</html>
```

Custom Control with Standard Properties

You can create a custom control with a standard property.

The **Data Lookup** property can be used for consuming the Data Lookups

1. Create a custom control (Tree).
   a. To use the DataLookupProperty as a property (Configuration Details) for the Tree View control, code in the Tree.cs control initialization file
   as follows:

```
private DataLookupProperty dataLookupDetails = null;/// <summary>
/// Gets or Sets the configurationDetails property that holds lookup name and the
parameter collection
/// </summary>
[DefaultValue(null)]
[DesignerProperty(775000, Categories.Behaviour,
[BindingAttribute(882700,
"Skelta.Forms.Core.CommonObjects.DataLookupBindingProperty")]
public DataLookupProperty DataLookupDetails
{
get
{
return dataLookupDetails;
}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
set
{
dataLookupDetails = value;
}
}
```

2. Build the custom control.
3. In **Forms Designer**, add the **TreeView** control to the form.
4. Modify the properties of the **TreeView** control as follows:
   a. In the **Basic** tab, click the **Data Source** icon. The **Lookup Source Configuration** page appears.
   b. In the **Data Source Type** drop-down, select a database.
   c. In the **Data Source** drop-down, select a lookup.
   d. Save the form.
5. Preview the form.
   You can see the the data lookup name and the parameter collection in the preview.

   Note: The **Tree** control is available as a standard control in Forms. This example is given to demonstrate the use of `DataLookupBindingProperty`.

Example: TreeView Control

A custom **TreeView** control using Kendo UI widget with control initialization, class, and JavaScript files.

- SFControl.cs (control initialization file)
- TreeView.cs (control class file)
- TreeViewBinding.cs (Bindings for the control)
- corp.customControls.treeView.js (JavaScript file for custom Knockout binding to support height, width, and read-only behavior)
- kendo.treeview.js
- knockout-kendo.treeview

Selecting the JavaScript files for the specific Kendo UI widget

The included kendo.all.min.js is limited to the following widgets:

- Grid
- DateTimePicker
- DatePicker
- TimePicker
- NumericTextBox
- ColorPicker
- PDF with the export features, pdf and drawing (built using the gulp command) for performance benefits.

To support additional widgets and features, you must refer only to the JavaScript files for the specific Kendo UI widget other than the JavaScript files for the included widgets. For this, you must be aware of script

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

dependencies and requirements for the Kendo UI widgets. Refer to Include Individual Widget Scripts for Kendo for the complete list of JavaScript files required for each Kendo UI widget.

Ensure you do not build the required Kendo UI widget JavaScript files using the gulp command as the script files created and registered will contain duplicate code parts.

for (var i = 0; i < parents.length; i++) {
parents[i].set("expanded", true);
}
},
_renderItem: function (options) {
if (!options.group) {
options.group = {};
}
options.treeview = this.options;
options.r = this.templates;
return this.templates.item(options);
},
_renderGroup: function (options) {
var that = this;
options.renderItems = function(options) {
var html = "",
i = 0,
items = options.items,
len = items ? items.length : 0,
group = options.group;
group.length = len;
for (; i < len; i++) {
options.group = group;
options.item = items[i];
options.item.index = i;
html += that._renderItem(options);
}
return html;
};
options.r = that.templates;
return that.templates.group(options);
}
});
ui.plugin(TreeView);
})(window.kendo.jQuery);
return window.kendo;
}, typeof define == 'function' && define.amd ? define : function(_, f){ f(); });
```

knockout-kendo.treeview.js

```
// Knockout binding for Kendo Tree View
(function ()
{
var createBinding = ko.kendo.bindingFactory.createBinding.bind(ko.kendo.bindingFactory);
//use constants to ensure consistency and to help reduce minified file size
var ENABLE = "enable"
VALUE = "value";
// Knockout Kendo Tree View
createBinding({
name: "kendoTreeView",
watch: {
data: function (value, options)
{
ko.kendo.setDataSource(this, value, options);
}
},
events: {
change: function (options, e)
{
if (ko.isWriteableObservable(options.value))
{
var tree = e.sender;
options.value(tree.dataItem(tree.select()));
}
}
},
async: true
});
}());
```

Add Custom Control Members as White List for Check syntax validations

To add custom control members as whiteList for Check syntax validations

1. Open the *Skelta.CustomControlsMembers.js* file from **BPMUITemplates\Default\NextGenForms\app\custom**
2. Uncomment the self invoking function.

```
(function ()
{
var standardControlMembers = skelta.forms.constants.controlsCollection;
var genericControlFunctions =
skelta.forms.constants.controlFunctions;//genericControlFunctions has properties -
nonContainerFunctions and containerFunctions which is a collection
of function names [{ name: "functionName"}]
var customControlMembers = {
functions: genericControlFunctions.nonContainerFunctions,//.concat([{ name:
"functionName" }
isContainerControl: false,
controlType: "ToolBar",
properties: [{ propertyName: "xmlNodeBoundTo", propertyType: "2", isWritable: false
},
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
{ propertyName: "tagName", propertyType: "0", isWritable: true },
{ propertyName: "id", propertyType: "2", isWritable: false },
{ propertyName: "value", propertyType: "0", isWritable: true },
{ propertyName: "isMandatory", propertyType: "0", isWritable: true },
{ propertyName: "readOnly", propertyType: "0", isWritable: true },
{ propertyName: "enable", propertyType: "0", isWritable: true },
{ propertyName: "resizable", propertyType: "0", isWritable: true },
{ propertyName: "visible", propertyType: "0", isWritable: true }]
}
standardControlMembers.push(customControlMembers);
})();
```

3. In the code:
   - The `genericControlFunctions` has the properties, `nonContainerFunctions` and `containerFunctions` which are a collection of function names - `[{ name: "functionName"}]`.
   - `controlType` is the name of the custom control.
4. Use the `customControlMembers` object as per the custom control by adding properties to the properties array.
   - `propertyName` is the name of the property.
   - `propertyType` is "0" for observable, "1" for observableArray and "2" for nonObservable.
   - `isWritable` is true or false - depending on whether the property is assignable or readonly.
5. Push the `customControlMembers` to the `standardControlMembers` collection.

For examples on adding "MaskedInput" and "Barchart" properties for Check syntax validations, see the Adding Masked Input Property for Check Syntax Validation and Adding Barchart Properties for Check Syntax Validations topics respectively.

Default Values

Default value is the value assigned to the control automatically when you do not set any value to the control explicitly.

Control	**Default Value**
Boolean	"False"
Check Box	Empty string
Date	Empty string
Drop-Down	Empty string (if **Options Caption** is set) First Options Value (if **Options Caption** is not set)
Email	Empty string
List	Empty string

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Control	Default Value
Number	Empty string
Radio Button	Empty string
Text	Empty string
Time	Empty string

Validation of Values

Value rules are triggered when the value of a control changes.

A data type mismatch occurs when an invalid value is set for a control either through the user interface (UI) or through the scripts. In such cases, the value of the control is reset.

When an invalid value is set for a control either through the UI or through the scripts, the control behaves as follows:

Control	User Interface	Scripts
• Boolean	• Not applicable.	• Updates the value of the control with the invalid value. • Shows the error message in the user interface. • Prevents submission of the form.
• Check Box • Drop-Down • List • Radio Button	• Not applicable.	• Updates the value of the control with the invalid value. • No error message is shown in the user interface. • Allows submission of the form with the invalid value.
• Date • Date Time • Time	• Updates the value of the control with the invalid value. • Shows the error message. • Prevents submission of the form.	• Updates the value of the control with the invalid value. • Shows the error message in the user interface. • Prevents submission of the form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Control	User Interface	Scripts
• Email • Text	• Updates the value of the control with the invalid value. • Shows the error message. • Prevents submission of the form.	• Updates the value of the control with the invalid value. • Shows the error message in the user interface. • Prevents submission of the form.

Note: When a value is set through the scripts for the **Value** or the **Default Value** property of a control, the validation for the property is not triggered on page load.

Form Layouts

Layouts are the organization of controls on a form using container controls. Layouts are used to design complex forms.

Design Form Layouts

Design a layout to organize controls on a form using container controls.

To design a form layout

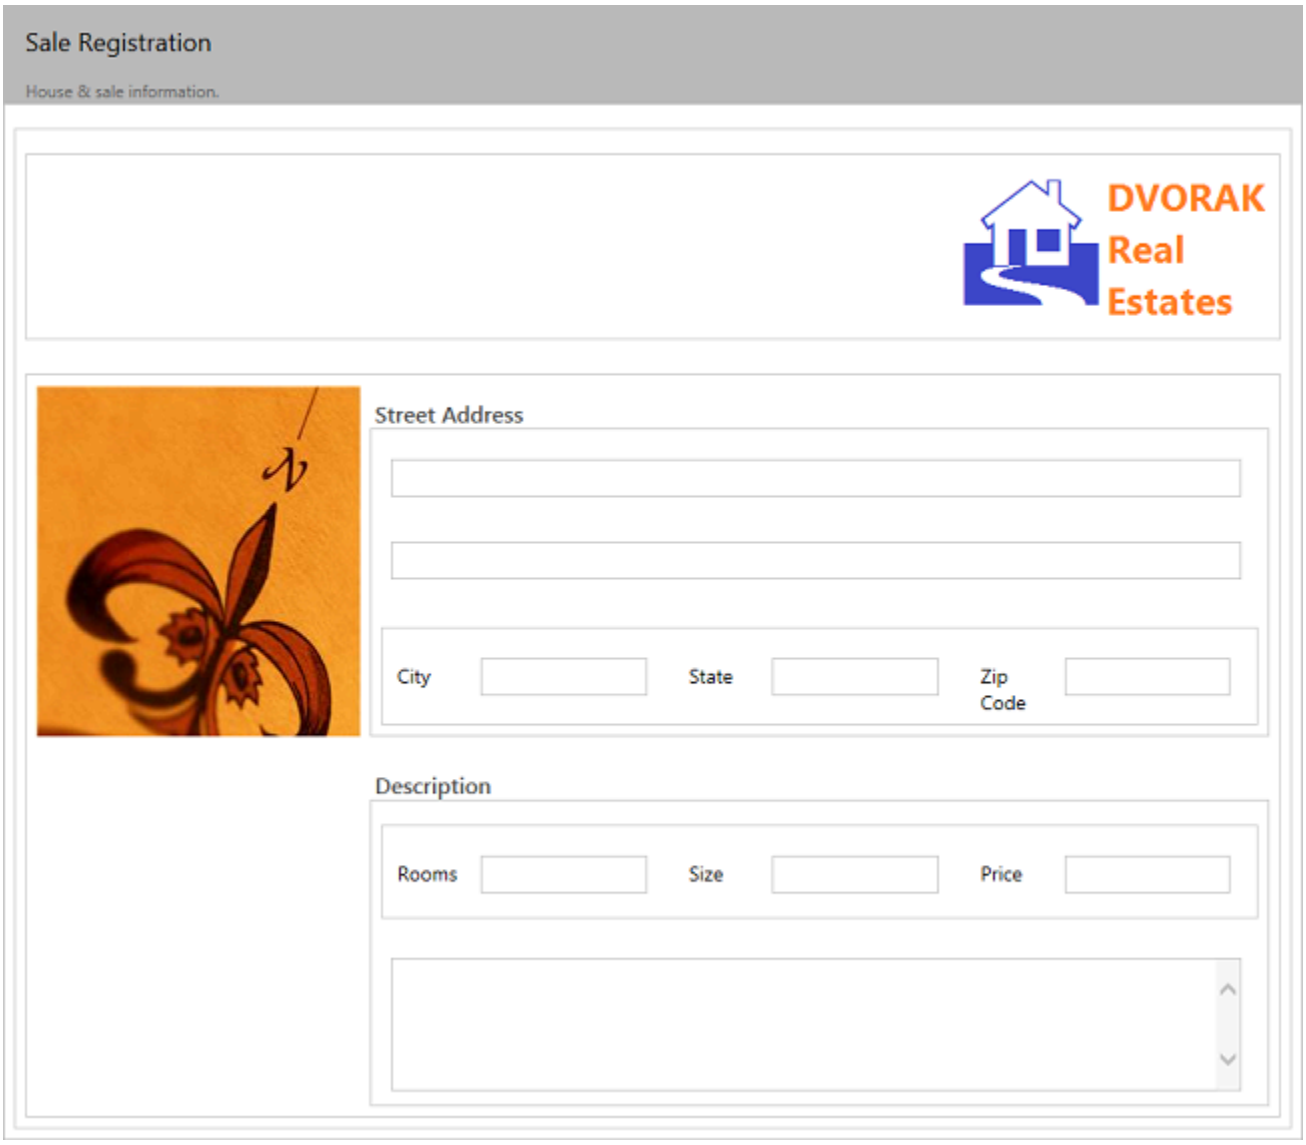
1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click **Design**). The **Forms Designer** page appears.
3. Drag a **Panel Form** container from the toolbox to the desired location on the canvas. The selected control appears on the canvas.
4. Point to the **Panel Form** container, and then click the **Properties** button. The **Properties** dialog box appears.
5. In the **Name** box, delete the name.
6. Click the **Appearance** tab, and then in the **Columns** box, type the number of columns required.
7. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
8. Drag the required controls or containers from the toolbox to the desired column on the **Panel Form** container.
9. Set the required properties for the new controls or containers.
10. Preview the form to check look and feel of the form with the layout at run-time.
11. Click the **Close** button. The form is saved and the **Forms Designer** page is closed.

Note:
- When placing controls and containers in **Base Form** and **Panel Form**, ensure the placed controls and containers are visible and accessible to the user.
- Controls in the other columns of the **Panel Form** cannot be aligned when there are no controls in the first column of the **Panel Form**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example: Sale Registration Form

A sale registration form for capturing information about a house for sale requires many controls. Placing controls one after the other on the form results in poor form design. Instead, use container controls to design layouts for organizing controls on the form. Layouts improve usability of the form.



To create the form

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. Click **New**, and then click **Form**. The **New Form** wizard appears.
3. In the **Name** box, type **Sale Registration**, and in the **Description** box, type **House & Sale information**.
4. Click **Save & Continue**. The **Sale Registration** form is created, and the **Form Options** wizard appears.

To design the form with layouts

1. Click **Design** this form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Click **Finish**. The **Forms Designer** page appears.
3. Drag **Panel Form** container from the toolbox to the canvas. The **Panel Form** appears on the canvas.
4. Point to the **Panel Form (P1)** container, and then click the **Properties** button. The **Properties** dialog box appears.
5. In the **Name** box, delete the name.
6. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
7. Drag **Panel Form** container from the toolbox and place it on the **Panel Form (P1)** container. The **Panel Form** appears on the canvas.
8. Point to the **Panel Form (P2)** container, and then click the **Properties** button. The **Properties** dialog box appears.
9. In the **Name** box, delete the name.
10. Click the **Appearance** tab, and then in the **Columns** box, type **2**. A two-column layout is created.
11. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
12. Drag **Image** control from the toolbox and place it on the second column of the **Panel Form (P2).** The **Image** control appears on the canvas.
13. Point to the **Image** control, and then click the **Properties** button. The **Properties** dialog box appears.
14. In the **Image Path** box, type the path to the image, and then click **Apply**. The properties are saved and the **Properties** dialog box is closed.
15. Drag **Panel Form** container from the toolbox and place it on the **Panel Form (P1)** container below the **Panel Form (P2)** container. The **Panel Form** appears on the canvas.
16. Point to the **Panel Form (P3)** container, and then click the **Properties** button. The **Properties** dialog box appears.
17. In the **Name** box, delete the name.
18. Click the **Appearance** tab, and then in the **Columns** box, type **2**. A two-column layout is created.
19. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
20. Drag **Image** control from the toolbox and place it on the first column of the **Panel Form (P3).** The **Image control** appears on the canvas.
21. Point to the **Image control**, and then click the **Properties** button. The **Properties** dialog box appears.
22. In the **Image Path** box, type the path to the image, and then click **Apply**. The properties are saved and the **Properties** dialog box is closed.
23. Drag **Base Form** container from the toolbox and place it on the second column of the **Panel Form (P3)** container. The **Base Form** container appears on the canvas.
24. In the **Name** box, type **Street Address**.
25. Click the **Appearance** tab, and then in the **Label Position** list, click **Suppress**.
26. Click the **Validation** tab, and then in the **Repeating** list, click **False**.
27. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
28. Drag **Text** control from the toolbox and place it on the **Base Form (B1)** container. The **Text** control appears on the canvas.
29. Point to the **Text** control, and then click the **Properties** button. The **Properties** dialog box appears.
30. In the **Name** box, delete the name.
31. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

32. Drag **Text** control from the toolbox and place it on the **Base Form (B1)** container. The **Text** control appears on the canvas.
33. Point to the **Text** control, and then click the **Properties** button. The **Properties** dialog box appears.
34. In the **Name** box, delete the name.
35. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
36. Drag **Panel Form** container from the toolbox and place it on the **Base Form (B1)** container below the text controls. The Panel Form appears on the canvas.
37. Point to the **Panel Form (P4)** container, and then click the **Properties** button. The **Properties** dialog box appears.
38. In the **Name** box, delete the name.
39. Click the **Appearance** tab, and then in the **Columns** box, type 3. A three-column layout is created.
40. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
41. Drag **Text** control from the toolbox and place it on the first column of the **Panel Form (P4).** The **Text** control appears on the canvas.
42. Point to the **Text** control, and then click the **Properties** button. The **Properties** dialog box appears.
43. In the **Name** box, type **City**.
44. Click the **Appearance** tab, and then in the **Label Position** list, click **Left**.
45. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
46. Drag **Text** control from the toolbox and place it on the second column of the **Panel Form (P4).** The **Text** control appears on the canvas.
47. Point to the **Text** control, and then click the **Properties** button. The **Properties** dialog box appears.
48. In the **Name** box, type State.
49. Click the **Appearance** tab, and then in the **Label Position** list, click **Left**.
50. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
51. Drag **Text** control from the toolbox and place it on the third column of the **Panel Form (P4).** The **Text** control appears on the canvas.
52. Point to the **Text** control, and then click the **Properties** button. The **Properties** dialog box appears.
53. In the **Name** box, type **Zip Code**.
54. Click the **Appearance** tab, and then in the **Label Position** list, click **Left**.
55. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
56. Drag **Base Form** container from the toolbox and place it on the second column of the **Panel Form (P3)** container below the **Base Form (B1)** container. The **Base Form** container appears on the canvas.
57. In the **Name** box, type **Description**.
58. Click the **Appearance** tab, and then in the **Label Position** list, click **Suppress**.
59. Click the **Validation** tab, and then in the **Repeating** list, click **False**.
60. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
61. Drag **Panel Form** container from the toolbox and place it on the **Base Form (B2)** container. The **Panel Form** appears on the canvas.
62. Point to the **Panel Form (P5)** container, and then click the **Properties** button. The **Properties** dialog box appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

63. In the **Name** box, delete the name.
64. Click the **Appearance** tab, and then in the **Columns** box, type **3**. A three-column layout is created.
65. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
66. Drag **Text** control from the toolbox and place it on the first column of the **Panel Form (P5)**. The **Text** control appears on the canvas.
67. Point to the **Text** control, and then click the **Properties** button. The **Properties** dialog box appears.
68. In the **Name** box, type **Rooms**.
69. Click the **Appearance** tab, and then in the **Label Position** list, click **Left**.
70. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
71. Drag **Text** control from the toolbox and place it on the second column of the **Panel Form (P5)**. The **Text** control appears on the canvas.
72. Point to the **Text** control, and then click the **Properties** button. The **Properties** dialog box appears.
73. In the **Name** box, type **Size**.
74. Click the **Appearance** tab, and then in the **Label Position** list, click **Left**.
75. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
76. Drag **Text** control from the toolbox and place it on the third column of the **Panel Form (P5).** The **Text** control appears on the canvas.
77. Point to the **Text** control, and then click the **Properties** button. The **Properties** dialog box appears.
78. In the **Name** box, type **Price**.
79. Click the **Appearance** tab, and then in the **Label Position** list, click **Left**.
80. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
81. Drag **Text** control from the toolbox and place it on the **Base Form (B2)** below the **Panel Form (P5).** The **Text** control appears on the canvas.
82. Point to the **Text** control, and then click the **Properties** button. The **Properties** dialog box appears.
83. Click the **Appearance** tab, and then in the **Display Mode** list, click **Multi Line**.
84. In the **Rows** box, type **5**.
85. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.

To preview the form

1. On the action bar, click **Preview**. The **Preview** dialog box appears.
2. Check look and feel of the **Sale Registration** form.
3. Click the **Close** button. The **Preview** dialog box is closed.

To publish the form

1. On the action bar, click **Publish**. The form is published and an information message appears.
2. Click **OK**. The information message is closed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Forms in Custom Pages

Forms in custom pages allow you to customize your business application by loading a required form. The forms in custom pages are applicable only for **Fill Form** scenarios and not for **Work Item Inbox** scenarios.

Load Single Form

Load a required form in a custom page to customize your business application.

To load a form in a custom page

1. Create a custom page using the Single Form Custom Page Template in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\NextGenForms* folder.
2. Edit the custom page using an HTML editor to add a form by replacing the placeholders with the **Repository Name**, **User ID**, **Form Name**, **Form Version**, and **Form ID** as follows:

```
var appName = "Forms Repository"; // Repository Name – Case Sensitive value should be provided
var userId = "skeltalist::326E19DC-A292-49A0-B8A0-B8E62A9F3F27"; // Repository Provider with the User ID separated by the “::”
var formName = "TestForm"; // Form Name – Case Sensitive value should be provided
var formVersion = "1"; // Form Version
var formId = "bb48516f-d69f-43ce-99f3-aa6e39d70281"; // Form ID – should be in small case letters
```

Note:
- `appName` is the Repository Name and is a case sensitive value.
- `userId` is the internal User ID in the form of Repository Provider Instance Name and the User Id separated by the “::”.
- `formName` is the Form Name, which needs to be shown in the custom page and is a case sensitive value.
- `formId` is the Form GUID, which needs to be shown in the custom page and should be in small case letters.

To access forms parameters in a custom page

To access form parameters in a custom page, refer Setting Form Parameters

To access a form in a custom page placed in a folder other than NextGenForms

If the custom page is not placed in the folder relative to the AVEVA Work Tasks installed path, *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\NextGenForms\..*,then declare the following constant with the variables defined while loading and accessing forms in a custom page.

Also, the value depends on the location of the custom page and is a relative path. Consider the custom page to be in the path *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Repository\Site*.. The below line of code should be added before the “`var appName …`” code.

```
skelta.serverUrl = "../../NextGenForms/";
```

We also need to update the Javascript and CSS file references in the custom page code as below (listed few references below as an example):

```
<script type="text/javascript" src="../../Common/JavaScripts/spin.min.js"></script>
<script type="text/javascript" src="../../NextGenForms/app/Skelta.min.js"></script>
<script type="text/javascript" src="../../NextGenForms/js/date.min.js"></script>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<link rel="stylesheet" href="../../NextGenForms/css/SkeltaForms.min.css" />
<link rel="stylesheet" href="../../CommonUXControls/StyleSheet/se.ui.min.css" />
```

To access a Pop-Up Form in a custom page

If the custom page is not placed in the folder relative to the AVEVA Work Tasks installed path, **<AVEVA Work Tasks Install Path>\BPMUITemplates\Default\NextGenForms\..**,then declare the following constant with the variables defined while loading and accessing forms in a custom page.

The value is pre-fixed while opening the PopupForm HTML page to create a relevant relative path. Also, the value of the constant depends on the location of the custom page.

Consider the custom page to be in the path *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Repository\Site\..* The below line of code should be added before the "`var appName …`" code.

```
skelta.forms.constants.popupFormContants.HtmRelativePath = "../../NextGenForms/";
skelta.serverUrl = "../../NextGenForms/";
```

Single Form Custom Page Template

Use this **Custom Page** template to load a form in a custom page.

```
<!doctype html>
<html>
<head>
<title>Loading a Form</title>

Localization

Internationalization and localization make software ready for the world by adapting the software to a specific market.

Internationalization

Internationalization is the process of adapting software to different languages and regional differences. Internationalization focuses on separating the language-related aspects of the software from the code.

Localization

Localization is the process of adapting internationalized software to a specific language, script, and culture. Localization focuses on cultural adaptation for specific countries, regions, and groups.

Localize Forms

Localize forms to make it usable with a specific language, script, and culture by localizing controls, standard validation messages, and messages in validation scripts.

Workflow Management Forms provides two types of localization in Enterprise Console.

- Design time localization
- Run time localization

Design time localization

Design time localization happens when a form is published. At the time of publishing a form, the Forms Engine will find all the keys (prefixed and suffixed with **@@**, for example **@@entity@@**) mentioned inside the form (either in the properties like tag name or button text or in the script) and replace the values from the text files inside **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2** folder including subfolders.

AVEVA Work Tasks saves the localized View Model Object in the database. When you open/render a form, it will be loaded from the View Model Object (except when preview). This means that any changes made in the locale files after the form is published will not reflect until the respective forms are republished.

Run time localization

Run time localization happens when a form is loaded either from Navigation Link, Pop-Up form, or is rendered in HTML page. The Forms Engine will load all the key value pairs from all the text files inside **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2\Standard** folder at client side.

To find the value of a key, use the **skelta.localize.getString()** API.

The keys mentioned with **@@** will be localized at the time of publishing of the form. At client side, **skelta.localize.getString()** can be used for run time localization.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Changing the key/value pair for design time localization will need all the dependent forms to be republished.
- Design time localization is faster than run time localization.

Localize Control Names and Descriptions

Localize a control name and description to make it usable with a specific language, script, and culture.

To localize a control name and description

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click **Design**). The **Forms Designer** page appears.
3. Point to the control, and then click the **Properties** button. The **Properties** dialog box appears.
4. In the **Name** box, type **@@**<*localize_name*>**@@.**
5. In the **Description** box, type **@@**<*localize_description*>**@@.**
6. Click **Apply**. The properties are saved and the **Properties** dialog box is closed.
7. Add a key-value pair for name and description in an existing or a new text file in the **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2** and **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2\Standard** folders in the following format: **@@**<*localization_key*>**@@:Localized Value**.

   That is **@@**<*localize_name*>**@@:Localized Name** for **Name** and for **@@**<*localize_description*>**@@:Localized Description** for **Description**.

   Note: In the format **@@**<*localization_key*>**@@,** the <*localization_key*> key name should not have **space** and **special characters**. However, you can use **-** and **_** characters for the key names.
8. On the action bar, click **Preview**.
9. Check look and feel of the form for browser with the localized values.
10. Click the **Close** button. The **Preview** dialog box is closed.

Example

To localize a **Text** control name to **Employee Name** and description to **Contract Employee**, first set the **Name** property to **@@emp_name@@** (the localization key you have chosen for the name) and set the **Description** property to **@@emp_desc@@** (the localization key you have chosen for the description), then add a key-value pair in an existing or a new text file in the **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2** folder as **@@emp_name@@:Employee Name** and **@@emp_desc@@:Contract Employee**.

Note:
- When you localize **Button Text** of **Button** control, use the unresolved localized text for **Value** while creating conditions for **Button Pressed** in **Possible Distinct Outputs** property for **Invoke Form** activity of workflow.
- For example, if the **Button Text** is **Approve** and the localized text is **@@Approve@@**, then use **@@Approve@@** for **Value** of **Button Pressed** in **Possible Distinct Outputs** property for **Invoke Form** activity of the workflow.
- For information about Invoke Form activity and Possible Distinct Outputs, see **Invoke Form Activity** in *Developer Guide*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Localize Standard Validation Messages

Localize a standard validation message to make it usable with a specific language, script, and culture.

To localize a standard validation message

1. Identify the key for a standard validation message from the text file in the **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2\Standard** folder.
2. Add a key-value pair in an existing or a new text file in the following format: **FormNGFMandatory:<@Name@><localized text>.**

Example

When the **Name** property of a control is left blank, the **Name is mandatory** validation message appears. The key for this message in the text file is **FormNGFMandatory**. To localize or change this message to, say, **Name must be specified.**, add a key-value pair in an existing or a new text file in the **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2\Standard** folder as **FormNGFMandatory: <@Name@> must be specified**.

Localize Messages in Validation Scripts

Localize a message in a validation script to make it usable with a specific language, script, and culture.

To localize a message in a validation script

1. Open an existing text file or create a new text file in the **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2\Standard folder**.
2. Add a key-value pair in the following format: **<message>:<localized text**>.

Example

To display a localized message, say, Special characters are not allowed., when validating the Employee Name property through a script, add a key-value pair in an existing or a new text file in the **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2\Standard** folder as **InvalidEmployeeName: Special characters are not allowed**.

Validation Script

```
if (currentValue==="%")
{
return new ValidationOptions(false,skelta.localize.getString("InvalidEmployeeName"));
}
```

Key-Value Pair

```
InvalidEmployeeName: Special characters are not allowed.
```

Localize Column Names in Data Grid

Data Grid column names considers localization for names with **@@** prefix and suffix.

Example of a Key-Value Pair:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

@@FN@@:First Name

Where, **@@FN@@** is the localized key given for a **Display Column** while configuring grids. Ensure not to provide any space in the localized key.

In the Configure Grids, double click the **Display Column** and specify the key with **@@** as prefix and suffix.

Add the key/value pair to the run time localization file. For more information, see section *Run time localization* in Localize Forms.

Number and Date Formats

Number Formats

Number formatting is used to convert a numeric value to a human readable string using culture specific settings.

Standard Numeric Formats

Format	Description	Example (for en-US)
n	Number	n 1234.567 is displayed as 1,234.57
		n0 10.12 is displayed as 10
		n5 10.12 is displayed as 10.12000
c	Currency	c 1234.567 is displayed as $1,234.57
		c0 1234.567 is displayed as $1,235
p	Percentage	p 0.222 is displayed as 22.20%
		p0 0.222 is displayed as 22%
e	Exponential	e4 0.122 is displayed as 1.2200e-1

Custom Numeric Formats

Create custom numeric format string using one or more custom numeric specifiers.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Format	Description	Example (for en-US)
0	Zero placeholder. Replaces the zero with the corresponding digit if one is present; otherwise, zero appears in the result string.	00000 1234.5678 is displayed as 01235
#	Digit placeholder. Replaces the hash sign with the corresponding digit if one is present; otherwise, no digit appears in the result string. **Note:** '#' specifier cannot be used to format a number as telephone number, that is (###)-###-####.	##### 1234.5678 is displayed as 1235
.	Decimal placeholder. Determines the location of the decimal separator in the result string. The '.' symbol is replaced with the localized decimal symbol. **Note:** You can set the decimal values only if the value in the **Decimal Places** box has been set to a number greater than 0.	0.00 0.45678 is displayed as 0.46
,	Group separator placeholder. Determines whether a group separator is required for a number. The ',' symbol is replaced with the localized group separator symbol. **Note:** - The numbers are grouped or separated based on the current server culture. This property is applicable only when the **Show Group Separator** property is set **to Yes**. - If you want to use comma as the group separator irrespective of the current server culture, then enter '**,**' in the **Group Separator** box.	##,# 12345678 is displayed as 12,345,678

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

%	Percentage placeholder The '%' symbol is replaced with the localized percentage symbol. **Note:** '%' symbol is interpreted as a format specifier in the format string. If you need to prevent this, you will need to precede the '%' symbol with a '\'.	• If the format is **p** and the value of the number is '0.25', then the number is displayed as '25%'. • If the format is **#.## %** and the value of the number is '0.25', then the number is displayed as '25%'. • If the format is **#.## \%** and the value of the number is '0.25', then the number is displayed as '0.25 %'.
$	Currency placeholder. The number is formatted based on the culture settings for currency in the current server. The $ symbol is replaced with the localized currency symbol. **Note:** '$' symbol is interpreted as a format specifier in the format string. If you need to prevent this, you will need to precede the '$' symbol with a '****'.	If the current server culture is “en-US”, then the currency is displayed as '$'. However, if the current server culture is “Brazilian”, then the currency is displayed as 'R$'. • If the format is **# $** and the number is 12, then the number is displayed as 12 R$. • If the format is **# \$** and the number is 12, then the number is displayed as 12 $.
;	Section separator. Defines sections with separate format strings for positive, negative, and zero numbers.	#.00 $;#.00 - $;#.00 $ If you enter the value as '125', then it is displayed as '125.00 $'. If you enter the value as '-125', then it is displayed as '125.00 - $'. If you enter the value as '0', then it is displayed as '0.00 $'.
"string"/'string'	Literal string delimiter. Indicates that the enclosed characters should be copied to the result string.	#,##,###.00 ‘₹’ or #,##,###.00 “₹” If you enter the value as '125.00', then it is displayed as '125.00 ₹'.

Date and Time Formats

Date and time formatting is to convert date and time value to a human readable string using culture's specific

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

settings.

Standard Date and Time Formats

Format	Description	Example (for en-US)
d	Short date pattern.	M/d/yyyy 11/6/2000
"D"	Long date pattern.	dddd, MMMM dd, yyyy Monday, November 06, 2000
F	Full date/time pattern.	dddd, MMMM dd, yyyy h:mm:ss tt Monday, November 06, 2000 12:00:00 AM
g	General date/time pattern (short time).	M/d/yyyy h:mm tt 11/6/2000 12:00 AM
G	General date/time pattern (long time).	M/d/yyyy h:mm:ss tt 11/6/2000 12:00:00 AM
M/m	Month/day pattern.	MMMM dd November 06
u	Universal sortable date/time pattern.	yyyy'-'MM'-'dd HH':'mm':'ss'Z' 2000-11-06 00:00:00Z
Y/y	Year/month pattern.	MMMM, yyyy November, 2000

Custom Date and Time Formats

Create custom date and time format string using one or more custom date and time specifiers.

Format	Description
d	The day of the month, from 1 through 31.
dd	The day of the month, from 01 through 31.
ddd	The abbreviated name of the day of the week.
dddd	The full name of the day of the week.
f	The tenths of a second in a date and time value.
ff	The hundredths of a second in a date and time value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

fff	The milliseconds in a date and time value.
M	The month, from 1 through 12.
MM	The month, from 01 through 12.
MMM	The abbreviated name of the month.
MMMM	The full name of the month.
h	The hour, using a 12-hour clock from 1 to 12.
hh	The hour, using a 12-hour clock from 01 to 12.
H	The hour, using a 24-hour clock from 1 to 23.
HH	The hour, using a 24-hour clock from 01 to 23.
m	The minute, from 0 through 59.
mm	The minute, from 00 through 59.
s	The second, from 0 through 59.
ss	The second, from 00 through 59.
tt	The AM/PM designator.
yy	The last two characters from year value.
yyyy	The year full value.

Form Scripts

Scripts are a list of instructions to accomplish a desired operation. You can use various methods in the Forms APIs in your scripts to customize your business applications. Forms use JavaScript to deliver rich and dynamic web content.

Use scripts to create business rules and complex scenarios in your forms.

Note:
- Forms customization through scripting can introduce security vulnerabilities if the End-Users who author those scripts are unfamiliar with Secure Coding principles or are acting maliciously. Forms Designer permission role should only be assigned to users who are trusted not to abuse the system and are familiar with secure coding principles.
- AVEVA Work Tasks supports JavaScript based on the ES5 (ES2014) standard, applicable for Forms.

Framework

The following framework is used to validate data on a form before submitting the form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- JavaScript
- Script Editor
- SOA through Scripts

JavaScript

JavaScript is a dynamic, object-oriented, and interpreted client-side scripting language for web pages. JavaScript is used to validate data on a form before submitting the form. JavaScript is also used to make content interactive or load new content on a page and submit data to a server without reloading the page.

Script Editor

Script Editor is a custom editor to code in JavaScript.

To work with the Script Editor

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click **Design**). The **Forms Designer** page appears.
3. Point to the control, and then click the **Properties** button. The **Properties** dialog box appears.
4. Click the **Scripts** tab, and then click the **Script Editor** button for the required property. The **Script Editor** page appears.
5. Code the script, and then click **Save & Close**.

   The script is saved and the **Script Editor** page is closed.

   Note: If you click **Cancel**, the **Script Editor** page is closed. Any changes made to the code since it was last saved, is discarded.

Script Editor Interface

Action Bar

Action bar has commands to edit the script and preview the form.

Menu/Command	Description
Undo	Undo the last change made to the script.
Redo	Redo the last change that was undone.
Revert	Revert to a previously saved script.
Clear All	Clear the code from the editor.
Indent All	Indent the code.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Check Syntax	Validate the code. **Note:** - Use Camel case when coding in JavaScript. - We recommend to validate the code before saving the script to ensure there are no errors in the code.
Preview	Preview the form. For more information, see Preview Forms.
Device Preview	Preview the form from a device. For more information, see Preview Forms.

XML Structure

The XML Structure displays all the controls that contain XML nodes in the same hierarchy as the form is designed. When you select a node, the default script is inserted in the script editor. If you select the same control as that in which you are coding the script, then the `currentValue` is displayed. If you select a container control, the default script inserted is `control.findByXmlNode("Xml node")`. If you select any other control, the default script inserted is `control.findByXmlNode("Xml node").value`.

APIs

The APIs displays all the `Skelta.form.utilities` (SFU) APIs. When you select an API, the API is inserted inside the script editor.

Control Structure

The Control Structure displays all the control nodes in the same hierarchy as the form is designed. When you select a node, the default script is inserted in the script editor. If you select the same control as that in which you are coding the script, then the currentValue is displayed. If you select a container control, the default script inserted is `control.findById("ID")`. If you select any other control, the default script inserted is `control.findById("ID").value`. If you select the top level root node, the script inserted is `control.topLevelForm`.

Intellisense

Use intellisene to code scripts in the Scripts Editor . Intellisense in the Script Editor is triggered when you press Ctrl + Space.

- When you press Ctrl + Space in a new line or when the Script Editor is empty, then a list of all the available global objects appears.
- When you write `control.` and press Ctrl + Space, then depending on the control or container that you are scripting for in the script editor, a list of the control or container properties and methods appears. For example:
  - To add scripts in the script editor of a **Text** control, when you write `control.` and press Ctrl + Space, a list of the properties and methods applicable only for Text control appears.
  - To add scripts in the script editor of a **Base Form** container, when you write `control.` and press Ctrl + Space, a list of the properties and methods applicable only for **Base Form** container appears.
- When you write `control.findById( , control.findByName(`, or `control.findByXmlNode(` and press Ctrl + Space, then a list of the Ids, names or XML nodes applicable for the control or container appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note:
- The editor must not have any string with **]]>** or **CDATA**, otherwise you will not be able to save the script.
- The script must return a value for all the properties under the **Scripts** tab of the respective control.
- The script is auto saved every 1 minute.
- To write the scripts for functions, see Best Practices.

Validate Scripts

Validate a script to ensure the code is valid.

To validate a script

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click Design). The **Forms Designer** page appears.
3. Point to the control, and then click the **Properties** button. The **Properties** dialog box appears.
4. Click the **Scripts** tab, and then click the **Script Editor** button for the required property. The **Script Editor** page appears.
5. Code the script, and then click **Check Syntax**. The code is validated.
6. Correct the invalid code and then click **Save & Close**. The script is saved and the **Script Editor** page is closed.

Properties and Methods

The following properties and methods are validated:

Properties	Methods
• enable • visible • readOnly • isMandatory • value • topLevelForm	• findById() • findByXmlNode() • findByName()

Validation

- Code is validated only when the **Check Syntax** button is clicked and not when the **Save** or **Save & Close** button is clicked.
- Control specific syntax is validated only if the script starts with the **control** keyword.
- User referenced JavaScript files are not validated.
- Run-time scenarios are not validated.

```
var b = "T1";
control.findById(b).value;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
var a = control;
// This line of code is not validated.
a.findById("T1").value
```

SOA through Scripts

1. Create a dynamic-link library (DLL) or an assembly with your custom business logic.
2. Add the assembly to the global assembly cache (GAC) or place the assembly in a dedicated folder.
3. If the assembly is placed in a dedicated folder, then register the location of the folder with the **SOA Folder List**.
4. In order to call the SOA method, code your script for your form taking care to ensure the type and order of the method parameters should match the method.

For information on using SOA through scripts, see SFU.soaMethod() API. For information about SOA, see *Workflow Management User Guide*.

Guidelines

This section defines the guidelines to be followed while using the form containers and controls.

Properties and Events

This section guides you on using the scripts to define the various properties and events of a control.

Enable

Use scripts for the **Enable** property to enable or disable a control.

To enable or disable a control

- Code the script as follows for the **Enable** property of a control:

Task	Script
• Enable the control.	`return true;`
• Disable the control.	`return false;`

To enable or disable a control based on the value of another control

You can enable or disable a control based on the value of another control.

Example

If you want to enable the **Last Name** (T2) control only when a name is entered in the **First Name** (T1) control, then you can code the script for the **Enable** property of the **Last Name** (T2) control as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
if(control.findById("T1").value !== "")
{
return true;
}
else
{
return false;
}
```

Note:
- The **currentValue** method returns the value for the current property of a control.
- For the **Enable** property, the value is true when the control is enabled and the value is false when the control is disabled.

Visible

Use scripts for the **Visible** property to show or hide a control.

To show or hide a control

- Code the script as follows for the Visible property of a control:

Task	Script
• Show the control.	`return true;`
• Hide the control.	`return false;`

To show or hide a control based on the value of another control

You can show or hide a control based on the value of another control.

Example

If you want to show the **Last Name** (T2) control only when a name is entered in the **First Name** (T1) control, then you can code the script for the **Visible** property of the **Last Name** (T2) control as follows:

```
if(control.findById("T1").value !== "")
{
return true;
}
else
{
return false;
}
```

Note:
- The **currentValue** method returns the value for the current property of a control.
- For the **Visible** property, the value is true when the control is shown and the value is false when the control is hidden.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Read-Only

Use scripts for the **Read-Only** property to allow or deny a user to enter a value for the control.

To allow or deny a user to enter a value for a control

- Code the script as follows for the **Read-Only** property of a control:

Task	Script
• Deny a user to enter a value for the control.	`return true;`
• Allow a user to enter a value for the control.	`return false;`

To allow or deny a user to enter a value for a control based on the value of another control

You can allow or deny a user to enter a value for a control based on the value of another control.

Example

If you want to deny a user to change the value in the **Comments** (T1) control when the **Edit Comments** (D1) control is set to **No** (here the value for **No** is **0** and the value for **Yes** is **1**), then you can code the script for the **Read-Only** property of the **Comments** (T1) control as follows.

```
if(control.findById("D1").value !== "1")
{
return true;
}
else
{
return false;
}
```

Note:
- The **currentValue** method returns the value for the current property of a control.
- For the **Read-Only** property, the value is true when the control is only viewable and the value is false when the control is editable.

Mandatory

Use scripts for the **Mandatory** property to enforce or bypass entering a value for a control.

To enforce or bypass entering a value for a control

- Code the script as follows for the **Mandatory** property of a control:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Script
• Enforce entering a value for the control.	`return true;`
• Bypass entering a value for the control.	`return false;`

To enforce or bypass entering a value for a control based on the value of another control

You can enforce or bypass entering a value for a control based on the value of another control.

Example

If you want to enforce entering a value for the **Last Name** (T2) control when a name is entered in the **First Name** (T1) control, then you can code the script for the **Mandatory** property of the **Last Name** (T2) control as follows:

```
if(control.findById("T1").value !== "")
{
return true;
}
else
{
return false;
}
```

Note:
- The **currentValue** method returns the value for the current property of a control.
- For the **Mandatory** property, the value is true when the control is enforced and the value is false when the control is bypassed.

Validate

Use scripts for the **Validate** property to validate custom validations for a control.

Validations are triggered only when a form is submitted and the submission of the form fails even if one validation fails.

To validate custom validations for a control

- Code the script as follows for the **Validate** property of a control:

Task	Script
• Validate custom validations for the control.	`return new ValidationOptions(true, "");`
• Show an error message when custom validations for the control fails.	`return new ValidationOptions(false, "Error Message");`

To validate custom validations for a control based on the value of another control

You can validate custom validations for a control based on the value of another control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example

If you want to enforce entering a value for the **Comments** (T1) control as per the selection in the **Action** (D1) control, then you can code the script for the **Validate** property of the **Comments** (T1) control as follows:

```
if(control.findById("D1").value !== "1")
{
if (control.findById("T1").value === "")
{
return new ValidationOptions(false, "Enter your comments.");
}
else
{
return new ValidationOptions(true, "");
}
}
else
{
return new ValidationOptions(true, "");
}
```

If you want to enforce entering a value for the **Password** (P1) control with at least eight characters containing at least a number, a lowercase letter, and an uppercase letter, then you can code the script for the **Validate** property of the **Password** (P1) control as follows:

```
var re = /(?=.*\d)(?=.*[a-z])(?=.*[A-Z]).{8,}/;
if( re.test(currentValue) === false)
{
return new ValidationOptions(false, "Password must have at least eight characters  and
contain a number, a lowercase letter, and an uppercase letter.");
}
else
{
return new ValidationOptions(true, "");
}
```

Options

Use scripts for the **Options** property to add options (options text and options value) for a **Check Box**, **Drop-down**, **Radio Button**, or **List** control.

Although JavaScript is used for scripting, the return value of the **Options** script is specified in JSON (JavaScript Object Notation) string format with attribute–value pairs.

To add options for a Check Box, Drop-down, Radio Button, or List control

- Code the script as follows for the **Options** property of a **Check Box**, **Drop-down**, **Radio Button**, or **List** control:

```
// Name is the Text Parameter and ID is the Value Parameter.
return [{"Name":"India","ID":"1"},{"Name":"UK","ID":"2"},{"Name":"USA","ID":"3"}];
```

Note:
- The options **Text** and **Value** parameters are mandatory and must be unique across all options.
- **Text Parameter** and **Value Parameter** properties must be specified before using the **Options** property script.
- Ensure that the value for the **Value Parameter** property is either String or Integer.
- If you add values using both **Options List** and **Options** script, then the values added using **Options** script takes

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

precedence.
- If you add options using scripts, then the value for the selected options persists even when the options are changed.
- To ensure no values are persisted, you need to explicitly clear the values before changing the options as given below.

```
control.value = "";
```

- If you explicitly clear the values, then the **On Data Change** event is triggered.
- Ensure the script returns a value.

To add options using Data Grid Values

You can add options for a **Check Box**, **Drop-down**, **Radio Button**, or **List** control using the values from a **Data Grid** control. To do this, first set the **Text Parameter** and the **Value Parameter** for the options of the control with the corresponding column name in the **Data Grid** control, and then code the script as follows:

When the Behavior property of Data Grid control is set as Data Grid

```
// Grid1 is the Data Grid whose values are used in the options of the control.
var gridCtrl = control.findByXmlNode("Grid1");
if (gridCtrl.source && gridCtrl.sourceData)
{
return gridCtrl.sourceData;
}
return [];
```

When the Behavior property of Data Grid control is set as Data Source

```
// Grid1 is the Data Grid whose values are used in the options of the control.
return control.findById("Grid1").source;
```

Note: We recommend to set the **Execution Mode** property of **Data Grid** control to **Synchronous** when the **Behavior** property of **Data Grid** control is set to **Data Source** and used in **Options** script.

To add options using Ajax function

You can add options for a **Check Box**, **Drop-down**, **Radio Button**, or **List** control using the ajax (Asynchronous JavaScript and XML) function.

Example

If you want to add options, which include country name and ID, to the **Country** (D1) control, then first code the options information in the JSON attribute-value pair format as follows for the following options text and value, and save the file as **CountryName.json** in the **BPMUITEMPLATES\Default** folder.

```
[{"Name":"India","ID":"1"},{"Name":"UK","ID":"2"},{"Name":"USA","ID":"3"}]
```

Options Text Parameter	Options Value Parameter
Name	ID

Options Text	Options Value
India	1
UK	2
USA	3

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Then, code the script as follows for the **Options** property of the **Country** (D1) control:

```
var resultData;
$.ajax(
{
type: "GET",
url: "CountryName.json",
contentType: "application/json; charset=utf-8",
async: false
,
dataType: "json",
timeout: 10000, //10 Seconds
// CountryName.json file located in the BPMUITEMPLATES\Default\ folder
// contains options information in the JSON attribute-value pair format.
success: function (result)
{
resultData = result;
// alert("Success Message :: " + result);
},
error: function (err)
{
alert("Failure Message :: " + err);
}
}
);
return resultData;
```

Note:
- If all the parameters in the script are not represented as strings (with double quotes), then the Ajax call may fail in the Azure environment.
- Ajax calls are supported only in synchronous mode.

Behavior

Use scripts for the **Behavior** property to manage records and edit values at run-time on a **Base Form** container.

To manage records and edit values at run-time on a Base Form container

- Code the script as follows for the **Behavior** property of a **Base Form** container:

Task	Script
• Allow a user to add or delete records for the control, and to edit values of the child controls.	`readEditBehaviourEnum.editable;`
• Deny a user to add or delete records for the control, and deny to edit values of the child controls.	`readEditBehaviourEnum.readOnly;`
• Allow a user to add or delete records for the	`readEditBehaviourEnum.allowOnlyAdd;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Script
control, but deny to edit values of the child controls.	

To manage records and edit values at run-time on a Base Form container based on the value of another control

You can manage records and edit values at run-time on a **Base Form** container based on the value of another control.

Example

If you want to manage records and edit values at run-time on the **Employee Details** (B1) container as per the selection in the **Edit Information** (R1) control, then you can code the script for the **Behavior** property of the **Employee Details** (B1) container as follows:

```
if(control.findById("R1").value === "0")
{
readEditBehaviourEnum.editable;
}
else if(control.findById("R1").value === "1")
{
readEditBehaviourEnum.readOnly;
}
else
{
readEditBehaviourEnum.allowOnlyAdd;
}
```

Extended Information

Use scripts for the **Extended Information** property to allow or deny a user to access the extended information (that is columns other than the display and value columns of the result set) based on the selection for a **Data Grid**, **Data Lookup**, **Pop-Up**, or **User Lookup** control.

When a **Data Lookup**, **Data Grid**, or **Hierarchical Grid** is mapped to a **Web API Lookup**, the JSON object is returned as a JSON string.

To allow or deny a user to access the extended information based on the selection for the control

- Code the script as follows for the **Extended Information** property of a **Data Grid** or **Data Lookup** control:

Task	Script
• Allow a user to access the extended information based on the selection for the control.	`return true;`
• Deny a user to access the extended information based on the selection for the control.	`return false;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To get extended information based on the selection on data change event

Example

Data Lookup

```
// Get extended information based on the selection on data change event.
var extendedInformation = control.extendedInformation;
if(extendedInformation !== null && extendedInformation !== undefined)
{
// Here Property Name is replaced with EmployeeName, which is the column name for the
database lookup.
control.findById("T1").value = extendedInformation["Title"];
//Alternatively use extendedInformation.EmployeeName;
}
```

Data Grid

```
// Get extended information based on the selection on data change event.
var rowData = control.findById("G1").extendedInformation; // Array
if(rowData.length > 0)
{
control.findById("T1").value = rowData[0].ID;
}
else
{
control.findById("T1").value = ""; // Undefined
}
```

Note: The DateTime column types would contain DateTime values (not String values), when the **Use Culture Specific Values** property is set to **No**.

Hierarchical Grid

```
var ex = control.extendedInformation;
var jobs = ex[0].WorkOrder.Job;// if multiple jobs is selected then Job will be array
if ($.isArray(jobs))
{
control.findById("T1").value ="";
for (var i = 0; i < jobs.length; i++)
{
control.findById("T1").value = control.findById("T1").value + " " + jobs[i].oper_id;
}
}
else
{
control.findById("T1").value = jobs.oper_id;
}
```

Note: The lookup names used in the hierarchical grid are WorkOrder and Job.

User Lookup

```
// Get extended information based on the selection on data change event.
// Property Names for Active Directory Provider.
var extendedInformation = control.extendedInformation;
if(extendedInformation !== null || extendedInformation !== undefined)
{
control.findById("T1").value = extendedInformation["UserDepartment"];
control.findById("T2").value = extendedInformation["UserDesignation"];
control.findById("T3").value = extendedInformation["UserDisplayName"];
control.findById("T4").value = extendedInformation["UserDistinguishedName"];
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.findById("T5").value = extendedInformation["UserEmail"];
control.findById("T6").value = extendedInformation["UserId"];
control.findById("T7").value = extendedInformation["UserManager"];
control.findById("T8").value = extendedInformation["UserName"];
control.findById("T9").value = extendedInformation["UserRole"];
}
```

```
// Using User Lookup extended information in scripts of other controls.
var userLookupControl = control.findById("U1");
if(userLookupControl.value !== "")
{
var userLookupExtendedInfo = userLookupControl.extendedInformation;
if(!SFU.isUndefined(userLookupExtendedInfo))
{
return userLookupExtendedInfo.UserEmail;
}
}
```

Note:
- In `extendedInformation["Property Name"]`, replace `Property Name` with column name for database lookup and XML Node for list lookup.

On Click

Use scripts for the **On Click** event of **Button** and **Card** controls, with the **Button Type** property set to **Custom** or **Navigate To**, to accomplish a desired operation.

You can code a script to save the details passed in the current form, on the **On Click** event of a **Button** control, of the **Button Type** "**Navigate To"**. You can then code anther script to retrieve this information in the embedded form.

Note: The **Navigate To** option uses the **SFU.getFormUrl** API to navigate to a different form. If the API returns an empty value for any reason, then the **On Click** event does not get executed and the navigation to another form does not happen.

Example

If you want to submit a form on click of the **Register** (B1) button with the **Button Type** property set to **Custom**, then you can code the script for the **On Click** event of the **Register** (B1) button as follows:

```
// Submit the form.
control.submitForm(event);
```

On Data Bound

Use scripts for the **On Data Bound** event of a **Data Grid** control to accomplish a desired operation when data is bound to the **Data Grid** control. For a Hierarchical Data Grid, On Data Bound is triggered on expansion of each row.

Data Grid and Hierarchical Data Grid

If you want to select the second record in the **Projects** (G1) control when data is bound to the **Projects** (G1) control, then you can code the script for the **On Data Bound** event of the **Projects** (G1) control as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// Select the second record in the Projects data grid.
var kGrid = e.sender;
var row = kGrid.tbody.find("tr").eq(1);
kGrid.select(row);
```

Note:
- The **On Data Bound** event of a **Data Grid** control is triggered every time the page is updated or when the grid is sorted or filtered.
- The **On Data Bound** event of a **Data Grid** control is triggered every time the grid is viewed in mobile view or in a mobile device.
- The **On Data Bound** event is fired only once on row expansion while on the same page.

Tree

If you want to change the text of the first node in the Projects (T1) control when data is bound to the Projects (T1) control, then you can code the script for the **On Data Bound** event of the Projects (T1) control as follows:

```
//Change the text of the first node in the tree
data[0].text = "Node 1";
```

For more information, see Show Icons in Data Grid Columns.

On Data Change

Use scripts for the **On Data Change** event of a control to accomplish a desired operation when the value of the control changes.

Use the `currentValue` variable to fetch the changed value of the control, and the `oldValue` variable to get the value which was replaced with the current value.

Examples

Consider three Text controls, FirstName (T1), SecondName (T2), and FullName (T3). If you want to display the full name (T3), everytime the FirstName (T1) and SecondName (T2) are updated, then you can code the script for the **On Data Change** event of T1 and (T2) control as follows:

On Data Change event for T1:

```
control.findByXmlNode("FullName").value=currentValue+"
"+control.findByXmlNode("SecondName").value;
```

On Data Change event for T2:

```
control.findByXmlNode("FullName").value=control.findByXmlNode("FirstName").value+"
"+currentValue;
```

Note: The currentValue is of type string for all controls except the **Number** control, which is of type number.

If you want to show the **Employee Name** (T2) when you enter the **Employee ID** using a Web API, then you can code the script for the **On Data Change** event of the **Employee ID** (T1) control as follows

```
// Use Web API to retrieve the Employee Name using the captured Employee ID.
// Here currentValue is passed as parameter.
$.ajax(
{
type: "GET",
url: "http://emp.corp.com/api/Employee/"+currentValue,
contentType: "application/json; charset=utf-8",
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
async:false,
dataType: "json",
success: function (result)
{
control.findById("T2").value = result[0].EmployeeName;
},
error: function (err)
{
}
}
);
```

Accessing old values

If the value of the check box **Job State** (**C1**) changes on an event and if you want to access the old value, then you can code the script for the **On Data Change** event of the **Job State** (**C1**) control as follows:

```
var oldValues = oldValue.split(';#');
var newValues = currentValue.split(';#');
var stateAdded = newValues.filter(function(n) {
return oldValues.indexOf(n) == -1;
});
var alertBody = "'" + stateAdded + "' State added for the Job."
SFU.showAlert("Job State Changed", alertBody,
function()
              {
                //Enter code to perform actions after the alert is closed.
              });
```

Data Grid

If you want to show the value from the the currently checked record in the **Projects Backlog** (G1) control for the **Projects Approved** (G2) control, then you can code the script for the **On Data Change** event of the **Projects Backlog** (G1) control as follows.

```
control.findById("G2").value = control.findById("G1").value;
```

If you want to show the value from the columns **Id**, **Title**, and **Application** of the currently checked record in the **Projects** (G1) control for the **Project ID** (T1), **Project Title** (T2), and **Project Application** (T3) controls respectively, then you can code the script for the **On Data Change** event of the **Projects** (G1) control as follows

```
var gridControl = control.findById("G1");
var rowData = SFU.getGridValue(gridControl);
control.findById("T1").value = rowData[0].<Lookupname>.Id;
control.findById("T2").value = rowData[0].<Lookupname>.Title;
control.findById("T3").value = rowData[0].<Lookupname>.Application;
```

Note:

- The DateTime column types would contain DateTime values (not String values), when the **Use Culture Specific Values** property is set to **No**.

- Data Grid with **Execution Mode** as **Synchronous** will not fire an **On Data Change** event when the form is loading. In case an **On Data Change** event is required to be fired, below are the options:

Option 1: Set the **Execution Mode** as **Asynchronous**.
Option 2: Retain the **Execution Mode** as **Synchronous**. Set the **Auto-load Grid** to **Never**. In the **On Form Load**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

script, write the below script:

```
control.findByXmlNode("GridXmlNode").autoLoadGrid =
skelta.grid.autoLoadGrid.OnFormLoadAndParameterChange;
setTimeout(function(){
control.findByXmlNode("GridXmlNode ").refreshGrid();
}, 0);
```

Hierarchical Data Grid

If you want to show the value from the hierarchical data grid , columns of each data source can be accessed as follows:

//Here the WorkOrder is the parent data source with the columns wo_id, wo_desc, and process_id. The Job is the child data source with columns wo_Id, oper_id, and seq_no.

```
var rowData= SFU.getGridValue(control.findById("G1"));
control.findById("T1").value = rowData[0].WorkOrder.wo_id;
control.findById("T2").value = rowData[0].WorkOrder.Job.oper_id;
```

Note:
- The above code is applicable only for one selected value (that is the currently checked record).
- The column names must be one of the selected column names in the data grid.

On Form Load

Use scripts for the **On Form Load** event of a form to accomplish a desired operation when the form loads.

Example

If you want to show an information message when you load the form, then you can code the script for the **On Form Load** event of the form as follows:

```
// Show an information message.
SFU.showAlert("Form Message", "Please fill all fields in the form.");
```

Note: Commented statements in the **On Form Load** script are executed.

On Record Add

Use scripts for the **On Record Add** event of a **Base Form** container to accomplish a desired operation when a record is added to the **Base Form** at run-time.

Example

If you want to show an information message when you add records to the **Employee Details (B1)** container at run-time, then you can code the script for the **On Record Add** event of the **Employee Details (B1)** container as follows:

```
// Show the number of records present.
alert("Number of records present: " + control.records().length);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

On Record Delete

Use scripts for the **On Record Delete** event of a **Base Form** container to accomplish a desired operation when a record is deleted from the **Base Form** at run-time.

Example

If you want to show an information message when you delete records from the **Employee Details (B1)** container at run-time, then you can code the script for the **On Record Delete** event of the **Employee Details (B1)** container as follows:

```
// Show the number of records present.
alert("Number of records present: " + control.records().length);
```

On Selection Change

Use scripts for the **On Selection Change** event of a control to accomplish a desired operation when the selection of the record for the control changes.

Data Grid

If you want to show the value from the column **CountryName** of the currently selected record in the **Countries** (G1) control for the **Country Name** (T1) control, then you can code the script for the **On Selection Change** event of the **Countries** (G1) control as follows:

```
// CountryName is the column name in the Countries data grid.
if (currentRowValue !== undefined)
{
control.findById("T1").value = currentRowValue.CountryName;
}
else
{
control.findById("T1").value = "";
}
```

Note: The DateTime column types would contain DateTime values (not String values), when the **Use Culture Specific Values** property is set to **No**.

Hierarchical Data Grid

If you want to show the value of the column oper_id of the Job data source from the hierarchical data grid ,then you can access it as follows:

```
//Here the WorkOrder is the parent lookup with the columns wo_id, wo_desc, and process_id.
The Job is the child lookup with columns wo_Id, oper_id, and seq_no.
control.findById("T2").value = currentRowValue.WorkOrder.Job.oper_id;
control.findById("T1").value = currentRowValue.WorkOrder.wo_id;
```

Selection Lost Behavior

The current record selection is lost when:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The data grid is sorted or filtered.
- The next or previous page of records is loaded in the data grid.
- The form is reloaded.
- The screen is changed in the mobile devices.
- The screen is switched between web and mobile view.
- The parametrized grid is refreshed.

Note:
- The **currentRowValue** method returns the value for the current selected record without the extended information.
- The value of the **currentRowValue** method is undefined when the form loads and when the record selection is lost.
- In a Data Grid configuration, if **Disable Selection** option is selected, then the **On Selection Change** event will fire only when the row is selected.
It will not fire on paging, sorting, and filtering.

Tree

If you want to show an alert message when a node is selected and output the data of the selected node as the alert message, then you can code the script for the **On Selection Change** event of the control as follows:

```
//Show an alert dialog when a node is selected and output the selected node's data as the alert message
window.alert(JSON.stringify(data));
```

The **On Selection Change** event passes a 'data' parameter which is a JavaScript object that contains the data values bound to the selected node.

On Tab Index Change

Use scripts for the **On Tab Index Change** event of a **Tabs** container to accomplish a desired operation when the tab index changes, that is when the selected tab changes.

Example

If you want to show an information message when you select a tab in the **Employee (T1)** container at run-time, then you can code the script for the **On Tab Index Change** event of the **Employee (T1)** container as follows:

```
// Show the selected tab index.
alert("You are now in tab " + (control.selectedTabIndex + 1));
```

For information on selecting a tab (that is switching to a tab) and determining the the tab index through APIs, see control.selectTab() and control.selectedTabIndex() respectively.

On Check Change

Use scripts for the **On Check Change** event of a **Tree** control to accomplish a desired operation when the state of a checkbox of a node is set or cleared.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example

If you want to show an alert indicating status of the checkbox status of the effected node., then you can code the script for the **On Check Change** event of the control as follows:

```
//Show an alert indicating the checkbox status of the effected node.
var status = isChecked ? "set" : "cleared";
window.alert("node's checkbox has been " + status);
```

Note:
- This event is fired when the checkbox status of every node is modified.
- In cases where the **Inherit Checked State** property is set to **Yes** or the **Checkbox Behavior** property is set to **Single**, then the event is fired once for each effected node as the tree automatically sets or clears the check states.

On Initialize

Use scripts for the **On Initialize** event of **Arc**, **Card, Gauge,** and **Progress Bar** controls to accomplish a desired operation after the control has been initialized, but before it is rendered to the UI. You can therefore change the configuration of the gauge at runtime.

Example

If you want to:

- set the value of the control to 50
- set the minimum and maximum value of the scale to 0 and 180
- set the start and end angle of the scale to -20 and 200
- set the target value to 120
- set the minor and major units of the scale to 15 and 30

then code the script for the **On Initialize** event of the control as follows:

```
control.value=50;
control.scaleMin=0;
control.scaleMax=180;
control.scaleAngleStart=-20;
control.scaleAngleEnd=200;
control.targetValue=120;
control.minorUnit=15;
control.majorUnit=30;
```

Record Visible

Use scripts for the **Record Visible** property to show or hide a record.

To show or hide a record

- Code the script as follows for the **Record Visible** property of a **Base Form** container:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Script	Task
• Show the record	`return true;`
• Hide the record	`return false;`

Example

Consider a **Base Form** container **Products** (**B1)** containing a **Text** control **Product Name (T1**) and a **Number** control **Quantity Available** (**N1**).

If you want to show the record only when **Quantity Available** (**N1**) for a product is more than 500 units, then you can code the script for the **Record Visible** property of the **Base Form** container **Products** (**B1**) control as follows:

```
var productQuantityAvailable = Number(control.findByXmlNode("QuantityAvailable").value);
if(productQuantityAvailable > 500)
{
//// This will show Records having QuantityAvailable more than 500 units
return true;
}
//// This will hide Records having QuantityAvailable less than or equal to 500 units
return false;
```

Range Color

Use scripts for the **Range Color** property to define a range of values with colors.

Example

If you want to define a range of values from 0 to 30 with yellow, 30 to 60 with green, and 60 to 100 with red, then code the script for the **Range Color** property of the control as follows:

```
return [
{
from: 0,
to: 30,
color: 'yellow'
},{
from: 30,
to: 60,
color:'green'
},
{
from: 60,
to: 100,
color:'red'}];
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Containers

This section defines the script guidelines to be followed while using the form containers.

Base Form

Use scripts to set and get values for the properties of the **Base Form** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Appearance

Property	Scripting Supported	Script

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Label Position	No	Not Applicable
Label-Control Area	No	Not Applicable

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Retain Space	No	Not Applicable
Display Mode	No	Not Applicable
Records Caption	No	Not Applicable
Record Position	No	Not Applicable
Image Path	No	Not Applicable
Adapt UI	No	Not Applicable
Custom Style Sheet Identifier	No	Not Applicable

Validation

Property	Scripting Supported	Example
Show Confirmation Message	No	Not Applicable
Confirmation Message	No	Not Applicable
Repeating	No	Not Applicable
Minimum Records	No	Not Applicable
Maximum Records	No	Not Applicable

Advanced

Property	Scripting Supported	Example
On Record Add	Yes	For more information, see scripting guidelines for On Record Add property.
On Record Delete	Yes	For more information, see scripting guidelines for On Record Delete property.
ID	No	Not Applicable

Behavior	Yes	**To set the property**
		`control.findById("ID").readEditBehaviour = readEditBehaviourEnum.editable;`
		`control.findById("ID").readEditBehaviour =`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

		`readEditBehaviourEnum.readOnly;`
		OR
		`control.findById("ID").readEditBehaviour = readEditBehaviourEnum.allowOnlyAdd;`
		OR
		To get the value of the property
		`control.findById("ID").readEditBehaviour;`

Default Number of Records	No	Not Applicable
Fast Append	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.
Behavior	Yes	For more information, see scripting guidelines for Behavior property.
Record Visible	Yes	For more information, see scripting guidelines for Record Visible property.

Note:
- In a Form with Delay Loading enabled, **Chart**, **Slider**, **Card**, and **Hierarchical List** controls inside a container are not supported.
- The **Chart** control loads in the Inbox only when the **Repeating** property of the Base Form is set to **False**.

Updating Column Names in a Base Form with Display Mode set to Grid

You can update the column name for a **Base Form** with **Display Mode** set to **Grid** by updating the **Tag Name** of the control present in the column.

For more details, see Update Column Names in a Base Form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Panel Form

Use scripts to set and get values for the properties of the **Panel Form** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Appearance

Property	Scripting Supported	Script

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Label Position	No	Not Applicable
Label-Control Area	No	Not Applicable
Width	Yes Readable	**To get the value of the property** `control.findById("ID").width;`
Height	Yes	**To get the value of the property** `control.findById("ID").height`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Script
	Readable	`;`
Retain Space	No	Not Applicable
Adapt Layout	No	Not Applicable
Show Panel Details	No	Not Applicable
Columns	No	Not Applicable
Tab Order	No	Not Applicable
Image Path	No	Not Applicable
Adapt UI	No	Not Applicable
Custom Style Sheet Identifier	No	Not Applicable

Advanced

Property	Scripting Supported	Example
ID	No	Not Applicable
Behavior	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.

Behavior	Yes	`return 0;`
		Allow a user to edit values of the child controls.
		`return 1;`
		Deny a user to edit values of the child controls.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Action Bar

Use scripts to configure the **Name**, **Enable**, and **Visible** properties for an Action Item.

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.

Tabs

Use scripts to set and get values for the properties of the **Tabs** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description= "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Appearance

Property	Scripting Supported	Script
Visible	Yes Writable	**To set the property** `control.findById("ID").visibl`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Script

	Readable	`e = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Label Position	No	Not Applicable
Label-Control Area	No	Not Applicable
Default Tab Index	No	Not Applicable
Show Border and Margin	No	Not Applicable
Image Path	No	Not Applicable
Adapt UI	No	Not Applicable
Custom Style Sheet Identifier	No	Not Applicable

Advanced

Property	Scripting Supported	Example
On Tab Index Change	Yes	For more information, see scripting guidelines for On Tab Index Change property.
ID	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.

Tab

Use scripts to set and get values for the properties of the **Tab** control.

Description	Yes	`return "Value for Description";`
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.

Controls

This section defines the script guidelines to be followed while using the form controls.

Arc

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Lookup Source	No	Not Applicable
Unit of Measurement	Yes Writable Readable	**To set the property** `control.findById("ID").arcUom="kg";` **To get the value of the property**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

		`control.findById("ID").arcUom;`

Target Value	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").arcTargetValue= 80;`
		To get the value of the property
		`control.findById("ID").arcTargetValue;`

Default Value	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").value=50;`
		To get the value of the property
		`control.findById("ID").value;`

Appearance

Property	Scripting Supported	Script

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Label Position	No	Not Applicable
Label-Control Area	No	Not Applicable
Width	No	Not Applicable
Retain Space	No	Not Applicable

Title	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").arcTitle = "Value for Title";`
		To get the value of the property
		`control.findById("ID").arcTitle;`

Decimal Places	Yes Writable Readable	**To set the property** `control.findById("ID").arcDecimalPlaces=3;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

		To get the value of the property `control.findById("ID").arcDecimalPlaces;`
Show Scale	No	Not Applicable

Scale Minimum Value	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").arcScaleMinValue=0;`
		To get the value of the property
		`control.findById("ID").arcScaleMinValue;`

Scale Maximum Value	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").arcScaleMaxValue=0;`
		To get the value of the property
		`control.findById("ID").arcScaleMaxValue;`

Scale Start Angle	No	Not Applicable
Scale Span Angle	No	Not Applicable
Control Background Color	No	Not Applicable
Background Color	No	Not Applicable
Bar Color	No	Not Applicable

Range	Yes
	Writable
	Readable
		To set the property
		`control.findById(“ID”).options=[{optionvalue:20,foreColor:"red"},{optionvalue:60,foreColor:"green"}];`
		To get the value of optionvalue property of the first element
		control.findById(“ID").options[0].optionvalue
		To get the value of foreColor property of the first element
		`control.findById(“ID").options[0].foreColor`
		Note: The **Options** property exposed in scripting is used for the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

		Range property.
Custom Style Sheet Identifier	No	Not Applicable

Visible	Yes	`return true;`
Value	Yes	`return 90;`

Attachment

Use scripts to set and get values for the properties of the **Attachment** control.

Basic

Property	Scripting Supported	Example
Name	Yes Writable	**To set the property** `control.findById("ID").tagName = "Value for Name";`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	Readable	**To get the value of the property** `control.findById("ID").tagName;`
XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Tooltip	No	Not Applicable

Appearance

Property	Scripting Supported	Script

Enable	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").enable = true;`
		To get the value of the property
		`control.findById("ID").enable;`

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Label Position	No	Not Applicable
Label-Control Area	No	Not Applicable
Retain Space	No	Not Applicable

Custom Attachment Type	No	Not Applicable
Show Delete Confirmation Message	No	Not Applicable
Delete Confirmation Message	No	Not Applicable

Advanced

Property	Scripting Supported	Example
On Data Change	Yes	For more information, see scripting guidelines for On Data Change property.
ID	No	Not Applicable
Storage Type	No	Not Applicable
Persist File Name	No	Not Applicable
Persist Custom File Name	No	Not Applicable
File Path Template	No	Not Applicable
Allow Multiple Attachments	No	Not Applicable
Maximum Attachments	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.
Visible	Yes	`return true;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

		For more information, see scripting guidelines for Visible property.
File Path Template	Yes	`return "<StoragePath>\\" + control.findByXmlNode("Department").value + "\\<GUID>_<FileName>.<FileExtension>";` For example, if the attachment storage path is *C:\Program files\AVEVA\Work Tasks\ Attachments*, the attached file is **Keywords.doc**, and the department is **Finance**, then at run time the file path is set to *C:\Program files\AVEVA\Work Tasks\\Attachments\Finance\ 527ee1d8-2c01-4d0a-b3c1-a8b121ca020b\Keywords.doc.*

Note:

- We do not recommend editing values using APIs.

- You can retrieve the file name via script as follows:

```
var fileListArray = control.findById("ID").fileList;
if (fileListArray.length > 0)
{
return fileListArray[0].name(); // Gives the file name.
}
else
{
return “”;
}
```

- You can retrieve the file via script as follows:

```
var fileListArray = control.findById("ID").fileList;
if (fileListArray.length > 0)
{
return fileListArray[0].fileObject(); // Gives the file object.
}
else
{
return “”;
}
```

- The **fileList** represents an array of **fileDetails**. You can access each file’s details using the above syntax.

- Multiple files can be attached only when the **Storage Type** property is set to **File System**. You can retrieve file paths of uploaded files via script as follows:

```
var filePathsSeparatedByPipeCharacters = control.findById("ID").skFilePath; // In case of multiple files, the file paths in this property are separated by a pipe character ‘|’.
```

- The **skFilePath** property is not supported in the Script Editor's intelligent code completion.

- You can empty the attachment control value via script as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.findById("ID").skFilePath = “”;
control.findById("ID").value = “”;
```

Boolean

Use scripts to set and get values for the properties of the **Boolean** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Tooltip	No	Not Applicable
Default Value	Yes Readable	**To get the value of the property** `control.findById("ID").defaultValue;`

Appearance

Property	Scripting Supported	Script

Enable	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").enable = true;`
		To get the value of the property
		`control.findById("ID").enable;`

Visible	Yes Writable Readable	**To set the property** `control.findById("ID").visible = true;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Script
		To get the value of the property `control.findById("ID").visible;`
Label Position	No	Not Applicable
Label-Control Area	No	Not Applicable
Retain Space	No	Not Applicable
Options Direction	No	Not Applicable
Custom Style Sheet Identifier	No	Not Applicable

Advanced

Property	Scripting Supported	Example
On Data Change	Yes	For more information, see scripting guidelines for On Data Change property.
ID	No	Not Applicable
Include in Summary	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.

Default Value	Yes	`return "True";`
		OR
		`return "False";`
		Note: The **Value** script takes precedence over the **Default Value** script.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example

Value	Yes	`return "True";`
		OR
		`return "False";`

Validate	Yes	`return new ValidationOptions(false, "Error Message");`
		OR
		`return new ValidationOptions(true, "");`
		For more information, see scripting guidelines for Validate property.

Note:
- Display value is readable. You can retrieve the display value via script as follows:
return control.findById("ID").displayValue;
- **Enable** and **Visible** properties hold their value as true or false. However, the **Value** property has a string value, which can be either **"True"** or **"False"**.

Button

Use scripts to set and get values for the properties of the **Button** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
Tooltip	No	Not Applicable

Button Text	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").buttonText = "Value for Button Text";`
		To get the value of the property
		`control.findById("ID").buttonText;`

Button Type	No	Not Applicable

Appearance

Property	Scripting Supported	Script

Enable	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").enable = true;`
		To get the value of the property
		`control.findById("ID").enable;`

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Label Position	No	Not Applicable
Label-Control Area	No	Not Applicable
Alignment	No	Not Applicable
Retain Space	No	Not Applicable
Display Mode	No	Not Applicable
Button Size	No	Not Applicable

Custom Style Sheet Identifier	No	Not Applicable

Validation

Property	Scripting Supported	Example
Show Confirmation Message	No	Not Applicable
Confirmation Message Text	No	Not Applicable

Advanced

Property	Scripting Supported	Example
On Click	Yes	For more information, see scripting guidelines for On Click property.
ID	No	Not Applicable
Form Button	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.

Note:
You can identify the last button clicked on a form through script as follows:

```
control.topLevelForm.lastButtonClickedText === "Name of the Button Text";
```

OR

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.topLevelForm.lastButtonClickedId === "Name of the Button ID";
```

This script is helpful when the control is used with the **Possible Distinct Outputs** property for **Invoke Workflow** activity of the workflow.

For example, if you want to enforce a user to enter comments when rejecting a form, then the following script can be coded for the **Mandatory** property of the **Text** control.

```
return (control.topLevelForm.lastButtonClickedText === "Reject")?true:false;
```

OR

```
return (control.topLevelForm.lastButtonClickedId === "B2")?true:false;
```

Card

You can use scripts to set and get values for the properties of the Card control.

Basic

Property	Scripting	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Lookup Source	No	Not Applicable
Enable Dynamic Label	No	Not Applicable
HeaderValue Left	Yes Readable	**To get the value of the property** `control.findByXmlNode("Card1").headerValueLeft;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

HeaderValue Right	Yes Readable	**To get the value of the property** `control.findByXmlNode("Card1").headerValueRight;`
Value (1-5)	Yes Readable	**To get the value of the property** `control.findByXmlNode("Card1").value1;`
Value (1-5) Label	Yes Readable	**To get the value of the property** `control.findByXmlNode("Card1").value3Label;`

Appearance

Property	Scripting Supported	Example

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Width	Yes Readable	**To get the value of the property** `control.findByXmlNode("Card1").width;`
Height	Yes Readable	**To get the value of the property** `control.findByXmlNode("Card1").height;`
Label Position	No	Not Applicable
Label-Control Area	No	Not Applicable
Retain Space	No	Not Applicable

Image Path	Yes
	Writable
		To set the property
		`var setimg = "https://www.image.com/image.png";`
		`control.CardImage(setimg);`

HeaderValue Left Display Limit	No	Not Applicable
Custom Style Sheet Identifier	No	Not Applicable

Advanced

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
On Click	Yes	For more information, see scripting guidelines for On Click.
ID	Yes Readable	
Enable Lookup Color	No	Not Applicable
Color	No	Not Applicable
Enable Refresh	No	Not Applicable
Refresh Rate	No	Not Applicable

Description	Yes Writable	`return "Value for Description";`
Visible	Yes Writable Readable	`return true;`

Action Script (1-3)	Yes	**To show the Pop-Up control**
		`var popupCtr =control.findByXmlNode("Popup form1");`
		`SFU.showPopupControl(popupCtr);`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example Scripting Scenarios and Rendering

The following sections provide example scenarios where scripting is used with the Card control. It also has example configuration with its corresponding Card control rendering.

Scripting Scenarios

Example scripts provided in this section can be used independently in the Card control's **On Click** event and **Action Script** properties.

Scenario 1: Calling a popup

Use the following script to call a popup through the **On Click** event property in the **Advanced** tab of the control properties page.

```
// Shows the Pop-Up control.
var popupCtr = control.findByXmlNode("Popupform2");
SFU.showPopupControl(popupCtr);
```

Scenario 2: Calling a workflow

Use the following script to call a workflow through the **Action Script** properties in the **Scripts** tab of the control properties page.

```
// Triggers the Click event of the invoke workflow control.
var gridControl = control.findByXmlNode("Grid1");
if(gridControl)
{
gridSelectedValue = gridControl.selectedValue;
if(gridSelectedValue)
{
control.findByXmlNode("hfGridEntID").value = gridSelectedValue.entID;
}
}
var invokeWorkflowControl = control.findById("I1");
SFU.invokeWorkflow(invokeWorkflowControl);
```

Scenario 3: Calling a form

Use the following script to call a form through the **Action Script** properties in the **Scripts** tab of the control properties page.

```
// Gets the form that has to be embedded in the current form.
var formsURL=SFU.getFormUrl("MDMTestForm","1");
control.findById("E1").url = formsURL;
```

Example Card Control Rendering

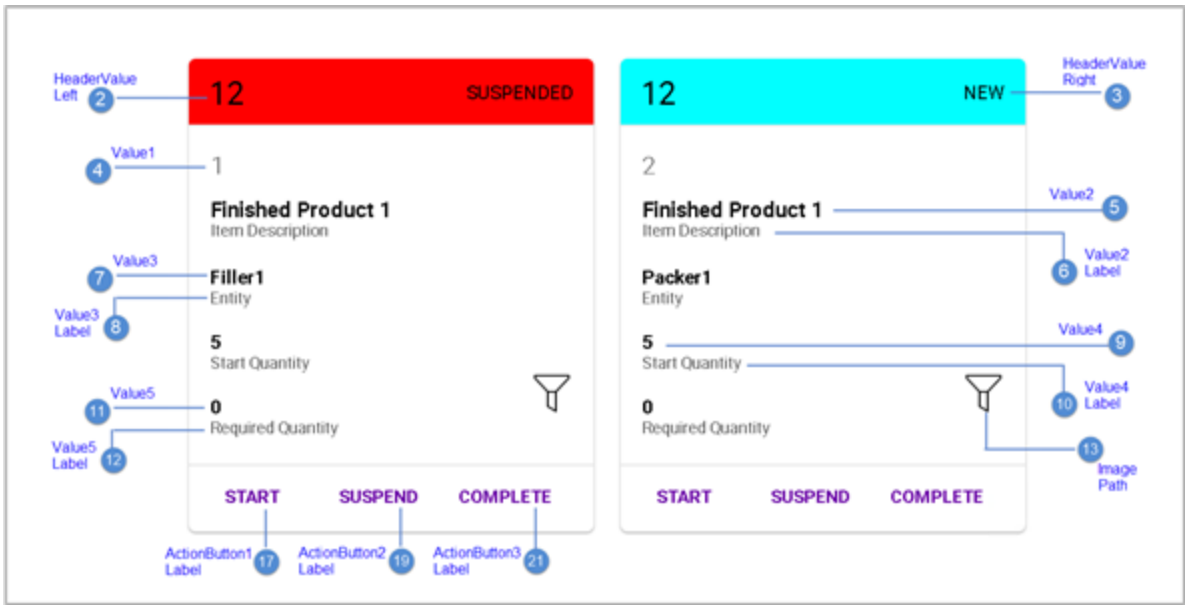
The following rendering example for Card control includes its corresponding configuration. The configured properties are listed in the table and the rest of the properties that are kept to their default values are no longer mentioned.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Basic	Appearance	Advanced
1. **Lookup Source**: `JobqueueLookup` 2. **HeaderValue Left**: `wo_id` 3. **HeaderValue Right**: `state_desc_h` 4. **Value1**: `oper_id` 5. **Value2**: `item_desc` 6. **Value2 Label**: `Item Description` 7. **Value3**: `ent_name` 8. **Value3 Label**: `Entity` 9. **Value4**: `qty_at_start` 10. **Value4 Label**: `Start Quantity` 11. **Value5**: `qty_reqd` 12. **Value4 Label**: `Required Quantity`	13. **Image Path**: `https://img.icons8.com/ios/2x/filter.png`	14. **Enable Lookup Color**: `Yes` (*selected*) 15. **Color:** `color_h` *(column in the Web API)* 16. **Enable Action1**: `Yes` (*selected*) 17. **ActionButton1 Label**: `Start` 18. **Enable Action2**: `Yes` (*selected*) 19. **ActionButton2 Label**: `Suspend` 20. **Enable Action3**: `Yes` (*selected*) 21. **ActionButton3 Label**: `Complete`

The displayed cards depend on the number of records in the lookup data source that you mapped. You can set a script in each of the action buttons using the **Action Script** properties in the **Scripts** tab.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Chart

Use scripts to set and get values for the properties of the **Chart** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Lookup Source	No	Not Applicable

Validation

Property	Scripting Supported	Example

Mandatory	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").isMandatory = true;`
		To get the value of the property
		`control.findById("ID").isMandatory;`

Advanced

Property	Scripting Supported	Example
On Data Change	Yes	For more information, see scripting guidelines for On Data Change property.
ID	No	Not Applicable
Text Parameter	Yes Writable	**To set the property**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example

	Readable	`control.findById("ID").optionText = "OText";`
		
		To get the value of the property
		
		`control.findById("ID").optionText;`

Value Parameter	Yes
	Writable
	Readable
		To set the property
		
		`control.findById("ID").optionValue = "OValue";`
		
		To get the value of the property
		
		`control.findById("ID").optionValue;`

Forms 2011 Compatible	No	Not Applicable
Include in Summary	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
		guidelines for Enable property.
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.
Mandatory	Yes	`return true;` For more information, see scripting guidelines for Mandatory property.

Default Value	Yes	`return "ValueOne";`
		
		OR
		
		`return "ValueOne;#ValueTwo;#ValueThree";`
		
		Note:
		- If the value is not one of the values set for the Value parameter in the Options property, then that value will not be a part of the options but will be a part of the XML instance.
		- Multiple values must be separated with ;#.
		- The Value script takes precedence over the Default Value script.

Value	Yes	`return "ValueOne";`
		
		OR
		
		`return "ValueOne;#ValueTwo;#ValueThr`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
		`ee";`

Validate	Yes	return new ValidationOptions(false, "Error Message");
		
		OR
		
		return new ValidationOptions(true, "");
		
		For more information, see scripting guidelines for Validate property.

Options	Yes	`return "[{\"OValue\":\"1\",\"OText\":\"ValueOne\"},{\"OValue\":\"2\",\"OText\":\"ValueTwo\"},{\"OValue\":\"3\",\"OText\":\"ValueThree\"}]";` Here OText is the Text Parameter and OValue is the Value Parameter. For more information, see scripting guidelines for Options property. **Note:** - Text Parameter and Value Parameter properties must be specified before using the Options property script. - Fore Color and Back Color properties cannot be set through scripts.

Note:
- Display value is readable.
- You can retrieve the display value via script as follows:

```
return control.findById("ID").displayValue;
```

Data Grid

Use scripts to set and get values for the properties of the **Data Grid** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Tooltip	No	Not Applicable
Configuration Name	No	Not Applicable

Appearance

Property	Scripting Supported	Script

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Read-Only	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").readOnly = true;`
		To get the value of the property
		`control.findById("ID").readOn`

Auto-load Grid	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").autoLoadGrid = skelta.grid.autoLoadGrid.OnFormLoadAndParameterChange;`
		`control.findById("ID").autoLoadGrid = skelta.grid.autoLoadGrid.OnFormLoad;`
		`control.findById("ID").autoLoadGrid = skelta.grid.autoLoadGrid.Never;`
		To get the value of the property
		`control.findById("ID").autoLoadGrid;`

Include in Summary	No	Not Applicable
Use Culture Specific Values	No	Not Applicable

Scripts

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.
Read-Only	Yes	`return false;` For more information, see scripting guidelines for Read-Only property.
Mandatory	Yes	`return true;` For more information, see scripting guidelines for Mandatory property.

Value	Yes	`return "%3CGrid%3E%3CData%3E%3CCountryLP%3E%3CCountryId%3E%3C!%5BCDATA%5B10%5D%5D%3E%3C%2FCountryId%3E%3CCountryName%3E%3C!%5BCDATA%5BIN%5D%5D%3E%3C%2FCountryName%3E%3C%2FCountryLP%3E%3C%2FData%3E%3C%2FGrid%3E";`
		Note:
		- The value represents the records whose check box is selected. To clear check box of all records, set the value to an empty string.
		- The return value must be URL encoded.
		- For example, `"<Grid><Data><CountryLP><CountryId><![CDATA[10]]></CountryId><CountryName><![CDATA[IN]]></CountryName></CountryLP></Data></Grid>"`
		
		where **CountryLP** is the Lookup name, **CountryId** and **CountryName** are columns persisted in the grid configuration is URL encoded as
		
		`"%3CGrid%3E%3CData%3E%3CCountryLP%3E%3CCountryId%3E%3C!%5B`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
		CDATA%5B10%5D%5D%3E%3C%2FCountryId%3E%3CCountryName%3E%3C!%5BCDATA%5BIN%5D%5D%3E%3C%2FCountryName%3E%3C%2FCountryLP%3E%3C%2FData%3E%3C%2FGrid%3E"

Validate	Yes	`return new ValidationOptions(false, "Error Message");`
		OR
		`return new ValidationOptions(true, "");`
		For more information, see scripting guidelines for Validate property.

Improving Performance of Parameterized Data Grid

The behavior of parameterized data grids on data change of parameters with Refresh On Parameter Change property is as follows.

Form Mode	Property Value	Control Behavior
New Mode (Fill Form, Preview Form)	Yes	Data grid is refreshed when a parameter is changed.
	No	Data grid is not refreshed when a parameter is changed. To refresh the data grid when the last parameter is changed, code the script for the **On Data Change** event of the last parameter as follows: `control.findById("G1").refreshOnParamChange = true;`
Edit Mode (Inbox)	Yes	Data grid is refreshed when a parameter is changed.
	No	Data grid is not refreshed when a parameter is changed. To refresh the data grid when a parameter is changed, code the script for the **On Data Change** event of that parameter as follows: `var editMode =`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Form Mode	Property Value	Control Behavior

		`SFU.isFormInEditMode();`
		`if(editMode)`
		`{`
		`control.findById("G1").refreshOnParamChange = true;`
		`}`

For more information, see Show Icons in Data Grid Columns.

Note:
- Display value is readable.
- You can retrieve the display value via script as follows:

```
return control.findById("ID").displayValue;
```

Data Lookup

Use scripts to set and get values for the properties of the **Data Lookup** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Tooltip	No	Not Applicable
Lookup Source	No	Not Applicable

Appearance

Property	Scripting Supported	Example
		property.
ID	No	Not Applicable
Date Format	Yes Readable	**To get the value of the property** `control.findById("ID").dateFormat;`
Forms 2011 Compatible	No	Not Applicable
Include in Summary	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.
Visible	Yes	`return true;` For more information, scripting guidelines for Visible property.
Read-Only	Yes	`return false;` For more information, scripting guidelines for Read-Only property.
Mandatory	Yes	`return true;` For more information, see scripting guidelines for Mandatory property.
Default Value	Yes	`return "12/31/2099 00:00:00";` **Note:** The **Value** script takes precedence over the **Default Value** script. The format of the date should be MM/dd/yyyy 00:00:00.
Value	Yes	`return "12/31/2099 00:00:00";` **Note:** The format of the date

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
		should be MM/dd/yyyy 00:00:00.

Validate	Yes	`return new ValidationOptions(false, "Error Message");`
		OR
		`return new ValidationOptions(true, "");`
		For more information, see scripting guidelines for Validate property.

Note:
- Display value is readable.
- You can retrieve the display value via script as follows:

```
return control.findById("ID").displayValue;
```

Date Time

Use scripts to set and get values for the properties of the **Date Time** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
Tooltip	No	Not Applicable

	Writable
	Readable
		To set the property
		`control.findById("ID").isMandatory = true;`
		To get the value of the property
		`control.findById("ID").isMandatory;`

Minimum Value	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").min = new Date("01/01/1901 00:00:00");`
		To get the value of the property
		`control.findById("ID").min;`

Maximum Value	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").max = new Date("12/31/2099 23:59:59");`
		To get the value of the property
		`control.findById("ID").max;`

Advanced

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
On Data Change	Yes	For more information, see scripting guidelines for On Data Change property.
ID	No	Not Applicable
Date Format	No	Not Applicable
Time Format	No	Not Applicable
Time Interval	No	Not Applicable
Include in Summary	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.
Visible	Yes	return true; For more information, see scripting guidelines for Visible property.
Read-Only	Yes	`return false;` For more information, see scripting guidelines for Read-Only property.
Mandatory	Yes	`return true;` For more information, see scripting guidelines for Mandatory property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
Default Value	Yes	`return "12/31/2099 00:00:00";` **Note:** The **Value** script takes precedence over the **Default Value** script. The format of the datetime should be MM/dd/yyyy HH:mm:ss.
Value	Yes	`return "12/31/2099 00:00:00";` **Note:** The format of the datetime should be MM/dd/yyyy HH:mm:ss.

Validate	Yes	`return new ValidationOptions(false, "Error Message");`
		OR
		`return new ValidationOptions(true, "");`
		For more information, see scripting guidelines for Validate property.

Example

If you want to show date and time in the **Formatted Time** (D1) Date Time control when you enter date and time in the **Entered Time** (T1) Text control, then you can code the script for the **On Data Change** event of the **Entered Time** (T1) Text control as follows:

```
// Show date and time in the Date Time control from the Text control.
// The date and time in the Text control is not converted to UTC.
var dateTime = new Date();
var dateTimeUtc = SFU.getDateTimeInServerUTCFormat(dateTime);
control.findById("D1").value=SFU.getDateTimeInStringFormat(dateTimeUtc,"MM/dd/yyyy
HH:mm:ss");
```

Note:
- Display value is readable.
_ You can retrieve the display value via script as follows:
`return control.findById("ID").displayValue;`

Drop-Down

Use scripts to set and get values for the properties of the **Drop Down** control.

Basic

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Tooltip	No	Not Applicable

Options Caption	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").optionCaption = "Value for Options Caption";`
		To get the value of the property
		`control.findById("ID").optionCaption;`

Options	No	Not Applicable
Default Value	Yes Readable	**To get the value of the property** `control.findById("ID").defaultValue;`

Appearance

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Script

Enable	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").enable = true;`
		To get the value of the property
		`control.findById("ID").enable;`

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Label Position	No	Not Applicable
Label-Control Area	No	Not Applicable
Width	No	Not Applicable
Retain Space	No	Not Applicable
Custom Style Sheet Identifier	No	Not Applicable

Validation

Property	Scripting Supported	Example

Mandatory	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").isMandatory = true;`
		To get the value of the property
		`control.findById("ID").isMandatory;`

Advanced

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
On Data Change	Yes	For more information, see scripting guidelines for On Data Change property. **Note:** If you use scripts for **On Data Change property** of a **Drop-Down** control to add a record to a **Base Form**, then the focus will be on the first control of the **Base Form**.
ID	No	Not Applicable

Text Parameter	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").optionText = "OText";`
		To get the value of the property
		`control.findById("ID").optionText;`

Value Parameter	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").optionValue = "OValue";`
		To get the value of the property
		`control.findById("ID").optionValue;`

Include in Summary	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.
Mandatory	Yes	`return true;` For more information, see scripting guidelines for Mandatory property.

Default Value	Yes	`return "ValueOne";`
		OR
		`return "ValueOne;#ValueTwo;#ValueThree";`
		Note:
		- If the value is not one of the values set for the **Value** parameter in the **Options** property, then that value will not be a part of the options but will be a part of the XML instance.
		- Multiple values must be separated with ;#
		- The **Value** script takes precedence over the **Default Value** script.

Value	Yes	`return "ValueOne";`
		OR
		`return "ValueOne;#ValueTwo;#ValueThree";`

Validate	Yes	`return new ValidationOptions(false, "Error Message");`
		OR
		`return new ValidationOptions(true, "");`
		For more information, see scripting guidelines for Validate property.

Options	Yes	`return "[{\"OValue\":\"1\",\"OText\":\"ValueOne\"},{\"OValue\":\"2\",\"OText\":\"ValueTwo\"},{\"OValue\":\"3\",\"OText\":\"ValueThree\"}]";`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
		Here **OText** is the **Text Parameter** and **OValue** is the **Value Parameter**. For more information, see scripting guidelines for Options property. **Note:** -**Text Parameter** and **Value Parameter** properties must be specified before using the **Options** property script. -**Fore Color** and **Back Color** properties cannot be set through scripts.

Note:
- Display value is readable.
- You can retrieve the display value via script as follows:

```
return control.findById("ID").displayValue;
```

Email

Use scripts to set and get values for the properties of the **Email** control.

Basic

Property	Scripting Supported	Example

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.

Note: Syntax Check for the scripts written for the controls inside the **Embed Form** control is not supported. A warning message appears in the script editor, when syntax check is performed and also whenever the scripts are saved. However, you can proceed to save the scripts.

Best Practices

- We recommend using unique XML nodes for controls in source forms to aid in scripting.
- We recommend using the `control.findByXmlNode()` method instead of the `control.findById()` method in source forms to avoid conflict of IDs between forms

Scenario 1 – Updating Value of T2 (Present inside Embed Form) from a control inside Embed Form

```
control.findByXmlNode("T2").value = "SomeValue";
```

Scenario 2 – Updating Value of T2 (Present Outside Embed Form) from a control inside Embed Form

```
Control.topLevelForm.findByXmlNode("T2").value = "SomeValue";
```

Scenario 3 – Updating Value of T2 (Present Inside Embed Form) from a control Outside Embed Form

```
control.findByXmlNode("EmbedFormXmlNode").findByXmlNode("T2").value= "SomeValue";
```

Embed Page

Use scripts to set and get values for the properties of the **Embed Page** control.

Time Period	Yes	**To set the property**
		For Duration
		`control.findById("Gantt1").ganttDuration = 8;`
		For Time Range scripting using Text control
		If you want to set the **Time Range's** start and end time properties in the **Gantt** (G1) control when you enter date and time in the **Entered Time** (T1) Text control, use the following script for the **On Data Change** event of the **Entered Time** (T1) Text control.
		`// assuming datetime string in "MM/dd/YYYY HH:mm:ss" format`
		`var str = currentValue;`
		`var d = str.split(" ")[0].split("/");`
		`var t = str.split(" ")[1].split(":");`
		`var dateTime = new Date(parseInt(d[2]), parseInt(d[0]), parseInt(d[1]), parseInt(t[0]), parseInt(t[1]), parseInt(t[2]));`
		`var dateTimeUtc = SFU.getDateTimeInServerUTCFormat(dateTime);`
		`control.findByXmlNode("Gantt1").ganttTimeRangeStartTime =SFU.getDateTimeInStringFormat(dateTimeUtc,"MM/dd/yyyy HH:mm:ss");`
		Note: The **Text** control date time input is a string with the format specified in the example script above and in UTC. This input is displayed in the Gantt Chart control in your local time.

Property	Scripting Supported	Example
Name	Yes	return "Value for Name";
Description	Yes	return "Value for Description";
Visible	Yes	return true;
Value	Yes	return 90;

Geolocation

Use scripts to set and get values for the properties of the **Geolocation** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Button Text	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").buttonText = "Value for Button Text";`
		To get the value of the property
		`control.findById("ID").buttonText;`

Appearance

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Script

Enable	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").enable = true;`
		To get the value of the property
		`control.findById("ID").enable;`

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Default Number of Records	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.
On Hierarchical List Load	Yes	For example, to apply a filter after the hierarchical list is loaded, code as follows: `control.findByXmlNode("Hierarchicallist1").applyFilter(function(recordValue){ if(recordValue.Progress > 50) { return true; } else { return false; } });`

On Level 1 List Load	Yes	**To set the Level 1 Indicator Color**
		`control.level1IndicatorColor = "#5482ab";`
		OR
		`control.level1IndicatorColor = "rgb(84,130,171)";`
		OR
		`control.level1IndicatorColor = currentRecord.IndiCol;`
		Note: Here, **IndiCol** is the column containing indicator color.
		To set the Level 1 Progress Color
		`control.level1ProgressColor = "#5482ab";`
		OR
		`control.level1ProgressColor = "rgb(84,130,171)";`
		OR
		`control.level1ProgressColor = currentRecord.ProCol;`
		Note: Here, **ProCol** is the column containing progress color.
		To set the Level 1 Progress Value

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example

		`control.level1ProgressValue = 70;`
		OR
		`control.level1ProgressValue = currentRecord.ProVal;`
		Note:
		- Here, **ProVal** is the column containing progress value.
		- Progress value should be between 0 and 100.
		- Float values are rounded to the nearest integer.
		To set the Level 1 Progress Description
		`control.level1ProgressDescription = "Value for Description";`
		OR
		`control.level1ProgressDescription = currentRecord.ProDesc;`
		Note: Here, **ProDesc** is the column containing progress description.

On Level 2 List Load	Yes	**To set the Level 2 Indicator Color**
		`control.level2IndicatorColor = "#5482ab";`
		OR
		`control.level2IndicatorColor = "rgb(84,130,171)";`
		OR
		`control.level2IndicatorColor = currentRecord.IndiCol;`
		Note: Here, **IndiCol** is the column containing indicator color.
		To set the Level 2 Progress Color
		`control.level2ProgressColor = "#5482ab";`
		OR
		`control.level2ProgressColor = "rgb(84,130,171)";`
		OR
		`control.level2ProgressColor = currentRecord.ProCol;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example

		Note: Here, **ProCol** is the column containing progress color.
		To set the Level 2 Progress Value
		`control.level2ProgressValue = 70;`
		OR
		`control.level2ProgressValue = currentRecord.ProVal;`
		Note:
		- Here, **ProVal** is the column containing progress value.
		- Progress value should be between 0 and 100.
		- Float values are rounded to the nearest integer.
		To set the Level 2 Progress Description
		`control.level2ProgressDescription = "Value for Description";`
		OR
		`control.level2ProgressDescription = currentRecord.ProDesc;`
		Note:
		- Here, **ProDesc** is the column containing progress description.
		- On some devices, progress description with more than 5 characters may get truncated.

On Level 3 List Load	Yes	**To set the Level 3 Indicator Color**
		`control.level3IndicatorColor = "#5482ab";`
		OR
		`control.level3IndicatorColor = "rgb(84,130,171)";`
		OR
		`control.level3IndicatorColor = currentRecord.IndiCol;`
		Note: Here, **IndiCol** is the column containing indicator color.
		To set the Level 3 Progress Color
		`control.level3ProgressColor = "#5482ab";`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example

		OR
		`control.level3ProgressColor = "rgb(84,130,171)";`
		OR
		`control.level3ProgressColor = currentRecord.ProCol;`
		Note: Here, **ProCol** is the column containing progress color.
		To set the Level 3 Progress Value
		`control.level3ProgressValue = 70;`
		OR
		`control.level3ProgressValue = currentRecord.ProVal;`
		Note:
		- Here, **ProVal** is the column containing progress value.
		- Progress value should be between 0 and 100.

		To set the Level 3 Progress Description
		`control.level3ProgressDescription = "Value for Description";`
		OR
		`control.level3ProgressDescription = currentRecord.ProDesc;`
		Note:
		- Here, **ProDesc** is the column containing progress description.
		- On some devices, progress description with more than 5 characters may get truncated.

On Level 1 Progress Click	Yes	**To set the property** `SFU.showAlert(currentRecord.ProDesc);` **Note:** Here, **ProDesc** is the column containing progress description. On clicking the progress, the description is shown as an alert message.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example

On Level 2 Progress Click	Yes	**To set the property**
		`SFU.showAlert(currentRecord.ProDesc);`
		`SFU.showAlert(parentRecord.ProDesc);`
		Note:
		- Here, **ProDesc** is the column containing progress description. On clicking the progress, the description is shown as an alert message.
		- On some devices, progress description with more than 5 characters may get truncated.

On Level 3 Progress Click	Yes	**To set the property**
		`SFU.showAlert(rootRecord.ProDesc);`
		`SFU.showAlert(currentRecord.ProDesc);`
		`SFU.showAlert(parentRecord.ProDesc);`
		Note:
		- Here, **ProDesc** is the column containing progress description. On clicking the progress, the description is shown as an alert message.
		- On some devices, progress description with more than 5 characters may get truncated.

On Level 2 Toggle	Yes	**To set the property**
		`if(toggleValue == true)`
		`{`
		`control.level1ProgressValue = 100;`
		`}`
		`else`
		`{`
		`control.level1ProgressValue = 50;`
		`}`
		`// Access above siblings`
		`selectItem.aboveSiblingValue = true;`
		`// Access all siblings`
		`selectItem.aboveSiblingValue = true;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example

		`// Access below siblings`
		`selectItem.belowSiblingValue = true;`
		`// Select each of the sibling and enable slide-toggle and set the progress color to red`
		`for(var i=0; i<selectItem.siblings.length; i++)`
		`{`
		`selectItem.siblings.toggle[i].level2ToggleEnable = true;`
		`selectItem.siblings.progress[i].progressColor= "red";`
		`}`
		Note: Setting level 3 properties using On Level 2 Toggle script is not supported.

On Level 3 Toggle	Yes	**To set the property**
		`if(toggleValue == true)`
		`{`
		`control.level1ProgressValue = 100;`
		`}`
		`else`
		`{`
		`control.level1ProgressValue = 50;`
		`}`
		`// Access above siblings`
		`selectItem.aboveSiblingValue = true;`
		`// Access all siblings`
		`selectItem.aboveSiblingValue = true;`
		`// Access below siblings`
		`selectItem.belowSiblingValue = true;`
		`// Select each of the sibling and enable slide-toggle and set the progress color to red`
		`for(var i=0; i<selectItem.siblings.length; i++)`
		`{`
		`selectItem.siblings.toggle[i].level3ToggleEnable = true;`
		`selectItem.siblings.progress[i].progressColor= "red";`
		`}`
		Note: Setting level 2 properties

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
		using On Level 3 Toggle script is only supported for Enable.

Note: You can specify search criteria on the hierarchical list. For more information, see control.applyFilter() and control.clearFilter() methods.

Hyperlink

Use scripts to set and get values for the properties of the **Hyperlink** control.

Basic

Property	Scripting Supported	Example

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.
Value	Yes	`return "Value for the control";`
Pre-Workflow Execution	Yes	`return false;` This script stops the execution of the workflow. The *Pre-Workflow Execution* script can be used to validate, update values in columns, and so on. **Note:** The workflow is triggered after the *Pre-Workflow Execution* scripts are executed.
Post-Workflow Execution	Yes	`control.findById("ID").value = blockingOutput;` The *Post-Workflow Execution* script can be used to perform actions based on the workflow execution status. **Note:** - The script is executed only for synchronously executed workflows. - The script is executed even when the workflow fails but the corresponding workflow status is returned. - The script is not executed when the workflow engine is not running.

Enabling Read-Only mode for the form while the workflow is processed

When a workflow is triggered through the **Invoke Workflow** control, we recommend to deny the user to edit values of controls on the form while the workflow is being processed.

To enable **Read-Only** mode for the form, you can code the script for the **Pre-Workflow Execution** property of the **Invoke Workflow** control as follows:

```
control.topLevelForm.readEditAddBehaviour = readEditBehaviourEnum.readOnly;
```

To disable **Read-Only** mode for the form after the workflow is processed, you can code the script for the **Post-Workflow Execution** property of the **Invoke Workflow** control as follows:

```
control.topLevelForm.readEditAddBehaviour = readEditBehaviourEnum.editable;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using workflowStatus and blockingOutput Variables

Use the **workflowStatus** variable to accomplish a desired operation based on the workflow status, and the **blockingOutput** variable to accomplish a desired operation using the **Blocking Output** from **Blocking Data Activity** of the workflow. For more information on workflow status codes, see **List of Internal Status Codes** in the *Developer Guide*.

```
// Do something based on the workflow status.
if (workflowStatus === "FN")
{
//Workflow finished without errors.
/* Accomplish a desired operation.
* Read blockingOutput variable if the workflow is expected to return Blocking Output from
Blocking Data Activity.
* Refresh the form or a control if the workflow is supposed to modify data on the form.
*/
}
else if (workflowStatus === "FE")
{
//Workflow finished with errors.
SFU.showAlert("Workflow triggered with errors.");
}
```

Label

Use scripts to set and get values for the properties of the **Label** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
Mandatory	Yes	`return true;` For more information, see scripting guidelines for Mandatory property.

