanian

ts	Tsonga	tn	Tswana
tr	Turkish	uk	Ukrainian
ur	Urdu	ve	Venda
vi	Vietnamese	xh	Xhosa
ji	Yiddish	zu	Zulu

4. Create a folder for the new culture under the Locales folder. For example, to setup the locale for French, create the folder fr-FR in *C:\Program files\AVEVA\Work Tasks\\Locales\fr-FR*.
5. Copy contents of the folder *C:\Program files\AVEVA\Work Tasks\\Locales\en-US* to the new folder.
6. Change the messages in all the Text files to the new language.

   For example, if the locale is French, then in Calendar.txt change the second string for all the keys. In the key, Calendar_Heading:Calendar Control, change the String "Calendar Control" to "Commande De Calendrier".

   Here, the left string "Calendar_Heading" is a Key and the second string "Calendar Control" is the value. Similarly, change the values for the following keys and verify.

   Calendar_Name: Nom De Calendrier

   Calendar_Provider: Fournisseur

   Calendar_TimeZone: Fuseau horaire

   Calendar_InheritsFrom : Hérite

   Save the changes as Unicode Encoding since the ANSI version does not support the display of special characters.
7. Stop AVEVA Work Tasks Services and reset IIS. Delete the cache files from *C:\WINDOWS\Temp\AVEVAWorkTasksTemp* or *C:\ WinNT\Temp\AVEVAWorkTasksTemp*. Delete the Framework Temp files. For example, delete the Framework64 from the *C:\WINDOWS\Microsoft.NET\Framework64\v4.0.30319\Temporary ASP.NET* folder.
8. Now restart the AVEVA Work Tasks Services and log into the EC Application. Open the Calendar module. Verify that all the text that was localized in the Calendar.text is reflected.

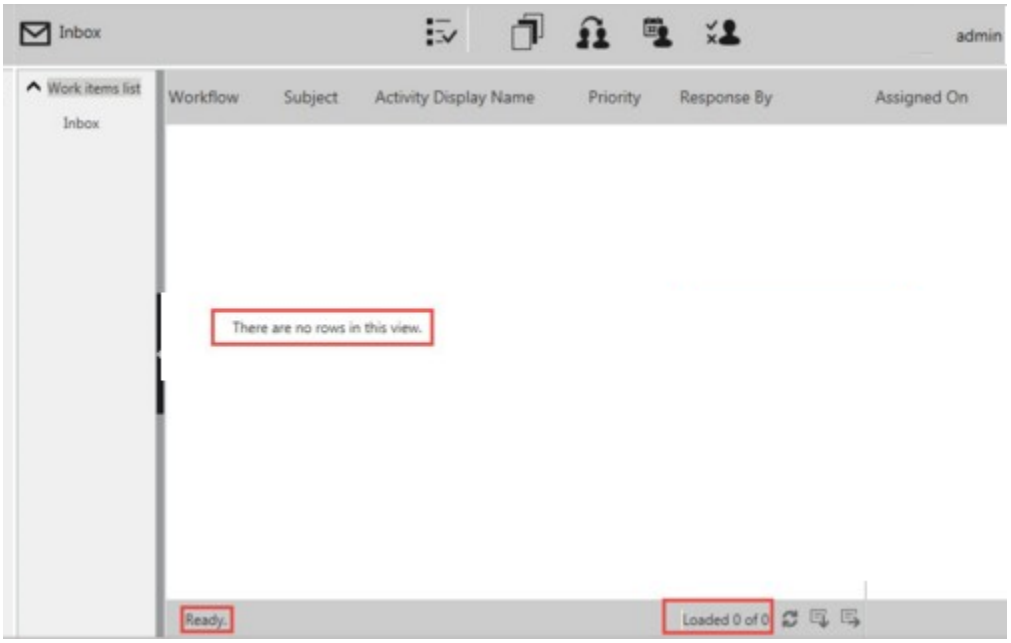
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: This change is required only for non-English cultures and need not be done for English cultures other than English (US).

9. Republish all the Forms for the new locales to get reflected.
10. To localize the user interfaces, create a locale-specific folder under the *..\WorkflowElements\Default* folder. For example, to localize user interfaces for French, create the fr-FR folder in *C:\Program files\AVEVA\Work Tasks\\Locales\fr-FR*.
11. Change the Images, JavaScripts, and StyleSheets to match the selected locale.

Steps to Localize Grid Control

In the **Grid Control**, the text highlighted in the image below can be localized using the instructions given below:



1. Follow the steps given in the link Steps to Localize AVEVA Work Tasks.
2. Refer to the following folder:

   ..\BPMUITemplates\Default\InterSoft\Grid\CommonLibrary\WebGrid\V10_0_7200\Localization

   Note: The default.xml file contains all the localization key value pairs related to the English culture. If the user configures the site in different cultures, few key value pairs might be missing. So the user will have to manually copy the missing key value pairs from default.xml to their respective culture XML file.

The value mentioned in the keys given below (Sort A to Z) are in English in other culture XML files also. If the users configures the site in different cultures, they can edit the value according to their culture.

```
<SortAscText>Sort A to Z</SortAscText>
<SortDescText>Sort Z to A</SortDescText>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to Localize Editor Control in WorkflowMemo and Wizard

Follow the instructions below to Localize Editor control in WorkflowMemo and Wizard.

1. Follow the steps given in the link Steps to Localize AVEVA Work Tasks.
2. Browse to the Telerik folder according to the theme configured to the repository. For example, if the default theme is enabled, then the Telerik folder will be inside - ..\BPMUITemplates\Default\themes\default\telerik\RadControls\Editor\Localization folder path.

   If the repository is not theme enabled, then refer to - BPMUITemplates\Default\telerik\RadControls\Editor\Localization folder path.

   Note: By default, Rad Editor localization folder contains English, French, and German culture key values. If the user configures in different cultures then the user must copy the **en-us** folder and copy it to their respective culture folders.

Steps to Localize the Escalation Email Wizard

Steps to Localize the Escalation Email wizard:

1. Follow the steps given in the link Steps to Localize AVEVA Work Tasks.
2. Change EmailBody.txt file available in **BPMUITemplates\Default\ProcessDesigner\Wizards\EmailContent\en-US**

Steps to Localize Repository Name in Enterprise Console

To Localize Repository Name in Enterprise Console

1. Follow the steps given in the link Steps to Localize AVEVA Work Tasks.
2. The repository name cannot include some characters for example certain UTF-8 and ASCII characters. To facilitate user understanding, the repository name can be localized by adding a key in the Locales folder.

Example: If the repository name is 'Human Resource' and the user wants to localize it to its Chinese equivalent '人力资源 ', the following key has to be added in the Locales folder:

SK_RepositoryDisplayName_Human Resource: 人力资源

The localized repository name will be displayed in:

1. Enterprise Console menu
2. Process Designer
3. Forms Designer

Note: The name displayed in the Database, Exception mails, and Logger Console cannot be localized. These will retain and display the original Repository name.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to Localize List Names

To Localize the List names follow the instructions given below:

1. Follow the steps given in the link Steps to Localize AVEVA Work Tasks.
2. Let us consider a user list with a list name as "Test List". The user now wants to localize the List name to Chinese language.

   In order to do this, the user has to:

   Add two keys in the Locales folder (EX: locales/en-US) in the following format:

   a. "ec_list_name_<List Name>:<Localized Name>"

   b. <List Name>:<Localized Name>

      In this scenario, it will be:

      "ec_list_name_Test List:"測試列表"

      and Test List:"測試列表"

Steps to Localize Forms

For information on localization steps, refer section *Localizing Forms* in *Forms and Lists User Guide*.

Steps to Localize Default Properties of Web Part Editor

This section gives you in-depth details of localizing the default properties of Web Part editor.

What are Default Properties

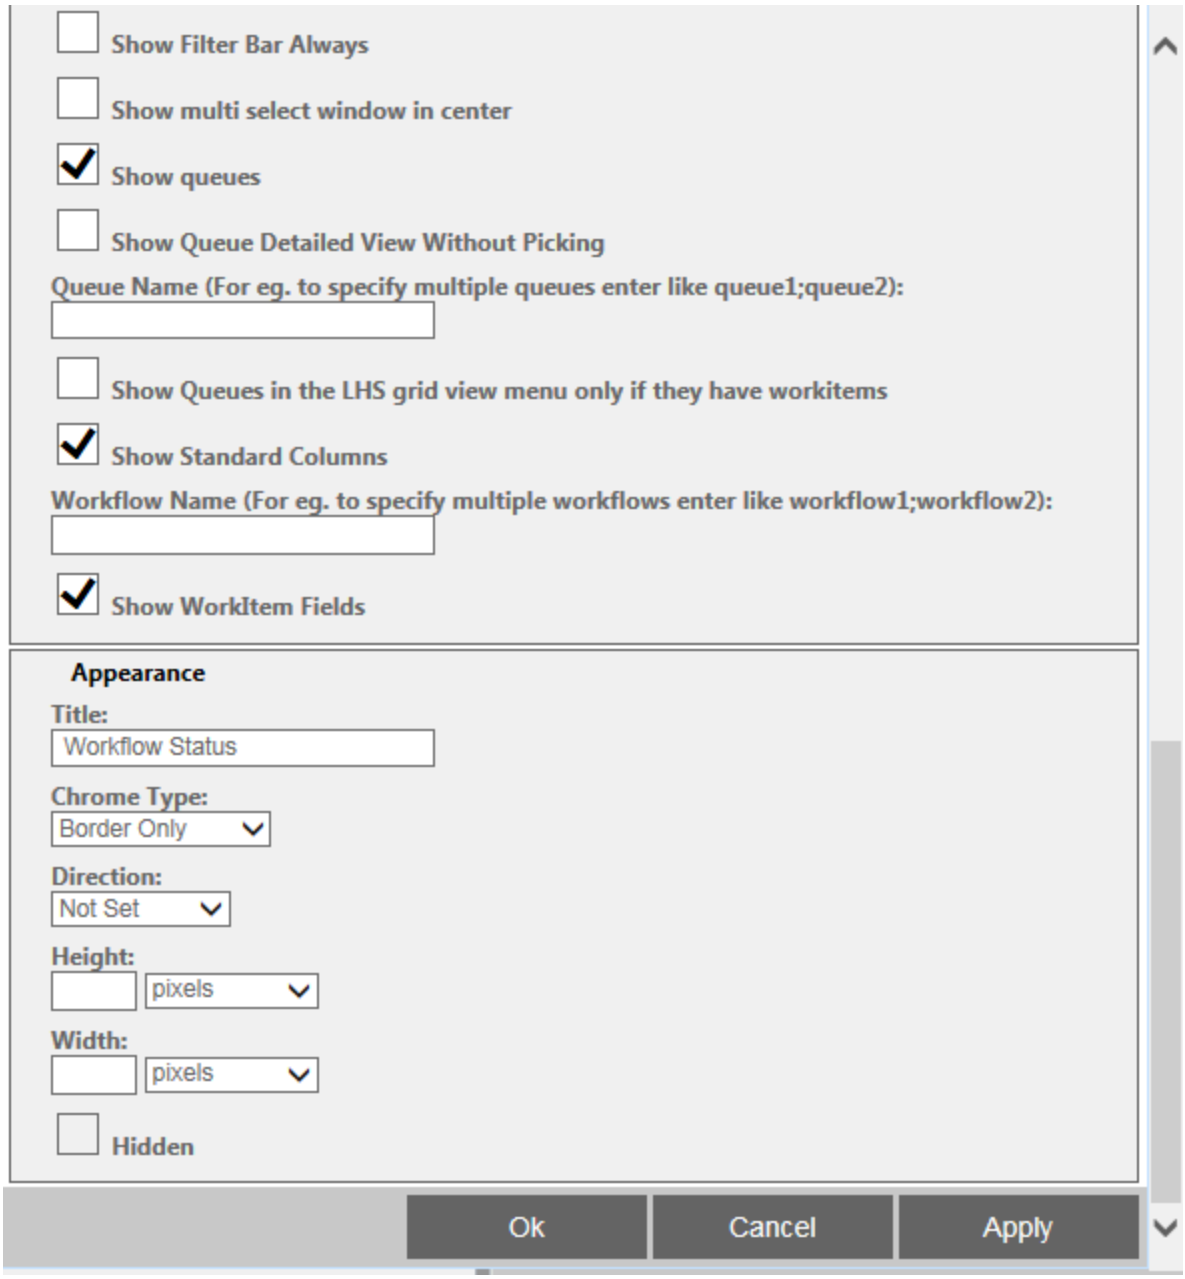
Default Properties are the properties of a web part editor which are localized internally by asp.net (Microsoft). These properties inherit the localization from the language pack specified in the web.config file.

Default Properties of Web Part Editor

Listed below are the Default Properties of the Web Part Editor:

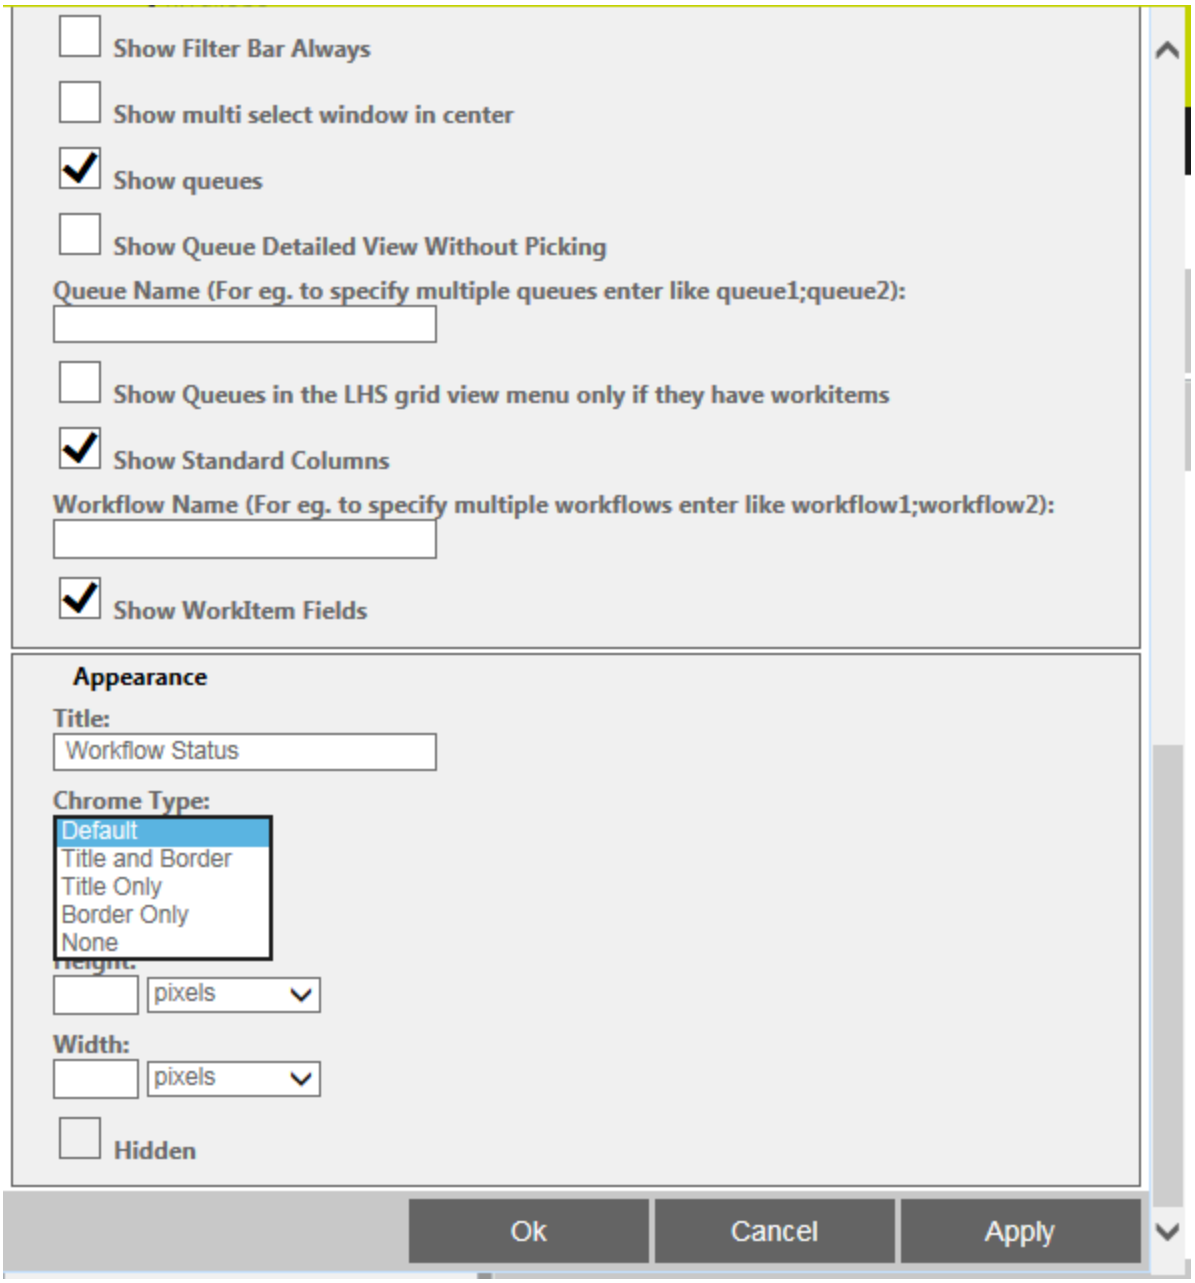
- All properties listed in the section of **Web Part Editor**, as shown in the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



- All the drop downs options of the default properties listed in the **Appearance** and **Layout** section of **Web Part Editor**, as shown in the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



1. Follow the steps given in the following link Steps to Localize AVEVA Work Tasks.
2. To localize the default properties **install the required language pack** from Microsoft web site.

Steps to Localize Provider in Role Lookup User Lookup and Assign Actor Property

In the user lookup, selecting a provider displays the localized provider property display texts in the drop down.

Pre-requisite

Follow the steps given in the following link Steps to Localize AVEVA Work Tasks.

Localizing Provider Property Display Text

The provider property display text is localized from the localization files. The key in the localization files is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

"<provider type>.<provider property display text>". If the key is found in the localization files, then the value would be picked from there; else it would use the "<provider property display text>".

For Eg: Examine the part of the data source provider XML for active directory:

```
<dataproviders>
<provider name="activedirectory" type="activedirectory">
<properties>
<property name="name" type="string"  displayname="Resource ID"
entitymappedproperty="UserName"/>
<property name="sAMAccountName" persistcolumn="UserIDString" type="string"
purpose="identifier" displayname="Account Name" entitymappedproperty="UserId"/>
:
<property name="department" type="string" purpose="department" displayname="Department"
entitymappedproperty="UserDepartment"/>
:
</provider>
</dataproviders>
```

From the above XML part, the "<provider type>" value is "activedirectory", and the "<provider property display text>" values are "Resource ID", "UserIDString", and "Department".

AVEVA Work Tasks has given localization key for two of the above property display texts from the xml part in the localization files as below:

activedirectory.Resource ID:Name

activedirectory.Account Name:Id

The bold text is the key in the localization file.

But since there is no entry for "Department" property display text, it would use the same display text, i.e., "Department".

Similar localization can be performed for provider property display texts if required.

Supported special characters for user and role lookup are:

: . / \ | } { ( ) + ' * ^ % @ ! ~ ` - _

Non-supported Localization Tags

Currently, the following sections are not localized due to internal purposes:

- Process Execution View
- ExpressionBuilder: Tree view structure
- Exception Emails. The message content in the Exception Emails have not been localized. However, other mail headings have been localized.
- All the list names in the List Name drop-down are not localized.
- Security Group Names: Except the Security Group Names, every other text in this screen is localized.
- XMLVariable Schema and tool tips are not localized.
- Tool tip for Calendar
- Tool tip for Time Picker
- Time picker heading
- Repository and Authentication Provider names in Enterprise Console Repository List page

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Localization Folders

The following folders in AVEVA Work Tasks contain localization elements:

1. Locales folder
2. Workflow Elements Folder

Locales Folder

The **<AVEVA Work Tasks Installation Folder>\Locales** folder is installed when you install AVEVA Work Tasks. This folder contains folders specific to the locale configured for the AVEVA Work Tasks installation. The default locale is "en-US" with the default path being *C:\Program files\AVEVA\Work Tasks\\Locales\en-US*.

Workflow Elements Folder

The **<AVEVA Work Tasks Installation Folder>\WorkflowElements\Default** folder is installed when you install AVEVA Work Tasks. This folder contains folders with images, JavaScript files, and Style Sheets used to render the AVEVA Work Tasks user-interface.

In addition, this folder also contains locale-specific folders that are used to localize the Images, JavaScript files, and Style Sheets for the AVEVA Work Tasks installation. The default locale folder is "en-US" with the default path being *C:\Program files\AVEVA\Work Tasks\\WorkFlowElements\Default\en-US*.

The en-US folder contains three sub-folders for Images, JavaScripts, and StyleSheet that contain the corresponding user-interface elements for the selected locale.

List of Keys to be Localized for Work Item List Control

The following are list of keys to be localized for Work Item List control:

1. **ec_newHeader** - EnterpriseConsole.txt
2. **ec_Repository** - EnterpriseConsole.txt
3. **ec_Provider** - EnterpriseConsole.txt
4. **ec_Home** - EnterpriseConsole.txt
5. **Subject** - Activities.txt
6. **Manage Work Item** - Activities.txt
7. **Workflow** - Strings.txt
8. **Activity Display Name** - WorkItemList.txt
9. **Response By** - WorkItemList.txt
10. **Assigned On** - WorkItemList.txt

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

11. **Take Ownership** - NewKeysBPM.txt
12. **Priority** - Propertypage.txt
13. **Go** - Activities.txt
14. **Approve** - Activities.txt
15. **Reject** - Activities.txt
16. **Comments** - Activities.txt
17. **Execution Details** - NewKeysBPM.txt
18. **Workflow Instance Id** - NewKeysBPM.txt
19. **Execution Details Id** - NewKeysBPM.txt
20. **Work Item Id** - NewKeysBPM.txt
21. **Activity** - NewKeysBPM.txt
22. **Data Submitted** - NewKeysBPM.txt
23. **Application** - Pdmenu.txt
24. **Show queue** - NewKeysBPM.txt
25. **Show alternate actor** - NewKeysBPM.txt
26. **Show resource calendar** - NewKeysBPM.txt
27. **Set preferences** - NewKeysBPM.txt
28. **Enable Multi Select** - NewKeysBPM.txt
29. **Disable Multi Select** - NewKeysBPM.txt
30. **Work Items list** - WorkItemList.txt
31. **Inbox** - WorkItemList.txt
32. **Worklist Folders** - WorkItemList.txt
33. **Save Layout** - WorkItemList.txt
34. **Delete Saved Layout** - WorkItemList.txt
35. **Enter the view name** - NewKeysBPM.txt
36. **View All Users** - NewKeysBPM.txt
37. **Ownership Taken?** - NewKeysBPM.txt
38. **Resource List** - Activities.txt
39. **Resource Name** - Activities.txt
40. **Action Taken** - Activities.txt
41. **Ownership** - NewKeysBPM.txt
42. **Yes** - NewKeysBPM.txt
43. **Hold** - NewkeysBPM.txt
44. **Reassign** - NewkeysBPM.txt
45. **Release** - NewkeysBPM.txt
46. **Delegate Work Item** - NewkeysBPM.txt
47. **Ownership** - NewkeysBPM.txt
48. **WorkList Layout Customization** - NewkeysBPM.txt

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

49. **AVEVA Work Tasks** - NewkeysBPM.txt
50. **Work item delivery preferences** - NewkeysBPM.txt
51. **Personal Work item delivery preferences**- NewkeysBPM.txt
52. **NOTE Work Items will be delivered to only Unchecked channels.NOTE** - NewkeysBPM.txt
53. **WebWorkList** - NewkeysBPM.txt
54. **MailWorkList** - NewkeysBPM.txt

Add the following two keys in NewKeysBPM.txt

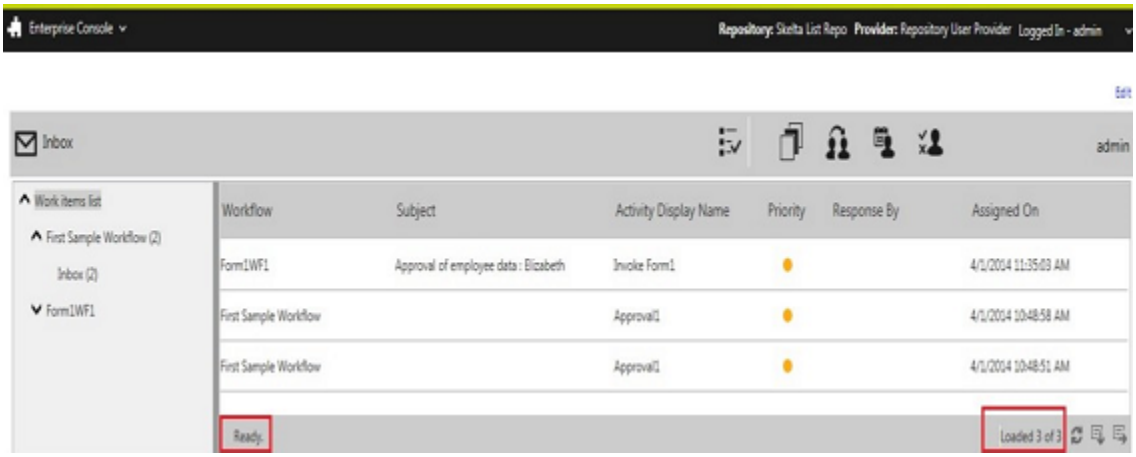
1. Layout saved successfully - NewKeysBPM.txt
2. Layout deleted successfully - NewKeysBPM.txt
3. Enable Multi Select - NewKeysBPM.txt
4. Work item list of - NewKeysBPM.txt

To set alignment for the document view, refer the file CustomDocViewDefault.html from the following path:

C:\Program files\AVEVA\Work Tasks\\WorkflowElements\Default\en-US\Activities\Activity

Keys for Localizing WebGrid Control

User can also localize WebGrids like 'Ready', 'Loading more data', 'Refreshing data'.



The keys for localizing WebGrid control are available in the following path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\BPMUITemplates\Default\InterSoft\Grid\CommonLibrary\WebGrid\V10_0_7200\Localization

Example: Suppose you want to localize the text "There are no rows in this view" in the WebGrid of Work Item page, do the following:

1. Go to [15 hive]\TEMPLATE\LAYOUTS\BPMUITemplates\Default\InterSoft\Grid\CommonLibrary\WebGrid\V10_0_7200\Localization folder.
2. Take a copy of **default.xml** file.
3. Rename this file to **wglang_en-US.xml** and change the file as shown in the following workflow.

   Before localizing

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<?xml version="1.0" encoding="utf-8" ?>
- <Localization culture="default" description="Default Language">
  - <CommonText>
      <Ready>Ready.</Ready>
      <More>Loading more data...</More>
      <LoadGroup>Loading group...</LoadGroup>
      <Sort>Sorting column...</Sort>
      <Group>Grouping column...</Group>
      <Ungroup>Ungrouping column...</Ungroup>
      <ChangeGroup>Changing group column...</ChangeGroup>
      <FilterText>Filtering column...</FilterText>
      <LoadChild>Loading child rows...</LoadChild>
      <ColumnChange>Changing columns...</ColumnChange>
      <Refresh>Refreshing data...</Refresh>
      <RefreshAll>Refreshing data and structure...</RefreshAll>
      <RefreshChild>Refreshing child table...</RefreshChild>
      <AddRow>Adding new row...</AddRow>
      <UpdateRow>Updating row...</UpdateRow>
      <DeleteRow>Deleting row...</DeleteRow>
      <ReadyError>Unhandled error occurred on last action. Click for more details.</ReadyError>
      <ColumnMove>Moving column...</ColumnMove>
      <Loaded>Loaded [n] of [total]</Loaded>
      <ExportText>Exporting...</ExportText>
      <NoData>There are no rows in this view.</NoData>
      <NewRowInfo>Please click here to add new row...</NewRowInfo>
      <GroupByBoxInfo>Drag a column header here to group by that column.</GroupByBoxInfo>
      <LoadSelfRefChild>Loading self referencing childrows...</LoadSelfRefChild>
```

After localizing:

```
wglang_en-US.xml - Notepad
File  Edit  Format  View  Help
    <LoadChild>Loading child rows...</LoadChild>
    <ColumnChange>Changing columns...</ColumnChange>
    <Refresh>Refreshing data...</Refresh>
    <RefreshAll>Refreshing data and structure...</RefreshAll>
    <RefreshChild>Refreshing child table...</RefreshChild>
    <AddRow>Adding new row...</AddRow>
    <UpdateRow>Updating row...</UpdateRow>
    <DeleteRow>Deleting row...</DeleteRow>
    <ReadyError>Unhandled error occurred on last action. Click for more details.</ReadyError>
    <ColumnMove>Moving column...</ColumnMove>
    <Loaded>Loaded [n] of [total]</Loaded>
    <ExportText>Exporting...</ExportText>
    <NoData>There are no rows to be displayed in this WebGrid.....</NoData>
    <NewRowInfo>Please click here to add new row...</NewRowInfo>
    <GroupByBoxInfo>Drag a column header here to group by that column.</GroupByBoxInfo>
    <LoadSelfRefChild>Loading self referencing childrows...</LoadSelfRefChild>
    <CalendarToday>Today</CalendarToday>
    <CalendarNone>None</CalendarNone>
    <Filtered>Filtered</Filtered>
    <Unfiltered>Unfiltered</Unfiltered>
    <LoadPreviewRow>Loading preview row...</LoadPreviewRow>
    <InputRequiredStatus>One or more cells require user input.</InputRequiredStatus>
    <UpdateSuccess>Record is updated successfully.</UpdateSuccess>
    <AddSuccess>Record is added successfully.</AddSuccess>
    <DeleteSuccess>Record is deleted successfully.</DeleteSuccess>
    <ReadOnlyCell>This cell is read only.</ReadOnlyCell>
    <ModifiedCell>This cell is modified.</ModifiedCell>
    <EditedCell>This cell is being edited.</EditedCell>
    <PagingLoading>Loading page {0}...</PagingLoading>
    <PagingStatus>Page {0} of {1}</PagingStatus>
    <PagingPartialGroup>(Record {0}-{1} of {2})</PagingPartialGroup>
  </CommonText>
  <MessageBoxText>
    <NoChildRow>There are no child rows for this record.</NoChildRow>
    <InProgress>Please wait while WebGrid is in progress processing request...</InProgress>
    <UnhandledError>Unhandled exception occurred. See following for details.</UnhandledError>
    <LoadMoreException>Load more data is only available when there are no group columns in RootTable.</LoadMoreExceptio
    <AddNewRow>The new row has been edited. Do you want to add the new row?</AddNewRow>
    <UpdateRow>The selected row has been edited. Do you want to update the changed row?</UpdateRow>
    <DeleteRow>Are you sure want to delete this row?</DeleteRow>
  </MessageBoxText>
  <Tooltip>
    <Refresh>Refresh grid data</Refresh>
    <LoadMore>Load more data</LoadMore>
    <ExportText>Export grid</ExportText>
    <Help>WebGrid.NET Client Help</Help>
    <RemoveFilters>Click to remove filters from the records</RemoveFilters>
    <RestoreFilters>Click to filter the records using the last saved filter</RestoreFilters>
    <NoFilter>There is no current filter</NoFilter>
    <InputRequired>This cell requires user input</InputRequired>
    <PagingFirst>First Page</PagingFirst>
    <PagingPrev>Previous Page</PagingPrev>
```

4. Save the file.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Keys for Localizing List Names

User can also localize list names like Workflows, Users, Event Provider, Navigation, SOA Assembly Folder, BizTalk Connections, Database Connections, File Watcher, Lookup and Dynamic Lists.

The default lists have "ec_list_name_" preceded the listname

Example:

ec_list_name_workflow:Workflow

ec_list_name_Users:Users

ec_list_name_Event Providers:Event Providers

ec_list_name_Event Associations:Event Associations

ec_list_name_Forms List:Manage Forms List

These list localization keys will be available in the following path.

[AVEVA Work Tasks Installed Path]\Locales\en-US\EnterpriseConsole.txt

To localize the list name:

1. Go to *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Locales**en-US*\ path.
2. Open **EnterpriseConsole.txt** file.
3. Provide list name that you would like to give in List Names section of the **EnterpriseConsole.txt** file as shown in the following figure.

```
// List Names
ec_list_name_Workflow:Workflows
ec_list_name_NavigationDetails:Navigation List
ec_list_name_Impersonation Users:Impersonation Users
ec_list_name_Users:Users
ec_list_name_Event Providers:Event Providers
ec_list_name_Event Associations:Event Associations
ec_list_name_Forms List:Manage Forms List
ec_list_name_Initiate Form:Initiate Form
ec_list_name_Assembly List:Assembly List
ec_list_name_Folder List:Folder List
ec_list_name_Security Right:Security Right
ec_list_name_Security Group:Security Group
ec_list_name_Security Group Mapping:Security Group Mapping
ec_list_name_BizTalk Connections:BizTalk Connections
ec_list_name_SAP Connections:SAP Connections
ec_list_name_FileWatcher List:FileWatcher List
ec_list_name_Manage List:Manage List
ec_list_name_Connection List:Connection List
ec_list_name_Lookup List:Lookup List
ec_list_name_List-Form Association List:List-Form Association List
```

4. Save the file.

Example: Localize Workflows to List of Workflows

To do the same:

1. Go to *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Locales**en-US*\ path.
2. Open **EnterpriseConsole.txt** file.
3. Provide list name as 'List of Workflows' in List Names section of the **EnterpriseConsole.txt** file as shown in the following figure.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Before localizing

```
// List Names
ec_list_name_Workflow:Workflows
ec_list_name_NavigationDetails:Navigation List
ec_list_name_Impersonation Users:Impersonation Users
ec_list_name_Users:Users
ec_list_name_Event Providers:Event Providers
ec_list_name_Event Associations:Event Associations
ec_list_name_Forms List:Manage Forms List
ec_list_name_Initiate Form:Initiate Form
ec_list_name_Assembly List:Assembly List
ec_list_name_Folder List:Folder List
ec_list_name_Security Right:Security Right
ec_list_name_Security Group:Security Group
ec_list_name_Security Group Mapping:Security Group Mapping
ec_list_name_BizTalk Connections:BizTalk Connections
ec_list_name_SAP Connections:SAP Connections
ec_list_name_FileWatcher List:FileWatcher List
ec_list_name_Manage List:Manage List
ec_list_name_Connection List:Connection List
ec_list_name_Lookup List:Lookup List
ec_list_name_List-Form Association List:List-Form Association List
```

After localizing

```
// List Names
ec_list_name_Workflow:List of Workflows
ec_list_name_NavigationDetails:Navigation List
ec_list_name_Impersonation Users:Impersonation Users
ec_list_name_Users:Users
ec_list_name_Event Providers:Event Providers
ec_list_name_Event Associations:Event Associations
ec_list_name_Forms List:Manage Forms List
ec_list_name_Initiate Form:Initiate Form
ec_list_name_Assembly List:Assembly List
ec_list_name_Folder List:Folder List
ec_list_name_Security Right:Security Right
ec_list_name_Security Group:Security Group
ec_list_name_Security Group Mapping:Security Group Mapping
ec_list_name_BizTalk Connections:BizTalk Connections
ec_list_name_SAP Connections:SAP Connections
ec_list_name_FileWatcher List:FileWatcher List
ec_list_name_Manage List:Manage List
ec_list_name_Connection List:Connection List
ec_list_name_Lookup List:Lookup List
ec_list_name_List-Form Association List:List-Form Association List
```

4. To verify this, login to the **Enterprise Console**.
5. From the **Enterprise Console** pull-down menu, select Workflows. The list name is localized from the 'Workflows' to the 'List of Workflows'.

Note: If already the application is opened, then just refresh the page to reflect the localized name.

User can follow the above steps to localize the other lists.

Note: If user has created any dynamic list then an entry should be made into *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Locales**en-US**EnterpriseConsole.txt* and "ec_list_name_" should precede the new listname.

Example: Assume that the 'Employee List' is created at the repository level. The entry 'ec_list_name_employee_list' should be placed in *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Locales**en-US**EnterpriseConsole.txt* and later you can localize this dynamic list.ec_list_name_employee_list:Employees

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

List

Localize the Response Sent for an Invalid Email to the Communication Engine

The response sent for an invalid email, for the Human Activities email or for the WaitForEmail Activity, to the AVEVA Work Tasks Communication Engine, can be localized. The value of **InvalidFilterMailMessage** key in the channel.txt file is emailed as a response to any invalid email. The channel.txt file can be found at **<AVEVA Work Tasks Install Directory>/Locales/en-US.**

The (key, value) pair can be specified in the channel.txt file as follows:

InvalidFilterMailMessage: <Localized message>

A sample of the value for this key is shown below

"System could not process your mail. Some of the key words not found in your mail to process it. Reply to the original message again."

Code Samples

For detailed code samples, refer to **AVEVA Work Tasks API Scenarios**.

Note: AVEVA Work Tasks supports Microsoft .NET Framework, accordingly build all custom codes on Microsoft .NET Framework supported version.

```
if (ServiceMapping.IsServiceMappedForCurrentServer(serviceName))
{
ServiceMapping serviceMapping = new ServiceMapping(serviceName, Server.Local);
SkeltaClientService clientService = new SkeltaClientService();
try
{
clientService.Stop(serviceMapping);
clientService.Start(serviceMapping);
}
finally
{
clientService.Close();
}
}
else
throw new Exception("This service is not mapped to the current server");
}

#endregion
}
}
```

Execute Workflow

Sample code to execute a published workflow:

```
Workflow.NET.Engine.Client objclient = new Workflow.NET.Engine.Client("LeaveReportsRepo",
"Leave WF"); //Provide Application/Repository name and Workflow name.
int executionid = objclient.Execute("activedirectory::john", "<test>m</test>"); //Provide
user id string
objclient.Close();
```

Custom Activity

AVEVA Work Tasks provides a set of interfaces and their supporting classes and members for the user to create and implement a custom activity.

Configure Custom Activity without any Properties

Create a new XML file with the following code template and update as required.

```
<?xml version="1.0" encoding="utf-8"?>
<actionsdata>
<version number="3.0" />
<propertytypes>
<propertytype name="SampleCustomPropertyModified"
classname="Workflow.NET.SampleCustomPropertyModified.SampleProperty" assemblyname="bin\
SampleCustomPropertyModified.dll"
webuiclassname="Workflow.NET.SampleCustomPropertyModified.SamplePropertyWebUI"
webuiassemblyname="bin\SampleCustomPropertyModified.dll" />
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
</propertytypes>
<category name="Custom Files" sortorder="15">
<action name="CustomActivity" displayname="Custom Activity">
<description>Custom activity. </description>
<image resourcename="bell.png"></image>
<handler classname="SampleCustomAction.CustomAction" assembly="bin\
SampleCustomAction.dll"></handler>
<properties></properties>
<return>
<value helpstring="Success">Success</value>
<value helpstring="UnSuccess">UnSuccess</value>
</return>
</action>
</category>
</actionsdata>
```

If the **properties** tag exists, then append to the existing properties instead of creating additional **properties** tag. Otherwise, add an empty **properties** tag to the XML file as follows.

```
<properties></properties>
```

Note: We recommend to create a new XML file instead of editing the existing XML files.

When you package a workflow with custom activity, if you need to correct the custom activity in the target repository, follow the steps mentioned in "*Resolving Custom Activities*" and "*Correcting Custom Activities*". For more information, see Resolve Custom Activities and Correct Custom Activities.

Custom Approval Activity

AVEVA Work Tasks provides a set of interfaces and their supporting classes and members that can be implemented in the class of a custom activity to develop a AVEVA Work Tasks human activity.

The following code sample shows how to create a sample Approval activity that looks and behaves like the AVEVA Work Tasks defined Approval activity.

Procedure

Dll Reference

```
System.Web
Workflow.NET.NET2
Skelta.HWS.ActivityHandler
```

Namespace Used

```
System
System.Web
System.Web.UI
System.Collections.Generic
System.Text
System.Collections
Workflow.NET.Engine
Workflow.NET.Interfaces
Skelta.Core
Skelta.HWS
Skelta.HWS.ActivityHandler
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To create a Sample Custom Approval Activity

- Go to **Start > Visual Studio 2005 > New > Projects->Class Library->SampleApprovalActivity**. This step will create a Class Library project in the path specified by the name SampleApprovalActivity.
- Create two class files under the project SampleApprovalHandler.cs and SampleApprovalControl.cs.
- In the SampleApprovalHandler.cs class file, inherit the HWSActivityProviderBase class which is the base class for all the resource activities.
- In the SampleApprovalControl.cs class file, inherit the class ActivityUIBase which while rendering the Work Item detail view. Inherit the INativeWebFormUIControl interface and it is used for setting the Current Work Item context to be used in Work Item detail view.

  SampleApprovalHandler.cs

```
using System;
using System.Collections.Generic;
using System.Text;
using Workflow.NET;
using Workflow.NET.Storage;
using Workflow.NET.Interfaces;
using Workflow.NET.Engine;
using Workflow.NET.Engine.Interfaces;
using Skelta.Core;
using Skelta.HWS;
using Skelta.HWS.WorkListChannel;
namespace SampleApproval
{
public class SampleApprovalHandler : HWSActivityProviderBase
{
public SampleApprovalHandler()
{
}

/// <summary>
/// Resolves the property names. Existing properties can be given different names using
this API.
/// MaximumActorsRequiredForActionCompletion is used in the Skelta for getting the
property value
/// as for approval it will be Affirmative Answer for Approval [% or Number] and for
checklist it will  ///  be Affirmative Answer for CheckList [% or Number].
/// </summary>
/// <param name="propertyName">Standard property name.</param>

 <input  type='SUBMIT'  class="inputbutton" value='@@Approve@@' name='btnApprove' />
    
 <input  type='SUBMIT' class="inputbutton" value='@@Reject@@' name='btnReject' />
 </TD>
 </TR>
</TABLE>
```

- Configure the Actions.Xml which will be in Skeltainstalledpath\BPM.NET\WorkflowElements\Default\en-US\Actions\XML for the Created Sample Approval under the Custom Activities Category. While configuring the Custom Activity, we need to specify the image filename of PNG type of size 40x40 for the custom activity which should be in the following folders. [SkeltaInstalledPath]\BPM.NET\WorkflowElements\Default\en-US\Actions\Images\Normal\Large, [SkeltaInstalledPath]\BPM.NET\WorkflowElements\Default\en-US\Actions\Images\Selected\Large,[SkeltaInstalledPath]\BPM.NET\BPMUITemplates\Default\ActivityImages.

Note: If an XML exception occurs after copying the below configuration in Actions.XML, open the actions.xml file in the browser and remove the extra spaces if any.

- The new Custom Activity will get displayed in the Process Designer under the category "Custom Activities", as shown in the image below.

Custom Choice Activity

AVEVA Work Tasks provides a set of interfaces and their supporting classes that can be implemented in the class of a custom activity to provide human activity behavior.

The following code sample shows how to create a sample choice activity that looks and behaves like the AVEVA Work Tasks defined choice activity with the usage of Sample aspx property inside the Sample Choice activity.

Procedure

Dll REFERENCE

```
System.Web
Workflow.NET.NET2
Skelta.HWS.ActivityHandler
```

NAMESPACE USED

```
System
System.Web
System.Web.UI
System.Collections
System.Collections.Generic
System.Text
Workflow.NET.Engine
Workflow.NET.Interfaces
Skelta.Core
Skelta.HWS
```

To create a Sample Custom Choice Activity

1. Go to **Start > Visual Studio > New > Projects >Class Library >SampleChoiceActivity.** This step will create a Class Library project in the path specified by the name SampleChoiceActivity.
2. Create two class files under the project SampleChoiceHandler.cs and SampleChoiceControl.cs.
3. In the SampleChoiceHandler.cs class file, inherit the HWSActivityProviderBase class which is the base class

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

for all the resource activities.

4. In the SampleChoiceControl.cs class file, inherit the class ActivityUIBase while rendering the Work Item Detail view. Inherit the INativeWebFormUIControl interface and it is used for setting the Current Work Item context to be used in the Work Item Detail view

5. Build the Class Library Project and place the assembly in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\bin* folder.
6. Create an HTML Page by the name SampleChoiceUI.htm in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Activities\Activity* folder. This SampleChoiceUI.htm is used for rendering the UI in the Work Item list as a Work Item Detail view. Copy the following contents in the created HTML page.

```
<TABLE WIDTH="100%" height="100%" BORDER="0" CELLPADDING="2" CELLSPACING="1"
class='righttdbg'>
<%#errorMessage%>
<TR VALIGN="TOP">
<TD align="left" width="<%#iframewidth%>" bgcolor="<%#iframebgcolor%>">
<%#iframeui%>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
</TD>
<TD>
<TABLE WIDTH="100%" BORDER="0" CELLSPACING="1" CELLPADDING="5">
<TR>
<TD align=left class='subtitle'>
<strong>@@Comments@@</strong>
</TD>
</TR>
<TR>
<TD align="left">
<TEXTAREA name='txtComment' cols=35 rows=15 wrap="VIRTUAL"
class="inputtextarea"></TEXTAREA>
</TD>
</TR>
<!--<TR>
<TD align="center"> </TD>
</TR>-->
</TABLE>
</TD>
</TR>
<TR VALIGN="TOP">
<TD height="25" colspan=2 align="right" bgcolor="#ffffff">
<%#Position1%>
<%#Position2%>
<%#Position3%>
<%#Position4%>
<%#Position5%>
<%#Position6%>
<%#Position7%>
<%#Position8%>
<%#Position9%>
<%#Position10%>
</TD>
</TR>
</TABLE>
```

7. Configure the Actions.XML file available in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Actions\XML* path for the created Sample Choice activity in the Custom Activities category. While configuring the Custom Activity, you must specify the image filename of type .PNG. The .png image must be of size 40x40 for the custom activity. The image must be available in the following folders:

   [AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Actions\Images\Normal\Large

   [AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Actions\Images\Selected\Large

   [AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\ActivityImages

   Note: If an XML exception occurs after copying the following configuration to the Actions.XML file, open the Actions.XML file in a browser, and remove the extra spaces, if any.

   Copy the following XML code to the <category name= "Custom Activities"> section of the Actions.XML file.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For example, <category name= "Custom Activities" sortorder="6" image="custom.gif">

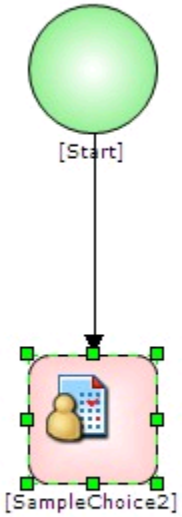
Note: Ensure to set the assembly (assembly and uihandlerassembly attributes) correctly. Also ensure that the current configuration loads the dll from AVEVA Work Tasks installed bin folder.

8. Open the Process Designer. The activity is displayed under the Custom Activities category.
9. Drag and drop the activity into the Process Designer. You can see the Custom Aspx Property in the Process Designer

The following figure shows the sample workflow created using the Sample Choice Activity.



We can the see the values set for the ASPX Property in the AVEVA Work Tasks Logger Console.

Implementation of Custom WorkItemForm

The WorkItemForm interface exposes different events available for a work item. For example, when a work item is created for an actor, a work item is updated by an actor etc.

Procedure

Dll Reference

```
System
System.Data
System.Xml
Workflow.NET.NET2
Skelta.HWS
```

Namespace Used

```
System
System.Collections.Generic
System.Text
System.Xml
Workflow.NET
Skelta.HWS.WorkListChannel
Skelta.HWS.WorkListChannel.Web
Skelta.HWS
Skelta.Core
```

To create a Custom Property

1. Go to Start->Visual Studio 2005->New->Projects->Class Library->CustomWorkItemForm. This step will create a Class Library project in the path specified by the name CustomWorkItemForm.
2. Create a class file under the project CustomWorkItemForm.cs.
3. Inherit the WorkItemFormBase class which internally implementing the IWorkItemForm interface and implement the interface ISkeltaAddInProvider. Activity and work item level information is maintained within

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the application by overriding the methods OnWorkItemTransaction, OnActivityTransaction, and OnWorkItemCreation. Suppose we want to perform some extra step when a work item is forwarded by the user, for this we can handle it in the method OnWorkItemTransaction.

```
using System;
using System.Collections.Generic;
using System.Text;
using System.Xml;
using Workflow.NET;
using Skelta.HWS.WorkListChannel;
using Skelta.HWS.WorkListChannel.Web;

}
}
```

All these methods are executed in the Transaction mode.

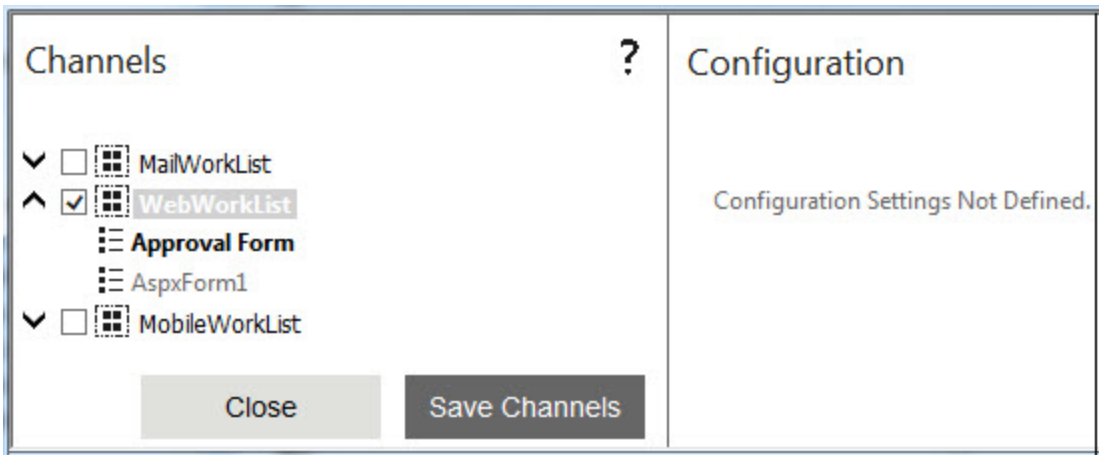
4. Compile the project and place the dll in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work TasksBPM.Net\bin* folder.
5. Configuration of Custom Work Item Form in the SKAddinProviders table of the Repository Database. Add a row in the SKAddInProviders table mentioning the type as Form and Name as return value of the method "FormType". i.e. CustomWorkItemForm as mentioned in the sample. The class name and the Assembly path should be provided accordingly. The following figure illustrates this entry:

```
Insert into
SKAddinProviders(Type,Name,Description,ClassName,Assembly,LastUpdatedDateTime)
values('Form','CustomWorkItemForm',NULL,'Skelta.HWS.WorkListChannel.Web.CustomWorkItemFo
rm',
'bin\CustomWorkItemForm.dll',getutcdate())
GO
```

Id	Type	Name	Descri...	ClassName	Assembly	Settings	IsGacAssembly	IsDefault	IsGlobal	LastUpdatedDateTime
66e15636-c8da-...	Form	CustomWorkItemForm	NULL	Skelta.HWS.WorkListChannel.Web.CustomWorkItemForm	bin\CustomWorkItemForm.dll	NULL	False	False	False	3/23/2010 12:45:55 PM
NULL	NULL	NULL	NULL	NULL	NULL	NULL	NULL	NULL	NULL	NULL

6. After the configuration of the Custom Work Item Form in the SKAddinProviders table, the CustomWorkItemForm will get displayed in the Delivery Channels Property, as shown below. The figure below shows the Approval Activity's Delivery Channels Property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



7. The messages put in the Custom Work Item form like Called for On Work Item Creation, etc can be seen in the Logger Console when we execute the workflow.

Configure Custom ASPX Property

Using the AVEVA Work Tasks defined interfaces, custom ASPX property can be created that can be used in any of the custom activity where this property can be used. This custom ASPX property will be available in the Activity Properties of the custom activity which is using this property.

Procedure

Dll Reference

```
System.Web
Workflow.NET.NET2
Workflow.NET.Web.Designer.NET2
```

Namespace Used

```
System
System.IO
System.Xml
System.Xml.XPath
System.Collections.Generic
System.Text
Workflow.NET
Workflow.NET.Engine
Workflow.NET.Interfaces
Workflow.NET.Web.Designer.Interfaces;
```

To create a Custom ASPX Property

1. Go to Start->Visual Studio 2005->New->Projects->Class Library->SampleCustomAspxProperty. This step will create a Class Library project in the path specified by the name SampleCustomAspxProperty.
2. Create two class files SampleCustomASPXProperty.cs and SampleCustomASPXPropertyWebUI.cs under the project.
3. There are two interfaces of AVEVA Work Tasks which will be used while developing a custom property. One is the IPropertyTypeWebUI interface and the other is the IPropertyType2 interface.
4. The IPropertyTypeWebUI interface is used to render the property in the Process Designer.
5. The IPropertyType2 interface is used for setting and getting the details of the property. IPropertytype2 interface inherits the IpropertyType interface internally.

   SampleCustomASPXProperty.cs Which Implements the IpropertyType2 Interface:

```
using System;
using System.IO;
using System.Xml;
using System.Xml.XPath;
using System.Collections.Generic;
using System.Text;
using Workflow.NET;
using Workflow.NET.Engine;

```
pda = new ProcessDesignerAdapter();

//To get the Process Designer details  corresponding to the current application
name,workflow name. This can be used in the ASPX pages which is getting opened from
the Process designer say menu .In the Code behind of ASPX page you will require
workflow related details like Application Name,Workflow Name and which is the current
action.
pda.LoadControlInstance(false);
ProcessDesignerControl = pda.ProcessDesignerControl;
sWorkflow = pda.ProcessDesignerControl.WorkflowName;
//Getting the Action Object from the Process Designer Control process definition
object which contains
//the details definition of the workflow by passing the action name
Workflow.NET.Action selAction =
ProcessDesignerControl.ProcessDefinition.Actions[actionname];
//Getting the property details based on the property name passed from the action
object
selProperty = selAction.Properties[propertyname];
aspxProperty =
(Workflow.NET.SampleAspxProperty.SampleCustomASPXPropertyType)selProperty.PropertyHan
dler;

if (!Page.IsPostBack)
{

if (!string.IsNullOrEmpty(aspxProperty.TextBoxValue))
 TextBox1.Text = aspxProperty.TextBoxValue;

DropDownList1.Items.Add(new ListItem("Orange", "Orange"));
DropDownList1.Items.Add(new ListItem("Yellow", "Yellow"));
DropDownList1.Items.Add(new ListItem("Green", "Green"));
DropDownList1.Items.Add(new ListItem("Blue", "Blue"));
DropDownList1.Items.Add(new ListItem("White", "White"));

if (!string.IsNullOrEmpty(aspxProperty.DropDownValue))
{
ListItem selectedItem = DropDownList1.Items.FindByValue(aspxProperty.DropDownValue);
selectedItem.Selected = true;

}
}

}

/// <summary>
/// On click Event handling of button
/// </summary>
/// <param name="sender"></param>
/// <param name="e"></param>
protected void Button1_Click(object sender, EventArgs e)
{
//Assigning to the Custom Property drop down value property with the selected
//dropdown value shown in the custom ASPX page UI
aspxProperty.DropDownValue = DropDownList1.SelectedItem.Value;
//Assigning to the Custom Property text value with the text box value shown in the
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
custom ASPX page UI
aspxProperty.TextBoxValue = TextBox1.Text;

//Writing the property values in the Xml format as defined per the WriteXML method of
the Custom
//Aspx property type
ProcessDesignerControl.WriteFile();
//To Refresh the Selected action so that the updated value appears in the property
and closing the window which shows the custom aspx page UI.
Response.Write("<script language='javascript'>
window.setTimeout('window.opener.refreshselectedaction()',100);window.opener.parent._
skProcessDesigner.RefreshProperties();window.setTimeout('window.close()',100);
</script>");

}

}
```

10. Copy the aspx page (CustomASPX.aspx and code behind) that is created to the web application BPMUITemplates\Default\ProcessDesigner folder. The sample is built to load the Custom ASPX page from this particular folder.
11. Update the property in Actions.XML under <properties> tag. Add the following tag in actions.xml under <properties> tag.

```
<propertytype name="SampleAspxProperty"
classname="Workflow.NET.SampleAspxProperty.SampleCustomASPXPropertyType"
assemblyname="Bin\SampleCustomAspxProperty.dll"
webuiclassname="Workflow.NET.SampleAspxProperty.SampleCustomASPXPropertyWebUI"
webuiassemblyname="Bin\SampleCustomAspxProperty.dll"/>
```

Now the property can be included in any custom activity under <properties> tag of Custom Activity.

For example:

```
<action name="CustomeActivity" displayname="Custom Activity">
<description>Custom Activity.</description>
<image resourcename="dummyaction.png"></image>
<handler classname="CustomeActivity.Class1" assembly="bin\
CustomeActivity.dll"></handler>
<properties>
<property name="CustomActivity Property" type="aspxproperty"></property>
</properties>
</action>
```

Custom Property

Using the AVEVA Work Tasks defined interfaces, custom property can be created that can be implemented by any custom activity. This custom property will be available in the Activity Properties of the custom activity implementing this.

```

Note: When you package a workflow with custom activity, if you need to correct the custom activity in the target repository, follow the steps mentioned in "*Resolving Custom Activities*" and "*Correcting Custom Activities*". For more information, see Resolve Custom Activities and Correct Custom Activities.

To create Custom Property

1. Go to Start->Visual Studio 2005->New->Projects->Class Library->SampleProperty. This step will create a Class Library project in the path specified by the name SampleProperty.
2. Create two class files under the project SampleProperty.cs and SamplePropertyWebUI.cs
3. There are two interfaces of AVEVA Work Tasks which will be used while developing a custom property. One is IPropertyTypeWebUI interface and the other is IPropertyType2 interface.
4. The IPropertyTypeWebUI interface is used to render the property in the Process Designer.

   Note: Add a reference to Skelta.Bpm.Quickflow.Bridge.dll.
5. The IPropertyType2 interface is used for setting and getting the details of the property. IPropertytype2 interface internally inherits the IpropertyType interface.

```

6. Build the Project.
7. Place the dll in the AVEVA Work Tasks Installed path\BPM.NET bin directory.
8. Configuration of Custom Property in the Actions.XML file (which will be located in WorkflowElements\Default\en-us\Actions\XML). We need to add the custom property under the properties tag with the classname,assemblyname,webuiclassname and webuiassemblyname for the custom property.

```
<propertytype name="SampleProperty"
classname="Workflow.NET.SampleProperty.SampleProperty"
assemblyname="bin\SampleProperty.dll"
webuiclassname="Workflow.NET.SampleProperty.SamplePropertyWebUI"
webuiassemblyname="bin\SampleProperty.dll"/>
```

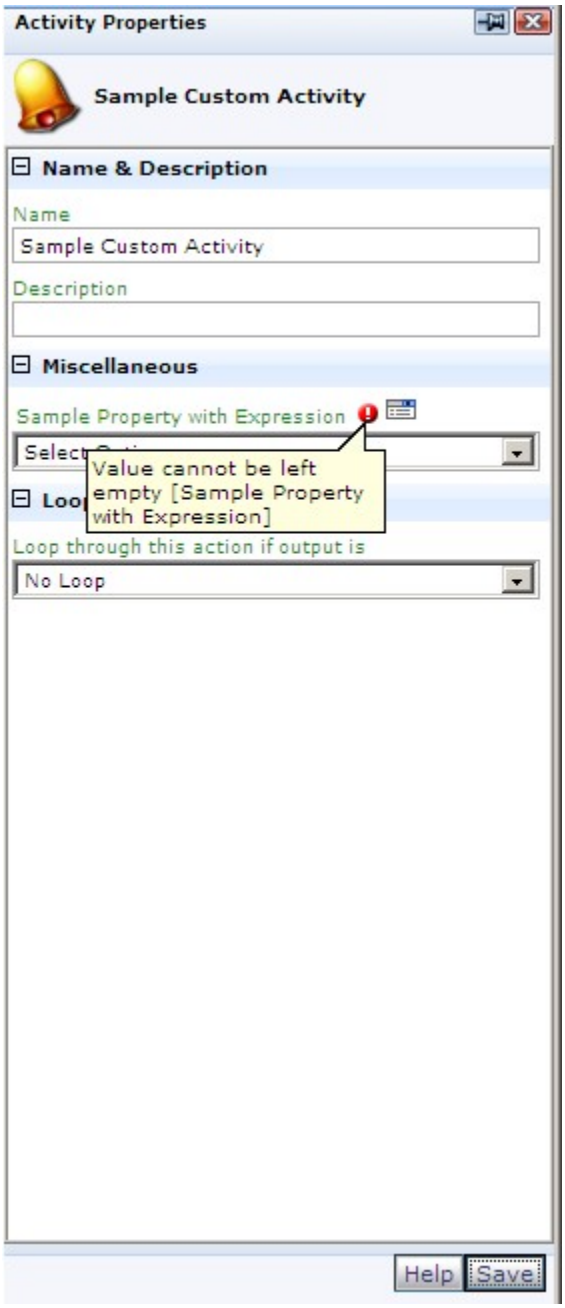
9. Configuration of Custom Property for the Custom Engine Activity (Specified in the next topic) in the Actions.XML file.

```
<action name="CustomActivity" displayname="Custom Activity">
 <description>Custom activity. </description>
 <image resourcename="Customac.png"></image>
 <handler classname="SampleCustomAction.CustomAction" assembly="bin\
SampleCustomAction.dll"></handler>
 <properties>
 <property name="Sample Property with Expression" type="SampleProperty"
mandatory="true">
 <choice>Yes;Yes</choice>
 <choice>No;No</choice>
 </property>
 </properties>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
    <return>
    <value helpstring="Success">Success</value>
    <value helpstring="UnSuccess">UnSuccess</value>
    </return>
   </action>
```

10. After the configuration of the custom property in the Actions.xml the Property will appear in the Process Designer for the specified custom activity as below. See that there is a mandatory icon that gets displayed when it is viewed from the Process Designer. This indicates that without providing the value to this property we cannot publish the workflow. The property is made mandatory using the attribute mandatory="true".



The following figure shows the property value set through the Expression Editor.

Custom Engine Activity

AVEVA Work Tasks provides an interface called IActionRun which can be implemented in the class file of a custom activity to develop a AVEVA Work Tasks engine activity.
The Engine Activity gets executed in Runtime by the Workflow Engine exe. No human intervention is required while executing the Engine Activity.

Procedure

Dll Reference

```
Workflow.NET.NET2
```

SampleProperty

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Namespace Used

```
System
System.Collections.Generic
System.Text
Workflow.NET
Workflow.NET.Interfaces
Workflow.NET.Engine
Workflow.NET.Engine.Interfaces
```

To create Custom Activity

1. Go to Start->Visual Studio->New->Projects->Class Library->SampleCustomAction. This step will create a Class Library project in the path specified by the name SampleCustomAction.
2. Add the following references:

   Workflow.NET.NET2.dll from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\bin*

   SampleProperty which is created in the previous topic of "Custom Property" from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\bin*
3. Create a class file CustomAction.cs under the project.
4. Copy the following code in CustomAction.cs and build the project.

   CustomAction.cs

```
using System;
using System.Collections.Generic;
using System.Text;
using Workflow.NET;
using Workflow.NET.Interfaces;
using Workflow.NET.Engine;
using Workflow.NET.Engine.Interfaces;
namespace SampleCustomAction
{
public class CustomAction :IActionRun
{
#region IActionRun Members

/// <summary>
/// This is maintained for backward Compatibility
/// </summary>
/// <returns></returns>
public IActivityWebUIHandler GetActivityWebUIHandler()
{
throw new Exception("The method or operation is not implemented.");
}

//// <summary>
/// The AVEVA Work Tasks workflow engine exe service calls this method to execute the
action.
/// </summary>
/// <param name="ExecutionID">Execution Id for the workflow for the current running
workflow instance.</param>
/// <param name="ExecutionDetailsID">Execution details id for the current running
action for the particular running workflow instance.</param>
/// <param name="CurrentContext">Workflow engine context which contains the details
of the Workflow.</param>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
/// <param name="CurrentAction">Current action object, This object has entire details
like properties collection used in this action. We can access the property value from
the properties collection using the CurrentAction object.</param>
/// <param name="InlinkOutput">This is the Previous Action's output which leads to
this action.</param>

//Gets the value entered for the property
customActivityPropertyValue = sampleProperty.Value;

}
//Displays the property value information in the Logger

CurrentContext.log.LogInformation("@#@ The Value of the sample property set in the
custom activity is :" + customActivityPropertyValue);

//Output of the current action. This is the return value of the current action.
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
//Suppose if you want to have conditional routing must assign a different value to
this Output parameter.

if (customActivityPropertyValue.ToUpperInvariant() == "YES")
Output = "Success";
else
Output = "UnSuccess";

return ActionResult.Completed;

}

#endregion
}
}
```

5. Place the dll in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasksbin* folder.
6. Open the **Actions.xml** file from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Actions\XML* and configure for the **Custom Activity** under **Custom Activities** category.
   It is recommended to save the Custom Activity definition as a separate XML file. This ensures that when you log on to the Enterprise Console after an upgrade, the existing Custom Activity definition is retained. You can use the following sample code as a reference while creating the XML file.

```
<?xml version="1.0" encoding="utf-8" ?>
<actionsdata>
<version number="3.0"/>
<category name= "My Custom Activities" sortorder="10"  image="custom.gif">
<action name="AbortWorkfow">
<description>Used to abort a workflow</description>
<image resourcename="icon-Control-Runtime-Workflow.png"></image>
<handler classname="CustomAction.AbortWorkflow" assembly="C:\ProgramFiles\Skelta\
BPM.NET\Bin\CustomActions\CustomAction.dll"></handler>
<properties>
<property name="Application" displayname="Repository Name" type="workflowmemo"
mandatory="true" helpstring="Name of the Repository."> </property>
<property name="Workflow" displayname="Workflow Name" type="string" mandatory="true"
helpstring="Name of the Workflow."> </property>
<property name="ExecutionID" displayname="Execution ID" type="workflowmemo"
mandatory="true" helpstring="Execution ID of the workflow instance that needs to be
aborted."> </property>
</properties>
<return>
<value helpstring="Workflow Aborted">Workflow Aborted</value>
<value helpstring="Workflow cannot be aborted">Workflow cannot be aborted</value>
<value helpstring="Couldn't Abort Workflow">Couldn't Abort Workflow</value>
</return>
</action>
</category>
</actionsdata>
```

   While configuring the Custom Activity, we need to specify the image filename of PNG type of size 40x40 for the custom activity which should be in the following folders:

   [AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Actions\Images\Normal\Large,
   [AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements\Default\en-US\Actions\Images\Selected\Large, and

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\ActivityImages

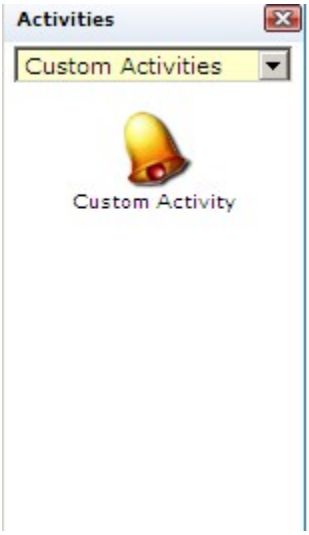
```
<action name="CustomActivity" displayname="Custom Activity">
<description>Custom activity. </description>
<image resourcename="bell.png"></image>
<handler classname="SampleCustomAction.CustomAction" assembly="bin\
SampleCustomAction.dll"></handler>
<properties>
 <property name="Sample Property with Expression" type="SampleProperty"
mandatory="true">
 <choice>Yes;Yes</choice>
 <choice>No;No</choice>
 </property>
</properties>
<return>
 <value helpstring="Success">Success</value>
 <value helpstring="UnSuccess">UnSuccess</value>
 </return>
</action>
```

Note: Suppose while configuring the Custom Activities in the Actions.XML file if you do not want to use any properties within the Custom activity, it is mandatory to specify the empty properties tag, as shown in the sample code below.

```
<action name="CustomActivity" displayname="Custom Activity">
<description>Custom activity. </description>
<image resourcename="bell.png"></image>
<handler classname="SampleCustomAction.CustomAction" assembly="bin\
SampleCustomAction.dll"></handler>
<properties></properties>
<return>
 <value helpstring="Success">Success</value>
 <value helpstring="UnSuccess">UnSuccess</value>
 </return>
</action>
```

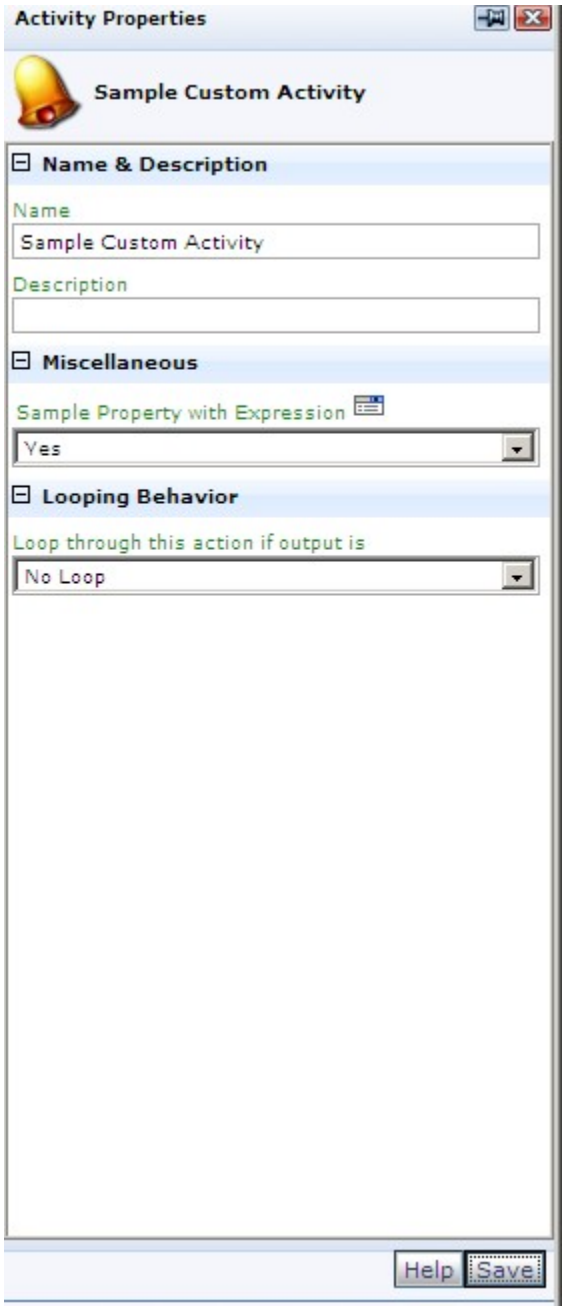
Note: Make sure to set the class name and assembly correctly for the Custom Activity. Classname="Namespace.Classname" and assembly="assembly name that you will get after building the Project".

7. Open the Process Designer and the activity should get displayed under the Custom Activities Category.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. Now you can drag and drop the activity to the Process Designer and set the property value and deploy the workflow.



9. Once you Execute a Workflow using the Custom activity you can see the set value of Property in the Logger Console after the custom activity gets executed.

Output

Configure ASPX Form as Work Item Detail View Page

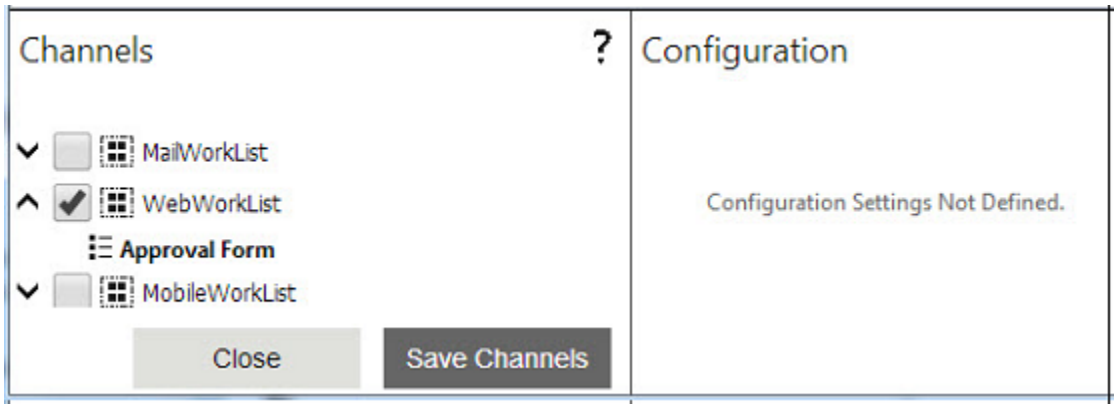
You can configure an ASPX form as the Detailed View page of the Work Item List Control. This topic describes the steps to configure the ASPX form.

To Configure the ASPX Form as a Detailed View Page

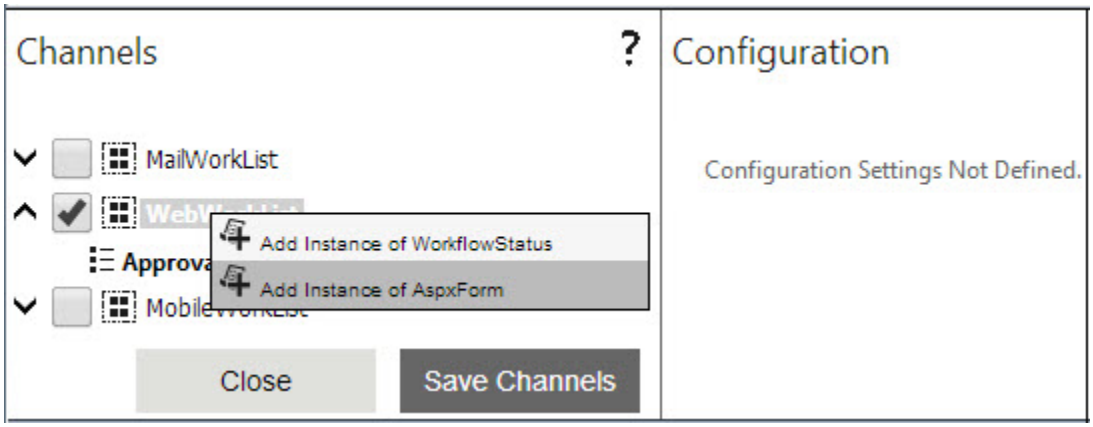
1. Select the **Human Activity**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

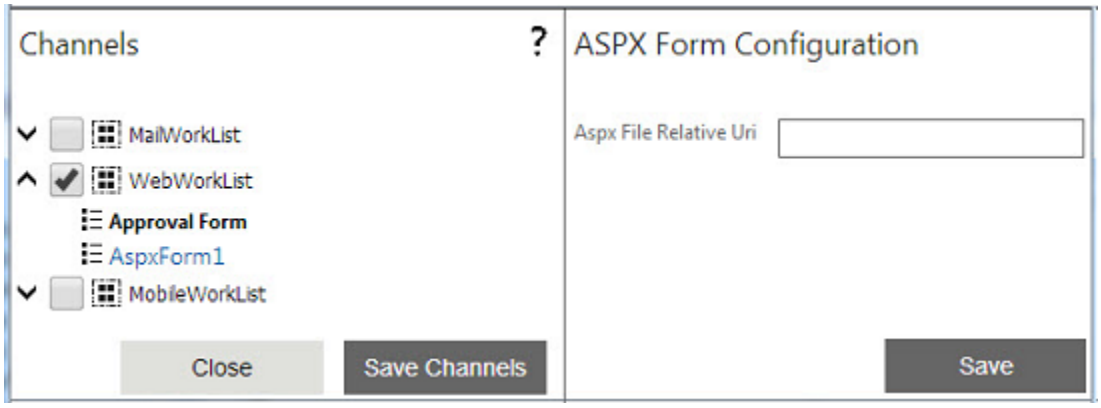
2. Click the **Delivery Channels** Property. A new window opens, as shown below.



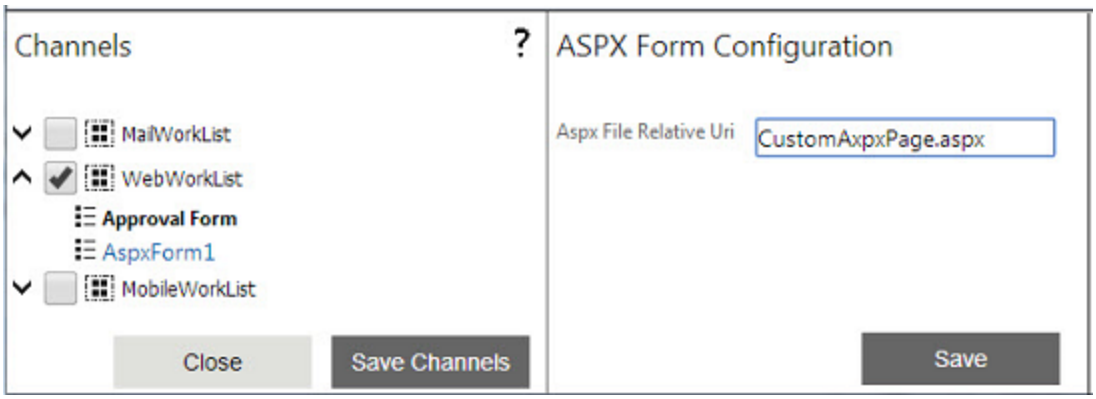
3. Right-click the WebWorkList to display the context menu with the **Add Instance of Aspx form** option, as shown below.



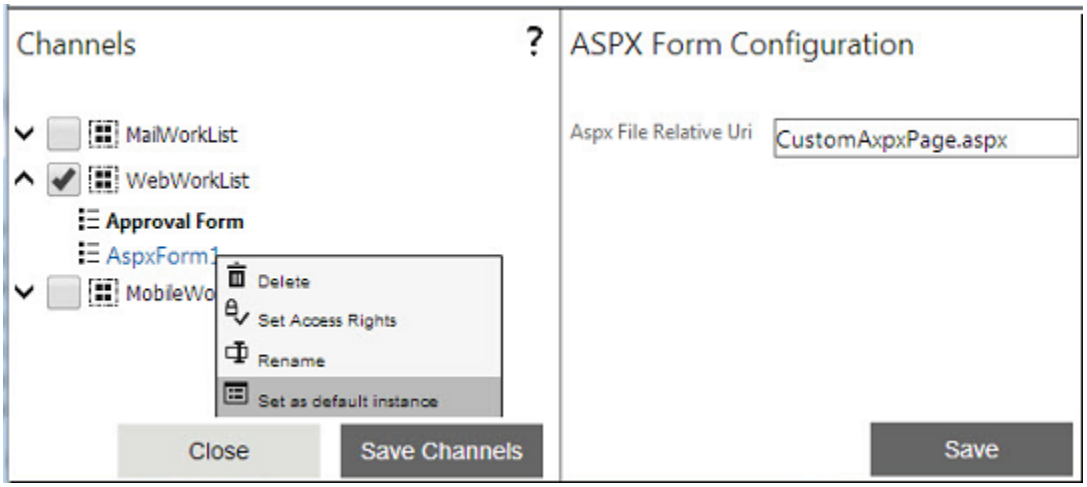
4. Click the Add Instance of Aspx form option. In the configuration settings fields that are displayed, specify the URL of the ASPX form, as shown below. You can specify the Relative or absolute Url in the text box.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



5. If you are accessing the Work Item List Control from the EC Site, then the CustomAspxPageDefault.aspx page should reside in the BPMUITemplates\Default\Repository\Site folder.
6. Set the Aspxform1 as the default instance by right-clicking Aspxform1 and selecting the **Set as default instance** option from the context menu.



7. Click the Save and Save Channels buttons.
8. Following are the steps and code samples for the Custom Aspx form to appear as Work Item detail view.
9. Create the CustomAspxPageDefault.aspx and CustomAspxPageDefault.aspx.cs in the BPMUITemplates\Default\Repository\Site folder.
10. In the CustomAspxPageDefault.aspx.cs file we will get the work item details using the Skelta.HWS.WorkListChannel.Web.WebWorkItemAdapter object. The Url respective to Work Item controls are secured. The Secured Url is getting build when we select a row from the Work Item list control using the WebWorkItemAdapter object. In the Custom Aspx page, we need to access the work item related details from the Secured url. The Processing of Secured url is achieved through the WebWorkItemAdapter object.

CustomAspxPageDefault.aspx

```
<%@ Page Language="C#" AutoEventWireup="true" CodeFile="CustomAspxPageDefault.aspx.cs"
Inherits="CustomASPXForm" %>

```
// The Url respective to Workitem controls are secured.
// The Secured Url is getting build when we select a row from the Workitem list control
 using the WebWorkItemAdapter object.
// In the Custom Aspx page we need to access the workitem related details from the Secured
url.
// The Processing of Secured url is achieved through the WebWorkItemAdapter object.
```

```
Skelta.HWS.WorkListChannel.Web.WebWorkItemAdapter adapter = new
Skelta.HWS.WorkListChannel.Web.WebWorkItemAdapter();

//ProcessWebChannelRequest Method is used to Decrypt the Securedurl passed to the Detail
Page and
//get the details related to Workitem like
 Applicationname,workflowname,executionid,currentworkitem etc
adapter.ProcessWebChannelRequest();

//adapter.CurrentWorkItem will give you the entire selected Workitem object details.
wItem = adapter.CurrentWorkItem;

//adapter.ApplicationName will give you the application name.
_application = adapter.ApplicationName;

//adapter.WorkflowName will give you the workflow name.
_workflow = adapter.WorkflowName;
```

```
//This is getting the Workitem id from the Workitem object
_workitemId = wItem.Id;

//adapter.CurrentWorkItem.Subject will give you the value of the Subject defined for the
activity
_workitemSubject = adapter.CurrentWorkItem.Subject;

//adapter.CurrentWorkItem.Subject will give you the value of the activity display name
_activityname = adapter.CurrentWorkItem.CurrentActivity.ActionDisplayName;

//adapter.CurrentWorkItem.ExecutionId will give you the Workflow Execution Id
_instanceid = adapter.CurrentWorkItem.ExecutionId.ToString();
```

```
//To Get the Possible outputs defined for the selected activity
System.Collections.Generic.Dictionary<string, string> GetStatusList = new
System.Collections.Generic.Dictionary<string, string>();
GetStatusList =
((Skelta.HWS.IHWSActivityProvider)adapter.CurrentWorkItem.HWSActivity.CurrentActivityHandle
r).GetPossibleStatusList();

foreach (string kvp in GetStatusList.Keys)
{
ddlStatus.Items.Add(new ListItem(kvp,GetStatusList[kvp]));

}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
btnSubmit.Click += new EventHandler(btnSubmit_Click);

}

/// <summary>
/// Event for handling the Submit button
/// </summary>
/// <param name="sender"></param>
/// <param name="e"></param>
protected void btnSubmit_Click(object sender, EventArgs e)
{
string status = ddlStatus.SelectedItem.Value;

//Submitting the Workitem
wItem.Submit("WebWorkList", status , "", "");

//Refreshing the Workitem grid after submitting the workitem
Page.ClientScript.RegisterClientScriptBlock(this.GetType(), "RefreshGrid", "<script
language='javascript'>RefreshWorkItemList();</script>");

}

}
```

Now, when you click any row in the Work items list, you will find this aspx page being displayed as the detailed view.

Get Client Credential Token

Use `GetDefaultClientCredentialToken()` method to return the client credential token using custom scope.

Syntax

```
var token = TokenServiceCommonFunctions.GetDefaultClientCredentialToken(applicationName);
```

Parameters

applicationName: Application Name

Return Value

This method returns token value of string datatype.

Example

```
//Get the default client credential token with custom scope.
var token = TokenServiceCommonFunctions.GetDefaultClientCredentialToken("applicationName");
```

Note: Use this function in the custom activity if the access token is required.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

IPropertyRoutingCondition

This interface has to be implemented by the custom property to return the dynamic routing condition values from the property.

GetRoutingConditionValues method will be available in the custom propety class which implements IPropertyRoutingCondition which returns SortedList which will be seen in the Process Designer when we link the custom action which uses this property to another Activity.

We have to define the Link tag under the Custom Activity Return tag Section.

```
<link property="PropertyNameAttribute" >;
```

Say we want to dynamically route the values based on the custom property named "SampleProperty", then we have to give the link tag under the Custom Activity Return tag Section like below.

```
<link property="SampleProperty" >;
```

Lists

This section provides information on workflow lists and creating a list item.

Workflow List

The Workflow List is a list of workflows and folders which contains workflows within it. The Workflow List provides a central interface that enables categorization of workflows.

Add Workflow Item to Workflow List

The list internally uses Form engine infrastructure. During list creation, the list columns are defined as form fields. When adding an item, values have to be set for these fields. The following code example demonstrates how to add a new work flow item to workflow list.

PROCEDURE

Dll REFERENCE

```
Workflow.NET.NET2
Skelta.forms.core
```

NAMESPACE USED

```
Workflow.NET
Skelta.forms.core
```

Try the following code in a console application by adding the above references and name spaces:

```
//Creating ListDefinition for specified Repository and List
//Here Repository="Repo1" and ListName="Workflow"
ListDefinition _listDef = ListDefinition.GetList(new
Skelta.Core.ApplicationObject(_applicationName), _listName);

//Here specify your repository name and retain the second parameter "Workflow"
//Creating a new listItem for the given list definition.
Skelta.Repository.List.ListItem newListItem = new Skelta.Repository.List.ListItem(listdef);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
//Assigning the Title and Description value for the list item.
((ListTextDataItem)newListItem.ListForm.Records[0].FindControlByID("_sys_wf_title")).Value
= "Workflow Name";

((ListTextDataItem)newListItem.ListForm.Records[0].FindControlByID("_sys_wf_desc")).Value =
"Description text";

//Accessing the ListTableForm in the Workflow list definition
ListTableForm listTableForm =
((ListTableForm)newListItem.ListForm.Records[0].FindControlByID("_sys_wfdef_form"));

//Setting the version value
((ListTextDataItem)listTableForm.Records[0].FindControlByID("_sys_wfdef_filename")).Value =
"1";

//For Workflow item, the Itemtype should be 1
newListItem.ItemType = 1;

//Accessing User context object created while logging in to Enterprise Console site
UserContext UserCtx = new UserContext();

newListItem.LoggedInUserId = UserCtx.LoggedInUserId;

// Note:User context will be available only when the user logins in the  enterprise
console.Otherwise // the LoggedInUserID has to be set manually
//Example: newListItem.LoggedInUserId = "activedirectory::John"

//For saving the item under a folder or workflow set the following property
//[ newListItem.ParentItemId = Guid of the Parent workflow folder/item ]

//Saving the list item
newListItem.Save();
```

Note: To create a workflow the itemtype should be 1 and to create a folder the itemtype should be 0.

Get All the Workflows Present in the Selected Repository

PROCEDURE

Dll REFERENCE

```
Workflow.Net.NET2
Skelta.Forms.Core
```

NAMESPACE USED

Skelta.Repository.List
Skelta.Forms.Core.Controls
```

The code below demonstrates how to get all the versions for a specified workflow.

```
//Namespaces
using Skelta.Repository.List;
using Skelta.Forms.Core.Controls;
using Workflow.NET;

//Class level Variables
string _applicationName = "MyRepo1";  //Repository Name

string Workflow="TestWf";  //Workflow name for which all version //information is required
string[] versions;  //Returns all the versions for a specified  workflow

Skelta.Repository.WorkflowList.WorkflowDataHandler wdh=new
Skelta.Repository.WorkflowList.WorkflowDataHandler(_applicationName);

//Pass the workflow name to get all the versions for this workflow
ListItemVersion[] workflowVersions=wdh.GetAllVersions(Workflow);
Versions=new string[workflowVersions.Length];

int itemCount=0;
foreach(ListItemVersion version in workflowVersions)
{
 versions[itemCount]=version.VersionStamp;
itemCount++;
}
```

Get All the Published Versions of a Workflow

PROCEDURE

Dll REFERENCE

```
Workflow.Net.NET2
Skelta.Forms.Core
```

NAMESPACE USED

```
Workflow.NET
Skelta.Repository.List
Skelta.Forms.Core.Controls
```

The code below demonstrates how to get all the published versions for a specified workflow.

```
//Namespaces
using Skelta.Repository.List;
using Skelta.Forms.Core.Controls;
using Workflow.NET;

//Class level Variables
string _applicationName = "MyRepo1";  //Repository Name
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
string _listName = "Workflow"; //This value is fixed for workflow list
string Workflow="TestWf";  //Workflow name for which all published version information is
required

//Create an object of ListDefinition class (_listDef) by passing //Repository name and List
name(Workflow) or Guid as parameters
ListDefinition _listDef=new ListDefinition.GetList(new
Skelta.Core.ApplicationObject(_applicationName), _listName);

//Id of the ListItem to import the workflow
 //This Id is obtained from the table SKEWorkflow, value fo the column Id corresponding to
your Repository Name(Application) and Workflow Name(Title)
Guid WfId = new Guid("65caf315-889e-4c46-b8d4-ea9b0e09013b");

//ListItem object for the specified workflow by passing ListDefinition object(_listDef) and
ListItem id(WFId)
Skelta.Repository.List.ListItem WFlistItem = new Skelta.Repository.List.ListItem(_listDef,
WFId);

//Get all the Published versions information for a specified workflow
ListItemVersion[] versionColl= WFlistItem.GetAllPublishedVersionsInformation();

//Creating a List for saving all the published version information for a specified workflow
List<ListItemVersion> versionList=new List<ListItemVersion>(versionColl);
```

Add Folder Item to Workflow List

The list internally uses Form engine infrastructure. During list creation, the list columns are defined as form fields. When adding an item, values have to be set for these fields.

For example: The following code example demonstrates how to add a new work flow item to Workflow list. For folder item, the Itemtype value should be 0.

PROCEDURE

Dll REFERENCE

```
Workflow.NET.NET2
Skelta.forms.core
```

NAMESPACE USED

```
Workflow.NET
Skelta.Forms.Core.Controls
```

Try the following code in a console application by adding the above references and name spaces:

```
//Creating ListDefinition for specified Repository and List
//Here Application="Repo1" and List="Workflow"
ListDefinition listdef = ListDefinition.GetList(new
Skelta.Core.ApplicationObject("Repository2"), "Workflow");

//Creating a new listItem for the given listdefinition.
Skelta.Repository.List.ListItem newListItem = new Skelta.Repository.List.ListItem(listdef);

//Assigning the Title and description for the listitem.
 ((ListTextDataItem)newListItem.ListForm.Records[0].FindControlByID("_sys_wf_title")).Value
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
= "Folder Name";
 ((ListTextDataItem)newListItem.ListForm.Records[0].FindControlByID("_sys_wf_desc")).Value
= "Description text";

//For "Folder" item, Itemtype should be 0
newListItem.ItemType = 0;

//Accessing User context created while logging in to Enterprise Console site
UserContext UserCtx = new UserContext();
newListItem.LoggedInUserId = UserCtx.LoggedInUserId;

//Note:User context will be available only when the user logins in the enterprise console.
Otherwise //the LoggedInUserID has to be set manually
//Example: newListItem.LoggedInUserId = "activedirectory::John"

//For saving the item under a folder or workflow set the following property
//newListItem.ParentItemId = Guid of the Parent workflow folder/item

//Saving the information in the database.
newListItem.Save();
```

Edit Existing Folder Item in Workflow List

The following code sample demonstrates how to edit the existing folder details available in the Workflow list.

PROCEDURE

Dll REFERENCE

```
Workflow.NET.NET2
Skelta.forms.core
```

NAMESPACE USED

```
Workflow.NET
Skelta.Forms.Core.Controls
Skelta.Repository.List
Skelta.Entity
```

Try the following code in a console application by adding the above references and name spaces:

```
//Creating ListDefinition for specified Repository and List
//Here Application="Telematics Repo" and List="Workflow"
ListDefinition listdef = ListDefinition.GetList(new
Skelta.Core.ApplicationObject("Telematics Repo"), "Workflow");
//Creating the User Context
UserContext UserCtx = new UserContext(new Guid("38D26E38-9AA2-4DBF-A6BD-5C45F9FA953E"),new
Skelta.Core.ApplicationObject("Telematics Repo"),"skeltalist") ;
Skelta.Repository.List.ListItemCollection newListItemCollection = new
Skelta.Repository.List.ListItemCollection(listdef);
DataTable dtAllRecords = new DataTable();
//Test is the folder name
dtAllRecords = newListItemCollection.GetRecords("Title", "Test",UserCtx.LoggedInUserId);
Guid folderGuid = new Guid(dtAllRecords.Rows[0]["Id"].ToString());
Skelta.Repository.List.ListItem newListItem = new Skelta.Repository.List.ListItem(listdef,
folderGuid);
//Assigning the Title and description for the listitem
((ListTextDataItem)newListItem.ListForm.Records[0].FindControlByID("_sys_wf_title")).Value
```

```
= "Testing";
((ListTextDataItem)newListItem.ListForm.Records[0].FindControlByID("_sys_wf_desc")).Value
="Description text";
//Saving the information in the database.
newListItem.Save();
```

Import the Workflow from Workflow Definition Xml

AVEVA Work Tasks provides a feature to import the workflow from the definition XML in the Process Designer. This can also be done using the AVEVA Work Tasks APIs programmatically. The following code sample demonstrates how to import the workflow.

PROCEDURE

Dll REFERENCE

```
Workflow.Net.NET2
Skelta.Forms.Core
```

NAMESPACE USED

```
Workflow.NET
Skelta.Repository.List
Skelta.Forms.Core.Controls
```

Try the following code in a console application by adding the above references and name spaces:

```
//Namespaces
using Skelta.Repository.List;
using Skelta.Forms.Core.Controls;
using Workflow.NET;

//Class level Variables

//Repository Name
string _applicationName = "MyRepo1";

//This value is fixed for workflow lists
string _listName = "Workflow";
ListDefinition _listDef = ListDefinition.GetList(new
Skelta.Core.ApplicationObject(_applicationName), _listName);

//specify path of exported workflow Xml file.
string strData = System.IO.File.ReadAllText (@"M:\SkeltaDev3.0\xml.xml");

//Id of ListItem to import the workflow
//This id is obtained from the table SKEWorkflow, value of the column Id corresponding to
your
//repository name(Application) and workflow (Title).
Guid gid = new Guid("65caf315-889e-4c46-b8d4-ea9b0e09013b");
Skelta.Repository.List.ListItem ListItemForImport = new
Skelta.Repository.List.ListItem(_listDef, gid);
ListTableForm listTableForm1 = ((ListTableForm)
ListItemForImport.ListForm.Records[0].FindControlByID("_sys_wfdef_form"));
string fileName =
(string)((ListTextDataItem)listTableForm1.Records[0].FindControlByID("_sys_wfdef_filename")
).Value;
string workflowname = ListItemForImport.Title;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
Workflow.NET.Interfaces.IDataHandler DBHandler = null;
Config ConfigObj = new Config(_applicationName);
Workflow.NET.Storage.Staging stg = new Workflow.NET.Storage.Staging(DBHandler);
stg.Update("MyRepo1", workflowname, fileName, strData);
ListItemForImport.LoggedInUserId = "skeltalist::1AA9AA25-92F8-4635-839B-CB029EB95B2F";

// If the provider is Active Directory the format is  "activedirectory::user id"
//1AA9AA25-92F8-4635-839B-CB029EB95B2F is userguid of the user admin in skelta list
//setting logged-In userid is mandatory
ListItemForImport.ChangeStatusAndUpdate(ListItemVersionStatus.Published);
```

Create New Version

The following code sample demonstrates the creation of a new version for a workflow.

PROCEDURE

Dll REFERENCE

```
Workflow.Net.NET2
Skelta.Forms.Core
```

NAMESPACE USED

```
Workflow.NET
Skelta.Repository.List
Skelta.Forms.Core.Controls
```

Try the following code in a console application by adding the above references and name spaces:

```
//Namespaces
using Skelta.Repository.List;
using Skelta.Forms.Core.Controls;
using Workflow.NET;

//Class level Variables
//Repository Name
string _applicationName = "MyRepo1";
//This value is fixed for workflow lists
string _listName = "Workflow";
ListDefinition _listDef = ListDefinition.GetList(new
Skelta.Core.ApplicationObject(_applicationName), _listName);
//specify path of exported Workflow xml file.
string strData = System.IO.File.ReadAllText(@"c:\ADSQLRep_TestWF_1.xml");

//Id of ListItem to which import the workflow
//This id is obtained from the table SKEWorkflow, value of the column Id corresponding to
your //repository name(Application) and workflow (Title).
Guid gid = new Guid("6ffa4b1f-9151-4158-b8b3-6733cf2f63ce");
Skelta.Repository.List.ListItem ListItemChangeVersion = new
Skelta.Repository.List.ListItem(_listDef, gid);
ListTableForm listTableForm1 =
((ListTableForm)ListItemChangeVersion.ListForm.Records[0].FindControlByID("_sys_wfdef_form"
));
string fileName =
(string)((ListTextDataItem)listTableForm1.Records[0].FindControlByID("_sys_wfdef_filename")
).Value;
string workflowname = ListItemChangeVersion.Title;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
Workflow.NET.Interfaces.IDataHandler DBHandler = null;
Config ConfigObj = new Config(_applicationName);
Workflow.NET.Storage.Staging stg = new Workflow.NET.Storage.Staging(DBHandler);

//Repository name
stg.Update("MyRepo1", workflowname, fileName, strData);
ListItemChangeVersion.LoggedInUserId = " skeltalist::1AA9AA25-92F8-4635-839B-CB029EB95B2F";

// If the provider is Active Directory the format is "activedirectory::user id"
//1AA9AA25-92F8-4635-839B-CB029EB95B2F is userguid of the user admin in skelta list
//setting logged-In userid is mandatory
ListItemChangeVersion.SaveAsNextMajorVersion(); // Can Create new version
 ListItemChangeVersion.ChangeStatusAndUpdate(ListItemVersionStatus.Published);
```

Create ListItem

The following code sample demonstrates the creation of a list item in the Workflows list.

PROCEDURE

Dll REFERENCE

```
Skelta.Forms.Core.dll
Workflow.Net.NET2.dll
```

NAMESPACE USED

```
Skelta.Repository.List
Skelta.Forms.Core.Controls
Workflow.NET
```

Create a console Application and execute the following code:

To create a listitem, follow the steps below:

1. Create an object (_listDef) of **ListDefinition** Class by passing application name and listname or Guid.
2. Create an object (_listItem) of **ListItem** class by passing ListDefinition object (_listDef).
3. Find the control named "_sys_wf_form" in the ListItem object (_listItem) and set to **ListMainForm** object (_listMainForm). Do the proper casting.
4. Set the "_sys_wf_title", _sys_wf_desc" controls value properties of **ListMainForm** object (_listMainForm). Do the proper castings.
5. Find the control named "_sys_wfdef_form" in the **ListItem** object(_listItem) and set to ListTableForm object (_listTableForm) . do the proper casting.
6. Set the "_sys_wfdef_filename","_sys_wfdef_productionid" controls value properties of **ListTableForm** object (_listTableForm). Do the proper castings.
7. Set the "LoggedInUserId" property of ListItem object (_listItem) to logged-In userid.
8. Finally call the save method of **ListItem** object (_listItem).

```
//Namespaces
using Skelta.Repository.List;
using Skelta.Forms.Core.Controls;
using Workflow.NET;
//Class level Variables
// Repository Name
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
string _applicationName = "MyRepo1";
// This value is fixed for workflow lists
string _listName = "Workflow";
ListDefinition _listDef;
_listDef = ListDefinition.GetList(new
Skelta.Core.ApplicationObject(_applicationName), _listName);
Skelta.Repository.List.ListItem _listItem = new
Skelta.Repository.List.ListItem(_listDef);

ListMainForm _listMainForm =
((ListMainForm)_listItem.ListForm.Records[0].FindControlByID("_sys_wf_form"));
((ListTextDataItem)_listMainForm.FindControlByID("_sys_wf_title")).Value = "TestWF";
((ListTextDataItem)_listMainForm.FindControlByID("_sys_wf_desc")).Value = "Test
Workflow";

ListTableForm _listTableForm =
((ListTableForm)_listItem.ListForm.Records[0].FindControlByID("_sys_wfdef_form"));
((ListTextDataItem)_listTableForm.Records[0].FindControlByID("_sys_wfdef_filename")).
Value = "1";
((ListIntDataItem)_listTableForm.Records[0].FindControlByID("_sys_wfdef_productionid"
)).Value = "0";
_listItem.LoggedInUserId = "skeltalist::1AA9AA25-92F8-4635-839B-CB029EB95B2F";

//1AA9AA25-92F8-4635-839B-CB029EB95B2F is userguid of the user admin in skelta list
 //setting logged-In userid is mandatory
_listItem.Save();
```

Save ListItem

Save a ListItem using list API.

The list API makes use of the following DLL references, namespaces, classes, and methods.

DLL Reference	Namespace
• Workflow.NET.NET2 • Skelta.Forms.Core	• System • Skelta.Repository.List

Class
• Skelta.Repository.List.ListDefinition • Skelta.Repository.List.ListItem

Methods
• `ListItem.Save()`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Methods
This method is used to save the ListItem.

Scenario 1

For the **Employee** list mapped to an **Emp** table with the fields such as **Title**, **Name**, **City**, **State**, **Pincode**, and **Age**, save the ListItem by running the following code.

```
using System;
using Workflow.NET;
using Workflow.NET.Engine;
using Skelta.Forms.Core.Controls;
using Skelta.Repository.List;
public class WorkflowScript0144412702584f2a8852a95a0a727737
{
public string Run(int ExecutionId, int ExecutionDetailsId, Workflow.NET.Engine.Context ctx,
Workflow.NET.Action action, string inlink)
{
string applicationname = ctx.ApplicationName;
string listname = "Employee";
ListDefinition lstdef = new ListDefinition(new
Skelta.Core.ApplicationObject(applicationname), listname);
Skelta.Repository.List.ListItem listItem = new Skelta.Repository.List.ListItem(lstdef);
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("Title"))).Value = "T3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("Name"))).Value = "A3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("City"))).Value = "C3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("State"))).Value = "S3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("PinCode"))).Value =
"P3";
((ListIntDataItem)(listItem.ListForm.Records[0].FindControlByName("Age"))).Value = "20";
listItem.Save();
return "saved";
}
}
```

Scenario 2

If we add a new column to the **Emp** Table say **Department**, then we need to call the `ClearTableNameKeyFromTableCollection` API before calling the `listitem.save()`.

```
Skelta.Core.DS.SingleTableObject.ClearTableNameKeyFromTableCollection(ctx.DataHandler.DataSourceTyp
applicationname, "EmpTable");
```

```
using System;
using Workflow.NET;
using Workflow.NET.Engine;
using Skelta.Forms.Core.Controls;
using Skelta.Repository.List;
public class WorkflowScript0144412702584f2a8852a95a0a727737
{
public string Run(int ExecutionId, int ExecutionDetailsId, Workflow.NET.Engine.Context ctx,
Workflow.NET.Action action, string inlink)
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
{
string applicationname = ctx.ApplicationName;
string listname = "Employee";
Skelta.Core.DS.SingleTableObject.ClearTableNameKeyFromTableCollection(ctx.DataHandler.DataS
ourceType, applicationname, "Emp");
ListDefinition lstdef = new ListDefinition(new
Skelta.Core.ApplicationObject(applicationname), listname);
Skelta.Repository.List.ListItem listItem = new Skelta.Repository.List.ListItem(lstdef);
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("Title"))).Value = "T3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("Name"))).Value = "A3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("City"))).Value = "C3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("State"))).Value = "S3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("PinCode"))).Value =
"P3";
((ListIntDataItem)(listItem.ListForm.Records[0].FindControlByName("Age"))).Value = "20";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("Department "))).Value =
"R&D";
listItem.Save();
return "saved";
}
}
```

Data Source

You can create a data source in the following ways:

- Implementing IDBConnectionString Interface
- Using ConnectionString
- Using Assembly File
- Subscribing AssemblyResolve Event while Using APIs for Database-related Activities

Implement IDBConnectionString Interface

The IDBConnectionString Interface can be used to secure the connection string configuration specified in theFarm Configuration Wizard's Database Settings screen. Custom data can be passed to the interface method by setting the inner text for the data source node.

Using this, the connection string can be moved from the configuration file to the DLL in order to enhance security. When creating a data source in Central Configuration, select the option "Connection Provider" and specify the dll generated in the Assembly Path field.

PROCEDURE

Dll REFERENCE

```
System
System.Data
Workflow.NET.NET2
```

NAMESPACE USED

```
System.Collections.Generic
System.Text
Workflow.NET
Workflow.NET.Storage
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
Workflow.NET.Interfaces
Workflow.NET.Engine
Workflow.NET.Engine.Interfaces
```

A sample implementation code is shown below.

```
public class GetConnectionString:IDBConnectionString
{
public GetConnectionString()
{

}
public GetConnectionString(string ParamAttributeFromConfigFile)
{

}

#region IDBConnectionString Members
  /// <summary>
/// This method gets called from skelta when a connection string is expected for DB
operation.
/// </summary>
/// <param name="AppName">Application Name.</param>
/// <param name="InnerTextValueFromDataSourceNode">This parameter is maintained for
backward compatibility and does not provide any value </param>
/// <returns></returns>

public string GetConString(string AppName,object InnerTextValueFromDataSourceNode)
{
return"server=localhost;database=skelta;uid=sa;pwd=;Pooling=False;";
}
#endregion
}
```

Create Data Source Using ConnectionString

The following example demonstrates the creation of data source using connection string. The data source created will be listed in the enterprise console and the repository can be created using the newly created data source.

PROCEDURE

Dll REFERENCE

```
Workflow.NET.NET2
Skelta.Configurations.DB
```

NAMESPACE USED

```
Workflow.NET
Skelta.Configurations.DB.Interfaces
Skelta.Configurations.DB
Skelta.FarmManager
```

Try the following code in a console application by adding the above references and name spaces:

```
using System;
using Skelta.Configurations.DB.Interfaces;
using Skelta.Configurations.DB;
using Workflow.NET;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
using Skelta.FarmManager;
namespace CreateDataSource
{
/// <summary>
/// Sample Class to create Data Source using Connection String
/// </summary>
class CreateDataSourceUsingConnectionString
{
static void Main(string[] args)
{
Test();
}

static void Test()
{
try
{
//Set Connection String
string connectionString = "Data Source=localhost;Integrated Security=True;";

//Provide a new name for the Database
string dataBase = "SampleDataBase";

//Creating a Data Source Object with name dataSource
DataSource dataSource = new DataSource();

//Set Name for the Data Source
dataSource.Name = "SampleDataSource";

//Check whether the Data Source Name Exists in Farm Database
DataSourceCollection datasourceCollec = new DataSourceCollection();
if (datasourceCollec.Contains(dataSource.Name))
{
datasourceCollec = null;
throw new Exception("Data Source \"" + dataSource.Name + "\" already exists in Farm
Database");
}

//Set Description for Data Source
dataSource.Description = "SampleDataSource";

//Set SourceType for Data Source(SQL=SQL Server)
dataSource.SourceType = "SQL Server";

//Set ConnectionStringXML for the Data Source
dataSource.ConnectionStringXML = "<datasource >" + connectionString + "Database=" +
dataBase + "</datasource >";

//Set DataBase handler
IDBCore coreHandler = DBCoreHandler.GetHandler(connectionString, "SQL Server");

//Create a new DataBase with Product Tables
coreHandler.CreateDatabaseWithReadCommittedSnapshot(dataBase);
Console.WriteLine("Database \"" + dataBase + "\" was successfully created");
//Run the Product Script to create Product Tables in DataBase
coreHandler.RunScript(Config.GetConfigFilePath() +
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
"DatabaseScripts\\SQLServer\\Workflow.NET.sql");

//Create a Database Archive with Product Tables
coreHandler = DBCoreHandler.GetHandler(connectionString, "SQL Server");
coreHandler.CreateDatabaseWithReadCommittedSnapshot(dataBase + "_BI");
Console.WriteLine("Database Archive \"" + (dataBase.ToString() + "_BI") + "\" was
successfully created");
//Run the Product Script to create Product Tables in DataBase Archive
coreHandler.RunScript(Config.GetConfigFilePath() +
"DatabaseScripts\\SQLServer\\Workflow.NET.sql");

//Save the Data Source
dataSource.Save();
Console.WriteLine("DataSource \"" + dataSource.Name + "\" was successfully created in the
Farm Database");
}
catch (Exception e)
{
Console.WriteLine(e.Message);
}
}
}
}
```

Create Data Source Using Assembly File

The following example demonstrates the creation of data source by fetching the connection string from the assembly file. Here the connection string is fetched from the connection class by providing the proper path in the class CreateDataSourceUsingAssembly.

PROCEDURE

Dll REFERENCE

```
Workflow.NET.NET2.dll
```

NAMESPACE USED

```
Workflow.NET
```

Create a ClassLibrary Project by name ConnectionClass and build it. Use the ConnectionClass.dll in the next Sample code.

```
using System;
using Workflow.NET.Interfaces;
namespace ClassLibrary1
{
/// <summary>
/// Sample Class to retrieve Connection String
/// </summary>
public class ConnectionClass : IDBConnectionString
{
public string GetConnectionString(string ApplicationName, object Parameter)
{
// Database Name is not required.New database will be created in the below code sample
return "Data Source=localhost;Integrated Security=True;Pooling=False;";
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
}
}
}
```

Give the path of the ConnectionClass.dll, created by the above sample code for restarting AVEVA Work Tasks services as a parameter to the Method LoadAssembly () in the below code.

IDBConnectionString

PROCEDURE

Dll REFERENCE

```
Workflow.NET.NET2.dll
Skelta.Configurations.DB.dll
```

NAMESPACE USED

```
Skelta.Configurations.DB.Interfaces
Skelta.Configurations.DB
Workflow.NET
Skelta.FarmManager
```

Add the reference of the ConnectionClass.dll that is created above.

Try the following code in a console application by adding the above references and name spaces:

```
using System;
using Skelta.Configurations.DB.Interfaces;
using Skelta.Configurations.DB;
using Workflow.NET;
using Skelta.FarmManager;
namespace CreateDataSource
{
/// <summary>
/// Sample Class to create Data Source using Assembly file.
/// Add Reference ConnectionClass.dll to this code before running it.
/// </summary>
class CreateDataSourceUsingAssembly
{
static void Main(string[] args)
{
Test();
}

static void Test()
{
try
{
string _ClassName = "";
string connectionString = "";

//Provide the new  Database name
string dataBase = "SampleDataBase";

//Creating a Data Source Object with name dataSource
DataSource dataSource = new DataSource();

//Provide the new Name for the Data Source
dataSource.Name = "SampleDataSource";

//Check whether the Data Source Name Exists in Farm Database
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
DataSourceCollection datasourceCollec = new DataSourceCollection();
if (datasourceCollec.Contains(dataSource.Name))
{
datasourceCollec = null;
throw new Exception("Data Source \"" + dataSource.Name + "\" already exists in Farm
Database");
}

//Set Description for Data Source
dataSource.Description = "SampleDataSource";

//Set SourceType for Data Source(SQL=SQL Server)
dataSource.SourceType = "SQL Server";

//Get Connection String from an Assembly

//*****Give the proper path of the ConnectionClass.dll for LoadAssembly Method********
\\ Provide the path of the Connection class dll that you created in the third code sample
Implementation of IDBConnectionString
System.Reflection.Assembly getAssembly =
Workflow.NET.CommonFunctions.LoadAssembly("C:\\ConnectionClass\\bin\\Debug\\ConnectionClass
.dll");
foreach (Type counterType in getAssembly.GetTypes())
{
if (counterType.IsClass)
{
if (Workflow.NET.CommonFunctions.IsInterfaceImplementedByType(counterType,
typeof(Workflow.NET.Interfaces.IDBConnectionString)))
{
_ClassName = counterType.ToString();
break;
}
}
}
connectionString = Workflow.NET.CommonFunctions.GetConnectionString("Central Config",
_ClassName, Environment.CurrentDirectory.ToString()+"\\ConnectionClass.dll", "", "", null);

//Set ConnectionStringXML for the Data Source
dataSource.ConnectionStringXML = "<datasource >" + connectionString + "Database=" +
dataBase + "</datasource >";

//Set DataBase handler
IDBCore coreHandler = DBCoreHandler.GetHandler(connectionString, "SQL Server");

//Create a new DataBase with Product Tables
coreHandler.CreateDatabaseWithReadCommittedSnapshot(dataBase);
Console.WriteLine("Database \"" + dataBase + "\" was successfully created");
coreHandler.RunScript(Config.GetConfigFilePath() +
"DatabaseScripts\\SQLServer\\Workflow.NET.sql");
//Run the Product Script to create Product Tables in DataBase
coreHandler.RunScript(Config.GetConfigFilePath() +
"DatabaseScripts\\SQLServer\\Workflow.NET.sql");

//Create a Database Archive with Product Tables
coreHandler = DBCoreHandler.GetHandler(connectionString, "SQL Server");
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

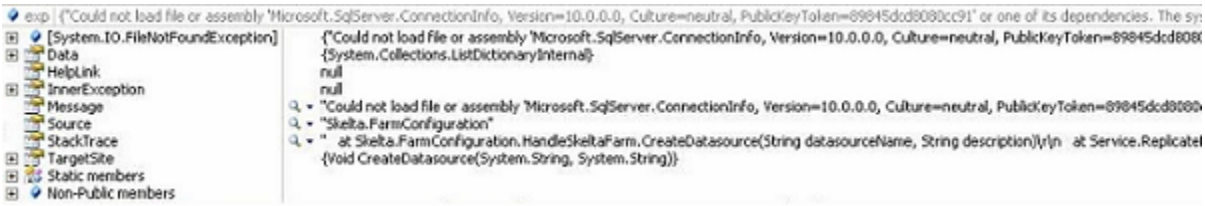
```
coreHandler.CreateDatabaseWithReadCommittedSnapshot(dataBase + "_BI");
Console.WriteLine("Database Archive \"" + (dataBase.ToString() + "_BI") + "\" was
successfully created");
//Run the Product Script to create Product Tables in DataBase Archive
coreHandler.RunScript(Config.GetConfigFilePath() +
"DatabaseScripts\\SQLServer\\Workflow.NET.sql");

//Save the Data Source
dataSource.Save();
Console.WriteLine("DataSource \"" + dataSource.Name + "\" was successfully created in the
Farm Database");
}
catch (Exception e)
{
Console.WriteLine(e.Message);
}
}
}
}
```

Subscribe AssemblyResolve Event while Using APIs for Database-related Activities

If any of the applications use AVEVA Work Tasks APIs for doing some database related activities, then the following code has to be used before calling the API.

Note: If the following code is not added then the following error message is displayed.



Code

```
AppDomain.CurrentDomain.AssemblyResolve += delegate(object sender, ResolveEventArgs e)
{
AssemblyName requestedName = new AssemblyName(e.Name);
if (requestedName.Name.Contains("Microsoft.SqlServer.ConnectionInfo"))
{
if (requestedName.Version.ToString() == "9.0.242.0")
{
throw new Exception("Can not load 9.0.242.0 dll too");
}
else
{
AssemblyName loadThis = new AssemblyName("Microsoft.SqlServer.ConnectionInfo");
loadThis.Version = new Version("9.0.242.0");
loadThis.CultureInfo = requestedName.CultureInfo;
loadThis.SetPublicKeyToken(requestedName.GetPublicKeyToken());
return Assembly.Load(loadThis);
}
}
else
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
if (requestedName.Name.Contains("Microsoft.SqlServer.Smo"))
{
if (requestedName.Version.ToString() == "9.0.242.0")
{
throw new Exception("Can not load 9.0.242.0 dll too");
}
else
{
AssemblyName loadThis = new AssemblyName("Microsoft.SqlServer.Smo");
loadThis.Version = new Version("9.0.242.0");
loadThis.CultureInfo = requestedName.CultureInfo;
loadThis.SetPublicKeyToken(requestedName.GetPublicKeyToken());
return Assembly.Load(loadThis);
}
}
else
return null;
}
};
```

Example:

If the below API is used to create a data source, then the above code sample has to be used before calling the **CreateDatasource() method.**

Using Assembly resolve event

```
AppDomain.CurrentDomain.AssemblyResolve += delegate(object sender, ResolveEventArgs e)
{
AssemblyName requestedName = new AssemblyName(e.Name);
if (requestedName.Name.Contains("Microsoft.SqlServer.ConnectionInfo"))
{
if (requestedName.Version.ToString() == "9.0.242.0")
{
throw new Exception("Can not load 9.0.242.0 dll too");
}
else
{
AssemblyName loadThis = new AssemblyName("Microsoft.SqlServer.ConnectionInfo");
loadThis.Version = new Version("9.0.242.0");
loadThis.CultureInfo = requestedName.CultureInfo;
loadThis.SetPublicKeyToken(requestedName.GetPublicKeyToken());
return Assembly.Load(loadThis);
}
}
else
{
if (requestedName.Name.Contains("Microsoft.SqlServer.Smo"))
{
if (requestedName.Version.ToString() == "9.0.242.0")
{
throw new Exception("Can not load 9.0.242.0 dll too");
}
else
{
AssemblyName loadThis = new AssemblyName("Microsoft.SqlServer.Smo");
loadThis.Version = new Version("9.0.242.0");
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
loadThis.CultureInfo = requestedName.CultureInfo;
loadThis.SetPublicKeyToken(requestedName.GetPublicKeyToken());
return Assembly.Load(loadThis);
}
}
else
return null;
}
};
HandleSkeltaFarm handlerSkeltaFarm = new HandleSkeltaFarm();
Skelta.FarmConfiguration.HandleSkeltaFarm.ConnectionStringDetails connectStrDetails = new
HandleSkeltaFarm.ConnectionStringDetails();
connectStrDetails.DataSource = "serverName";// Server name
connectStrDetails.DatabaseType = "SQL Server";
connectStrDetails.IntegratedSecurity = true;// true if Windows authentication is used
connectStrDetails.DatabaseName = "DataBaseName";// Database name
handlerSkeltaFarm.PrepareConnectionString(connectStrDetails);
handlerSkeltaFarm.CreateDatasource("DataSourcename", "Datasource description");
```

Without using Assembly resolve event

```
HandleSkeltaFarm handlerSkeltaFarm = new HandleSkeltaFarm();
Skelta.FarmConfiguration.HandleSkeltaFarm.ConnectionStringDetails connectStrDetails = new
HandleSkeltaFarm.ConnectionStringDetails();
connectStrDetails.DataSource = "serverName";// Server name
connectStrDetails.DatabaseType = "SQL Server";
connectStrDetails.IntegratedSecurity = true;// true if Windows authentication is used
connectStrDetails.DatabaseName = "DataBaseName";// Databse name
handlerSkeltaFarm.PrepareConnectionString(connectStrDetails);
handlerSkeltaFarm.CreateDatasource("DataSourcename", "Datasource description");
```

XML Variable API

ASSEMBLY REFERENCES (dlls)

```

```
Skelta.Enterprise.XmlStorageType
```

Mapping the value of XML Variable

If the defined XML variable's internal storage is of type Variable, following code has to be included while invoking the workflow.

```
Workflow.NET.VariablesCollection varCol = new Workflow.NET.VariablesCollection();

string xstring =
"<Employees><Employee><Name>John</Name><Department>Development</Department></Employee></Emp
loyees>";

// EmployeeXmlVariable is the name of the XmlVariable defined in the workflow
varCol.Add("EmployeeXmlVariable", "string", xstring);

//Initializes a new instance of the Client class with the specified application and
workflow names
Client objSKClient = new Client("MyRepository","MyWorkflow");

//xmlData can be any Content data that is being passed to the workflow
string xmlData = "<Employee><Name>John</Name></Employee>";

//Executes a workflow with a version number, user id, custom XML content and variable
collection object; xmlData is the content data
objSKClient.Execute(1,"activedirectory::Bob",xmlData,varCol);

// If the defined Xml variable's internal storage is of type: Content , XmlVariable will
take the data from the passed content provided the schema of the Content variable be the
same as passed from here.
```

Updating XML variables

The XML variables defined for a workflow can be updated by getting the current context of the work item and referring to the XML variables, _WorkFlowContext.XmlVariables.Values will give the XML variables defined in the workflow.

```
Workflow.NET.VariablesCollection varCol = new Workflow.NET.VariablesCollection();
string xstring =
"<Employees><Employee><Name>John</Name><Department>Development</Department></Employee></Emp
loyees>";

// EmployeeXmlVariable is the name of the XmlVariable defined in the workflow
varCol.Add("EmployeeXmlVariable", "string", xstring);

//Initializes a new instance of the Client class with the specified application and
workflow names
Client objSKClient = new Client("MyRepository","MyWorkflow");

//xmlData can be any Content data that is being passed to the workflow
string xmlData = "<Employee><Name>John</Name></Employee>";

//Executes a workflow with a version number, user id, custom XML content and variable
collection object; xmlData is the content data
objSKClient.Execute(1,"activedirectory::Bob",xmlData,varCol);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// If the defined Xml variable's internal storage is of type: Content , XmlVariable will
take the data from the passed content provided the schema of the Content variable be the
same as passed from here.
```

Updating the value of the node

The value of a node in the XML can be updated. Here, we will update the "Name" node value of the Employee XML using the following code.

```
//_WorkFlowContext is the runtime context object
Workflow.NET.Engine.Context _WorkFlowContext;
int executionId = 123;

//Gets the workflow Context for the specified execution id where executionId is the
Execution Id (type int) of the workflow.
_WorkFlowContext = Workflow.NET.Engine.Context.GetContext(executionId, "MyRepository");

_WorkFlowContext.XmlVariables["EmployeeXmlVariable"].RawXml =
"<Employees><Employee><Name>Kevin</Name><Department>Testing</Department></Employee></Employ
ees>";

//Updating the value of the node
object[] Submittedvalues = new object[1];
//object[1] refers to the node Name
 Submittedvalues[0] = "Ken";
 _WorkFlowContext.XmlVariables["EmployeeXmlVariable"].SetNodeValue("//Employee/Name",
Submittedvalues);
//EmployeeXmlVariable is the name of the XML variable defined in the workflow
//_WorkFlowContext is the runtime context object
```

XML String(value of the XML variable):
<Employees><Employee><Name>Kevin</Name><Department>Testing</Department></Employee</Employees>

Output(Name of the Employee in the variable has been updated):

<Employees><Employee><Name>Ken</Name><Department>Testing</Department></Employee></Employees>

Updating the Root node

To update the root node, the **XML nodelist** has to be build and the following code has to be executed.

```
 XML String (value of the XML variable):
<Employees><Employee><Name>Kevin</Name><Department>Testing</Department></Employee</Employee
s>
Output (Root node of the XML variable has been changed as shown below):
<Employees><Employee><Name>John</Name><Department>Development</Department></Employee></Empl
oyees>
Getting the value of a node of a XML Variable
To get the value of a node, the following code has to be executed.
//_WorkFlowContext is the runtime context object
Workflow.NET.Engine.Context _WorkFlowContext;
int executionId = 123;

//Gets the workflow Context for the specified execution id where executionId is the
Execution Id (type int) of the workflow.
_WorkFlowContext = Workflow.NET.Engine.Context.GetContext(executionId, "MyRepository");

//XML string, using which the root node of the XMLvariable has to be updated
string xstring =
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
"<Employees><Employee><Name>John</Name><Department>Development</Department></Employee></Emp
loyees>";
//Creating the XML nodelist
XmlDocument xdoc = new XmlDocument();
xdoc.LoadXml(xstring);
XmlNodeList xnodelist = xdoc.SelectNodes("//Employees/Employee");
//Defining the object array
object[] submittedvalues = new object[xnodelist.Count];
int i = 0;
//Fill the object array
foreach (XmlNode xnode in xnodelist)
{
 submittedvalues[i] = xnode;
i = i + 1;
 }

//Sets the updated value to the root node. Updates the EmployeeXmlVariable's (the name of
the XMLvariable which is defined in the workflow)root node with the data specified above (
xstring )

_WorkFlowContext.XmlVariables["EmployeeXmlVariable"].SetNodeValue("//Employees/Employee",
submittedvalues);
//_WorkFlowContext is the runtime context object

//_WorkFlowContext is the runtime context object
Workflow.NET.Engine.Context _WorkFlowContext;
int executionId = 123;

//Gets the workflow Context for the specified execution id where executionId is the
Execution Id (type int) of the workflow.
_WorkFlowContext = Workflow.NET.Engine.Context.GetContext(executionId, "MyRepository");

//Getting the value of the Name node from the Employee Xml
Object[] values =
_WorkFlowContext.XmlVariables["EmployeeXmlVariable"].GetNodeValues("//Employees/Employee/
Name");

//If there are many Xml Variables we can loop through the Xml variable collection to get
the required Xml Variable
//foreach (Workflow.NET.XmlVariable xVariable in //_WorkFlowContext.XmlVariables.Values)
// {
 //Getting the node values of a Xml variable
// if(xVaraiable.Name == "EmployeeXmlVariable")
// {
 // GetNodeValues returns an object array
// Object[] values = xVariable.GetNodeValues("//Employees/Employee/Name");
// break;
// }
//}
```

XML String(value of the XML variable):
<Employees><Employee><Name>Kevin</Name><Department>Testing</Department></Employee><Employee><Name>J

Output: values[0]: Kevin

values[1]: John

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Getting the XMLNodeList from XML Variable

```
//_WorkFlowContext is the runtime context object
Workflow.NET.Engine.Context _WorkFlowContext;
int executionId = 123;

//Gets the workflow Context for the specified execution id where executionId is the
Execution Id (type int) of the workflow.
_WorkFlowContext = Workflow.NET.Engine.Context.GetContext(executionId, "MyRepository");

//Getting XmlNodeList from Xml Variable
XmlNodeList nodeList=
_WorkFlowContext.XmlVariables["EmployeeXmlVariable"].GetXmlNodes("//Employees/Employee");

//if there are more no. of Xml Variables we can loop through, verify and get the Xml
NodeList
//foreach (Workflow.NET.XmlVariable xVariable in _WorkFlowContext.XmlVariables.Values)
//{
//  Getting the nodes of a Xml variable
//  if(xVariable.Name == "EmployeeXmlVariable")
// {
// XmlNodeList nodelist = //xVaraiable.GetXmlNodes(("//Employees/Employee");
// break;
// }
//}
```

<Employees><Employee><Name>Kevin</Name><Department>Testing</Department></Employee><Employee><Name>J

Output: Gives us the Employee collection(XML Node List)

XmlNode1:Employee – Kevin

XmlNode2:Employee – John

Create Web Service Using Windows Application

This example illustrates how to create a Web Service in a Windows application.

PROCEDURE

Dll REFERENCE

```
Workflow.NET.NET2
Skelta.HWS
```

NAMESPACE USED

```
System
System.Data
System.Web
System.Web.Services
System.Web.Services.Protocols
Workflow.NET
Skelta.HWS
Skelta.Core
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. In Visual Studio, open ASP.NET Web Service.
2. Add reference "Skelta.HWS.dll" and "WorkFlow.Net.Net2.dll".
3. Write the code in Appcode\Service.cs

```
using System;
using System.Data;
using System.Web;
using System.Web.Services;
using System.Web.Services.Protocols;
using Workflow.NET;
using Skelta.HWS;
using Skelta.Core;
[WebService(Namespace = "http://tempuri.org/")]
[WebServiceBinding(ConformsTo = WsiProfiles.BasicProfile1_1)]
public class Service : System.Web.Services.WebService
{
ApplicationObject application = null;
WorkflowObject workflow = null;
Actor actor = null;
public Service ()
 {

//Uncomment the following line if using designed components
//InitializeComponent();
application = new ApplicationObject("WebServiceRep");
workflow = new WorkflowObject("WebServiceWF", application);
}

[WebMethod]
public string HelloWorld()
{
return "Hello World";
}

[WebMethod]
public DataSet GetWorkItemList(string realActorId)
{
WorkItemCollection workItemCollection = new WorkItemCollection(application, workflow,
new
Actor(application, realActorId), false, "WebWorkList");
return workItemCollection.GetRecords();
}

[WebMethod]
public DataSet GetWorkItemQueueList(Guid queueId, string realActorId)
{
WorkItemCollection workItemCollection = new WorkItemCollection(application, workflow,
queueId, new Actor(application, realActorId));
return workItemCollection.GetRecords();
}

[WebMethod]
public void SubmitWorkItem(Guid workitemId, string statusSubmitted)
{
WorkItem workItem = new WorkItem(workflow, workitemId);
workItem.Submit("WebWorkList", statusSubmitted, "", "");
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
}

[WebMethod]
public string[] GetWorkItemOutputs(Guid workitemId)
{
WorkItem workItem = new WorkItem(workflow, workitemId);
System.Collections.Generic.Dictionary<string, string>  outputs =
((Skelta.HWS.IHWSActivityProvider)workItem.HWSActivity.CurrentActivity.ActionHandler)
.GetPossibleStatusList();
string[] statusList = new string[outputs.Count];
outputs.Keys.CopyTo(statusList, 0);
return statusList;
}

[WebMethod]
public void PickNextItem(Guid queueId, string realActorId)
{
Skelta.HWS.Queue.Queue queue = new Skelta.HWS.Queue.Queue(application, queueId);
Actor actor  = new Actor(application, realActorId);
Skelta.HWS.WorkItem workitem = queue.GetNextItem(queueId, actor);

workitem.PickItem(actor, true);
}

}
```

4. Design a simple workflow. Publish it and associate with an event. Note that the workflow name should be the same as mentioned above.
5. To check whether the web service you created is working or not, right-click "Service.asmx" in the Solution Explorer, and click "View in Browser". A web page should appear.
6. Use the web service in the Window Application Form. Create a Window Application in Visual Studio. For example, WebServiceApplication1.
7. Design the Form. Apply the Proper Naming Convention. Add Reference of "System.web.Services."
8. Go to Visual Studio Command Prompt.

Navigate to the Windows Application Directory in the Command Prompt. Type the following command.

wsdl /language:CS /n:"Microsoft.SqlServer.ReportingService2005"

http://localhost:1283/SupportWf/Service.asmx?WSDL(this should be URL of the Web Service)

This step is to create a code file of the Web Service. Make use of the web service class, create an object of it and start using its methods.

1. Type the code behind for the Form.

```
using System;
using System.Collections.Generic;
using System.ComponentModel;
using System.Data;
using System.Drawing;
using System.Text;
using System.Windows.Forms;

namespace WebServiceApplication1
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
public partial class Form1 : Form
{
 SupportWF sf = new SupportWF();//creating an object of Web Service Class
 string realActorId = "skeltalist::fbb172c5-5daf-4e5d-bcff-6500b95004f1";
 Guid workitemId = Guid.Empty;
 Guid queueId = new Guid("dad821c0-eec7-464d-879c-14b76d3e4a55");
public Form1()
{
InitializeComponent();
}

private void GetWorkItems_Click(object sender, EventArgs e)
{
DataSet ds = sf.GetWorkItemList(realActorId);
workitemId = Guid.Empty;

dataGridView1.DataSource = ds.Tables["CollectionBaseTable"];

dataGridView1.SelectionMode = DataGridViewSelectionMode.FullRowSelect;

}

void dataGridView1_RowEnter(object sender,
System.Windows.Forms.DataGridViewCellEventArgs e)
{
comboBox1.Items.Clear();
workitemId = new Guid(((DataGridView)sender).Rows[0].Cells[0].Value.ToString());
string[] outPuts = sf.GetWorkItemOutputs(workitemId);
foreach (string strValue in outPuts)
{
if (!comboBox1.Items.Contains(strValue))
comboBox1.Items.Add(strValue);
}
}
private void dataGridView1_CellContentClick(object sender, DataGridViewCellEventArgs e)
{

}

private void comboBox1_SelectedIndexChanged(object sender, EventArgs e)
{

}

private void GetQueueItems_Click(object sender, EventArgs e)
{
DataSet ds = sf.GetWorkItemQueueList(queueId, realActorId);
workitemId = Guid.Empty;
dataGridView1.DataSource = ds.Tables["CollectionBaseTable"];
dataGridView1.SelectionMode = DataGridViewSelectionMode.FullRowSelect;

comboBox1.Items.Clear();

}

private void PickQueueItem_Click(object sender, EventArgs e)
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
{
sf.PickNextItem(queueId, realActorId);

}

private void Submit_Click(object sender, EventArgs e)
{
string comboBoxValue = comboBox1.Text;
sf.SubmitWorkItem(workitemId, comboBoxValue);
}
}
}
```

2. Run the application. Click **GetWorkItems**, it will display the current item of the Workitem List. (Approval Activity).
3. Approval Activity has two outputs, Approved or Rejected. So in the Combo Box, it will show two WorkItem tasks. Select any WorkItem Task (Approved or Rejected) and click **Submit**. The task gets submitted to the WorkItem.
4. Click **GetQueueItems** button. The current item in the Queue will be displayed.
5. Click **PickQueueItem**, select any Queue item and click **PickQueueItem**. It will pick the item from the Queue.

SOA

SOA consists of SOA repository and SOA consumption using AVEVA Work Tasks Expression Editor and SOA Activities. SOA repository contains the registered SOA Folders and SOA assemblies. Assemblies can be registered from the GAC (Global Assembly Cache) or from the SOA folders. Once an assembly is registered it will be available for consumption in AVEVA Work Tasks.

To use it in a workflow, you need to instantiate the required class in the Start Activity. The required constructor parameter, if any, can be set while instantiating the class. Public Methods available in the class could be accessed in expression builder properties of available actions.

Examples:

- How to Use SOA in a Simple Method?
- How to Use a Web Service or Remote Service using SOA Infrastructure?
- How to Use an Application that Interacts with the SQL Server?
- How to Use Static Members of the Class?
- How to Pass the Object as Parameter to the Constructor?
- How to Use Scripting in Expression Editor?
- How to Use Expression in Constructor Parameter?
- Execute Methods with Out Parameters in SOA
- Retrieve Multiple Records from Database Using SOA

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

How to Use SOA in a Simple Method?

This example illustrates the use of SOA in a simple method in a .NET framework assembly

PROCEDURE

NAMESPACE USED

```
System
System.Collections.Generic
System.Text
```

To create a New Project

1. Launch **Microsoft Visual Studio**. The Visual Studio Start Page opens.
2. On the **File** menu, point to **New**, and then select **Project**. The New Project dialog box appears.
3. In the right pane, select **Class Library**.
4. Create your .net Class Library. For example, in the **Name** box, type MySkeltaTest.
5. Set the path to save the project. For example, in the **Location** drop-down, set the location as M:\Work.
6. In the **Solution Name** box, type the directory name. By default, it displays the directory name as the specified project name.
7. Click **OK**. The MySkeltaTest project gets created in the path M:\Work.

   Sample code to create the class

```
using System;
using System.Collections.Generic;
using System.Text;
namespace MySkeltaTest
{
public class MyTest
{
private int id;
public MyTest()
{
}
public MyTest(int inde)
{
id = inde;
}
public string GetName()
{
return "Welcome to Skelta SOA";
}
public string GetNextName()
{
return "Wonderful feature";
}
public string Unique_Name(int iID)
{
if (iID == 1return "Use WEB Service";
}
else if (iID == 2)
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
return "Access SQL Server data";
}
else if (iID == 1)
{
return "Access COM object";
}
else
return "What not";
}
}
}
```

8. Build the created project. The dll gets created in M:\Work\MySkeltaTest\MySkeltaTest\bin\Debug folder.

   Adding this folder in the SOA Folder option:

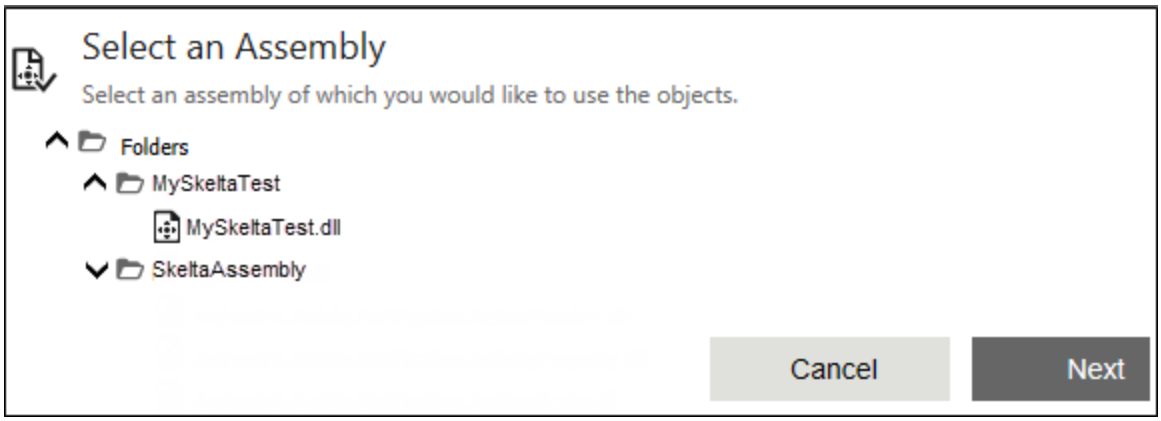
9. On the Windows Start menu, point to **All Programs**, point to **Wonderware**, point to **AVEVA Work Tasks**, and then click **Central Configuration**. The Central Configuration page appears.
10. Click Repository List. The Repository List page appears.
11. In the Site Path column, click the desired link to log on to the desired repository. You would be redirected to the Enterprise Portal.
12. Select the required **Authentication Provider**.
13. Log on to the **Enterprise Console**.
14. In the **Enterprise Console**, click the **Menu** button, click Settings, and then click SOA Folder. The Folder List page appears.
15. On the action bar, click **New**. The **Folder Configuration**- New wizard appears.
16. In the **Title** box, type a name for the folder, and in the **Description** box, type a description for the folder.
17. In the **Physical Path** box, type the physical path. For example, M:\Work\MySkeltaTest\MySkeltaTest\bin\Debug.
18. Click **View Assemblies**. All the assemblies available in the given path will be listed in the List of Assemblies section.
19. Click **Save**. The SOA folder is created.

    Adding Assembly into SOA Assembly Repository

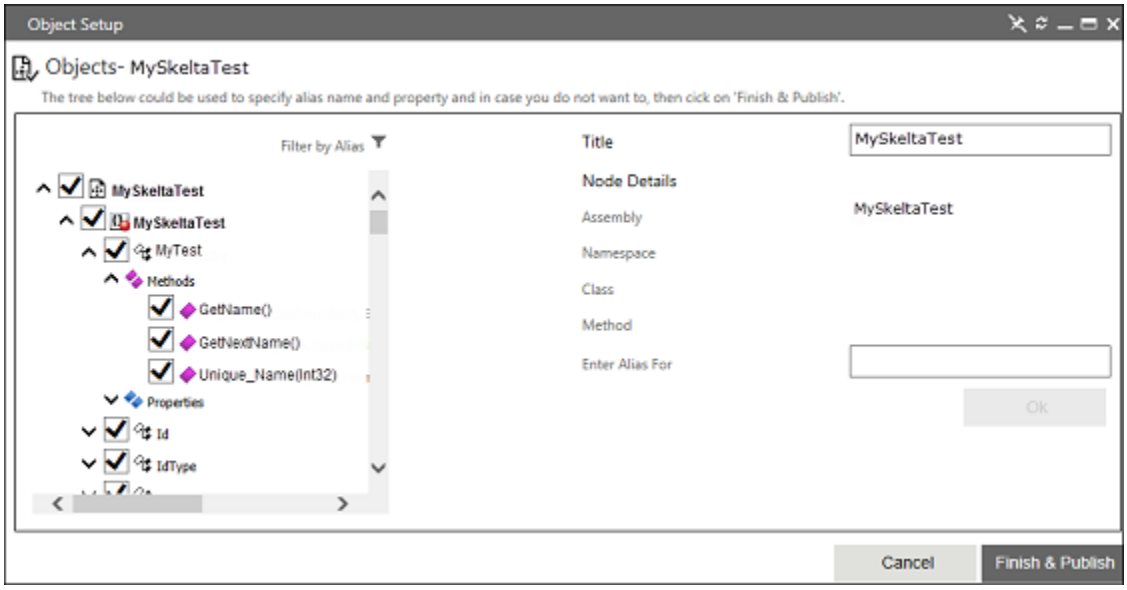
20. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **SOA Assembly**. The **Assembly List** page appears.
21. On the action bar, click **New**, and then click **From Assembly Folder** to select an assembly from a registered folder. The **Select an Assembly** page appears.
22. Select the assembly. The assembly must be a .NET Framework assembly.

    After you select an assembly, you can browse through the namespaces, classes, and methods of the assembly. You can also provide an alias for the selected methods.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



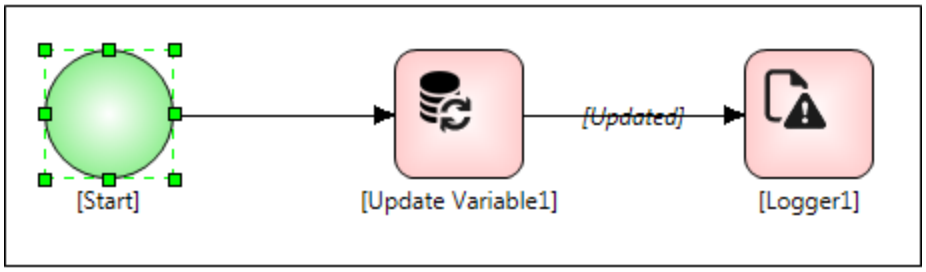
23. Click **Next**. The **Object Setup** page appears.
24. Select methods to provide an alias.



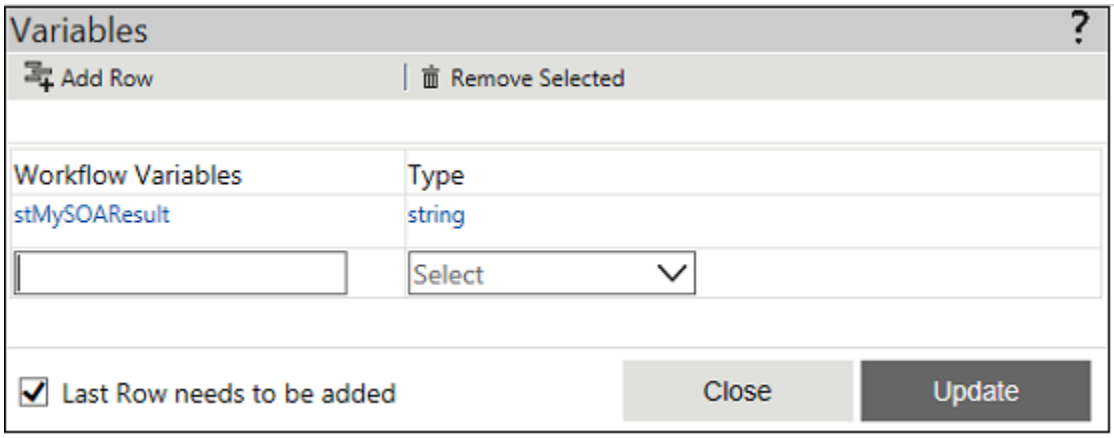
Note: By default, all the classes and methods are checked. If you do not want to use any particular class or method, then uncheck the class or method. However, the unchecked class will not be displayed in the Start Activity of the SOA Object Instance property. The unchecked class will be displayed in the Expression Editor of any activity, but the data will not be available.

25. Click **Finish** & **Publish**.
26. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**. The Workflows page appears.
27. Design a workflow. The **Process Designer** appears.
28. In the **Activity Properties** of the Start activity, select SOA Object Instances property to instantiate a class for the specific purpose. The **SOA Object Instance** page appears.
29. Select the appropriate constructor for the specified class.
30. Click **Save** to save the object instance.
31. Design a simple workflow that has two activities, Update **Variable Activity** and **Logger Activity**. You need the Update activity to update a variable, and the Logger activity to display a value.

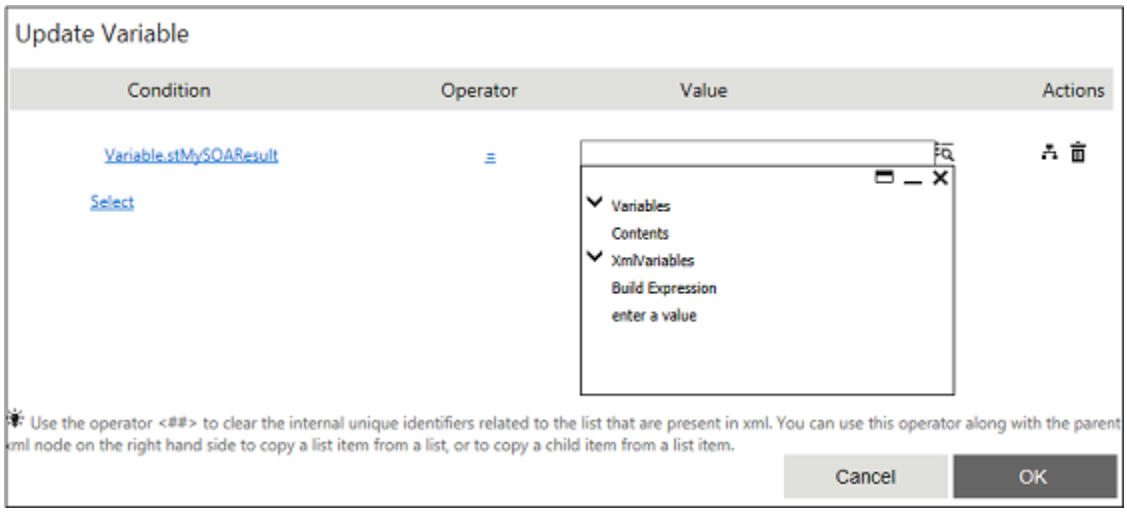
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



32. In the **Activity Properties** of the Start activity, click the **Variable** property to create a variable of type string. For example, you can name the variable as stMySOAResult.

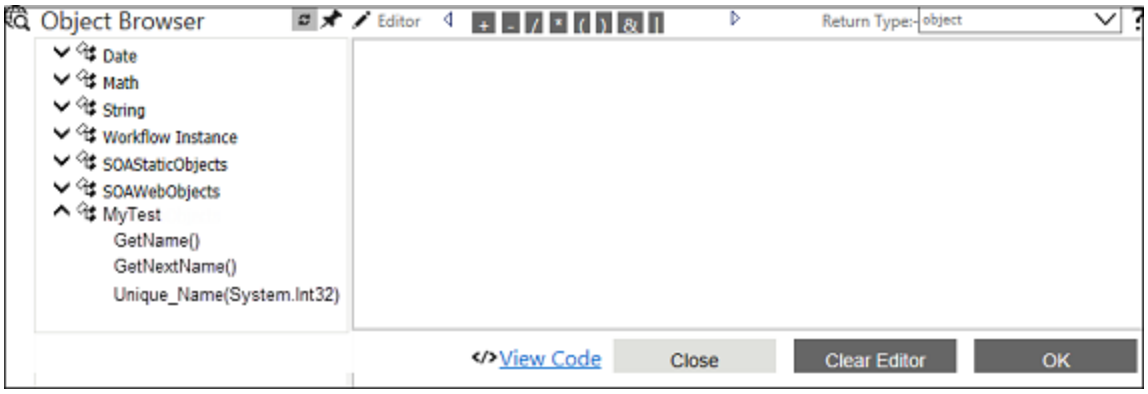


33. Click **Update**.
34. In the **Activity Properties of the Update Variable** activity, select **Set Variable** property. The **Update Variable** page appears.
35. In the **Condition** column, select the variable.

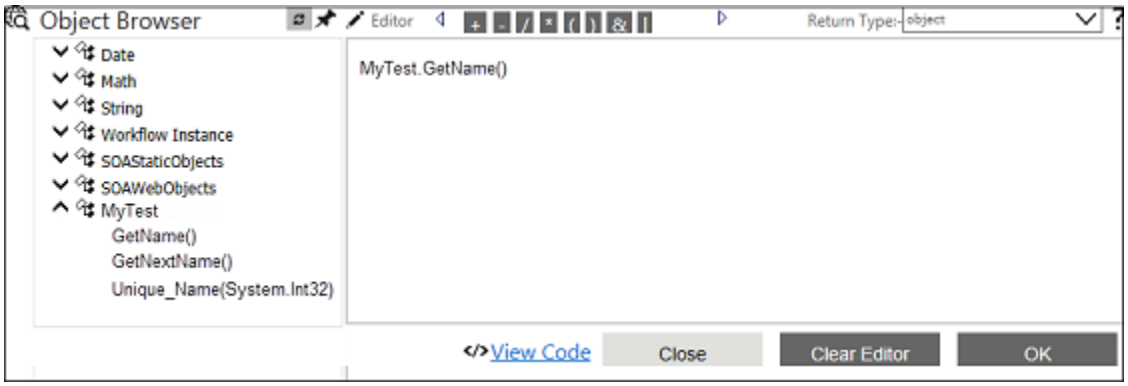


36. In the **Value** column, select **Build Expression**.

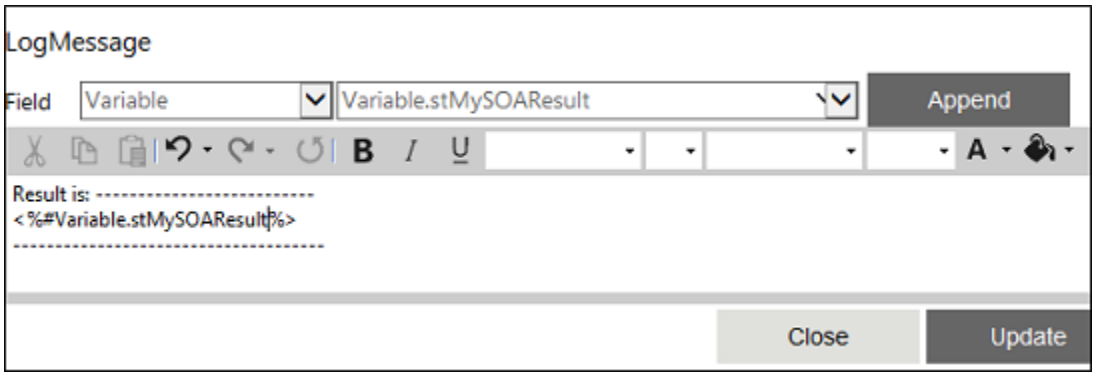
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



37. Use the instance method. For example, My Test.



38. In the Activity Properties of the Logger activity, select the LogMessage property. The **LogMessage** page appears.



39. Type the log message to be displayed.
40. Click **Update**. The result appears in the **Logger Console**.

How to Use a Web Service or Remote Service using SOA Infrastructure?

This example illustrates how to use a web service or remote service using SOA infrastructure. The example is a very simple one which can be modified to have a more practical scenario.

PROCEDURE

NAMESPACE USED

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
System
System.Web
System.Web.Services
System.Web.Services.Protocols
```

To create a New Web Service

1. On the **Windows Start** menu, point to **All Programs**, and then click **Microsoft Visual Studio**. The Visual Studio Start Page appears.
2. In the **File** menu, point to **New**, and then click **Web Site**. The **New Web Site** dialog box appears.
3. In the **Templates** pane, select **ASP.NET Web Service**. This is selected by default, and you can retain the default.
4. Enter a name for the website by changing the default name in the **Location** text box, for example, M:\Work\WebSite8. You can retain the default selection of File System in the Location drop down.
5. Click **OK**.

   Sample Code for creating Web service using System;

```
using System.Web;
using System.Web.Services;
using System.Web.Services.Protocols;
[WebService(Namespace = "http://skeltaSoa.org/")]
[WebServiceBinding(ConformsTo = WsiProfiles.BasicProfile1_1)]
public class Service : System.Web.Services.WebService
{
public Service ()
{

//Uncomment the following line if using designed components
//InitializeComponent();
}

[WebMethod]
public string SkeltaTest()
{
return "This is my SketlaTest";
}

}
```

To create a Web Site

Complete the following steps to create a web site to host the created web service:

1. Open IIS Manager.
   - For Windows Server 2012, on the Start page click the Server Manager tile, and then click OK. In the Server Manager, click the Tools menu, and then click Internet Information Services (IIS) Manager.
   - For Windows 8.1, on the Start page type Control Panel, and then click the Control Panel icon in the search results. On the Control Panel screen, click System and Security, click Administrative Tools, and then click Internet Information Services (IIS) Manager.
2. In the Connections pane, right-click the Sites node in the tree, and then click Add Website.
3. In the Add Website dialog box, enter a friendly name for your website in the Site name box.
4. If you want to select a different application pool than the one listed in the Application Pool box, click Select.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

In the Select Application Pool dialog box, select an application pool from the Application Pool list and then click OK.

5. In the Physical path box, enter the physical path of the website's folder, or click the browse button to navigate the file system to find the folder.
6. If the physical path that you entered in the previous step is to a remote share, click Connect as to specify credentials that have permission to access the path. If you do not use specific credentials, select the Application user (pass-through authentication) option in the Connect As dialog box.
7. Select the protocol for the website from the Type list.
8. If you must specify a static IP address for the website (by default, this is set to All Unassigned), enter the IP address in the IP address box.
9. Enter a port number in the Port text box.
10. Optionally, enter a host header name for the website in the Host Header box.
11. If you do not have to make any changes to the site, and you want the website to be immediately available, select the Start Web site immediately check box.
12. Click OK.

Creating Proxy dll

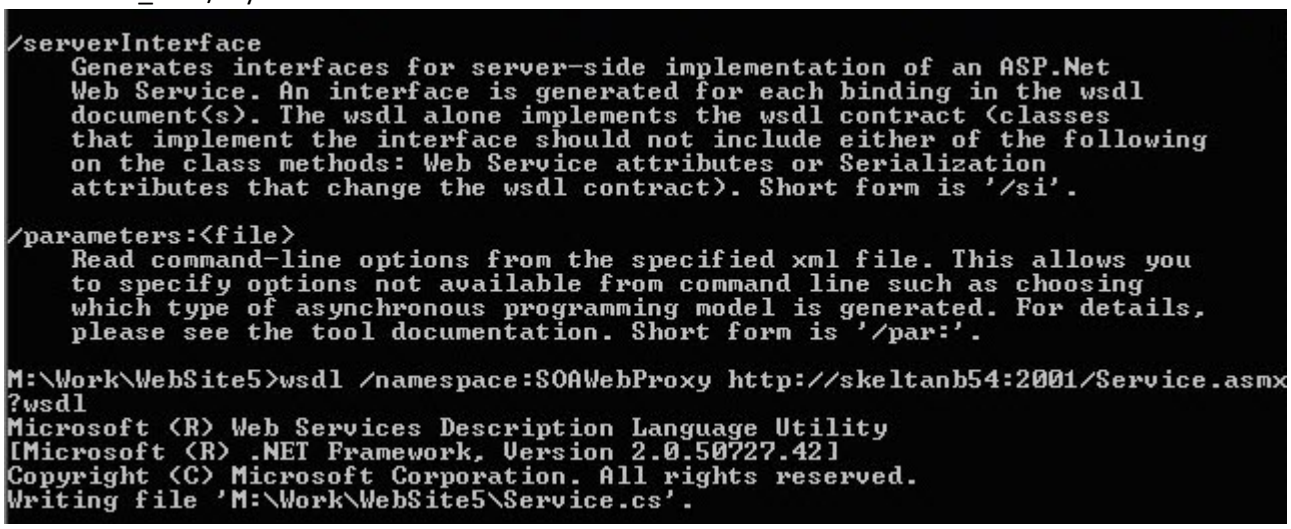
We have to create a Proxy dll since the proxy does all the marshalling and serialization/deserialization of parameters and returns to/from a web service.

Creating proxy dll using WSDL

Create the proxy class of the web service using the WSDL tool. Use the wsdl.exe utility to generate code for XML web service clients and XML web service using ASP.NET from WSDL contract files, XSD schemas, and discomap discovery documents. This tool can be used in conjunction with disco.exe.

In Visual Studio Command Prompt, run the following command:

C:\Program Files\Microsoft Visual Studio\VC> wsdl /namespace:SkeltaSOAWebProxy http://localhost:1508/WebService_New/MyWebService.asmx?wsdl



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To create proxy dll using CSC command

1. Create DLL using CSC command.
2. Create a new project 'SOAWebServiceUse'.
3. Right-click 'SOAWebServiceUse' project which created and click Add Reference.
4. Add reference 'SkeltaSOAService.Dll' to use.

Place this compiled proxy class in the dll and refer the same from where you want to access the Web Service.

Create a .net Assembly to consume the Web Service method.

```
using System;
using System.Collections.Generic;
using System.Text;
using SOAWebProxy;

namespace SOAWebSeriveUsage
{
public class SOAWebSeriveUsage
{
public SOAWebSeriveUsage() { }
public string GetWebServiceData()
{
SOAWebProxy.Service ser = new SOAWebProxy.Service();
return ser.SkeltaTest();
}
}
}
```

Do not forget to add the Proxy.dll in the reference.

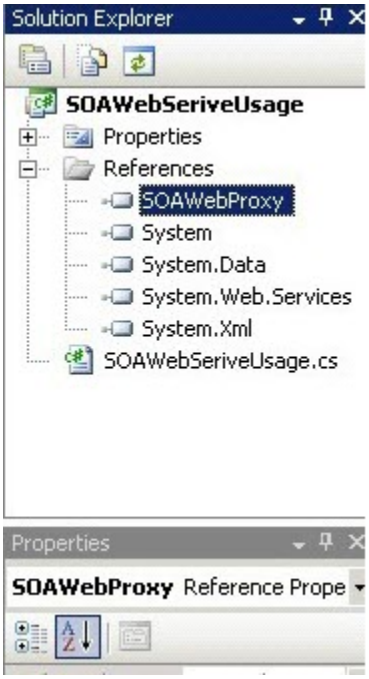


Figure - Solution Explorer

Adding New SOA Folder

The very basic component of SOA repository is the Folder. Basically you need to register a folder to consume the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

assemblies from the folder. Add the reference folder into the SOA Folders.

Adding new folder in the SOA Folder option:

1. Go to **Start > All Programs > AVEVA > Work Tasks > Central Configuration**.
2. Go to the **Repository List**.
3. Click Site Path from which you would like to login to the repository. This redirects to the Enterprise Portal.
4. Click arrow button to enter into the **Enterprise Console**.
5. In the **Enterprise Console**, enter the **User Name** and **Password**. Click the icon next to the Password field to login.
6. From the **Enterprise Console** menu, select **Tools > SOA Assembly**.
7. In the ribbon bar, click **New Folder**.
8. In the **Title** text box, enter the folder name as 'MySkeltaTest'.
9. In the **Description** text area, enter a description for the folder.
10. In the **Physical Path** text box, enter the physical path to verify the presence of the assembly using the view assembly option.
11. Click **Verify Assemblies**.
12. Click **Save**.

Adding Assembly

There are two options to add assembly into the SOA repository i.e. **From GAC or From Assembly Folder**.

To add an assembly in the SOA repository, choose the **SOA > Assemblies** option from the Enterprise Console.

Note:

- If the web service is not available, the system shows the warning message:
“Unable to access < Web service url>. The web service call will be ignored for further processing. Exception message ...".
The methods consumed in the Workflow will not be executed.

- After upgrading the product, validation may not happen when you click on **View Code** or **OK** button in the Expression Editor. If you get an "Access Denied" message in the Logger Console, delete the SOA Web service dll from the Windows Temp folder and access it again.

- If the SOA Execute activity configured with SOA Web service is not working, you need to delete that activity and reconfigure it.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

How to Use an Application that Interacts with the SQL Server?

This example illustrates how to use an application which interacts with SQL server.

Table Structure

Employees – Main table to store employee details

CREATE TABLE [dbo].[Employees](
[ID] [int] IDENTITY(1,1) NOT NULL,
[EmployeeID] [nchar](10) COLLATE SQL_Latin1_General_CP1_CI_AS NOT NULL,
[Name] [nvarchar](50) COLLATE SQL_Latin1_General_CP1_CI_AS NOT NULL,
[Address] [nvarchar](max) COLLATE SQL_Latin1_General_CP1_CI_AS NULL,
[DOJ] [datetime] NULL
) ON [PRIMARY]

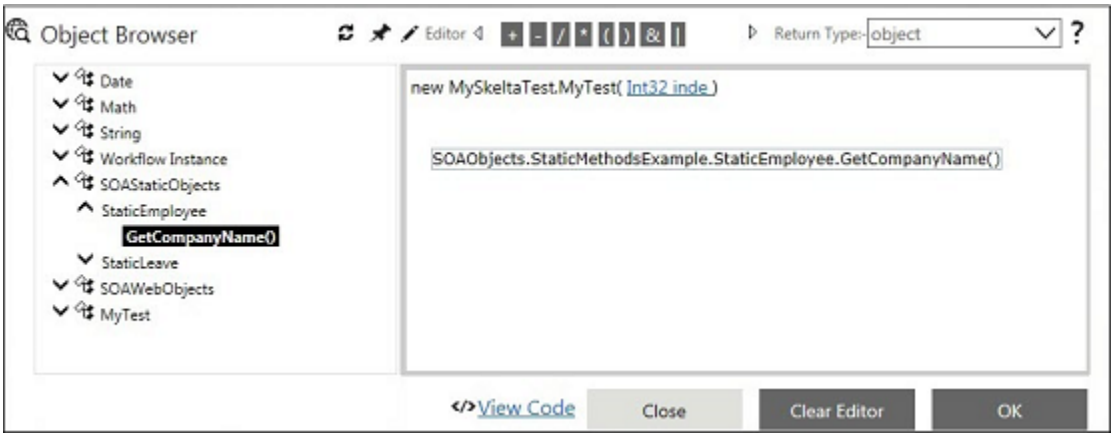
Table to store Leave Balance

CREATE TABLE [dbo].[LeaveBalance](
[ID] [int] NULL,
[CL_Balance] [numeric](18, 2) NULL,
[SL_Balance] [numeric](18, 2) NULL
) ON [PRIMARY]
```

How to Use Static Members of the Class?

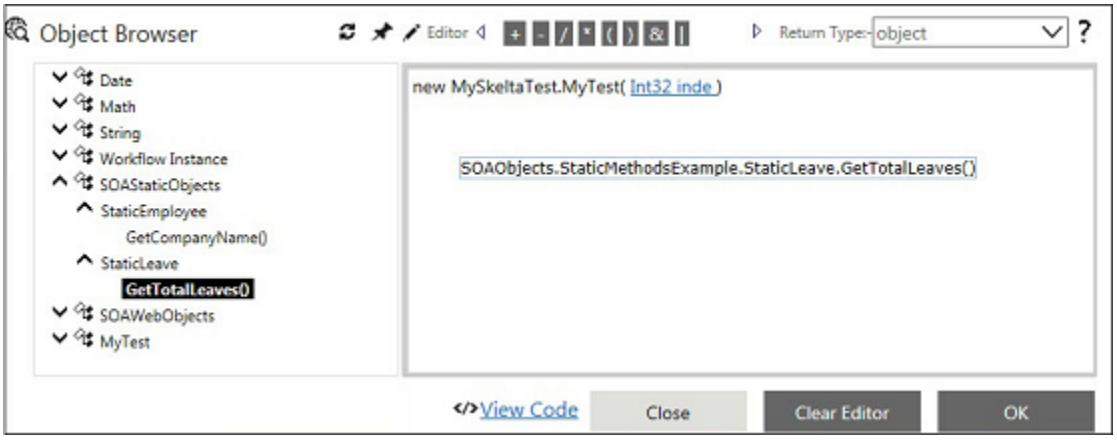
This example shows how to use static members of the class in SOA Property Editor/Expression Editor. To use Static members, there is no need to create the instance of the class. After registering an assembly into the SOA Assembly list, all the static members of the registered class will get loaded into the SOA Property Editor/ Expression editor and can make use of the same for passing the parameter.

Static methods of a class in SOA Property Editor



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Static methods of a class in Expression Editor:

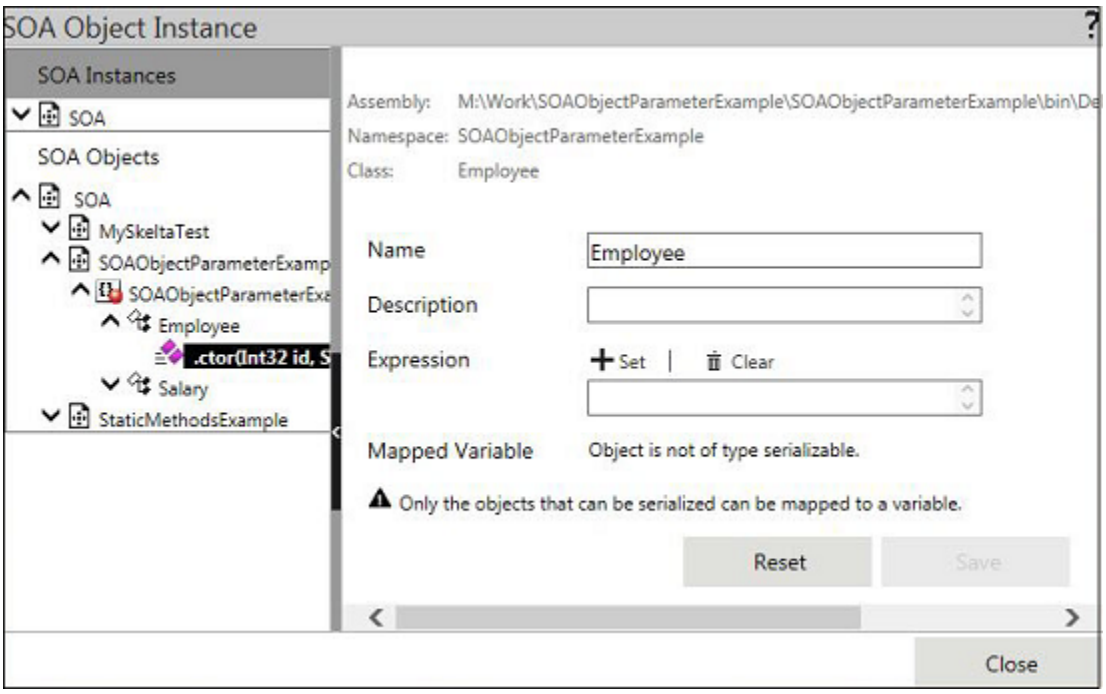


How to Pass the Object as Parameter to the Constructor?

This example shows how to use the object as parameter to the constructor parameter.

For example, consider 'Employee' and 'Salary' to be two classes of an assembly. Employee object can be created by passing the employee information as parameter to the constructor. If 'Salary' object takes 'Employee' object as parameter, then it can be created by making use of the previously created instance 'Employee'.

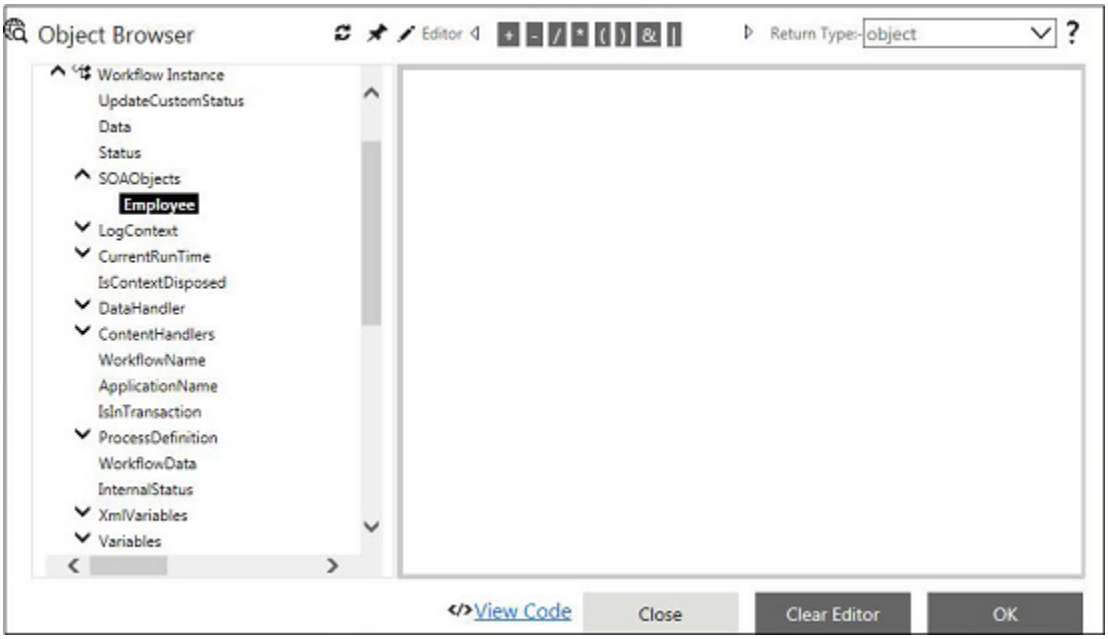
Step1: Create an instance of a class by using SOA Property Editor.



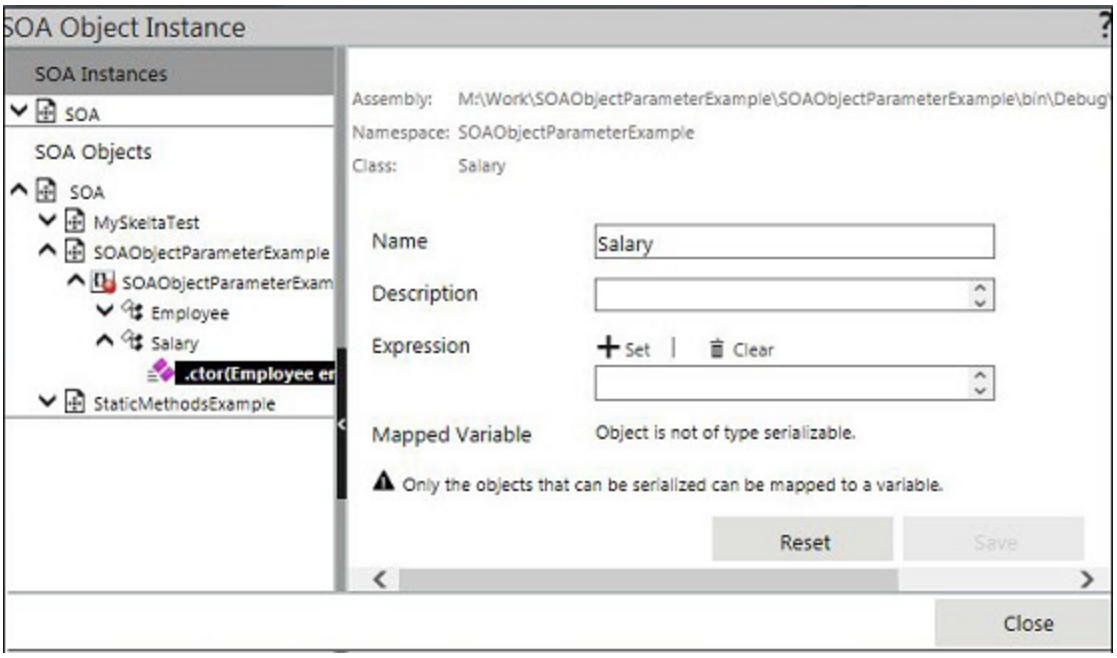
Step 2: All saved instances will be listed in Object Browser/Workflow Instances/SOA Objects.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Step 3: Click and drop as a parameter of the constructor of another instance which takes the object as parameter.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Note: There is no need to type cast the parameter value as specific object when we use the object instance as parameter. This is because the compiler takes care of type casting to specific type of object.

How to Use Scripting in Expression Editor?

In some scenarios, users want to execute a series of expressions together and return the value of the last statement. This can be achieved by separating the statements by semi colon (;).

The below example shows how one can execute multiple statements and return the value of the last statement.

If the user wants to execute one or more expressions in SOA Expression Editor, then the statements can be separated by using semicolon (;).

Example:

In the below example, there are three statements.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. int a = 10;
2. Variable.varResult = a;
3. Employee.GetEmployeeName();

Here, the execution sequence takes place from the first statement.

Step Details:

1. Variable 'a' with integer type will be created with the value 10.
2. AVEVA Work Tasks Variable 'Variable.varResult' will be updated with the value of 'a' that is 10.
3. SOA Expression 'Employee.GetEmployeeName();' will be executed and value will be returned.

Note: By using this feature, there is no need to use the 'Update Variable' activity for simple data updation to any AVEVA Work Tasks Variables.

How to Use Expression in Constructor Parameter?

This example shows how to pass expression as parameter to the constructor parameter.

.ctor (int EmployeeID, string EmployeeName, string Department, string Designation, int Age, double Salary)

The above constructor takes 6 parameters.

Constructor parameters can be passed like this.

.ctor (5, "ABC" + "XYZ", "R & D", "Analyst", 30, 50000)

Here, the second parameter is passed as the expression: **"ABC" + "XYZ"** which is evaluated at the time of execution and updated with the value "ABCXYZ."

SOA Object Support

The aim of the Object Support in AVEVA Work Tasks Object Access (SOA) is to enhance the capability of executing and persisting real time entities in long running workflows.

Features Supported for SOA

Features supported

- Support for variables of type Object to hold any real time entity that can be serialized i.e. marked as 'Serializable'.
- Support for mapping the variable to a constructor in the SOA property editor. This maps the variable to the constructor and during execution the variable gets updated with the object.
- Persistence of the real time entity or object in long running workflows.
- Changing the property of an object stored in the variable at runtime. This increases the flexibility in handling the object.

Scenario

Telematics organization is one of the leading automobile manufacturing companies. It needs to buy spare parts for manufacturing automobile from various spare parts manufacturers. This happens at all stages of manufacturing. It requires approval from the concerned manager.

Telematics organization needs to automate the process of buying Radiators. In this scenario, Radiator as a product comes under the Product entity.

The above scenario can be achieved by using AVEVA Work Tasks Object Access (SOA) to build the 'Product' entity and hold it in the long running process. Persistence of the 'Product' entity in the workflow enhances its capability to handle the complex objects in long running workflows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

How to Create a Class for Handling the 'Product' Object?

The scenario explained in the previous page can be designed by following the steps given in the examples in the next few pages.

To create a Class for Handling the 'Product' Object

Note: You can make use of any existing class to build the scenario.

'Product' class: Product information.

'OrderLineCalculator' class: Operations performed on 'Product' object.

Note: Only the objects that can be serialized can be persisted in long running workflows. Objects that need to be stored in the AVEVA Work Tasks variables should be marked as 'Serializable'.