Default Value	Yes	`return "ValueOne";`
		OR
		`return "ValueOne;#ValueTwo;#ValueThree";`
		Note:
		- If the value is not one of the values set for the **Value** parameter in the **Options** property, then that value will not be a part of the options but will be a part of the XML instance.
		- If multiple values are set when the **Selection Mode** property is set to **Single**, then only the first value will be a part of the options but all values will be a part of the XML instance.
		- Multiple values must be separated with ;#
		- The **Value** script takes precedence over the **Default Value** script.

Value	Yes	`return "ValueOne";`
		OR
		`return "ValueOne;#ValueTwo;#ValueThree";`

Validate	Yes	`return new ValidationOptions(false, "Error Message");`
		OR
		`return new ValidationOptions(true, "");`
		For more information, see scripting guidelines for Validate property.

Options	Yes	`return "[{\"OValue\":\"1\",\"OText\":\"ValueOne\"},{\"OValue\":\"2\",\"OText\":\"ValueTwo\"},{\"OValue\":\"`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
		`3\",\"OText\":\"ValueThree\"} ]";` Here **OText** is the **Text Parameter** and **OValue** is the **Value Parameter**. For more information, see scripting guidelines for Options property. **Note:** - **Text Parameter** and **Value Parameter** properties must be specified before using the Options property script. - **Fore Color** and **Back Color** properties cannot be set through scripts.

Note:
- Display value is readable.
- You can retrieve the display value via script as follows:

```
return control.findById("ID").displayValue;
```

Number

Use scripts to set and get values for the properties of the **Number** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

Scripts

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.

Validate	Yes	`return new ValidationOptions(false, "Error Message");`
		OR
		`return new ValidationOptions(true, "");`
		For more information, see scripting guidelines for Validate property.

Example

If you want to populate the value of the **Name** (T1) control in the Pop-Up form with the value of the **Last Name** (T2) control in the parent form, then you can code the script for the **Value** property of the **Name** (T1) control as follows:

```
if(!SFU.isUndefined(window.parentViewModel))
{
return window.parentViewModel.topLevelForm.findById("T2").value;
}
```

If you want to populate the value of the **Project** (T3) control in the parent form with the value of the **Assigned Project** (T2) control in the Pop-Up form, then you can code the script for the **On Data Change** event of the **Details** (P1) control as follows:

```
if(!SFU.isUndefined(control.extendedInformation))
{
control.findById("T3").value = control.extendedInformation["Textinput2"];
}
```

If, **Assigned Project** (T2) control in the Pop-Up form is inside a container **Project Details** (B1), then you can code the script for the **On Data Change** event of the **Details** (P1) control as follows:

```
if(!SFU.isUndefined(control.extendedInformation))
{
control.findById("T3").value = control.extendedInformation["B1"]["T2"];
}
```

Retain Space	No	Not Applicable

Title	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").progressBarTitle = "Value for Title";`
		To get the value of the property
		`control.findById("ID").progressBarTitle;`

Decimal Places	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").progressBarDecimalPlaces=3;`
		To get the value of the property
		`control.findById("ID").progressBarDecimalPlaces;`

Scale	No	Not Applicable

Scale Minimum Value	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").progressBarScaleMinValue=0;`
		To get the value of the property
		`control.findById("ID").progressBarScaleMinValue;`

Scale Maximum Value	Yes Writable Readable	**To set the property** `control.findById("ID").progressBarScaleMaxValue=0;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

		To get the value of the property `control.findById("ID").progressBarScaleMaxValue;`
Control Background Color	No	Not Applicable
Background Color	No	Not Applicable
Bar Color	No	Not Applicable

Range	Yes	**To set the property**
		`control.findById(“ID”).options=[{optionvalue:20,foreColor:"red"},{optionvalue:60,foreColor:"green"}];`
		To get the value of optionvalue property of the first element
		`control.findById(“ID").options[0].optionvalue`
		To get the value of foreColor property of the first element
		`control.findById(“ID").options[0].foreColor`
		Note: The **Options** property exposed in scripting is used for the **Range** property.

Custom Style Sheet Identifier	No	Not Applicable

Advanced

Property	Scripting Supported	Example
On Initialize	Yes	For more information, see scripting guidelines for **On Initialize** property.

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Visible	Yes	`return true;`
Value	Yes	`return 90;`

Radio Button

Use scripts to set and get values for the properties of the **Radio Button** control.

Basic

Property	**Scripting Supported**	**Example**

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Tooltip	No	Not Applicable
Options	No	Not Applicable
Default Value	Yes	**To get the value of the property** `control.findById("ID").defaul`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
	Readable	`tValue;`

Appearance

Property	Scripting Supported	Script

Enable	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").enable = true;`
		To get the value of the property
		`control.findById("ID").enable;`

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Label Position	No	Not Applicable
Label-Control Area	No	Not Applicable
Width	No	Not Applicable
Height	No	Not Applicable
Retain Space	No	Not Applicable
Options Per Row	No	Not Applicable
Options Direction	No	Not Applicable

Validation

Property	Scripting Supported	Example

Mandatory	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").isMandatory = true;`
		To get the value of the property
		`control.findById("ID").isMand`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
		`atory;`

Advanced

Property	Scripting Supported	Example
On Data Change	Yes	For more information, see scripting guidelines for On Data Change property.
ID	No	Not Applicable

Text Parameter	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").optionText = "OText";`
		To get the value of the property
		`control.findById("ID").optionText;`

Value Parameter	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").optionValue = "OValue";`
		To get the value of the property
		`control.findById("ID").optionValue;`

Include in Summary	No	Not Applicable

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
Mandatory	Yes	`return true;` For more information, see scripting guidelines for Mandatory property.
Default Value	Yes	`return "ValueOne";` **Note:** -If the value is not one of the values set for the **Value** parameter in the **Options** property, then that value will not be a part of the options but will be a part of the XML instance. -The **Value** script takes precedence over the **Default Value** script.
Value	Yes	`return "ValueOne";`

Validate	Yes	`return new ValidationOptions(false, "Error Message");`
		OR
		`return new ValidationOptions(true, "");`
		For more information, see scripting guidelines for Validate property.

Options	Yes	`return "[{\"OValue\":\"1\",\"OText\":\"ValueOne\"},{\"OValue\":\"2\",\"OText\":\"ValueTwo\"},{\"OValue\":\"3\",\"OText\":\"ValueThree\"}]";` Here **OText** is the **Text Parameter** and **OValue** is the **Value Parameter**. For more information, see scripting guidelines for Options property. **Note:** - **Text Parameter** and **Value Parameter** properties must be specified before using the Options property script. - **Fore Color** and **Back Color** properties cannot be set through scripts.

Note:
- Display value is readable.
- You can retrieve the display value via script as follows:

```
return control.findById("ID").displayValue;
```

Report Viewer

Use scripts to set and get values for the properties of the **Report Viewer** control.

Basic

Property	Scripting Supported	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Report Name	No	Not Applicable
Report Configuration	No	Not Applicable

Appearance

Property	Scripting Supported	Script

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Enable	Yes	`return true;` For more information, see scripting guidelines for Enable property.
Visible	Yes	`return true;` For more information, see scripting guidelines for Visible property.
Mandatory	Yes	`return true;` For more information, see scripting guidelines for Mandatory property.

Default Value	Yes	`return "639aa10e-dc02-446f-ac2e-d750550f7edb";`
		`Where "639aa10e-dc02-446f-ac2e-d750550f7edb" is a GUID`
		Note: The **Value** script takes precedence over the **Default Value** script.

Value	Yes	`return "639aa10e-dc02-446f-ac2e-d750550f7edb";` `Where "639aa10e-dc02-446f-ac2e-d750550f7edb" is a GUID`

Validate	Yes	`return new ValidationOptions(false, "Error Message");`
		OR
		`return new ValidationOptions(true, "");`
		For more information, see scripting guidelines for Validate property.

Note:
- Display value is readable.
- You can retrieve the display value via script as follows:
`return control.findById("ID").displayValue;`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Widget

Use scripts to set and get values for the properties of the **Data Grid** control.

Use **Widget** control to create reusable graphical components. You can maintain a library of widgets for the other users to use.

Properties

The properties for the control are grouped under the following tabs:

Basic

Property	Scripting	Example

Name	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").tagName = "Value for Name";`
		To get the value of the property
		`control.findById("ID").tagName;`

XML Node	Yes Readable	**To get the value of the property** `control.findById("ID").xmlNodeBoundTo;`

Description	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").description = "Value for Description";`
		To get the value of the property
		`control.findById("ID").description;`

Widget Type	No	Not Applicable
Widget	Yes Readable	**To get the value of the property** `control.findByXmlNode("Widget1").widgetName;`
Configuration	Yes Readable Writable	**To get the value of the property** `control.findByXmlNode("Widget1").confName;`
Form Details	No	Not Applicable

Appearance

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Scripting Supported	Example
Style	No	Not Applicable
In Designer	No	Not Applicable

Visible	Yes
	Writable
	Readable
		To set the property
		`control.findById("ID").visible = true;`
		To get the value of the property
		`control.findById("ID").visible;`

Label Position	No	Not Applicable
Label-Control Area	No	Not Applicable
Retain Space	No	Not Applicable
Custom Style Sheet Identifier	No	Not Applicable

Advanced

Property	Scripting Supported	Example
On Data Change	Yes	For more information, see scripting guidelines for On Data Change property.
ID	No	Not Applicable
Add Values as Url	No	Not Applicable
Widget Properties	Yes	**To get the value of the property** `control.findByXmlNode("Widget1").widgetProperties;` The properties are listed based on the Widget selected in the control. For more information, see the respective Widget documentation. • Grid Widget • Hierarchy Selector Widget **Note**: Form Parameters are considered as **Widget Properties** for the Widget control irrespective of the data

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

		type. The **Widget Properties** are always represented as String data type.

Scripts

Property	Scripting Supported	Example
Name	Yes	`return "Value for Name";`
Description	Yes	`return "Value for Description";`
Visible	Yes Writable Readable	`return true;`
Default Value	Yes	`return "Default value for the control";` **Note:** The **Value** script takes precedence over the **Default Value** script.
Value	Yes	`return "Value for the control";`

Validate	Yes	`return new ValidationOptions(false, "Error Message");`
		OR
		`return new ValidationOptions(true, "");`
		For more information, see scripting guidelines for Validate property.

Widget Scripts	Yes	The dynamic scripts are listed based on the Widget selected in the control. For more information, see the respective Widget documentation on the dynamic scripts. • Grid Widget • Hierarchy Selector Widget

		Note: This property is not applicable for Widget Type - Form.

Forms Parameters

Forms parameters are form-level variables used to store data in:

- Form Link
- Pop-Up Control
- Invoke Form Activity

The value of a forms parameter is used when the form is rendered.

Types of Forms Parameters

- String
- Array
- Number
- Date
- Object

Rules for Forms Parameter Names

Forms parameter names are case-sensitive and can start with a number. However, forms parameter names:

- Must be unique.
- Cannot contain non-English characters.
- Cannot contain spaces.
- Cannot contain special characters such as ' ! " # % & ( ) * , . / : ; ? @ [\ ] ^ _ ` { | } ~ + < = >

Add Forms Parameters

Add a forms parameter to use with a workflow at run-time.

To add a forms parameter to a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click **Design**). The **Forms Designer** page appears.
3. On the action bar, click **Properties**. The **Properties** dialog box appears.
4. Click the **Advanced** tab, and then click the **Add parameter** button under the **Forms Parameters**. A new row

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

appears.

5. Enter the parameter name in the **Parameter Name** box, and select the **Parameter Type**.
6. Click **Apply**. The forms parameter is saved and the **Properties** dialog box is closed.
7. Click the **Close** button. The form is saved and the **Forms Designer** page is closed.

Delete Forms Parameters

Delete a forms parameter when the forms parameter is no longer required.

To delete a forms parameters from a form

1. In the **Enterprise Console**, click the **Menu** button, and then click **Forms**. The **Forms** page appears.
2. Right-click on a form, and then click **Design Form** (or click on a form, and then click **Design**). The **Forms Designer** page appears.
3. On the action bar, click **Properties**. The **Properties** dialog box appears.
4. Click the **Advanced** tab, and then click the **Delete Parameter** button at the end of a forms parameter under the **Forms Parameters**.
5. Click **Apply**. The forms parameter is deleted and the **Properties** dialog box is closed.
6. Click the **Close** button. The form is saved and the **Forms Designer** page is closed.

Set Forms Parameters

Set forms parameters to manage controls on a form at run-time.

Setting Forms Parameters through Form Links

- When you create a **Form Link**, you can select and type values for the parameters. For more information,see Creating Forms Links.

Setting Forms Parameters through Pop-Up Control

- When you create a **Pop-Up** control, you can select parameters and map it to parent form controls. For more information, see *To add Form Details for the Control* under *Form Details* property in Pop-Up.

Setting Forms Parameters through External Systems

The forms parameter must be specified in JSON (JavaScript Object Notation) string format with attribute–value pairs. Multiple forms parameters can be specified by separating them with commas.

Syntax

```
// extForParam is the global variable used for setting Forms Parameters.
window.extFormParam = { "<formsParameterName>": { "id": <idValue>, "mappedParentControl":
"<mappedParentControlValue>", "name": "<formsParameterName>", "type":
"<formsParameterType>", "value": "<formsParameterValue>" } };
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Value	Description
<formsParameterName>	Name of the forms parameter.
<idValue>	Value of the forms parameter ID. This value is optional. Use null if no value is used.
<mappedParentControlValue>	Value of the forms parameter mapped to the parent control. This value is optional. Use "" if no value is used.
<formsParameterType>	Type of the forms parameter. For more information about, see Types of Forms Parameters.
<formsParameterValue>	Value of the Forms Parameter.

Example

Setting Forms Parameters through an HTML page

If you can want to populate the **First Name** and the **Last Name** text controls on the **Employee** form with values from the **FName** and the **LName** forms parameters, then you can code the form and the HTML page as follows:

Script the **On Form Load** property of the **Employee** form to populate the text controls with the values from the forms parameters.

```
// T1and T2 are the Text controls for the First Name and the Last Name respectively.
control.findById("T1").value = control.topLevelForm.formParameters["FName"].value;
control.findById("T2").value = control.topLevelForm.formParameters["LName"].value;
```

Code the HTML page to set the values for the forms parameters.

```
// John and Doe are values set to FName and LName respectively.
// extForParam is the variable used for setting Forms Parameters.
// This code must appear before the loadViewAndViewModelFromServer() function.
window.extFormParam = { "FName": { "name": "FName", "type": "STRING", "value": "John" },
"LName": { "name": "LName", "type": "STRING", "value": "Doe" } };
```

Forms Parameters for Invoke Form Activity

Forms parameters are form-level variables used in workflows at run-time to store data from a workflow and display the data in a form. The value of a forms parameter is used when the form is rendered.

Forms parameters are specifically used in **Invoke Form** scenarios where a form is populated as a **Work Item** and the parameters work within the boundaries of the **Invoke Form** activity.

Default Forms Parameters

The default parameters that can be obtained from the forms parameters in **Invoke Form** scenario using JavaScript are:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Forms Parameters	Script
Execution ID	control.topLevelForm.formParameters["variable.executionId"].value
Execution Details ID	control.topLevelForm.formParameters["variable.executionDetailsId"].value
Submitted User ID	control.toplevelForm.formParameters["submittedById"].value
Work Item ID	control.topLevelForm.formParameters["variable.workItemId"].value
Workflow Name	control.topLevelForm.formParameters["variable.workflowName"].value

Accessing Forms Parameters through scripts

```
// Script for the On Data Change event.
// GetWFName is a forms parameter set from an external system (Workflow).
// Gets the workflow name on data change of the control.
var getwfname = control.topLevelForm.formParameters["GetWFName"];
if(getwfname !== undefined && getwfname !== null){
 return (getwfname.value);
}
// Script for the Visible property.
// GetWFName is forms parameter set from an external system (Workflow).
// Hides the control based on the forms parameter value.
var getwfname = control.topLevelForm.formParameters["GetWFName"];
if(getwfname !== undefined && getwfname !== null){
 return (getwfname.value !== null?false:true);
}
```

Accessing Default Forms Parameters through scripts

```
// Accesses the default forms parameter - Workflow name.
var getwfname = control.topLevelForm.formParameters["variable.workflowName"];
if(getwfname !== undefined && getwfname !== null){
 if(getwfname.value !== null){
 return getwfname.value;
 }
}
```

Note: When a forms parameter of type date is set through a workflow variable of type date in the **Invoke Form** activity, the forms parameter will contain a "T" separator between date and time.

Best Practices

We recommend the following best practices when working with scripts in your forms.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Ensure you do not use keywords for variables.
  - Do not use **control** and **currentValue** for creating variables.
- Ensure you use a string for the **Value** property of the **Boolean, Date, Time,** and **DateTime** controls.
  - **Enable**, **Visible**, **Read-Only**, and **Mandatory** properties hold their value as true or false. However, the **Value** property for the **Boolean** control has a string value, which can be either "**True**" or "**False**".
  - **Value** property for the **Date**, **Time**, and **DateTime** should be given in the specific string format. Refer the scripting section on these controls for more details.
- Ensure you refer to the same control.
  - Refer to the same control when scripting for the **Enable**, **Visible**, **Read-Only**, **Value**, or **Validate** property of a control.
  - Use the **currentValue** method in the script to refer to the value of the property of a control that is scripted.
  - Do not validate the **Value** property of a control that is set as invisible.
- Ensure the script returns a value.
  - The script must return a value even when the entire script is commented except when scripting for the **On Data Change**, **On Form Load**, **On Click**, and so on events.
  - Most of the scripts present in the Scripts Tab of which the common ones are **Name**, **Description**, **Enable**, **Visible**, **Read-Only**, **Mandatory**, **Validate**, and **Default Value**, require a return value.
  - Refer the scripts documentation for the control to know which ones require a return value and accordingly have the scripts written.
- Ensure the script returns the required value.
  - The script should return a Boolean value for the **Enable**, **Visible**, **Read-Only**, or **Mandatory** property of a control.
  - The default value of the property for a control is returned when the script does not have a return statement.
  - The previous value for the **Enable**, **Visible**, **Read-Only**, or **Mandatory** property of a control is retained when the script does not have a return statement or the return value is invalid.
- Ensure invalid values are not set through the scripts.
  - The invalid values are cleared on submission of a form, and other rules such as validation, minimum value, and maximum value are not triggered when an invalid value is set through the scripts for the **Value** property of a **Number**, **Date**, or **Time** control.
- Ensure commented code is handled in the script.
  - The script should not contain only commented code as in such cases the code is executed.
  - The script should not contain unnecessary comments, and the code that is no longer required should be removed.
- Scripts like **Name**, **Description**, **Enable**, **Visible**, etc. in the **Scripts** tab, except for the **On Form Load** script, create dependency injections based on the Script written. Hence, we recommend to write code that would perform the required checks and return a value. Also, these scripts should not set values to other controls or properties..
- Ensure the rules are triggered.
  - Validation rules for a **Number**, **Date**, or **Time** control are not triggered at form load when scripting for the **Value** property of the control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Ensure the **Equality Operator (==)** is used instead of the **Identity Operator (===)** when type conversion is not required.
  - The **Equality Operator (==)** is used for an abstract comparison and converts the operands to the same type before making the comparison, whereas the **Identity Operator (===)** is used for a strict comparison and is true only if the operands are of the same type.

    Example

    If the **Number (N1)** control is set to 123.00, then the following comparison is false as the **Number (N1)** control returns 123.

    ```
    if(control.findById("N1").value === "123.00")
    {
       alert("True");
    }
    else
    {
       alert("False");
    }
    ```

    The comparison will be true when the operator or operand is changed as follows:

    ```
    if(control.findById("N1").value == "123")
    ```

    OR

    ```
    if(control.findById("N1").value === 123.00)
    ```

    Note: If the **Number** (N1) control is set to 123.45, then the **Number** (N1) control returns 123.45, and you can continue to compare as follows:

    ```
    if(control.findById("N1").value === "123.45")
    ```

    as the decimal value other than 0 is not discarded.

- Ensure you create a variable outside the AJAX call and assign that variable inside the success function. Then return the variable after the AJAX call, when you code a synchronous AJAX call which returns a result, as shown in below example.

  ```
  var returnData;
  $.ajax({
     type: …,
     async: false,
     url: …,
     contentType: …,
     dataType: …,
     data: …,
     success: function(result)
     {
     returnData = result;//true or false
     },
     error: …
  });
  return returnData;
  ```

- Ensure you check the syntax of the script before you save the script.
- In case of scripts that return value, when you use control.findByXmlNode, control.findById, and/or control.findByName APIs to refer to the properties like **Enable**, **Visible**, **Value**, etc., the dependency would be created on these properties. So if any value change occurs to the dependent properties, the script would re-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

trigger.

- Ensure you write the scripts for functions as shown below:

  Assign function to Variable:

  ```
  var count = function(value) {
     return value.length;
  };
  ```

  IIFE functions:

  ```
  function () {
     //write your js code here
  });
  ```

  Global functions:

  ```
  window.calculateLength = function(value) {
     return value.length;
  };
  ```

- Avoid writing huge scripts in the scripts editor in Forms. The script editor has an auto save functionality, which would save the scripts without having the script been completely verified on the syntax. This is due to the fact that the scripts are not lost in case of a system crash. But there is a negative effect for this functionality as well. After the system crash (let's assume), when you open the form and preview, it might not show the preview and give exceptions. So you would need to update the scripts where you had left off before the system crash, and make appropriate corrections. Hence, it is better to avoid large scripts written in the script editor. Instead, use custom js files to write down the huge scripts and have a call to those custom script functions from the Form scripts.

- The **On Data Change** script for a control would not execute when value is set in the **On Form Load** script. This is done to prevent inadvertent triggering of **On Data Change** event when instance xml is set while invoking the form.

  Example:

  A Form is having only 1 Textinput control. The **On Form Load** script is defined as below:

  ```
  console.log("**********************************************************Textinput1 value
  set from On Form Load");
  control.findByXmlNode("Textinput1").value = "Value set from On Form Load";
  ```

  And have the **On Data Change** script for the Textinput control as below:

  ```
  console.log("**********************************************************Textinput1 - On
  Data Change script - value: " + currentValue);
  ```

  When you preview the form, it would not execute the **On Data Change** script of the Textinput control, as you have set the value of the TextInput control in the **On Form Load** script. Below is the console log result:

  ```
  **********************************************************Textinput1 value set from On
  Form Load
  ```

- Property based scripts takes precedence – **Name**, **Description**, **Enable**, **Visible**, **Mandatory**, **Value**, **Default Value** type of scripts

  - Example with **On Form Load** script and **Textinput Value** script:

    A Form is having only 1 Textinput control. The **On Form Load** script is defined as below:

    ```
    console.log("**********************************************************Textinput
    1 value set from On Form Load");
    control.findByXmlNode("Textinput1").value = "Value set from On Form Load";
    ```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

And have the **Value** script for the Textinput control as below:

```
console.log("**********************************************************Textinput
1 value set via Value script");
return "Value set from Textinput control's Value script";
```

When you preview the form, it would execute the **On Form Load** event of the Textinput control, but as you have the **Value** script defined for the TextInput control, the **Value** script would take precedence. Below is the console log result:

```
**********************************************************Textinput1 value set
from On Form Load
**********************************************************Textinput1 value set
via Value script
**********************************************************Textinput1 value set
via Value script
**********************************************************Textinput1 value set
via Value script
```

Note: The last 2 logs related to Value script execution happens due to internal handling of scenario around value script for Validation and On Form Load completion events.

- Example with **Button On Click** script and **Textinput Enable** script:

  A Form is having only 1 Textinput control. In the Textinput control properties, set **Enable** property as **No** and define the Enable script as below:

  ```
  console.log("**********************************************************Textinput
  Enable property set to True via Textinput Enable script");
  return true;
  ```

  Let us add a button control and give the **On Click** script as below:

  ```
  console.log("**********************************************************Textinput
  Enable property set to False via button click");
  control.findByXmlNode("Textinput1").enable = false;
  ```

  When you preview the form, it shows the Textinput control in enabled state, as the **Enable** script takes precedence.

  When you click on the button, you would see that the Textinput control is still in the enabled state, as the **Enable** script takes precedence. Below is the console log result:

  ```
  **********************************************************Textinput Enable
  property set to True via Textinput Enable script
  **********************************************************Textinput Enable
  property set to False via button click
  **********************************************************Textinput Enable
  property set to True via Textinput Enable script
  ```

- The control's value set last via a script would have it's On Data Change script executed last.

  Example:

  A Form having controls - 2 Dateinput, 1 Textinput, and 1 Button.

  The Dateinput1 control has the **On Data Change** script as below:

  ```
  console.log("**********************************************************Dateinput1 On
  Data Change script - Update Textinput1 with value");
  control.findByXmlNode("Textinput1").value = currentValue;
  ```

  The Dateinput2 control has the **On Data Change** script as below:

  ```
  console.log("**********************************************************Dateinput2 On
  Data Change script - Update Textinput1 with value");
  ```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.findByXmlNode("Textinput1").value = currentValue;
```

The button control has the **On Click** script as below:

```
console.log("*****************************************************Set Dateinput1
value as 03/20/2022");
control.findByXmlNode("Dateinput1").value = "03/20/2022 00:00:00";
console.log("*****************************************************Set Dateinput2
value as 03/30/2022");
control.findByXmlNode("Dateinput2").value = "03/30/2022 00:00:00";
```

When you preview the form, it would show the Textinput control's value as the Dateinput2 control's value, as the button **On Click** script sets the Dateinput2 control's value at the end. Below is the console log result:

```
*****************************************************Set Dateinput1 value as 03/
20/2022
*****************************************************Dateinput1 On Data Change
script - Update Textinput1 with value
*****************************************************Set Dateinput2 value as 03/
30/2022
*****************************************************Dateinput2 On Data Change
script - Update Textinput1 with value
```

If you change the order in which the Dateinput control values are set via the button **On Click** script, you will have to change the button **On Click** script as below:

```
console.log("*****************************************************Set Dateinput2
value as 03/30/2022");
control.findByXmlNode("Dateinput2").value = "03/30/2022 00:00:00";
console.log("*****************************************************Set Dateinput1
value as 03/20/2022");
control.findByXmlNode("Dateinput1").value = "03/20/2022 00:00:00";
```

When you preview the form, it would show the Textinput control's value as the Dateinput1 control's value, as the button **On Click** script sets the Dateinput1 control's value at the end. Below is the console log result:

```
*****************************************************Set Dateinput2 value as 03/
30/2022
*****************************************************Dateinput2 On Data Change
script - Update Textinput1 with value
*****************************************************Set Dateinput1 value as 03/
20/2022
*****************************************************Dateinput1 On Data Change
script - Update Textinput1 with value
```

- Referring to properties of the same control or other control in scripts like **Name**, **Description**, **Enable**, **Visible**, **Read-Only**, **Mandatory**, **Default Value**, **Value**, and **Validate**, would create the dependencies on those properties. If any change happens to those dependent control properties, the scripts would get executed.

  Example:

  Consider a Textinput control's Scripts Tab containing scripts for **Name, Description, Enable, Visible, Read-Only, Mandatory, Default Value, Value**, and **Validate**. These scripts are also based on the control's respective property except in the case of **Validate** script, like **Enable** script of Textinput control would relate to the **Enable** property of the Textinput control.

  So, when you define these kind of scripts, which require return values, then those return values are targeted to the respective property's value. When writing scripts, you would refer to other controls and their properties in the scripts, which create dependencies for these kinds of scripts. For example, consider a BooleanInput control and a Textinput control in the Form. The Textinput control's **Enable** script is given as below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
if (control.findByXmlNode("Booleaninput1").value == "True")
{
   return true;
}
else
{
   return false;
}
```

When you preview the form, the Textinput control is disabled, as the BooleanInput control is set to **No**. If you change the BooleanInput control to **Yes**, then the Textinput control is enabled. This is how dependency gets created for BooleanInput control's **Value** property when used in the Textinput control's **Enable** script.

Note: You should not set any other control properties or value in these scripts, only reading the values can be done. For example, you cannot set the **Read-Only** property's value for the same control or other control, in the control's enable script. This is to avoid unwanted behavior and/or recursive loops in the form.

- When all the property based scripts like **Name, Description, Enable, Visible,** etc. are given for a control, the properties are defined for the control initially. Once the **On Form Load** script completes execution, these scripts would get executed.

  Example:

  Lets define a form with a Textinput control. Have the **On Form Load** script as below:

  ```
  console.log("**********************************************************On Form Load
  script executed");
  ```

  Have the Textinput control's **Name** script as below:

  ```
  console.log("**********************************************************Textinput1 Name
  script");
     return currentValue;
  ```

  Similarly, have the Textinput control's **Description** script as below:

  ```
  console.log("**********************************************************Textinput1
  Description script");
     return currentValue;
  ```

  Similarly, define the scripts for **Enable, Visible, Read-Only, Mandatory, Default Value,** and **Value** in the **Scripts** tab for the Textinput control.

  When you preview the form, the console log result is as below:

  ```
  ******************************************************On Form Load script executed
  ******************************************************Textinput1 Mandatory script
  ******************************************************Textinput1 Name script
  ******************************************************Textinput1 Description script
  ******************************************************Textinput1 Visible script
  ******************************************************Textinput1 Read-Only script
  ******************************************************Textinput1 Enable script
  ******************************************************Textinput1 Value script
  ```

  The order of these scripts execution is not important, they might get triggered again based on the dependencies they have. The important point is that we should never set any other control's value in these scripts. We can only refer or read other control's property values or the same control's property values in these scripts, which would create the dependencies and accordingly the execution of the scripts would happen based on the dependencies, as and when these dependent values are changed.

APIs

Application programming interface (API) is a set of functions to accomplish a specific task. APIs provide speed, reliability, and extensibility.

Forms APIs

Application programming interface (API) is a set of functions to accomplish a specific task. APIs provide speed, reliability, and extensibility.

Forms APIs make use of the following namespaces, classes, and objects.

Namespace	Class	Object
skelta skelta.forms	utilities	control

Use forms APIs to customize your business applications.

SFU.closeForm()

Use `closeForm()` method to close the window in which the form is rendered.

Syntax

```
SFU.closeForm();
```

Parameters

None.

Return Value

None.

Example

```
// Close the window in which the form is rendered
SFU.closeForm();
```

SFU.decodeXmlValue()

Use `decodeXmlValue()` method to decode all characters in the encoded XML value.

The following encoded characters are decoded as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Encoded Value	Decoded Value
&	&
'	'
"	"
<	<
>	>

Syntax

```
sRetVal = SFU.decodeXmlValue(string);
```

Parameters

Parameter	Description
string	String to be decoded.

Return Value

This method returns a string value.

Example

```
// Decode encoded XML value.
SFU.decodeXmlValue("&amp;quot;Developer&amp;apos;s&amp;quot; Guide");
//&amp;quot;Developer&amp;apos;s&amp;quot; Guide is decoded as "Developer's" Guide.
```

SFU.encodeXmlValue()

Use `encodeXmlValue()` method to encode all characters in the XML value.

The following characters in the XML value are encoded as follows:

XML Value	Encoded Value
&	&
'	'
"	"
<	<

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

XML Value	Encoded Value
>	>

Syntax

```
sRetVal = SFU.encodeXmlValue(string);
```

Parameters

Parameter	Description
string	String to be encoded.

Return Value

This method returns a string value.

Example

```
// Encode XML value.
SFU.encodeXmlValue("\"Developer's\" Guide");
//"Developer's" Guide is encoded as &amp;quot;Developer&amp;apos;s&amp;quot; Guide.
```

SFU.getClientCredentialToken()

Use `getClientCredentialToken()` method to get the client credential token with custom scope.

Syntax

```
var accessToken = SFU.getClientCredentialToken();
```

Return Value

This method returns token value of string datatype.

Example

```
//Get the client credential token with custom scope.
var accessToken = SFU.getClientCredentialToken();
```

Note:
For Azure Active Directory provider, this method returns the token with the scope - `api://<clientid>/worktasks/`
For AVEVA Connect provider, this method returns the token with the scope - `ac_worktasks`
For AVEVA Identity Manager provider, this method returns the token with the scope - `system`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SFU.getDateTimeInStringFormat()

Use `getDateTimeInStringFormat()` method to get the date time from the string format.

Syntax

```
sRetVal = SFU.getDateTimeInStringFormat(dateTime,
skelta.forms.constants.dateFormats.dateTimeFormatForCoreValue);
```

Parameters

Parameter	Description
dateTime	Date and Time object. **Note**: The time zone from the JavaScript Date object is not considered.
skelta.forms.constants.dateFormats.dateTimeFormatForCoreValue	Date and Time Formate Constant.

Return Value

This method returns a date time string.

Example

```
// Show date and time in the Date Time control from the value of the Forms Parameter.
var myDateTime = control.topLevelForm.formParameters["DateTimeParam"].value;
var OutDateTime = SFU.getDateTimeInStringFormat(myDateTime,
skelta.forms.constants.dateFormats.dateTimeFormatForCoreValue);
control.findById("D1").value = OutDateTime;
```

SFU.getDateTimeInServerUTCFormat()

Use `getDateTimeInServerUTCFormat()` method to get the date and time in Server or Local culture.

Syntax

```
sRetVal = SFU.getDateTimeInServerUTCFormat(dateTime, forUIValue);
```

Parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
dateTime	Date and Time object. **Note**: The time zone from the JavaScript Date object is not considered.
forUIValue	A Boolean flag which determines whether the dateTime parameter value has to be converted to a local/display value based on the server UTC offset. This parameter is optional. The default value is **false**.

Return Value

This method returns a date and time object.

Example

```
// Get the date and time in Server culture.
var dateTime = new Date();
var dateTimeUtc = SFU.getDateTimeInServerUTCFormat(dateTime);
// Get the date and time in Local culture.
var dateTimeUtc = new Date(); // UTC Date value
var dateTime = SFU.getDateTimeInServerUTCFormat(dateTimeUtc, true);
```

SFU.getDateTimeInUTCFormat()

Use `getDateTimeInUTCFormat()` method to get the date and time in UTC.

Syntax

```
sRetVal = SFU.getDateTimeInUTCFormat(dateTime);
```

Parameters

Parameter	Description
dateTime	Date and Time object. **Note**: The time zone from the JavaScript Date object is not considered.

Return Value

This method returns a date and time object.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example

```
// Get the date and time in UTC.
var dateTime = new Date();
var dateTimeUtc = SFU.getDateTimeInUTCFormat(dateTime);
```

SFU.getFormUrl()

Use `getFormUrl()` method to get the URL, which can be used to navigate to a different form.

Note: This API is not supported in AVEVA Work Tasks Pro App.

Syntax

```
SFU.getFormUrl(formName,formVersion);
```

Parameters

Parameter	Description
formName	Name of the form that you want to navigate to. The value must be a string.
formVersion	Version of the form. The value should be string. If the value is set to blank, then the latest published version of the form is considered.

Note:
- Ensure that the form with the specified title and the version exists and is in the "Published" state.

- Folders are not supported for this API.

Return Value

This method returns the URL.

Example

```
// Get the form that has to be embedded in the current form.
var formsURL=SFU.getFormUrl("ApplicationForm1","1");
control.findByXmlNode("Embedpage1").url = formsURL;
```

SFU.getGridValue()

Use `getGridValue()` method to get the persisted column values when the check box is selected for the record.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Syntax

```
aRetVal = SFU.getGridValue(gridControl);
```

Parameters

Parameter	Description
gridControl	Grid control.

Return Value

This method returns an array of objects.

Example

```
// Get the persisted column values.
var gridControl = control.findById("G1");
var rowData = SFU.getGridValue(gridControl);
control.findById("T3").value = rowData[0].<lookupname>.AddressID;
control.findById("T4").value = rowData[0].<lookupname>.City;
control.findById("T5").value = rowData[0].<lookupname>.PostalCode;
```

Note: The DateTime column types would contain DateTime values (not String values), when the **Use Culture Specific Values** property is set to **No**.

SFU.getImagePath()

Use `getImagePath()` method to include image from the image path for the **Image** control.

Syntax

```
SFU.getImagePath(imagePath);
```

Parameters

Parameter	Description
imagePath	Path to the image for the Image control.

Return Value

None

Example

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// Include MyLogo.png image for the Image control through the Value script.
return SFU.getImagePath("<BPMUITemplates>/Images/MyLogo.png");
```

SFU.getJSONObjectFromXml()

Use `getJSONObjectFromXml()` method to convert an XML string to a JSON object.

Syntax

```
sRetVal = SFU.getJSONObjectFromXml(xmlString);
```

Parameters

Parameter	Description
xmlString	XML string to convert to JSON object.

Return Value

This method returns a JSON object.

Example

```
// Define an XML string.
var xmlString = "<MyRoot><FirstName>John</FirstName><LastName>Smith</LastName></MyRoot>";
// Convert the XML string to a JSON object.
var jsonObj = SFU.getJSONObjectFromXml(xmlString);
// The JSON object will be returned as:
// {
// "MyRoot" : {
//  "FirstName":"John",
//  "LastName":"Smith",
// }
```

SFU.getLookupSchemaAndData()

Use `getLookupSchemaAndData()` method to get Data Lookup schema and data from Lookup name.

Syntax

```
SFU.getLookupSchemaAndData(lookupName, lookupParameters, getAllColumnData);
```

Parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
lookupName	Name of the Data Lookup.
lookupParameters	Collection of parameters for parameterized Data Lookup This parameter is optional. Pass this only when lookup is Parameterised
getAllColumnData	Boolean parameter. Default value is false. Pass this as true when all the columns from the Data Lookup query are required. This parameter is optional. Pass this only when all the columns from the Lookup query are required.

Return Value

This method returns a JSON object containing Display column, Value column, Data.

Example

For examples, see Data Binding Drop-Down Controls Using a Lookup Name (Parameterized) and Data Binding Drop-Down Controls Using Lookup Name (Non-parameterized)

SFU.getServerUtcOffset()

Use `getServerUtcOffset()` method to get the difference in minutes from the UTC and the server time.

Syntax

```
nRetVal = SFU.getServerUtcOffset();
```

Parameters

None.

Return Value

This method returns a numeric value.

Example

```
// Get the difference in minutes from the UTC and the server time.
var offsetMin = SFU.getServerUtcOffset();
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SFU.getStorageItem()

Use `getStorageItem()` method to get value for the specified key in the web storage.

Syntax

```
aRetVal = SFU.getStorageItem(key);
```

Parameters

Parameter	Description
key	Key in the web storage for which value is required.

Return Value

This method returns an array.

Example

```
// Get value for the specified key in the web storage.
var workItems = SFU.getStorageItem("WorkItemData");
```

SFU.getUserAccessToken()

Use `getUserAccessToken()` method to get the logged in user access token.

Syntax

```
var UserAccessToken = SFU.getUserAccessToken();
```

Return Value

This method returns user access token.

Example

```
//Get the user access token.
var UserAccessToken = SFU.getUserAccessToken();
```

SFU.getUserLookupExtendedInformation()

Use `getUserLookupExtendedInformation()` method to get the extended information for the user using the virtual actor ID.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Syntax

```
sRetVal = SFU.getUserLookupExtendedInformation(virtualActorId);
```

Parameters

Parameter	Description
virtualActorId	Virtual Actor ID.

Return Value

This method returns a string value.

Example

```
// Get the Email (which is the extended information) for the user using the virtual actor
ID.
var extendedInformation = SFU.getUserLookupExtendedInformation(currentValue,false);
control.findById("T6").value = extendedInformation["UserEmail"];
//Here, currentValue refers to virtualActorId
```

SFU.getUserMemberOf()

Use `SFU.getUserMemberOf()` method to get the list of groups name to which the logged-in user is the direct member. This API works only with the Azure Active Directory repository.

Syntax

```
SFU.getUserMemberOf);
```

Return Value

List of groups name to which the logged-in user is the direct member. If the user is part of multiple groups, comma separated string of the groups is returned.

Example 1

```
// Gets the Groups for the logged-in user being the direct member
var groups = SFU.getUserMemberOf();
// groups variable would get a value like- "Everyone,skeltalist::Admin"
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SFU.getUserRoles()

Use `SFU.getUserRoles()` method to get the roles of a user.

Syntax

```
SFU.getUserRoles(userIdWithProvider)
```

Parameters

Parameter	Description
userIdWithProvider	User Id of the user for whom the roles are fetched. This parameter is optional. If the parameter is not passed, it fetches the roles for the current logged-in user.

Return Value

Roles of the User. If the user has multiple roles, comma separated string of the roles is returned.

Example 1

```
// Gets the Roles for the logged-in user
var roles = SFU.getUserRoles();
// roles variable would get a value like- "Everyone,skeltalist::Admin"
```

Example 2

```
// Gets the Roles for the User with Id "XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX"
var roles = SFU.getUserRoles("skeltalist::XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX");
// roles variable would get a value like- "Everyone,skeltalist::Contributor"
```

The `userIdWithProvider` value varies based on the authentication provider configured. This value should have the Entity instance mapped for the repository to be prefixed along with real id of the user.

- If the repository is mapped to **Repository User Provider**, the `userIdWithProvider` will be skeltalist::[GUID]. Here the GUID is of the user john, taken from SKEUsers table present in the Repository DB.

  For example: skeltalist:: C99B4110-C8CC-410B-BF70-93F3A7E34EDF
- If the repository is mapped to the **Active Directory** user provider, the `userIdWithProvider` will be activedirectory::[samAccountName]. Here, samAccountName is an active directory property value.

  For example: activedirectory::john

Note: The `SFU.getUserRoles()` method does not work in AVEVA Work Tasks Pro app.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SFU.getUserSecurityGroup()

Use `SFU.getUserSecurityGroup()` method to get the effective security group of a user.

Syntax

```
SFU.getUserSecurityGroup(userIdWithProvider)
```

Parameters

Parameter	Description
userIdWithProvider	User Id of the user for whom the security group is fetched. This parameter is optional. If the parameter is not passed, it fetches the roles for the current logged-in user.

Return Value

Effective Security Group of the User.

Example 1

```
// Gets the Effective Security Group for the logged-in user
var securityGroup = SFU.getUserSecurityGroup();
// securityGroup variable would get a value like- "Administrator"
```

Example 2

```
// Gets the Effective Security Group for the User with Id "XXXXXXXX-XXXX-XXXX-XXXX-
XXXXXXXXXXXX".
var securityGroup = SFU. getUserSecurityGroup("skeltalist::XXXXXXXX-XXXX-XXXX-XXXX-
XXXXXXXXXXXX");
// securityGroup variable would get a value like- "Contributor"
```

The `userIdWithProvider` value varies based on the authentication provider configured. This value should have the Entity instance mapped for the repository to be prefixed along with real id of the user.

- If the repository is mapped to **Repository User Provider**, the `userIdWithProvider` will be skeltalist::[GUID]. Here the GUID is of the user john, taken from SKEUsers table present in the Repository DB.

  For example: skeltalist:: C99B4110-C8CC-410B-BF70-93F3A7E34EDF
- If the repository is mapped to the **Active Directory** user provider, the `userIdWithProvider` will be activedirectory::[samAccountName]. Here, samAccountName is an active directory property value.

  For example: activedirectory::john

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SFU.getValueForRightCode()

Use `SFU.getValueForRightCode()` method to get the values for security rights of a user.

Syntax

```
SFU.getValueForRightCode(rights, userIdWithProvider)
```

Parameters

Parameter	Description
rights	Array of Right codes
userIdWithProvider	User Id of the user for whom the roles are fetched. This parameter is optional. If the parameter is not passed, it fetches the roles for the current logged-in user.

Return Value

Values for security right codes.

Example 1

```
// Gets the values for Security Rights for the logged-in user
var rightsValue = SFU.getValueForRightCode(["CanView", "CanEdit"]);
// rightsValue variable would get values of the rights as a key-value pair
var valueForCanViewRight = rightsValue["CanView"];
var valueForCanEditRight = rightsValue["CanEdit"];
```

Example 2

```
// Gets the values for Security Rights for the User with Id "XXXXXXXX-XXXX-XXXX-XXXX-
XXXXXXXXXXXX".
var rightsValue = SFU.getValueForRightCode(["CanView", "CanEdit"], "skeltalist::XXXXXXXX-
XXXX-XXXX-XXXX-XXXXXXXXXXXX");
// rightsValue variable would get values of the rights as a key-value pair
var valueForCanViewRight = rightsValue["CanView"];
var valueForCanEditRight = rightsValue["CanEdit"];
```

The `userIdWithProvider` value varies based on the authentication provider configured. This value should have the Entity instance mapped for the repository to be prefixed along with real id of the user.

- If the repository is mapped to **Repository User Provider**, the `userIdWithProvider` will be skeltalist::[GUID].

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Here the GUID is of the user john, taken from SKEUsers table present in the Repository DB.

For example: skeltalist:: C99B4110-C8CC-410B-BF70-93F3A7E34EDF

- If the repository is mapped to the **Active Directory** user provider, the `userIdWithProvider` will be activedirectory::[samAccountName]. Here, samAccountName is an active directory property value.

  For example: activedirectory::john

Note: The API `SFU.getValueForRightCode()` is applicable only for “Repository” or “Global” types of “Scope of Right” values.

SFU.getVirtualActorId()

Use `getVirtualActorId()`method to get the logged on user ID.

Syntax

```
sRetVal = SFU.getVirtualActorId();
```

Parameters

None.

Return Value

This method returns a string value.

Example

```
// Get the logged on user ID.
SFU.getVirtualActorId();
```

SFU.getXmlFromJSONObject()

Use `getXmlFromJSONObect()` method to convert a JSON object to an XML string.

Syntax

```
sRetVal = SFU.getXmlFromJSONObject(JSONobj);
```

Parameters

Parameter	Description
JSONobj	JSON object to convert to XML string.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Return Value

This method returns an XML string.

Example

```
// Define a JSON object.
var jsonObj = {
 "MyRoot" : {
"FirstName":"John",
"LastName":"Smith",
}
};
// Convert the JSON object to an XML string.
var xmlString = SFU.getXmlFromJSONObject(jsonObj);
// The XML String will be returned as:
// "<MyRoot><FirstName>John</FirstName><LastName>Smith</LastName></MyRoot>"
```

SFU.hideLoader()

Use `hideLoader()` method to hide the loader.

Note: The showLoader and hideLoader APIs have a limitation wherein, the loader is immediately shown or hidden and the number of calls made to show or hide the loader is not considered. Therefore, the number of calls made to the loader cannot be tracked and the show or hide action cannot be performed accordingly.

Syntax

```
SFU.hideLoader();
```

Parameters

None.

Return Value

None.

Example

```
// Hide the loader.
SFU.hideLoader();
```

SFU.includeCustomCssFiles()

Use `includeCustomCssFiles()` method to include custom CSS files in the form.

In the AVEVA Work Tasks Pro app, the API loads the content asynchronously.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Syntax

```
SFU.includeCustomCssFiles(filesArray);
```

Parameters

Parameter	Description
filesArray	Path array of custom CSS Files to include in the form.

Return Value

None

Example

```
// In Form On Load event, include your CSS file as a part of the rendering form.
var files=["custom/css/MyCustomFile.css"];
OR
var files=["custom/css/myCustomFile1.css", "custom/css/myCustomFile2.css"];
```

```
SFU.includeCustomCssFiles(files);
```

Note:
- Update the CSS files in the path: **../<BPMUITemplates>/Default/NextGenForms/custom/css**.
- If Theme is applied, the css file must be tagged with **FormCustomThemePath**, for example, var cssFiles=["FormCustomThemePath:MyCustomStyleSheet.css"]; and must be placed in **../<BPMUITemplates>/Default/NextGenForms/custom/Themes/<ThemeName>/css**.
- If Theme is not applied, the css file can be placed in **../<BPMUITemplates>/Default/NextGenForms/custom/css/MyCustomStyleSheet.css**. You can create folder structure in **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/css/** to place the css files, for example, **../<BPMUITemplates>/Default/NextGenForms/custom/css/Mycssfolder/MyCustomStyleSheet.css**
- For support in the AVEVA Work Tasks Pro app, update the CSS files in the path **../<BPMUITemplates>/Default/NextGenForms/custom/css**.
- For AVEVA Work Tasks Pro app, mapping of themes is not considered.

SFU.includeCustomJsFiles()

Use `includeCustomJsFiles()` method to include custom JS files in the form.

In the AVEVA Work Tasks Pro app, the API loads the content asynchronously.

Syntax

```
SFU.includeCustomJsFiles(filesArray);
```

Parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
filesArray	Path array of custom JS Files to include in the form.

Return Value

None

Example

```
// In Form On Load event, include your JS file as a part of the rendering form.
var files=["custom/js/MyCustomFile.js"];
OR
var files=["custom/js/myCustomFile1.js", "custom/js/myCustomFile2.js"];
SFU.includeCustomJsFiles(files);
```

Note:
- Update the js files in the path: **../<BPMUITemplates>/Default/NextGenForms/custom/js**
- The js file must be tagged with **FormCustomPath** or **FormCustomThemePath.** For example, var jsFiles=["FormCustomThemePath:myCustomFile.js"]; and must be placed in **../<BPMUITemplates>/Default/NextGenForms/custom/js**.
- For support in the AVEVA Work Tasks Pro app, update the js files in the path **../<BPMUITemplates>/Default/NextGenForms/custom/js**.
- For AVEVA Work Tasks Pro app, mapping of themes is not considered.

SFU.initializeWidgetFormCommunication()

Use `SFU.initializeWidgetFormCommunication()` method to establish communication between Widget control and a Form.

Syntax

```
SFU.initializeWidgetFormCommunication(control)
```

Parameters

For information on establishing communication and defining parameters, see Configure Communication between Widget Control and Form.

SFU.invokeWorkflow()

Use `invokeWorkflow()` method to trigger the **Click** event of the **Invoke Workflow** control.

Syntax

```
SFU.invokeWorkflow(control);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameters

Parameter	Description
control	Control which represents the Invoke Workflow control.

Return Value

None.

Example

```
// Trigger the Click event of the Invoke Workflow control.
var invokeWorkflowControl = control.findById("I1");
SFU.invokeWorkflow(invokeWorkflowControl);
```

SFU.isArray()

Use `isArray()` method to determine if an object is an array or not.

Syntax

```
bRetVal = SFU.isArray(object);
```

Parameters

Parameter	Description
object	Object to determine.

Return Value

This method returns a boolean value.

Example

```
// Check if the object is an array.
var rowData = ["a","b","c","d"];
if (SFU.isArray(rowData))
{
// Perform required operations.
}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SFU.isControlInNewMode()

Use `isControlInNewMode()` method to determine if a record of a **Base Form** is in new mode where the control exists.

Syntax

```
bRetVal = SFU.isControlInNewMode(control);
```

Parameters

Parameter	Description
control	Control whose mode needs to determined.

Return Value

This method returns a boolean value.

Example

```
// Check whether the control is in new mode.
var chkCtrl = control.findById("T1");
var isNewMode = isControlInNewMode(chkCtrl);
if (isNewMode)
{
// Perform required operations.
}
```

SFU.isEmpty()

Use `isEmpty()` method to determine if the value specified is empty.

Syntax

```
bRetVal = SFU.isEmpty(value);
```

Parameters

Parameter	Description
value	Value to check.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Return Value

This method returns a boolean value.

Example

```
// Define a variable and check if the specified value is empty.
var employeeNameVal = control.findByXmlNode("EmployeeName").value;
var valEmpty = SFU.isEmpty(employeeNameVal);
```

SFU.isFormInEditMode()

Use `isFormInEditMode()` method to determine if a form is in edit mode or not.

Syntax

```
SFU.isFormInEditMode();
```

Parameters

None.

Return Value

This method returns a boolean value.

Example

```
// Check whether the form is in edit mode.
var editableForm = SFU.isFormInEditMode();
if (editableForm){
// Perform required operations.
}
```

SFU.isMobileDisplayMode()

Use `isMobileDisplayMode()` method to determine if a form is rendered in mobile display mode or not.

Syntax

```
bRetVal = SFU.isMobileDisplayMode();
```

Parameters

None.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Return Value

This method returns a boolean value.

Example

```
// Check the display mode of the form.
var isMobileMode = SFU.isMobileDisplayMode();
if (isMobileMode)
{
// Perform required operations.
}
```

SFU.isNumber()

Use `isNumber()` method to determine if a value from a string or number is number.

Syntax

```
bRetVal = SFU.isNumber(value, acceptEmptyString);
```

Parameters

Parameter	Description
value	Value to check.
acceptEmptyString	Pass as **true** to consider an empty string as number. This parameter is optional.

Return Value

This method returns a boolean value.

Example

```
// Check if the value from the string is number.
var valControl = control.findById("T1").value;
var valNumber = SFU.isNumber(valControl);
// Return true if value contains "123" or 123.
// Returns false if value contains "12A3" or ""
// Check if a value from the string is empty and consider it as number.
var valControl = control.findById("T1").value;
var valNumber = SFU.isNumber(valControl,true);
// Returns true if value contains "123", 123,or "".
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SFU.isUndefined()

Use `isUndefined()` method to determine if an object is defined or not or if an object is null.

Syntax

```
bRetVal = SFU.isUndefined(object);
```

Parameters

Parameter	Description
object	Object to determine.

Return Value

This method returns a boolean value.

Example

```
// Get the Country control by XML node.
var countryControlObject = control.findByXmlNode("Country");
// Check whether the Country control exists.
var countryControlExists = SFU.isUndefined(countryControlObject);
if (countryControlExists){
// Perform required operations.
}
```

SFU.isWorkTasksPro()

Use `isWorkTasksPro()` method to determine if the Form is accessed from AVEVA Work Tasks Pro (Mobile application).

Syntax

```
SFU.isWorkTasksPro();
```

Parameters

No Parameters

Return Value

This method returns a boolean value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example

```
if (SFU.isWorkTasksPro())
{
//// Add your script when Form is accessed from AVEVA Work Tasks Pro
}
```

SFU.isWorkTasksProConnectedToInternet()

Use `isWorkTasksProConnectedToInternet()` method to determine if the Form accessed from AVEVA Work Tasks Pro (Mobile application) is connected to the server.

Syntax

```
SFU.isWorkTasksProConnectedToInternet();
```

Parameters

No parameters

Return Value

This method returns a boolean value.

Example

```
if (SFU.isWorkTasksProConnectedToInternet())
{
//// Add your script when Form is accessed from AVEVA Work Tasks Pro and connected to the
server.
}
```

SFU.logMessageToWMLogger()

Use `SFU.logMessageToWMLogger()` method to show log messages in the AVEVA Work Tasks Logger to the user.

Syntax

```
SFU.logMessageToWMLogger(message, logType);
```

Parameters

Parameter	Description
message	Log message to be display to the user.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

logType	Determines the type of log message, whether it is an information, an error, or a warning. For example, - if logType is specified as 1, it is an error message - if logType is specified as 2, it is a warning message - if logType is specified as 3, it is an information message

Return Value

None.

Example

```
// Show the welcome message to the user.
SFU.logMessageToWMLogger("Welcome to AVEVA Work Tasks", 3);
OR
SFU.logMessageToWMLogger("Welcome to AVEVA Work Tasks", "3")
```

Note: This API can be used to send log messages from AVEVA Work Tasks Pro app to AVEVA Work Tasks Logger.

SFU.parseNumberValue()

Use `parseNumberValue()` method to convert the value to number.

If the value is not number, then the method returns the number 0.

Syntax

```
nRetVal = SFU.parseNumberValue(value);
```

Parameters

Parameter	Description
value	Value to be converted to number.

Return Value

This method returns a numeric value.

Example

```
// Convert the value to number.
var txtVal = control.findById("T1").value;
var numVal = SFU.parseNumberValue(txtVal);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// Returns the number for valid number. For example, returns 123 for 123.
// Returns 0 for invalid number. For example, returns 0 for "12A3" or "".
```

SFU.reloadForm()

Use `reloadForm()` method to reload a form to the initial stage.

Syntax

```
SFU.reloadForm();
```

Parameters

None.

Return Value

None.

Example

```
// Reload the form to the initial stage.
SFU.reloadForm();
```

SFU.setStorageItem()

Use `setStorageItem()` method to set key and value for the key in the web storage.

Syntax

```
SFU.setStorageItem(key,value);
```

Parameters

Parameter	Description
key	Key in the web storage.
value	Value for the key in the web storage.

Return Value

None.

Example

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// Set key and value for the key in the web storage.
SFU.setStorageItem("WorkItemData","WO2015");
```

SFU.soaMethod()

Use soaMethod() method to call the SOA method.

Syntax

```
SFU.soaMethod("TitleName", "TitleName.ClassName", "MethodName", [Parameters], true);
```

Parameters

Parameter	Description
TitleName	Name of the Assembly.
ClassName	Name of the Class.
MethodName	Name of the Method.
Parameters	Parameters. Use **[ ]** if there are no parameters.
true/false	Use **true** to show error an alert message in case of any exception. Otherwise, use **false**.

Return Value

This method returns an object.

Example

```
// Call the SOA method to get the age of the employee.
var empName=control.findById("T1").value;
var empAge=control.findById("N1").value;
var empSal=control.findById("N2").value;
var empGender=control.findById("T2").value;
if(empName !== '')
{
var empDetails= SFU.soaMethod("EmpDetails", "EmployeeDetails.Employee",
"GetEmployeeDetailsByName", ['"+empName+"'], true);
return empDetails.Age;
}
else
{
return currentValue;
}
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: You must parse the parameters to match the SOA method parameter types.

SFU.showAlert()

Use `showAlert()` method to show a notification to the user.

Syntax

```
SFU.showAlert(title, message [, callbackHandlerFn]);
```

Parameters

Parameter	Description
title	Title of the message
message	Message to display to the user.
callbackHandlerFn	A function that is triggered after the alert message is closed.

Note: You can include HTML content in the title and message.

Return Value

None.

Example

```
// Show the welcome message to the user.
SFU.showAlert("Hi", "Welcome to AVEVA Work Tasks",
function()
{
//enter code to perform actions after the alert is closed.
});
```

SFU.showConfirmation()

Use `showConfirmation()` method to show a confirmation message to the user.

Note: The API `SFU.showConfirmationAlert()`is deprecated and is replaced by `SFU.showConfirmation()`.

Syntax

```
SFU.showConfirmation(title, message [, callbackHandlerFn]);
```

Parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
title	Title of the message.
message	Message to display to the user.
callbackHandlerFn(val)	A function that is triggered after the confirmation action is performed. Here val is a boolean value that represents the confirmation result.

Note: You can include HTML content in the title and message.

Return Value

None.

Example

```
// Show the confirmation message to the user.
SFU.showConfirmation("Save File", "Do you want to save this file?",
function(val)
{
if (val)
{
//enter code to save the file
}
});
```

SFU.showError()

Use `showError()` method to show an error message to the user.

Syntax

```
SFU.showError(title, message [, callbackHandlerFn [, details]]);
```

Parameters

Parameter	Description
title	Title of the message
message	Message to display to the user.
callbackHandlerFn	A function that is triggered after the error message is closed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
details	More details about the message.

Note: You can include HTML content in the title, message, and details.

Return Value

None.

Example

```
// Show the error message to the user.
SFU.showError("Validation Error", "Please verify the values before you save the form.",
function()
{
//enter code to perform actions after the error message is displayed.
},
"Age is not specified.<br>Date of joining should be earlier than today's date.");
```

SFU.showLoader()

Use `showLoader()` method to show the loader.

Note: The showLoader and hideLoader APIs have a limitation wherein, the loader is immediately shown or hidden and the number of calls made to show or hide the loader is not considered. Therefore, the number of calls made to the loader cannot be tracked and the show or hide action cannot be performed accordingly.

Syntax

```
SFU.showLoader();
```

Parameters

None.

Return Value

None.

Example

```
// Show the loader.
SFU.showLoader();
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SFU.showPopupControl()

Use `showPopupControl()` method to show the Pop-Up control.

Syntax

```
SFU.showPopupControl(control);
```

Parameters

Parameter	Description
control	Control which represents the Pop-Up control.

Return Value

None.

Example

```
// Show the Pop-Up control.
var popupControl = control.findByXmlNode("Popupform1");
SFU.showPopupControl(popupControl);
```

SFU.showWarning()

Use `showWarning()` method to show a warning message to the user.

Syntax

```
SFU.showWarning(title, message [, callbackHandlerFn]);
```

Parameters

Parameter	Description
title	Title of the message.
message	Message to display to the user.
callbackHandlerFn(val)	A function that is triggered after the confirmation action is performed. Here val is a boolean value that represents the confirmation result.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: You can include HTML content in the title and message.

Return Value

None.

Example

```
// Show the warning message to the user.
SFU.showWarning("Clear Form", "Clear Form will clear all the contents in the Form. Do you
want to continue?",
function(val)
{
if (val)
{
control.topLevelForm.clearContent();
}
});
```

SFU.subscribeToControlParameters()

Use `subscribeToControlParameters()` method to the subscribe to the parameters of a control so that the callBack Function is called when a value of the parameter control changes.

Syntax

```
SFU.subscribeToControlParameters(control, parameterCollection, functionToBeCalled)
```

Parameters

Parameter	Description
control	Control
parameterCollection	Collection of parameters for parameterized Data Lookup
functionToBeCalled	Function to be called when the value of the parameter control changes

Return Value

None

Example

If a custom control uses Lookup Binding, use this method for subscribing to changes in value of the Parameter

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

control to call the callback function.

see the TreeView JS file corp.customControls.treeView.js for reference.

SFU.updateFormHeaderForWorkTasksPro()

Use `SFU.updateFormHeaderForWorkTasksPro()` method to update the form header.

Syntax

```
SFU.updateFormHeaderForWorkTasksPro(formHeader)
```

Parameters

Parameter	Description
formHeader	The value to be passed to update the form header.

Return Value

None.

Example

```
// Get the value of a key from the locale.
var localizedHeader = skelta.localize.getString("headerKey");
// Set the localized value as the Form header
SFU.updateFormHeaderForWorkTasksPro(localizedHeader);
```

Note: This API is applicable only for AVEVA Work Tasks Pro app.

control.addRecord()

Use `addRecord()` method to add a record to the **Base Form**.

Syntax

```
// B1 is a Base Form object.
B1.addRecord(object);
or
B1.addRecord();
```

Parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
object	Record to add. This parameter is optional.

Return Value

This method returns the new record added.

Example

```
// Define a record to add.
var dataObj = { Name:"Kevin",Address:"Park Street 1" };
// Define a Base Form object.
var B1 = control.findById("B1");
// Add the record to the Base Form.
B1.addRecord(dataObj);
// or B1.addRecord();
```

Note: If you use this method to add a record using scripts for the **On Record Add** property of the **Base Form**, then at run-time a recursive loop will cause the browser to stop responding.

control.addRecordToBottom()

Use **addRecordToBottom()** method to add a record at the end of the existing records on the **Base Form**.

Syntax

```
// B1 is a Base Form object.
B1.addRecordToBottom();
or
B1.addRecordToBottom(object);
```

Parameters

Parameter	Description
object	Record to add. This parameter is optional.

Return Value

This method returns the new record added.

Example

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// Define a record to add.
var dataObj = { Name:"Kevin",Address:"Park Street 1" };
// Define a Base Form object.
var B1 = control.findById("B1");
// Add the record to the Base Form.
B1.addRecordToBottom(dataObj);
// or B1.addRecordToBottom();
```

Note: If you use this method to add a record using scripts for the **On Record Add** property of the **Base Form**, then at run-time a recursive loop will cause the browser to stop responding.

control.addRecordToPosition()

The `addRecordToPosition()` method to add a record at a specific position on the **Base Form**.

Syntax

```
// B1 is a Base Form object.
B1.addRecordToPosition(index);
or
B1.addRecordToPosition(index,object);
```

Parameters

Parameter	Description
index	Specifies the position of the object to be added.
object	Record to add. This parameter is optional.

Return Value

This method returns the new record added.

Example

```
// Define a record to add.
var dataObj = { Name:"Kevin",Address:"Park Street 1" };
// Define a Base Form object.
var B1 = control.findById("B1");
// Add the record to a position on the Base Form.
B1.addRecordToPosition(2,dataObj);
// or B1.addRecordToPosition(2);
```

Note: If you use this method to add a record using scripts for the **On Record Add** property of the **Base Form**, then at run-time a recursive loop will cause the browser to stop responding.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

control.addRecordToTop()

Use `addRecordToTop()` method to add a record at the top of the existing records on the **Base Form**.

Syntax

```
// B1 is a Base Form object.
B1.addRecordToTop(object);
or
B1.addRecordToTop();
```

Parameters

Parameter	Description
object	Record to add. This parameter is optional.

Return Value

This method returns the new record added.

Example

```
// Define a record to add.
var dataObj = { Name:"Kevin",Address:"Park Street 1" };
// Define a Base Form object.
var B1 = control.findById("B1");
// Add the record to the Base Form.
B1.addRecordToTop(dataObj);
// or B1.addRecordToTop();
```

Note: If you use this method to add a record using scripts for the **On Record Add** property of the **Base Form**, then at run-time a recursive loop will cause the browser to stop responding.

control.applyFilter()

Use `control.applyFilter()` to specify search criteria on the hierarchical list at the first level.

Syntax

```
control.applyFilter(functionToBeCalled);
```

Parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
functionToBeCalled	Function to be called when search criteria is set.

Return Value

This method returns a boolean value.

Example

```
// Filter records where the ProcessStatus column is set to 1.
control.findByID("H1").applyFilter(
function(currentVal)
{
if(currentVal.ProcessStatus == 1)
{
return true;
}
else
{
return false;
}
}
);
// Shows records in the hierarchical list matching the search criteria.
```

control.associatedForm

Use `associatedForm` method to get the immediate record form object.

Syntax

```
control.associatedForm;
```

Parameters

None.

Return Value

This method returns a control object.

Example

```
// Consider a Base Form with Text controls for
// Employee ID, First Name, and Last Name, and a
// Button control for displaying the employee names.
// Define On Click script for the Button control.
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
baseFormObj.items()[0].findByXmlNode("EmployeeID");
// Get the associated record to which the Button control belongs to.
var associatedForm = control.associatedForm;
// Display the employee names.
skeltaUtils.showAlert("Employee Name is " + associatedForm.findByXmlNode("FirstName").value
+ " " );
```

For more examples, refer to Delete Record in a Base Form Control.

control.clearContent()

Use **clearContent(event)** method to clear values of controls on a record or all records on a **Base Form**, clear values of controls on a **Panel Form**, or clear values of controls on a form.

Syntax

```
control.clearContent();
```

Parameters

None.

Return Value

None.

Example

```
// Clear the values of controls on the record of the Base Form.
control.findById("B1").records()[0].clearContent();
// Clear the values of controls on the Base Form.
control.findById("B1").clearContent();
// Clear the values of controls on the Panel Form.
control.findById("P1").clearContent();
// Clear the values of controls on the form.
control.topLevelForm.clearContent();
```

control.clearFilter()

Use `control.clearFilter()` to clear search criteria on the hierarchical list.

Syntax

```
control.clearFilter();
```

Parameters

None.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Return Value

None.

Example

```
// Clears search criteria on the hierarchical list.
control.clearFilter()
```

control.controls()

Use `control.controls()` property to get the array of controls in a record of a container.

Here controls is applicable only to containers and its records.

Syntax

```
control.controls();
```

Parameters

None.

Return Value

This property returns an array of control object.

Example

```
// Get the array of controls in the associated record of the control in the Base Form.
var ctrlArr = control.associatedForm.controls;
// which is similar to
// var ctrlArr = control.findById("B1").records()[1].controls;
for (var i = 0; i < ctrlArr.length ; i++)
{
// Perform required operation on each control.
}
```

control.dataContainerForm

Use `dataContainerForm` method to get the immediate container form object.

Syntax

```
control.dataContainerForm;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameters

None.

Return Value

This method returns a control object.

Example

```
// Consider a Base Form with Text controls for
// Employee ID, First Name, and Last Name, and a
// Button control for looking up duplicate names in the form.
// Define On Click script for the Button control.
baseFormObj.items()[0].findByXmlNode("EmployeeID");
// Get the associated record to which the Button control belongs to.
var associatedForm = control.associatedForm;
// Get the First Name for comparison.
var firstName = associatedForm.findByXmlNode("FirstName").value;
// Get the Last Name for comparison.
var lastName = associatedForm.findByXmlNode("LastName").value;
// Get the main container form which contains all the records.
var dataContainerForm = control.dataContainerForm;
var records = dataContainerForm.records();
var totalRecords = records.length;
// Define record index which needs to be skipped for comparison.
var currentRecordIndex = records.indexOf(associatedForm);
// Define duplicates found flag.
var duplicatesFound = false;
// Traverse through the records.
for (var i = 0; i < totalRecords; i++)
{
  // Skip the record index, which needs to be skipped for comparison.
  if (i == currentRecordIndex)
{
  continue;
}
  var recordObj = records[i];
  // Compare the first and the last names.
  if ((recordObj.findByXmlNode("FirstName").value == firstName) &&
(recordObj.findByXmlNode("LastName").value == lastName))
{
// Set the duplicate flag.
duplicatesFound = true;
  break;
}
}
// Check the duplicate flags and show appropriate messages.
if (duplicatesFound)
{
skeltaUtils.showAlert("Duplicates Found!");
}
else
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
skeltaUtils.showAlert("No Duplicates Present!");
}
```

Refer to Delete Record in a Base Form Control for more example(s).

control.findAllById()

Use `findAllById()` method to find an array of controls with a specific ID on the form.

Syntax

```
control.findAllById(controlID);
```

Parameters

Parameter	Description
controlID	ID of the control to search on the form.

Return Value

This method returns an array of control objects.

Example

```
// Find all Text controls in the same and lower hierarchy on the form.
control.findAllById("T1");
// Find all Text controls anywhere on the form.
control.findAllById("T1",1);
// Find all Text controls in the same hierarchy on the form.
control.findAllById("T1",2);
```

control.findAllByName()

Use `findAllByName()` method to find an array of controls with a specific name on the form.

Syntax

```
control.findAllByName(controlname);
```

Parameters

Parameter	Description
Control Name	Name of the control to search on the form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Return Value

This method returns an array of control objects.

Example

```
// Find all controls in the same and lower hierarchy on the form.
control.findById("B1").findAllByName("Name");
// Find all controls anywhere on the form.
control.findById("B1").findAllByName("Name",1);
// Find all controls in the same hierarchy on the form.
control.findById("B1").findAllByName("Name",2);
```

control.findAllByXmlNode()

Use `findAllByXmlNode()` method to find an array of controls with a specific XML node on the form.

Syntax

```
control.findAllByXmlNode(mappedXMLnode);
```

Parameters

Parameter	Description
mappedXMLnode	XML node of the control to search on the form.

Return Value

This method returns an array of control objects.

Example

```
// Find all controls in the same and lower hierarchy on the form.
control.findById("B1").findAllByXmlNode("EmployeeName");
// Find all controls anywhere on the form.
control.findById("B1").findAllByXmlNode("EmployeeName",1);
// Find all controls in the same hierarchy on the form.
control.findById("B1").findAllByXmlNode("EmployeeName",2);
```

control.findById()

Use `findById()` method to find a control with a specific ID on the form.

Syntax

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.findById(controlID);
```

Parameters

Parameter	Description
controlID	ID of the control to search on the form.

Return Value

This method returns a control object.

Example

```
// Set a value for the Text control
control.findById("T1").value = "Hello World";
```

control.findByName()

Use `findByName()` method to find a control with a specific name on the form.

Syntax

```
control.findByName(controlname);
```

Parameters

Parameter	Description
controlname	Name of the control to search on the form.

Return Value

This method returns a control object.

Example

```
// Set a value for the Text control.
control.findByName("Employee Name").value = "John Dow";
```

control.findByXmlNode()

Use `findByXmlNode()` method to find a control with a specific XML node on the form

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Syntax

```
control.findByXmlNode(mappedXMLnode);
```

Parameters

Parameter	Description
mappedXMLnode	XML node of the control to search on the form.

Return Value

This method returns a control object.

Example

```
// Set a value for the Text control.
control.findByXmlNode("EmployeeName").value = "John Dow";
```

control.findChildRecordControlById()

Use `findChildRecordControlById()` method to find a control with a specific ID in the child record and its children.

Syntax

```
control.findChildRecordControlById(controlID);
```

Parameters

Parameter	Description
controlID	ID of the control to search in the child record.

Return Value

This method returns a control object.

Example

```
// Set a value for the Text control.
control.findChildRecordControlById("T1").value = "Hello World";
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

control.findChildRecordControlByName()

Use `findChildRecordControlByName()` method to find a control with a specific name in the child record and its children.

Syntax

```
control.findChildRecordControlByName(controlname);
```

Parameters

Parameter	Description
controlname	Name of the control to search in the child record.

Return Value

This method returns a control object.

Example

```
// Set a value for the Text control.
control.findChildRecordControlByName("Employee Name").value = "John Doe";
```

control.findChildRecordControlByXmlNode()

Use `findChildRecordControlByXmlNode()` method to find a control with a specific XML node in the child record and its children.

Syntax

```
control.findChildRecordControlByXmlNode(mappedXMLnode);
```

Parameters

Parameter	Description
mappedXMLnode	XML node of the control to search in the child record.

Return Value

This method returns a control object.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example

```
// Set a value for the Text control.
control.findChildRecordControlByXmlNode("EmployeeName").value = "John Doe";
```

control.findImmediateChildRecordControlById()

Use `findImmediateChildRecordControlById()` method to find a control with a specific ID in the child record (but not its children) of a container.

Here controls is applicable only to containers and its records.

Syntax

```
control.findImmediateChildRecordControlById(controlID);
```

Parameters

Parameter	Description
controlID	ID of the control to search in the immediate child record but not its children.

Return Value

This method returns a control object.

Example

```
// Set a value for the Text control.
control.findImmediateChildRecordControlById("T1").value = "Hello World";
```

control.findImmediateChildRecordControlByName()

Use `findImmediateChildRecordControlByName()` method to find a control with a specific name in the child record (but not its children) of a container.

Here controls is applicable only to containers and its records.

Syntax

```
control.findImmediateChildRecordControlByName(controlname);
```

Parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
controlname	Name of the control to search in the immediate child record but not its children.

Return Value

This method returns a control object.

Example

```
// Set a value for the Text control.
control.findImmediateChildRecordControlByName("Employee Name").value = "John Doe";
```

control.findImmediateChildRecordControlByXmlNode()

Use `findImmediateChildRecordControlByXmlNode()` method to find a control with a specific XML node in the child record (but not its children) of a container.

Here controls is applicable only to containers and its records.

Syntax

```
control.findImmediateChildRecordControlByXmlNode(mappedXMLnode);
```

Parameters

Parameter	Description
mappedXMLnode	XML node of the control to search in the immediate child record but not its children.

Return Value

This method returns a control object.

Example

```
// Set a value for the Text control.
control.findImmediateChildRecordControlByXmlNode("EmployeeName").value = "John Doe";
```

control.getFormSubmissionData()

Use `getFormSubmissionData()` method to get form data in JSON format from a form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Here form is applicable only to top level form.

from a top level form.

Syntax

```
sRetVal = control.getFormSubmissionData();
```

Parameters

None.

Return Value

This method returns a JSON object.

Example

```
// Get form data in JSON format from the top level form.
var instanceJSON = control.topLevelForm.getFormSubmissionData();
// convert JSON data to XML string
var instanceXml = SFU.getXmlFromJSONObject(instanceJSON);
// Assign the form instance XML string to a multi-line Text control with XML node set as
SubmittedFormXml.
control.findByXmlNode("SubmittedFormXml").value = instanceXml;
```

control.getType()

Use `getType()` method to determine the type of a control on form.

Syntax

```
// B1 is a Base Form object.
tRetVal = control.findById("B1").getType();
```

Parameters

None.

Return Value

This method returns the type of control.

Example

```
// Define a variable and get the type of control.
var controlType = control.findById("B1").getType();
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

control.refreshCard()

Use `refreshCard()` method to reload data in a card.

Syntax

```
control.refreshCard();
```

Parameters

None.

Return Value

None.

Example

```
// Reload data in a Card.
control.findByXmlNode("Card1").refreshCard();
```

control.refreshData()

Use `refreshData()` method to reload data in a gantt chart.

Syntax

```
control.refreshData();
```

Parameters

None.

Return Value

None.

Example

```
// Reload data in a Gantt Chart.
control.findByXmlNode("Gantt3").refreshData();
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

control.refreshGrid()

Use `refreshGrid()` method to reload records in a data grid.

Syntax

```
control.refreshGrid();
```

Parameters

None.

Return Value

None.

Example

```
// Reload records in a data grid.
control.findById("G1").refreshGrid();
```

control.refreshTree()

Use `refreshTree()` method to reload a tree.

Syntax

```
control.refreshTree();
```

Parameters

None.

Return Value

None.

Example

```
// Reload records in a data grid.
control.findById("T1").refreshTree();
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

control.remove()

Use `remove()` method to delete a control from a record on the Base Form.

Syntax

```
// B1 is a Base Form object.
var recordToBeDeleted = B1.records()[1];
recordToBeDeleted.remove();
```

Parameters

None.

Return Value

None.

Example

```
// Define a Base Form object.
var B1 = control.findById("B1");
// Set the control to be deleted from the record of the Base Form.
var recordToBeDeleted = B1.records()[1];
// Delete the control from the record of the Base Form.
recordToBeDeleted.remove();
```

Refer to Delete Record in a Base Form Control for more example(s).

control.removeAll()

Use `removeAll()` method to delete all controls from a record on the Base Form.

Syntax

```
// B1 is a Base Form object.
control.findById("B1").removeAll();
```

Parameters

None.

Return Value

None.

Example

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// Define a Base Form object.
var B1 = control.findById("B1");
// Delete all controls from the record of the Base Form.
B1.removeAll();
```

control.removeAt()

Use `removeAt()` method to delete a record from a specific position on the Base Form.

Syntax

```
// B1 is a Base Form object.
control.findById("B1").removeAt(position);
```

Parameters

Parameter	Description
position	Specifies the position of the object to be removed.

Return Value

None.

Example

```
// Define a Base Form object.
var B1 = control.findById("B1");
// Delete a record from a position on the Base Form.
B1.removeAt(1);
```

Refer to Delete Record in a Base Form Control for more example(s).

control.removeRecord()

Use `removeRecord()` method to delete a record from the Base Form.

Syntax

```
// B1 is a Base Form object.
B1.removeRecord(object);
```

Parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
object	Record to delete. This parameter is optional.

Return Value

None.

Example

```
// Define a Base Form object.
var B1 = control.findById("B1");
// Remove the record from the Base Form.
B1.removeRecord(Object);
```

For more examples, refer to Delete Record in a Base Form Control.

control.submitClick()

Use `submitClick()` method to submit a record on a **Base Form** or **submit a Base Form**.

Syntax

```
control.submitClick(event);
```

Parameters

Parameter	Description
event	Specifies the event handler.

Return Value

None.

Example

```
// Submit the record on the Base Form.
control.associatedForm.submitClick(event);
// Submit the Base Form.
control.dataContainerForm.submitClick(event);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

control.selectedTabIndex()

Use `control.selectedTabIndex()` to get the index of the selected tab in the **Tabs** container.

Syntax

```
nRetVal = control.selectedTabIndex();
```

Parameters

None.

Return Value

This method returns a numeric value.

Example

```
// Define a variable and get the index of the selected tab in the Tabs container.
var tabIndex = control.findById("T1").selectedTabIndex;
```

control.selectRecord()

Use `selectRecord()` method to select a specific record from the **On Data Bound** event of the **Data Grid**.

Syntax

```
control.selectRecord(e,recordNumber);
```

Parameters

Parameter	Description
e	Constant for events triggered in the data grid such as paging, filtering, sorting, and so on.
recordNumber	Specifies the record number of the record in the data grid to be selected.

Return Value

None.

Example

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// Select the second record in the Data Grid.
control.selectRecord(e,2);
```

Note:
- In the **Data Grid** control, the **Select First Record** property takes precedence over the script to select a record in the **On Data Bound** event.
- For example, in a **Data Grid** control when the **Select First Record** property is set to **Yes** and a script in the **On Data Bound** event is set to select the second record, the first record is selected.
- Therefore, `selectRecord()` method and the **Select First Record** property must not be used together.

control.selectTab()

Use `control.selectTab()` method to select a specific tab, that is switch to a specific tab, in the **Tabs** container.

Syntax

```
control.selectTab(index);
```

Parameters

Parameter	Description
index	Specifies the index of the tab to be selected. **Note:** Index starts from 0.

Return Value

None.

Example

```
// Select the second tab in the Tabs container.
control.findById("T1").selectTab(1);
```

control.submitForm()

Use `submitForm()` method to submit a form.

Syntax

```
control.submitForm(event);
```

Parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
event	Specifies the event handler.

Return Value

None.

Example

```
// Submit the form.
control.submitForm(event);
```

control.sumById()

Use `sumById()` method to get the sum of the value of all controls with a specific ID on the form.

Syntax

```
// N1 is a Number object.
nRetVal = control.findById("N1").sumById();
```

Parameters

None.

Return Value

This method returns a numeric value.

Example

```
// Define a variable and get the sum of the value of all controls with a specific ID.
var sum = control.findById("N1").sumById();
// Add all Number controls in the same and lower hierarchy on the form.
control.findById("N1").sumById("N1");
// Add all Number controls anywhere on the form.
control.findById("N1").sumById("N1",1);
// Add all Number controls in the same hierarchy on the form.
control.findById("N1").sumById("N1",2);
```

control.sumByName()

Use `sumByName()` method to get the sum of the value of all controls with a specific name on the form.

Syntax

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// N1 is a Number object.
nRetVal = control.findById("N1").sumByName();
```

Parameters

None.

Return Value

This method returns a numeric value.

Example

```
// Define a variable and get the sum of the value of all controls with a specific name.
var sum = control.findByName("Amount").sumByName();
// Add all Number controls in the same and lower hierarchy on the form.
control.findById("N1").sumByName("Amount");
// Add all Number controls anywhere on the form.
control.findById("N1").sumByName("Amount",1);
// Add all Number controls in the same hierarchy on the form.
control.findById("N1").sumByName("Amount",2);
```

control.sumByXmlNode()

Use `sumByXmlNode()` method to get the sum of the value of all controls with a specific XML node on the form.

Syntax

```
// N1 is a Number object.
nRetVal = control.findById("N1").sumByXmlNode();
```

Parameters

None.

Return Value

This method returns a numeric value.

Example

```
// Define a variable and get the sum of the value of all controls with a specific XML node.
var sum = control.findByXmlNode("Amount").sumByXmlNode();
// Add all Number controls in the same and lower hierarchy on the form.
control.findById("N1").sumByXmlNode("Amount");
// Add all Number controls anywhere on the form.
control.findById("N1").sumByXmlNode("Amount",1);
// Add all Number controls in the same hierarchy on the form.
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.findById("N1").sumByXmlNode("Amount",2);
```

control.topLevelForm()

Use `topLevelForm()` property to find the parent or top level form.

Syntax

```
control.topLevelForm();
```

Parameters

None.

Return Value

This property returns a control object.

Example

```
// Get parameters of the form.
control.topLevelForm.formParameters["<parameter_name>"].value
// The parameters of the form will be returned as:
// <value_of_the_parameter>
```

control.topLevelForm.actionbar.getActionItemByName()

Use `control.topLevelForm.actionbar.getActionItemByName()` method to get the Action Item by design-time name. Using this API, you can change the **Visible** and/or **Enable** properties of the Action Item as shown in the example below.

Syntax

```
var actionItem = control.topLevelForm.actionbar.getActionItemByName("actionItemName");
```

Parameters

Parameter	Description
actionItemName	Name of the action item.

Return Value

None.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Examples

Toggle the Visible property of the Action Item using a Button Click script

```
//New Action Item1 represents the name of the Action Item.
var actionItem = control.topLevelForm.actionbar.getActionItemByName("New Action Item1");
if(!SFU.isUndefined(actionItem))
{
actionItem.visible= !actionItem.visible;
}
```

Toggle the Enable property of the Action Item using a Button Click script

```
//New Action Item1 represents the name of the Action Item.
var actionItem = control.topLevelForm.actionbar.getActionItemByName("New Action Item1");
if(!SFU.isUndefined(actionItem))
{
actionItem.enable= !actionItem.enable;
}
```

control.updateLevel1ProgressDisplay()

Use `control.updateLevel1ProgressDisplay()` to to update a hierarchical list at the first level.

Syntax

```
control.updateLevel1ProgressDisplay(indicatorColor, progressValue, progressDescription,
progressColor);
```

Parameters

Parameter	Description
`indicatorColor`	Indicator color for the control
`progressValue`	Progress value for the control
`progressDescription`	Progress description for the control
`progressColor`	Progress color for the control

Return Value

None.

Example

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
//Set indicator color, progress value, description, and color for the hierarchical list at
the first level.
control.findByName("Hierarchical List HL").updateLevel1ProgressDisplay("#5482AB", 25,
"Warning", "Red");
```

control.updateLevel2()

Use `control.updateLevel2()` method to reload records in a hierarchical list at the second level.

Syntax

```
control.updateLevel2();
```

Parameters

None.

Return Value

None.

Example

```
// Reload records in a hierarchical list at the second level.
control.findByXmlNode("Hierarchicallist1").updateLevel2();
```

```
//Update children for a hierarchical list at the first level.
//Note: You cannot update children for a hierarchical list at the second level.
for (var i = 0; i < control.findByXmlNode("Hierarchicallist1").children.length; i++)
{
control.findByXmlNode("Hierarchicallist1").children.progress[i].indicatorColor = "Green";
control.findByXmlNode("Hierarchicallist1").children.progress[i].progressValue = value;
control.findByXmlNode("Hierarchicallist1").children.toggle[i].level2ToggleEnable = true;
}
control.findByXmlNode("Hierarchicallist1").updateLevel2();
```

```
//Update siblings for the hierarchical list at the second level.
for (var i = 0; i < control.findByXmlNode("Hierarchicallist1").sibling.length; i++)
{
control.findByXmlNode("Hierarchicallist1").sibling.progress[i].indicatorColor = "#252ABA";
control.findByXmlNode("Hierarchicallist1").sibling.progress[i].progressValue = 98;
control.findByXmlNode("Hierarchicallist1").sibling.toggle[i].level2ToggleEnable = true;
}
control.findByXmlNode("Hierarchicallist1").updateLevel2();
```

control.updateLevel2ProgressDisplay()

Use `control.updateLevel2ProgressDisplay()` to to update a hierarchical list at the second level.

Syntax

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.updateLevel2ProgressDisplay(indicatorColor, progressValue, progressDescription,
progressColor);
```

Parameters

Parameter	Description
indicatorColor	Indicator color for the control
progressValue	Progress value for the control
progressDescription	Progress description for the control
progressColor	Progress color for the control

Return Value

None.

Example

```
//Set indicator color, progress value, description, and color for the hierarchical list at
the second level.
control.findByName("Hierarchical List HL").updateLevel2ProgressDisplay("#5482AB", 25,
"Warning", "Red");
```

control.updateLevel2SelectItem()

Use `control.updateLevel2SelectItem()` method to select records in a hierarchical list at the second level.

Syntax

```
control.updateLevel2SelectItem(object);
```

Parameters

Parameter	Description
object	Item to update.

Return Value

None.

Example

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// Select each of the sibling and enable slide-toggle.
for (var i=0; i<selectItem.siblings.toggle.length; i++)
{
selectItem.siblings.toggle[i].level2ToggleEnable = true;
}
control.updateLevel2SelectItem(object);
```

control.updateLevel2ToggleDisplay()

Use `control.updateLevel2ToggleDisplay()` to update toggle values for a hierarchical list at the second level.

Syntax

```
control.updateLevel2ToggleDisplay(enable, visible);
```

Parameters

Parameter	Description
`enable`	Enable or disable the slide-toggle. • Set **true** to enable the slide toggle. • Set **false** to disable the slide-toggle.
`visible`	Show or hide the slide-toggle. • Set **true** to show the slide toggle. • Set **false** to hide the slide-toggle.

Return Value

None.

Example

```
//Enable and show the slide-toggle for hierarchical list at the second level.
control.findByXmlNode("Hierarchicallist1").updateLevel2ToggleDisplay(true,true);
```

control.updateLevel3()

Use `control.updateLevel3()` method to reload records in a hierarchical list at the third level.

Syntax

```
control.updateLevel3();
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameters

None.

Return Value

None.

Example

```
// Reload records in a hierarchical list at the third level.
control.findByXmlNode("Hierarchicallist1").updateLevel3();
```

```
//Update children for a hierarchical list at the first level.
//Note: You cannot update children for a hierarchical list at the second level.
for (var i = 0; i < control.findByXmlNode("Hierarchicallist1").children.length; i++)
{
control.findByXmlNode("Hierarchicallist1").children.progress[i].indicatorColor = "Green";
control.findByXmlNode("Hierarchicallist1").children.progress[i].progressValue = value;
control.findByXmlNode("Hierarchicallist1").children.toggle[i].level2ToggleEnable = true;
}
control.findByXmlNode("Hierarchicallist1").updateLevel2();
```

```
//Update siblings for the hierarchical list at the third level.
for (var i = 0; i < control.findByXmlNode("Hierarchicallist1").sibling.length; i++)
{
control.findByXmlNode("Hierarchicallist1").sibling.progress[i].indicatorColor = "#252ABA";
control.findByXmlNode("Hierarchicallist1").sibling.progress[i].progressValue = 98;
control.findByXmlNode("Hierarchicallist1").sibling.toggle[i].level3ToggleEnable = true;
}
control.findByXmlNode("Hierarchicallist1").updateLevel3();
```

control.updateLevel3ProgressDisplay()

Use `control.updateLevel3ProgressDisplay()` to to update a hierarchical list at the third level.

Syntax

```
control.updateLevel3ProgressDisplay(indicatorColor, progressValue, progressDescription,
progressColor);
```

Parameters

Parameter	Description
`indicatorColor`	Indicator color for the control
`progressValue`	Progress value for the control
`progressDescription`	Progress description for the control

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
progressColor	Progress color for the control

Return Value

None.

Example

```
//Set indicator color, progress value, description, and color for the hierarchical list at
the third level.
control.findByName("Hierarchical List HL").updateLevel3ProgressDisplay("#5482AB", 25,
"Warning", "Red");
```

control.updateLevel3SelectItem()

Use `control.updateLevel3SelectItem()` method to select records in a hierarchical list at the third level.

Syntax

```
control.updateLevel3SelectItem(object);
```

Parameters

Parameter	Description
object	Item to update.

Return Value

None.

Example

```
// Select each of the sibling and enable slide-toggle.
for (var i=0; i<selectItem.siblings.toggle.length; i++)
{
selectItem.siblings.toggle[i].level3ToggleEnable = true;
}
control.updateLevel3SelectItem(object);
```

control.updateLevel3ToggleDisplay()

Use `control.updateLevel3ToggleDisplay()` to update toggle values for a hierarchical list at the third level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Syntax

```
control.updateLevel3ToggleDisplay(enable, visible);
```

Parameters

Parameter	Description
`enable`	Enable or disable the slide-toggle. • Set **true** to enable the slide toggle. • Set **false** to disable the slide-toggle.
`visible`	Show or hide the slide-toggle. • Set **true** to show the slide toggle. • Set **false** to hide the slide-toggle.

Return Value

None.

Example

```
//Enable and show the slide-toggle for hierarchical list at the third level.
control.findByXmlNode("Hierarchicallist1").updateLevel3ToggleDisplay(true,true);
```

control.validateControl()

Use `validateControl()` method to validate a control, and all controls in a container control.

Syntax

```
bRetVal = control.validateControl();
```

Parameters

None.

Return Value

This method returns a boolean value.

Example

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
// Validate the Text control.
control.findById("T1 ").validateControl();
```

control.validateForm()

Use `validateForm()` method to method to validate a form.