```
using System;
using System.Collections.Generic;
using System.Text;
namespace Product
{
/// <summary>
/// Product Class
/// </summary>
[Serializable]
public class Product
{
string _code = string.Empty;
string _name = string.Empty;
string _description = string.Empty;
double _unitPrice = 0.0;

/// <summary>
/// Product code
/// </summary>
public string Code
{
get { return _code; }
set { _code = value; }
}

/// <summary>
/// Product name
/// </summary>
public string Name
{
get { return _name; }
set { _name = value; }
}

/// <summary>
/// Product Description
/// </summary>
public string Description
{
get { return _description; }
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
set { _description = value; }
}

/// <summary>
/// Price
/// </summary>
public double UnitPrice
{
get { return _unitPrice; }
set { _unitPrice = value; }
}
public Product(string code, string name, string description, double price)
{
this._code = code;
this._name = name;
this._description = description;
this._unitPrice = price;
}
}

/// <summary>
/// Order Class
/// </summary>
public class OrderLineCalculate
{
public OrderLineCalculate() { }

/// <summary>
/// Get Total amount to be paid
/// </summary>
/// <param name="product">Product</param>
/// <param name="quantity">Quantity</param>
/// <returns>Total Price to be paid</returns>
public double GetAmount(Product product, int quantity)
{
return (product.UnitPrice * quantity);
}
}
}
```

1. Using the above code creates an assembly. For e.g. Product.dll
2. Place the assembly in the SOA folder, the folder from which the SOA assemblies are registered. For e.g. M:\SOA\Assemblies\Product.dll.
3. Register the folder (M:\SOA\Assemblies) in the AVEVA Work Tasks Object Access folder.
4. Register the 'Product' assembly [Product.dll] in SOA Assemblies from the SOA folder.
5. The registered assembly will get displayed in the SOA assembly list.

How to Create an Object Instance?

The below example shows how the user can create an Object Instance.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To create an Object Instance

Instance creation is required to invoke the members of the object.

1. Create an instance of 'Product' object. This can be done in the SOA property editor of the **Start Activity**.

   Instantiating SOA Objects

   Instantiating objects can be done by making use of the constructors of the object. The SOA property editor allows to create an object instance by using constructors.

   Instantiating and persisting the object instance can be done in different ways. This is explained below.

   a. **Creating an instance of the object by using 'Constructors'**

      Description: In the above example, we have 'Product' object and in order to use the Product object in AVEVA Work Tasks workflows, we need to create an object instance of the 'Product'. Creating object instance can be done in the SOA property editor by using the constructor defined for the 'Product' object.

      Steps:

      a. Click the constructor defined for 'Product' object.
      b. Click 'Set' to set the expression/define the constructor parameters. It will open the Expression Editor for setting the expression.
      c. Pass the appropriate parameters to the constructor expression.
      d. Save the expression.

      By creating an object instance, it is possible to build an expression with the methods and properties of the 'Product' class. In the workflow, whenever an expression with the 'Product' object is encountered, the workflow engine will create an instance of the 'Product' object and resolve the expression. Instance creation happens in all the places wherever the expression is associated with the 'Product' object. In this way, the expression with methods and properties of an object gets resolved.

   b. **Creating an instance of the object using 'Constructors' and mapping the object to a variable**

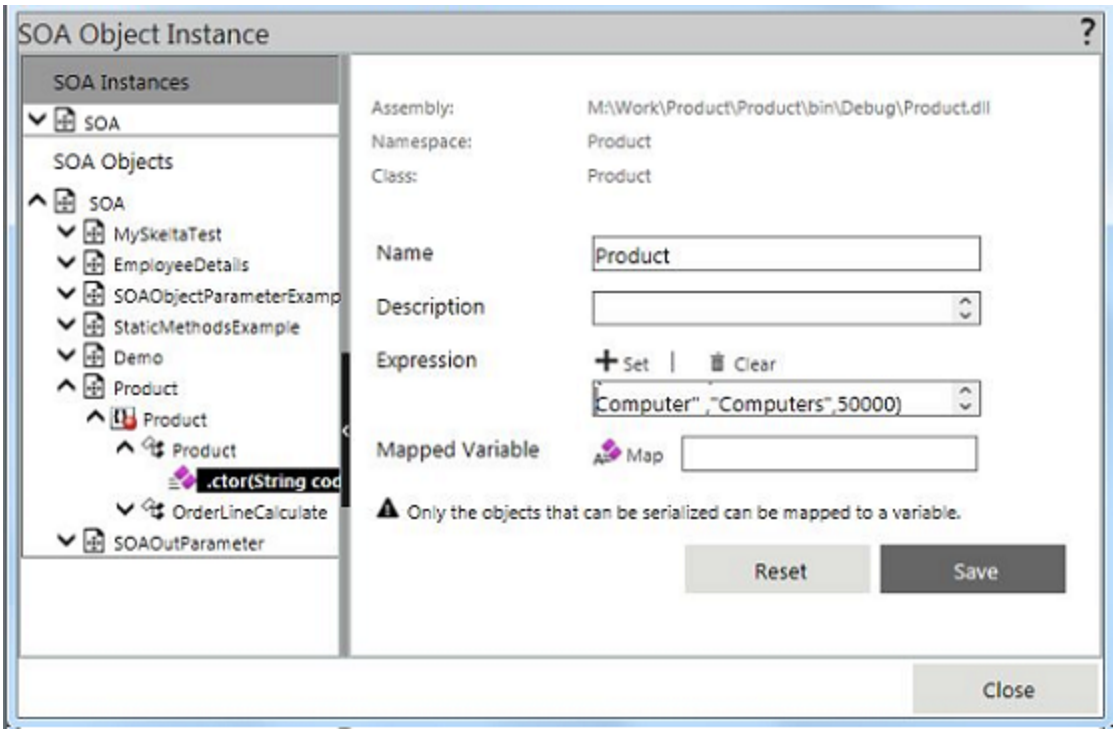
      Description: Considering the first approach, in some scenarios there may be a requirement of storing the object and persist it in the long running workflows.

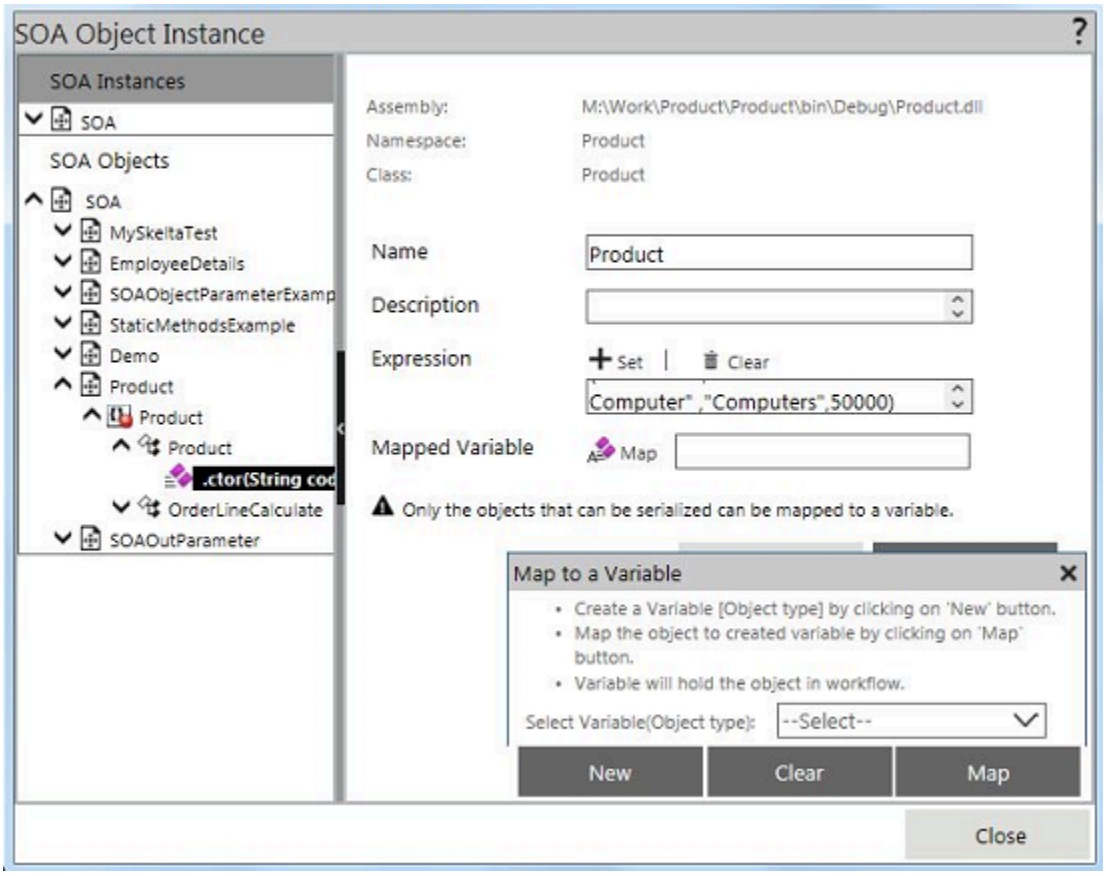
      SOA object mapping provides an option to store object state in a variable. This increases the flexibility in handling the complex object in long running workflows.

      Mapping an object to a variable will persist the object state in the workflow. This happens for the first time whenever an object is instantiated; when you invoke the object after that, it will return the object information which is stored in the variable. This will not only hasten the process of resolving the expression built with the object mapped to a variable, but also persist the object state in long running workflows.

      Mapping an object to a variable can be done at the time of configuring the instance in the 'SOA Property' editor. This approach is explained in depth in the next topic.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



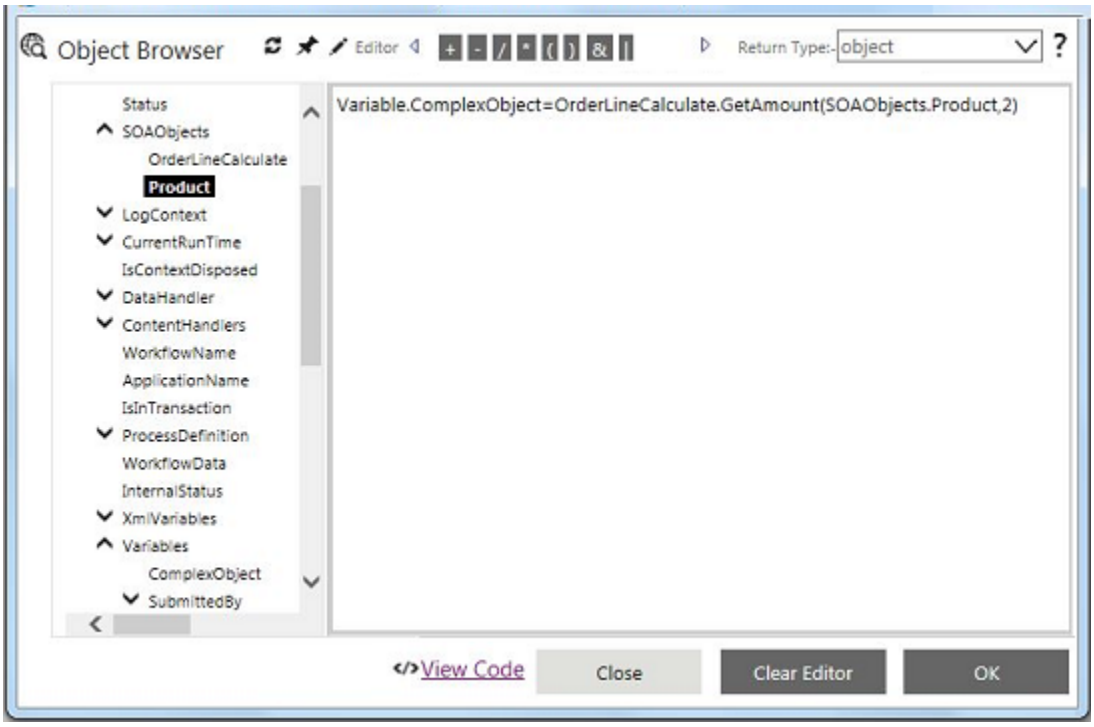


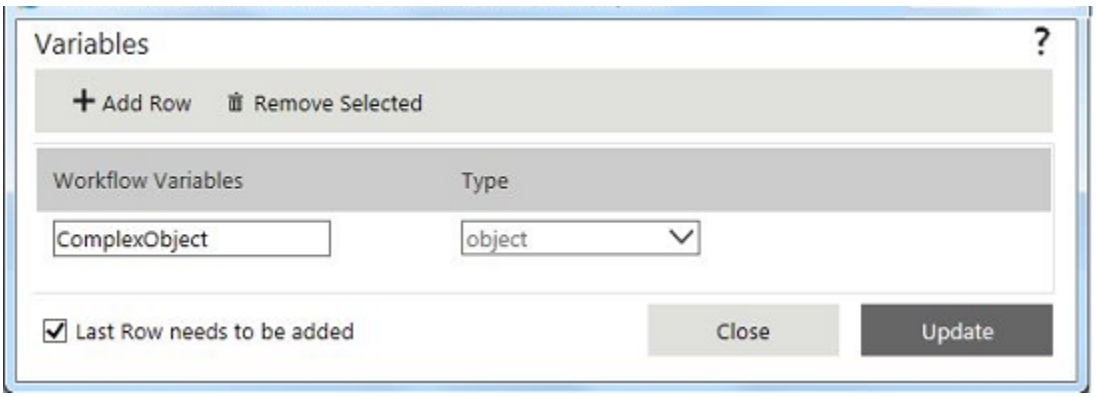
Note: Only objects that are Serializable can be mapped to a variable/persist in the workflow. Variable mapping should be used only when an object needs to be persisted in long running workflows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

c. **Mapped Variables**

Description: Any object can be directly mapped to a variable without any constructor. In some scenarios, there may be a requirement to store a complex object in a variable. For e.g.: the 'Employee' object returned from a web service.





This can be done by simply assigning the object to a variable in the SOA Expression Editor.

How to Create a Variable?

The below example shows how the user can create a Variable.

To create a Variable

1. Create a variable of type 'Object' in the Start Activity, for e.g. 'ProductObject'. This variable will hold the 'Product' object in the process. This variable is also used for object mapping. Mapping of an object to a variable will store the object state in the variable. This will enhance the capability of persisting the real time entities in the long running workflow.

   The following steps will explain how to create an instance of object (Approach (a)), and how to map an

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

object to a variable (Approach (b)).

'Product' object with all the available constructors will be displayed in the 'SOA Objects'. Objects that can be serialized will have the option 'Map to Variable'.

Note: 'Mapped variable' feature gets enabled only for objects that are marked as 'Serializable'.

2. Create a 'Product' object instance by selecting a constructor and pass the appropriate parameters to it.
3. Click 'Set' to set the expression to the constructor.
4. Pass the valid parameters to the constructor. E.g.: "Rad01","Radiator","Spare Part Automobile", 20000

   Map the variable to the object. The Mapped variable will get automatically filled with the real time entity whenever the object gets instantiated. This happens for the first time, and further invoking the object will get the object state stored in the variable.
5. Click 'Map to Variable' to map a variable to the instance. Only object type variables can be mapped to SOA Objects. A pop-up with 'Map to Variable' will get displayed.
6. Select the variable to be mapped and click 'Map'. This will map the variable to the SOA Object. It is possible to create a variable of type object by clicking 'New' and mapping the variables.
7. The Mapped variable will get displayed in the 'Mapped Variable' field.
8. After the variable is mapped, click 'Save' to save the instance.
9. Create an instance of 'OrderLineCalculator' class. This object will be used for calculating the total amount.

How To

In AVEVA Work Tasks, learn how to:

- Add users to an active directory
- Create custom wizards
- Return values from the engine to the client
- Implement the interface to get Action and Workflow status change information from the engine
- Get the username with the domain name format

Add Users to Active Directory

To add users to the **Active Directory**, do the following:

1. Select **Administrative Tools** from the **Control Panel** and point to **Active Directory Users and Computers**.
2. The **Active Directory Users and Computers** window opens.
3. Right click **Users** and point to **New** to add a new user. New **Object - User** wizard opens.
4. Enter the details of the new user.
5. Click **Next** or **Cancel** to abort. **New Object - User** password wizard opens.
6. Enter the password for the new user and deselect the check boxes.
7. Click **Next** or **Cancel** to abort. **New Object - User** final wizard opens.
8. Click **Finish**.
9. Double-click the new user added. **Administrator Properties** window opens.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

10. Click **Member Of** tab from the administrator properties window.
11. Click **Add**. The **Select Groups** window opens.
12. Enter Administrator and click **Check Names**.
13. Click **OK**.

    Note: Users who have administrator privileges can log into the Enterprise Console.

14. Make sure that all the users have logged into the Enterprise Console site for the concerned repository at least once.
15. Click **Organization** tab from the administrator properties window.
16. Enter the **Title** and click **Change**.
17. Enter a name and click **Check Names**.
18. Click **OK**.

Create Custom Wizards

AVEVA Work Tasks provides a set of interfaces and their supporting classes and members that can be implemented in the class of a custom activity to create a custom wizard. The following procedure creates an Email Wizard that is available in the Process Designer in the menu bar as well as under the Wizard category in the activities tool box.

PROCEDURE

Dll REFERENCE

```
System
System.Data
System.XML
System.DirectoryServices
Workflow.NET.NET2
```

NAMESPACE USED

```
System
System.Collections.Generic
System.Text
Skelta.Wizards.Core.Interfaces
Workflow.NET
Skelta.Core
System.ComponentModel
Skelta.Wizards.Core
System.XML
```

The following steps and code illustrate the creation of a custom email wizard. The custom email wizard is listed in the AVEVA Work Tasks Wizards window.

Step 1:

1. Create a new project of type class library and name as CustomWizards.
2. Add a reference to Skelta.Wizards.Core.dll and Workflow.NET.NET2.dll.
3. Add a new class file called EmailWizard.cs. This class file should implement the interface IWizard and ISkeltaAddInProvider.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Implement the functions as follows.

```
using System;
using System.Collections.Generic;
using System.Text;
using Skelta.Wizards.Core.Interfaces;
using Workflow.NET;
using Skelta.Core;
using System.ComponentModel;
using Skelta.Wizards.Core;
using System.Xml;
namespace CustomWizards
{
public class EmailWizard : IWizard ,ISkeltaAddInProvider
{
///Constructor  defining the outputs of the wizard and setting the title and description
///properties of the wizard
public EmailWizard()
{
_Outputs.Add("Sent");
_Outputs.Add("Not Sent");
_Description ="EmailWizard Description";
_Title = "Email Wizard";
}
#region IWizard Members
///Implementing the Category property of the interface
private string _Category;
public string Category
{
get { return _Category; }
}
//Implementing the Description property of the interface
private string _Description = string.Empty;
public string Description
{
 get { return _Description; }
 set { _Description = value; }
}
///Implementing the Display Name property of the interface
private string _DisplayName = string.Empty;
[DesignerSerializationVisibility(DesignerSerializationVisibility.Content)]
public string DisplayName
{
get { return _DisplayName; }
set { _DisplayName = value; }
}
//Implementing the Favorites property of the interface
private Dictionary<string, string> _Favourites = new Dictionary<string, string>();
[DesignerSerializationVisibility(DesignerSerializationVisibility.Hidden)]
public Dictionary<string, string> Favourites
{
 get { return _Favourites; }
 set { _Favourites = value; }
}
///Implementing the GetDiagram method of the interface for creating Actions and Links
and dumping the same into process designer
public void GetDiagram(Diagram diagram, Workflow.NET.Action previousAction, string
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
output)
{
Workflow.NET.Action startAction = diagram.Actions["Start"];
if (previousAction == null)
{
 previousAction = startAction;
 output = string.Empty;
}
string email1ActivityName = string.Empty;
while (true)
{
 email1ActivityName = ActivityNamingContainer.Instance.GetName("Email");
 if (!diagram.Actions.ContainsKey(email1ActivityName))
 break;
}
 Workflow.NET.Action emailAction = Utilities.CreateAction(diagram,
 previousAction.ProcessDefinition.ActionsDefinition, "Email", email1ActivityName,
"Email",
 previousAction, string.Empty);

}
```

Note: If you wish to create a property whose value changes dynamically across wizards like the above Subject, Body etc then that property should be prefixed with the below piece of code "[DesignerSerializationVisibility(DesignerSerializationVisibility.Content)]" Otherwise if you prefer to use hard coded values, then prefix that property with the below piece of code to hide that property accordingly "[DesignerSerializationVisibility(DesignerSerializationVisibility.Hidden)]" . The above note is applicable during serialization and deserialization of data inside the Wizard Manager.

Step 2:

Build CustomWizards.dll and add the dll into the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder

Step 3:

1. Create a new ASP Web application **CustomWizardUI** and add user control page called **EmailWizardUI.ascx** which is your UI for the email wizard.
2. Use the <asp:Wizard> control to define your wizard steps.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Hide the wizard navigation buttons.

```
//EmailWizardUI.ascx
<%@ Control Language="C#" AutoEventWireup="true" CodeFile="EmailWizardUI.ascx.cs" Inheri
ts="CustomWizardUI.EmailWizardUI" %>
<link href="styles/template-wizard.css" rel="stylesheet" type="text/css" />
<asp:Wizard ID="AspWizard" runat="server" ActiveStepIndex="0"  Width="100%" DisplaySideB
ar="False" Height="100%">
  <WizardSteps>
  <asp:WizardStep ID="WizardStep1" runat="server" Title="Step 1" >
  <table width="100%" align="center" cellpadding="0" cellspacing="0" border="0" >
  <tr>
 <td align="center" valign="top">
 <table width="100%" border="0" cellspacing="0" cellpadding="0">
 <tr>

  <asp:TextBox ID="subjectTb" runat="server" ></asp:TextBox>
  </td>
  </tr>
  <tr>
  <td>
  <asp:Label ID="bodyLabel" runat="server" ></asp:Label>
  </td>
  <td>
  <asp:TextBox ID="bodyTb" runat="server" ></asp:TextBox>
  </td>
  </tr>
  </table>
  </td>
  </tr>
  </table>
  </asp:WizardStep>
  </WizardSteps>
  <StepNextButtonStyle CssClass="hide" />
  <StartNextButtonStyle CssClass="hide" />
  <FinishCompleteButtonStyle CssClass="hide" />
  <FinishPreviousButtonStyle CssClass="hide" />
  <CancelButtonStyle CssClass="hide" />
  <StepPreviousButtonStyle CssClass="hide" />
</asp:Wizard>
// End of EmailWizardUI.ascx
```

4. Apply the stylesheet template-wizard.css to the page. This exists in \BPMUITemplates\Default\Wizards\ styles folder.
5. Paste the file to the \BPMUITemplates\Default\Wizards\ folder.

Step 4:

1. Create the code behind for your user control. Your user control can use either code behind or library. Either way, it needs to inherit from IWizardUI interface and System.Web.UI.UserControl.
2. If you have used a class file as code behind, copy the same to \BPMUITemplates\Default\Wizards\ folder or

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

use as a library CustomWizardUI.EmailWizardUI.

3. Add the reference of the **CustomWizards.dll**
4. Write the necessary code for the wizard action.

```
// EmailWizardUI.ascx.cs
using System;
using System.Data;
using System.Configuration;
using System.Collections;
using System.Web;
using System.Web.Security;
using System.Web.UI;
using System.Web.UI.WebControls;
using System.Web.UI.WebControls.WebParts;
using System.Web.UI.HtmlControls;
using Skelta.Wizards.Core;
using Skelta.Wizards.Core.Interfaces;
using Workflow.NET;
using CustomWizards;

namespace CustomWizardUI
{
public partial class EmailWizardUI : System.Web.UI.UserControl, IWizardUI
{
private bool isValid = true;

protected void Page_Load(object sender, EventArgs e)
{
tolabel.Text = "To";
fromlabel.Text = "From";
subjectLabel.Text = "Subject";
bodyLabel.Text = "Body";
}

///Returns the Email Wizard from pre entered values
private IWizard GetWizard()
{
EmailWizard emailwizard = null;
if (IsPostBack)
{
emailwizard = (_WizardData as EmailWizard);

if (Request.Form[toTb.UniqueID] != null)
emailwizard.To = Request.Form[toTb.UniqueID];
if (Request.Form[fromTb.UniqueID] != null)
emailwizard.From = Request.Form[fromTb.UniqueID];
if (Request.Form[subjectTb.UniqueID] != null)
emailwizard.Subject = Request.Form[subjectTb.UniqueID];
if (Request.Form[bodyTb.UniqueID] != null)
emailwizard.Body = Request.Form[bodyTb.UniqueID];

}
return emailwizard;
}
```

```
///Sets  the Email Wizard with user entered values
public void SetWizard(IWizard wizardData)
{
EmailWizard spEventWizard = wizardData as EmailWizard;
toTb.Text = spEventWizard.To;
fromTb.Text = spEventWizard.From;
subjectTb.Text = spEventWizard.Subject;
bodyTb.Text = spEventWizard.Body;
}

#region IWizardUI Members

///Sets or gets  the wizard
private IWizard _WizardData;
public IWizard WizardData
{
get
{
if (_WizardData == null)
return null;
return GetWizard();
}
set
{
_WizardData = value;
SetWizard(_WizardData);
}
}

///Returns the total number of pages in the wizard UI
public int TotalPages
{
get { return AspWizard.WizardSteps.Count; }
}

///Sets or gets the current page of the wizard UI
public int CurrentPage
{
get
{
return AspWizard.ActiveStepIndex;
}
set
{
AspWizard.ActiveStepIndex = value;
}
}

///Sets or gets the Direction whether the user clicked "Next" ///or "Previous"
private NavaigationType _Direction = NavaigationType.Next;
public NavaigationType Direction
{
get
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
return _Direction;
}
set
{
_Direction = value;
}
}

///Sets or gets the ValidationStatus whether the
///wizard pages are valid or not
private bool _validationstatus;
public bool ValidationStatus
{
get
{
return isValid;
}
set
{
isValid = value;
}
}
#endregion
}
}
// end of EmailWizardUI.ascx.cs
```

Note: ValidationStatus property is helpful if you wish to validate the current page before moving on to the next one. If the page is not valid, this property can be set to false and vice versa.

Step 5:

Open your repository database and add a row to the table SKAddInProviders. The sql command is given below.

```
INSERT INTO
[SKAddInProviders]([Type],[Name],[Description],[ClassName],[Assembly],[Settings],[IsGacAsse
mbly],[LastUpdatedDatetime]) VALUES ('Wizard',<your wizard name>,<your wizard
description>,<your project name(which contains EmailWizard.cs)>,<location of your project
dll (which contains EmailWizard.cs)> , <xml string specifying the category of the wizard
and the favorites, image and whether the wizard is a start up wizard or not> ,0,getdate())
```

For example, the SQL Command for the above Email Wizard would be:

```
INSERT INTO
[SKAddInProviders]([Type],[Name],[Description],[ClassName],[Assembly],[Settings],[IsGacAsse
mbly],[LastUpdatedDatetime])  VALUES ('Wizard','EmailWizard','Email Wizard Description',
'CustomWizards.EmailWizard','bin\CustomWizards.dll','<wizard><Category>Human
Activities</Category><ImageName>Images\
Email.png</ImageName><IsStartupWizard>false</IsStartupWizard><Favourites><FavouriteElement>
ApprovalWizard</FavouriteElement></Favourites></wizard>',0,getdate())
```

The example row that is added for the Email Wizard. You can add any wizard of your own. You just need to specify which category it will belong to in the Settings column. In this case, the Wizard comes under the Human Activities category. Favorites of a wizard can also be specified in the Favourites tag. Whether the wizard is just used for provisioning i.e. IsStartupWizard can also be set in the IsStartupWizard tag.

Step 6:

1. Do not forget to paste the EmailWizardUI.ascx and EmailWizardUI.ascx.cs(code behind) files into

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

BPMUITemplates\Default\Wizards folder.

2. Add the necessary resource files into the Locales folder and the required styles into BPMUITemplates\Default\Wizards\styles folder and images into the BPMUITemplates\Default\Wizards\Images folder.

Step 7:

Copy the above created **CustomWizards.dll** into the bin folder of the **Enterprise Console** i.e.*[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\EnterpriseConsole\bin*

Your wizard is now ready.

Return Values from Engine to Client

The below code sample attempts to demonstrate the communication between the AVEVA Work Tasks engine and the client. For example, based on the property Applicationuri entered in the Activity Properties of the custom action named **"Agent app Navigator"** [It is created by using the below code], appropriate messages are displayed in the Logger Console.

PROCEDURE

Dll REFERENCE

```
System
Workflow.NET.NET2
```

NAMESPACE USED

```
System
System.Collections.Generic
System.Text
Workflow.NET
```

Steps to Create Custom Activity

Step 1

1. Define the class for the custom action's handler using the following code; build as a DLL and put this dll in *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder.

```
using System;
using System.Collections.Generic;
using System.Text;
using Workflow.NET;

namespace AppNavigatorActivity
{
    public class AppNavigator :
Workflow.NET.Engine.Interfaces.IActionRun,Workflow.NET.Engine.Interfaces.IActionEventMes
sage
    {
        #region IActionRun Members

        Workflow.NET.Interfaces.IActivityWebUIHandler
        Workflow.NET.Engine.Interfaces.IActionRun.GetActivityWebUIHandler()
        {
            throw new Exception("The method or operation is not implemented.");
        }
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 Workflow.NET.Engine.Interfaces.ActionResult Workflow.NET.Engine.Interfaces.IActionRun.R
un(int    ExecutionID, int ExecutionDetailsID,
Workflow.NET.Engine.Context CurrentContext,
Workflow.NET.Action CurrentAction, string InlinkOutput, bool Retrying, out string Output
)
        {
            CurrentContext.log.LogInformation("Inside Action");
//Setting blocking output value for a workflow
            CurrentContext.BlockingOutput =
(string)((Property)CurrentAction.Properties["ApplicationURI"]).Value+","+ExecutionDetail
sID;
            Output = "";
            return Workflow.NET.Engine.Interfaces.ActionResult.Sleep;
        }

        #endregion

 #region IActionEventMessage Members

void Workflow.NET.Engine.Interfaces.IActionEventMessage.HandleEventMessage(int execution
ID, int executionDetailsID, Workflow.NET.Engine.Context currentContext,
Workflow.NET.Action currentAction, object eventMessage, bool retrying, out string output
, out Workflow.NET.Engine.Interfaces.ActionResult result, out bool ignoreOutputAndResult
)
{
      output = eventMessage.ToString().ToLower();
      result = Workflow.NET.Engine.Interfaces.ActionResult.Completed;
      ignoreOutputAndResult = false;
}

#endregion

    }
}
```

2. Define custom action using the following code, this must be added to the Actions.xml.

```
<category name= "BPO Activities" sortorder="8" image="custom.gif">
  <action name="ApplicationNavigator" displayname="Agent App Navigator">
    <description>Dummy action to replace the action types which are not
present.</description>
    <image resourcename="dummyaction.png"></image>
    <handler classname="AppNavigatorActivity.AppNavigator"
     assembly="AppNavigatorActivity.dll"></handler>
    <properties>
      <property name="ApplicationURI" type="string"></property>
    </properties>
          <return>
            <value helpstring="Next">Next</value>
            <value helpstring="Previous">Previous</value>
            <value helpstring="End">End</value>
          </return>
</action>
</category>
```

3. The custom action will be added to the Process Designer under the category BPO Activities (the category defined for the custom action).
4. Set the **ApplicationURI** property for the action.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Step 2

The value from the AVEVA Work Tasks engine can be returned to the client by using the out parameter in the Client.ExecuteBlocking method.

Create a web Application and include this code to check the returned values from the engine.

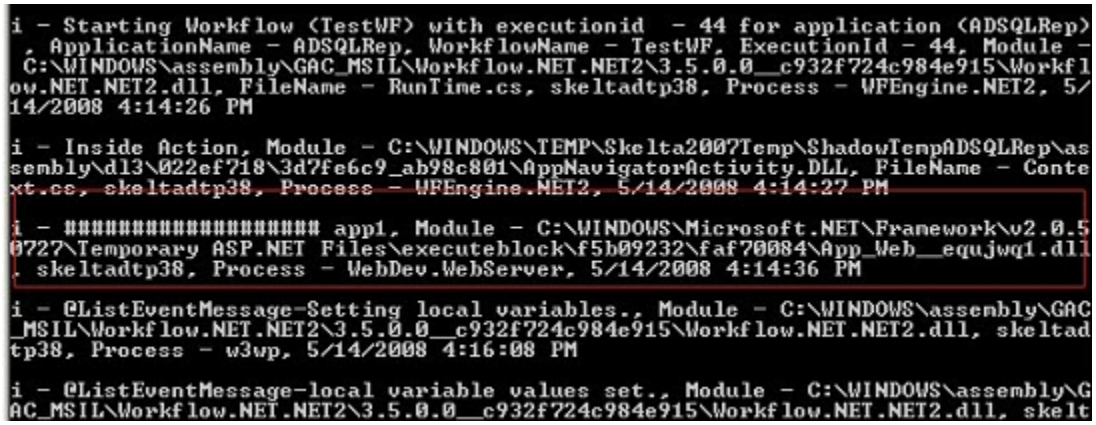
```
Workflow.NET.Engine.Client cl = new Workflow.NET.Engine.Client("Application", "workflow");
//Encapsulates the information required for redirecting the client.
Workflow.NET.Engine.SynchronousActionData syncData = new
Workflow.NET.Engine.SynchronousActionData(false, this.Context);
string url = "";
//Requests for the execution of the specified version of the workflow and waits till an
action in the workflow returns a URL for redirecting the client.
//The client can handle the redirection or leave the redirection to the application.
cl.ExecuteBlocking("activedirectory::bob", "<content></content>", syncData, true, out url);
cl.Close();
ProcessSyncData(syncData);

void ProcessSyncData(Workflow.NET.Engine.SynchronousActionData syncData)
{
if (syncData.IsExplicitBlockingOutput)
{
//The output returned from the workflow using BlockingOutput in Context is stored to the
variable "message"
string message = syncData.BlockingOutput.ToString().ToLower();
string[] msgs = message.Split(',');
message = msgs[0];
Log logger = new Log();

if (message == "app1")
logger.LogInformation("################### app1");
else if (message == "app2")
logger.LogInformation(" ############### app2");
else if (message == "app3")
logger.LogInformation(" ############### app3");
else
logger.LogInformation(" ############### No matching output");
}
```

Output:

The value typed in the property **ApplicationURI** of the custom activity is **app1** and a message "app1" is displayed in the Logger Console as shown below:



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Implement Interface to Get Action and Workflow Status Change Information from Engine

In scenarios where custom logic has to be implemented on the basis of the changes in the status of Workflows or Actions, we can make use of the IWorkflowInformation interface to get the Workflow events from the AVEVA Work Tasks engine.

We can only get the status and cannot change it using this interface. The class implementing the Workflow.NET.Interfaces.IWorkflowInformation can be used the get alerts from engine on changes in status.

Note: This interface cannot be used to get Workflow Execution Pending status. In the sample code, we will create a dll which logs custom message on to the logger based on the change in the workflow status.

PROCEDURE

Dll REFERENCE

System

Workflow.NET.NET2

NAMESPACE USED

System

Workflow.NET

Workflow.NET.Interfaces

Skelta.Core

A sample implementation code is shown below.

```
using System;
using Workflow.NET;
using Workflow.NET.Interfaces;
public class ExecutionInfo:IWorkflowInformation, ISkeltaAddInProvider
{
Log logger = new Log();
public ExecutionInfo()
{
logger.MachineName="";
logger.ModuleName="WFExecutionInfo";
logger.Source="";
logger.FileName="";
}

public void OnActionExecutedWithErrors(int ExecutionId, int ExecutionDetailsID, string
ActionName, Exception ObjException)
{
// TODO: Add ExecutionInfo.OnActionExecutedWithErrors implementation
logger.LogInformation("Testing: Action executed with errors for ExecutionId:"+ ExecutionId
+", ExecutionDetailsID:"+ ExecutionDetailsID +", ActionName:"+ ActionName +",
Exception:"+ObjException.Message);
}

public void OnWorkflowCompletedSuccessfully(int ExecutionId)
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// TODO: Add ExecutionInfo.OnWorkflowCompletedSuccessfully implementation
logger.LogInformation("Testing: Workflow completed successfully for ExecutionId:"+
ExecutionId);
}

public string ApplicationName
{
get
{
// TODO: Add ExecutionInfo.ApplicationName getter implementation
return null;
}
set
{
logger.LogInformation("Testing: Application Name:"+ value);
}
}

public void OnActionStatusUpdate(int ExecutionId, int ExecutionDetailsID, string
ActionName, string Status)
{
// TODO: Add ExecutionInfo.OnActionStatusUpdate implementation
logger.LogInformation("Testing: Action status updated for ExecutionId:"+ ExecutionId +",
ExecutionDetailsID:"+ ExecutionDetailsID +", ActionName:"+ ActionName +", Status:"+Status);
}

public void OnWorkflowCompletedWithErrors(int ExecutionId)
{
// TODO: Add ExecutionInfo.OnWorkflowCompletedWithErrors implementation
logger.LogInformation("Testing: Workflow completed with errors for ExecutionId:"+
ExecutionId);
}

public void OnWorkflowStatusUpdate(int ExecutionId, string Status)
{
// TODO: Add ExecutionInfo.OnWorkflowStatusUpdate implementation
logger.LogInformation("Testing: Workflow status updated for ExecutionId:"+ ExecutionId +",
Status:"+ Status);
}

public void OnWorkflowStarted(int ExecutionId)
{
// TODO: Add ExecutionInfo.OnWorkflowStarted implementation
logger.LogInformation("Testing: Workflow started for Application:"+ ApplicationName +",
ExecutionId:"+ ExecutionId );
}

#region ISkeltaAddInProvider Members
Guid _Id = Guid.Empty;
public Guid Id
{
get { return _Id; }
}
public void InitializeProvider(string settings, Guid id)
{
_Settings = settings;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
_Id = id;
}
string _Settings = "";
public string Settings
{
get { return _Settings; }
}
#endregion
}
```

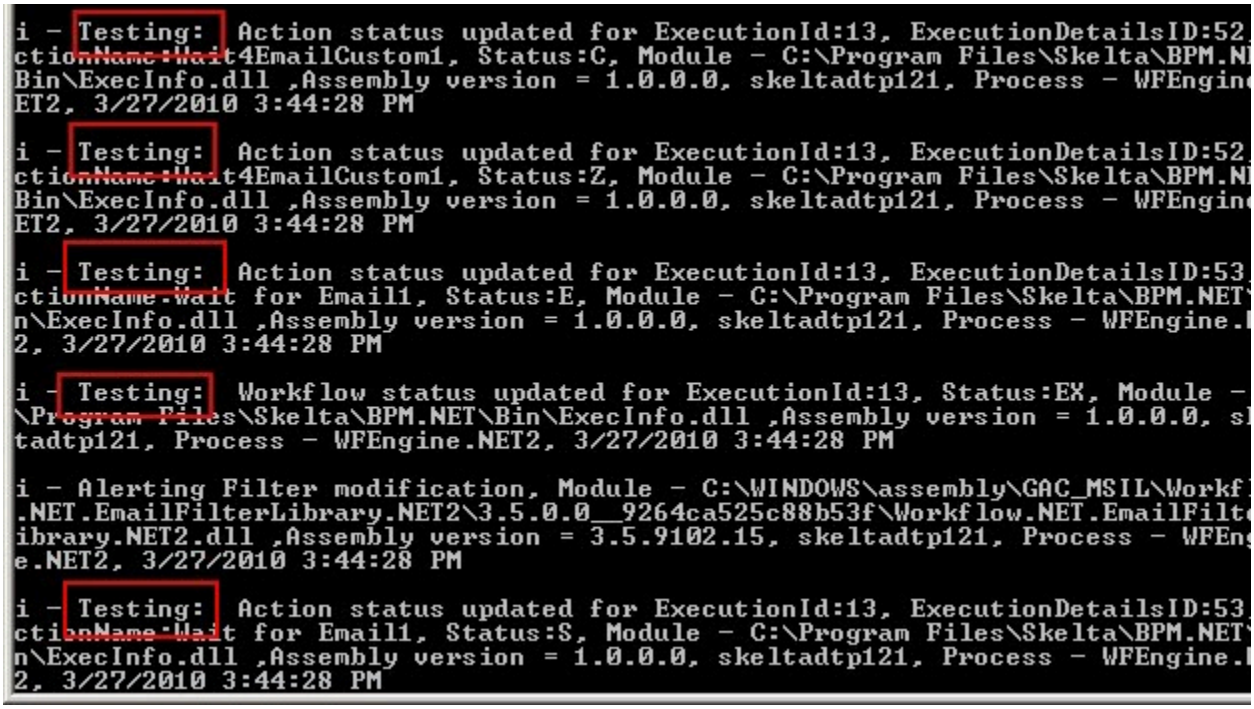
Compile the class and add the dll in to the AVEVA Work Tasks\bin folder. Now make an entry in the SKAddInProviders table in the Repository database.

Run the following SQL Command, after providing the specific values for ClassName and Assembly on the repository database.

```
INSERT INTO SKAddInProviders (Type,[Name],ClassName,[Assembly],Settings,IsGacAssembly)
VALUES('WorkflowInformation','WorkflowInformation','ClassName','bin\<DLLName>.dll','',1)
```

Note: Ensure the Name column of the table is unique. The Type and [Name] must be 'WorkflowInformation'.

To test the working of the implementation, test run a workflow from the specific repository with the logger kept open. You can see that the custom message getting displayed in the Logger Console.



Get User Name with Domain Name

In scenarios where you want to get the user name in the format *<domain name>\<user name>,* you can use the below options based on the requirement.

- For User interface, use `UserContext.GetUserName`.
- To use inside an activity, use `Context.DownLevelLogOnName`. This method can be used in expressions based on the requirement and criteria.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

DownLevelLogOnName is for getting the user name with domain name in run time. The following code sample demonstrates how to use DownLevelLogOnName in action run method. For example, adding a new variable in the variable collection with DownLevelLogOnName and assigning the value at runtime.

```
{
try
{
string customActivityPropertyValue = "";
VariablesCollection variables = CurrentContext.Variables;
if (variables.Contains("DownLevelLogOnName"))
{
Workflow.NET.Variable Var = variables["DownLevelLogOnName"];
Var.Value = CurrentContext.DownLevelLogOnName.ToString();
}
else
{
variables.Add("DownLevelLogOnName", "string",
CurrentContext.DownLevelLogOnName.ToString());
}
CurrentContext.log.LogInformation("Testing DownLevelLogOnName value :" +
CurrentContext.DownLevelLogOnName.ToString());
Output = "Success";
}
catch
{
Output = "UnSuccess";
}
return ActionResult.Completed;
}
```

Best Practices

Workflows:

1. Do not call the same workflow in a loop.
2. Before importing the workflow that has a child workflow, ensure to change or remove the repository name (application) of the child workflow from the process definition XML, if the repository does not exist in the importing environment.

SOA:

Two SOA Assemblies cannot have the same assembly name or class name.

While attaching a backed up Repository DataSource, ensure that the source SOA assembly registration dlls are registered in the target computer. Any customizations in the source SOA assembly must be copied to the target computer before publishing the workflow.

Dashboard:

1. In the dashboard, we recommend to use a Queue web part in the right zone.
2. In the dashboard, if multiple Inbox web parts are used, we recommend to set the **ReadingPaneinPopupWindow** to *true*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. In Mozilla Firefox, dashboard does not support web part drag and drop feature. Instead, use web part editor to move the web parts.
4. Do not to use the same list with different views in the dashboard.
5. We recommend the following configurations when multiple list web parts are displayed in dashboard:
   a. Disable **Show Header** and **Show Ribbon** bar properties.
   b. Use unique list view names across list web parts.
6. To apply the list view, it is mandatory to enable the **ShowListViews** property for the list web part.
7. List Views are recommended only for lists that are created with existing tables and not with generic tables.
8. For better performance of list view, it is recommended not to use the same tables for multiple list tables in the list.
9. To avoid multiple listing of the same items in list web part, it is recommended not to select the child table columns as grid columns for the list view.
10. Avoid using special characters while creating list folders.
11. For the Expression Editor to work in Firefox, pressing the space bar or any other key as a first step.

Web Parts:

1. Web part title should not be more than 200 characters.
2. Security Group Mapping in List Control Web Part should be used at List level and ListItem level.
3. Mandatory configurations for Adding Multiple List Control Web Part in Dashboard are as follows:
   a. Disable the properties Show Header and Show Ribbon Bar.
   b. Use unique list view names across all the List Control Web Part.
   c. Create list views with All items enabled.
   d. If you create similar lists in multiple list control web parts placed in a single homepage, you might not be able to view the list views properly.
4. We recommend to refresh the grid manually after creating items or folders in a grid.
5. You can specify height and width in percentage or in pixels for all the web parts except the Queue Control web part. However, for the Forms List web part, you can specify the height and width in pixels alone.
6. In a dashboard opened in Mozilla Firefox, you can move the web parts across the zones using the Web Editor.
7. We recommend to use the following Web Parts only once in a homepage:
   a. Calendar controls
   b. Queue

Database Tips

- In order to support database with a different culture or case-sensitive collation, make sure the database queries are written in case-sensitive format.

  For example:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

A query build against the above table should be:

Correct:

```
SELECT Id FROM SKAddInProviders
```

Wrong:

```
SELECT id FROM SKAddInProviders [Id column contains small letter i]
SELECT Id FROM SKAddinProviders [Table name contains small letter i]
```

The same applies for readers and rows in DataTable.

```
reader["id"] is wrong
reader ["Id"] is correct
```

Coding Tips

Close the Client Object

1. The below code is used for executing a workflow.

```
string xmlcontent = "<Expense><Amount>2000</Amount></Expense>";
Client objClient = new Client("MyApps","MyWF");
try
{
int ExecutionID = objClient.Execute(Convert.ToInt32(Session["UserID"]), xmlcontent);
 }
 catch
 {
//.....
}
 finally
 {
 if (objClient != null)
{
objClient.Close();
 }
}
```

It is mandatory to call the Close () method after the execute () method.

Dispose the Context object to avoid memory leaks

The Workflow.NET.Engine.Context class encapsulates all the information about the executing workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Usage of this class within other objects during workflow execution is required to access the executing workflow details. The Context object uses the Dispose (implementation of IDisposable interface) method to free up all the unmanaged resources. It is mandatory to call the Dispose method after usage of Context Object.

The sample codes shown below describes different scenarios for usage of Context object and the best practice of ensuring Disposal of context object by calling Dispose method. In some scenarios, calling Dispose on a different object takes care of Disposal of Context object used within that object as well.

The sample code below is used for disposing the context object:

```
Workflow.NET.Engine.Context workflowContext = Workflow.NET.Engine.Context.GetContext(17,
"Spill Repo");
using (workflowContext)
{
Workflow.NET.VariablesCollection workflowVariables = workflowContext.Variables;
}
//Context gets disposed automatically since we use using block
or
Workflow.NET.Engine.Context workflowContext = Workflow.NET.Engine.Context.GetContext(17,
"Spill Repo");
try
{
Workflow.NET.VariablesCollection workflowVariables = workflowContext.Variables;
//Do something
}
catch (Exception exception)
{
//Handle Exception.
}
finally
{
workflowContext.Dispose();
}
//Context is disposed explicitly
```

Mandatory to call Dispose of HWSActivity object

In HWSActivity object the Dispose method has to be called mandatorily as follows:

```
ApplicationObject appObject = new ApplicationObject("Telematics");
WorkflowObject workflowObject = new WorkflowObject("LeaveWF", appObject);
// Creating HWSActivity Object
HWSActivity hwsActivity = new HWSActivity(workflowObject, new
Guid("49e411e3-7487-4ad3-a4c7-40d88f5f75cf"));
try
{
String actionName = hwsActivity.CurrentActivity.ActionDisplayName;
//do something
}
catch (Exception exception)
{
//Handle exception
Console.WriteLine("Error:" + exception.Message);
}
finally
{
hwsActivity.Dispose();
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
}
 // HWSActivity object is disposed explicitly.
```

The Work Item object (Skelta.HWS.WorkItem) also uses the context object which has to be released; now we have the Dispose method exposed in the Work Item object.

Mandatory to call Dispose of Work Item object

AVEVA Work Tasks Work Item List control is used to display all the activities for a user and from which the user can perform the tasks. User can also use the Work Item control in their custom application and load their Work Items. The Work Item object is largely used while building the Work Item detailed view, submitting or processing the Work Item etc.

Ensure that the Dispose method is called in the following format while using Work Item object in your code

```
ApplicationObject appObject = new ApplicationObject("Telematics");
WorkflowObject workflowObject = new WorkflowObject("LeaveWF", appObject);
//Creating Workitem object
WorkItem workItem = new WorkItem(workflowObject, new
Guid("dca38d4d-0c5d-4e3c-af98-77c5f2990709"));
try
{
Console.WriteLine("HWSActivity Name: " + workItem.HWSActivity.ActivityName);
//Do something
}
catch (Exception exception)
{
//Handle Exception
}
finally
{
workitem.Dispose();
}
//WorkItem object is disposed explicitly.
```

References to the WorkItem object through the WebWorkitemAdapter class may be present, where the Dispose method has been exposed.

Mandatory to call Dispose of WebWorkitemAdapter object

While using the WebWorkitemAdapter object (Skelta.HWS.WorkListChannel.Web. WebWorkitemAdapter), please ensure that the following format is followed to dispose the adapter object:

```
public WebWorkItemAdapter adapter;
try
{
adapter = new WebWorkItemAdapter();
adapter.ProcessWebChannelRequest();
_workitemSubject = adapter.CurrentWorkItem.Subject;
//Do something
}
catch(Exception exception)
{
//Handle Exception
}
finally
{
adapter.Dispose();
}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: If both HWSActivity and the Work Item object are used, disposing the HWSActivity object will dispose the current context object.

For example:

```
ApplicationObject appObject = new ApplicationObject("Telematics");
WorkflowObject workflowObject = new WorkflowObject("LeaveWF", appObject);
HWSActivity hwsActivity = new HWSActivity(workflowObject, new
Guid("49e411e3-7487-4ad3-a4c7-40d88f5f75cf"));
Skelta.HWS.WorkItem workItem = new Skelta.HWS.WorkItem(hwsActivity);
try
{
workItem.Status = "Approved";
workItem.Save();
workItem.Submit("WebWorkList", "Approved", "","Approved @"+ DateTime.Now);
}
catch(Exception exception)
{
//Handle Exception
}
finally
{
hwsActivity.Dispose();
}
```

2. The below changes are required for culture compatibility

```
"".ToUpper() or "".ToLower() should not be used. Use "".ToUpperInvariant() or
"".ToLowerInvariant() for string comparison.
```

Wrong :

```
string str = "windows";
  if(str.ToUpper() == "WINDOWS"){ }
```

Correct:

```
string str = "windows";
  if(str.ToUpperInvariant() == "WINDOWS"){ }
```

3. Script Activity should not be used for complicated tasks. Performance issues can occur if external DLLs are loaded and used. We recommend using custom activity in place of script activity, as there might be some memory related issues using script activity whenever a reference to an external dll is required.
4. Only use the common methods defined in common functions to get the transaction scope.
   a. Workflow.NET.CommonFunctions.GetNewTransactionScope() [Joins a parent transaction if available, else executes in a new transaction].
   b. Workflow.NET.CommonFunctions.GetRequiredNewTransactionScope() [Starts a new transaction]
   c. Workflow.NET.CommonFunctions.GetSuppressedTransactionScope() [Suppresses the transaction for execution within the scope. Parent transaction is till valid.]
   d. Skelta.Core.DS.SingleTableObject.GetTransactionScope()[Joins a transaction if available, else suppresses the transaction. Combination of GetNewTransactionScope && GetSuppressedTransactionScope]
5. To implement an impersonated database connection, implement the DB connection pooling at the AVEVA Work Tasks Level. Due to this change, you are required to follow a few standards while using data handlers inside transaction scope in a custom activity.

Keep the following points in mind:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Connection has to be disposed of in the transaction after use.
2. Make sure the data reader is closed after use.
3. Always complete the transaction.

Wrong:

Data handler is disposed of outside the transaction. A transaction which is initialized in the transaction should be disposed within the transaction scope.

```
try
{
   using (TransactionScope TScope = Skelta.Core.DS.SingleTableObject.GetTransactionScope())
   {
     DBHandler = Workflow.NET.Storage.DataHandlerFactory.GetDataHandler(new
Workflow.NET.Config(this.ApplicationName));
     IDataParameter idp1 = DBHandler.GetParameter("@PreferredChannelName",
preferredChannelName);
     IDataParameter idp2 = DBHandler.GetParameter("@Id", this.Id);
     IDataParameter idp3 = DBHandler.GetParameter("@LastUpdatedDateTime",DateTime.UtcNow);
     DBHandler.ExecuteUpdate(sql, idp1, idp2, idp3);
     TScope.Complete();
    }
}
catch (Exception e)
{
    throw e;
}
finally
{
if (DBHandler != null)
DBHandler.Dispose();
}
```

Correct:

```
try
 {
  using (TransactionScope TScope = Skelta.Core.DS.SingleTableObject.GetTransactionScope())
  {
     DBHandler = Workflow.NET.Storage.DataHandlerFactory.GetDataHandler(new
Workflow.NET.Config(this.ApplicationName));
     using (DBHandler)
     {
     IDataParameter idp1 = DBHandler.GetParameter("@PreferredChannelName",
preferredChannelName);
     IDataParameter idp2 = DBHandler.GetParameter("@Id", this.Id);
     IDataParameter idp3 = DBHandler.GetParameter("@LastUpdatedDateTime", DateTime.UtcNow);
     DBHandler.ExecuteUpdate(sql, idp1, idp2, idp3);
     }
     TScope.Complete();
     }
   }
   catch (Exception e)
   {
      throw e;
   }
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Performance Tips

Recommended Steps for Optimum Performance

1. AVEVA Work Tasks dlls configured in the SKAddInProviders table and AVEVA Work Tasks table schemas can be cached for better performance.
   - The code given below needs to be put in the application on start of the web application.

     ```
     Skelta.Core.EnableCaching.Initialize(new
      Skelta.Core.ApplicationObject("ApplicationName"), null);
     ```
   - If new dlls are added/existing dlls are changed and if they need to be re-cached the below code can be used.

     ```
     Skelta.Core.EnableCaching.Reset(new Skelta.Core.ApplicationObject("ApplicationName"),
     null);
     ```
   - For resetting the cache in engine, use the code given below. By default when the engine starts all the dlls and table schemas are cached.

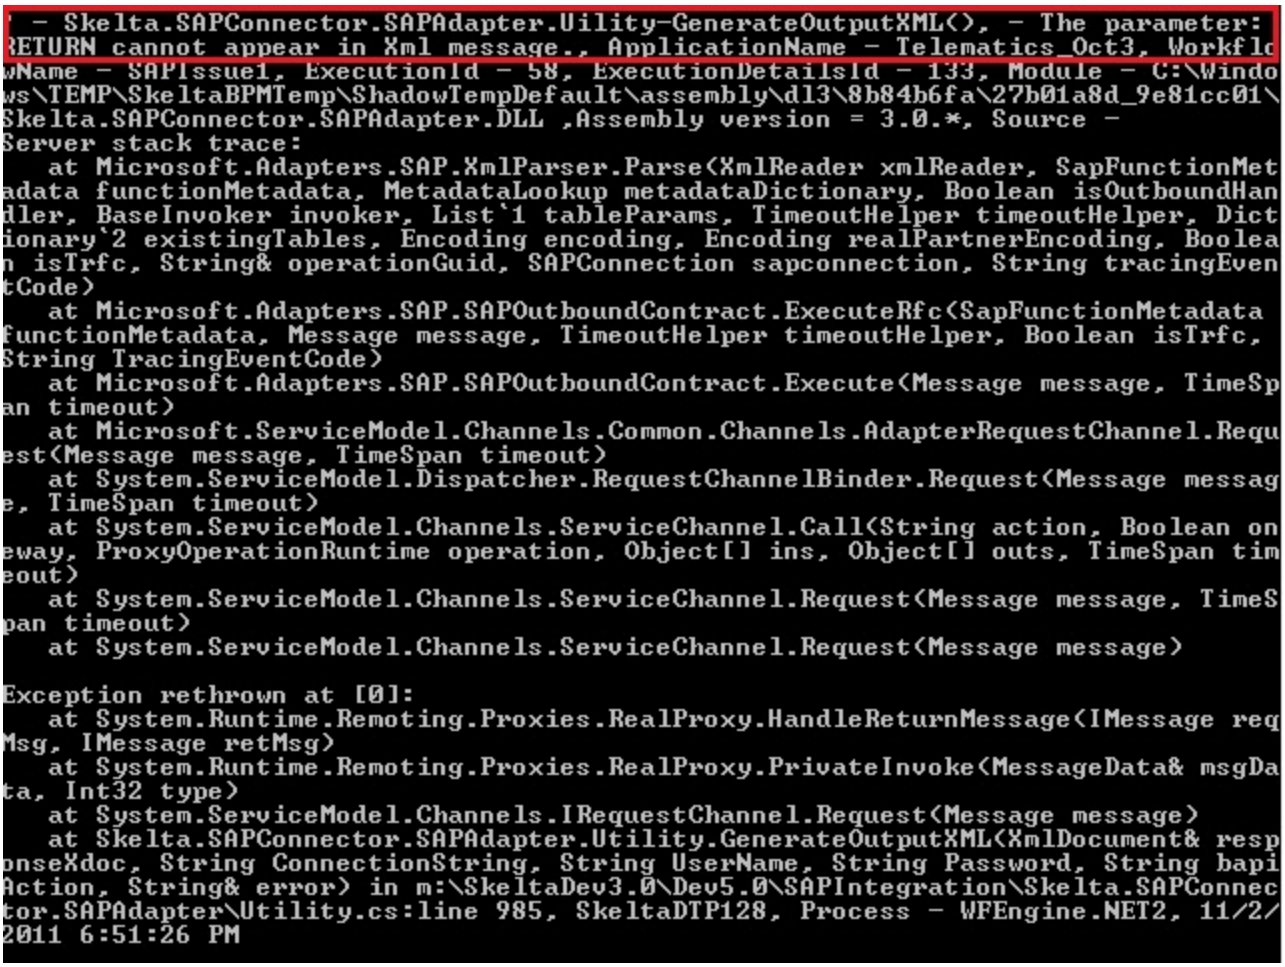
     ```
     Workflow.NET.Engine.Client client = new
     Workflow.NET.Engine.Client("ApplicationName","WorkflowName");
     client.ResetCache();client.Close();
     ```
2. You can set the threads that can be used by AVEVA Work Tasks in the farm configuration UI.
   - AVEVA Work Tasks Engine properties have the option to set Thread Pool Size.
3. You can ensure reliable performance even under heavy loads.
   - To ensure reliable performance even under heavy loads make sure **Connection Pooling** is enabled. By default, pooling is enabled and Max Pool Size is **300**.
4. Go for fail over clustering if the loads expected are high. Use different servers for running the AVEVA Work Tasks Service and Databases.

Troubleshoot Issues

1. While executing the BAPI_RFC Execute activity, the logger might log the following error message:

The parameter: RETURN cannot appear in XML message..... as shown in the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



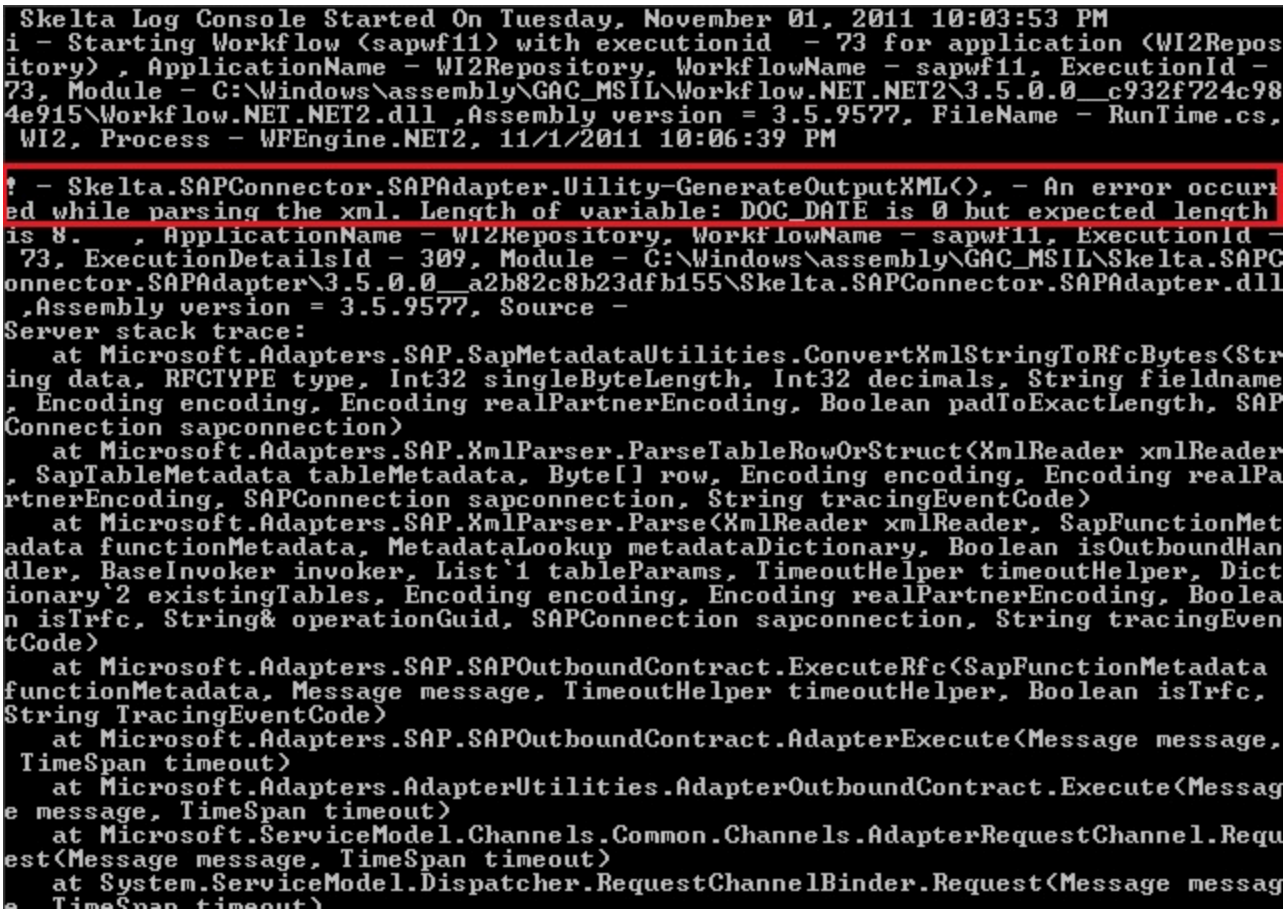
Solution

- Go to **BAPIRFC Execute** activity and select the **No** option in the **Include Return Parameter** property.

3. The following error message appears:

An error occurred while parsing the xml. Length of variable: DOC_DATE is 0 but expected length is 8.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The Date Time type parameter must always be provided with the required values.

Solution:

You can either provide the required value to all the Date Time type parameters or delete the nodes from the Input XML Variable present in the Start activity. To delete the node, right-click the node, delete it, and save the variable.

4. Unable to send or receive emails and SMS using the AVEVA Work Tasks Communication Service.

Possible Cause

The Communication Service is hosted on Port 25. If any other application or process uses the same port, the port will be unavailable to the Communication service. Hence, you will not be able to send and receive emails and SMS.

Solution

After you restart the **Communication Service**, we recommend you to use Telnet to verify the availability of port 25. This helps you to ensure that the communication service is started and running. However, ensure to maintain a time delay of a minute between the communication service restart and Telnet.

Use the following command to verify the availability of port 25:

```
Telnet <Computer Name> 25
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. When upgrading a large database, the following error appears: The transaction associated with the current connection has completed, but has not been disposed. The transaction must be disposed before the connection can be used to run SQL statements.

Possible Cause

Upgrading a large database takes more than 10 minutes, due to the size of the database, but the default transaction timeout settings is 10 minutes.

Solution

Increase the transaction timeout settings in the **machine.config** file as follows:

```
<system.transactions>
<machineSettings maxTimeout="01:00:00"/>
</system.transactions>
```

6. Start Activity slows down and takes time to start when the workflow is executed.

Possible Cause

The invalid web service was registered in the Repository.

Solution

Make the necessary changes in the web service URL and ensure that the web service URL is valid.

Limitations

- Messages or notifications in **AVEVA Work Tasks**, which are returned by third party controls such as, ISWebGrid, Telerik, or Kendo does not comply with the Message bar usage and guidelines.
- When Email Notification is configured for an **Invoke Form Activity**, the form opens through the Email. However, when the form is submitted successfully, the confirmation message does not appear.
- When you receive an email notification configured for an **Invoke Form Activity**, and click the link in the email, the form opens in a window. If Google Chrome is the default browser, then the window closes as expected.
- In **Invoke Form Activity**, *Multi-select* and *Close* on *Finish* property are not supported in Forms.
- The user interface messages and error messages for Publish, UnPublish, and Publish and Test run in workflows do not conform to the Message bar standards.
- While packaging, workflows containing the following combination of Property and Activity does not work as expected:
  - Exception Template Property (Affected activity : Start Activity)
- You can associate multiple events to a single workflow. However, the event provider type must be the same.
- Although localization is supported, some of the special characters such as, ' " # & / & [\ ] | ~ + < > are not supported for Workflow names and List names. We recommend that these special characters are not used in naming the activities.
- When a workflow with Message Queue activities is installed in the target environment and if its associated artifact (Message Queue Connection) does not get installed, then the workflow is installed in Draft status. If you manually publish this workflow, it will return unexpected results.

Forms and Lists User Guide

This section is intended for the users to create user interfaces and entities respectively for business process management applications. Forms and lists form the foundation of a business application and integrate with workflows for managing the business processes.

Features available in Forms and Lists

Forms

Designing the user interface is one of the most important aspects of developing a business application. Use web-based forms to easily create complex user interfaces with responsive design and cross-browser compatibility. Forms integrate with lists and workflows to enable rapid deployment of business applications.

- Create rich browser-based forms and use folders to organize forms.
- Import and export forms as XML documents and save specific versions of forms to keep track of changes.
- Design intricate forms using the simple drag-and-drop forms designer with advanced set of controls, and use layouts to organize controls on forms.
- Preview and publish forms across platforms and devices with a native look and feel for mobile devices.
- Secure forms by defining rights assigned to forms or set of forms grouped under folders.
- Generate dynamic list forms and associate forms to workflows to trigger workflows and pass data.
- Populate options through scripts for Check Box, Drop-Down, Radio Button, and List controls.
- Add validation checks and interactivity to forms using the dedicated script editor with client-side JavaScript.
- Achieve fast and fluid application performance with optimized client-side code execution.

For more information about forms, see Forms.

Lists

Entities are the building blocks of business applications. Use lists to easily create complex business entities. Lists are mapped to single or multiple SQL tables. Lists also integrate with forms and workflows to enable rapid deployment of business applications.

- Create rich browser-based lists and use folders to organize lists.
- Import and export lists as XML documents.
- Design functional lists using the simple drag-and-drop lists designer with basic set of controls.
- Secure lists by defining rights assigned to lists or set of lists grouped under folders.
- Generate dynamic list forms and associate lists to workflows to trigger workflows and pass data.

For more information about lists, see Lists.

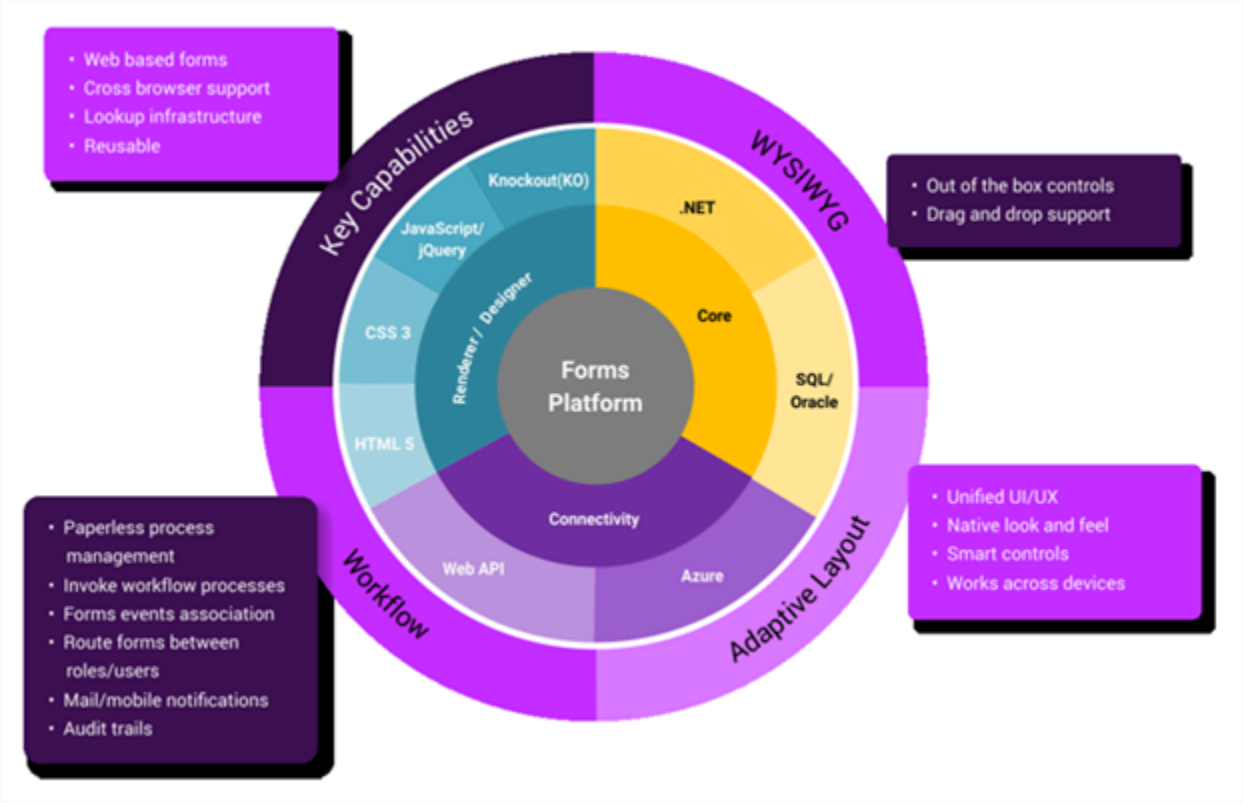
Forms

This section provides information on getting started with Forms and how to access the Forms.

Introduction

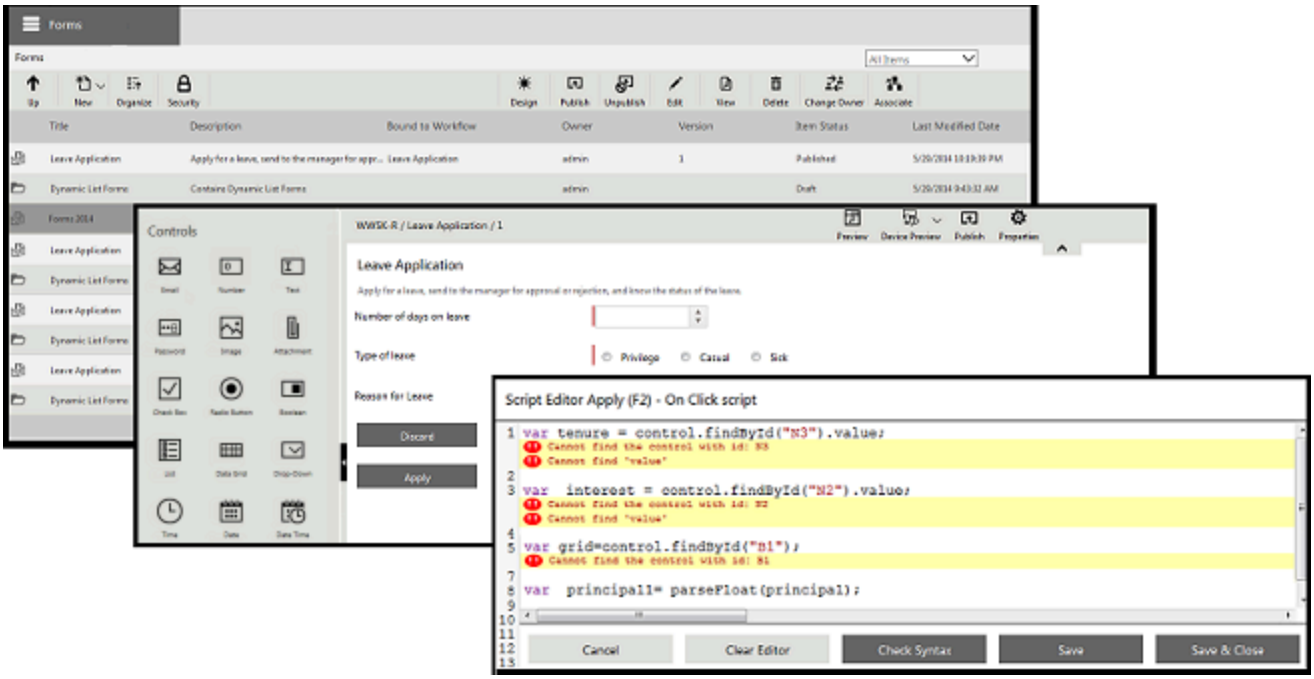
AVEVA Work Tasks Forms is a powerful platform to design and use sophisticated forms in your enterprise. The forms platform uses the latest .NET framework, and is developed using HTML5, CSS3, and Knockout JavaScript for a rich and responsive user experience. You can connect to forms with various Web APIs and through the Azure cloud platform.

Forms Platform



The forms platform offers a "what you see is what you get (WYSIWYG)" experience with an adaptive layout and embeddable support for workflow enhancements.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Forms, Forms Designer, and Script Editor

Key Capabilities	Workflow Enhancements
Web based forms • Cross-browser support • Lookup infrastructure • Reusable	• Paperless process management • Invoke workflow processes • Forms events association • Route forms between roles and between users • Mail and mobile notifications • Audit trails

Form preview on a mobile device

WYSIWYG Experience	Adaptive Layout	Embeddable Support
• Out of the box controls • Drag and drop support	• Unified user interface and user experience • Native look and feel • Smart controls • Works across devices	• Custom Control Infrastructure • Single page – Model View ViewModel (MVVM)

Get Started with Forms

Create, design, preview, and publish a simple form to use with workflows.

Follow the steps to create an employee registration form to enter and submit employee information such as

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

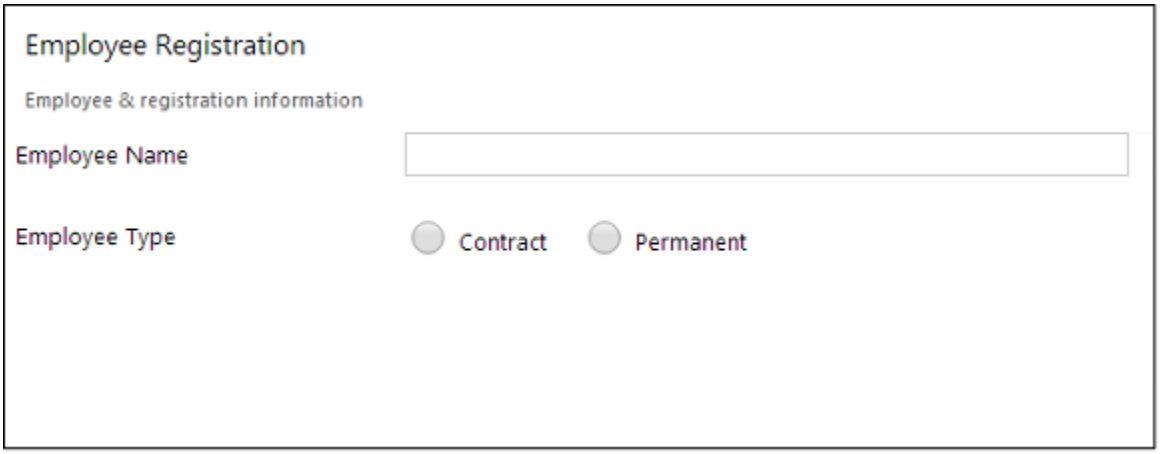
name and type.

To get started with your first form

Creating Form

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. Click **New**, and then click **Form**. The **New Form** wizard appears.
3. In the **Name** box, type **Employee Registration**, and in the **Description** box, type **Employee & registration information**.
4. Click **Save & Continue**. The **Employee Registration** form is created, and the **Form Options** wizard appears.

Designing Form



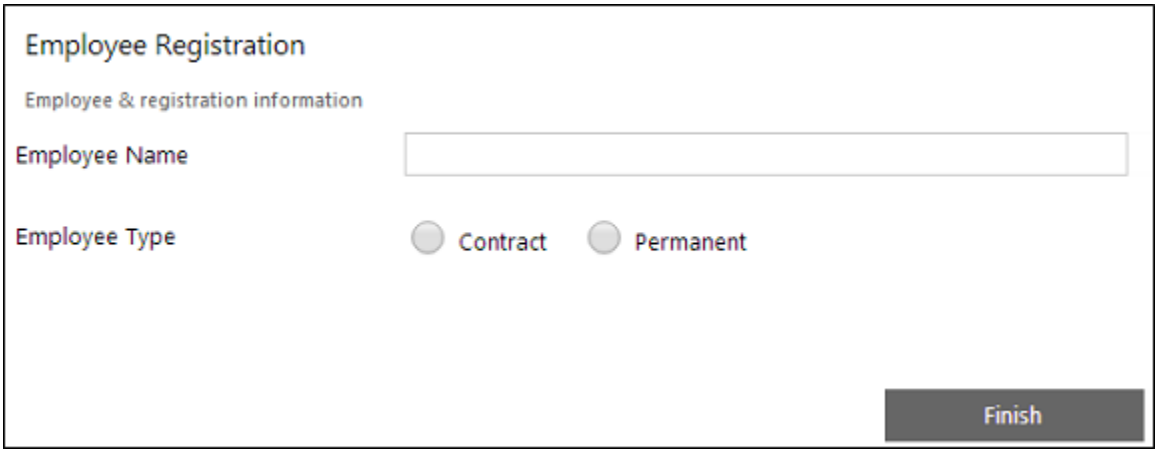
Employee Registration Form on Forms Designer Canvas

1. Click **Design this form**.
2. Click **Finish**. The **Forms Designer** page appears.
3. Drag **Text** control from the toolbox to the canvas. The **Text** control appears on the canvas.
4. Point to the **Text** control on the canvas, click **Textinput1**, and then type **Employee Name**.
5. Drag **Radio Button** control from the toolbox to the canvas. The **Radio Button** control appears on the canvas.
6. Point to the **Radio Button** control on the canvas, click **Radiobuttongroup1**, and then type **Employee Type**.
7. Point to the **Radio Button** control on the canvas. The **Shortcut** menu appears.
8. Click the **Properties** button. The **Properties** dialog box appears.
9. Under **Options**, Click **Add Record**. A new record appears.
10. In the **Text** box, type **Contract**, and in the **Value** box, type **1**.
11. Again, under **Options**, Click **Add Record**. A new record appears.
12. In the **Text** box, type **Permanent**, and in the **Value** box, type **2**.
13. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Previewing Form

Employee Registration Form preview on browser:



Publishing Form

1. On the action bar, click **Publish**. The form is published and an information message appears.
2. Click **OK**. The information message is closed.

Closing Forms Designer

Click the **Close** button. The **Forms Designer** page is closed.

Note:
- After you create the **Employee Registration** form, the form will be available in the **Forms** page to perform further operations.

Access Forms

Use the **Forms** page to create, organize, import, save, design, publish, manage, secure, and associate forms to workflows.

To access Forms

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.

   The **Forms** page shows the title, description, bound to workflow, owner, version, item status, and last modified date for the forms.