Syntax

```
bRetVal = control.validateForm();
```

Parameters

None.

Return Value

This method returns a boolean value.

Example

```
// Validate the Base Form.
control.dataContainerForm.validateForm();
// Validate all the forms.
control.topLevelForm.validateForm();
```

control.validateRecord()

Use `validateRecord()` method to validate a record on a **Base Form**.

Syntax

```
bRetVal = control.validateRecord();
```

Parameters

None.

Return Value

This method returns a boolean value.

Example

```
// Validate the record on the Base Form.
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.associatedForm.validateRecord();
```

isControlVisible()

Use `isControlVisible()` method to determine if the control is visible.

Syntax

```
bRetVal = isControlVisible(control);
```

Parameters

Parameter	Description
control	Control object.

Return Value

This method returns a boolean value.

Example

```
// Define a variable and check if the specified control is visible.
var ctr = control.findById("T1");
var isVisible = isControlVisible(ctr);
if(isVisible)
{
control.findById("T1").value = "Some Value";
}
```

skelta.localize.getString()

Use `getString()` method to get the value of a key from the locale.

Syntax

```
sRetVal = skelta.localize.getString("key");
```

Parameters

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Parameter	Description
key	Key of the locale string.

Return Value

This method returns a string value.

Example

```
// Get the value of a key from the locale.
var localeVal = skelta.localize.getString("key ");
```

Note: To get the value of the key from the locale, update the local key value in the path: **..Locales\en-US\Forms2\Standard**
localization_key:Localized Name - Here, localization_key is the 'key' and Localized Name is the value

skelta.userContext.getUserContextFor()

Use `getUserContextFor()` method to get the form information.

Syntax

```
sRetVal = skelta.userContext.getUserContextFor(formConstants);
```

Parameters

Parameter	Description
formConstants	Form Constants.
	"appN" – Application Name "uId" – User ID "vId" – Virtual Actor ID "fName" – Form Name "vStamp" – Form Version "itemId" – Item ID "listName" – List Name "themePath" – Theme Path "culture" – Culture

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

	"deviceId" – Device ID (applicable only for AVEVA Work Tasks Pro app) "accessToken" – Access Token of the logged-in user

Return Value

This method returns a string value.

Example

```
// Get the application name of the form.
var applicationName = skelta.userContext.getUserContextFor("appN");
```

Note: For this API, the Access token constant is not supported in System Platform.

skelta.grid.getDataSource()

Use `getDataSource()` method in **On Data Bound** event of a Data Grid to get the name of the data source. Here the data source is the lookup consumed in the grid configuration.

Syntax

```
var dataSource = skelta.grid.getDataSource(e.sender);
```

Parameters

Parameter	Description
sender	sender from the event parameter (e) in On Data Bound script.

Return Value

This method returns a string value.

Example

// This prints the lookup name in the browser console.

```
var dataSource = skelta.grid.getDataSource(e.sender);
console.log(dataSource);
```

Web APIs

Web APIs are frameworks to build HTTP services for browsers and mobile devices. Use Web APIs to customize

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

your business applications.

To add a Web API

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Web API**.

   The **Web API List** page appears.
2. Click **New**.

   The **Web API List Item** wizard appears.
3. In the **Name** box, type a name for the API.
4. In the **Description** box, type a description for the API.
5. In the **Source** box, select the Web API.
   - If you select the Web API, you need to provide the **Base Address**, **Request URI**, and **Authentication Mode**. For more information, see Configure Web API
   - If you select the OpenAPI, the **Advanced Option** is available. Select **Yes** to provide the **Base Address**, **Request URI**, and **Authentication Mode**.

     The SwaggerUrl is displayed when the Web API is configured from Swagger. The Web API schema is fetched from Swagger file. For more information, see Web API Type files for Swagger/OpenAPI based Web APIs
6. In the **Base Address** box, type a URL in the format: **http://localhost/MySite/**.

   You can also enter an IPv6 URL for the **Base Address**. The IPv6 address must be enclosed within square brackets.
7. In the **Request URI** box, type a URI. This is an optional parameter.

   For example, **api/product/1** for **http://localhost/MySite/api/product/1** (for Request URI without parameters) or **api/{product}/{ID}** for **http://localhost/MySite/api** (for Request URI with parameters).
8. Select one of the following options for **Authentication Mode**:
   - **No Authentication**: If the Web API does not require authentication.
   - **Windows**: If the Web API is Windows authenticated.
   - **User Access Token**: If the Web API requires the currently logged-in user's access token.

     Note: If User Access Token is configured for the Web API and associated with Scheduler Event Association, the workflow fails.
   - **Basic Authentication**: If the Web API requires basic authentication. Provide the user name with domain and the password.
   - **Certificate**: If the Web API requires certificate authentication. Provide the certificate store location and the thumbprint. For more information on certificate-based authentication, see Web API Certificate-based Authentication.

     Note: The thumbprint should not contain any spaces. In some machines, the characters in thumbprint should be in upper case.
   - **Service to Service Access Token**: If the Web API requires Service to Service Access Token. To get the Access Token, provide **Authority URL**, **Audience**, **Client ID**, **Client Secret**, and **Scope**.

     In the **Authority URL**, provide the token end-point of the respective repository provider. For example,

     AVEVA Connect: `{authority url}/oauth/token`

     Azure Active Directory: `{authority url}/oauth2/v2.0/token`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

AVEVA Identity Manager: `{authority url}/connect/token`

9. Do one of the following:
   - Test the Web API server connection.
     a. Click **Test Server**. An information message appears.

     Note:
     - The **Request URI** and **Authentication Mode** details are not required to test the Web API connection.
     - The Web API connection is successful if the site is pointing to the default IIS port, the Server is running but the Application Pool is stopped.
     - The Web API connection is unsuccessful if the Server, Site, or IIS is stopped.
   - Preview the data fetched using the Web API.
     a. Click **Preview**. The Preview dialog box appears.

     Preview is available only for **.json** file format.

     Note: When you click **Preview**,
     - If the Web API is configured with **Headers**, the option **Show Headers** is available, and you can select **Yes** to view the desired Keys and Values. But, if the Web API does not have **Headers** configured, the data fetched from the Web API gets listed directly.
     - For both Web API and OpenAPI, you need to provide the Key and Value for the Headers. These are the mandatory properties.

     b. Check the data fetched using the Web API.
     c. Click **Close** (or click the **Close** button). The Preview dialog box is closed.
   - Save the Web API.
     a. **Click Save & Close**. The API is added, and an information message appears.
     b. Click **OK** (or click the **Close** button). The information message is closed.

Note:
- You can pass parameters in the **Request URI** using braces **{ }**.
- For example, **api/{product}/{ID}** for **http://localhost/MySite/api.**
- If the Web API is Windows authenticated, then the status of the **Windows Authentication** must be set to **Enabled** for the **EnterpriseConsole** site under **AVEVAWorkTasksSites** site in the **IIS Manager**.
- If a Web API method (action) is modified, then you must create the web API List Item, the Web API Lookup, or the Web API activity again.
- Web APIs can recognize the response received in the ODATA (Open Data Protocol) format.
- The **Preview** option is available only for Web APIs, which support JSON format.
- The **Preview** button is enabled only when Request URI is provided.
- The data fetched using Web API would not consider the column names containing characters **: /** and ****.
- The password should not contain **<** and **>** characters.

Web API Certificate-based Authentication

You can authenticate the Web API using following configurations:

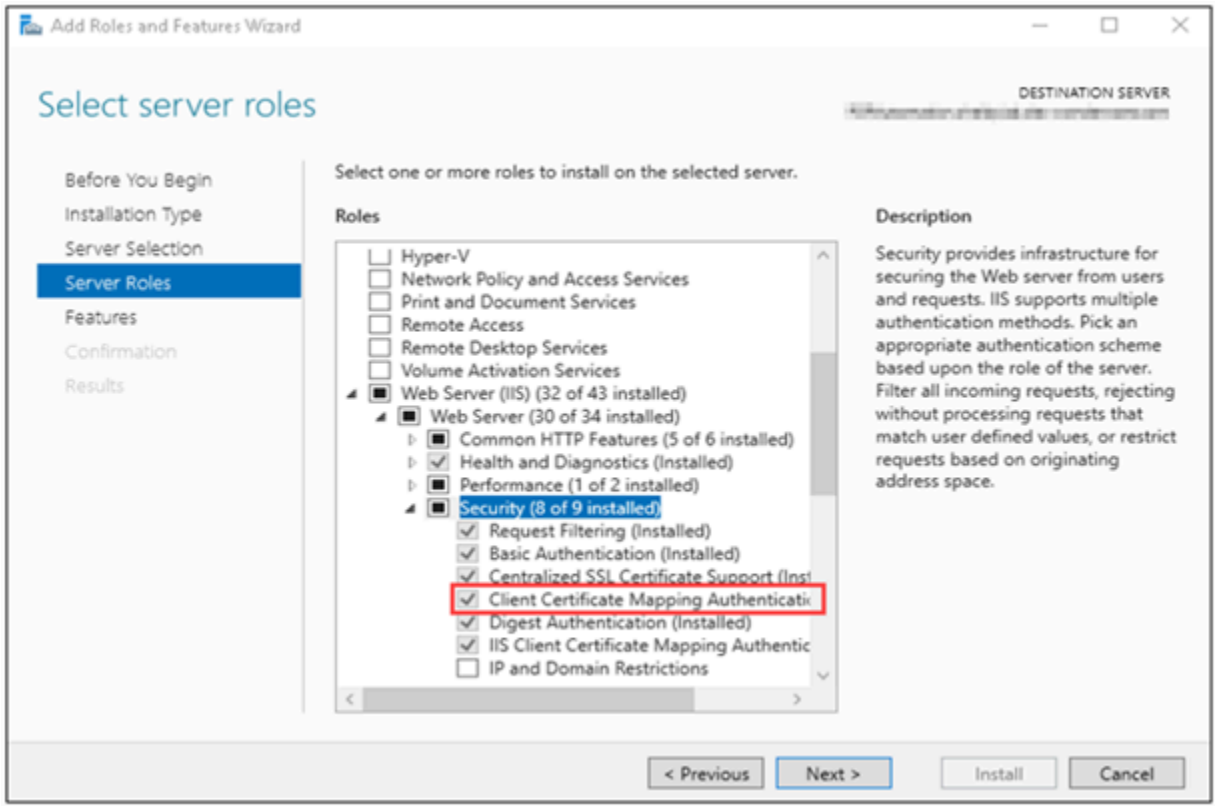
- Web API Server Configuration
- Web API Client Configuration

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Web API Server Configuration

Enable Client Certificate Mapping Authentication

- In Windows features, select **Server Roles**, and enable **Client Certificate Mapping Authentication** option.



Generate and Install Root Certificate

1. To generate the root certificate,
   a. Run the Command prompt and navigate to the *makecert* tool.
   b. Execute the below command:

      makecert -n "CN=<FQDN>" -r -sv ClientRootCA.pvk ClientRootCA.cer

      Replace *<FQDN>* with the fully qualified domain name of the machine (i.e. the computer name with the domain).

      The certificate is generated in the same path.

Note: The *makecert* utility is part of the Windows SDK.

2. To install the certificate,
   a. Run MMC on your machine. Then click **File** > **Add/Remove Snap-in.**
   b. Select **Certificate** and click **Add>**.
   c. Select **Computer account** option in the **Certificates snap-in** dialog box and click **Next**.
   d. Select **Local Computer** option in the **Select Computer** dialog box and click **Finish**.

   The generated certificate will be available at *Certificates (Local Computer) > Trusted Root Certification*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Authorities > Certificates

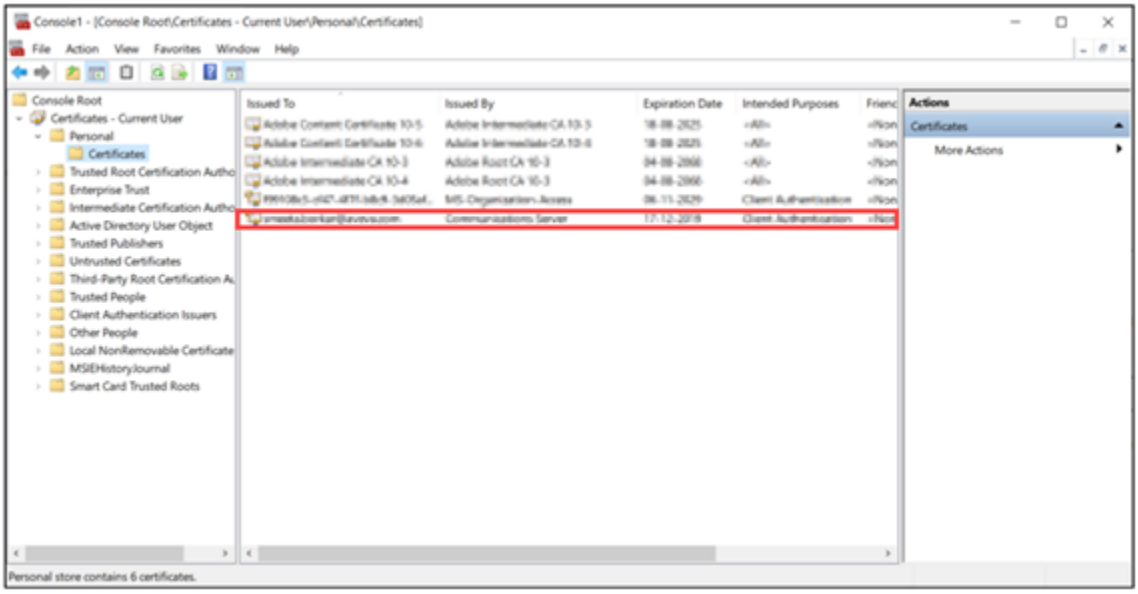
Generate and Install Client Certificate

1. To generate the client certificate,
   a. Run the Command prompt and navigate to the *makecert* tool
   b. Execute the below command:

      makecert -sk MyKeyName -iv ClientRootCA.pvk -n "CN=<username>" -ic ClientRootCA.cer -sr currentuser -ss my -sky signature -pe

      where, *<username>* is the current user name you have logged with.
2. To install the certificate,
   a. Run MMC on your machine. Then click **File** > **Add/Remove Snap-in.**
   b. Select **Certificate** and click **Add>**.
   c. Select **My user account** option in the **Certificates snap-in** dialog box.
   d. Click **Finish**.

   The generated certificate will be available at *Certificates (Current User) > Personal > Certificates*.



Export the Generated Certificate

To export the certificates for client authentication:

1. Navigate to Console Root\Certificates - Current User\Personal\Certificates.
2. Right-click on the generated certificate, click **All Tasks** and then click **Export**.
3. In the Certificate Export Wizard,
   - Select **Yes, export the private ke**y option to export certificate with the private key.
   - Select **No, do not export the private key** option if you do not want the private key.
4. To export the certificates with private key (.pfx certificate) for client authentication,
   a. In the Certificate Export Wizard, select **Yes, export the private ke**y option to export certificate with the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

private key.

b. Select the **Personal Information Exchange PKCS #12 (.PFX)** option. Select the **Include all certificates in the certification path if possible** and the **Export all extended properties** check boxes and then click **Next**.

c. Provide the password and click **Next**.

d. Specify the location and name for the file to be exported. Click **Next** and then click **Finish**.

The certificate with private key is available for client authentication.

5. To export the certificates with public key (.CER certificate) for client authentication,

a. In the Certificate Export Wizard, select **No, do not export the private key** option.

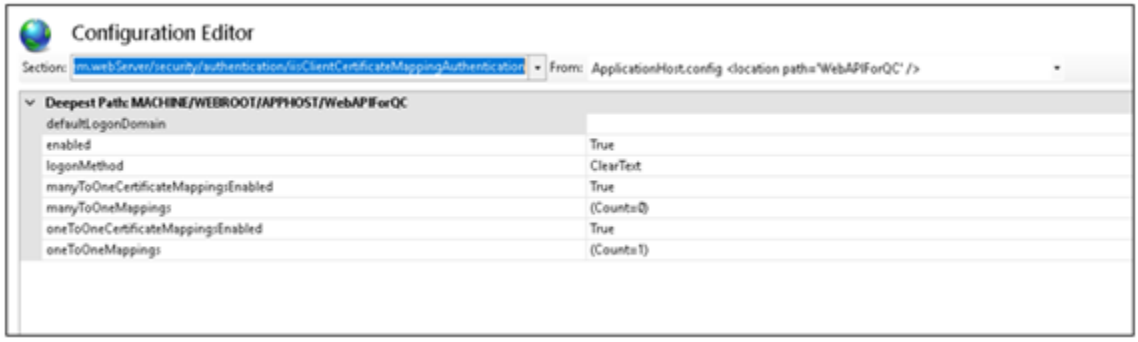
b. Select the **Base-64 encoded X.509 (.CER)** option and click **Next**.

c. Specify the location and name for the file to be exported. Click **Next** and then click **Finish**.

This certificate is used for IIS client certificate mapping authentication

Configuring IIS Mapping

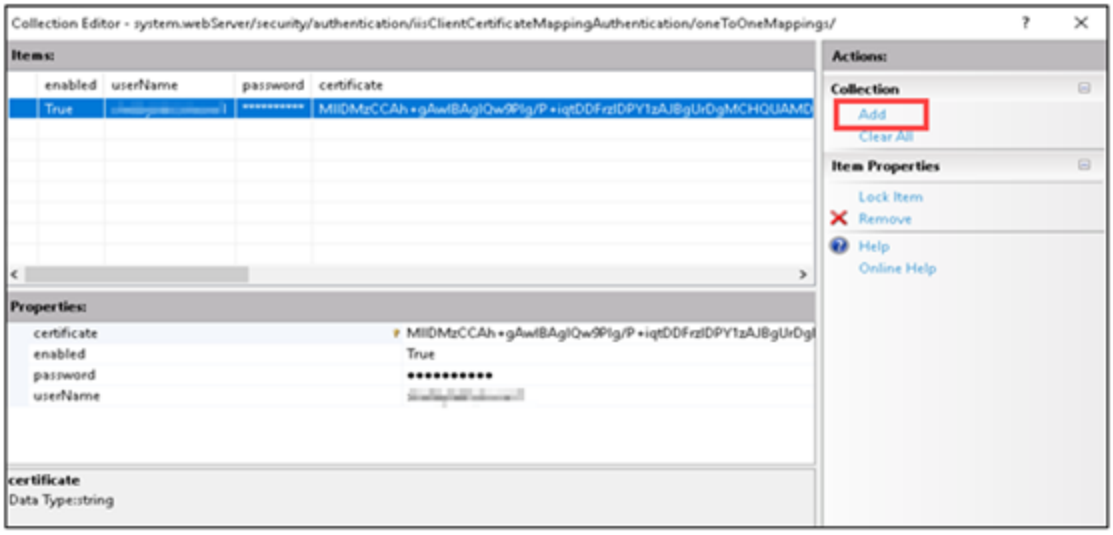
1. Open IIS to configure your site to map website to client certificate.
2. Click on your website and double click on Authentication.
3. Disable all authentication types.
4. Open Configuration Editor in Management Section.



- In the **Section**, enter *system.webServer/security/authentication/iisClientCertificateMappingAuthentication.*
- For the **enabled** property, enter **True**.
- For the **oneToOneMappingsEnabled** property, enter **True**.

5. Click the **oneToOneMappings** property.
6. In the Collection Editor dialog box, click **Add**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



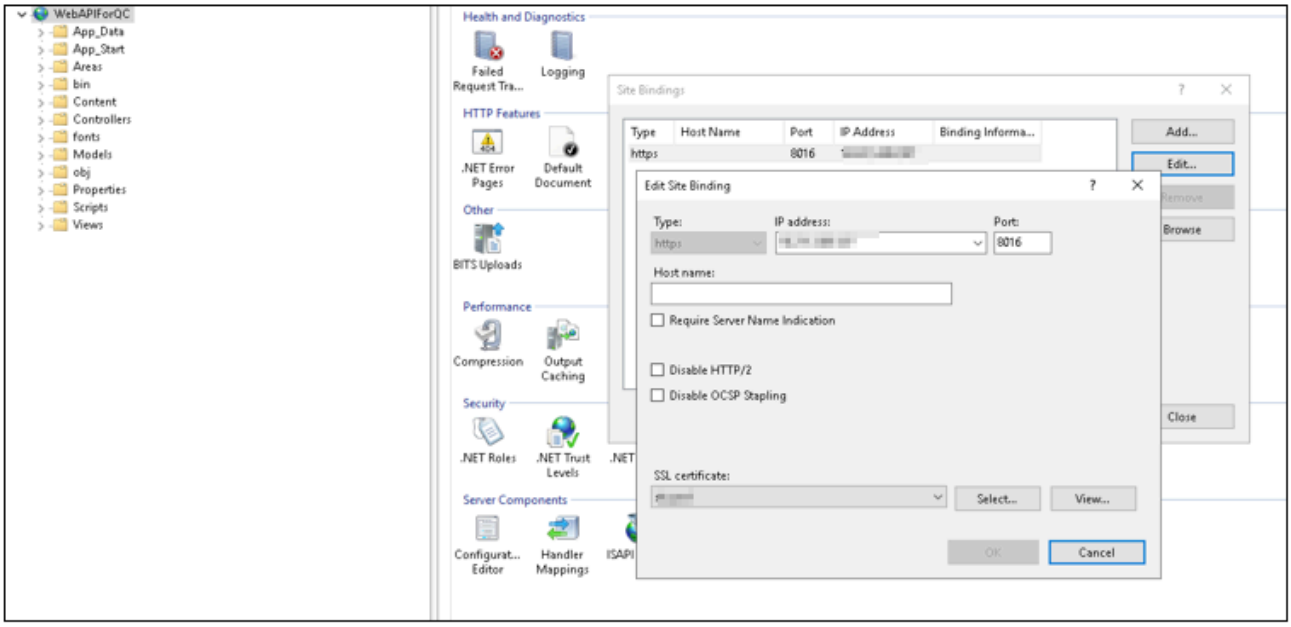
7. For the **certificate** property, copy and paste the public certificate that was exported (in step 5 of the section *Export the generated certificate*).

   Note: Open the Public certificate in the notepad and copy the encrypted certificate value in a single line.

8. For the **enabled** property, enter **True**.
9. Enter the valid Windows username and password which is used to login to the server machine.
10. Close the dialog box and click **Apply**.

    Mapping to your site is completed.

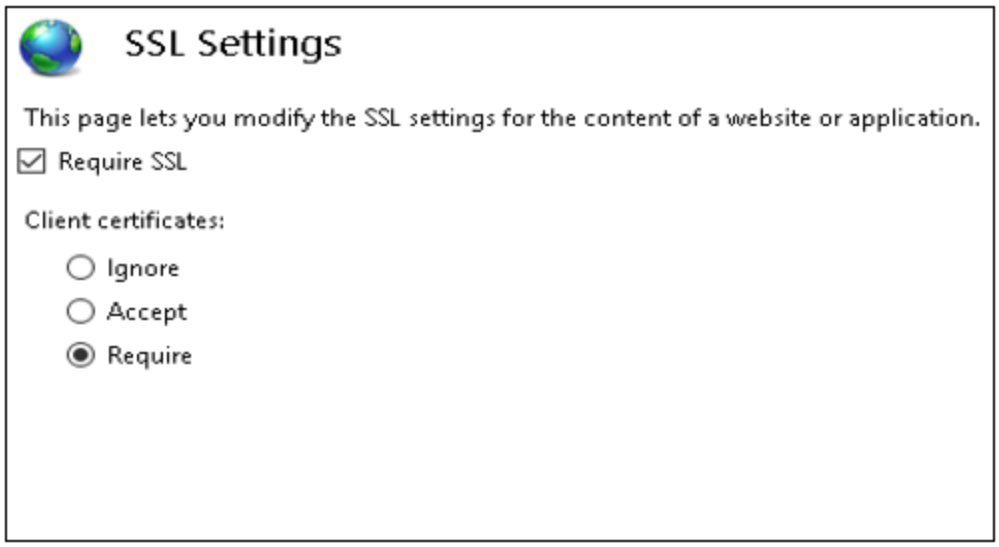
11. Import the certificate in IIS and edit **Site Bindings**.



- Under **Type** property, select **https**.
- Under **SSL certificate** property, select the certificate.

12. Click the **SSL Settings** and select **Require SSL** check box.

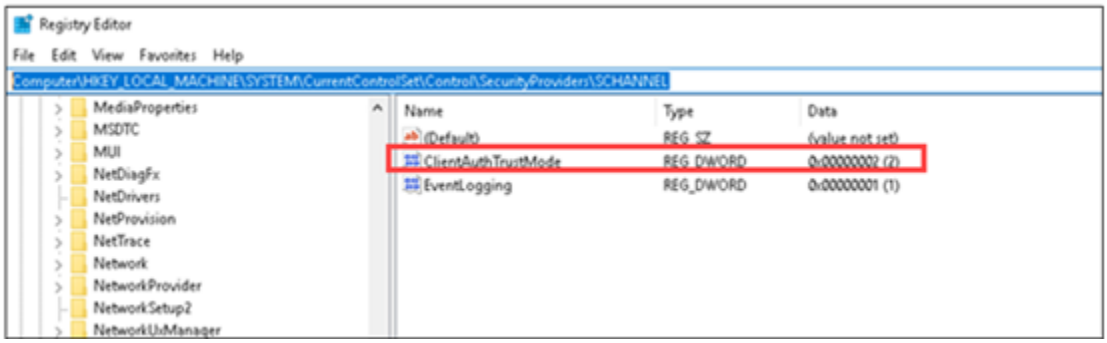
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Select the **Require SSL** checkbox and under the **Client certificates** section, select the **Require** option to make any client connection require a certificate to the site.

Modify Registry

- Modify/Add 'ClientAuthTrustMode' key in the Registry Editor under *Computer**HKEY_LOCAL_MACHINE**SYSTEM**CurrentControlSet**Control**SecurityProviders**SCHANNEL.*



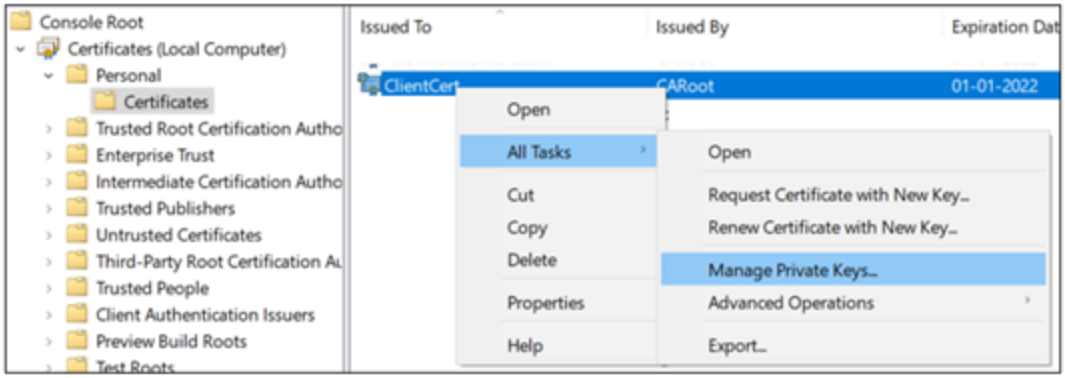
Add value as 2 for ClientAuthTrustMode Key.

Web API Client Configuration

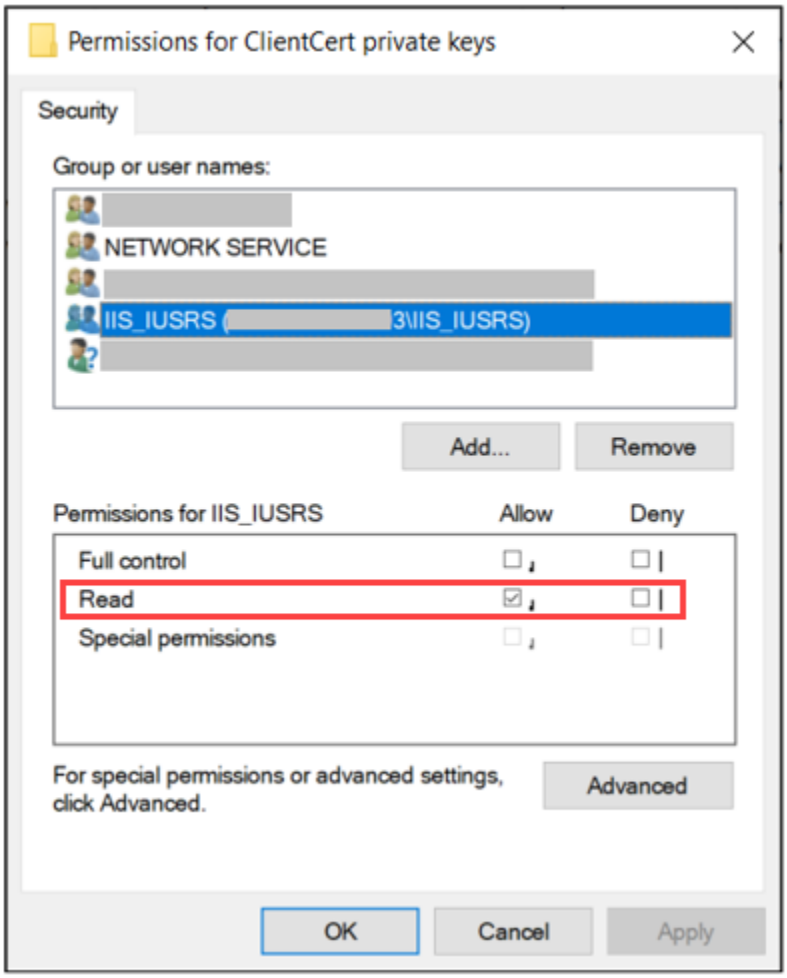
Install Certificate at Client Site

1. Install the exported certificate with private key under *Certificates(Local Computer)**Personal**Certificate*.
2. Right click on the installed certificate and select **All Tasks**>**Manage Private Keys** option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

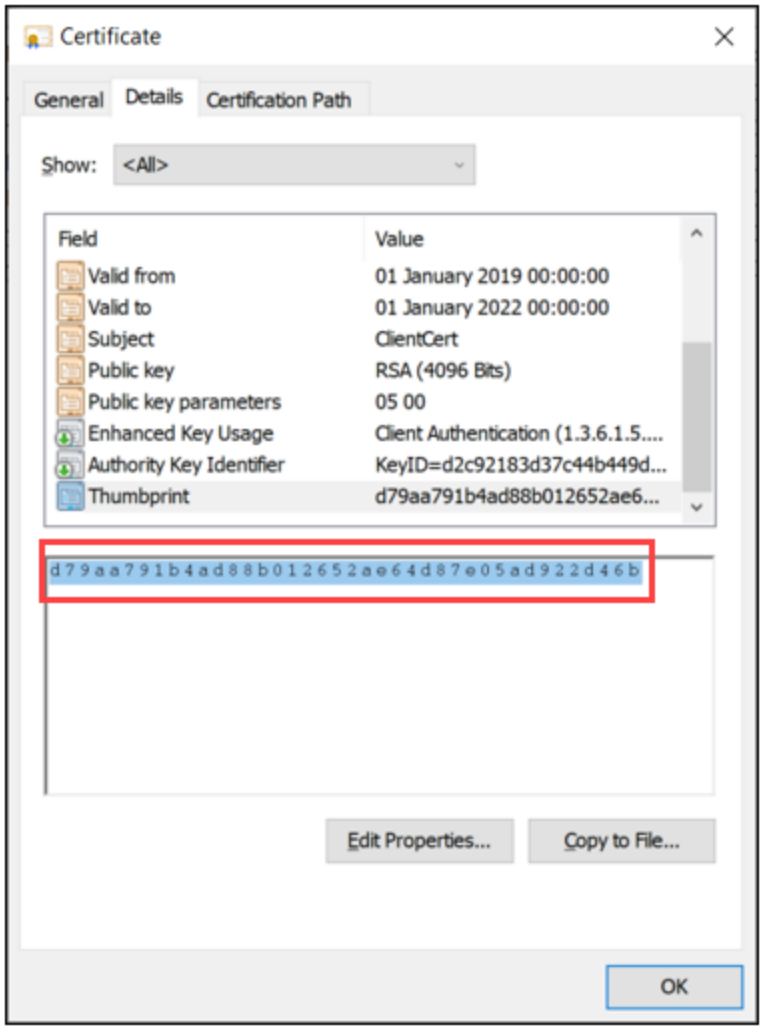


3. Add Read permissions to *NETWORK SERVICE* and <*MachineName*>*IIS_IUSERS*.



4. Open the certificate and copy the **Thumbprint** from the **Details** tab.
   This thumbnail is used to configure the Web API list item.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Web API Type files for Swagger/OpenAPI based Web APIs

You can add a Web API resource file in the *<Install Folder>\Resources\WebAPI*

For example: *C:\Program Files\AVEVA\Work Tasks\Resources\WebAPI*

There can be many files or a single file with multiple Web API types. These Web API types will get loaded in Web API List source dropdown. The existing Web APIs and the APIs which are not Swagger/OpenAPI based Web APIs are considered as Generic types.

The sample schema to add the Web API types is as given below:

```
<?xml version="1.0" encoding="utf-8"?>
<WebAPITypes>
<WebAPIType Name="TestOpenAPINoAuth">
<SwaggerConfiguration><![CDATA[http://localhost:63452/swagger/DotNetCoreWebAPIForTestV1/
swagger.json]]></SwaggerConfiguration>
<BaseAddress><![CDATA[http://localhost:63452/]]></BaseAddress>
<Authentication Mode="No Authentication"/>
</WebAPIType>
<WebAPIType Name="TestOpenAPI301Spec">
<SwaggerConfiguration><![CDATA[http://localhost:8040/swagger/DotNetCoreWebAPIForTestV1/
swagger.json]]></SwaggerConfiguration>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<BaseAddress><![CDATA[http://localhost:8040/]]></BaseAddress>
<Authentication Mode="Windows" >
<ImpersonationUser><![CDATA[domain\username]]></ImpersonationUser>
</Authentication>
</WebAPIType>
<WebAPIType Name="TokenAccessAPI">
<SwaggerConfiguration><![CDATA[http://localhost:8032/swagger/V1/
swagger.json]]></SwaggerConfiguration>
<BaseAddress><![CDATA[http://localhost:8032]]></BaseAddress>
<Authentication Mode="Access Token"/>
</WebAPIType>
<WebAPIType Name="TestOpenAPI20Spec">
<SwaggerConfiguration><![CDATA[http://localhost:8010/swagger/DotNetCoreWebAPIForTestV1/
swagger.json]]></SwaggerConfiguration>
<BaseAddress><![CDATA[http://localhost:8010/]]></BaseAddress>
<Authentication Mode="Basic Authentication">
<UserName><![CDATA[domain\username]]></UserName>
</Authentication>
</WebAPIType>
<WebAPIType Name="Certificate Auth">
<SwaggerConfiguration><![CDATA[http://localhost:8010/swagger/DotNetCoreWebAPIForTestV1/
swagger.json]]></SwaggerConfiguration>
<BaseAddress><![CDATA[http://localhost:8010]]></BaseAddress>
<Authentication Mode="Certificate" >
<Location><![CDATA[LocalMachine]]></Location>
<Thumbprint><![CDATA[]]></Thumbprint>
</Authentication>
</WebAPIType>
</WebAPITypes>
```

Web API Source

Web API source is used to define the details of the OpenAPI which can be then fetched through the **Source** dropdown of Web API List page. Use Web API Source to customize your business applications.

To add a Web API Source

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Web API Source**.

   The **Web API Source** page appears.
2. Click **New**.

   The **Web API Source List Item** wizard appears.
3. In the **Name** box, type a name for the Web API source.
4. In the **Description** box, type a description for the Web API source.
5. In the **Swagger Url** box, type the swagger url of the Web API that was created and configured using swagger.
6. In the **Base Address** box, type a URL in the format: **http://localhost/MySite/**.

   You can also enter an IPv6 URL for the **Base Address**. The IPv6 address must be enclosed within square brackets.
7. Select one of the following options for **Authentication Mode**:
   - **No Authentication**: If the Web API source does not require authentication.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Windows**: If the Web API source is Windows authenticated. Provide the impersonation user.
- **Access Token**: If the Web API source requires ArchestrA Security Token Service (ASTS) access token authentication.
- **Basic Authentication**: If the Web API source requires basic authentication. Provide the user name with domain and the password.
- **Certificate**: If the Web API source requires certificate authentication. Provide the certificate store location and the thumbprint. For more information on certificate-based authentication, see Web API Certificate-based Authentication.

  Note: The thumbprint should not contain any spaces. In some machines, the characters in thumbprint should be in upper case.

8. Click **Save**. The Web API source is added.

Note: Once the Web API Source gets consumed by Web API, you can change the authentication mode and other values and save it. But when you again select the Web API Source from the drop-down, then the values from the Web API Source are populated, and the previously saved values are lost.

To sync the OpenAPI details

You can sync the OpenAPI details in the XML file located in the Resource folder in the installation path and save it in the database. Any modifications made in the XML file will be reflected in the Web API Source page when you sync.

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Web API Source**.

   The **Web API Source** page appears.
2. Click **Sync**.

   The OpenAPI details in the XML file located in the **Resource** folder in the installation path is synced and will get displayed in the **Web API Source** page.

Import a New Form using an API

Use the following API to import a new Form :

```
                try
    {
// Specify the form Id
        var formId = "C0084A77-0BAE-4237-9D75-1FA09B59E82B";
        // Specify the form name
        var formName = "New";
        // specify the form version
        var formVersion = "1";
        // Specify the application/repository name
        var applicationName = "PSI12Sprint05Repo";
        // Forms List Name
        var formListName = "Forms List";

        BaseForm newDefinition;
        BaseForm currentFormDefinition;
        Skelta.Entity.UserContext userContext = new Skelta.Entity.UserContext(new
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
Guid("B6FD1625-D203-4DEC-933D-516789E90E45"), new
Skelta.Core.ApplicationObject(applicationName), "skeltalist");

            Skelta.Forms.Web.CommonFunctions.ValidateCachedForm(formId, formVersion, out
currentFormDefinition, formListName);
            XmlDocument xmlDoc = new XmlDocument();
    // Specify form definition xml file path
            xmlDoc.Load(@"C:\PSI12Sprint05Repo_New_Form.xml");
            var newFormDefinitionString = xmlDoc.InnerXml;
            newDefinition = BaseForm.LoadDefinitionXml(newFormDefinitionString);
            newDefinition =
Workflow.NET.FormsUtility.UpdateNextGenFormDefinition(newDefinition);
            newDefinition.TopLevelForm.FormTitle = formName;
            Skelta.Forms.Web.CommonFunctions.UpdateDefinitionToDBAndValidateCache(formId,
formVersion, newDefinition, formListName);
         }
         catch(Exception ex)
         {
         }
```

Note:
- The code imports the specified form definition without performing validations, for example, checking product or build versions.
- If the the form definition contains an invoke workflow control, then the API imports the form definition but does not create workflow association entries. You have to create them manually.
- If a form definition contains an invoke workflow control, and if you import the invoke workflow control from either the context menu or the Forms Designer, then the workflow association entries are created.

Scenarios

This section demonstrates some scenarios and examples on using Forms:

- Scenario 1: Purchase Order Form
- Scenario 2: Vehicle Registration Form
- Scenario 3: EMI Form
- Examples

Scenario 1: Purchase Order Form

Purchase order form scenario shows how you can use a Base Form container to create and repeat line items, code scripts to automatically calculate values, and update a value on data change event.

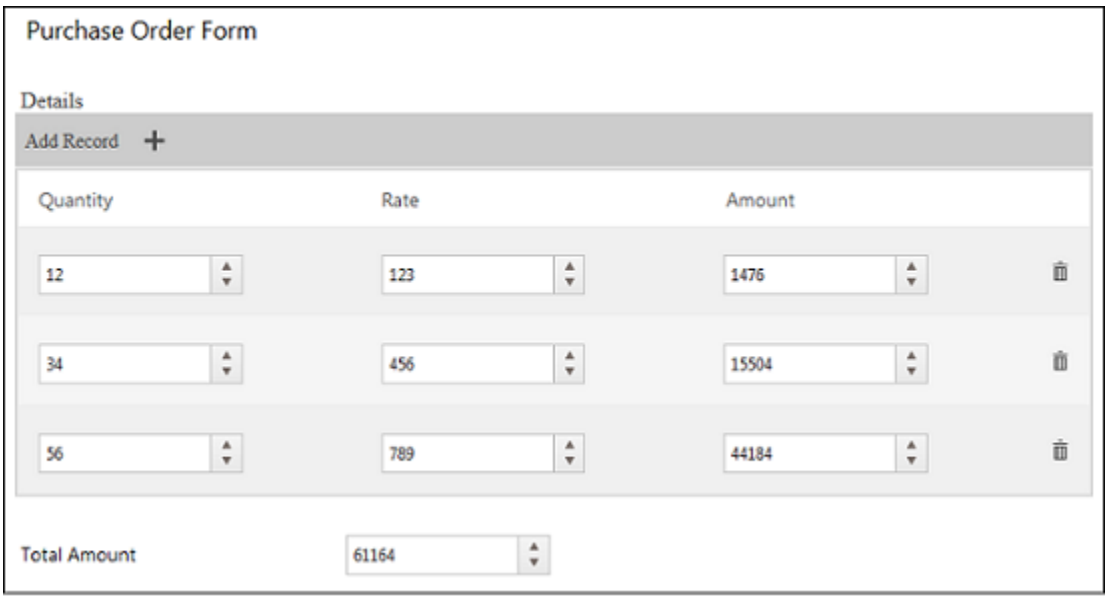
Requirements

A purchase order form which:

- captures information about quantity and rate as a line item.

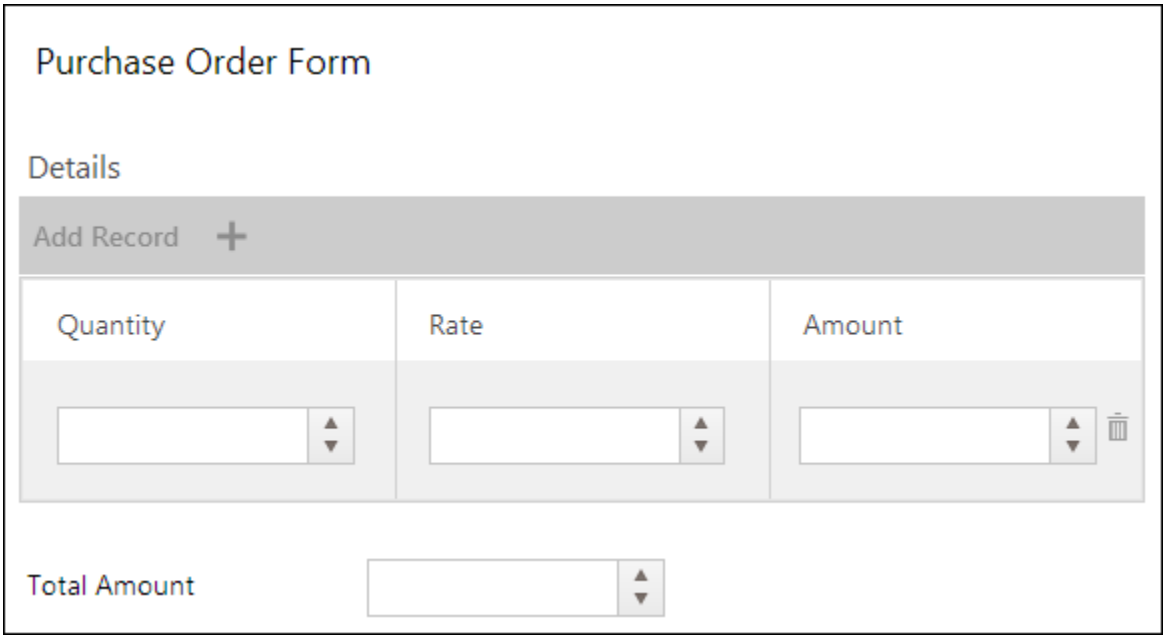
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- automatically calculates the amount by multiplying quantity and rate and displays it as a line item.
- starts with one line item and provides an option to add as many line items as required.
- automatically calculates the total amount by adding each line item amount.



Design

1. Create a form.
2. Add a **Base Form** container on the form and set the **Display Mode** to **Grid**, to create line items.
3. Add three **Number** controls on the **Base Form** container to capture quantity and rate and display the amount, as a line item.
4. Add a **Number** control on the form to display the total amount.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Scripts

1. Code the script as follows for the **Value** property of the **Amount** control to automatically calculate the amount:

   ```
   qty=control.findByXmlNode("Quantity").value;
   rate=control.findByXmlNode("Rate").value;
   return qty*rate;
   ```

2. Code the script as follows for the On Data Change property of the Amount control to automatically calculate the total amount:

   ```
   control.findByXmlNode("TotalAmount").value= control.sumByXmlNode("Amount");
   ```

Note: The **sumByXmlNode()** method adds the value of each instance of the specified control.

Scenario 2: Vehicle Registration Form

Vehicle registration form scenario shows how you can show or hide Panel Form containers to display relevant information based on a selection.

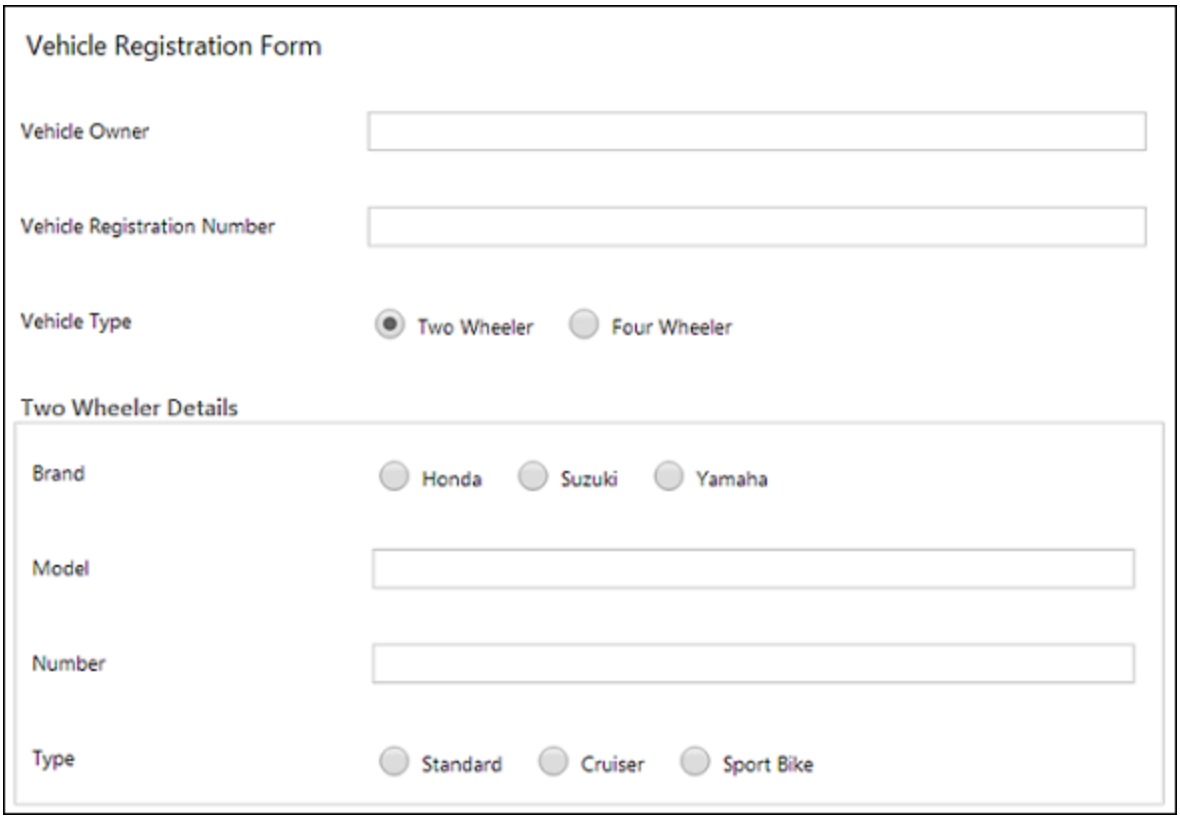
Requirements

A vehicle registration form which:

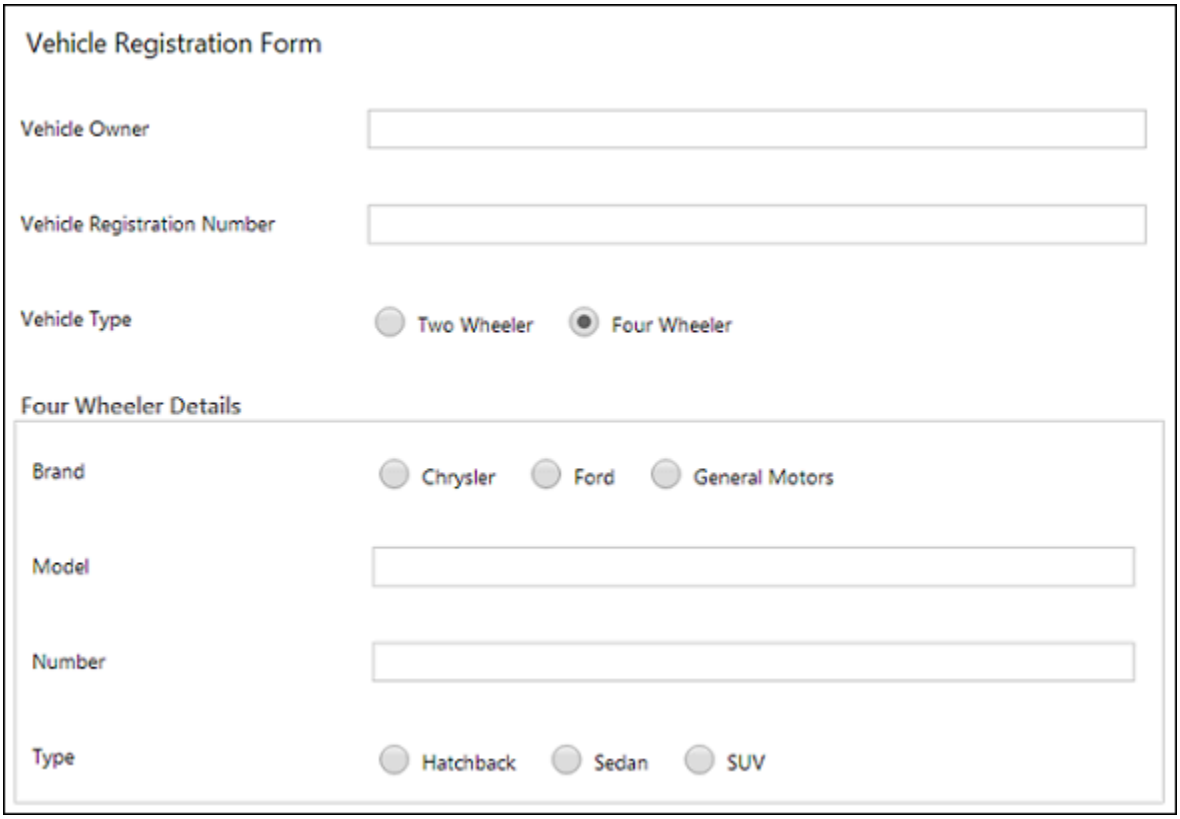
- captures information about a vehicle owner, vehicle registration number, and vehicle type.
- displays the two wheeler additional information by default.
- automatically displays the relevant additional information to capture based on the selected vehicle type.
- captures additional information about the selected vehicle type such as brand, model, number, and type.

The following figure represents the Vehicle Registration Form for entering information about Two Wheelers.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



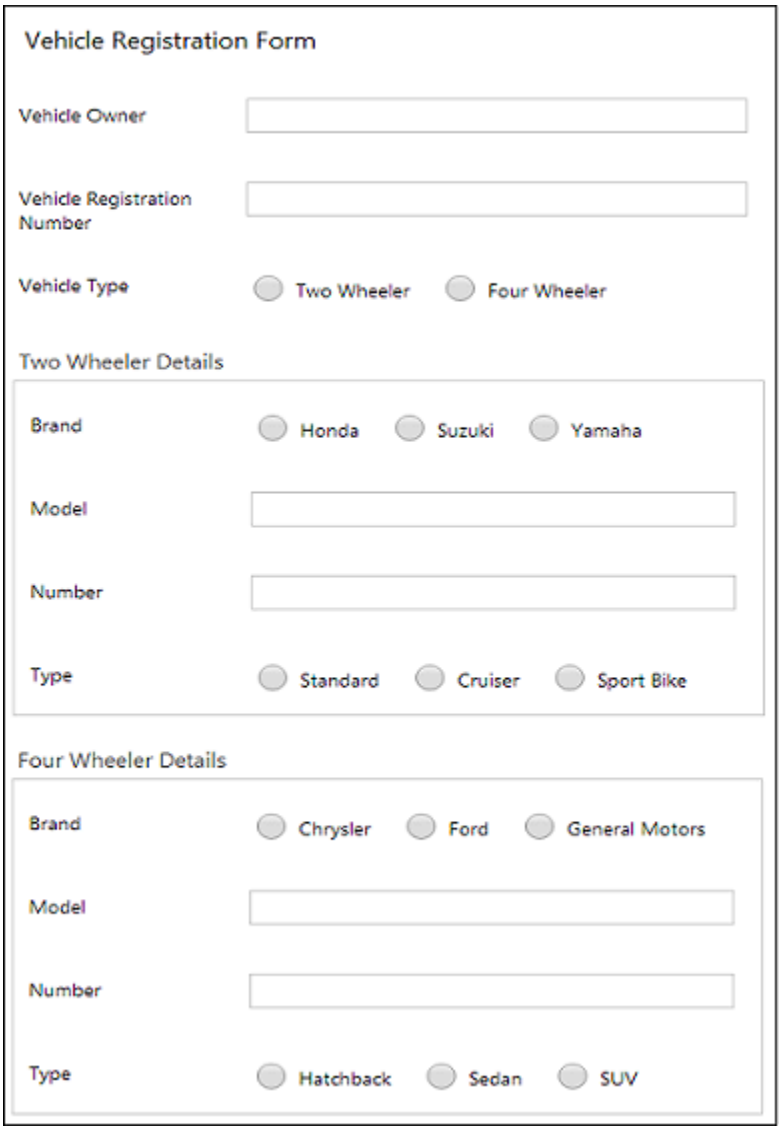
The following figure represents the Vehicle Registration Form for entering information about Four Wheelers.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Design

1. Create a form.
2. Add two **Text** controls on the form to capture vehicle owner and vehicle registration number.
3. Add a **Radio Button** control on the form to select the vehicle type and set the **Default Value** to the value of the two wheeler option.
4. Add two **Panel Form** containers on the form to capture additional information about the selected vehicle type.
5. Add two **Text** controls on each of the **Panel Form** to capture model and number.
6. Add two **Radio Button** controls on each of the **Panel Form** to capture brand and type.
7. To hide the Four Wheeler Panel Form, set the value of the **Visible** property to **No** in the **Appearance** tab.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Scripts

Code the script as follows for the **On Data Change** property of the **Vehicle Type** control to automatically displays the relevant additional information based on the selected vehicle type:

```
if( currentValue == "2")
 {
 control.findById('P1').visible = true;
 control.findById('P2').visible = false;
 }
else
 {
 control.findById('P1').visible = false;
 control.findById('P2').visible = true;
 }
```

Vehicle Type control has the value 2 and 4 set for the **Two Wheeler** and **Four Wheeler** options respectively. **P1** and **P2** are the IDs for the **Two Wheeler Details** and **Four Wheeler Details** containers respectively.

Scenario 3: EMI Form

EMI (Equated Monthly Installment) form scenario shows how you can use scripts to automatically add line items on a Base Form container on data change event.

Requirements

An EMI form which:

- captures information about principal, rate, and tenure.
- automatically calculates the EMI amount, interest amount, principal reduction, and balance due using the EMI formula and displays it as a line item for each installment number.

EMI Formula

EMI = (P*r) (1+r)^n / (1+r)^n - 1

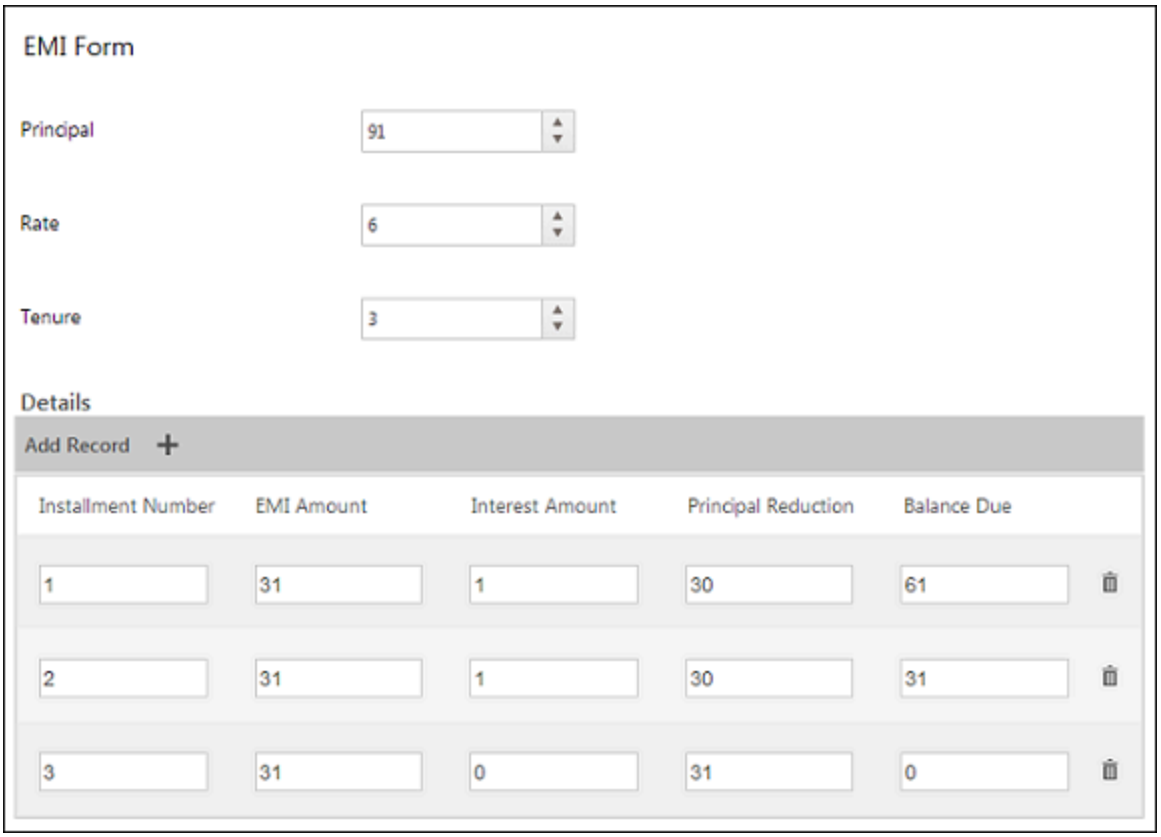
where:

P = Principal (amount of loan).

r = Rate of interest per installment period.

n = Number of installments in the tenure.

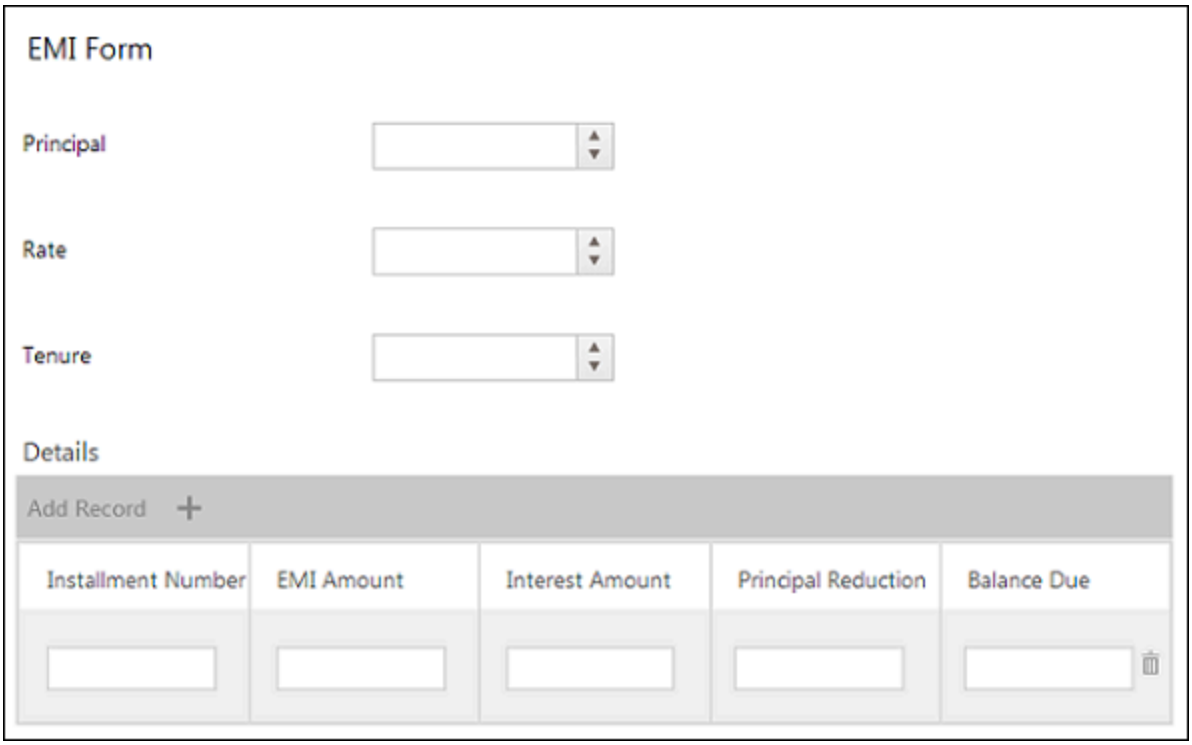
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Design

1. Create a form.
2. Add three **Number** controls on the form to capture principal, rate, and tenure.
3. Add a **Base Form** container on the form and set the **Display Mode** to **Grid**, to create line items.
4. Add five **Text** controls on the **Base Form** container to display the installment number, EMI amount, interest amount, principal reduction, and balance due, as a line item.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Scripts

Code the script as follows for the **On Data Change** property of the **Tenure** control to automatically calculate the **EMI** and display the line items:

```
var tenure =control.findByXmlNode("Tenure").value;
var interest = control.findByXmlNode("Rate").value;
var principal =control.findByXmlNode("Principal").value;
if (principal === 0 || interest === 0 || tenure === 0)
{
return;
}
var grid=control.findByXmlNode("Details");
var principal1= parseFloat(principal);
var interest1 = parseFloat(interest );
var tenure1 = parseFloat(tenure );
var ipm =parseFloat(parseFloat(interest1) / parseFloat("1200.0"));
var EMId =((principal1 * ipm) * parseFloat(Math.pow(parseFloat(ipm + 1), tenure1))) /
parseFloat(parseFloat((Math.pow(parseFloat(ipm+1), tenure1))) - 1);
var EMI =Math.round(EMId);
var count=grid.records().length;
for (i=count; i>0; i--)
{
grid.removeAt(i);
}
for (j=0; j<tenure; j++)
{
var newRow=grid.addRecordToBottom();
newRow.findByXmlNode("InstallmentNumber").value = j+1;
if (j===0)
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
newRow.findByXmlNode("PrincipalReduction").value = Math.round((EMI-(principal/100)));
newRow.findByXmlNode("EMIAmount").value =EMI;
newRow.findByXmlNode("InterestAmount").value = Math.round((principal)/100);
newRow.findByXmlNode("BalanceDue").value = Math.round(principal - (EMI-(principal/100)));
}
else
{
var newprincipal=grid.records()[j-1].findByXmlNode("BalanceDue").value;
newRow.findByXmlNode("EMIAmount").value =EMI;
newRow.findByXmlNode("PrincipalReduction").value =Math.round((EMI-(newprincipal/100)));
newRow.findByXmlNode("InterestAmount").value =Math.round((newprincipal)/100);
newRow.findByXmlNode("BalanceDue").value = Math.round(newprincipal - (EMI-(newprincipal/
100)));
}
}
```

Examples

This section demonstrates the examples for using Forms features.

Accessing Values of a Selected Row Through Other Controls

You can access the column values for a selected row of a data grid through other controls.

Data Grid

In the following example, we create a lookup named **Employee**, with a column named **Salary** that holds the salaries of all the employees. We create a form with **Data Grid** control and configure the lookup to the **Data Grid** control. We also add a **Button** and **Text** control to the form. Let us now consider that we want to fetch the salary of a selected employee .We can access this value through the **Text** control in the form as follows:

1. Create a lookup and name it as **Employee**.
2. Create a G**rid Configuration** using the **Employee** lookup.
3. Create a form and add a **Data Grid** control.
4. Modify properties of the **Data Grid** control as follows:
   a. In the **Basic** tab, set the **Configuration Name** property to the grid configuration created in Step 2.
5. Add a **Button** and **Text** control to the form.
6. Set the **Button Type** property of the **Button** control to **Custom**.
7. Code the script for the **On Click** event of the **Button** control as follows:

   ```
   var gridSelecedValue=control.findByXmlNode("Grid1").selectedValue;
   control.findByXmlNode("Textinput1").value=gridSelecedValue.<ColumnName>;
   ```

The script uses the `selectedValue` property to fetch the column value of selected row. When you click the button, the **Text** control gets updated with the Salary value (column), of the selected Employee.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Hierarchical Grid

In the following example, we create a hierarchical data grid with lookups named **Work Order** (parent lookup), and **Jobs** (child lookup). We create a form and consume this grid configuration in the form. We also add a **Button** and **Text** control to the form. Let us now consider that we want to fetch the **Job_Id** of a selected Job. We can access this value through the **Text** control in the form as follows:

1. Create a Hierarchical Data Grid using the lookups **Work Order** (parent lookup) and **Jobs** (child lookup). For more information on creating a Hierarchical Data Grid, see the topic Create a Hierarchical Data Grid.
2. Create a form and consume the grid configuration created in step 1.
3. Add a **Button** and **Text** control to the form.
4. Set the **Button Type** property of the **Button** control to **Custom**.
5. Code the script for the **On Click** event of the **Button** control as follows:

```
var gridSelecedValue =control.findByXmlNode("Grid1").selectedValue;
control.findByXmlNode("Textinput1").value=gridSelecedValue.<ParentLookupName>.<ChildLookupName>
```

The script uses the `selectedValue` property to fetch the column value of selected row. When you click the button, the **Text** control gets updated with the Job_Id (column), of the selected Job.

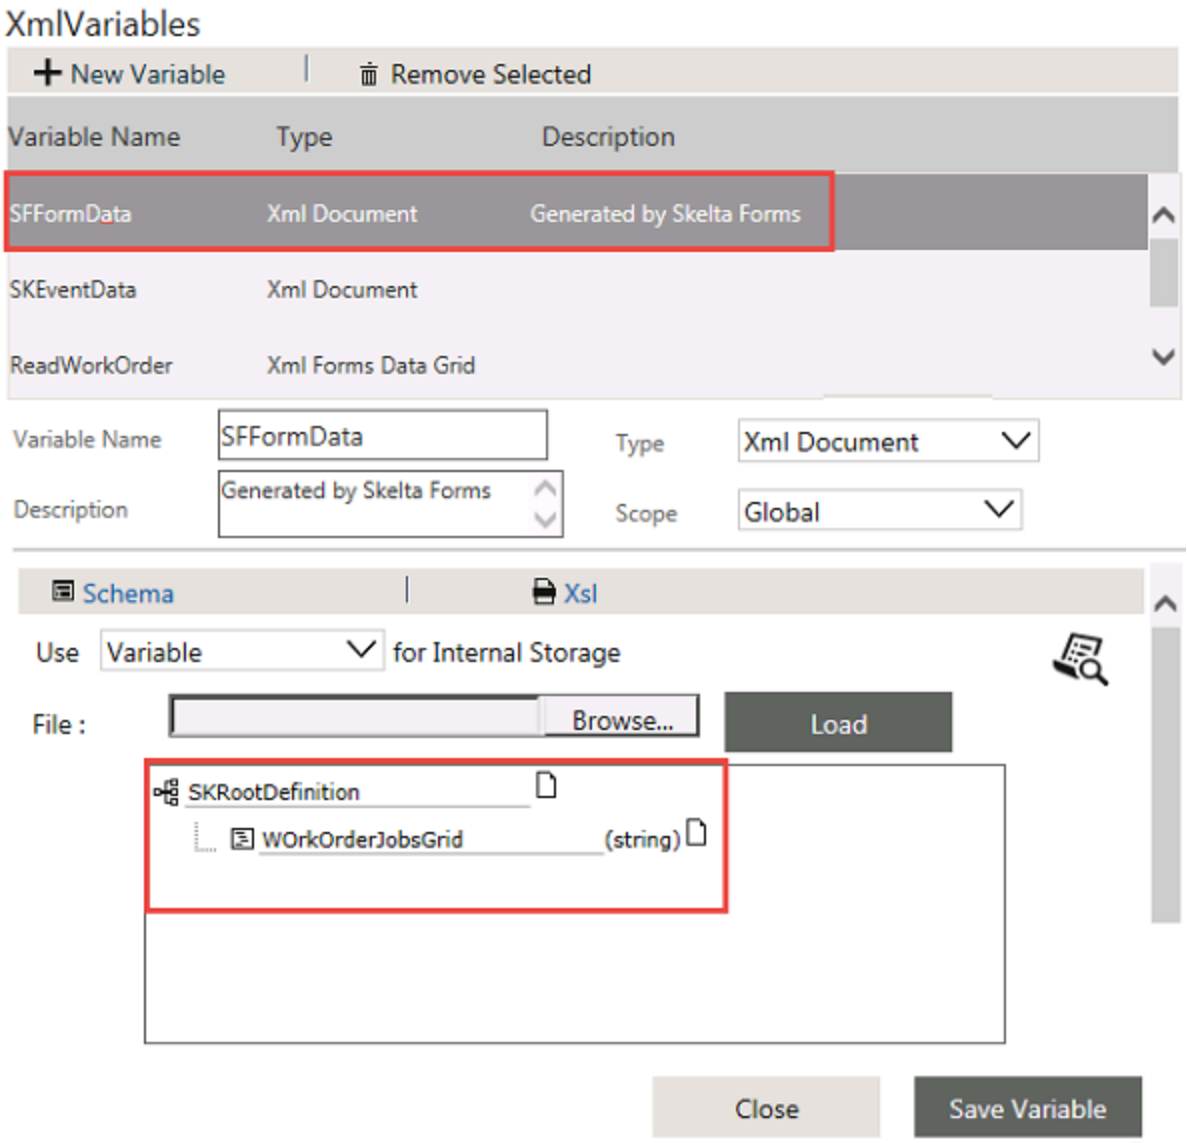
Add Data Grid to Workflows

You can add Data Grid to workflows. The Data Grid values can be read and modified within workflows.

In this example, we create a workflow with a For-Each loop activity. The user selects a Job in the **WorkOrderJobsGrid** and clicks **Finish**. The For-Each Loop activity iterates through the **WorkOrderJobsGrid**. An information mail is sent to the actor with details of Work Order Id, Operation ID and the Sequence number of the selected Job.

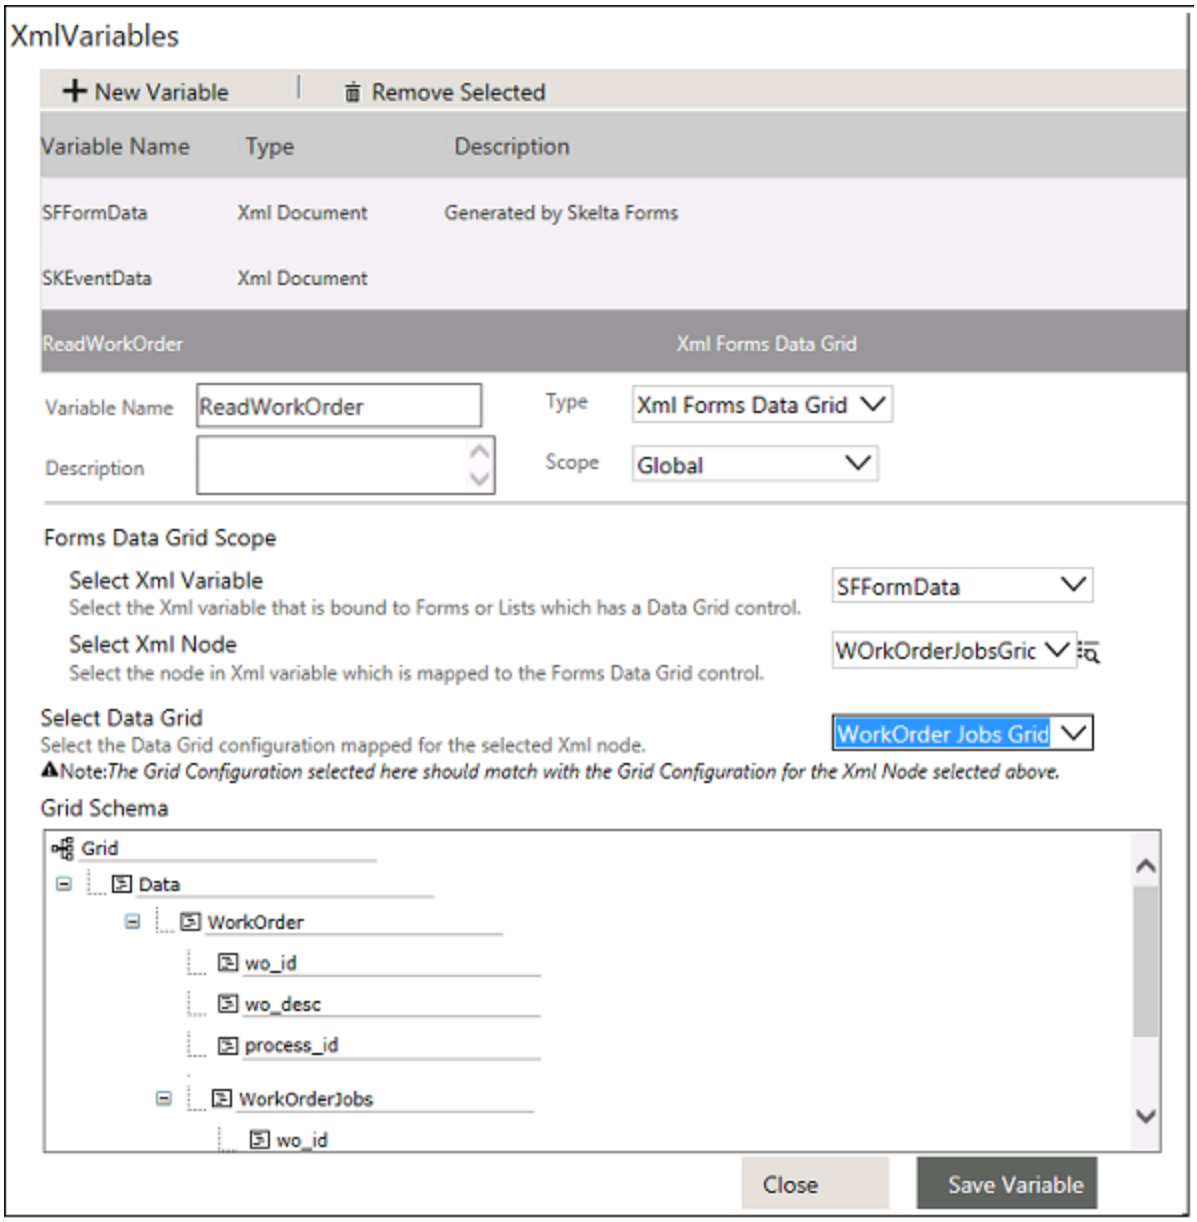
1. Create a form with a two level grid configuration, containing two lookups, Work Order and Jobs. Name the form as **WorkOrderJobs** scenario.
2. Associate the form with a workflow and name the workflow as **WorkOrder Jobs WF**.
3. Design the workflow. The **SFFormData** variable is created for the associated **WorkOrderJobs** scenario form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



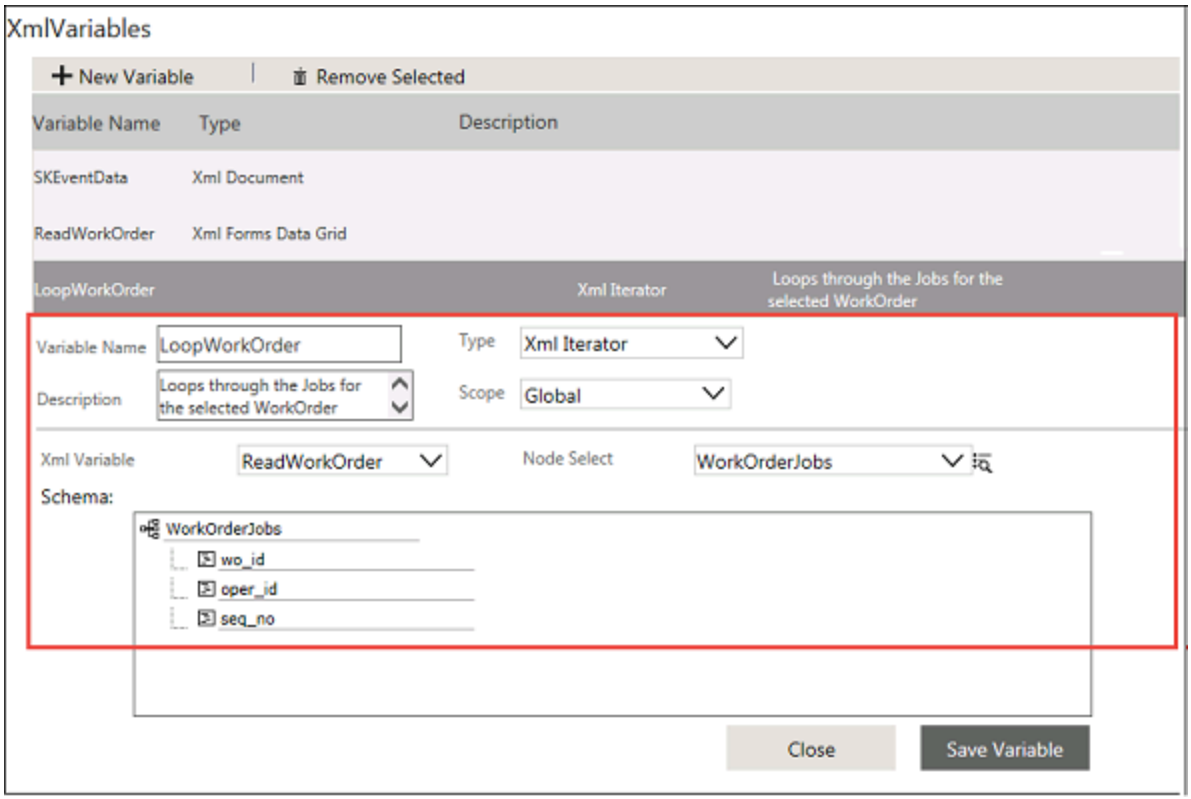
4. **WorkOrderJobsGrid** is the mapped XML node for the Work Order and Jobs grid.
5. The grid selection information is stored in these nodes. To extract the required values and use it within workflows, we need to create XML variables of type XML Forms Data Grid.
6. Create a new XML variable of type XML Forms Data Grid for **Work Order** and **Jobs** Grid.
7. Select **WorkOrderJobsGrid** XML Node which is mapped to the Work Order and Jobs grid. This contains the complete selection information of the Data Grid.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



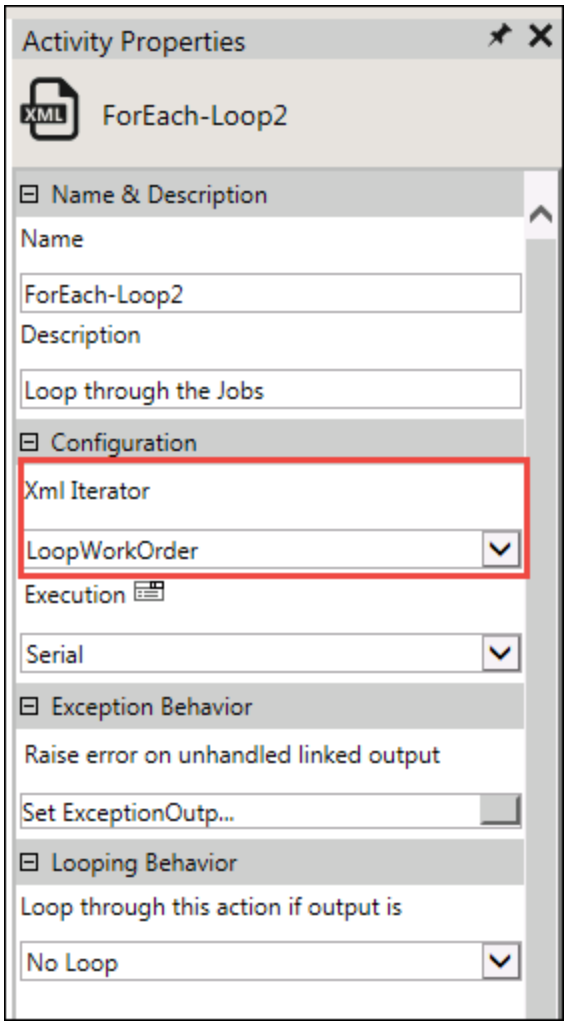
8. We need an XML Iterator variable to loop through the Jobs for the selected Work Order. Create an XML Iterator variable **LoopWorkOrder** as shown in the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

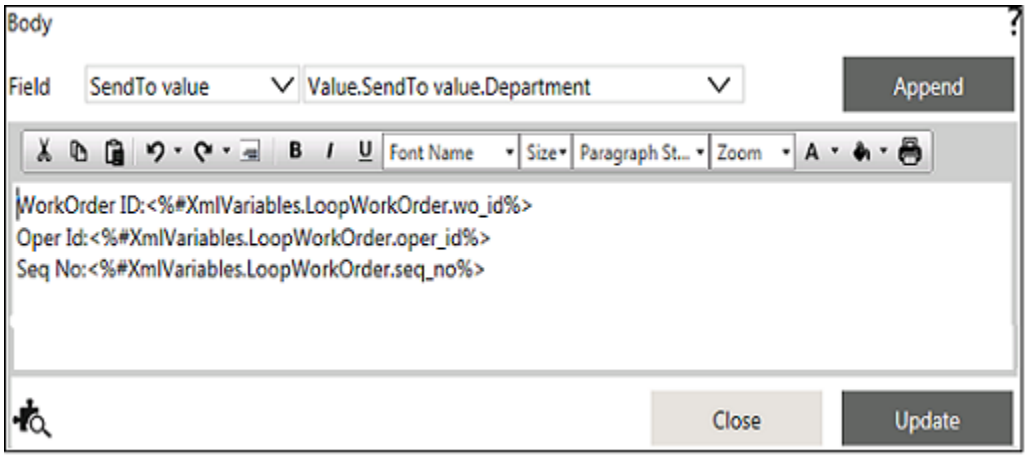


9. Add a For-Each Loop activity. Set its Xml Iterator property with Iterator variable created above.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

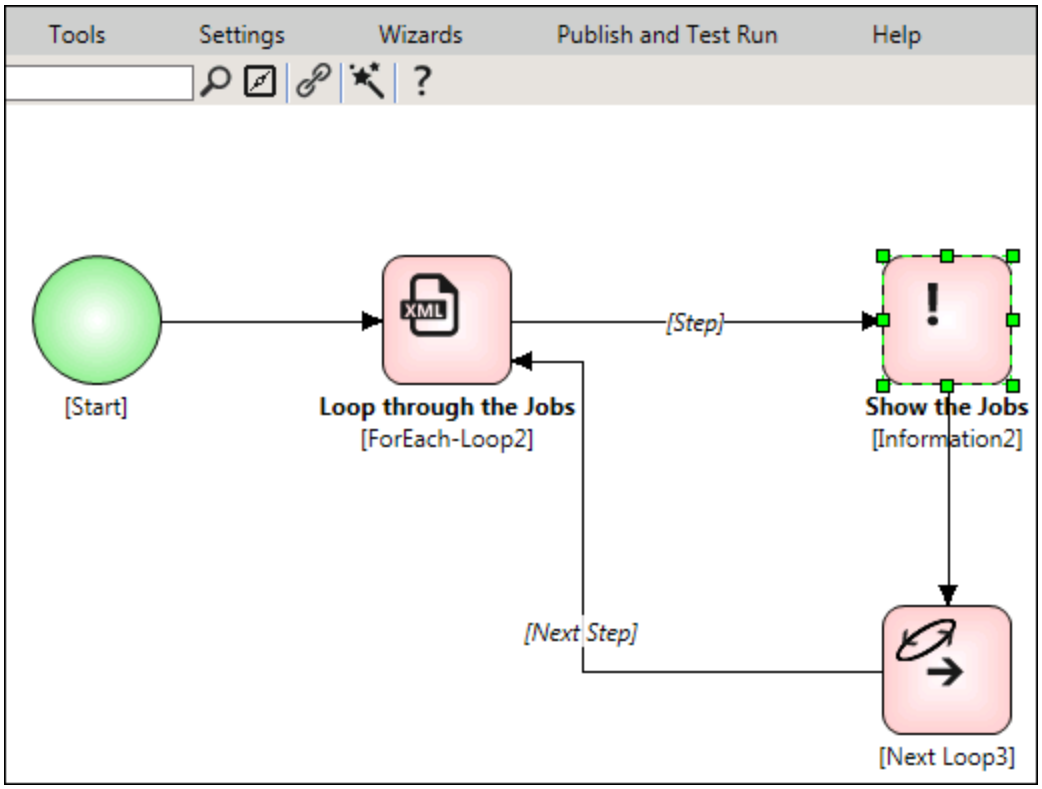


10. Add an Information activity. Set its **Body** property to show the Work Order ID, Oper ID, and the Seq No for the selected Job.

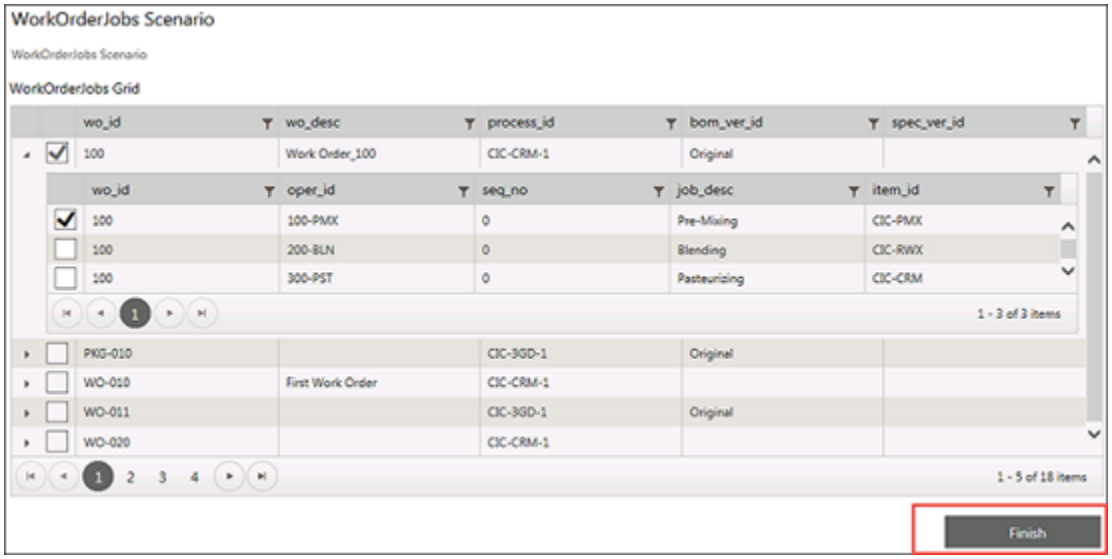


11. Publish and Test Run the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



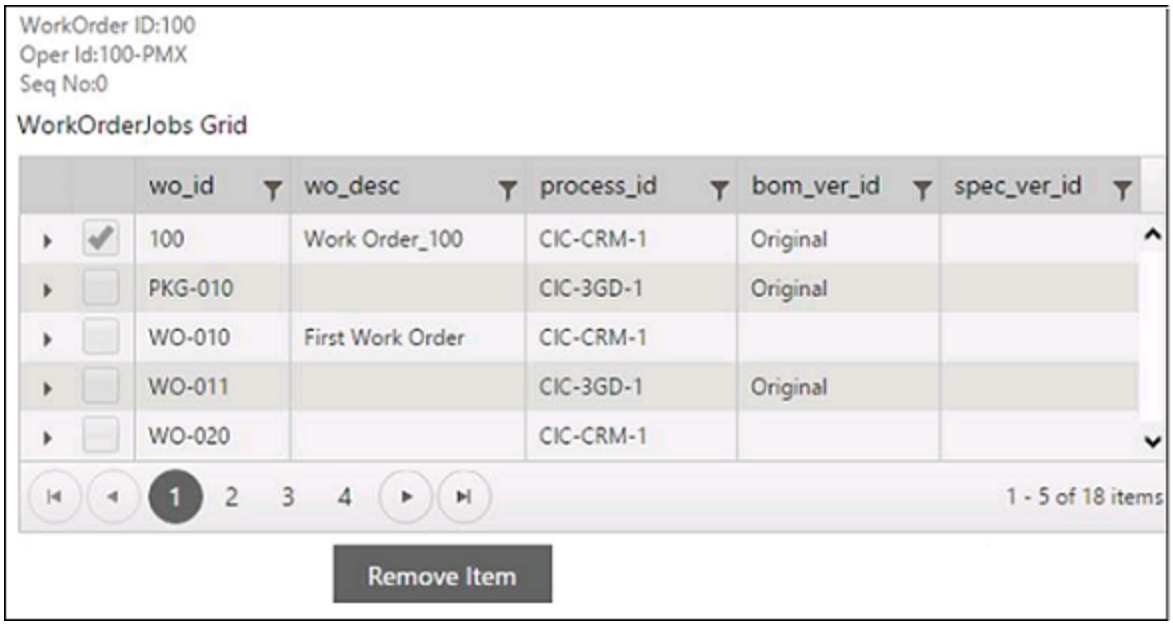
12. Select rows from **Work Order Jobs Grid** in the form and then click **Finish**.



13. Information is sent with the details of the selected job.

Workflow	Subject	Activity Display Name	Priority	Response By	Assigned On
WorkOrder Jobs WF	100 100-PMX 0	Information2	●		12/8/2015 5:00:02 PM
WorkOrder Jobs WF	100 0 100-PMX	Information2	●		12/8/2015 4:58:31 PM
WorkOrder Jobs WF	100-PMX 0	Information2	●		12/8/2015 3:58:19 PM

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Create a Hierarchical Data Grid

You can create a multilevel hierarchical data grid to map multiple data sources.

In the following example we create one non parameterized lookup (Work Order) and three parameterized lookups (**Jobs**, **Job Steps**, and **Job Steps Data**). Then, we create a four level hierarchical data grid using the lookups and map all the parameters.Then, design a form and use this data grid in the form using the **Data Grid** control.

1. Create the following four lookups:
   a. **Work Order** -Non-parameterized
   b. **Jobs** - Parameterized on the Work Order lookup(**wo_id**)
   c. **Job Steps** -Parameterized on the **Jobs** lookup (**wo_id**, **oper_id**, **seq_no**)
   d. **Job Steps Data** - Parameterized on the **Job Steps** lookup (**wo_id**, **oper_id**, **seq_no**, **step_no**)
2. Create a four level, hierarchical grid configuration and name it as **MES Configuration**.
3. Select the data sources in the same order as the lookups created in step 1 .
4. Click **Parameter Mapping**.
   The parameter mapping screen appears. Map the child parameters to the parent column.
5. Save the parameter mapping and the grid configuration.
6. Design a form and consume the grid configuration, **MES Configuration** in the **Data Grid** control.
7. Click **Preview**.

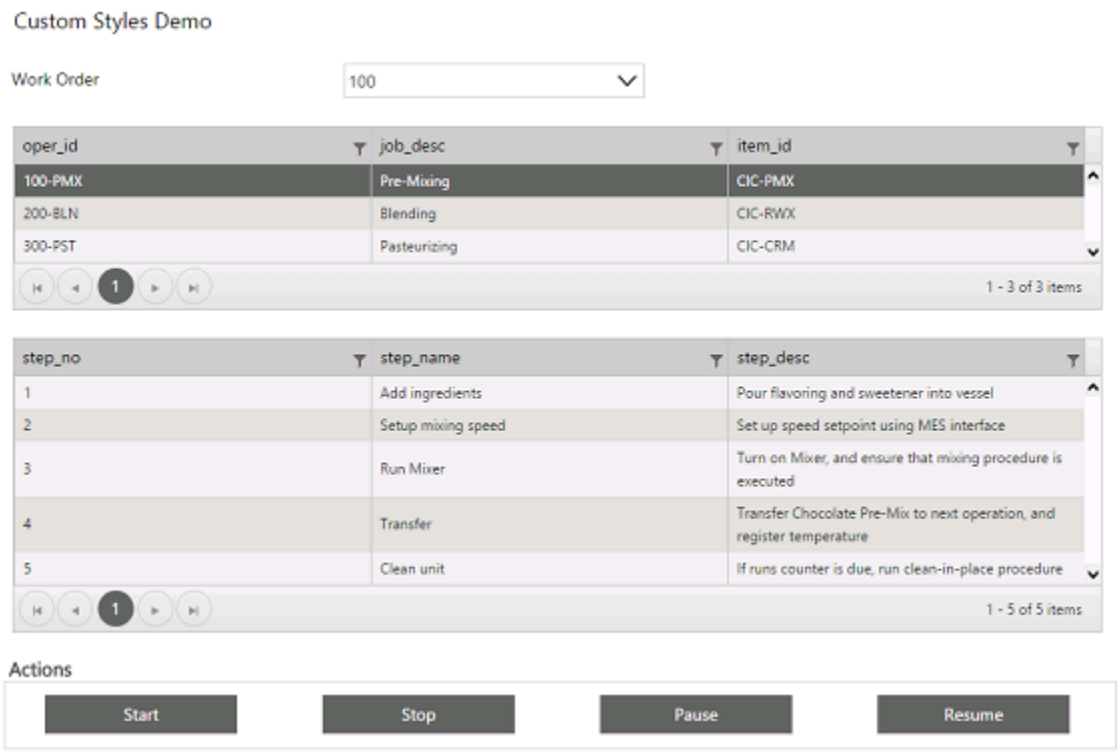
Customize Forms Using Custom Styles

You can customize forms using custom styles to change the style of the forms user interface.

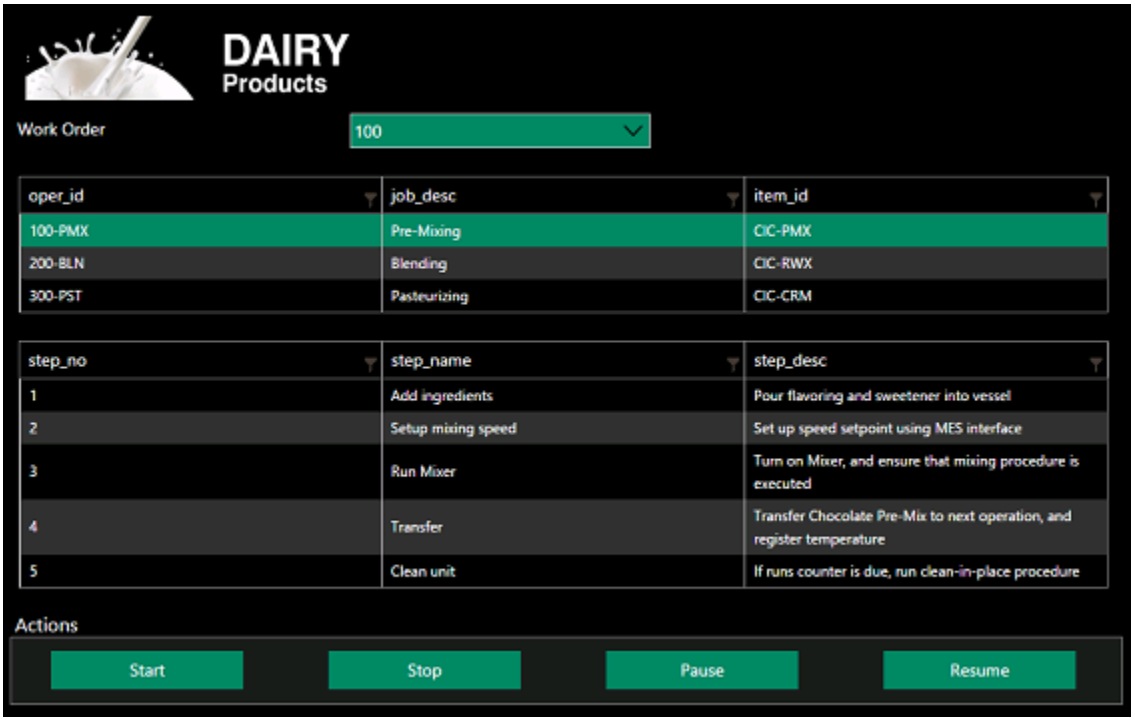
Here we will customize a form with **Data Lookup**, **Data Grid**, **Panel Form**, and **Button** controls using custom styles.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Default Form



Customized Form



1. Create a form, and add **Data Lookup**, **Data Grid**, **Panel Form**, and **Button** controls.
2. Modify properties of the form as follows:
   a. In the **Appearance** tab, set the **Custom Style Sheet** property to **WorkOrderStyles** (the name of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

custom style sheet).

For example, **WorkOrderStyles** for style sheet located at **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/css/WorkOrderStyles.css.**

Note:
- For earlier versions of the product, the location for style sheet is **BPMUITemplates/Default/Themes/<ThemeName>/NextGenForms/css/custom/WorkOrderStyles.css**
- If **Theme** is not applied and if the style sheet name is tagged with **FormCustomPath:** or **FormCustomThemePath:**, the location is **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/css/WorkOrderStyle.css**
- If **Theme** is applied and if the style sheet name is tagged with **FormCustomPath:** or **FormCustomThemePath:**, the location is **<Installpath>/Web/BPMUITemplates/Default/NextGenForms/custom/Themes/<ThemeName>/css/WorkOrderStyle.css**

3. In the **WorkOrderStyle.css**, code as follows:

```
/* Changing the Background Color */
html:not(.skd) .skfcn
{
background-color: black;
}
/* Form Header Styles */
html:not(.skd) .skh
{
background-image: url(../images/Dairy-Header2.png);
background-repeat: no-repeat;
background-position: 20px 10px;
height: 80px;
}
/* Hiding the Form Title Text*/
html:not(.skd) .skh .sktt
{
display: none;
}
/* Controls Label Styles - Using without Custom Style Identifier as it needs to be applied to all control labels */
html:not(.skd) .skctr .skfli
{
color: white;
}
/* Grid Styles - With Custom Style Identifier 'jobSteps' */
html:not(.skd) .jobSteps_skctr .k-grid
{
border-color: rgb(128, 128, 128);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
background-color: #000;
}
/* Grid Header Styles */
html:not(.skd) .jobSteps_skctr .k-grid .k-grid-header
{
border-color: rgb(128, 128, 128);
background-color: #000;
padding-right: 0 !important;
}
/* Grid Header Cell Styles */
html:not(.skd) .jobSteps_skctr .k-grid .k-grid-header table th[role="columnheader"]
{
background-color: #000;
}
/* Grid Header Cell Text Styles */
html:not(.skd) .jobSteps_skctr .k-grid .k-grid-header table th[role="columnheader"] .k-
link
{
color: #FFF !important;
}
/* Grid Content Styles */

Data Binding Drop-Down Controls Using Lookups

You can populate the options of a drop-down control, that is options binding, using a lookup through a data grid control set as data source on the same form.

You can use any type of lookup (**Database, Repository List**, or **Web API** for data binding options of **Check Box**, **List**, **Drop-Down**, or **Radio Button** control.

1. Create a lookup.
2. Create a **Grid Configuration** using the lookup.
3. Create a form, and add a **Data Grid** control.
4. Modify properties of the **Data Grid** control as follows:
   a. In the **Basic** tab, set the **Configuration Name** property to the grid configuration created in Step 2.
   b. In the **Advanced** tab, set the **Behavior** property to **Data Source**.
5. Add a **Drop-Down** control to the form.
6. Modify properties of the **Drop-Down** control as follows:
   a. In the **Advanced** tab, set the **Text Parameter** and **Value Parameter** properties to the column names of the grid as required.
   b. In the **Scripts** tab, set the script for the **Options** property as follows:

   ```
   return control.findById("G1").source;
   ```

Data Binding Drop-Down Controls Using Lookup Name (Non-parameterized)

You can populate the options of a drop-down control, that is options binding, using a lookup name.

You can use any type of lookup (**Database**, **Repository List**, or **Web API** for data binding options of **Check Box**, **List**, **Drop-Down**, or **Radio Button** control.

1. Create a lookup with the name **Products**.
   Let us consider that Products is a Database lookup with the following configuration:
   Query- select * from Products
   Value- Products.ProductKey
   Display Name- ProductName
2. Add a **Drop-Down** control to the form.
3. Modify properties of the Drop-Down control as follows:
   a. In the **Advanced** tab, set the **Text Parameter** to **ProductName** and **Value Parameter** to **ProductKey**.
   b. In the **Scripts** tab, set the script for the **Options** property as follows:
   `return SFU.getLookupSchemaAndData("Products").Data;`

Data Binding Drop-Down Controls Using a Lookup Name (Parameterized)

You can populate the options of a drop-down control that is options binding, using a parameterized lookup

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

name.

You can use any type of lookup (**Database**, **Repository List**, or **Web API** for data binding options of **Check Box**, **List**, **Drop-Down**, or **Radio Button** control.

1. Create a lookup with the name **Products** that is parameterized on **Productcategory**
   Let us consider that **Products** is a Database lookup with the following configuration:
   Query- select * from Products where ProductCategoryKey = @key
   Value- Products.ProductKey
   Display Name- ProductName
2. Add a **Drop-Down** control to the form.
3. Modify properties of the **Drop-Down** control as follows:
   a. In the **Advanced** tab, set the **Text Parameter** to **ProductName** and **Value Parameter** to **ProductKey**.
   b. In the **Scripts** tab, set the script for the **Options** property as follows:

```
var parameterCollection = [
{
Name: "@key",
Value: "Bikes"
}];
var lookupSchemaAndData = SFU.getLookupSchemaAndData("Products",
parameterCollection);
return lookupSchemaAndData.Data;
```

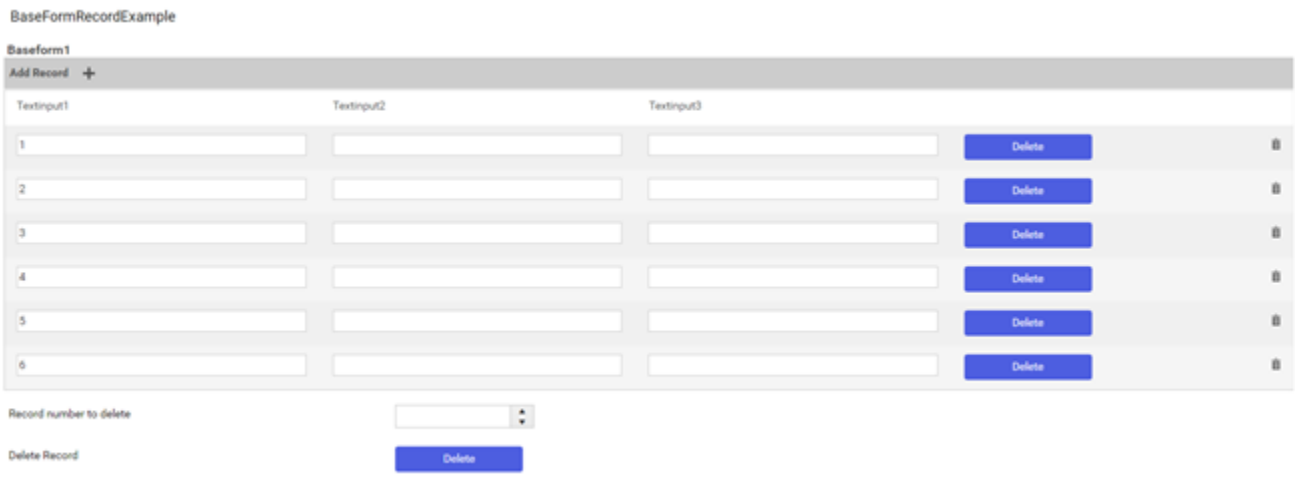
Delete Record in a Base Form Control

Consider a BaseForm control containing several **TextInput** controls and a **Delete** button with a custom OnClick script as follows:

```
control.dataContainerForm.removeRecord(control.associatedForm);
// you can also use below script to delete the record
// control.associatedForm.remove();
```

Here, the control referred to is the **Delete** button, as specified in the OnClick script.

`control.associatedForm` represents the record within the BaseForm control while `control.dataContainerForm` represents the BaseForm control itself.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For a BaseForm control, the `removeRecord` API, as demonstrated in the script, facilitates the removal of a record.

Another example is the presence of a **Number** control labeled **Record number to delete**, where the user can specify the record number to be deleted. Additionally, there is a delete record option with **Delete** button equipped with a custom OnClick script designed to delete the specified record as shown below:

```
numberRecordControlValue = control.findByXmlNode("Recordnumbertodelete").value;
var recordNumber = SFU.isNumber(numberRecordControlValue)?
parseInt(numberRecordControlValue) : 0;
if (recordNumber > 0 && recordNumber <=
control.findByXmlNode("Baseform1").records().length)
{
control.findByXmlNode("Baseform1").removeRecord(
control.findByXmlNode("Baseform1").records()[recordNumber - 1]
);
// you can also use below script by giving the record number to be deleted
// control.findByXmlNode("Baseform1").removeAt(recordNumber); // This method does not
require a zero based index value for the record number
}
else
{
SFU.showError(document.title, "Please specify a valid record number");
}
```

Get User Information of Logged-on User

You can get user information of the logged-on user using SFU.getVirtualActorId() and SFU.getUserLookupExtendedInformation() APIs.

Here we will use these APIs to get user information of the logged-on **Active Directory** user.

1. Create a form with seven **Text** controls on the form.
2. Modify the properties of the **Form** as follows:
   a. In the **Scripts** tab, set the script for the **On Form Load** property as follows:

   // Get logged-on user information of the Active Directory User.

   var virtualActorId = SFU.getVirtualActorId();

   // Get the Extended Information for the user using the Virtual Actor ID.

   // Here loggedOnUserInformation holds the property names of the provider.

   var loggedOnUserInformation = SFU.getUserLookupExtendedInformation(virtualActorId);

   // Populate the Text controls with the user information.

   control.findById("T1").value = loggedOnUserInformation.UserDepartment;

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.findById("T2").value = loggedOnUserInformation.UserDesignation;
control.findById("T3").value = loggedOnUserInformation.UserDisplayName;
control.findById("T4").value = loggedOnUserInformation.UserDistinguishedName;
control.findById("T5").value = loggedOnUserInformation.UserEmail;
control.findById("T6").value = loggedOnUserInformation.UserId;
control.findById("T7").value = loggedOnUserInformation.UserManager;
control.findById("T8").value = loggedOnUserInformation.UserName;
control.findById("T9").value = loggedOnUserInformation.UserRole;
```

Hide the Column Header in a Data Grid

To hide the column header in a data grid, write the following script in ODB event of the grid:

```
var dataSource = skelta.grid.getDataSource(e.sender);
if(dataSource === "Job")
{
//this hides the columns header of Job grid
e.sender.thead.closest(".k-grid-header").hide();
}
```

Localize BlockingOutput Messages for Invoke Workflow Control

You can localize **BlockingOutput** messages for the **Invoke Workflow** control.

1. Create a workflow with a **BlockingOutput** activity and set the message as **@@MyBlockingOutput@@** (localization key).
2. Add a key-value pair in an existing or a new text file in the **<AVEVA Work Tasks Install Path>\Locales\<culture>\Forms2** folder in the following format:

   `@@<localization_key>@@:Localized Value`
3. Create a form, and add an **Invoke Workflow** control and a **Text** control.
4. Modify properties of the **Invoke Workflow** control as follows:
   a. In the **Basic** tab, set the **Workflow Details**, **XML Variable Name**, and **XML Schema** properties.
   b. In the **Advanced** tab, set the **Execution Mode** property to **Synchronous** to synchronously trigger the workflow created in step 1.
   c. In the **Scripts** tab, set the script for the **Post-Workflow Execution** property as follows:

      `control.findById("T1").value = skelta.localize.getString("@@MyBlockingOutput@@");`
5. Publish the workflow.
6. Preview the form, and click the **Invoke Workflow** control to get the localized value in the **Text** control.

Prevent Duplicate Data Entries in Controls

You can prevent duplicate data entries in controls for records.

In this example, we create a form with the fields, **Bill Ref No.** , **Bill Date**, and **Amount**. When you add multiple

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

records, and enter same values for the **BIll Ref No.** , a validation message appears.

1. Create a form. Here, we have named it **Duplicate Validation Sample**.
2. Add a **Base Form** control to the form and name it **Bill Details**.
3. Add a **Text** control to the **Base Form** control and modify the properties of the **Text** control as follows:
   a. In the **Basic** tab, set the **Name** property to **Bill Ref No.** , and **XML Node** to **BillRefNo**.
   b. In the **Scripts** tab, set the script for the **Validate** property as follows:

```
/*Check for Bill Reference Number duplication in the form.*/
var returnObj = new ValidationOptions();
returnObj.isValid = true;
returnObj.message = "";
var currentContainer = control.dataContainerForm;
var currentContainerRecords = currentContainer.records();
var currentRecordIndex  = currentContainerRecords.indexOf(control.associatedForm);
for (var i = 0; i < currentContainerRecords.length; i++)
{
// Need not check for duplicate values in the same record.
  if (currentRecordIndex !== i)
  {
    if
(currentContainerRecords[i].findChildRecordControlByXmlNode("BillRefNo").value.toLowerCase()
=== currentValue.toLowerCase())
    {
      returnObj.isValid = false;
      returnObj.message = "Duplicate values are not allowed";
      break;
    }
  }
}
return returnObj;
```

4. Add a **Date** control, and name it **Bill Date**.
5. Add a **Number** control, and name it **Amount**.
6. **Save** and **Publish** the form.
7. **Preview** the form.
8. Enter a value under the **Bill Ref No.** field.
9. Add another record, and enter the same value again under the **Bill Ref No.** field.
   The following validation message appears below the **Bill Ref No.** field of the second record:
   Duplicate values are not allowed
10. Click **Finish**. An error message appears. The validation message also appears below the **Bill Ref No.** field of

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the first record.

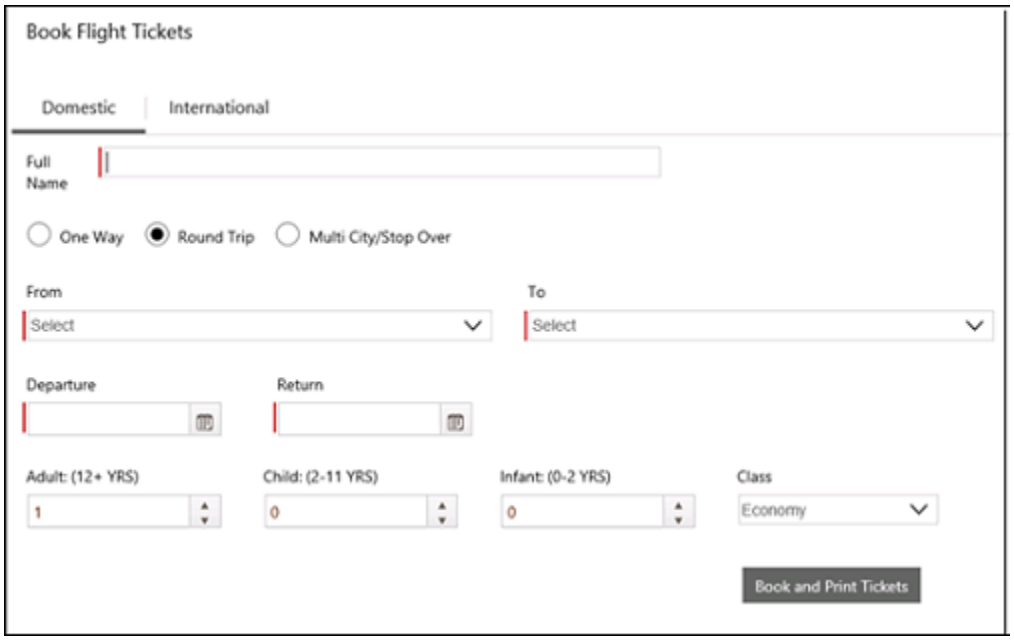
Print a Form

In the following example, we create two forms. The first form is the main form , called **Book Flight Tickets**. The user uses this form to book the flight tickets.

The second form is the **Booking Confirmation** form. This form serves as a confirmation for the tickets booked.

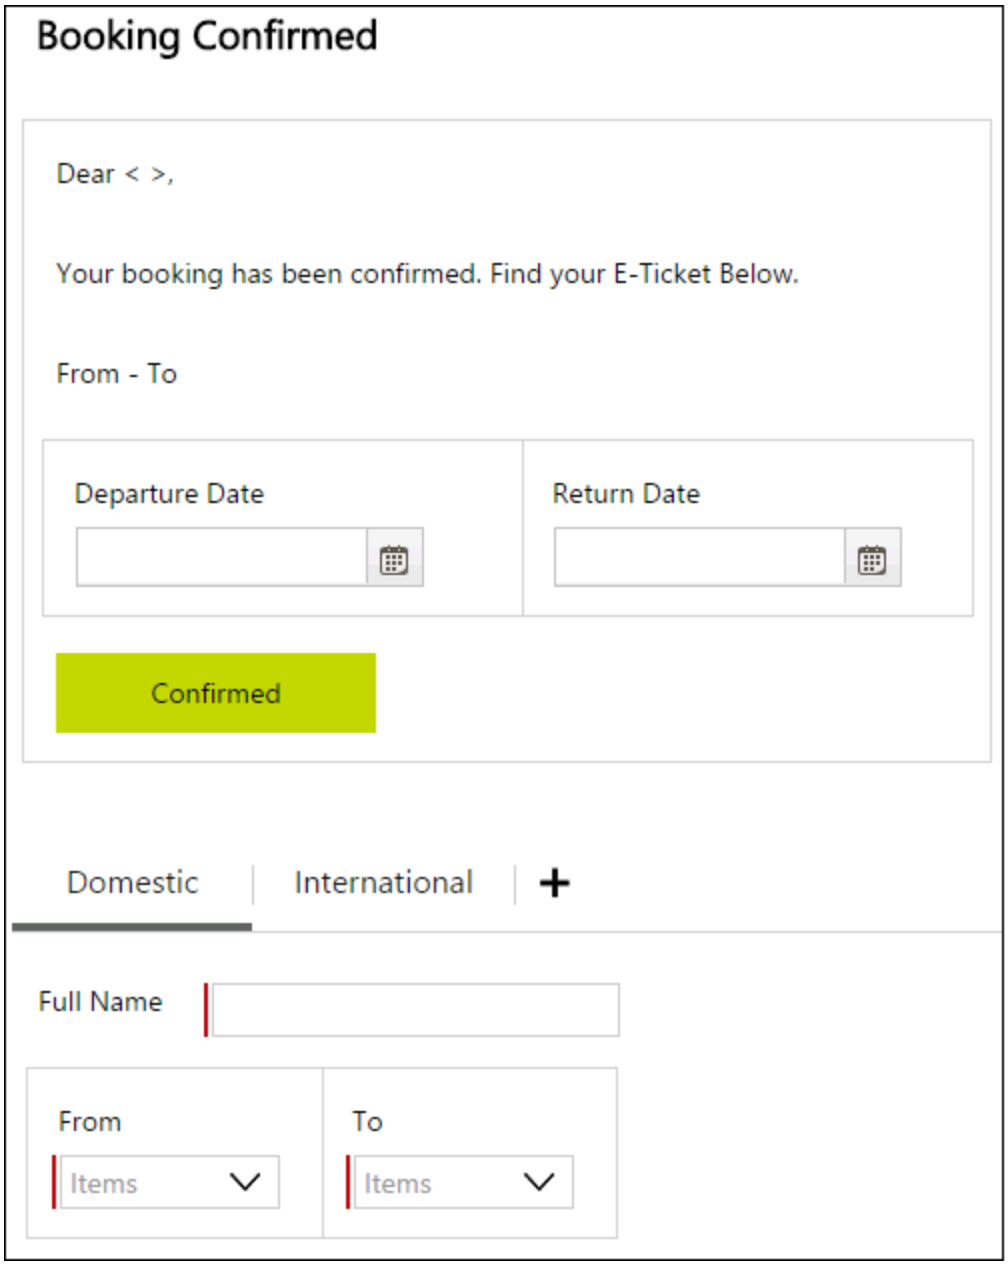
The controls in the **Booking Confirmation** form are mapped to the controls of the **Book Flight Tickets** form. Also, the **Print Form** property in the **Book Flight Tickets** form is set to the **Booking Confirmation** form. After the user books the flight tickets using the the **Book Flight Tickets** form, and clicks **Book and Print Tickets**, the user receives a confirmation.

1. Create the **Book Flight Tickets** form as shown in the image below.



2. Modify the properties of the **Book and Print Tickets** button control as follows:
   a. In the **Basic** Tab, set the **Button Type** as **Print**.
3. Create the **Booking Confirmation** form as shown in the following image:

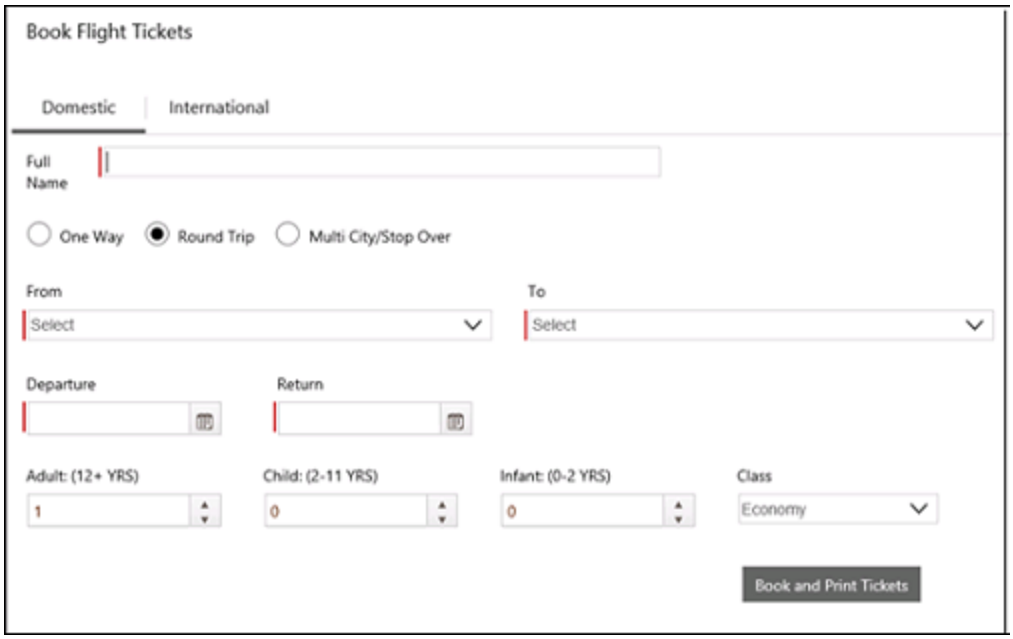
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



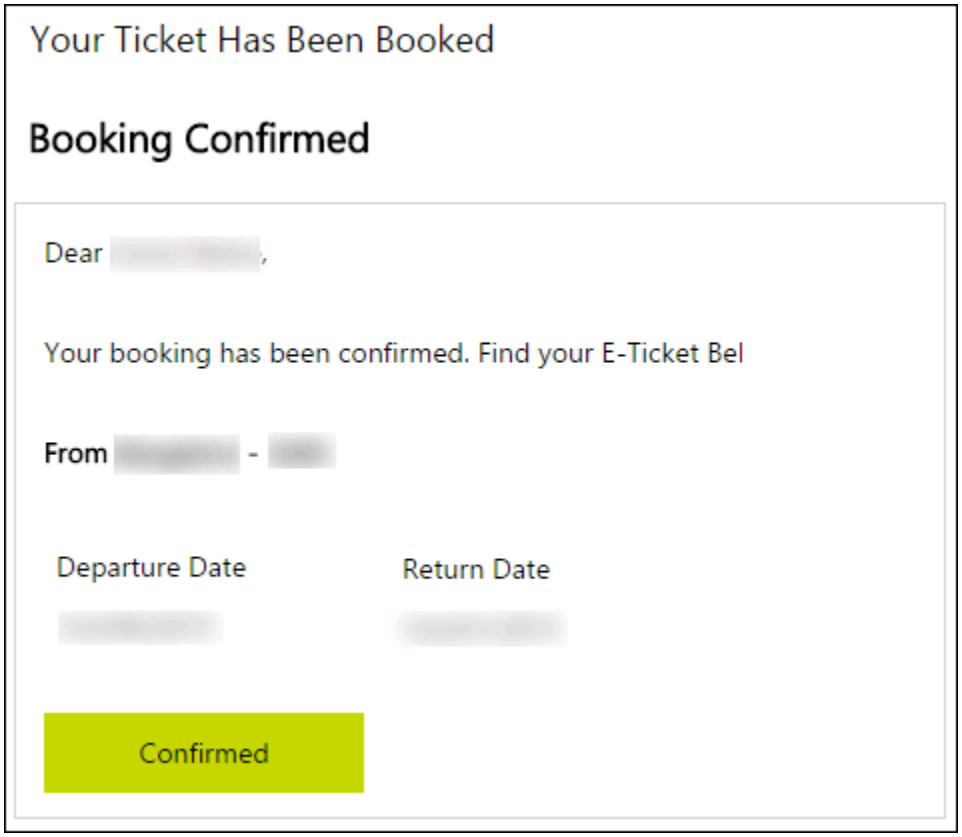
Note: Make sure the XML node value is same across the main form and the print form for the values to be mapped.

4. Modify the properties of the **Book and Print Tickets** button control as follows:
   a. In the **Basic** Tab, set the **Print Form** property to the **Booking Confirmation** form.
5. Publish both the forms.
6. Preview and fill the values in the **Book Flight Tickets** form. Refer to the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



7. Click **Book and Print** Tickets.The following screen appears.



You can now print this confirmation.

Select and Act on Multiple Work Items Using the Enable Multi Select option

In the following example, we demonstrate the use of the **Enable Multi Select** option in the **Inbox**, by selecting

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

multiple work items related to Invoke Form Activity and acting on them from the inbox.

1. Create a **Leave Request** form, with **From** and **To** fields using **Date** control and and a **Comments** field using the **Text** control.
2. Create a **Manager Approval** form with a **Comments** field using **Text** control.

   Note: Ensure that the XML Node property details of the **Text** control (Comments field) is the same in the **Leave Request** and **Manager Approval** forms.
3. Create a workflow, with an **Invoke Form Activity**. Name the workflow as **Leave Manager**.
4. Modify the activity properties of the **Invoke Form Activity** as follows:
   a. Set the **Form Name** property to the Leave Request form.
   b. Select **Input Instance XML** as **SFFormData**.
   c. Set the **Form to be opened on work item multi-select** to **Manager Approval** form.
   d. Select **Output Instance XML** as **SFFormData**.
5. In **Fill Form**, click **Leave Request**.The **Leave Request** form opens. Select the **From** and **To** date and click **Finish**.

   The first leave request gets submitted.
6. Repeat step 5 to create multiple leave requests.
7. In **Inbox**, click the **Enable Multi Select** option.

   Check boxes appear under **Workflows**, indicating that the **Enable Multi Select** option is enabled.
8. Right-click on a workflow and select **Select all similar items**.

   All the similar workflows get selected and the **Manager Approval** form opens.
9. Type your comments and click **Finish**.
10. All the selected leave requests are removed from **Fill Form** and their output instance XML gets updated with the common comments given in the **Manager Approval** form.

Set the Consider Available Height and Dynamic Page Size Properties

1. Create and design a form with the following controls:
   - Two Tabs
   - Panel Form with two columns
   - Data Grid
   - Embed Form
2. Configure the required properties in all the above controls and set the **Consider Available Height** property for all the controls to **Yes**.
3. In the **Data Grid** control, set the **Dynamic Page Size** property to **Yes**.
4. If the controls are within a nested container and if the value of the **Consider Available Height** property is set to **Yes** for the child control, then this property should be set to **Yes** in all parent containers.

Set Values for a Data Grid on Post Execution of a Workflow

You can set values for a Data Grid, after a workflow is executed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Create a form with a **Data Grid**, **Hidden Field**, and **Invoke Workflow** controls.
2. Create a **Work Order** lookup.
3. Modify properties of the Data Grid control as follows:
   a. In the **Basic** tab, set the **Configuration Name** property to **WorkOrder** lookup created in step 2.
   b. In the Advanced tab, set the script for the **On Data Bound** property as follows:

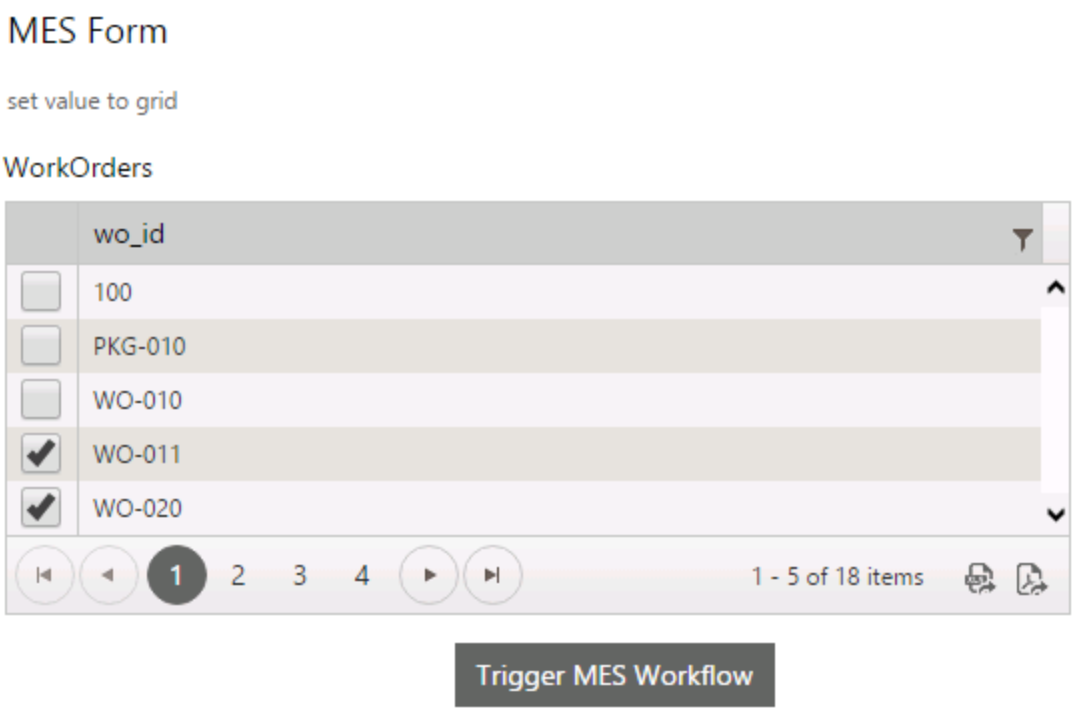
```
var gridValues = control.findById("H1").value;//"100,WO-010"
if (gridValues)
{
var workOrders = [];
var values = gridValues.split(",");
for (var i = 0; i < values.length; i++)
{
workOrders.push({ "wo_id": values[i] });
}
//grid object has to be in this json object format
//Grid object with property data which is again an object with property of workorder which is lookup name which is always an array of objects with property as perists column names
var gridValue = { Grid: { Data: { WorkOrder: workOrders } } };
//the below api is used to get xml from the object.
var gridXml = SFU.getXmlFromJSONObject(gridValue);
//grid value is encoded xml
control.value = encodeURIComponent(gridXml);
}
```

   The script gets a value from the **Hidden Field** control,and sets the value for the Data Grid. The Data Grid internally selects the appropriate checkboxes.
4. Save the Data Grid.
5. In the **Scripts** tab, set the script for the **Post-Workflow Execution** property as follows:

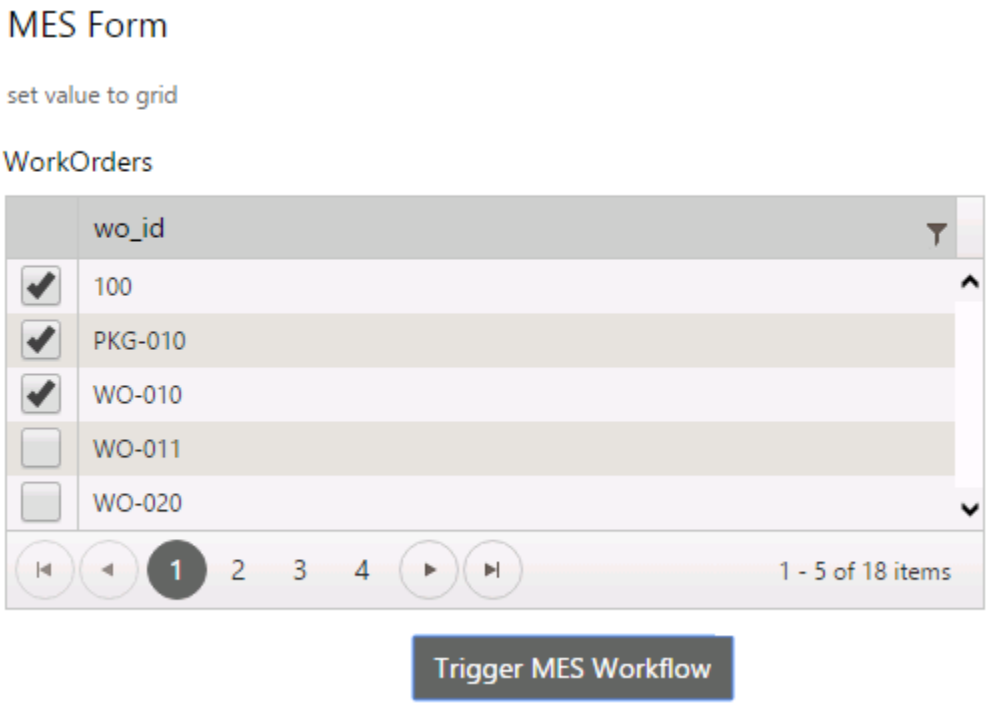
```
control.findById("H1").value= blockingOutput;
control.findById("G1").refreshGrid();
```

   The script sets the value for the **Hidden Field** control with the blocking output, and the **Data Grid** control is refreshed.
6. Save the Invoke Workflow.
7. During run time, select the appropriate checkboxes on the grid,and trigger the workflow using the Invoke Workflow .

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



8. During post execution of the workflow, the grid is refreshed and the new values are automatically selected.



Show Embedded Data from Web API Lookup in Data Grid

You can map **Web API Lookup** with columns containing JSON objects to **Data Grid** columns to show embedded data instead of JSON strings using scripts.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Here we will parse the JSON string in the 8th column of the **Data Grid** to show only the names.

1. Create a **Web API Lookup** with a column containing JSON object.
2. Create a **Grid Configuration** using the lookup.
3. Create a form, and add a **Data Grid** control.
4. Modify properties of the **Data Grid** control as follows:
   a. In the **Advanced** tab, set the script for the **On Data Bound** property as follows:

```
var kGrid = e.sender;
var allRows = $(kGrid)[0].tbody[0].children;
ko.utils.arrayForEach(allRows, function(eachRow)
{
// Here 8 is the column number containing JSON object.
var oldText = $(eachRow).find("td:eq(8)").text();
$(eachRow).find("td:eq(8)").text($.parseJSON(oldText).Name);
});
```

Note: The script only affects the displayed values in the **Data Grid**. Filtering and sorting is still based on the actual JSON string and not the displayed data.

Show Icons in Data Grid Columns

You can replace text with icons in a column of a **Data Grid** using CSS.

Here we will replace the text **Yes** and **No** with a green and a red colored icon respectively in the **Published** column of the **Data Grid**.

1. Create a lookup (**Database**, **Repository List**, or **Web API**).
2. Create a **Grid Configuration** using the lookup.
3. Create a form, and add a **Data Grid** control.
4. Modify properties of the **Data Grid** control as follows:
   a. In the **Basic** tab, set the **Configuration Name** property to the grid configuration created in Step 2.
5. Place images (icons) for replacing the text in the **<Installpath>/Web/<BPMUITemplates>/NextGenForms/custom/Themes/<ThemeName>/images** folder.

   Note:
   - If the image name is tagged with **FormCustomPath:**, the location of image is **<Installpath>/Web/<BPMUITemplates>/NextGenForms/custom/images**
   -If the image name is tagged with **FormCustomThemePath:**, the location of image is **<Installpath>/Web/<BPMUITemplates>/NextGenForms/custom/Themes/<ThemeName>/images**
   - For AVEVA Work Task Pro App, if the image name is tagged with **FormCustomPath:** or **FormCustomThemePath:**, the location is **<Installpath>/Web/<BPMUITemplates>/NextGenForms/custom/images**
   - For AVEVA Work Tasks Pro App, mapping of themes is not considered.
6. Create a CSS file, code it as follows, and place it in the **<Installpath>/Web/<BPMUITemplates>/NextGenForms/custom/Themes/<ThemeName>/NextGenForms/**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

css folder.

```
.Published
{
background-repeat: no-repeat;
background-image: url("../images/bullet_green.png");
background-position: center;
}
.Draft
{
background-repeat: no-repeat;
background-image: url("../images/bullet_red.png");
background-position: center;
}
```

7. Modify properties of the **Data Grid** control as follows:
   a. In the **Advanced** tab, set the script for the **On Data Bound** property as follows to replace text with icons in the **Published** column at run-time:

```
var kGrid = e.sender;
var allRows = $(kGrid)[0].tbody[0].children;
ko.utils.arrayForEach(allRows, function(eachRow)
{
// Here 5 is the Published column
// which is the fifth column in the Data Grid
// with values Yes or No.
var oldText = $(eachRow).find("td:eq(5)").text(), className = "";
if(oldText === "Yes")
{
className = "Published";
}
else
{
className = "Draft";
}
$(eachRow).find("td:eq(5)").text("");
$(eachRow).find("td:eq(5)").addClass(className);
});
```

Note: The records in a grid are not filtered when text is replaced with icons.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Update Column Names in a Base Form

You can update the column names in a **Base Form** with **Display Mode** set to **Grid** by updating the tag name of the control present in the column.

1. Create a form, and add a **Base Form** container control.
2. Add 2 controls to the record of the **Base Form** container control as follows:
   - **Text** control for the first column.
   - **Number** control for the second column.
3. Add a **Button** control and name it **Update Column Names**.
4. Modify properties of the **Button** control as follows:
   a. In the **Basic** tab, set the **Button Type** as **Custom**.
   b. In the **Advanced** tab, set the script for the **On Click** property as follows:

```
control.findByXmlNode("FirstColumn").tagName = "Updated Column 1 Name";
control.findByXmlNode("SecondColumn").tagName = "Updated Column 2 Name";
```

Use Data from Data Grid Set As Data Source

You can set the **Behavior** property of a **Data Grid** to **Data Source** to use the data without showing the **Data Grid** control on the form.

Here we will use data from a **Data Grid** set as **Data Source** to set the **Button Text** for several buttons.

1. Create a lookup (**Database**, **Repository List**, or **Web API**).
2. Create a **Grid Configuration** using the lookup.
3. Create a form, and add a **Data Grid** control.
4. Modify properties of the **Data Grid** control as follows:
   a. In the **Basic** tab, set the **Configuration Name** property to the grid configuration created in Step 2.
   b. In the **Advanced** tab, set the **Behavior** property to **Data Source**.
5. Add a **Text** control and several **Button** controls to the form.
6. Modify the properties of the **Text** control as follows:
   a. In the **Scripts** tab, set the script for the **Value** property as follows to set the **Button Text** with the **Job_wo_id**.

```
var numRec;
var ctrlId;
var dataSrc = control.findById("G1").source;
// Loop through the records returned.
if(dataSrc.length > 0)
{
for (i = 0; i < dataSrc.length; i++) {
numRec = i + 1;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
ctrlId = "B" + numRec;
control.findById(ctrlId).buttonText = dataSrc[i].Job_wo_id;
}
}
// Return number of records.
return dataSrc.length;
```

Use Data from Parameterized Data Grid in Base Form

You can populate controls on a **Base Form** on selection of a record in a **Data Grid**, using data from another **Data Grid** set as **Data Source**.

Here we will use the **Work Order** data lookup to populate the **Jobs** data grid on selection of a **Work Order ID** from the **Work Order** data lookup. Then we will populate the controls in the **Job Steps** base form from the selection of the record in the **Jobs** data grid, using data from **Job Steps** data grid that was set as data source.

1. Create 3 lookups (**Database**, **Repository List**, or **Web API**):
   - **Work Order**
   - **Jobs** (parameterized on **Order ID** from **Work Order** lookup)
   - **Job Steps** (parameterized on **Work Order ID** and **Jobs ID** from **Jobs** lookup)
2. Create a **Grid Configuration** using the lookups:
   - **Jobs**
   - **Job Steps**
3. Create a form, and add a **Data Lookup** control for **Work Order** lookup.
4. Modify properties of the **Data Lookup** control (**Work Order**) as follows:
   a. In the **Basic** tab, set the **Lookup Source** property to the **Work Order** lookup created in Step 1.
5. Add a **Data Grid** control for **Jobs** lookup.
6. Modify properties of the **Data Grid** control (**Jobs**) as follows:
   a. In the **Basic** tab, set the **Configuration Name** property to the grid configuration created in Step 2, and set the **Parameters** as **Work Order** (that is the **Work Order** data lookup control).
   b. In the **Advanced** tab, set the **Select First Record** property to **Yes** to automatically select the first record when the **Data Grid** control is loaded.
7. Add a **Data Grid** control for **Job Steps** lookup.
8. Modify properties of the **Data Grid** control (**Job Steps**) as follows:
   a. In the **Basic** tab, set the **Configuration Name** property to the grid configuration created in Step 2, and set the **Parameters** as **Work Order ID** and **Jobs ID** (from **Jobs** data grid control).
   b. In the **Advanced** tab, set the **Behavior** property to **Data Source**.
9. Add a **Base Form** container control for **Job Steps**.
10. Add 3 controls to the record of the **Base Form** container control (**Job Steps**) as follows:
    - **Text** control for **JobStepDescription**
    - **Number** control for **ProcessOrderID**
    - **Number** control for **BatchNumber**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

11. Modify properties of the **Data Grid** control (**Jobs Steps**) as follows:
    a. In the **Advanced** tab, set the script for the **On Data Bound** property as follows to populate the controls on the record of the **Base Form** container control (**Job Steps**):

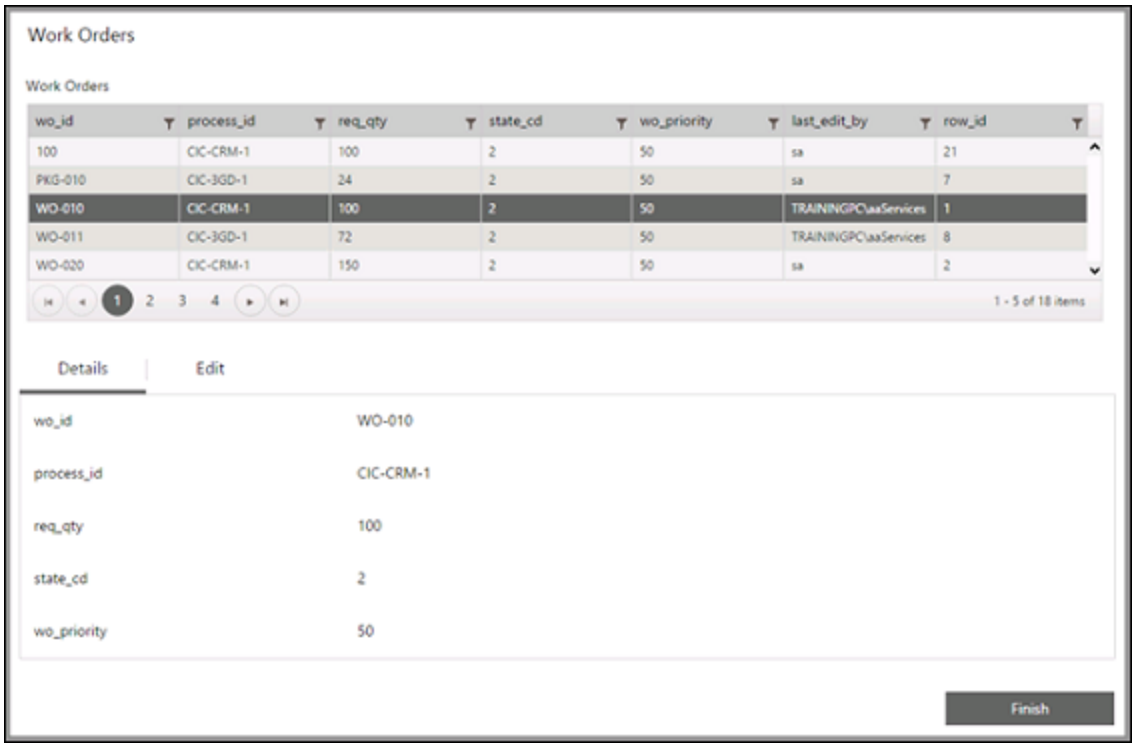
```
// Here B1 is the Job Steps Base Form container control.
var b1 = control.findById("B1");
b1.removeAll();
var stepsSource = control.source;
if (stepsSource && stepsSource.length > 0)
{
ko.utils.arrayForEach(stepsSource, function (parameter)
{
var newRecord = b1.addRecord();
newRecord.findById("T1").value = parameter.JobStepDescription;
newRecord.findById("N1").value = parameter.ProcessOrderID;
newRecord.findById("N2").value = parameter.BatchNumber;
});
}
```

Use the Security APIs

In the following example, we create a **Work Order** form and we hide controls based on the Security Group of the user viewing the form.

1. Create a **Work Order** form as shown in the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



2. Modify the properties of the **Edit** tab of the **Tabs** control as follows:
   a. In the **Scripts** tab, set the script for the **Visible** property as follows:

```
var securityGroup = SFU.getUserSecurityGroup();
if(securityGroup === "WorkOrderAdmin")
{
return true;
}
return false;
```

3. Publish the form.

The **Edit** tab is not visible to a user who does not belong to the **WorkOrderAdmin** security group.

Note: You can use `SFU.getUserRoles()` and `SFU.getValueForRightCode()` security API's in the same way as described in this example.

View Attachments uploaded from Forms

You can view attachments uploaded from forms in ASPX pages using scripts as follows.

Here we will view a photograph uploaded from a form in an ASPX page.

1. Create a list and the dynamic list form.
2. Populate the list using the dynamic list form, and also upload the photograph using the attachment control on the form.
3. Create an ASPX page with a button control.
4. Code the on click event for the button as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
protected void Button_Click(object sender, EventArgs e)
{
securedValue.HeaderPersisted = true;
this.LoadFileContent(true, "Emp001");
}
private void LoadFileContent(bool isHeaderPersisted, string title)
{
var dbConnection = new SqlConnection();
try
{
int startIndex = 0;
if (isHeaderPersisted)
{
AttachmentHeader header = new AttachmentHeader();
// Repository Name
header.ApplicationName = "Forms Repository";
// Attachment File Name
header.FileName = securedValue.FileName;
header.HeaderVersion = 1;
byte[] info = header.BuildHeader();
startIndex = info.Length;
}
// Connection string
dbConnection.ConnectionString =
ConfigurationManager.ConnectionStrings["myConnectionString"].ConnectionString;
// SQL command for querying the database table
var command = new SqlCommand("select Id, Photograph from Employee where Title=@title",
dbConnection);
// Parameter for the title column
command.Parameters.AddWithValue("@title", title);
// Open the database connection
dbConnection.Open();
// Execute reader
var reader = command.ExecuteReader();
// Read the data from reader and write the same into the Context.Response
if (reader.HasRows)
{
while (reader.Read())
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
    Byte[] bytes = (Byte[])reader.GetValue(1);
    var ms = new MemoryStream(bytes);
    Byte[] thumbnailByteArray = new Byte[ms.Length];
    ms.Position = startIndex;
    ms.Read(thumbnailByteArray, 0, Convert.ToInt32(ms.Length));

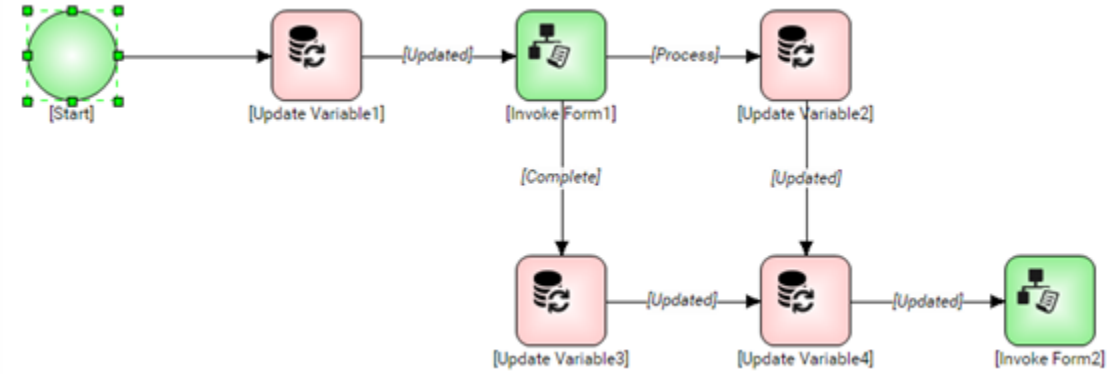
// File type
Response.ContentType = "application/jpg";
Response.BinaryWrite(thumbnailByteArray);
Response.Flush();
}
}
}
catch (Exception ex)
{
throw ex;
}
finally
{
// Close the database connection
dbConnection.Close();
}
```

Access Attachments from Another Form

You can access or use the Attachments submitted in a different form by using Update Variable Activity.

Consider, we have a form that can submit the feedback from users with some attachment as a reference. After feedback has been submitted, it initiates a workflow, which has an Invoke Form activity pointing to another Form, wherein we need to access the attachment submitted by the user for further evaluation. To do this, we would need to use an Update Variable Activity.

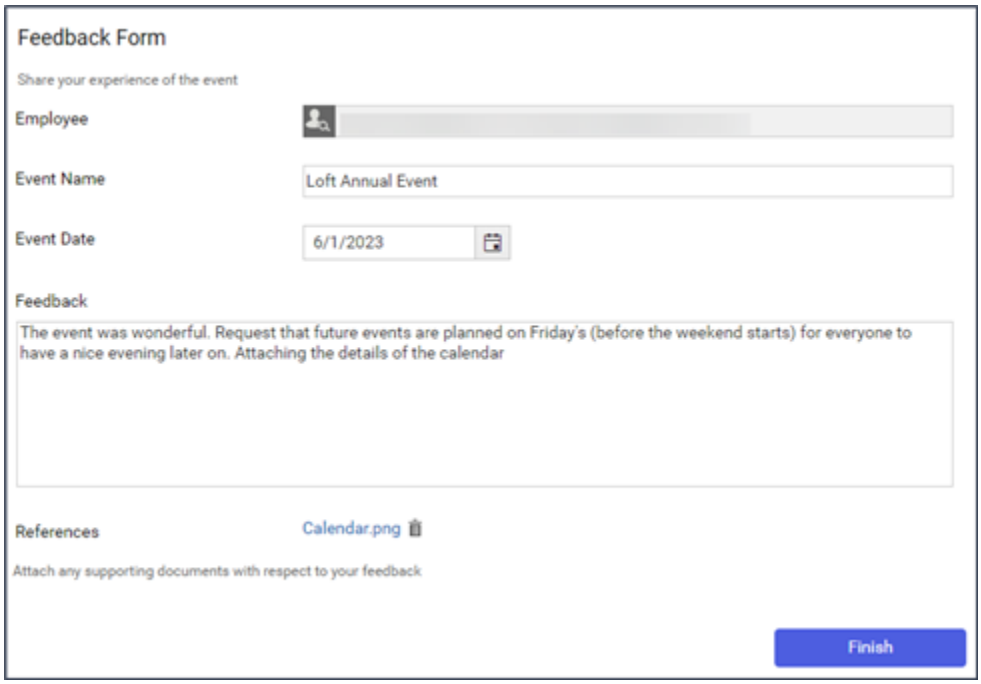
This is the sample workflow to understand the use case of accessing attachments from another Form.



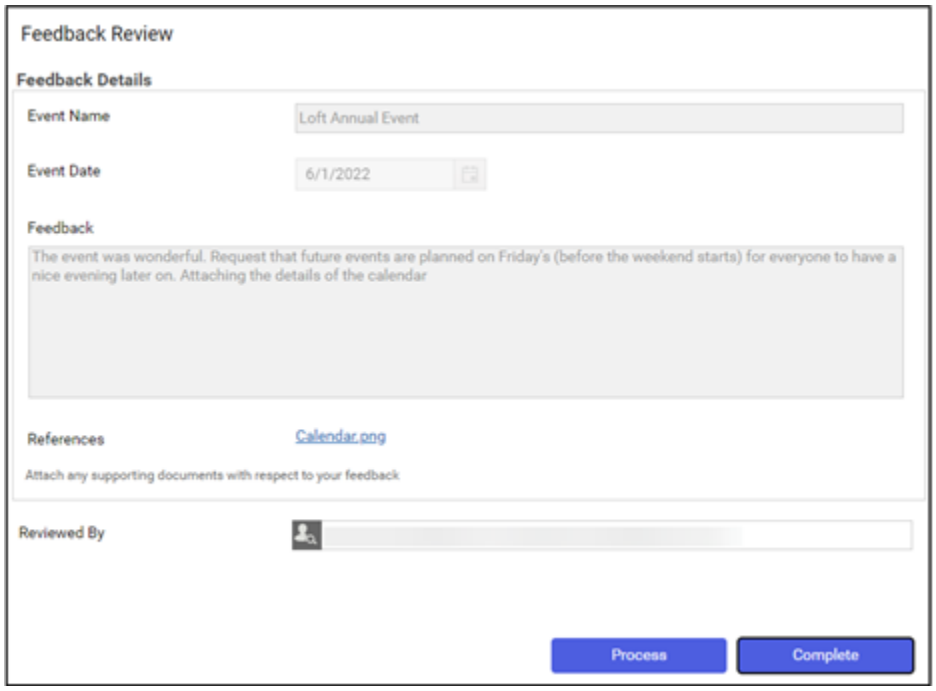
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To access attachments from another Form

1. Create a Feedback Form with fields and attachment control as shown in the image below.



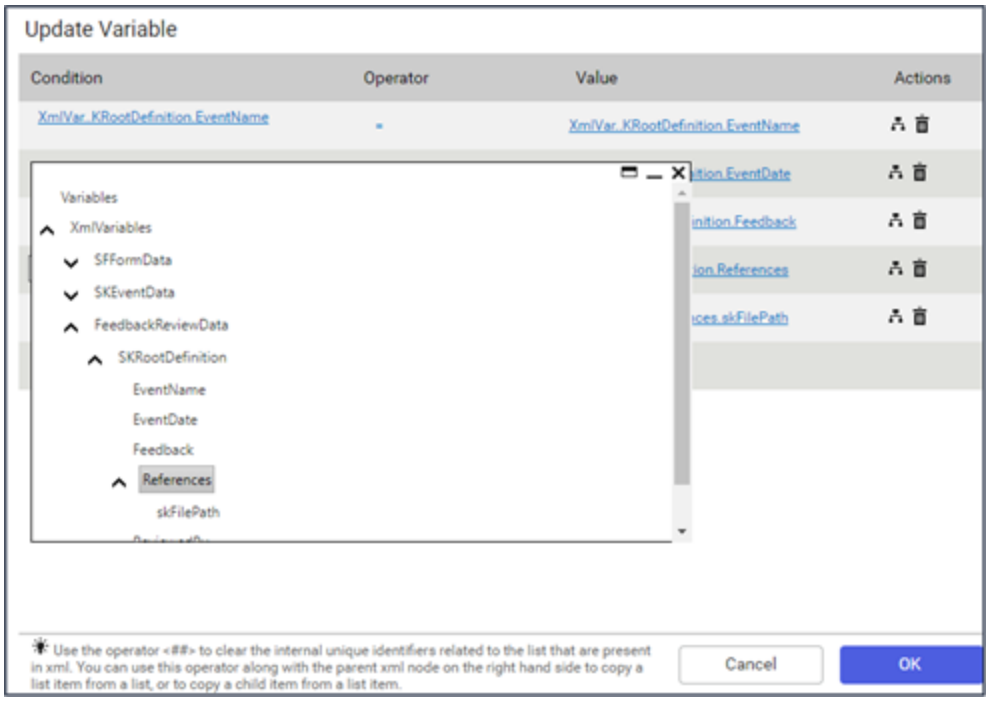
2. Create another Feedback Review Form.



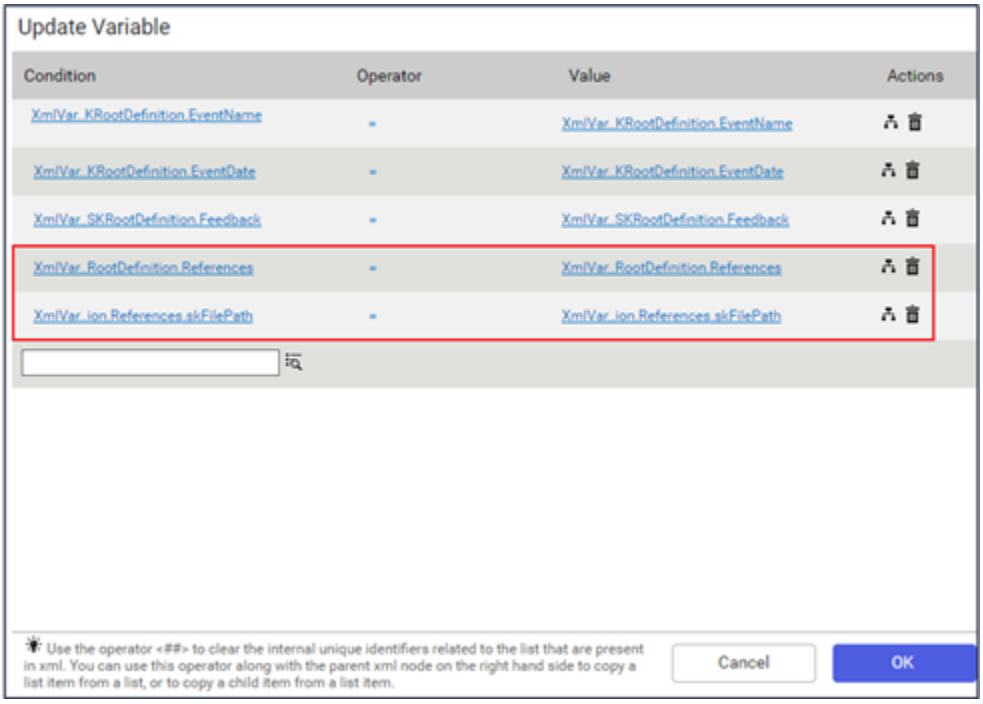
3. Create Update Variable activity with the XMLVariables shown in below image.

   In the Update Variable activity, update the LHS and RHS to transfer the Data between the XML Variables representing the **Feedback Form** and **Feedback Review Form**, wherein the **RHS** would be **Feedback Form Xml Variable** nodes and **LHS** would be the **Feedback Review Form Xml Variable** nodes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The submitted Form information gets stored in the **SFFormData** Xml Variable. The Invoke Form Activity pointing to another form used for Verification would be referring to another Form Xml Variable, say **FeedbackReviewData**. To have the Attachment details present in the **FeedbackReviewData** Xml Variable, we would need to assign the Xml Node **References** and its attribute node **skFilePath** from **SFFormData** to **FeedbackReviewData** as shown below (the Attachment node is named as **References** in the below image):



Now the Invoke Form Activity workitems, representing the **Feedback Review Form**, could refer to the **Attachment**, which was done in the **Feedback Form** submitted by the users.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Troubleshooting Forms

This section provides information on the common problems while using Forms and the resolutions to overcome those problems. It also lists the supported library versions and answers to some frequently asked questions.

Troubleshoot

1. Forms and other pages in the Enterprise Console does not respond when left idle for a long time.

Resolution:

Log on to the **Enterprise Console** again.

2. In the Safari browser:

1. Tabbing through the forms controls does not focus on the control and skips controls that are rendered as links.
2. Adding records in the **Grid** view of a **Base Form** at run-time by pressing the Tab key from the last focused control of the record does not work.

Resolution:

Edit the advanced settings of the Safari browser and select **Press Tab to highlight each item on a webpage** check box.

3. Unable to display image using the Image control.

Possible Causes:

In the HTML code, the image src attribute of the image tag takes the computer name instead of the IP address. The image is not displayed if the computer name of the machine is not resolved.

Resolution:

Analyze the HTML code using the developer tool of the browser. If the computer name is not being resolved in the **img src** attribute, contact your network administrator.

4. Adding values of number controls using the Value script appends the numbers instead of summing them up.

```
// Adding number values without typecasting the values will append the numbers.
instOne = control.findById("N1").value;
instTwo = control.findById("N2").value;
return instOne + instTwo;
```

Resolution:

Typecast the values of number controls to numeric values before summing them up.

```
// Typecast the values of number controls to numeric values to sum the numbers.
instOne = control.findById("N1").value;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
instTwo = control.findById("N2").value;
if(instOne != "")
 instOne = Number(instOne);
if(instTwo != "")
 instTwo = Number(instTwo);
return instOne + instTwo;
```

5. An alert message Unable to get property <column name> of undefined or null reference appears when an item is selected and cleared in the Data Grid control with the Extended Information property set to Yes, and the value in the bound Text control is not cleared.

Resolution:

Script as follows to resolve this issue.

```
var rowData = control.findById("G1").extendedInformation; // Array
if(rowData.length > 0)
 {
 control.findById("T1").value = rowData[0].ID;
 }
else
 {
 control.findById("T1").value = ""; // Undefined
 }
```

6. After upgrading from Skelta BPM.NET 2011 to Wonderware Skelta BPM 2014, the maximum transfer size of JSON strings from server to client is restricted to 102400 characters.

Possible Causes:

The default maximum transfer size of JSON strings from server to client is 102400 characters, which is equivalent to 100 KB of Unicode string data.

Resolution:

In the **web.config** file, edit the maximum length of JSON strings as follows:

```
<configuration>
 <system.web.extensions>
 <scripting>
 <webServices>
 <jsonSerialization maxJsonLength="4096000"/>
 </webServices>
 </scripting>
 </system.web.extensions>
</configuration>
```

7. In the On Form Load script, commented statements are executed.

Resolution:

In the JavaScript code, remove the commented statements.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. In the iOS WorkTask app:

1. Debugger does not work.
2. Form does not render.

Resolution:

In the JavaScript code, remove the debugger statements.

9. In Firefox browser, dialog boxes do not appear after selecting Prevent this page from creating additional dialogs.

Possible Causes:

The **Firefox** browser provides an option to the user to turn off subsequent dialog boxes if additional dialog boxes are shown within 3 seconds.

Resolution:

Reload the web page and do not select **Prevent this page from creating additional dialogs**, if it appears again.

10. Data Lookup control shows “T” separator between Date and Time for Date Time data.

Possible Causes:

JSON Date Time data has “T” separator between Date and Time.

Resolution:

Return database column containing Date Time data as string when retrieving date time from the database.

For example, convert LastUpdatedDateTime column from date time to string as follows:

```
SELECT Id,Name, LastUpdatedDateTime, CONVERT(nvarchar(150), LastUpdatedDateTime,121) AS
DisplayUpdatedDateTime FROM Employee
```

11. When API confirmation message, API Alert message, API Error message, and API warning message are present in one button control, only the first API message is displayed on a surface device.

Possible Causes:

Scripting guidelines to display messages are not followed.

Resolution:

Script as follows to resolve this issue.

```
SFU.showConfirmation("Test <b>Confirmation</b>", "Confirmation Details:Do you <b>wish</b>
to continue?",
function (val)
{
if (val)
{
SFU.showAlert("Continue", "Confirmation Process will be continued.<br/>Please contact admin
for more information.",
function ()
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
SFU.showWarning("Test ,<b>Warning</b>", "Warning Details:Do you <b>wish</b> to continue?",
function (val)
{
if (val)
{
SFU.showAlert("Continue", "Warning Process will be continued.<br/>Please contact admin for
more information.");
}
});
});
}
});
```

12. In a form with Data Grid control, at runtime if you select one record, multiple records are checked automatically. Also, the On Selection Change event gets triggered multiple times.

Possible Causes:

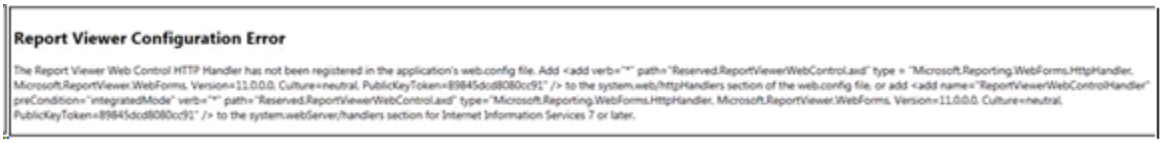
In the Data Grid configuration, the Persist Columns selected are not unique.

Resolution:

Ensure that the Persist Columns are unique.

13. Report Viewer configuration error.

The following error message appears when you try to view a Form that contains a Report Viewer control.



Resolution:

If the web site is created in integrated mode, enter the following entry in the webserver\handler section of the web.config file of the respective Microsoft SharePoint site:

```
<add verb="*" path="Reserved.ReportViewerWebControl.axd"
type="Microsoft.Reporting.WebForms.HttpHandler, Microsoft.ReportViewer.WebForms,
Version=11.0.0.0, Culture=neutral, PublicKeyToken=89845dcd8080cc91" validate="false" />
```

14. The error message, depicted in the image below, appears in the following scenarios:

- Design a form with a custom control, take a backup of the repository, and use that repository as an attached data source. Replace the control in a form when the custom control dll is not present in the specific environment.
- Import a form into an environment where the custom control is not present.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Resolution:

Perform the following to ensure that the custom control is present in the environment:

- Ensure that the dll is present in the SOA Folder or GAC.
- Ensure that all the required js and css files are present in the NextGenForms Folder.
- Create a SOA folder with the same name and add the same physical path where the custom control dll is present.
- Create Form Controls with the same name for the imported and exported Forms.

15. The error message, depicted in the image below, appears in the following scenarios:

- Design a form with a custom control, which has an exception.
- Replace a control from **Replacement Control Configuration** with a custom control, which has an exception.

Resolution:

Perform the following to ensure that there is no error while loading the control:

- Ensure that the dll is present in the SOA Folder or GAC.
- Ensure that custom control is configured in the Forms Control.
- Correct the exception and replace the dll.

16. The error messages, depicted in the below images, appears in the following scenarios:

- When a Form definition is imported, the below error appears from the custom control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Resolution:

Perform the following to ensure that there is no error while loading the control:

- Ensure that the dll is present in the SOA Folder or GAC.
- Ensure that custom control is configured in the Forms Control.
- Correct the exception and replace the dll.
- Open the XML file and delete the custom control definitions.

17. The JavaScript "debugger;" statement is not present in the Forms script during run time.

Resolution:

As part of performance tuning, we had introduced the minification of the View model when publishing the Form. The debugger works in the preview page, but in Fill Form, Form link, Work Item, or any places other than the preview page, the View model does not have the debugger statement due to minification.

In an environment, you can change this behavior. In the Farm DB, there is a SKRepository table. In the **Properties** column, there is a property **formEnableMinification** which has the value **True**. If changed to **False**, the minification does not happen for the published Forms and you can debug the Form. After changing the property value in the table for the respective repository, republish the Form for the changes to take effect.

Note: You should not change the property value in the production environment.

18. External URL for Web API, Embed Page, Images, and so on do not load in the Form, and an error gets logged in the Browser Console as "Refused to … because it violates the following Content Security Policy …"

Possible Cause:

Loading of the External URL for Web API, Embed Page, Images, and so on depends upon the Content Security Policy for the Enterprise Console Web Application.

Resolution:

This applies to images used in controls like Image, RichText, and so on in Forms and Embed Page control with the URL set to a different domain. The Content Security Policy can be modified as per user requirement and defined accordingly. For more details, refer to Content Security Policy documentation on the W3C website. You can specify the URLs based on the same domain in the Form controls. For images, you can use data-URLs.

Supported Library Versions

The version of the library supported in the release is as follows:

AVEVA Work Tasks 2023

Library	Version
ajaxmin	5.14.5506
angular	12.2.x
codemirror	5.58.3
crypto-js	3.1.2
date	1.0 Alpha-1
jquery	3.6.0
jquery.dotdotdot	1.7.4
jshint	2.12.0
jsonpath	1.0.0
jszip	3.10.1
kendo UI	2021.3.1207
knockout	3.5.1
knockout-kendo	0.10.0
Microsoft.ReportingServices.ReportViewerControl.WebForms	15.0.1537.0
Newtonsoft JSON.NET	13.0.1
paho-mqtt	1.1.0
pako-deflate	2.0.4
spin	2.0.0
xml2json	1.1.5

AVEVA Work Tasks 2020 Update 2

FAQs

Can I data bind the Grid Form using SOA?

No. However, using SOA, you can customize this functionality.

As soon as I submit a form, can I navigate to a different form to fill more details?

There is a feature called synchronization of forms which will redirect the user to a different form on submission of a form. The new form is a part of the workflow's Invoke Form Activity.

Lists

This section provides information on how to work with lists.

- Create and Organize
- Import and Export
- Design and Preview
- Manage and Secure

Introduction

Workflow Management Lists is a powerful platform to design and use functional lists in your enterprise. The lists platform uses the ASP.NET framework, and is developed for a rich user experience. You can connect to lists with various APIs from an external environment, and associate various events to workflow activities.

Key Capabilities	Workflow Enhancements
• Web based lists • Cross-browser support • Out of the box controls • Drag and drop support • Lookup infrastructure • Dynamic list forms • Reusable	• Paperless process management • Invoke workflow processes • Lists events association • Route lists between roles and between users • Mail and mobile notifications • Audit trails

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Access Lists

Use the **Manage List** page to create, organize, import, save, design, manage, and secure lists.

To access Manage List

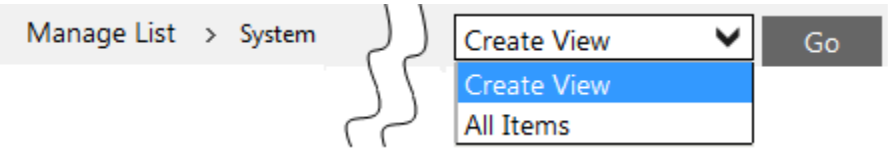
1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. The **Manage List** page shows the title, description, owner, and last modified date for the lists.

Manage List Interface

Manage List interface has a breadcrumbs, an action bar, and a list of lists.

Breadcrumbs

Breadcrumbs display the path to the child list or folder, and has commands to customize and view the list of lists.

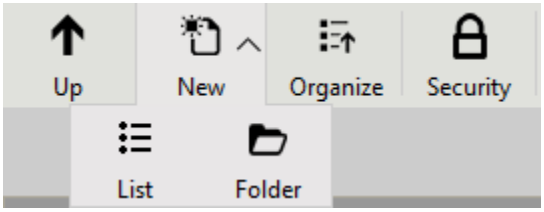


Command	Description
All Items	Default view to display the list of lists.
Create View	Create a new view to display the list of lists.

Action Bar

Action bar has commands to manage lists and folders. Standard commands are available all the time whereas contextual commands are available only when a list is selected.

Standard Commands



Menu/Command	Command	Description
Up		Go back to the parent list or folder.
New	List	Create a new list. For more information, see Create List.
	Folder	Create a new folder to group and organize lists.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

		For more information, see Creating Folders for Lists.
Organize		Organize the list by moving the list to a folder or by making the list a child item of another list. For more information, see Organizing Lists.
Security		View or customize the security level for the lists. For more information, see Set Security of Lists.

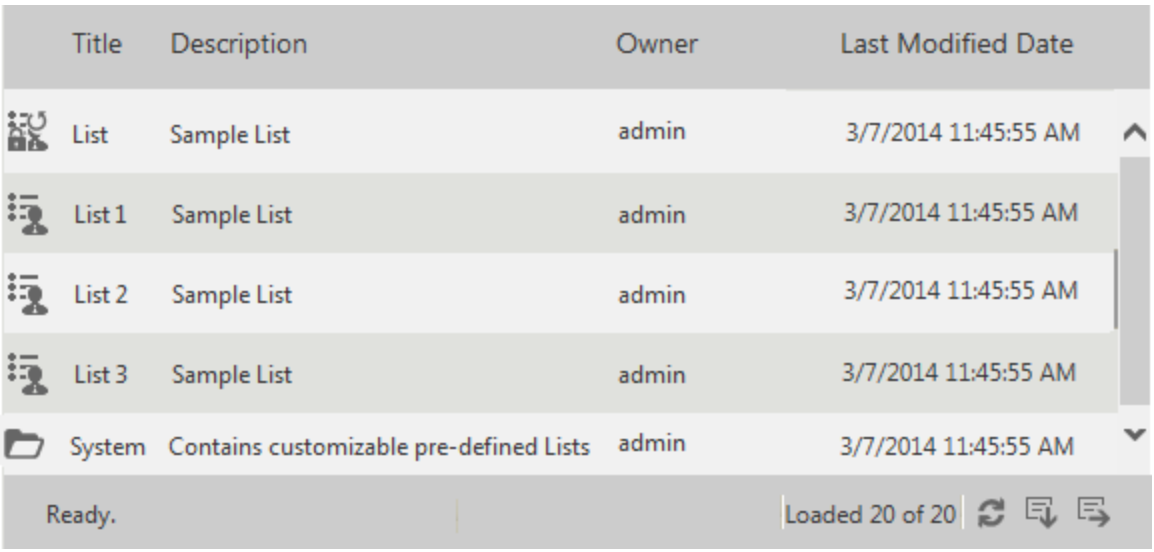
Contextual Commands

Command	Description
Design	Design the list with the list designer. For more information, see Design Lists.
Edit	Edit description of the list and then change design of the list with the list designer. For more information, see Editing Lists.
View	Preview the list. For more information, see Previewing Lists.
Delete	Delete the list. For more information, see Deleting Lists.
Change Owner	Change owner of the list. For more information, see Changing Ownership of Lists.

List

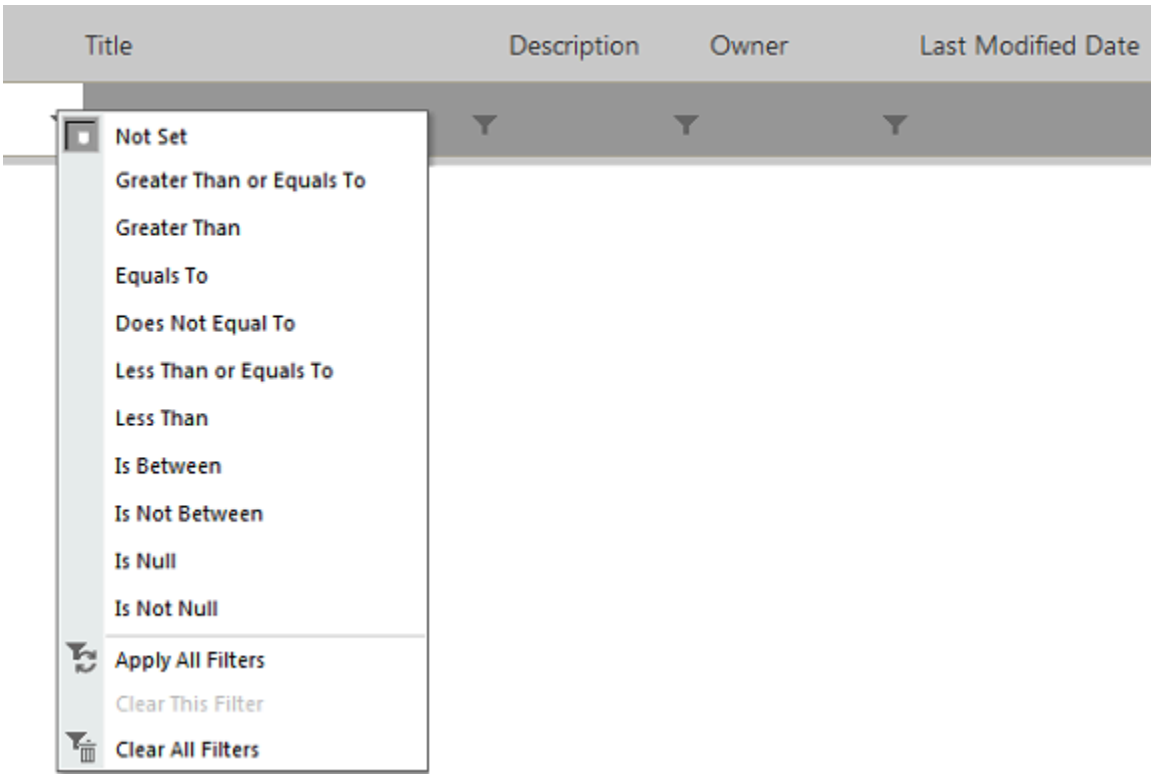
List of lists shows the title, description, owner, and last modified date for the lists. Click on a column to sort the lists.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Filter Bar

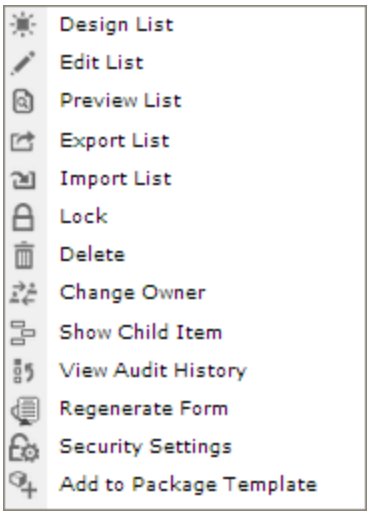
Filter bar can help to quickly find the desired lists from the list of lists. Filter bar has a funnel button and a parameter area for every column of the list of lists. The filter button shows the available filter options and the parameter area is for entering the filter criteria. The filter bar is hidden by default. Right-click on the column header, and then click **Filter Bar**, to access the filter bar. For more information about filter bar, see Filter Lists.



List Shortcut Menu

List shortcut menu has commands to manage the list. The list of commands available is dynamic and changes when the list is locked or disabled. Right-click on a list to access the shortcut menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Command	Description
Design List	Design the list with the list designer. For more information, see Design Lists.
Edit List	Edit description of the list and then change design of the list with the list designer. For more information, see Editing Lists.
Preview List	Preview the list. For more information, see Previewing Lists.
Export List	Export the list as an XML document. For more information, see Exporting Lists.
Import List	Import the list from an XML document. For more information, see Importing Lists. **Note:** Table or table schema associated with the list is not imported.
Lock	Lock the list. For more information, see Locking Lists.
Unlock	Unlock the list. For more information, see Unlocking Lists.
Delete	Delete the list. For more information, see Deleting Lists.
Change Owner	Change owner of the list. For more information, see Changing Ownership of Lists.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Show Child Item	Show child items of the list. For more information, see Viewing Child Items of Lists.
View Audit History	View audit history of the list. For more information, see Viewing Audit History of Lists.
Regenerate Form	Regenerate the form associated with the list. For more information, see Regenerating Forms. **Note:** When you regenerate a form, customizations previously made to the form is lost.
Security Settings	View or customize the security level for the lists. For more information, see Set Security of Lists.
Add to Package Template	Add the list to a package template.

Create and Organize

Map XML Nodes

XML node binds a database to a list, and maps a list to a form, and a form to a workflow. This ensures the data submitted from the form is available in the list and the database.

The default value for the **Mapped XML Node** property is the value for the **Tag name** property without the spaces. If you edit this value later, then it might affect the mapping between lists, forms, and workflows.

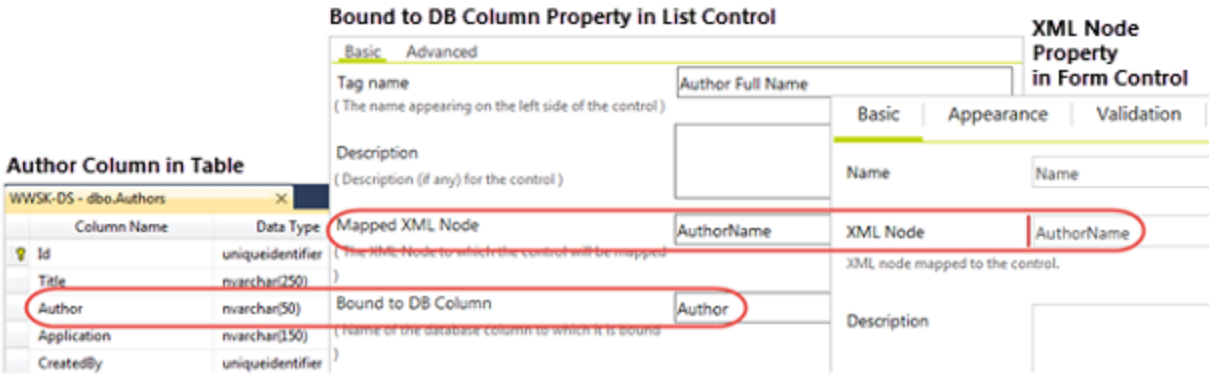
Mapping between a database, list, and form

When creating a list, you bind a control in the list to a field in the table of a database by setting the value of the field as the value of the **Bound to DB Column** property for the control in the list. Similarly, when creating a form, you should map a control in the form to a control in a list by setting the value of the **Mapped XML Node** property for the control in the list as the value of the **XML Node** property for the control in the form. When a dynamic list form is generated, the system takes care of this mapping.

Example

Here is an example showing the mapping between a database, list, and form using the database field and the XML Node.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Mapping	Description
Field of the table to control of the list	The **Author Full Name** control in the **Book Author** list is bound to the **Author** field in the **WWSK-DS-dbo.Authors** table of the repository database by setting **Author** (which is the value of the field) as the value of the **Bound to DB Column** property for the **Author Full Name** control in the **Book Author** list.
Control of the list to control of the form	The **Name** control in the **Writer** form is mapped to the **Author Full Name** control in the **Book Author** list by setting **AuthorName** (which is the value of the Mapped XML Node) as the value of the **XML Node** property for the **Name** control in the **Writer** form.

Create List

Create a list to use with forms and workflows.

To create a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. On the action bar, click **New**, and then click **List**. The **New List** wizard appears.
3. In the **Title** box, type a name for the list, and in the **Description** box, type a description for the list.
4. Do one of the following:

Task	Action
• Enable folder support for the list to group and organize the list.	• Under **Enable folder support?**, click **Yes**.
• Disable folder support for the list.	• Under **Enable folder support?**, click **No**.

5. Click **Save & Continue**. The list is created, and the **Select Table** wizard appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Do one of the following:

Task	Action
• Store the list data in generic table.	• Select **Generic Table**. **Note:** The list fields are automatically mapped to the fields in the generic table.
• Store the list data in an existing table.	1. Select **CustomList Table**. 2. Select a table from the list of existing tables. **Note:** - Table name and column name must not contain any spaces or special characters. - Click the **Refresh** icon to refresh the list of existing tables.
• Create a new table and add columns to it.	1. Select **CustomList Table**. 2. Click icon. The **Create Table** properties dialog box opens. 3. In the **Table Name** box, enter the name for the table. 4. To add column, in the **Column Name** box, enter the name for the column. The column name should not be the Reserved list column name. 5. Select the **Data Type** and the corresponding **Length** and **Scale** if applicable. 6. For **Allow Nulls** option, select **Yes** if you want to pass null values or else select **No**. 7. Click **Save**. The table gets saved to the database. **Note:** - Table name and column name must not contain any spaces or special characters. - Table should not have Reserved list column names. - Table can have maximum 64 columns apart from Reserved List columns. - You cannot create a new Folder in Custom List, which is mapped to a table with **Allow Nulls** option set to **No** for column(s).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
• Edit an existing table to add the columns.	1. Select **CustomList Table**. 2. Select a table from the list of existing tables. 3. Click icon to add the columns in the table. 4. Click **Save** after adding new column(s). **Note:** - Table name and column name must not contain any spaces or special characters. - Column name should not start with the number. - Table should not have Reserved list column names. - Table can have maximum 64 columns apart from Reserved List columns. - You cannot delete the existing column in a table. - You can edit the Existing table for a newly created list before clicking **Submit** button from the List designer. - Click **Refresh** icon to refresh the list of existing tables. - You cannot create a new Folder in Custom List, which is mapped to a table with **Allow Nulls** option set to **No** for column(s).

7. Click **Save & Continue**. The list is created, the **New List** wizard is closed, and the **Table** wizard appears.
8. Design the list, and then click **Submit**. The list is saved and the **Form Settings** dialog box appears.
9. Follow the steps for *To auto generate the form* in Auto Generating Forms.

Note:
- If an existing custom table from the repository is deleted from the database, the table name still appears in CustomList table List Box. Mapping table entry in SKListTables must be deleted to delist from CustomList table List box.

Create Child List Items

Every list item can have child items.

For example: For a workflow, the child items are either child workflows or folders.

To create child items for list items

1. Select a list item for which you want to create a child item.
2. Right-click and then select **Show Child Item**.
3. Click **New** and then create the child item.

   The child items are created successfully.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create Folders for Lists

Create a folder for a list to group and organize the list.

To create a folder for a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. On the action bar, click **New**, and then click **Folder**. The **New Folder** wizard appears.
3. In the **Title** box, type a name for the folder, and in the **Description** box, type a description for the folder.
4. Click **Save & Close**. The folder is created, and an information message appears.
5. Click **OK** (or click the **Close** button). The information message and the **New Folder** wizard are closed.

Organize Lists

Organize a list by moving the list to a folder or by making the list a child item of another list.

To organize a list by moving the list to a folder

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. On the action bar, click **Organize**. The **Organize Manage List** dialog box appears.
3. Drag a list to a folder. The list is moved to the folder.
4. Click **Close**. The **Organize Manage List** dialog box is closed.

To organize a list by making the list a child item of another list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. On the action bar, click **Organize**. The **Organize Manage List** dialog box appears.
3. Drag a list to another list. The list is now a child item of another list.
4. Click **Close**. The **Organize Manage List** dialog box is closed.

View Child Items of Lists

View child items of a list to see lists organized under the list.

To view child items of a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Show Child Item**. The child items page for the list appears.
3. The child items page for the list shows the available child lists.

Note: To go back to the **Manage List** page, on the action bar, click **Up**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Manage Data

Manage data by creating, exporting, and importing Excel Template with List Columns for both CustomList and Generic List table. The template has three rows - **Column Name**, **Data Type**, and **Size**.

To create and import List Template

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. On the action bar, click **Manage Data**.

   Note: The **Manage Data** option is available only to the users who are part of Standard Administrators Security Group.
3. Do one of the following:

Task	Action
• Create a schema of the table in the form of Excel Template.	• Click **Create List Template** from the Ribbon Bar. Excel template gets created with three rows (Column Name, Data Type, Size) where, **Column Name** is the **Mapped Xml node** in the List Designer if it is changed. Otherwise, it is the Column Name from the table. Excel Template gets downloaded in the **Downloads** folder with the filename **ListName_DateTime.xlsx**.
• Import list data in bulk through the Excel Template that was created. **Note**: - Before importing, fill data in the Excel Template created using **Create List Template** option. - Ensure that **Date** and **Time** value is in server or local culture and Boolean field has the value as **True** or **False**.	a. Click **Import List Data** from the Ribbon Bar. b. Select the file to be imported i.e. Excel Template file filled with list data. c. Click **Import** to insert the data into the list. The list data gets imported in bulk in the form of Excel Template with three rows (Column Name, Data Type, and Size).
• Export list items to the Excel sheet to export the list data in bulk.	• Click **Export List Data** from the Ribbon Bar. Excel template gets created with three rows (Column Name, Data Type, Size) with the list data. where, **Column Name** is the **Mapped Xml node** in the List Designer if it is changed. Otherwise, it is the Column Name from the table. Excel Template gets downloaded in the **Downloads** folder with the filename **ListName_DateTime.xlsx**. Exported List Items to the Excel will be sorted

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
	based on the LastUpdatedDateTime Column.

Note:
- The **Create List Template** and **Import List Data** options support the Lists with Parent table only. You can upload up to 5000 records in the List Template excel file using **Import List Data** option.
- You need to provide data in all the **Columns** which are marked as mandatory in the excel template.
- Ensure that you do not have the duplicate values for the primary key columns while filling the data in Excel Template.
- Modifying **Column Name** or adding new columns in the Excel Template is not supported.
- There is no validation of the data entered in Excel. Hence, make sure the value is entered as per the datatype mentioned.
- Attachment Control in the list is not supported while exporting or importing the list data.

Import and Export

Import Lists

Import a list to create the list from an XML document.

The XML schema defines the controls and properties of the controls for the list.

To import a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Import List**. The **Import** dialog box appears.
3. Click **Browse**. The **Choose File to Upload** dialog box appears.
4. Select an XML document, and then click **Open**. The XML document is selected and the **Choose File to Upload** dialog box is closed.
5. Click **Import**. The list is imported and an information message appears.
6. Click **Close**. The **Import** dialog box is closed.

Note:
When a list is imported:
- The table or table schema associated with the list is not imported.
- The existing controls and properties of the controls for the list are overwritten with the controls and properties of the controls defined in the XML schema.
- Ensure the repository has the same data provider as the repository from which the list was exported.

Export Lists

Export a list to save the list as an XML document.

The XML schema defines the controls and properties of the controls for the list. After successfully exporting a list, you can import the XML document to create similar lists.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To export a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Export List**. The **Export** dialog box appears.
3. Click **Export**. The **Save As** dialog box appears.
4. Click **Save**. The list is exported as an XML document, and the **Save As** dialog box is closed.

Design and Preview

This section provides information on designing, editing, deleting, and previewing list.

- Design Lists
- Edit Lists
- Delete Lists
- Preview Lists

Design Lists

Design a list to add controls to the list.

To design a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on list, and then click **Design**). The **List Designer** page appears.
3. Design the list, and then click **Submit**. The list is saved and the **Form Settings** dialog box appears.
4. Follow the steps for *To auto generate the form* in Auto Generating Forms..

Edit Lists

Edit a list to change description and design of the list.

To edit a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Edit List** (or click on a list, and then click **Edit**). The **Edit List** dialog box appears.
3. In the **Description** box, edit description for the list.
4. Click **Save & Continue**. The description for the list is saved, the **Edit List** dialog box is closed, and the **List Designer** page appears.
5. Design the list, and then click **Submit**. The list is saved and the **Form Settings** dialog box appears.
6. Follow the steps for *To auto generate the form* in Auto Generating Forms.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: You cannot edit the name of the list. To edit properties of a list, see Editing Properties of Lists.

Delete Lists

Delete a list when the list is no longer required.

To delete a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Delete** (or click on a list, and then click **Delete**). A confirmation message appears.
3. Click **OK**. The confirmation message is closed, the list is deleted, and an information message appears.
4. Click **Close** (or click the **Close** button). The information message is closed.

Note: If you delete a list, then the list cannot be restored.

Preview Lists

Preview a list to check look and feel of the list at run-time and the XML generated for the list.

To preview only the list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Preview List** (or click on a list, and then on the action bar, click **View**). The **Preview** dialog box appears.
3. Check look and feel of the list.
4. Click the **Close** button. The **Preview** dialog box is closed.

To preview the list and the XML generated for the list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Preview List** (or click on a list, and then on the action bar, click **View**). The **Preview** dialog box appears.
3. Check look and feel of the list, and then click **Submit**. The **Instance XML** dialog box appears.
4. Check the generated XML, and then click the **Close** button. The **Instance XML** dialog box is closed.
5. Click the **Close** button. The **Preview** dialog box is closed.

Manage and Secure

This section explains you on how to manage and secure the lists.

- Lock Lists
- Unlock Lists

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Filter Lists
- Change Ownership of Lists
- Set Security of Lists
- View Audit History of Lists
- Regenerate Forms

Delete List Items

You can delete multiple list items.

.

To delete list item(s)

1. In the **Enterprise Console**, click the **Menu** button, click **List**, and then select the **Custom List** from which you want to delete the list items or folders.

   Note: **List** option is available under **Menu** if you have created custom lists.
2. To delete List Items or Folders, you can either,
   - Select ALL check box to delete all the list items.
   - Select a list item check box to delete that particular list item.
3. Click **Delete** icon on the ribbon bar. All the selected list items will get deleted.

   Note:
   - If the List Item or Folder has Child Items, that List Item or Folder will not get deleted. You need to first delete the child List Item.

Lock Lists

Lock a list to prevent other users from editing the list.

To lock a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The Manage List page appears.
2. Right-click on a list, and then click **Lock**. The list is locked and an information message appears.
3. Click **OK** (or click the Close button). The information message is closed.

   Note: When a list is locked, a lock overlay icon appears on the icon of the list.

Unlock Lists

Unlock a list to allow other users to edit the list.

To unlock a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a locked list, and then click **Unlock**. The list is unlocked and an information message appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Click **OK** (or click the Close button). The information message is closed.

Note: When a list is unlocked, the lock overlay icon disappears from the icon of the list.

Filter Lists

Filter lists to quickly find the lists you are looking for from the list of lists.

Filtering lists is useful especially when there are a large number of lists.

To apply a filter for the lists

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click the column header, and then click **Filter Bar**. The filter bar appears.
3. Enter a value in the filter bar for a column, and then press Enter.
4. Click the **Funnel** button on the column, and then click a filter option. The filter option is selected.
5. Click **Apply All Filters**. The filtered result appears.

To clear a filter for the lists

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click the filter bar (or click the **Funnel** button on the column), and then click **Clear All Filters**. The filtered result is cleared.

Filter Options

Filter lists using one of the filter option for each column:

Option	Description
Not Set	Show lists without applying any filters. This is the default filter option.
Greater Than or Equal To	Show lists where the value of the column is greater than or equal to the specified value.
Greater Than	Show lists where the value of the column is greater than the specified value.
Equal To	Show lists where the value of the column is equal to the specified value.
Does Not Equal To	Show lists where the value of the column is not equal to the specified value.
Less Than or Equal To	Show lists where the value of the column is less than or equal to the specified value.
Less Than	Show lists where the value of the column is less than

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Option	Description
	the specified value.
Is Between	Show lists where the value of the column is between the specified inclusive range of values.
Is Not Between	Show lists where the value of the column is not between the specified inclusive range of values.
Like	Show lists where the value of the column is as per the specified value.
Does Not Like	Show lists where the value of the column is not as per the specified value.
Contains	Show lists where the value of the column contains the specified value.
Does Not Contain	Show lists where the value of the column does not contain the specified value.
Is Null	Show lists where the value of the column is null.
Is Not Null	Show lists where the value of the column is not null.
Is Empty	Show lists where the value of the column is an empty string.
Is Not Empty	Show lists where the value of the column is not an empty string.
Apply All Filters	Apply all filters set for the columns.
Clear This Filter	Clear all filters set for a column.
Clear All Filters	Clear all set filters.

Change Ownership of Lists

Change owner of a list to allow other user to own and control the list.

To change owner of a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Change Owner** (or click on a list, and then on the action bar, click **Change Owner**). The **Change Owner** dialog box appears.
3. Click the **User Lookup** button. The **User Lookup** dialog box appears.
4. Select a user, and then click **Update**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Click **Save**. The owner of the list is changed and an information message appears.
6. Click **OK** (or click the **Close** button). The information message and the **Change Owner** dialog boxes are closed.

Set Security of Lists

Secure lists by defining rights assigned to a list or a set lists grouped under a folder.

A lists user or role inherits the rights assigned at a repository level. However, the administrator can customize the rights at a list level and also assign rights to groups and map users to groups.

Standard Settings

Use standard settings to view security set at the list level, if available, or at the repository level for:

- a role or user.
- the security group customization and resource mapping.

To view security set for a role or user

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. On the action bar, click **Security**. The **Security Settings** page appears.
3. In the **Standard settings** tab, click **View Effective Security For User/Role**.
4. Do one of the following:

Task	Action
• View security set at the list level, if available, or at the repository level for a role.	1. In the **Role Based** tab, click the **Role Lookup** button. The **Role Lookup** dialog box appears. 2. Select a role, and then click **Update**. 3. Click **View Rights**. The effective rights for the role appears.
• View security set at the list level, if available, or at the repository level for a user.	1. Click the **User Based** tab. 2. Click the **User Lookup** button. The **User Lookup** dialog box appears. 3. Select a user, and then click **Update**. 4. Click **View Rights**. The effective rights for the user appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To view security group customization and resource mapping

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. On the action bar, click **Security**. The **Security Settings** page appears.
3. In the **Standard settings** tab, click **View Security Mapping at List Level**.
4. Click on a **Security Group**. The **Viewing Security Group Rights** dialog box appears.
5. Check the security group customization and resource mapping.
6. Click **Close** (or click the **Close** button). The **Viewing Security Group Rights** dialog box is closed.

Advanced Settings

Use advanced settings to edit the existing mapping, add a new resource mapping or delete the existing mapping by enabling mapping at List level.

To set or edit the security group customization and resource mapping

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. On the action bar, click **Security**. The **Security Settings** page appears.
3. Click the **Advanced settings** tab, and then do one or more of the following:

Task	Action
• Set the security group customization and resource mapping.	• Click **Enable List Specific Security**. **Note:** This option is available only when the security group customization and resource mapping has not been set or removed.
• Remove the security group customization and resource mapping.	• Click **Remove Security from this List**.
• Edit the security group customization.	• Click **Customize Security Group for this List**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
• Edit the resource mapping.	• Click **Security Group - Resource Mapping for this List**.

View Audit History of Lists

View audit history of a list to see date, time and user information when the list was locked and unlocked, and when the list owner was changed.

To view audit history of a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **View Audit History**. The **Audit History** dialog box appears.
3. The **Audit History** dialog box shows the action, user, version, message, and date for the list.
4. Click the **Close** button. The **Audit History** dialog box is closed.

Regenerate Forms

Regenerate a form to automatically generate the form again to create a dynamic list form.

To regenerate a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Regenerate Form**. The **Form Settings** dialog box appears.
3. Do one of the following:

Task	Action
• Deny the system to regenerate the form.	a. Click the **No** option. b. Click **OK**. The **Form Settings** dialog box is closed.
• Allow the system to regenerate the form.	a. Click the **Yes** option. b. Click **OK**. The **Form Settings** dialog box is closed and the **Forms Designer** page appears. c. If you want to validate the auto generated form, then follow the steps for Validate Dynamic List Forms. d. Click the **Close** button. The form is saved and the **Forms Designer** page is closed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: When you regenerate a form, customizations previously made to the form is lost.

Lists Designer

List Designer is a web-based design tool, with a drag-and-drop capable interface, to create functional lists. Drag a control from the toolbox to the design area to add the control to the list. Dragging is also supported for repositioning and copying controls. Use **List Designer** to create functional lists with various controls.

To access List Designer

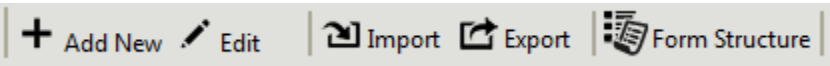
1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on a list, and then on the action bar, click **Design**). The **List Designer** page appears.

List Designer Interface

List Designer interface has an action bar, toolbox, and canvas.

Action Bar

Action bar has commands to manage the list and controls on the list.

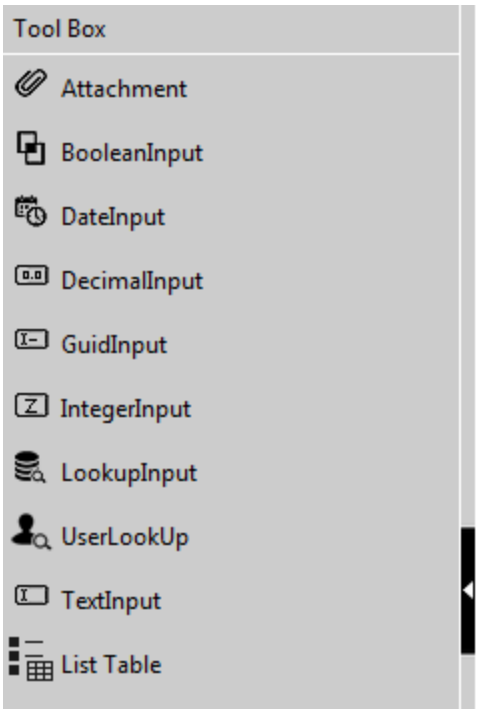


Command	Description
Add New	Add new control to the list. For more information, see Adding Controls.
Edit	Edit properties of the list. For more information, see Editing Properties of Lists.
Import	Import the list from an XML document. For more information, see Importing Lists.
Export	Export the list as an XML document. For more information, see Exporting Lists.
Form Structure	View the structure of the form associated with the list. For more information, see Viewing Form Structure.

Toolbox

Toolbox has controls for designing the list.

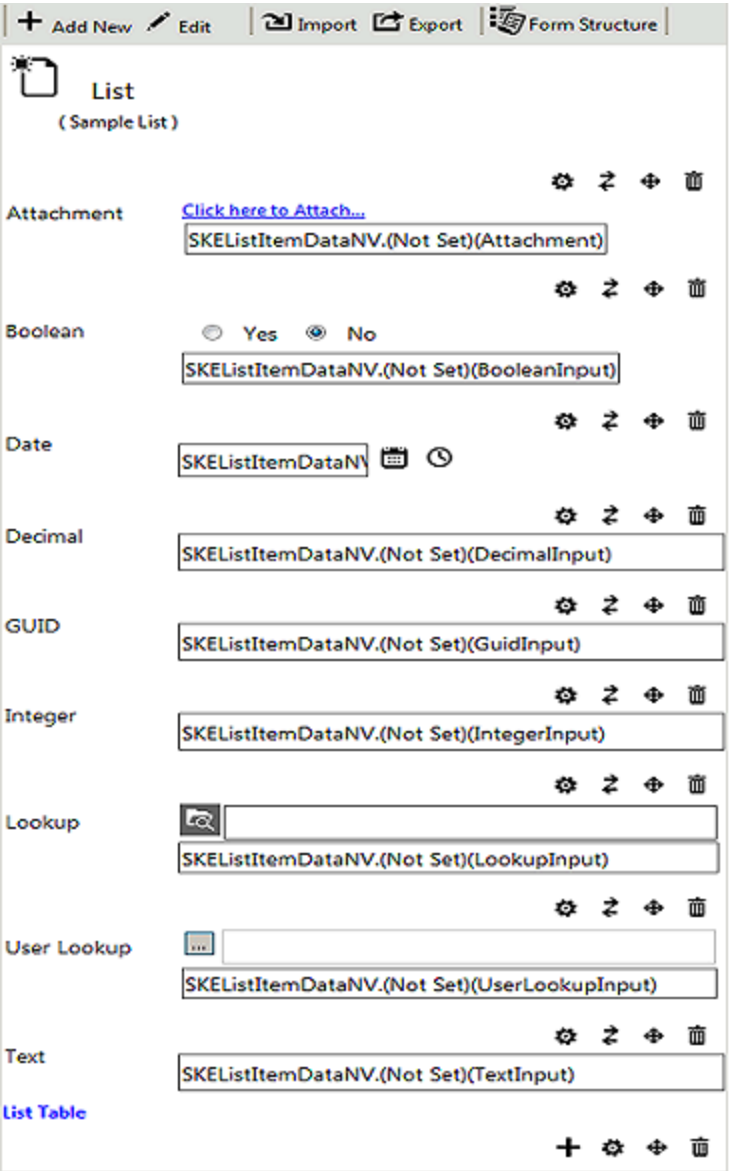
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Canvas

Canvas is the area in the **List Designer** where the list is designed by dragging controls from the toolbox. Dragging is also supported for repositioning controls.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Control Menu

Control menu has commands to manage the control. The menu is placed on the right side above the control.

Command	Description
Properties	Edit properties of the control. For more information, see Edit Properties of Controls.
Replace	Replace the control. For more information, see Replace Controls.
Move	Move the control to the desired location on the canvas.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Command	Description
	For more information, see Move Controls.
Delete	Delete the control. For more information, see Deleting Controls.

Note: To design a form or edit an existing form in **Lists Designer**, the Workflow Management Forms Server license has to be acquired.

Manage Lists

This section explains how you can import, export, edit properties, view form structure, and auto generate forms lists using List Designer.

- Import Lists
- Export Lists
- Edit Properties of Lists
- View Form Structure
- Auto Generating Forms

Import Lists

Import a list to create the list from an XML document.

The XML schema defines the controls and properties of the controls for the list.

To import a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on a list, and then on the action bar, click **Design**). The **List Designer** page appears.
3. On the action bar, click **Import**. The **Import** dialog box appears.
4. Click **Browse**. The **Choose File to Upload** dialog box appears.
5. Select an XML document, and then click **Open**. The XML document is selected and the **Choose File to Upload** dialog box is closed.
6. Click **Import**. The list is imported and an information message appears.
7. Click **Close**. The **Import** dialog box is closed.

Note:
When a list is imported:
- The table or table schema associated with the list is not imported.
- The existing controls and properties of the controls for the list are overwritten with the controls and properties of the controls defined in the XML schema.
- Ensure the repository has the same data provider as the repository from which the list was exported.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Export Lists

Export a list to save the list as an XML document.

The XML schema defines the controls and properties of the controls for the list. After successfully exporting a list, you can import the XML document to create similar lists.

To export a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on a list, and then on the action bar, click **Design**). The **List Designer** page appears.
3. On the action bar, click **Export**. The **Save As** dialog box appears.
4. Click **Save**. The list is exported as an XML document, and the **Save As** dialog box is closed.

Edit Properties of Lists

Edit properties of a list to change appearance and functionality of the list.

To edit properties of a list

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on a list, and then on the action bar, click **Design**). The **List Designer** page appears.
3. On the action bar, click **Edit**. The **Properties** dialog box appears.
4. Edit properties of the list, and then click **Save**. The properties are saved and the **Properties** dialog box is closed.

View Form Structure

View structure of the form associated with a list to check the structure of the form and to save the form as an XML document.

To view structure of the form

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on a list, and then on the action bar, click **Design**). The **List Designer** page appears.
3. On the action bar, click **Form Structure**. The **Form Structure** dialog box appears.
4. Do one of the following:

Task	Action
• Include controls with blank XML node.	• Under **Ignore blank XmlNodeBoundTo ?**,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
	click **Yes**.
• Exclude controls with blank XML node.	• Under Ignore blank **XmlNodeBoundTo ?**, click **No**.

5. Do one of the following:

Task	Action
• Export the form associated with the list.	a. Click **Export**. The **Save As** dialog box appears. b. Click **Save**. The list is exported as an XML document, and the **Save As** dialog box is closed. c. Click **Close**. The **Form Structure** dialog box is closed.
• Close the Form Structure dialog box.	• Click **Close**. The **Form Structure** dialog box is closed.

Auto Generating Forms

Automatically generate the form when you create a list to create a dynamic list form.

Follow the steps for To access List Designer, and then click **Submit.** The confirmation message appears.

To auto generate the form

1. In the confirmation message, click **CANCEL**. The form is generated and an information message appears.
2. Click **OK**. The **List Designer** page is closed.

To edit the auto generated form

1. In the confirmation message, click **OK** to edit the auto generated form. List is successfully saved, the form associated with this list is generated, and an information message appears..
2. Click **OK**. The **List Designer** page is closed and the **Forms Designer** page appears.
3. Design the form and Publish it, so that the new list can be used.

Note:
- The auto generated form is saved, with the same name as that of the list, in the **Dynamic List Forms** folder in the **Forms** page.
- The form associated with the list must be published before using the list.

Manage Controls

This section explains how you can add, replace, move, delete and edit properties of controls.

- Add Controls

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Replace Controls
- Move Controls
- Delete Controls
- Edit Properties of Controls

Add Controls

Add a control to the canvas to build the list.

To add a control from the toolbox

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on a list, and then on the action bar, click **Design**). The **List Designer** page appears.
3. Do one of the following:

Task	Action
• Place a control at the end of other controls on the canvas.	• Drag a control from the toolbox to the orange bar on the canvas.
• Place a control above a control on the canvas.	• Drag a control from the toolbox to the green bar of a control on the canvas.

4. The selected control appears on the canvas and the **Properties** dialog box appears
5. Edit properties of the control, and then click **Apply**. The properties are saved and the **Properties** dialog box is closed.

To add a control from the action bar

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on a list, and then on the action bar, click **Design**). The **List Designer** page appears.
3. On the action bar, click **Add New**. The **Add a new control** dialog box appears.
4. In the **Title** box, type a name for the control, and in the **Description** box, type a description for the control.
5. Click a control, and then click **Next**. The control appears at the end of other controls on the canvas, the **Add a new control** dialog box is closed, and the **Properties** dialog box appears.
6. Edit properties of the control, and then click **Apply**. The properties are saved and the **Properties** dialog box is closed.

Note: The name of the control should not be the same as the column names that are defined in the SKEListItemDataNV table in the Repository Database.

The below are the column names defined in the SKEListItemDataNV table in the Repository Database:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Id, Application, CreatedBy, CreatedDateTime, LastUpdatedDateTime, Title, Description, WIP, WIPItemId, MainItemId, ParentItemId, RecordParentItemId, TableId, ItemRowIndex, IsLatest, Version, VersionHistory, Status, LockedBy, LockedOn, ItemId, ItemType, SecurityItemId, Owner, ModifiedBy, IsDisabled, WorkflowStatus, SecurityCustomizationId, ListID, SecuritySettings, AuditTrail, nvarchar1, nvarchar2, nvarchar3, nvarchar4, nvarchar5, nvarchar6, nvarchar7, nvarchar8, ntext1, ntext2, ntext3, ntext4, sql_variant1, nvarchar9, nvarchar10, nvarchar11, nvarchar12, nvarchar13, nvarchar14, nvarchar15, nvarchar16, ntext5, ntext6, ntext7, ntext8, sql_variant2, nvarchar17, nvarchar18, nvarchar19, nvarchar20, nvarchar21, nvarchar22, nvarchar23, nvarchar24, ntext9, ntext10, ntext11, ntext12, sql_variant3, nvarchar25, nvarchar26, nvarchar27, nvarchar28, nvarchar29, nvarchar30, nvarchar31, nvarchar32, ntext13, ntext14, ntext15, ntext16, sql_variant4, nvarchar33, nvarchar34, nvarchar35, nvarchar36, nvarchar37, nvarchar38, nvarchar39, nvarchar40, ntext17, ntext18, ntext19, ntext20, sql_variant5, nvarchar41, nvarchar42, nvarchar43, nvarchar44, nvarchar45, nvarchar46, nvarchar47, nvarchar48, ntext21, ntext22, ntext23, ntext24, sql_variant6, nvarchar49, nvarchar50, nvarchar51, nvarchar52, nvarchar53, nvarchar54, nvarchar55, nvarchar56, ntext25, ntext26, ntext27, ntext28, sql_variant7, nvarchar57, nvarchar58, nvarchar59, nvarchar60, nvarchar61, nvarchar62, nvarchar63, nvarchar64, ntext29, ntext30, ntext31, ntext32, sql_variant8, int1, int2, int3, int4, int5, int6, int7, int8, int9, int10, int11, int12, int13, int14, int15, int16, decimal1, decimal2, decimal3, decimal4, decimal5, decimal6, decimal7, decimal8, decimal9, decimal10, decimal11, decimal12, datetime1, datetime2, datetime3, datetime4, datetime5, datetime6, datetime7, datetime8, bit1, bit2, bit3, bit4, bit5, bit6, bit7, bit8, bit9, bit10, bit11, bit12, bit13, bit14, bit15, bit16, uniqueidentifier1, uniqueidentifier2, uniqueidentifier3, uniqueidentifier4, uniqueidentifier5, uniqueidentifier6, uniqueidentifier7, uniqueidentifier8, uniqueidentifier9, uniqueidentifier10, uniqueidentifier11, uniqueidentifier12, uniqueidentifier13, uniqueidentifier14, uniqueidentifier15, uniqueidentifier16, uniqueidentifier17, uniqueidentifier18, uniqueidentifier19, uniqueidentifier20, uniqueidentifier21, uniqueidentifier22, uniqueidentifier23, uniqueidentifier24, uniqueidentifier25, image1, image2, image3, image4, image5, image6, image7, image8, image9, image10, image11, image12, image13, image14, image15

Replace Controls

Replace a control to change the control on the canvas.

To replace a control

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on a list, and then on the action bar, click **Design**). The **List Designer** page appears.
3. On the control, click the **Replace** icon. The **Replace Control** dialog box appears.
4. Click a control, and then do one of the following:

Task	Action
• Allow the system to copy the values of similar properties from the existing control to the new control.	• Under **Copy similar properties ?**, click **Yes**.
• Deny the system to copy the values of similar properties from the existing control to the new control.	• Under **Copy similar properties ?**, click **No**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Click **Replace**. The control is replaced on the canvas and the **Replace Control** dialog box is closed.

Move Controls

Move a control to reposition the control to the desired location on the canvas.

To move a control

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on a list, and then on the action bar, click **Design**). The **List Designer** page appears.
3. On the control, click the **Move** button, and then do one of the following:

Task	Action
• Place a control at the end of other controls on the canvas.	• Drag a control from the toolbox to the orange bar on the canvas.
• Place a control above a control on the canvas.	• Drag a control from the toolbox to the green bar of a control on the canvas.

4. The selected control appears at the desired location on the canvas.

Delete Controls

Delete a control when the control is no longer required.

To edit properties of a control

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on a list, and then on the action bar, click **Design**). The **List Designer** page appears.
3. On the control, click the **Delete** button. A confirmation message appears.
4. Click **Yes**. The control is deleted from the canvas and the confirmation message is closed.

Note: If you delete a control, then the control cannot be restored.

Edit Properties of Controls

Edit properties of a control to change appearance and functionality of the control.

To edit properties of a control

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Right-click on a list, and then click **Design List** (or click on a list, and then on the action bar, click **Design**). The **List Designer** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. On the control, click the **Properties** button. The **Properties** dialog box appears.
4. Edit properties of the control, and then click **Save**. The properties are saved and the **Properties** dialog box is closed.

Control Properties

The properties for a control are grouped under the following tabs depending on the control:

- Basic
- Appearance

For information about the properties of a control, see Controls.

Lists API

Application programming interface (API) is a set of functions to accomplish a specific task. APIs provide speed, reliability, and extensibility.

Use lists APIs to customize your business applications.

Create List using ListDefinition

Create a list using the list API.

The list API makes use of the following DLL references, namespaces, classes, and methods.

DLL Reference	Namespace
• Workflow.NET.NET2 • Skelta.Forms.Core • Skelta.Forms.Web	• System • Skelta.Repository.List • Skelta.Forms • Skelta.Forms.Core.Controls • Skelta.Core • Skelta.Repository.List.Action • System.Data

Class
• Skelta.Repository.List.ListDefinition • Skelta.Repository.List.ListItem • Skelta.Forms.Web.Common.ListFormDesignerFunctions • Skelta.Forms.Web.Common.DynamicListCommonFunctions

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Class
• Skelta.Forms.Core.Controls.ListMainForm • Skelta.Repository.List.Action.ListASPXUIAction • Skelta.Repository.List.Action.ActionDelete • Skelta.Repository.List.Action.ActionNewCategory • Skelta.Repository.List.Action.ListEventHandlerProvider • Skelta.Repository.List.ListTableCollection • Skelta.Core.DS.SkeltaParameter

Methods
• `ListItem.Save(ListItemVersionStatus)` This method saves a list item to a specific version. • `ListDefinition.Save()` This method saves a list.

Scenario

Create an Employee Details list mapped to an Employee table with the fields such as Title, Name, Age, Salary, Department, and Manager by running the following code.