Forms Interface

Forms interface has breadcrumbs, an action bar, and a list of forms.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Breadcrumbs

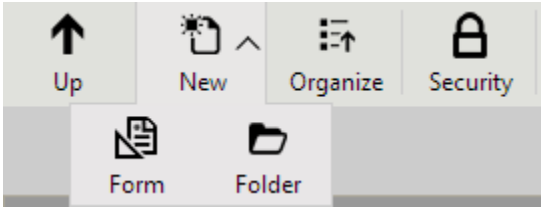
Breadcrumbs display the path to the child form or folder, and has commands to customize and view the list of forms.

Command	Description
All Items	Default view to display the list of forms.
Create View	Create a new view to display the list of forms.

Action Tool Bar

Action tool bar has commands to manage forms and folders. Standard commands are available all the time whereas contextual commands are available only when a form is selected.

Standard Commands

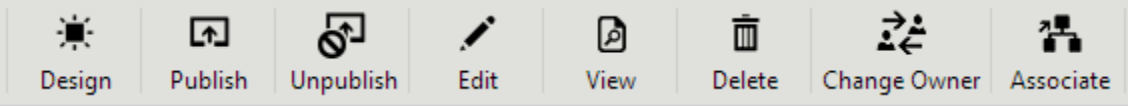


Menu/Command	Command	Description
Up		Go back to the parent form or folder.
New	Form	Create a new form. For more information, see Create Forms.
	Folder	Create a new folder to group and organize forms. For more information, see Create Folders for Forms.
Organize		Organize the form by moving the form to a folder or by making the form a child item of another form. For more information, see Organize Forms.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Security		View or customize the security level for the forms. For more information, see Set Security of Forms.

Contextual Commands

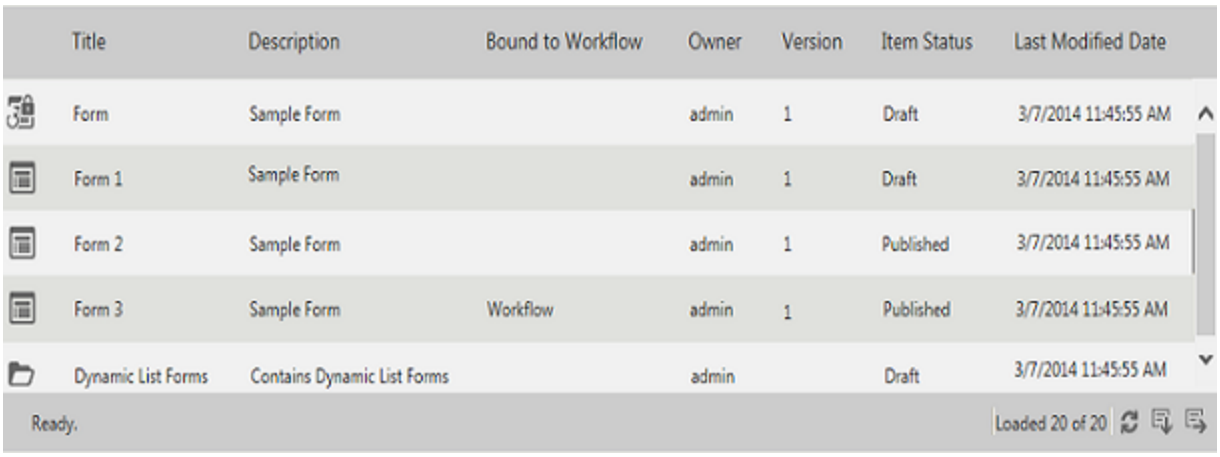


Command	Description
Design	Design the form with the forms designer. For more information, see Design Forms.
Publish	Publish the form or the folder. For more information, see Publish Forms or Publish Folders.
Unpublish	Unpublish the form or the folder. For more information, see Unpublish Forms or Unpublish Folders.
Edit	Edit description of the form and then change design of the form with the forms designer. For more information, see Edit Forms.
View	Preview the form. For more information, see Preview Forms.
Delete	Delete the form. For more information, see Delete Forms.
Change Owner	Change owner of the form. For more information, see Change Ownership of Forms.
Associate	Associate the form to a workflow. For more information, see Associate Forms to Workflows.

List

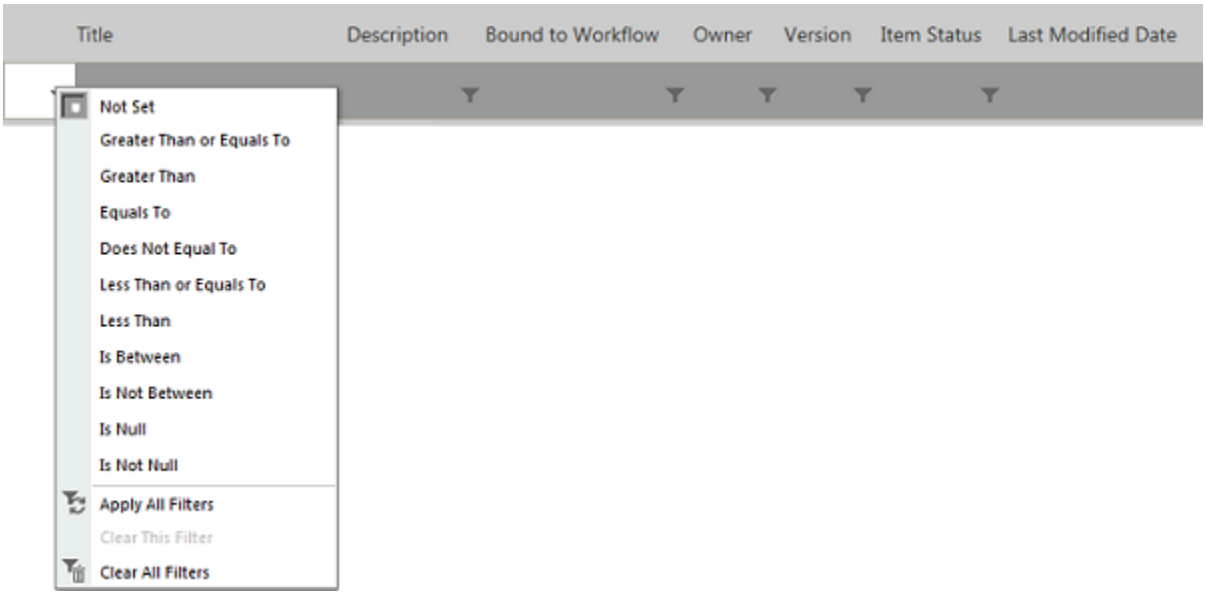
List of forms shows the title, description, bound to workflow, owner, version, item status, and last modified date for the forms. Click on a column to sort the forms.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Filter Bar

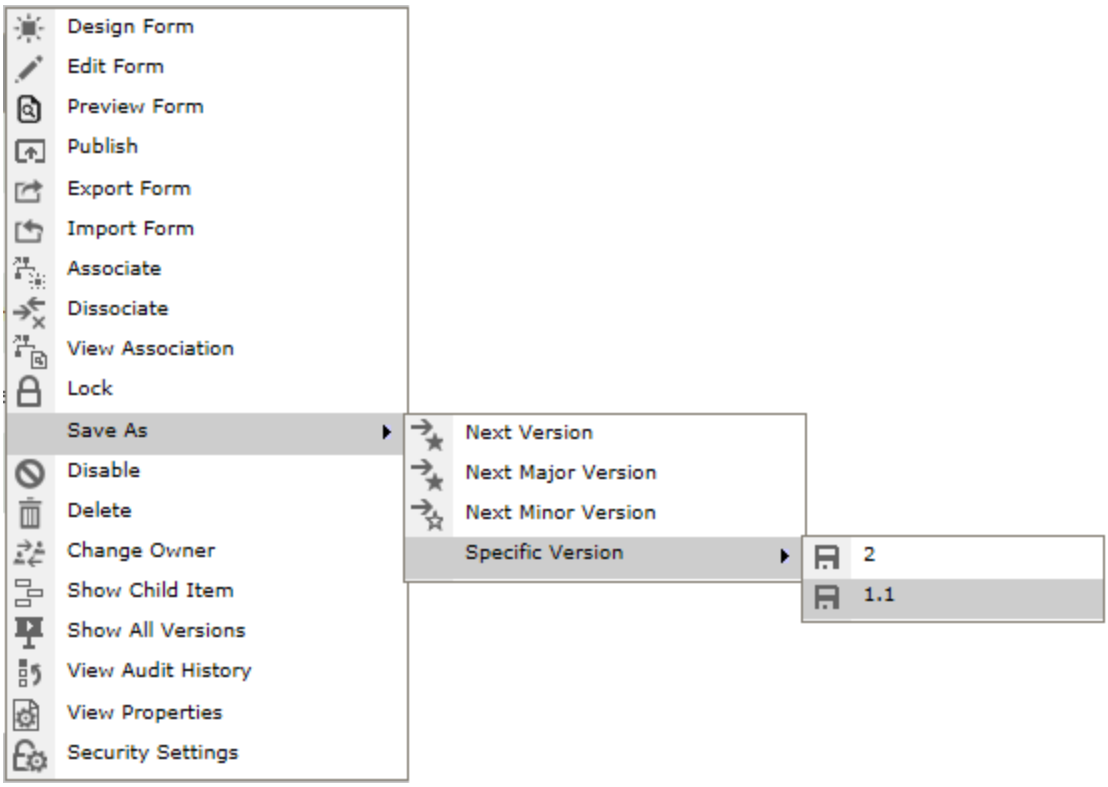
Filter bar can help to quickly find the desired forms from the list of forms. Filter bar has a funnel button and a parameter area for every column of the forms list. The filter button shows the available filter options and the parameter area is for entering the filter criteria. The filter bar is hidden by default. Right-click on the column header, and then click **Filter Bar**, to access the filter bar. For more information about filter bar, see Filter Forms.



List Shortcut Menu

List shortcut menu has commands to manage the form. The list of commands available is dynamic and changes when the form is locked or disabled. Right-click on a form to access the shortcut menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Command	Description
Design Form	Design the form with the forms designer. For more information, see Design Forms.
Edit Form	Edit description of the form and then change design of the form with the forms designer. For more information, see Edit Forms.
Preview Form	Preview the form. For more information, see Preview Forms.
Publish	Publish the form. For more information, see Publish Forms or Publish Folders.
Unpublish	Unpublish the form. For more information, see Unpublish Forms or Unpublish Folders.
Export Form	Export the form as an XML document. For more information, see Export Forms.
Import Form	Import the form from an XML document. For more information, see Import Forms.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Command	Description
Associate	Associate the form to a workflow. For more information, see Associate Forms to Workflows.
Dissociate	Remove association of the form from a workflow. For more information, see Dissociate Forms from Workflows.
View Association	View association of the form with a workflow. For more information, see View Association of Forms with Workflows.
Lock	Lock the form. For more information, see Lock Forms.
Unlock	Unlock the form. For more information, see Unlock Forms.
Save As	Save a different version of the form. For more information, see Saving Versions of Forms.
Disable	Disable the form. For more information, see Disable Forms.
Enable	Enable the form. For more information, see Enable Forms.
Delete	Delete the form. For more information, see Delete Forms.
Change Owner	Change owner of the form. For more information, see Change Ownership of Forms.
Show Child Item	Show child items of the form. For more information, see View Child Items of Forms.
Show All Versions	Show all versions of the form. For more information, see View Versions of Forms.
View Audit History	View audit history of the form. For more information, see View Audit History of Forms.
View Properties	View properties of the form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Command	Description
	For more information, see View Properties of Forms.
Security Settings	View or customize the security level for the forms. For more information, see Set Security of Forms.

Create and Organize Forms

For information on creating and organizing the forms, see the topics:

- Create Forms
- Create Folders for Forms
- View Child Items of Forms
- Organize Forms

Create Forms

Create a form to use with workflows.

To create a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. On the action bar, click **New**, and then click **Form**. The **New Form** wizard appears.
3. In the **Name** box, type a name for the form.

   Note: Name cannot contain special characters such as # ~ & + \ " ' < > | @ ! $ % * ( ) = / { } ?
4. In the **Description** box, type a description for the form.

   Note: Description cannot contain special characters such as # ~ & + \ " ' < > | @ ! $ % * ( ) = / { } ?
5. Click **Save & Continue**. The form is created, and the **Form Options** wizard appears.
6. Do one of the following:

Task	Action
• Design the form.	1. Click **Design this form**. 2. Click **Finish**. The **Forms Designer** page appears. 3. Design the form, and then click the **Close** button. The form is saved and the **Forms Designer** page is closed.
• Cancel further operations.	1. Click **No task to be performed now**. 2. Click **Finish**. The form is saved and an information

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
	message appears. 3. Click **OK** (or click the **Close** button). The information message and the **Form Options** wizard are closed.

Note: You can set the description only when you create or edit a new form.

Create Folders for Forms

Create a folder for a form to group and organize the form.

To create a folder for a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. On the action bar, click **New**, and then click **Folder**. The **New Folder** wizard appears.
3. In the **Title** box, type a name for the folder, and in the **Description** box, type a description for the folder.
4. Click **Save & Close**. The folder is created, and an information message appears.
5. Click **OK** (or click the **Close** button). The information message and the **New Folder** wizard are closed.

View Child Items of Forms

View child items of a form to see forms organized under the form.

To view child items of a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Show Child Item**. The child items page for the form appears.
   The child items page for the form shows the available child forms.

   Note: To go back to the **Forms** page, on the action bar, click **Up**.

Organize Forms

Organize a form by moving the form to a folder or by making the form a child item of another form.

To organize a form by moving the form to a folder

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. On the action bar, click **Organize**. The **Organize Forms** dialog box appears.
3. Drag a form to a folder. The form is moved to the folder.
4. Click **Close**. The **Organize Forms** dialog box is closed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To organize a form by making the form a child item of another form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. On the action bar, click **Organize**. The **Organize Forms** dialog box appears.
3. Drag a form to another form. The form is now a child item of another form.
4. Click **Close**. The **Organize Forms** dialog box is closed.

Import and Save Forms

You can import a form to create the form from an XML document as well as export a form to save the form as an XML document.

- Import Forms
- Export Forms
- View Versions of Forms

Import Forms

Import a form to create the form from an XML document.

The XML schema defines the controls and properties of the controls for the form.

To import a form

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Import Form**. The **Import** dialog box appears.
3. Click **Choose File** to select the Form XML file to be imported, and then click **Import**. The form is imported and an information message appears.
4. Click **Close**. The **Import** dialog box is closed.

To import a form in Forms Designer

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. On the action bar, click **Import**. The **Import** window appears.
4. Click **Browse**. The **Choose File to Upload** dialog box appears.
5. Select an XML document, and then click **Open**. The XML document is selected and the **Choose File to Upload** dialog box is closed.
6. Click **Import**. The form is imported and an information message appears.
7. Click **Close**. The **Import** window is closed.

Note:
- When a form is imported, the existing controls and properties of the controls for the form are overwritten with

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the controls and properties of the controls defined in the XML schema.
- You cannot import an XML schema defined for Forms.

Export Forms

Export a form to save the form as an XML document.

The XML schema defines the controls and properties of the controls for the form. After successfully exporting a form, you can import the XML document to create similar forms.

To export a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Export** Form. A message bar appears.
3. Click **OK**. The **Save As** dialog box appears.
4. Click **Save**. The list is exported as an XML document, and the **Save As** dialog box is closed.

To export a form in Forms Designer

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. On the action bar, click **Export**. The list is exported as an XML document.

View Versions of Forms

View versions of a form to see available versions of the form and other information for each version of the form.

To view versions of a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Show All Versions**. The versions page for the form appears.

   The versions page for the form shows the version, comments, status, archived status, creation date and time, and workflow for the associated form.

   Note: You can also design, edit properties, preview, delete, publish or unpublish, and change owner for a version of the form.

Design and Publish Forms

You can do the following while working with Forms:

- Design a form to add controls and containers to the form.
- Edit a form to change description and design of the form.
- Delete a form when the form is no longer required.
- Preview a form to check look and feel of the form at run-time and the XML generated for the form.
- Publish a form to use the form in a workflow.The form associated to a workflow is a Fill Form, and appears in

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the Fill Form page only when both the form and the workflow are published.

- Unpublish a form to prevent using the form in a workflow.
- Publish a folder to use the forms associated to workflows in the folder in the Fill Form page.
- Unpublish a folder to prevent using the forms associated to workflows in the folder in the Fill Form page.

Design Forms

Design a form to add controls and containers to the form.

To design a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. Design the form, and then click the **Close** button. The form is saved and the **Forms Designer** page is closed.

Edit Forms

Edit a form to change description and design of the form.

To edit a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Edit Form** (or click on a form, and then on the action bar, click **Edit**). The **Edit Form** dialog box appears.
3. In the **Description** box, edit description for the form.
4. Click **Save & Continue**.

   The description for the form is saved, and the **Edit Form** dialog box is closed.

   The **Forms Designer** page appears.
5. Design the form, and then click the **Close** button. The form is saved and the **Forms Designer** page is closed.

Note: You cannot edit the name of the form. To edit properties of a form, see Edit Properties of Forms.

Delete Forms

Delete a form when the form is no longer required.

To delete a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Delete** (or click on a form, and then on the action bar, click **Delete**). A message bar appears.
3. Click **OK**.

   The message bar is closed,and the form is deleted.

   A message bar appears.
4. Click **Close** (or click the **Close** button). The message bar is closed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: If you delete a form, then the form cannot be restored.

Preview Forms

Preview a form to check look and feel of the form at run-time and the XML generated for the form.

To preview only the form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Preview Form** (or click on a form, and then on the action bar, click **View**). The **Preview** dialog box appears.
3. Check the look and feel of the form.
4. Click the **Close** button. The **Preview** dialog box is closed.

To preview the form and the XML generated for the form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Preview Form** (or click on a form, and then click **View**). The **Preview** dialog box appears.
3. Check the look and feel of the form, and then click **Finish**. The **Instance XML** dialog box appears.
4. Check the generated XML, and then click the **Close** button. The **Instance XML** dialog box is closed.
5. Click the **Close** button. The **Preview** dialog box is closed.

Publish Forms

Publish a form to use the form in a workflow.The form associated to a workflow is a **Fill Form**, and appears in the **Fill Form** page only when both the form and the workflow are published.

To publish a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**.

   The **Forms** page appears.
2. Right-click on a form, and then click **Publish** (or click on a form, and then on the **Action** bar, click **Publish**).

   The form is published and a message bar appears.
3. Click **Close**.

   The message bar is closed.

Note: When you publish a form, the item status of the form changes from draft to published.

To publish multiple forms

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**.

   The **Forms** page appears.
2. Select multiple forms, and then on the **Action** bar, click **Publish**.

   The forms are published and a message bar appears.
3. Click **Close**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The message bar is closed.

Note: When you publish forms, the item status of the forms changes from draft to published.

Unpublish Forms

Unpublish a form to prevent using the form in a workflow.

To unpublish a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**.

   The **Forms** page appears.
2. Right-click on a form, and then click **Unpublish** (or click on a form, and then on the **Action** bar, click **Unpublish**).

   The form is unpublished and a message bar appears.
3. Click **Close**.

   The message bar is closed.

   Note: When you unpublish a form, the item status of the form changes from published to draft.

To unpublish multiple forms

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**.

   The **Forms** page appears.
2. Select multiple forms, and then on the **Action** bar, click **Unpublish**.

   The forms are unpublished and a message bar appears.
3. Click **Close**.

   The message bar is closed.

Note: When you unpublish forms, the item status of the forms changes from published to draft.

Publish Folders

Publish a folder to use the forms associated to workflows in the folder in the **Fill Form** page.

To publish a folder

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a folder, and then click **Publish** (or click on a folder, and then on the action bar, click **Publish**). The folder is published and an information message appears.
3. Click **Close** (or click the **Close** button). The information message is closed.

   Note:
   - When you publish a folder, the item status of the folder changes from draft to published.
   - Associated forms appear in the **Fill Form** page only when both the forms and the workflows are published.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Unpublish Folders

Unpublish a folder to prevent using the forms associated to workflows in the folder in the **Fill Form** page.

To unpublish a folder

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a folder, and then click **Unpublish** (or click on a folder, and then on the action bar, click **Unpublish**). The folder is unpublished and an information message appears.
3. Click **Close** (or click the **Close** button). The information message is closed.

Note: When you unpublish a folder, the item status of the folder changes from published to draft.

Manage and Secure Forms

To manage and secure forms, you can do the following:

- Lock Forms
- Unlock Forms
- Disable Forms
- Enable Forms
- Filter Forms
- Change Ownership of Forms
- Set Security of Forms

You can also view properties of a form to see versions and child items for the form.

View audit history of a form to see date, time and user information when the form was locked and unlocked, and when the form owner or version was changed.

Create a form link to add a form to the menu, and to set a form as the home page.

Lock Forms

Lock a form to prevent other users from editing the form.

To lock a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Lock**. The form is locked and a message bar appears.
3. Click the **Close** button. The message bar is closed.

Note: When a form is locked, a lock overlay icon appears on the icon of the form.

Unlock Forms

Unlock a form to allow other users to edit the form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To unlock a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a locked form, and then click **Unlock**. The form is unlocked and a message bar appears.
3. Click the **Close** button. The message bar is closed.

Note: When a form is unlocked, the lock overlay icon disappears from the icon of the form.

Disable Forms

Disable a form to prevent editing or using the form.

To disable a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The Forms page appears.
2. Right-click on a form, and then click **Disable**. The form is disabled and a message bar appears.
3. Click the **Close** button. The message bar is closed.

Shortcut Menu Commands

When a form is disabled, some commands on the shortcut menu are no longer available to prevent editing or using the form.

Available Commands	Unavailable Commands
• Preview Form • View Association • Lock (or Unlock if the form is locked) • Enable • Delete • Show Child Item • View Audit History • View Properties	• Design Form • Edit Form • Publish • Unpublish • Export Form • Import Form • Associate • Dissociate • Save As • Change Owner • Show All Versions • Security Settings • Add to Package Template

Enable Forms

Enable a form to allow editing or using the form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To enable a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a disabled form, and then click **Enable**. The form is enabled and a message bar appears.
3. Click the **Close** button. The message bar is closed.

Filter Forms

Filter forms to quickly find the forms you are looking for from the list of forms. Filtering forms is useful especially when there are a large number of forms.

To apply a filter for the forms

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click the column header, and then click **Filter Bar**. The filter bar appears.
3. Enter a value in the filter bar for a column, and then press Enter.
4. Click the **Funnel** button on the column, and then click a filter option. The filter option is selected.
5. Click **Apply All Filters**. The filtered result appears.

To clear a filter for the forms

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click the filter bar (or click the **Funnel** button on the column), and then click **Clear All Filters**. The filtered result is cleared.

Filter Options

Filter forms using one of the filter option for each column:

Option	Description
Not Set	Show forms without applying any filters. This is the default filter option.
Greater Than or Equal To	Show forms where the value of the column is greater than or equal to the specified value.
Greater Than	Show forms where the value of the column is greater than the specified value.
Equal To	Show forms where the value of the column is equal to the specified value.
Does Not Equal To	Show forms where the value of the column is not equal to the specified value.
Like	Show forms where the value of the column is like the specified value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Option	Description
Does Not Like	Show forms where the value of the column is not like the specified value.
Contains	Show forms where the value of the column contains the specified value.
Does Not Contain	Show forms where the value of the column does not contain the specified value.
Less Than or Equal To	Show forms where the value of the column is less than or equal to the specified value.
Less Than	Show forms where the value of the column is less than the specified value.
Is Between	Show forms where the value of the column is between the specified inclusive range of values.
Is Not Between	Show forms where the value of the column is not between the specified inclusive range of values.
Is Null	Show forms where the value of the column is null.
Is Not Null	Show forms where the value of the column is not null.
Is Empty	Show forms where the value of the column is an empty string.
Apply All Filters	Apply all filters set for the columns.
Clear This Filter	Clear all filters set for a column.
Clear All Filters	Clear all set filters.

Change Ownership of Forms

Change owner of a form to allow other user to own and control the form.

To change owner of a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Change Owner** (or click on a form, and then on the action bar, click **Change Owner**). The **Change Owner** dialog box appears.
3. Click the **User Lookup** button. The **User Lookup** dialog box appears.
4. Select a user, and then click **Update**.
5. Click **Save**. The owner of the form is changed and an information message appears.
6. Click **OK** (or click the **Close** button). The information message and the **Change Owner** dialog boxes are

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

closed.

Set Security of Forms

Secure a form by defining rights assigned to a form or a set of forms grouped under a folder.

A forms user or role inherits the rights assigned at a repository level. However, the administrator can customize the rights at a form level and also assign rights to groups and map users to groups.

Standard Settings

Use standard settings to view security set at the list level, if available, or at the repository level for:

- a role or user.
- the security group customization and resource mapping.

To view security set for a role or user

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. On the action bar, click **Security**. The **Security Settings** page appears.
3. In the **Standard Settings** tab, click **View Effective Security For User/Role**.
4. Do one of the following:

Task	Action
• View security set at the list level, if available, or at the repository level for a role.	a. In the **Role Based** tab, click the **Role Lookup** button. The **Role Lookup** dialog box appears. b. Select a role, and then click **Update**. c. Click **View Rights**. The effective rights for the role appear.
• View security set at the list level, if available, or at the repository level for a user.	a. Click the **User Based** tab. b. Click the **User Lookup** button. The **User Lookup** dialog box appears. c. Select a user, and then click **Update**. d. Click **View Rights**. The effective rights for the user appear.

To view security group customization and resource mapping

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Click **Security**. The **Security Settings** page appears.
3. In the **Standard Settings** tab, click **View Security Mapping** at **List Level**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click on a **Security Group**. The **Viewing Security Group Rights** dialog box appears.
5. Check the security group customization and resource mapping.
6. Click **Close** (or click the **Close** button). The **Viewing Security Group Rights** dialog box is closed.

Advanced Settings

Use advanced settings to edit the existing mapping, add a new resource mapping or delete the existing mapping by enabling mapping at List level.

To set or edit the security group customization and resource mapping

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Click **Security**, in the **Security group**. The **Security Settings** page appears.
3. Click the **Advanced** settings tab, and then do one or more of the following:

Task	Action
• Set the security group customization and resource mapping.	• Click **Enable List Specific Security**. **Note:** This option is available only when the security group customization and resource mapping has not been set or removed.
• Remove the security group customization and resource mapping.	• Click **Remove Security from this List**.
• Edit the security group customization.	• Click **Customize Security Group for this List**.
• Edit the resource mapping.	• Click **Security Group - Resource Mapping for this List**.

Follow the steps for the required task from Workflow Management Security Framework in the *Workflow Management User Guide*.

View Properties of Forms

View properties of a form to see versions and child items for the form.

To view properties of a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **View Properties**. The **Form Properties** dialog box appears.
3. Do one of the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
• See version information for the form.	• Click the **Version** tab. The **Version** tab shows the version, status, and the archived status for the form.
• See child item information for the form.	• Click the **Childitems** tab. The **Childitems** tab shows the title, description, bound to work version, and status for the form.

4. Click the **Close** button. The **Form Properties** dialog box is closed.

View Audit History of Forms

View audit history of a form to see date, time and user information when the form was locked and unlocked, and when the form owner or version was changed.

To view audit history of a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **View Audit History**. The **Audit History** dialog box appears.
   The **Audit History** dialog box shows the action, user, version, message, and date for the form.
3. Click the **Close** button. The **Audit History** dialog box is closed.

Create Forms Links

Create a form link to add a form to the menu, and to set a form as the home page.

To create a form link and add the form to the menu

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. Click the <User> icon, and then click **Repository Settings**. The **Repository Settings** page appears.
3. Click the **Advanced settings** tab, and then click **Manage Navigation List**. The **Navigation List** page appears.
4. Click **New**, and then click **Form Link**. The **New Form Link** dialog box appears.
5. In the **Title** box, type a name for the form link, and in the **Description** box, type a description for the form link.
6. In the **Select a Form** list, select a form.
7. If there are parameters for the form, then the parameters appear. In such cases, type values for the parameters, if required.
8. In the **Image Name** box, type the name of an image for the form link.
9. Under **Window Mode**, do one of the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
• Make the form appear over the window.	• Click **Pop-up**.
• Make the form appear in the window.	• Click **Inline**.

10. Under **Show in Navigation List**, select as follows:

Task	Action
• Show form link in the navigation menu of the **Enterprise Console**.	• Select **Web**.
• Show form link in the navigation menu of the **AVEVA Work Tasks Pro** app.	• Select **Mobile**.

Note:
- The **Show in Navigation List** property is applicable only when the **Window Mode** property is set to **Inline**.
- By default, the **Show in Navigation List** is set to **Web**.
- To improve usability of the navigation menu in the **AVEVA Work Tasks Pro** app, we recommend limiting the number of links.

11. In the **Menu Order** box, type a number to position the link in the **Enterprise Console** menu.

Note:
- By default, the **Menu Order** number will be one more than the highest **Menu Order** number entered for the links in the **Navigation List**.
- You can enter either a positive or a negative integer. Negative **Menu Order** numbers take precedence over positive **Menu Order** numbers.
- If you clear the **Menu Order** number, then the system will set the **Menu Order** to **0**.
- The link with the lowest **Menu Order** number appears first in the menu followed by other links in the ascending order of their **Menu Order** number.
- In case of links with the same **Menu Order** number, the last saved link takes precedence and appears before the other links with the same **Menu Order** number.
- When you upgrade the product, the **Menu Order** number for the user created links will be set to null.
- You must log out and log on to the **Enterprise Console** to see changes in the order of the menu items.

12. Click **Save**. The form link is saved and an information message appears.
13. Click **OK** (or click the **Close** button). The information message and the **New Form Link** dialog box are closed.

To set a form link as the home page

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. Click the <User> icon, and then click **Repository Settings**. The **Repository Settings** page appears.
3. Click the **Advanced settings** tab, and then click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click on a security group, and then click **Edit** (or click on a security group, and then on the action bar, click **Edit**). The **Modify a Security Group** dialog box appears.
5. In the **Default Home Page** list, select a form link.
6. Click **Save**. The security group settings are saved, the **Modify a Security Group** dialog box is closed, and the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Synchronization dialog box appears.

7. Under **Do you want to Synchronize it?,** click **Yes**, and then click **Submit**. The synchronization settings are saved and an information message appears.
8. Click **OK** (or click the **Close** button). The information message and the **Synchronization** dialog box are closed.

Note:

- To set a form as home page:
  - You must create a form link.
  - The **Window Mode** for the form link must be set to **Inline**.
  - The Default Home page item will not be available in the Navigation menu. Login and logout of the Enterprise Console to view the newly created item in the Dashboard.
  - To set the Default Home page for Limited Access Security Group in the Work Tasks Pro App, disable the permission for **Show Only Owned Item**.
- It is recommended not to use Form link with **Window Mode** as **Inline**, which uses a form associated to a synchronous workflow with an **Invoke Form** activity having **Redirect URL** and **Custom Document View URL** properties.
- Enter the values for forms parameters as follows:

Forms Parameters	**Value**
Array	Comma separated **Example:** 1,2,3,4 OR a,b,c,d
Date	mm/dd/yyyy 00:00:00 **Example:** 12/31/2099 00:00:00
Date-Time	mm/dd/yyyy HH:mm:ss in UTC format **Example:** 12/31/2099 23:59:59
Object	JSON string **Example:** {"firstname":"Allen","lastname":"Brewer","telephone":["123-456-7890","098-765-4321"]}

- The values for forms parameters are not validated when saving forms links. However, at run time, when the parameter values of type number, array, and object are converted, a messaged is logged if the conversion fails.
- When you edit a forms link, you can refresh the parameters of the form by clicking on **Reload Parameters**.
- Forms links created show the name of the forms link instead of the name of the form in the **Enterprise Console** menu.
- When you upgrade the product, you can change the name shown on the menu from forms name to forms link name in one of the following ways:
  1. Opening and saving the forms link.
  2. Appending the forms links title in **SKENavigationDetails** in the database. For example, if the forms link name is **Billing Address** then append **FormLink=Billing Address** as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
InstanceForm.aspx?ListItemId=67f364af-96e4-4d9e-9295-2a70ba3d30d5&ItemType=2&WM=1&FormLi
nk=Billing Address
```

Dynamic List Forms

You can automatically generate the form when you create a list to create a dynamic list form. You can also validate the automatically generated form to check mapping of the controls between the list and the form associated with the list.

Create Dynamic List Forms

Automatically generate the form when you create a list to create a dynamic list form.

To create a list and then automatically generate the form associated with the list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. On the action bar, click **New**, and then click **List**. The **New List** wizard appears.
3. In the **Title** box, type a name for the list, and in the **Description** box, type a description for the list.
4. Do one of the following:

Task	Action
• Enable folder support for the list to group and organize the list	• Click **Yes** for **Enable folder support?** When folder support is enabled, you can create folders in the list, and you would be able to move lite items under the folders and organize them.
• Disable folder support for the list.	• Click **No** for **Enable folder support?**

5. Click **Save & Continue**. The list is created, and the **Select Table** wizard appears.
6. Do one of the following:

Task	Action
• Store the list data in generic table.	• Click **Generic Table**. **Note**: The list fields are automatically mapped to the fields in the generic table.
• Store the list data in an existing table.	• Click **Existing Table** and select a table from the list of existing tables. **Note**: - Click the **Refresh** button to refresh the list of existing tables.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
	- If the List Form is created with an existing table and if the table contains a column name with a space, then list items are not created for such list forms.

7. Click **Save & Continue**. The list is created, the **New List** wizard is closed, and the **Table** wizard appears.
8. Design the list, and then click **Submit**. The list is saved and the **Form Settings** dialog box appears
9. If you want to edit the auto generated form, then follow the steps for *To auto generate the form* in Auto Generating Forms.
10. Click **OK**. The form is generated, the **Form Settings** dialog box is closed, and an information message appears.
11. Click **OK**. The information message and the **List Designer** page are closed.

To edit the auto generated form

1. In the **Form Settings** dialog box, click **Edit Auto Generated Form**.
2. Click **OK**. The form is generated, the **Form Settings** dialog box is closed, and an information message appears.
3. Click **OK**. The information message and the **List Designer** page are closed, and the **Forms Designer** page appears.
4. Design the form, and then click the **Close** button. The form is saved and the **Forms Designer** page is closed.

Note:
- The auto generated form is saved, with the same name as that of the list, in the **Dynamic List Forms** folder in the **Forms** page.
- The form associated with the list must be published before using the list. Otherwise, you will not be able to add or edit list items.
- List Forms should not be associated to workflows.
- If an existing custom table from the repository is deleted, the table name still appears in CustomList table List Box because the **Refresh** button is not working.
- For information about using lists, see Lists.

Validate Dynamic List Forms

You can validate the automatically generated form to check mapping of the controls between the list and the form associated with the list.

To check mapping of the controls between a list and the form associated with the list

1. In the **Forms Designer** page, on the action bar, click the **Validate List** button. The mapping of the controls between the list and the form associated with the list is checked.
2. Do one of the following:

Outcome	Action
• Validation fails and an error page appears.	a. Read the error and the description.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Outcome	Action
	b. Click **Close** (or click the **Close** button). The error page is closed. c. Edit the controls on the **Forms Designer** page to correct the errors, if possible.
• Validation is successful and a message bar appears.	• Click the **Close** button.

3. Click the **Close** button. The **Forms Designer** page is closed.

Note: In the **Forms Designer** page, on the action bar, the **Validate List** button is available only when:
- The **Edit Auto Generated Form** option is selected in the **Form Settings** dialog box while creating and submitting the list.
- The **Yes** option is selected in the **Form Settings** dialog box while editing and submitting the list.

Associate Forms to Workflows

Forms are seamlessly integrated with workflows. You can associate a form to a new or an existing workflow. The XML variables associated with a form allow you to build a complex workflow.

Associating a form to different types of workflow activities such as Invoke Form, Information, and so on help to create an end-to-end business application.

Associate Forms to Workflows

Associate a form to a workflow to initiate the workflow when the form is submitted.

Associated forms appear in the **Fill Form** page only when the forms, the workflows, and the folders containing them are published.

You can associate multiple forms to a workflow.

You can overwrite SFFormData of a workflow associated with another version of the form, considering that the existing version of the form is a primary form.

To associate a form to a workflow

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Associate** (or click on a form, and then on the action bar, click **Associate**).
3. Do one of the following:

Task	Action
• Associate a form to the workflow.	• Follow the steps for Binding a form to the workflow.
• Edit association of the the form already associated to a workflow.	• Follow the steps for Editing Association. **Note**: When you edit the association, the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
	existing association details of the form gets deleted.
• Edit mappings of the form already associated to a workflow.	• Follow the steps for Editing Mappings.

Note:
- Ensure the form is published before associating the form to a workflow. Otherwise, the **SFFormData** will not show the schema in the workflow.
- Ensure the associated form is republished, the **SFFormData** is reloaded and saved, and the workflow is republished when there is an update in the form. Otherwise, the **SFFormData** will not show the updated schema in the workflow.
- When the workflow is associated with the unpublished Form (primary Form), you need to either publish the primary Form or dissociate the workflow to associate it with the other Form.
- You cannot unpublish the Form defined as a part of mapping details in the other Form.

Bind a Form to the Workflow

Use **Bind to an existing workflow** option to bind the form to the workflow. You can also associate a form to the workflow to which another form is already associated.

In the **Form Binding** window, you can do one of the following:

Task	Action
• Select a workflow to which the form will be associated.	1. Select **Bind to an existing workflow**. 2. Select a workflow, and then select a version of the workflow. 3. Select the **Execute workflow synchronously** check box if you want to execute the associated form synchronously. 4. Click **Save**, and then click **Close**. The form is associated to the workflow. **Note**: When you select a workflow to which another form is already associated, you get the message *Workflow is already associated to a form. Would you like to specify the mappings for the Workflow Xml?* Click **OK** in the message belly bar and follow the steps for Form XML Mapping to associate a form.
• Create a workflow to which the form will be associated.	• Follow the steps for To design a workflow to which the form will be associated.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
• Cancel further operations.	1. Click **No task to be performed now**. 2. Click **Finish**. The **Bind** wizard is closed.

Form XML Mapping

In the **Form XML Mapping** window, you can map the elements and the attributes of the workflow XML variable with the form's XML structure.

To map the elements and attributes

1. Select a form name from the **Form Name** drop-down list and then select a version from the **Form Version** drop-down list which would be used for triggering the workflow. The **Form Name** drop-down lists all the published forms associated to the workflow.

   Note: Select the Form Name and Form Version having the same schema as that of Workflow XML which would be used to trigger the workflow.
2. Select the attributes and elements from the **Workflow XML** column to be mapped with the form being associated.
3. Select the attributes or elements from the **Form XML** column to be mapped with the selected elements and attributes of the **Workflow XML**.
4. Click **Add Record** to specify more mappings.
5. Repeat steps 2 and 3 to add and map more attributes and elements to the form being associated.
6. Click **Save**. The successful mapping message appears.
7. Click **Close**.

Note:
- The form being associated and mapped will not be listed in the **Form Name** drop-down list in the **Form XML Mapping** page.
- You cannot dissociate a form that is defined as a part of mapping details in another form.
- The schema of the Workflow XML should be same as that of the mapped Form XML. When the parent node having child elements in Workflow XML is mapped with the parent node in Form XML, then only the elements and attributes with the same XML nodes will be considered.
- The mappings cannot contain same Workflow XML values.
- The runtime execution of the mappings would be as per the order defined.
- The Form Xml Mapping is not considered while packaging the Form artifact.
- Mapping of the skFilePath attribute of an Attachment-based XML node is not supported.

Edit Association of the Already Associated Form

When the workflow is already associated to the form and when you associate the form again to the workflow, you get the **Edit Association** option to redefine or edit the existing association details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To edit association of the already associated form

1. In the Enterprise Console, click the Menu button, and then click Forms. The Forms page appears.
2. Right-click on a form, and then click Associate (or click on a form, and then on the action bar, click Associate).

   The message *Workflow is already associated to the form with the mapping details. Would you like to edit the association or edit the mapping?* appears.
3. Click **Edit Association**.

   Note: When you edit the association, the existing association and mapping details of the form is removed.
4. Bind the form to an existing workflow. Follow the steps for Binding a form to an existing workflow.

   The message *Workflow is already associated to a form. Would you like to specify the mappings for the Workflow Xml?* appears.
5. Click **OK**.

   The **Form XML Mapping** window appears.
6. Follow the steps for Form XML Mapping.

   The form is associated again to an existing workflow with the updated association and mapping details.

Edit Mappings of the Already Associated Form

When the workflow is already associated to the form with mapping details and when you associate the form again to the workflow, you get the **Edit Mappings** option to edit the existing mapping details.

To edit mappings of the already associated form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Associate** (or click on a form, and then on the action bar, click **Associate**).

   The message *Workflow is already associated to the form with the mapping details. Would you like to edit the association or edit the mapping?* appears.
3. Click **Edit Mappings**.

   The **Form XML Mapping** window appears.
4. Follow the steps for Form XML Mapping.

   The form is associated again to an existing workflow with the updated mapping details.

View Association of Forms with Workflows

View association of a form with the workflow to see which workflow is initiated when the form is submitted.

To view the workflow name for the associated form

- In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The Forms page appears.

  The **Bound to Workflow** column shows the workflow name for the associated form.

To view the workflow name, version, and status for the associated form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Right-click on a form, and then click **View Association**. The **Associated Workflow** dialog box appears.

   The **Associated Workflow** dialog box shows the workflow name, version, and status for the associated form.
3. Click the **Close** button. The **Associated Workflow** dialog box is closed.

Dissociate Forms from Workflows

Dissociate a form to remove its association from the workflow.

To dissociate a form from the workflow

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on an associated form, and then click **Dissociate**. The form is dissociated from the workflow and a confirmation message appears.
3. Click **Yes**. The confirmation message is closed.

Note: When a form is dissociated from the workflow, the form is not available in Fill Forms.

Design Workflows for Associated Forms

Design a workflow for the associated form to initiate the workflow when the form is submitted.

Follow the steps for Associate Forms to Workflows till you a get the **Bind** wizard.

To design a workflow to which the form will be associated

1. In the **Bind** wizard, click **Design a new workflow**.
2. Select the **Execute workflow synchronously** check box if you want to execute the associated form synchronously.
3. Click **Next**. The **New Workflow** wizard appears.
4. In the **Title** box, type a name for the workflow, and in the **Description** box, type a description for the workflow.
5. Click **Save & Continue**. A workflow is created, and the **Workflow Options** wizard appears.
6. Do one of the following:

Task	Action
• Design the workflow to which the form will be associated.	a. Click **Design the Workflow now**. b. Click **Finish**. The **Process Designer for Workflow** page appears. c. Create a new workflow.
• Cancel further operations.	a. Click **No task to be performed now**. b. Click **Finish**. The **Workflow Options** wizard is closed.

Forms Designer

Forms Designer is a "what you see is what you get (WYSIWYG)" web-based design tool, with a drag-and-drop capable interface, to create rich web-based forms. Forms designer supports direct drop, smooth scroll, and device previews.

- Drag a control from the toolbox to the canvas to add the control to the form.
- Drag a control on the canvas to move or clone a control on the form.
- Edit tags inline and manage actions for controls with an on demand control shortcut menu.
- Create complex responsive layouts without affecting the schema with smart controls.
- Select columns and adjust column widths with ease.

Use **Forms Designer** to create rich forms with various controls.

To access Forms Designer

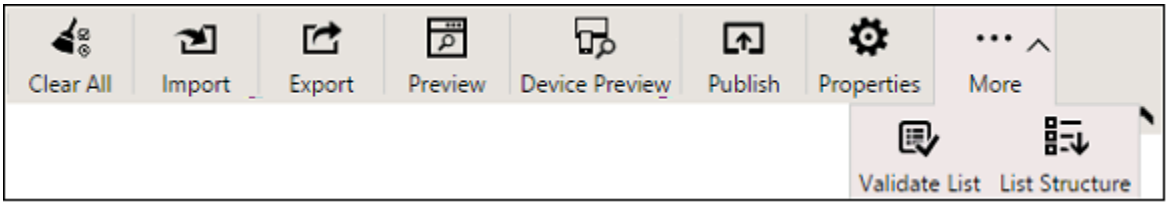
1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.

Forms Designer Interface

Forms Designer interface has an action bar, toolbox, and canvas.

Action Bar

Action bar has commands to manage the form and controls on the form.



Menu/Command	Description
Clear All	Clear the controls. For more information, see Clear Controls.
Import	Import the form. For more information see, Import Forms.
Export	Exporting the form. For more information see, Export Forms.
Preview	Preview the form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Menu/Command	Description
	For more information, see Preview Forms.
Device Preview	Preview the form for mobile device. For more information, see Preview Forms.
Publish	Publish the form. For more information, see Publishing Forms.
Properties	Edit properties of the form. For more information, see Edit Properties of Forms.
Validate List	Validate form associated with the list. For more information, see Validate Dynamic List Forms.
List Structure	View the structure of the list. For more information, see List Structure.

To manage the visibility of the action bar

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. Do one of the following:

Task	Action
Hide the action bar.	On the action bar, click the **Arrow** button. The action bar is hidden in the **Forms Designer** except for the **Arrow** button. Show the action bar.	Click the **Arrow** button at the top of the **Forms Designer**. The action bar is shown in the **Forms Designer**.

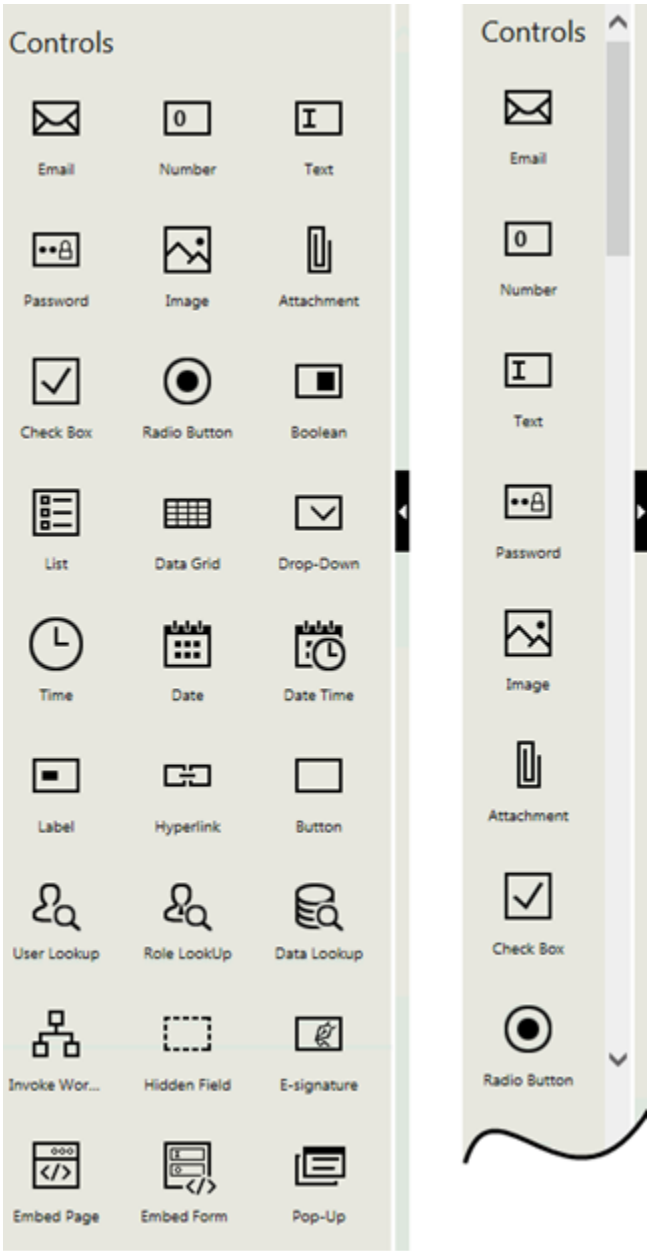
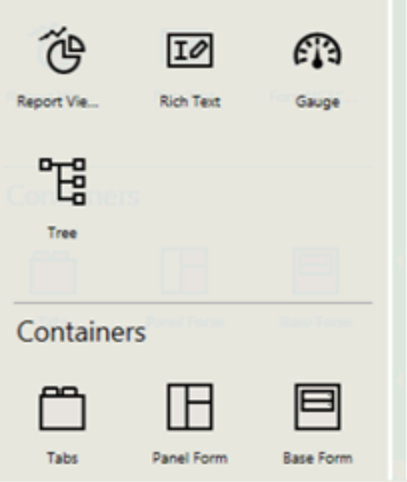
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Toolbox

Toolbox has categories to group controls for designing the form. The size of the toolbox can be changed from three columns to one column to increase the size of the canvas.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Categories	Description
Controls	Common controls to design the form. For more information, see Controls.
Containers	Container controls to design the form. For more information, see Containers.

To manage the size of the toolbox

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. Do one of the following:

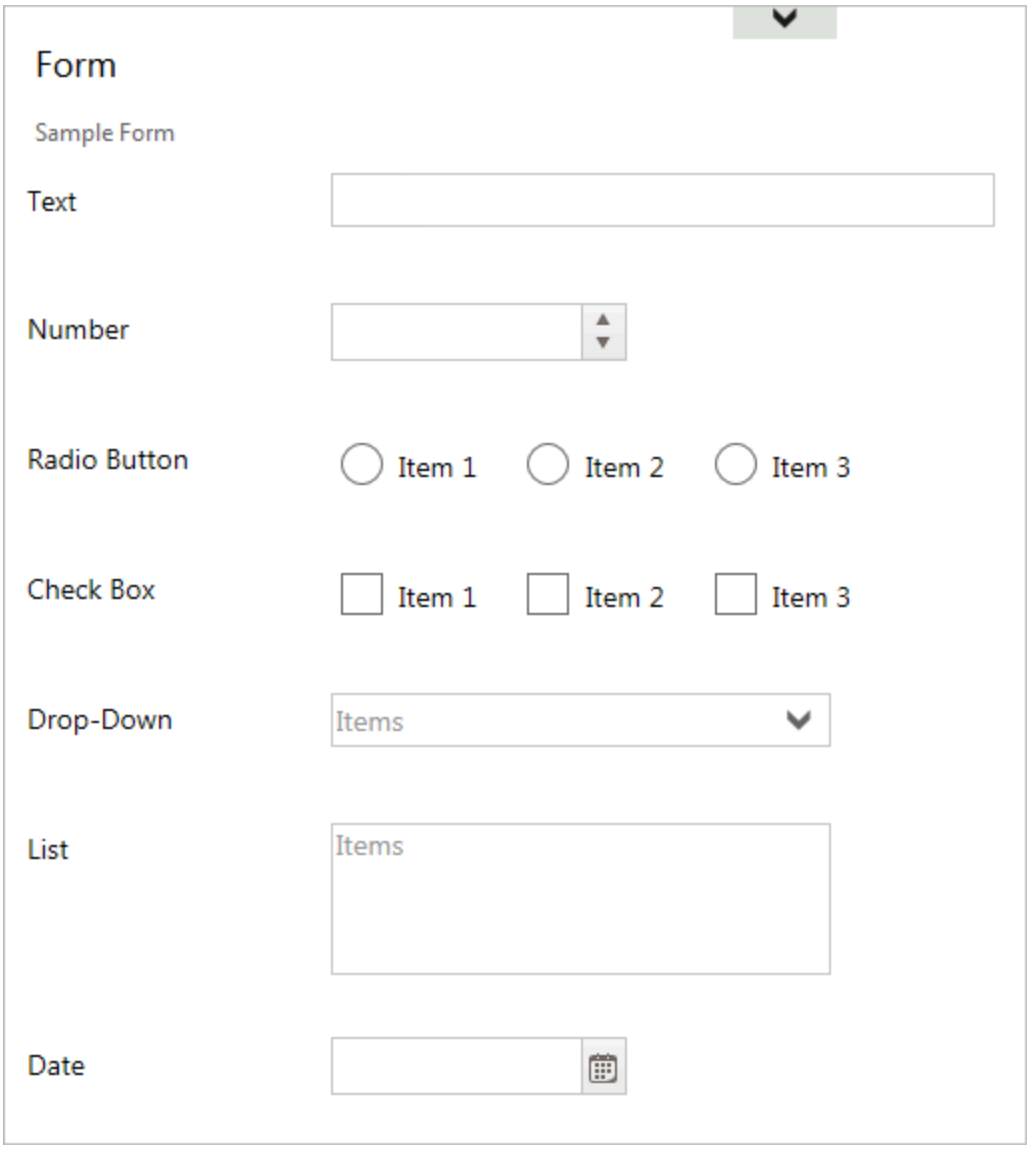
Task	Action
Change size of the toolbox from three columns to one column.	On the toolbox, click the **Arrow** button. The size of the toolbox is changed from three columns to one column.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
	Change size of the toolbox from one column to three columns.	On the toolbox, click the **Arrow** button. The size of the toolbox is changed from one column to three columns. 
Canvas

Canvas is the area in the **Forms Designer** where the form is designed by dragging controls from the toolbox. Dragging is also supported for repositioning and copying controls.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Control Shortcut Menu

Control shortcut menu has commands to manage the control. Point to a control on the canvas to access the shortcut menu.

Command	Description
Move	Move the control to the desired location on the canvas. For more information, see Moving Controls.
Clone	Create a copy of the control and then move it to the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Command	Description
	desired location on the canvas. For more information, see Cloning Controls.
Delete	Delete the control. For more information, see Deleting Controls.
Replace	Replace the control. For more information, see Replace Controls.
Properties	Edit properties of the control. For more information, see Editing Properties of Controls.

To access control shortcut menu

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. Point to the control on the canvas. The **Shortcut** menu appears.

Note: To design a form or edit an existing form in **Forms Designer**, the Workflow Management Forms Server license has to be acquired.

Manage Forms

You can edit properties of the form, preview and publish forms. You can view the structure of the list associated with the form.

- Edit Properties of Forms
- Preview Forms
- Publish Forms
- List Structure

Edit Properties of Forms

Edit properties of a form to change appearance and functionality of the form.

To edit properties of a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. On the action bar, click **Properties**. The **Properties** dialog box appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Edit properties of the form, and then click **Apply**. The properties are saved and the **Properties** dialog box is closed.

Preview Forms

Preview a form to check look and feel of the form at run-time and the XML generated for the form.

To preview a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. Do one of the following:

Task	Action
• Check look and feel of the form for browser.	• On the Action bar, click **Preview** to preview the form.
• Check look and feel of the form for mobile device.	• On the Action bar, click **Device Preview** to preview the form.

Publish Forms

Publish a form to use the form in a workflow.

To publish a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. On the action bar, click **Publish**. The form is published and an information message appears.
4. Click **OK**. The information message is closed.

List Structure

View the structure of the list associated with the form. The **List Structure** option is applicable only for the forms that are generated from a AVEVA Work Tasks List. You can also export the list structure as an XML file.

To view the list structure

1. In the **Enterprise Console**, click menu icon, and then click **Forms**.

   The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**).

   The **Forms Designer** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. On the action bar,click **List Structure**.

   The **List Structure** dialog box appears.

   You can view the structure of the list.
4. To export the list structure as an XML file, click **Export**.

   The list structure is exported in an XML file.
5. Click **Cancel** to close the dialog box.

Manage Controls

You can add, move, clone, delete, clear and replace controls. You can also edit the name and properties of control.

- Add Controls
- Move Controls
- Clone Controls
- Delete Controls
- Clear Controls
- Replace Controls
- Edit Name of Controls
- Edit Properties of Controls

Add Controls

Add a control to the canvas to build the form.

To add a control

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click **Design**). The **Forms Designer** page appears.
3. Drag a control from the toolbox to the desired location on the canvas. The selected control appears on the canvas.

Move Controls

Move a control to reposition the control to the desired location on the canvas.

To move a control

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click **Design**). The **Forms Designer** page appears.
3. Point to the control on the canvas. The **Shortcut** menu appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click the **Move** button, and then drag the control to the desired location on the canvas.

Clone Controls

Clone a control to create a similar control on the canvas.

To clone a control

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click **Design**). The **Forms Designer** page appears.
3. Point to the control on the canvas. The **Shortcut** menu appears.
4. Click the **Clone** button, and then drag the control to the desired location on the canvas.

Note:
- You can clone all controls including container controls.
- When you clone a container control, the container including the controls in the container is copied.
- When you clone a control, the copy of the control is the same as the original control except for the ID, that is generated automatically.

Delete Controls

Delete a control when the control is no longer required.

To delete a control

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click **Design**). The **Forms Designer** page appears.
3. Point to the control on the canvas. The **Shortcut** menu appears.
4. Click the **Delete** button. A confirmation message appears.
5. Click **OK**. The control is deleted from the canvas and the confirmation message is closed.

Note: If you delete a control, then the control cannot be restored.

Clear Controls

You can clear all the controls in a form.

Note: You cannot recover the controls after clearing them using this option. Export the form as an XML file to maintain a backup of the form before executing this option.

To clear all controls

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. On the action bar, click **Clear All**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click **OK**. All the controls in the form are deleted.

Replace Controls

You can replace a control to change a control to a different control at the same position on the canvas.

To replace a control

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click **Design**). The **Forms Designer** page appears.
3. Point to the control on the canvas. The **Shortcut** menu appears.
4. Click the **Replace** button. The **Replacement Control Configuration** page appears.
5. In the **Replacement Control** list, click a control.

   The **Replacement Control** drop-down lists,

   a. the controls if the control you want to replace is the basic control

   b. the containers if the control you want to replace is the container (Base Form and Panel Form)
6. Do one of the following:

Task	Action
• Copy values of similar properties from the existing control to the replaced control.	• Under **Copy Similar Properties**, click **Yes**.
• Delete the existing control and add a new control.	• Under **Copy Similar Properties**, click **No**.

7. Click **Apply**. The control is replaced and the **Replacement Control Configuration** page is closed.

Note:
- If you replace a control, then the control cannot be restored.
- Replacing a control with the **Pop-Up**, **Embed Form**, or **Tab** control or vice-versa is not supported.
- You can replace the basic control with another basic control and not with the container.
- You can replace the container with another container and not with the basic control.

Edit Name of Controls

You can edit name of a control inline to quickly change the name that identifies the control.

To edit name of a control inline

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click **Design**). The **Forms Designer** page appears.
3. Point to the control, click the existing name, and then type a new name.

   The new name is saved.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Edit Properties of Controls

You can edit properties of a control to change appearance and functionality of the control.

To edit properties of a control

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then on the action bar, click **Design**). The **Forms Designer** page appears.
3. Point to the control on the canvas. The **Shortcut** menu appears.
4. Click the **Properties** button. The **Properties** dialog box appears.
5. Edit properties of the control, and then click **Apply**. The properties are saved and the **Properties** dialog box is closed.

Control Properties

The properties for a control are grouped under the following tabs depending on the control:

- Basic
- Appearance
- Validation
- Advanced
- Scripts

For information about the properties of a control, see Controls.

Design Guidelines

This section provides information about the custom styles, boundaries and limits, and the best practices to follow while designing the forms.

- Custom Styles
- Boundaries and Limits
- Best Practices

Custom Styles

Custom style sheets help you to change the style of the forms user interface and customize the style according to your corporate style guidelines.

Use custom style sheets to change style for HTML elements of controls using CSS classes.

To create a custom style

1. Create a style sheet in the **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/css/** folder.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. If Theme is applied, the css file must be tagged with **FormCustomThemePath**, for example, var cssFiles=["FormCustomThemePath:MyCustomStyleSheet.css"]; and must be placed in **../<BPMUITemplates>/Default/NextGenForms/custom/Themes/<ThemeName>/css**.
3. If Theme is not applied, the css file can be placed in **../<BPMUITemplates>/Default/NextGenForms/custom/css/MyCustomStyleSheet.css**.
   You can create folder structure in **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/css/** to place the css files, for example, **../<BPMUITemplates>/Default/NextGenForms/custom/css/Mycssfolder/MyCustomStyleSheet.css**
4. Enter the name of the style sheet for the **Custom Style Sheet** property of the form. For example, enter **MyCustomStyleSheet** for **MyCustomStyleSheet.css**.
5. Enter the name of the identifier for the **Custom Style Identifier** property of the control.
6. Edit the style sheet to define styles for HTML elements of controls using CSS classes.

Note:
- Prefix the **Custom Style Identifier** of a control with the **CSS Class** name to apply the style to the specific control.
- Use the **CSS Class** name by itself to apply the style to all the controls.
- Suffix your CSS declarations with `!important` to ensure it takes precedence over normal declarations.

Arc

You can modify the style for the HTML elements of Arc using SVG elements and CSS classes.

HTML Element	CSS Class
Unit of Measurement (UOM)	.skarc-uom#skarc-uomid
Value	.skarc-value#skarc-valueid
Title	.skarc-title#skarc-titleid
Scale Ticks	.skarc-scaleticks
Scale Text	.skarc-scaletext#skarc-scaletextid

Prefix the Custom Style Identifier of a control with the CSS Class name to apply the style to the specific control. For example:

```
/* arc1id is the Custom Style Identifier of the Arc control. */
.arc1id_skctr
```

Note: If you plan to use your own CSS file, the Custom Style Identifier that you define in the file must match the value that you specify in the **Custom Style Sheet Identifier** property in the **Appearance** tab of the control's properties page. For example: `arc1id`

Example

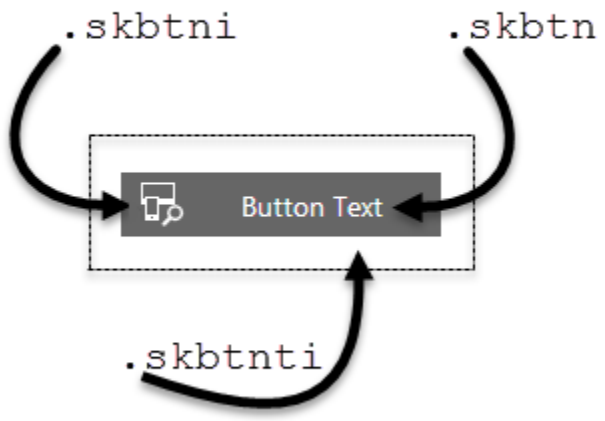
```
/* Change scale text fill color and font to black and Roboto. */
.arc1id_skctr .skarc-scaletext#skarc-scaletextid
{
fill: black !important;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
font-family: 'Roboto' !important;
font-weight: 400 !important;
font-size: 15px !important;
}
```

Button

You can change style for HTML elements of **Button** using CSS classes.



HTML Element	CSS Class
Button (for Button with Text and Image)	.skbtnti
Button Text	.skbtn
Button Image	.skbtni

For other HTML elements and the corresponding CSS classes related to **Button**, see Other Controls.

Prefix the **Custom Style Identifier** of a control with the **CSS Class** name to apply the style to the specific control. For example:

```
/* Button1 is the Custom Style Identifier of the Button control. */
.Button1_skbtn
```

Example

```
/* Change the Button text color to red. */
/* Button1 is the Custom Style Identifier. */
.Button1_skbtn
{
 color: red !important;
}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: Suffix your CSS declarations with `!important` to ensure it takes precedence over normal declarations.

Card

You can use custom style sheets to change style for HTML elements of controls using CSS classes.

For detailed steps on creating a custom style, see Custom Styles.

Modify the style for the HTML elements of Card using SVG elements and CSS classes.

HTML Element	CSS Class
CardContainer	.skcardwrapper
CardControl	.skcard.skcardflt
CardHeader	.skcardheader
CardContent	.skcardcontent
CardValue1Container	#skcardval1block
CardValue1	#skcardvl1
CardValue2	#skcardvl2
Cardv345Wrapper	#skcardvl345Wrap
CardValue3	#skcardvl3
CardValue4	#skcardvl4
CardValue5	#skcardvl5
CardImage	.skcardImg
CardFooter	.skcardfooter
CardButtonDefault	.skcardbtndef
CardButtonBlack	.skcardbtnblk
CardActionButton1	#skcardactbtn1
CardActionButton2	#skcardactbtn2
CardActionButton3	#skcardactbtn3

Prefix the Custom Style Identifier of a control with the CSS Class name to apply the style to the specific control. For example:

```
/* mdmcardcn is the Custom Style Identifier of the Card control. */
.mdmcardcn_skctr
```

Note: If you plan to use your own CSS file, the Custom Style Identifier that you define in the file must match the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

value that you specify in the **Custom Style Sheet Identifier** property in the **Appearance** tab of the control's properties page. For example: `mdmcardcn`

Examples

```
/* Change card header font size. */
.mdmcardcn_skctr .skcardheader h1
{
font-size: 14px!important;
}
/* Change card value font properties and color. */
.mdmcardcn_skctr #skcardvl3 p #skcardvl4 p #skcardvl5 p
{
font-size: 8px!important;
color: red!important;
font-family: 'robotobold' !important;
}
```

Gantt Chart

You can modify the style for the HTML elements of Gantt Chart using SVG elements and CSS classes.

HTML Element	CSS Class
Title	.skgantt-title#skgantt-titleid
Start Time and End Time	.skgantt-datetimetext#skgantt-datetimetextid
Segment Highlight	.skgantt-segment#skgantt-segmentid
GanttHeader	.skgantt-header#skgantt-headerid
GanttValue1	.skgantt-vl1#skgantt-vl1id
GanttValue2	.skgantt-vl2#skgantt-vl2id
GanttValue3	.skgantt-vl3#skgantt-vl3id

Prefix the Custom Style Identifier of a control with the CSS Class name to apply the style to the specific control. For example:

```
/* gantt1id is the Custom Style Identifier of the Gantt Chart control. */
.gantt1id_skctr
```

Note: If you plan to use your own CSS file, the Custom Style Identifier that you define in the file must match the value that you specify in the **Custom Style Sheet Identifier** property in the **Appearance** tab of the control's properties page. For example: `gantt1id`

Example

```
/* Change title color and font to black and Roboto. */
.gantt1id_skctr .skgantt-title#skgantt-titleid
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
fill: black !important;
font-size: 23px !important;
font-family: 'Roboto' !important;
font-weight: 400 !important;
}
```

Gauge

You can change style for HTML elements of **Gauge** using SVG elements and CSS classes.

HTML Element	CSS Class
Control Area	.skga
Gauge Area	.skga-guage
Gauge Value Labelr	.skga-label

Prefix the **Custom Style Identifier** of a control with the **CSS Class** name to apply the style to the specific control. For example:

```
/* E1 is the Custom Style Identifier of the Gauge control. */
.E1_skctr
```

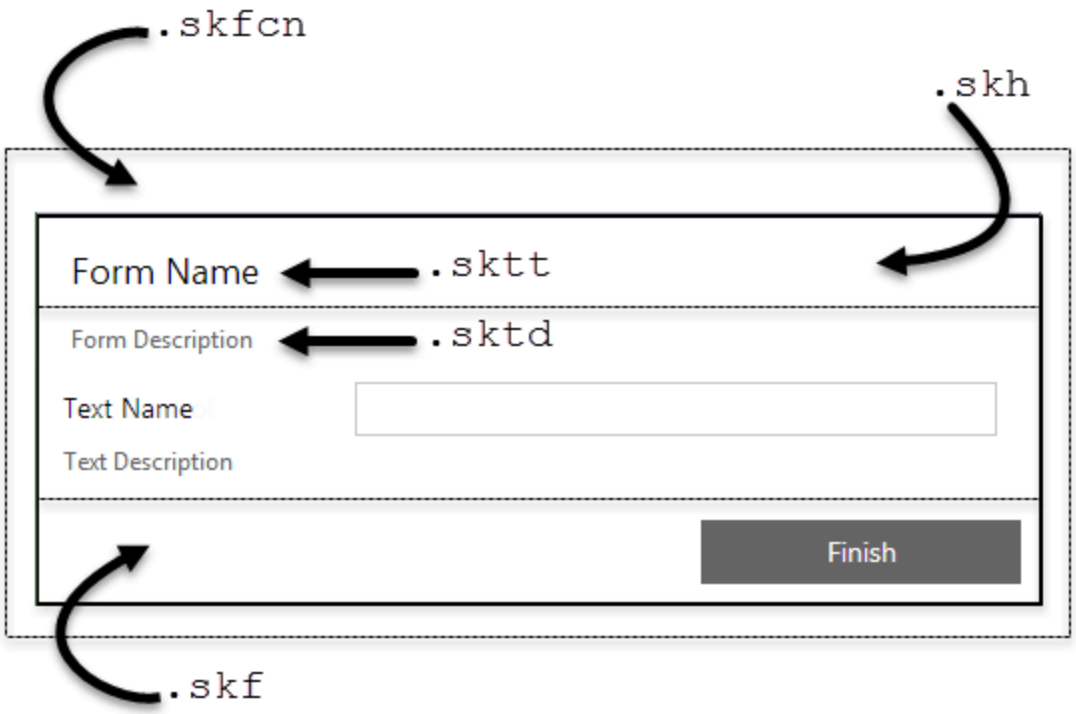
Example

```
/* Change value label color to green and bold. */
.E1_skctr skga-label
{
font-weight:bold;
color: ‘green’;
}
```

Form

You can change style for HTML elements of **Form** using CSS classes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



HTML Element	CSS Class
Form	.skfcn
Form Header	.skh
Form Footer	.skf
Form Name	.sktt
Form Description	.sktd

Example

```
/* Change Form background color to grey. */
.skfcn
{
 background-color: grey !important;
}
```

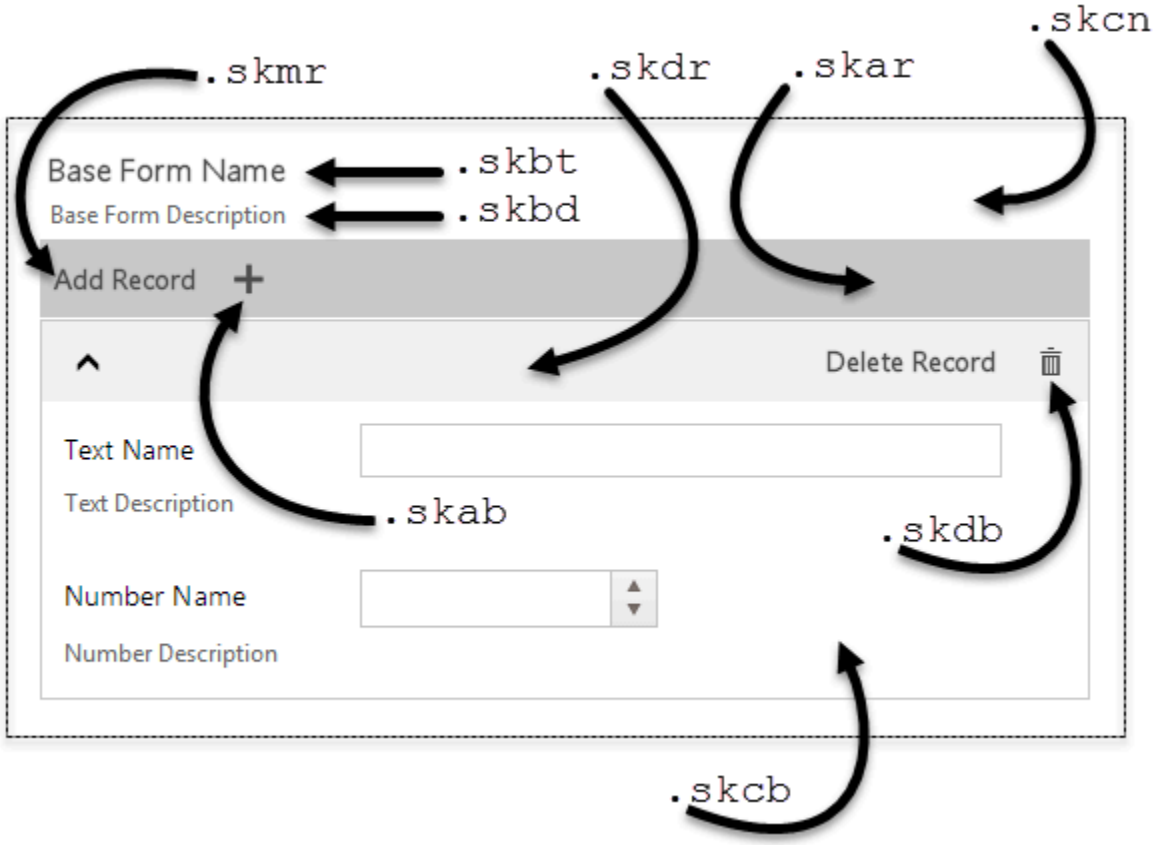
```
/* Change Form background color to black except in Form Designer. */
html:not(.skd) .skfcn
{
background-color: black;
}
```

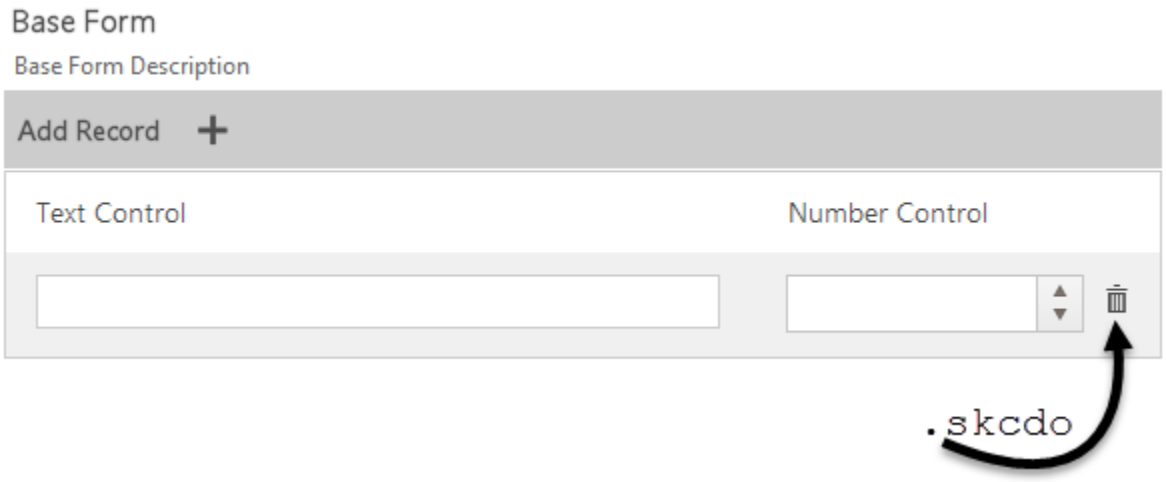
Note: Suffix your CSS declarations with `!important` to ensure it takes precedence over normal declarations.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Base Form

You can change style for HTML elements of **Base Form** using CSS classes.





HTML Element	CSS Class
Base Form	.skcn
Base Form Name	.skbt

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

HTML Element	CSS Class
Base Form Description	.skbd
Record Caption	.skmr
Add Record Row	.skar
Add Record Icon	.skab
Delete Record Row	.skdr
Delete Record Icon (Default)	.skdb
Delete Record Icon (Grid)	.skcdo
Base Form Body	.skcb

Prefix the **Custom Style Identifier** of a control with the **CSS Class** name to apply the style to the specific control. For example:

```
/* BaseForm1 is the Custom Style Identifier of the Base Form container. */
.BaseForm1_skbt
```

Example

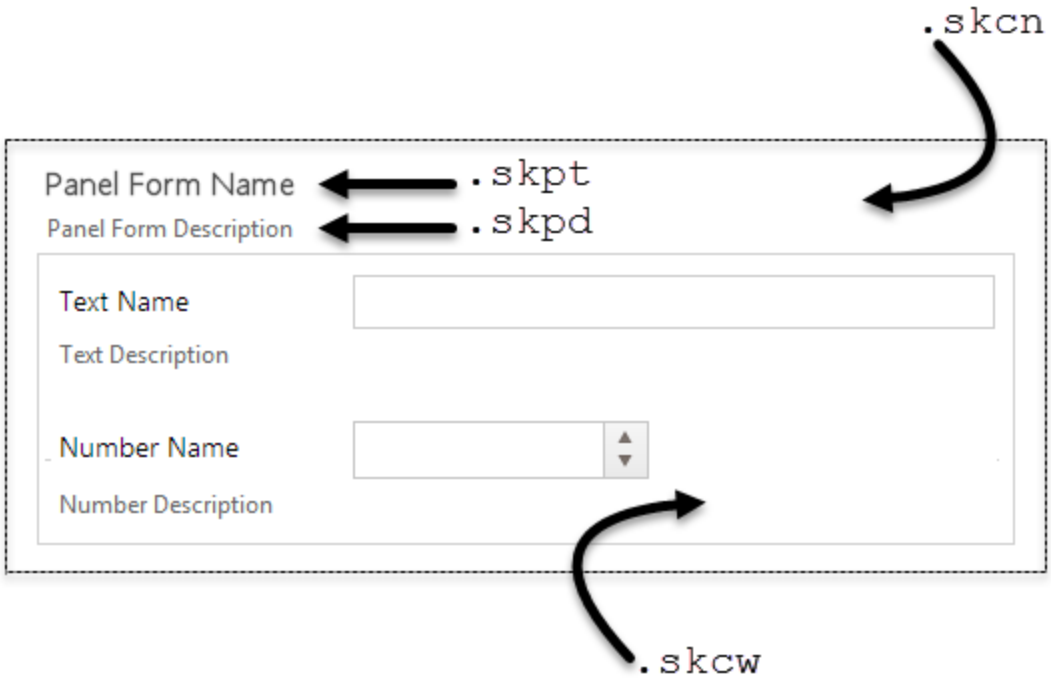
```
/* Change font size of Base Form name to 20px. */
/* BaseForm1 is the Custom Style Identifier. */
.BaseForm1_skbt
{
 font-size: 20px !important;
}
```

Note: Suffix your CSS declarations with `!important` to ensure it takes precedence over normal declarations.

Panel Form

You can change style for HTML elements of **Panel Form** using CSS classes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



HTML Element	CSS Class
Panel Form	.skcn
Panel Form Name	.skpt
Panel Form Description	.skpd
Panel Form Body	.skcw

Prefix the **Custom Style Identifier** of a control with the **CSS Class** name to apply the style to the specific control. For example:

```
/* PanelForm1 is the Custom Style Identifier of the Panel Form container. */
.PanelForm1_skpt
```

Example

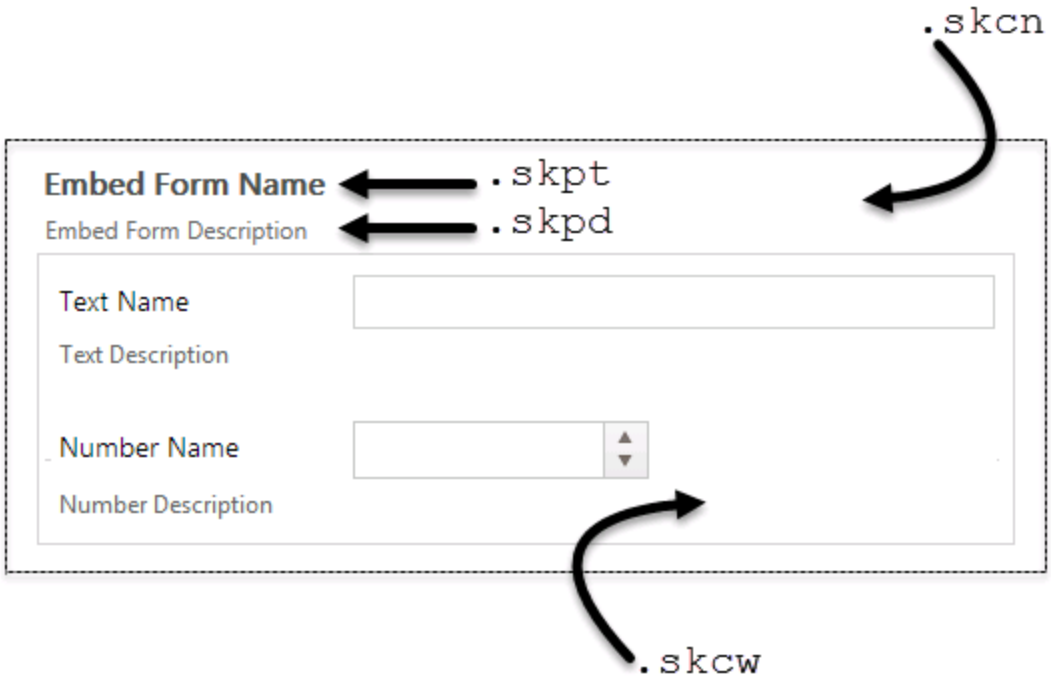
```
/* Change font size of Panel Form name to 20px. */
/* PanelForm1 is the Custom Style Identifier. */
.PanelForm1_skpt
{
 font-size: 20px !important;
}
```

Note: Suffix your CSS declarations with `!important` to ensure it takes precedence over normal declarations.

Embed Form

You can change style for HTML elements of **Embed Form** using CSS classes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



HTML Element	CSS Class
Embed Form	.skcn
Embed Form Name	.skpt
Embed Form Description	.skpd
Embed Form Body	.skcw

Prefix the **Custom Style Identifier** of a control with the **CSS Class** name to apply the style to the specific control. For example:

```
/* EmbedForm1 is the Custom Style Identifier of the Embed Form container. */
.EmbedForm1_skpt
```

Example

```
/* Change font size of Embed Form name to 20px. */
/* EmbedForm1 is the Custom Style Identifier. */
.EmbedForm1_skpt
{
 font-size: 20px !important;
}
```

Note: Suffix your CSS declarations with `!important` to ensure it takes precedence over normal declarations.