```
CREATE TABLE [dbo].[Employee](
 [Id] [uniqueidentifier] NOT NULL CONSTRAINT [DF__Employee__Id__1E6F845E] DEFAULT
(newid()),
 [Title] [nvarchar](250) NULL,
 [Name] [varchar](50) NULL,
 [Age] [int] NULL,
 [Salary] [money] NULL,
 [Department] [varchar](50) NULL,
 [Manager] [varchar](50) NULL,
 [Application] [nvarchar](150) NULL,
 [CreatedBy] [uniqueidentifier] NULL,
 [CreatedDateTime] [datetime] NULL,
 [LastUpdatedDateTime] [datetime] NOT NULL,
 [WIP] [bit] NULL,
 [WIPItemId] [uniqueidentifier] NULL,
 [MainItemId] [uniqueidentifier] NULL,
 [ParentItemId] [uniqueidentifier] NULL,
 [RecordParentItemId] [uniqueidentifier] NULL,
 [TableId] [uniqueidentifier] NULL,
 [ItemRowIndex] [int] NULL,
 [IsLatest] [bit] NULL,
 [Version] [nvarchar](25) NULL,
 [VersionHistory] [nvarchar](max) NULL,
 [Status] [int] NULL,
 [LockedBy] [uniqueidentifier] NULL,
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 [LockedOn] [datetime] NULL,
 [ListID] [uniqueidentifier] NULL,
 [SecuritySettings] [nvarchar](max) NULL,
 [ItemId] [uniqueidentifier] NULL,
 [ItemType] [int] NULL,
 [SecurityItemId] [uniqueidentifier] NULL,
 [Owner] [uniqueidentifier] NULL,
 [ModifiedBy] [uniqueidentifier] NULL,
 [AuditTrail] [nvarchar](max) NULL CONSTRAINT [DF_Employee_AuditTrail] DEFAULT (''),
 [IsDisabled] [bit] NULL CONSTRAINT [DF_Employee_IsDisabled] DEFAULT ((0)),
 [WorkflowStatus] [varchar](50) NULL,
 [SecurityCustomizationId] [uniqueidentifier] NULL,
CONSTRAINT [PK_Employee] PRIMARY KEY NONCLUSTERED
(
[Id] ASC
)WITH (PAD_INDEX = OFF, STATISTICS_NORECOMPUTE = OFF, IGNORE_DUP_KEY = OFF, ALLOW_ROW_LOCKS
= ON, ALLOW_PAGE_LOCKS = ON) ON [PRIMARY]
) ON [PRIMARY] TEXTIMAGE_ON [PRIMARY]
GO
CREATE NONCLUSTERED INDEX [IX_AMI_Employee] ON [dbo].[Employee]
(
 [Application] ASC,
 [MainItemId] ASC,

}
```

Note: Ensure to replace all <RepositoryName> instances with your repository name.

Update List Item by Validating Security

Check and update a list item using the list API.

The list API makes use of the following DLL references, namespaces, classes, and methods.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

DLL Reference	Namespace
Workflow.NET.NET2	• System • Skelta.Repository.List

Class
• Skelta.Repository.List.ListDefinition • Skelta.Repository.List.ListItem

Methods
• `ListItem.CanChangeStatus (ListItemVersionStatus)` This method checks whether you can change the status of a list item, and returns a Boolean value. • `ListItem.ChangeStatusAndUpdate(ListItemVersionStatus)` This method changes the status of a list item and updates the list item.

Scenario

For the **Employee Details** list mapped to an **Employee** table with the fields such as **Title**, **Name**, **Age**, **Salary**, **Department**, and **Manager**, update list item by running the following code.

```
using System;
using Skelta.Repository.List;
namespace ListObject
{
public class DynamicList
{
static void Main(string[] args)
{
DynamicList DL = new DynamicList();
DL.UpdateListItem("SkeltaRepo", "Employee", "admin");  }
private void UpdateListItem(string applicationname, string listname, string LoggedInUser)
{
// Creating ListDefinition Object.
ListDefinition userlist = new ListDefinition(new
Skelta.Core.ApplicationObject(applicationname), listname);
Guid listitemguid = new Guid("cead17b3-d91d-42d2-ac00-da0ccd1e3611");
// Creating ListItem Object.
ListItem listitem = new ListItem(userlist, listitemguid);
// Checking whether list item can be updated.
if (listitem.CanChangeStatus(ListItemVersionStatus.Published))
{
// Updating list item.
((ListTextDataItem)(listitem.ListForm.Records[0].FindControlByName("Name"))).Value = "ken
smith";
listitem.ChangeStatusAndUpdate(ListItemVersionStatus.Completed);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
Console.WriteLine("ListItem has been successfully Updated");
}
else
{
Console.WriteLine("Can not update ListItem");
}
}
}
}
}
```

Delete List Item by Validating Security

Check and delete a list item using the list API.

The list API makes use of the following DLL references, namespaces, classes, and methods.

DLL Reference	Namespace
Workflow.NET.NET2	• System • Skelta.Repository.List

Class
• Skelta.Repository.List.ListDefinition • Skelta.Repository.List.ListItem

Methods
• `ListItem.CanDelete()` This method checks whether you can delete an item, and returns a Boolean value. • `ListItem.Delete()` This method deletes a list item.

Scenario

For the **Employee Details** list mapped to an **Employee** table with the fields such as **Title**, **Name**, **Age**, **Salary**, **Department**, and **Manager**, delete list item by running the following code.

```
using System;
using Skelta.Repository.List;
namespace ListObject
{
public class DynamicList
{
static void Main(string[] args)
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
{
DynamicList DL = new DynamicList();
DL.DeleteListItem("SkeltaRepo", "Employee", "admin");
}
 private void DeleteListItem(string applicationname, string listname, string LoggedInUser)
{
// Creating ListDefinition Object.
ListDefinition userlist = new ListDefinition(new
Skelta.Core.ApplicationObject(applicationname),
listname);
// Creating ListItem object.
ListItem listitem = new ListItem(userlist, new
Guid("cead17b3-d91d-42d2-ac00-da0ccd1e3611"));
// Checking whether list item can be deleted.
if (listitem.CanDelete())
{
// Deleting list item.
listitem.Delete();
Console.WriteLine("ListItem has been successfully deleted");
}
else
{
Console.WriteLine("Can not delete ListItem");
}
}
}
}
}
```

Get Values of Default Field of List

Retrieve values of the list items for the default field using the list API.

The list API makes use of the following DLL references, namespaces, classes, and methods.

DLL Reference	Namespace
Workflow.NET.NET2	• System • Skelta.Repository.List

Class
ListDataHandler

Methods
• `GetAllListItemsWithDefaultField()` This method retrieves values of all list items for the default field. • `GetTopLevelListItemsWithDefaultField()`

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Methods
This method retrieves values of the top level list items for the default field. • `GetChildListitemsWithDefaultFieldForValue()` This method retrieves values of the child level list items for the default field. • `GetChildListItemsWithDefaultFieldForId(id)` This method retrieves values of the child level list items for the default field for a specific ID. • `GetChildListitemsWithDefaultFieldForValue(name)` This method retrieves values of the child level list items for the default field for a specific name.

Scenario

Create a list called **Customers** with **CustomerId (Int Datatype)** configured as the **UniqueField** and **CustomerName** configured as the **DefaultField**. Retrieve the values of the new Properties **DefaultField** and **Unique Field** added to the ListDefintion by running the following code.

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using Skelta.Repository.List;
namespace ConsoleApplication1
{
class Program
{
static void Main(string[] args)
{
string repository = "March 2011";
string list = "Customers";
// Creating ListDataHandler object.
ListDataHandler ldh = new ListDataHandler(repository, list, false);
// Retrieving DefaultField.
string defaultfield = ldh.DefaultField;
// Retrieving UniqueField.
string uniquefield = ldh.UniqueField;
// Retrieving top level list items with DefaultField.
Dictionary<Guid, object> customeritems = new Dictionary<Guid, object>();
customeritems = ldh.GetTopLevelListItemsWithDefaultField();
// Looping through individual items to retrieve them.
foreach (KeyValuePair<Guid, object> customer in customeritems)
{
Guid Id = customer.Key;
string customername = customer.Value.ToString();
}
// Retrieving all list items with DefaultField.
Dictionary<Guid, object> customeritems1 = new Dictionary<Guid, object>();
customeritems1 = ldh.GetAllListItemsWithDefaultField();
// Looping through individual items to retrieve them.
foreach (KeyValuePair<Guid, object> customer in customeritems1)
{
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
Guid Id = customer.Key;
string customername = customer.Value.ToString();
}
// Retrieving all child items (sub customers) of a specific item (customer) with name John.
object cusotmername = "John";
Dictionary<Guid, object> subcustomeritems = new Dictionary<Guid, object>();
subcustomeritems = ldh.GetChildListitemsWithDefaultFieldForValue(customername);
// Looping through individual items to retrieve them.
foreach (KeyValuePair<Guid, object> customer in subcustomeritems)
{
Guid Id = customer.Key;
string customername = customer.Value.ToString();
}
// Retrieving all child items (sub customers) of a specific item (customer) with Id field.
Guid itemid = new Guid("87B15910-54F8-4F78-9EA5-3E3FD3AD3286");
Dictionary<Guid, object> subcustomeritems1 = new Dictionary<Guid, object>();
subcustomeritems1 = ldh.GetChildListItemsWithDefaultFieldForId(itemid);
// Looping through individual items to retrieve them.
foreach (KeyValuePair<Guid, object> customer in subcustomeritems1)
{
Guid Id = customer.Key;
string customername = customer.Value.ToString();
}
// Retrieving the Item Id for the customer with the name Kevin.
object cname = "Kevin";
Guid KevinId = ldh.GetListItemIdForDefaultField(cname);
}
}
}
```

Save ListItem

Save a ListItem using list API.

The list API makes use of the following DLL references, namespaces, classes, and methods.

DLL Reference	Namespace
• Workflow.NET.NET2 • Skelta.Forms.Core	• System • Skelta.Repository.List

Class
• Skelta.Repository.List.ListDefinition • Skelta.Repository.List.ListItem

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Methods
• `ListItem.Save()` This method is used to save the ListItem.

Scenario 1

For the **Employee** list mapped to an **Emp** table with the fields such as **Title**, **Name**, **City**, **State**, **Pincode**, and **Age**, save the ListItem by running the following code.

```
using System;
using Workflow.NET;
using Workflow.NET.Engine;
using Skelta.Forms.Core.Controls;
using Skelta.Repository.List;
public class WorkflowScript0144412702584f2a8852a95a0a727737
{
public string Run(int ExecutionId, int ExecutionDetailsId, Workflow.NET.Engine.Context ctx,
Workflow.NET.Action action, string inlink)
{
string applicationname = ctx.ApplicationName;
string listname = "Employee";
ListDefinition lstdef = new ListDefinition(new
Skelta.Core.ApplicationObject(applicationname), listname);
Skelta.Repository.List.ListItem listItem = new Skelta.Repository.List.ListItem(lstdef);
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("Title"))).Value = "T3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("Name"))).Value = "A3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("City"))).Value = "C3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("State"))).Value = "S3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("PinCode"))).Value =
"P3";
((ListIntDataItem)(listItem.ListForm.Records[0].FindControlByName("Age"))).Value = "20";
listItem.Save();
return "saved";
}
}
```

Scenario 2

If we add a new column to the **Emp** Table say **Department**, then we need to call the `ClearTableNameKeyFromTableCollection` API before calling the `listitem.save()`.

```
Skelta.Core.DS.SingleTableObject.ClearTableNameKeyFromTableCollection(ctx.DataHandler.DataSourceTyp
applicationname, "EmpTable");
```

```
using System;
using Workflow.NET;
using Workflow.NET.Engine;
using Skelta.Forms.Core.Controls;
using Skelta.Repository.List;
public class WorkflowScript0144412702584f2a8852a95a0a727737
{
public string Run(int ExecutionId, int ExecutionDetailsId, Workflow.NET.Engine.Context ctx,
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
Workflow.NET.Action action, string inlink)
{
string applicationname = ctx.ApplicationName;
string listname = "Employee";
Skelta.Core.DS.SingleTableObject.ClearTableNameKeyFromTableCollection(ctx.DataHandler.DataS
ourceType, applicationname, "Emp");
ListDefinition lstdef = new ListDefinition(new
Skelta.Core.ApplicationObject(applicationname), listname);
Skelta.Repository.List.ListItem listItem = new Skelta.Repository.List.ListItem(lstdef);
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("Title"))).Value = "T3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("Name"))).Value = "A3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("City"))).Value = "C3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("State"))).Value = "S3";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("PinCode"))).Value =
"P3";
((ListIntDataItem)(listItem.ListForm.Records[0].FindControlByName("Age"))).Value = "20";
((ListTextDataItem)(listItem.ListForm.Records[0].FindControlByName("Department "))).Value =
"R&D";
listItem.Save();
return "saved";
}
}
```

Advanced List Features

This section explains the advanced List features available in AVEVA Work Tasks.

List Control Properties

The Tool Box provides a set of controls to design a list. The List Designer provides an easy to use drag and drop interface for designing a list using the various controls. Controls can also be added by clicking the Add New icon on the List Menu.

The following is a reference to all the controls, including their attributes and script properties. The attributes of a list are arranged in two tabs, Basic and Advanced. The Scripts tab attributes are common for all the controls and is explained in "Viewing Scripts in Lists".

List(Parent)

There are two tabs for setting the properties:

Basic

Field	Description
Tag name	Enter a tag name that identifies the list main form name.
Description	Enter a description for the list main form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Mapped XML Node	This field displays the XML node mapped to the list main form. It allows mapping of a List to a Form and the Form to a Workflow. **Note:** Editing the Mapped XML Node at a later instance will affect the mapping between Forms, Lists and Workflows.
DefaultSortOrder **	This property is used to display the list items in a specified order for the dynamic list. You can specify the comma separated column names for list sorting. Example: In a list, assume that there are columns like OrderNo, Name, Description, Quantity, Price and Total. To sort the list based on the OrderNo, Name and Quantity, specify the Default Sort Order property as OrderNo, Name, Quantity.
Allow Child items?	Select **Yes**, to allow child items, else select **No**.
Show All Standard Columns?	Select **Yes**, to show all standard columns, else select **No**.
Show Specific Standard Columns?	Type the Standard Columns which you want to display in the grid, separated by commas. To show the columns; Title, Description, Owner, Version, Item Status, Work in Progress, Workflow Status, and LastModified Date type **Title**, **Description**, **Owner**, **Version**, **Status**, **WIP**, **WFStatus,** and **LMD** respectively separated by commas.
Table name	This field displays the database table name to which the list main form is bound to. To edit the table, click the **Table** button and select the required table.

The column names specified in the **Default Sort Order** property and the actual columns names should be same. If the column name entered in the **Default Sort Order** property and the actual column name is different then that column will be ignored while sorting.

If a column specified in the **Default Sort Order** property is not available in the grid then the column will be ignored while sorting. For example, if **Default Sort Order** property is specified as **OrderNo**, **Name**, **Quantity** but if the **OrderNo** column is not available in the grid, then the list will be sorted based on the **Name** and **Quantity** columns.

The **Allow Sorted** property and the **Default Sort Order** properties are different. By default, the **Allow Sorted** property of list item is set as **False**. For example, if **DefaultSortOrder** property is specified as **OrderNo**, **Name**, **Quantity** and the **Allow Sorted** property of the **OrderNo** is set as **True** then list items will be displayed with default sort order specified in the **Default Sort Order** property when the dynamic list is loaded for the first time. If you sort by **OrderNo** column then list items are displayed based on the OrderNo column.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For faster sorting, index the columns specified in the default sort order property.

Advanced

Field	Description
Default Field	It is the default field used to hold the item details such as item id, version and item type. The field that is specified in the Default Field will serve the purpose of Title field. The options **Available in grid?** and **Available in lookup?**, should be set as **Yes** in the **List properties** dialog for the field that is set as **Default Field**. Example: If the field **Name** is specified as Default Field, then the control Name should be edited and the options **Available in grid?** and **Available in lookup?** should be set as **Yes**.
Id	The reference identification code in this field is generated automatically.
Unique Title?	Select **Yes** for the title to be unique, else select **No**.
Unique Field	This field works as a unique key to the List. The list item is identified based on the unique key. Every list can have a unique key defined, based on which the list item is identified. Given a scenario where the user creates an Order List with Order Type, Order Category, and Order ID fields. Since the Order ID is the uniquely identifiable key for this list, it becomes the unique key. In addition, the user can assign multiple fields to a unique key. For example, in an 'Employee List' which has First Name, Last Name, Address, Age etc., the user can assign the First Name and the Last Name as the Unique Key for this list item. Note that the user is not restricted to use only string values (first name and last name are a part of the type string). The user may use different combinations of Integer, String fields and date fields etc. For example, the user can use Age and Date of Birth or Address and Telephone number as a Unique Key. Unique Key can be defined to a maximum limit of five fields in a list. **Note:** Unique key can be defined only in a parent table.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Attachment

There are two tabs for setting the properties:

Basic

Field	Description
Tag name	Enter a tag name that identifies the list main form name.
Description	Enter a description for the list main form.
Mapped XML Node	This field displays the XML node mapped to the list main form. It allows mapping of a List to a Form and the Form to a Workflow. **Note:** Editing the Mapped XML Node at a later instance will affect the mapping between Forms, Lists and Workflows.
Bound to DB Column	Enter the name of the database column to which it is bound.

Advanced

Field	Description
Grid display width	Enter the grid display width.
Available in grid?	Select **Yes**, if you want to make the content available in the grid, else select **No**. This field should be set as **Yes**, if the control is set as Default Field
Available in lookup?	Select **Yes**, if you want to make the control available in any lookup, else select **No**. This field should be set as **Yes**, if the control is set as Default Field
Grid caption	Enter a caption for the grid.
Grid Index	This field is used to display field names on the Lists page in a specific order. The field names will be displayed in an ascending order. By default, the value for **Grid Index** field is 100. You can enter only numerical value for the Grid Index

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
	field. Example: Assume that, 'Employee Details' list has the 'Employee Name', 'Employee Id', 'Experience', 'Skills' and 'Salary' fields. If you specify the Grid Index value as follows: Employee Name - 2, Employee Id - 1, Experience - 40 ('Experience' field is '40' in case later you want to add fields before 'Experience' field and after 'Employee Name'), Skills - 3, Salary - 5, Then it will display the fields in the specified order on the Lists page. i.e. Employee Id, Employee Name, Skills, Salary and Experience. **Note:** Make sure that the Grid Index that you have specified is unique for a field.
Id	The reference identification code in this field is generated automatically.
Lookup display index	Enter a numerical value that identifies the Lookup display Index.
Persist file name as Header	It persists the filename uploaded by user as the header information along with the file.
Id of the control which persists filename	If the Persist file name as Header property is set as No, the filename of the uploaded file can also be persisted in another control present at the same hierarchy.
Is a lookup title?	Select **Yes**, if you want to make the control act as a lookup title, else select **No**.
Image Path (Relative URL)	Enter the image relative url, where the image is located.

BooleanInput

The **BooleanInput** control is used to define a Boolean value (Yes or No).

There are two tabs for setting the properties:

Basic

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Tag name	Enter a tag name that identifies the control name.
Description	Enter a description for the control.
Mapped XML Node	This field displays the XML node mapped to the control. It allows mapping of a List to a Form and the Form to a Workflow. When you add a control for the first time, the XML Node is dynamically altered to reflect the Tag Name. **Note:** Editing the Mapped XML Node at a later instance will affect the mapping between Forms, Lists and Workflows.
Bound to DB column	Enter the name of the database column to which it is bound.
Mandatory?	Select **Yes**, if the control has to be a mandatory field, else select **No**.
Allow Sorting	Select **Yes**, if you want to allow the sorting of the list column, else select **No**.

Advanced

Field	Description
Available in grid?	Select **Yes**, if you want to make the content available in the grid, else select **No**. This field should be set as **Yes**, if the control is set as **Default Field.**
Available in lookup?	Select **Yes**, if you want to make the control available in any lookup, else select **No**. This field should be set as **Yes**, if the control is set as **Default Field**.
Grid caption	Enter a caption for the grid.
Grid Display Type	Select the appropriate grid display type from the drop-down list. The available types are: • Only Text • Only Image • ImageAndText

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Grid Index	This field is used to display field names on the Lists page in a specific order. The field names will be displayed in an ascending order. By default, the value for Grid Index field is 100. You can enter only numerical value for the Grid Index field. Example: Assume that, 'Employee Details' list has the 'Employee Name', 'Employee Id', 'Experience', 'Skills' and 'Salary' fields. If you specify the Grid Index value as follows: Employee Name - 2, Employee Id - 1, Experience - 40 ('Experience' field is '40' in case later you want to add fields before 'Experience' field and after 'Employee Name'), Skills - 3, Salary - 5, Then it will display the fields in the specified order on the Lists page. i.e. Employee Id, Employee Name, Skills, Salary and Experience. **Note:** Make sure that the Grid Index that you have specified is unique for a field.
Grid display width	Enter the grid display width.
Id	The reference identification code in this field is generated automatically.
Image Path (Relative URL)	Enter the image relative url, where the image is located.
Is a lookup title?	Select **Yes**, if you want to make the control act as a lookup title, else select **No**.
Lookup display index	Enter a numerical value that identifies the Lookup display Index.

DateInput

The **DateInput** control is used to define the date, along with the Calendar pick list.

There are two tabs for setting the properties:

Basic

Id	Displays the identification code for the reference.
Image Path (Relative URL)	Enter the image relative url, where the image is located.
Is a lookup title?	Select **Yes**, if you want the control to act as a lookup title, else select **No**.
Lookup display index	Enter a numerical value that identifies the Lookup display index.

LookupInput

The **LookupInput** control is used to select the look up input from the drop-down list.

There are two tabs for setting the properties:

Basic

Field	Description
Tag name	Enter a tag name that identifies the control name.
Description	Enter a description for the control.
Mapped XML Node	This field displays the XML node mapped to the control. It allows mapping of a List to a Form and the Form to a Workflow. When you add a control for the first time, the XML Node is dynamically altered to reflect the Tag Name. **Note:** Editing the Mapped XML Node at a later instance will affect the mapping between Forms, Lists and Workflows.
Bound to DB column	Enter the name of the database column to which it is bound.
Mandatory?	Select **Yes**, if the control has to be a mandatory field, else select **No**.
Lookup Window Title	Enter a title, which is to be displayed above the lookup grid.
Lookup Window Description	Enter a description, which is to be displayed above the lookup grid.
Lookup Window Page Height	Enter an integer value in this field, to set the height of

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
	the Lookup Window Page in pixels. A value '0' will set the height of the field in default percentage value.
Lookup Window Page Width	Enter an integer value in this field, to set the width of the Lookup Window Page Width in pixels. A value '0' will set the width of the field in default percentage value.
Show as DropDown?	Select Yes, if you want to show List Lookup control as a drop-down. The **Lookup Window Page Height** and **Lookup Window Page Width** field can be used to change height and width of the **Lookup** control. Select **No**, if you want to show Lookup control.
Allow Sorting	Select **Yes**, if you want to allow the sorting of the list column, else select **No**.
Data Source	Click **Data Source** button to select the Lookup Data Source. The Data source for a lookup can be a Database or a List. Database is used to populate lookup data from a database and List is used to populate data from an existing List. For more details on how to create a new lookup, refer Lookup Settings.

Advanced

Field	Description
Available in grid?	Select **Yes**, if you want to make the content available in the grid, else select **No**. This field should be set as Yes, if the control is set as Default Field
Available in lookup?	Select **Yes**, if you want to make the control available in any lookup, else select **No**. This field should be set as **Yes**, if the control is set as **Default Field**.
Grid caption	Enter a caption for the grid.
Grid Display Type	Select a grid display type from the drop-down list. The available types are:

List Table

The **List Table** control is used to select a table for storing list data. To use the existing table, you need to create a table before navigating to the List Designer. For more information on creating a table, see Create List.

The available tables are:

- Generic Table
- Existing Table

In the **Select Table** screen, select an option and click **Select**.

If you select the **Generic Table** option, the corresponding **Properties** dialog box opens, which allows you to set its properties.

There are two tabs for setting the properties:

Basic

Field	Description
Tag name	Enter a tag name that identifies the control name.
Description	Enter a description for the control.
Mapped XML Node	This field displays the XML node mapped to the control. It allows mapping of a List to a Form and the Form to a Workflow. When you add a control for the first time, the XML Node is dynamically altered to reflect the Tag Name. **Note:** Editing the Mapped XML Node at a later instance will affect the mapping between Forms, Lists and Workflows.
Table Name	This field displays the database table name to which the list main form is bound to. To edit the table, click the **Table** button and select the required table.

Advanced

Field	Description
Id	The reference identification code in this field is generated automatically.

If you select the **Existing Table** option, then select a table from the available list and click **Select**. The corresponding **Properties** dialog box opens, which allows you to set its properties. You can set the properties as explained above.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: For generic List, ensure that the Bound to DB column Name is not the same for both Parent and Child control.

In addition, if 2 rows have the same data in all the columns displayed in the grid, then the row will not be displayed twice, since we use Distinct queries.

So ensure that at least one column (Display column) is added to distinguish the 2 data rows containing similar data.

XML Variables for Lists

Introduction to XML List Variables

AVEVA Work Tasks introduces XML Variables as a way to provide data inputs to workflows. The various types of XML Variables provided can be configured in the Start activity through the XML Variable property. An XML List type XML Variable can be mapped to any list schema i.e. either to lists provided out of the box or to lists created dynamically using create list option, to perform retrieval of data of a list item.

Using XML list XmlVariable, you can fetch the data from any list. XML Variable for XML list can be mapped to any XML List schema for inserting, updating and retrieving list items. Also you can attach the list to a workflow very easily in a few steps.

Scope of List XML Variable

List XML variable can be set to **Current**, **New** and **List Query** scopes. In that, you can set Current and New scopes at the time of creating XML List type XML variable and all the three scopes including List Query can set up in the List Navigator activity properties.

- **Current** : The XML variable will be pointed to the list item which initiated the workflow.
- **New** : The XML variable will be pointed to add a new list item to the list. Accessing this XML variable before adding an item will not give any details. After adding a list item, this XML variable will have the details of the added item. To add another item, use a list navigator action to re-initialize the scope as New.
- **List Query**: This property allows you to build a query for the list and fetch the items based on the query.

Create a Workflow for a List in a Single Step

The List workflow option in the Workflow Ribbon bar helps to create and associate a workflow to a list in a single step.

To create a workflow for a list

1. Login to the **Enterprise Console** and create a list.
2. Click the **Enterprise Console** menu on the top and select Workflows from the drop-down list. The **Workflows** page appears.
3. Click **List** on the **Ribbon Bar**. The **New List Workflow** dialog box appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
New List Workflow	
Title	Enter a title of workflow for the List in this field.
Description	Enter a description for the workflow in this field.
Associate to List Event - This can also be done using the 'Associate' icon in the Workflow List Menu.	
List	Select a list id by clicking the **List** button. The List Explorer screen opens. Select the list name from the drop-down list and click **Submit**.
Event	Select an event from this drop-down list. The available options are **OnCreate**, **OnDelete**, **OnPublish**, **OnUnPublish**, and **OnVersionChange**.

4. Enter the appropriate details.
5. Click **Save and Continue**. The Workflow Options dialog box appears.

   Note: You can perform four tasks – provision the workflow, start the Workflow Wizard, design the Workflow, or just perform no task at all.
6. Select the required task by clicking the corresponding radio button and click Finish.
7. Using List workflow there are three incidents taken place.

Workflow Creation

When you click **Finish**, a workflow is created for the selected list. You can open this workflow by either by selecting Design the Workflow now from tasks or using Design Workflow in context menu of the workflow item.

List XML Variable

An XML variable of XML List type is also created by default and the list name is used as the variable name. To view the XML Variable, go to the workflow designer screen. Right click the **Start activity**, select **Activity Properties** from the options and then select the **Xml Variables** icon from the **Activity Properties**.

You can notice that, the variable is created with scope as **Current** , which means, this variable is responsible to give the information of the list item which initiates the workflow. The XML variables displayed in tree-view are the XML nodes that are mapped to the controls while creating the list.

System nodes are also created automatically for internal use. This helps you to save the list item in to another version as published or draft and also helps to save the item as folder for the list item.

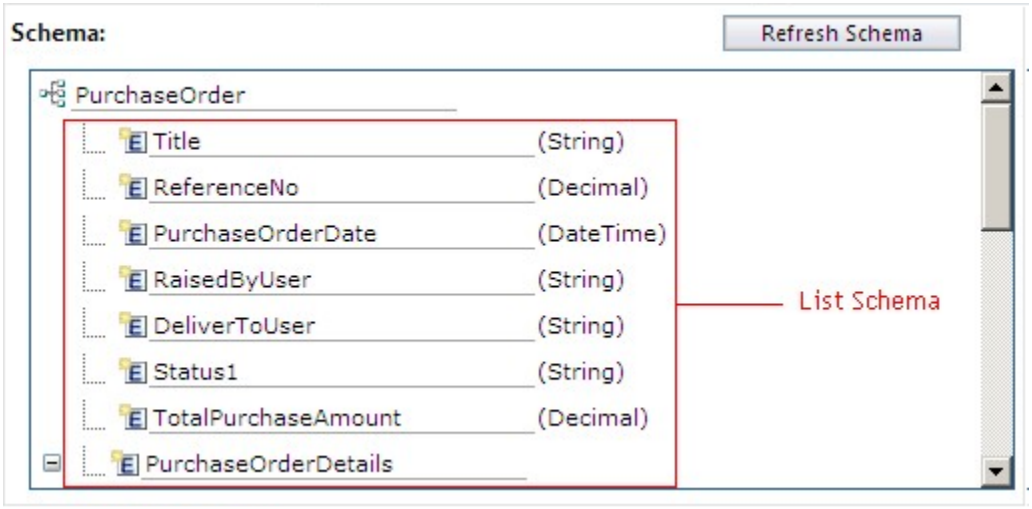
List Event Association

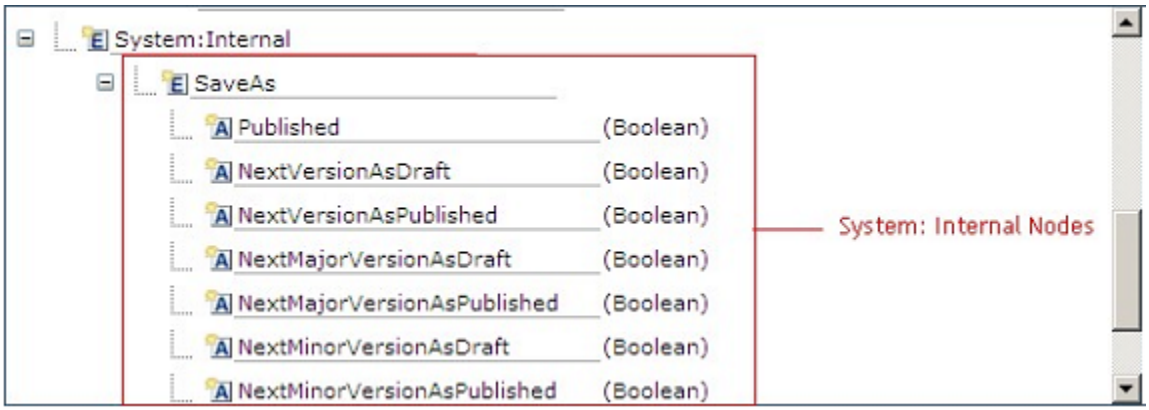
This workflow is associated to the list event that you have selected at the time of execution. To view the associations, select the workflow, right click and select View Associations from the options.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Schema of XML List XML Variable

The schema of XML list includes schema of the list and system internal nodes.





System Internal Nodes

When you create a list XML variable for the list, system internal nodes are also created automatically for internal use. This will help you to save your list item as a different version as **Published** or **Draft** when you update an item. It will also help you to save the item **As Folder** and **Published**.

If you want to add a new list item with **Published** status, select **Published** from the **SaveAs** option under **System:Internal** and then set value as **True**.

Similarly, you can select an appropriate operation from the **Operations** node to **Delete**, **Enable**, or **Disable** folders. Just as saving the folder, you can select these operations and then set the value as **True**.

Create an XML List Type XML Variable

XML Variable of List type can be configured in the Start activity through the XML Variable property. XML Variable of List type can be mapped to any list schema i.e. either to lists provided out of the box or to lists created dynamically using create list option, to perform retrieval of data of a list item.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To create an XML List type XML Variable

1. If you select **Design the Workflow now** option from the Workflow option screen while creating a workflow for the list.
2. Right click the **Start** and select **Activity Properties** from the options.
3. Click the **More** button in the **XMLVariables** field.
4. Click **New Variable** to add a new variable.
5. Type a variable name in the **Variable Name** field.
6. Select type as **XML List** from the **Type** drop-down list.
7. Type the List name in the **Select List** field or click the **List** button to select the list.
8. The XML schema displayed in tree-view are the XML nodes that are mapped to the controls while creating the list. Also you can see the System Internal nodes that are created automatically for internal use. This will help you to save the list item in another version as draft or published and help to create a folder.
9. Select the scope from the **Choose the ListItem to work on** section. The available options are:
   - **Current**: This will help to work with the list item that initiated the workflow.
   - **New**: The XML variable will be pointed to add a new list item to the list.
10. After entering all the required data, click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window. Now you have created an XML List type XML Variable.

Note:
- Later you can modify the variable. Click the **Refresh Schema** to reload the changes made to the list.
- After refreshing the schema, click **Save Variable** to save the changes.

Change the Scope of the XML List XML Variable

The scope (Choose the list item to work on options) of the XML list XML variable can be changed during the runtime. After the scope is changed, the XML list XML variable will be using the changed scope. You can change the scope of the XML list XML Variable using List Navigator activity during the workflow execution. Using this action, you can also navigate the XML list XML variable to another list having the similar schema.

To change the scope of the XML List XML Variable

1. Click **Activities** and select **List Activities** from the options.
2. Drag and drop **List Navigator** activity.
3. Select the **XML variable**, for which the scope needs to be changed, from the **XML Variable** of **List Type** drop down list.
4. Type/select the list name in the **List Name** or **ID** field. This property helps to change the list that needs to be worked on. The list entered here should have the same schema of the list from which the XML variable is created. If you don't want to change the working on list, then leave this field blank. After you change the list, the XML variable will be using the changed one.

   As an example, you have a list called Purchase Orders and another list called Approved Purchase Orders which has the same schema of the Purchase Orders list. If you want to add/update some item in the Approved Purchase Orders, you don't have to create separate XML variables for both the lists. You can use the same XML variables since both lists have the same schema. In this case, create XML variable for Purchase Orders. Enter the List Name as Approved Purchase Orders. And then set the scope as New. This

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

will point to the Approved Purchase Orders list and add/update the item in that list.

5. Click the drop-down and select the scope from the options. The available options are **Current**, **New** and **List Query**. Here you can change the scope.

Note:
- You can also use the list id. Id should be inside curly braces.
- Format to use {ListId}.Tell that this is optional and the list id need not have to be given when the list name is provided and vice versa.
- Also they can provide both as {ListId}ListName format.

Set up the List Query Scope

This property allows you to build the query for the list and retrieve the data based on the query. You need to point to any particular item to perform any task based on that item. This can be done by building the query using **List Query**.

To set up the list query scope

1. Select **List Query** as the scope and click **Save**. Then click the **Query** button of **List Query** property.
2. Click the **Query** button. The **List Query** dialog box appears.
3. The following are the field values for List Query window:

Field	Description
ListName	Select the list from List Name drop-down list.
Table	By clicking on this textbox, a popup allows you to select the corresponding table for query. The respective table name will display in the popup window based on the list selected by the user.
Column	You can select this drop-down list to select the column or field of the corresponding list.
Operator	You can select this drop-down list to select an operator (either one of =,>, <,>=, <=, <>, IN, Not IN, Like) to build the query.
Type	You can select this drop-down list to select a type. The value is automatically displayed in the textbox.
Condition	You can select this drop-down list to select the condition [either of End, And, Or, '),' '('.
Add	You can click this button to add a query in the field.
Clear	You can click this button to clear the query contents.
OK	You can click this button to save this query.
Close	You can click this button to close this window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Enter the details and click **Add** to add the List Query.
5. Click **OK** and then click **Close**.
6. As an example, you have a list named 'Purchase Orders' and you want to update the records that have the **Reference No** value '456789' and '123456' . This query can be built using list query.
7. Click the **Query** button to build the query for the list 'Purchase Orders'.
8. The list name **Purchase Orders** is selected automatically. If the list is not selected, select your list from the **List Name** drop-down list. Click the **Table** field. The pop up window allows you to select the table of the 'Purchase Orders'.
9. Click on **SKEListItemDataNV**. This will display automatically in the text box. Here the table names displayed in the tree view are the parent table (one on the top) and the child table (below one).
10. Click the **Column** drop-down list.
11. Select **int1** from the options since the field **Reference No** is mapped to this column of the database.
12. Select '=' operator from the **Operator** drop-down list.
13. Select **Value** from the **Type** drop-down list.
14. Type '**456789**' in the textbox.
15. Select **OR** from the **Condition** drop-down list to add another query.
16. Click **Add** to add the condition in the textfield.
17. Here, **SKEListItemDataNV** is the table name where the list has been stored and **t1** is the internal name that has been used for the main table. If there is any child table also, it will display as **t2. int1** in the field name, to that you need to point your XML variable and **456789** is the value for that field.
18. Repeat the same steps for the list item having '**123456**' as **Reference No**.
19. Enter the value as '**123456**'.
20. Select **End** from the **Condition** drop-down list.
21. Click **Add**. The build query will be displayed in the text field.
22. Click **OK** and then click **Close**.
23. Click **Update**.
24. You can replace the value for the query, with the variables. To replace, select the text/value to be replaced, and then select the respective field from the drop-down list and click **Append**.
25. A list query that uses a variable will look like this : **(SKEListItemDataNV(t1).int1 = '<%#XmlVariables.purchaseorders.PurchaseOrders.ReferenceNo%>'**.
26. Click **Update** and close the window.

Create an XML List Iterator Type XML Variable

XML List Iterator type XML variable is used to iterate through the list items (parent items) of a list and helps to retrieve/update data from a workflow.

To create an XML List Iterator type XML Variable

1. Right-click the **Start** Activity and select **Activity Properties** from the options. The **Process Designer** page appears.
2. Click the **More** button in the **XMLVariables** field. The existing list of XML variable is displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. You have to create an XML List type XML variable before creating XML List Iterator type XML variable. If you have already created XML List type XML variable, you can proceed to the following step. See Creating an Xml List type Xml variable to create XML List XML variable.
4. Click **New Variable** to add a new variable.
5. Enter a variable name in the **Variable Name** field.
6. Select **Xml List Iterator** from the **Type** drop-down list.
7. Select an XML Variable from the **Xml Variable** drop-down list.

   Note: If you need to loop through the grid items of an item while iterating through the list items, you need to select the respective **Xml List Iterator** type XML variable.
8. Select a repeating node from the **Node Select** drop-down list. Select the XML node which is mapped to the grid in the list.
9. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window.

Create an XML Iterator Type XML Variable for Grid Items

XML Iterator type XML variable is used to iterate though the child items (grid items) of a list item in a workflow.

To create an Xml Iterator type Xml Variable for grid items

1. Right-click the **Start** Activity and select **Activity Properties** from the options.
2. Click the **More** button in the **XMLVariables** field. The existing list of XML variables is displayed.
3. You have to create an XML List Iterator type XML variable before creating XML Iterator type XML variable. If you have already created XML List Iterator type XML variable, you can proceed to the following step. See Create an XML List Type XML Variable to create XML List XML variable.
4. Click **New Variable** to add a new variable.
5. Type a variable name in the **Variable Name** field.
6. Select XML Iterator from the **Type** drop-down list.
7. Select an XML Variable from the **Xml Variable** drop-down list.

   Note: If you need to loop through the grid items of an item while iterating through the list items, you need to select the respective XML List Iterator type XML variable.
8. Select a repeating node from the **Node Select** drop-down list. Select the XML node which is mapped for the grid in the list.
9. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window.

   Note: The user is unable to get the immediate values or attributes for the root node, if it was repeating.

Example

Consider an XML Schema

```
<EmployeeDetails>
<Employee Name='John'>ID123</Employee>
<Employee Name='Ken'>ID222</Employee>
</EmployeeDetails>
```

In this case, the repeating element is Employee. From the workflow, the user was unable to view the Name and ID values in runtime.In the above case, the repeating Element being Employee, from the workflow, the user was

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

unable to view the Name and ID values in runtime. In order to view the values, the user had to build the schema in the following pattern.

```
<EmployeeDetails>
<Employee>
<Emp Name='John'>ID123
</Emp>
</Employee>
<Employee>
<Emp Name='Ken'>ID222
</Emp>
</Employee>
</EmployeeDetails>
```

XML Variable Scenarios

This section explains various scenarios on how to use List XML Variables while:

- Add a New List Item
- Update the List Item that Alerted the Workflow
- Save the List item as Different Version as Draft/Published using XML Variable
- Add New Item to a List Folder using List XML Variable
- Delete an Item from a List Folder using XML Variable
- Move an Item to a Folder using List XML Variable
- Create a New Folder using XML Variable
- Add a New List Item with Grid Items
- Add a New Grid Item to the Existing List Item
- Copy a List Item with Grid Items
- Iterate through the List Item and Grid Item of the List

Add a New List Item

AVEVA Work Tasks allows you to add a new list item to the list using XML List XML variables. Update Variable activity can be used to add/update an item to the list. To add an item you need to select the scope as New from Choose the List Item to Work on options. You can also use List Navigator Activity to set the scope. With the help of a scenario, we will explain this function.

Assume that you have created a list called Purchase Orders with the following fields.

- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

  - Quantity
  - Unit Price
  - Item Total
- Total Purchase amount

Now you want to add items to this list.

To add a new List Item

1. Logon to the **Enterprise Console** and launch **Workflow Designer** page.
2. You need to create an XML List type XML variable for the Purchase Orders list. If the variable is not created, follow the below mentioned procedure to create.
3. Click the **More** button in the **XMLVariables** property from the **Start** Activity Properties.
4. Click **New Variable** to add a new variable.
5. Type the variable name as purchaseorders.
6. Select type as **XML List** from the **Type** drop-down list.
7. Type the List name in the **Select List** field or click the **Query** button to select the list. In this case, select Purchase Orders list.
8. Select **New** as scope from the **Choose the ListItem to work on** options to point to a new item in the Purchase Orders list.
9. Now you can see the XML nodes in a tree-view that are mapped to the controls while creating the list.
10. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window.

    Note: If you set the scope as Current while creating the XML List type XML variable, you can change it in to New using List Navigator activity.
11. Drag and drop **Update Variable** activity to add an item to the list.
12. Click the **More** button in the **Set Variables** property.
13. Click the **Select** link and select the respective field of the XML List type XML Variable created for the list (in this case purchaseorders). The fields displayed in the tree-view are representing the XML nodes of the controls in the list.
14. Select a field for which you want to set the value, from the tree-view and enter the value for the field in the right-hand side text box, or you can use **Value** button to set the value.
15. If you want to set the value, select **enter a value** from the tree-view, and then enter the value. Also you can select variables or contents or any XML Variable nodes directly by selecting the respective node from the tree-view. If you want to combine multiple node values, you can build an expression by selecting **Build Expression**.
16. In the same way, you can set the value for all other fields in the list for the new item. Make sure to specify the values for all mandatory fields of the list.
17. After setting the value for the entire field, click **OK**. When you execute this workflow, a new item will get added based on the value that you have set.

Update the List Item that Alerted the Workflow

AVEVA Work Tasks allows you to update the list item that alerted the workflow using XML List Type XML Variable. Update Variable activity can be used to add/update an item to the list. To update an item you need to select the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

scope as Current from Choose the List Item to Work on options. You can also use List Navigator Activity to set the scope. With the help of a scenario, we will explain this function.

Assume that you have created a list called Purchase Orders with the following fields and alerted the workflow.

- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price
  - Item Total
- Total Purchase Amount

Now you want to update an item in the same list. Follow the procedure.

To update the list item that alerted the workflow

1. Logon to the **Enterprise Console** and go to **Workflow Designer** page.
2. You need to create an XML List type XML variable for the Purchase Orders list. If the variable is not created, follow the procedure mentioned below to create the variable.
3. Click the **More** button in the **XMLVariables** property from the **Start** Activity Properties.
4. Click **New Variable** to add a new variable.
5. Type the variable name as 'purchaseorders'.
6. Select type as **XML List** from **Type** the drop-down list.
7. Type the List name in the **Select List** field or click the **Query** button to select the list. In this case, select 'Purchase Orders' list.
8. Select **Current** as the scope from the **Choose the ListItem to work on** options to point to an item in the Purchase Orders list.
9. Now you can see the XML nodes in a tree-view that are mapped to the controls while creating the list.
10. Then click Save Variable. A message is displayed saying ‘Variable Updated’. Close the window.

    Note: If you set the scope as New while creating the **Xml List** type XML variable, you can change it in to **Current** using **List Navigator** activity.
11. Drag and drop **Update Variable** activity to update an item in the list.
12. Click the **More** button in the **Set Variables** property.
13. Click the Select link and select the respective field of the XML List type XML Variable created for the list (in this case purchaseorders). The fields displayed in the tree-view are representing the XML nodes of the controls in the list.
14. Select a field for which you want to set the value from the tree menu. Then enter the value for the field in the right-hand side text box or click the **Value** button to set the value.
15. If you want to set the value, then select enter a value from the tree-view, and then enter the value. Also you

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

can select variables or contents or any XML variables nodes directly by selecting the respective node from the tree-view. If you want to combine multiple node values, you can build an expression by selecting Build Expression.

16. Similarly, you can set the value for other fields that you want to update. In this case, you are only updating the field Title which has the value Order for Illustrator.
17. Click **OK**. When you execute this workflow, the item gets updated based on the value that you have set.

Save the List item as Different Version as Draft/Published using XML Variable

There are two kinds of lists, version enabled and version not enabled. If your list is version enabled, you can save the item as a different version as published or draft using System Internal variables. This can be done at the time of setting the value for activity.

Assume that you are creating a workflow and it is attached to the out of box list workflow which is version enabled.

To save the list item as different version as draft/published using Xml Variable

1. Right click the **Start** activity and select **Activity Properties** from the options.
2. Click the **More** button in the field.
3. For the version enabled list, you can see the list of schema in a tree-view under **System:Internal**. Nodes include Save As NextVersionAsDraft, NextVersionAsPublished and so on. You can use this nodes to save an item in to another version as draft or published.
4. Use **List Query** and point to an item that you want to update and save as different version. See Setting up the List Query.
5. Then drag and drop **Update Variable** activity. Click **Set Variables** button in the **Set Variables** field.
6. Click the **Select** link and then click the drop-down list that appears.
7. Assume that you want to update the item **Description** having the value 'Workflow Management'. So select **Description** from the drop-down list and enter the value as 'Workflow Management'.
8. Now, you want to save this item as **Next Version** as Draft. For that click the drop-down.
9. Select **NextVersionAsDraft** from the **SaveAs** options under **System:Internal**.
10. Then enter the value as 'True'.
11. Click **OK**. This will update the item Title and also will save the item as next version as draft.

    In the same way you can save any item in to different versions like Next Major Version as Published/Draft, Next Minor Version as Published/Draft while updating the item.

    Note: If you select multiple **SaveAs** conditions and set the value as **True**, the last condition will be taken into account and the item will be saved based on the last condition. Also for the list that is not version enabled, the system will automatically save the item as published.

Add New Item to a List Folder using List XML Variable

A new item can be added to a list folder using list XML Variable. This can be done using Update Variable activity and List Navigator activity.

Follow the steps below to add a new item to a list folder.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Right-click the **Start** activity and select **Activity Properties** from the options.
2. Click the **More** button in the **XMLVariables** field.
3. Create a new variable of type **XML List**. Select the list to which a new item is to be added from the **Select List** drop-down. The XML variable scope should be set as **New**.
4. Drag and drop the List Navigator activity from the List Activities category. List Navigator activity is used to navigate to the folder to which the list item is to be added. You need to set the following properties:
5. **XmlVariable of List Type** - You need to select the XML variable created in the Start activity.
6. **Folder Name** - Select the folder name to which a new list item is to be added.
7. **Scope** - The scope should be set as New.
8. **Enable Errors Encountered Output** - It should be set as **No**.
9. You can set different paths for outputs - Action Completed and Folder Not Found. **Folder Not Found** is given by the activity when the folder is not found in the list.
10. Then drag and drop **Update Variable** activity. Click **Set Variables** button in the **Set Variables** field.
11. Click the **Select** link and then click the drop-down list that appears. Navigate to the Title field of the new variable and set its value. The value for the Title field will be the name of the new item.
12. Click **OK** to save the settings.
13. Publish the workflow. Execute the workflow to create a new item in the folder selected in the **Folder Name** property.

Delete an Item from a List Folder using XML Variable

Items can be deleted from a list folder using the delete option under the Operations node in the System Internal Variables. This can be done in the **Update Variable** activity.

The steps given below uses the same scenario used in the previous topic and considers Purchase Order List for the scenario.

To delete an item using XML Variable

1. In the **Update Variable** activity properties pane, select the **Set Variable** icon.
2. In the Update Variable screen, select the **Delete** option in the Operations node in the System Internal node.
3. Set the Operator Value to **True**.
4. Click **OK** to save it.

To enable an item using XML Variable

1. In the **Update Variable** activity properties pane, select the **Set Variable** icon.
2. In the Update Variable screen, select the **Enable** option in the Operations node in the System Internal node.
3. Set the Operator Value to **True**.
4. Click **OK** to save it.

To disable an item using XML Variable

1. In the **Update Variable** activity properties pane, select the **Set Variable** icon.
2. In the Update Variable screen, select the **disable** option in the Operations node in the System Internal node.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Set the Operator Value to **True**.
4. Click **OK** to save it.

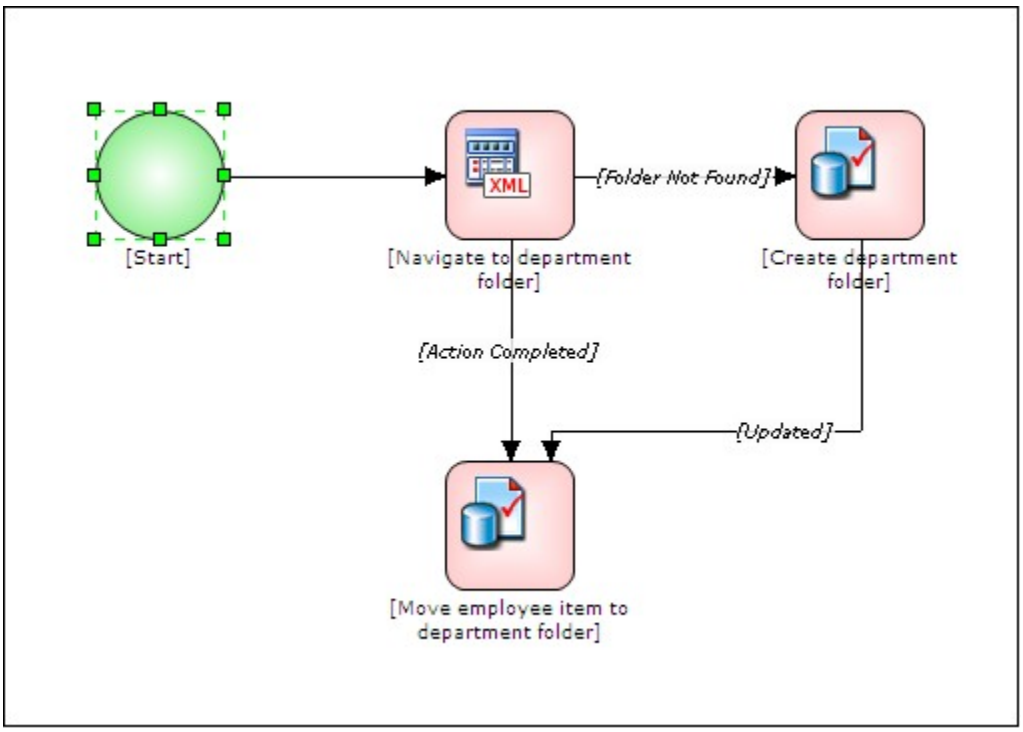
Move an Item to a Folder using List XML Variable

You can move an item to a list folder using list XML variable. This can be done using Update Variable activity and List Navigator activity.

Scenario

An organization has got multiple departments. Each employee information needs to be moved into the respective department folder under the Employee List. If the folder does not exist, the respective department folder needs to be created under the Employee List.

Follow the steps below to move an item to a list folder.



1. Create a list called Employee, with fields as shown below.
   - Title
   - Name
   - Department
   - Experience
   - - Company
   - - Years
2. Go to **Enterprise Console** -> **Workflows**. Create a **List Workflow** and associate it to the **OnCreate** event of Employee List.
3. In the Process Designer, right click the **Start** activity and select **Activity Properties** from the options.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click the **Set Variables** button in the **XMLVariables** field.
5. Create a new variable **EmployeeDepartment** of type **XML List**. Select the **Employee** list from the **Select List** dropdown. The XML variable scope should be set as New. [This XML variable is used in the workflow to check the existence of department folder, and create a new department folder if not found in the Employee List].
6. Drag and drop the List Navigator activity from the List Activities category. List Navigator activity is used to navigate to the folder to which list item is to be moved. You need to set the following properties:

   XmlVariable of List Type - You need to select the XML variable - EmployeeDepartment created in the Start activity.

   Folder Name - Select the department folder name to which the list item is to be moved.

   Scope - The scope should be set as New.

   Enable Errors Encountered Output - It should be set as **No**.
7. You can set different paths for outputs - **Action Completed** and **Folder Not Found**. **Action Completed** output is given by the activity if the XML variable has navigated to the folder specified. **Folder Not Found** is given by the activity when the folder is not found in the list. [**Folder Not Found** output is given by the activity only when the **Enable Error Encountered Output** property is set as **No**].
8. Create the department folder in the list, when the output is **Folder Not Found**. Drag and drop **Update Variable** activity. Click the **Set Variables** icon in the **Set Variables** field.
9. Set the title field of EmployeeDepartment list XML variable to department folder name and System:Internal -> SaveAs -> AsFolder to true.
10. When the folder is found (i.e. Action Completed output), drag and drop Update Variable activity. Click the **Set Variables** button in the Set Variables field.
11. Click the **Select** link and then click the drop-down list that appears. Set the System:Internal -> Operations -> **MoveToFolder** with the department name of the employee. [This is to be done on the list XML variable that points to the employee added].
12. Click **OK** to save the settings.
13. Publish the workflow.
14. Create a new item in the list.
15. The workflow gets triggered. The department name folder gets created in the Employee List and the employee information moves under the respective department folder.

Create a New Folder using XML Variable

Folders can be created in a list using System Internal Variables if the list allows folders to be created. This can be done using **Update Variable** activity.

Follow the steps below to create a folder in Workflow list which allows folders to be created.

To create a new folder using XML Variable

1. Right-click the **Start** activity and select **Activity Properties** from the options.
2. Click the **More** button in the **XMLVariables** field.
3. Create a new variable of type **XML List**. Select list as **Workflow**. The XML variable scope should be set as **New**.
4. Then drag and drop **Update Variable** activity. Click the **Set Variables** button icon in the **Set Variables** field.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Click the **Select** link and then click the drop-down list that appears. Navigate to the Title field of the new variable and set its value. The value for the Title field will be the name of the new folder.
6. To create a new folder, select **AsFolder** from the **SaveAs** options under **System:Internal**. Set its value to true.
7. If your list is version enabled and you want the status of the created folder to be Published, select **Published** from the **SaveAs** options under **System:Internal**. Set its value to true.
8. Click **OK** to save the settings.
9. Publish the workflow. Execute the workflow to create a new folder.

Note: Folder names are not allowed to have special characters like - :"\\"""<>;|*/{}?

Add a New List Item with Grid Items

AVEVA Work Tasks allows you to add list items with grid items to any list using the XML variable. Update Variable activity can be used to perform this task. An XML Iterator type XML variable should be created to add the grid items (child items) and the XML Navigator activity can be used to point to the grid.

This can be explained through the scenario mentioned below.

A list Purchase Orders has been created with the following fields.

- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price
  - Item Total
- Total Purchase amount

From the workflow, you have to add an item along with the child item to the **Purchase Orders** list.

To add a new list item with grid items

1. Logon to the **Enterprise Console** and launch **Workflow Designer** page.
2. You need to create an XML List type XML variable for the Purchase Orders list. If the variable is not created, follow the procedure mentioned below to create the variable.
3. Click the **More** button in the **XMLVariables** property from the **Start** Activity Properties.
4. Click **New Variable** to add a new variable.
5. Type the variable name as 'purchaseorders'.
6. Select type as **XML List** from the **Type** drop-down list.
7. Type the List name in the **Select List** field or click **Select List** button to select the list. In this case select Purchase Orders list.
8. Select **New** as scope from the **Choose the ListItem to work on** options to point to the new item in the list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Now you can see the XML nodes in a tree menu that are mapped to the controls while creating the list. You can also notice that the parent XML nodes and child XML nodes (PurchaseOrderDetails grid) are also displayed.
10. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window.
11. Drag and drop **Update Variable** activity to add an item in the list.
12. Click the **Set Variables** button icon in the **Set Variables** property.
13. Click the **Select** link and select the respective field of the XML List type XML Variable created for the list (in this case purchase orders). The fields displayed in the tree-view are representing the XML nodes of the controls in the list.
14. Select a field for which you want to set the value from the tree- view. Then enter the value for the field in the right-hand side text box. If you want to set the value, select **enter a value** from the tree-view, and then type the value. Also you can select variables or contents or any XML variables nodes directly by selecting the respective node from the tree-view. If you want to combine multiple node values, you can build an expression by selecting **Build Expression**.
15. After setting the value for all the fields in the parent item (controls in the main form) that you want to add, click **OK**. This will add a list item to the list, while executing the workflow, with the fields in the main form.
16. If you want to add an item to the grid (in this case, if you want to add a **Purchase Order Details** grid item), use **Xml Navigator** activity. **Xml Navigator** can be used to point to an item in the grid (**Purchase Order Details** in this case). For this purpose you need to create an **Xml Iterator** type **Xml Variable**. This can be created from the **Start** activity XML variable property. In the XML Variable screen, click **New Variable**.
17. Type the variable name as **purchaseorderdetails**.
18. Select **Xml Iterator** from the **Type** drop-down list.
19. Select **purchaseorders** from the **Xml Variable** drop-down list.
20. Select the repeating node (Qualification) from the **Node Select** drop-down list.
21. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window.
22. Drag and drop **Xml Navigator** activity.
23. Select **purchaseorderdetails** from **Xml Iterator** drop-down list and select **Yes** from **Create New Node** properties to create a new node.
24. Select the appropriate **Location**. The available options are:

    First: Navigates to the first record in the collection.

    Last: Navigates to the last record in the collection.

    Next: Navigates to the next record based on the current location.

    Previous: Navigates to the previous record based on current location.

    Index: Navigates to the record identified in the Index field.
25. Since we have to append the items in **Purchase Order Details** grid, select the option as **Last**.
26. Click **Save**.
27. Drag and drop the **Update Variable** activity to enter the grid field values.
28. Click the **Set Variables** button in the **Set Variables** property.
29. Click the **Select** link and select the respective field of the XML Iterator type XML Variable created for the list (in this case purchaseorderdetails), i.e. grid items. The fields displayed in the tree-view are representing the XML nodes of the controls in the **Purchase Order Details** grid.
30. Select a field for which you want to set the value from the tree- view and type the value for the field in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

right-hand side text box.

31. After setting the value for all the fields in the child item, click **OK**. A new item with grid will be added to the list while executing the workflow.

Note: If you want to add multiple items, use XML Navigator and Update Variable activities for Iterator within the For-Next Loop activities

Add a New Grid Item to the Existing List Item

AVEVA Work Tasks allows you to add list items with grid items to the existing list item using XML variable. Update Variable activity can be used to perform this task. An XML Iterator type XML variable should be created to add the grid items (child items) and the XML Navigator activity can be used to point to the grid. Also you have to use List Query property of List Navigator activity to build the query and to point to the list item to add a new grid.

This can be explained through the scenario mentioned below.

A list Purchase Orders has been created with the following fields.

- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price
  - Item Total
- Total Purchase Amount

From the workflow, now you have to add a grid item to a particular order say Reference No. 456789 in the Purchase Orders list.

To add a new grid item to the existing list item

1. Login to the **Enterprise Console** and go to **Workflow Designer**.
2. You need to create an XML List type XML variable for the Purchase Orders list. If the variable is not created, follow the procedure mentioned below to create a variable.
3. Click the **More** button icon in the **XMLVariables** property from the **Start** Activity Properties.
4. Click **New Variable** to add a new variable.
5. Enter the variable name as **purchaseorders**.
6. Select XML List from the **Type** drop-down list.
7. Enter the List name or click the **Select List** button to select the list. In this case, select Purchase Orders list.
8. Select **New** as scope from the **Choose the ListItem to work on** options to point to the new item in the list.
9. Now you can see the XML nodes in a tree-view that are mapped to the controls while creating the list. You can also notice that the parent XML nodes and child XML nodes (PurchaseOrderDetails grid) are also

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

displayed.

10. Click **Save Variable**. A message is displayed saying 'Variable Updated'. Close the window.
11. Drag and drop the **List Navigator** activity and select **List Query** as the scope.
12. Click **List Query** button in the **List Query** property.
13. Click the **Query** button to build the query for the list Purchase Orders.
14. Select Purchase Orders from the **List Name** drop-down list.
15. Click **Table** field to select the table.
16. Select **SKEListItemDataNV** displayed on the top of the tree-view since you are building a query for an item in the parent table. This will be displayed automatically in the text box.
17. Click the **Column** drop-down list.
18. Select **int1** from the options as it is mapped to the Reference No field.
19. Select **=** operator from the **Operator** drop-down list.
20. Select **Value** from the **Type** drop-down list.
21. Type **456789** in the textbox.
22. Select **End** from the **Condition** drop-down list to end the query.
23. Click **Add** to add the condition in the text field.
24. Here, SKEListItemDataNV is the table name where the list has been stored and t1 is the internal name that has been used for the main table. If there is any child table also, it will display as t2. Int1 is the field name to which you want to point your XML variable and 456789 is the value for that field.
25. Click **OK** and then click **Close**.
26. Click **Update**.
27. If you want to add an item to the grid (in this case, if you want to add a Qualification grid item), use XML Navigator activity. XML Navigator can be used to point to an item in the grid (PurchaseOrderDetails in this case). For this purpose you need to create an XML Iterator type XML Variable. This can be created from the Start activity XML variable property.
28. On the XML Variable screen, click **New Variable**.
29. Type the variable name as purchaseorderdetails.
30. Select **Xml Iterator** from the **Type** drop-down list.
31. Select **purchaseorders** from the **Xml Variable** drop-down list and select the repeating node (Qualification) from the **Node** Select drop-down list.
32. Click **Save Variable**. A message is displayed saying **Variable Updated**. Close the window.
33. Drag and drop **Xml Navigator** activity.
34. Select **purchaseorderdetails** from **Xml Iterator** drop-down list and select **Yes** from **Create New Node** properties to create a new node.
35. Select the appropriate Location. The options available are:

    First: Navigates to the first record in the collection.

    Last: Navigates to the last record in the collection.

    Next: Navigates to the next record based on the current location.

    Previous: Navigates to the previous record based on current location.

    Index: Navigates to the record identified in the Index field.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

36. Since we have to append the items in **Purchase Order Details** grid, select the option as **Last**.
37. Click **Save**.
38. Drag and drop the **Update Variable** activity to enter the grid field values.
39. Click the **Set Variables** button in the **Set Variables** property.
40. Click the **Select** link and select the respective field of the XML Iterator type XML Variable created for the list (in this case purchaseorderdetails), i.e. grid items. The fields displayed in the tree-view are representing the XML nodes of the controls in the PurchaseOrderDetails grid.
41. Select a field for which you want to set the value from the tree-view. Then enter the value for the field in the right-hand side text box. If you want to set the value, then select enter a value from the tree-view, and then enter the value. Also you can select variables or contents or any XML variables nodes directly by selecting the respective node from the tree-view. If you want to combine multiple node values, you can build an expression by selecting **Build Expression**.
42. After setting the value for all the fields in the child item, click **OK**. Now, a grid item will be added to the list while executing the workflow.

    Note: If you want to add multiple items, use XML Navigator and Update Variable for Iterator within the For-Next Loop activities.

Copy a List Item with Grid Items

AVEVA Work Tasks allows you to copy a list item with grid items to any list, but both the lists should have the same schema. You can perform this task with the help of Update Variable activity. To iterate through the grid items, you need to create XML Iterator type XML variable for the grid. This feature can be explained with the help of a scenario.

Telematics is an organization which maintains a Purchase Orders list to keep a track of all the purchase orders raised by the company.

The Purchase Orders contains details like:

- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price
  - Item Total
- Total Purchase Amount

Telematics also maintains another list called **Approved Purchase Order** which has the same schema of the **Purchase Order** list. Now you want to copy an item with grid (Purchase Order approved) to the Approved Purchase Order list when the item is approved.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To copy a list item with grid items

1. Login to the **Enterprise Console** and go to **Workflow Designer**.
2. You need to create an XML List type XML variable for the Purchase Order list. If the variable is not created, follow the procedure mentioned below to create the variable.
3. Click the **More** button in the **XMLVariables** property from the **Start Activity Properties**.

   Here, for Purchase Order list you need to create an XML List type XML variable to work with the current purchase order item and XML Iterator type XML variable to loop through the child/grid nodes of the current purchase order item.
4. Click **New Variable** to add a new variable.
5. Type the variable name as 'purchaseorders'.
6. Select type as **XML List** from the **Type** drop-down list.
7. Type the List name in the **Select List** field or click the **Select List** button to select the list. In this case select **Purchase Orders** list.
8. Select **Current** as the scope from the **Choose the ListItem to work on** options to point to the an item in the list.
9. Now you can see the XML nodes in a tree-view that are mapped to the controls while creating the list. You can also notice that the parent XML nodes and child XML nodes (PurchaseOrderDetails grid) are also displayed.
10. Click **Save Variable**. A message is displayed saying ‘Variable Updated’.
11. Now, you need to create XML Iterator type XML variable to iterate through the child nodes(in this case, PurchaseOrderDetails). For that, click **New Variable** from the XML Variable screen.
12. Enter the variable name as purchaseorderdetails.
13. Select **XML Iterator** as type from the **Type** drop-down list.
14. Select **purchaseorders** from the **XML Variable** drop-down list.
15. From the **Node Select** drop-down, select the repeating node, i.e. PurchaseOrderDetails.
16. Click **Save Variable**. A message is displayed saying ‘Variable Updated’.
17. In the same way you have to create XML variables for Approved Purchase Order list. For Approved Purchase Order list, you need to create XML List type XML variable to add an item and a XML Iterator type XML variable to map to the grid items of the new purchase order item.
18. Click **New Variable** to add a new variable, from the **XML Variable** property of **Start** activity.
19. Enter the variable name as approvedpurchaseorders in the **Variable Name** field.
20. Select XML List as type from the **Type** drop-down list.
21. Enter the List name in the **Select List** field or click the Select List button to select the list. In this case, select Approved Purchase Orders list.
22. Select **New** as scope from the **Choose the ListItem to work on** options to point to the new item in the list.
23. Now you can see the XML nodes in a tree-view that are mapped to the controls while creating the list. You can also notice that the parent XML nodes and child XML nodes (PurchaseOrderDetails grid) are also displayed.
24. Click **Save Variable**. A message is displayed saying ‘Variable Updated’.
25. Now, you need to create **XML Iterator** type XML variable to iterate through the child nodes. For that, click **New Variable** from the XML Variable screen.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

26. Enter the variable name as **approvedpurchaseorderdetails**.
27. Select **XML Iterator** as type from the **Type** drop-down list.
28. Select **approvedpurchaseorders** from the **XML Variable** drop-down list.
29. From the **Node Select** drop-down, select the repeating node, i.e. PurchaseOrderDetails.
30. Click **Save Variable**. A message is displayed saying 'Variable Updated'.
31. Drag and drop **Update Variable** activity to set value for the parent nodes or the item.
32. Click the **Set Variables** button in the **Set Variables** property.
33. Click the **Select** link and select the respective field of the XML List type XML Variable created for the list (in this case approvedpurchaseorders). The fields displayed in the tree-view are representing the XML nodes of the controls in the list.
34. Select a field for which you want to set the value from the tree-view under approvedpurchaseorders. The selected variable for the field **Title** will be displayed in the text box as '**XmlVariables.approvedpurchaseorders.ApprovedPurchaseOrders.Title**.'
35. Enter the value for the field in the right-hand side text box. Select the respective field of the purchaseorders XML variable (purchase order item to be copied). The selected XML variable for the field will be displayed as '**XmlVariables.purchaseorders.PurchaseOrders.Title'**. Set the value for all other fields in the same way.
36. After setting the value for all the fields in the parent form (controls in the main form) that you want to add, click **OK**. This will add a list item to the new list (Approved Purchase Order), while executing the workflow, with the values in the current Purchase Orders item.
37. Next, you need to iterate through the grid/child items of the current purchase order and to add the child items in the new list (Approved Purchase Order). Drag and drop ForEach-Loop activity to loop through the grid items.
38. Select **XML Iterator** type XML variable that you have created for the current Purchase Order from the **XML Iterator** drop-down list (in this case, purchaseorderdetails).
39. If you want to add an item to the grid (in this case, if you want to add a purchase order details grid item), use **XML Navigator activity**. XML Navigator can be used to point to an item in the grid (purchaseorderdetails in this case).
40. Drag and drop **XML Navigator** activity.
41. Select approvedpurchaseorderdetails from **XML Iterator** drop-down list and select Yes from Create New Node properties to create a new node.
42. Select the appropriate **Location**. The available options are:

- First: Navigates to the first record in the collection.
- Last: Navigates to the last record in the collection.
- Next: Navigates to the next record based on the current location.
- Previous: Navigates to the previous record based on current location.
- Index: Navigates to the record identified in the Index field.

    1. Since we have to append the items in **Purchase Order Details** grid, select the option as **Last**.
    2. Click **Save**.
    3. Drag and drop **Update Variable** activity to set the value for the grid item fields of the new list item.
    4. Click the **Set Variables** button in the **Set Variables** property.
    5. Click the **Select** link and select the respective field of the XML List type XML Variable created for the list

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

(in this case ApprovedOrderDetails). The fields displayed in the tree-view are representing the XML nodes of the controls in the list.

6. Select the XML variable **PurchaseOrderDetails** from the tree-view. You can either select PurchaseOrderDetails node or select all child nodes separately. In this case, you are selecting the PurchaseOrderDetails node. The variable will be displayed in the text box as '**XmlVariables.approvedpurchaseorderdetails.PurchaseOrderDetails'**.
7. Set the value in the right-hand side text box. Select the respective field of the purchaseorderdetails XML variable (purchase order item to be copied) from the tree-view. The selected variable will be displayed in the text box as '**XmlVariables.purchaseorderdetails.PurchaseOrderDetails'**.
8. After setting the value for the fields in the child item that you want to add, click **OK**. This will add a grid item to the new list (Approved Purchase Order), while executing the workflow, with the values in the current (Purchase Order) list.

   Note: You can also select each node in the grid separately and set the value for each node.
9. Complete the loop with a **Next** activity and finish the workflow with appropriate link conditions.

Iterate through the List Item and Grid Item of the List

AVEVA Work Tasks allows you to loop through the list items and grid items of a list. An XML List Iterator type XML variable can be used to iterate through the list items, where XML Iterator type XML variable can be used to iterate through the grid items of a list. This feature can be explained with the help of a Purchase Order list scenario.

The Purchase Orders contain details like:

- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price
  - Item Total
- Total Purchase Amount

Now you want to loop through the approved purchase order items (items with status as Approved) as well as its child items.

To iterate through the list item and grid item of the list

1. Login to the Enterprise Console and go to Workflow Designer.

   Note: As a first step, you need to create an XML List type XML variable for the Purchase Orders list. If the variable is not created, follow the procedure mentioned below to create a variable.
2. Click the **More** button in the **XMLVariables** property from the Start Activity Properties.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Click **New Variable** to add a new variable.
4. Enter the variable name as **purchaseorders**.
5. Select XML List from the **Type** drop-down list.
6. Enter the List name or click the **Select List** to select the list. In this case, select Purchase Orders list.
7. Select the scope from the Choose the ListItem to work on options. Later you can change the scope of the variable to List Query to query the approved purchase orders using List Navigator activity.
8. Click **Save Variable**. A message is displayed saying 'Variable Updated'.
9. Now, you need to create XML List Iterator type XML variable to iterate through the approved purchase order items. For that click **New Variable** from the XML Variable screen.
10. Type the variable name as **purchaseorderiterator**.
11. Select **XML List Iterator** from the Type drop-down list.
12. Select **purchaseorders** from the **List XML Variable** drop-down list.
13. Click **Save Variable**. A message is displayed saying 'Variable Updated'.
14. Now, you need to create XML Iterator type XML variable for the purchaseorderiIterator (XML List Iterator type) XML variable to iterate through the child nodes of the currently iterating purchase order item. For that click New Variable from the XML Variable screen.
15. Type the variable name as **purchaseorderdetails**.
16. Select **XML Iterator** from the **Type** drop-down list.
17. Select **purchaseorderiterator** from the **XML Variable** drop-down list.
18. From the **Node Select** drop-down LIST, select the repeating node, i.e. PurchaseOrderDetails.
19. Click **Save Variable**. A message is displayed saying 'Variable Updated'.
20. Use **List Navigator** activity to query the approved purchase order items.

    In this case, the following query is used to retrieve the approved purchase orders. **SKEListItemDataNV(t1).nvarchar3 = 'Approved'**, where **SKEListItemDataNV** is the table used to store the list items and **nvarchar3** is the table column mapped to the Status field.
21. Use ForEach-Loop and Next Loop activities to loop through the approved purchase order items.
22. Select **purchaseordersiterator** from the **XML Iterator** drop-down list of ForEach Loop activity.
23. Use any action as per the requirement to retrieve the data. You need to access the value of the parent nodes from the purchaseordersiterator XML variable.
24. Use another set of ForEach-Loop and Next activities within the existing loop to iterate through the grid items (PurchaseOrderDetails).
25. Select **purchaseorderdetails** from the XML Iterator drop-down list of ForEach Loop activity.
26. Use any action as per the requirement to retrieve the data. You need to access the value of the parent nodes from the purchaseorderdetails XML variable.

List Views

List View provides a host of options to view Lists according to your preferences. It allows you to customize views according to specific requirements. You can create and use views to see the items in a list that are most important to you or that best fit your purpose. For example, you can create views of the list items that were created most recently, or the list items that apply to a specific department, or of the items created by one

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

person. There should be at least one default view created.

You can use this feature to set different views like Filtered view, Read-only View, Group by view etc. You can make these views either public or private by adding the attributes. These attributes allow you to set permissions for the created views, thereby ensuring confidentiality in your organization.

For example, a task list has several views, such as the tasks due today, the tasks assigned to the user, all tasks, and so on.

List View Introduction

List View provides a host of options to view Lists according to your preferences. It allows you to customize views according to specific requirements. You can create and use views to see the items in a list that are most important to you or that best fit your purpose. For example, you can create views of the list items that were created most recently, or the list items that apply to a specific department, or of the items created by one person. There should be at least one default view created.

You can use this feature to set different views like Filtered view, Read-only View, Group by view etc. You can make these views either public or private by adding the attributes. These attributes allow you to set permissions for the created views, thereby ensuring confidentiality in your organization.

For example, a task list has several views, such as the tasks due today, the tasks assigned to the user, all tasks, and so on.

Work with List Views

You can create different list views, add filters, and manage views.

About Creating List Views

This section provides detailed procedures for creating a new list view. After creating a new list view, you can start customizing the view according to your preferences. All the views can be selected from the drop-down list in the right-hand top corner of the List View screen.

In order to understand the different options in List View, let's use a working scenario.

Scenario

The Telematics Company is a Product Support Service Provider and uses Lists in their service for Product Support. They have ten long-standing clients to whom they have to cater product support services through Email, Phone, and Web. Some of these clients are tagged as 'Gold' clients to whom, Telematics readily provides support over the phone. While some other clients are tagged as 'Silver' clients to whom Telematics provides support through Email. Similarly, there is a host of classification based on various parameters to categorize the customer related information. In order to manage the customer related information, Telematics has created **Support Incident** lists using Lists in which, the organization categorizes the Support Incidents information under specific columns. Here is a table that gives you the column name and its description:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Column Name	Description
Number	Specific number assigned to the incident
Title	Title of the Support incident
Service User	Name of the user who is using this service
Service	The name of the product used by the organization – BPM.NET 2006, BPM.NET 2007, BPM.NET 2009, BPM.NET 2009 August Update
Service Level	The type of customer - Gold or Silver
Incident Status	Status of the Support Incident which is displayed as - In progress, Resolved, Closed, New, and Level 2
Support Person	Personnel working on this issue
Business Unit	Name of the customer organization
Incident Type	Type of Support Incident - Query or Development
Incident Origin	Origin of the Support Incident - By Email, Web, Phone

Telematics team likes to use List View feature to view all the information related to these clients in customized views.

Each of the upcoming topics gives you a walk-through on how Telematics achieves these tasks.

Create a New View

This section provides detailed procedures for creating a new view. The Telematics Representative working with lists of Support Incidents wants to create a view to see incidents which have originated through emails. The representative can create this view, by selecting the Create View option.

Note: The Support Incidents lists here refers to the group of lists created by the Telematics organization for the purpose of this tutorial. Support Incident is not the system generated list item.

To add a new view

1. In the **Enterprise Console**, click menu icon, click **Lists**, and then click **Support Incidents**. The **Support Incidents** list items page appears. By default, the All Items option is displayed in the View drop-down field and hence all the list items related to Support Incidents are displayed in this view.
2. In the **View** drop-down list field, select **Create View**, and then click **Go**. The **Create View** screen appears.

   Note: For every list created through List Infrastructure, a default field must be configured. For example, the Order ID field becomes the default field in an Order list and the Department Name becomes the default field in a Department list. While creating a list view, in the available columns, the user will not have an option to uncheck these fields as these are the default fields. Here, we are using the **Title** field as the default field for the **Support Incidents** lists. Hence, the list view users cannot deselect or select this display column name.
3. Type the name **By Email** for this view.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Check the **Make this the default view** check box. This option can be used to make this view as the default view for your Support Incidents lists.
5. Select the **Public** option if you want to display this view to all the users.
6. In the **Grid Columns**, check the columns **Number**, **Service User**, **Incident Status**, **Incident Type**, **Incident Origin**, **Created By**, **Created DateTime**, **Owner**, and **Status** from the **Display Column Name** field to display specific information related to these column headings in this view.
7. Similarly, select the order of the display columns from the **Display Order Number** field to display the columns in the required order.

Adding Filters

1. You can even add filters to get specific information under the selected columns. In this scenario, we will add a filter to get the incidents originated from emails. In the Filter Columns field, the Show all items in this view is selected by default. If you want to add any filters, then you will have to click the **Show items only when the following is true** option. Only then the Filter options are displayed.
2. Click the **Show items only when the following is true** radio button in the Filter Columns field. You can see the options appearing in the field.
3. Select the **Incident Origin** column from the column drop-down list.
4. Select the **is equal to** filter condition from the filter condition drop-down list.
5. Select **Value** from the Value field.

   If the variable option is selected from the Value column, the user should ensure to specify the appropriate data type in the condition field. If the user specifies inappropriate data type in the condition field, a validation message appears asking the user to modify the data type.
6. Type **Email** in the condition field.
7. Click **Create View**.

   Note: While creating a list view, the user may come across certain exceptions owing to reasons like assigning inappropriate values, repeating the same column in the sort expression, database connectivity errors etc. An exception message appears in a pop-up window highlighting the possible reasons for the exception.

To view the lists under the By Email View

- Select the **By Email** view from the View drop-down list in the Support Incidents list screen. You can see that the information has been arranged according to the column specifications and filter conditions assigned by you. All the incidents originated from Email have been displayed in the Incident Origin column.

  You can see that all the different columns specified by you are displayed in this view. You can also see that the Title column appears in this view. This is because, the Title column is one of the default list column in the Support Incident list items.

Note: Item selection is not retained, when a view is applied to the list items and the position of the list item is changed because of the applied view. For example: If the view applied is sorted by Date and Time, then the position of the selected list item will change as the date modified for the list item also changes.

Create a Default View

This section provides detailed procedures for creating a default view.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Default view can be created to view the same view every time the user logs into the portal.

Note: There can be only one default view for the Public view and one for the Private view. If there are any existing private default views and the user wants to create a new default private view, then the user can either overwrite this new view as a default view or create a new view without selecting the default view.

Scenario

The Telematics Support representative wants to see upon login all the support issues related to the 'Gold' customers, since they are given top priority. The representative can create a default view with the following specifications and view the same every time they log into the system.

To create a default view

1. In the **Enterprise Console**, click the **Menu** button, click **Lists**, and then click **Support Incidents**. The **Support Incidents** list items page appears.
2. Go to the **View** drop-down list field and select **Create View**.
3. Type the name **Gold** for this view of the list.
4. In the **Create New View** screen, check the **'Make this the default view'** check box.
5. Since, you had created the By Email view as default view, the system asks you if you want to overwrite it. Select **OK**.
6. Select the **Public** option if you want to display this view to all the users.
7. In the **Grid Columns**, check the columns **Number**, **Service Level**, **Incident Status**, **Support Person**, **Business Unit**, **Service**, **Incident Type**, **Incident Origin**, and **Created By** from the **Display Column Name** field to display specific information related to these column headings in this view.
8. Similarly, select the order of the display columns from the **Display Order Number** field to display the columns in a particular order.

To add Filters

You can add filters to get specific information under the selected columns. In this scenario, we will add a filter to get the support issue list related to the **Gold** customers under the Service Level .

1. Click the **Show items only when the following is true** radio button in the 'Filter Columns' field. You can see the options appearing in the field.
2. Select the **Service Level (SupportIncidents)** column, **Is equal to**, and **Value** from the drop-down lists.
3. Type **Gold** in the filter condition field.
4. Click **Create View**.

To view the Default view

- Select the **Gold** view from the **View** drop-down list in the Support Incidents list screen. All the list items under the Service Level related to the **Gold** customers will be listed.

Create a Public View

This section provides detailed procedures for creating a Public view.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Public view option can be chosen when you want to allow all the users to view the list items.

Scenario

Consider the case of Support Incident List items. The Telematics representative wants to create a view that can be displayed to all the users. The Administrator can select the Public View option to make all the three views accessible to the end users.

To add a public view, refer to Creating a New List View.

Create a Private View

This section provides detailed procedures for creating a Private view.

The Private view option can be used if you want to create a view according to your personal choice. After this option is selected, the other users will not be able to see this view option in the View drop-down list.

Scenario

Consider the case of Support Incident List items. The Telematics representative wants to create a view consisting of the incidents which are of the **In Progress** status. The representative can select the Private view option to achieve this task.

To add a private view

1. In the **Enterprise Console**, click the **Menu** button, click **Lists**, and then click **Support Incidents**. The **Support Incidents** list items page appears.
2. Go to the **View** drop-down list field and select **Create View**.
3. Type the name **In Progress** for this view of the list.
4. Click the **Private** radio button in the **Scope of the View** to make this view inaccessible to other users.
5. Select the **Grid Columns Service User**, **Incident Status**, **Business Unit**, **Service**, **Service Level**, **Incident Type**, **Incident Origin**, and **Modified By**.
6. In the **Filter Column** field, select **Incident Status**, **Is Equal To**, and **Value** from the filter option drop-down lists.
7. Type **In Progress** in the filter condition field.
8. Click **Create View**.

To view the Private view

Login as the user who has created the private view and select the **InProgress** view from the **View** drop-down list in the Support Incidents list screen. All the list items which have the incident status as In Progress will be listed in this view. If you login as a different user then you can see all the other views except this view.

Add Filters

This section provides detailed procedures to add filters to the views.

Filters can be added to further classify the information in the lists. The user can create filters using the filter expressions.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Scenario

Consider the case of the Support Incident list items. The Support Representative wants to create a **High Priority** view to view all the support incidents related to the Business Unit, where the Incident Origin is Email and the Service Level is Gold. To achieve this, the representative can create a view and build a filter expression. When creating a view, the user has an option to create filters for any of the user defined and system generated fields. There are different filter conditions that can be used for creating the filters. Below are the filter conditions that can be used.

- is equal to
- is not equal to
- is greater than
- is less than
- is greater than or equal to
- is less than or equal to
- contains

To add filters to the views

1. In the **Enterprise Console**, click the **Menu** button, click **Lists**, and then click **Support Incidents**. The **Support Incidents** list items page appears.
2. Go to the **View** drop-down list field and select **Create View**.
3. Type the name by **High Priority** for this view of the list.
4. In the **Filter Columns** field, click **Show items only when the following is true** radio button.
5. Select **Business Unit** from the **Show the items when column** drop-down list.
6. Select the **is equal to** filter condition from the filter condition drop-down list.
7. Select the **Value** from the **Value** drop-down list.
8. Type **Telematics** in the empty field.
9. Select the **and** radio button to add additional filters. By default, the Or button is selected.
10. Add another filter by selecting **Incident Origin** from the **When column** drop-down list.
11. Select the **is equal to** filter condition from the filter condition drop-down list.
12. Select the **Value** from the **Value** drop-down list.
13. Type **Email** in the empty field.
14. Click the **Show More Columns** to add more filters.
15. Another set of filter conditions appears in the filter field.
16. Click the **And** radio button.
17. In the new filter rows, select **Service Level** from the **When column** drop-down list.
18. Select the **is equal to** filter condition from the filter condition drop-down list.
19. Select the **Value** from the Value drop-down list.
20. Type **Gold** in the empty field.
21. Click **Create View**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To view the filtered view

- Select the **High Priority** view from the **View** drop-down list in the Support Incidents list screen. You can see the grid columns according to your filter specifications.

Filter Grouping

This option is used to execute the filter conditions in a specific order by applying the parenthesis at the appropriate position in the filter conditions.

Scenario

Consider that the Telematics Support Manager wants to create a view for "Open Incidents for GOLD AMC" with the following conditions.

- ServiceLevel = 'GOLD'
- Incident Status either "Waiting" or "InProgress"

The condition can be as given below:

ServiceLevel = 'GOLD' and Incident Status either Incident Status is "Waiting" or "InProgress"

In this filter, we first need to evaluate the condition Incident Status is "Waiting" or "InProgress". Later, we need to join it with the ServiceLevel = 'GOLD'. The filter condition is given below:

((ServiceLevel = 'GOLD') and (Incident Status = "Waiting" or Incident Status = "InProgress"))

If we do not specify the order of execution (by putting the parenthesis) the condition might get evaluated as follows and may result in invalid data:

First the filter gets executed for the condition given below :

ServiceLevel = 'GOLD' and Incident Status = "Waiting"

And then it gets executed for the condition given below:

Incident Status ="InProgress"

Hence, it is very important to add the parenthesis to get the required grouping.

To create a Group Filter

1. Create a new view with the name **Open Incidents for Gold ABC**. Follow steps 1- 4 from the previous section to create a new view.
2. In the **Filter Columns** field, click **Show items only when the following is true** radio button.

   The Show items only when the following is true fields appear on the screen.
3. Select **Business Unit** from the **Show the items when column** drop-down list.
4. Select the **is equal to** filter condition from the drop-down list.
5. Select the **Value** from the drop-down list.
6. Type **ABC Corporation** in the empty field.
7. Select the **and** radio button to add additional filters. By default, the **Or** button is selected.
8. Add another filter by selecting **Service Level** from the **When column** drop-down list.
9. Select the **is equal to** filter condition from the drop-down list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

10. Select the **Value** from the drop-down list.
11. Type **Gold** in the empty field.
12. Add another filter by selecting **Incident Status** from the **When column** drop-down list.
13. Select the **is equal to** filter condition from the drop-down list.
14. Select the **Value** from the drop-down list.
15. Type **Waiting** in the empty field.
16. Click the **Show more Columns** to get more columns.
17. Click **Or** and add another filter for the **Incident Status**, with value as **Inprogress**.
18. Click the **Set Filter Order** tab to get all the filter conditions.
19. To group the filter conditions of the Incident Status, add an open parenthesis '(' after And and a close parenthesis ')' at the end of the filter conditions.

    For example: **Business Unit = ABC Corporation And (Incident Status = Waiting Or Incident Status = Inprogress)**
20. Click the **Validate** button to validate the expression. If any parenthesis mismatch is found, an error message pops up. If no errors are found, then the Validation success message pops up on your screen.
21. Click **Create View** to view the Incident Status of the ABC Corporation.
22. To see the view, choose the **Open Incidents for Gold ABC** view from the Create View drop-down list.

Use Date Time Variable to Filter Columns

Let us understand this by using a scenario. The Telematics Support Manager wants to create a view to get all the in progress and closed incidents created during the current year. To achieve this, the Manager has to follow the procedure given below:

To use Date System Variable to Filter Columns:

1. Create a new view with the name **In Progress and Closed Issues**. Follow steps 1- 4 from the previous section to create a new view.
2. In the **Filter Columns** field, click **Show items only when the following is true** radio button.
3. Select the **and** radio button to add additional filters. By default, the **Or** button is selected.
4. Add another filter by selecting **Incident Status** from the **When column** drop-down list.
5. Select the **is equal to** filter condition from the drop-down list.
6. Select the **Value** from the drop-down list.
7. Type **In Progress** in the empty field.
8. Select the **and** radio button to add additional filters. By default, the Or button is selected.
9. Add another filter by selecting **Incident Status** from the **When column** drop-down list.
10. Select the **is equal to** filter condition from the drop-down list.
11. Select the **Value** from the drop-down list.
12. Type **Closed** in the empty field.
13. Select the **And** radio button to add additional filters.
14. Add another filter by selecting **CreatedDateTime** from the When column drop-down list.
15. Select the **is equal to** filter condition from the drop-down list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

16. Select the **Variable** from the drop-down list.
17. Select the **Variable.Sys.This Year** from the variable drop-down.
18. Click the **Create View** button at the end of the screen.
19. To see the view, choose the **In Progress and Closed Issues** view from the Create View drop-down list.

Note: The date is stored in the UTC format in the database. Hence, the user needs to provide the date in UTC format in the filter area. Since, UTC date contains time too, the user should provide the exact time to filter with 'Equals to' operator. The date format for Microsoft SQL Server should be mm/dd/yyyy.

Sort the Columns

This section provides detailed procedures to sort the order of the grid columns.

This option can be used to sort the columns according to your preference.

Scenario

Consider the case of the Support Incident List View. The Telematics Support Manager wants to create a tasks view by sorting the incident numbers in descending order. The Manager can use the Sort Columns option to get this view.

To sort the columns in the views

1. In the **Enterprise Console**, click menu icon, click **Lists**, and then click **Support Incidents**. The **Support Incidents** list items page appears.
2. Go to the **View** drop-down list field and select **Create View**.
3. Type the name **Tasks** for this view of the list.
4. In **Sort Columns**, select the **Number** option from the **Sort by** field.
5. Select **Descending** order radio button.
6. If you want to sort other columns, you can click the **Show More Columns** and make the necessary selections.
7. Click **Create View**.

Note: Sorting can be done to a maximum of 10 columns.

To view the Tasks view

- Select the **Tasks** view from the **View** drop-down list in the Support Incidents list screen. You can see the grid columns according to your specifications.

System Variables

List infrastructure provides default system variables that can be used in Filters while creating a view. They can be categorized as below:

- Date Time Variables:

These variables can be used to compare or filter on DateTime Columns.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- User variables:

These variables can be used to compare filter on loggedin user ID context.

- Workflow Status:

These variables can be used to filter list items based on workflow instance status.

Date Time Variables

The following datetime variables allow the user to filter datetime columns of the list:

All the datetime variables in this topic have been explained assuming the present date as 19th, month as January, and year as 2011.

Variable to filter datetime columns for Today

This variable is used to compare datetime columns for today. For example, the Support Manager wants to get all the incidents created today. To achieve this the Manager has to specify the **Created DateTime** variable equal to **Variable.Sys.Today** in the view creation window.

By specifying this variable, the user will be able to view all the support incidents created today.

Variable System Current Week

This variable is used to compare datetime columns for the current week. For example, the Support Manager wants to get all the incidents created today. To achieve this the Manager has to specify the **Created DateTime** variable equal to **Variable.Sys.Current Week** in the view creation window.

By specifying this variable, the user will be able to view all the support incidents created during the current week.

Variable System Last 10 days

This variable is used to compare datetime columns for the last 10 days. For example, the Support Manager wants to get all the incidents created during the last 10 days. To achieve this the Manager has to specify the **Created DateTime** variable equal to **Variable.Sys.Last 10 Days** in the view creation window.

By specifying this variable, the user will be able to view all the support incidents created during the last 10 days.

Variable System Current Month

This variable is used to compare datetime columns for the current month. For example, the Support Manager wants to get all the incidents created this month. To achieve this the Manager has to specify the **Created DateTime** variable equal to **Variable.Sys.Current Month** in the view creation window.

By specifying this variable, the user will be able to view all the support incidents created during this month.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Variable System Lasts 2 Months

This variable is used to compare datetime columns for the last 2 months. For example, the Support Manager wants to get all the incidents created during the last two months. To achieve this the Manager has to specify the **Created DateTime** variable equal to **Variable.Sys.Last 2 Months** in the view creation window.

By specifying this variable, the user will be able to view all the support incidents created during the last 2 months.

Variable System This Year

This variable is used to compare datetime columns for the current year. For example, the Support Manager wants to get all the incidents created this year. To achieve this, the Manager has to specify the Created DateTime variable equal to Variable.Sys.This Year in the view creation window.

By specifying this variable, the user will be able to view all the support incidents created this year.

Date Range logic for each Date System variable

Variable	From Date	To Date
Variable.Sys.Today		Current date.
Variable.Sys.Current Week	Start date of current week. (Start of the week is as per the culture.)	End date of current week.
Variable.Sys.Last 10 Days	10 days prior to current date.	Current date.
Variable.Sys.Current Month	First day of current month.	Last day of current month.
Variable.Sys.Last 2 Months	First day of the month which is two months prior to the current month.	Last day of the month which is one month prior to the current month.
Variable.Sys.This Year	First day of the current year.	Last day of the current year.

Workflow Variables

The following variables allow the user to filter the columns according to the workflow instance status of incidents:

Variable System Workflow Status Completed

This variable is used to compare the completed workflow instance status. For example, the Support Manager wants to get all the incidents which contain workflows with completed status. To achieve this the Manager has to specify the **Workflow Status** variable equal to **Variable.Sys.WFStatus.Completed** in the view creation window.

By specifying this variable, the user will be able to view all the support incidents which contain workflows with completed status.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Variable System Workflow Status InProgress

This variable is used to compare the InProgress workflow instance status . For example, the Support Manager wants to get all the incidents which contain workflows which show in the progress status. To achieve this, the Manager has to specify the **Workflow Status** variable equal to **Variable.Sys.WFStatus.InProgress** in the view creation window.

By specifying this variable, the user will be able to view all the support incidents which contain workflows which show in the progress status.

Variable System Workflow Status Errors

This variable is used to compare the Errors workflow instance status. For example, the Support Manager wants to get all the incidents which contain workflows which contain errors in them. To achieve this, the Manager has to specify the **Workflow Status** variable equal to **Variable.Sys.WFStatus.Errors** in the view creation window.

By specifying this variable, the user will be able to view all the support incidents which contain workflows which are erroneous.

User Variables

This variable allows the user to filter the columns according to the logged in user.

Variable System LoggedInUser

This variable is used to filter the columns based on the logged in user. For example, the Support Manager wants to get all the incidents created/owned by a particular logged in user. To achieve this, the Manager has to specify the Logged In User variable equal to **Variable.Sys.LoggedInUserId** in the view creation window.

By specifying this variable, the user will be able to view all the support incidents related to the logged in user. For this the user has to log in with the logged in user credentials.

Group Columns

This section provides detailed procedures to group the columns in a particular order in the view.

Columns can be grouped for better organizing of your list item columns. You can group columns of similar or related information. You can group the columns in expanded mode or collapsed mode.

Scenario

Consider the case of the Support Incident list items. When the Telematics Support Manager logs in and navigates to the support incident list, there can be many records in the list. The Manager can group similar columns of information for display either in the collapsed mode or in expanded mode.

To group columns in the view

1. In the **Enterprise Console**, click the **Menu** button, click **Lists**, and then click **Support Incidents**. The **Support Incidents** list items page appears.
2. Go to the **View** drop-down list field and select **Create View**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Type the name **Status** for this view of the list.
4. In the **Group Columns** field, select the **Collapsed** group mode. You can see that the Group Columns field gives a provision to give three group column conditions. To give more conditions, click **Show More Columns**.
5. Select the **Incident Status** from the **Group Column** by drop-down list.
6. Select the **Ascending** or **Descending** option.
7. In the **then group by** drop-down list, select **Incident Type** and select **Descending order**.
8. Click the **Show More Columns** button to include another group condition **Incident Origin** and select the **Ascending order**.
9. Click **Create View**.

To view the group columns view

- Select the **Status** view from the **View** drop-down list in the Support Incidents list screen. You can see the specified grid columns grouped according to your specifications.

  If you had selected the **Expanded** mode, then the Incident Information would be in hierarchical order.

Display All Items

This section provides detailed procedures to display all the items in the list view.

This option can be used to allow all the list items to be displayed to the user. Lists can be grouped in a folder and upon opening the lists, only the lists outside the folder are displayed by default. By checking this option, even the lists within a folder can be viewed upon opening the lists.

To display all items in the view

1. In the **Enterprise Console**, click the **Menu** button, click **Lists**, and then click **Support Incidents**. The **Support Incidents** list items page appears.
2. Go to the **View** drop-down list field and select **Create View**.
3. Type the name **All Support Issues** for this view of the list.
4. Select the **Display All Items** check box.
5. Click **Create View**.

To view the displaying all items view

- Select the **All support issues** view from the **View** drop-down list in the Support Incidents list screen. You can see all the lists, including the ones within a folder.

Create a Read-Only View

This section provides detailed procedures to create a read only view.

If you want to restrict the users from editing or deleting the list items, then you can check this option. After this option is selected, the other users will not be able to edit or delete the list items in this view.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Scenario

The Telematics Representative wants to make the Status view as the Read-only view in order to restrict the users from editing or deleting the list items in this view.

To create read only view

1. In the **Enterprise Console**, click the **Menu** button, click **Lists**, and then click **Support Incidents**. The **Support Incidents** list items page appears.
2. Go to the **View** drop-down list field and select **Create View**.
3. Type the name **Status** for this view of the list.
4. Select the **Read Only** check box to disable the editing and deleting list view options for the end-user.
5. Click the **Create View**.

To view the read-only view

- Select the **Incident Information** view from the **View** drop-down list in the Support Incidents list screen. This view will be a read-only list which cannot be edited or deleted.

Arrange Grid Columns

This section provides detailed procedures for arranging grid columns.

The appearance of the grid columns in the list view can be arranged according to your preference. You can specify the names of the grid columns and the order of their appearance in the list view.

Scenario

Consider the case of the Support Incident List View. The user wants the columns in the list view to be displayed in a different order. The user can change the position or order of the columns to be rendered in the list grid. This helps the user to organize the information in the view.

The default system fields displayed while creating the view are listed below. These fields can be used for sorting or filtering purposes and also to display it in the grid.

- CreatedBy
- CreatedDateTime
- ModifiedBy
- Owner
- WorkflowStatus

To arrange the grid columns in the views

1. In the **Enterprise Console**, click the **Menu** button, click **Lists**, and then click **Support Incidents**. The **Support Incidents** list items page appears.
2. Go to the **View** drop-down list field and select **Create View**.
3. Type the name **By Email** for this view of the list.
4. In the **Grid Columns** field, select the **Display Column Name** and **Display Order Number** in the required order.
5. Click **Create View**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To view the By Email view

- Select the **By Email** view from the **View** drop-down list in the Support Incidents list screen. You can see all the grid columns according to your specifications.

Copy from Existing Views

This section provides detailed procedures for copying from existing views.

While creating a new view which is similar to an existing view, but with few differences, you can copy the template of an existing view and continue creating a new view.

Scenario

Consider the case of the Support Incident View. The user has created some of the public views to get easy access to all the support incident list items. However, the user now wants to create a view to get only the Query incidents which have originated through Email. To achieve this, the user can create a new view while selecting the existing view (By Email), that was created previously. This feature can help the user to create a new view by using the template of an existing view.

To copy from pre-existing views

1. In the **Enterprise Console**, click the **Menu** button, click **Lists**, and then click **Support Incidents**. The **Support Incidents** list items page appears.
2. Go to the **View** drop-down list field and select **Create View**.
3. Type the name **Email Query** for this view of the list.
4. Select the **By Email** template from the pre-existing views in the **Copy From** drop-down list.

   You can see that the display column selections made in the By Email template are displayed here because of selecting the By Email in the Copy From field.
5. Click the **Show items only when the following is true** radio button in the **Filter Columns** field. You can see the By email filter conditions appearing in the field.
6. Add another filter condition by selecting **Incident Type**, **is equal to**, and **Value**.
7. Type **Query** in the condition field.
8. Click **Create View**.

To view the Email Query view

- Select the Email Query view from the **View** drop-down list in the Support Incidents list screen. All the list items which have originated by email and are of the query incident type are listed.

Manage Views

This section provides detailed procedures for managing and securing the views created using the List Views feature. From this page, you can create, edit/update, or delete a view. You can even modify the security settings for a view.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Update a View

This section provides detailed procedures for updating a list view.

Scenario

The Telematics representative wants to update the **Email Query** view by excluding some of the grid columns in the view. To update a view the user has to select the Update View option in the Update View screen.

To update a view

1. In the **Enterprise Console**, click menu icon, click **Lists**, and then click **Support Incidents**. The **Support Incidents** list items page appears.
2. Go to the **View** drop-down list field and select **Email Query** view.
3. Click **Go**. The **Update View** screen appears.
4. Uncheck the **Number**, **Support Person**, and **Created By** check boxes and reassign the column order numbers.
5. Click the **Update View** button at the end of the screen.

   Note: While updating a list view, the user may come across certain exceptions owing to reasons like assigning inappropriate values, repeating the same column in the sort expression, database connectivity errors etc. An exception message appears in a pop-up window highlighting the possible reasons for the exception.

To view the updated Email Query screen

- Select the **Email Query View** from the View drop-down list in the Support Incidents screen.

Delete a View

This section provides detailed procedures for deleting a list view.

Scenario

The Telematics representative wants to delete the Incident Information Read-Only view. To delete a view the user has to select the Delete View option in the Update View screen.

To delete a view

1. In the **Enterprise Console**, click the **Menu** button, click **Lists**, and then click **Support Incidents**. The Support Incidents list items page appears.
2. Go to the **View** drop-down list field and select **Incident Information** view.
3. Click **Go**. The **Update View** screen appears.
4. Click the **Delete View** button at the end of the screen.

To view the result of deleting the view

- On clicking the View drop-down list you will not be able to find the Incident Information view option in the list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Secure a View

AVEVA Work Tasks security feature allows the administrator to assign rights for groups and map users to the groups. This option helps you to define security for a view.

The **List View Securi**ty consists of **Standard Settings** and **Advanced Settings**.

- **Standard Settings** is a reporting function that allows you to view the Security for User/Role or the Security Mapping at List Level.
- **Advanced Settings** allows you to modify the existing mapping, add a new resource mapping or delete the existing mapping by enabling mapping at List level.

There are two ways to enable security at list level:

- Enabling Resource Mapping
- Customizing the Security Group Definitions

To access Standard Settings

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage Views**. The **Manage Views** page appears.
2. Click the **Security** icon on the **Ribbon Bar**. The **Security Settings** page appears.

Field	Description
View Effective Security For User/Role	Click this link to select a role/user and view the effective security group and rights for the selected role/user.
View Security Mapping at List Level	Click this link to view the security mapping at the list level. It provides details of the Security Groups, Roles and Users having access to the List.

To access Advanced Settings

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage Views**. The **Manage Views** page appears.
2. Click the **Security** icon on the **Ribbon Bar**.
3. Select the **Advanced Settings** tab. The **Security Settings** page appears.
4. Click the **Enable List specific Security** link. The **Enable Security wizard** is displayed.

Field	Description
Security Group Customization	Select this option to complete the wizard and display the Security Group screen. Security Group is a list which lets the user to create a new security group, modify, view and delete an

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
	existing security group. It also lets the user to view the effective mapping for a particular security group, which displays the information about the security group and its mappings, it shows where the entire security group is mapped to the resource and/or modified.
Resource Mapping	Select this option to complete the wizard and display the Security Group Mapping screen. It allows the user to set the priority, if the user is part of multiple roles and if these roles are mapped to different security groups. While defining the Security Group to Role mapping there will be an option to set a priority number. So in case a user is part of multiple roles and if these roles are mapped to different Security Groups then based on the Lowest priority number given to the roles the security will take effect.

5. Select the required option(s) and click **Next** to complete the wizard.
6. Select the appropriate Security Group and click **Edit** on the Ribbon bar. If you select the Administrator group security and click **Edit**, the **Modifying an Existing Security Group** dialog box appears.
7. Select the appropriate options and click **Save**.

Applying security for a list view

- AVEVA Work Tasks allows you to apply the security for a specific list view. Then this security will not affect any other views in the Manage View page.

To apply the security for specific view

1. On the **Manage View**, select a View and right click.
2. Select **Security Settings** from the right click options. The **Security Settings** page appears.
3. Select the **Advanced Settings** tab.

Field	Description
Security Group- Resource Mapping for this List Item	Click this link to add, modify and delete Resource Mapping at List Item level.
Customize Security Group at List Item level	Click this link to customize Security Group at List Item level
Remove Security from this ListItem	Click this link to remove security for deleting the Resource Mapping /Security Group Customization from the intermediate above level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click the required link. If you select **Customize Security Group for this List Item**, the **Security Group** page appears.
5. Select appropriate **Security Group** and click **Edit** on the Ribbon bar. If you select the Administrator group security and click Edit the Modifying an Existing Security Group dialog box appears.

   Note: You can restrict the display of specific view in the List View drop-down by de-selecting the **Can Consume Item** right of the security group. To display the specific view in the List View drop-down, select the **Can Consume Item** right of the security group.
6. Select the appropriate options and click **Save**.

Note: If you apply the security at View level, it will not affect any other View present in the Manage View page. All the security settings that you have been configured specifically for a view will be applicable only for that particular view.

List Lookups

Lookup is a powerful feature in AVEVA Work Tasks that allows you to fetch data from a List or a SQL Database. Lookup Settings is a separate module that allows you to create lookups and maintain it as a Lookup list.

The Data source for a lookup can be a Database or List. Database is used to populate lookup data from a database and List is used to populate data from an existing List. When you create a List or Form, the Lookup Input control can be easily linked to the desired lookups available in the Lookup list. Consider a scenario of creating a new user for the "User list". Details of the user like name, password, email, department and manager fields are required. In this scenario, Managers can be the existing users from the "Manager list" for which the lookup can be created.

Supported Data Types

Supported Data Types

The supported data types for SQL include bigint, binary, bit, char, date, datetime, decimal, float, int, money, nchar, numeric, nvarchar, real, smalldatetime, smallint, smallmoney, tinyint, uniqueidentifier, varbinary, varchar, and xml. This is applicable for database queries, stored procedures, and list lookups.

BigInt, Decimal, Float, and Money data types in the List control is limited to the range -999999999999999 to 999999999999999. This limited range is due to the limitation of a number in the underlying JavaScript technology used in Forms.

SmallMoney data types in the List control is limited to the range -214748.3648 to 214748.3647. Also, the Number control in the associated form generated by the List is limited to 2 decimal places. So, the Number control range would be from -214748.36 to 214748.36.

The supported data types for Oracle include bfile, binary_double, binary_float, blob, char, clob, date, float, interval day, interval year, long, long raw, nchar, nclob, number, nvarchar2, raw, rowid, urowid, varchar, and varchar2. This is applicable for database queries and stored procedures.

Note:
- Each user in the "Manager list" will have a unique id but can have similar names.
- Lookup control has properties **Value column** and **Display column**.
- The value for the **Value** column will be persisted in the form instance XML of the "User list". However, the value for the "display column" is retrieved from the "Manager list" based on the value of the **Value** column when the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

form is rendered. Hence its mandatory that the **Value** column selected for the lookup control has unique values.
- For the **Display** column, it is recommended to use the **String** data type. In the case of Database Lookup, the Display column should be of a data type that can be implicitly converted to a string during execution. For other types of lookups, consider using general data types such as **String**, **Number**, or **DateTime**. Avoid using data types like **Binary**, **Large Text Columns**, or **Arrays**. In summary, a **String** data type is the preferred choice for the Display column.

Start Lookup Settings

This section explains how to start the Lookup Settings.

To start Lookup Settings

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Lookup Settings**. The Lookup Settings page appears.
2. The **Lookup Settings** page shows the title, description, lookup type, owner, item status, work in progress, workflow status, and last modified date for the lookup lists.

Lookup Settings Interface

A proper understanding of the Lookup Settings Interface allows you to effectively use the various features of the application.

The **Lookup List** is the default screen that is displayed when you start **Lookup Settings**. It allows you to create new database lists, lookup lists, and organize them.

Lookup Settings Interface

Lookup Settings interface has a breadcrumbs, an action bar, and a list of lookups.

Breadcrumbs

Breadcrumbs display the path to the child lookup or folder, and has commands to customize and view the list of lookups.

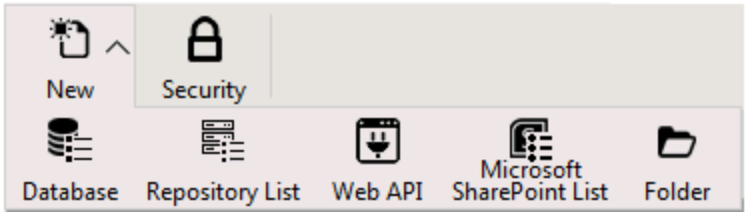
Command	Description
All Items	Default view to display the list of lookups.
Create View	Create a new view to display the list of lookups.

Action Bar

Action bar has commands to manage lookups and folders. Standard commands are available all the time whereas contextual commands are available only when a lookup is selected.

Standard Commands

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



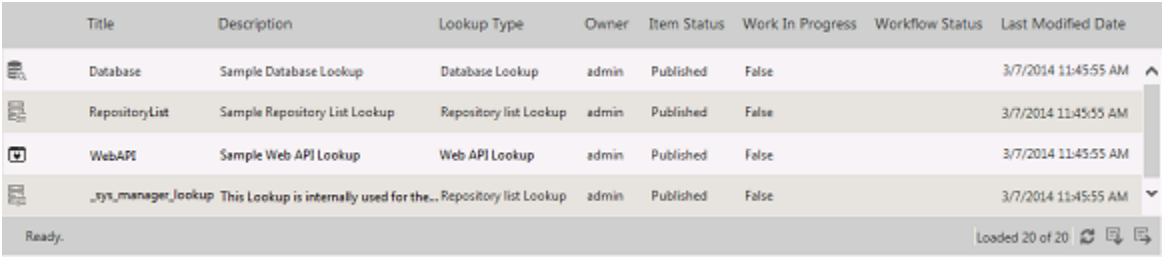
Menu/Command	Command	Description
New	Database	Create a new database lookup.
	Repository List	Create a new repository list lookup.
	Web API	Create a new web API lookup.
	Folder	Create a new folder to group and organize lookups.
Security		View or customize the security level for the lookups.

Contextual Commands

Command	Description
Edit	Edit the lookup.
Delete	Delete the lookup.

List

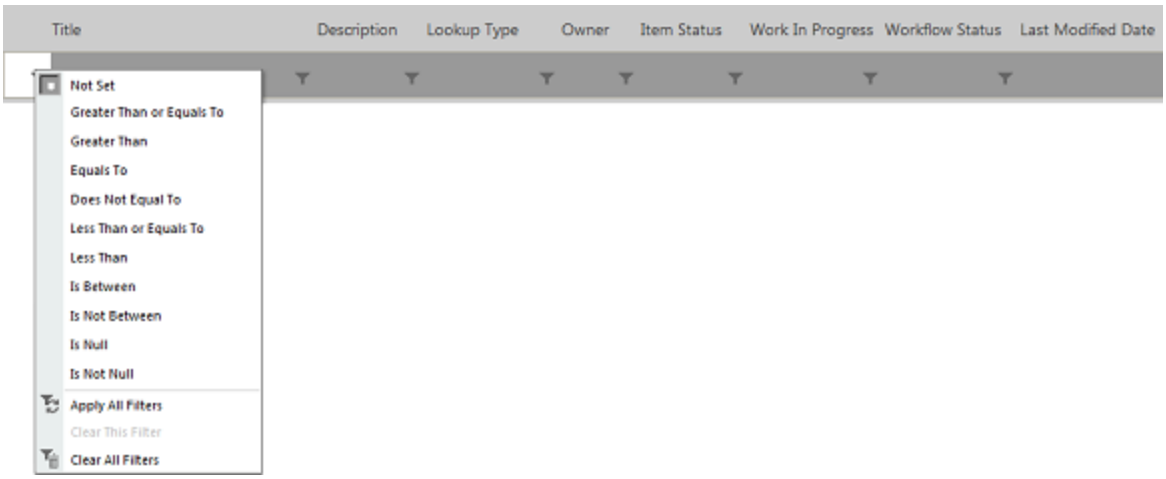
List of lookups shows the title, description, lookup type, owner, item status, work in progress, workflow status, and last modified date for the lookups. Click on a column to sort the lookups.



Filter Bar

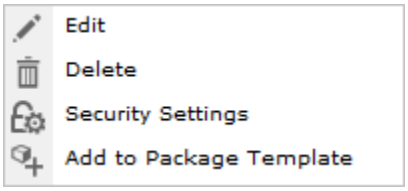
Filter bar can help to quickly find the desired lookup from the list of lookups. Filter bar has a funnel button and a parameter area for every column of the list of lookups. The filter button shows the available filter options and the parameter area is for entering the filter criteria. The filter bar is hidden by default. Right-click on the column header, and then click **Filter Bar**, to access the filter bar.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



List Shortcut Menu

List shortcut menu has commands to manage the lookup. Right-click on a lookup to access the shortcut menu.



Command	Description
Edit	Edit the lookup.
Delete	Delete the lookup.
Security Settings	View or customize the security level for the lookups.
Add to Package Template	Add the lookup to a package template.

Lookup Settings

This section provides information on the following:

- Add a New Repository List Lookup
- Add a New Database Lookup
- Add a New Web API Lookup
- Edit a List Lookup
- Organize Lookup Lists
- Delete a List Lookup

Add a New Repository List Lookup

This section provides detailed procedures for creating a new Repository List lookup.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To add a new Repository List lookup

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Lookup Settings**. The **Lookup Settings** page appears.
2. Click the **New Lookup List** icon on the **Ribbon Bar**. The **New Repository List Lookup** dialog box appears.

Field	Description
Lookup Name	Enter the appropriate title for the lookup.
Description	Enter the appropriate description for the lookup.
List Name	Select the List name to be associated with the lookup.
Get all records	Select the required option. • Select **True**, if you would like to display all the records from the list. • Select **False**, if you would like to display only selected records from the list. When you select **False**, the List Query field is displayed below this field.
List Query	Click the **Query** button to build a filter query to get the required records. This field is enabled only if the **Get all records** option is selected as "False". Query can be built using Value, Parameter or Table Fields. For more information on building a List Query, see Add a List Query.
Order By Query	Click the **Query** button to build a query to sort the list items based on the given condition (Similar to Order by clause of the sql queries). Data can be either in ascending or descending order. For more information on building a Order By Query, see Add an Order By Query.
Table	Click this text box to select the required table. The tables that are associated to a List are displayed in a tree menu as shown below. The tree menu displays the hierarchy of tables.
Available Columns	This field displays all the columns associated to the selected table.
Selected Columns	This field displays all the selected columns of the selected table. You can select or deselect the columns.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Display Column	This field displays the column to be displayed in the lookup. For example, Employee Name column.
Value	Select the required option. The options are Auto, Custom. • If **Auto** option is selected, the Id column of the table selected is considered as value field. For Example, for an Employee list, the Employee Name will be display column and Employee ID will be Value column. • If **Custom** option is selected, you can specify the desired value column.. **Note:** The column specified in the **Value** field should identify a unique row in the table.
Display value column in grid	Select the required option. The options are Yes, No. • If **Yes** option is selected, the selected value column is displayed in the lookup. • If **No** option is selected, the selected value column is not displayed in the lookup.
Form	This field does not support any functionality for the current release.

Note:
- The column "Title" will always be a part of the Available Columns and Display Column fields. The "Title" column should not be selected if it is not a part of the List Definition.
- The **Title** of repository list lookups cannot have special characters and blank space. The only allowed special character is _ (underscore). Also, the Title starting with _SYS_ is not allowed.

3. Type the lookup name in the **Lookup Name** field and enter its description in the **Description** field.
4. Select the List name, and then select the required columns.
5. Click **Update**.

Please note the following important things about the **Dynamic Query Builder**.

The following operators are available for creating queries using the Dynamic Query Builder:

- =
- >

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- <
- >=
- <=
- <>
- IN
- Not In
- Like
- Is Null
- Is Not Null

Queries cannot have any Special Characters except '@' for Parameter Name.

Add a List Query

Using List Query, you can built a filter query for the lookup to fetch records. This field is enabled only if the **Get all records** option is selected as **False** in the **New Repository List Lookup** dialog box.

To build a query

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Lookup Settings**. The **Lookup Settings** page appears.
2. Click the **New Lookup List** icon on the **Ribbon Bar**. The **New Repository List Lookup** dialog box appears.
3. Click the **Query** icon against **List Query** to build a filter query to get the required records.

   The **Dynamic Query Builder** dialog box opens.

Field	Description
Condition (*Prefix*)	Grouping prefix for the condition.
Table	Click this text box to select the required table. The tables that are associated to a List are displayed in a tree menu. The tree menu displays the hierarchy of tables.
Column	Select the column associated to the selected table.
Operator	Select the available operator for creating Query.
Type	• Select the Type to display the filtered records. The available Type options are Value, Table Field, and Parameter.
Value	• When the Type is **Value**, the Value can be given as a string with Single quotes for a string or a number for Number type as per the Column

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
	selected. • When Type is **Table Field**, in the Value, the table and the column can be specified. • When Type is **Parameter**, the Value can be given as @<parameter name>.
Condition (*Suffix*)	Grouping suffix for the condition with the option of specifying AND and OR operators to build multiple conditions based query.

4. Click **Add** to add the query.

   Multiple conditions can be specified using the Condition (*Prefix*) and Condition (*Suffix*) options.
5. Click **Save** to save the query.
6. Click **Clear** to remove the data entered in the Query Builder.

Add an Order By Query

Using Order By Query, you can build a query to sort the list items based on the given condition (similar to Order by clause of the sql queries). Data can be either in ascending or descending order.

To build an Order Byquery

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Lookup Settings**. The **Lookup Settings** page appears.
2. Click the **New Lookup List** icon on the **Ribbon Bar**. The **New Repository List Lookup** dialog box appears.
3. Click the **Query** icon against **Order By Query** to build a query to sort the list items.

   The **Dynamic Order By Query Builder** dialog box opens.

Field	Description
Table	Click this text box to select the required table. The tables that are associated to a List are displayed in a tree menu. The tree menu displays the hierarchy of tables.
Column	Select the column associated to the selected table.
Sort	Select **ASC** to list the items in ascending order or **DESC** to list in the descending order.

4. Click **Add** to add the query.

   Multiple columns can be specified for the Order By query.
5. Click **Save** to save the query.
6. Click **Clear** to remove the data entered in the Query Builder.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Add a New Database Lookup

Add a **Database Lookup** to use the result set in the lookup.

To add a Database Lookup

1. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Lookup Settings**. The **Lookup Settings** page appears.
2. Click **New**, and then click **Database**. The **New Database Lookup** dialog box appears.
3. In the **Title** box, type a name for the database lookup, and in the **Description** box, type a description for the database lookup.
4. Do one of the following:

Task	Action
• Design the database lookup using a query.	a. In the **Command Type** list, click **Query**, and then click **Continue**. The **New Database Lookup** dialog box appears with additional options. b. Follow the steps for Add a New Database Lookup Using Query.
• Design the database lookup using a stored procedure.	a. In the **Command** Type list, click **Stored Procedure**, and then click **Continue**. The **New Database Lookup** dialog box appears with additional options. b. Follow the steps for Add a New Database Lookup Using Stored Procedure.

Note: Lookup title cannot have special characters and blank space. The only allowed special character is _ (underscore). Also, the Title starting with _SYS_ is not allowed.

Default Search Behaviour of Database Lookups

The default search behaviour of database lookups is to include the **Display Value** column and the **Value** column. If there is only a single **Value** column, then that **Value** column is considered, otherwise the first column returned from the results of the select query is considered provided that column is part of the **Value** column.

For example, If the **Display Value** is **EmpDetails**, the **Value** column contains multiple columns – **Emp.Address**, **Emp.Name**, and **Emp.Age**, and the select query is `SELECT * from Emp;` then **EmpDetails** from the **Display Value** column and **Emp.Name** from the **Value** column is considered for the search as the **Emp.Name** column is the first column in the database table.

Add a New Database Lookup Using Query

Add a **Database Lookup** using query to use the result set in the lookup.

- Follow the steps for Add a New Database Lookup till you a get the **New Database Lookup** dialog box.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To add a Database Lookup using a Query

1. Select the Database connection. Enter the required query. Data will be retrieved based on the query from the database.

   Note:
   - You can write queries to fetch data from tables, synonyms and views.
   - The use of aliases, aggregate functions, joins in database lookup query is supported through the use of views.
   - Click here for a scenario on handling aliases, aggregate functions, joins in the database lookup query.
   - The Database Lookup only supports the dbo schema by default. However, you can create views to support any other custom
   schemas.
   -The database lookup query supports the use of CASE expression. Click here for a scenario on using CASE expression in the
   query.
   - Square brackets should not be used in the SQL query for Oracle database. In case the Square brackets are used as part of a string, then the user must use **CONCAT** or **||** and **CHR** functions instead of Square brackets. For example, if the string used in the query is 'Home [test] Page', then it can be given in either of the following two ways:
   -- CONCAT('Home ', CONCAT(CHR(91), CONCAT('test', CONCAT(CHR(93), ' Page'))))
   -- 'Home ' || CHR(91) || 'test' || CHR(93) || ' Page'

2. Click **Load Parameters** to load parameters from the query, and then select a data type for each listed parameter.

   Note:
   - For SQL database, the supported data types include Big Integer, Boolean, Byte, Char, Date, DateTime, Decimal, Double, Guid, Integer, Single, Small Integer, and String.
   - For Oracle database, the supported data types include Big Integer, Byte, Char, Date, DateTime (in correct format), Decimal, Double, Integer, Single, Small Integer, and String. For Guid data, use nvarchar2 instead of raw.

3. Enter the column name to be used as **Value** field in the lookup input control. The value field column(s) must be one of the selected columns in the Query field. Example: Employee.EmployeeId denotes Employee table and EmployeeId column.

   Ensure that the case of the table name used in the **Value** field matches with the case of the table name in the query. For example, if the table name given in the query is **EmployeeDepartment**, then an entry **employeeDepartment** in the Value field, is considered invalid.

   Note:
   - If required, you can enter multiple column names separated by commas.
   - Please ensure that the column names are always preceded by table names.
   - Also, the column name(s) should identify a unique row in the table.
   For example, TableName.Id,TableName.title,TableName.description

4. Enter the column name to be used as display field in the lookup input control. Example: FirstName.
5. Click **Validate & Preview**. It validates all the entries made for the creating the database lookup. If all the entries are valid, a preview of the data fetched by the database lookup is displayed.

   Also, if the database lookup query is with parameters, you can preview the data after providing valid sample inputs. Click here for a database lookup scenario based on query with parameters.

   Note:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Following are some of the important checks to be done to ensure that the entries for the database lookup are valid:
- The **Title** of database lookups cannot have the following special characters: `~! @#$%^&*()+|`-=\\{}:\"<>?[];',./ - (Including blank space)`. The only allowed special character is _ (underscore).
- The **Title** of database lookups cannot begin with a number. For example, 12EmployeeDetailsDBLookup is an invalid entry.
- The query entered in the **Query** field must be syntactically correct.
- Also, the query validation will fail when the query is executed on a invalid database connection or the table name or column names used in the query are invalid. For example, if the query entered is **"Select * Employee Where Id=@id"**, on click of **Validate & Preview**, an error message is displayed as the query is syntactically incorrect.
- All the columns entered in the **Value** field must belong to the same table. For example, **Employee.EmployeeId**,**Department.DeptId** is an invalid entry.
- The columns entered in **Value** field must not repeat. For example, **Employee.EmployeeId**,**Employee.EmployeeId** is an invalid entry.
- The columns entered in the **Value** and **Display Name** fields must be a part of the query. For example, the query is **"Select Id, Dept, Designation From Employee"**. **Value** field entered is **Employee.DeptId** and **Display Name** is **EmpName**. This is an invalid scenario as the columns entered for the **Value** and **Display Name** fields are not a part of the query.
- The column specified in the **Value** field should identify a unique row in the table.

6. Click **Close** in the **Preview** screen. Click **Save** in the database lookup screen to save the changes to the database lookup.

Please note the following important points about Database Lookup:

- If Lookup fails to resolve the Display Column value based on the Lookup value, then the Lookup value will be shown as the display text for that particular Lookup.
- For lookups created on case sensitive databases, ensure that the queries entered are also case sensitive.
- Do not use an image field (type: Byte Array) as the value field for the Database lookup
- Display Name of database lookups which have been created on external (i.e. non repository) databases, cannot be resolved when viewed from the Lists grid.
- The parameters used in the database lookup query should not have any special characters, should not be blank and should be in `columnname=@parametername` format.
- Also, note the following important points while creating Database lookups to be associated with the Grid Configuration:
- If any of the columns selected in the database lookup used in a Grid Configuration are image fields of type Byte Array, the Data Grid on rendering does not show the images. The image columns will be shown as System Byte. Also, these columns cannot be used in workflows.
- If the column names in the selected data source lookups have any special characters other than _, the user will not be allowed to select them in the Persist Columns field. Also, if the column names have space or begin with numbers the user will not be allowed to select them in the Persist Columns field.
- If the value field in the lookup which is consumed in a Grid Configuration has a special character, space or begins with a number, the Grid Configuration will be considered invalid.
- Filter on Display Value for Data Lookup control is through SQL Like operator. Therefore, we recommend setting the Display Name column, which is of string data type. For more information, refer to Supported Data Types.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Add a New Database Lookup Using Stored Procedure

Add a **Database Lookup** using stored procedure to use the result set in the lookup.

- Follow the steps for Add a New Database Lookup till you a get the **New Database Lookup** dialog box.

To add a Database Lookup using a Stored Procedure

1. In the **Database Connection** list, click the name of the database connection.
2. Click **Configure** for the **Procedure Details**. The **Procedure Details** dialog box appears.
3. In the **Procedure Name** box, type the name of the stored procedure, and then click **Load Details**.
4. If there are parameters for the stored procedure, then the parameters appear. In such cases, do the following:
   a. By default, all parameters are selected. Click to clear parameters that are not required to be passed when the stored procedure is called, if required.
   b. Type values for the parameters, and then click **Load Columns**. The **Value Column** and the **Display Name Column** are populated.
5. In the **Value Column** list, click the column names to be used as the value fields.
6. In the **Display Name Column** list, click a column name to be used as the display field.
7. Click **Save**. The procedure details configuration is saved and the **Procedure Details** dialog box is closed.
8. Do one of the following:

Task	Action
• Show the value field in the grid.	• Click **Yes** for the **Show Value Column**.
• Show the display field in the grid.	• Click **No** for the **Show Value Column**.

9. Click **Save**. The database lookup is created and the **New Database Lookup** dialog box is closed.

Note:
- The **Title** of database lookups cannot have special characters and blank space. The only allowed special character is _ (underscore). Also, the Title starting with _SYS_ is not allowed.
- Stored procedures from Oracle databases are not supported, and therefore any database connection to Oracle database will not be available in the **Database Connection** list.
- Only the user defined stored procedures that return only the result set are supported.
- Only the first result set is supported for stored procedures that return multiple result sets.
- Only the columns from the result set, not the out parameters, are supported for the value and display name columns.
- Multiple value columns are currently not supported.
- The supported data types for the value column include bit, datetime, decimal, double, guid, int32, int64, nvarchar, single, uint16, uint32, uint64, and varchar.
- The supported data types for the parameters include bigint, bit, char, date, datetime, datetimeoffset, decimal, float, int, money, nchar, nvarchar(max), numeric, nvarchar, real, rowversion, smalldatetime, smallint, smallmoney, varchar(max),
time, tinyint, uniqueidentifier, and varchar.
- Only the mandatory parameters, that is the parameters that are selected, are made available in **Data Lookup** and **Data Grid** controls.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The column specified in the **Value** field should identify a unique row in the table.
- While passing the parameters for lookups and data grid controls, ensure that the value for the **Boolean** data type is either **True** or **False**.
- While passing the parameters for lookups and data grid controls, ensure that the value for the **Date Time** control is converted from the UTC format to the local time format. For more information about the Date Time control, see Date Time.

Adding parameters for stored procedures

For string parameters, empty string value is passed, and not null values.

To check whether the string parameter value passed to the stored procedure is empty, add the following condition in the **Where** clause:

```
NULLIF(@EmpName,'') is null
```

Where, **@EmpName** is a string parameter in the stored procedure and **NULLIF** is an SQL function.

You can also check whether the string parameter is empty by adding the following condition in the **Where** clause:

```
@EmpName=‘’
```

Also while defining the parameters, ensure that the parameters are given default values as shown below:

```
CREATE PROCEDURE [dbo].EmpDetailsProc
-- Add the parameters for the stored procedure here
@EmpID decimal(18, 0) = null,
@EmpName nvarchar(MAX) = null,
@IsMarried bit = null,
@EmpDOJ datetime = null,
@Guid uniqueidentifier = null,
@Salary float = null
:
:
```

Add a New Web API Lookup

Web APIs are frameworks to build HTTP services for browsers and mobile devices. Use Web APIs to customize your business applications.

To add a Web API Lookup

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Lookup Settings**. The **Lookup Settings** page appears.
2. Click **New**, and then click **Web API**. The **New Web API Lookup** page appears.
3. In the **Name** box, type a name for the API.
4. In the **Description** box, type a description for the API.
5. In the **Web API** list, select a Web API connection.

   Based on the Web API connection selected, enter the URI in the **Request URI** box.

   For example, **api/product/1** for **http://localhost/MySite/api/product/1** (for Request URI without parameters) or **api/{product}/{ID}** for **http://localhost/MySite/api** (for Request URI with parameters).

   - For the Web API not configured with open API specifications, the **Load Columns** option is available to get

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the columns data. When you click **Load Columns** button, the Web API will be executed in the Web API server. Based on the Web API functionality, there is a possibility of data update or delete. For more information, see Configure Web API

- For the Web API configured with open API specifications, specify the **Operation Group** and **Operation** for the selected Web API to get the columns data. For more information on configuring open Web API connection, see Invoke Web API: Configure OpenAPI.

6. Select column names for the **Selected Columns**. The selected columns are displayed in the lookup. Ensure that the value column contains unique data.
7. Select the data type for the selected column name for the **Selected Columns**, if required.

Note: The data type mentioned for the selected columns is used while fetching the data. Make sure that the data type specified for the selected column matches with the source data.

8. In the **Display Column** drop-down list, select the column name.
9. In the **Value Column** drop-down list, select the column name.
10. In the **Encoding** drop-down list, select the encoding type. The supported encoding types are **Default**, **UTF-7**, **UTF-8**, and **UTF-16**. The **Default** encoding type is used for backward compatibility.
11. Select **Yes** for **Advanced Settings**, if you want to add the Header value or display the value of request URI.

    The Header value is displayed if the Web API has the Header value. You can also add a new Header value.

    Note:
    - In the case of Web API, you cannot set the **Headers** as optional i.e. the **Optional** property of the Header cannot be set to **YES**. For each Header, the Key and Value are mandatory properties.
    - In the case of OpenAPI, you cannot set the **Optional** property of the **Header**. You cannot provide the Key, but you need to provide the Value. If the **Optional** property is **YES** and the Value is empty, the value will not be sent to the Web API and will be considered null. If the **Optional** property is **NO**, you need to provide the Value.
12. In the **JSON Path for Child Item** box, provide the JSON path to retrieve child nodes in a JSON having multiple nodes.
13. Select **Yes** for **Display Value Column in Grid**, if you want to display the value column.
14. In the **Display Value Request URI** box, type a URI. For example, **api/DataTable/{Id} for http://localhost/MySite/api/DataTable/**.
15. Click **Save**.

    The Web API lookup is saved and the **Web API** dialog box is closed.

    Note:
    - The **Title** of Web API lookups cannot have special characters and blank space. The only allowed special character is _ (underscore). Also, the Title starting with _SYS_ is not allowed.

    - The Web API for the **Display Value Request URI** helps in resolving the display value directly from the specific row of data. This helps to maintain consistency in the data displayed, save the network bandwidth, and improve the speed of execution.

    - The value of the **Owner** for the Web API Lookup in lists is not resolved by default as it involves connecting to a Web API and thereby consuming network bandwidth and reducing the speed of execution. A workaround is to add an additional field in the list and a corresponding hidden field in the form to map the value with the display value, and show only the display value field in the list grid.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Web API Lookup settings can be deleted even if they are being used.

- The column specified in the **Value** field should identify a unique row in the table.

- The Web API response should be in the JSON format.

- The columns containing JSON objects should be mapped only to string data types. Further, these columns should not be configured for **Display Column** or **Value**.

Edit a List Lookup

This section provides detailed procedures for editing the Lookup.

To edit a lookup

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Lookup Settings**. The **Lookup Settings** page appears.
2. Select the appropriate lookup and click **Edit**
   OR
   Right click the appropriate lookup and select **Edit**. The **Edit Repository List Lookup** dialog box appears.
3. **Edit** the appropriate details and click **Update**.

Organize Lookup Lists

Organize a lookup list by performing one of the following:

- Moving the lookup list to a folder.
- Making the lookup list a child item of another lookup list.

To organize a lookup list by moving the lookup list to a folder

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Lookup Settings**. The **Lookup List** page appears.
2. On the action bar, click **Organize**. The **Organize Lookup List** dialog box appears.
3. Drag a lookup list to a folder. The lookup list is moved to the folder.
4. Click **Close**. The **Organize Lookup List** dialog box is closed.

To organize a lookup list by making the lookup list a child item of another lookup list

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Lookup Settings**. The **Lookup List** page appears.
2. On the action bar, click **Organize**. The **Organize Lookup List** dialog box appears.
3. Drag a lookup list to another lookup list. The lookup list is now a child item of another lookup list.
4. Click **Close**. The **Organize Lookup List** dialog box is closed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Delete a List Lookup

This section provides detailed procedures for deleting a Lookup.

To delete a lookup

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Lookup Settings**. The **Lookup Settings** page appears.
2. Select the appropriate lookup and click **Delete**. A warning message is displayed.
3. Click **Yes**.

List Lookup Scenarios

This section explains some of the scenarios on using the List Lookup features:

- Create a Lookup for a Database Table
- Create a Lookup for a Database Table with Composite Primary Key
- Create Dependent Lookup from Database Tables
- Create a Lookup for a List
- Search or Sort within a Lookup Data
- Add an Item from Lookup Control
- Use ExtendedInformation Property for List Lookups
- Use ExtendedInformation Property for Database Lookups
- Use Aliases, Joins, Aggregate Functions in Database Lookup Query
- Use CASE Expression in the Database Lookup Query

Create a Lookup for a Database Table

AVEVA Work Tasks allows you to create a database lookup and list lookup to retrieve data from a database. This allows the user to select from a set of options, for example list of states, countries etc. To create a database lookup, you need to connect to a database.

Before starting with the scenario, create a database connection.

To connect to a database

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Database Connections**. The **Database Connections** page appears.
2. On the **Ribbon bar**, click **New**. The **New Connection** dialog box appears.
3. In the **Title** box, type the appropriate name for the connection. In this case, enter **formslistscenario**.
4. In the **Description** box, type any description. This is not mandatory.
5. Select the **Connect to repository datasource** check box to connect to the current repository database. A database connection for the repository datasource is successfully created and is displayed in **Connection List** page.

   Or

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Clear the **Connect to repository datasource** check box to connect to an external database. Perform the steps mentioned in the following tables.

Field	Description
Database Type	Select appropriate database type from the options. Available options are SQL Server and Oracle. In this case, select **SQL Server**.
Connection Type	Select the appropriate connection type from the options. Available options are Connection String and Connection Provider. Select **Connection String**.
Server Name	Click the **Refresh** button and then select the appropriate server that you are using, from the drop-down list. In this case, you will select **Server1\SQLEXPRESS**.
Authentication Type	Select the appropriate authentication type from the drop-down list. Since, you are using windows for authentication, select **Windows** from the drop-down list.
User Id	Enter your user Id, if you have selected any other authentication type than Windows.
Password	Enter your password, if you have selected any other authentication type than Windows.
Advanced Settings	Enter any advanced settings, if required.
Database	Click the **Refresh** button and then select the appropriate database that you are using, from the drop-down list. In this case, you will select **FormsScenarioDB**.

6. Enter the details as mentioned in the field description table.
7. Click **Test Connection**.

   A message appears indicating that the connection is successful.
8. Click **Close**.
9. Click **Save**.

   The database connection is listed the **Connection List** page.

Now, you have created a database connection. Next, you will create a database lookup for Countries. The Country lookup will retrieve the data from the database table and display the list of countries along with the other details like country code.

To create the lookup

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Lookup Settings**. The **Lookup Settings** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. On the **Ribbon bar**, click **New**, and then click **Database**. The **New Database Lookup** window appears.
3. In the **Title** box, type a name for the database lookup.
4. In the **Description** box, type a description for the database lookup.
5. In the **Command Type** drop-down list, select **Query**.
6. Click **Continue**.
7. Enter the details as mentioned in the field description table.

Field	Description
Database Connection	Select an appropriate database connection from the drop-down list. You have created the database connection **formslistscenario**, so select that database connection.
Query	Enter the query to execute and display the lookup input control. Data will be retrieved based on the query from the database. Example: **SELECT * from Country**.
Value	Enter the column name to be used as value field in the lookup input control. Example: **Country.CountryId**. If required, you can enter multiple column names separated by commas. Please ensure that the column names are always preceded by table names. For example, TableName.Id, TableName.title, TableName.description. Also, the column name(s) should identify a unique row in the table.
Display Name	Enter the column name to be used as display field in the lookup input control. Example: **CountryName**.
Display value column in grid	Show or hide the value column in the grid. • Select **True** to show the value column in the grid. • Select **False** to hide the value column in the grid. The default value is **True**.

8. Click **Save**. The details are saved and the lookup is listed in the **Lookup List** page.

Note: You have created the **Country** lookup. This lookup can be used to retrieve data in the form.

To design a form

1. Design a new form. For more information about designing a form, see Designing Forms.
2. Drag and drop the Data Lookup control in the form.
3. Edit the properties for the Data Lookup control.
4. Click the **Lookup Source** icon. The **Lookup Source Configuration** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Select the **Database Lookup** in the **Data Source Type**.
6. Select **Country** in the **Data Source**.
7. Click **Save & Continue**.
8. Click **Apply** in the **Property** window.
9. Click **Preview**.
10. Enter the first three characters for the Country in the **Data Lookup** control. The countries whose title contains the specified characters are displayed in the drop-down list.
11. Select the appropriate country from the drop-down list.
12. Click **Finish**.

Create a Lookup for a Database Table with Composite Primary Key

The Database lookup supports creating lookups for tables which have more than one column defined as the primary key.

Consider a **Job-Steps** scenario from a typical manufacturing process. A **work order** is a collection of jobs that produce an item. A **job** is a list of steps or procedures that are executed to produce an item or version of item.

Let us say, the work order details are stored in the **Work_Order** table with **wo_id** as the work order id. Jobs involved for producing an item are stored in the **Job** table with **oper_id** as the job id. The various steps that make up one specific job are stored in the **Job_Steps** table. To uniquely identify any row in the **Job_Steps** table we need **wo_id**, **oper_id**, **seq_no** and **step_no** columns.

In this scenario, we will create a lookup for **Jobs** and a lookup for **Job Steps**. The user selects a Job from the Job Lookup. Job Step lookup gives the list of steps involved in completion of the selected Job.

Before Starting with the scenario, create a database connection. The table schemas for the tables involved are as follows:

Job Table Schema

Column Names
wo_id
oper_id
seq_no
job_desc
state_cd
job_priority

Job_Step Table Schema

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Column Names
wo_id
oper_id
seq_no
step_no
step_seq
step_name
step_desc
action_type

To connect to a database

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Database Connections**. The **Database Connections** page appears.
2. On the **Ribbon bar**, click **New**. The **New Connection** dialog box appears.
3. In the **Title** box, type the appropriate name for the connection. In this case, enter **MESWorkOrderConnection**.
4. In the **Description** box, type any description. This is not mandatory.
5. Select the **Connect to repository datasource** check box to connect to the current repository database. A database connection for the repository datasource is successfully created and is displayed in **Connection List** page.

   Or

   Clear the **Connect to repository datasource** check box to connect to an external database. Perform the steps mentioned in the following tables.

Field	Description
Database Type	Select appropriate database type from the options. Available options are SQL Server and Oracle. In this case, select **SQL Server**.
Connection Type	Select the appropriate connection type from the options. Available options are Connection String and Connection Provider. Select **Connection String**.
Server Name	Click the **Refresh** button icon and then select the appropriate server that you are using, from the drop-down list. In this case, you will select **Server1\SQL2008STANDARD**.
Authentication Type	Select the appropriate authentication type from the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
	drop-down list. Since, you are using SQL Server for authentication, select **SQL Server** from the drop-down list.
User Id	Enter your user Id, if you have selected any other authentication type than Windows.
Password	Enter your password, if you have selected any other authentication type than Windows.
Advanced Settings	Enter any advanced settings, if required.
Database	Click the **Refresh** button and then select the appropriate database that you are using, from the drop-down list.

6. Enter the details as mentioned in the field description table.
7. Click **Test Connection**. A message appears indicating that the connection is successful.
8. Click **Close**.
9. Click **Save**. The database connection is listed in the **Connection List** page.

   Now, you have created a database connection.

   Next, you have to create a database lookup for Job and Job Steps.

To create the lookup

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Lookup Settings**. The **Lookup Settings** page appears.
2. On the **Ribbon** bar, click **New**, and then click **Database**. The **New Database Lookup** window appears.
3. In the **Title** box, type a name for the database lookup. In this case, enter **JobLookup**.
4. In the **Description** box, type a description for the database lookup.
5. In the **Command Type drop**-down list, select **Query**.
6. Click **Continue**.
7. Enter the details as mentioned in the field description table.

Field	Description
Database Connection	Select an appropriate database connection from the drop-down list. You have created the database connection **MESWorkOrderConnection**, so select that database connection.
Query	Enter the query to execute and display the lookup input control. Data will be retrieved based on the query from the database. Example: **SELECT * from**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
	job
Value	Enter the column names to be used as value field in the lookup input control. Example: **job.wo_id, job.oper_id, job.seq_no** **Note:** The column specified in the **Value** field should identify a unique row in the table.
Display Name	Enter the column name to be used as display field in the lookup input control. Example: **job_desc**.

8. Click **Validate & Preview**. If the validation is successful and the preview has been generated, click **Save**. The details are saved and the Lookup List page appears.

Note: You have created the JobLookup. This lookup can be used to retrieve data in the form.

Next, you need to add another lookup for Job_Steps table.

9. Follow the steps above for creating a Database lookup. Enter the details for creating the lookup.

Field	Description
Title	Enter the appropriate title for the lookup. In this case, enter **JobStepLookup**.
Description	Enter any description. This is not mandatory.
Database Connection	Select an appropriate database connection from the drop-down list. You have created the database connection **MESWorkOrderConnection**, so select that database connection.
Query	Enter the query to execute and display the lookup input control. Data will be retrieved based on the query from the database. Example: **SELECT * from job_step where wo_id=@woid and oper_id=@operid and seq_no=@seq_no** **Note:** The parameters used in the database lookup query should not have any special characters, should not be blank and should be in columnname=@parametername format.
Value	Enter the column names to be used as value field in the lookup input control. **Example:Job_Step.Wo_Id, Job_Step.Oper_Id, Job_Step.Seq_No, Job_Step.Step_No** **Note:** The column specified in the **Value** field should identify a unique row in the table.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Display Name	Enter the column name to be used as display field in the lookup input control. Example: step_desc.

10. Click **Validate & Preview**. The **Preview** dialog box for **Resolve Parameter** appears. Enter valid sample inputs for the parameters and then click Proceed.

The **Preview** screen appears with the preview of the data fetched by the database lookup.

11. Click **Close**.
12. Click **Save**. The details are saved and the lookups are listed in the **Lookup List** page.
13. Design a new form.
14. Drag and drop the Data Lookup control in to the form.

1. Edit the properties for the Data Lookup control.
2. Click the **Lookup Source** icon. The **Lookup Source Configuration** page appears.
3. Select the **Database Lookup** in the **Data Source Type**.
4. Select **JobLookup** in the **Data Source**.
5. Click **Save & Continue**.
6. Click **Apply** in the **Property** window.
7. Drag and drop another Data Lookup control in to the form.
8. Edit properties for the Data Lookup control.
9. Click the **Lookup Source** icon. The **Lookup Source Configuration** page appears.
10. Select the **Database Lookup** in the **Data Source Type**.
11. Select **JobStepLookup** in the **Data Source**.

    Note: Since, you have set the 'where' condition for the **JobStepLookup**, the **Parameters** field is displayed in the Lookup.

12. Click **Save & Continue**.
13. Click **Apply** in the **Property** window.
14. Click in the text box next to the **Controls** drop-down box.
15. Select **wo_id** from the tree structure. Also set the other two parameters using values from the SKRootDefinition of JobsLookup.
16. Click **Submit**.
17. In the **Lookup Input Property** window, click **Save**. The JobStepLookup control is added to the form.
18. Click **Preview** to preview the form.
19. Click the **Search** button corresponding to the Jobs Lookup field. Select any job by double-click or by the **Select** button.
20. Click the **Search** button corresponding to the Job Steps Lookup field. It displays the list of job steps involved in the selected job.
21. Select a Job Step.

    Note: Multiple values set in the **JobStepsLookup** allow you to select a Job Step.

22. Click **Finish**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create Dependent Lookup from Database Tables

AVEVA Work Tasks allows its users to create dependent lookups, i.e. the second lookup will display the values based on the value selected from the first lookup. This functionality is very important in forms and list.

In this scenario, you will learn how to create a dependent lookup with the help of two tables; Country and State. The Country table consists of two columns, **CountryID** and **CountryName**. The State table consists of three columns, **StateID**, **StateName**, and **CountryID**.

We will then create two lookups, Country Lookup and State Lookup. The Country lookup is similar to the one we have created in the scenario, Create a Lookup for a Database Table.

In this scenario, we will use the 'where' condition in the query builder while creating the State lookup.

To create a dependent lookup from database tables

1. Create a lookup with the name **State** with the details as mentioned in the field description table.

Field	Description
Database Connection	Select appropriate database connection from the drop-down list. For more details on how to create the database connection, refer to the scenario, Create a Lookup for a Database Table.
Query	Enter the query to execute and display the lookup input control. Data will be retrieved based on the query from the database. Here, you need to specify the 'Where' condition also. Then the value will be retrieved based on the where condition. Example: **SELECT * from State where CountryId=@CountryId**
Value	Enter the column name to be used as value field in the lookup input control. Example: **State.StateId** **Note:** - If required, you can enter multiple column names separated by commas. - Ensure that the column names are always preceded by table names. For example, **TableName.Id,TableName.title,TableName.description**. - Also, the column name(s) should identify a unique row in the table.
Display Name	Enter the column name to be used as display field in the lookup input control. Example: **StateName**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Create another lookup with the name **Country** with the details as mentioned in the field description table.

Field	Description
Database Connection	Select appropriate database connection from the drop-down list. For more details on how to create the database connection, refer to the scenario, Create a Lookup for a Database Table.
Query	Enter the query to execute and display the lookup input control. Data will be retrieved based on the query from the database. Example: **SELECT * from Country**
Value	Enter the column name to be used as value field in the lookup input control. Example: **Country.CountryId** **Note:** - If required, you can enter multiple column names separated by commas. - Ensure that the column names are always preceded by table names. For example, **TableName.Id,TableName.title,TableName.description**. - Also, the column name(s) should identify a unique row in the table.
Display Name	Enter the column name to be used as display field in the lookup input control. Example: **CountryName**

To design a form

1. Design a new form. For more information about designing a form, see Designing Forms.
2. Drag and drop the Data Lookup control in to the form.
3. Edit the properties for the Data Lookup control.
4. Click the **Lookup Source** icon in the **Data Source** field. The **Lookup Source Configuration** page appears.
5. Select the **Database Lookup** in the **Data Source Type**.
6. Select **Country** in the **Data Source**.
7. Click **Save & Continue**.
8. Click **Apply** in the **Property** window.
9. Drag and drop the Data Lookup control in the form.
10. Edit the properties for the Data Lookup control.
11. Click the **Lookup Source** icon. The **Lookup Source Configuration** page appears.
12. Select the **Database Lookup** in the **Data Source Type**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

13. Select **State** in **Data Source**.

    The **Parameters** field is displayed.

    Note: In the case of parameterized lookups, when the parent lookup selection is changed the value selected in the child lookup is not getting cleared off.
    In this scenario, consider that the user selects a Country and then selects a State for that Country. When the user changes the Country selection, the State lookup value remains the same. The value selected in the State lookup is not being cleared off.

14. For the parameter **@CountryId**, select the first Data Lookup control from the drop-down list.
15. Click **Save & Continue**.
16. Click **Apply** in the **Property** window.
17. Click **Preview**.
18. Enter the first three characters for the Country in the Data Lookup control. In the drop-down list, the countries with the title containing the three characters are displayed.
19. Select the appropriate country from the drop-down list.
20. Enter the first three characters for the State in the Data Lookup control. In the drop-down list, the states with their title containing the three characters and belonging to the selected country in the Country Data Lookup control, are displayed.
21. Select the appropriate state from the drop-down list.

Create a Lookup for a List

AVEVA Work Tasks has the provision to create a Database lookup and List lookup to retrieve data. In the Database lookup the data is retrieved from database tables whereas in a List lookup, data is retrieved from List.

In this scenario, you will create a lookup for the **Employee Details** list. Consider a form which is used for filling in an employee's annual rating with two fields, **Employee** and **Rating**. Employee field will be a drop-down (lookup) only for the active Employees. In this scenario we will try to understand, how to build an active employee lookup.

Before we start with the scenario, create an **Employee Details** list with three fields Title, Employee Number and Active.

To create a lookup for a list

1. Create an **Employee Details** list.
2. Run the script mentioned below in the repository database.

```
CREATE TABLE [dbo].[EmployeeDetails](
[Id] [uniqueidentifier] NOT NULL CONSTRAINT [DF__EmployeeDetails__Id__1E6F845E] DEFAULT (newid()),
[Title] [nvarchar](250) NOT NULL,
[EmployeeNumber] [nvarchar](150) NULL,
[Active] [bit] NULL,
[Application] [nvarchar](150) NULL,
[CreatedBy] [uniqueidentifier] NULL,
[CreatedDateTime] [datetime] NULL,
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
[LastUpdatedDateTime] [datetime] NOT NULL,
[WIP] [bit] NULL,
[WIPItemId] [uniqueidentifier] NULL,
[MainItemId] [uniqueidentifier] NULL,
[ParentItemId] [uniqueidentifier] NULL,
[RecordParentItemId] [uniqueidentifier] NULL,
[TableId] [uniqueidentifier] NULL,
[ItemRowIndex] [int] NULL,
[IsLatest] [bit] NULL,
[Version] [nvarchar](25) NULL,
[VersionHistory] [nvarchar](max) NULL,
[Status] [int] NULL,
[LockedBy] [uniqueidentifier] NULL,
[LockedOn] [datetime] NULL,
[ListID] [uniqueidentifier] NULL,
[SecuritySettings] [nvarchar](max) NULL,
[ItemId] [uniqueidentifier] NULL,
[ItemType] [int] NULL,
[SecurityItemId] [uniqueidentifier] NULL,
[Owner] [uniqueidentifier] NULL,
[ModifiedBy] [uniqueidentifier] NULL,
[AuditTrail] [nvarchar](max) NULL CONSTRAINT [DF_EmployeeDetails_AuditTrail] DEFAULT
('),
[IsDisabled] [bit] NULL CONSTRAINT [DF_EmployeeDetails_IsDisabled] DEFAULT ((0)),
[WorkflowStatus] [varchar](50) NULL,
[SecurityCustomizationId] [uniqueidentifier] NULL,
CONSTRAINT [PK_EmployeeDetails] PRIMARY KEY NONCLUSTERED
(
[Id] ASC
)WITH (PAD_INDEX = OFF, STATISTICS_NORECOMPUTE = OFF, IGNORE_DUP_KEY = OFF,
ALLOW_ROW_LOCKS = ON, ALLOW_PAGE_LOCKS = ON) ON [PRIMARY]
) ON [PRIMARY] TEXTIMAGE_ON [PRIMARY]
GO
```

Note: Add two additional columns to the standard column as follows:

```
[EmployeeNumber] [nvarchar] (150) NULL,
[Active] [bit] NULL,
```

3. Make an entry in the SKListTables as mentioned below.

```
Insert into SKListTables (Application,TableName)
Values ('<Repository Name>','EmployeeDetails')
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Go

Note: Replace <Repository Name> with the repository you are using.

4. Create a new List named, **Employee Details** for the above table.
5. The **Title** control is of type TextInput to capture the employee name.
6. The **Employee Number** control is of type TextInput to capture employee number.
7. The **Active** control is of type BooleanInput to identify if the employee is active or not.

   Note: For simplicity in this scenario we will use the form auto generated by the list.
8. Input the employee records as follows.

   - John (Active Employee)

   - Tim (Active Employee)

   - Mike (In Active Employee)

   Note: Our next step would be to create a lookup, which will later be used in a Form.
9. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Lookup Settings**. The **Lookup Settings** page appears.
10. Click **New Lookup List**. The **New List Lookup** window appears.
11. Type the **Lookup Name** as "Employees".
12. Type the description to identify the lookup.
13. Select the **Employee Details** list from the **List Name** drop-down list.
14. Select the "False" option for the **Get all records** option.

    Note: Selecting "False" will enable the List Query. In this scenario we have selected "False", since we require active users only. If you select "True" all the employees will be selected.
15. Click **More** button corresponding to the **List Query** field. The **Dynamic Query Builder** dialog box appears.

    Note: Our aim is to build a query to select all employees with column Active with value as "1".
16. Click the **Table** text box. The tables are displayed in a tree menu.
17. Select "EmployeeDetails".
18. Select "Active" from the **Column** drop-down list.

    Note: Active is the column used in the WHERE condition.
19. Select "=" from the **Operator** drop-down list.
20. Select "Value" from the **Type** drop-down list.
21. Type "1" in the parameter field next to the **Type** drop-down list.

    Note: This is used to specify the value when it is populated from another field in the form.
22. Click **Add**. The **Dynamic Query Builder** dialog box appears.
23. Click **Save**.
24. Select the **No** option in the **Select distinct records** field.

    Note: Next we navigate to the Display Columns section. It is used to select the columns to be displayed in the lookup window.
25. Click the **Table** text box.
26. Select "EmployeeDetails" from the tree menu. The columns in the **EmployeeDetails** list is displayed in the **Available Columns** field.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

27. Select Title, EmployeeNumber, Active and click the **Add** button. These fields are selected in the **Selected Columns** field.
28. Select "EmployeeDetails.Title" in the **Display Column** drop-down list.

    Note: It is very important to understand the purpose of the fields, Display Column and Value.

    When the user selects an employee from the Lookup, the Employee name is displayed in the field, but the value that gets stored in the database would be the Employee Number.

    - If you select the **Auto** option in the Value field, the ID column is stored in the database.
    - If you select the **Custom** option in the Value field, you can select the column to be stored in the database as the value.
29. Select the "Custom" option in the **Value** field. A text box and a drop-down list will appear adjacent to the "Custom" option.
30. Click on the Text box and select "EmployeeDetails" from the tree menu.
31. Select "EmployeeDetails.EmployeeNumber" from the drop-down list.
32. Select "Yes" for **Display value column in grid** option.
33. Click **Save**. The **Employee** lookup is created and listed in the Lookup List.

    Note: This lookup can now be used in multiple forms. The following section explains, how the lookup will be used in a Form.

34. In the **Enterprise Console Menu**, click menu icon, and then click **Forms**. The **Forms** page appears.
35. Create a new form named "Employee Rating".
36. Drag and drop the **Lookup Input** control in the **Form Canvas**.
37. Edit the control properties, type the name as "Employee".
38. Click the **Data Source** button corresponding to the **Data Source** field. The **Look up list Explorer** dialog box appears.
39. Click the **Lookup List** text box.
40. Expand the tree menu and select "Employees".
41. Click **Submit**. The "Employee" lookup is selected in the **Look up list Explorer** dialog box appears.
42. Click **Save**. The **Forms Designer** window will be displayed with the "Employee" Lookup Input control.
43. Click the **Preview** button. The **Employee Rating** form is appears in the preview mode.
44. Click the **Search** button. A popup window of all active employees are displayed.
45. Select the employee "John" from the list and click **Select**. The name is populated in the form.
46. Click **Finish**. You can view the generated XML.

The following observations were made in a List lookup scenario where the List lookup is created on a List with child table as shown below.

1. Add countries and states to the list. Also, add a country without adding the respective state.
2. Create a list lookup for the above list with Display Column as "State" and Value Column as "StateId".
3. Consume this lookup in the form's lookup control.

In the lookup which has been rendered as Popup or drop-down, if the user selects a country without a State (child record), the pop up window is not getting closed(popup) or on submit the lookup value is being cleared off(drop-down).

Search or Sort within a Lookup Data

AVEVA Work Tasks has the provision to search or sort within a lookup data. Lookup controls provide the essential function of helping you maintain data integrity in your database environment.

Assume that, you have created a lookup called **PurchaseOrder**. See Create a Lookup for a Database Table and Create a Lookup for a List to know how to create a lookup.

In this scenario we will learn how to sort the lookup data in the ascending order of **ReferenceNo**. In the second part, we will see how to search for a purchase order for an item with ItemName that contains the term **DEL**. This can be achieved by setting the property accordingly while designing the form.

Note: To search or sort within a lookup data, you have to set the following property in the Lookup Input Property window.Select **Yes** for the **Display Filter** option or select **No** for the **Show as Drop down** option.

Having set the property to search or sort the lookup data while designing the form, now let us examine how it works:

To sort the lookup data in the ascending order of ReferenceNo

1. Preview your form.
2. Click the the **Search** button icon near the **PurchaseOrder ReferenceNo** field. All the items in the Purchase Orders list are displayed in the grid form.
3. Click the **ReferenceNo** column heading to sort the lookup data in the ascending order of ReferenceNo.

To search for a purchase order for an item with ItemName that contains the term DEL

1. Click the **Filter** button on the **Item Name** column header to see all the filter options that are available for that column's cells displayed in the filter list.
2. Click **Contains**.
3. Click the text box and type the parameter as **DEL**.
4. Again click the **Filter** button on the **Item Name** column header and select the **Apply All Filters** option. The results of the filtering are displayed.

Add an Item from Lookup Control

AVEVA Work Tasks has the provision to add a new item for the source list from Lookup control. To achieve this, the **Show add new item option for lookup** property of the **LookupInput** control should be set to **Yes**.

The user can add new items for the source list means the list for which the lookup is created using **Add new item** button.

Note: The user who fills the form must have "Can Create Item" right for that list (Source list). Apart from the preview form, in all other forms this option is available if this property is configured as "Yes". By default, this property will be set to "No". This option will be available only if the source list is a dynamic list.

The above feature is explained through a **Vendors list**(Source list) and **Purchase Receiving list**(Destination list) scenario form. The 'Vendors' list has all the vendors and created a lookup for the vendor list. This lookup is used in 'Purchase Receiving' list to get the vendor information. Suppose if the vendor is not there in vendors list, then you can add a new vendor to the 'Vendors' list which will be used in the 'Purchase Receiving' list using this feature.

Before starting with the scenario, create **Vendor list** and **Purchase Receiving list** and map custom tables

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

of **Vendor list** and **Purchase Receiving list**.

For 'Vendors' Lookup Input Control , set **Show add new item option for lookup** property to **Yes**.

To add a new item from Lookup:

1. Select **Purchase Receiving** list from the Enterprise Console. The 'Purchase Receiving' page is displayed.
2. Click on the **New** icon. The **Purchase Receiving** form is displayed.
3. Click on **Vendor** lookup.
4. The **Vendor** lookup dialog box appears. Search for a required user, if not found, add a new vendor using **Add new item**.
5. Click **Add new item** to add a new vendor in the 'Vendors' list. The 'Vendors' list is displayed. Add the required information.
6. Click **Submit**. The newly added vendor is displayed in the 'Purchase Receiving' list.
7. Click on **Vendor** lookup control. The newly added item appears

Use ExtendedInformation Property for List Lookups

This scenario demonstrates the use of "ExtendedInformation" property for List Lookups to populate the employee details.

Scenario

In this scenario, the administrator wishes to see the employee details such as Employee ID, Email, Phone, Mobile, Department and Gender on selection of the employee's name.

Steps to achieve the scenario

1. Create a List lookup **EmployeeListLookup** through **Lookup Settings**. For more details on creating List Lookups, click here.
2. Create a **Employee Form** through **Enterprise Console -> Forms** which consumes the **EmployeeListLookup**.

   The highlighted **Select Employee** control is a Lookup Input control through which the **EmployeeListLookup** is being consumed by the form.
3. Set the **On Data Change** property under the **Advanced** tab for the **Select Employee** Lookup Input control. Add the following script to this property.

```
var extendedInformation = control.extendedInformation;
if(extendedInformation !== null || extendedInformation !== undefined)
{
control.findById("T1").value = extendedInformation["EmployeeId"];
control.findById("T2").value = extendedInformation["LastName"] + " " +
extendedInformation["FirstName"];
control.findById("T3").value = extendedInformation["Phone"];
control.findById("T4").value = extendedInformation["Mobile"];
control.findById("T5").value = extendedInformation["Email"];
control.findById("T6").value = extendedInformation["Department"];
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
control.findById("T7").value = extendedInformation["Gender"];
}
```

4. Click **Save** to save the changes to the properties. Preview the form.
5. Select the required employee from the list of employees.

Use ExtendedInformation Property for Database Lookups

This scenario demonstrates the use of "**ExtendedInformation**" property for Database Lookups to populate the employee details.

Scenario

In this scenario, the administrator wishes to see the employee details such as **Employee ID**, **Email**, **Phone**, **Mobile**, **Department** and **Gender** on selection of the employee's name. Following is a snapshot of the employee details of the organization.

	EmployeeId	FirstName	LastName	Email	Phone	Mobile	DepartmentName	Gender
▶	1	Guy	Gilbert	guy1@ad.com	123456	1234567890	Production	M
	2	Kevin	Brown	kevin@ad.com	234567	2345678901	Marketing	M
	3	Roberto	Tamburello	rob1@a.com	345678	3456789012	Engineering	M
	4	Jolynn	Dobney	jou@ad.com	456789	4567890123	Production	F
	5	Ruth	Ellerbrock	ruth@ad.com	567890	5678901234	Production	F
	6	Gail	Erickson	gail@ad.com	678901	6789012345	Engineering	F

Steps to achieve the scenario

1. Create a Database lookup **EmployeeDBLookup** through **Lookup Settings**.
2. Create a Form **Employee Form** through **Forms** page which consumes the **EmployeeListLookup**.

   The **Select Employee** control is a Lookup Input control through which the **EmployeeDBLookup** is being consumed by the form.
3. Set the **On Data Changed Script** property under the **Advanced** tab for the **Select Employee** Lookup Input control. Add the following script to this property.

```
var extendedInformation = control.extendedInformation;
if(extendedInformation !== null || extendedInformation !== undefined)
{
control.findById("T1").value = extendedInformation["EmployeeId"];
control.findById("T2").value = extendedInformation["LastName"] + " " +
extendedInformation["FirstName"];
control.findById("T3").value = extendedInformation["Phone"];
control.findById("T4").value = extendedInformation["Mobile"];
control.findById("T5").value = extendedInformation["Email"];
control.findById("T6").value = extendedInformation["Department"];
control.findById("T7").value = extendedInformation["Gender"];
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

}

4. Click Save to save the changes to the properties. Preview the form.
5. Select the required employee from the list of employees.

Use Aliases, Joins, Aggregate Functions in Database Lookup Query

The database lookup query supports the use of aliases, joins and aggregate functions etc. through the use of views. Following is a scenario to demonstrate the use of views to handle aliases, joins and aggregate functions.

Scenario

The administrator wishes to see the list of all the departments in the organization and also the number of employees in each department. Following is a snapshot of the Employee details and Department details of the organization.

Employee

	EmployeeKey	FirstName	LastName	MiddleName	DepartmentName
1	43	Peng	Wu	J	Quality Assurance
2	79	Sean	Alexander	P	Quality Assurance
3	81	Diane	Margheim	L	Research and Development
4	114	Mark	Harrington	L	Quality Assurance
5	117	Gigi	Matthew	N	Research and Development
6	149	Andreas	Berglund	T	Quality Assurance
7	162	Dylan	Miller	A	Research and Development
8	204	Hazem	Abolrous	E	Quality Assurance
9	221	Michael	Raheem	NULL	Research and Development
10	257	Sootha	Charncherngkha	T	Quality Assurance

Department

	DepartmentGroupKey	DepartmentGroupName
1	1	Corporate
2	2	Executive General and Administration
3	3	Inventory Management
4	4	Manufacturing
5	5	Quality Assurance
6	6	Research and Development
7	7	Sales and Marketing

Achieving this scenario requires the use of joins, aliases and aggregate functions in the query as shown below:

```
SELECT DepartmentGroupKey AS DepartmentId,
DepartmentGroupName AS DepartmentName, COUNT(EmployeeKey) AS [Number of Employees]
FROM DimDepartmentGroup INNER JOIN DimEmployee
ON DepartmentName=DepartmentGroupName
GROUP BY DepartmentGroupKey,DepartmentGroupName;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to achieve the scenario

Joins and aliases are supported in the database lookup query through the use of views. Follow the steps give below to achieve the above scenario:

1. Create a view in the database, say **DepartmentEmpCount** as shown below:

```
CREATE VIEW DepartmentEmpCount
AS
SELECT DepartmentGroupKey AS DepartmentId,
DepartmentGroupName AS DepartmentName, COUNT(EmployeeKey) AS [NumberOfEmployees]
FROM DimDepartmentGroup INNER JOIN DimEmployee
ON DepartmentName=DepartmentGroupName
GROUP BY DepartmentGroupKey,DepartmentGroupName;
```

2. Create a database lookup, **DeptEmployeeCount** as shown below. Enter the query in the Query field as "**Select * From DepartmentEmpCount**", where DepartmentEmpCount is the view name.
3. Click **Validate & Preview**. The count of employees for each department is displayed.

Use CASE Expression in the Database Lookup Query

The database lookup query supports the use of CASE expression. The following scenario demonstrates the use of CASE expression in the database lookup query.

Scenario

Consider a work order - job scenario where the supervisor wants to identify all the "**Blending**" and "**Pre-mixing**" jobs with the job quantity rejected greater than 5.

JOB table schema

Column Names
wo_id
oper_id
seq_no
job_desc
state_cd
job_priority
item_id
qty_rejected

Follow the steps given below to achieve this scenario.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to achieve the scenario

1. Create a database lookup, say JobQtyRejectedLookup.

   A CASE expression is added to the query to achieve this scenario. The query is as follows:

   ```
   Select wo_id,oper_id,seq_no,job_desc,item_id,qty_rejected,
   Case
   When job_desc='Blending' and qty_rejected>5 then 1
   When job_desc='Pre-mixing' and qty_rejected>5 then 2
   Else 3
   End as Job_Qty_Rejected
   from job
   ```

   Note: Ensure that the columns being used in the CASE expression are a part of the SELECT clause. For example, in the above query job_desc and qty_rejected are a part of the SELECT clause. The column Job_Qty_Rejected cannot be used as a part of display column or a value column.

2. Click **Validate & Preview**. The column Job_Qty_Rejected is displayed which helps the user to identify the **Blending and Pre-mixing jobs with quantity rejected greater than 5**.

List Scenarios

This section explains some of the scenarios on using the List features:

- Create a Leave Application List
- Create a List Mapped to Multiple Tables
- Modify the Default List Form
- Sort List Data
- Export List Item Data to an Excel Sheet
- Enable Versioning for List Item
- Sort List items using DisplaySortOrder Property
- Set Custom View for a List Control from a Custom ASPX Page using API

Create a Leave Application List

AVEVA Work Tasks allows you to create a list and store the data inside the list. You have the provision to map your list to a single table or multiple tables and also to map to an existing table or a generic table which is provided by AVEVA Work Tasks.

In this scenario, you will create a typical Leave Application list and map to a generic table. Our sample leave application list will have the following fields.

- Employee Name
- Employee No: A unique number that identifies the Employee
- Absence Type: The type of absence (whether Sick Leave, Casual Leave, or Privileged Leave)
- Starting date of leave

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Ending date of leave
- And whether the leave is for a complete day or half a day

You will design a leave application list with the above mentioned fields. This can be created and designed from the Manage List page.

To create the Application List

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. On the **Ribbon Bar**, click **New**. The **Create List** window is displayed.
3. Enter the **Title** as **Leave Application**.
4. Enter the description to identify your list.
5. Select **Yes** for **Is Folder Supported?** option to make your list folder supported. Then, you can organize your list in folders.

   Note: If the **Title** field is removed from the base List, Folder is not supported for the list.
6. Click **Save** and Continue. The **Select Table** window is displayed.
7. In this case, you will map your list to the Generic table which is provided by AVEVA Work Tasks. So select Generic Table option, which is selected by default.
8. Click **Next**. The **List Designer** page is displayed.
9. The **Title** field is displayed automatically. The first field in your sample list is **Name of Employee**. So drag and drop a **TextInput** control in to the orange bar in the list name area, from the **Tool Box**. The property window of the **TextInput Control Property** window is displayed.

Field	Description
Tag name	Enter a tag name as **Name of Employee**.
Description	Enter the description for the control. This is not mandatory.
Mapped XML Node	Click anywhere after entering the tag name. The Mapped XML Node field is filled automatically.
Bound to DB Column	This field specifies to which database column you want to map this field.
Mandatory	Select **Yes** radio button to make this field mandatory.
Allow Sorting	Selecting **Yes** will enable sorting by this field.

10. Enter the details and then click **Save**.

    Note: Since, you are in a beginning stage; you will not go in to the settings like, Appearance, Validation, Advanced and Scripts.
11. Next, you need to design the **Employee Number** field. Drag and drop **TextInput** control in to the orange bar in the list name area from the **Tool Box**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Tag name	Enter a tag name as **Employee No**.
Description	Enter the description for the control. This is not mandatory.
Mapped XML Node	Click anywhere after entering the tag name. The Mapped XML Node field is filled automatically.
Bound to DB Column	Specifies to which database column you want to map this field.
Mandatory	Select **Yes** radio button to make this field mandatory.
Allow Sorting	Selecting **Yes** will enable sorting by this field.

12. Enter the details as explained in the field description table, then click **Save**.
13. Next field in your leave form is **Absence Type (Leave Type).** You need to include the options like **Casual Leave**, **Sick Leave** and **Privileged Leave**. Here, we do not have a drop-down control. So select any control and name it as Leave Type. Later when designing the form for the list, you can replace this control with a Dropdown control. In this case you will drag and drop a TextInput control. The **TextInput Control property** window is displayed.
14. Enter the **Tag name** as **Leave Type** and enter the description for the control. This is not mandatory.
15. Click anywhere after entering the tag name. The **Mapped XML Node** field is filled automatically.
16. Select **Yes** radio button to make this field mandatory.
17. After entering all the necessary details, click **Save**.
18. An applicant should mention the leave duration in his/her leave application form. For that there should be the leave starting date and ending date fields in the list. So, next, you will create leave starting date field. For that drag and drop **DateInput** in to the orange bar in the list name area from the **Tool Box** options. The **Date Input Properties** window is displayed.

Field	Description
Tag name	Enter a tag name as **Leave Start Date**.
Description	Enter the description for the control. This field is not mandatory.
Mapped XML Node	Click anywhere after entering the tag name. The Mapped XML Node field is filled automatically.
Bound to DB Column	Specify to which database column you want to map this field. This field is not mandatory. Type **LeaveStartDate**.
Mandatory	Select **Yes** radio button to make this field mandatory.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Allow Sorting	Selecting **Yes** will enable sorting by this field.

19. After entering all the required information as mentioned in the field description, click **Save**.
20. Next, you will design an end date for the leave. For that drag and drop the **DateInput** control in to the orange bar in the list name area. The **Date Input Properties** window is displayed.

Field	Description
Tag name	Enter a tag name as **Leave End Date**.
Description	Enter the description for the control. This field is not mandatory.
Mapped XML Node	Click anywhere after entering the tag name. The Mapped XML Node field is filled automatically.
Bound to DB Column	Specify to which database column you want to map this field. This field is not mandatory. Type **LeaveEndDate**.
Mandatory	Select **Yes** radio button to make this field mandatory.
Allow Sorting	Selecting **Yes** will enable sorting by this field.

21. After entering all the needed information as mentioned in the field description, click **Save**.
22. Next, you need to design a field to mention whether the leave is for a complete day or a half day. For that drag and drop **BooleanInput** control in to the orange bar in the list area. The **Boolean Input Property** window is displayed.

Field	Description
Tag name	Enter a tag name as **Half day?.**
Description	Enter the description for the control. This field is not mandatory.
Mapped XML Node	Click anywhere after entering the tag name. The Mapped XML Node field is filled automatically. You need to delete the '?' mark from the node as XML Node should not have any space or special characters.
Bound to DB Column	Specify to which database column you want to map this field. This field is not mandatory. Type **Halfday**.
Mandatory	Select **Yes** radio button to make this field mandatory.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Allow Sorting	Selecting **Yes** will enable sorting by this field.

23. Enter the essential data in the respective fields as explained in the field description table. Then click **Save**.
24. Now, you have designed all the fields required for your leave application. Click **Submit** to save the list.
25. A form for your list is auto generated. Click **Yes** if you want to edit the auto generated list form. Clicking **No** will take you to the List Manage page, There you can see the Leave Application list.

    Note: When you submit a list, a form is automatically created for the list. You can customize the control properties or modify the properties in the forms designer page.
26. Next, you will see how to create items for the Leave Application list that you have created now.

To create Leave Application list items

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. When you click **Leave Application**, the corresponding list item window is displayed.
3. Since, this list is just created now, you will not find any items. You will notice that the column headings are same of your Leave Application list. On the Ribbon bar, click **New** to create new item. The **New List Item** window is displayed.
4. Enter the details. Ensure that all the mandatory fields are entered correctly.
5. After entering all the mandatory fields, click **Submit**.

Now, you can see that a Leave Application list item is added. In the same way, you can create any number of list items for any list that you have created.

Create a List Mapped to Multiple Tables

AVEVA Work Tasks allows you to create a list and to map your list to multiple tables. You can select an existing table or a generic table which is provided by AVEVA Work Tasks to map the table.

In this scenario, you will create a **Purchase Order** list and map to multiple tables. You will map to custom tables **Purchase Order** and **Purchase Order Details** which are created in your database server. Our sample **Purchase Orders** list will have the following fields.

- Reference Number
- Purchase Order Date
- Raised By User
- Deliver To User
- Status
- Purchase Order Details
  - Item Name
  - Quantity
  - Unit Price

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Item Total
- Total Amount

Note: Both the parent and child should have the standard columns apart from those listed above.

You will design a **Purchase Orders** list with the above mentioned fields. This can be created and designed from the **Manage List** page.

Before starting with the scenario, you need to create **Purchase Order** and **Purchase Order Details** tables in your database.

To create a list mapped to multiple tables

1. Login to your SQL Server Database.
2. Copy the script mentioned below to your server and execute the script.

```
USE [FormsScenarioDB]
GO
/****** Object: Table [dbo].[PurchaseOrder] Script Date: 12/01/2008 18:50:42 ******/
SETANSI_NULLSON
GO
SETQUOTED_IDENTIFIERON
GO
SETANSI_PADDINGON
GO
CREATE TABLE [dbo].[PurchaseOrder](
[Id] [uniqueidentifier] NOT NULL CONSTRAINT [DF__PurchaseOrder__Id__1E6F845E] DEFAULT
(newid()),
[Title] [nvarchar](250) NOT NULL,
[Application] [nvarchar](150) NULL,
[CreatedBy] [uniqueidentifier] NULL,
[CreatedDateTime] [datetime] NULL,
[LastUpdatedDateTime] [datetime] NOT NULL,
[WIP] [bit] NULL,
[WIPItemId] [uniqueidentifier] NULL,
[MainItemId] [uniqueidentifier] NULL,
[ParentItemId] [uniqueidentifier] NULL,
[RecordParentItemId] [uniqueidentifier] NULL,
[TableId] [uniqueidentifier] NULL,
[ItemRowIndex] [int] NULL,
[IsLatest] [bit] NULL,
[Version] [nvarchar](25) NULL,
[VersionHistory] [nvarchar](max) NULL,
[Status] [int] NULL,
[LockedBy] [uniqueidentifier] NULL,
[LockedOn] [datetime] NULL,
[ListID] [uniqueidentifier] NULL,
[SecuritySettings] [nvarchar](max) NULL,
[ItemId] [uniqueidentifier] NULL,
[ItemType] [int] NULL,
[SecurityItemId] [uniqueidentifier] NULL,
[Owner] [uniqueidentifier] NULL,
[ModifiedBy] [uniqueidentifier] NULL,
[AuditTrail] [nvarchar](max) NULL CONSTRAINT [DF_PurchaseOrder_AuditTrail] DEFAULT
(''),
[IsDisabled] [bit] NULL CONSTRAINT [DF_PurchaseOrder_IsDisabled] DEFAULT ((0)),
[WorkflowStatus] [varchar](50) NULL,
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
[SecurityCustomizationId] [uniqueidentifier] NULL,
[ReferenceNo] [nvarchar](50) NULL,
[PurchaseOrderDate] [datetime] NULL,
[RaisedBy] [nvarchar](50) NULL,
[DeliverTo] [nvarchar](50) NULL,
[TotalAmount] decimal(12,2) NULL,
CONSTRAINT [PK_PurchaseOrder] PRIMARY KEY NONCLUSTERED
(
[Id] ASC
)WITH (PAD_INDEX = OFF, STATISTICS_NORECOMPUTE = OFF, IGNORE_DUP_KEY = OFF,
ALLOW_ROW_LOCKS = ON, ALLOW_PAGE_LOCKS = ON) ON [PRIMARY]
) ON [PRIMARY] TEXTIMAGE_ON [PRIMARY]
GO
Insert into SKListTables (Application,TableName)
Values ('FormsScenarioRepo','PurchaseOrder')
/***** Note: You need to replace the repository name ‘FormsScenarioRepo’ with your
repository name. Also replace the database ‘FormsScenarioDB’ with your
database name *******/
Go
```

To create purchase order details:

- Copy the script given below to your database server and execute it.

```
USE [FormsScenarioDB]
GO
/****** Object: Table [dbo].[PurchaseOrderDetails] Script Date: 12/01/2008 18:49:10
******/
SETANSI_NULLSON
GO
SETQUOTED_IDENTIFIERON
GO
SETANSI_PADDINGON
GO
CREATE TABLE [dbo].[PurchaseOrderDetails](
[Id] [uniqueidentifier] NOT NULL CONSTRAINT [DF__PurchaseOrderDetails__Id__1E6F845E]
DEFAULT (newid()),
[Title] [nvarchar](250) NOT NULL,
[Application] [nvarchar](150) NULL,
[CreatedBy] [uniqueidentifier] NULL,

[AuditTrail] [nvarchar](max) NULL CONSTRAINT [DF_PurchaseOrderDetails_AuditTrail]
DEFAULT (''),
[IsDisabled] [bit] NULL CONSTRAINT [DF_PurchaseOrderDetails_IsDisabled] DEFAULT ((0)),
[WorkflowStatus] [varchar](50) NULL,
[SecurityCustomizationId] [uniqueidentifier] NULL,
[ItemName] [nvarchar](50) NULL,
[Quatitiy] decimal(12,2) NULL,
[UnitPrice] decimal(12,2) NULL,
[ItemTotal] decimal(12,2) NULL,
CONSTRAINT [PK_PurchaseOrderDetails] PRIMARY KEY NONCLUSTERED
(
[Id] ASC
)WITH (PAD_INDEX = OFF, STATISTICS_NORECOMPUTE = OFF, IGNORE_DUP_KEY = OFF,
ALLOW_ROW_LOCKS = ON, ALLOW_PAGE_LOCKS = ON) ON [PRIMARY]
) ON [PRIMARY] TEXTIMAGE_ON [PRIMARY]
GO
Insert into SKListTables (Application,TableName)
Values ('< FormsScenarioRepo>','PurchaseOrderDetails')
/***** Note: You need to replace the repository name ‘FormsScenarioRepo’ with your
repository name. Also replace the database ‘FormsScenarioDB’ with your
database name *******/
Go
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To create the Purchase Order:

1. On the **Ribbon** bar, click **New**. The **Create List** window is displayed.
2. Enter the **Title** as **Purchase Orders**.
3. Enter any description to identify your list.
4. Select **Yes** for **Is Folder Supported?** option to make your list folder supported. Then you can organize your list in folders.

   Note: If the **Title** field is removed from the base List, Folder is not supported for the list.
5. Click **Save and Continue**. The **Select Table** window is displayed.
6. In this case, you will map your list to the custom table. So select **Existing Table** option. When you select this option, the **Select Table** field is displayed.
7. Click the **Refresh** button. The tables that you have created in your database server are displayed in the **Select Table** field.
8. Select **Purchase Orders** table from the list and then click **Next**. The **List Designer** page appears.

   All the fields that you have created in your database are displayed in the list. Now you want to add one child item i.e. **Purchase Order Details** to the list. Assume that you want to add the grid just before the **Total Purchase Amount** field.
9. Drag and drop **List Table** from the **Tool Box** to the green area of the **Total Amount** field. The **Select Table** window is displayed.
10. Select **Existing Table** option to map your child table to the custom table.
11. Click the **Refresh** button. The tables that you have created in your database server are displayed in the **Select Table** field.
12. Select **Purchase Order Details** table from the list and then click Next. The **ListTableForm** property window is displayed.
13. Enter the **Tag name** as **Purchase Order Details**.
14. Click **Save**.
15. Now, you have designed all the fields required for your **Purchase Order** list. In this case you have two lists -parent list and child list- and both are mapped to different tables. Click **Submit** to save the list.
16. A form for your list is auto generated. Select **Yes**, if you want to edit the auto generated list form. Selecting **No** will take you to the **Manage List** page, There you can see the **Purchase Order** list.

    Note: When you submit a list, a form is automatically created for the list. You can customize the control properties or modify the properties in the forms designer page.