Progress Bar

You can modify the style for the HTML elements of Progress Bar using SVG elements and CSS classes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

HTML Element	CSS Class
Unit of Measurement (UOM)	.skprogress-uom#skprogress-uomid
Value	.skprogress-value#skprogress-valueid
Title	.skprogress-title#skprogress-titleid
Scale Ticks	.skprogress-scaleticks
Scale Text	.skprogress-scaletext#skprogress-scaletextid

Prefix the Custom Style Identifier of a control with the CSS Class name to apply the style to the specific control. For example:

```
/* progress1id is the Custom Style Identifier of the Progress Bar control. */
.progress1id_skctr
```

Note: If you plan to use your own CSS file, the Custom Style Identifier that you define in the file must match the value that you specify in the **Custom Style Sheet Identifier** property in the **Appearance** tab of the control's properties page. For example: `progress1id`

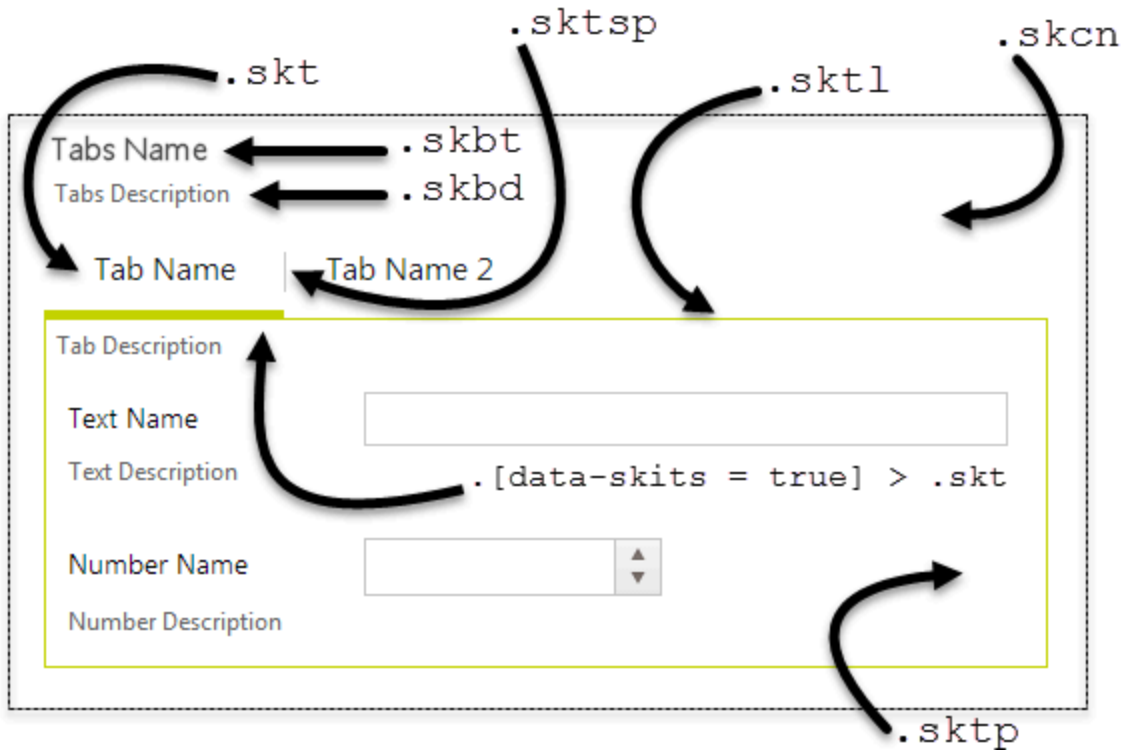
Example

```
/* Change scale text fill color and font to black and Roboto. */
.progress1id_skctr .skprogress-scaletext#skprogress-scaletextid
{
fill: black !important;
font-family: 'Roboto' !important;
font-weight: 400 !important;
font-size: 15px !important;
}
```

Tabs

You can change style for HTML elements of **Tabs** using CSS classes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



HTML Element	CSS Class
Tabs	.skcn
Tab	.skt
Tabs/Tab Name	.skbt
Tabs/Tab Description	.skbd
Selected Tab	[data-skits=true] > .skt
Tab Line	.sktl
Tab Body	.sktp
Tab Separator	.sktsp

Prefix the **Custom Style Identifier** of a control with the **CSS Class** name to apply the style to the specific control. For example:

```
/* Tabs1 is the Custom Style Identifier of the Tabs container. */
.Tabs1_skcn
```

Example

```
/* Change the Tabs border color to blue. */
/* Tabs1 is the Custom Style Identifier. */
```

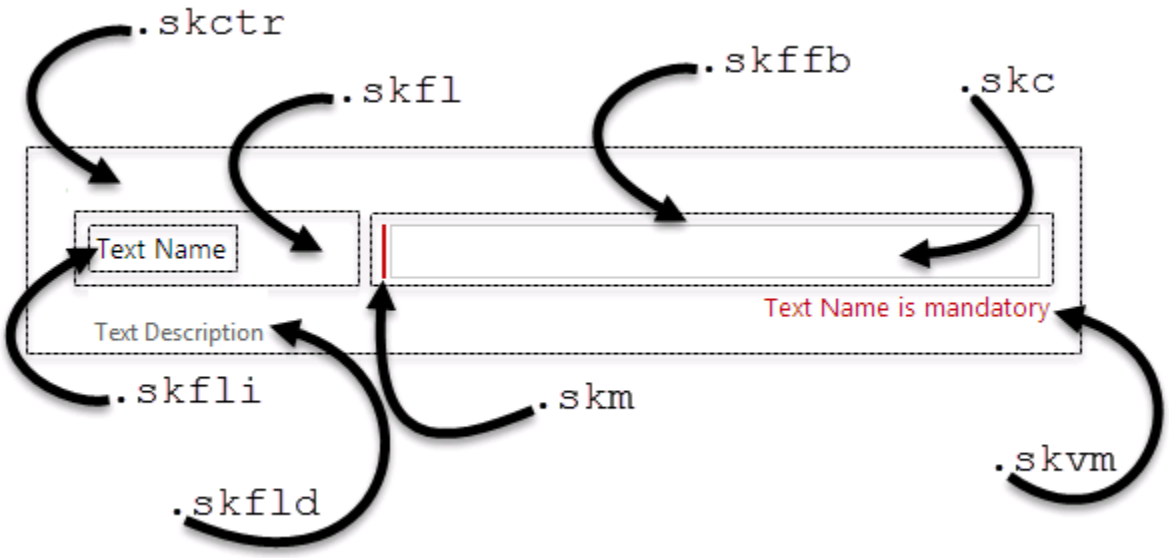
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
.Tabs1_skcn
{
 border: 1px solid blue !important;
}
```

Note: Suffix your CSS declarations with `!important` to ensure it takes precedence over normal declarations.

Other Controls

You can change style for HTML elements of controls other than **Form**, **Base Form**, **Panel Form**, and **Tabs** using CSS classes.



HTML Element	CSS Class
Control Container	.skctr
Control	.skc
Control Description	.skfld
Label Area	.skfl
Control Area	.skffb
Control Label	.skfli
Control Mandatory Indicator	.skm
Control Validation Message	.skvm

Prefix the **Custom Style Identifier** of a control with the **CSS Class** name to apply the style to the specific control. For example:

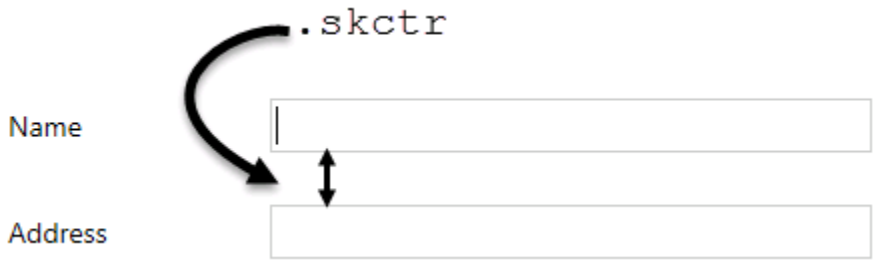
```
/* Text1 is the Custom Style Identifier of the Text control. */
.Text1_skvm
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example

```
/* Set the control label area to 100 pixels and use the remaining pixels for the control.
*/
/* Label Styles */
.skfl
{
 width: 100px;
}
/* Control Styles */
.skffb
{
 width: calc(100%-100px);
}
```

The default width and padding between the controls is 50px and 5px respectively. You can reduce the width and padding using CSS classes.



```
/* Decrease space from 50px to 20px and padding from 5px to 1px.*/
.skctr
{
   min-height: 20px;
   padding: 1px;
}
```

Note: Suffix your CSS declarations with `!important` to ensure it takes precedence over normal declarations.

Boundaries and Limits

Boundaries are absolute values that cannot be exceeded by design, whereas limits are maximum values that are recommended for optimal performance.

You need to know the boundaries and limits, and configure limits for your environment to achieve acceptable performance.

Test Environment

The boundaries and limits specified are determined by testing performance in mobile devices in the following intranet environment.

System	Operating System	Processor	Memory
AVEVA Work Tasks Engine	Microsoft Windows Server 2012 R2 Standard	Intel(R) Xeon(R) Silver 4110 CPU @ 2.10 GHz,	16 GB

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

System	Operating System	Processor	Memory
		2095 MHz	
AVEVA Work Tasks Client and Webserver	Microsoft Windows Server 2012 R2 Standard	Intel(R) Xeon(R) Silver 4110 CPU @ 2.10 GHz, 2095 MHz	16 GB
Database Server	Microsoft Windows Server 2012 R2 Standard	Intel(R) Xeon(R) Silver 4110 CPU @ 2.10 GHz, 2095 MHz	16 GB

Device	Operating System
Apple iPhone 8	iOS 13
Apple iPad	iOS 11
Samsung Galaxy S8	Android 8
UWP	Windows 10 (version number 1903)

Note:
- Many factors affect performance in a given environment (including configuration of systems running the server software, network configurations, maximum data transfer rates associated with different devices, other enterprise applications participating in the processes, and back-end database systems), and each factor may affect performance in a different area.
- If the limits specified do not work or are not applicable in your environment, then you will have to thoroughly test your environment to determine the optimal limits.
- Do not interpret the performance characteristics presented in this document as a benchmark measurement for supporting all computers. Only empirical testing on the target computer can provide accurate data.

Boundaries and Limits by Property

The boundaries and limits by property is as follows.

Property	Boundary	Limit
Name	30 characters	10 characters
XML Node	15 characters	5 characters
Enable Multi Select	75 work items	50 work items
Scripts	200 lines	100 lines

Note: The boundaries and limits recommended are based on the performance in mobile devices.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Control Classification

Controls are classified as simple, moderate, or complex based on data that can be bound to the control.

Simple	Moderate	Complex
Boolean	Attachment	Chart
Button	Check Box	Data Grid
Date	Drop-Down	Data Lookup
Date Time	Image	Hierarchical List
Email	List	
Hidden Field	Radio Button	
Hyperlink	Rich Text	
Invoke Workflow	Tab	
Label		
Number		
Password		
Slider		
Text		
Time		

Note:
- The number of records retrieved determines the complexity of the **Role Lookup** and **User Lookup** controls.
- The number and type of controls determines the complexity of the **Base Form** and **Panel Form** controls.
- The **Pop-Up** control acts as a normal form.
- The number and type of controls and also the data that persists back to the parent form determines the complexity of the **Pop-Up** Control.
- The **Pop-Up** control also does not support forms with **Pop-Up** controls.
- The data loaded determines the complexity of the **Embed Page** and **Report Viewer** controls.
- The data transfer between the server and the client is limited to 4 MB.

Boundaries and Limits by Control

The boundaries and limits by control is as follows.

Simple Controls

Control	Boundary	Limit
Date	1/1/1901 to 12/31/2099	1/1/1901 to 12/31/2099
Time	00:00:00	00:00:00

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Control	Boundary	Limit
	to 23:59:59	to 23:59:59
Number	-999999999999999.00 to 999999999999999.00	-999999999999999.00 to 999999999999999.00
Text	4096	255
Slider	15	5

Moderate Controls

Control	Boundary	Limit	Notes
Attachment	30 MB	5 MB	
Check Box	100 options	10 options	
Drop-Down	200 options	50 options	
Image	300 KB	50 KB	Image of type Portal Network Graphics (PNG) is recommended.
List	100 options	10 options	
Radio Button	100 options	10 options	
Rich Text	10 controls with 5000 characters per control	5 controls with 2500 characters per control	Images and tables are not considered.
Tab	15 controls per tab	10 controls per tab	
Tree	1000 child nodes	500 child nodes	

Complex Controls

Control	Boundary	Limit	Notes
Base Form	12 records with 5 controls per record	10 records with 5 controls per record	
Chart	10000 records	5000 records	
Data Grid	1000 records with 10	500 records with 5	The data transfer

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Control	Boundary	Limit	Notes
	records per page	records per page	between the server and the client is limited to 4 MB.
Data Lookup	10000 records with 50 records per lookup with autocomplete length of 5	5000 records with 50 records per lookup with autocomplete length of 3	The data transfer between the server and the client is limited to 4 MB.
Hierarchical List	20000 records with 50 records per page	10000 records with 50 records per page	
Panel Form	20 controls per panel with 5 columns	10 controls per panel with 3 columns	

Note:
- The boundaries and limits recommended are based on the performance in mobile devices.
- The **Embed Page** and **Report Viewer** controls are not considered for determining the boundaries and limits.
- The Form loading slows when Hierarchical List and Chart control is loaded using Web API Lookup.

Boundaries and Limits by Form

The boundaries and limits by form is as follows.

Form	Boundary	Limit	Notes
Form	Form with: • 40 simple controls • 30 moderate controls • 20 complex controls • 20 lines of script for 20 controls • 15 concurrent access	Form with: • 25 simple controls • 20 moderate controls • 15 complex controls • 20 lines of script for 15 controls • 10 concurrent access	Form loads within 5 seconds.

Note:
- The boundaries and limits recommended are based on the performance in mobile devices.
- The **Embed Page** and **Report Viewer** controls are not considered for determining the boundaries and limits.
- The combination of the controls determines the complexity of the form.
- The number of container controls (such as Base Form, Panel Form, Tabs, and so on) affects the performance of the form.
- A maximum of 5 levels of container controls (such as Base Form, Panel Form, Tabs, and so on) per form is recommended.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Best Practices

We recommend the following best practices when designing your forms.

- Ensure you use **Containers** appropriately for aesthetic and performance benefits.
  - Use containers to group controls logically.
  - Use **Base Form** to create a set of repeatable controls at run-time.
  - Use **Panel Form** to create layouts without generating XML nodes.
  - Use **Tabs** to group associated controls on the same page with set of related controls separated into sections (**Tab**).
  - Use limited number of **Tabs** and **Tab** to load tabs and forms faster.
- Ensure you use **Controls** appropriately for performance benefits.
  - Use minimum viable controls per form and avoid overloading controls to load controls and forms faster.
  - Use small file size attachments with **Attachment** to upload attachments faster.
  - Use small file size images with **Image** to load images faster.
  - Use predefined options either through the property or through the script instead of populating the options from the server when the number of options is limited with **Check Box, Drop-Down, Radio Button**, and **List** to load options faster.
  - Use **Drop-Down** only the number of options is limited with **Data Lookup** to load lookups faster.
  - Use **Pop-Up** to include sub-forms to load forms faster.
  - Use **Pop-Up** to open forms in a new browser window to improve forms performance.
  - Use lookup definitions configured for limited result set with **Data Lookup** to load lookups faster.
  - Use 10 records and autocomplete length of 3 or more with **Data Lookup** to improve data retrieval speed and to load lookups faster.
  - Use **Extended Information** only when required and with limited fields with **Data Lookup** and **Data Grid** to improve data retrieval speed and to load lookups and grids faster.
  - Use **Persist Display Value** with **Data Lookup** to cache the display value in the edit mode of forms to load lookups faster.
  - Use parameterized lookups and grids for limited result set with **Data Lookup** and **Data Grid** to improve data retrieval speed and to load lookups and grids faster.
  - Use grid definitions configured for limited result set with **Data Grid** to load grids faster.
  - Use only the required fields to display and persist with **Data Grid** to improve data retrieval speed and to reduce the size of the instance XML.
  - Use selection (highlight) instead of confirmation (check) with **Data Grid** to reduce the size of the instance XML.
  - Use selection of record instead of with **Data Grid** to reduce the size of the instance XML.
- Ensure you use **Forms** appropriately for aesthetic and performance benefits.
  - Use forms with minimal controls and add or remove controls progressively as the workflow progresses to load forms faster and to improve the usability of forms.
  - Use short **Name** and **XML Node** for properties of controls to reduce the size of the instance XML and to improve the data transfer speed between servers and clients.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

  - Use short **Description** and only if required for properties of controls to reduce the size of the definition XML.
  - Use optimized JavaScript code without unnecessary closures to improve script execution.
  - Use asynchronous calls instead of synchronous calls with **On Data Change** event.
  - Use well-formed JSON instead of XML when exchanging data between servers and clients, and limit the return information to only the required information for performance benefits.
  - Use GET method as appropriate with AJAX calls in scripts and cache the relevant APIs to avoid reloading the APIs on every request to improve script execution.
  - Use queue to handle multiple AJAX calls in scripts and request at once to improve script execution.
- Ensure you use Content Security Policy appropriately. Loading of the External URL for Web API, Embed Page, Images, and so on depends upon the Content Security Policy for the Enterprise Console Web Application.
  - Modify and define the Content Security Policy as per the user requirement. For more details, refer to Content Security Policy documentation on the W3C website.
  - Specify the URLs based on the same domain in the Form Controls. For images, you can use data-URLs.

Form Controls

Controls are the basic components of a form to view, enter, or submit data. Controls are grouped as basic controls and container controls. Container controls are used to place basic controls, and container controls, on a container control to create a complex form section or layout.

Note: The **Print** button in the Form does not work if there are angular controls like Hierarchical list, Chart, and Slider present in the Form.

Containers

Container controls are used to place basic controls, and container controls, on a container control to create a complex form section or layout.

Form

Use **Form** as a basic container to place other containers and controls.

Properties

The properties for the form are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the form. This value is also used for the title of the form.
XML Node	XML node mapped to the form. Use this value to map

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	a list to a form and a form to a workflow. The default value is the value for the **Name** property without the spaces. **Note:** If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the form.
Show Save Button	Show or hide the save button for the form. • Select **Yes** to show the save button for the form. • Select **No** to hide the save button for the form. The default value is **Yes**.
Save Button Text	Text for the save button of the form. The default value is **Finish**.

Appearance

Property	Description
Label Position	Position of the label for the child control. • Select **Default** to allow the system to align the label for the child control. The system aligns the label to the left of the child control. • Select **Left** to align the label to the left of the child control. • Select **Top** to align the label to the top of the child control. • Select **Right** to align the label to the right of the child control. • Select **Bottom** to align the label to the bottom of the child control. • Select **Suppress** to hide the label for the child control. The default value is **Default**. **Note:** - This property is applicable only if the **Label Position** property for the child control is set to **Default**. - For example, if the **Label Position** property for the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	child control is set to **Default** and the **Label Position** property for the **Base Form** is set to **Top**, then the label for the child control is aligned to the top of the child control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Auto-size Window	Allow or deny the system to automatically size the window to the available screen size on form load. • Select **Yes** to allow the system to automatically size the window to the available screen size on form load. • Select **No** to deny the system to automatically size the window to the available screen size on form load. The default value is **No**. **Note**: - When the **Auto-size Window** is set as Yes, the following forms appear as screen size on form load: - Preview form - Fill form - Invoke form - Reports - Submitted form

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	- Pop-up form, where the form is set as Pop-up - For a form set as Inline form, the **Auto-size Window** property not applicable. - When the Auto-size Window is set to *Yes*, and **Maximize the window on load** of **Invoke Form activity** is set to *No*, the **Auto-size** Window value overrides the **Invoke Form activity** value. - While creating a list item, the **Auto-size Window** property is not applicable even if the **Auto-size Window** property for the list associated form is set to *Yes*.
Desktop View Only	Turn off the UI adjustment based on the screen width. • If the value is set to **Yes**, the view generated for the Form is not responsive, even if the value of the **Adapt UI** property at the container level is set to **Yes**. • If the value is set to **No**, the view generated for the Form is responsive. You can change the responsiveness at the container level using the **Adapt UI** property. The default value is **No**.
Delay the Loading of Containers	Display contents when the container controls are accessed. • Select **Yes** to display the content of the container controls only when the controls are accessed. • Select **No** to always display the content of the container controls. Consider a scenario where **Delay the Loading of Containers** option is enabled and a **Data Grid** with **Behavior** property is set as **Data Source**. When a script is used for the **Options** property to add options for **Drop-down** control, data will not be loaded in the drop-down control until the data grid is loaded. For more information on **Options** property, see

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Options. **Note:** - This property is applicable only if the **Desktop View Only** property is set to **Yes**. - This property is not supported in AVEVA Work Tasks Pro App.
Custom Style Sheet	Name of the custom style sheet. For example, **FormCustomPath:MyCustomStyleSheet** for style sheet located at **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/css/MyCustomStyleSheet.css** **Note**: - If the style sheet name is tagged with **FormCustomPath:**, the location is **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/css/MyCustomStyleSheet.css** - If the style sheet name is tagged with **FormCustomThemePath:**, the location is **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/Themes/<ThemeName>/css/MyCustomStyleSheet.css** - If the stylesheet name is not tagged with **FormCustomPath:** or **FormCustomThemePath:**, the location of style sheet of earlier version will be considered i.e. **<Installpath>/Web/BPMUITemplates/Default/Themes/<ThemeName>/NextGenForms/css/custom/ MyCustomStyleSheet.css**. - If **Theme** is not applied and if the style sheet name is tagged with **FormCustomPath:** or **FormCustomThemePath:**, the location is **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/css/MyCustomStyleSheet.css** - If **Theme** is applied and if the style sheet name is tagged with **FormCustomPath:** or **FormCustomThemePath:**, the location is **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/Themes/<ThemeName>/css/**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	MyCustomStyleSheet.css - For earlier versions of the product, the location for style sheet is **<Installpath>/Web/BPMUITemplates/Default/Themes/<ThemeName>/NextGenForms/css/custom/ MyCustomStyleSheet.css** - For AVEVA Work Tasks Pro, mapping of themes is not considered. For information about using custom style sheets, see Custom Styles.

Advanced

Property	Description
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Submit Form with Enter Key	Allow or deny a user to submit a form by pressing the Enter key. • Select **Yes** to allow a user to submit the form by pressing the Enter key. • Select **No** to deny a user to submit the form by pressing the Enter key. The default value is **Yes**. **Note:** - This property is applicable only if the **Button Type** property of **Button** control is set to **Submit**. -If there are multiple Submit buttons in the form, then the submit action with Enter key is performed on the first Submit button. - If the Submit button is the first control in the form, then point the cursor to the input controls and then press the **Enter** key to submit the form.
Forms Parameters	Form-level variables for use in workflows. For information about using **Forms Parameters**, see Forms Parameters.
MQTT Topics	Access external data through MQTT for use in forms. • Click the **Add** button to add MQTT topic. Then

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	click the **Settings** button to configure the topic. For more information, see MQTT Topic Configuration.
Enable Action Bar	Enable or disable Action bar during run-time. • Select the **No** check box if you do not want the Action bar to be enabled. • Select the **Yes** check box if you want the action bar to be enabled. When you select **Yes**, the **Action Bar** section appears. For information about enabling action bar, see Action Bar.

Scripts

Property	Description
On Form Load	Run a script when a form is loaded. For more information, see scripting guidelines for On Form Load event

Action Bar

An Action bar contains a group of icons, which are used to perform certain actions. The Action bar has the action items defined by the user during the design time and it is available to the user while using the form during run-time.

Note:
- Action bar is supported only on the web browsers. However, it is not supported in AVEVA Work Tasks Pro App.
- When the window is in the Responsive mode (< 800 pixels in width) in the Web browsers, the Action bar is not displayed.
- Action bar supports only one level of child Action Items.
- You can add multiple child Action Items to an Action Item.

To enable Action bar

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. Right-click on the form for which you want to enable Action bar, and then click **Design Form**. The **Forms Designer** page appears.
3. On the Action tool bar in the **Forms Designer**, click **Properties**. The **Properties** dialog box appears.
4. Click the **Advanced** tab.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Click **Yes** for the **Enable Action Bar** property.

   The **Action Bar** section appears.

6. Click the **+** icon.

   A new action item is added.

7. Click the **Properties** icon.

   The **Action Bar Item - Properties** window appears.

8. In the **Basic** tab, specify the following details:

Property	Description
Name	Name that identifies the Action Item. This value is also used for the label of the Action Item.
Image Path	Path to the image for the Action Item. The image path is specified as: • A URL starting with http:// or https://. • An image path tag. For information about using image path tags, see Image Path Tags in Image. • A path to the BPMUITemplates folder as BPMUITemplates\Default\Images\. If you want to use an image and a hover image for an Action Item, then add the respective images in the *<NextGenForms/custom/Themes/<ThemeName>/images* path. **Note**: - If the image name is tagged with **FormCustomPath:**, the location is **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/images** - If the image name is tagged with **FormCustomThemePath:**, the location is **<Installpath>/Web/BPMUITemplates/Default/<NextGenForms/custom/Themes/<ThemeName>/images** - If the image name is not tagged with **FormCustomPath:** or **FormCustomThemePath:**, the location of image of earlier version will be considered i.e. **<Installpath>/Web/BPMUITemplates/Default/Themes/<ThemeName>/NextGenForms/images** folder. - For AVEVA Work Tasks Pro, mapping of themes is not considered.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	For example: If the image **ClearAll.png** is available in *<NextGenForms/custom/Themes/<ThemeName>/images*, then ensure that you add the hover image **ClearAll-Hover.png** (with **-Hover** suffixed to the image name) in the same path. **Note:** - Ensure the size of the image (icon) is 25x25 pixels. - You can use relative paths as follows: -- Use . for the current folder where the html page resides. -- Use .. for the folder above the current folder where the html page resides.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description

Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet.
	If you want to use an image and a hover image for an Action Item using a CSS, then add the respective images in the *<NextGenForms/custom/Themes/<ThemeName>/images* path and add the CSS file in the *<NextGenForms/custom/Themes/<ThemeName>/css* path.
	The CSS can be defined as:
	`.customItem .icon`
	`{`
	`background-image: url("../../images/ClearAll.png");`
	`}`
	`.customItem:hover .icon`
	`{`
	`background-image: url("../../images/ClearAll-Hover.png");`
	`}`
	`.customItem[disabled='disabled']:hover .icon`
	`{`
	`background-image: url("../../images/ClearAll.png");`
	`}`
	For the Action Item, enter the CSS class name as **customItem**.
	For information about using custom style sheets, see Custom Styles.
	Note:
	- The value must start with an alphabet and can contain only alphanumeric characters.
	- For AVEVA Work Tasks Pro, mapping of themes is not considered.

Tooltip	Message that appears when the pointer hovers over the Action Item.
Enable	Enable or disable the Action Item. • Select **Yes** to enable the Action Item. • Select **No** to disable the Action Item. The default value is **Yes**. For more information about enabling or disabling the Action Item via script, see control.topLevelForm.actionbar.getActionItemByName().

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Visible	Show or hide the Action Item. • Select **Yes** to show the Action Item. • Select **No** to hide the Action Item. The default value is **Yes**. For more information about changing the Visible property of the Action Item via script, see control.topLevelForm.actionbar.getActionItemByName().
Action Type	Action for the Action Item. • Select **Link to Existing Control** to perform the respective action, when the Action Item is clicked. • Select **Specify Script** to enter a script that must be executed, when the Action Item is clicked. To link to an existing control. a. Select **Link to Existing Control**. The **Existing Control** drop-down list appears with the controls (of **Button**, **Popup**, **Invoke Workflow** types**)** present in the **Forms Designer** including the ones present in the **Embed Form Controls**. b. In the **Existing Control** drop-down list, select the required control to be executed, when the Action Item is clicked. The Action Item is linked to the selected control.

9. Click **Apply**.

The properties are applied to the Action Item.

10. Repeat steps 6 - 9 to add more Action Items.

Scripts

For information about using scripts, see scripting guidelines for Action Bar control.

Applying styles for Action Bar

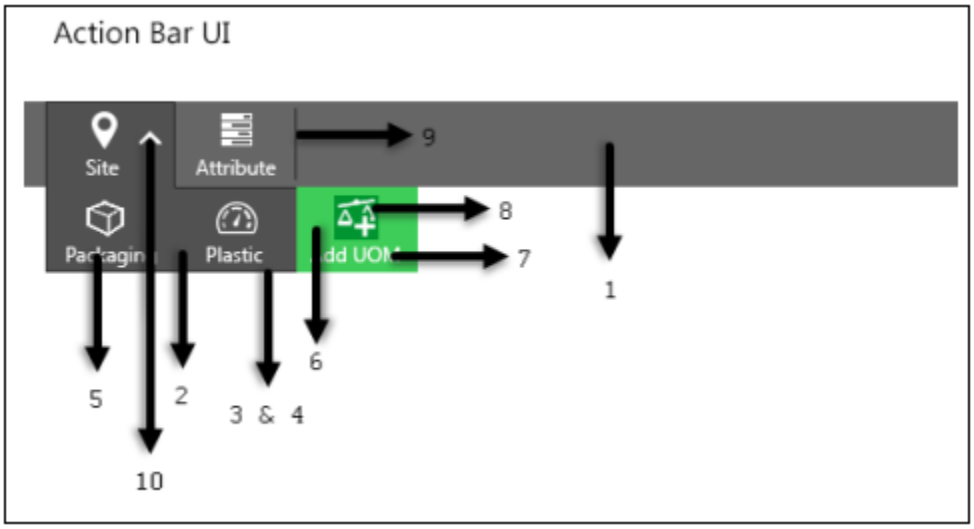
You can apply the following styles for the Action bar:

1. Background color for the action bar.
2. Background color for the parent and child Action items in expanded mode.
3. Borders for the expanded child Action item.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Borders for the expanded parent Action item.
5. Text color for the Action item.
6. Background color for the Action item on hover.
7. Text color for the Action item on hover.
8. Background color for the icon in the Action item on hover.
9. Action item separator.
10. Action item down arrow, Action item up arrow.

The following image represents the Action bar with custom styles applied. The numbers in the image represent the styles for the Action bar mentioned above.



Add the following CSS file in the *<NextGenForms/custom/Themes/<ThemeName>/css* path. The CSS can be defined as follows:

```
/*Background color for the action bar*/
.actionBarWrapper .actionBar
{
   background-color: #666666;
}
/*Background color for the parent and child Action items in expanded mode*/
.actionBarWrapper .actionBar .subMenu, .actionBarWrapper .actionBar .menuItem.selected,
.actionBarWrapper .actionBar .menuItem.subSelected, .actionBarWrapper .actionBar
.subSubMenu
{
   background-color: #515151;
}
/*Borders for the expanded parent Action item*/
.actionBarWrapper .actionBar .menuItem.selected, .actionBarWrapper .actionBar
.menuItem.subSelected
{
   box-shadow: inset -1px 0 0 0 #7F7F7F, inset 1px 1px 0 0 #7F7F7F;
   /*box-shadow: none !important;*/
}
/*Borders for the expanded child Action item*/
.actionBarWrapper .actionBar .subMenu, .actionBarWrapper .actionBar .subSubMenu
{
   box-shadow: inset 0 0 0 1px #7F7F7F;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
}
/*Text color for the Action item*/
.actionBarWrapper .actionBar .menuItem .content .name
{
   color: #ffffff;
}
/*Text color for the Action item on hover*/
.actionBarWrapper .actionBar .menuItem:hover .content .name
{
   color: #ffffff;
}
/*Background color for the Action item on hover*/
.actionBarWrapper .actionBar .menuItem:not(.menuItemDisabled):hover
{
   background-color: #3dcd58;
}
/*Background color for the icon in the Action item on hover*/
.actionBarWrapper .actionBar .menuItem:hover .icon
{
   background-color: #009530;
}
/*Action item separator*/
.actionBarWrapper .actionBar .separator
{
   background: #7F7F7F;
}
/*Action item down arrow*/
.actionBarWrapper .actionBar .menuItem .downArrow
{
   border-color: rgba(0, 0, 0, 0) #FFFFFF #FFFFFF rgba(0, 0, 0, 0);
}
/*Action item up arrow*/
.actionBarWrapper .actionBar .menuItem.selected .downArrow
{
   border-color: #FFFFFF rgba(0, 0, 0, 0) rgba(0, 0, 0, 0) #FFFFFF;
}
```

MQTT Topic Configuration

To add an MQTT topic and link it to an existing control or specify a script

1. In the MQTT Topic Configuration page, specify the following details:

Property	Description
Topic	Enter the path of the topic.
MQTT Connection	Select the MQTT Connection. **Note**: When MQTT Connection is changed, the latest published message of the topic is displayed in the **Subscribed Value** text box.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Subscribed Value	The latest published message is displayed in the **Subscribed Value** text box. The **Subscribed Value** text box is empty when the published message is not available. Click **Refresh** button to retrieve the latest published message. **Note**: When the **Topic** and the **MQTT Connection** is changed, **Refresh** button is disabled for 5 seconds. It is enabled after the subscribed value is received.
Data Type	Select the data type of the topic value. For more information on available data types, see Data Types in MQTT Topic Configuration.
JSON Path	Specify the JSON Path. This is required only for topic message containing valid JSON string and when publisher sends message as JSON object. You must specify the path to access the node in the JSON string. For examples, see Specify JSON Path.
Array	Select the **Array** option as **Yes** if the published message is an array. **Note**: The format for the supported array values is <element1>, <element2>, ..., <elementN>
Separator	Specify the character comma (,) to separate the array. **Note**: Only one character can be entered in the Separator box.
Element	Enter the position of the element in the array to be extracted. The minimum value is 1 and the maximum value is 999999999999999. **Note**: When the **Array** option is **Yes** and an array element position is not specified, the value displayed in **Extracted Value** box is based on the value selected in **Action Type** box. - If you select **Link to Existing Control**, then the first element value of the array is displayed. - If you select **Specify Script**, the whole array value is displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Action Type	Two options are available for Action Type: • **Link to Existing Control** In the **Existing Control** list, select a control (available on the form). • **Specify Script** Click the **Script Editor** button to specify the script in the Script Editor page.
Existing Control	Select the existing controls available in the form. The controls which have the value is listed like TextInput, Number, etc.
Action Script	Click the **Script Editor** button. Specify the script that is to be executed. For example, `control.findByXmlNode("Textinput1").value= currentValue;` Click **Save & Close.**The script is executed when message is arrived.
Extracted Value	Displays the value extracted from the Subscribed Value. The Extracted value is based on **Topic**, **MQTT Connection**, **Data Type**, **JSON path**, and **Array.** • If Array is **Yes**, then the Separator and Element is considered. • If the **Action Type** is **Link to Existing Control**, then the Extracted value is shown based on the Existing Control type. • If the **Action Type** is **Specify Script**, then the currentValue type is based on the selected Data Type .

2. Click **Save & Continue**.

The **Forms** properties page appears.

Note: After you save the settings, the setting details are displayed in the **Topic** box. For example, the displayed information is:
- <*Control name ~ topic*>, when the Action type is **Link To Existing Control**, and <*Control not linked*> when control is not linked.
- <*Script ~ topic*>, when the Action type is **Script**.
- MQTT topics are not supported in AVEVA Work Tasks Pro.

For information about MQTT Connections, see **MQTT Connections** in the Developer Guide.

Data Types in MQTT Topic Configuration

The available data types you can configure in MQTT topic are:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **String**

  If the string value is assigned to the TextBox control, then the value is converted to string.

  If there is any mismatch of format, the error is logged in Browser Console as:

  Error occurred during String type conversion for the topic '<@topicname@>'.

- **Boolean**

  If the true value is assigned to the Boolean control, True is enabled.

  If the false value is assigned to the Boolean control, False is enabled.

  The supported Boolean values are:

  1. True values:

     - true (is not case sensitive and is a Boolean flag)

     - 1 (can be numeric or in string format)

     - yes (is not case sensitive and should be passed only in string format)

     - y (is not case sensitive)

  2. False values:

     - false (is not case sensitive and is a Boolean flag)

     - 0 (can be numeric or in string format)

     - no (is not case sensitive and should be passed only in string format)

     - n (is not case sensitive)

  If the Boolean values are assigned to the TextBox control, the value is converted to string.

  If the Boolean values are assigned to the Number control other than 1 and 0; and if there is any mismatch of format, the error is logged in the Browser Console as:

  Error occurred during Boolean type conversion for the topic '<@topicname@>'.

- **Integer**

  If the integer value is assigned to the Number control, the value takes 15 digits as specified by the property's boundary limit.

  It is recommended to have the precision set to the Number control as per the source.

  If the integer value is assigned to the TextBox control, the value is converted to strings.

  If there is any mismatch of format, the error is logged in Browser Console as:

  Error occured during Number type conversion for the topic '<@topicname@>'.

- **Float**

  If the float value is assigned to the Number control, the value displayed is as specified by the property's boundary limit.

  It is recommended to have the precision set to the Number control as per the source.

  If the float value is assigned to the TextBox control, the value is converted to strings.

  Only decimal separator is allowed to represent the decimal number.

  If there is any mismatch of format, the error is logged in Browser Console as:

  Error occurred during Number type conversion for the topic '<@topicname@>'.

- **Double**

  If the Double value is assigned to the Number control, the value displayed is as specified by the property's

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

boundary limit.

It is recommended to have the precision set to the Number control as per the source.

If the Double value is assigned to the TextBox control, the value is converted to strings.

Only decimal separator is allowed to represent the decimal number.

If there is any mismatch of format, the error is logged in Browser Console as:

E*rror occurred during Number type conversion for the topic '<@topicname@>'*.

Note: When the selected data type is Float/Double and the Linked control is a number (without decimal), then the extracted value is displayed with precision.

- **DateTime**

  If the DateTime value is assigned to the ‘DateTime’ control, the value displayed is as specified by the property's boundary limit and local browser specific culture.

  If the DateTime value is assigned to the 'TextBox' control, the value displayed is string values. For example, *Mon Mar 11 2019 19:23:35 GMT+0530 (India Standard Time)*.

  The supported DateTime value is only in string format and should be in en-US format.

  The supported DateTime formats are:

  “MM/dd/yyyy hh:mm:ss.fff tt",

  "MM/dd/yyyy hh:mm:ss tt”

  If there is any mismatch of format, the error is logged in Browser Console as:

  Error occurred during DateTime format conversion for the topic '<@topicname@>'.

- **ElapsedTime**

  If the ElapsedTime value is assigned to the TextBox control, the time is displayed as HH:mm:ss.fff (where HH represents 24 hour format, mm represents minutes, ss represents seconds, and fff represents milliseconds).

  The ElapsedTime datatype should be the decimal number. For example, the decimal part is milli seconds(.fff) and the integer part is converted to HH:mm:ss.

  If there is any mismatch of format, the error is logged in Browser Console as:

  Error occurred during ElapsedTime format conversion for the topic '<@topicname@>'.

Specify JSON Path

To access **b** in the JSON string:

```
{"a": {"b":"1"}}
```

specify as follows:

```
a.b
OR
a["b"]
OR
["a"].b
OR
["a"]["b"]
```

To access the second item of the array **b** that contains value **2** in the JSON string:

```
{
"a": [
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
"b": "1"
},
{
"b": "2"
},
{
"b": "3"
}
]
}
```

specify as follows:

```
a.b[1]
OR
a["b"][1]
OR
["a"].b[1]
OR
["a"]["b"][1]
```

Base Form

Use **Base Form** control to manage controls placed on the record (child controls) in your form.

You can place any number of controls on a record, and add and delete records for the control. At run-time, you can click **Add Record** to repeat a record, and click **Delete Record** to remove a record. You can view the values of the child controls in the **Summary** of the **Base Form** only when the **Repeating** property for the child controls is set to **True**, and the form is viewed on a small form factor mobile device. Maximum three control values are considered in the **Summary** view.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. The default value is the value for the **Name** property without the spaces. **Note:** If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.

Appearance

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**. **Note:** If the value is **No**, then the child controls will be hidden even when the **Visible** property for the child controls is set to **Yes**.
Label Position	Position of the label for the child control. • Select **Default** to allow the system to align the label for the child control. The system aligns the label to the left of the child control. • Select **Left** to align the label to the left of the child control. • Select **Top** to align the label to the top of the child control. • Select **Right** to align the label to the right of the child control. • Select **Bottom** to align the label to the bottom of the child control. • Select **Suppress** to hide the label for the child control. The default value is **Default**. **Note:** - This property is applicable only if the **Label Position** property for the child control is set to **Default**. - For example, if the **Label Position** property for the child control is set to **Default** and the **Label Position** property for the **Base Form** is set to **Top**, then the label for the child control is aligned to the top of the child control. -The labels for all the controls are suppressed except - Data Grid, E-signature, Label, Embed Form, Embed Page, Report Viewer, Tab , Panel, and Base Form.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Display Mode	Show or hide the tabular view for the control. • Select Form to hide the tabular view for the control. • Select Grid to show the tabular view for the control. The default value is **Grid**.
Show Column Name	Show or hide the column name, when the **Display Mode** is set to **Grid**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Yes** to show the column name. • Select **No** to hide the column name. The default value is **Yes**.
Records Caption	Suffix for the add and delete links. The default suffix is **Record**. **Note:** The suffix is limited to 50 characters.
Record Position	Position of the records added at run-time for the control. • Select Top to position the records, added at run-time, at the top of the existing records for the control. • Select **Bottom** to position the records, added at run-time, at the bottom of the existing records for the control. The default value is **Bottom**.
Image Path	Path to the image for the control. The image path is specified as: • A URL starting with **http://** or **https://**. • An image path tag. For information about using image path tags, see *Image Path Tags* in Image. • A path to the **BPMUITemplates** folder as **BPMUITemplates\Default\Images**. **Note:** You can use relative paths as follows: - Use **.** for the current folder where the html page resides. - Use **..** for the folder above the current folder where the html page resides. - Base form image will be displayed when the screen is in Mobile View (< 800px)
Adapt UI	Change the user interface of the control based on the display width. • Select **Yes** to allow the system to change the user interface of the control based on the display

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	width. The **Web View** is rendered for the control when the screen width is greater than or equal to 800 pixels. Otherwise, the **Mobile View** is rendered for the control. • Select **No** to deny the system to change the user interface of the control based on the display width. In this case, the **Web View** is rendered for the control. The default value is **Yes**. **Note:** The responsiveness of the container depends on the value set for the **Desktop View Only** property at the Form level.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Show Confirmation Message	Show or hide the confirmation message for the control. • Select **Yes** to show the confirmation message for the control. • Select **No** to hide the confirmation message for the control. The default value is **No**.
Confirmation Message Text	Confirmation message for the control. **Note:** This property is applicable only when the **Show Confirmation Message** property is set to **Yes**.
Repeating	Allow or deny a user to repeat records for the control. • Select **True** to allow a user to repeat records for the control. • Select **False** to deny a user to repeat records for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Not Set** to allow the system to set the value for the control. The system allows a user to repeat records for the control. The default value is **Not Set**.
Minimum Records	Minimum records for the control. The default value is **0**. **Note:** This property is applicable only when the **Repeating** property is set to **True**.
Maximum Records	Maximum records for the control. Enter 0 for infinite records. The default value is **0**. **Note:** This property is applicable only when the **Repeating** property is set to **True**.

Advanced

Property	Description
On Record Add	Run a script when a record is added. For more information, see scripting guidelines for On Record Add property.
On Record Delete	Run a script when a record is deleted. For more information, see scripting guidelines for On Record Delete property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Behavior	Manage records and edit values at run-time. • Select **Editable** to allow a user to add or delete records for the control, and to edit values of the child controls. • Select **Read-Only** to deny a user to add or delete records for the control, and deny to edit values of the child controls. • Select **Allow Only Add** to allow a user to add records for the control, but deny to edit values of the existing child controls. That is when the form

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	is loaded, the existing records cannot be edited or deleted, but new records can be added, edited, and deleted till the form is submitted. The default value is **Editable**.
Default Number of Record	Number of records added at run-time for the control. The default value is **1**.
Fast Append	Add records in the **Grid** view at run-time by pressing the **Tab** key from the last focused control of the record. • Select **Yes** to allow adding records in the **Grid** view at run-time by pressing the Tab key from the last focused control of the record. • Select **No** to deny adding records in the **Grid** view at run-time by pressing the Tab key from the last focused control of the record. The default value is **No**. **Note:** This property is not applicable if: - The **Display Mode** is set to Form or the Repeating property is set to **False**. - The last focused control is a control on a child **Base Form** or a custom control. - The form is viewed on a small form factor mobile device.

Scripts

For information about using scripts, see scripting guidelines for Base Form control.

Note:
- Description of controls placed on **Base Form** with **Display Mode** set as **Grid** is not displayed.
- Name set through scripts for controls placed on **Base Form** with **Display Mode** set as **Grid** is not displayed.
- Label of controls placed on **Base Form** is truncated if there are too many controls or if the label is too long.
- When a **Base Form** with the **Default Number of Records** set in a form, associated to a workflow with an **Invoke Form** activity to the same form, is used in **Fill Form**, and if all records for the **Base Form** are deleted while submitting the **Fill Form**, then, in the **Invoke Form** activity, the **Base Form** will continue to display the **Default Number of Records**.
- In a Form with Delay Loading enabled, **Chart**, **Slider**, **Card**, and **Hierarchical List** controls inside a container are not supported.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Panel Form

Use **Panel Form** control to group controls placed on the control (child controls) in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. **Note:** If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**. **Note:** If the value is **No**, then the child controls will be hidden even when the **Visible** property for the child controls is set to **Yes**.
Label Position	Position of the label for the child control. • Select **Default** to allow the system to align the label for the child control. The system aligns the label to the left of the child control. • Select **Left** to align the label to the left of the child control. • Select **Top** to align the label to the top of the child control. • Select **Right** to align the label to the right of the child control. • Select **Bottom** to align the label to the bottom of

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	the child control. • Select **Suppress** to hide the label for the child control. The default value is **Default**. **Note:** - This property is applicable only if the **Label Position** property for the child control is set to **Default**. - For example, if the **Label Position** property for the child control is set to **Default** and the **Label Position** property for the **Panel Form** is set to **Top**, then the label for the child control is aligned to the top of the child control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Consider Available Height	Resize the height of the control or container based on the available height. • Select **Yes** to resize the height based on available height. • Select **No** to retain the space. The default value is **No**. **Note:** - The Consider Available Height property is not applicable for the following: -Designer view -Print form -Panel form with horizontal tab order - If this property is set to **Yes** and a value is specified in the **Height** property, minimum height is considered. - This property is applicable only in web view. - When more than one control or container is set with **Consider Available Height** at the same level of container or form, then the available space is distributed evenly between those controls or containers. For example, consider a Form which contains two Panel forms with **Consider Available Height** set to **Yes**, where Panel form 1 has two TextInput controls and Panel form 2 has one TextInput control. The Panel form 1's height is more than Panel form 2's height as Panel form 1 contains two TextInput controls and the available empty space in the form is evenly distributed between the two Panel forms.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Show Panel Details	Show or hide the title, description, and margin for the control. • Select **Yes** to show the title, description, and margin for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **No** to hide the title, description, and margin for the control. The default value is **Yes**.
Columns	Number of columns for the control. Enter a value from 1 to 10. **Note:** - Decreasing the number of columns will delete that many last columns with all its controls. For example, decreasing the number of columns from 5 to 3 would delete the last 2 columns with all its controls. - The columns with its controls deleted cannot be restored.
Tab Order	Tab order for the child controls. • Select **Horizontal** to set the tab order one after the other for the child controls. • Select **Vertical** to set the tab order one below the other for the child controls. The default value is **Vertical**.
Image Path	Path to the image for the control. The image path is specified as: • A URL starting with **http://** or **https://**. • An image path tag. For information about using image path tags, see *Image Path Tags* in Image. • A path to the **BPMUITemplates** folder as **BPMUITemplates\Default\Images**. **Note:** You can use relative paths as follows: - Use **.** for the current folder where the html page resides. - Use **..** for the folder above the current folder where the html page resides.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Adapt UI	Change the user interface of the control based on the display width. • Select **Yes** to allow the system to change the user interface of the control based on the display width. The **Web View** is rendered for the control when the screen width is greater than or equal to 800 pixels. Otherwise, the **Mobile View** is rendered for the control. • Select **No** to deny the system to change the user interface of the control based on the display width. In this case, the **Web View** is rendered for the control. The default value is **Yes**. **Note:** The responsiveness of the container depends on the value set for the **Desktop View Only** property at the Form level.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Behavior	Edit values at run-time. • Select **Editable** to allow a user to edit values of the child controls. • Select **Read-Only** to deny a user to edit values of the child controls. The default value is **Editable**.

Scripts

For information about using scripts, see scripting guidelines for Panel Form control.

Note: Embed Form is not supported in **Panel Form** with **Tab Order** set to **Horizontal**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Tabs

Use **Tabs** control to group controls placed on the tab in your form. By default, a Tab control is added to the control.

The Tabs container supports only 10 tabs. But in each tab, you can place any number of tab controls and you can also add or delete these controls.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
Description	Description for the control.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**. **Note:** If the value is **No**, then the child controls will be hidden even when the **Visible** property for the child controls is set to **Yes**.
Label Position	Position of the label for the child control. • Select **Default** to allow the system to align the label for the child control. The system aligns the label to the left of the child control. • Select **Left** to align the label to the left of the child control. • Select **Top** to align the label to the top of the child control. • Select **Right** to align the label to the right of the child control. • Select **Bottom** to align the label to the bottom of the child control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Suppress** to hide the label for the child control. The default value is **Default**. **Note:** - This property is applicable only if the **Label Position** property for the child control is set to **Default**. - For example, if the **Label Position** property for the child control is set to **Default** and the **Label Position** property for the **Tab** is set to **Top**, then the label for the child control is aligned to the top of the child control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Consider Available Height	Resize the height of the control or container based on the available height. • Select **Yes** to resize the height based on available height. • Select **No** to retain the space. The default value is **No**. **Note:** - The Consider Available Height property is not applicable for the following: -Designer view -Print form

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	-Panel form with horizontal tab order - If this property is set to **Yes** and a value is specified in the **Height** property, minimum height is considered. - This property is applicable only in web view. - When more than one control or container is set with **Consider Available Height** at the same level of container or form, then the available space is distributed evenly between those controls or containers. For example, consider a Form which contains two Panel forms with **Consider Available Height** set to **Yes**, where Panel form 1 has two TextInput controls and Panel form 2 has one TextInput control. The Panel form 1's height is more than Panel form 2's height as Panel form 1 contains two TextInput controls and the available empty space in the form is evenly distributed between the two Panel forms.
Default Tab Index	The default tab index for the control.
Show Border and Margin	Show or hide the border and margin for the control. • Select **Yes** to show the border and margin for the control. • Select **No** to hide the border and margin for the control. The default value is **Yes**.
Image Path	Path to the image for the control. The image path is specified as: • A URL starting with **http://** or **https://**. • An image path tag. For information about using image path tags, see *Image Path Tags* in Image. • A path to the **BPMUITemplates** folder as **BPMUITemplates\Default\Images**. **Note:** You can use relative paths as follows: - Use **.** for the current folder where the html page resides.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	- Use **..** for the folder above the current folder where the html page resides.
Adapt UI	Change the user interface of the control based on the display width. • Select **Yes** to allow the system to change the user interface of the control based on the display width. The **Web View** is rendered for the control when the screen width is greater than or equal to 800 pixels. Otherwise, the **Mobile View** is rendered for the control. • Select **No** to deny the system to change the user interface of the control based on the display width. In this case, the **Web View** is rendered for the control. The default value is **Yes**. **Note:** The responsiveness of the container depends on the value set for the **Desktop View Only** property at the Form level.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
On Tab Index Change	Run a script when the value of the tab index changes, that is when the selected tab changes. For more information, see scripting guidelines for On Tab Index Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.

Scripts

For information about using scripts, see scripting guidelines for Tabs property.

Keyboard-based Navigation

When the focus is on the Tab, you can use the **Left** and **Right** keyboard arrows to navigate from one Tab element to the next Tab element in the Form having the Tabs control.

Tab

Use **Tab** control to group controls placed on the control (child controls) in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
Description	Description for the control.

Appearance

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**. **Note:** If the value is **No**, then the child controls will be hidden even when the **Visible** property for the child controls is set to **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.

Advanced

Property	Description
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.

Scripts

For information about using scripts, see scripting guidelines for Tab control.

Controls

This section explains the properties of different form controls available in AVEVA Work Tasks.

Arc

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	(Required) XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	example, `@FirstName`. • Use forward slash (**/**) for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent, which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it may affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Enable Column Bindings	Enable this option to set up the lookup source. • Select **Yes** to enable use of the lookup source. • Select **No** if column binding is not necessary. If enabled, specify the column names based on the lookup source definition for **Unit of Measurement**, **Target Value**, and **Default Value** properties**.** The default value is **No**.
Lookup Source	(Required) Name of the item from the lookup list. **Note**: This is only visible when the **Enable Column Bindings** property is set to **Yes**. To add a name of the item for the control from the lookup list: 1. Click the **Lookup Source** button. The Lookup Source Configuration page appears. 2. In the **Data Source Type** list, select a type of data source. **Note**: Supported datasource types are database and Web API lookup source. 3. In the **Data Source** box, select a data source. 4. In the **Parameters** section, select the parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	to include, if applicable. 5. Click **Save & Continue**. The selected name is set for the control and the Lookup Source Configuration page is closed.
Unit of Measurement	Unit of measurement for the value of the control. This supports two lines with 12 characters for each line and a tooltip is shown when you hover over this property. An ellipsis is added if it exceeds the 12-character limit.
Target Value	Target value of the control. This is the value that the target indicator points at. If this property is left blank, the target indicator is not shown at preview or runtime.
Default Value	This is the value of the control. This supports 10 characters and a tooltip is shown when you hover over this property. An ellipsis is added if the value exceeds the 10-character limit.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note**: If the value is 0, then the width of the control is set as per the default value of 360.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Title	Name or information text for the control. It is shown

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	directly above the top-left corner of the control. This supports two lines with 20 characters for each line and a tooltip is shown when you hover over this property. An ellipsis is added if it exceeds the 20-character limit. If you want to add a line break, use the html tag ` `. **Note:** If this property is not configured or blank, nothing is shown, the other control contents use its space, and the control size is adjusted based on the available content within the control. The described behavior also applies to the **Unit of Measurement** property.
Decimal Places	Decimal places for the default value of the control. It also applies to the values in the **Range** property. This displays a maximum number of 3 decimal places. The default value is **0**. **Note**: At runtime, if this property is empty or has a non-numeric value, it resets back to 0. If its value is greater than 3, it stays at its maximum value of 3.
Scale Minimum Value	(Required) Minimum value displayed on the scale. The default value is **0**. **Note**: At runtime, if this property is empty or has a non-numeric value, its value is set to 0.
Scale Maximum Value	(Required) Maximum value displayed on the scale. The default value is **100**. **Note**: At runtime, if this property is empty or has a non-numeric value, its value is set to 100.
Scale Start Angle	Angle at which the scale starts. The default value is **0**, where the angle starts at 9 o 'clock. This accepts a minimum value of 0 and maximum of 360. **Note**: If this property is left blank, it resets back to its default value.
Scale Span Angle	The length at which the angle spans based on the **Scale Start Angle** property. The default value is **180** degrees. This accepts a minimum value of 0 and maximum of

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	360. **Note**: If this property is left blank, it resets back to its default value.
Show Scale	Show or hide the scale in the control. • Select **Yes** to show the scale in the control. • Select **No** to hide scale in the control. If this is set to **Yes**, the **Number of Division** property is visible. The default value is **No**.
Number of Division	Number of division within the scale, from the scale minimum value to the maximum value. This number divides the difference between the **Scale Maximum Value** and **Scale Minimum Value**. For example: • **Scale Minimum Value** = 0 • **Scale Maximum Value** = 200 • **Number of Division** = 5 So the difference between the scale max and min values is 200. The difference divided by the number of division is 40. The scale tick marks are then shown as 0, 40, 80, 120, 160, and 200. **Note:** This is only visible when the **Show Scale** property is set to **Yes**. The default value is **10**.
Control Background Color	The color to represent the background of the control. The default is white.
Background Color	The color to represent the background of the bar in the control. The default is gray.
Bar Color	The color to represent the bar in the control. The default is green.
Range	The breakpoint to apply in the control range bar. Each added row corresponds to a breakpoint and for each breakpoint value, you can assign a color. You can

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	have a maximum of 10 breakpoints. **Note**: If the configured range does not cover the full scale, the undefined range takes the color that is set for the **Bar Color** property. The value for the breakpoint must be between the specified value for the **Scale Minimum Value** and **Scale Maximum Value** properties.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
On Initialize	Run a script after the control has been initialized, but before it is rendered to the UI. For more information, see *Scripting Guidelines*.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Enable Refresh	Enable or disable control refresh. • Select **Yes** to enable control refresh and configure the **Refresh Rate** property. • Select **No** to disable control refresh. The default value is **No**.
Refresh Rate	This is how often the control display is refreshed, in seconds, to fetch value from the data source. **Note**: This is only visible if the **Enable Refresh** property is set to **Yes**. The default value is 30 seconds and the valid refresh rate is from 5 to 600 seconds.

Scripts

For information about using scripts, see scripting guidelines for Arc control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example Arc Rendering

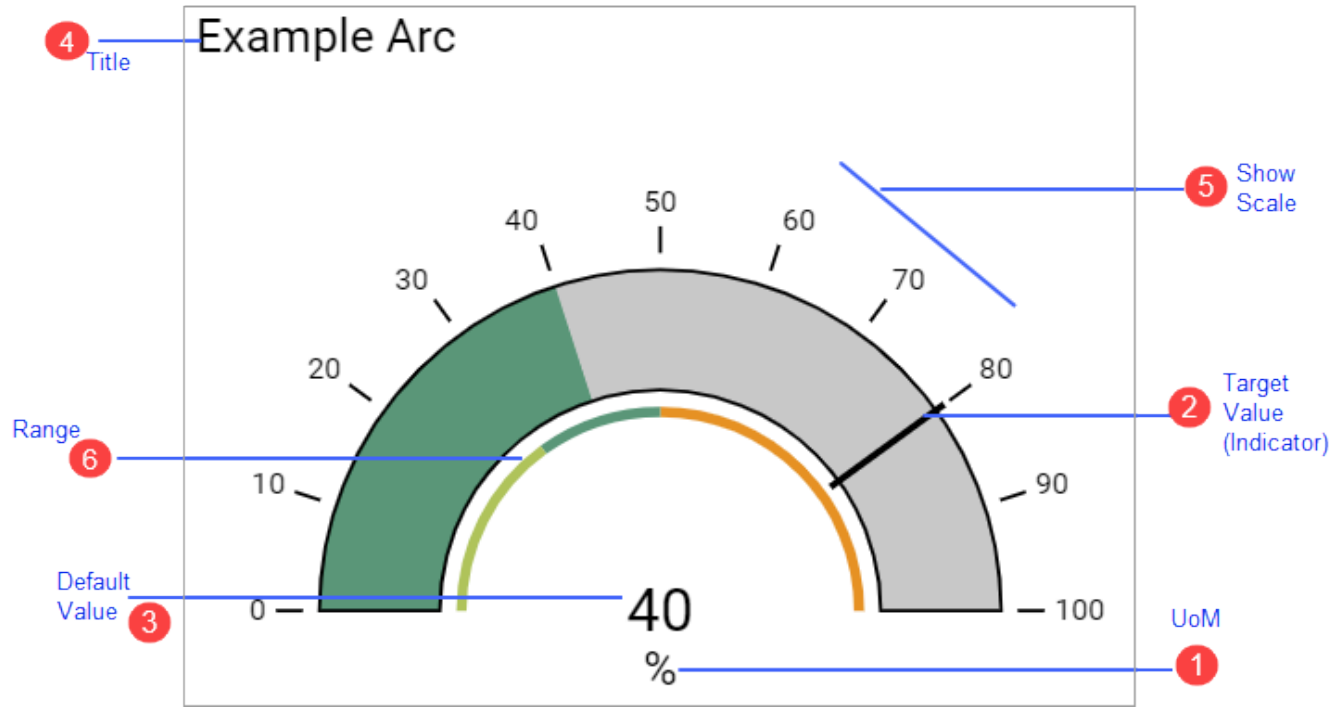
The following rendering examples for Arc control are based on the configuration in the control's properties page. The configured properties are listed in the table and most of the properties that are kept to their default values are no longer mentioned.

Example configuration and rendering

Basic	Appearance
1. **Unit of Measurement**: `%` 2. **Target Value**: `80` 3. **Default Value**: `40`	4. **Title**: `Example Arc` 5. **Show Scale**: `Yes` (selected) • **Number of Division**: `10` (default) 6. **Range** (*with three breakpoints*) • Value 1 - 30 (lime) • Value 2 - 50 (green) • Value 3 - 100 (orange)

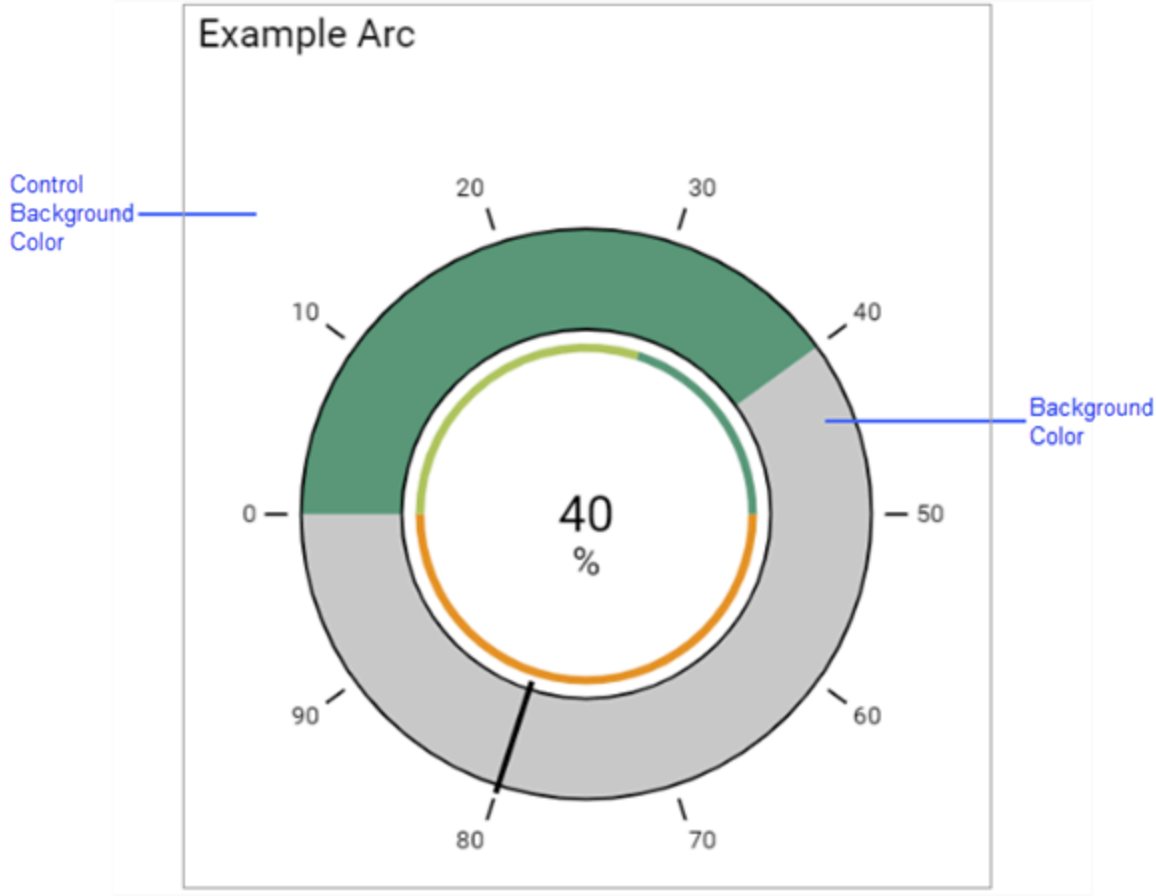
The range bar in the following example shows the three breakpoints as specified in the configuration. The target indicator is pointing at the specified **Target Value** of 80.

For the rendered bar color to show the **Default Value**, notice that it takes the assigned color of the second breakpoint (50, green) because the **Default Value** falls on that breakpoint range.



The following example rendering has the same configuration, but the **Scale Span Angle** property is set to 360.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Attachment

Use **Attachment** control to attach a file in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows. -Prefixing with **@** is not supported when the **Storage Type** property is set to **File System**.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
File Name Length	Length of characters for the file name.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	The default value is 0. For example, if the value is set to 8 and the file name of the attachment has 12 characters, then only the first 8 characters of the file name are retained. If the file name of the attachment has 6 characters, then the file name is retained as is. The abbreviated file name is displayed in the form. However, when you download the file, the name of the file is retained as is. **Note:** If the value is 0, then the file name is retained as is.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Attachment Type	File type of attachment for the control. • Select **All** to attach any file types of attachment. • Select **Images** to restrict the file types of attachment to images (BMP, DIB, GIF, JFIF, JPE, JPEG, JPG, and PNG). • Select **Tagged Images (TIFF)** to restrict the file types of attachment to tagged images (TIF and TIFF). • Select **Portable Documents (PDF)** to restrict the file types of attachment to portable documents. • Select **Office Documents** to restrict the file types of attachment to office documents (DOC, DOCM, DOCX, DOTM, DOTX, MPP, MPT, POTM, POTX, PPAM, PPSM, PPSX, PPT, PPTM, PPTX, SLDM, SLDX, THMX, XLAM, XLS, XLSB, XLSM, XLSX, XLTM, XLTX, and XSN). The default value is **All**. **Note:** - If you select **All** along with other options, then the other options are ignored and you can attach any file types of attachment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	- If no option is selected, then you can attach any file types of attachment. - You cannot attach the files having .exe file extensions as they are not supported.
Custom Attachment Type	Custom file type of attachment for the control. For example, `.txt;.rtf` to restrict the file types of attachment to text and rich text formats. **Note:** This value disables the **Attachment Type** property and restricts the allowed file type to the value specified.
Show Delete Confirmation Message	Show or hide the custom delete confirmation message for the control. • Select **Yes** to show the custom delete confirmation message for the control. • Select **No** to hide the custom delete confirmation message for the control. The default value is **No**.
Delete Confirmation Message	Delete confirmation message for the control. **Note:** This property is applicable only when the **Show Delete ConfirmationMessage** property is set to **Yes**.

Advanced

Property	**Description**
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Storage Type	Storage type of attachment for the control. • Select **Database** to store attachment in the database. • Select **File System** to store attachment in the file system. The default value is **Database**. **Note:** - **File System** as storage type does not support:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	-- attachments that are part of lists. -- archiving and purging.
Security Mode	Set the security mode to None or Encryption to secure the attachment. • Select **None** to have the value for the attachment in database as Base64 encoded. The value in Form Instance XML will not be encrypted. • Select **Encryption** to have the encrypted value for the attachment in the database as BLOB. The value in Form Instance XML will be encrypted. The default value is **Encryption**. **Note:** This property is applicable only when the **Storage Type** property is set to **Database**.
Persist File Name	Keep the file name of the attachment as the header. • Select **Yes** to keep the file name. • Select **No** to rename the file. The default is **Yes**. **Note:** This property is applicable only when the **Storage Type** property is set to **Database**.
Persist Custom File Name	ID of the Text control whose value is used as the header. If you do not want to persist the file name, then you can persist a custom file name in another control. The **Persist Custom File Name** property takes the ID of a Text control where it can store the attached file name information. You can then get the file name from this control through scripts. **To select the Text control** 1. Click the **Persist Custom File Name** button. The **Text Control Configuration** page appears. 2. In the **Text Control** list, select a Text Control. 3. Click **Save & Continue**. The ID of the selected Text control is set for the **Persist Custom File Name** property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: - This property is applicable only when the **Storage Type** property is set to **Database**. - We recommend to have the **Text** control in the same container where the **Attachment** control is present.
File Path Template	File path template for storing attachment in the file system for the control. For information about using file path template tags, see *File Path Template Tags*. The default value is **<StoragePath>\<Year>\<Month>\<Date>\<GUID>_<FileName>.<FileExtension>**. **Note:** - This property is applicable only when the **Storage Type** property is set to **File System**. - The **<StoragePath>** tag should be the first tag in the file path template, otherwise the file path template will be invalid. - The application pool identity of the web application should have the appropriate rights to the folder where the attachments are stored. - Date and time values resolved in file path template tags are in Universal Coordinated Time (UTC) format, and the time value is in 24-hour time format.
Allow Multiple Attachments	Allow or deny a user to attach multiple files for the control. • Select **Yes** to allow a user to attach multiple files for the control. • Select **No** to deny a user to attach multiple files for the control. The default value is **No**. **Note:** - This property is applicable only when the **Storage Type** property is set to **File System**. - In AVEVA Work Tasks Pro for Android: -- Multiple files can be attached only from the gallery, when the value of the property is set to **Yes**. -- Only the first attachment gets attached when the value of the property is set to **No**.
Maximum Attachments	Maximum number for attachments for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	The default value is **5**. **Note:**- This property is applicable only when the **Allow Multiple Attachments** property is set to **Yes**. - By default, the maximum value allowed is 10. If you want to change this, then override the **AttachmentMaximumLimit** entry in the **Properties** column in the **SKRepository** table of the Farm database. -- For example, to override the maximum value allowed to 20, change **[CDATA[<<Maximum Number of Attachments>>]]** as follows: `<property key="AttachmentMaximumLimit"><![CDATA[20]]></property>` -- If the value specified is less than **2**, then the value is taken as **2**. -- If the value specified is greater than **99**, then the value is taken as **99**.
Source Type	Source type of attachment for the control. • Select **Camera** to capture the image and store it in the selected storage type. • Select **Gallery** to select the existing file and store it in the selected storage type. • Select **Camera and Gallery** to either capture the image or select the existing file. The default value is **Camera and Gallery**. **Note:** - This property is available only for **AVEVA Work Tasks Pro** app. - For UWP, this property is not applicable. - For iOS, the Gallery option opens both the camera and gallery file picker options.

Scripts

For information about using scripts, see scripting guidelines for Attachment control.

Note:
- We recommend to keep the file size lesser than 30 MB to avoid errors during the upload. Also, you can download a file only if the size is 30 MB or lesser.
- The request timeout controls the time taken for a request to process, which also controls uploading/ downloading the file. So, it is recommended to set the Request timeout to an appropriate value as per the upload limit set in the environment. The default value for the request timeout is set to 900 secs.
- The upload limit is based on the settings for the `maxAllowedContentLength` setting in the web.config of the Enterprise Console Web Application. The default limit is 4 MB. Refer the Microsoft documentation for any

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

changes to be made for increasing the upload limit.
- The attachment might take some time to upload when the system optimizes the database for storage of attachments.
- When the **Storage Type** is set to **Database**, the attachment is uploaded to the server immediately after clicking **Upload**.
-- The uploaded attachments are stored in the **Data** column of the **SKEListItemDataTemp** table.
-- The Attachment control value securely holds information to the location where the attachment is stored.
-- The uploaded attachment cannot be retrieved or processed through workflows and so on.
- When the **Storage Type** is set to **File System**, the attachment is not uploaded to the server immediately after clicking **Upload**. The attachment is uploaded when you:
-- submit the form (even in preview mode)
-- click **Invoke Workflow** (even in preview mode)
-- submit **Pop-Up** form (even in preview mode)
-- save as drafts
- Special characters " ", ";", and "," in the file name of the attachment will be replaced with "_" in the downloaded attachment.

File Path Template Tags

Tag	Description
<StoragePath>	Resolves to the **Attachment Storage Path** specified while creating the repository. For example, If the specified **Attachment Storage Path** is **C:\ProgramData\Workflow Management\ Attachments**, it is resolved to **C:\ProgramData\Workflow Management\ Attachments** **Note:** The **<StoragePath>** tag should be the first tag in the file path template, otherwise the file path template will be invalid.
<Year>	Resolves to the current year in **yyyy** format. For example, If the current date is **June 7, 2018** it is resolved to **2018**
<Month>	Resolves to the current month in **MM** format. For example, If the current date is **June 7, 2018** it is resolved to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Tag	Description
	06
<Date>	Resolves to the current date in **dd** format. For example, If the current date is **June 7, 2018** it is resolved to **07**
<Hours>	Resolves to the current hour in **HH** format. For example, If the current time is **10:02:03.004 PM**, it is resolved to **22**
<Minutes>	Resolves to the current minute in **mm** format. For example, If the current time is **10:02:03.004 PM**, it is resolved to **02**
<Seconds>	Resolves to the current second in **ss** format. For example, If the current time is **10:02:03.004 PM**, it is resolved to **03**
<Milliseconds>	Resolves to the current millisecond in **mmm** format. For example, If the current time is **10:02:03.004 PM**, it is resolved to **004**
<GUID>	Resolves to a UUID in **RFC4122 version 4 (random)** format (**xxxxxxxx-xxxx-4xxx-yxxx-xxxxxxxxxxxx**) For example, **527ee1d8-2c01-4d0a-b3c1-a8b121ca020b**
<FileName>	Resolves to the original file name of the attachment. For example,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Tag	Description
	If the attached file is **Keywords.doc**, it is resolved to **Keywords**
<FileExtension>	Resolves to the original file extension of the attachment. For example, If the attached file is **Keywords.doc**, it is resolved to **doc**

Boolean

Use **Boolean** control to select either Yes or No in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Default Value	The default value for the control.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the **control**. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	Position property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Options Direction	Direction of the options for the control. • Select **Horizontal** to align the options next to each other for the control. • Select **Vertical** to align the options one below the other for the control. The default value is **Horizontal**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	contain only alphanumeric characters.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Include in Summary	Allow or deny a user to view the value in the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the Summary of a Base Form. • Select **No** to deny a user to view the value in the Summary of a Base Form. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Boolean control.

Button

Use **Button** control to perform an action in your form. You can display both text and image on the control.

Properties

The properties for the control are grouped under the following tabs:

Basic

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Button Text	Text for the control. **Note:** - This value is required when the control is used with the **Possible Distinct Outputs** property for **Invoke Form** activity of the workflow. - For information about Invoke Form activity and Possible Distinct Outputs, see *Invoke Form Activity* in *Developer Guide*.
Button Type	Action for the control. • Select **Submit** to allow the control to submit the form. • Select **Validate** to allow the control to validate controls on the form. • Select **Cancel** to allow the control to close or reload the form. • Select **Custom** to allow the control to perform custom actions on the form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Print** to allow the control to print the form. This feature is not available for mobile devices. • Select the **Navigate** option to navigate to another form. The default value is **Custom**. When you select **Print**, the **Print Form** option appears. You can link a form that you want to print. **To link a form that you want to print** 1. Click the **Print Form** button. The **Form Details Configuration** page appears. 2. In the **Form Name** box, click a form name. 3. In the **Form Version** box, click a form version. 4. Click **Save & Continue**. The selected form is linked to the control, and the **Form Details Configuration** page is closed. When you select **Navigate**, the **Navigate To Form** option appears. You can navigate to another form, from the current form. **To navigate to a form** 1. Click the **Navigate to Form** button. The **Form Details Configuration** page appears. 2. In the **Form Name** box, click a form name. 3. In the **Form Version** box, click a form version. 4. Click **Save & Continue**. The selected form is embedded in the current form, and the **Form Details Configuration** page is closed. **Note:** - If the value is **Validate** and the **Form Button** property is set to **Yes**, then the control will validate all the controls on the form. - If the value is **Validate**, the **Form Button** property is set to **Yes**, and the control is placed on **Tab**, then the control will validate all the controls on the **Tab**. -If the value is **Cancel** and the form is loaded in a separate window, then the control closes the form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	- If the value is **Cancel** and the form is loaded within an existing window (inline), then the control reloads the form. - If the value is **Custom**, then the control will perform custom actions on the form as per the script set for the **On Click** property of the control. - The **Print** feature is not supported in mobile devices. - The **Navigate** feature is applicable for Form Links. - Consider a scenario where a **Button** control of Button Type **Navigate** is consumed in a pop-up form. To close the pop-up form, use a custom button and use the SFU.closeForm API in the form to be navigated to. If you are using Invoke Workflow to invoke a workflow, call the SFU.closeForm API in the post-execution script of the Invoke Workflow. You can close the pop-form using this API only if the **Open New Window** property of the **Pop-Up** control is set to **YES**. However, if the value of this property is set to **NO**, then the pop-up form does not get closed. - Ensure that the form you want to navigate to is published, before it is consumed during runtime. - Forms parameters are not supported for the **Navigate** option. - Consider a scenario where a script is written for the **On Click** event with the **Button Type** property set to **Navigate** and the **On Click** script makes an AJAX call to a web API. If the AJAX call is *Synchronous*, the navigation to another form will happen only after the response from the Web API is received. However, if the AJAX call is *Asynchronous*, the navigation might happen before the response from the Web API is received. - Consider a scenario where 'Form1' has been configured to navigate to 'Form2'. If you preview the 'Form1' and click the **Navigate** button, the 'Form2' will be displayed. However, if you try to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	submit the 'Form2', the **instance xml** will not be displayed. - The form configured as **Navigate To** option is a Fill form type. If there is **Submit** button for that form, then associate a workflow to the form.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Alignment	Alignment of the control with respect to the form. • Select **Default** to allow the system to align the control. The system aligns the control to the left of the form or as specified by the control. • Select **Left** to align the control to the left of the form. • Select **Right** to align the control to the right of the form. • Select **Center** to align the control to the center of the form.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Display Mode	Show text and/or image for the control. • Select **Text** Only to show only text for the control. • Select **Image** Only to show only image for the control. • Select **Text and Image** to show both text and image for the control. The default value is **Text Only**.
Button Size	Size of the button for the control. • Select **Standard** to set the size of the control to 120 x 32 pixels. • Select **Small** to set the size of the control to 30 x 30 pixels. • Select **Medium** to set the size of the control to 180 x 86 pixels. • Select **Large** to set the size of the control to 280 x 130 pixels. The default value is **Standard**.
Image Path	Path to the image for the control. The image path is specified as: • A URL starting with **http://** or **https://**. • An image path tag. For information about using image path tags, see *Image Path Tags* in Image. • A path to the **BPMUITemplates** folder as **BPMUITemplates\Default\Images**. **Note:** You can use relative paths as follows: - Use **.** for the current folder where the html page resides. - Use **..** for the folder above the current folder where the html page resides. We recommend the following image sizes when the **Display Mode** property is set to Image. • **Small** – 30 x 30 pixels. • **Medium** – 180 x 86 pixels. • **Large** – 280 x 130 pixels.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	We recommend the following image sizes when the **Display Mode** property is set to Text and Image. • **Small** – 30 x 30 pixels. • **Medium** – 40 x 40 pixels. • **Large** – 50 x 50 pixels. **Note:** - This property is applicable only when the **Display Mode** property is set to **Image** or **Text and Image**, and the **Button Size** property is set to **Small**, **Medium** or **Large**. - If the **Display Mode** property is set to **Text and Image** and the **Button Size** property is set to **Small**, then only the image is displayed.
Image Position	Position of the image with respect to the text for the control. • Select **Left** to align the image to the left of the text for the control. • Select **Right** to align the image to the right of the text for the control. • Select **Top** to align the image to the top of the text for the control. • Select **Bottom** to align the image to the bottom of the text for the control. The default value is **Left**. **Note:** This property is applicable only when the **Display Mode** property is set to **Text and Image**.
Show as Link	Enable or disable the control to show as link. • Select **Yes** to enable the control to show as link. • Select **No** to disable the control to show as link. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	contain only alphanumeric characters.

Validation

Property	Description
Show Confirmation Message	Show or hide the confirmation message for the control. • Select **Yes** to show the confirmation message for the control. • Select **No** to hide the confirmation message for the control. The default value is **No**.
Confirmation Message Text	Confirmation message for the control. **Note:** This property is applicable only when the **Show Confirmation Message** property is set to **Yes**.

Advanced

Property	Description
On Click	Run a script when a button is clicked. For more information, see scripting guidelines for On Click property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Form Button	Enable or disable the control to act as form button. When this property is enabled, the control is displayed at the bottom-right corner of the form. • Select **Yes** to enable the control to act as form button. • Select **No** to disable the control to act as form button. The default value is **No**. **Note:** - If the value is **Yes**, and the form is viewed on a mobile device, then the control appears in the **Action Bar** of the mobile device. -If the Form Button control is placed in the **Container**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	and the value is set to **Yes**, the control is not displayed at the bottom-right corner of the form.

Scripts

For information about using scripts, see scripting guidelines for Button property.

Card

Use **Card** control to display data in a card from a Lookup data source in your form.

Properties

Control properties are grouped into three tabs: **Basic**, **Appearance**, and **Advanced**. The **Scripts** tab is used for properties configuration through scripting.

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	(Required) XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use forward slash (**/**) for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent, which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it may affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Lookup Source	Name of the item from the lookup list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	To add a name of the item for the control from the lookup list: 1. Click the **Lookup Source** button. The Lookup Source Configuration page appears. 2. In the **Data Source Type** list, select a data source type. 3. In the **Data Source** box, select a data source. 4. In the **Parameters** section, select the control properties from the list, which you want to map to each of the given parameters, if applicable. 5. Click **Save & Continue**. The selected name is set for the control and the Lookup Source Configuration page is closed.
Enable Dynamic Label	Enable use of the value (2-5) label properties for data mapping based on the selected data source lookup. • Select **Yes** to enable mapping to a column name in the data source using the value label properties. • Select **No** to disable column name mapping and use the value label properties for static button name or text for localization. The default value is **No**.
HeaderValue Left	A text field associated to a column name in the selected data source lookup. You need to check for the column name in the data source and manually enter it in the control property page to assign it to this property. Example column name: • `entity_name` • `wo_id` The corresponding value for the assigned column name appears on the top left of the control's header bar. **Note**: If this property is blank, nothing is shown, but its space is retained in the control. You have the option to configure the number of displayed characters through **HeaderValue Left Display Limit** property. The default column value

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	display limit is 12. **Note**: If the column value is more than 12 characters, you can adjust the font size to fit in the control through CSS.
HeaderValue Right	A text field associated to a column name in the selected data source lookup. You need to check for the column name in the data source and manually enter it in the control property page to assign it to this property. Example column name: • `state_desc_h` *(Job state)* • `wo_status_desc` *(WO status)* The corresponding value for the assigned column name appears on the top right of the control's header bar. **Note**: If this property is blank, nothing is shown, but its space is retained in the control. The maximum number of displayed characters for the column value is 10. If the column value has more than 10 characters to display, an ellipsis is added to indicate that, and the full column value is shown in a tooltip on mouse hover.
Value1	A numeric or text field associated to a column name in the selected data source lookup. You need to check for the column name in the data source and manually enter it in the control property page to assign to this property. Example column name: • `item_id` • `wo_id` The corresponding value for the assigned column name appears in the middle of the control just below the header bar. If this property is blank, nothing is shown, but its space is retained in the control. The maximum number of displayed characters for the column value is 26. If the column value has more than 26 characters to display, an ellipsis is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	added to indicate that, and the full column value is shown in a tooltip on mouse hover.
Value (2-5)	A text field associated to a column name in the selected data source lookup. You need to check for the column name in the data source and manually enter it in the control property page to assign to this property. Example column name: • `entity_name` • `wo_id` The assigned column name to the property and its corresponding value appear in the control after the **Value1** property. The maximum number of displayed characters for the column value in **Value 2** is 27 and in **Value (3-5)** is 30. If the column value has more characters to display than the maximum number, an ellipsis is added to indicate that, and the full column value is shown in a tooltip on mouse hover.
Value (2-5) Label	Description for the **Value** property, text to support localization, or a value of a lookup column name. For example: • `Entity Name` • `@@entity_name@@` *(for localization)* If the **Enable Dynamic Label** property is set to **No**, you can use each **Label** property to specify a description for a particular **Value** property or use each of them for localization text. For localization, ensure that you add the value you specified in the **Label** property in its corresponding resource file in the **Locales** folder under the product installation path. If the **Enable Dynamic Label** property is set to **Yes**, you can assign a column name to each **Label** property from the selected data source lookup, and the value of that column name is shown in the control as the label for a particular **Value** property**.** If the value of the column name is empty, nothing is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	shown, but its space is retained. **Note**: If a particular **Label** property is not configured or blank, that field is not shown. The other values use its space, and the size of the control is adjusted based on the available data (values) within the control. The maximum number of displayed characters for the column value in **Value2 Label** is 34 and in **Value (3-5) Label** is 36. If the column value has more characters to display than the maximum number of characters, an ellipsis is added to indicate that, and the full column value is shown in a tooltip on mouse hover.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Width	Width in pixels for the control. The default value is **0**. **Note**: If the value is 0, then the width of the control is set as per the default value.
Height	Height in pixels for the control. The default value is **0**. **Note**: If the value is 0, then the height of the control is set as per the default value and is automatically adjusted based on the content within the control.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. This is applicable only when the **Label Position** is set to **Left** or **Right**.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Image Path	The location of the image that you want to use in the control. This can be a URL that starts with **http** or **https**, or path with **<BPMJITemplates>**, **<ThemePath>**, or **<ThemeName>** tags.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	Note: The supported icon size is 45 pixels.
HeaderValue Left Display Limit	Number of characters to show for the **HeaderValue Left** property before the ellipsis. This accepts a maximum display limit of 25. If the column value has more characters to display than the specified limit, an ellipsis is added to indicate that, and the full column value is shown in a tooltip on mouse hover. The default value is **12**. **Note**: If the column value is more than 12 characters, you can adjust the font size to fit in the control through CSS.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
On Click	Run a script after the control is clicked.
On Initialize	Run a script after the control has been initialized, but before it is rendered to the UI.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Enable Lookup Color	Enable use of color defined in the selected data source lookup for the control's header bar. • Select **Yes** to enable use of the color from the data source lookup. • Select **No** to enable the color picker in the **Color** property and select the color to use. The default value is **Yes**.
Color	Color for the control's header bar. If the **Enable Lookup Color** property is set to **Yes**, specify the column name from the lookup that contains the color in this property, otherwise use the color picker to assign the color for the control's header bar.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Auto-load Card	Allow or deny the system to automatically load the control. • Select **On Form Load and Parameter Change** to allow the system to automatically load the control when the form is loaded and when the parameter is changed. • Select **Never** to deny the system to automatically load the control when the form is loaded and when the parameter is changed. The default value is **On Form Load and Parameter Change**. **Note**: For parameterized lookup, when setting the value to **Never**, use the **control.refreshCard()** method to reload records on demand in the Card control.
Enable Refresh	Enable or disable control display refresh. The default value is **No**.
Refresh Rate	The number of times the control display is refreshed in seconds. The default value is **30** seconds.
Enable Dynamic Action Buttons Label	Enable use of the action button (1-3) label properties for data mapping based on the selected data source lookup. • Select **Yes** to enable mapping to a column name in the data source using the action button properties. • Select **No** to disable column name mapping and use the action button properties for static button name or text for localization. The default value is **No**.
Enable Action (1-3)	Call the script defined in a particular **Action Script** property in the **Scripts** tab. If you select **No**, the action button is not visible in the control. The default value is **No**.
ActionButton (1-3) Label	Name for **ActionButton (1-3)** or text to support localization. If the **Enable Dynamic Action Buttons Label** property is set to **No**, you can use each **Action Button Label**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	property to specify a name for a particular **ActionButton** or use it for localization text. For localization, ensure that you add the value you specified here in its corresponding resource file in the **Locales** folder under the product installation path. If the **Enable Dynamic Action Buttons Label** property is set to **Yes**, you can assign a column name to each **Action Button Label** property from the selected data source lookup, and the value of that column name is shown in the control as the label for the action button. **Note**: If a particular **Action Button Label** property is not configured or blank, nothing is shown, and the way the other action buttons are shown is adjusted accordingly. The maximum number of displayed characters for the column value is 10. If the column value has more than 10 characters to display, an ellipsis is added to indicate that, and the full column value is shown in a tooltip on mouse hover.

Scripts

For information about using scripts, see scripting guidelines for Card control.

Chart

Use **Chart** control to view a chart in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
Description	Description for the control.
Lookup Source	Name of the item in the **Lookup List**. **To add a name of the item in the Lookup List for the control** 1. Click the **Lookup Source** button. The **Lookup**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	Source Configuration page appears. 2. In the **Data Source Type** list, click a data source type. 3. In the **Data Source box**, click a data source. 4. In the **Parameters** list, click and select a control on the form, if applicable. 5. In the **X-Axis** list, click a data series with unique values for the category (horizontal) axis. 6. In the **Y-Axis** list, click one or more integer or numeric data series for the value (vertical) axis. 7. Click **Save & Continue**. The selected name is set for the control and the **Lookup Source Configuration** page is closed. To configure the Lookup Source for Sankey chart, see Lookup Source Configuration for Sankey Chart. **Note:** - Parameterized and non-parameterized lookups are supported for Database. Only non-parameterized lookups are supported for Web API. - To render donut or pie chart, only one integer or numeric data series should be selected for the y-axis of the chart. - For information about Lookup List, see List Lookups.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	• Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **450**. **Note:** If the value is 0, then the height of the control is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Chart Type	Type of chart for the control. • Select **Area Chart** to show area chart for the control. • Select **Bar Chart** to show bar chart for the control. • Select **Donut Chart** to show donut chart for the control. • Select **Line Chart** to show line chart for the control. • Select **Pie Chart** to show pie chart for the control. • Select **Sankey Chart** to show a flow from one set of values to another. • Select **Scatter Chart** to show scatter chart for the control. The default value is **Area Chart**. **Note:** - To render donut or pie chart, only one integer or numeric data series should be selected for the y-axis of the chart. - For Sankey chart, the chart type has to be selected before selecting the Datasource. - In **AVEVA Work Tasks Pro** app, the Sankey chart width does not get adjusted in the container when the orientation is changed.
Show Axis Titles	Show or hide the axis titles for the control. • Select **Yes** to show the axis titles for the control. • Select **No** to hide the axis titles for the control. The default value is **Yes**.
Show Legend	Show or hide the legend for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	• Select **Yes** to show the legend for the control. • Select **No** to hide the legend for the control. The default value is **Yes**.
Sankey Chart Node Unit	Displays the unit used for Sankey chart nodes.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
On Initialize	Run a script after the control has been initialized, but before it is rendered to the UI.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.

Scripts

For information about using scripts, see scripting guidelines for Chart control.

Note: In **AVEVA Work Tasks Pro** app, the chart is rendered after sampling down the data to 1000 points, if the data exceeds 1000 points.

Lookup Source Configuration for Sankey Chart

Sankey chart is a visualization used to depict a flow from one set of values to another. The things being connected are called nodes and the connections are called links. Sankey chart is used when you want to show a many-to-many mapping between two categorical dimensions.

To configure Lookup Source for Sankey chart

1. Click the **Lookup Source** icon. The **Lookup Source Configuration** page appears.
2. In the **Data Source Type** list, select a data source type.
3. In the **Data Source for Sankey Nodes**, select a data source for the Sankey nodes.
4. In the **Sankey Node Id**, select a node Id that will be displayed in the Sankey chart. These Ids can be used to create links between source and target nodes. The node Id should have unique value.
5. In the **Sankey Node Names**, select a node name that will be displayed in the Sankey chart. The Sankey Node name should be a string.
6. In the **Data Source for Sankey Links**, select a data source for the Sankey links.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. In the **Sankey Source Nodes**, select the source node for the Sankey chart. The source node should have the value specified in the Sankey Node Id field.
8. In the **Sankey Target Nodes**, select the target node for the Sankey chart. The Target node should have the value specified in the Sankey Node Id field.
9. In the **Sankey Link Value**, select a link value between the source and the target nodes. The link value should be an integer.
10. Click **Save & Continue**. The selected name and Lookup Source configuration is set for the control and the **Lookup Source Configuration** page is closed.

Note:
- Parameterized and non-parameterized lookups are supported for Database. Only non-parameterized lookups are supported for Web API.
- For information about Lookup List, see List Lookups.

Check Box

Use **Check Box** control to turn on or turn off an option by selecting or clearing the check box in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Options	Options for the control. **To add an option to the control** 1. Click **Add Record**. A new record appears. 2. In the **Text** box, enter the options text. 3. In the **Value** box, enter the options value. 4. In the **Fore Color** palette, click a color (or in the **Color Code** box, enter hexadecimal code of the color), and then click **Apply**. The selected color is applied to the foreground of the options text. 5. In the **Back Color** palette, click a color (or in the **Color Code** box, enter hexadecimal code of the color), and then click **Apply**. The selected color is applied to the background of the options text. **To clear fore color for an option of the control** • On the **Fore Color** palette, in the **Color Code** box, enter **#1b1b1b**, and then click **Apply**. The **Fore Color** is reset to the default color. **To clear back color for an option of the control** • On the **Back Color** palette, in the **Color Code** box, enter **#1b1b1b**, and then click **Apply**. The **Back Color** is reset to the default color. **To delete an option from the control** • Click the **Delete** button. The record is deleted. **Note:** The options **Text** and **Value** parameters are mandatory and must be unique across all options.
Default Value	The default value for the control. **Note:** - The value must be one of the values set for the **Value** parameter in the **Options** property. -Multiple values must be separated with **;#**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to Top, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Options Per Row	Number of options per row for the control. Enter a value from 0 to 10.
Options Direction	Direction of the options for the control. • Select **Horizontal** to align the options next to each other for the control. • Select **Vertical** to align the options one below the other for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	The default value is **Horizontal**.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**. **Note:** Validation message appears only on submission of the form.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. Important: The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Text Parameter	Name that identifies the options text to use in scripts for the control.
Value Parameter	Name that identifies the options value to use in scripts for the control.
Forms 2011 Compatible	Make the control compatible with Forms 2011, that is the forms used in BPM 2011. • Select **Yes** to allow the system to make the control

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	compatible with Forms 2011. • Select **No** to deny the system to make the control compatible with Forms 2011. The default value is **No**. **Note:** When a control on a form is made Forms 2011 compatible, the XML instance of the form with the control is changed to ensure compatibility with Forms 2011.
Include in Summary	Allow or deny a user to view the value in the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the Summary of a Base Form. • Select **No** to deny a user to view the value in the Summary of a Base Form. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Check Box control.

Data Grid

Use **Data Grid** control to display data in tabular form from a data source in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Configuration Name	Specifies grid view configuration. **To specify grid view configuration** 1. Click the **Configuration Name** button. The **Grid View Configuration** page appears. 2. In the **Grid Configuration** dropdown list, select the required grid configuration. The data grid preview with columns and their values appears. The **Parameters** list is also displayed if there are any parameters associated with the grid configuration. In the **Parameters** list, click and select a control on the form, if applicable. On the data grid column, you can perform the following actions: • Sorting single or multiple columns • Sort column values in Ascending order

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Sort column values in Descending order • Resizing columns 3. Click **Save & Continue**. The selected name is set for the control and the **Configuration Name** page is closed. **Note:** - For **Parameters**, the **Title** of the control on the form is displayed, if set for the control. Otherwise, the **XML Node** of the control on the form is displayed. - In forms designer, when you try to parameterize on a hierarchical grid, only the root level columns are listed. - In the **Grid View Configuration** page, resizing the last data grid column to a smaller size is not supported due to Third Party Control limitations. - Ensure that you map a **Number** control to an **Integer** or **Numeric** type of Data Grid parameter.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Read-Only	Allow or deny a user to enter a value for the control. • Select **Yes** to deny a user to enter a value for the control. • Select **No** to allow a user to enter a value for the control. The default value is **No**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Suppress**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to Top, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Consider Available Height	Resize the height of the control or container based on the available height. • Select **Yes** to resize the height based on available height. • Select **No** to retain the space. The default value is **No**. **Note:** - The Consider Available Height property is not applicable for the following: -Designer view -Print form -Panel form with horizontal tab order - If this property is set to **Yes** and a value is specified in the **Height** property, minimum height is considered. - This property is applicable only in web view. - When more than one control or container is set with **Consider Available Height** at the same level of container or form, then the available space is distributed evenly between those controls or containers. For example, consider a Form which contains two Panel forms with **Consider Available Height** set to **Yes**, where Panel form 1 has two TextInput controls and Panel form 2 has one TextInput control. The Panel form 1's height is more than Panel form 2's height as Panel form 1 contains two TextInput controls and the available empty space in the form is evenly distributed between the two Panel forms.
Rearrange Columns	Allow or deny a user to reorder the columns by dragging the header cells. • Select **Yes** to allow a user to reorder the columns. • Select **No** to deny a user to reorder the columns. The default value is **No**. **Note**: At the runtime, the reordering of the columns is not

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	persistent. In hierarchical grid, the column reordering of the child grid, at runtime, is not persistent during the following conditions: -Pagination -Grid Refresh -In mobile view
Resize Columns	Allow or deny a user to resize the columns by dragging the edges of the header cells. • Select **Yes** to allow a user to resize the columns.. • Select **No** to deny a user to resize the columns. The default value is **No**.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Multiple Selection	Allow or deny a user to select multiple records for the control. • Select **Yes** to allow a user to select multiple records for the control. • Select **No** to deny a user to select multiple records for the control. The default value is **Yes**. For information on behavior of the data grids on data change with the **Multiple Selection** property, see *Multiple and Parametrized Data Grids*.
Show Export Button	Show or hide the export button for the control. • Select **Yes** to show the export button for the control. • Select **No** to hide the export button for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	The default value is **No**. **Note:** - The export button is available at every level in a hierarchical grid. - You cannot export all levels at same time. - If you select **No** to hide the export button,then the footer with paging buttons is visible only if the data of the grid is greater than the page size. This is applicable at every level. - If you select **Yes** to show the export button, then the footer is visible even if the data of the grid is lesser than or equal to the page size. - Export is not supported in Work Tasks Pro UWP App.
Export Type	File type of exported data for the control. • Select **All** to show both Excel document and Portable document export buttons for the control to export data to an Excel document or a Portable document respectively. • Select **Excel** to show the Excel document export button for the control to export data to an Excel document. • Select **PDF** to show the Portable document export button for the control to export data to a Portable document. The default value is **All**. **Note:** - PDF saves only the screenshots for the current page of the control. - When you export a Data Grid with large data as a pdf, the browser crashes. To avoid this issue, in the **Scripts** tab of the Forms container, set the script for the **On Form Load** property as follows: `$.getScript("js/pako_deflate.min.js");` This enables compression in the pdf, and it is required if your dataset is very large.
Export All Pages	Allow or deny a user to export all pages for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Yes** to allow a user to export all pages for the control. • Select **No** to deny a user to export all pages for the control. However, the system allows the user to export only the current page for the control. The default value is **No**.
Adapt UI	Change the user interface of the control based on the display width. • Select **Yes** to allow the system to change the user interface of the control based on the display width. The **Web View** is rendered for the control when the screen width is greater than or equal to 800 pixels. Otherwise, the **Mobile View** is rendered for the control. • Select **No** to deny the system to change the user interface of the control based on the display width. In this case, the **Web View** is rendered for the control. The default value is **Yes**. **Note:** The responsiveness of the container depends on the value set for the **Desktop View Only** property at the Form level.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Advanced

Property	Description
On Data Bound	Run a script when data is bound to the control. For more information, see scripting guidelines for On Data Bound property.
On Data Change	Run a script when value of the control changes. **Note:** In a data grid, if the persist column is of bit type, then the **On Data Change** event does not trigger as expected. For more information, see scripting guidelines for On Data Change property.
On Selection Change	Run a script when selection of the record changes. For more information, see scripting guidelines for On Selection Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Behavior	Show or hide data for the control. • Select **Data Grid** to show data for the control. • Select **Data Source** to hide data for the control. The default value is **Data Grid**. For information on using **Data Grid** values in other controls, see Using Data Grid Values in Options script. For more information on using a using data from a data grid set as a data source, see Use Data from Data Grid Set As Data Source.
Execution Mode	Allow or deny a user to retrieve data for server calls immediately. • Select **Asynchronous** to deny a user to retrieve data for server calls immediately. • Select **Synchronous** to allow a user to retrieve data for server calls immediately. The default value is **Asynchronous**. **Note:** In a hierarchical grid,this property is applicable only at the root level. The child levels are always in the **Asynchronous** mode.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Dynamic Page Size	Display records per page based on the available height. • Select **Yes** to display records per page based on available height. • Select **No** to display all the records. The default value is **No**. **Note**: - This property is not applicable to Print -If **Dynamic Page Size** property is set to **Yes**, then the value set for the **Page Size** property is considered as the minimum value. - The row height is fixed with **Dynamic Page Size** set to **Yes**. -The Data Grid with **Execution Mode** property set to **Synchronous** is not supported with **Dynamic Page Size** property set to **Yes**.
Page Size	Number of records added at run-time for the control. By default, the page size is set to greater than 1.
Extended Information	Allow or deny a user to access the extended information (that is columns other than the display and value columns of the result set) based on the selection for the control. • Select **Yes** to allow a user to access the extended information based on the selection for the control. • Select **No** to deny a user to access the extended information based on the selection for the control. The default value is **No**.
Select First Record	Allow or deny the system to automatically select the first record when the control is loaded. • Select **Yes** to allow the system to automatically select the first record when the control is loaded. • Select **No** to deny the system to automatically select the first record when the control is loaded. The default value is **No**. **Note:** - In the **Data Grid** control, the **Select First Record** property takes precedence over the script to select a

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	record in the **On Data Bound** event. - For example, in a **Data Grid** control when the **Select First Record** property is set to **Yes** and a script in the **On Data Bound** event is set to select the second record, the first record is selected - Therefore, control.selectRecord() method and the **Select First Record** property must not be used together. - In a hierarchical grid, if the **Allow Selection** property is applied at the child level, then the parent record expands automatically and the child record is selected.
Auto-Select Record	Allow or deny the system to automatically select the record when the check box is selected and vice versa. • Select **Yes** to allow the system to automatically select the record when the check box is selected and vice versa. • Select **No** to deny the system to automatically select the record when the check box is selected and vice versa. The default value is **No**. **Note:** - If the **Multiple Selection** property is set to **Yes** and the check box for the record is previously selected, then selecting the record does not clear the check box. - In such cases, select the check box for the record to clear the check box for the record.
Summary Columns	Columns to view in the summary of a **Base Form**. **Note:** - When the **Extended Information** property is set to **Yes**, any column can be specified. Otherwise, only the **Display** columns and the **Value** columns can be specified. Multiple values must be separated with a comma. - In a hierarchical grid, this property is applicable only for the root level columns.
Auto-load Grid	Allow or deny the system to automatically load the control. • Select **On Form Load and Parameter Change** to allow the system to automatically load the control

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	when the form is loaded and when the parameter is changed. • Select **On Form Load** to allow the system to automatically load the control only when the form is loaded. • Select **Never** to deny the system to automatically load the control when the form is loaded and when the parameter is changed. The default value is **On Form Load and Parameter Change**. **Note:** - For non-parameterized data grids, setting the value to **On Form Load and Parameter Change** is the same as setting the value to **On Form Load**. - Use the control.refreshGrid() method to reload records on demand in the data grid .
Include in Summary	Allow or deny a user to view the value in the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the Summary of a Base Form. • Select **No** to deny a user to view the value in the **Summary** of a Base Form. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.
Use Culture Specific Values	Enable values of the grid to be stored as culture specific values. • Select **Yes** if you want to store the values of the grid as culture specific values. • Select **No** if you do not want to store the values of the grid as culture specific values. The default value is **No**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: - Stored values of different data types such as **Number**, **String**, **Boolean**, **Date**, **Time**, and **DateTime** will not be persisted across different cultures. For example: If you submit a form from 'Fill Form' in 'en-US' culture and open the form from the 'Inbox' in 'pt-BR' culture, then the culture specific values are not persisted. - This property appears in **Data Grid** only for upgraded repository from versions prior to Wonderware Skelta BPM 2017. For a new repository, this property will not be displayed and the value will be **No** internally. - The **SFU.getGridValue()** API and the script having scriptable value as **selectedValue** and **extendedInformation** for data grid, now returns **DateTime** object. - The **DateTime** values are displayed as per the browser time zone.

Scripts

For information about using scripts, see scripting guidelines for Data Grid control.

For an example on accessing values of a column of a selected row in a Data Grid, see Accessing Values of a Selected Row Through Other Controls

Note:
- The format and culture for date and time value displayed in the control is as per the current server and not as stored in the database.
- The number values are displayed in the data grid as per the culture, considering only the decimal separator.
- When the data type is not a string but a number, date, time and so on, the data type is first converted to string for comparison and then filtered accordingly.
- If the persist column is of **DateTime** type, then in runtime the grid displays only the seconds. The milliseconds are neither displayed nor persisted. Filter options such as **equal to** will not work if milliseconds is persisted in the database for the **Date**, **Time**, and **DateTime** data types.
- If **Date** type is configured as Database column in SQL server, the **Date** type is displayed in the **DateTime** format in the UI.
- While filtering data, it is recommended to enter only valid inputs for **Date**, **Time**, and **DateTime** data types.
- If the Boolean type has Null data in the database and if the **Use Culture Specific Values** property for the **Data Grid** is set to **Yes**, then the Null data for the Boolean type is displayed as **False** in the UI.

Multiple and Parameterized Data Grids

You can use two data grids, and populate the destination data grid based on the record selected in the source data grid. The destination data grid is also called as the parameterized data grid as it is populated using the parameters from the source data grid.

The behavior of the data grids on data change with the **Multiple Selection** property is as follows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Value of the Multiple Selection Property set for the Source Data Grid	Value of the Multiple Selection Property set for the Destination Data Grid	Behavior of the data grids on data change
No	No	If you select a record in the source data grid, then the destination data grid is populated and you can select a record in the destination grid.
No	Yes	If you select a record in the source data grid, then the destination data grid is populated and you can select a record or multiple records in the destination grid.
Yes	No	If you select a record in the source data grid, then the destination data grid is populated and you can select a record in the destination grid. If you select multiple records in the source data grid, then the destination data grid is not updated and results in an invalid scenario.
Yes	Yes	If you select a record or multiple records in the source data grid, then the destination data grid is populated and you can select a record or multiple records in the destination grid.

Configure Grids

Use **Grid Configuration** to configure a data source for populating a data grid in forms.

To add a Grid Configuration

1. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Grid Configuration.**

   The **Grid Configuration** page appears.
2. Click **New**, and then click **Grid Configuration**. The **New Grid Configuration** dialog box appears.
3. In the **Title** box, type a name for the grid configuration, and in the **Description** box, type a description for the grid configuration.

   Note: In the **Title**, the allowed special characters are **_** and **-** only. In the **Description**, the allowed special characters are **- _ .** and **,** only.
4. In the **Hierarchical Level** drop-down list, select the number of levels you want the **Data Grid** control to display.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Click the **More** button for the **Data Source**, and then in the **Data Source** list, select the the data source. For the first data source all the lookups appear, but for the data sources after the first, only the parameterized lookups appear in the list.
6. In the **Display Columns** list, click the column names to show in the data grid. Double-click the column name to set the grid captions.

   To provide run time localized values, see Localize Column Names in Data Grid

   Note: For Grid Captions, the special characters **< > [ ] ‘ “ &** are not allowed.
7. In the **Persist Columns** list, click the column names to store in the instance XML of the form.
8. Do one of the following.

Task	Action
• Show check box for the records in the grid.	• Click **Yes** for the **Show Check Box**.
• Hide check box for the records in the grid.	• Click **No** for the **Show Check Box**.

9. Select Allow Selection option to enable or disable row selection in the Data Grid through:
   a. Mere selection (that is click to select the row)
   b. Check boxes (that is select checkboxes to select rows)

   If you select **Allow Selection** for a data source lookup, the user can select the row through mere selection or through check boxes, and the columns selected in the **Persist Columns** field are persisted in the form instance XML. The checkboxes are disabled for the rows in the parent grid, and no checkboxes are available for the rows in the child grid.

   Select **Disable Selection** if you do not want to persist any values in the form instance XML and instead want to use the Data Grid as a reference grid. The user can select the row through mere selection at that level for the Data Grid and only at the last level for the Hierarchical Data Grid.
10. If the **Hierarchical Level** is more than 1, click **Parameter Mapping**.

    The **Parameter Mapping** window appears.

    To map the parameters of the lookups, select the parameters in the drop-down list.
11. Click **Save** to save the parameter mapping. The **Parameter Mapping** window is closed.
12. Click **Advanced Settings** to highlight records, if required.

    For more information, see Highlight Records.
13. Click **Save**. The grid configuration is saved.
14. Click **Close**. The **New Grid Configuration** dialog box is closed.

Note:
- Database column names with space or special characters are not supported. This is due to the limitation in grid control of **Kendo UI for jQuery**.

- If a data source lookup, value field for a lookup, or a parameter associated with a grid configuration changes, then you must reconfigure the Grid and save the changes again.

- The Hierarchical Data Grid is not supported in mobile devices.

- When the database is not available, the tree lookup item will be disabled and cannot be selected.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The default number of database connection entries for each repository is 1. If you want to change the entry, override the **NumberOfDatabaseConnectionRetries** entry in the **Properties** column in the **SKRepository** table of the Farm database.

For example, to override the number of database connection entries to 20, change **[CDATA[0]] to [[CDATA[20]]** for **NumberOfDatabaseConnectionRetries** as follows.

```
<property key="NumberOfDatabaseConnectionRetries"><![CDATA[20]]></property>
```

- Backward compatibility exists for grid configuration, with support for column header localization based on column names, when the localization key is not specified with "@@" prefix and suffix.

- When you edit the grid configuration, the errors are logged in the Browser Console due to the usage of third-party controls in the page.

- The Persist columns should have data types such as numbers (without decimals), GUID, and string.

Update Grid Configuration for Lookup Modification

The **Requires Update** column in the **Grid Configuration** page displays the value as **0** or **1** to indicate if you need to revisit and update the grid configuration based on the Lookup modification. By default, it is set to **0** and indicates that no update is required. The value is set to **1**, if there is any change in the Lookup configuration.

The **Requires Update** column is set to **1,** when the Grid Configuration's **Display Columns**, **Persist Columns**, **Parameter Mapping**, and/or **Highlighting Records** settings are affected with the Lookup configuration change.

To update Grid Configuration for Lookup Modification

1. In the **Enterprise Console**, click menu icon, click **Settings**, click **Data Grid**, and then click **Grid Configuration**. The **Grid Configuration** page appears.
2. Right-click on a grid configuration for which the **Requires Update** column displays the value **1**, and then click **Edit** (or click on a grid configuration, and then on the action bar, click **Edit**). The **Edit Grid Configuration** dialog box appears.
3. Update the **Display Columns**, **Persist Columns**, **Parameter Mapping**, and **Highlighting Records** settings whichever applicable and then save the Grid Configuration.

   The Grid Configuration is saved with the updated Lookup configuration.

Highlight Records

Use **Highlight Cells/Rows** to highlight cells or rows of a data grid based on business conditions.

To highlight Cell or Row

1. In the **Enterprise Console**, click menu icon, click **Settings**, click **Data Grid**, and then click **Grid Configuration**. The **Grid Configuration** page appears.
2. Right-click on a grid configuration, and then click **Edit** (or click on a grid configuration, and then on the action bar, click **Edit**). The **Edit Grid Configuration** dialog box appears.
3. Click **Advanced Settings**. The **Advanced Settings** dialog box appears.
4. Do one of the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
• Apply fore color for a cell in the grid.	• In the **Apply To** list, click **Cell ForeColor**.
• Apply back color for a cell in the grid.	• In the **Apply To** list, click **Cell BackColor**.
• Apply fore color for a row in the grid.	• In the **Apply To** list, click **Row ForeColor**.
• Apply back color for a row in the grid.	• In the **Apply To** list, click **Row BackColor**.

5. In the **Color** list, click a color or enter hexadecimal code of the color.
6. In the **Data Source** list, click a column of the lookup.
7. In the **Operator** list, click an operator. The operators are populated based on the data type of the selected column of the lookup.

Task	Action
Boolean	• True • False
Date	• After • Before • Last Month (considers days in the previous month, that is from the first day of the previous month to the last day of the previous month) • Last X Years (considers days in the past years, that is from the last day of December of the previous year to the first day of January of the current year minus X) • Last Year (considers days in the last year, that is from the first day of January to the last day of December of the last year) • Next Month (considers days in the next month, that is from the first day of the next month to the last day of the next month) • Next X Years (considers days in the future years, that is from the first day of January of the next year to the last day of December of the current year plus X) • Next Year (considers days in the next year, that is from the first day of January to the last day of December of the next year) • On Or After • On Or Before • This Month (considers days in the current month, that is from the first day of the month to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
	the last day of the month) • This Week (considers days under the current ISO 8601 week number) • This Year (considers days in the current year, that is from the first day of January to the last day of December of the year) • Today • Tomorrow • Yesterday
Numeric	• Equals • Not Equals • Greater Than • Greater Than or Equal To • Lesser Than • Lesser Than or Equal To
String	• Begin With • Does Not Begin With • Contains Data • Does Not Contain Data • Ends With • Does Not Ends With • Equals • Not Equals

8. In the **Value** box, type a value for the column.
9. Click the **Add Row** button to add an additional row if required.
10. Click **Save**. The conditions for highlighting records are saved.
11. Click **Save**. The **Edit Grid Configuration** dialog box is closed.

Note:
- Database column names with special characters except underscore are not supported.
- The appropriate data type must be set for the selected columns of the Web API lookup in the **Lookup Settings**. Otherwise, only operators for the **String** data type will be available in the **Operator** list for the column.
- Boolean value can be entered as `0` or `false` for false value and `1` or `true` for true value.
- Date and time values must be set as per the server culture in the format, MM/DD/YYYY. The date time values should only contain date part.
- Date is not validated and must be entered only in `MM/DD/YYYY` format without the preceding zeros. For example, **September 8, 2007** should be entered as `9/8/2007` and not `09/08/2007`.
- Value column does not support single quotation mark (') special character.

When multiple conditions are specified the last specified condition takes precedence.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- To ensure optimal performance, restrict the total number of conditions to a maximum of 10. The condition is applied only if the column is displayed in the grid.

Data Lookup

Use **Data Lookup** control to search for data from a data source in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note**: - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Lookup Source	Name of the item in the **Lookup List**. **To add a name of the item in the Lookup List for the control** 1. Click the **Lookup Source** button. The **Lookup**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Source Configuration page appears. 2. In the **Data Source Type** list, click a data source type. 3. In the **Data Source box**, click a data source. 4. In the **Parameters** list, click and select a control on the form, if applicable. 5. Click **Save & Continue**. The selected name is set for the control and the **Lookup Source Configuration** page is closed. **Note:** - For **Parameters**, the **Title** of the control on the form is displayed, if set for the control. Otherwise, the **XML Node** of the control on the form is displayed. - For information about Lookup List, see List Lookups.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Read-Only	Allow or deny a user to enter a value for the control. • Select **Yes** to deny a user to enter a value for the control. • Select **No** to allow a user to enter a value for the control. The default value is **No**.
Label Position	Position of the label for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Suppress**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Watermark	Hint text that appears when no value is entered for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Show as Drop-Down	Enable or disable the control to show as Drop-Down. • Select **Yes** to enable the control to show as Drop-Down. • Select **No** to disable the control to show as Drop-Down. The default value is **No**. **Note:** If you select **Yes**, then a user will not be able to type in the control at run-time.
Drop-Down Height	Drop-down height in pixels for the control. The default value is **300**. **Note:** - The minimum value for drop-down height is 300. The value below 300 is not considered at runtime. - If the value is 0, then the drop-down height of the control is set as per the default values.
Adapt UI	Change the user interface of the control based on the display width. • Select **Yes** to allow the system to change the user interface of the control based on the display width. The **Web View** is rendered for the control

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	when the screen width is greater than or equal to 800 pixels. Otherwise, the **Mobile View** is rendered for the control. • Select **No** to deny the system to change the user interface of the control based on the display width. In this case, the **Web View** is rendered for the control. The default value is **Yes**. **Note:** The responsiveness of the container depends on the value set for the **Desktop View Only** property at the Form level.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**. **Note:**If you configure a **Data Lookup** control as mandatory, then when you select an item from the drop-down, the mandatory message appears. The message disappears after you have selected an item.
Autocomplete Length	Number of characters to start autocomplete. The default value is **3**. **Note:** If the value is 0, then the autocomplete length for the control is set as per the default values.
Show Confirmation Message	Show or hide the confirmation message for clearing the value of the control in devices.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Yes** to show the confirmation message for the control. • Select **No** to hide the confirmation message for the control. The default value is **Yes**.
Confirmation Message Text	Confirmation message for clearing the value of the control in devices. The default value is **Are you sure you want to clear the value?** **Note:** This property is applicable only when the **Show Confirmation Message** property is set to **Yes**.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Default Number of Records	Number of records added at run-time for the control. The default value is **50**. **Note:** If the value is 0, then the default number of records for the control is set as per the default values.
Retain Selected Value	Keep or lose the selected value for the control when the current parameter values from the source get changed. • Select **Yes** to keep the selected value for the control. • Select **No** to lose the selected value for the control. The default value is **No**.
Resolve Value in Edit Mode	When the Form is in the edit mode like opening a Form via WorkItem in Inbox, then update or keep the Lookup display value and the extended information (if the property Extended Information is Yes) based on

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	the selection for the control. • Select **Yes** to update the Lookup Display Value and the Extended Information. • Select **No** to keep the existing Lookup Display Value and the Extended Information. The default value is **No** for performance improvement.
Persist Display Value	Keep or lose the display value for the control on submission of the form. • Select **Yes** to keep the display value for the control. • Select **No** to lose the display value for the control. The default value is **Yes**.
Extended Information	Allow or deny a user to access the extended information (that is columns other than the display and value columns of the result set) based on the selection for the control. • Select **Yes** to allow a user to access the extended information based on the selection for the control. • Select **No** to deny a user to access the extended information based on the selection for the control. The default value is **No**.
Include in Summary	Allow or deny a user to view the value in the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the Summary of a Base Form. • Select **No** to deny a user to view the value in the Summary of a Base Form. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Data Lookup control.

Note:
- The format and culture for date and time value displayed in the control is as per the current server and not as stored in the database.
- On Web, autocomplete uses the **Starts With** filter to complete the string, and on AVEVA Work Tasks Pro app, autocomplete uses the **Contains** filter to complete the string.
- When the data type is not a string but a number, date, time and so on, the data type is first converted to string for comparison and then filtered accordingly.
- When **Persist Display Value** is set to **No**, date and date time values are not supported as value fields of the lookup.
- The default data lookup time out is 50 seconds. You can change this value in the **web.config** file.

```
<appSettings>
<add key="lookupTimeout" value="50" />
</appSettings>
```

- When **Data Lookup** is the first control on a form and the form is viewed on a mobile device, then the lookup with populated data (ready for entry or selection) is shown instead of the complete form with other controls.
- Ensure that you map a **Number** control to an **Integer** or **Numeric** type of Data Grid parameter.

Keyboard-based Navigation

You can use the keyboard to perform the following actions:

- To open the drop-down list,
  - use the **Alt** + **Down Arrow** keys (in case, **Yes** option is selected for the **Show as Drop-Down** property)
  - type the search string (in case, **No** option is selected for the **Show as Drop-Down** property)
- To navigate and highlight the listed option, use the **Up** and **Down Arrow** keys.
- To load more options in the list,
  - use the **Alt** + **Page Down** keys for Windows 10 and Windows 2016 machines
  - use the **Shift + Alt + Page Down** keys for Windows 11 machine
- To select highlighted option in the list, use the **Enter** key.
- To close the list, use the **Esc** key.

Date

Use **Date** control to select a date in your form.

Properties

The properties for the control are grouped under the following tabs:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Default Value	The default value for the control. **Note:** Ensure the value is within the **Minimum Value** and the **Maximum Value**.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Read-Only	Allow or deny a user to enter a value for the control. • Select **Yes** to deny a user to enter a value for the control. • Select **No** to allow a user to enter a value for the control. The default value is **No**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is Default. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the

Property	Description
	control. The default value is **No**.
Minimum Value	Minimum date value for the control. The default value is **01/01/1901**.
Maximum Value	Maximum date value for the control. The default value is **12/31/2099**.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Date Format	Date format for the control. For example, MM/dd/yyyy. Always use M for month. The default value is taken from the current server culture. For more information, see Date and Time Formats. **Note:** Date format must contain at least month, date, and year components. Date format is not validated.
Forms 2011 Compatible	Make the control compatible with Forms 2011, that is the forms used in BPM 2011. • Select **Yes** to allow the system to make the control compatible with Forms 2011. • Select **No** to deny the system to make the control compatible with Forms 2011. The default value is **No**. **Note:** When a control on a form is made Forms 2011 compatible, the XML instance of the form with the control is changed to ensure compatibility with Forms 2011.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Include in Summary	Allow or deny a user to view the value in the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the Summary of a Base Form. • Select **No** to deny a user to view the value in the Summary of a Base Form. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Date control.

Date Time

Use **Date Time** control to select a date and time in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Default Value	The default value for the control. **Note:** Ensure the value is within the Minimum Value and the Maximum Value.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Read-Only	Allow or deny a user to enter a value for the control. • Select **Yes** to deny a user to enter a value for the control. • Select **No** to allow a user to enter a value for the control. The default value is **No**.
Label Position	Position of the label for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select Left to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: If the value is 0, then the width of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**.
Minimum Value	Minimum date and time value for the control.
Maximum Value	Maximum date and time value for the control.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Date Format	Date format for the control. For example, MM/dd/yyyy. Always use M for month. The default value is taken from the current server culture. For more information, see Date and Time Formats. **Note:** - Date format must contain at least month, date, and year components. - Date format is not validated.
Time Format	Time format for the control. For example, hh:mm:ss tt. Use HH for 24-hour time. The default value is taken from the current server culture. For more information, see Date and Time Formats. **Note:** - Time format must contain at least: --- Hour and minute components for 24-hour time. --- Hour, minute, and period components for 12-hour time. - Time format is not validated. - For cultures, which do not support AM/PM, the "tt" or "t" must not be specified in the format.
Time Interval	Interval between two consecutive time slots to show in the list for the control.
Include in Summary	Allow or deny a user to view the value in the **Summary** of a **Base Form**. • Select **Yes** to allow a user to view the value in the Summary of a Base Form. • Select **No** to deny a user to view the value in the Summary of a Base Form. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Scripts

For information about using scripts, see scripting guidelines for Date Time control.

Note:
- Value is saved in the Universal Coordinated Time (UTC) format.
- The Display Values are based on the browser time zone.
- Format and culture are taken from the current server.
- However, if the **Date Format** and the **Time Format** are specified, then the given formats are used but applied using the current server culture.

Drop-Down

Use **Drop-Down** control to select an option from a list in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Options Caption	Header for the options for the control.
Options	Options for the control. **To add an option to the control** 1. Click **Add Record**. A new record appears. 2. In the **Text** box, enter the options text. 3. In the **Value** box, enter the options value. 4. In the **Fore Color** palette, click a color (or in the **Color Code** box, enter hexadecimal code of the color), and then click **Apply**. The selected color is applied to the foreground of the options text. 5. In the **Back Color** palette, click a color (or in the **Color Code** box, enter hexadecimal code of the color), and then click **Apply**. The selected color is applied to the background of the options text. **To clear fore color for an option of the control** • On the **Fore Color** palette, in the **Color Code** box, enter **#1b1b1b**, and then click **Apply**. The **Fore Color** is reset to the default color. **To clear back color for an option of the control** • On the **Back Color** palette, in the **Color Code** box, enter **#1b1b1b**, and then click **Apply**. The **Back Color** is reset to the default color. **To delete an option from the control** • Click the **Delete** button. The record is deleted. **Note:** - The options **Text** and **Value** parameters are mandatory and must be unique across all options. - The **Fore Color** and **Back Color** properties are currently not supported in devices.
Default Value	The default value for the control. **Note:** The value must be one of the values set for the **Value** parameter in the **Options** property.

Appearance

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is Default. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	The default value is **No**. **Note:** Validation message appears only on submission of the form.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Text Parameter	Name that identifies the options text to use in scripts for the control.
Value Parameter	Name that identifies the options value to use in scripts for the control.
Include in Summary	Allow or deny a user to view the value in the **Summary** of a **Base Form**. • Select **Yes** to allow a user to view the value in the **Summary** of a **Base Form**. • Select **No** to deny a user to view the value in the **Summary** of a **Base Form**. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Drop-Down control.

Email

Use **Email** control to enter email addresses in your form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Default Value	The default value for the control. **Note:** Ensure the value is within the **Maximum Length**. Multiple values must be separated with a semicolon.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Read-Only	Allow or deny a user to enter a value for the control. • Select **Yes** to deny a user to enter a value for the control. • Select **No** to allow a user to enter a value for the control. The default value is **No**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Watermark	Hint text that appears when no value is entered for the control.
Width	Width in pixels for the control. The default value is **0**. Note: If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**.
Maximum Length	Maximum length of the value for the control. The default value is **0**. **Note:** If the value is 0, then the maximum length for the control is not set.
Multiple Email IDs	Allow or deny a user to enter multiple email IDs for the control. • Select **Yes** to allow a user to enter multiple email IDs for the control. • Select **No** to deny a user to enter multiple email IDs for the control. The default value is **No**.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Include in Summary	Allow or deny a user to view the value in the **Summary** of a **Base Form**. • Select **Yes** to allow a user to view the value in the Summary of a Base Form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **No** to deny a user to view the value in the Summary of a Base Form. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Email control.

Embed Form

Use **Embed Form** control to use the entire form as a part of another form. You can design the common section in a Form and use it in other forms through the Embed Form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. The default value is the value for the **Name** property without the spaces. **Note:** If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Form Details	Details of the form that is to be linked. **To add Form Details for the control** 1. Click the **Form Details** button. The **Form Details Configuration** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	2. In the **Form Name** box, click a form name. 3. In the **Form Version** box, click a form version. 4. Click **Save & Continue**. The selected form details is set for the control, and the **Form Details Configuration** page is closed. **Note:** - **Embed Form** control does not support forms with **Embed Form** controls. -We recommend using unique XML nodes for controls in source forms to aid in scripting. - We recommend using the `control.findByXmlNode()` method instead of the `control.findById()` method in source forms to avoid conflict of IDs between forms. -The definition of the source form is fetched and used for the embed form. The source form is no longer referenced after the properties of the control are saved. Therefore, the source form does not have to be available in the repository after the properties are configured. - If both the main and embed form contains pop-up control, then ensure that the IDs are different. - The draft version of the selected form is considered.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: If the value is 0, then the height of the control is set as per the default values.
Consider Available Height	Resize the height of the control or container based on the available height. • Select **Yes** to resize the height based on available height. • Select **No** to retain the space. The default value is **No**. **Note:** - The Consider Available Height property is not applicable for the following: -Designer view -Print form -Panel form with horizontal tab order - If this property is set to **Yes** and a value is specified in the **Height** property, minimum height is considered. - This property is applicable only in web view. - When more than one control or container is set with **Consider Available Height** at the same level of container or form, then the available space is distributed evenly between those controls or containers. For example, consider a Form which contains two Panel forms with **Consider Available Height** set to **Yes**, where Panel form 1 has two TextInput controls and Panel form 2 has one TextInput control. The Panel form 1's height is more than Panel form 2's height as Panel form 1 contains two TextInput controls and the available empty space in the form is evenly distributed between the two Panel forms.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Show Panel Details	Show or hide the Title, Description, and Margin. • Select **Yes** to show the panel details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **No** to hide the panel details. The default value is **Yes**.
Adapt UI	Change the user interface of the control based on the display width. • Select **Yes** to allow the system to change the user interface of the control based on the display width. The **Web View** is rendered for the control when the screen width is greater than or equal to 800 pixels. Otherwise, the **Mobile View** is rendered for the control. • Select **No** to deny the system to change the user interface of the control based on the display width. In this case, the **Web View** is rendered for the control. The default value is **Yes**. **Note:** The responsiveness of the container depends on the value set for the **Desktop View Only** property at the Form level.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.

Scripts

For information about using scripts, see scripting guidelines for Embed Form control.

Note:
- This control might impact performance as the data loaded determines the performance of the control.
- If the form specified in the **Embed Form** control, contains an **On Form Load** script, then the script does not get executed. To overcome this, use a **Hidden Field** control with the script added to the value script.
- **Embed Form** control does not support forms with **Embed Form** controls.
- **Embed Form** is not supported in **Panel Form** when with **Tab Order** set to **Horizontal**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Embed Form** is not supported for MQTT.

Embed Page

Use **Embed Page** control to show a webpage in your form.

Note:
- The Embed Page control uses an iframe to load the url. If the source Url has an HTTP Response header X-Frame-Options, it might not load in the Embed Page control. Refer to X-Frame-Options documentation on the W3C website.
- This control is not supported in AVEVA Work Tasks Pro.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
Description	Description for the control.
URL	URL for the webpage for the control. Start the URL with **http://** or **https://** or the path with the **<BPMUITemplates>** tag. The **<BPMUITemplates>** tag replaces the path with the application path including the Default folder. For example, **<BPMUITemplates>/Report.html** is replaced as **/EnterpriseConsole/BPMUITemplates/Default/Report.html**

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Top**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Consider Available Height	Resize the height of the control or container based on the available height. • Select **Yes** to resize the height based on available height. • Select **No** to retain the space. The default value is **No**. **Note:** - The Consider Available Height property is not applicable for the following: -Designer view -Print form -Panel form with horizontal tab order - If this property is set to **Yes** and a value is specified in the **Height** property, minimum height is considered. - This property is applicable only in web view. - When more than one control or container is set with **Consider Available Height** at the same level of container or form, then the available space is distributed evenly between those controls or containers. For example, consider a Form which contains two Panel forms with **Consider Available Height** set to **Yes**, where Panel form 1 has two TextInput controls and Panel form 2 has one TextInput control. The Panel form 1's height is more than Panel form 2's height as Panel form 1 contains two TextInput controls and the available empty space in the form is evenly distributed between the two Panel forms.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	The default value is **No**.
Show Scrollbars	Show or hide scrollbars for the control. • Select **Yes** to show scrollbars for the control. • Select **No** to hide scrollbars for the control. The default value is **Yes**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. On Data Change script always works with the value script for the Embed Page. To set the Embed Page Url and also trigger the Embed Page's On Data Change script, see Set Embed Page Url and Trigger the On Data Change Script. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.

Scripts

For information about using scripts, see scripting guidelines for Embed Page control.

Note: This control might impact performance as the data loaded determines the performance of the control.

Set Embed Page Url and Trigger the On Data Change Script

Use the below script to set the Embed Page Url and also trigger the Embed Page's On Data Change script.

```
// Below line would set the url of the Embed Page to load
control.findById("E1").url = "http://www.skelta.com";
// Below line would set the value of the Embed Page control, so that
// the On Data Change script of the Embed Page is fired.
control.findById("E1").value = "http://www.skelta.com";
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

E-signature

Use **E-signature** control to authenticate the identity of a user who signed the document and to confirm the integrity of the signed document in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. The default value is the value for the **Name** property without the spaces. **Note:** If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Show Header	Show or hide the header for the control. • Select **Yes** to show the header for the control. • Select **No** to hide the header for the control. The default value is **Yes**.
Signed By Text	Signed By text for the control.
User Name Text	User Name text for the control.
Password Text	Password text for the control.
Signed On Text	Signed On text for the control.
Comments Text	Comments text for the control.
Image Path	Path to the image for the control. The image path is specified as: • A URL starting with **http://** or **https://**. • An image path tag. For information about using image path tags, see *Image Path Tags* in Image. • A path to the **BPMUITemplates** folder as **BPMUITemplates\Default\Images**. **Note:** - You can use relative paths as follows: --- Use **.** for the current folder where the html page resides. --- Use **..** for the folder above the current folder where the html page resides.
Adapt UI	Change the user interface of the control based on the display width. • Select **Yes** to allow the system to change the user interface of the control based on the display width. The **Web View** is rendered for the control when the screen width is greater than or equal to 800 pixels. Otherwise, the **Mobile View** is rendered for the control. • Select **No** to deny the system to change the user interface of the control based on the display width. In this case, the **Web View** is rendered for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	The default value is **Yes**. **Note:** The responsiveness of the container depends on the value set for the **Desktop View Only** property at the Form level.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Comments Required	Enforce or bypass entering comments for the control. • Select **Yes** to enforce entering comments for the control. • Select **No** to bypass entering comments for the control. The default value is **No**.

Advanced

Property	Description
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Date Format	Date format for the control. For example, MM/dd/yyyy. Always use M for month. The default value is taken from the current server culture. For more information, see Date and Time Formats. **Note:** Date format must contain at least month, date, and year components. Date format is not validated.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Time Format	Time format for the control. For example, hh:mm:ss tt. Use HH for 24-hour time. The default value is taken from the current server culture. For more information, see Date and Time Formats. **Note:** - Time format must contain at least: --- Hour and minute components for 24-hour time. --- Hour, minute, and period components for 12-hour time. - Time format is not validated.
User Mode	Number of users required to sign using the control. • Select **Single** User to allow only one user to sign using the control. • Select **Multiple** User to allow multiple users to sign using the control. The default value is **Single User**.

Scripts

For information about using scripts, see scripting guidelines for E-signature control.

Note:
- Only one **E-signature** control is supported per form.
- Use **Pop-Up** control to apply e-signature multiple times or use progressive forms for multi-stage approvals.
- The E-signature control is not supported when you access AVEVA Work Tasks Pro through Azure Active Directory authentication or AVEVA Connect.

Gantt Chart

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	(Required) XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Use forward slash (**/**) for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use a forward slash (**/**) to denote a parent, which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it may affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Lookup Source	(Required) Name of the item from the lookup list. To add a name of the item for the control from the lookup list: 1. Click the **Lookup Source** button. The Lookup Source Configuration page appears. 2. In the **Data Source Type** list, select a type of data source. **Note**: Supported datasource types are database and Web API lookup source. 3. In the **Data Source** box, select a data source. 4. In the **Parameters** section, select the parameters to include, if applicable. 5. Click **Save & Continue**. The selected name is set for the control and the Lookup Source Configuration page is closed.
Event State	Column name that corresponds to the state of an event in the selected lookup source. The maximum number of displayed characters for the value of this property is 25. If the value exceeds the character limit, an ellipsis is added and the full column value is shown in a tooltip on mouse hover. **Note**: This property is shown in the details pane with the **Event Color** as part of the header for a Gantt Chart's selected segment. In the body of the details

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	pane, the **Event Start Time**, **Event End Time,** and **Event Name** properties are shown.
Event Start Time	Column name that corresponds to an event's start time in the selected lookup source. **Note**: This must be in UTC format in the source and in the lookup configuration, its data type must be set to DateTime.
Event End Time	Column name that corresponds to an event's end time in the selected lookup source. **Note**: This must be in UTC format in the source and in the lookup configuration, its data type must be set to DateTime.
Event Name	Column name that corresponds to the name or description of an event in the selected lookup source. The maximum number of displayed characters for the value of this property is 25. If the value exceeds the character limit, an ellipsis is added and the full column value is shown in a tooltip on mouse hover.
Event Color	Column name that corresponds to the color of an event in the selected lookup source.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note**: If the value is 0, then the width of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Bar Thickness	Thickness of the Gantt bar in pixels. The default value is 0. The value other than the default must be from 10 to 150 pixels.
Time Period	This controls the period of data to be displayed in the Gantt Chart control. • Select **Duration** to specify a time period in hour. This is based on the last segment's end time relative to now. If this is selected, the **Duration** property is shown after the **Time Period** property with 8 hours as the default value. Otherwise, **Duration** property is hidden. • Select **Time Range** to enable the use of **ganttTimeRangeStartTime** and **ganttTimeRangeEndTime** properties in scripting. You can use the **Time Range** start and end time properties with **Date Time** or **Text** controls when scripting. For example scripts, see *Scripting Guidelines* for **Time Period** property. For more information on Date Time and Text controls, see Date Time and Text. The default value is **Duration**.
Duration	See **Time Period** property. **Note**: If this property is updated through scripting or **refreshData()** is triggered, the Gantt Chart control is redrawn. Currently selected segment and its details pane are no longer shown.
Show Details Pane	Show or hide the Gantt Chart segment's details pane. • Select **Yes** to show the details pane when a segment in the control is selected. • Select **No** to hide the details pane and remove the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	space it occupies. The default value is **Yes**.
Show Time Range	Show or hide the start and end date/time. • Select **Yes** to show the start and end date/time in the control. • Select **No** to hide the start and end date/time in the control. The default value is **No**. The start time is calculated based on the specified value in the **Duration** property subtracted from the last segment end time (end time - duration).
Title Position	Position of the title for the control. • Select **Left** to align the title to the left of the control. • Select **Right** to align the title to the right of the control. • Select **Suppress** to hide the title for the control. The default value is **Left**.
Title	Title of the Gantt control. It is shown directly above the top-left corner of the control. This supports two lines with 35 characters for each line. An ellipsis is added if it exceeds the 35-character limit. If you want to add a line break, use the html tag ` `. **Note:** If this property is not configured or blank, nothing is shown, the other control contents use its space, and the control size is adjusted based on the available content within the control. If this property is configured for column bindings, even if the configured data column returns a blank value, where nothing is shown, the space is retained.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	contain only alphanumeric characters.

Advanced

Property	Description
On Click	Run a script after the control is clicked.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Enable Refresh	Enable or disable control auto refresh. • Select **Yes** to enable control refresh and configure the **Refresh Rate** property. • Select **No** to disable control refresh. The default value is **No**. **Note**: This property will not work on the control even if it is set to **Yes** if the control segment's details pane is shown.
Refresh Rate	This is how often the control display is refreshed, in seconds, to fetch value from the data source. **Note**: This is only visible if the **Enable Refresh** property is set to **Yes**. The default value is 30 seconds and the valid refresh rate is from 10 to 600 seconds.
Enable Action (1 - 3)	Call the script defined in a particular **Action Script** property in the **Scripts** tab. The default value is **No**. If you keep the default, the action button is not visible in the segment details window. If you set this to **Yes**, its corresponding **Action** property appears, where you can specify the name or label of that particular action.
Action (1-3)	Name or label for **Action (1-3).** The maximum number of displayed characters is 8. If it exceeds the character limit, an ellipsis is added and the full label is shown in a tooltip on mouse hover.

Scripts

For information about using scripts, see scripting guidelines for Gantt Chart control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

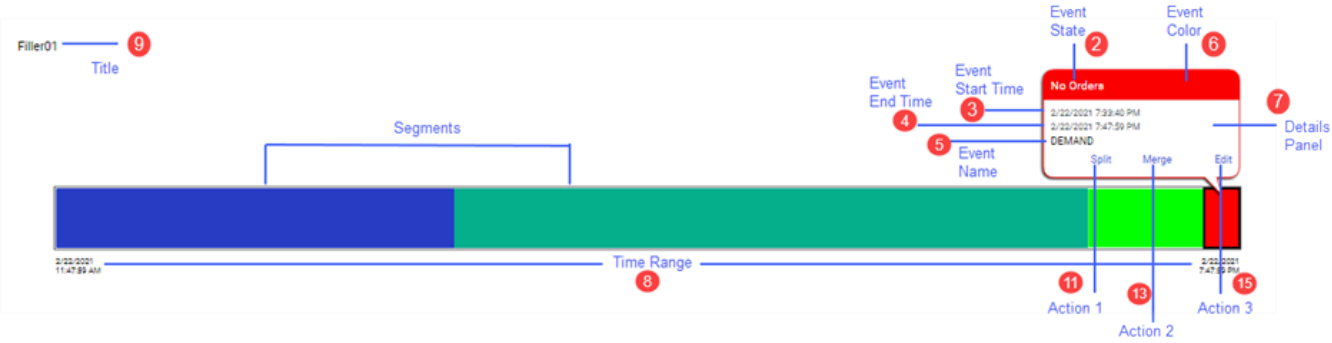
Example Gantt Chart Rendering

The following rendering example for Gantt Chart control are based on the configuration in the control's properties page. The configured properties are listed in the table and most of the properties that are kept to their default values are no longer mentioned.

Example configuration and rendering

Basic	Appearance	Advanced
1. **Lookup Source**: `entity_23_B` 2. **Event State**: `reas_desc` 3. **Event Start Time**: `event_time_utc` 4. **Event End Time**: `event_end_time_utc` 5. **Event Name**: `state_desc` 6. **Event Color**: `state_color`	7. **Show Detail Panel**: `Yes` (selected) 8. **Show Time Range**: `Yes` (selected) 9. **Title**: `Filler01`	10. **Enable Action 1**: `Yes` (selected) 11. **Action 1**: `Split` 12. **Enable Action 2**: `Yes` (selected) 13. **Action 2**: `Merge` 14. **Enable Action 3:** `Yes` (selected) 15. **Action 3**: `Edit`

The data displayed in the segment details window is from the defined lookup source and the mapped column name for each of the displayed properties.



When you select a Gantt Chart segment, it is highlighted with a black border, and the corresponding segment details pane appears as shown in the example rendering. You can click the segment again, or click anywhere within the area of the control if you want to hide the segment details and deselect the segment.

Gauge

Use **Gauge** control to display data in a gauge in your form.

Note: This control is not supported in AVEVA Work Tasks Pro.

Properties

The properties for the control are grouped under the following tabs:

Basic

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.

Appearance

Property	Description
Visible	Show or hide the **control**. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	The default value is **No**.
Alignment	Alignment of the control with respect to the form. • Select **Left** to align the control to the left of the form. • Select **Right** to align the control to the right of the form. • Select **Center** to align the control to the center of the form.
Scale Minimum Value	Minimum value displayed on the scale. The default value is 0.
Scale Maximum Value	Maximum value displayed on the scale. The default value is 100.
Scale Start Angle	The angle at which the scale starts. The default value is -30 degrees.
Scale End Angle	The angle at which the scale ends. The default value is 210 degrees.
Scale Major Unit	Value of major tick marks on the scale. For example, if the **Unit of Measurement** is set to lb, and the **Scale Major Unit** is set to 50, then every major tick mark will denote a value of 50 lb. The gauge is limited to a maximum of 100 major tick marks at runtime.Therefore, the value for the major unit must be set such that no more than 100 units would be rendered on the gauge. The default value is 20.
Scale Minor Unit	Value of minor tick marks on the scale. For example, if the **Unit of Measurement** is set to lb, and the **Scale Minor Unit** is set to 10, then every minor tick mark will denote a value of 10 lb. The gauge is limited to a maximum of 200 minor tick marks at runtime.Therefore, the value for the minor unit must be set such that no more than 200 units would be rendered on the gauge. The default value is 10.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Value Position	Position of the value for the control. • Select **Top** to align the label to the top of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Bottom**.
Show Target Indicator	Show or hide the target indicator of the control. • Select **Yes** to show the target indicator of the control. • Select **No** to hide the target indicator of the control. The default value is **Yes**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
On Initialize	Run a script after the control has been initialized, but before it is rendered to the UI. For more information, see scripting guidelines for On Initialize property.
Range Color	Run a script to apply a color to a range of values on the the gauge. For more information, see scripting guidelines for Range Color property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Target Value	Target value of the gauge. This is the value that the Target indicator points at.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	The default value is 0.
Unit of Measurement	Unit of measurement for value of the control.
Decimal Places (Precision)	Decimal places for the value of the control. The default value is 0.

Note: The Gauge control is not supported in mobile devices and in responsive views in containers.

Scripts

For information about using scripts, see scripting guidelines for Gauge control.

Geolocation

Use **Geolocation** control to get the geographical position of the user.

Note:You need to enable the location services on your browser or device to access the Geolocation feature.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
Description	Description for the control.
Button Text	Text for the control.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	- This is applicable only when the **Label Position** is set to **Left** or **Right**.
Alignment	Alignment of the control with respect to the form. • Select **Default** to allow the system to align the control. The system aligns the control to the left of the form or as specified by the control. • Select **Left** to align the control to the left of the form. • Select **Right** to align the control to the right of the form. • Select **Center** to align the control to the center of the form.
Display Mode	Show text and/or image for the control. • Select **Text** Only to show only text for the control. • Select **Image** Only to show only image for the control. • Select **Text and Image** to show both text and image for the control. The default value is **Text Only**.
Button Size	Size of the button for the control. • Select **Standard** to set the size of the control to 120 x 32 pixels. • Select **Small** to set the size of the control to 30 x 30 pixels. • Select **Medium** to set the size of the control to 180 x 86 pixels. • Select **Large** to set the size of the control to 280 x 130 pixels. The default value is **Standard**.
Image Path	Path to the image for the control. The image path is specified as: • A URL starting with **http://** or **https://**. • An image path tag. For information about using

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	image path tags, see *Image Path Tags* in Image. • A path to the **BPMUITemplates** folder as **BPMUITemplates\Default\Images**. **Note:** You can use relative paths as follows: - Use **.** for the current folder where the html page resides. - Use **..** for the folder above the current folder where the html page resides. We recommend the following image sizes when the **Display Mode** property is set to Image. • **Small** – 30 x 30 pixels. • **Medium** – 180 x 86 pixels. • **Large** – 280 x 130 pixels. We recommend the following image sizes when the **Display Mode** property is set to Text and Image. • **Small** – 30 x 30 pixels. • **Medium** – 40 x 40 pixels. • **Large** – 50 x 50 pixels. **Note:** - This property is applicable only when the **Display Mode** property is set to **Image** or **Text and Image**, and the **Button Size** property is set to **Small**, **Medium** or **Large**. - If the **Display Mode** property is set to **Text and Image** and the **Button Size** property is set to **Small**, then only the image is displayed.
Image Position	Position of the image with respect to the text for the control. • Select **Left** to align the image to the left of the text for the control. • Select **Right** to align the image to the right of the text for the control. • Select **Top** to align the image to the top of the text for the control. • Select **Bottom** to align the image to the bottom of

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	the text for the control. The default value is **Left**. **Note:** This property is applicable only when the **Display Mode** property is set to **Text and Image**.
Show as Link	Enable or disable the control to show as link. • Select **Yes** to enable the control to show as link. • Select **No** to disable the control to show as link. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Form Button	Enable or disable the control to act as form button. When this property is enabled, the control is displayed at the bottom-right corner of the form. • Select **Yes** to enable the control to act as form button. • Select **No** to disable the control to act as form button. The default value is **No**. **Note:** If the value is **Yes**, and the form is viewed on a mobile device, then the control appears in the **Action Bar** of the mobile device.

Scripts

For information about using scripts, see scripting guidelines for Geolocation property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Hidden Field

Use **Hidden Field** control to submit custom data in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Default Value	The default value for the control.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Include in Summary	Allow or deny a user to view the value in

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the Summary of a Base Form. • Select **No** to deny a user to view the value in the Summary of a Base Form. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form..

Scripts

For information about using scripts, see scripting guidelines for Hidden Field control.

Note:
- **Hidden Field** control is visible on the form only at design-time.
- At run-time, the width of space occupied by **Hidden Field** controls on a record in the **Grid** view of a **Base Form** is distributed proportionately to other controls on the record of the **Base Form**.

Hierarchical List

Use **Hierarchical List** control to view a hierarchical list in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
Description	Description for the control.
Lookup Source	Name of the item in the **Lookup List**. **To add a name of the item in the Lookup List for the control** 1. Click the **Lookup Source** button. The **Lookup**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Source Configuration page appears. 2. In the **Data Source Type** list, click a data source type. 3. In the **Data Source box**, click a data source. 4. In the **Parameters** list, click and select a control on the form, if applicable. 5. Design your hierarchical list by dragging and dropping the column names. 6. Click **Save & Continue**. The selected name is set for the control and the **Lookup Source Configuration** page is closed. **Note:** - Only non-parameterized Web API lookups are supported. - The first node is used for generating the schema. If the elements are missing, it will not be shown in the Lookup Source Configuration. - For information about Lookup List, see List Lookups.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	the control. • Select **Suppress** to hide the label for the control. The default value is **Top**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **450**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Default Number of Records	Number of records added at run-time for the control. The default value is **50**. **Note:** If the value is 0, then the default number of records for the control is set as per the default values.

Scripts

For information about using scripts, see scripting guidelines for Hierarchical List control.

Hyperlink

Use **Hyperlink** control to create a link to a URL in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Hyperlink Text	Clickable text in the hyperlink for the control.
URL	URL for the hyperlink for the control. Start the URL with **http://** or **https://** or the path with the **<BPMUITemplates>** tag.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Include in Summary	Allow or deny a user to view the value in the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the **Summary** of a **Base Form**. • Select **No** to deny a user to view the value in the **Summary** of a **Base Form**. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Hyperlink control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Image

Use **Image** control to insert an image in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Image Path	Path to the image for the control. The image path is specified as: • A URL starting with **http://** or **https://**. • An image path tag. For information about using image path tags, see *Image Path Tags*. A path to the **BPMUITemplates** folder as **BPMUITemplates/**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Default/NextGenForms/custom/Images/. **Note**: - If the image name is tagged with **FormCustomPath:**, the location is **<Installpath/Web/BPMUITemplates/Default/NextGenForms/custom/images/MyImage.png** - If the image name is tagged with **FormCustomThemePath:**, the location is **<Installpath/Web/BPMUITemplates/Default/NextGenForms/custom/Themes/<ThemeName>/Images/MyImage.png** - If the image name is not tagged with **FormCustomPath:** or **FormCustomThemePath:**, the location of image of earlier version will be considered i.e. **<Installpath>/Web/BPMUITemplates/Default/Themes/<ThemeName>/NextGenForms/images** folder. - For AVEVA Work Tasks Pro, mapping of themes is not considered. - You can use relative paths as follows: --- Use **.** for the current folder where the html page resides. --- Use **..** for the folder above the current folder where the html page resides.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.

Property	Description
	control. The system aligns the control to the left of the form or as specified by the control. • Select **Left** to align the control to the left of the form. • Select **Right** to align the control to the right of the form. • Select **Center** to align the control to the center of the form.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Downscale Image	Reduce size of the image for the control based on the display width. • Select **Yes** to allow the system to reduce size of the image for the control based on the display width. • Select **No** to deny the system to reduce size of the image for the control based on the display width. The default value is **No**.
Alternate Text	Alternate text for the control.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.

Scripts

For information about using scripts, see scripting guidelines for Image control.

Image Path Tags

Tag	Description
<BPMUITemplates>	Replaces the path with the application path excluding the theme name attached to the repository. For example, **<BPMUITemplates>/Images/imagename.png** is replaced as **/EnterpriseConsole/BPMUITemplates/Default/Images/imagename.png**
<ThemePath>	Replaces the path with the application path including the theme name attached to the repository. For example, **<ThemePath>/Images/imagename.png** for the Lite theme is replaced as **/EnterpriseConsole/BPMUITemplates/Default/Themes/Lite/Images/imagename.png** When there is no theme attached to the repository, the theme name folder along with the parent themes folder is removed from the path. For example, **/EnterpriseConsole/BPMUITemplates/Default/**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Tag	Description
	Images/imagename.png
<ThemeName>	Replaces the path with the theme name attached to the repository. For example, **<BPMUITemplates>/Themes/<ThemeName>/Images/imagename.png** for the Lite theme is replaced as **/EnterpriseConsole/BPMUITemplates/Default/Themes/Lite/Images/imagename.png** When there is no theme attached to the repository, the **<ThemeName>** tag along with the parent themes folder is removed from the path. When there is no parent themes folder, the theme name folder is removed from the path. When there is no theme name folder, the **<ThemeName>** tag is removed from the path.

Invoke Workflow

Use **Invoke Workflow** control to invoke a workflow from your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Button Text	Text for the Invoke Workflow button.
Workflow Details	Details of the workflow that is to be invoked. **To add Workflow Details for the control** 1. Click the **Workflow Details** icon. The **Workflow Details Configuration** page appears. 2. In the **Workflow Name** box, click a workflow name. 3. In the **Workflow Version** list, click a workflow version. 4. Click **Save & Continue**. The selected workflow details is set for the control and the **Workflow Details Configuration** page is closed. **Note:** - Workflow details are displayed in **<Workflow Name> ~ <Workflow Version>** format. - When the selected version of the workflow is in published state, and all or any one of the following properties are modified: -Workflow Details -XML Variable Name - XML Schema then, the workflow must be unpublished, or a different version of the workflow must be selected, or a new version of the workflow must be created. - For more information, see Overwriting Workflows.
XML Variable Name	XML variable name to store the form XML Schema in workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	To add an XML Variable Name for the control 1. Click the **XML Variable Name** icon. The **XML Variable Configuration** page appears. 2. Select the existing XML variable name or create a new XML variable. • To select the existing variable name, click **Select XML Variable** drop-down list and select the name. • To create a new variable, a. Select **Create New...** option from the **Select XML Variable** drop-down list. b. Enter the name for the XML Variable in the **Specify Name** text box. The specified name gets saved to the XML Variable list. 3. Click **Save & Continue**. The selected XML variable name is set for the control and the **XML Variable Configuration** page is closed. **Note**: The **Selected XML Variable** drop-down lists all the existing XML variables. You can either select the existing variable or create a new variable. For more information, see About XML Variables.
XML Schema	Form XML schema to create the XML variable for workflow. **To add an XML Schema for the control** 1. Click the **XML Schema** icon. The **XML Schema Configuration** page appears. 2. Click **Form** for a form or click **Grid** for a grid in the **Schema**. 3. If you select **Grid** in the schema, then select a grid in the **Grid** box. The Grid box lists all the grid controls in the form including the ones present in the Embed form controls. 4. Click **Save & Continue**. The selected XML schema is set for the control and the **XML Schema Configuration** page is closed. **Note:** - When the XML schema set for the Form or Grid does not match with the XML schema set for the XML

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Variable of the selected workflow, the XML Variable must be overwritten. - For more information, see Overwriting XML Variables.
Mapping Schema	Mapping Schema to create mapping definition for workflow. You can map the schema only when the XML schema set for the Form or Grid does not match with the XML schema set for the XML Variable of the selected workflow. **To map the schema for the control** 1. Configure the **XML Schema**. Refer steps 1 to 4 of **XML Schema** in the above row. 2. Click the **Mapping Schema** icon to map the Workflow XML schema with the control XML schema. **Note**: Clear the existing mapping definition (if exists), in case: - a new XML Variable is selected - a Form XML schema is changed to a Grid XML schema or vice-versa Click the **Remove** icon to clear the existing mapping definition. The **XML Variable Overwrite Configuration** page appears. 3. Select the **Create a mapping schema** option and then click **Save & Continue**. The I**nvoke Workflow XML Mapping** page appears. 4. Select the elements or attributes from the **Workflow XML** column to be mapped with the elements or attributes of the **Invoke Workflow XML**. 5. Click **Save**. The selected XML schema is mapped with the control and the **Invoke Workflow XML Mapping** page is closed. **Note:** When the XML schema set for the Form or Grid does not match with the XML schema set for the XML Variable of the selected workflow, the XML Variable must be overwritten or mapped. For more information, see Overwriting XML Variables.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Alignment	Alignment of the button with respect to the form. • Select **Default** to allow the system to align the button. The system aligns the button to the left of the form or as specified by the control. • Select **Left** to align the button to the left of the form. • Select **Right** to align the button to the right of the form. • Select **Center** to align the button to the center of the form.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Display Mode	Show text and/or image for the button. • Select **Text Only** to show only text for the button. • Select **Image Only** to show only image for the button. • Select **Text and Image** to show both text and image for the button. The default value is **Text Only**.
Button Size	Size of the button for the control. • Select **Standard** to set the size of the control to 120 x 32 pixels. • Select **Small** to set the size of the control to 30 x 30 pixels. • Select **Medium** to set the size of the control to 180 x 86 pixels. • Select **Large** to set the size of the control to 280 x 130 pixels. The default value is **Standard**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Image Path	Path to the image for the control. The image path is specified as: • A URL starting with **http://** or **https://**. • An image path tag. For information about using image path tags, see *Image Path Tags* in Image. • A path to the **BPMUITemplates** folder as **BPMUITemplates\Default\Images**. **Note:** - You can use relative paths as follows: --- Use **.** for the current folder where the html page resides. --- Use **..** for the folder above the current folder where the html page resides. We recommend the following image sizes when the **Display Mode** property is set to **Image**. • **Small** – 30 x 30 pixels. • **Medium** – 180 x 86 pixels. • **Large** – 280 x 130 pixels. We recommend the following image sizes when the **Display Mode** property is set to **Text and Image**. • **Small** – 30 x 30 pixels. • **Medium** – 40 x 40 pixels. • **Large** – 50 x 50 pixels. **Note:** - This property is applicable only when the **Display Mode** property is set to **Image** or **Text and Image**, and the **Button Size** property is set to **Small**, **Medium** or **Large**. - If the **Display Mode** property is set to **Text and Image** and the **Button Size** property is set to **Small**, then only the image is displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Image Position	Position of the image with respect to the text for the control. • Select **Left** to align the image to the left of the text for the control. • Select **Right** to align the image to the right of the text for the control. • Select **Top** to align the image to the top of the text for the control. • Select **Bottom** to align the image to the bottom of the text for the control. The default value is **Left**. **Note:** This property is applicable only when the Display Mode property is set to Text and Image.
Show as Link	Enable or disable the control to show as link. • Select **Yes** to enable the control to show as link. • Select **No** to disable the control to show as link. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Show Confirmation Message	Show or hide the confirmation message for the control. • Select **Yes** to show the confirmation message for the control. • Select **No** to hide the confirmation message for the control. The default value is **No**.
Confirmation Message Text	Confirmation message for the control. **Note:** This property is applicable only when the **Show Confirmation Message** property is set to **Yes**.
Show Success Message	Show or hide the success message for the control. • Select **Yes** to show the success message for the control. • Select **No** to hide the success message for the control. The default value is **No**.
Success Message Text	Success message for the control. **Note:** This property is applicable only when the **Show Success Message** property is set to **Yes**.

Advanced

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Execution Mode	Allow or deny a user to act on consecutive tasks immediately without navigating to the **Inbox**. • Select **Asynchronous** to deny a user to act on consecutive tasks immediately without navigating to the **Inbox**. • Select **Synchronous** to allow a user to act on consecutive tasks immediately without navigating to the **Inbox**. The default value is **Asynchronous**. **Note:** - The default timeout for synchronous execution is 20 seconds to ensure optimal performance. The execution status of the workflow gets updated to FE (Finished with Error) in case there is a timeout. - When Invoke workflow control is configured to initiate a Quickflow, the **Execution Mode** is set to **Synchronous** and is read-only. - If you wish to change the timeout duration, override the **defaultredirectiontimeout** entry in the **Properties** column of the row with the name **WorkflowManagementGlobalSettings** in the **SkService** table of the Farm database. For example, to override the timeout duration to 60 seconds, change **[CDATA[0]]** to **[[CDATA[60]]** for **defaultredirectiontimeout** as follows: `<property key="defaultredirectiontimeout"><![CDATA[60]]></property>` Reset IIS and restart Workflow Engine for the changes to reflect. - When the **Execution Mode** is set to **Synchronous**, ensure that none of the activities initiated through the Invoke Workflow control have a sleep behavior. For instance, activities like Human or Scheduler activities that enter sleep mode should not be included.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Close Form	Allow or deny the system to close the form when the workflow is invoked. • Select **Yes** to allow the system to close the form when the workflow is invoked. • Select **No** to deny the system to close the form when the workflow is invoked. The default value is **No**. **Note:** When a form is loaded in a separate window, the system closes the form when the workflow is invoked. When a form is loaded within an existing window (inline), the system reloads the form when the workflow is invoked. This property is not supported in InTouch HMI and InTouch OMI.
Form Button	Enable or disable the control to act as form button. When this property is enabled, the control is displayed at the bottom-right corner of the form. • Select **Yes** to enable the control to act as form button. • Select **No** to disable the control to act as form button. The default value is **No**. **Note:** If the value is **Yes**, and the form is viewed on a mobile device, then the control appears in the **Action Bar** of the mobile device.

Scripts

For information about using scripts, see scripting guidelines for Invoke Workflow control.

Overwrite Workflows

When the selected version of the workflow is in published state, and one or all of the following Invoke Workflow control properties are modified
-Workflow Details
-XML Variable Name
-XML Schema
then the workflow must be unpublished, or a different version of the workflow must be selected, or a new version of the workflow must be created.

Use the **Workflow Overwrite Configuration** page to select an overwrite configuration.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Follow the steps for Editing Properties of Controls till you a get the **Properties** dialog box for the **Invoke Workflow** control, edit properties of the control, and then click **Apply**.

To overwrite a workflow

1. In the **Workflow Overwrite Configuration** page, do one of the following:

Task	Action
• Unpublish the selected version of the workflow.	a. Under **Overwrite Configuration**, click **Unpublish current version**. b. Follow the steps for *Changing the state of running or paused workflow instances*.
• Create a new draft version of the selected workflow.	Under **Overwrite Configuration**, click **Create a new draft version**.
• Select a specific draft version of the selected workflow.	a. Under **Overwrite Configuration**, click **Select a draft version**. b. In the **Workflow Version** list, click a workflow version to select a specific draft version of the selected workflow. **Note:** This option is available only when the selected workflow has multiple draft versions.

2. Click **Apply**. The **Workflow Overwrite Configuration** page is closed.

Change the state of running or paused workflow instances

1. In the **Workflow Overwrite Configuration** page, do one of the following:

Task	Action
• Unpublish the selected workflow by pausing all running instances of the workflow.	• In the **Workflow Instances** box, click **Pause**. All running instances of the selected workflow are paused and the workflow is unpublished.
• Unpublish the selected workflow by terminating all running and paused instances of the workflow.	• In the **Workflow Instances** box, click **Kill**. All running and paused instances of the selected workflow are terminated and the workflow is unpublished.

2. Click **Apply**. The **Workflow Overwrite Configuration** page is closed.

Overwrite XML Variables

When the XML schema set for the **Invoke Workflow** control does not match with the XML schema set for the XML Variable of the selected workflow, the XML Variable must be overwritten or mapped with the selected workflow.

Use the **XML Variable Overwrite Configuration** page to select an overwrite configuration.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Follow the steps for Editing Properties of Controls till you a get the **Properties** dialog box for the **Invoke Workflow** control,
2. Edit the properties of the control, and then click **Apply**.

To map or overwrite an XML Variable

1. In the **XML Variable Overwrite Configuration** page, do one of the following:

Task	Action
• Map the XML Variable schema to the selected workflow.	• Under **Overwrite Configuration**, select the **Create a mapping schema** option. For information on how to map the schema, refer Mapping Schema property in Invoke Workflow.
• Overwrite the XML Variable in the current draft version of the selected workflow.	• Under **Overwrite Configuration**, select the **Use current version** option.
• Save the XML Variable in the new draft version of the selected workflow.	• Under **Overwrite Configuration**, select the **Create a new draft version** option.
• Overwrite the XML Variable in the specific draft version of the selected workflow.	1. Under **Overwrite Configuration**, select the **Select a draft version** option. 2. In the **Workflow Version** list, click a workflow version to select a specific draft version of the selected workflow. **Note:** This option is available only when the selected workflow has multiple draft versions.

2. Click **Apply**. The XML variable is mapped, overwritten, or saved for the selected version of the workflow, the **XML Variable Overwrite Configuration** page is closed, and the **Properties** dialog box for the **Invoke Workflow** control is closed.

Label

Use **Label** control to show a label in your form. You can use labels to add information in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers.For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Display Text	Text for the control.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the **Name** for the control. • Select **Default** to allow the system to align the Name. The system aligns the Name to the left of the control area or as specified by the container control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Left** to align the Name to the left of the control area. • Select **Top** to align the Name to the top of the control area. • Select **Right** to align the Name to the right of the control area. • Select **Bottom** to align the Name to the bottom of the control area. • Select **Suppress** to hide the Name for the control area. The default value is **Suppress**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the **Name** for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the **Name** is aligned to the top of the control area.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Alignment	Alignment of the **Display Text** with respect to the form. • Select **Default** to allow the system to align

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	the **Display Text**. The system aligns the **Display Text** to the left of the form or as specified by the control. • Select **Left** to align the Display Text to the left of the form. • Select **Right** to align the Display Text to the right of the form. • Select **Center** to align the Display Text to the center of the form.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Show Line	Show or hide a line below the text for the control. • Select **Yes** to show a line below the text for the control. • Select **No** to hide a line below the text for the control. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. Important: The value must start with an alphabet and

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	can contain only alphanumeric characters.

Advanced

Property	Description
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Include in Summary	Allow or deny a user to view the value in the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the Summary of a Base Form. • Select **No** to deny a user to view the value in the Summary of a Base Form. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Label control.

List

Use **List** control to select one or many options from a list in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Options	Options for the control. **To add an option to the control** 1. Click **Add Record**. A new record appears. 2. In the **Text** box, enter the options text. 3. In the **Value** box, enter the options value. 4. In the **Fore Color** palette, click a color (or in the **Color Code** box, enter hexadecimal code of the color), and then click **Apply**. The selected color is applied to the foreground of the options text. 5. In the **Back Color** palette, click a color (or in the **Color Code** box, enter hexadecimal code of the color), and then click **Apply**. The selected color is applied to the background of the options text. **To clear fore color for an option of the control** • On the **Fore Color** palette, in the **Color Code** box, enter **#1b1b1b**, and then click **Apply**. The **Fore Color** is reset to the default color.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	To clear back color for an option of the control • On the **Back Color** palette, in the **Color Code** box, enter **#1b1b1b**, and then click **Apply**. The **Back Color** is reset to the default color. **To delete an option from the control** • Click the **Delete** button. The record is deleted. **Note:** - The options **Text** and **Value** parameters are mandatory and must be unique across all options. - The **Fore Color** and **Back Color** properties are currently not supported in devices.
Default Value	The default value for the control. **Note:** - The value must be one of the values set for the **Value** parameter in the **Options** property. - If the **Selection Mode** property is set to **Single**, then the value must be only one of the values set for the **Value** parameter in the **Options** property. - If the **Selection Mode** property is set to **Multiple**, then the value can be one or many values set for the **Value** parameter in the **Options** property. Multiple values must be separated with **;#**

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: If the value is 0, then the width of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Rows	Number of rows for the control. The default value is **4**.
Selection Mode	Selection mode for the control. • Select **Single** to allow a user to select only one option for the control. • Select **Multiple** to allow a user to select one or many options for the control. The default value is **Single**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**. **Note:** Validation message appears only on submission of the form.

Advanced

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Text Parameter	Name that identifies the options text to use in scripts for the control.
Value Parameter	Name that identifies the options value to use in scripts for the control.
Forms 2011 Compatible	Make the control compatible with Forms 2011, that is the forms used in BPM 2011. • Select **Yes** to allow the system to make the control compatible with Forms 2011. • Select **No** to deny the system to make the control compatible with Forms 2011. The default value is **No**. **Note:** When a control on a form is made Forms 2011 compatible, the XML instance of the form with the control is changed to ensure compatibility with Forms 2011.
Include in Summary	Allow or deny a user to view the value in the **Summary** of a **Base Form**. • Select **Yes** to allow a user to view the value in the Summary of a Base Form. • Select **No** to deny a user to view the value in the Summary of a Base Form. The default value is **No**. **Note:** This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for List control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Number

Use **Number** control to enter and view numerical data in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Default Value	The default value for the control. **Note:** Ensure the value is within the Minimum Value and the Maximum Value.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Read-Only	Allow or deny a user to enter a value for the control. • Select **Yes** to deny a user to enter a value for the control. • Select **No** to allow a user to enter a value for the control. The default value is **No**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Watermark	Hint text that appears when no value is entered for the control.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**.
Auto-update Value	Allow or deny the system to automatically update the value to the nearest minimum or maximum value for the control. • Select **Yes** to allow the system to automatically update the value to the nearest minimum or maximum value for the control. • Select **No** to deny the system to automatically update the value to the nearest minimum or maximum value for the control. The default value is **No**. For example, assume the **Minimum Value** property is set to 5 and the **Maximum Value** property is set to 10. Now if a user enters the value as 2, then the system automatically updates the value to 5. Similarly, if a user enters the value as 12, then the system automatically updates the value to 10. This behavior is applicable only when the value is set via the User Interface (UI), not via script.
Minimum Value	Minimum value for the control. **Note**: The decimal value supported is up to two decimal places.
Maximum Value	Maximum value for the control. **Note**: The decimal value supported is up to two decimal places.

Advanced

Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Read-Only	Allow or deny a user to enter a value for the control. • Select **Yes** to deny a user to enter a value for the control. • Select **No** to allow a user to enter a value for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	The default value is **No**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label Control-Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	- This is applicable only when the **Label Position** is set to **Left** or **Right**.
Watermark	Hint text that appears when no value is entered for the control.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**.
Text Pattern	Regular expression to validate the text for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	For example, use the following regular expression to validate a text string as a phone number: `^[2-9]\d{2}-\d{3}-\d{4}$`
Minimum Length	Minimum length of the value for the control. The default value is **0**. **Note:** If the value is 0, then the minimum length for the control is not set.
Maximum Length	Maximum length of the value for the control. The default value is **0**. **Note:** If the value is 0, then the maximum length for the control is not set.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Security Mode	Retain or secure the value for the control. • Select **None** to retain the value for the control in plain text. • Select **Encryption** to secure the value for the control with AES-128. • Select **Form Type** to secure the value of the control with the encryption algorithm used in Forms. • Select **List Type** to secure the value of the control with algorithms similar to the encryption mechanism used to encrypt the login password. The default value is **Encryption**.
Persist Password	Keep or lose the value for the control on submission of the form. • Select **Yes** to keep the value for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **No** to lose the value for the control. The default value is **No**.

Scripts

For information about using scripts, see scripting guidelines for Password control.

Note:
- **Password** control does not populate the password automatically even if the autofill or autocomplete option in the browser is turned on.
- Text pattern, minimum length, maximum length, and custom validations are applicable only for plain text password.
- We recommend using HTTPS with SSL encryption for additional security.

Pop-Up

Use **Pop-Up** control to open a form as a pop-up window in your form. You can reuse your existing form using this control.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. The default value is the value for the **Name** property without the spaces. **Note:** If you edit this value later, then it might affect the mapping between forms, lists, and workflows..
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Button Text	Text for the control.
Persist Form Definition	Allow or deny a user to persist the form definition. The definition of the source form is fetched and used for the pop-up form. The source form is no longer

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	referenced after the properties of the control are saved. Therefore, the source form does not have to be available in the repository after the properties are configured. • Select **Yes** to allow a user to persist the form definition. • Select **No** to deny a user to persist the form definition. The default value is **No**. The pop-up form pointing to a form with Persist Form Definition set to **No** shows the draft version of the form in the Preview only rather than the published version. The pop-up form pointing to a form with Persist Form Definition set to **Yes** is the draft version of the form.
Form Details	Details of the form that is to be linked. **To add Form Details for the control** 1. Click the **Form Details** button. The **Form Details Configuration** page appears. 2. In the **Form Name** box, click a form name. 3. In the **Form Version** box, click a form version. 4. In the **Parameters** list, click and select a control on the form, if applicable. This maps a pop-up form parameter to a parent form control. The Parameters list appears only if the version of the selected form contains **Forms Parameters**. 5. Click **Save & Continue**. The selected form details is set for the control, and the **Form Details Configuration** page is closed. **Note:** - Ensure the selected form has a **Button** control with the **Button Type** set to **Cancel**, otherwise you will not be able to close the form. - If you click **Finish**, then the form will be submitted and closed. However, an empty instance XML will be generated. - For **Parameters**, the **Title** of the control on the form is displayed, if set for the control. Otherwise, the **XML Node** of the control on the form is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	displayed. - For information about using **Forms Parameters**, see Forms Parameters.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Alignment	Alignment of the control with respect to the form. • Select **Default** to allow the system to align the control. The system aligns the control to the left of the form or as specified by the control. • Select **Left** to align the control to the left of the form. • Select **Right** to align the control to the right of the form. • Select **Center** to align the control to the center of the form.
Dimension	Dimension in percentage for the pop-up window of the control. The default value is **0**. **Note:** If the value is 0, then the dimension for the pop-up window of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Display Mode	Show text and/or image for the control. • Select **Text Only** to show only text for the control. • Select **Image Only** to show only image for the control. • Select **Text and Image** to show both text and image for the control. The default value is **Text Only**.
Button Size	Size of the button for the control. • Select **Standard** to set the size of the control to 120 x 32 pixels. • Select **Small** to set the size of the control to 30 x 30 pixels. • Select **Medium** to set the size of the control to 180 x 86 pixels. • Select **Large** to set the size of the control to 280 x 130 pixels. The default value is **Standard**.
Image Path	Path to the image for the control. The image path is specified as: • A URL starting with **http://** or **https://**. • An image path tag. For information about using image path tags, see *Image Path Tags* in Image. • A path to the **BPMUITemplates** folder as **BPMUITemplates\Default\Images**. **Note:** You can use relative paths as follows: - Use **.** for the current folder where the html page resides. - Use **..** for the folder above the current folder where the html page resides.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	We recommend the following image sizes when the **Display Mode** property is set to Image. • **Small** – 30 x 30 pixels. • **Medium** – 180 x 86 pixels. • **Large** – 280 x 130 pixels. We recommend the following image sizes when the **Display Mode** property is set to Text and Image. • **Small** – 30 x 30 pixels. • **Medium** – 40 x 40 pixels. • **Large** – 50 x 50 pixels. **Note:** - This property is applicable only when the **Display Mode** property is set to **Image** or **Text and Image**, and the **Button Size** property is set to **Small**, **Medium** or **Large**. - If the **Display Mode** property is set to **Text and Image** and the **Button Size** property is set to **Small**, then only the image is displayed.
Image Position	Position of the image with respect to the text for the control. • Select **Left** to align the image to the left of the text for the control. • Select **Right** to align the image to the right of the text for the control. • Select **Top** to align the image to the top of the text for the control. • Select **Bottom** to align the image to the bottom of the text for the control. The default value is **Left**. **Note:** This property is applicable only when the **Display Mode** property is set to **Text and Image**.
Show as Link	Enable or disable the control to show as link. • Select **Yes** to enable the control to show as link. • Select **No** to disable the control to show as link. The default value is **No**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Open New Window	Allow or deny a user to open form in a new browser window. • Select **Yes** to allow a user to open form in a new browser window. • Select **No** to deny a user to open form in a new browser window. However, the system allows the user to open form in the same browser window. The default value is **No**. **Note:** Opening the form in a new browser window improves form performance, but the values for the controls on submission of the form will not be persisted.
Persist Value	Keep or lose the value for the control on submission of the form opened as a pop-up window. • Select **Yes** to keep the value for the control on submission of the form opened as a pop-up window. • Select **No** to lose the value for the control on submission of the form opened as a pop-up window. The default value is **Yes**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Form Button	Enable or disable the control to act as form button. When this property is enabled, the control is displayed at the bottom-right corner of the form. • Select **Yes** to enable the control to act as form button. • Select **No** to disable the control to act as form button. The default value is **No**. **Note:** If the value is **Yes**, and the form is viewed on a mobile device, then the control appears in the **Action Bar** of the mobile device.

Scripts

For information about using scripts, see scripting guidelines for Pop-Up control.

Note:
- **Pop-Up** control does not support forms with **Pop-Up** controls.
- **Pop-Up** control does not support **Chart**, **Slider**, **Card**, and **Hierarchical List** controls when the **Persist Form Definition** property is set to **Yes**.

Progress Bar

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	(Required) XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use forward slash (**/**) for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent, which is not a

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it may affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Enable Column Bindings	Enable this option to set up the lookup source. • Select **Yes** to enable the use of the lookup source. • Select **No** if column binding is not necessary. If enabled, specify the column names based on the lookup source definition for **Unit of Measurement**, **Target Value**, and **Default Value** properties**.** The default value is **No**.
Lookup Source	(Required) Name of the item from the lookup list. **Note**: This is only visible when the **Enable Column Bindings** property is set to **Yes**. To add a name of the item for the control from the lookup list: 1. Click the **Lookup Source** button. The Lookup Source Configuration page appears. 2. In the **Data Source Type** list, select a type of data source. **Note**: Supported datasource types are database and Web API lookup source. 3. In the **Data Source** box, select a data source. 4. In the **Parameters** section, select the parameters to include, if applicable. 5. Click **Save & Continue**. The selected name is set for the control and the Lookup Source Configuration page is closed.
Unit of Measurement	Unit of measurement for the value of the control. This supports a single line with 24 characters and a tooltip is shown when you hover over this property. An ellipsis is added if it exceeds the 24-character limit.
Target Value	Target value of the control. This is the value that the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	target indicator points at. However, if this property is left blank, the target indicator is not shown at preview or runtime. The default value is **0**.
Default Value	This is the value of the control. This supports 10 characters and a tooltip is shown when you hover over this property. An ellipsis is added if the value exceeds the 10-character limit.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note**: If the value is 0, then the width of the control is set as per the default value of 360.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Title	Name or information text for the control. It is shown directly above the top-left corner of the control. This supports two lines with 35 characters for each line and a tooltip is shown when you hover over this property. An ellipsis is added if it exceeds the 35-character limit. If you want to add a line break, use the html tag . **Note:** If this property is not configured or blank, nothing is shown, the other control contents use its space, and the control size is adjusted based on the available content within the control. The described behavior also applies to the **Unit of Measurement** property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Decimal Places	Decimal places for the default value of the control. It also applies to the values in the **Range** property. This displays a maximum number of 3 decimal places. The default value is **0**. **Note**: At runtime, if this property is empty or has a non-numeric value, it resets back to 0. If its value is greater then 3, it stays at its maximum value of 3.
Scale Minimum Value	(Required) Minimum value displayed on the scale. The default value is **0**. **Note**: At runtime, if this property is empty or has a non-numeric value, its value is set to 0.
Scale Maximum Value	(Required) Maximum value displayed on the scale. The default value is **100**. **Note**: At runtime, if this property is empty or has a non-numeric value, its value is set to 100.
Scale	Show or hide the scale, or use the **Range** property values in the control. • Select **Hide** to hide the scale in the control. • Select **Show** to show the scale in the control. • Select **Ranges** to use the breakpoint values specified under the **Range** property instead of the scale values. **Note**: If **Ranges** is selected, the scale value shows the decimal places based on what is specified in the **Decimal Places** property. If this is set to **Show**, the **Number of Division** property is visible. The default is **Hide**.
Number of Division	Number of division within the scale, from the minimum value to the maximum value. This number divides the difference between the **Scale Maximum Value** and **Scale Minimum Value**. For example: • **Scale Minimum Value** = 0 • **Scale Maximum Value** = 200 • **Number of Division** = 5

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	So the difference between the scale max and min values is 200. The difference divided by the number of division is 40. The scale tick marks are then shown as 0, 40, 80, 120, 160, and 200. **Note:** This is only visible when the **Scale** property is set to **Show**. The default value is **10**.
Control Background Color	The color to represent the background of the control. The default is white.
Background Color	The color to represent the background of the bar in the control. The default is gray.
Bar Color	The color to represent the bar in the control. The default is green.
Range	The breakpoint to apply in the control range bar. Each added row corresponds to a breakpoint and for each breakpoint value, you can assign a color. You can have a maximum of 10 breakpoints. **Note**: If the configured range does not cover the full scale, the undefined range takes the color that is set for the **Bar Color** property. The value for the breakpoint must be between the specified value for the **Scale Minimum Value** and **Scale Maximum Value** properties.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
On Initialize	Run a script after the control has been initialized, but before it is rendered to the UI. For more information, see *Scripting Guidelines.*
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Enable Refresh	Enable or disable control refresh. • Select **Yes** to enable control refresh and configure the **Refresh Rate** property. • Select **No** to disable control refresh and hide the **Refresh Rate** property. The default value is **No**.
Refresh Rate	This is how often the control display is refreshed, in seconds, to fetch value from the data source. **Note**: This is only visible if the **Enable Refresh** property is set to **Yes**. The default is 30 seconds and the valid refresh rate is from 5 to 600 seconds.

Scripts

For information about using scripts, see scripting guidelines for Progress Bar control.

Example Scripting Scenarios and Rendering

The following sections provide example scenarios where scripting is use with the Progress Bar control. It also has example configuration with its corresponding Progress Bar control rendering.

Example Progress Bar Rendering

The following rendering examples for Progress Bar control are based on the configuration in the control's properties page. The configured properties are listed in the table and most of the properties that are kept to their default values are no longer mentioned.

Example configuration and rendering

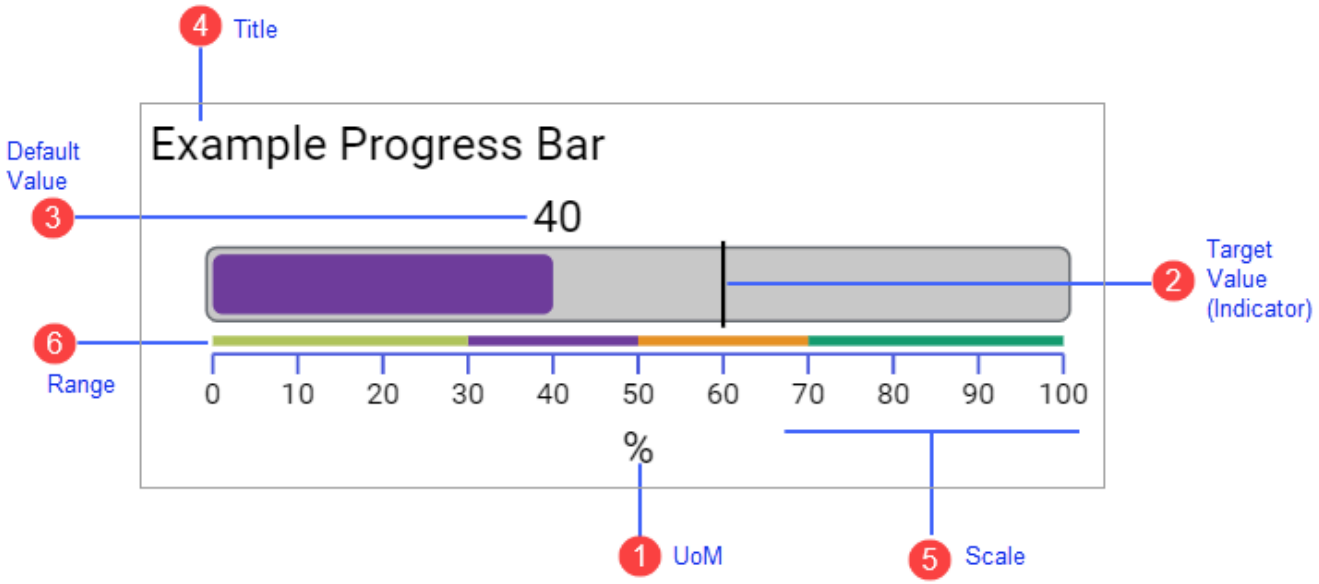
Basic	Appearance
1. **Unit of Measurement**: `%` 2. **Target Value**: `60`	4. **Title**: `Example Progress Bar` 5**. Scale**: `Show` (selected)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Basic	Appearance
3. **Default Value**: `40`	• **Number of Division**: `10` (default) 6. **Range** (*with three breakpoints*) • Value 1 - 30 (lime) • Value 2 - 50 (purple) • Value 3 - 70 (orange)

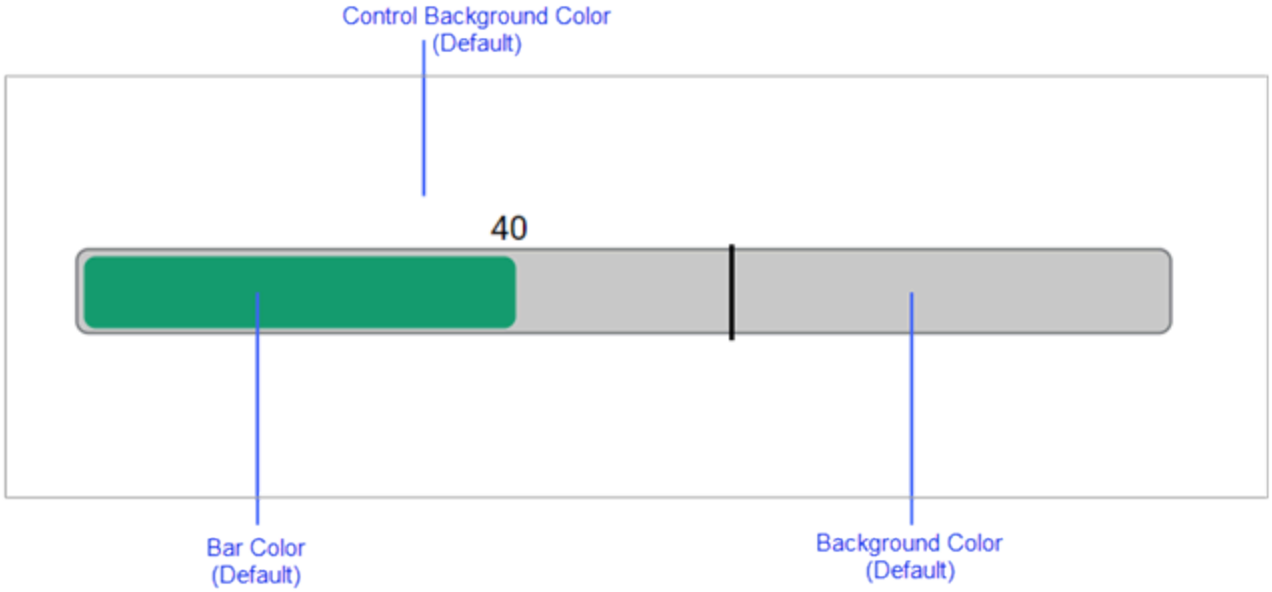
In the following rendering example, the configured range does not cover the full scale, so the undefined range takes the color that is set for the **Bar Color** properties, which in the current configuration is set to the default green color.

For the rendered bar color to show the **Default Value**, notice that it takes the assigned color of the second breakpoint (50, purple) because the **Default Value** falls on that breakpoint range.



The next example rendering has a configuration where most of the properties are kept to their default values. The properties that are empty by default are also left the same way, except for the **Default Value** and **Target Value** properties, so 40 is shown as well as the target indicator. However, the **Target Value** of 60 is not shown since the **Scale** property is set to **Hide (**by default), so the scale is hidden.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



QR Code

Use **QR Code** control to scan a QR code. This control is applicable only for **AVEVA Work Tasks Pro** App.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Button Text	Text for the control.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Alignment	Alignment of the control with respect to the form. • Select **Default** to allow the system to align the control. The system aligns the control to the left of the form or as specified by the control. • Select **Left** to align the control to the left of the form. • Select **Right** to align the control to the right of the form. • Select **Center** to align the control to the center of the form.
Display Mode	Show text and/or image for the control. • Select **Text** Only to show only text for the control. • Select **Image** Only to show only image for the control. • Select **Text and Image** to show both text and image for the control. The default value is **Text Only**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Button Size	Size of the button for the control. • Select **Standard** to set the size of the control to 120 x 32 pixels. • Select **Small** to set the size of the control to 30 x 30 pixels. • Select **Medium** to set the size of the control to 180 x 86 pixels. • Select **Large** to set the size of the control to 280 x 130 pixels. The default value is **Standard**.
Image Path	Path to the image for the control. The image path is specified as: • A URL starting with **http://** or **https://**. • An image path tag. For information about using image path tags, see *Image Path Tags* in Image. • A path to the **BPMUITemplates** folder as **BPMUITemplates\Default\Images**. **Note:** You can use relative paths as follows: - Use **.** for the current folder where the html page resides. - Use **.** for the folder above the current folder where the html page resides. We recommend the following image sizes when the **Display Mode** property is set to Image. • **Small** – 30 x 30 pixels. • **Medium** – 180 x 86 pixels. • **Large** – 280 x 130 pixels. We recommend the following image sizes when the **Display Mode** property is set to Text and Image. • **Small** – 30 x 30 pixels. • **Medium** – 40 x 40 pixels. • **Large** – 50 x 50 pixels. **Note:** - This property is applicable only when the **Display**

Property	Description
On Data Change	Run a script when the value of the control changes.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Form Button	Enable or disable the control to act as form button. When this property is enabled, the control is displayed at the bottom-right corner of the form. • Select **Yes** to enable the control to act as form button. • Select **No** to disable the control to act as form button. The default value is **No**. **Note:** If the value is **Yes**, and the form is viewed on a mobile device, then the control appears in the **Action Bar** of the mobile device.

Scripts

For information about using scripts, see scripting guidelines for Button property.

Note:

AVEVA Work Tasks utilizes a third-party library to enable barcode scan and support scanning. Note that all variations of a code, such as GS1 based on Code 128, may not be supported.

The supported barcode types for iOS, Android, and UWP are listed below:

Supported Barcode Types for iOS	Supported Barcode Types for Android and UWP
EAN-8, EAN-13	EAN-8, EAN-13, UPC-A, UPC-E
Code 39, Code 93, Code 128	Code 39, Code 93, Code 128
ITF	ITF
AZTEC	AZTEC
QR Code	QR Code
Data Matrix	Data Matrix
PDF 417	PDF 417
Codabar	Codabar
	RSS-14 (all variants), RSS Expanded (most variants)

MaxiCode

Radio Button

Use **Radio Button** control to select one of a group of mutually exclusive options in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Options	Options for the control. **To add an option to the control** 1. Click **Add Record**. A new record appears. 2. In the **Text box**, enter the options text.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	3. In the **Value box**, enter the options value. 4. In the **Fore Color** palette, click a color (or in the **Color Code** box, enter hexadecimal code of the color), and then click **Apply**. The selected color is applied to the foreground of the options text. 5. In the **Back Color** palette, click a color (or in the **Color Code** box, enter hexadecimal code of the color), and then click **Apply**. The selected color is applied to the background of the options text. **To clear fore color for an option of the control** • On the **Fore Color** palette, in the **Color Code** box, enter **#1b1b1b**, and then click **Apply**. The **Fore Color** is reset to the default color. **To clear back color for an option of the control** • On the **Back Color** palette, in the **Color Code** box, enter #1b1b1b, and then click Apply. The **Back Color** is reset to the default color. **To delete an option from the control** • Click the **Delete** button. The record is deleted. **Note:** The options **Text** and **Value** parameters are mandatory and must be unique across all options.
Default Value	The default value for the control. **Note:** The value must be one of the values set for the **Value** parameter in the **Options** property.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a Base Form with **Label Position** property set to Top, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Options Per Row	Number of options per row for the control. Enter a value from 0 to 10.
Options Direction	Direction of the options for the control. • Select **Horizontal** to align the options next to each other for the control. • Select **Vertical** to align the options one below the other for the control. The default value is **Horizontal**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**. **Note:** Validation message appears only on submission of the form.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Text Parameter	Name that identifies the options text to use in scripts for the control.
Value Parameter	Name that identifies the options value to use in scripts for the control.
Include in Summary	Allow or deny a user to view the value in the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the Summary of a Base Form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **No** to deny a user to view the value in the Summary of a Base Form. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Radio Button control.

Report Viewer

Use **Report Viewer** control to view reports in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
Description	Description for the control.
Report Name	Name that identifies the report. **Note:** This property is applicable only if the **Report View Option** in the **Report Configuration** is set to Popup.
Report Configuration	Configure the report view. **To configure the report view** 1. Click the **Report Configuration** button. The **Report Configuration** page appears. 2. Configure the report view, and then click **Submit**. The configuration is saved and the **Report Configuration** page is closed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	For more information, see Report Viewer Configuration.

Appearance

Property	Description
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Top**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.

Scripts

For information about using scripts, see scripting guidelines for Report Viewer control.

Note:
- The Report Viewer control is currently not supported in mobile devices.
- When a parameter of a Report in SSRS is defined with Specified Default Values and if any of the default values specified does not exist in the Available Values of the parameter, then none of the valid default values is selected. For example, if the Available Values for the Report Parameter is specified as 1, 2, 3, 4 and the Default Values for the Report Parameter is specified as 3, 4, 5, 6; the Report displayed in the **Report Viewer** control does not consider the valid Default Values for the parameter.
- When a Boolean Parameter has Available and Default Specified values, you can define only one default value and two Available values. The value should be either true or false.
- DateTime Multiple Values Parameter type is not supported.
- In the SSRS Report Builder, set the Report with the **Language** property to **=User!Language**. This will display the Report in the **Report Viewer** control as per the locale or language of the web application.

Report Viewer Configuration

The **Report Viewer Configuration** control allows you to configure the report view.

In the **Report Viewer properties** window, click the **Report Configuration** option. The Report Configuration page appears and configure the following:

- **Report View Option**: The following options are available to view the report in forms:
  - Embed
  - Popup
  - Export

  Embed: The report view can be embedded in the form using the following settings:
- **Display Options**: Displays the following options:
  - Parameter Prompts
  - ToolBar
  - Back Button
  - Page Navigation Controls
  - Refresh Button
  - Find Controls
  - Export Controls
  - Print Button

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Report Template**: Select the required report template from the dropdown list to generate the report view.
- **Parameters**: Allows you to set the values for the selected report template parameters. On selecting the required Report Template, the parameters defined for this particular template will be listed. All the parameters with the * mark are mandatory.

  By default, only the unhidden parameters are displayed. You can check the **Include Hidden Parameters** option to view all the hidden parameters.

  You can specify a value for these parameters in two ways:

  - **Controls**: Select **Controls** from the parameter dropdown and click the button to select a form control. At runtime, the value of the control will be reflected on the parameter, based on which the reports are fetched from the Reports list.

    Note: It is recommended to have controls, which are used as parameters, in the same level as that of the report viewer control.

  - **Values**: Users can select the Values option in the parameter drop-down and specify the value.

    Among the parameters displayed here, the Time Zone ID and the TagName parameters have specific icons, Time Zone and Historian Tag, displayed against them respectively. Users should note that it is a prerequisite to have a Historian Connection established before selecting a Time Zone or a Historian Tag. For more information on how to establish a Historian Connection, refer to Creating a Historian Connection under the Report Activities topic in *Developer Guide*.

Time Zone: If a report parameter name is the Time Zone ID, then the Time Zone icon will be displayed for that particular parameter.

On clicking of this icon, the Time Zone screen pops up. Here, the user can select the required Historian Connection. On selection of the connection, different time zones will be populated in the Time Zone drop-down list. The user can select an appropriate time zone and click Select.

Historian Tag: If a report parameter name is TagName, then the Historian Tag icon is displayed for that particular parameter.

On clicking of this icon, the Historian Tags screen pops up. Here, the user can select the required Historian Connection. On selection of the connection, all the Historian tags will be displayed in the left-hand side list box of Select Tag(s) section.

The user can select the required tags, click the > button to move the tags to the right-hand side of the Select Tag(s) section and click Select. If the user wants remove any tag from the right-hand side list box, then the user has to select the tag(s) and click the < button. The tag will be placed in the left-hand side list box.

A parameter can also be set to a null value, based on the parameter definition in the Report Template. In such cases the parameter would be displayed as shown in the image given below:

This is available only when the Values option is selected in the Parameters drop-down list. As seen in the above image, selecting the null check box would disable the value-specific controls of that parameter.

Note: Embed option is recommended for small reports as large reports would degrade the performance of the form.

Pop-up: This option works very similar to the Embed option. Users can select the Popup radio button to configure a report to be viewed in a pop-up screen. For more details, refer to Embed section.

Export: Select this option to export <>:

Report Source: Specify the source of the report. If the Report radio button is selected, all reports from the Reports list will be listed in the Report drop-down.

If the Report Generator Activity radio button is selected, then the user has to set the Report Reference Variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The user can specify a value for these parameters in two ways:

Users can select Controls option in the parameter drop-down and click the button to select a Form control. At runtime, the value of the control would reflect on the parameter, based on which the report view is generated.

Users can select the Values option in the parameter drop-down and specify the value. The value should be the Title or GUID of the report.

Report: Select the report from the drop-down list which has all the available Reports.

Appearance

Field	Description
Is control enabled?	Select **Yes**, if the control has to be enabled, else select **No**.
Label Position	Select the positioning of the label from the drop-down list. The available options are Default, Left, Top, Right, Bottom, and Suppress.
Is control read only?	Select **Yes**, if the control has to be visible, else select **No**.
Width	Enter an integer value in this field, to set the width of the field in pixels. **Note**: A value '0' will set the width of the field in default percentage value.
Height	Enter an integer value in this field, to set the height of the field in pixels. **Note**: A value '0' will set the height of the field in default percentage value.
Mobile Display Mode	Select the required mode from the drop-down list to display this control in the mobile devices. The available options are: Default, Show only in Web, and Show only in Mobile

Validation

Field	Description
Watermark	Enter a suitable value in this field, which is the default value that appears, when the controls value is empty.

Advanced

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Id	The reference identification code in this field is generated automatically.
On Data Changed Script	Click the icon and enter the script to run when a data change event occurs. The event occurs when the value of this control changes.

Note: Report View Control does not support scripts.

Scripts

For more information, refer to *Using Scripts in the Forms*.

Viewing a Report as an embedded report in a form using Report Viewer Control

Given below are the steps to view a Report as an embedded report:

1. Create a new form using the **Tools** > **Manage Forms** > **New**.
2. Drag and drop a **Date Time Input** control.
3. Enter the **Tag name** and click in the **Mapped XML Node** field to populate the value.
4. Click **Save**.
5. Drag and drop the **Report Viewer** control to the form designer.
6. Enter the **Tag name** and click in the **Mapped XML Node** field to populate the value.
7. Click the **Report Configuration** icon to open the window.
8. Specify all the required properties in this window. Refer to Embed section for more details.
9. Click **Submit** in the Report Configuration window.
10. Click **Save** in the Report Viewer properties window.
11. Click the **Preview** button in the ribbon bar.
12. In the preview window, enter a value in the **Date Time Input** field. The report will be generated on the screen.

    To view the report in a full screen mode, click the **View Report** in full screen link.

Viewing a Report in a Pop-up window using Report Viewer Control

Given below are the steps to view a Report in a pop-up window:

1. Create a new form using the **Tools** > **Manage Forms** > **New**.
2. Drag and drop a **Date Time Input** control.
3. Enter the **Tag name** and click in the **Mapped XML Node** field to populate the value.
4. Click **Save**.
5. Drag and drop the **Report Viewer** control to the form designer.
6. Enter the **Tag name** and click in the **Mapped XML Node** field to populate the value.
7. Click the **Report Configuration** icon to open the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. Specify all the required properties in this window. Refer to Pop-up section for more details.
9. Click **Submit** in the Report Configuration window.
10. Click **Save** in the **Report Viewer** properties window.
11. Click the **Preview** button in the ribbon bar.

    In the preview window, enter a value in the **Date Time Input** field and click the **View Report** link.

    The report appears in a pop-up window as shown in the image given below:

Viewing a Report through a Download link in a form using Report Viewer Control

Given below are the steps to view a Report through a download link:

1. Create a new form using the **Tools** > **Manage Forms** > **New**.
2. Drag and drop the **Report Viewer** control to the form designer.
3. Enter the Tag name and click in the **Mapped XML Node** field to populate the value.
4. Click the **Report Configuration** icon to open the window.
5. Specify all the required properties in this window. Refer to Download section for more details.
6. Click **Submit** in the Report Configuration window.
7. Click **Save** in the Report Viewer properties window.
8. Click the **Preview** button in the ribbon bar.

    In the preview window, click the **Download Report** link.

    By clicking the **Download** button, you can either save the report to the required location on your computer or open it to view its contents.

Note: The Report Viewer control settings within an embedded form control will be overridden with the settings of the Report Viewer Control present in the same form. This occurs if the Report Viewer Control and the embedded form control having a Report Viewer Control are present in the same form and both the Report Viewer Control in the Form and the Report Viewer controls within the embedded form control have the same Id.

To resolve this, export the main form and change the Report Viewer control Id and ensure it is different from the Id of Report viewer control present in the embedded form control. Import the edited XML back to the forms designer.
Report Viewer Control does not support scripts.

Embed Reports

Embed a report view to show the report view in your form.

- Follow the steps for Editing Properties of Controls till you a get the **Properties** dialog box for the Report Viewer control.

To embed a report

1. Click the **Report Configuration** button. The **Report Configuration** page appears.
2. Under **Report View Option**, click **Embed**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Under **Display Options**, click the required options to show the selected UI elements in the report view.
4. In the **Report Template** list, click a report template based on which the report view is generated.
5. Under **Parameters**, set the values for the required report template parameters.
6. Click **Include Hidden Parameters** to show the hidden report template parameters, and then set the values, if required.
7. Click **Submit**. The configuration is saved and the **Report Configuration** page is closed.

Note:
- If you select the **Parameter Prompts** option (under **Display Options** in **Report Configuration**), then ensure the **Width** and **Height** properties set for the control is at least 250 pixels to display the report view properly.
- Similarly, if the **Parameter Prompts** option is not selected, then ensure the **Width** and **Height** properties set for the control is at least 200 pixels to display the report view properly.

Link Pop-up Reports

Show as a link to a report view in your form to open the report view as a pop-up window.

- Follow the steps for Editing Properties of Controls till you a get the Properties dialog box for the Report Viewer control.

To link a report

1. Click the **Report Configuration** button. The **Report Configuration** page appears.
2. Under **Report View Option**, click **Popup**.
3. Under **Display Options**, click the required options to show the selected UI elements in the report view.
4. In the **Report Template** list, click a report template based on which the report view is generated.
5. Under **Parameters**, set the values for the required report template parameters.
6. Click **Include Hidden Parameters** to show the hidden report template parameters, and then set the values, if required.
7. Click **Submit**. The configuration is saved and the **Report Configuration** page is closed.

Note:
- If you select the **Parameter Prompts** option (under **Display Options** in **Report Configuration**), then ensure the **Width** and **Height** properties set for the control is at least 250 pixels to display the report view properly.
- Similarly, if the **Parameter Prompts** option is not selected, then ensure the **Width** and **Height** properties set for the control is at least 200 pixels to display the report view properly.

Link Downloadable Reports

Show as a link to a report view in your form to download the report view.

- Follow the steps for Editing Properties of Controls till you a get the **Properties** dialog box for the **Report Viewer** control.

To download a report

1. Click the **Report Configuration** button. The **Report Configuration** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Under **Report View Option**, click **Download**.
3. Under **Report Source**, do one of the following:

Task	Action
• Show all reports to select in the **Reports** list.	• Click **Report**.
• Set the Report Reference Variable.	a. Click **Report Generator Activity**. b. In the **Report Reference Variable** list, click **Controls**, and then click the **More** button to click a form control. OR In the **Report Reference Variable** list, click **Values**, and then enter a **GUID** or **Title** of the report.

4. In the **Report** list, click a report.
5. Click **Submit**. The configuration is saved and the **Report Configuration** page is closed.

RFID

Use **RFID** control to scan a RFID tag using Near Field Communication. This control is applicable only for AVEVA Work Tasks Pro App.

Note:
- RFID control supports only RFID of plain text type.
- RFID control is not supported in AVEVA Work Tasks Pro app for UWP.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	**Description**
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Button Text	Text for the control.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Alignment	Alignment of the control with respect to the form. • Select **Default** to allow the system to align the control. The system aligns the control to the left of the form or as specified by the control. • Select **Left** to align the control to the left of the form. • Select **Right** to align the control to the right of the form. • Select **Center** to align the control to the center of the form.
Display Mode	Show text and/or image for the control. • Select **Text** Only to show only text for the control. • Select **Image** Only to show only image for the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	control. • Select **Text and Image** to show both text and image for the control. The default value is **Text Only**.
Button Size	Size of the button for the control. • Select **Standard** to set the size of the control to 120 x 32 pixels. • Select **Small** to set the size of the control to 30 x 30 pixels. • Select **Medium** to set the size of the control to 180 x 86 pixels. • Select **Large** to set the size of the control to 280 x 130 pixels. The default value is **Standard**.
Image Path	Path to the image for the control. The image path is specified as: • A URL starting with **http://** or **https://**. • An image path tag. For information about using image path tags, see *Image Path Tags* in Image. • A path to the **BPMUITemplates** folder as **BPMUITemplates\Default\Images**. **Note:** You can use relative paths as follows: - Use **.** for the current folder where the html page resides. - Use **..** for the folder above the current folder where the html page resides. We recommend the following image sizes when the **Display Mode** property is set to Image. • **Small** – 30 x 30 pixels. • **Medium** – 180 x 86 pixels. • **Large** – 280 x 130 pixels. We recommend the following image sizes when the **Display Mode** property is set to Text and Image.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• **Small** – 30 x 30 pixels. • **Medium** – 40 x 40 pixels. • **Large** – 50 x 50 pixels. **Note:** - This property is applicable only when the **Display Mode** property is set to **Image** or **Text and Image**, and the **Button Size** property is set to **Small**, **Medium** or **Large**. - If the **Display Mode** property is set to **Text and Image** and the **Button Size** property is set to **Small**, then only the image is displayed.
Image Position	Position of the image with respect to the text for the control. • Select **Left** to align the image to the left of the text for the control. • Select **Right** to align the image to the right of the text for the control. • Select **Top** to align the image to the top of the text for the control. • Select **Bottom** to align the image to the bottom of the text for the control. The default value is **Left**. **Note:** This property is applicable only when the **Display Mode** property is set to **Text and Image**.
Show as Link	Enable or disable the control to show as link. • Select **Yes** to enable the control to show as link. • Select **No** to disable the control to show as link. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
On Data Change	Run a script when the value of the control changes.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Form Button	Enable or disable the control to act as form button. When this property is enabled, the control is displayed at the bottom-right corner of the form. • Select **Yes** to enable the control to act as form button. • Select **No** to disable the control to act as form button. The default value is **No**. **Note:** If the value is **Yes**, and the form is viewed on a mobile device, then the control appears in the **Action Bar** of the mobile device.

To use the value coming from RFID control, use the **On Data Change** script of RFID Control. For example,