    Through **Forms Designer** the child table can be replaced with **Grid**. Refer to the scenario Modify the Default List Form.

    Next, you will create **Purchase Order** list items.

To create Purchase Order list items

1. In the **Enterprise Console**, click ☰ menu icon, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Click **Purchase Order**. The corresponding list item window is displayed.

   Since, this list is just created now, you will not find any items. You will notice that the column headings are

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

same of your **Purchase Order** list. On the **Ribbon** bar, click **New** to create a new item. The **New List Item** window is displayed.

3. Enter the details. Ensure that all the mandatory fields are entered correctly.
4. After entering all the mandatory fields, click **Submit**.

Now, you can see that a **Purchase Order** list item is added. In the same way, you can create any number of list items for any list that you have created.

Modify the Default List Form

AVEVA Work Tasks allows its end users to modify the default list forms using **Edit** option. When you submit a list, a form is automatically generated for that list and it will be saved in the **Forms** page. You can find the generated form inside the **Dynamic List Forms** folder in the Forms page.

In List Designer, you have very limited controls and that are not sufficient to design a sophisticated form. So you need to design a list with available controls. After creating a list a form is auto-generated for the list. This auto-generated form can be modified later.

In the previous scenario, you have created a Purchase Order list and a form was auto generated for the list. In this scenario, you will modify the Purchase Orders form to make it more functional.

The objective is to replace the control form with the grid and place all the child items in the grid.

To modify the default list form

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The Forms page appears.
2. In the **Dynamic List Forms**, you will see a form with the same name of the list i.e **Purchase Order**. Select that list and on the Ribbon bar click **Edit**. The **Forms Designer** page is displayed.

   Note: We are now replacing the Purchase Order Details form with grid.
3. Click the **Replace Control** button corresponding to the **Purchase Order Details** control. The **Replace Control** window is displayed.
4. Click the drop-down list and select Grid option.
5. Select **Yes** for the field, **Copy similar properties?** This is to maintain the same properties for the control.
6. Click **Replace**. The form control is replaced with the Grid control.
7. Click **Submit**.

   Note: Similarly you can replace List controls with Form controls like Radio Buttons, Lookup Input etc.

   If you have deleted any field by mistake, you can add the deleted field by dragging and dropping the appropriate control. But ensure to use the same XML node bound to the table of the deleted control.

   Assume that you have deleted the field **Purchase Order Date** from your **Purchase Order** list. But after deleting it, you have realized that you require the same field and you want to create the field.

To add the Purchase Order Date

1. Drag and drop the **Date Input** in to the orange bar of the form area. This will add the control at the end of the form. If you want to add the control in the previous location, drop the control in to the green bar of the control which was just after the **Purchase Order Date** in your previous form. The Date Input Property window is displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Enter the **Tag name** as **Purchase Order Date**.
3. Enter the same Mapped XML Node of the field in the form that you have deleted. Your XML node was **PuchaseOrderDate**. So enter this in the Mapped XML Node field.
4. Then click **Save**. The date field is added to the form.

Note: In this scenario, you have added the Date Input. If you wish, you can add DateTime input control also. Ensure that you have entered the same XML node of the deleted field.

Sort List Data

AVEVA Work Tasks allows you to sort the list items in the ascending order (A to Z) or in the descending order (Z-A), Oldest to Newest, Newest to Oldest, Smallest to Largest and Largest to Smallest orders depending on the nature of the field. If you have thousands of list items in your console, you can locate a particular record by sorting the list items.

Before we start with this scenario, create an **Employee Details** list with three list items, Employee ID, Employee Name and Employee Address using TextInput controls.

Our objective is to enable sorting for the Employee Name column.

To sort list data

1. Launch the **Employee Details** list in the List Designer.
2. Click the **Properties** button corresponding to the Employee Name control. The **Properties** dialog box appears.
3. Select **Yes** for the Allow Sorting option and click **Save**. The List Designer page is displayed.
4. Click **Submit**. The **Re-Generate Form** dialog box is displayed.
5. Select **No**, **do not regenerate the default form** and click **OK**. The Manage List page is displayed.
6. On the **Console Menu**, select **Lists** and click **Employee Details**.
7. Right click the **Employee Name** column header.
8. Apply the required sort type. For Example, if you select **Sort AtoZ**, the **Employee Names** will be displayed in the alphabetic order A to Z.

Note: The sorting order will vary depending on the field you have selected. If you select the **Employee ID** field, sorting order will be **Smallest to Largest** and **Largest to Smallest**.

In the above example, we have enabled sorting only for the list item **Employee Name**. When you click the column header of **Employee ID** or **Employee Address**, the sort option is disabled.

Export List Item Data to an Excel Sheet

AVEVA Work Tasks provides an option to export list item data as an Excel Sheet.

Before we start with this scenario, create an Employee Details list with three list items, Employee ID, Employee Name and Employee Address using TextInput controls.

Populate the **Employee Details** list with some valid data.

Our objective is to export the data entered to an MS Excel (.xls) format.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To export list item data to an excel sheet

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **Manage List**. The **Manage List** page appears
2. Click **Employee Details**. The Employee Details list items are displayed.
3. Click the **Export** button on the right bottom corner of the Status bar.
4. Select **Excel** option and click **Export now**. The **File Download** window is displayed.
5. Click **Save**. The **Save As** window is displayed.
6. Select the appropriate location, type the file name and click **Save**.

Enable Versioning for List Item

AVEVA Work Tasks allows its users to create different versions for a list item which is mapped to multiple tables (parent and child). The information in the parent table is considered as an identifier and is not versioned. All child table information is versioned.

In case of Employee Details, the parent table contains the parent items, Employee Name and Employee No. This list is not version enabled until a child list is added.

Versioning can be enabled for a child table with a single row of data and for a child table with multiple rows of data. In this scenario, first you will see how a child table with one record can be version enabled and the second scenario deals with a child table with multiple records.

Assume that you are creating an **Employee Details** list with the following table schema.

Table **Employee Details** with fields

- EmployeeName
- EmployeeNo

Table **Address** with fields

- CurrentAddress
- PermanentAddress

Also assume that, to map the list you have created two tables Employee Details and Address in your database.

If you have not created the tables in your database, use the script given below to create the Employee Details table.

To create an Employee Details table

1. Login to your **SQL Server**.
2. Copy the script given below to your server and execute.

```
USE [formsandlist]
GO
/****** Object: Table [dbo].[EmployeeDetails] Script Date: 12/15/2008 15:47:44 ******/
SET ANSI_NULLS ON
GO
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
SET QUOTED_IDENTIFIER ON
GO
SET ANSI_PADDING ON
GO
CREATE TABLE [dbo].[EmployeeDetails](
 [Id] [uniqueidentifier] NOT NULL CONSTRAINT [DF__EmployeeDetails__Id__1E6F845E] DEFAULT (newid()),
 [Title] [nvarchar](250) NOT NULL,
 [Application] [nvarchar](150) NULL,
 [CreatedBy] [uniqueidentifier] NULL,
 [CreatedDateTime] [datetime] NULL,
 [LastUpdatedDateTime] [datetime] NOT NULL,
 [WIP] [bit] NULL,
 [WIPItemId] [uniqueidentifier] NULL,
 [MainItemId] [uniqueidentifier] NULL,
 [ParentItemId] [uniqueidentifier] NULL,
 [RecordParentItemId] [uniqueidentifier] NULL,
 [TableId] [uniqueidentifier] NULL,
 [ItemRowIndex] [int] NULL,
 [IsLatest] [bit] NULL,
 [Version] [nvarchar](25) NULL,
 [VersionHistory] [nvarchar](max) NULL,
 [Status] [int] NULL,
 [LockedBy] [uniqueidentifier] NULL,
 [LockedOn] [datetime] NULL,
 [ListID] [uniqueidentifier] NULL,
 [SecuritySettings] [nvarchar](max) NULL,
 [ItemId] [uniqueidentifier] NULL,
 [ItemType] [int] NULL,
 [SecurityItemId] [uniqueidentifier] NULL,
 [Owner] [uniqueidentifier] NULL,
 [ModifiedBy] [uniqueidentifier] NULL,
 [AuditTrail] [nvarchar](max) NULL CONSTRAINT [DF_EmployeeDetails_AuditTrail] DEFAULT (''),
 [IsDisabled] [bit] NULL CONSTRAINT [DF_EmployeeDetails_IsDisabled] DEFAULT ((0)),
 [WorkflowStatus] [varchar](50) NULL,
 [SecurityCustomizationId] [uniqueidentifier] NULL,
 [EmployeeName] [nvarchar](50) NULL,
 [EmployeeNo] [nvarchar](50) NULL,
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 CONSTRAINT [PK_EmployeeDetails] PRIMARY KEY NONCLUSTERED
 (
 [Id] ASC
 )WITH (PAD_INDEX = OFF, STATISTICS_NORECOMPUTE = OFF, IGNORE_DUP_KEY = OFF,
ALLOW_ROW_LOCKS = ON, ALLOW_PAGE_LOCKS = ON) ON [PRIMARY]
 ) ON [PRIMARY] TEXTIMAGE_ON [PRIMARY]
 GO
 Insert into SKList Tables (Application,TableName)
 Values ('<SketlaListandForms>','EmployeeDetails')
 /***** Note: You need to replace the repository name ‘<SkeltaListandForms>’ with your
repository name. Also replace the database ‘formsandlist’ with
 your database name *******/
 Go
```

To create an Address table

- Copy the script given below to your database server and execute it.

```
USE [formsandlist]
GO
/****** Object: Table [dbo].[Address] Script Date: 12/15/2008 15:49:29 ******/
SET ANSI_NULLS ON
GO
SET QUOTED_IDENTIFIER ON
GO
SET ANSI_PADDING ON
GO
CREATE TABLE [dbo].[Address](
 [Id] [uniqueidentifier] NOT NULL CONSTRAINT [DF__Address__Id__1E6F845E] DEFAULT
(newid()),
 [Title] [nvarchar](250) NOT NULL,
 [Application] [nvarchar](150) NULL,
 [CreatedBy] [uniqueidentifier] NULL,
 [CreatedDateTime] [datetime] NULL,
 [LastUpdatedDateTime] [datetime] NOT NULL,
 [WIP] [bit] NULL,
 [WIPItemId] [uniqueidentifier] NULL,
 [MainItemId] [uniqueidentifier] NULL,
 [ParentItemId] [uniqueidentifier] NULL,
 [RecordParentItemId] [uniqueidentifier] NULL,
 [TableId] [uniqueidentifier] NULL,
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
[ItemRowIndex] [int] NULL,
[IsLatest] [bit] NULL,
[Version] [nvarchar](25) NULL,
[VersionHistory] [nvarchar](max) NULL,
[Status] [int] NULL,
[LockedBy] [uniqueidentifier] NULL,
[LockedOn] [datetime] NULL,
[ListID] [uniqueidentifier] NULL,
[SecuritySettings] [nvarchar](max) NULL,
[ItemId] [uniqueidentifier] NULL,
[ItemType] [int] NULL,
[SecurityItemId] [uniqueidentifier] NULL,
[Owner] [uniqueidentifier] NULL,
[ModifiedBy] [uniqueidentifier] NULL,
[AuditTrail] [nvarchar](max) NULL CONSTRAINT [DF_Address_AuditTrail] DEFAULT (''),
[IsDisabled] [bit] NULL CONSTRAINT [DF_Address_IsDisabled] DEFAULT ((0)),
[WorkflowStatus] [varchar](50) NULL,
[SecurityCustomizationId] [uniqueidentifier] NULL,
[CurrentAddress] [nvarchar](150) NULL,
[PermanentAddress] [nvarchar](150) NULL,
CONSTRAINT [PK_Address] PRIMARY KEY NONCLUSTERED
(
[Id] ASC
)WITH (PAD_INDEX = OFF, STATISTICS_NORECOMPUTE = OFF, IGNORE_DUP_KEY = OFF,
ALLOW_ROW_LOCKS = ON, ALLOW_PAGE_LOCKS = ON) ON [PRIMARY]
) ON [PRIMARY] TEXTIMAGE_ON [PRIMARY]
GO
Insert into SKListTables (Application,TableName)
Values ('SketlaListandForms','Address')
/***** Note: You need to replace the repository name ‘SkeltaListandForms’ with your
repository name. Also replace the database ‘formsandlist’ with
your database name *******/
Go
```

To create the Employee Details list

1. On the **Manage List** page, click **New**. The **Create List** window is displayed.
2. Enter the **Title** as **Employee Details**.
3. Enter any description to identify your list.
4. Select **Ye**s for **Is Folder Supported?** option to make your list folder supported so that you can organize your

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

list in folders.

Note: If the **Title** field is removed from the base List, the Folder is not supported for the list.

5. Click **Save and Continue**. The **Select Table** window is displayed.
6. In this case, you will map your list to the custom table. Hence, select the **Existing Table** option. Then, the **Select Table** field is displayed.
7. Select **EmployeeDetails** table from the list and then click **Next**. The **List Designer** page appears.

Note: All the fields that you have created in your database are displayed in the list. The parent items like **Title**, **EmployeeName** and **EmployeeNo** are displayed in the list.

8. Click **Submit**.
9. A form with the same name as that of the list is auto-generated when you submit the list. Select Yes if you want to regenerate the form, else select **No**. You can also edit the form using the **Edit** option from the **Forms** page.

This list data is not version enabled. Let us see how non-versioned data is managed in a list.

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Click **Employee Details**. The Employee Details items list is displayed.
3. Click **New** on the Ribbon bar to create a new list item for the **Employee Details** list.
4. Type the list item details as follows.

Field	**Data**
Title	Mr
EmployeeName	Alex
EmployeeNo	A00012

5. Click **Submit**. The list item is saved.
6. Select the list item and right click the mouse. Since the Employee Details list does not have a child list, it is not version enabled. So you cannot see the **Save As** context menu in the right click options.

Next, add one child table **Address** to the **Employee Details** list to make this list version enabled.

To add an Address list

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Select the **Employee Details** list and click **Edit** on the **Ribbon bar**. The **Create List** window is displayed.
3. You can edit the **Description** and Folder Supported option. The **Title** field will be disabled for editing. Click **Save & Continue**. The **Forms Designer** page is displayed with the **Employee Details** list.
4. Drag and drop the **List** table in to the orange bar of the list name area. The **Select Table** window is displayed.
5. Select the **Existing Table** option to map your child table to the custom table.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Select the **Address** table from the list and then click **Select**. The **Form Property** window is displayed.
7. Enter the **Tag name** as **Address**.**List Table**
8. Click **Save**.
9. Now, a child list table is also added to the Employee Details list and this data will be versioned.
10. Click **Submit**. The **Re-Generate Form** dialog box appears.
11. A form with the same name as that of the list is auto-generated when you submit the list. Select **Yes, regenerate the default form** and click **OK** if you want to regenerate the form, else select **No, do not regenerate the default form** option and click **OK**. Select **Yes** and regenerate the default form with the new fields (Current Address and Permanent Address).
12. Remove the **Title** Field from the **Address** child form. See Also Deleting a Control.
13. Next, disable the repeating property of the **Address** since a person will have only one current address and permanent address. For that, click the **Properties** button for the **Address** control. The **Address Properties** window is displayed.
14. Delete the **Mapped XML Node**.
15. Select **False** from the **Is repeating** drop-down list.
16. Click **Save**.
17. Click **Submit**.

Now, you can create list items for this and save it as a different version. To verify this:

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Click **Employee Details**. The Employee Details items page is displayed.
3. Click **New** on the Ribbon bar to create a new list item for the Employee Details list.
4. Type the list item details.

Field	**Data**
Title	Mr
EmployeeName	John
EmployeeNo	J012
CurrentAddress	21, HSR Layout, Bangalore
PermanentAddress	2nd Cross Rd, Powai, Mumbai

5. Click **Submit**. The list item is saved.
6. Then select the list item and right-click it to open the context menu. Since the Employee Details list is version enabled, you can see the **Save As** context menu in the right-click options. This menu will help you to create different versions for the list item.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To save an item as next major version:

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Select **Lists** and click **Employee Details**.

   Note: Our objective is to create a next major version for the item.
3. Right click the required item list.
4. Click **Next Major Version**. The **Save List Item** dialog box appears. You can specify your comments in the text box provided. Let us leave the field blank as it is not a mandatory field.
5. Click **Save New Version**. An information message appears.
6. Click **OK**. An information message appears.
7. Click **OK**.
8. Right-click the same item list and select **Show All Versions**.

   Note: In the same way, you can create Next Minor Version, Specific Version and Next version of the list item. If you make any changes in the main list i.e. Employee Details, this will reflect in all the versions. If you make changes in the Address items, that will not affect any other items or other versions.

Version enabling for a child table with multiple records

Next you will see how a child table with multiple records can be version enabled. For this purpose, add one repeating child item **Qualification** to the existing list.

The **Qualification** table has the following schema:

- Title
- University
- Year of Pass

Before starting with this scenario, create a table **Qualification** in your database.

To create a Qualification table

1. Login to your **SQL Server**.
2. Copy the following script to your server and execute it.

```
CREATE TABLE [dbo].[Qualification](
 [Id] [uniqueidentifier] NOT NULL CONSTRAINT [DF__Qualification__Id__1E6F845E] DEFAULT (newid()),
 [Title] [nvarchar](250) NOT NULL,
 [Application] [nvarchar](150) NULL,
 [CreatedBy] [uniqueidentifier] NULL,
 [CreatedDateTime] [datetime] NULL,
 [LastUpdatedDateTime] [datetime] NOT NULL,
 [WIP] [bit] NULL,
 [WIPItemId] [uniqueidentifier] NULL,
 [MainItemId] [uniqueidentifier] NULL,
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
 [ParentItemId] [uniqueidentifier] NULL,
 [RecordParentItemId] [uniqueidentifier] NULL,
 [TableId] [uniqueidentifier] NULL,
 [ItemRowIndex] [int] NULL,
 [IsLatest] [bit] NULL,
 [Version] [nvarchar](25) NULL,
 [VersionHistory] [nvarchar](max) NULL,
 [Status] [int] NULL,
 [LockedBy] [uniqueidentifier] NULL,
 [LockedOn] [datetime] NULL,
 [ListID] [uniqueidentifier] NULL,
 [SecuritySettings] [nvarchar](max) NULL,
 [ItemId] [uniqueidentifier] NULL,
 [ItemType] [int] NULL,
 [SecurityItemId] [uniqueidentifier] NULL,
 [Owner] [uniqueidentifier] NULL,
 [ModifiedBy] [uniqueidentifier] NULL,
 [AuditTrail] [nvarchar](max) NULL CONSTRAINT [DF_Qualification_AuditTrail] DEFAULT
('''),
 [IsDisabled] [bit] NULL CONSTRAINT [DF_Qualification_IsDisabled] DEFAULT ((0)),
 [WorkflowStatus] [varchar](50) NULL,
 [SecurityCustomizationId] [uniqueidentifier] NULL,
 [University] [nvarchar](50) NULL,
 [YearofPass] [int] NULL,
 CONSTRAINT [PK_Qualification] PRIMARY KEY NONCLUSTERED
 (
 [Id] ASC
 )WITH (PAD_INDEX = OFF, STATISTICS_NORECOMPUTE = OFF, IGNORE_DUP_KEY = OFF,
ALLOW_ROW_LOCKS = ON, ALLOW_PAGE_LOCKS = ON) ON [PRIMARY]
 ) ON [PRIMARY] TEXTIMAGE_ON [PRIMARY]
 GO
```

To add a Qualification child table to the Employee Details list

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Select the **Employee Details** list and click **Edit** on the **Ribbon** bar. The **Create List** window is displayed.
3. You can edit the **Description** and **Folder Supported** options. The **Title** field will be disabled for editing. Click **Save & Continue**. The **Forms Designer** page is displayed with the **Employee Details** list.
4. Drag and drop the **List Table** in to the orange bar of the list name area. The **Select Table** window is displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Select the **Existing Table** option to map your child table to the custom table.
6. Select the **Qualification** table from the list and then click **Select**. The **List TableForm Property** window is displayed.
7. Enter the **Tag** name as **Qualification**.
8. Click **Save**. The **List Designer** page appears. Now, a child list table is also added to the **Employee Details** list and this data will be versioned.
9. Click **Submit**. The **Re-Generate Form** dialog box appears.
10. A form with the same name as that of the list is auto-generated when you submit the list. Select **Yes, regenerate the default form** and click **OK** if you want to regenerate the form, else select **No**, **do not regenerate the default form** option and click **OK**. On regenerating the form, all the changes made to the form will be lost. So it is recommended that you do not select this option. You can also edit the form using the **Edit** option from the **Forms** page.

To edit the list form

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. Select the **Employee Details** form and click **Edit** on the Ribbon Bar.
3. Replace the **Qualification** Form with the **Grid** control.
4. Click **Save**.
5. Click **Submit**.

Now, you can create list items for this and save it as a different version. In this scenario, you will add multiple records in the **Qualification** grid and save it as different version. To verify this:

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **Manage List**. The **Manage List** page appears.
2. Click **Employee Details**. The **Employee Details** items page is displayed.
3. Click **New** on the Ribbon bar to create a new list item for the Employee Details list.
4. Type the list item details.

Field	**Data**
Title	Mr
EmployeeName	Alex
EmployeeNo	A00352
CurrentAddress	21, BTM Layout, Bangalore
PermanentAddress	706, Oxford, 21, Thane

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Data
Qualification 1	
Title	MCA
University	University of Bangalore
YearofPass	2002
Qualification 2	
Title	ME
University	University of Mumbai
YearofPass	2005

5. Click **Submit**. The list item is saved.
6. Select the list item and right-click the mouse. Since the **Employee Details** list is version enabled, you can see the **Save As** context menu in the right-click options. This menu will help you to create different versions for the list item.
7. Our objective is to create a next version for the item.
8. Click **Next Version**. The **Save List** Item dialog box appears. You can specify your comments in the text box provided. Let us leave the field blank as it is not a mandatory field.
9. Click **Save New Version**. An information message appears.
10. Click **OK**. An information message appears.
11. Click **OK**.
12. Right-click the same item list and select **Show All Versions**.

Note: In the same way, you can create Next Minor Version, Specific Version and Next version of the list item. If you make any changes in the main list i.e. Employee Details, this will reflect in all the versions. If you make changes in the Address items, that will not affect any other items or versions.

Sort List items using DisplaySortOrder Property

In a **Process Order** list, assume that there are columns like **OrderNo**, **Name**, **Description**, **Quantity**, **Price** and **Total**. By default, the user wants to display the list items in a sorted order whenever a list loads at first time.

Steps

1. Create a **Process Order** list as follows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Control	Name
TextInput	Title
IntegerInput	OrderNo
TextInput	Name
IntegerInput	Quantity
DecimalInput	Price
DecimalInput	Total

2. Add a few items in the Process Order list using **New** option.
3. Open Process Order list. Click **Edit** to set the **DefaultSortOrder** property.
4. Set the **DefaultSortOrder** property as **OrderNo**, **Name**, **Quantity**.
5. Click **Save** and then click **Submit**. The **Re-Generate Form** dialog box appears.
6. Select **Yes**, regenerate the default form and click **OK**.
7. The list items are displayed in a sorted order after the **Process Order** list is loaded.

Set Custom View for a List Control from a Custom ASPX Page using API

The following code demonstrates how to set a custom view for a List control from a custom ASPX page using API.

```
//Create a ViewItem
Skelta.Repository.List.ListDefinition listDefn = null;
Skelta.Repository.List.ListItemCollection _ListItems = null;
listDefn = ListDefinition.GetList(new Skelta.Core.ApplicationObject("repo1"),"Employee");
_ListItems = new Skelta.Repository.List.ListItemCollection(listDefn);
String _ ViewName = "myview";
Skelta.Repository.List.ListView.ListViewItem _ListViewItem = null;
_ListViewItem = Skelta.Repository.List.ListView.ListViewManager.GetListViewItem(listDefn,
"myview");
if (_ListViewItem != null)
{
ListViewManager _ViewManager = new
Skelta.Repository.List.ListView.ListViewManager(_ListViewItem);
_ListItems.IsTopLevelFormView = _ViewManager.IsTopLevelView;
List<string> filterColumns = new List<string>();
string _FilterQueryWithParam = string.Empty;
string _WFStatusParamQry = string.Empty;
bool _WFStatusFilter = false;
Workflow.NET.Config configObj = new Workflow.NET.Config(_ApplicationName);
IDataHandler dbHandler = DataHandlerFactory.GetDataHandler(configObj);
List<IDataParameter> _ViewFilterParamsCol =
_ViewManager.GetFilterParameterCollection(dbHandler, out _FilterQueryWithParam,out
_WFStatusFilter,out _WFStatusParamQry);
   if (_WFStatusFilter)
   {
_ListItems.WFStatusFilter = true;
_ListItems.WFStatusParamQry = _WFStatusParamQry;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
}
string viewCols;
_ViewManager.GetDisplayColumnsInfo(out viewCols);
string totalRows ="";
DataTable itemsDataTable = null;
if (_ViewManager.DisplayAllItems)
{
itemsDataTable = _ListItems.GetRecords(_UserId, Guid.Empty, "", "", "", out totalRows, _"",
_"", Fields.GridSpecific, Display.AllItems, viewCols, _FilterQueryWithParam,
_ViewFilterParamsCol);
}
else
itemsDataTable = _ListItems.GetRecords(_UserId, Guid.Empty, "", "", "", out totalRows,
_CustomQuery, _CustomQueryJoinClause, Fields.GridSpecific, Display.MainItems, viewCols,
_FilterQueryWithParam, _ViewFilterParamsCol);

}
```

Lists Integration

List integration is used to facilitate the import and export of data to and from the List.

Introduction

Microsoft SQL Server Integration Services (SSIS) is an extensive data integration platform that is used to transfer, transform, and merge information from various sources, and then load onto multiple systems.

Workflow Management List Data Exchange (SLDE) is built on the SSIS data flow component and is flexible to support various industry standard data sources. The SLDE components allow importing and exporting data into List, data store.

To make the List infrastructure flexible to load application data, an important capability is support for data import from and to various data sources. The SLDE components include List Source and List Destination for SSIS data flow, and Workflow Execution Task for SSIS control flow. List is also an Extraction, Transformation and Loading (ETL) tool.

Objective of this Guide

The objective of this guide is to provide information on using List Integration components with SSIS.

Audience for this Guide

This target audience for this guide is:

- An SSIS Package developer who is proficient in SSIS.
- SQL Server Experts.

Guide Conventions

The conventions used in this guide are as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Typographical Convention	Represents
Bold	A menu or a menu option.
Hyperlink	A hyperlink to a related topic.
All CAPS	Keys on the keyboard.
Type	Information you need to enter.
Note:	A note provides additional information about a certain topic.

Abbreviations and Acronyms

Acronym	Full Form
SSIS	SQL Server Integration Component
BIDS	Business Intelligence Development Studio
SSDT	SQL Server Data Tools

Note: Workflow Management List Data Exchange is available only on request and may take time to deliver based on the target environment.

Need for Lists Integration

List integration is used to facilitate the import and export of data to and from the List.

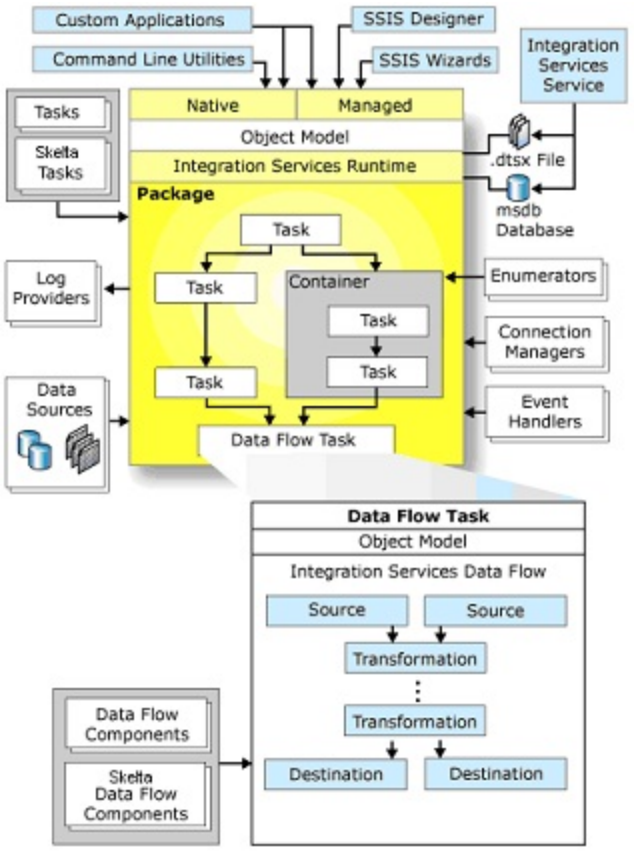
Need for Lists Integration Components

User data is usually scattered across flat files, CSV, and XL, to name a few. The List Integration components are needed to import data from various data sources and to export data to a different format.

About Lists Integration Components

List Source Data Flow and List Destination Data Flow are the two List Integration components. SSIS components are built on custom task and custom data flow component. As the SSIS components are built on SSIS, the architecture is the same as that of SSIS. The following chart shows the SSIS architecture:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Key Features and Benefits

Since List Source Data Flow and List Destination Data Flow are created for SSIS, all the feature and benefits provided by SSIS are available. These include the ability to:

- Handle multiple sources with different formats (flat file, CSV, etc.) for import and export of data.
- Handle Structured, semi-structured, and unstructured data.
- Huge data volumes.
- Change cryptic data into meaningful information when it is imported or exported.
- Load multiple destinations (flat file, CSV, etc.) at the same time.
- Ability to extract and transform data.

The key benefits of the List Integration components include the ability to:

- Import from many types of data
- Export to many types of data
- Merge data
- Support transactions

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Prerequisites

For prerequisites, refer to the Install Integration Services.

Note:
- Ensure SQL Server client is installed on the machine where the AVEVA Work Tasks client component is installed.
- Ensure the SQL Server Integration Services are running on the SQL Server. Refer to the configuration section for more details on configuring the component.
- While importing data, ensure:
-- the format of date/time fields is the same as in the SQL database.
-- null values are blank instead of “NULL”.
-- Boolean values are either “false” or “true” instead of “0” or “1” respectively.

Installation and Configuration

The installation steps include the following:

1. Copy the main assembly to the appropriate component folder under the 64-bit Program Files folder.
2. Install the appropriate assemblies in the global assembly cache (GAC).
3. Stop and restart the SSIS service (because it caches the list of installed components).
4. Restart SSDT, and BIDS or Visual Studio.
5. If necessary, make manual adjustments to the list of custom components in the Toolbox.

Note: If repository settings are not available in SSIS, then install Newtonsoft assemblies from the **<AVEVA Work Tasks Installation Path>\Bin** folder to the global assembly cache (GAC).

64-Bit Installation

SQL Server Client Components

1. Copy Skelta.SSIS.Pipeline.ListDestination.dll and Skelta.SSIS.Pipeline.ListSource.dll to **C:\Program Files\Microsoft SQL Server\<<SQL Server Version Number>>\DTS\PipelineComponents**.

   For <<SQL Server Version Number>> refer to File Locations for Default and Named Instances of SQL Server.
2. Register the DLL files to Assembly GAC. Refer to Install an Assembly into the Global Assembly Cache.

About Configuration

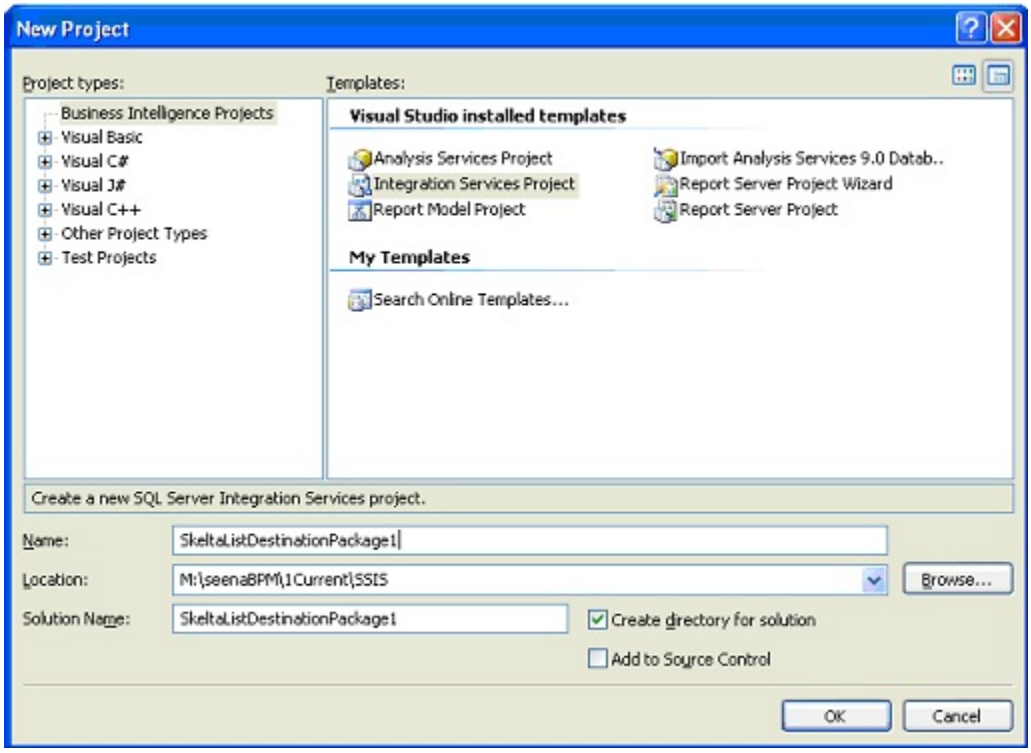
After completing the installation, you need to add the List Integration component to the Toolbox. Follow the steps given below:

1. Create a new SSIS project.
2. Drag and drop a Data Flow task.
3. Add the component to the Toolbox.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

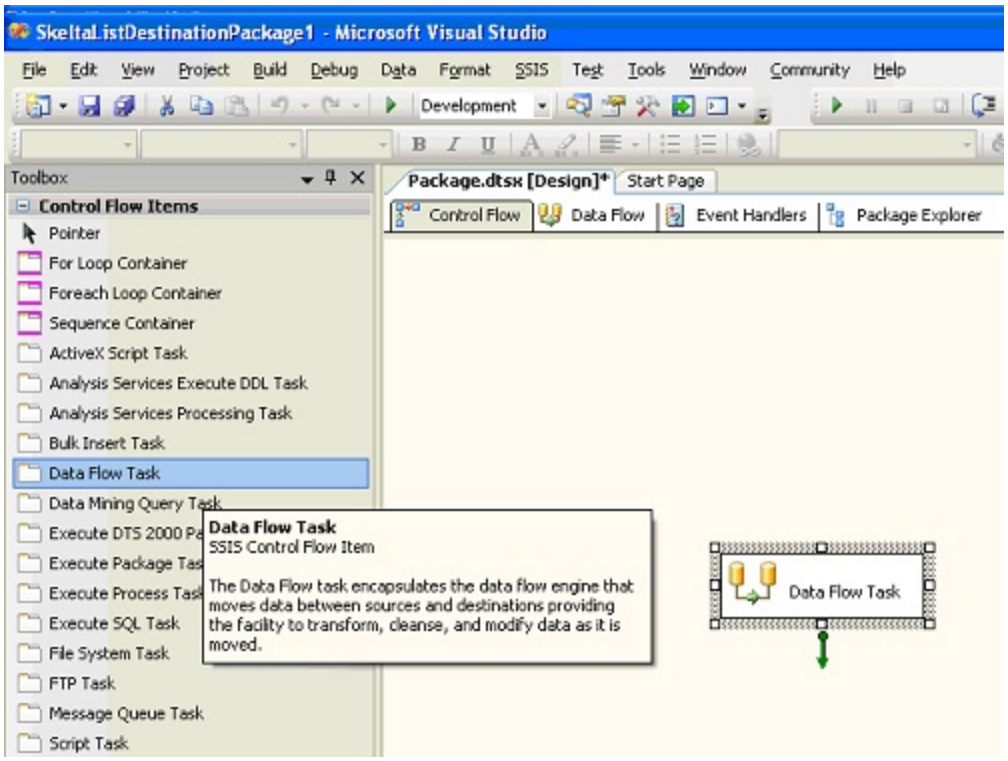
To configure List Destination component, perform the following steps:

1. Create a new SSIS project.
2. Start Visual Studio.
3. Click **File > New > Project > Business Intelligence Projects > Integration Service Project**.
4. Enter **Project Name**.
5. Click **OK** to create the project. A blank Control Flow is created.



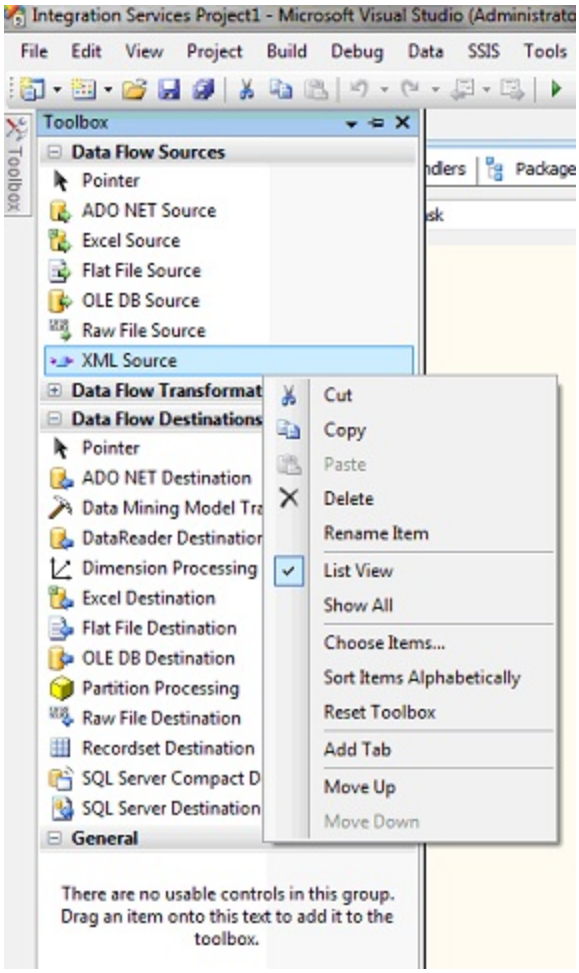
6. Drag and drop a Data Flow Task item into the Control Flow.
7. Double-click on the task to switch to the data flow view.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



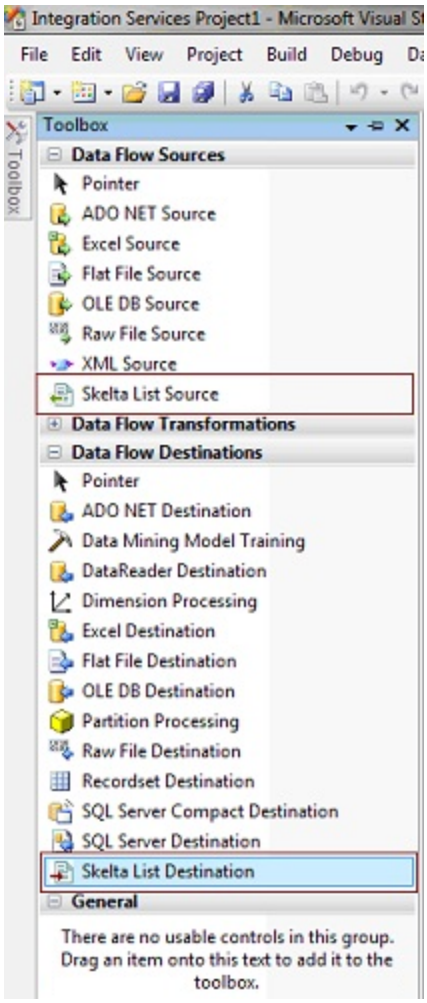
8. Go to the **Toolbox** of the Data Flow Sources and in the select **XML Source** drop-down list, check the **List View** option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



9. You can see the List Source under the Data Flow Sources and List Destination under Data Flow Destinations.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



List Source Data Flow

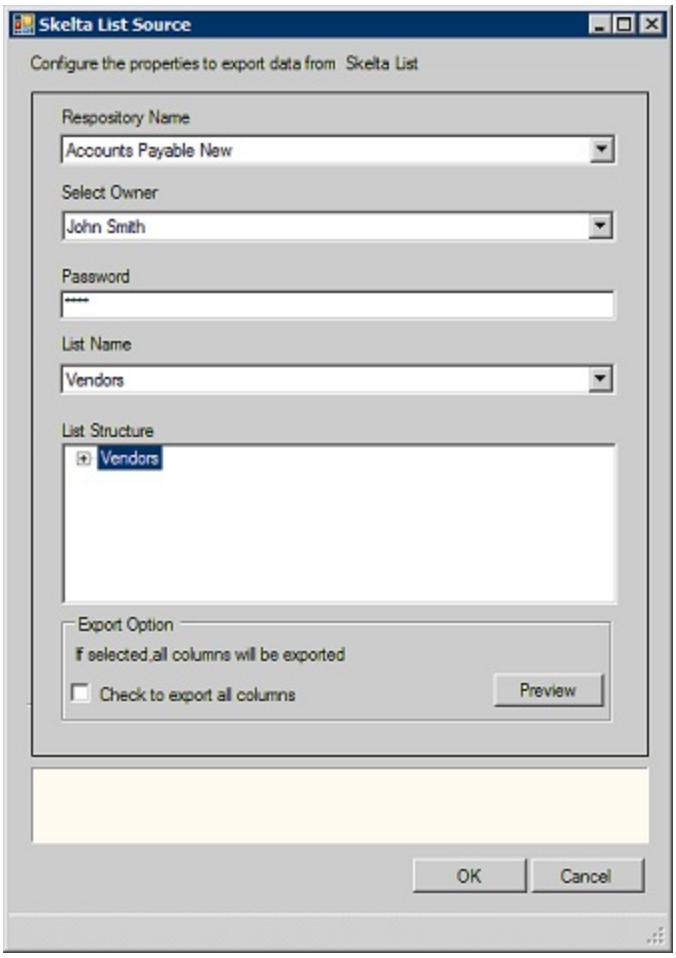
This section includes information about import/export of data from/to any SQL Server Integration Services (SSIS) supported data flow components:

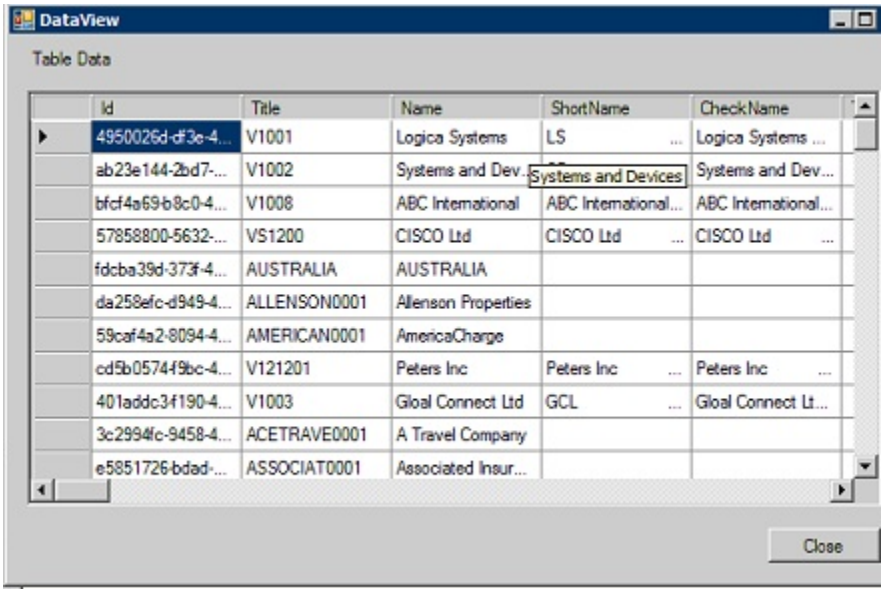
- About List Source Data Flow
- List Destination Data Flow

About List Source Data Flow

The List Source Data Flow feature is used to export data from List to any SSIS-supported destination. The List Source component is available in the list of Source dataflow components. You can select the list from which the data is to be exported. If the list is mapped to multiple tables, you can select the tables from which the data is to be exported.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.





Field	Description
Repository name	Select the repository name.
List Name	Select the **List Name** from which the data is to be

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

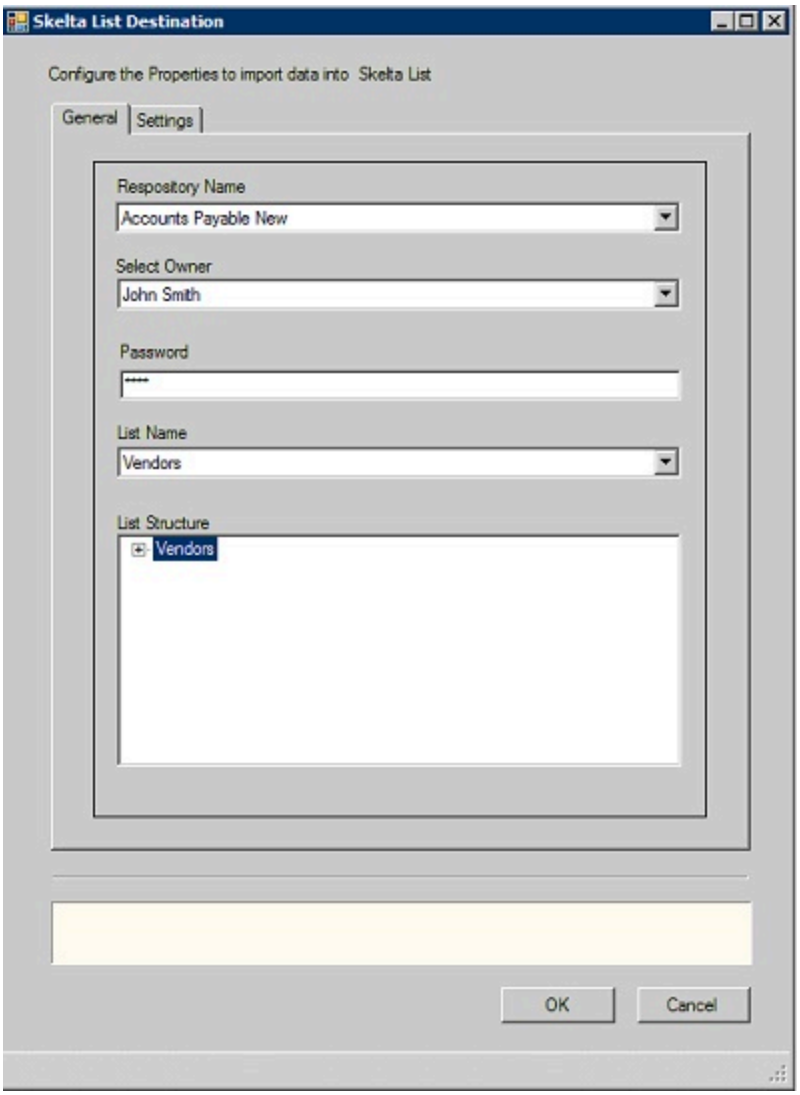
Field	Description
	exported.
List Structure	Select the **Table Name** from which the data is to be imported.
Preview	See the **Preview** of the selected table.
Export Option	Select the **Check** to export all columns if you want to export all the columns. If not, only the user-defined columns will be exported.
Select Owner	Select the **Owner** from the drop-down list.
Password	Key in the password.

List Destination Data Flow

You need to use the **List Destination Data** flow component to import data from any SSIS-supported data flow component. The List Destination component is available in the destination dataflow components. You can select the list to which the data is to be imported. If the list is mapped to multiple tables, you can select the tables to which the data is to be exported.

General Tab

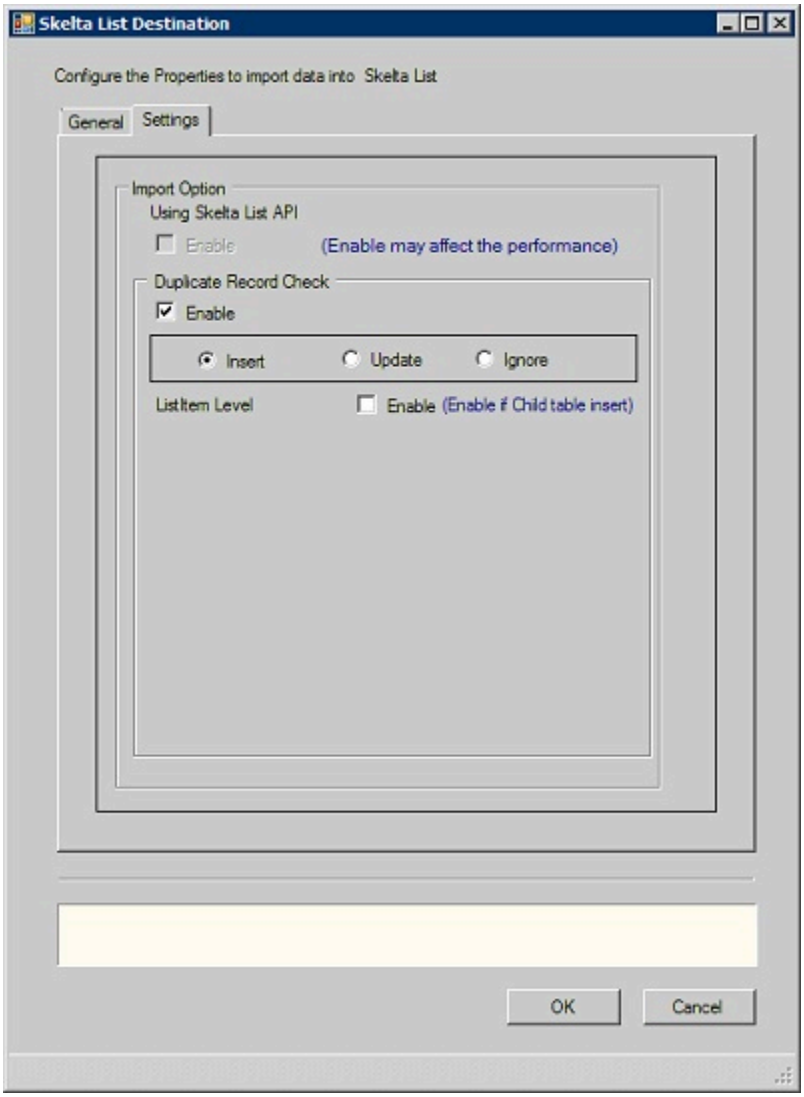
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Field	Description
Repository name	Select the repository name.
List Name	Select the **List Name** from which the data is to be imported.
List Structure	Select the **Table Name** from which the data is to be imported.
Select Owner	Select the owner from the drop-down list.
Password	Key-in the password.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Tab



Field		Description
Using List API	Enabled	Select this box for importing data using the List APIs. Using this option may affect the performance of the system.
Duplicate Check	Enable	Select this box to enable checking of duplicates.
	Insert	Select this radio button if you need to insert the item to the list even if it is a duplicate item.
	Update	Select this radio button if you need

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

		to update the item.
	Ignore	Select this radio button for checking duplicate records. If a duplicate record exists, it will be ignored.

Import and Export Data

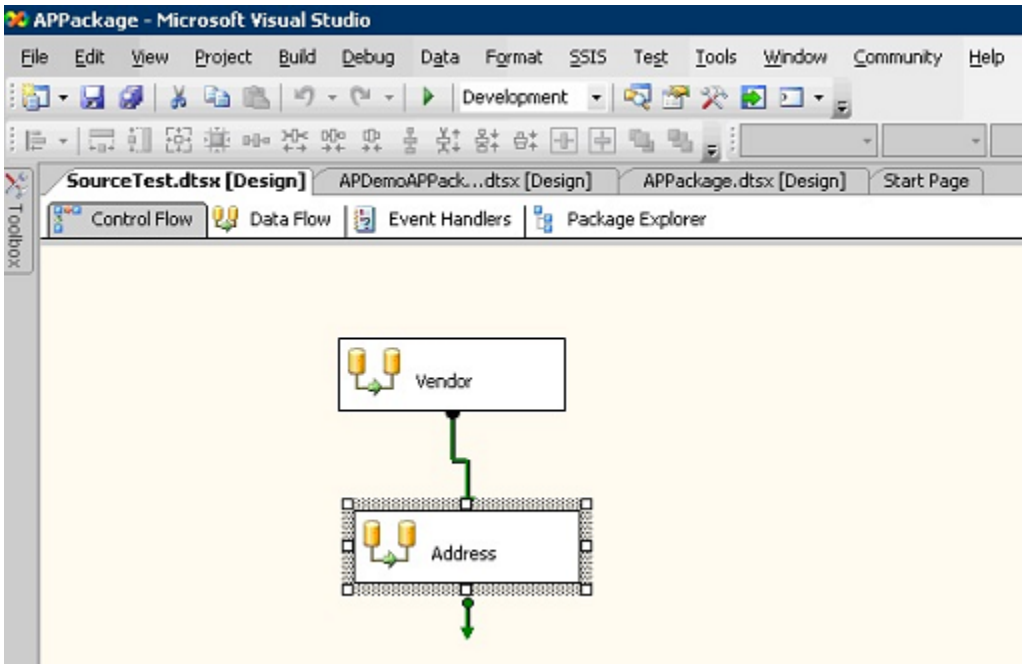
In this section, you will learn to use the List integration components in an SSIS package. The examples refer to Excel as a data source and data destination. You can also use other data sources such as a DBF file, CSV, flat file, to name a few.

How to Export Data to Excel?

Scenario

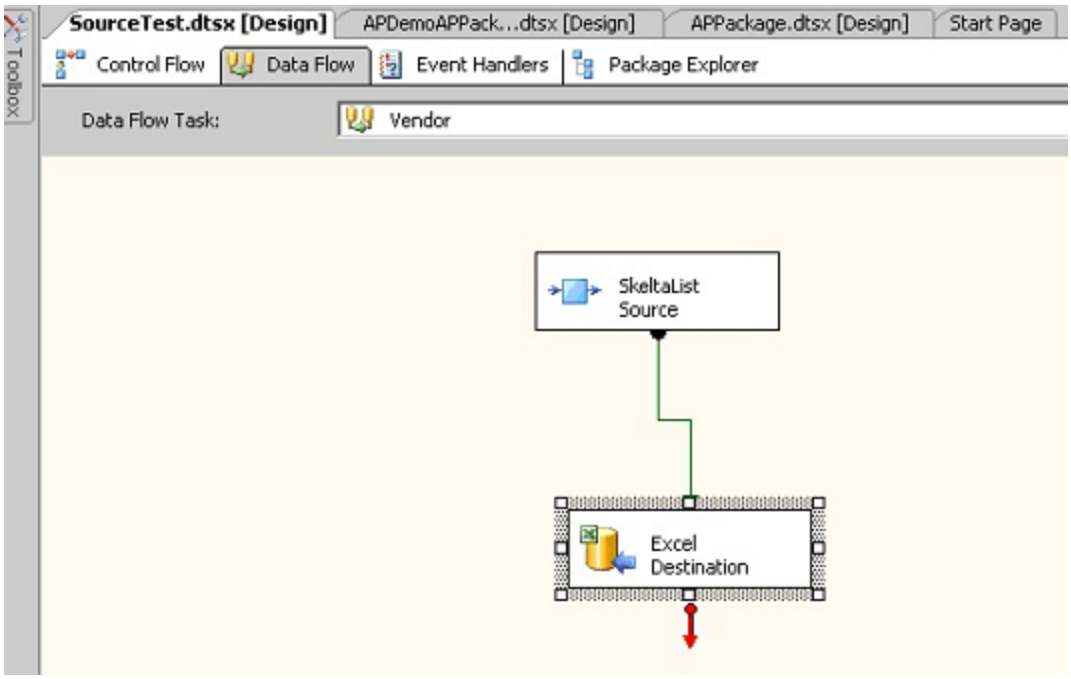
You need to export vendor list data from the List. The SSIS package consists of two dataflow tasks, one for the vendor and one for VendorAddress. The vendor list is mapped to two tables - Vendor and Address. The data from these tables is exported to an Excel file called VendorDetails.xls.

1. Open **SQL Server Business Intelligence Development Studio**.
2. In **Control Flow**, drag and drop the **Dataflow** task from the **Toolbox**.

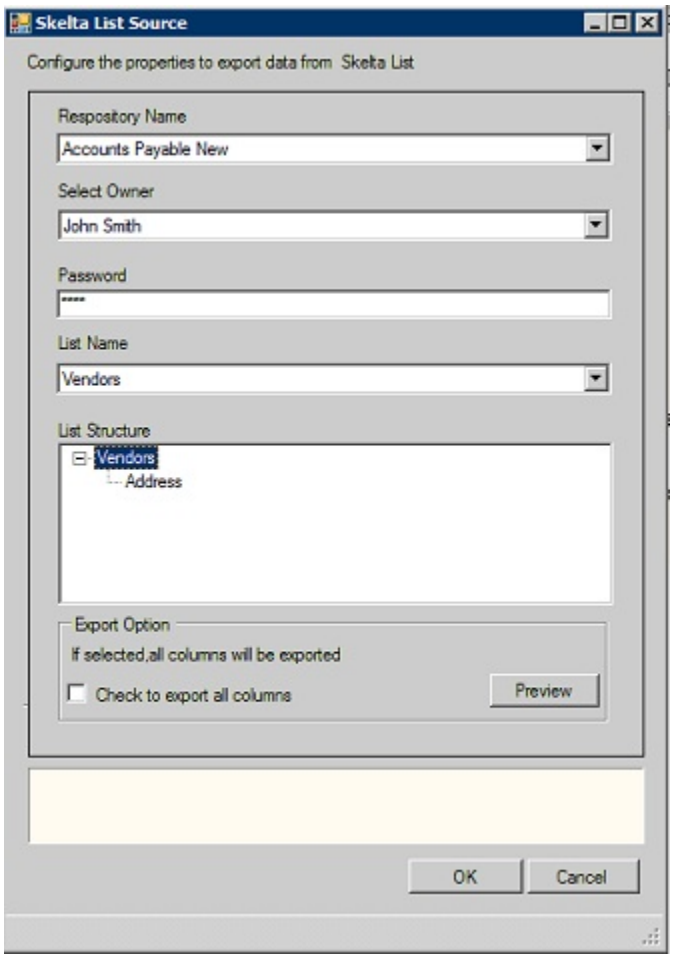


3. Click the **Dataflow** tab of the **Vendor** data flow task.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



4. Drag and drop the **List Source** data flow component.
5. Double-click the **List source** to open the List Source property window.

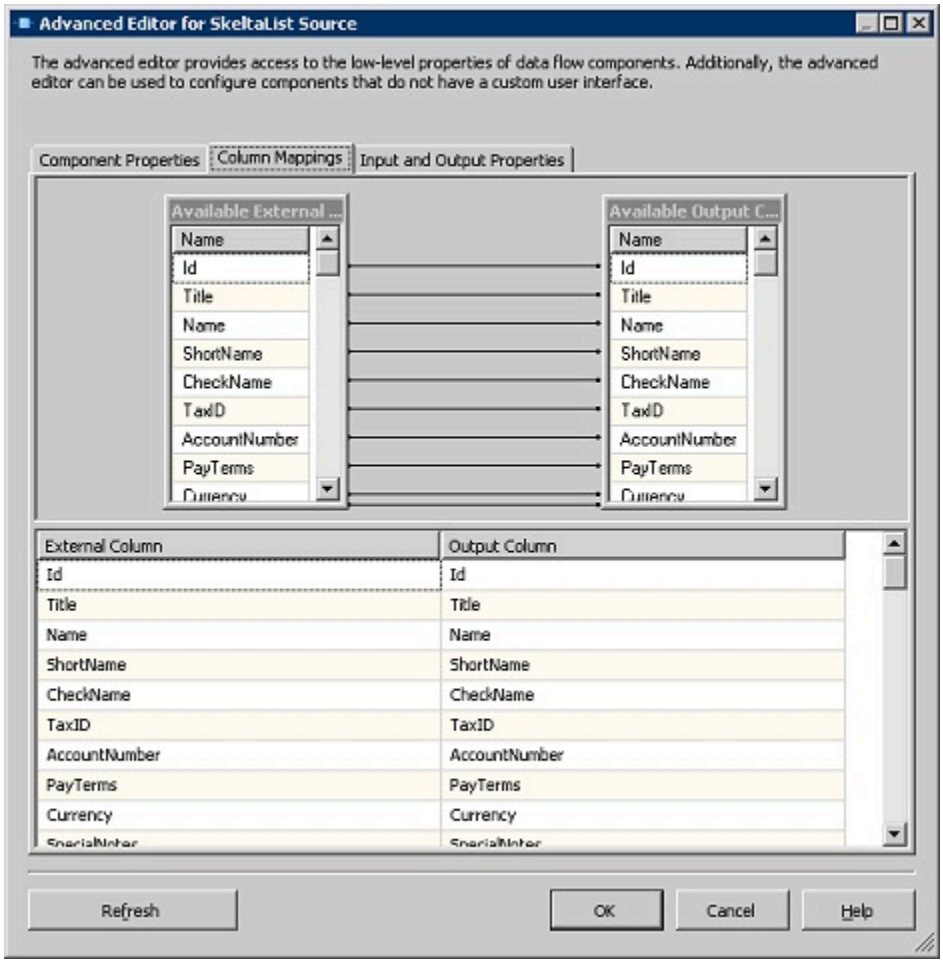


© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Next you need to set the properties. Select the Repository name.
7. Select owner from the drop-down list.
8. Enter the Password.
9. Select Vendor from the list names.
10. Select the Vendor Table from the List Structure tree.

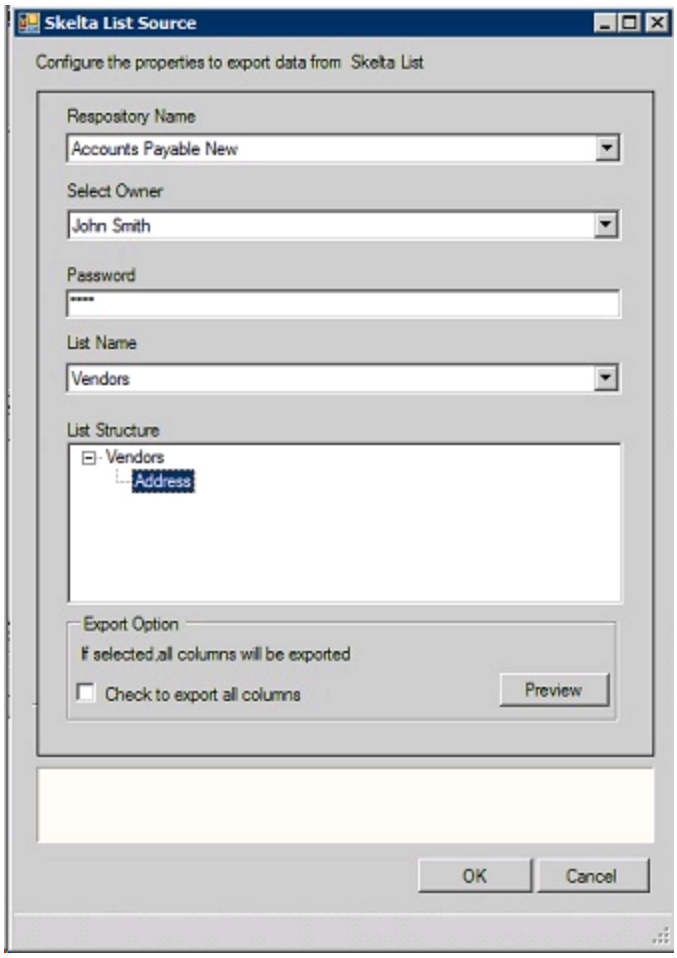
Note: Checking Export all columns option will check all the columns.

11. Click **OK** to save.
12. Drag the **Excel Destination** component. Link the List source with the Excel destination.
13. Next, you need to map the columns.
14. Right-click the List Source component and select the advanced editor.
15. Go to column mapping and map the corresponding columns from List source column to Excel sheet destination columns.

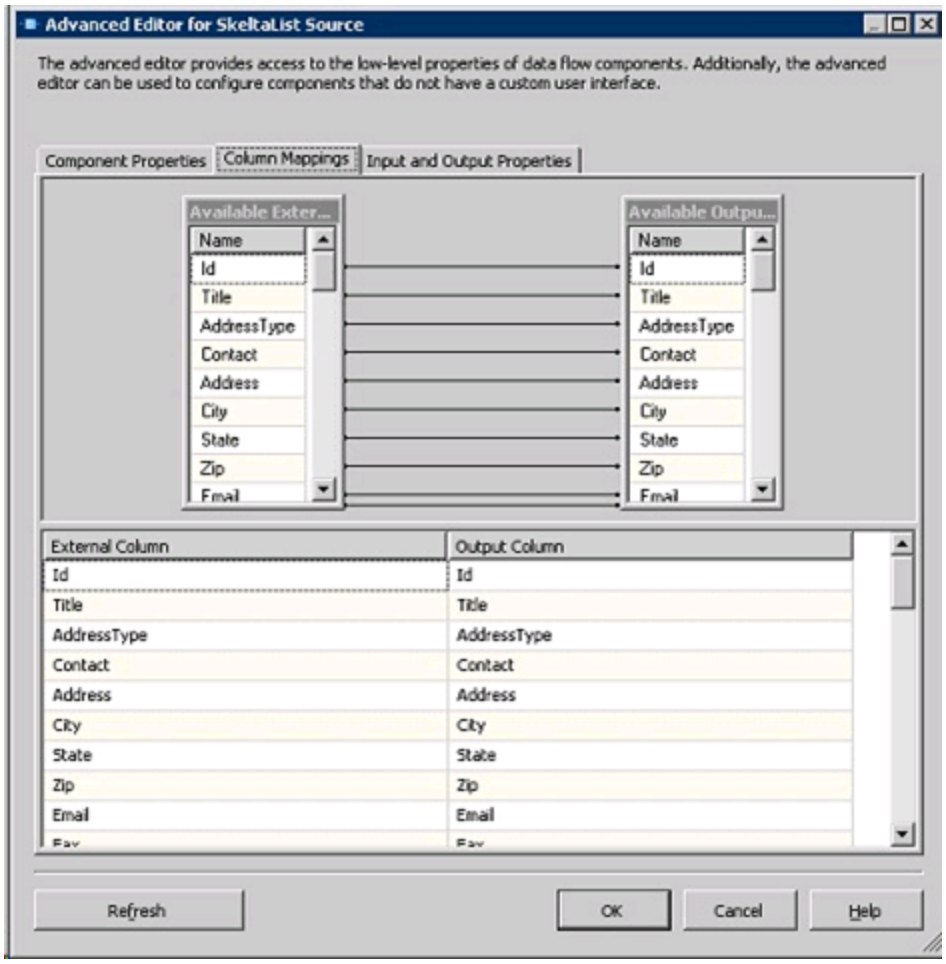


16. Go to control flow design dataflow for **Address**.
17. Drag and drop the Dataflow task and rename it as **Address**.
18. Go to dataflow task. Drag and Drop List Source component and configure the properties as explained in the above steps.

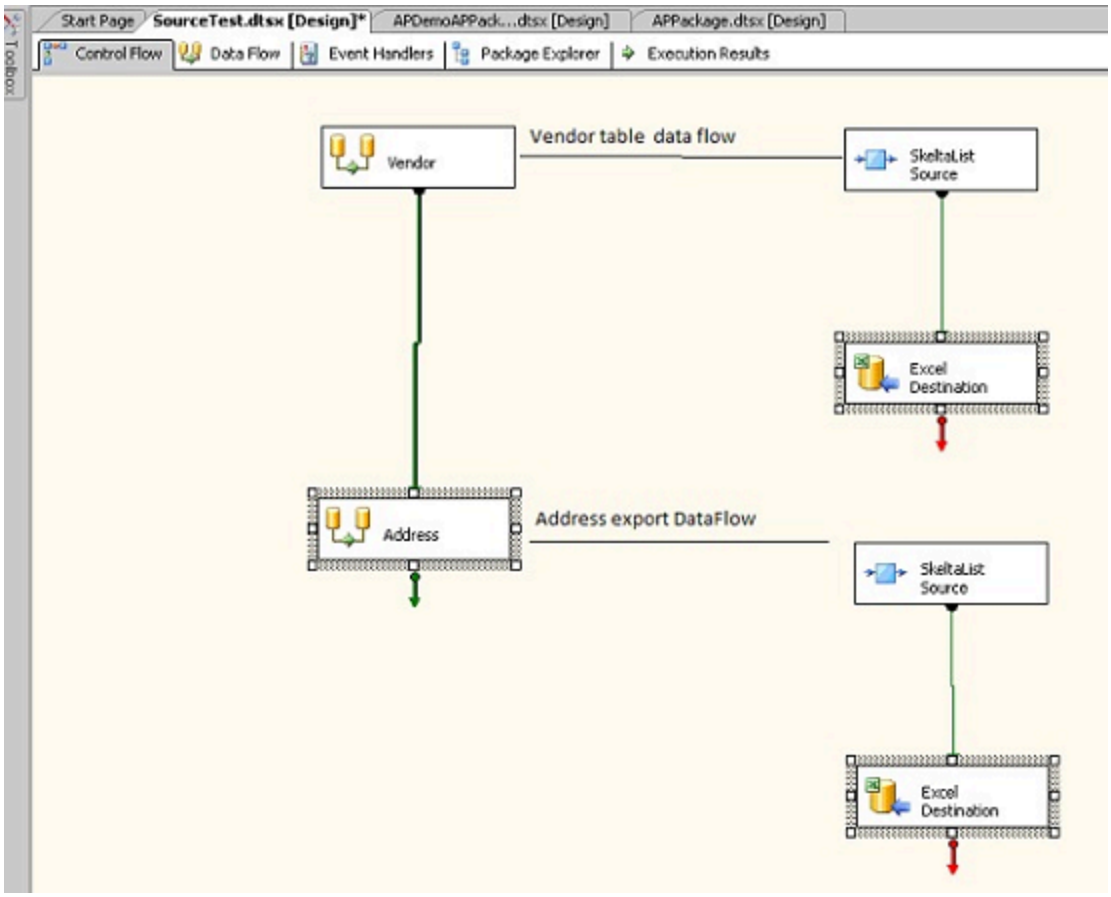
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



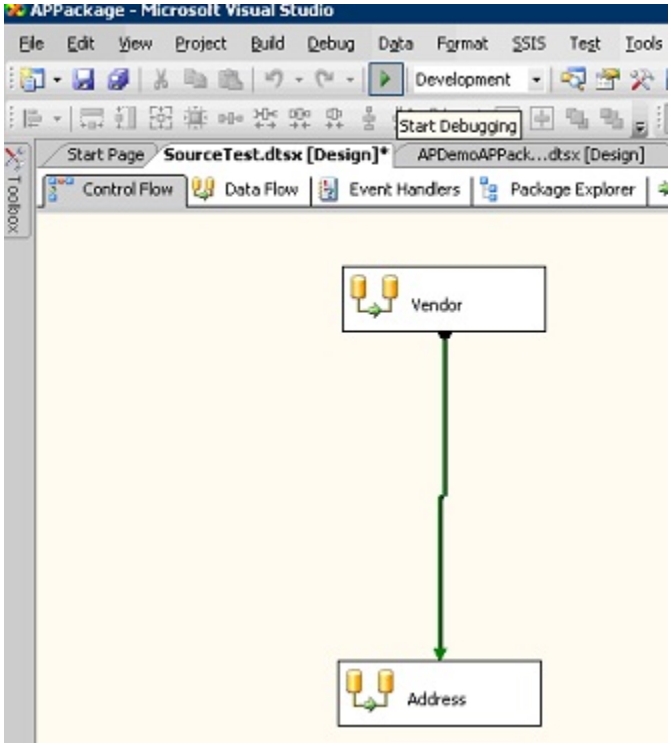
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

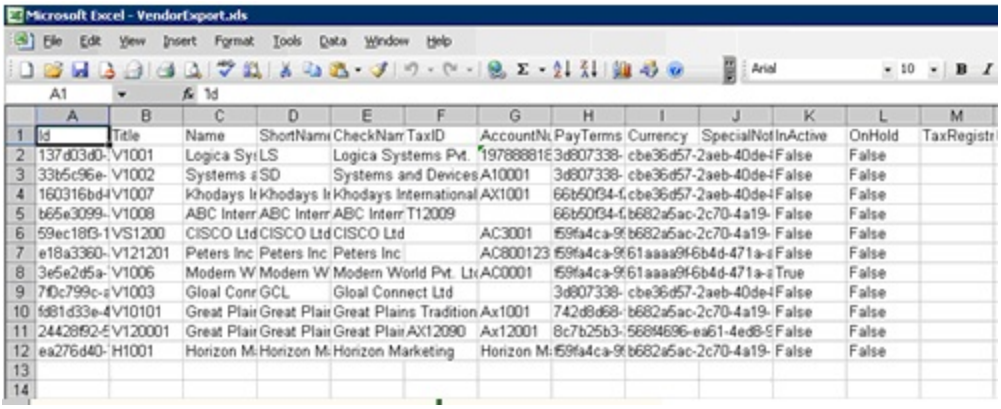


19. In the Package diagram, click on the **Start Debug** option in the BID to execute the package.



20. You have successfully exported data from the vendor list to **VendorExport.xls**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



How to Import Data from Excel?

Scenario

Importing data from a comma-separated flat file to a List called Employee List.

The Employee List is mapped with two tables, EmployeeMaster and EmployeeDetails. The comma-separated flat file contains employee information. The employee first name and last name needs to be inserted in the Employee Main Table. The employee details (Address, Phone, Email, Department, etc) needs to be inserted in the EmployeeDetails Table.

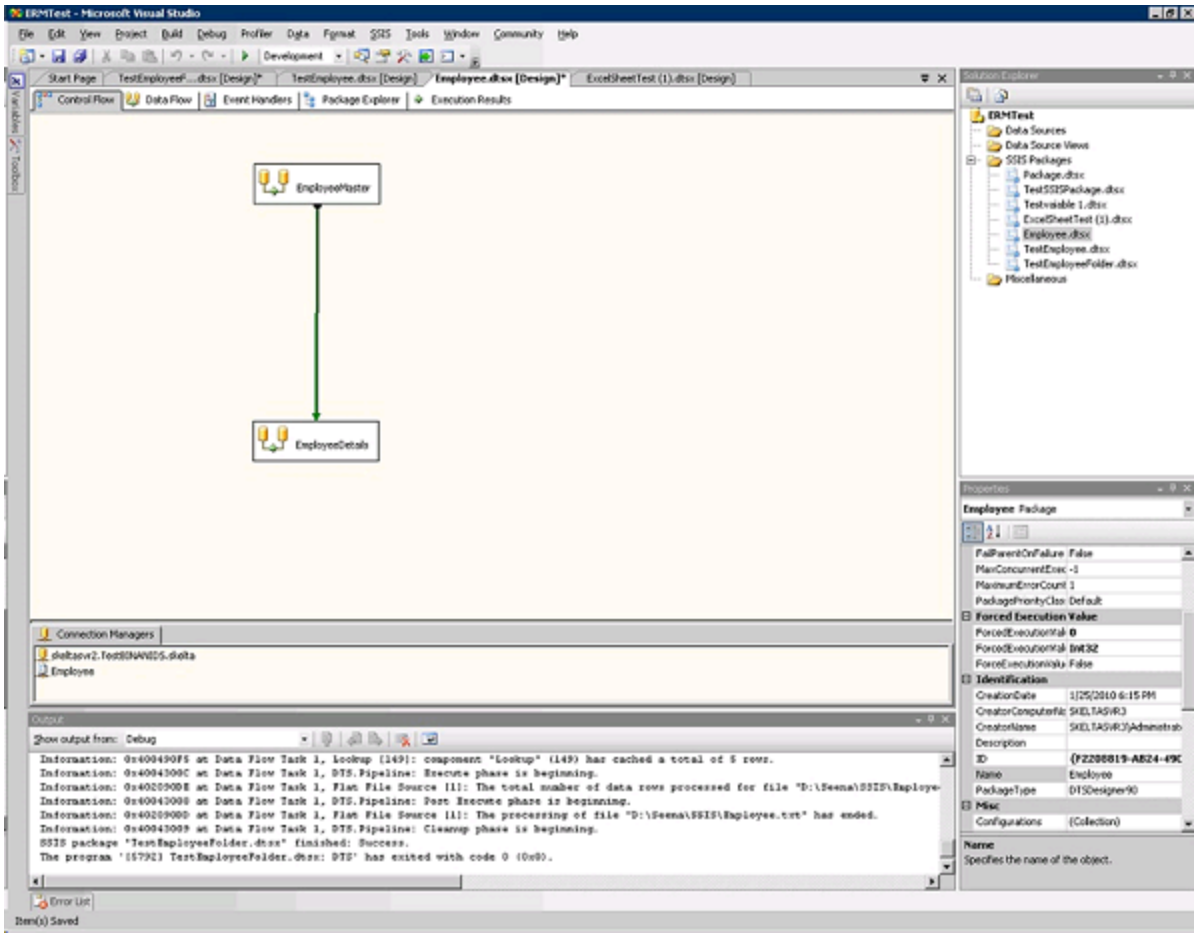
To accomplish the above-mentioned requirement, create an SSIS Package with two Dataflow tasks - one for EmployeeMaster and the second for EmployeeDetails. The steps to create the package:

1. Open SQL Server Business Intelligence Development Studio (BIDS).
2. Add the dataflow task from the Toolbox.
3. Drag and drop the flat file source component to the first dataflow task.
4. Configure the flat file data source.
5. Add the List Destination component and configure it in the second data flow task.
6. Map the column.
7. Open SQL Server Business Intelligence Development Studio.

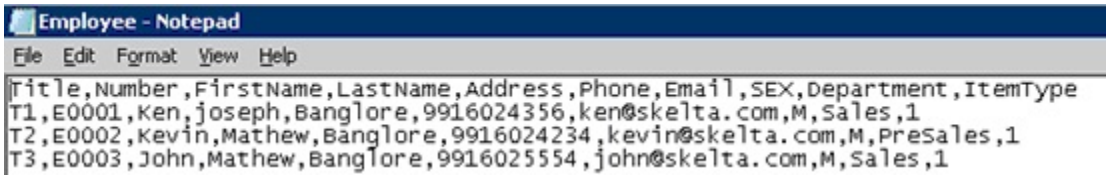
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. Drag and drop the flat file source component.
9. Go to Control Flow.Drag and drop the dataflow task from the Toolbox.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

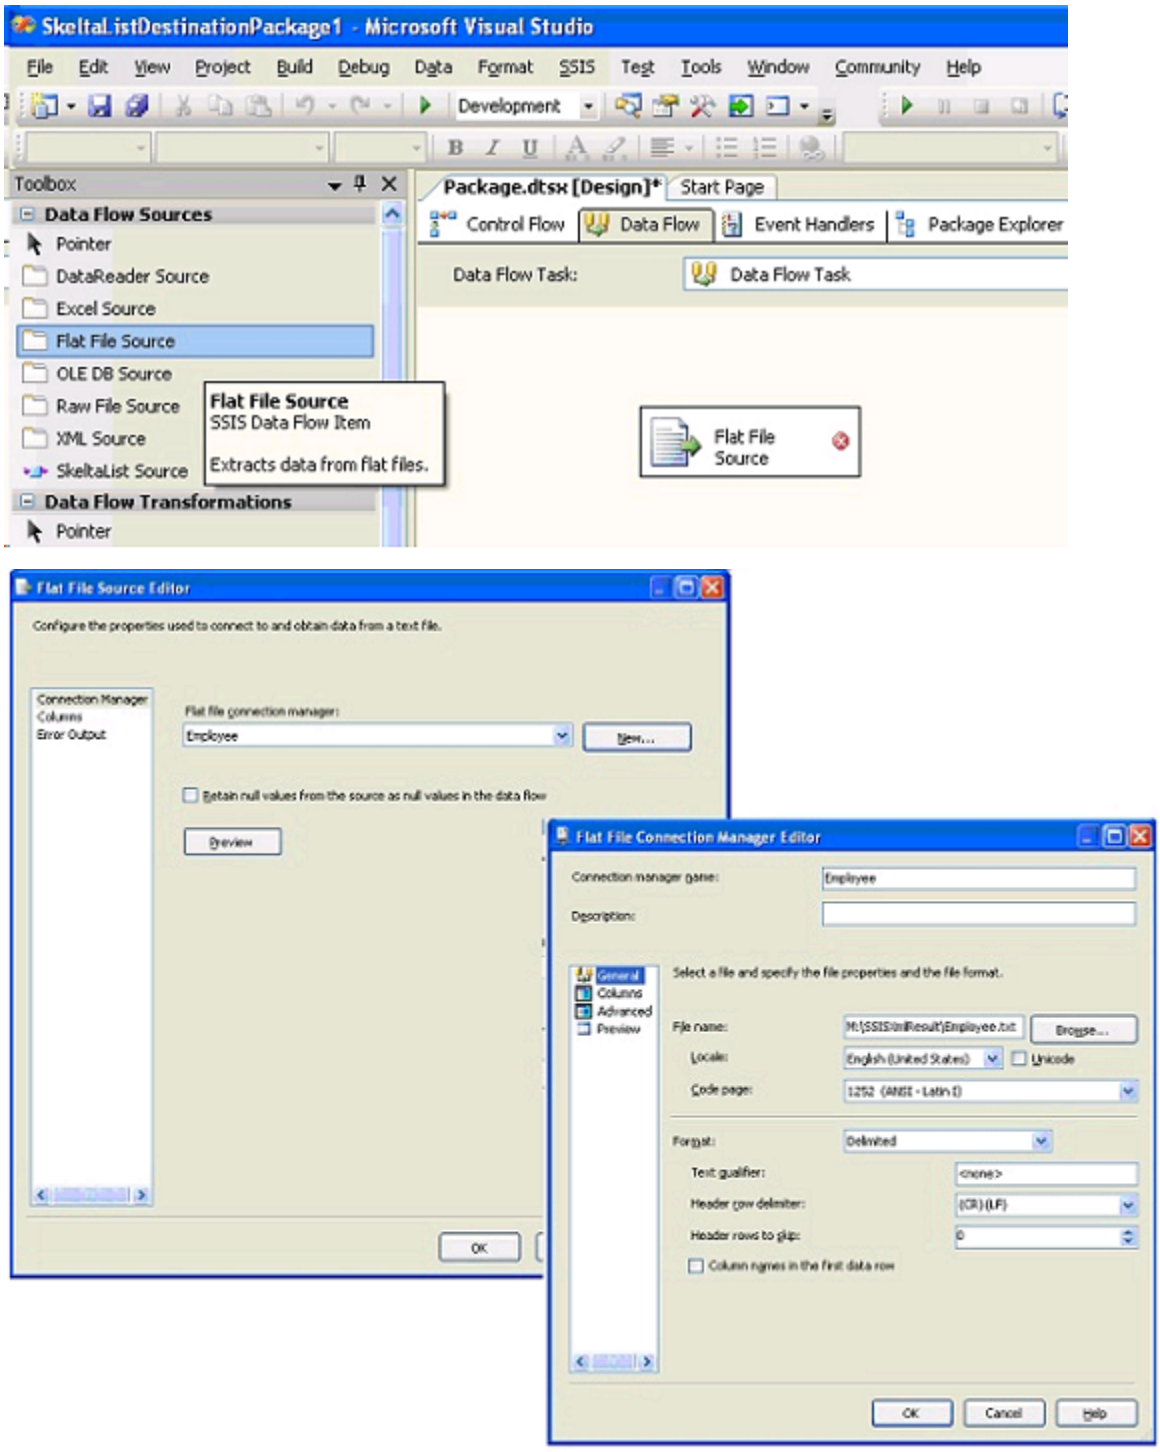


10. Go to Dataflow tab of the Employeemaster data flow task. The Employee.txt has the following data:



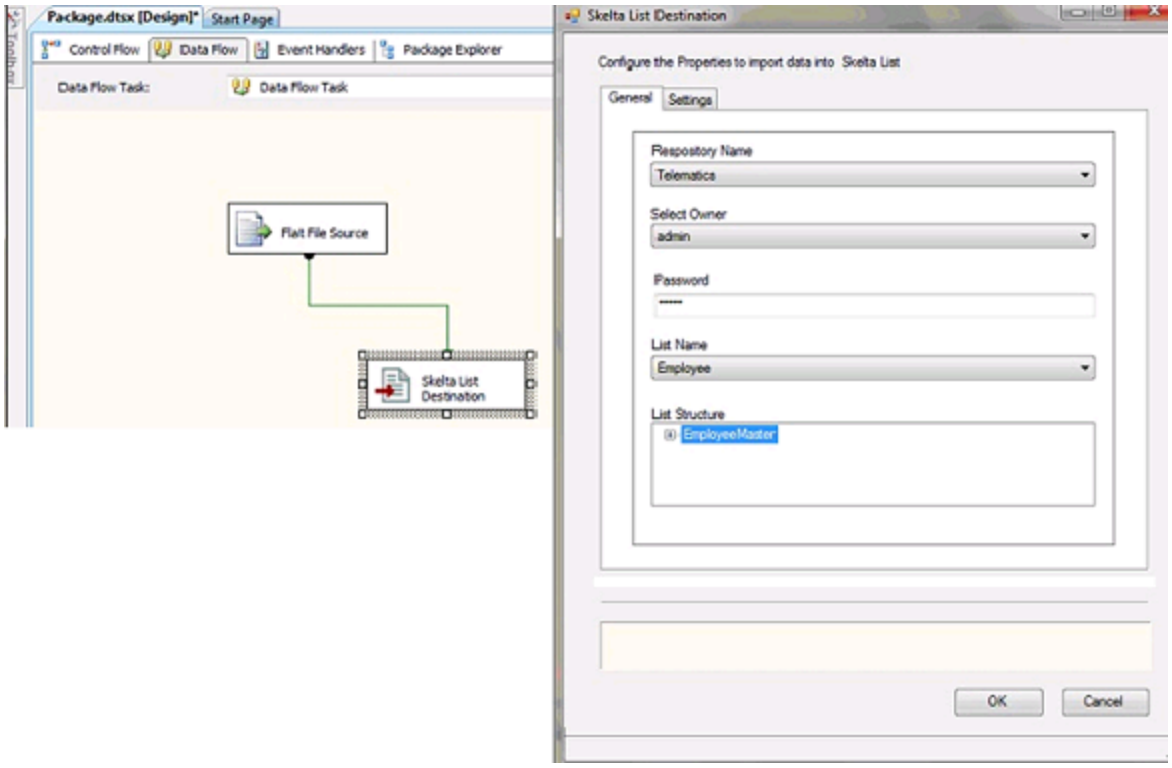
11. Drag and drop the Flat file Source component, and configure the Flat file source as shown below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

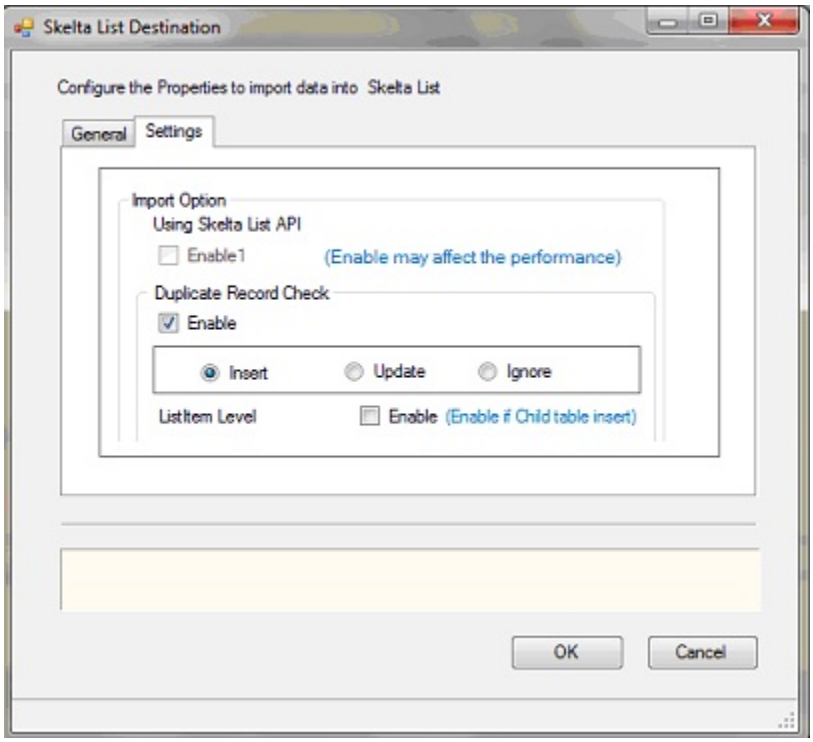


12. Next, you need to add List Destination component. Drag and drop the List Destination data flow component. Double click on the List destination to open the Destination property window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



13. Next, you need to configure the General and settings properties. Select General Tab, Repository name, List name Employee, and Employee Main Table from the List Structure tree.

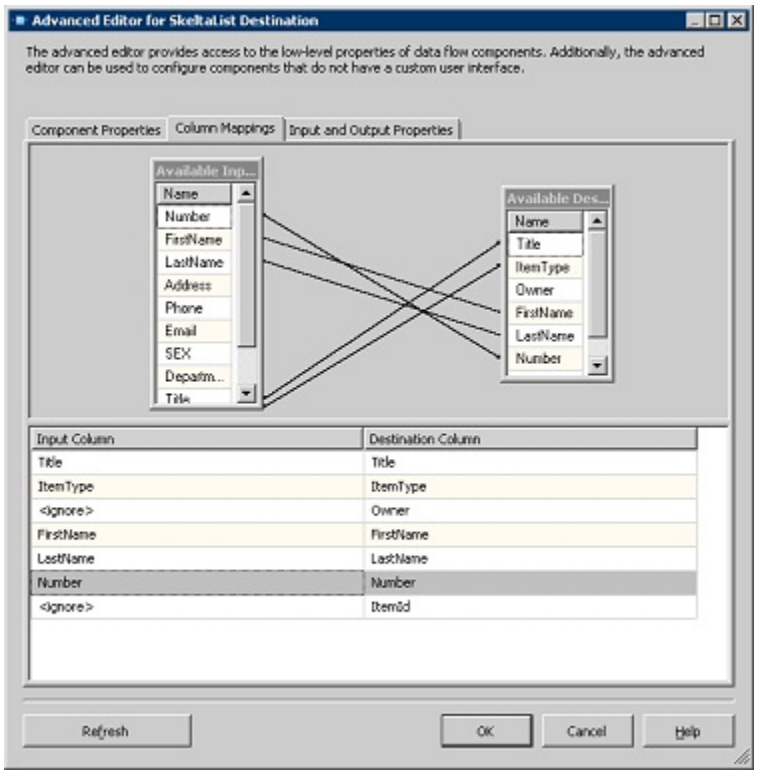


14. Next, you need to set the Export settings. Click the Settings tab.
15. Duplicate Check
    - Enable: Select this box to enable checking of duplicates.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Insert: Select this radio button if you need to insert the item to the list even if it is a duplicate item.
- Update: Select this radio button if you need to update the item.
- Ignore: Select this radio button for checking duplicate records. If a duplicate record exists, it will be ignored.

16. Click **OK** to save.
17. Next, you need to do Column Mapping. Right-click the List Destination component and select the advanced editor. Go to column mapping and map the corresponding columns from Flat file to List Destination columns.



18. Go to control flow design dataflow for EmployeeDetails.
19. Drag and drop Dataflow task and rename it as Employee Details.

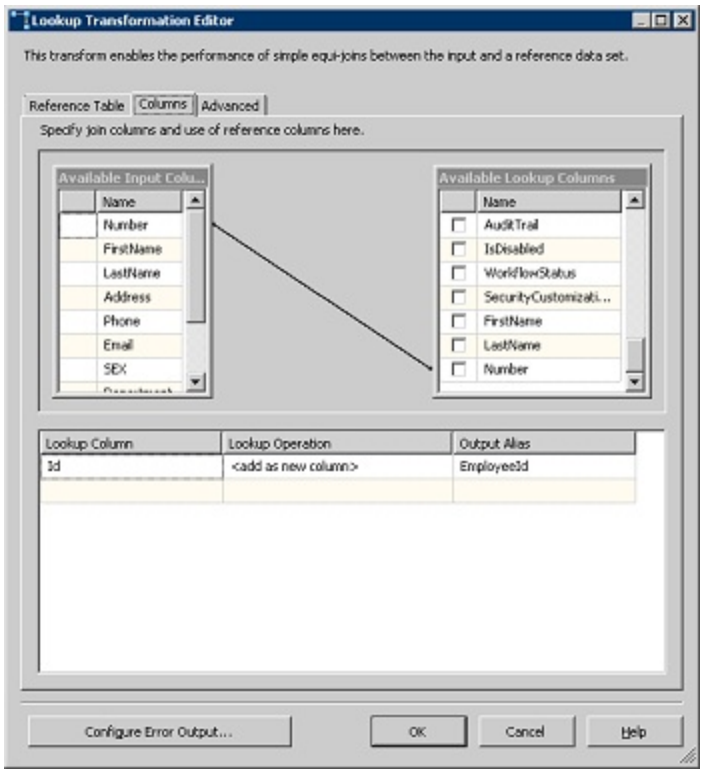
    Note: For the Child Table entry, you need to map the RecordParentItemId field in the Listdestination column.

    EmployeeId is mapped to the Destination column RecordParentItemId. To get the EmployeeId Lookup, the Dataflow Transformation component needs to be used. In the Lookup component, map the number with the Employeemaster table number field and take the Id of the Employee from the Employee Maser Table.

Lookup dataflow Transformation component configuration

1. Drag and drop lookup component in the Dataflow task. Link the Flat file source to Lookup component.
2. In the columns tab map the Number with the EmployeeMaster Column Number, take the Lookup Column as Id.Give Output Alias as EmployeeId. This column can be used to map to RecordParentItemid in the Listdestination Columns mapping.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

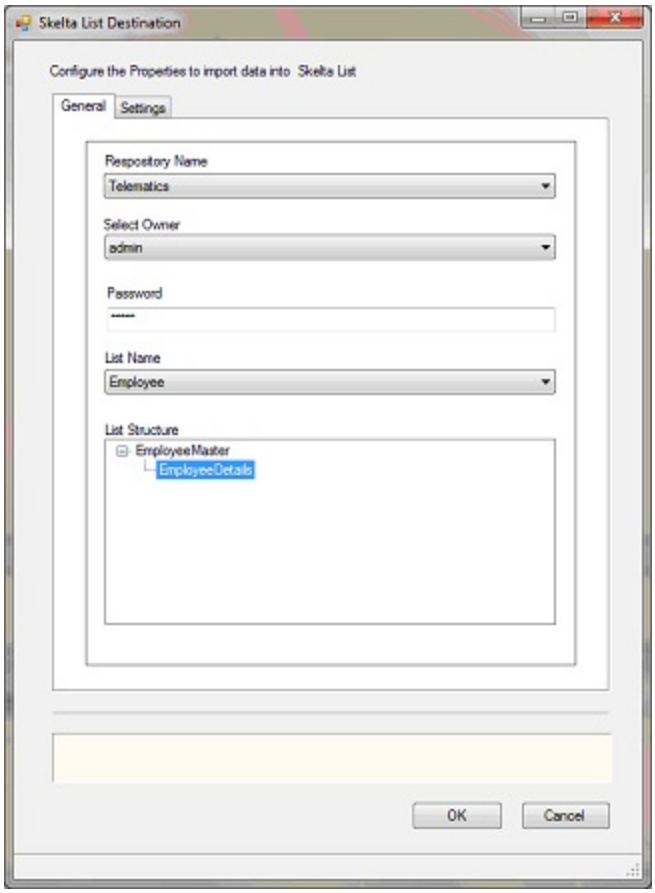


3. Drag and drop the ListDestination.

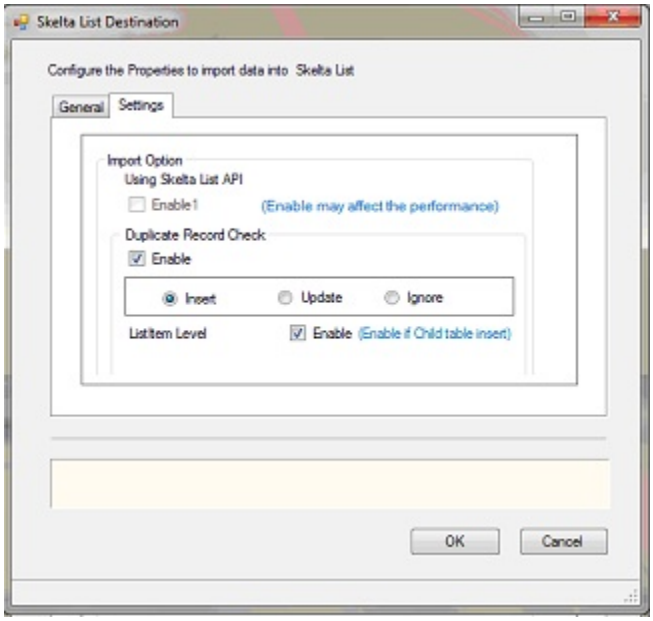
General Configuration

1. Repeat 14th Step. 1. Next, you need to set the Export settings. Click the Settings tab.
2. Select EmployeeDetails table.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

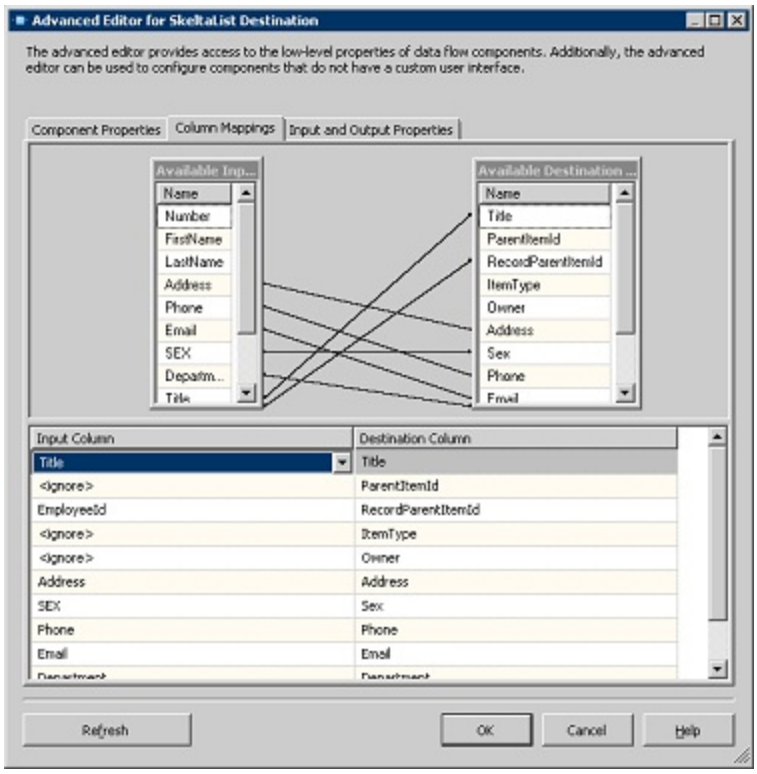


3. Next, you need to set the Settings configuration. If the insertion is to Child table Enable ListItemLevel.

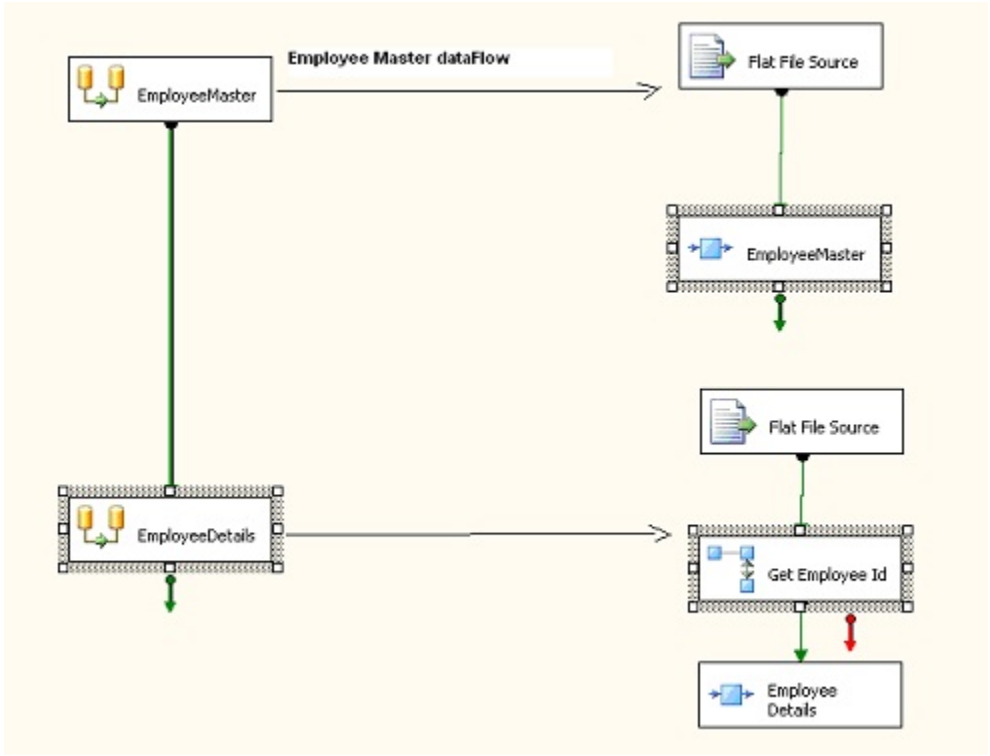


4. Next, you need to set the Column Mapping.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

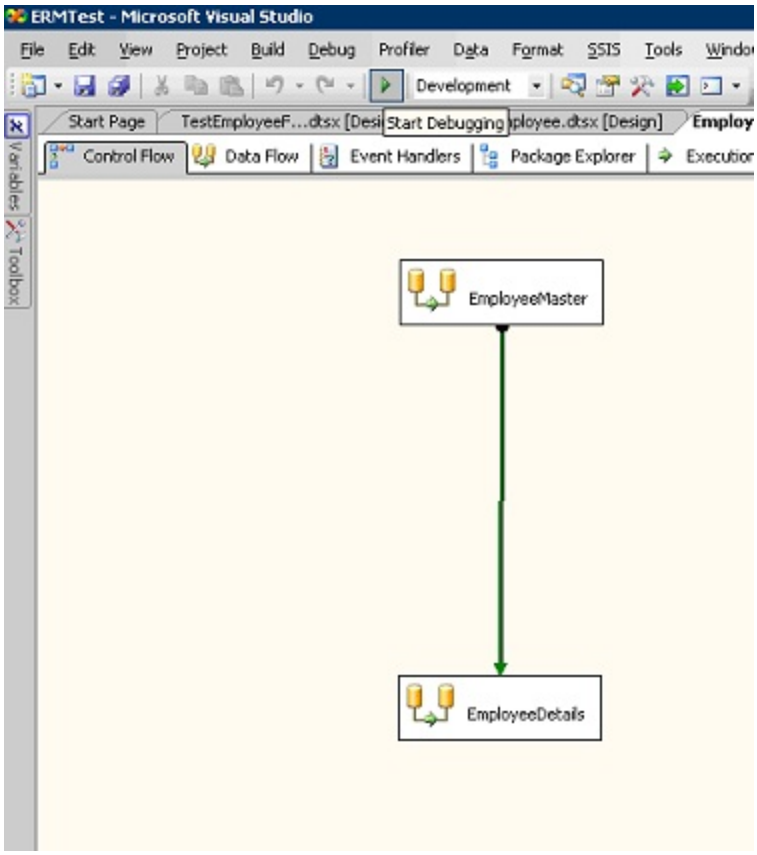


5. The Package diagram is shown below.



6. To Execute the package, Click the Start Debug option in BID.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



7. After execution of the Package, the Employee data from Employee.txt has been imported in the Employee list.

Troubleshooting Lists

This section provides information on the known issues, the issues encountered while working with Lists and the resolution.