```
control.findByXmlNode("Textinput").value = currentValue;
```

"Textinput" is the value coming from RFID Control.

Scripts

For information about using scripts, see scripting guidelines for Button property.

Rich Text

Use **Rich Text** control to enter and view rich text data in your form. You can style the text, align the paragraphs, increase or decrease indentation, insert hyperlinks, images, and tables. To access the inserted hyperlink, press the Control key, and then click on the hyperlink text.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use / for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the Name property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.

Appearance

Property	Description
Show Toolbar	Show or hide the toolbar. • Select **Yes** to show the toolbar. • Select **No** to hide the toolbar. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Read - Only	Allow or deny a user to enter a value for the control. • Select **Yes** to deny a user to enter a value for the control. • Select **No** to allow a user to enter a value for the control. • The default value is **No**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: If the value is **Yes**, then the toolbar will not be visible, irrespective of the value of the **Show Toolbar** property.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** -If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **100%.** The recommended value is **200px**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **250 px**. **Note:** -If the value is 0, then the height of the control is set as per the default values. - In iOS devices, the height of the **Rich Text** control automatically resizes to fit contents. You cannot customize the height nor can you set the height to the default value.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the

Property	Description
	control. • Select **No** to bypass entering a value for the control. The default value is **No**.

Advanced

Property	Description
Id	Reference identification code for the control. This value is automatically generated and cannot be changed.
Include in Summary	Allow or deny a user to view the value in the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the Summary of a Base Form. • Select **No** to deny a user to view the value in the Summary of a Base Form. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form. -When the control is used in a **Base Form**, the formatting applied to the text is not reflected in the summary. The text appears as plain text.
Toolbar Options	Select the type of toolbar based on the toolbar styles and commands displayed. • Select **Standard** to display the standard toolbar styles and commands. • Select **Advanced** to display all the toolbar styles and commands. The default type is **Standard**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: In an iOS device, to use the **Advanced** toolbar in the **Rich Text** control outside any of the **Container** controls, make sure the height and width is set to values higher than the default values.

Note:
- Entering or editing values in the **Rich Text** control is not supported in the **Mozilla Firefox** browser.

- When you select a color from the color picker, make sure the form window is large enough to display the color picker completely to be able to select the text color and background color. If the window is small and the color picker is not displayed completely, you might not be able to select a color.

- Toolbar is not supported in devices.

- **Rich Text** control has the following limitations in iOS devices:
- You cannot open Hyperlinks present in the **Rich Text** control.
- The height of the **Rich Text** control automatically resizes to fit contents. You can neither customize the height nor can you set the height to the default value.
- When you set the width of the **Rich Text** control to the default value, the right hand side border is not displayed. Also, when you switch from landscape mode to portrait mode or vice versa, the text you type goes beyond the border of the control.
- Images take time to load.

- The script, object, and iframe tags are not supported in **Rich Text** control when added through **View HTML** window and cannot view it in the Form.

Scripts

For information about using scripts, see scripting guidelines for Rich Text control.

Role Lookup

Use **Role Lookup** control to search for roles, in the providers mapped to the repository, in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Default Value	The default value for the control. **To add the default value for the control** 1. Click the **Role Lookup** button. The **Default Value** dialog box appears. 2. In the **Search For** box, enter a search keyword. 3. Click **Search**. The search results appears. 4. Click a role in the search results, and then click **Save**. The selected role is set as the default value and the **Default Value** dialog box is closed. **To delete the default value for the control** • Click the **Clear** button. The selected role is deleted.

Appearance

Property	Description
Enable	Enable or disable the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Include in Summary	Allow or deny a user to view the value in the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the **Summary** of a **Base Form**. • Select **No** to deny a user to view the value in the **Summary** of a **Base Form**. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Role Lookup control.

Signature

Use **Signature** control to capture a user's signature in a form by drawing on a touch enabled device. The signature is rendered as a picture and shown to the user in edit mode of the form (i.e. before save or submit). The Signature is saved in an encrypted format after the form is saved or submitted. The user cannot edit the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

saved signature, but has the option to undo/clear the Signature before the form is saved or submitted.

This control works across browsers in web and via the AVEVA Work Tasks Pro app.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. The default value is the value for the **Name** property without the spaces. **Note:** If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Top**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **400**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: If the value is 400, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass drawing signature for the control. • Select **Yes** to enforce drawing signature for the control. • Select **No** to bypass drawing signature for the control. The default value is **No**.

Advanced

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Security Mode	Set the security mode to None or Encryption to secure the signature. • Select **None** to have the value of signature as Base64 encoded image. • Select **Encryption** to have the encrypted value for the signature. The default value is **Encryption**.

Scripts

For information about using scripts, see scripting guidelines for Signature control.

Note:
- The value for the Signature control can be more than 1024 characters, but this can restrict it from being injected as an attribute value in the Intouch OMI.
- Validation for the other controls, before the Signature control, are skipped due to Signature control's validation.

Slider

Use **Slider** control to set and view numerical data in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`.

Property	Description
	The default value is **No**.
Text Pattern	Regular expression to validate the text for the control. For example, use the following regular expression to validate a text string as a phone number: `^[2-9]\d{2}-\d{3}-\d{4}$`
Minimum Length	Minimum length of the value for the control. The default value is **0**. **Note:** If the value is 0, then the minimum length for the control is not set.
Maximum Length	Maximum length of the value for the control. The default value is **0**. **Note:** If the value is 0, then the maximum length for the control is not set.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Include in Summary	Allow or deny a user to view the value in the **Summary** of a **Base Form**. • Select **Yes** to allow a user to view the value in the **Summary** of a **Base Form**. • Select **No** to deny a user to view the value in the **Summary** of a **Base Form**. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	- For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Text control.

Time

Use **Time** control to select a time in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Default Value	The default value for the control. **Note:** The value must be in 24-hour time format. Ensure the value is within the **Minimum Value** and the **Maximum Value**.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Read-Only	Allow or deny a user to enter a value for the control. • Select **Yes** to deny a user to enter a value for the control. • Select **No** to allow a user to enter a value for the control. The default value is **No**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**.
Minimum Value	Minimum time value for the control. The default value is **00:00:00**.
Maximum Value	Maximum time value for the control. The default value is **23:59:59**.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Time Format	Time format for the control. For example, hh:mm:ss tt. Use HH for 24-hour time. For more information, see Date and Time Formats. **Note:** - Time format must contain at least: --- Hour and minute components for 24-hour time. --- Hour, minute, and period components for 12-hour time.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	- Time format is not validated. - For cultures, which do not support AM/PM, the “tt” or “t” must not be specified in the format.
Time Interval	Interval between two consecutive time slots to show in the list for the control. The default value is **01:00:00**.
Include in Summary	Allow or deny a user to view the value in the Summary of a Base Form. • Select **Yes** to allow a user to view the value in the **Summary** of a **Base Form**. • Select **No** to deny a user to view the value in the **Summary** of a **Base Form**. The default value is **No**. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for Time control.

Note:
- Time value is saved in text format and not in Universal Coordinated Time (UTC) format.
- Time value is in 24-hour time format.
- **Minimum Value** and **Maximum Value** properties together specify a range, hence their values cannot be the same.
- However, you can set a value for the **Default Value** property and then set the **Enable** property to **No** to restrict the time to a fixed value.

Tree

Use **Tree** control to display data in a tree view representation from a data source in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Data Source	Lookup data source used to populate the tree. **To configure the lookup source** 1. Click **Data Source** button to select the lookup data source. 2. In the **Data Source Type** list, select the type of data source. 3. In the **Data Source** list, select the data source. 4. Click **Save & Continue**.
Node ID Column	The column name of the column that contains IDs to identify every node used in the tree.
Node Parent Column	The column name of the column that contains IDs to identify parents of the nodes used in the tree. **Note:** If the node parent column is blank in the configuration, or if the parent ID specified does not

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	correspond to any node in the tree, then that node is placed on the root of the tree.
Node Label Column	The column name of the column that contains text to label the nodes used in the tree.

Appearance

Property	Description
Visible	Show or hide the **control**. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.
Expand Nodes	Expand or collapse the nodes of the tree by default when the tree loads. • Select **Yes** if you want the nodes of the tree to expand by default when the tree loads. • Select **No** if you want the nodes of the tree to collapse by default when the tree loads. The default value is **Yes**.

Advanced

Property	Description
On Data Bound	Run s script when data is bound to the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	For more information, see scripting guidelines for On Data Bound property.
On Selection Change	Run a script when selection of the record changes. For more information, see scripting guidelines for On Selection Change property.
On Check Change	Run a script when the state of the checkbox changes, that is when the checkbox is selected or cleared. For more information, see scripting guidelines for On Check Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Checkbox Behavior	Allow or deny a user to select single or multiple records for the control. • Select **Single** to allow a user to select a single record for the control. • Select **Multiple** to allow a user to select multiple records for the control. • Select **None** to deny a user to select a record for the control. The default value is **None**.
Node Checked Column	Column name for selecting the checkbox in the control.
Inherit Checked State	Allow or deny the system to automatically inherit the state of the parent checkbox for the child nodes when the checkbox of the parent node is selected or cleared. • Select **Yes** to allow the system to automatically inherit the state of the parent checkbox for the child nodes. For example,consider that **Oil** is the parent node

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	with **Crude** and **Refined** as child nodes. When you set **Inherit Checked State** to **Yes**, and if you select **Oil**, then **Crude** and **Refined** inherit the state of the parent node **Oil**, and are automatically selected. If **Oil** is unchecked, and if you select **Crude** and **Refined**, then **Oil** automatically sets to an indeterminate state (dash). If **Oil** is checked, and if you select **Crude** and **Refined**, then **Oil** remains in a checked state. **Note:** There is no visual indication of the parent node in an indeterminate state. • Select **No** to deny the system to automatically inherit the state of the parent checkbox for the child nodes. When you set **Inherit Checked State** to **No**, and if you select **Oil**, then **Crude** and **Refined** do not inherit the state of the parent node **Oil**, and do not get selected. The default value is **No**

Note: The **Tree** control is not supported in AVEVA Work Tasks Pro App.

Scripts

For information about using scripts, see scripting guidelines for Tree control

User Lookup

Use **User Lookup** control to search for users, in the providers mapped to the repository, in your form.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces. **Note:** - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Tooltip	Message that appears when the pointer hovers over the control.
Default Value	The default value for the control. **To add the default value for the control** 1. Click the **User Lookup** button. The **Default Value** dialog box appears. 2. In the **Provider** box, click a provider. 3. In the **Search For** box, enter a search keyword. 4. In the **In** list, click a search criteria. 5. Click **Search**. The search results appears. 6. Click a user in the search results, and then click **Save**. The selected user is set as the default value, and the **Default Value** dialog box is closed. **To delete the default value for the control** • Click the **Clear** button. The selected user is deleted.
Show Default User	Show or hide the logged on user as the default user for the control. • Select **Yes** to show the logged on user as the default user for the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **No** to hide the logged on user as the default user for the control. The default value is **Yes**.

Appearance

Property	Description
Enable	Enable or disable the control. • Select **Yes** to enable the control. • Select **No** to disable the control. The default value is **Yes**.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	placed on a **Base Form** with **Label Position** property set to **Top**, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Watermark	Hint text that appears when no value is entered for the control.
Width	Width in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the width of the control is set as per the default values.
Height	Height in pixels for the control. The default value is **0**. **Note:** If the value is 0, then the height of the control is set as per the default values.
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Validation

Property	Description
Mandatory	Enforce or bypass entering a value for the control. • Select **Yes** to enforce entering a value for the control. • Select **No** to bypass entering a value for the control. The default value is **No**.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Extended Information	Allow or deny a user to access the extended information (that is columns other than the display and value columns of the result set) based on the selection for the control. • Select **Yes** to allow a user to access the extended information based on the selection for the control. • Select **No** to deny a user to access the extended information based on the selection for the control. The default value is **No**.
Include in Summary	Allow or deny a user to view the value in the **Summary** of a **Base Form**. • Select **Yes** to allow a user to view the value in the **Summary** of a **Base Form**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Select **No** to deny a user to view the value in the **Summary** of a **Base Form**. The default value is No. **Note:** - This property is applicable only when the control is used on a **Base Form** with **Repeating** property set to **True**, and the form is viewed on a small form factor mobile device. - For information about **Summary** of a **Base Form**, see Base Form.

Scripts

For information about using scripts, see scripting guidelines for User Lookup control.

Widget

Use **Widget** control to create reusable graphical components. You can maintain a library of widgets for the other users to use.

Note: If you add or modify any standard widget files, it should be manually added to the package in the 'Additional files' section of the packages.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Description
Name	Name that identifies the control. This value is also used for the label of the control.
XML Node	XML node mapped to the control. Use this value to map a list to a form and a form to a workflow. • Prefix with **@** to use the value of the control as an attribute with the immediate parent node. For example, `@FirstName`. • Use **/** for a parent-child node configuration to uniquely identify a control in a form with multiple containers. For example, `Employee/FirstName`. The default value is the value for the **Name** property without the spaces.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	Note: - If you use **/** to denote a parent which is not a container and the parent is at the same level as that of the child, then the XML node for the control is not generated. - If you edit this value later, then it might affect the mapping between forms, lists, and workflows.
Description	Description for the control.
Default Value	The default value for the control.
Widget Type	Select the widget type from the drop-down list. The widget types available are: Inline, Embed, and Form.
Widget	Select the available widget. This property is available when the selected widget type is **Inline** and **Embed**.
Configuration	Select the available configuration. This property is available when the selected widget type is **Inline** and **Embed**.
Form Details	Applicable for **Form** widget type. Provide the **Form Details**. To select the form, 1. In the **Form Name** box, select a form name. 2. In the **Form Version** box, select a form version. 3. Click **Save & Continue**. The selected form is embedded in the widget, and the **Form Details Configuration** page is closed. For more information, see Configure Communication between Widget Control and Form.

Appearance

Property	Description
Style	Height and Width in pixels for the control. The default value for Height and Width is **0**. **Note:** If the value is 0, then the height and width of the control is set as per the default values.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	- The characters **< > &** are not supported. - The only supported value for height and width is the pixel.
In Designer	Option to view the space taken by the Widget as per the Style property in Design mode.
Visible	Show or hide the control. • Select **Yes** to show the control. • Select **No** to hide the control. The default value is **Yes**.
Label Position	Position of the label for the control. • Select **Default** to allow the system to align the label. The system aligns the label to the left of the control or as specified by the container control. • Select **Left** to align the label to the left of the control. • Select **Top** to align the label to the top of the control. • Select **Right** to align the label to the right of the control. • Select **Bottom** to align the label to the bottom of the control. • Select **Suppress** to hide the label for the control. The default value is **Suppress**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label Position** property of the container control determines the position of the label for the control. - For example, if the value is **Default** and the control is placed on a **Base Form** with **Label Position** property set to Top, then the label is aligned to the top of the control.
Label-Control Area	Area occupied by the label and the control in percentage. • Select **Default** to allow the system to set the label

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	and the control areas. • Select **Custom** to specify the label area. The control area is automatically set based on the label area. The default value is **Default**. **Note:** - If the value is **Default** and the control is placed on a container control, then the value of the **Label-Control Area** property of the container control determines the area of the label for the control. - This is applicable only when the **Label Position** is set to **Left** or **Right**.
Consider Available Height	Resize the height of the control or container based on the available height. • Select **Yes** to resize the height based on available height. • Select **No** to retain the space. The default value is **No**. **Note:** - The Consider Available Height property is not applicable for the following: -Designer view -Print form -Panel form with horizontal tab order - If this property is set to **Yes** and a value is specified in the **Height** property, minimum height is considered. - This property is applicable only in web view. - When more than one control or container is set with **Consider Available Height** at the same level of container or form, then the available space is distributed evenly between those controls or containers. For example, consider a Form which contains two Panel forms with **Consider Available Height** set to **Yes**, where Panel form 1 has two TextInput controls and Panel form 2 has one TextInput control. The Panel form 1's height is more than Panel form 2's height as Panel form 1 contains two TextInput controls and the available empty space in the form is evenly distributed between the two Panel forms.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Retain Space	Reserve or remove space when the control is hidden. • Select **Yes** to keep space when the control is hidden. • Select **No** to remove space when the control is hidden. The default value is **No**.
Custom Style Sheet Identifier	Prefix for the CSS class name in the custom style sheet. For information about using custom style sheets, see Custom Styles. **Note:** The value must start with an alphabet and can contain only alphanumeric characters.

Advanced

Property	Description
On Data Change	Run a script when value of the control changes. For more information, see scripting guidelines for On Data Change property.
ID	Reference identification code for the control. This value is automatically generated and cannot be changed.
Add Values as Url	Option to add values as URL parameters. • Select **Yes** to enable adding values as URL parameters. • Select **No** to disable adding values as URL parameters. For more information, see Configure Communication between Widget Control and Form.
Widget Properties	The widget properties are listed based on the **Widget** selected in the control, when the **Widget Type** is **Inline** or **Embed**. See the respective Widget documentation for the available widget properties. • Grid Widget

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	• Hierarchy Selector Widget If the **Widget Type** is **Form**, the Form Parameters are listed based on the **Form Details** property of the control. For more information, see Configure Communication between Widget Control and Form. **Note**: Form Parameters are considered as **Widget Properties** for the Widget control irrespective of the data type. The **Widget Properties** are always represented as String data type.

Scripts

For information about using scripts, see scripting guidelines for Widget control.

Dynamic Widget Properties and Events

The widgets support dynamic properties and events. The following dynamic properties and events are defined in a **wjson** file. Localizing the dynamic properties and events is supported through a localization text file in AVEVA Work Tasks.

Widget	Property	Event
Grid	notify	onCellChange
	data	onInitialize
	prevRowValue	onRowSelection
	newCellValue	
	modifiedRows	
	selectedRow	
	selectTopGridItem	
Hierarchy Selector	data	onInitialize
	selectedObj	onSelectionChange
	selectedvalue	
	selectNode	

Each widget has its own **wjson** file (**BaseGrid.wjson**, **HierarchySelector.wjson**). You can use the corresponding widget wjson file to update the names of its properties and events accordingly.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

You can access the **wjson** file in the following folders:

- *<WorkTasksInstallPath>***\Web\BPMUITemplates\Default\NextGenForms\custom\Widgets\BaseGrid**
- *<WorkTasksInstallPath>***\Web\BPMUITemplates\Default\NextGenForms\custom\Widgets\HierarchySelector**

Add or Edit a Dynamic Property or Event

Update the corresponding section of the **wjson** file to add or edit a dynamic property or event.

Note: Whenever you update the **wjson** and localization text files, you need to reset the IIS.

1. Depending on the task you want to do, perform either of the following:
   - To add a new dynamic property or event:
     a. Copy an existing item and paste into the section where you want to insert it.
     b. Assign a unique sequence number. Any number that isn't used yet in the file. If there's a duplicate sequence number, the application displays the first property in the list and ignores the other one.
     c. Add the new name for the property or event and save the file.

     Note: Ensure that you don't miss a syntax element in the file such as comma (,). If something is missed, the properties are not shown in the Properties page. The issue related to this is logged in the WTLogger Console.

     The following example is a **wjson** file for the Hierarchy Selector widget.

   - To edit an existing property or event entry, update the name of the corresponding property or event, and save the file.
2. If you are editing or updating the name of an existing property or event, you also need to update the localization text file.

   You can access these localization files from *<AVEVAWorkTasksInstallPath>***\Locales\en-US\Forms2\Standard**.
   - **Forms_AWT***<VersionNumber>***_BaseGrid.txt**
   - **Forms_AWT***<VersionNumber>***_HierarchySelector.txt**

     If you want to set a newly created property or event for localization, add it to the localization file. Follow

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the existing text format to avoid encountering some issues.

Note: If the name of the new property or event isn't added in the localization file, the application takes the name defined in the **wjson** file.

Grid Widget

The Grid widget allows you to display a dynamic data based on a configured dataset. With this widget, you can configure:

- How data is rendered within the grid
- What text to display in the column headers
- Whether the data in a cell or column is editable or read only. If it is editable, whether it is an input field or a dropdown list
- A tooltip to display the full details of a truncated data in a cell
- The column width

  Note: An option to adjust the column width using the mouse is available.
- Column data filtering, sorting, and reordering
- The number of records to display per page
- Column data types and cell background color

Properties

The Grid widget uses the following properties and some of them are defined as a function in a configuration file. For information on how the properties are used, see Grid widget properties usage. The following table describes the supported Grid properties:

Property	**Supported datatype**
Notify	Object *This is an object converted to a JSON string through JSON.stringify() method*.
Data	Object *This is an object converted to a JSON string through JSON.stringify() method*.
Previous Row Value	Object *This is an object converted to a JSON string through JSON.stringify() method*.
New Cell Value	String
Modified Rows	Object *This is an object converted to a JSON string through JSON.stringify() method*.
Selected Row	Object

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Supported datatype
(selectedRow)	*This is an object converted to a JSON string through JSON.stringify() method*.
Select Top Grid Item (selectTopGridItem	Object *This is an object converted to a JSON string through JSON.stringify() method*.

Limitations

- Tooltip is not supported in datetime and numeric datatypes.
- The widget's numeric text box has a precision limitation of up to 16 digits only. Numbers longer than 16 digits are converted to exponential numbers and lose their precision.

Grid Widget Properties Usage

The Grid widget is using the following properties to handle incoming or outgoing data and event.

Notify

This property is used for data validation inside the configuration file to pass a validation script in the **On Cell Change** event property of the widget in the Properties' **Scripts** tab. For example validation script, see Validate Data.

This is also used to provide additional functionality like in the **//notify operations** section of the code, where you can use the filter, export, reset, and clear filter operations through scripting.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
//notify operations
cwidget.on("notify", function () {
    var grid = $(widgetObject.baseGrid.domElement).children("#kendogrid").data("kendoGrid");
    var notifyobj = JSON.parse(cwidget.notify);
    var functionName = "";
    var fileType = "";
    var field = "";
    var operator = "";
    var value = "";
    var validationResult = false;
    if (notifyobj != null && notifyobj.Functionname != null)
    {
        functionName = notifyobj.Functionname.toUpperCase();
    }
    switch (functionName) {
        case "EXPORT":
            if (notifyobj.Filetype != null)
            {
                fileType = notifyobj.Filetype.toUpperCase();
            }
            if (fileType == "PDF") {
                grid.saveAsPDF();
            }
            else if (fileType == "EXCEL") {
                grid.saveAsExcel();
            }
            break;
        case "RESETSORTORDER":
            grid.dataSource.sort({});
            break;
        case "CLEARFILTER":
            grid.dataSource.filter({});
            break;
        case "FILTER":
            field = notifyobj.field;
            operator = notifyobj.operator;
            value = notifyobj.value;
            grid.dataSource.filter({
                "field": field,
                "operator": operator,
                "value": value
            });
            grid.dataSource.read();
            break;
        case "VALIDATE":
            validationResult = notifyobj.result;
            if (validationResult == false){
                e = widgetObject.baseGrid.event;
                e.preventDefault();
            }
            break;
```

For example, you can use the following scripts when you want to export data to either PDF or Excel:

```
control.findByXmlNode("grid1").widgetProperties.notify =
'{"Functionname":"Export","Filetype":"Excel"}';
```

```
control.findByXmlNode("grid1").widgetProperties.notify =
'{"Functionname":"Export","Filetype":"Pdf"}';
```

Note: This operation only exports the data that is currently displayed on the grid, but not the entire list.

For information on other scripts, see the following topics:

- Clear Data Filters
- Reset Grid Data Sort Order Setting
- Filter Data through Scripting

Data

This property is used for incoming data. To bind the data to the Grid widget container, you can use the following example script in an **On Click** event.

```
try {
debugger;
var lookup = SFU.getLookupSchemaAndData("UOMLookup", null, true);
if (lookup.DisplayColumn === "" && lookup.ValueColumn === "" && lookup.Data.length === 0)
throw new Error("Lookup not found!");
control.findByXmlNode(“grid1”).widgetProperties.data = JSON.stringify(lookup.Data);
} catch (error) {
SFU.showError("Lookup Failed!");
}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

In the configuration file, you need to define all the column headers under the **//Columns** and **//Field names with datatypes** sections**.** See the **BaseGrid_conf.js** file.

Previous Row Value and **New Cell Value**

These properties are also used for validation, where the **New Cell Value** property is used to get the edited cell value and **Previous Row Value** is for the old row value.

Modified Rows

This property is used to get the list of rows that are modified with their current values. This syncs with the cell changes. If no modifications are made, this property is empty.

Selected Row

This property is used to retrieve the corresponding value for each column in a selected row of a Grid widget.

Example

```
try{
var selectedrows =
JSON.parse(control.findByXmlNode("Widget1").widgetProperties.selectedRow);
console.log(selectedrows);
}
catch(e){
}
```

Select Top Grid Item

This property is used to select the first record in a Grid widget for every new session or when the data is loaded for the first time. You need to use this with the **data** property in order to work.

For example, you can use the following script in an **On Initialize** event.

```
control.findByXmlNode("Widget1").widgetProperties.selectTopGridItem =JSON.stringify(true);
var testData = [{
"uom_id": 1,
"description": "Pieces",
"oper_id": "Filling",
"canSchedJobs": true,
"seq_no": 0,
"state_desc": "NEW",
"color": 16776960,
"req_qty": 300000000,
"qty_prod": 100,
"last_edit_comment": "",
"req_finish_time": "2014-02-10T15:20:08Z"
},
{
"uom_id": 2,
"description": "Gram",
"oper_id": "Filling",
"canSchedJobs": true,
"seq_no": 0,
"state_desc": "READY",
"color": 65535,
"req_qty": 600,
"qty_prod": 300,
"last_edit_comment": "",
"req_finish_time": "2014-02-13T15:20:08Z"
}, {
"uom_id": 3,
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
"description": "Count",
"oper_id": "Filling",
"canSchedJobs": false,
"seq_no": 0,
"state_desc": "RUNNING",
"color": 65280,
"req_qty": 800,
"qty_prod": 500,
"last_edit_comment": "",
"req_finish_time": "2014-02-12T15:20:08Z"
}];
control.findByXmlNode("Widget1").widgetProperties.data=JSON.stringify(testData);
```

Grid Widget Event

The Grid widget supports the following events:

- On Cell Change
- On Initialize
- On Row Selection

On Cell Change

Use scripts for the **On Cell Change** event of a Grid widget to validate changes to a cell value.

This event gets the value for the **modifiedValue** and **oldValue** properties of the Grid widget. For more information on validating changes, see Validate Data.

Example

If you want to verify the modified value of a column, you can have a script like in the following example. This verifies that the modified value of the description column is "desc".

When you modify a cell value and remove focus from the cell, the **On Cell Change** event is triggered.

```
var validate = {};
var validate1 = function(validate)
{
var modified = (JSON.parse(event.modifiedvalue));
//To get a modified value of a column name (example: description)
var description = (modified).description;
// To check a column value (example: description column has a value of a sample string
value "desc")
if (description=="desc")
{
validate.result = true;
}
else
{
validate.result = false;
}
validate.Functionname = "Validate";
return validate;
};
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.findByXmlNode("Widget1").widgetProperties.notify=JSON.stringify(validate1(validate)
);
```

To get the previous row value of a Grid widget, you can use the following script:

```
var oldvalue = (JSON.parse(event.oldvalue));
// To get previous value of a column name: abbreviation
var oldabb = (oldvalue).abbreviation;
// To get previous value of a column name: description
var olddes = (oldvalue).description;
```

On Initialize

Use scripts for the **onInitialize** event of a Grid widget to accomplish a desired operation after the widget control is initialized, but before it is rendered to the UI.

Example

If by default you want to load the actual dataset from a database lookup once the widget is launched, add the script on the **On Initialize** event.

On Row Selection

Use scripts for the **onRowSelection** event of a Grid widget to return a dataset for a selected row in a Grid widget. You can use this with the **selectedRow** property.

Note: This event is ignored when filtering or sorting data, or resizing the Grid widget.

Example

```
try{
var selectedrows =
JSON.parse(control.findByXmlNode("Widget1").widgetProperties.selectedRow);
console.log(selectedrows);
}
catch(e){
}
```

Configure the Grid Widget

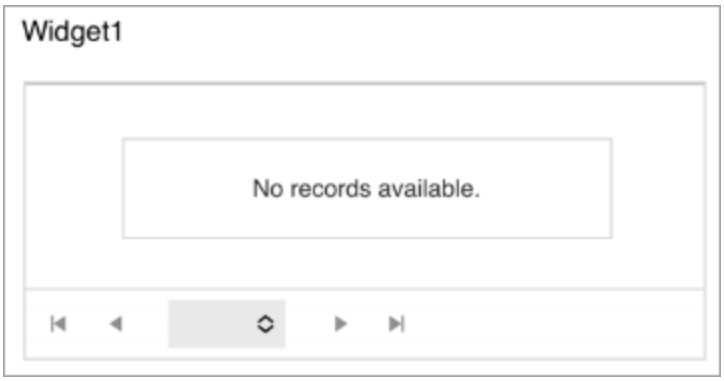
Modify specific sections in the configuration file to meet your required widget settings.

Pass Data to or from the Widget

You can pass data to or from the Grid widget either through a Web API or Database lookup. You need to define the data columns in the configuration file for them to appear in the widget.

If the schema section of the configuration file is missing, removed, or commented out, the widget is shown without columns and looks something like this:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



If the schema is available in the configuration file but no data is defined, the widget appears only with the schema columns and looks something like this:

Note: The screenshots are from an iOS device.

Define Data Columns

Define Data Columns

The data columns must be defined in the following sections of the configuration file to load your own dataset:

- **//Columns**
- **//section for cell datatypes and input field**

Some column headers are listed by default, just like in the following screenshot. You can replace them with the ones in your own dataset.

Note: Hiding column headers can only be done in the JavaScript configuration file and not through the lookup configuration.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// Columns

columns: [{
    field: "wo_id",
    //title: "Workorder",
    title: "Id",
    width: '180px',

},
{
    field: "ProductName",
    width: "200px",
    title: WW_localize("@@WidgetBaseGridProductName@@"),

},

{
    field: "CategoryID",
    width: "200px",
    title:  WW_localize("@@WidgetBaseGridCategory@@"),
    hidden: true,

    template: templateFunction,
    editable: function () {
        return false
    }
},
{
    field: "oper_id",
    title: "Operation",

}, {
    field: "seq_no",
    title: "Seq No",
```

Grid widget supports localization. You have the option to localize the column headers or Grid titles. In the screenshot, the **title** field is used to define the localization's key-value pair. For information on localization, see Localize Widgets.

Clear Data Filters

Clear Data Filters

If you want to clear the currently selected data filter, you can use the following example script with the **On Click** event of a Work Task control, together with the widget's **Notify** property .

```
control.findByXmlNode("grid1").widgetProperties.notify = '{"Functionname":"CLEARFILTER"}';
```

Reset Grid Data Sort Order Setting

Reset Grid Data Sort Order Setting

If you want to reset the sort order setting of the Grid data, you can use the following example script with the **On Click** event of a Work Tasks control.

```
control.findByXmlNode("grid1").widgetProperties.notify =
'{"Functionname":"RESETSORTORDER"}';
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Validate Data

Validate Data

The Grid widget allows you to perform validation at cell level. You can validate data when a user updates a value. Some of the validation rules are provided by default as part of the Grid widget's configuration file (**BaseGrid_SampleData_conf.js**), and include:

- Limiting the number of character string value
- Limiting the number of decimal places for numeric data fields
- Required fields

You can use the default validation or you can perform validation through scripting outside of the widget using other controls. If you create external validation scripts, the Grid widget handles them through a boolean result flag. The following are example validation scripts that the Grid widget recognizes, which you can add to the **On Cell Change** event property of the widget:

```
validate = {}; validate.result=true; validate.Functionname = 'Validate';
control.findByXmlNode("grid1").widgetProperties.notify=JSON.stringify(validate);
```

```
validate = {}; validate.result=false; validate.Functionname = 'Validate';
control.findByXmlNode("grid1").widgetProperties.notify=JSON.stringify(validate);
```

In the example scripts, if the result is true, the widget accepts the new value. If the result is false, the cell value returns to its previous value.

Old and modified values

You can use the following example scripts to get the previous row and new cell values of the Grid with the **On Cell Change** event property of the widget.

Old row value

```
var oldval = (JSON.parse(event.oldvalue));
```

For example, if you want to get the previous row value of a **uom_id** column cell:

```
var uom = JSON.parse(oldval).uom_id;
```

Modified cell value

```
var modified = (JSON.parse(event.modifiedvalue));
```

For example, if you want to get the new cell value of a **uom_id** column cell:

```
var uom = JSON.parse(modified).uom_id;
```

Disabling default validation

If you want to do the validation outside the widget, remove or comment out the validation section in the code.

The highlighted validation section in the following screenshot is for validating the required fields and character string limit respectively.

Note: Character string limit validation works on edit mode and not on initial data load.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
118             // section for cell datatypes and input field.
119             schema: {
120                 model: {
121                     id: "uom_id",
122                     fields: {
123                         uom_id: { type: "number", editable: false },
124                         description: {
125                             editable: true,
126                             defaultValue: "",
127                             validation: {
128                                 required: true,
129                                 maxlength:"10",
130                             }
131                         },
```

The validation for limiting the number of decimal places is added to one of the example fields. Search for the **weightEditor** line in the code, which serves as the placeholder code for limiting the number of decimal places.

```
222             field: "req_qty",
223             title: "Req Qty",
224             attributes:{class:"number"},
225             editor: weightEditor,
226              template: function (dataItem) {
227                 return widgetObject.baseGrid.formattedNumber(dataItem.req_qty,3);
```

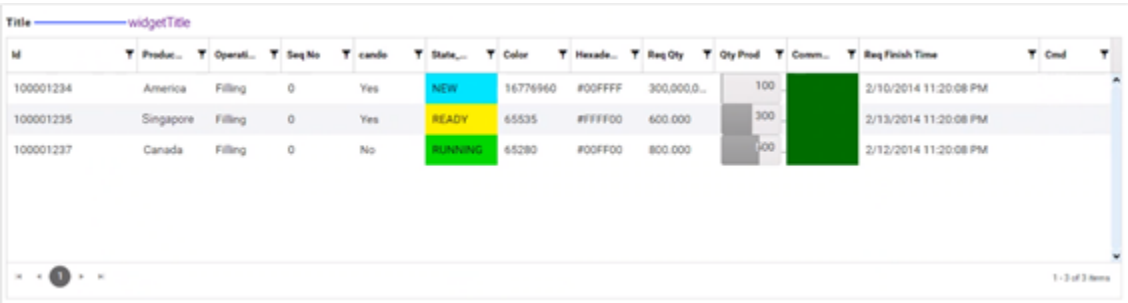
Grid Widget Configurable Parameters

Configurable parameters are provided in the configuration file to give you the option to change widget default settings.

Modify Grid Widget Title

Modify Grid Widget Title

The Grid widget's user interface label property that you can configure is marked in the following screenshot. Localizing this property is also supported. For localization information, see Localize Widgets.



To modify the title, under the code's **var conf** line, update the **widgetTitle** property accordingly. By default, this property is mapped to the value defined in the localization text file (**Forms_AWT2020U2_BaseGrid.txt**). You can access the text file from *<AVEVAWorkTasksInstallPath>***\Locales\en-US\Forms2\Standard**.

```
84          var conf = {
85              widgetTitle: WW_localize("@@WidgetBaseGridWidgetTitle@@"),
```

If you don't want to localize this property, simply enter the title that you want to appear in the UI. You can either remove the "**WW_localize...**" value or comment it out as highlighted in the following screenshot.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
var conf = {
    widgetTitle: "GridTitle", //WW_localize("@@WidgetBaseGridWidgetTitle@@")
```

Modify Column Width and Column Headers

Modify Column Width and Column Headers

You can modify column width and column headers using the **width** and **title** properties under the **//Columns** section of the configuration file. The default value for the width in each of the columns enables the widget to properly render and adjust data display. A scroll bar appears if there are more columns to display.

Note: If a **title** is not specified, the value for the **field** property is displayed.

```
// Columns

columns: [{
    field: "wo_id",
    //title: "Workorder",
    title: "Id",
    width: '180px',

},
{
    field: "ProductName",
    width: "200px",
    title: WW_localize("@@WidgetBaseGridProductName@@"),

},

{
    field: "CategoryID",
    width: "200px",
    title:  WW_localize("@@WidgetBaseGridCategory@@"),
    hidden: true,

    template: templateFunction,
    editable: function () {
        return false
    }
},
{
    field: "oper_id",
    title: "Operation",

}, {
    field: "seq_no",
    title: "Seq No",
```

Set Number of Records to Display in a Grid Page

Set Number of Records to Display in a Grid Page

You can set the number of records or rows to display on each grid page using the **pageSize** property under the **//Options** section of the configuration file. The Grid loads a maximum of 1000 records.

If in a widget control (or container), the **Consider Available Height** setting is set to *Yes*, the page size value that you set serves as the minimum number of rows to display. If there's an available white space, such as when resizing the browser window so that it increases the height of the widget, the Grid widget fills it with more rows or records.

If the **Consider Available Height** setting is set to *No* and you specify a fixed height, the Grid widget takes the page size value and fills the available white space accordingly based on the fixed height. When resizing the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

browser window, the size of the Grid widget remains the same; it still has the same height and the same displayed records, and only the browser window size changes.

```
// Options
noRecords: true,
filterable: {
    mode: "menu"
},
resizable: true,
sortable: {
    mode: "multiple",
    allowUnsort: true,
    showIndexes: true
},
editable: true,
selectable: true,
scrollable: true,
persistSelection: true,
pageable: {
    pageSize: 7,
    position: "bottom",
    responsive: true
},
```

Configure Cell Datatypes and Input Field

Configure Cell Datatypes and Input Field

You can configure the cell datatypes and input field under the **//section for cell datatypes and input field** section of the code within the configuration file. In this section, you can modify the listed fields, input field behavior, and their datatypes.

```
// section for cell datatypes and input field.
schema: {
    model: {
        id: "uom_id",
        fields: {
            uom_id: { type: "number", editable: false },
            description: {
                editable: true,
                defaultValue: "",
                validation: {
                    required: true,
                    maxlength:"10",
                }
            },

            period1: { type: "string", editable: true },
            period: { type: "string", editable: true },

            CategoryID: {
                editable: true,
                field: "CategoryID",

            },
            oper_id: { type: "string", editable: false },
            canSchedJobs: { type: "boolean", editable: true },
            seq_no: { type: "number", defaultValue: 0, editable: true, validation: { required: true, min: 0 } },
            state_desc: { editable: false },
            color: { type: "number" },
            req_qty: { type: "number", editable: true },
            qty_prod: { editable: true },
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configure Column Background Color

Configure Column Background Color

You can configure the column background color under the **//column background color** section.

```
, {
   field: "last_edit_comment",
   title: "Comment",
   //column background color
   attributes: {
       style: "background-color: green",
   },
```

Add Column-value Tooltip

Add Column-value Tooltip

Enable tooltip for each column row value at the column level. To add a tooltip, add a **template** key right after the column header, as shown in the following screenshot.

```
   {
       field: "description",
       template: "<span title='#:kendo.toString(data.description, \"n4\")#'>#:description#</span>"
   },
```

Grid widget UI controls

The following are some of the UI controls that you can use within the Grid widget:

- Datetime picker
- Drop-down list
- Progress bar
- Textbox
- Number control

Most of the codes that enable or add these controls are already available in the configuration file (**BaseGrid_SampleData_conf.js**) as placeholder codes. If you don't want to use them, you can just remove or comment out the sections.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Add Progress Bar in Grid Column

Add Progress Bar in Grid Column

You can add a progress bar through the following code updates. There are two sections in the configuration file that you need to update to add a progress bar.

- In the **//Columns** section where all the column headers are defined, add a **template** key in the column header where you want to add a progress bar. The following screenshot is an example from the configuration file.

```
230         }, {
231             field: "qty_prod",
232             title: "Qty Prod",
233             //progress bar
234             template: "<div class='progress'  style='width: 100%;'></div>"
235         }, {
```

- In the **//adding progress bar** section, you can update the code similar to the following screenshot, depending on your requirement.

```
300             //adding progress bar
301             grid.tbody.find(".progress").each(function (e) {
302                 var row = $(this).closest("tr");
303                 var model = grid.dataItem(row);
304                 $(this).kendoProgressBar({
305                     max: model.req_qty,
306                     value: model.qty_prod,
307                     change: function (e) {
308                         e.progressWrapper.css({
309                             "background-color": "green",
310                             "border-color": "blue"
311                         });
```

Add Datetime Picker

Add Datetime Picker

Add a datetime picker for a particular field using the code under the **//adding Datetime picker** section of the configuration file. You can comment it out if you don't want to use it.

```
254 field: "req_finish_time", title: "Req Finish Time", format: "{0:dd MMM yyyy HH:mm:tt}", width: '250px',
255 //adding Datetime picker
256 editor: function (container, options) {
257         var input = $("<input/>");
258         input.attr("name",options.field);
259         input.appendTo(container);
260         input.kendoDateTimePicker({});
261 },
262 template: function (dataItem) {
263     return widgetObject.baseGrid.formattedDateTime(dataItem.req_finish_time);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Add Drop-down List

Add Drop-down List

You can use the following codes to have a drop-down list instead of a text input field. There are placeholder sections in the configuration file that you need to update to have a drop-down list in your own dataset.

- The **//adding drop down** section that defines the drop-down function. Update the code depending on which column you want to add the drop-down list.

  In the following code, the **"comment"** value is linked to the **var testDataCat** section of the code. If you use this code as is, that **testDataCat** section is where the values for the drop-down list are defined.

```
86      //adding drop down
87      widgetObject.baseGrid.categoryDropDownEditor = function (container, options) {
88
89          $('<input required name="' + options.field + '"/>')
90              .appendTo(container)
91              .kendoDropDownList({
92                  autoBind: false,
93                  dataTextField: "comment",
94                  dataValueField: "comment",
95                  dataSource: {
96                      //type: "odata",
97                      transport: {
98                          read: widgetObject.baseGrid.CatDataSourceRead
99                      }
100                 }
```

- For every column field to which you want to put a drop-down list, you need to have the following highlighted code, modified based on your dataset.

```
236                 field: "last_edit_comment",
237                 title: "Comment",
238                 //column background color
239                 attributes: {
240                     style: "background-color: green",
241                 },
242                 editor: widgetObject.baseGrid.categoryDropDownEditor,
243                 //dropdown
244                 template: function (dataItem) {
245
246                     if (typeof (dataItem.last_edit_comment) == 'undefined')
247                         dataItem.last_edit_comment = "";
248
249                     return dataItem.last_edit_comment;
250                 }
```

- The **var testDataCat** section. This is only for test values.

```
299     var testDataCat = [{
300         "comment_id": 1,
301         "comment": "Positive2",
302     }, {
303         "comment_id": 2,
304         "comment": "Neutral2",
305     }, {
306         "comment_id": 3,
307         "comment": "Negative2",
308     }];
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Sort, Filter, and Reorder

The Grid widget comes with sorting, filtering, and reordering features. Sorting data is based first on datatype and then sorted in alphabetical order for a single column at a time.

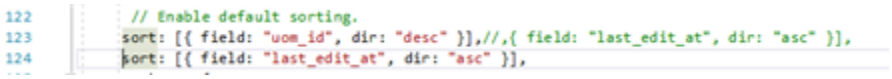
Filtering data can be applied to multiple columns. The grid persists the order of sorted and filtered data, and when you refresh the data through scripting, it keeps the sorted or filtered order too.

Note: The funnel icon is highlighted to indicate a filtered column.

Change Default Sorting Behavior

Change Default Sorting Behavior

You can change the default sorting behavior in the **//Enable default sorting** section of the configuration file.



Filter Data through Scripting

Filter Data through Scripting

You can use the following script with any of the Work Tasks controls to filter data.

```
control.findByXmlNode("grid1").widgetProperties.notify =
'{"Functionname":"FILTER","field":"description","operator":"startswith","value": "g"}';
```

Column Data Alignment

The column data is left aligned by default. If you want to align the data to the right, you are given the option to do that in each of the columns.

In the configuration file, add a line for **attributes** to set the class defined in the **Grid.style.css** file. You can find the css file in this location: <*AVEVAWorkTasksInstallPath*>**\Web\BPMUITemplates\Default\NextGenForms\custom\Widgets\BaseGrid\css**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Hierarchy Selector Widget

The Hierarchy Selector widget allows you to navigate to a multi-level dataset, and select a particular item class or category depending on the dataset you use it with.

This widget has a parent-child structure and requires a minimum of 2 levels. It accommodates the highest to the lowest level of data, where the parent node or highest level item can have another level of data.

With this widget, you can configure:

- The widget title, header, and the parent-child node section captions
- Color for selected parent and child nodes

Properties

The Hierarchy Selector widget uses the following properties and defines them as a function in a configuration file. For information on how the properties are used in the configuration file, see Hierarchy Selector Widget Properties Usage.

The following table lists the supported Hierarchy Selector properties and the type of data it accepts.

Property	Supported Datatype
Data	Object *This is an object converted to a JSON string through JSON.stringify() method*.
Selected Object	Object *This is an object converted to a JSON string through JSON.stringify() method*.
Selected Value	*This depends on the type of the returned property, which is defined in the* **nodesMapping** *or* **defaultNodesMapping** *section of the configuration file. The returned value is converted to a JSON string.*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Hierarchy Selector Widget Properties Usage

The following sections describe how the Hierarchy Selector widget properties are used in the configuration file.

Data

This property is defined as a function and this is called for incoming data.

```
//Subscribe to data property to handle new set of parent child node
cwidget.on('data', function () {
    if (typeof cwidget.data != 'undefined' && cwidget.data !== '') {
        try {
          // pass in data will be stringify
          widgetObject.hs.updateWidget(JSON.parse(cwidget.data));
        }
        catch(ex){
          alert(WW_localize("@@WidgetHSErrorSetDataConvertToObject@@")+ ex);
        }
    }
      else{
        alert(WW_localize("@@WidgetHSErrorSetDataConvertToObjectFromEmptyUndefined@@"));
    }
});
```

Incoming data is handled through the **defaultNodesMapping**, **nodesMapping,** and **nodesValue** sections in the configuration file.

The dataset you are using needs to follow the **nodesValue** structure. If there are changes to the **nodesValue** properties, you need to update the **nodesMapping** properties to match those changes. If there are no changes, then you can remove the **nodesMapping** section from your script. The configuration file will then use the **defaultNodesMapping** settings.

Under the **nodesValue** section in the following screenshot is the example data structure that the widget recognizes.

The entire tree structure needs to be passed to the widget and is not necessarily built as you select node.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
var testData =
{
  "nodesMapping" :
  {
    "groupName" : "GroupName",
    "groupNodes" : "UtilizationReasonGroups",
    "showGroupAsEnabled": "IsEnable",
    "childNodes" : "UtilizationReasons",
    "childName" : "Name",
    "childColor" : "EquipmentState.Color",
    "selectedChildNodeValue": "Name"
  },

  "nodesValue" :
  [{
    "GroupName": 'Changeover',
    "IsEnable" : false,
    "UtilizationReasonGroups": [],
    "UtilizationReasons":
    [{
      "Name": 'Changeover1',
      "EquipmentState":
      {
        "Name": 'DOWNTIME',
        "Color": '#DC0A0A',
      },
    },
    {
      "Name": 'Changeover2',
      "EquipmentState":
      {
        "Name": 'RUNNING',
        "Color": '#009848',
      },
    },
    {
      "Name": 'Planned Changeover',
      "EquipmentState":
      {
        "Name": 'PLANNED DT',
        "Color": '#F5A623',
      },
    },
```

Selected Object and **Selected Value**

These properties are defined in the configuration file for outgoing data with the **selectedChildNode** function. For example scripts see Pass Data to and from Widget.

Select Node

This property is used to take an object with any number of property value pairs for comparison. Using this property, you can set a default value or persist a node selection in a hierarchy.

Note: The **On Selection Change** event is triggered when the same node is selected through this property. This is because before selecting a child node, its parent node is selected first, where null is omitted. After that, the child node that you want is selected. So on each API call, if there's a matching node, there are two **On Selection Change** events received.

API parameter:

```
{
childNode:{
property1:value1,
property2:value2,
:
}
}
```

Example

```
control.findByXmlNode("Widget1").widgetProperties.selectNode = JSON.stringify(
{
childNode:{
reasonGroupID : 15,
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
reasonID: 20,
}
});
```

Validation scenarios

There are scenarios where the Hierarchy Selector widget doesn't work as expected, which includes the following:

- If a node selection cannot be found, an error is thrown in the console log. No error is shown in the UI and no error code is returned.
- If the **childNode** parameter isn't defined correctly, an error is thrown in the console log.

  For example:

  ```
  control.findByXmlNode("Widget1").widgetProperties.selectNode = JSON.stringify(
  {
  childNode123:{
  reasonGroupID : 15,
  reasonID: 20,
  }
  });
  ```

- If the **childNode** value is null or empty, or isn't an object (such as numeric value), an error is thrown in the console log.

  For example:

  ```
  control.findByXmlNode("Widget1").widgetProperties.selectNode = JSON.stringify(
  {
  childNode:null
  });
  or
  control.findByXmlNode("Widget1").widgetProperties.selectNode = JSON.stringify(
  {
  childNode:{ }
  });
  or
  control.findByXmlNode("Widget1").widgetProperties.selectNode = JSON.stringify(
  {
  childNode:5
  });
  ```

- Error without calling JSON stringify (UI error)

  For example:

  ```
  control.findByXmlNode("Widget1").widgetProperties.selectNode =
  {
  childNode:{
  reasonGroupID : 15,
  reasonID: 20,
  }
  };
  ```

Hierarchy Selector Events

The Hierarchy Selector widget supports the following events:

- On Initialize

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- On Selection Change

On Initialize

Use scripts for the **On Initialize** event of a Hierarchy Selector widget to accomplish a desired operation after the widget control is initialized, but before it is rendered to the UI.

Example

If by default you want to load the actual dataset from a database lookup once the widget is launched, add the script on the **On Initialize** event.

On Selection Change

Use scripts for the **onSelectionChange** event of a Hierarchy Selector widget to perform a particular operation when transitioning from select to deselect state.

This event is triggered when a child node is selected or deselected. A child node is deselected when a parent or group node is selected, or a breadcrumb trail is selected. When the same child node is selected multiple times continuously or there is a constant deselect state, this event is triggered only once.

When a child node is selected or deselected, the value is fetched from the widget's **Selected Object** and **Selected Value** properties through scripting. A stringify null value is passed through the **Selected Object** (selectedObj) and **Selected Value** (selectedValue) properties on a deselect state.

Example

In the following example the **selectedObj** and **selectedValue** widget properties are used to passed the value of the selected reason object and the different properties within the reason object into the specified controls.

```
if(control.findByXmlNode("Widget1").widgetProperties.selectedObj != null &&
control.findByXmlNode("Widget1").widgetProperties.selectedObj != '')
{
var x = JSON.parse(control.findByXmlNode("Widget1").widgetProperties.selectedObj);
var y = JSON.parse(control.findByXmlNode("Widget1").widgetProperties.selectedValue);
var v = null;
if(x != null)
{
for(var prop in x)
{
if(x.hasOwnProperty(prop))
{
v = v+ prop + ": "+x[prop] + "\n";
}
}
control.findByXmlNode("ReasonAttribute1").value = x.reas_cd;
control.findByXmlNode("MESReasonselectedGroupID").value = x.reas_grp_id;
control.findByXmlNode("ReasonAttribute2").value = x.reas_desc;
control.findByXmlNode("ReasonAttribute3").value = x.color;
}
else
{
control.findByXmlNode("ReasonAttribute1").value = "";
control.findByXmlNode("MESReasonselectedGroupID").value = "";
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.findByXmlNode("ReasonAttribute2").value = "";
control.findByXmlNode("ReasonAttribute3").value = "";
}
var z = 'selected Value :'+y + "\n";
z += 'selected Obj :'+v;
control.findByXmlNode("selectedValueWidget2").value = '' + y;
control.findByXmlNode("ReturnwholeObjectvaluesWidget2").value = z;
}
```

Configure Hierarchy Selector Widget

Modify specific sections in the configuration file to meet your required widget settings.

Pass Data to and from Widget

The Hierarchy Selector uses the widget's **Data** property for incoming data and the **Selected Object** and **Selected Value** properties for outgoing data. The data must be in a JSON string (*stringify*) format to be recognized and passed to and from the widget.

To see the supported data structure and how **Data, Selected Object,** and **Selected Value** are used in the configuration file, see Hierarchy Selector Widget Properties Usage.

The following are examples of how the **Selected Object** and **Selected Value** properties are used for scripting to return an object (which is the selected child node) with all its properties and to return a specific object property, respectively. In both cases, the script is added to a property in a Work Tasks control.

In the following examples, the scripts are added to the **Value** property of a textbox control.

To retrieve the value returned for the **selectedObj** *property*

```
var temp = control.findByXmlNode("Widget1").widgetProperties.selectedObj;
var v ="";
if(temp != undefined && temp != "")
{
var reason = JSON.parse(temp);
if(reason != null)
{
for(var prop in reason)
{
if(reason.hasOwnProperty(prop))
{
//console.log(prop + ": "+reason[prop]);
v = v+ prop + ": "+reason[prop] + "\n";
}
}
}
}
return v;
```

To retrieve the value returned for the **selectedValue** *property*

```
var temp = control.findByXmlNode("Widget1").widgetProperties.selectedValue;
if(temp != undefined && temp != "")
{
return JSON.parse(temp);
}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
else
{
return "";
}
```

The selected child node can either return an object or a specific object property. If it returns an object, the returned data is passed to the **Selected Object** property. If it is a specific object property, then the data is passed to the **Selected Value** property. You can define the specific object property under the **defaultNodesMapping** section of the configuration file.

If you want to access any of the properties of the returned object, the following is an example script that you can use, where it returns the value for the specified property or column field.

To retrieve the value of any property from the returned object

```
var temp = control.findByXmlNode("Widget1").widgetProperties.selectedObj;
if(temp != undefined && temp != "")
{
var reason = JSON.parse(temp);
if(reason != null)
{
return reason.reas_cd;
}
else
{
return "";
}
}
else
{
return "";
}
```

Load Hierarchical Dataset

Load Hierarchical Dataset

The Hierarchy Selector widget supports a tree data structure. If your dataset does not match this structure, you need to create your own utility helper to convert your current structure to the supported tree structure. To see the supported tree structure, see the test data section in the **Hierarchy_SampleData_conf.js** file**.**

The Hierarchy Selector supports an **On Initialize** event property for scripting. For example, if by default, you want to load the actual dataset from a database lookup once the widget is launched, add your script in **On Initialize.** But if you are using the **Hierarchy_SampleData_conf.js** file, the widget loads the sample data first, and then triggers the script in **On Initialize.**

During runtime, if you switch to a different configuration file, the widget triggers the script in the **On Initialize** event. If you switch to a configuration with sample data, the same behavior described applies—the widget loads the sample data first—and then calls the script in the **On Initialize** event.

To load the parent-child hierarchical dataset

1. In the corresponding widget configuration file, define the dataset that you want to load under the **defaultNodesMapping** section. The section looks similar to the following:

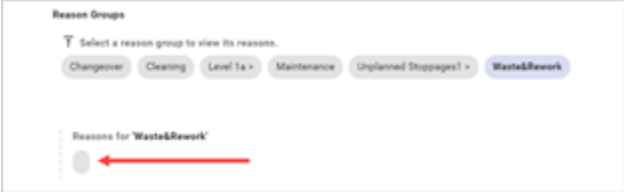
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// defaultNodesMapping is used to map property name use in incoming data.
// It will be used if nodesMapping is NOT supplied
defaultNodesMapping :
{
    "groupName": "",  // required
    "groupNodes": "", // required
    "showGroupAsEnabled": "", // optional, map to property name to show group
    "childNodes": "", // required
    "childName": "",  // required
    "childColor": "",  // optional, it can be null or empty string. If null or
    "selectedChildNodeValue": "" // optional, property name of return object.
},
```

2. Replace the current value for each of the properties listed with the ones that you have in your dataset. You can use the test data to see how this works. For info on using the test data, see Using the test data in Hierarchy Selector .

Things to take note of:

- If the **groupName** and **childName** properties under the **defaultNodesMapping** section are incorrectly mapped, their corresponding data doesn't get loaded, and you see an empty node image like in following screenshot. To resolve this issue, check your configuration file and fix the column mapping accordingly.



- The value that you specify for each of the listed properties is case sensitive. It must match the name from the dataset to load the data properly.
- The **showGroupAsEnabled** property allows you to map a property or a column name in a dataset to indicate if a group or parent node is selectable or not through an enable or disable visual cue.

  The value of the mapped column name or property is expected to be a boolean data type, where in, if the value is **False**, the parent or group node is shown as disabled and takes the color assigned to the **defaultParentDisabledColor** property in the configuration file. If the value is **True**, the node's color is kept as is, where it takes the color assigned to the **defaultParentNonSelectedColor** property.
- The **childColor** property supports a **null** value. If no color is specified, then the widget uses the default color of the selected child item**.** For information on the default color of the selected child node, see Set Color for Child Node.
- The following are the supported color codes. It also supports the actual color name. For example, **green**, **blue**, and so on.

	Color	Example
	Hex	#ff0000
	RGB	rgb(255, 0, 0)
	HSL	hsl(0, 100%, 50%)

If you provide an invalid color code or string, a color rendering issue is encountered. For example, **#Z34FF9**, **"#blue"**. To fix it, correct the invalid value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Override the Hierarchy Selector's Default Behavior for Selected Child Node

Override the Hierarchy Selector's Default Behavior for Selected Child Node

The Hierarchy Selector widget provides an option to override its default behavior on handling returned data (selected child node).

By default, selected child node is returned as a data object and passed through the widget's **Selected Object** property. The widget also provides an option to return a specific data object property through the function parameters defined in the configuration file. This specific object property is passed through the widget's **Selected Value** property.

To override the widget's default behavior

- Uncomment the **selectedChildNode** function section in the configuration file. If you are using the main configuration file (**Hierarchy_conf.js**), look for this section, and modify it accordingly based on the example code provided in the configuration file with sample data:

```
// uncomment selectedChildNode function to provide own customization. The function will be called when child node is selected/deselected.
// parameters:
//           selectedChildObject - selected child node object. Null when deselected.
//           selectedChildValue  - selected child node property value which property name is set in "selectedChildNodeValue" of defaultNodesMapp
// selectedChildNode : function(selectedChildObject,selectedChildValue)
// {
// }
```

  The example code that overrides the widget's selected child node behavior is available in the **Hierarchy_SampleData_conf.js** file, as shown in the following screenshot.

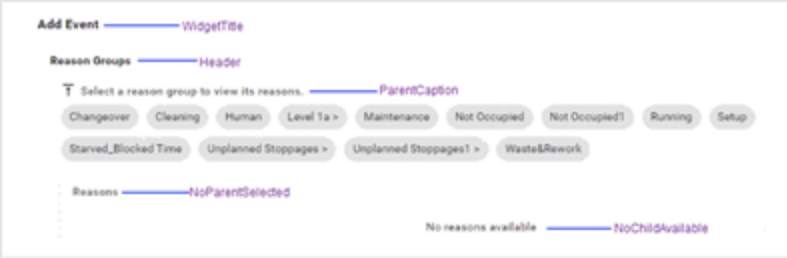
```
// uncomment selectedChildNode function to provide own customization. The function will be called when child node is select
// parameters:
//           selectedChildObject - selected child node object. Null when deselected.
//           selectedChildValue  - selected child node property value which property name is set in "selectedChildNodeValu
selectedChildNode : function(selectedChildObject,selectedChildValue)
{
    // Provide customization on routing extra selected property to value3 and value4
    // (value3 and value4 need to be added in widget.json)
    cwidget.selectedObj = JSON.stringify(selectedChildObject);
    cwidget.selectedValue = JSON.stringify(selectedChildValue);

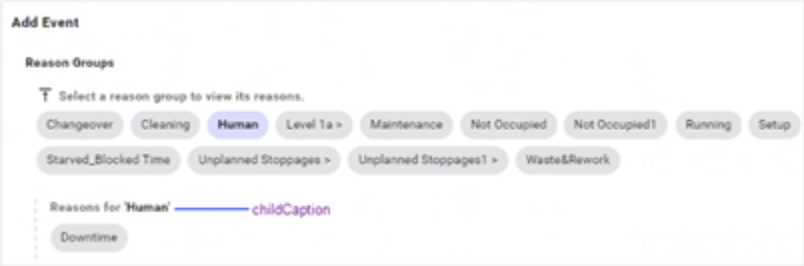
    if(selectedChildObject != null && selectedChildObject.EquipmentState != null)
    {
      cwidget.value3 = JSON.stringify(selectedChildObject.EquipmentState.Name);
      cwidget.value4 = JSON.stringify(selectedChildObject.EquipmentState.Color);
    }
    else
    {
```

Modify Widget Title, Header, and Captions

The user interface label properties that you can configure in the Hierarchy Selector widget are marked in the following screenshots. Localizing these properties is also supported. For localization information, see Localize Widgets.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.





To modify the title, header, and captions in the Hierarchy Selector widget, go to the **//Title, header, and captions** section of the code in the configuration file and update the properties accordingly.

By default, the label properties are mapped to the values that you define in a text file (**Forms_AWT**<*VersionNumber*>**_HierarchySelector.txt)** used for localization as shown in the following screenshot. You can access the text file from <*AVEVAWorkTasksInstallPath*>**\Locales\en-US\Forms2\Standard**.

```
var conf={
    // Title, header, and captions
    widgetTitle : WW_localize("@@WidgetHSTitle@@"),
    header : WW_localize("@@WidgetHSheader@@"),
    parentCaption :WW_localize("@@WidgetHSParentCaption@@"),
    childCaption : WW_localize("@@WidgetHSChildCaption@@"),
    captionNoParentSelected : WW_localize("@@WidgetHSCaptionNoParentSelected@@"),
    widgetHSNoChildAvailable : WW_localize("@@WidgetHSNoChildAvailable@@"),
    noData : WW_localize("@@WidgetHSNoData@@"),
```

If you don't want to localize the label properties, simply enter the value that you want to appear in the UI for each of the label properties. You can either remove the "**WW_localize...**" value or comment it out as highlighted in the following screenshot.

```
40  var conf={
41      // Title, header, and captions
42      widgetTitle : "Title here", //WW_localize("@@WidgetHSTitle@@")
43      header : "Header",
44      parentCaption :WW_localize("@@WidgetHSParentCaption@@"),
45      childCaption : WW_localize("@@WidgetHSChildCaption@@"),
46      captionNoParentSelected : WW_localize("@@WidgetHSCaptionNoParentSelected@@"),
47      widgetHSNoChildAvailable : WW_localize("@@WidgetHSNoChildAvailable@@"),
48      noData : WW_localize("@@WidgetHSNoData@@"),
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Set Color for Parent Node

Keep or modify the assigned default color for the parent node when it is selected, initially loaded and a node is yet to be selected, or to show that it's disabled for selection.

```
// default disabled, select and non-select color for parent node
defaultParentDisabledColor: "#707070",
defaultParentNonSelectedColor : "#E0E0E0",
defaultParentSelectedColor : "#4D5EE03D",
```

Set Color for Child Node

Keep or modify the assigned default color for the child node when it is selected or on its initial display, where nothing is selected yet.

Note: The following default colors are used if the **childColor** property under the **nodesMapping** or **defaultNodesMapping** is not defined.

```
58          // default select and non-select color for child node if child color in nodesMapping or defaultNodesMapping is not defined
59          defaultChildNonSelectedColor : "#E0E0E0",
60          defaultChildSelectedColor : "#4D5EE03D",
```

Localize Widgets

Localize the widget to make it usable with a specific language, script, and culture. Localization for widget works the same way as it's done for AVEVA Work Tasks controls, where the key-value pairs are updated with **@@** prefix and suffix.

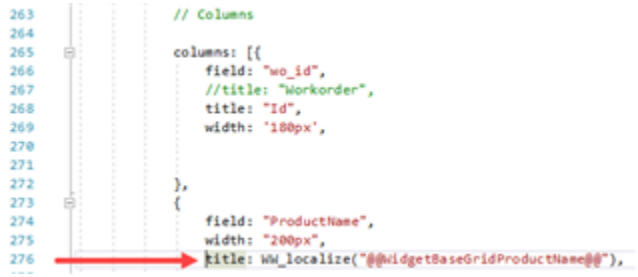
To localize the widget

1. In the corresponding configuration file, do the following:
   - (Hierarchy Selector) In the **//Title, header, and captions** section, keep the default and go to step 2. That section is already set to support localization by default. You only need to ensure that the value of the properties matches the ones in the localization text file.
   - (Grid) You are given the option to localize the Grid title and the different column headers in your dataset. By default, the Grid title is already set for localization, so you can just proceed to step 2. Ensure that the value of the property matches the one in the text file.

     For the column headers, use the **title** field to define the text to localize under the **//Columns** section of the code.

     For example:

     ```
     title: WW_localize("@@WidgetBaseGridProductName@@"),
     ```



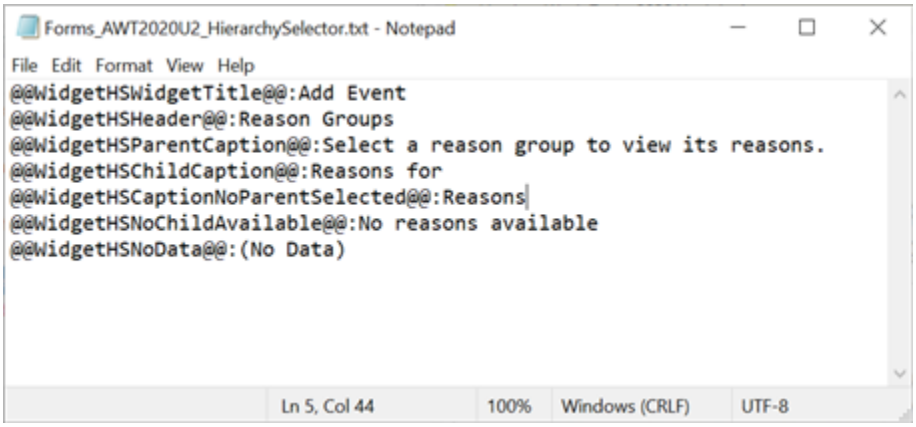
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

This must match the item in the localization text file. For example format of the text file, see Example localization text file.

2. Open each of the widgets' corresponding **wjson** file and check which properties defined in the said file you want to localize. For information on **wjson** file, see Dynamic Widget Properties and Events.
3. Open the corresponding widget text file for localization and define the values for each of the properties. You can access the widget text files from *<AVEVAWorkTasksInstallPath>***\Locales\en-US\Forms2\Standard.**
   - **Forms_AWT***<VersionNumber>***_BaseGrid.txt**
   - **Forms_AWT***<VersionNumber>***_HierarchySelector.txt**
4. To localize for cultures other than English (US), update the **web.config** file and create a separate localization text file for that language. For detailed steps on localizing for other cultures, see *Developer Guide* > *Localization* > *Steps to Localize AVEVA Work Tasks.*

Example localization text file

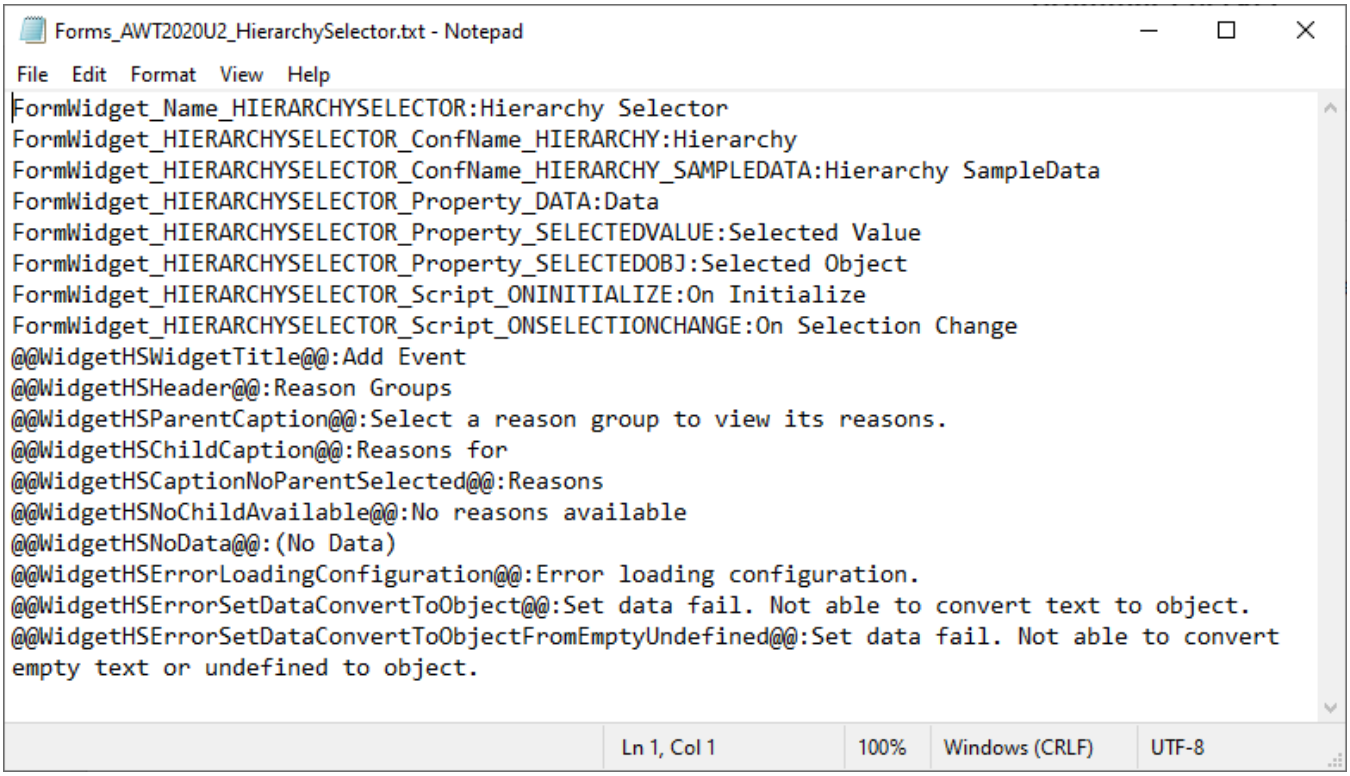
If you want to localize labels and column headers, you need to list them all in the text file like in the following example. The header or label enclosed with **@@** sign must also be defined in the configuration file as described in Localize Widgets.



The widgets are using a **wjson** file to define dynamic properties and events that appear in the AVEVA Work Tasks Properties page. The properties that you want to localize are then listed in the widget's text localization file. The following is an example of localization text file with properties from a **wjson** file.

Note: AVEVA Work Tasks requires some text conventions to follow when defining the key-value pairs in the localization text file. Pay attention to the text items in upper case format. If you're adding a new property or event in the **wjson** file, or a new configuration file, and you want it localized, follow the same format as in the following screenshot.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Configure Communication between Widget Control and Form

To configure communication between Widget control and a Form, you need to set the **Widget Type** as **Form** in the Widget control. Also, the **Form Details** property needs to be specified, which will be addressed as the Target Form in this topic. For information on specifying the Form Details property, see Widget.

Read more in below topics on how to establish the communication between the Widget control and the Target Form:

Initialize Communication

To initialize communication, you need to write the scripts in the Target Form. The below script can be used in the **On Form Load** script to initialize the communication context:

```
SFU.initializeWidgetFormCommunication(control);
```

To establish communicate between the Widget control and the Target Form, you need to define Form Parameters for the Target Form. So, when you configure the Widget control with **Widget Type** as **Form** and set the **Form Details** property to the Target Form, it would list the Form Parameters defined in the Target Form as the Widget properties. These Widget properties will be the communication points between the Widget control and the Target Form.

Note: Form Parameters are considered as **Widget Properties** for the Widget control irrespective of the data type. The **Widget Properties** are always represented as String data type.

Capture Values

To capture the values in the Target Form when the Widget control property is updated, you need to define the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

script as below (can be done for all the Widget properties, which needs to be captured):

```
ifc_msgHandler["FormParameterName"]= function(value){
// write scripts to update the UI with the value coming
// from the widget control to the form.
};
```

where, **FormParameterName** is the Form Parameter defined in the Target Form, which would be the Widget Property name in the Widget control.

So, the **On Form Load** script will look like as shown below, which includes the initialization part as well:

```
SFU.initializeWidgetFormCommunication(control);
ifc_msgHandler["FormParameterName"]= function(value){
// write scripts to update the UI with the value coming
// from the widget control to the form.
};
```

Send Values

To send values from the Target Form to the widget control, you need to define the script as below:

```
ifc_send("FormParameterName", "Value to be sent");
```

where, **FormParameterName** is the Form Parameter defined in the Target Form.

The above script can be written as required in the Target Form, like from an **On Click** script of a button control or an **On Data Change** script of a Textinput control.

Read URL Parameter Values

The Widget control has a property **Add Values as Url** and is available only when the **Widget Type** is set as **Form**. When **Add Values as Url** is set to **Yes**, then the Widget properties, which are the Form Parameters based properties, are passed as URL parameters to the iFrame control used internally to render the Form for the Widget control.

To read the URL Parameter values, use the below script in the Target Form:

```
var urlParameterValue = ifc_getFormParam("FormParameterName");
```

where, **FormParameterName** is the Form Parameter defined in the Target Form.

Custom Controls

Custom controls are controls designed with specific or custom properties. Custom controls make use of the advanced forms features and support jQuery and Knockout based JavaScript controls.

Custom controls can be added either to a custom category or to the **Controls** category in the **Forms Designer** toolbox.

A custom control is created and integrated with the forms as follows:

- Create a dynamic-link library (DLL) or an assembly where all the prerequisites for creating and registering a custom forms control is followed.
- Add the assembly to the global assembly cache (GAC) or place the assembly in a dedicated folder.
- If the assembly is placed in a dedicated folder, then register the location of the folder with the **SOA Folder List**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Register the assembly as a forms custom control through the **Forms Controls.**
- Use the new custom control in your forms from the toolbox in the **Forms Designer**.

Note:

- When you add a custom control as part of the Form, the reference to the path of the custom control is present in the Form. Hence, if you import the Form containing custom control in another environment, the Form expects that the custom control is present in the same path.

- For support in the AVEVA Work Tasks Pro app,
- update the CSS files in the path **../<BPMUITemplates>/Default/NextGenForms/custom/css**.
- update the js files in the path **../<BPMUITemplates>/Default/NextGenForms/custom/js**.
- For AVEVA Work Tasks Pro, mapping of themes is not considered.

Create Custom Controls

Create a custom control to design a control with specific or custom properties.

To create a custom control

1. Create a DLL project (**Visual C# > Windows > Class Library**) using Visual Studio.NET.
2. Create or add two .cs files – **SFControls.cs** (control initialization file) and **MyCustom.cs** (public control class file) to your project.
3. Add a reference to the **Skelta.Forms.Core.dll** (located at **<AVEVA Work Tasks Install Path>\Bin** folder) in your project.
4. Add the following namespaces to your **MyCustom.cs** file.

   ```
   using Skelta.Forms.Core;
   using Skelta.Forms.Core.External;
   using Skelta.Forms.Core.CommonObjects;
   using Skelta.Forms.Core.Controls;
   using Skelta.Forms.Core.Interfaces;
   ```

5. Ensure the control class (**MyCustom.cs**) inherits from the **BaseDataExternalControl** class.
6. Write the control definition code with the following in mind:
   a. Ensure the **Core Designer** is set to **Next Generation Designer** and the **Designer Category** is set to **Custom** to show up the control in the toolbox of the **Forms Designer**.

      ```
      [DesignerControl(992200, CoreDesigner.NextGenDesigner, DesignerCategory.Custom)]
      public class MyControl : BaseDataExternalControl
      ```

   b. Suppress properties, if required, using the attribute **SuppressedPropertiesNextGen**.

      ```
      // Suppress properites PropertyName1, PropertyName2, and PropertyName3.
      [SuppressedPropertiesNextGen("PropertyName1;PropertyName2;PropertyName3;")]
      ```

   c. Override the **GetNewInstanceForClone()** function, create an instance of the control, and assign the basic properties of the control.
   d. Override the **GetControlHtml()** function and define the HTML code. Use the **TopLevelForm.InDesignMode** boolean variable to segregate the designer and run-time views, if required. Ensure all view model properties are specific to the instance defined in the view.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

e. Override the **GetViewModelDefinition()** function (if required) to define the **ViewModel** definition of the Knockout binding based on the custom control Binding Attribute (For more information, see *Binding Attribute* in Attributing Properties). Ensure all view model properties are specific to the instance defined in the view model. For more information, see Autocomplete.cs.

f. Override the **GetViewModelScript()** function (if required) to define the **ViewModel** script based on the predefined named script like **Value**, **Validate**, **Mandatory** and so on.

g. Ensure you add the JS file reference to **this.TopLevelForm.RuntimeJS** variable to add custom JS files referred by the custom control. The variable is a key value pair collection where the key is the file name and the value is the file path (absolute or relative). Also ensure the JS files are present in the **BPMUITemplates/Default/NextGenForms/custom/js** folder. Otherwise, it will not be rendered.

Note: For the earlier versions of the product, ensure the JS files are present in the **BPMUITemplates/Default/NextGenForms/js** folder.

h. Ensure you add the CSS file reference to **this.TopLevelForm.RuntimeCss** variable to add custom CSS files referred by the custom control. The variable is a key value pair collection where the key is the file name and the value is the file path (absolute or relative). Also ensure the CSS files are present in the **BPMUITemplates/Default/NextGenForms/custom/css** folder. Otherwise, it will not be rendered.

Note: For the earlier versions of the product, ensure the CSS files are present in the **BPMUITemplates/Default/NextGenForms/css** folder.

i. Define rules for a custom control to validate the data using the client-side JavaScript, if required. For more information, see Rules and Defining Rules.

j. Create class properties as control properties.

```
//Designer Property
[DesignerProperty(773000, Categories.Validation, CoreDesigner.NextGenDesigner)]
//Binding Property
[BindingAttribute(882995, "Skelta.Forms.Core.CommonObjects.IntegerBindingProperty")]
```

7. Create **SFControls.cs** class under **Skelta.Forms.ExternalControls** namespace.
8. Add the following namespaces to your **SFControls.cs** file.

```
using Skelta.Forms.Core.Controls;
using Skelta.Forms.Core.External;
using MyCustomControls; // Control namespace
```

9. Implement the **IExternalControls** in the **SFControls** class.
   a. In the **IExternalControls.GetControl(string controlFullName)** method, return the new control instance based on the control namespace.
   b. In the **GetControls** method, return a new object array which contains all the control instances.
10. Build your project, create a **SOA** folder on your hard drive (for example, **C:\SOA**), place your custom control DLL file in the folder, and then register the location of the folder with the **Skelta SOA Folder List**.
11. Register the custom control DLL file through the **Form Controls** to display the custom control in the controls or custom category. For more information, see Custom Categories.

Note:
- Control initialization file must always be named as **SFControls.cs** and the class name must always be named as **SFControls**.
- Ensure reference to the **Skelta.Forms.Core.dll** assembly is the same as the assembly on the AVEVA Work Tasks server.
- For information about SOA, see *Object Access* in the *Workflow Management User Guide*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To localize the text for the custom control

- See Localization.

To add an icon to a custom control

1. Add a custom icon in the **<AVEVA Work Tasks Install Path>/Web/BPMUITemplates/Default/NextGenForms/Themes/<ThemeName>/images** folder.

   Note:
   - If the image name is tagged with **FormCustomPath:**, the location is **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/images/MyImage.png**

   - If the image name is tagged with or **FormCustomThemePath:**, the location is **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/images/MyImage.png**

   - If the image name is not tagged with **FormCustomPath:** or **FormCustomThemePath:**, the location of image of earlier version will be considered i.e. **<Installpath>/Web/BPMUITemplates/Default/Themes/<ThemeName>/ NextGenForms/images** folder.

2. Open the **SkeltaCustomControlDesigner.css** file in the **<AVEVA Work Tasks Install Path>/Web/BPMUITemplates/Default/NextGenForms/Themes/<ThemeName>/custom\css** folder.

   Note: If the stylesheet name is not tagged with **FormCustomPath:** or **FormCustomThemePath:**, the location of stylesheet of earlier version will be considered.

1. Add the following style to the **SkeltaCustomControlDesigner.css** file.

```
/* Replace <custom_icon> with the file name for the normal icon. */
/* Replace <namespace.classname> with the custom control namespace and class name. */
.sktbci[data-skttp="<namespace.classname>"]
{
background-image: url(../../images/<custom_icon>.png);
}
/* Replace <custom_icon_hover> with the file name for the hover icon. */
.sktbc:hover > .sktbci[data-skttp="<namespace.classname>"]
{
background-image: url(../../images/<custom_icon_hover>.png);
}
```

2. Save the **SkeltaCustomControlDesigner.css** file.
3. Reload the **Forms Designer** page to see the custom control with the custom icon in the toolbox.

Extend Existing Controls

Create a custom control by inheriting and extending from an existing forms control to leverage the features of the existing control.

When a custom control class inherits from one of the existing forms control class and the **ICustomControl** interface, the custom control has access to all the features of the existing forms control. You can extend the forms control by overriding the existing properties and functionalities of the forms control class.

Use **GetViewModelDefinition()** function to make use of the existing forms control properties by assigning values

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

to the existing forms control property using the **base** keyword. Override **GetControlTypeName** property and return the base type of the control to inherit all features of the existing control.

Example: Inheriting all features of Text Control

Custom control inheriting all features from the Text control class:

```
public override string GetControlTypeName
{
get
{
return typeof(TextInput).Name;
}
}
```

Example: Inheriting Text Control

Custom control inheriting from the Text control class:

```
[DesignerControl(992200, CoreDesigner.NextGenDesigner, DesignerCategory.Custom)]
public class FirstName: TextInput, ICustomControl
```

Example: Extending ViewModelDefinition() and ViewModelScript() functions

```
public override string GetViewModelDefinition()
{
 base.MaxLength = 10;
 base.MinLength = 4;
 return base.GetViewModelDefinition();
}
public override string GetViewModelScript()
{
 string code = string.Empty;
 var valueScript = this.PropertyExpressions.Where(e => e.Name == "Value").ToList();
 if (valueScript.Count == 0)
 {
 string retVal = "Test Value";
 code = "if(currentValue==\"" + string.Empty + "\"" + "){ return \"" + retVal + "\"" + ";}
else{ return currentValue; }";
 this.PropertyExpressions.Add(new Property("Value", code));
 }
 var validateScript = this.PropertyExpressions.Where(e => e.Name == "Validate").ToList();
 if (validateScript.Count == 0)
 {
 string comma = ",";
 string validationmsg = "Comma (,) is not a valid character";
 code = "if(currentValue.indexOf(\"" + comma + "\"" + ") > -1){ return new
ValidationOptions(false, \"" + validationmsg + "\"" + ");} else { return new
ValidationOptions(true, \"" + string.Empty + "\"" + "); }";
 this.PropertyExpressions.Add(new Property("Validate", code));
 }
 return base.GetViewModelScript();
}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Custom Properties

Custom properties are properties designed with specific or custom attributes.

Attributing Properties

Attributing properties is defining a custom property of a custom control to render the property in the **Property** pages and the forms **ViewModel**.

Attributing properties includes defining:

Designer Property

Designer property determines the location of a custom property in the **Property** page of a custom control.

```
[DesignerProperty(int index, Categories categoryType, CoreDesigner designerType)]
```

where **index** is the property index, **categoryType** is the property tab, and **designerType** is the forms type.

Example

```
// Setting the location of the custom property
// in the Behaviour tab of the Property page.
[DesignerProperty(773000, Categories.Behaviour, CoreDesigner.NextGenDesigner)]
```

OR

```
[DesignerProperty(int index, Categories categoryType, Type controlProperty, string
propertyDetails)]
```

where **index** is the property index, **categoryType** is the property tab, **controlProperty** is the property type for the IControlProperty, and **string** is the property details. The **string** is an associated property name for the form XML definition. To generate the string, create a form with the required controls configured with the required properties and then export the form.

Note: We do not recommend using lookups and data grid controls as the forms will be dependent on the repository.

Example

```
// Setting the location of the custom property
// in the Behaviour tab of the Property page.
public string DataFormXml
{
get
{
// Code to return the form XML definition
}
}
[DesignerProperty(773000, Categories.Behaviour, typeof(GridProperty), "DataFormXml")]
```

Binding Attribute

Binding attribute determines how a custom property is rendered in the client-side JavaScript **ViewModel**.

```
[BindingAttribute(PropertyIndex, "<Namespace>.<ClassName>", BindingPropertyName =
"<ViewModelPropertyName>, IsObservable = <TrueFalse>")]
```

Example

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// Custom binding is defined under MyIntegerBindingProperty class
// located at MyNamespace.MyIntegerBindingProperty class path.
[BindingAttribute(882995, true, "MyNamespace.MyIntegerBindingProperty")]
```

Note:
- New index should be defined for each custom property.
- Index value for a custom property should be higher than the defined property index values.
- Properties for custom controls are cached in IIS. Therefore, we recommend to reset the IIS to clear the IIS cache when new properties are added or existing properties are changed.

Property Index

Property index determines the sequence in which a property is rendered on the **Forms Designer Property** page and on the forms at run-time.

Common Properties

Property	Index
ID	881000
Description	881100
Name	881200
Visible	881300
Retain Space	881400
Enable	881500
Read-Only	881600
Mandatory	881700
Lost Focus	881800
Height	881900
Width	882000
Tooltip	882100
Value	882200
Default Value	882300
Control Binding	882400

List Properties

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Index
Default Value	882500
Options	882600
Options Text	882700
Options Value	882800
Control Binding	882900

Button Properties

Property	Index
Button Text	882500
Button Type	882600
Value	882700

Event Lookup Properties

Property	Index
Control Binding	882500

Radio Button Properties

Property	Index
Default Value	882500
Control Binding	882600
Options	882700
Options Text	882800
Options Value	882900
Options Per Row	883000

Text Properties

Property	Index
Persist Password	882500
Encryption Mode	882600
Pattern	882700

Drop-Down Properties

Property	Index
Default Value	882500
Options	882600
Default Text	882700
Options Text	882800
Options Value	882900

Base Form Properties

Property	Index
ID	881010
Control Binding	882500
Behavior	88260

Create Custom Properties

Create a custom property to define a new property.

To create a custom property

1. Create a class property with a getter and setter section along with the user defined logic.
2. Decorate the class property with the **DesignerProperty** property attribution.
   (For more information, see *Designer Property* in Attributing Properties.)

```
// Setting the location of the custom property
// in the Behaviour tab of the Property page.
[DesignerProperty(773000, Categories.Behaviour, CoreDesigner.NextGenDesigner)]
OR
[DesignerProperty(773000, Categories.Behaviour, typeof(GridProperty), "DataFormXml")]
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. If you want the custom property to be a part of the View Model, then you must decorate the class property with the **BindingAttribute** property attribution.

   ```
   / Custom binding is defined under IntegerBindingProperty class
   // located at Skelta.Forms.Core.CommonObjects.IntegerBindingProperty class path.
   [BindingAttribute(882995, "Skelta.Forms.Core.CommonObjects.IntegerBindingProperty")]
   ```

4. Provide a **default value** for the custom property, if required, by decorating the class property with the DefaultValue property attribution.

Example

```
private string _step = "0";
/// <summary>
/// Get/set the step value for the slider.
/// </summary>
[DefaultValue("1")]
[DesignerProperty(775000, Categories.Behaviour, CoreDesigner.NextGenDesigner)]
[BindingAttribute(882998, EFormMode.NextGenMode,
"Skelta.Forms.Core.CommonObjects.IntegerBindingProperty")]
public string Step
{
 get { return _step; }
 set
 {
 _step = value;
 }
}
```

IControlProperty

IControlProperty is the interface for the control property.

Definition of IControlProperty

```
public interface IControlProperty
{
BaseControl GetPropertyControl(BaseControl control, PropertyInfo propertyInformation);
void ReadProperty(PropertyInfo propertyInformation, IXPathNavigable xmlDocument, object
propertyValue);
void WriteProperty(IXPathNavigable xmlDocument, BaseDataControl propertyControl,
BaseControl control);
}
```

GetPropertyControl()

This method renders the property for the custom control.

Syntax

```
BaseControl GetPropertyControl(BaseControl control, PropertyInfo propertyInformation);
```

Parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
control	Control for which the property is being rendered.
propertyInformation	Information about the property.

Return Value

This method returns the control.

ReadProperty()

This method reads the property value and updates the instance XML for the custom control.

Syntax

```
void ReadProperty(PropertyInfo propertyInformation, IXPathNavigable xmlDocument, object propertyValue);
```

Parameters

Parameter	Description
propertyInformation	Information about the property.
xmlDocument	Form instance XML.
propertyValue	Value of the property.

Return Value

This method returns the control.

WriteProperty()

This method writes the property value for the custom control.

Syntax

```
void WriteProperty(IXPathNavigable xmlDocument, BaseDataControl propertyControl, BaseControl control);
```

Parameters

Parameter	Description
xmlDocument	Form instance XML.
propertyControl	Property of the control.
control	Control for which the property is being rendered.

Return Value

This method returns the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Custom Bindings

Custom bindings are specific knockout bindings for the **ViewModel** at run-time. Custom bindings override the Knockout binding based on the custom control Binding Attribute (For more information, see *Binding Attribute* in Attributing Properties).

To create custom bindings

1. Create a custom binding class by inheriting the IBindingProperty.
2. Add the following namespaces to your custom binding property class file.

   ```
   using Skelta.Forms.Core;
   using Skelta.Forms.Core.Classes;
   using Skelta.Forms.Core.CommonObjects;
   using Skelta.Forms.Core.Controls;
   using Skelta.Forms.Core.Interfaces;
   ```

3. Implement RenderBinding function of the IBindingProperty interface.

   ```
   // For String, Number, Boolean
   <ContainerName>.<ControlID>.<KnockoutPropertyName> = ko.observable();
   <ContainerName>.<ControlID>.<KnockoutPropertyName> = ko.observable(<PropertyValue>);

   // For Array
   <ContainerName>.<ControlID>.<KnockoutPropertyName> = ko.observableArray();
   <ContainerName>.<ControlID>.<KnockoutPropertyName> =
   ko.observableArray(<ArrayPropertyVariable>);
   // Container Name
   bindingHelperObject.ViewModelContainerName
   // Control ID
   bindingHelperObject.Control.Id
   ```

4. Return the Knockout binding code snippet as a string.
5. Add the following function in the custom control class.

   ```
   public override IBindingProperty GetBindingClassObject(string fullyQualifiedClassPath)
   {
   try
   {
   return
   (IBindingProperty)Activator.CreateInstance(Type.GetType(fullyQualifiedClassPath));
   }
   catch (Exception ex)
   {
   return null;
   }
   }
   ```

Example

Custom binding for items, series, and colors properties of the Knockout Kendo Bar Chart control. The items, series, and colors are required arrays added with a third party JavaScript file.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
class BarchartBindingProperty : IBindingProperty
{
/// <summary>
/// The Value Property Implementation.
/// </summary>
/// <param name="bindingHelper">binding Helper object</param>
/// <returns>The implementation of Value Property</returns>
public string RenderBinding(object bindingHelper)
{
StringBuilder stringBuilder = new StringBuilder();
BindingHelper bindingHelperObject = (BindingHelper)bindingHelper;
var chartControl = bindingHelperObject.ViewModelContainerName + "." +
bindingHelperObject.Control.Id;
//// KO binding where items and series variables will get the array data from the external
source (3rd Party JS file).
 stringBuilder.AppendLine(bindingHelperObject.ViewModelContainerName + "." +
bindingHelperObject.Control.Id + "._items = ko.observableArray();");
stringBuilder.AppendLine(bindingHelperObject.ViewModelContainerName + "." +
bindingHelperObject.Control.Id + "._series = ko.observableArray();");
stringBuilder.AppendLine(bindingHelperObject.ViewModelContainerName + "." +
bindingHelperObject.Control.Id + "._colors = ko.observableArray();");
//// Items
stringBuilder.AppendLine("if(" + chartControl + "._itemsURL !== \"\") {");
stringBuilder.AppendLine(chartControl + "._items(getItems(" + chartControl +
"._itemsURL));");
stringBuilder.AppendLine("}");
stringBuilder.AppendLine("else {");
stringBuilder.AppendLine(chartControl + "._items(eval(" + chartControl + "._itemsData));");
stringBuilder.AppendLine("}");
//// Series
stringBuilder.AppendLine("if(" + chartControl + "._seriesURL !== \"\") {");
stringBuilder.AppendLine(chartControl + "._series(getSeries(" + chartControl +
"._seriesURL));");
stringBuilder.AppendLine("}");
stringBuilder.AppendLine("else {");
 stringBuilder.AppendLine(chartControl + "._series(eval(" + chartControl +
"._seriesData));");
stringBuilder.AppendLine("}");
//// Colors
stringBuilder.AppendLine("if(" + chartControl + "._colorsURL !== \"\") {");
stringBuilder.AppendLine(chartControl + "._colors(getColors(" + chartControl +
"._colorsURL));");
stringBuilder.AppendLine("}");
stringBuilder.AppendLine("else {");
stringBuilder.AppendLine(chartControl + "._colors(eval(" + chartControl +
"._colorsData));");
stringBuilder.AppendLine("}");
return stringBuilder.ToString();
}
}
```

Note:
Assignment of KO observable variables must be a function.

```
control.<property(value)>;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For example:

```
chartControl.items(<JSONCollection>);
```

IBindingProperty

IBindingProperty is the interface for the custom control.

Definition of IBindingProperty

```
public interface IBindingProperty
{
string RenderBinding(object bindingHelper);
}
```

Rules

Rules validate the value of a control.

Rule Structure

Object	Description
RuleFor	Associated property for the rule.
RuleName	JavaScript function name for the rule. This name is used in the client-side JavaScript and this JavaScript function is called when the rule is executed.
RuleDefinition	Error message for the rule.
ControlType	Associated control for the rule.
RenderMode	Render the control in HTML5 or HTML.

Lost Focus Rules

Lost focus rules trigger when a control looses focus or when a form is submitted.

Example

```
rules.Add(new Rule { RuleFor = "lostFocus", RuleName = "RuleName", RuleDefinition = "Error
Message", ControlType = this.GetType().Name, RenderMode = RenderingMode.Html5.ToString()
});
```

Value Rules

Value rules are triggered when the value of a control changes or when a form is submitted.

Example

```
rules.Add(new Rule { RuleFor = "Value", RuleName = "RuleName", RuleDefinition = "Error
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
message", ControlType = this.GetType().Name, RenderMode = RenderingMode.Html5.ToString()
});
```

Note:
- **RuleName** defined in the control class file is used as is in the client-side JavaScript function.
- When a rule in the **Rules** collection fails, further rules are not executed.

Define Rules

Define rules for a custom control to validate the data using the client-side JavaScript.

To define custom control rules

1. Override the **Rules** collection property in the custom control class.
2. Define the rule name, rule definition, control type, and render mode, if required.
3. At the client-side custom control JavaScript file, implement a JavaScript function with the following in mind:
4. Use the same name for the JavaScript function as that of the rule name defined in the custom control class.
5. Use the **Control**, **ControlValue** and **ruleObject** for parameters.
6. Verify the **ControlValue** parameter before taking any action.
7. Get the rule definition message using **ruleObject.ErrorMessage** property.

Example: Custom Control Class

```
/// <summary>
/// Rules for the control
/// </summary>
public override Collection<Rule> Rules
{
get
{
Collection<Rule> rules = base.Rules;
string ruleName = "MinMaxNumberValidation";
string errorMessage = "$$Name$$ value is out of range.";
rules.Insert(0, new Rule { RuleFor = "Value", RuleName = ruleName, RuleDefinition =
errorMessage,
ControlType = this.GetType().Name, RenderMode = this.RenderAs.ToString() });
return rules;
}
}
```

Example: Custom Control Client-side JavaScript

```
function minMaxNumberValidation(controlValue, control, ruleObject)
{
if (control.renderMode === "NonHtml5")
{
var errorMessage = "";
var errorBoolValue = false;
var errorCode = errorConstants.none;
var value = parseFloat(controlValue);
if (!isNaN(value))
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
{
if ((value >= control.min && value <= control.max) == false)
{
errorBoolValue = true;
errorCode = errorConstants.valueValidationRules;
control.validationError(errorBoolValue);
control.validationErrorMessage(Skelta.localize.getString(ruleObject.errorMessage).replace("
$$Name$$", control.xmlNodeBoundTo.toString()));
control.validationErrorCode(errorCode);
}
}}
}
```

Reference External CSS and JS Files

Reference external CSS and JS files dynamically by adding those files in the **RuntimeCSS** and **RuntimeJS** collections while returning the **GetControlHTML()** function to render custom controls in the **Forms Designer** page and at run-time of the forms.

Example

```
private void addJsCssFiles()
 {
//// <link rel="stylesheet" href="css/jquery-ui.css" />
 //// <script src="js/jquery-ui.js" type="text/javascript"></script>
 //// <script src="js/knockout-jquery-ui-widget.js" type="text/javascript"></script>
 //// <script src="js/autocomplete-datasource.js" type="text/javascript"></script>
 if (string.IsNullOrEmpty (this.TopLevelForm.RuntimeCss["css1"]))
 {
 this.TopLevelForm.RuntimeCss.add("css1", "css/jquery-ui.css");
 }
 if (string.IsNullOrEmpty (this.TopLevelForm.RuntimeJS["js1"]))
 {
 this.TopLevelForm.RuntimeJS.add("js1", "js/jquery-ui.js");
 }
 if (string.IsNullOrEmpty (this.TopLevelForm.RuntimeJS["js2"]))
 {
 this.TopLevelForm.RuntimeJS.add("js2", "js/knockout-jquery-ui-widget.js");
 }
 if (string.IsNullOrEmpty (this.TopLevelForm.RuntimeJS["js3"]))
 {
 this.TopLevelForm.RuntimeJS.add("js3", "js/autocomplete-datasource.js");
 }
 }
```

Note:
- CSS file should be placed in the **<AVEVA Work Tasks Install Path>/Web/BPMUITemplates/Default/NextGenForms/custom/css/** folder.
- JS file should be placed in the **<AVEVA Work Tasks Install Path>/Web/BPMUITemplates/Default/NextGenForms/custom/js** folder.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Localization

Localize a custom control name, property, and description to make it usable with a specific language, script, and culture.

To localize a custom control name in Forms Designer Toolbox

- Add a new key-value pair in a custom text file and place the file in the **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2** folder in the following format: **FormNGFControl<namespace.classname>:localized Name**.

  For example, to localize the **Masked Input Control** control name, code as follows:

  ```
  FormNGFControlFormCustomControl.MaskedInputControl:Masked Input
  ```

Note: Replace **namespace.classname** with the custom control namespace and class name.

To localize a custom property name and description

- Add a new key-value pair in a custom text file and place the file in the **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2** folder in the following format: **Form<property name>Property:localized Name** and **Form<property name>PropertyDescription:localized Description**.

  For example, to localize the name and description of the **Retain Selected Value** property, code as:

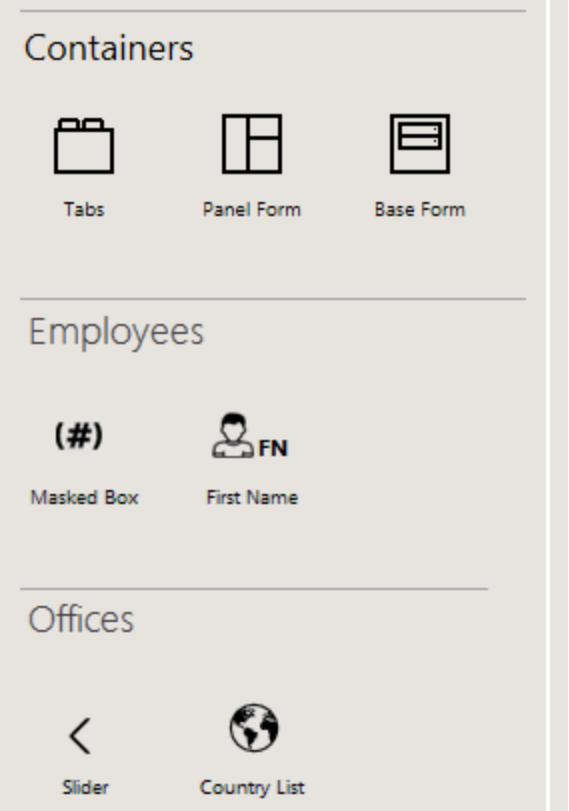
  ```
  FormRetainSelectedValueProperty:Retain Selected Value
  ```

  ```
  FormRetainSelectedValuePropertyDescription:Keep selected value regardless of the current parameter values.
  ```

Custom Categories

Custom categories organize custom controls in the **Forms Designer** toolbox.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Custom categories are displayed in the **Forms Designer** toolbox after the default **Controls** and **Containers** category.

Create Custom Categories

Create a custom category to organize custom controls in the **Forms Designer** toolbox.

To create a custom category in the Forms Designer toolbox

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Form Controls**. The **Form Controls** page appears.
2. On the action bar, click **New**, and then click **Folder**. The **New Folder** wizard appears.
3. In the **Title** box, type a name for the folder, and in the **Description** box, type a description for the folder.
4. Click **Save & Close**. The folder is created, and an information message appears.
5. Click **OK** (or click the **Close** button). The information message and the **New Folder** wizard are closed.

Note:
The name of the folder created in the **Form Controls** page is used for the name of the category in the **Forms Designer** toolbox.
- Custom category is displayed in the **Forms Designer** toolbox only if a custom control is added to the folder.
- Custom controls can be added either to one of the custom categories or to the **Controls** category in the **Forms Designer** toolbox.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Add Custom Controls in Custom Categories

Add a custom control in a custom category of the **Forms Designer** toolbox to organize custom controls in the **Forms Designer** toolbox.

To add a custom control in a custom category of the Forms Designer toolbox

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Form Controls**. The **Form Controls** page appears.
2. Right-click on a folder, and then click **Show Child Item** (or double-click the folder). The child items page for the folder appears.
3. On the action bar, click **New**, and then click **Form Control**. The **New Form Control** wizard appears.
4. In the **Name of the control** box, type a name for the control, and in the **Description** box, type a description for the control.
5. Click **Save & Continue**. The control is created, and the **Form Custom Control** wizard appears.
6. Do one of the following:

Task	Action
• Select the custom control assembly created in the global assembly cache (GAC).	a. Click **GAC**. A list of assembly files appear. b. Click the assembly file for the custom control, and then click **Save**. The custom control is added to the custom category of the **Forms Designer** toolbox.
• Select the custom control assembly created in the dedicated folder.	a. Click **Folder**. A list of assembly files appear. b. Click the assembly file for the custom control, and then click **Save**. The custom control is added to the custom category of the **Forms Designer** toolbox.

Note: If a Custom Form Control is consumed inside a form, you cannot edit or delete the Custom Form Control. To modify or delete the Custom Form Control, ensure it is not used in any form.

Add Custom Controls in the Controls Category

Add a custom control in the Controls category of the Forms Designer toolbox to make it easily available in the toolbox.

To add a custom control in the Controls category of the Forms Designer toolbox

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Form Controls**. The **Form Controls** page appears.
2. On the action bar, click **New**, and then click **Form Control**. The **New Form Control** wizard appears.
3. In the **Name of the control** box, type a name for the control, and in the **Description** box, type a description for the control.
4. Click **Save & Continue**. The control is created, and the **Form Custom Control** wizard appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Do one of the following:

Task	Action
• Select the custom control assembly created in the global assembly cache (GAC).	a. Click **GAC**. A list of assembly files appear. b. Click the assembly file for the custom control, and then click **Save**. The custom control is added to the Controls category of the **Forms Designer** toolbox.
• Select the custom control assembly created in the dedicated folder.	a. Click **Folder**. A list of assembly files appear. b. Click the assembly file for the custom control, and then click **Save**. The custom control is added to the Controls category of the **Forms Designer** toolbox.

Note: Custom control added to the **Controls** category is displayed after the last control in the **Controls** category.

Organize Form Controls

Organize a form control by performing one of the following:

- Moving the form control to a folder.
- Making the form control a child item of another form control.

To organize a form control by moving the form control to a folder

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Form Controls**. The **Form Controls** window appears.
2. On the action bar, click **Organize**. The **Organize Form Controls** dialog box appears.
3. Drag a form control to a folder. The form control is moved to the folder.
4. Click **Close**. The **Organize Form Controls** dialog box is closed.

To organize a form control by making the form control a child item of another form control

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Form Controls**. The **Form Controls** window appears.
2. On the action bar, click **Organize**. The **Organize Form Controls** dialog box appears.
3. Drag a form control to another form control. The form control is now a child item of another form control.
4. Click **Close**. The **Organize Form Controls** dialog box is closed.

Example: Masked Input Control

A custom Masked Input control with control initialization, class, and JavaScript files.

- SFControl.cs (control initialization file)

- MaskedInput.cs (control class file)
- skelta.maskedinput.js (JavaScript file)
- Adding Masked Input Property for Check Syntax Validation

SFControl.cs

```
using CustomControl;
using Skelta.Forms.Core.Controls;
using Skelta.Forms.Core.External;
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
namespace Skelta.Forms.ExternalControls
{
class SFControls : IExternalControls
{
#region IExternalControls Members
BaseControl IExternalControls.GetControl(string controlFullName)
{
switch (controlFullName)
{
case "CustomControl.MyCustom":
return new MyCustom();
default:
return null;
}
}
object[] IExternalControls.GetControls()
{
return new object[] { new MyCustom() };
}
#endregion
}
}
```

MaskedInput.cs

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Skelta.Forms.Core;
using Skelta.Forms.Core.External;
using Skelta.Forms.Core.CommonObjects;
using Skelta.Forms.Core.Controls;
using Skelta.Forms.Core.Interfaces;
using System.ComponentModel;
using System.Collections.ObjectModel;
namespace CustomControl
{
```

}
/// <summary>
/// Add CSS files associated with the custom control.
/// </summary>
private void AddCssFiles()
{
/* As this custom control has no specific CSS, no custom CSS file is added. */
////if (string.IsNullOrEmpty (this.TopLevelForm.RuntimeCss["MyCSSFile"]))
////{
////  // "this.TopLevelForm.RuntimeCss" is the collection which holds your custom CSS
files.
////  // It is a key-value pair collection where the key is the file name and the value is
the file path(absolute or relative).
////  // Ensure the CSS files are present in the "BPMUITemplates/Default/NextGenForms/css"
folder. Otherwise, it will not be rendered.
////  this.TopLevelForm.RuntimeCss.Add("MyCSSFile", "css/maskedinput.css");
////}
}
/// <summary>
/// Add custom JS files associated with the custom control.
/// </summary>
private void AddJsFiles()
{
if (string.IsNullOrEmpty (this.TopLevelForm.RuntimeJS["MyJsFile"]))
{
// "this.TopLevelForm.RuntimeJS" is the collection which holds your custom JS files.
// It is a key-value pair collection where the key is the file name and the value is the
file path(absolute or relative).
// Ensure the JS files are present in the "BPMUITemplates\Default\NextGenForms\js" folder.
Otherwise, it will not be rendered.
 this.TopLevelForm.RuntimeJS.Add("MyJsFile", "js/Skelta.maskedinput.js");
}
}
/// <summary>
/// Rules for the control - Add custom validations for the control when value of the
control changes.
/// </summary>
public override Collection<Rule> Rules
{
get
{
// By default a few rules like Mandatory are added.
 // We recommend to insert or add rules instead of creating a new rules collection.
Collection<Rule> rules = base.Rules;
// RuleFor -  Associated property for the rule.
// RuleName - JavaScript function name for the rule.
// RuleDefnition - Error message for the rule.
// ControlType - Associated control for the rule.
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 // RenderMode - Render the control in HTML5 or HTML.
rules.Insert(0, new Rule { RuleFor = "Value", RuleName =
"Skelta.forms.maskedInput.validation", RuleDefinition = "Enter valid data (mask text: " +
this.Mask + ")", ControlType = this.GetType().Name });
return rules;
}
}
}
}
```

skelta.maskedinput.js

```
(function ()
{
if (skelta.utilities.isUndefined(skelta.forms))
{
// Create the Skelta.Forms namespace
skelta.createNamespace("skelta.forms");
}
skelta.forms.maskedInput = (function ()
{
function maskOperation(elem)
{
var cpf = elem;
//getting key code of pressed key
var key = window.event;
var keycode = (key.which) ? key.which : key.keyCode;
//comparing pressed keycodes
if (keycode > 31 && (keycode < 48 || keycode > 57))
{
//(" You can enter only characters 0 to 9 ");
return false;
}
if ((cpf.value.length == cpf.placeholder.indexOf("-", cpf.value.length)))
{
cpf.value += "-";
return true;
}
if (cpf.value.length == cpf.placeholder.length || cpf.value.length >
cpf.placeholder.length)
{
return false;
}
return true;
}
function maskValidation(controlvalue, control, ruleObject)
{
if (!controlvalue) return;
var cpf = control.domElement;
var errMessage = ruleObject.errorMessage;
if (cpf.placeholder.length != controlvalue.length)
{
errorBoolValue = true;
control.validationError(true);
control.validationErrorMessage(errMessage);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.validationErrorCode(errorConstants.valueValidationRules);
}
}
return {
keyPress: maskOperation,
validation: maskValidation
}
}());
})();
```

Add Masked Input Property for Check Syntax Validation

The following code represents how to add the "Mask" property along with the other common properties for check syntax validation.

```
(function ()
{
var standardControlMembers = skelta.forms.constants.controlsCollection;
var genericControlFunctions =
skelta.forms.constants.controlFunctions;//genericControlFunctions has properties -
nonContainerFunctions and containerFunctions which is a collection
of function names [{ name: "functionName"}]
var maskedInputMembers = {
functions: genericControlFunctions.nonContainerFunctions,//.concat([{ name: "functionName"
}
isContainerControl: false,
controlType: "MaskedInput",
properties: [{ propertyName: "xmlNodeBoundTo", propertyType: "2", isWritable: false },
{ propertyName: "tagName", propertyType: "0", isWritable: true },
{ propertyName: "id", propertyType: "2", isWritable: false },
{ propertyName: "value", propertyType: "0", isWritable: true },
{ propertyName: "isMandatory", propertyType: "0", isWritable: true },
{ propertyName: "readOnly", propertyType: "0", isWritable: true },
{ propertyName: "enable", propertyType: "0", isWritable: true },
{ propertyName: "mask", propertyType: "2", isWritable: false },
{ propertyName: "visible", propertyType: "0", isWritable: true }]
}
standardControlMembers.push(maskedInputMembers);
})();
```

In the example, the "Mask" property is a nonobservable variable and is a readonly property, indicated by **propertyType: "2"** and **isWritable: false** in the above code.

For more information on the usage of the above code, see Adding Custom Controls for Check Syntax Validation.

Custom Controls with Kendo UI

You can create a custom control with Kendo UI widget to design a control with specific or custom properties of Kendo UI widgets.

- Create Custom Controls with Kendo UI
- Create Knockout Bindings for Kendo UI
- Knockout Bindings for Kendo UI

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create Custom Controls with Kendo UI

Create a custom control with Kendo UI widget to design a control with specific or custom properties of Kendo UI widgets.

To create a custom control with a Kendo UI Widget

1. Create a DLL project (**Visual C# > Windows > Class Library**) using Visual Studio.NET.
2. Create or add two .cs files – **SFControls.cs** (control initialization file) and **MyCustom.cs** (public control class file) to your project.
3. Add a reference to the **Skelta.Forms.Core.dll** (located at **<AVEVA Work Tasks Install Path>\Bin** folder) in your project.
4. Add the following namespaces to your **MyCustom.cs** file.

   ```
   using Skelta.Forms.Core;
   using Skelta.Forms.Core.External;
   using Skelta.Forms.Core.CommonObjects;
   using Skelta.Forms.Core.Controls;
   using Skelta.Forms.Core.Interfaces;
   ```

5. Ensure the control class (**MyCustom.cs**) inherits from the **BaseDataExternalControl** class.
6. Write the control definition code with the following in mind:
   a. Ensure the **Core Designer** is set to **Next Generation Designer** and the **Designer Category** is set to **Custom** to show up the control in the toolbox of the **Forms Designer**.

      ```
      [DesignerControl(992200, CoreDesigner.NextGenDesigner, DesignerCategory.Custom)]
      public class MyControl : BaseDataExternalControl
      ```

   b. Suppress properties, if required, using the attribute **SuppressedPropertiesNextGen**.

      ```
      // Suppress properites PropertyName1, PropertyName2, and PropertyName3.
      [SuppressedPropertiesNextGen("PropertyName1;PropertyName2;PropertyName3;")]
      ```

   c. Override the **GetNewInstanceForClone()** function, create an instance of the control, and assign the basic properties of the control.
   d. Override the **GetControlHtml()** function and define the HTML code. Use the **TopLevelForm.InDesignMode** boolean variable to segregate the designer and run-time views, if required. Ensure all view model properties are specific to the instance defined in the view. For examples, refer to Knockout-Kendo examples.
   e. Override the **GetViewModelDefinition()** function (if required) to define the **ViewModel** definition of the Knockout binding based on the custom control Binding Attribute (For more information, see *Binding Attribute* in Attributing Properties). Ensure all view model properties are specific to the instance defined in the view model. For more information, see Autocomplete.cs.
   f. Override the **GetViewModelScript()** function (if required) to define the **ViewModel** script based on the predefined named script like **Value**, **Validate**, **Mandatory** and so on.
   g. Build the following JS files to include the specific **Kendo UI** widget and the **Knockout** bindings for the specific **Kendo UI** widget.

      – kendo.custom.min.js (for the specific **Kendo UI** widget). For more information, see Example: RichTextBox Control.

      – knockout-kendo.custom.min.js (for the **Knockout** bindings). For more information, see Create Knockout Bindings for Kendo UI.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

h. Ensure you add the JS file reference – for the specific **Kendo UI** widget followed by the **Knockout** bindings for the specific **Kendo UI** widget – to **this.TopLevelForm.RuntimeJS** variable to add custom JS files referred by the custom control in the **GetControlHtml()** function. The variable is a key value pair collection where the key is the file name and the value is the file path (absolute or relative). Also ensure the JS files are present in the **BPMUITemplates\Default\NextGenForms\js** folder. Otherwise, it will not be rendered.

i. Ensure you add the CSS file reference to **this.TopLevelForm.RuntimeCss** variable to add custom CSS files referred by the custom control in the **GetControlHtml()** function. The variable is a key value pair collection where the key is the file name and the value is the file path (absolute or relative). Also ensure the CSS files are present in the **BPMUITemplates\Default\NextGenForms\css** folder. Otherwise, it will not be rendered.

j. Define rules for a custom control to validate the data using the client-side JavaScript, if required. For more information, see Rules and Defining Rules.

k. Create class properties as control properties.

```
//Designer Property
[DesignerProperty(773000, Categories.Validation, CoreDesigner.NextGenDesigner)]
//Binding Property
[BindingAttribute(882995, "Skelta.Forms.Core.CommonObjects.IntegerBindingProperty")]
```

7. Create **SFControls.cs** class under **Skelta.Forms.ExternalControls** namespace.
8. Add the following namespaces to your **SFControls.cs** file.

```
using Skelta.Forms.Core.Controls;
using Skelta.Forms.Core.External;
using MyCustomControls; // Control namespace
```

9. Implement the **IExternalControls** in the **SFControls** class.
   a. In the **IExternalControls.GetControl(string controlFullName)** method, return the new control instance based on the control namespace.
   b. In the **GetControls** method, return a new object array which contains all the control instances.
10. Build your project, create a **SOA** folder on your hard drive (for example, **C:\SOA**), place your custom control DLL file in the folder, and then register the location of the folder with the **Skelta SOA Folder List**.
11. Register the custom control DLL file through the **Form Controls** to display the custom control in the controls or custom category. For more information, see Custom Categories.

Note:
- Control initialization file must always be named as **SFControls.cs** and the class name must always be named as **SFControls**.
- Ensure reference to the **Skelta.Forms.Core.dll** assembly is the same as the assembly on the AVEVA Work Tasks server.
- For information about SOA, see *Object Access* in the *Workflow Management User Guide*.

To localize the text for the custom control

- See Localization.

To add an icon to a custom control

1. Add a custom icon in the **<AVEVA Work Tasks Install Path>\Web\BPMUITemplates\Default\Themes\<ThemeName>\NextGenForms\images** folder.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Open the **SkeltaCustomControlDesigner.css** file in the **<AVEVA Work Tasks Install Path>\Web\BPMUITemplates\Default\Themes\<ThemeName>\NextGenForms\css\custom** folder.

1. Add the following style to the **SkeltaCustomControlDesigner.css** file.

```
/* Replace <custom_icon> with the file name for the normal icon. */
/* Replace <namespace.classname> with the custom control namespace and class name. */
.sktbci[data-skttp="<namespace.classname>"]
{
background-image: url(../../images/<custom_icon>.png);
}
/* Replace <custom_icon_hover> with the file name for the hover icon. */
.sktbc:hover > .sktbci[data-skttp="<namespace.classname>"]
{
background-image: url(../../images/<custom_icon_hover>.png);
}
```

2. Save the **SkeltaCustomControlDesigner.css** file.
3. Reload the **Forms Designer** page to see the custom control with the custom icon in the toolbox.

Note: The Kendo UI JavaScript files - **kendo.all.full.js** and **knockout-kendo.full.js** - are available at **BPMUITemplates/Default/NextGenForms/js/** folder for reference.

Create Knockout Bindings for Kendo UI

Create **Knockout** bindings for specific **Kendo UI** widgets.

To create the Knockout bindings for the specific Kendo UI Widget

1. Create and add the following code to your **knockout-kendo.custom.min.js** file.

```
(function ()
{
var createBinding = ko.kendo.bindingFactory.createBinding.bind(ko.kendo.bindingFactory);
//use constants to ensure consistency and to help reduce minified file size
var CLICK = "click",
CLICKED = "clicked",
CLOSE = "close",
COLLAPSE = "collapse",
CONTENT = "content",
DATA = "data",
ENABLE = "enable",
EXPAND = "expand",
ENABLED = "enabled",
EXPANDED = "expanded",
ERROR = "error",
FILTER = "filter",
HIDE = "hide",
INFO = "info",
ISOPEN = "isOpen",
MAX = "max",
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
MIN = "min",
OPEN = "open",
PALETTE = "palette",
READONLY = "readonly",
RESIZE = "resize",
SEARCH = "search",
SELECT = "select",
SELECTED = "selected",
SHOW = "show",
SUCCESS = "success",
SIZE = "size",
TARGET = "target",
TITLE = "title",
VALUE = "value",
VALUES = "values",
WARNING = "warning";
}());
```

2. Create binding for the specific **Kendo UI** widget to the function.

   For information on **Knockout** bindings for **Kendo UI** widgets, see Knockout Bindings for Kendo UI (In this file, the **Kendo UI** widgets that are currently not used are commented. Uncomment the specific **Kendo UI** widget to create the bindings to the function).

```
// For example, to create Knockout binding for Autocomplete Kendo UI widget, use the
following code
createBinding({
name: "kendoAutoComplete",
events: {
change: VALUE,
open: {
writeTo: ISOPEN,
value: true
},
close: {
writeTo: ISOPEN,
value: false
}
},
watch: {
enabled: ENABLE,
search: [SEARCH, CLOSE],
data: function (value)
{

Example: Barchart Control

A custom **Barchart** control using Kendo UI widget with control initialization, class, JavaScript, and CSS files.

- SFControl.cs (control initialization file)
- BarChart.cs (control class file)
- BarChartBindingProperty.cs (Bindings for the control)
- knockout-kendo.kendochart.js (JavaScript file for Knockout binding of the specific Kendo UI widget)
- corp.customcontrol.barchart.js (JavaScript initialization file)
- Adding Barchart Properties for Check Syntax Validation

Add Barchart Properties for Check Syntax Validation

The following code represents how to add the "Barchart" properties along with the other common properties for check syntax validation.

```
(function ()
{
var standardControlMembers = Skelta.forms.constants.controlsCollection;
var genericControlFunctions =
Skelta.forms.constants.controlFunctions;//genericControlFunctions has properties -
nonContainerFunctions and containerFunctions which is a collection
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
of function names [{ name: "functionName"}]
var barchartMembers = {
functions: genericControlFunctions.nonContainerFunctions,//.concat([{ name: "functionName"
}
isContainerControl: false,
controlType: "Barchart",
properties: [{ propertyName: "xmlNodeBoundTo", propertyType: "2", isWritable: false },
{ propertyName: "tagName", propertyType: "0", isWritable: true },
{ propertyName: "id", propertyType: "2", isWritable: false },
{ propertyName: "value", propertyType: "0", isWritable: true },
{ propertyName: "isMandatory", propertyType: "0", isWritable: true },
{ propertyName: "readOnly", propertyType: "0", isWritable: true },
{ propertyName: "enable", propertyType: "0", isWritable: true },
{ propertyName: "itemsData", propertyType: "2", isWritable: true },
{ propertyName: "seriesData", propertyType: "2", isWritable: true },
{ propertyName: "colorsData", propertyType: "2", isWritable: true }]
}
standardControlMembers.push(barchartMembers);
})();
```

In the example, the "itemsData", "seriesData", and "colorsData" properties are nonobservable variables, indicated by **propertyType: "2"** and **isWritable: true** respectively in the above code.

For more information on the usage of the above code, see Adding Custom Controls for Check Syntax Validation.

Example: RichTextBox Control

A custom **RichTextBox** control using Kendo UI widget with control initialization, class, and JavaScript files.

- SFControl.cs (control initialization file)
- RichTextBox.cs (control class file)
- knockout-kendo.editor.js (JavaScript file for Knockout binding of the specific Kendo UI widget)
- richtextbox.js (JavaScript file for custom Knockout binding to support height, width, and read-only behavior)

Selecting the JavaScript files for the specific Kendo UI widget

The included **kendo.all.min.js** is limited to widgets – **Grid**, **DateTimePicker**, **DatePicker**,**TimePicker**, **NumericTextBox**, **ColorPicker**, **Editor**, **Treeview**, **Gauge** and PDF export features – **pdf** and **drawing** (which is built using the **gulp** command) for performance benefits.

To support additional widgets and features, you must refer only to the JavaScript files for the specific Kendo UI widget other than the JavaScript files for the included widgets. For this, you must be aware of script dependencies and requirements for the Kendo UI widgets. Refer to Include Individual Widget Scripts for Kendo for the complete list of JavaScript files required for each Kendo UI widget.

Ensure you do not build the required Kendo UI widget JavaScript files using the **gulp** command as the script files created and registered will contain duplicate code parts.

Custom Controls with Angular 12

You can create a custom control with Angular 12 to design a control with specific or custom properties of Angular 12.

Create Custom Controls with Angular 12

Create a custom control with Angular 12 to design a control with specific or custom properties of Angular 12.

To create a custom control with Angular 12

1. Create a DLL project (**Visual C# > Windows > Class Library**) using Visual Studio.NET.
2. Create or add two .cs files – **SFControls.cs** (control initialization file) and **MyCustom.cs** (public control class file) to your project.
3. Add a reference to the **Skelta.Forms.Core.dll** (located at **<Skelta BPM Install Path>\Bin** folder) in your project.
4. Add the following namespaces to your **MyCustom.cs** file.

   ```
   using Skelta.Forms.Core;
   using Skelta.Forms.Core.External;
   using Skelta.Forms.Core.CommonObjects;
   using Skelta.Forms.Core.Controls;
   using Skelta.Forms.Core.Interfaces;
   ```
5. Ensure the control class (**MyCustom.cs**) inherits from the **BaseDataExternalControl** class.
6. Write the control definition code with the following in mind:
   a. Ensure the **Core Designer** is set to **Next Generation Designer** and the **Designer Category** is set to **Custom** to show up the control in the toolbox of the **Forms Designer**.

      ```
      [DesignerControl(992200, CoreDesigner.NextGenDesigner, DesignerCategory.Custom)]
      public class MyControl : BaseDataExternalControl
      ```
   b. Suppress properties, if required, using the attribute **SuppressedPropertiesNextGen**.

      ```
      // Suppress properites PropertyName1, PropertyName2, and PropertyName3.
      [SuppressedPropertiesNextGen("PropertyName1;PropertyName2;PropertyName3;")]
      ```
   c. Override the **GetNewInstanceForClone()** function, create an instance of the control, and assign the basic properties of the control.
   d. Override the **GetControlHtml()** function and define the HTML code. Use the **TopLevelForm.InDesignMode** boolean variable to segregate the designer and run-time views, if required. Ensure all view model properties are specific to the instance defined in the view.

      For example:

      ```
      StringBuilder stringBuilder = new StringBuilder();

      if (this.TopLevelForm.InDesignMode)
      ```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
{
stringBuilder.Append("<div class=\"dropDownDesignClass\"></div>");
}
else
{
stringBuilder.Append("<drop-down" + this.UniqueControlId() + " controlid= \"" +
this.Id + "\" data-bind=\"" + CustomBindings.AngularInstanceId + ":
skelta.forms.utilities.getGuId()\"></drop-down" + this.UniqueControlId() + ">");
}
return stringBuilder.ToString();
```

Where **"drop-down" + this.UniqueControlId()** selector and **controlid** are the custom attributes. And dropDownDesignClass is a css class defined to show the UI/UX at design time.

e. Override the **GetViewModelDefinition()** function (if required) to define the **ViewModel**. Define a function and subscribe to **isFormLoaded** event of **topLevelForm**.

For example, the **ViewModel** can be built as:

```
var viewModelDefinitionBuilder = new StringBuilder();
var ctr = "_" + this.ParentForm.Id + "." + this.Id;
var javascriptFileInclusions = "['/inline.bundle.js', '/polyfills.bundle.js',
'/styles.bundle.js', '/vendor.bundle.js', '/main.bundle.js']";
viewModelDefinitionBuilder.Append(base.GetViewModelDefinition());
viewModelDefinitionBuilder.Append(ctr + ".initialize" + " = function()");
viewModelDefinitionBuilder.Append("{");
viewModelDefinitionBuilder.Append("window.controlInstance = " + ctr + ";");
viewModelDefinitionBuilder.Append(@"skelta.forms.utilities.includeCustomJsFiles(" +
javascriptFileInclusions + ", true, true);");
viewModelDefinitionBuilder.Append("};");
if (!string.IsNullOrEmpty(this.OnInitializeScript))
{
viewModelDefinitionBuilder.AppendLine(ctr + ".onInit = function(control) {");
viewModelDefinitionBuilder.AppendLine(this.OnInitializeScript);
viewModelDefinitionBuilder.AppendLine("}");
}
return viewModelDefinitionBuilder.ToString();
```

Note: Ensure the included JS files are present in the **<Installpath>\Web\BPMUITemplates\Default\NextGenForms\js** folder.

a. Define rules for a custom control to validate the data using the client-side JavaScript, if required. For more information, see Rules and Defining Rules.

Create class properties as control properties.

```
//Designer Property
[DesignerProperty(773000, Categories.Validation, CoreDesigner.NextGenDesigner)]
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
//Binding Property
[BindingAttribute(882995, "Skelta.Forms.Core.CommonObjects.IntegerBindingProperty")]
```

7. Create **SFControls.cs** class under **Skelta.Forms.ExternalControls** namespace.
8. Add the following namespaces to your **SFControls.cs** file.

```
using Skelta.Forms.Core.Controls;
using Skelta.Forms.Core.External;
using MyCustomControls; // Control namespace
```

9. Implement the **IExternalControls** in the **SFControls** class.
   a. In the **IExternalControls.GetControl(string controlFullName)** method, return the new control instance based on the control namespace.
   b. In the **GetControls** method, return a new object array which contains all the control instances.
10. Build your project, create a **SOA** folder on your hard drive (for example, **C:\SOA**), place your custom control DLL file in the folder, and then register the location of the folder with the **Skelta SOA Folder List**.
11. Register the custom control DLL file through the **Form Controls** to display the custom control in the controls or custom category. For more information, see Custom Categories.

Note:
- Control initialization file must always be named as **SFControls.cs** and the class name must always be named as **SFControls**.
- Ensure reference to the **Skelta.Forms.Core.dll** assembly is the same as the assembly on the AVEVA Work Tasks server.
- For information about SOA, see Object Access in the *User Guide*.
-Ensure all Bundled JS files are present in the **<Installpath>\Web\BPMUITemplates\Default\NextGenForms\js** folder.

To localize the text for the custom control

- See Localization.

To add an icon to a custom control

1. Add a custom icon in the **<Install Path>\Web\BPMUITemplates\Default\Themes\<ThemeName>\NextGenForms\images** folder.
2. Open the **SkeltaCustomControlDesigner.css** file in the **<Install Path>\Web\BPMUITemplates\Default\Themes\<ThemeName>\NextGenForms\css\custom** folder.
3. Add the following style to the **SkeltaCustomControlDesigner.css** file.

```
/* Replace <custom_icon> with the file name for the normal icon. */
/* Replace <namespace.classname> with the custom control namespace and class name. */
.sktbci[data-skttp="<namespace.classname>"]
{
background-image: url(../../images/<custom_icon>.png);
}
/* Replace <custom_icon_hover> with the file name for the hover icon. */
.sktbc:hover > .sktbci[data-skttp="<namespace.classname>"]
{
background-image: url(../../images/<custom_icon_hover>.png);
}
```

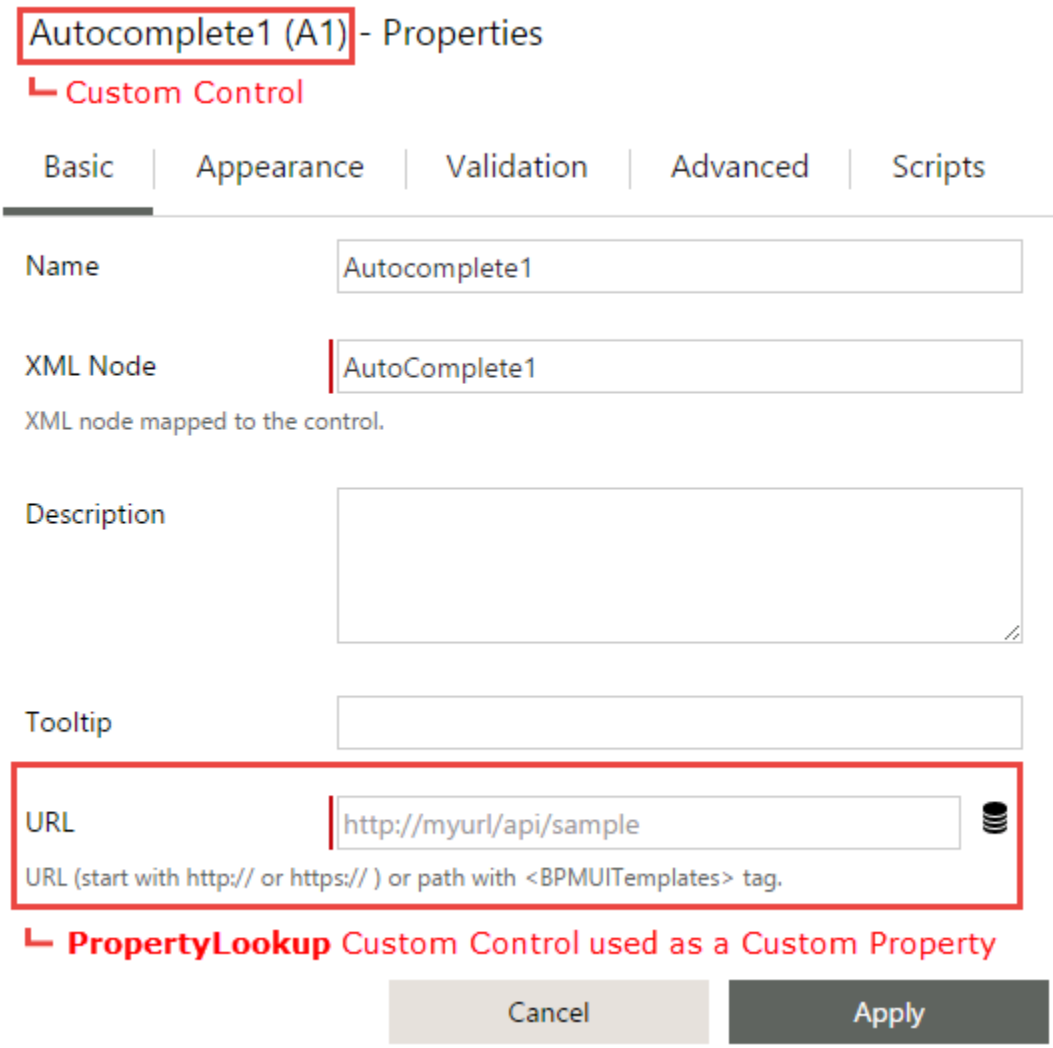
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Save the **SkeltaCustomControlDesigner.css** file.
5. Reload the **Forms Designer** page to see the custom control with the custom icon in the toolbox.

Custom Controls with Custom Properties

You can create a custom control with a custom property (which is actually a custom control).

Here the **Autocomplete** custom control makes use of the **PropertyLookup** custom control as its custom property (**URL**).



1. Create a custom control (**PropertyLookup**) to take inputs from the secondary page.

   The **PropertyLookup** control is an internal control, which is a control whose **Designer Category** is not set and therefore does not appear in the **Toolbox** of the **Forms Designer**.

   The **PropertyLookup** control is a read-only text box with an icon on the right and two properties:

   – **ImageClass** for showing an icon on the right

   – **ClickFunction** for handling the icon click event

   The **PropertyLookup.css** CSS file implements the **ImageClass** property and the **PropertyLookup.js** JavaScript

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

file implements the **ClickFunction** property.

2. Create another custom control (**Autocomplete**) and use the first custom control (**PropertyLookup**) as a custom property (**URL**).
   a. To use the **PropertyLookup** control as a property (**URL**) for the **Autocomplete** control, code in the **Autocomplete.cs** control initialization file as follows:

   ```
   [DesignerProperty(376567, Categories.Behaviour, typeof(PopupProperty), "")]
   [Binding(883100, "Skelta.Forms.Core.CommonObjects.CommonStringBindingProperty")]
   public string URL
   {
   get;
   set;
   }
   ```

   Here the **PopupProperty** refers to the **PopupProperty.cs** control initialization file, which renders the property (**URL**) for the **Autocomplete** control using the **IControlProperty** interface.
   b. To use an inline frame (iframe) in the property page, code in the **PropertyLookup.js** JavaScript file as follows:

   ```
   // Here PropertyLookup.htm is placed in the NextGen folder.
   parent.document.getElementById("propertyLookupFrame").src = "PropertyLookup.htm";
   parent.document.getElementById("propertyLookupFrame").attributes["data-skfsw"].value
   = 1;
   ```

   
   Here the **propertyLookupFrame** renders the inline frame using the **PropertyLookup.htm** HTML file. The `attributes["data-skfsw"].value = 1` ensures the inline frame is shown on top of the forms control property page.
   c. To access the **editPage View Model**, code in the **PropertyLookup.htm** HTML file as follows:

   ```
   var editPageVm = window.parent.frames["editframe"].viewModelObject ?
   window.parent.frames["editframe"].viewModelObject :
   window.parent.frames["editframe"].contentWindow.viewModelObject;
   ```

   d. To close the inline frame on click event, code in the **PropertyLookup.htm** HTML file as follows:

   ```
   parent.document.getElementById("propertyLookupFrame").attributes["data-skfsw"].value
   = 0;
   parent.document.getElementById("propertyLookupFrame").attributes["src"].value = "";
   ```

Example: PropertyLookup Control

A custom **PropertyLookup** control with control initialization, class, JavaScript, CSS, and HTM files.

- SFControl.cs (control initialization file)
- PropertyLookup.cs (control class file)
- PropertyLookup.js (JavaScript file)
- PropertyLookup.css (CSS file)

SFControl.cs

```
using Custom.Forms.Controls;
using Skelta.Forms.Core.Controls;
using Skelta.Forms.Core.External;
namespace Skelta.Forms.ExternalControls
{
class SFControls : IExternalControls
{
#region IExternalControls Members
BaseControl IExternalControls.GetControl(string controlFullName)
{
switch (controlFullName)
{
case "Custom.Forms.Controls.PropertyLookup":
return new PropertyLookup();
default:
return null;
}
}
object[] IExternalControls.GetControls()
{
return new object[] { new PropertyLookup() };
}
#endregion
}
}
```

PropertyLookup.cs

```
using Skelta.Forms.Core;
using Skelta.Forms.Core.Controls;
namespace Custom.Forms.Controls
{
using System.Collections.Generic;
using System.Text;
/// <summary>
/// Lookup control for property window
/// </summary>
////[DesignerControl(992202, CoreDesigner.NextGenDesigner, DesignerCategory.Custom)]
[SuppressedPropertiesNextGen("DefaultValue;EnableResponsiveView")]
public class PropertyLookup : BaseDataExternalControl
{
```