Known Issues

List Item

While trying to create a new List Item, if the **Edit** and **View** security rights are set for the Form, you will not be allowed to create the new List Item.

Troubleshoot Lists

Issue

When the **OnCreate** event is triggered, the system is not able to find the newly added list item while trying to update the list XML variable.

Possible Cause

OnCreate event fires just before saving the list item, which triggers the **Update Variable** activity before creation

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

of the list item. This results in the system not being able to find the newly added list item.

Resolution

Add a **Human Activity** before the **Update Variable** activity.

OR

Add a **Scheduler Activity** before the **Update Variable** activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Quickflow User Guide

This *Quickflow User Guide* is for users to create a system that executes the business logic faster using "micro workflow execution engines" running parallel to the workflow engine.

Getting Started

Quickflow helps you to create a system that executes the business logic faster using "micro workflow execution engines" running parallel to the workflow engine.

Quickflow application supports following features:

- Design and execute transient workflows
- Associate Quickflow with various event providers like Forms, LogicApp, FileWatcher, Scheduler, and Message Broker
- Enable the activity status persistence
- Integrate with ArchestrA Identity Manager (AIM) / System Management Server

Prerequisites

Before deploying Quickflow, ensure that the following prerequisites are met:

- ERLANG is installed
- RabbitMQ is installed
- RabbitMQ Management Plugin and AMQP 1.0 Plugin is enabled
- RabbitMQ users are configured
- Valid certificate is available
- AIM is configured and registered

Install ERLANG/OTP

Download **ERLANG/OTP** (version 27.1.2) from *http://www.erlang.org/downloads* and install it.

Note: Run the Erlang installer using an Administrative account so that the registry key for the RabbitMQ installer is present in the system.

Install RabbitMQ

Download **RabbitMQ** (version 4.0.4) from *https://www.rabbitmq.com/install-windows.html* and install it.

For more information on RabbitMQ, refer *https://www.rabbitmq.com.*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Enable RabbitMQ Management Plugin and AMQP 1.0 Plugin

After installing RabbitMQ, enable the RabbitMQ Management plugin and AMQP 1.0 plugin.

Open the RabbitMQ Command Prompt and run the following commands:

- `rabbitmq-plugins enable rabbitmq_management` (to enable RabbitMQ Management plugin)
- `rabbitmq-plugins enable rabbitmq_amqp1_0` (to enable AMQP plugin)

Also, ensure the following:

- You have access to http://localhost:15672 to ensure access to the RabbitMQ Management site.
- You use localhost. The guest credentials works only if the hostname is localhost.

Configure RabbitMQ Users

Configure additional users and provide appropriate access rights.

1. Log in to the **RabbitMQ Management Site**.
2. Select the **Admin** tab.
3. In **Add a user** section, enter the name and the password.
4. Provide access rights to all channels and topics to the user.
5. Click **Add user**.

Certificate to be used with the Quickflow Engine

Any communication from and to a Quickflow Engine is secured. For the secured communication, the system requires a certificate. The System Management Server can be used to import/generate the certificate. You can also use a commercial certificate if you have or create a new certificate.

1. Open the Certificate Management Console.
2. Find the appropriate certificate you want to use.
3. Select **All Tasks** and **Export** the certificate.
4. Follow the steps provided by the wizard. Save the certificate (for example, MyCertificate.pfx) on the desktop.

Configure and Register Token Service

Configure Token service using System Management Server (SMS). For more information on configuring Token service, refer Configuring and Registering Token Service.

After configuring Token service, you can register it with AVEVA Work Tasks 2023 SP1 using **Farm Configuration Wizard** or **Central Configuration** > **Token Service Setting**.

Note: Only one AIM server can be registered for a Farm.
- While configuring Token service, ensure the SMS server is online.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Deploy Quickflow

You can deploy the Quickflow Engine using the **Central Configuration** page.

Prerequisites

- Install **AVEVA Work Tasks 2023 SP1**. For more information on what you need to do prior to deploying a Quickflow Engine, see Prerequisites.

To deploy Quickflow Engine

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then **Central Configuration**.
2. Click **Quickflow Settings**.

   The **Quickflow** page appears.
3. Enter the following details under **Message Broker Details** section:
   - **URI**: Enter the URI of the server where Message Broker is installed. URI is the machine name or the IP address of the machine (e.g. 192.168.0.100).
   - **User Name**: Enter the user name of the Message Broker server. The user name should not include space.
   - **Password**: Enter the password of the Message Broker server. The password should not include space.
   - **Port**: Enter the port for Message Broker server. You cannot enter the port number that is already used by other application.
   - **AMQPS**: Select the check box for the secured connection with Message Broker server.

     Note:
     - If you use Azure service bus, select the AMQPS check box and provide the Azure bus Uri and the credentials.
     - If you use other Message Brokers, uncheck the AMQPS check box and enter the Uri of the server where Message Broker is installed. Uri is the machine name or the IP address of the machine.
   - **Token Service**: Select the registered AIM token service or the AVEVA Connect token service (to connect through AVEVA cloud).

     Note:
     - If you access Central Configuration using AVEVA Connect authentication, then deploy Quickflow using AVEVA Connect token service.
     - If you access Central Configuration using Azure Active Directory authentication, then deploy Quickflow using AAD token.
     -If you reconfigure the Token service, then Quickflow must also be re-deployed.
4. Enter the following details under **Server Details** section:
   - **Server Name**: Displays the list of AVEVA Work Tasks servers available.
   - **Https Port**: Enter the port number for the server.
   - **Certificate**: Select the valid certificate file.
   - **Password**: Enter the password of the attached certificate.

     Note:
     - When you redeploy the Quickflow, ensure to select the Certificate again while deploying.
     - You cannot update the **Server Details** section, if you have selected the **Secure Web Sites** option while configuring **Security Settings** in Farm Configuration Wizard. The configured Security Settings details will

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

be considered while deploying Quickflow.

5. Click **Deploy**.

   The Quickflow application gets integrated in the AVEVA Work Tasks system.

   Note:
   - When the AVEVA Work Tasks - Client Service is restarted, the Quickflow application pool should be started again.
   - If the Quickflow deployment fails, see the Troubleshoot section.
   - If the execution time exceeds 10 seconds, the Quickflow fails showing an error.

After the Quickflow is successfully deployed, ensure that:

- Quickflow Status Monitor service is installed and running.
- Quickflow web application is created under the "AVEVAWorkTasksSites" site.

Create Quickflow

In this section, you will learn how to create a Quickflow. As an example, the "Invoke Web API" activity is configured to invoke a web API from the Quickflow.

Prerequisites

- Download and install AVEVA Work Tasks 2023 SP1.
- Create a repository.
- Log on to the repository using Administrator credentials.

This section is categorized into:

- Designing a Quickflow
- Publishing and executing a Quickflow
- Viewing the result in the Execution View

To design a Quickflow

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**.

   The **Workflows** page appears.
3. On the action bar, click **New,** and then click **Quickflow.**

   The **New Quickflow** wizard appears.
4. In the **Title** box, type a name for the Quickflow, and in the **Description** box, type a description for the Quickflow.
5. Select the **Persistence** checkbox to enable the activity status persistence.

   Note:
   - For a Quickflow with parent and child Quickflows, the activity status persistence depends on the the

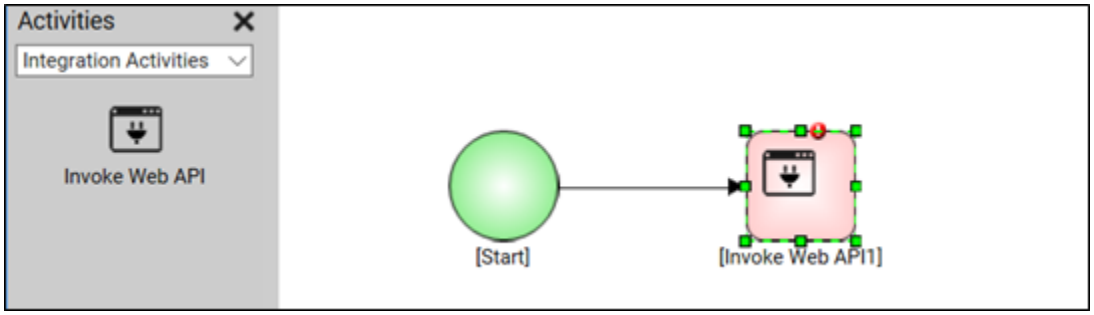
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

persistence enabled or disabled for the parent Quickflow and not on the child Quickflow persistence property.
For example, if the persistence is enabled for parent Quickflow, the activity status will persist even if the child Quickflow has disabled persistence property.
- If the persistence is enabled, the activity status will not be reflected when the execution time exceeds.

6. Click **Save & Continue**.

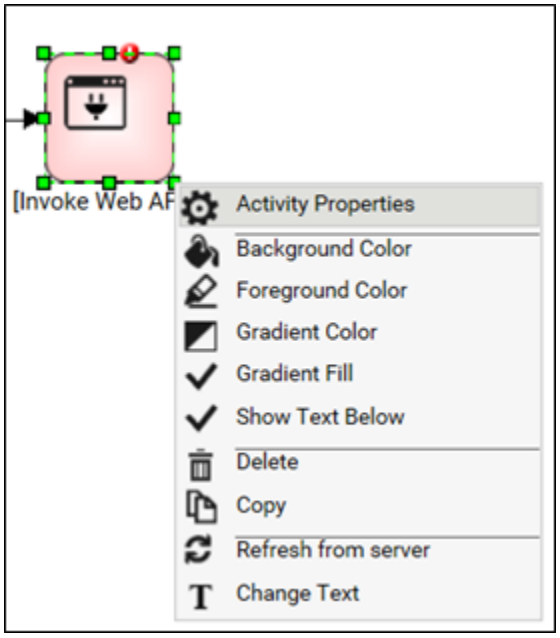
   The Quickflow is created, and gets opened in the **Process Designer** page.

7. Drag an **Invoke Web API** activity from the **Integration Activities** to the design area.



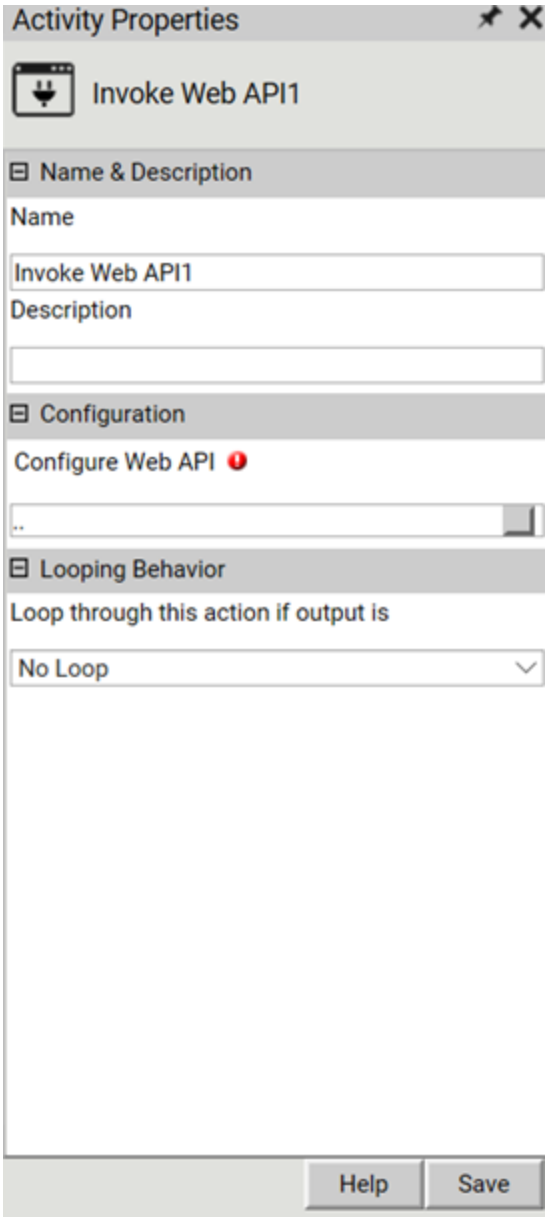
8. Right-click **Invoke Web API** activity, and then click **Activity Properties**.

   The **Activity Properties** window appears.



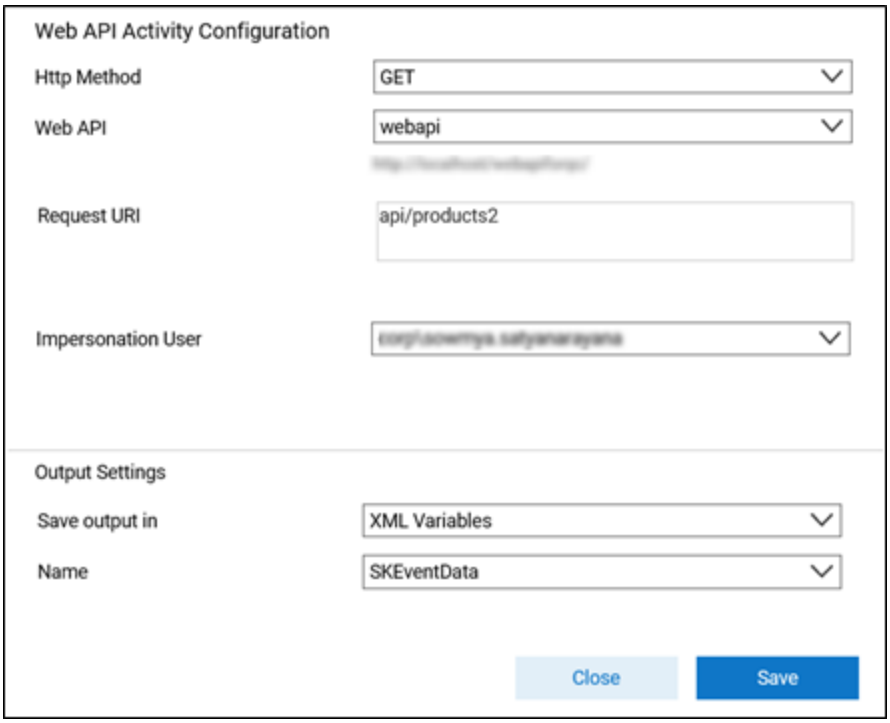
9. Configure the **Invoke Web API** activity properties.
   a. Enter a **Name** and **Description** for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



b. Click the edit icon under the **Configure Web API** property.
   The **Web API Activity Configuration** window appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



c. You have to configure the Web API to be called. Web APIs are frameworks to build HTTP services for browsers and mobile devices.

   For more information about this activity property, see Configure Web API.

10. Click **Save** in the **Web API Activity Configuration** window to save all the data entered.

    Your first Quickflow is created.

To Publish and Execute the Quickflow

1. Click **Publish** from the menu.

   A message appears to confirm that the Quickflow is published successfully.

2. Click **Close**.

   The **Process Designer** closes and the **Workflows list** appears. The list now displays one new Quickflow.

3. Right-click on the **Quickflow**, and then click **Publish and Test Run**.

   This option publishes the Quickflow and then test runs it.

   The **Process execution view** appears where you can see the execution status.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Start Activity** and the **Invoke Web API Activity** are executed successfully.

Note:
- If the Status is "Execution Pending" in the **Process execution view** window, then click the **Refresh** button to get the latest status.
- If the execution time exceeds 10 seconds, the Quickflow fails showing an error.

The Variable values are not stored in the database and hence will not be available in the Execution view or the Repository.

Note:
- In some pages, you may find that Quickflows are named as Workflows in the Enterprise Console.
- Quickflow with **Unsuccessful** output is not supported.

Save Workflow as Quickflow

You can save the published workflow as Quickflow for faster execution. The **Save as Quickflow** option is available only for the published workflows.

Note: The workflows which have the activities and properties that are supported by Quickflow can only be saved as Quickflow.

To Save the Workflow as a Quickflow

- Select and right-click the workflow you want to save as Quickflow, and then select **Save as Quickflow**.

  The selected workflow gets saved as Quickflow.

Activities

The different activities found in an AVEVA Work Tasks Quickflow are categorized as the following:

- Start Activity
- Communication Activities
- Engine Activities
- Integration Activities
- Message Queue Activities
- Logic App Activities
- AttributeReadWrite Activity
- Custom Activity

Refer to the Supported Activities table for a more comprehensive list.

Supported Activities

The table lists the supported activities and the respective supported properties:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity	Name and Description	Configuration	Quickflow Supported Configuration?	Exception Behavior	Looping Behavior
Start Activity	Yes	Variables	Yes Type - Dropdown will not have **actor** option to select	No	No
		Contents	No		
		XmlVariables	Yes Type - Xml Document and Xml Iterator options are available Xsl option is hidden		
		Analyst's Process Model Filename for Execution View	No		
		SOA Object Instances	No		
		Initialize Variable(s)	Yes		
Notification Activity	Yes	Notification Type	Yes Only Email notification available	No	No
		Actors	Yes		
		Notification Contents	Yes		
AVEVA Work Tasks Pro Push Notification activity	Yes				
Blocking Output Activity	Yes	Set Blocking Output	Yes	No	No

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity	Name and Description	Configuration	Quickflow Supported Configuration?	Exception Behavior	Looping Behavior
Database Activity	Yes	Database Connection	Yes	No	No
		Query Builder	Yes		
Decision Activity	Yes	Decisions	Yes	No	No
ForEach-Loop Activity	Yes	Xml Iterator	Yes	No	No
For-Loop Activity	Yes	Loop Variable	Yes	No	No
		Loop Count	Yes		
Invoke Web API Activity	Yes	Configure Web API	Yes	No	No
Logger Activity	Yes	LogType	Yes	No	No
		LogMessage	Yes		
Next Loop Activity	Yes	-	-	No	No
Rule Activity	Yes	Condition	Yes	No	No
Set Workflow Output Variable Activity	Yes	Set Workflow Output	Yes	No	No
Synchronize Activity	Yes	-	Yes	No	No
Update Parent Variables	Yes	Parent Workflow Application Name	Yes	No	No
		Parent Workflow Name	Yes		
		List Parent Variables	Yes

Activity	Name and Description	Configuration	Quickflow Supported Configuration?	Exception Behavior	Looping Behavior
Update Variable Activity	Yes	Set Variable	Yes Operator - <##> option is hidden Actions - Contents option is hidden	No	No
Xml Navigator Activity	Yes	Xml Iterator	Yes	No	No
		Location	Yes		
Workflow Activity		Repository	Yes - Read Only		
		Workflow	Yes		
		Version	Yes		
		Contents for ChildWorkflow	Yes		
		Variables for ChildWorkflow	Yes		
		XmlVariables for ChildWorkflow	Yes		
		Wait for the child workflow?	Yes - Disabled		
		Execution mode	No		
		Control child workflow?	No		
		Is Blocking Output Supported?	No		
Invoke Web API Activity	Yes	Configure Web API	Yes	No	No
Script Activity	Yes	Programming	Yes Language supported - C#.NET and VBScript	No	No

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity	Name and Description	Configuration	Quickflow Supported Configuration?	Exception Behavior	Looping Behavior
XML Action Activity	Yes	Get Variable	Yes	No	No
		Get Data			
		Set Variables			
		Assign Empty Node Values			
SendMQData Activity	Yes	Message Queue Connection	Yes	No	No
Call Logic App Activity	Yes	Logic App Connection and Data	Yes	No	No
AttributeReadWrite Activity	Yes	Unique Environment Name	Yes	No	No
		Relative Reference Object			
		Retry Count			

Note:
- Human activities are not supported in Quickflow application.
- As the Exception Behavior property is not supported in Quickflow, the behavior of the activity output is different from that of Workflow. Even if the activity execution results in unlinked output, the Quickflow shows it as complete.

Start Activity

Activity Description

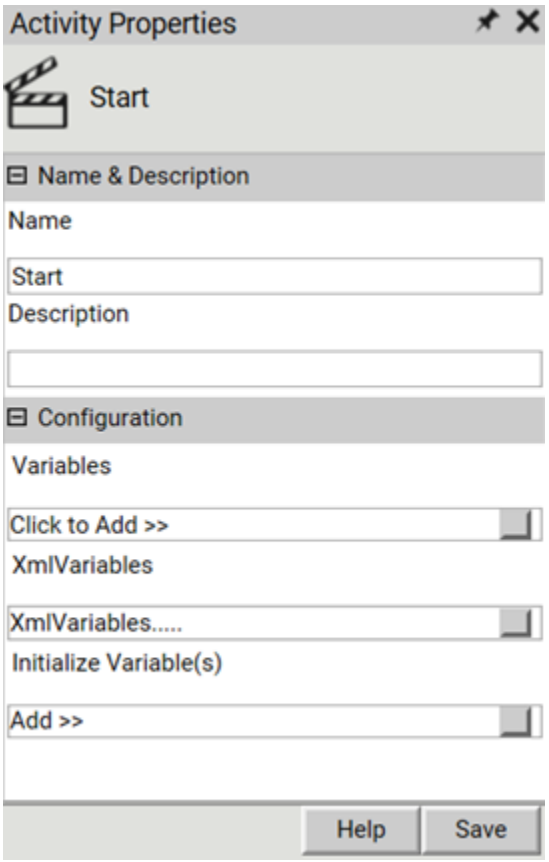
The Start activity is the first activity in a Quickflow. The icon corresponding to this activity is displayed by default in the Design Area. The Variables used in the execution of the Quickworkflow are declared here. The starting point for redirection can also be set in this activity. This will enable redirection at the beginning of the Quickflow until it is turned off later in the Quickflow.

Activity Properties

You can configure the Start activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **Start** activity and select

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the **Activity Properties** option.



Note: Every time you input a value for a property, ensure to save the data. Click the **Save** button on the **Activity Properties** window. You need to save the property so that the subsequent properties in the activity can inherit the required information.

The Activity Properties are organized in groups of related properties. The properties under each group are described in this topic.

Name & Description

You can use these properties to specify the name and description of the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

You can use these properties to specify the web service details.

Variables - The variables used in the workflow, including Local Variables, can be specified using this property.

Property Type: Optional (*Set this property only if needed*.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To set the Variable property

1. To specify the variables, click the button for the 'Variables' property to open the property window.
2. Enter the variable name in the **Workflow Variables** field. Prefix the variable name with '@' if it is a local variable.
3. Select the corresponding variable type from the **Type** drop down field.
4. After entering the variable details, click **Add Row** to add this variable and to display a new row for entering another variable.
5. Remove rows if necessary by selecting them and clicking **Remove Selected**.
6. After entering all the variables, click **Update**.

See Start - Variables for a detailed description of the Variables property window.

XML Variables - The XML Variables used in the Quickflow can be specified using this property.

Property Type: Optional (Set this property only if necessary.)

To set the XML Variables property

1. To specify the XML Variables, click the button for the 'XML Variables' property to open the XML Variables window.
2. Click **New Variable** to add a new variable.
3. This will enable the **Variable Name** field. Enter the name of the new XML Variable in this field and a description in the **Description** field.
4. Now select the XML Variable type from **Type** drop down. You can select from either **XMLDocument** or **XMLIterator**.
5. Click the **Schema** tab caption 'Schema' to specify the schema for the XML variable.
   - If XMLDocument was selected in Step 4, clicking this tab will display the corresponding set of controls.
     - You can select Variable or Content as the option for internal storage from Use [ ] for Internal Storage drop down field.
     - Specify a file name or browse for the file containing XML Data. Click the Load button to load the contents of the file. The XMLschema corresponding to the loaded file is displayed in the configuration area.
       You can also build the schema from scratch within this area.
   - If XMLIterator was selected in Step 4, clicking this tab will display the corresponding set of controls.
     - You can select the XML Variable from which you can extract the node to be set as the XML Iterator.
     - Select the node to be set from the Select Node drop down field. The XML schema corresponding to the selected node is displayed in the configuration area.
       You can also build the schema from scratch within this area.

     a. Click the Save Variable button, to save the new XML Variable.
     b. Click Close to close the Property window.

See XML Variables for a detailed description of the XML Variables window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Start - Variables

Variables Property Window

You can set the workflow variables in the Variable property window. To open this window, click the button in the 'Variables' property. The Variables dialog box is displayed in a grid, which has a blank row where you can enter the parameters for a new variable.

The dialog has two tabs at the top to manage the rows of variables in the grid.

- **Add Row** - You can click this tab to add the newly entered variable and display a new row to the grid where you can add another variable.
- **Remove Selected** - You can click this tab to remove the selected variable in the grid.

The grid has the following parameters that you need to specify for the new variable.

- **Workflow Variables** - You can use this field to enter the variable name. Prefix the variable name with '@' if it is a local variable.
- **Type** - You can use the drop-down list in this field to select the data type for the variable. The drop-down list displays the following data types - string, number, date, array, actor, object, boolean, float, and decimal.

There are two buttons and a check box at the bottom of the dialog box.

- **Update** - You can click this button to save the newly added variable(s).
- **Close** - You can click this to close the property window without saving the newly added variables.
- **Last Row needs to be added** - You need to select this check box to save the last row added.

Note: To initialize the **Date** variable, enter the date in mm/dd/yyyy format.

XML Variables

AVEVA Work Tasks uses XML variables to provide data inputs to workflows. XML variables can be configured in the Start activity through the XML Variables property. The following are the types of XML Variable in AVEVA Work Tasks:

- XML Document
- XML Iterator

This section provides further information on XML Variables and on the XML Variable User Interface.

About XML Variables

AVEVA Work Tasks uses XML variables to provide data inputs to workflows. XML variables can be configured in the Start activity through the **XMLVariables** property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Different Types of XML Variables:

The following table lists different XML variables available for a Quickflow:

XML variable	Description
XML Document	Using 'XML Document' variable, the required items can be fetched.
XML Iterator	'XML Iterator' variable allows you to define variables for repeating XML elements and attributes.

The XML Variable Interface provides the following functionality:

- Defining XML schema for the XML Variable either by specifying the complete schema or loading an XML document which is the source of the schema.
- Defining variables of type XML Document to retrieve data from XML files.
- Defining variables of type XML Iterator to retrieve data within repeating nodes within an XML schema. The XML Iterator represents a collection of XML Nodes at some level in the XML variable schema. It allows you to perform actions on XML nodes such as looping through XMLnodes and getting the value of a specific node at any location.

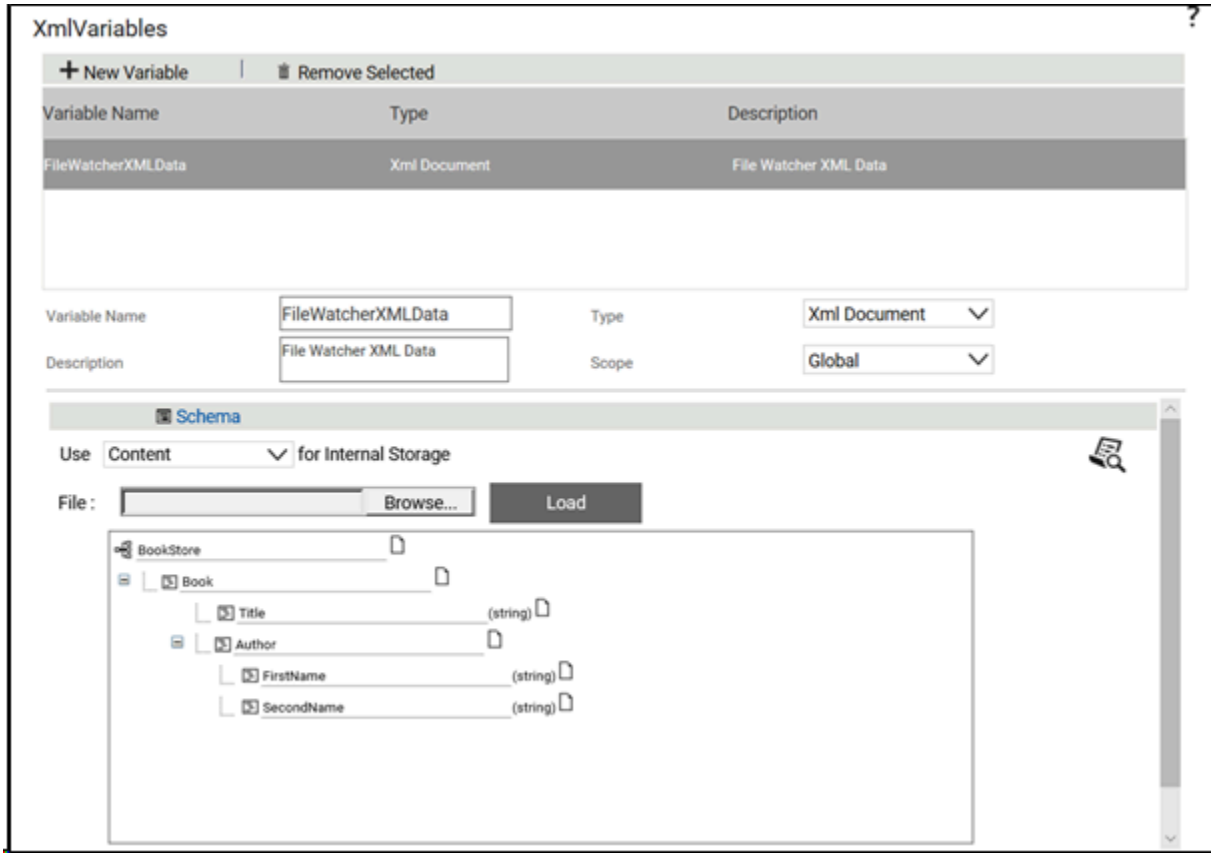
Note: Support for Special Characters in XML node Names of XML Variables: Special characters such as, < > { } * ? [ ] ( ) - _ , = | ; ` +, and % are allowed while naming XML node of XML Variables. XMLVariable will not support **XML node names** with special characters, such as \, ~, !, ', :, ", #, `, &, ., @, ^, and $.

XML Variable User Interface

The XML Variable User Interface is for configuring XML Variables. This window is opened when you click the **XMLVariables** property of the **Start** activity. All XML Variables added for the workflow are displayed in rows in the **grid**. The variable properties that are specific to a XMLVariable are displayed in the Variable Properties section for an XML Variable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

XML Variable User Interface



Common Properties Available for All XML Variables

The following properties are common for all XML Variables:

XML Variable Property		Description
Variable Name		This property is used to specify the name of the variable.
Type		This property specifies the type of the XML Variable. The available XML Variable types are XML Document and XML Iterator.
Description		This property specifies the description of the XML Variable
Scope	Global	If the XML Variable is of Global scope, then you have to set the value of this field as Global for the variable. Where that variable can be used anywhere in that workflow

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

XML Variable Property		Description
		instance.
	Local	If the XML Variable is of Local scope then the value of the variable is local to a workflow instance.

Introduction to XML Document XML Variable

An XML Variable of type **XML Document** can be used to fetch the required items.

XML Variable of type 'XML Document'

When the variable type is 'XML Document', the following properties are displayed as seen in the image below.

Property Description:

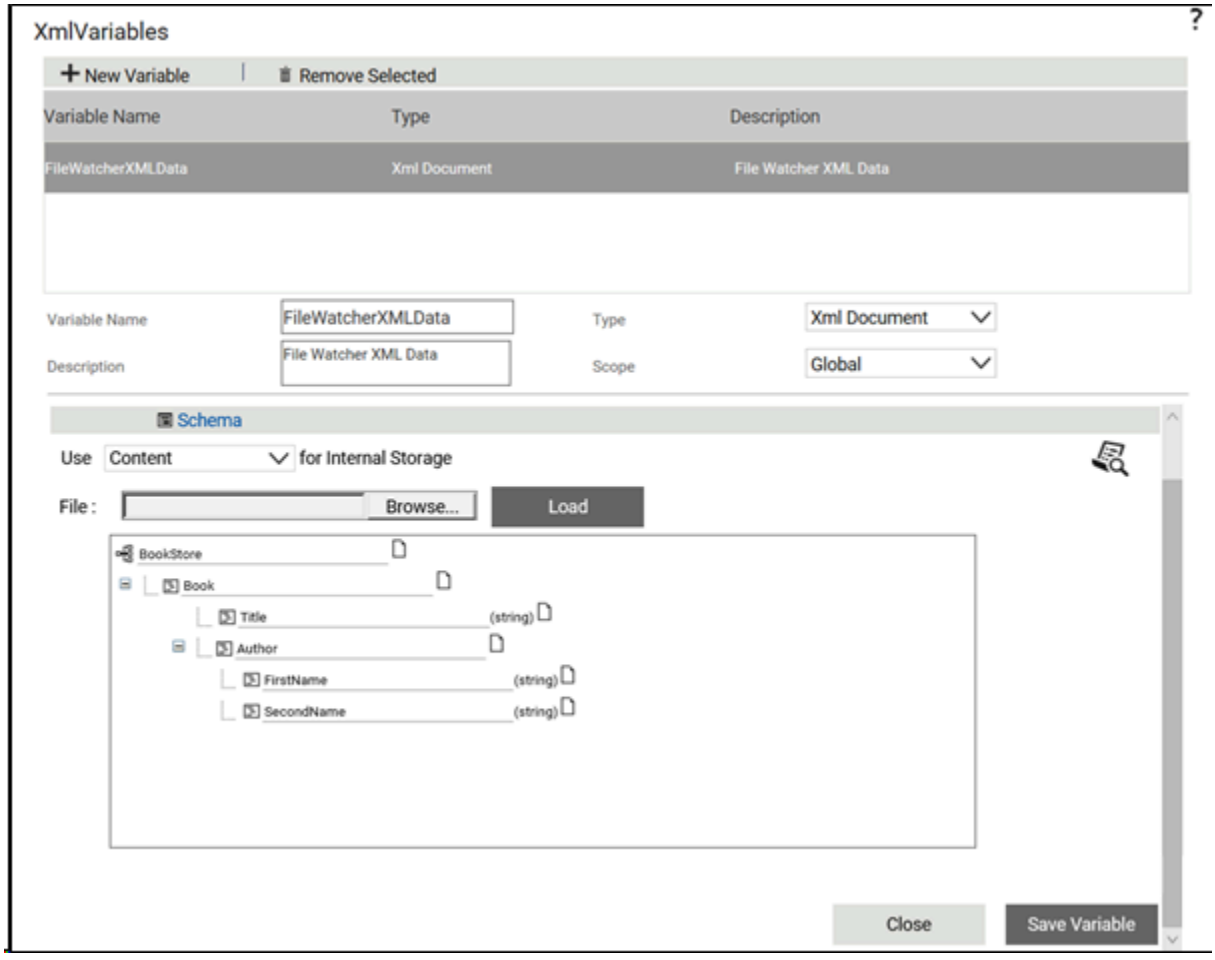
XML Variable Property	Description
Internal Storage	This property is used to specify the internal storage type of the XML Variable. • If the selection is Content, then XML Variable value will be stored as content in workflow context. You cannot update values for such XML variables, since the content data cannot be changed during workflow execution. • If the selection is Variable, then the same will be stored as a variable. You can update the values for such XML variables using "Update Variable" activity under engine activities. **Note:** The default storage option of XML variable is Variable.
File	Location of the schema file, if any XML schema is available. Otherwise user can create the schema using Schema designer.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create XML Variable of Type 'XML Document'

To add a XML Document Variable

1. Click **New Variable** button in the XML Variable User Interface.
2. Enter the following information:
   - **Variable Name**: Enter the name of the variable.
   - **Type**: Select XML Document from the drop-down list. This field defaults to XML Document. The XML Iterator type option is available only if another variable of XML Document type exists.
   - **Description**:- Enter a description for the variable.
   - **Scope**: Select the scope of the variable. The scope of the variable can be either Global or Local. Select Local, if the value of the variable is local to a workflow instance.
3. **Schema**: Build the XML Schema. You can either build the schema or use the existing XML file to create the schema.
4. Specify how the variable is to be used in Use for Internal Storage field. The field defaults to Content. To store as variable, select Variable in this field. If the scope of the variable is **Global**, you must set this field to **Variable**.
5. Click **Save Variable** to save the new variable.
6. Click **Close** to save the node properties.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

See Also: Build XML Schema

Build XML Schema

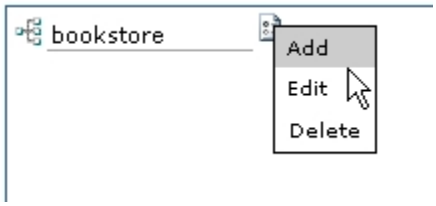
You can build a XML Schema in two ways:

1. Define schema in the XML Variable interface
   a. Adding a Node
   b. Editing a Node
   c. Deleting a Node
2. Loading schema from an existing file

Define Schema in the XML Variable Interface

When a new variable is created, the schema displays the root node by default. Click the string "root"and type the name over it.

The following image shows the node options:



To add a node

1. To add a node, click the Properties icon to the right of the name. Select **Add**. The **Properties** window for the new node appears.
2. Specify the following properties of the node:
   - **Name**: Enter a name of the node.
   - **Type**: Select the node type. The options available are **element** and **attribute**.
   - **Data Type**: Select the data type. This property specifies the data type of the XML Node. The available data types are string, integer, long, double, decimal, date, time, dateTime, boolean, and base64binary.
   - **Repeating**: Select this check box, if the node is a repeating one.
3. Click **OK**.
4. Click **Save Variable** to save node properties.
5. Click **Close**.
6. To add more nodes, repeat step 1 to step 6.

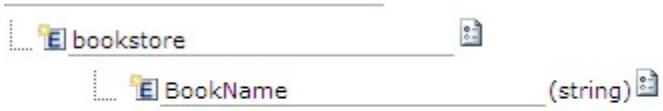
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: Select the respective node where you want add a node. If a node is of Attribute type, then you cannot add a node under it. The Add option will be disabled for Attribute type of node.

To edit an existing node

1. To edit an existing node, click the **Properties** icon to the right of the node to be edited.
2. Select **Edit**. The Properties window for the existing node appears.

3. Modify properties in the Properties window.
4. Click **OK**.

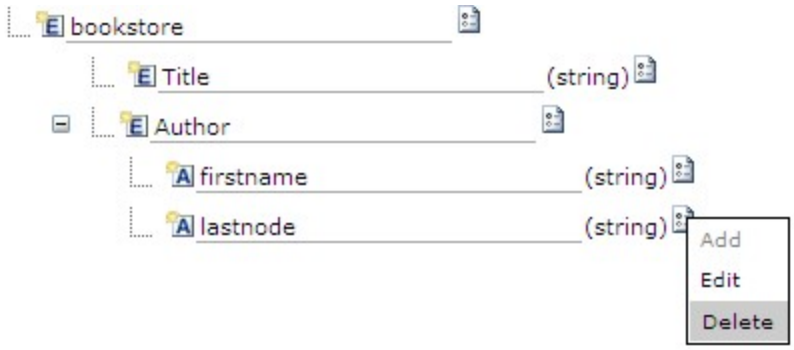


5. Click **Save Variable** to save node properties.
6. Click **Close**.

To delete a node

1. To delete a node, click the **Properties** icon to the right of the node to be deleted.
2. Select **Delete**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



To load Schema from an Existing File

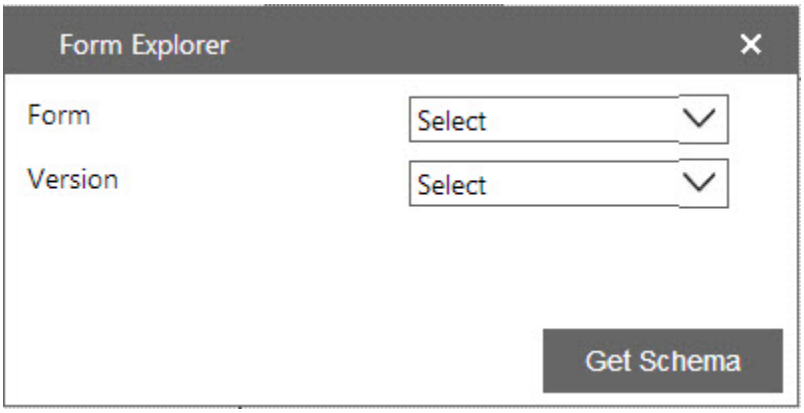
1. Click **Browse** to select file with schema information. You can select XML files to load schema.

2. The XML schema is loaded from the file.
3. To edit a node, right-click the node, and then select **Edit**. Modify properties in the Properties window.
4. To delete a node, right-click the node, and then select **Delete**

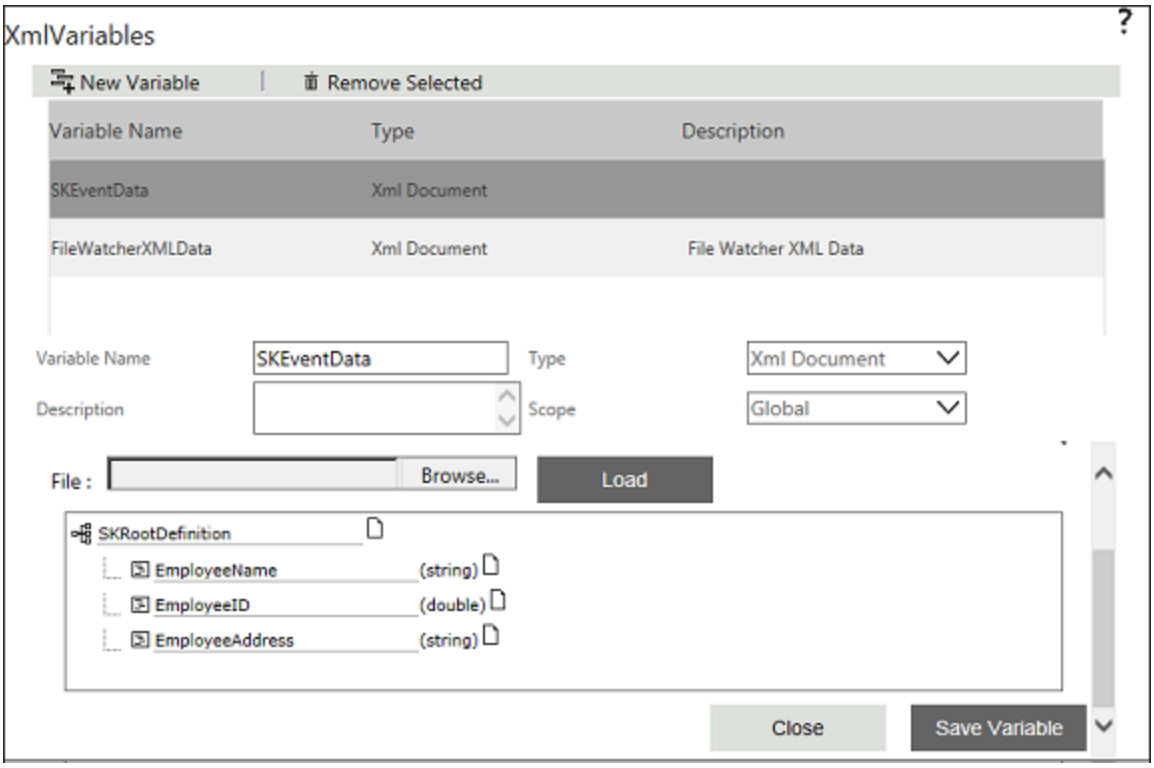
Determine XML Variable Schema from Forms

After a form is associated to a particular workflow, the form creates the XML Variable named **SFFormData** of type **XML Document** in the **Start** activity of that workflow. This will have the schema of the form.

AVEVA Work Tasks provides the **Form Explorer** icon to choose the form and its version. This icon will get displayed only for XML Variable of type XMLDocument. Any XML Variable of type XML Document can now get its schema from any form and its version available in the **Manage Forms** List.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Before introducing, when some changes were done in the form, the XML Variable had to be deleted and the form had to be re-associated in order to get the updated list of controls.

Refer to the *Lists and Forms Guide* for more information on Lists and Forms.

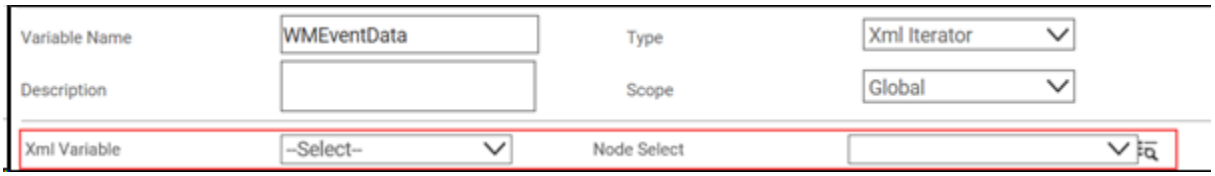
Introduction to 'XML Iterator' XML Variable

XML Iterator Variables allows you to define variables for repeating XML elements and attributes. This variable type represents a collection of XML nodes at any level in the XML Variable schema. It allows you to perform actions on XML nodes such as looping through XML nodes and deriving the value of a specific node at any location.

Note: The XML Iterator type option is available only if another variable of XML Document type exists

XML Variable of type 'XML Iterator'

When the variable type is changed to **XML Iterator**, following extra properties are displayed as seen in the image below.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Description

'XML Iterator' XML Variable Property	Description
XML Variable	All variables of type XML Document and XML Iterator are listed for selection. Select the parent XML Variable. The parent variable of an XML Iterator variable can be another XML Iterator Variable.
Node Select	Only nodes in the parent variable are displayed in this drop-down. Select the node that the variable represents.

See Create XML Variable of Type XML Iterator for more information.

Create XML Variable of Type 'XML Iterator'

To create XML Variable of type XML Iterator Variable

- Click **New Variable** button in the XML Variable Interface.
- Enter the following information:

  Variable Name - Enter the name of the variable.

  Description - Enter a description for the variable.

  Type - This field defaults to XML Document. Select XML Iterator from the drop-down. The XML Iterator type option is available only if another variable of XML Document type exists.

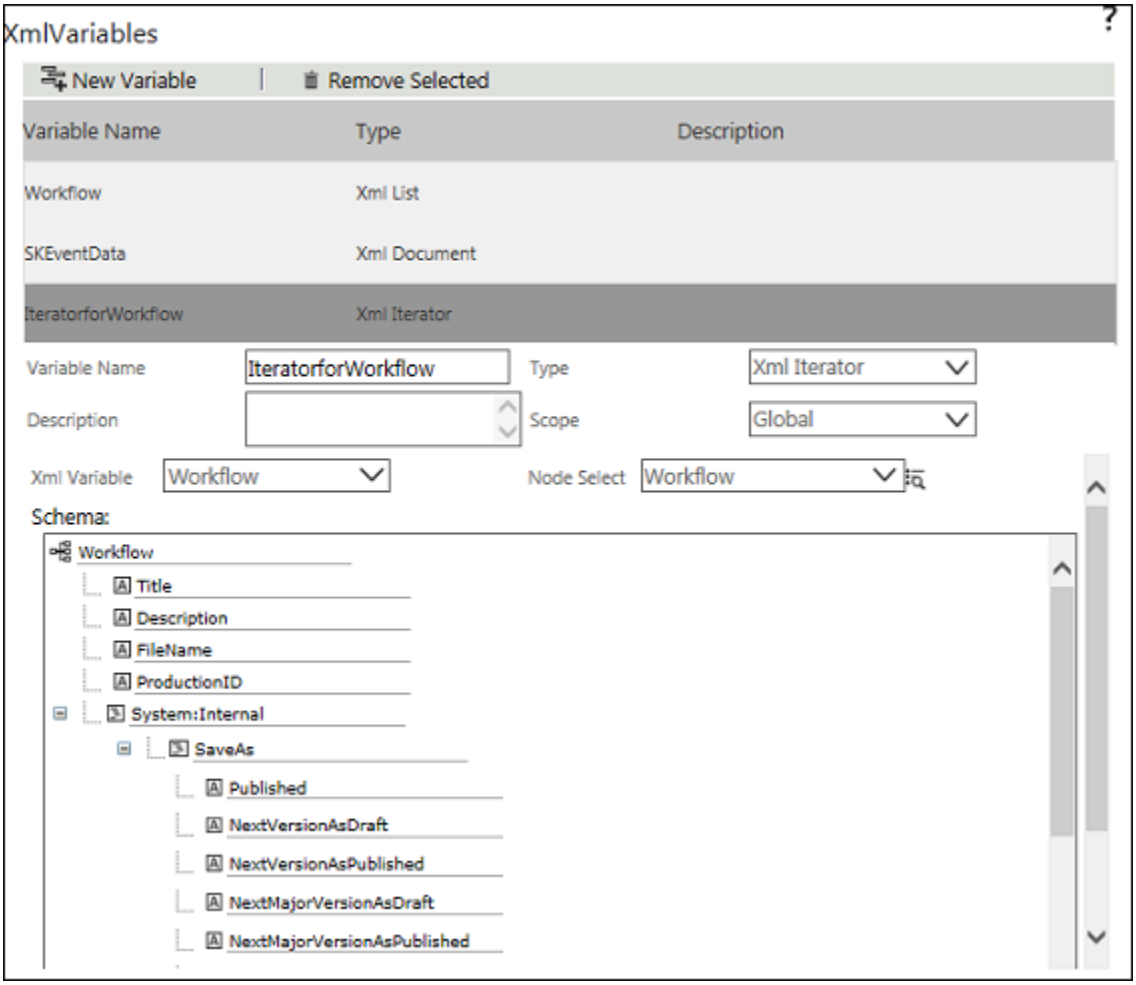
  Scope - Select the scope of the variable. The scope of the variable can be either Global or Local.
- When the variable type is changed to **XML Iterator**, two additional properties are displayed as seen in the image below.

  XML Variable - Select the parent XML Variable. All variables of type XML Document and XML Iterator are listed for selection. The parent variable of an XML Iterator variable can be another XML Iterator Variable.

  Select Node - Select the node that the variable represents. Only the nodes in the parent variable are displayed.
- Click **Save Variable**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

XML Iterator Variable Properties



Use 'XML Iterator' Type Variables

XML Iterator Variables can be used in any of the following ways:

- **Building conditions for setting Activity Properties** - XML Iterator Variables can be used like an XML Variable to build conditions for setting Activity Properties. However, when you select the XML Variable of XML Iterator type, only the nodes under the selected node of the parent variable are shown.
- **In ForEach-Loop activity** - XML Iterator variables can be used in the ForEach-Loop activity to loop through an activity till it executes for the entire collection in the XMLIterator variable. Example of XML Iterator Variable in ForEach-Loop.
- **Navigate to a specific node in the collection** - XML Iterator variables can be used in the XML Navigator Activity to go to a specific node in the collection and then perform an action. Example of XML Navigator Activity.

Example of XML Iterator Variable in ForEach-Loop

In this example, the XML Iterator Variable is used to get approval from all managers in the Managers.XML file

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

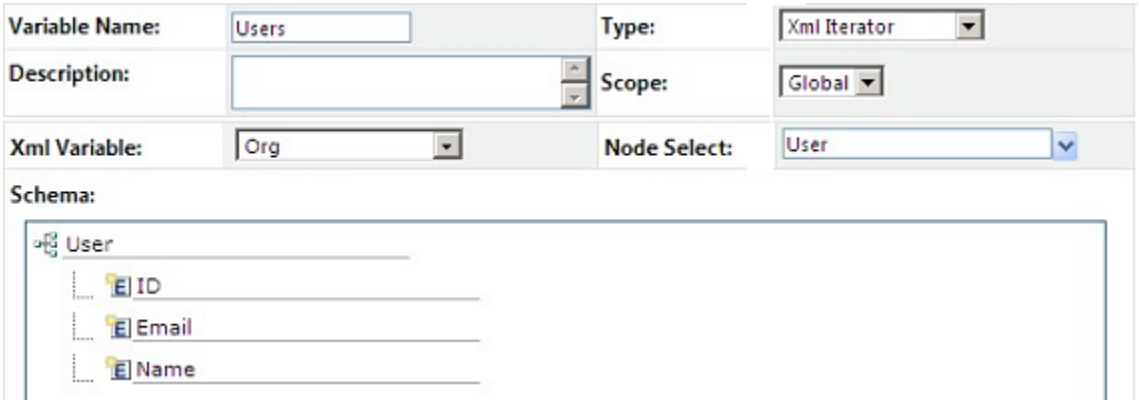
containing the list of all the users who are managers.

Managers.XML file

```
<Managers>
<Users>
<User id=1>
<Name>John</name>
</User>
<User id=2>
<Name>Jim</name>
</User>
<User id=3>
<Name>Victor</name>
</User>
<User id=4>
<Name>Andy</name>
</User>
</Users>
</ Managers >
```

Step 1: XML Iterator Variable is defined for users. The node Users holds the collection of managers.

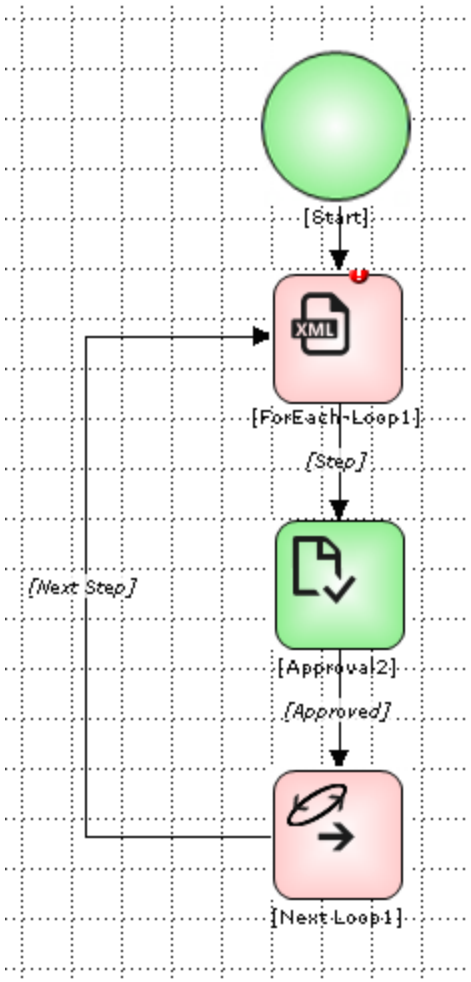
XML Iterator Variable for Managerial Users



Step 2: The approval activity is set within a ForEach-Loop activity.

ForEach-Loop Activity for Looping Approvals

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

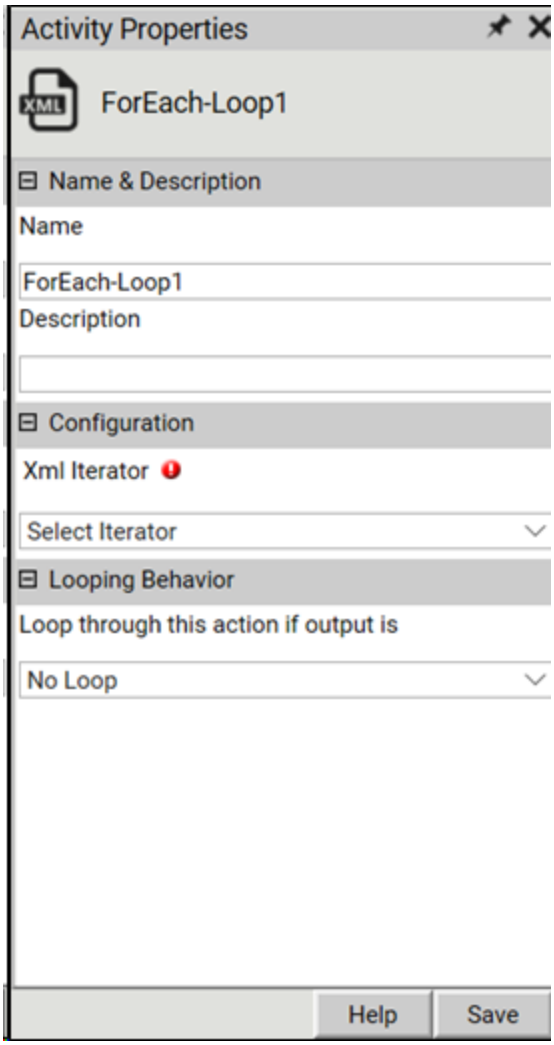


Step 3: The XML Iterator Variable 'Users' is defined in XML Iterator field of ForEach-Loop properties. The Execution type is set to Serial as the approval is to be processed serially.

Note: The Execution type is set to Parallel as the approval is to be processed simultaneously by all approvers. When the Execution type is Parallel, the Next Loop activity is not required.

ForEach-Loop Property for XML Iterator

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



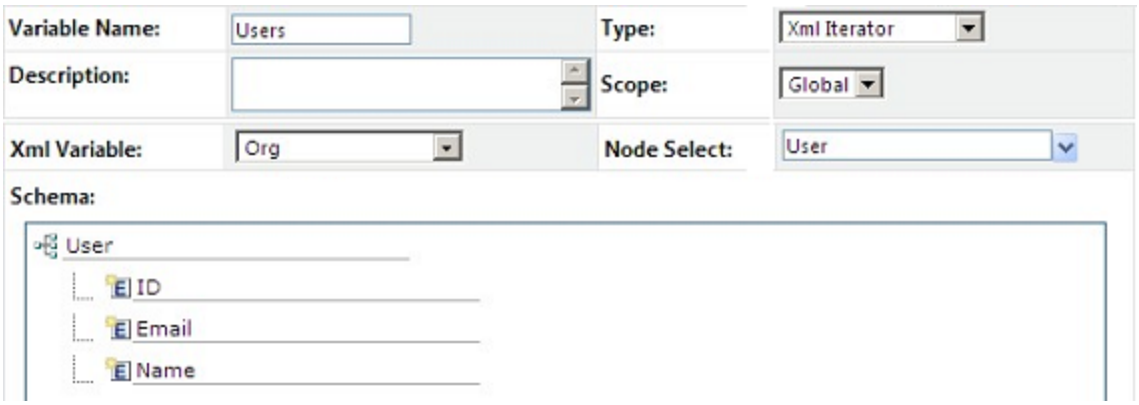
Example of XML Navigator Activity

A company allocates new laptops to employees as and when new inventories are received based on date of requisition. Allotments are to be approved by the manager of the requisitions user. Users with requisitions are added to a waiting list by the Facilities Management System. Allotments are made to the user at the top of the list. When the allotment is complete, the user is removed from the list. If a manager rejects the allotment, the allotment is made to the next person in the waiting list. This example demonstrates how the XML Navigator Activity is used to automate a process.

Step 1: A global XML Iterator variable is defined for the node users.

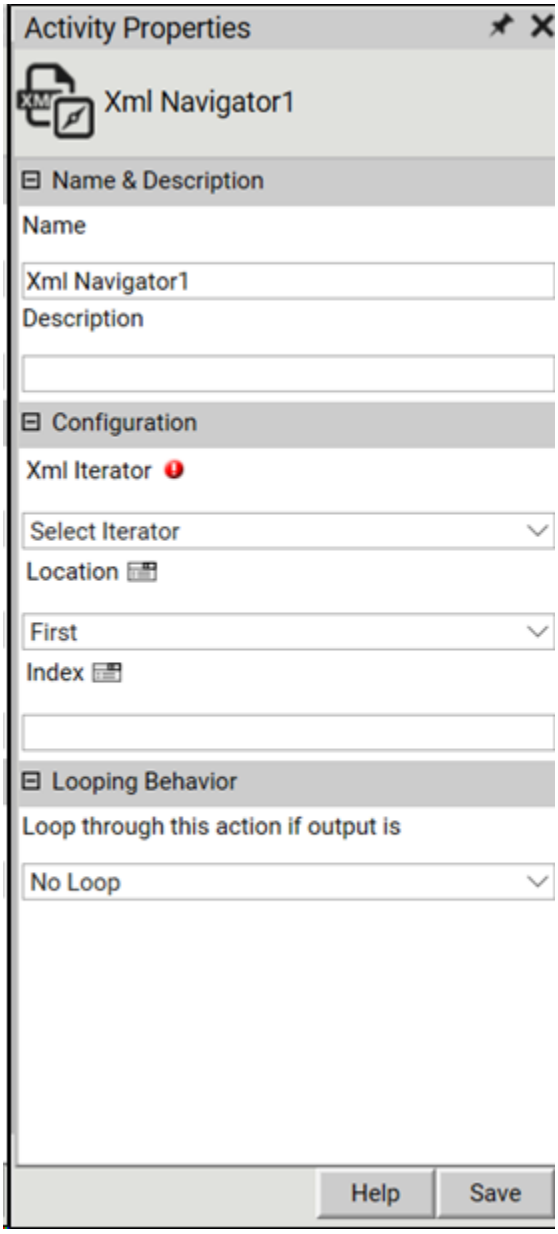
XML Iterator Variable for Users

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Step 2: The XML Navigator activity is added to the workflow with **Location** set to First.

XML Navigator Properties

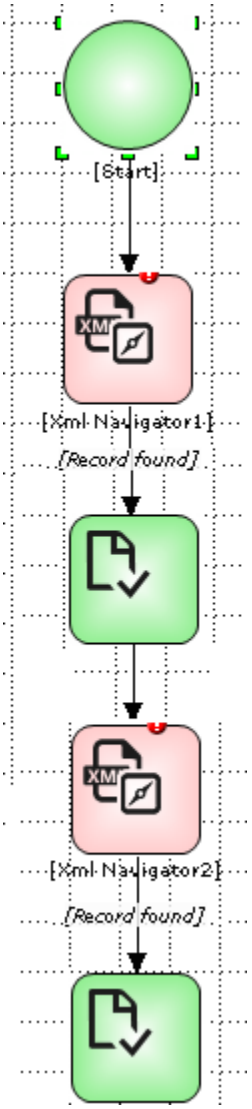


© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Step 3: An Approval activity is added after the XML Navigator Activity that sends an approval task to the manager of the user at the top of the list. The XMLNavigator links to Approval only if a record is found in the waiting list.

Step 4: The Approval task is linked to another XML Navigator Activity with the property set to **Next**.

Step 5: The following figure depicts the workflow after adding these two properties.

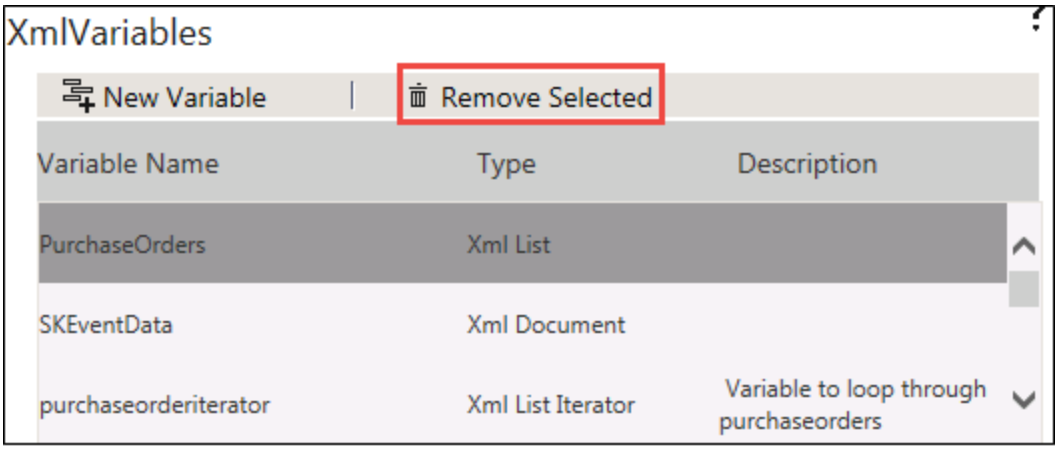


Delete XML Variables

To delete an XML Variable

1. Select the variables to be removed.
2. Click **Remove Selected** in the **XMLVariables** window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Note: You cannot delete a variable that is the parent of another **XML Iterator** type variable

Communication Activities

There are two main types of Communication activities:

- Notification Activity: The Notification Activity is incorporated in the workflow process design to send notifications to actors in the form of email.
- AVEVA Work Tasks Pro Push Notification Activity: The AVEVA Work Tasks Pro Push Notification activity is used to send notifications to the AVEVA Work Tasks Pro application.

Notification Activity

Activity description

The Notification Activity is incorporated in the workflow process design to send notifications to actors in the form of email. The messages can be customized for each actor by appending the resource properties to the message.

Activity Properties

The Notification activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Notification activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Notification Type - The supported Notification type is "Email".

Property Type: Mandatory (This property must be set if the action is to be assigned to any resource(s).)

Actors

The property in the Actors group has been described below. You can use this property to specify the content of the notification.

ToResource- This property specifies the resource(s) to which the notification is to be sent.

Property Type: Mandatory (This property must be set if the action is to be assigned to any resource(s).)

Steps to set the To property

1. To specify the actors to receive the Notification message, click the button for the 'To' property to open the property window.
2. In this window, build an expression to select the actors using the actors properties. Select an attribute from the first drop down list, then select the operator, type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the corresponding drop downs. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression to the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Notification - ToResource for a detailed description of the To property window.

See the Using XML Variables section in the About XML Variables topic for details on how to use the XMLVariables to build the expression.

Notification Contents

The properties in the Notification Contents group have been described below. You can use these properties to specify the content of the notification.

From Email Address - This property specifies the email address from which the email notifications will be sent. If the Notification type is of the form 'Email' then this property must be set. If it is not set, then the email notifications will not be sent.

Property Type: Optional (This property needs to be set only if the notification type selected in the corresponding property is 'Email'.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Message - This is the actual content of the notification sent to the resource(s). The notification can be customized for each resource.

Property Type: Optional (This property needs to be set only if required.)

Steps to set the Message property

1. To specify the Notification message, click the button for the 'Message' property to open the property window.
2. In this window, enter the message text directly in the text editor.
3. If you want to personalize the message you can do so using the **Field** controls to add resource property values. For example, to add a message that includes the name of the actor submitting the approval request, you can do as follows: First type in the text "Hello". Next select "Variable" and "Variable.SubmittedBy.name" from the two drop downs for **Field** and click **Append**. This will add the placeholder for the variable after the text entered in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the name, resulting in a personalized salutation. Type in a message in the next line to complete the message body.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, repeat the last command, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the message, click **Update** to save it.
7. Click the **Close** button to close the window without saving the message.

See Notification: ToResource for a detailed description of the Message property window.

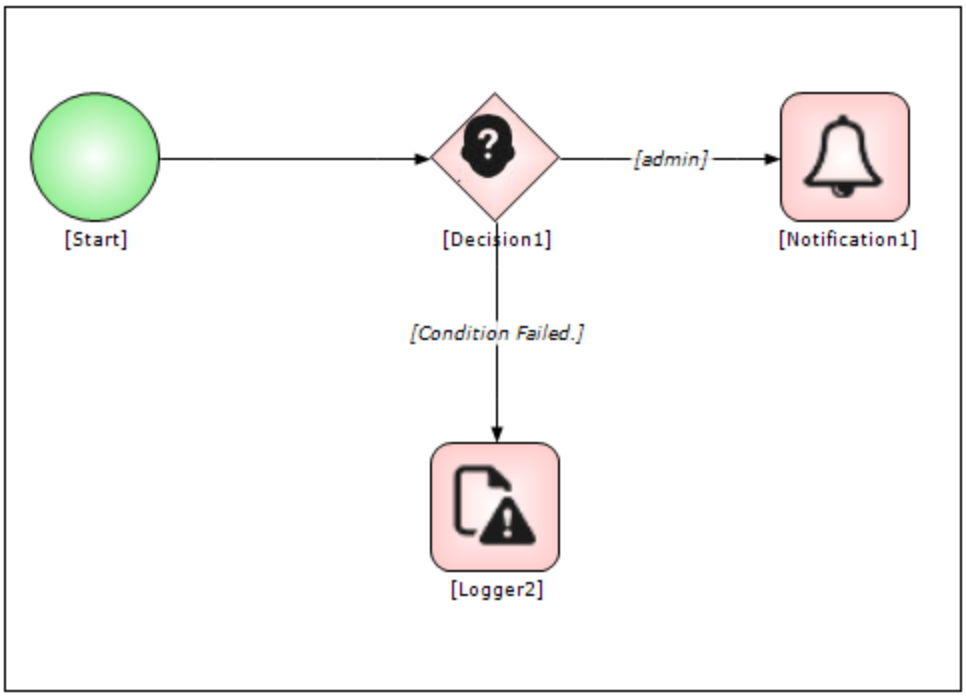
Activity outputs

The Notification Activity does not return any value.

Example for Notification Activity

In an organization, whenever Decision1 condition is successful, a Notification is sent to the Admin. If the Decision1 condition fails, it will be logged into the Logger2, as shown in below workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



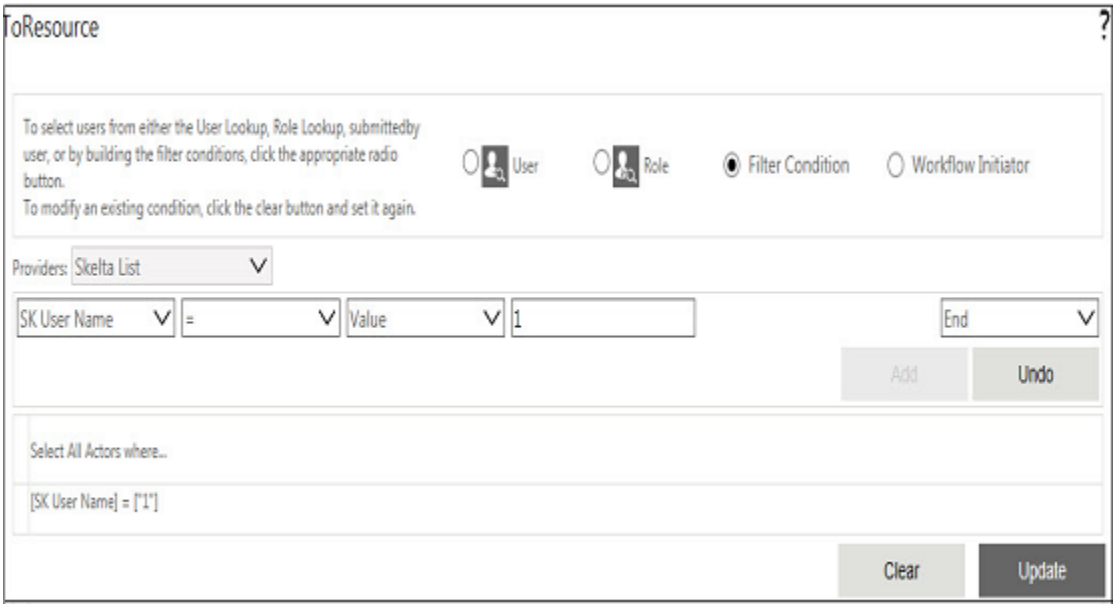
Whenever a workflow triggers a Decision, it will be logged in Logger2 if it fails. If Decision1 is successful, a Notification will be send to the Assign actor.

Settings For Notification Activity:

Notifications can be sent in the form of **Email** to cell phones.

Step 1: Select **Notification Type** as **Email** type to send notification.

Step 2: Click **ToResource** property to specify the resource(s) to which the notification has to be sent.



Step 3: Select specified **Actor** and click **Update** to save the changes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Notification: ToResource

You can set the actors to whom the Notification is to be sent in this property window. To open this window, click the button for the 'To' property.

The Assign Actor window provides the flexibility of assigning actors either by building an expression or through User lookup, Role lookup or Workflow Initiator. This window has a set of radio buttons and drop downs to select the actor and different parameters required to build an expression to identify the actor(s). You can also find related buttons next to the drop downs.

Different Methods of Assigning an Actor

- **Assigning an Actor by building an expression**:

  Filter Condition is the default option that is selected when the Assign Actor window is accessed. This option allows you to build an expression to identify the actor. The section below explains how the set of drop down buttons helps you choose different parameters required to build and expression.
- The Providers drop-down- You can select the required provider from the Providers drop-down.
- The Attribute drop down - You can select the attribute to be used to identify the actor, e.g., "AdministratorId", in this drop down.
- The Operator drop down - You can select the operator for the expression here. E.g., "="
- The Value type drop down - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

- **Assigning an Actor through User Lookup**
  Through the **User Lookup** you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through User Lookup
  - Select the **User Lookup** option.
  - The **User Lookup** dialog is displayed, search and select the required actor.

  - Click **Update** in the **User Lookup** dialog and verify the Assign Actor window.
    In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Click **Update** in the Assign Actor(s) window to update the selected actor(s) in **Assign Actor** property. Actor(s) selected through User Lookup will be updated in the Assign Actor property.

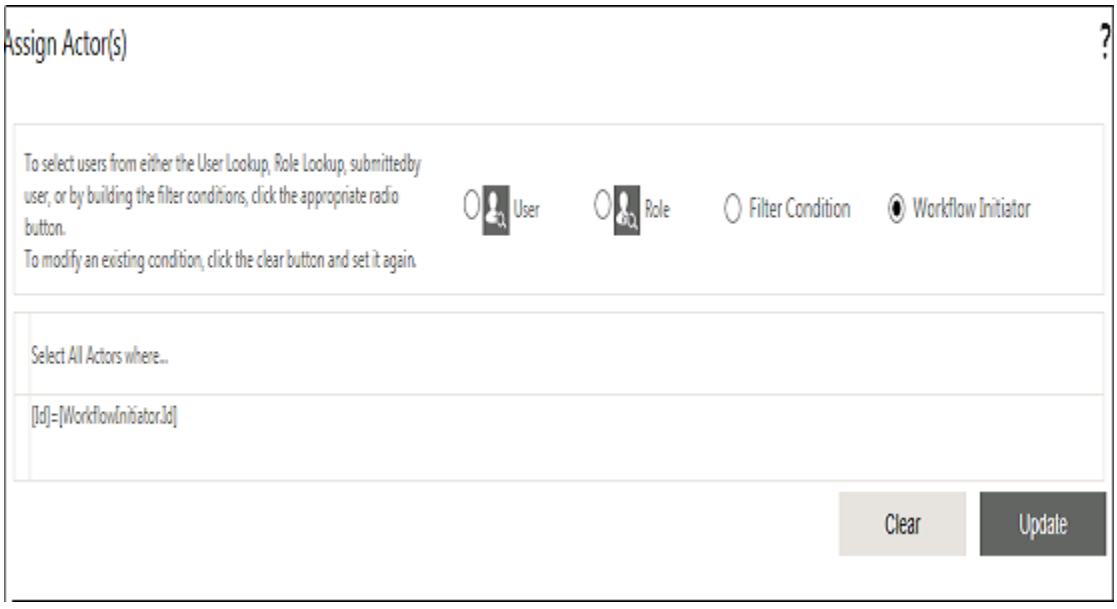
- **Assigning an Actor through Role Lookup**
  Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an actor through Role Lookup
  - Select the **Role Lookup** option.
  - The **Role Lookup** dialog is displayed, search and select for the required role.

  - Click **Update** in the **Role Lookup** dialog and verify the Assign Actor window.
    In the **Assign Actor** window, you will see that an expression is displayed, refer the image below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Click **Update** in the Assign Actor(s) window to update the Assign Actor property.

- **Assigning an Actor through Workflow Initiator**
  Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Assign Actor window, refer the image below:

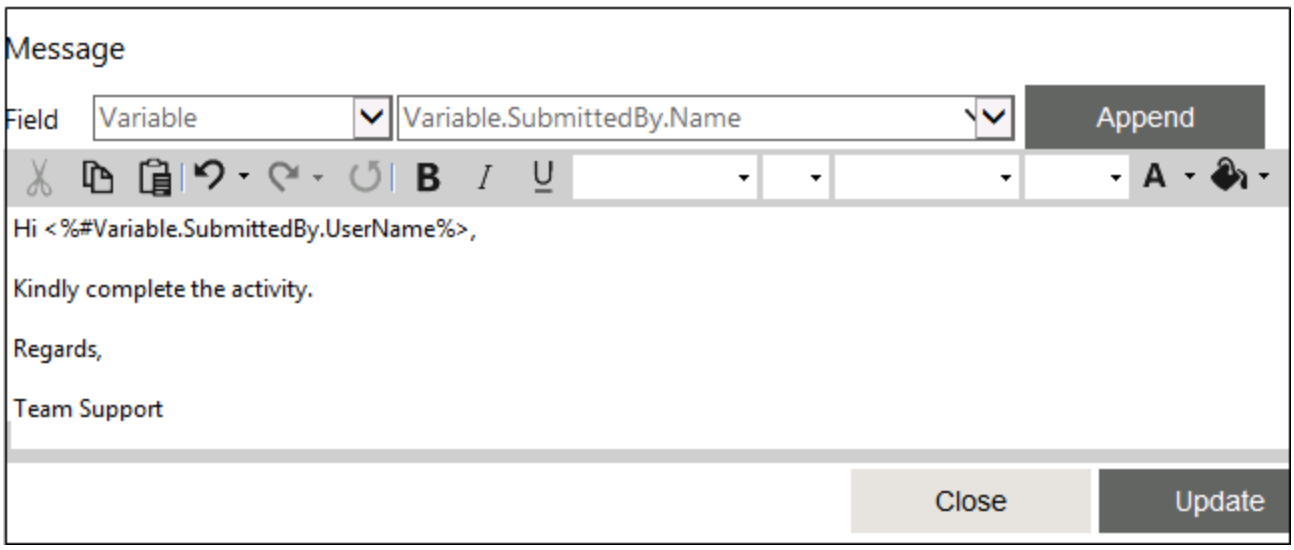


Notification: Message

Message Property window

You can specify a message for the Notification in this property window. To open this window, click the button for the 'Message' property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The window has a text editor to enter the Notification message text. You can do this either by entering a discrete value directly in the text editor or by using the **Fi**eld controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/drop down - You can specify the actual value of the message. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the message text in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Notification message.
- **Append** - You can click this button to add the specified value, variable or content to the text editor.

Tip: You can specify the Notification message using a combination of discrete value and variable or content. This helps in personalizing the message for each actor. For example, you can specify the salutation line in the message as "Hello <%#Variable.SubmittedBy.name%>,". Here, the string "Hello" must be typed directly in the text editor. The second half of the salutation is a placeholder, which will be replaced by the variable value during run-time. This must be added by selecting the appropriate variable option from the **Field** drop down and clicking **Append**. The rest of the message can be typed in the editor. This will result in the same message going to different actors with their respective names in the salutation line.

The text tool bar above the text editor allows you to manage and format the Notification message text. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the message
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window, you will find the following buttons:

- **Update** - You can click this button to save the message.
- **Close** - You can click this button to close this window.

AVEVA Work Tasks Pro Push Notification Activity

Activity Description

The AVEVA Work Tasks Pro Push Notification activity is used to send notifications to the AVEVA Work Tasks Pro application. When this activity is added and configured in a workflow along with other activities which need human interaction, a notification is sent to the actor intimating the actor that action is required on the assigned task.

Activity Properties

Name and Description

The properties in the Name & Description are used to specify the name and description for the activity.

Name: This property is used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description: This property is used to specify a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group allows you to configure the functionality of the activity.

Recipient Resource: This property is used to configure the resources who have to receive the notification. A maximum of 16 resources can be configured as recipients to receive notification. If more than 16 resources are configured, then the 16 active resources will receive the notifications.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

You can also build an expression to configure the recipient, this expression will be evaluated at runtime and the recipient will be configured.

Property Type: Mandatory (This property needs be set to add the recipients.)

For more information on Recipient Resource, see Configure Recipient Resource.

Notification Type: This property allows you to configure custom notification type based on the device and operating system used.

Property Type: Mandatory (This property needs to be set to configure the type of notification specific to a device.)

For more information on Notification Type Setting, see Setting Notification Type.

Message: This property allows you to configure the content of the notification message.

You can also build an expression to configure the notification message. The message will be updated dynamically at runtime.

Property Type: Mandatory (This property must be set to configure the content of the notification.)

Retry on Failure?: When this property is set to **Yes** and the notification is not sent, attempts to re-send the notification will be made based on the value defined in the Retry Count property.

By default it is set to **Yes**.

Property Type: Optional (This property needs to be set only if necessary.)

Retry Count: Number of re-tries that needs to be attempted to send the notification. The value specified for this property should be from 1 to 10 only.

Property Type: Optional (This property needs to be set only if necessary.)

Activity output is successful: This property lets you decide when the activity is successful. The available options are **If notification is sent to at least one device** and **If notification is sent to all devices**.

- When **If notification is sent to at least one device** is selected, the activity will be successful only when the notification is sent to at least one device.
- When **If notification is sent to all devices** is selected, the activity will be successful only when the notification is sent to all the devices

Reference Topics

- Set Notification Type
- Mapped Error Outputs
- AVEVA Work Tasks Pro Push Notification Activity Scenarios

Configure Recipient Resource

The **Recipient Resource** property allows you to configure the users who have to receive the notification. A maximum of 16 resources can be configured as recipients to receive notification. If more than 16 resources are configured, then the 16 active resources will receive the notifications.

Different Methods of Assigning an Recipient Resource

Assigning an Recipient by building an expression:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Filter Condition is the default option that is selected when the Recipient Resource is accessed. This option allows you to build an expression to identify the Recipient. The section below explains how you can choose different parameters required to build and expression.

- The Providers list - You can select the required provider from the Providers list.
- The Attribute list - You can select the attribute to be used to identify the Recipient. For example, "AdministratorId", in this list.
- The Operator list - You can select the operator for the expression here. E.g., "="
- The Value type list - You can select the type of value to assign to the attribute in the expression. You can specify Variable, Content, Value, or XMLVariables here.
- The Value text box/list - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding list.
  - If you had selected "Value", it will display a text box here. You can enter a discrete value in this box to complete the expression.
  - If you had selected "Variable", "Content", or "XMLVariables", there will be a list instead of the field. This list will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator list - You can select logical operators from this list to build compound expressions. The options available are "End", "And", "Or", "')' And", and "')' Or". You can select "End" to complete the expression.
- **Add** - You can click this button to add the new expression to the text area.
- **Undo** - You can click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

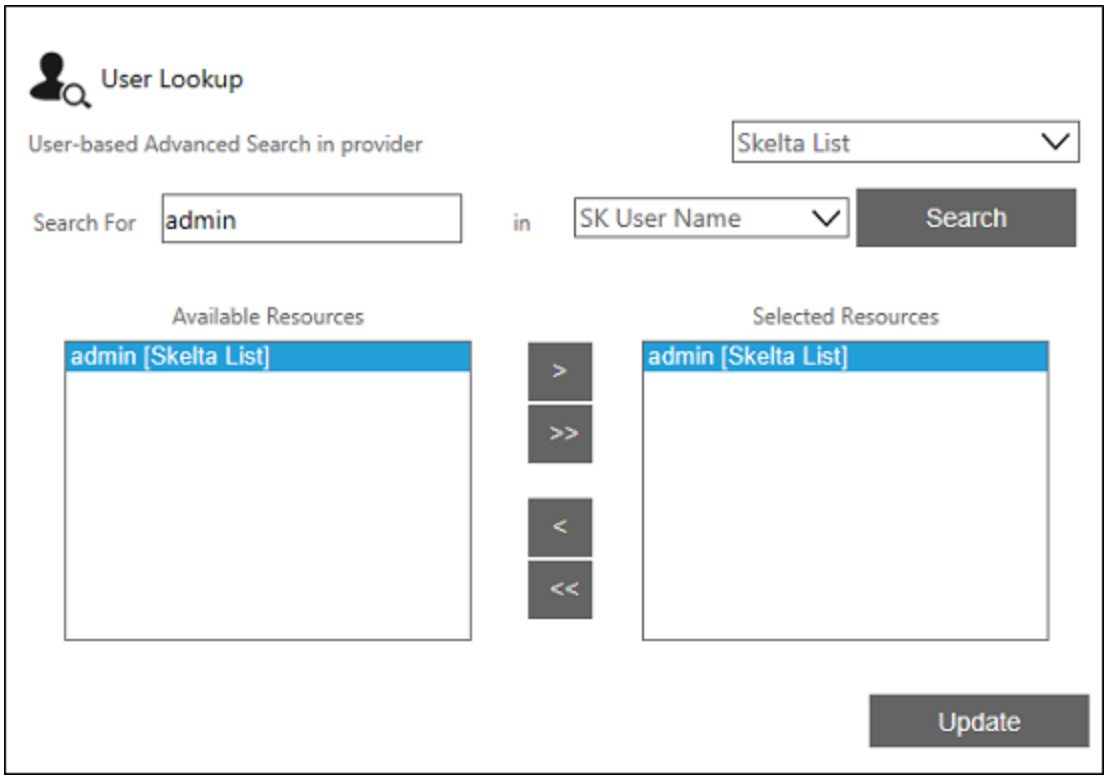
- **Clear** - You can click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - You can click this button to save the expression that has been added to the text area.

To assign an Recipient Resource through User Lookup

Through the **User Lookup** you can search and select user(s). This automatically builds the expression and the same is updated in the text area. Follow the steps given below to assign an Recipient Resource through User Lookup

1. Select the **User Lookup** option. The **User Lookup** dialog is displayed.
2. Search and select the required user.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



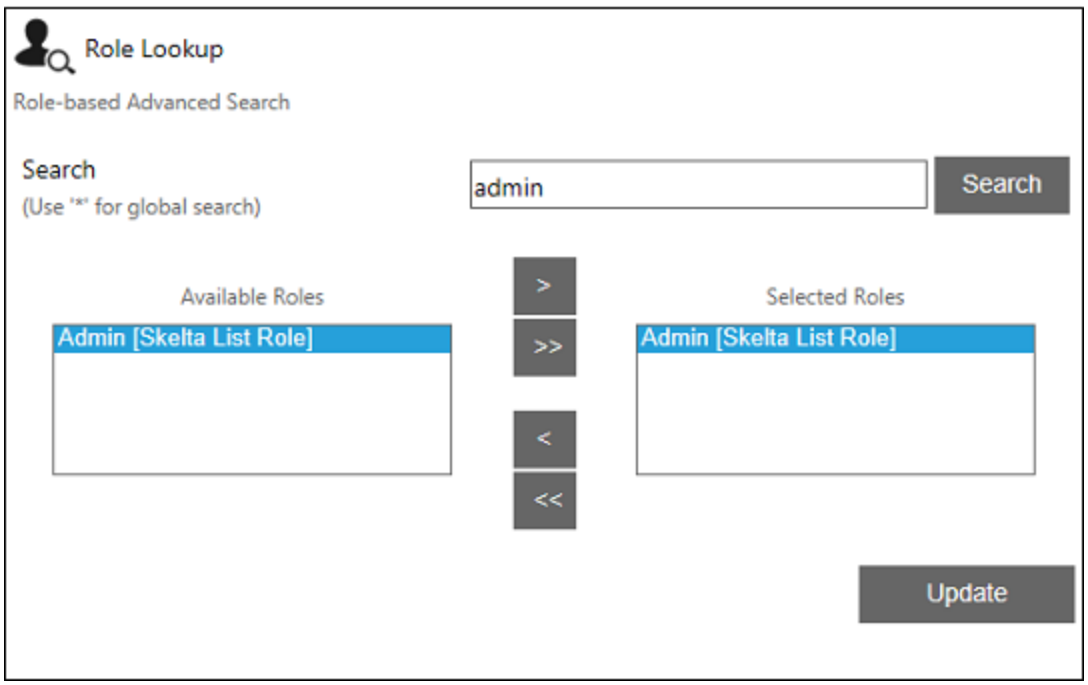
3. Click **Update** in the **User Lookup** dialog. In **Recipient Resource**, you will see that an expression is displayed.
4. Click **Update** in **Recipient Resource** to update the selected user in the **Recipient Resource** property.

To assign an Recipient Resource through Role Lookup

Through the **Role Lookup** you can search and select a specific role. This automatically builds the expression and the same is updated in the text area.

1. Select the **Role Lookup** option. The **Role Lookup** dialog is displayed.
2. Search and select for the required role.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click **Update** in the **Role Lookup** dialog and verify the Recipient Resource. In **Recipient Resource**, you will see that an expression is displayed.
4. Click **Update** in **Recipient Resource** to update the **Recipient Resource** property.

Assigning an Recipient Resource through Workflow Initiator

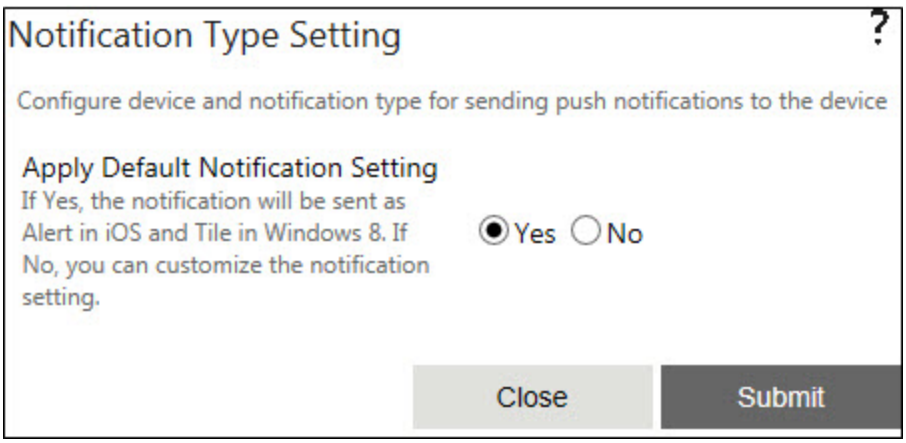
Selecting the **Workflow Initiator** allows you to assign the task to the Workflow Initiator, that is the user who closes the workflow. An expression is built automatically and updated in the text area of Recipient Resource.

Set Notification Type

In **AVEVA Work Tasks Pro Push Notification Activity**, you can configure different types of notification based on the device being used. You can choose to continue with the default notification type or customize the notification type.

To use the default notification type, set the option **'Apply Default Notification Setting'** as **Yes**. Default notification for iOS is **Alert** and for Windows 8.1 it is **Tile**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Configuring Custom Notification Type

1. Click the edit icon in **Notification Type** property. The **Notification Type Setting** is displayed.
2. Select **No** for the option **'Apply Default Notification Setting'**. The option of **Device and Notification Type** is now available for selection.

   The default selection for the option **'Apply Default Setting'** is **Yes**.
3. Select the operating system used on your device and then select the **Notification Type**.
   - iOS operating system, supports only the default notification specific to iOS.
   - For Windows 8.1 operating system, the available notification types are **Tile** and **Toast**
     - When **Tile** is selected the notifications are displayed on tile of the application
     - When **Toast** is selected the notifications are displayed as pop-up notifications

---

Note: Push Notification activity will continue to execute successfully even after unregistering for notification from the **Farm Configuration Wizard**. In such cases, unpublish the workflow, unregister for notification from the **Farm Configuration Wizard**, and then republish the workflow.

AVEVA Work Tasks Pro Push Notification Activity Scenarios

Activity in waiting state

The activity will be in waiting state, when the first attempt to send notification fails and the property **Retry on Failure** is set to **Yes**.

When the first attempt by the activity to send the notification fails, an entry is made into the database. This entry is read by the **ArchestrA Mobile Notification Service** which in turn attempts to re-send the notification based on the value entered in the **Retry Count** property.

The activity will be completed only after all the attempts to retry the notifications are made.

Activity output is successful when Recipient Resource is inactive/blocked/not logged in

When multiple recipient resources are configured in the AVEVA Work Tasks Pro Push Notification Activity and one or more recipient is inactive/blocked/not logged in, the activity will be considered as successful if the notification is sent to all other active recipients.

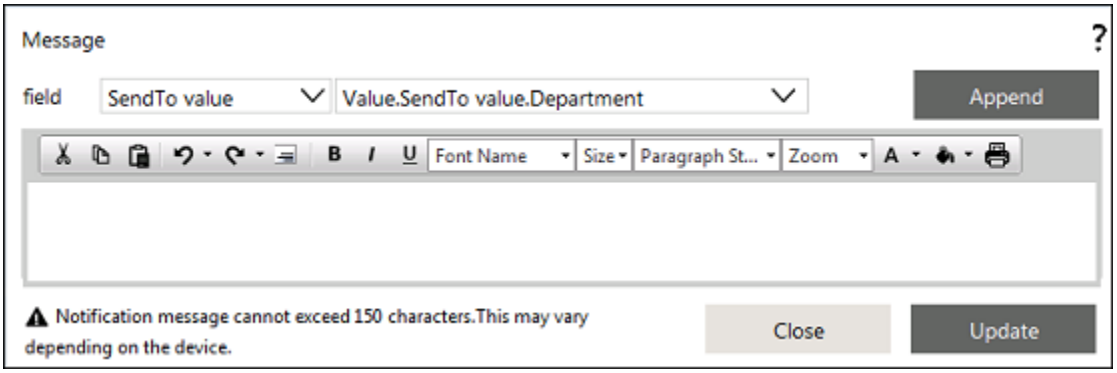
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Unsuccessful activity output scenarios:

- First attempt to send notification fails and **Retry on Failure** is set to **No**.
- When **Retry on Failure** is set to **Yes** and **Activity is successful** is set to **If notification is sent to at least one device:** If notification is not sent to any device even after consecutive attempts to resend notification based on the value specified in **Retry Count**.
- When **Retry on Failure** is set to **Yes** and **Activity is successful** is set to **If notification is sent to all devices:** If notification is not sent to one or more devices even after consecutive attempts to resend the notification based on the value specified in **Retry Count**.

Configure Notification Message

Use the **Message** property to configure the content of the notification message.



You can also build an expression to configure the notification message. The message will be updated dynamically at runtime.

For iOS devices, the notification message can have a maximum of 150 characters. In Windows 8.1 devices, if the notification message exceeds 208 characters, then the notification message is truncated. In both iOS and Windows 8.1 devices, the notification message is displayed in plain text, hence all html tags are removed.

Engine Activities

The following are the types of Engine activities:

- BlockingOutput Activity: The BlockingOutput activity facilitates synchronous execution of workflow activities with an active form.
- Database Activity: The Database activity enables execution of queries, stored procedures, and functions from the workflow.
- Decision Activity: The Decision activity can be used to insert a decision in the workflow.
- ForEach-Loop Activity: The ForEach-Loop activity is used to loop an activity through a collection within an XMLIterator Variable.
- For-Loop Activity: The For-Loop activity can be used to start a loop within a workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Logger Activity: The Logger activity logs messages like information, warnings, and errors.
- Next Loop Activity: The Next Loop activity can be used as the terminal activity in a loop initiated using a For-Loop Activity.
- Rule Activity: The Rule activity allows complex rules or expressions to be built into the workflow.
- Set Workflow Output Variable: The Set Workflow output variable activity can be used to set the output of the parent workflow from the child workflow.
- Synchronize Activity: The Synchronize Activity synchronizes the execution of different activities.
- Update Parent Variables Activity: The Update Parent variables activity is used to update a parent workflow variable from a child workflow, provided both child and parent workflow belong to the same repository.
- Update Variable Activity: The Update Variable activity can be used to update the value of Variables and XmlVariable that can be used in the subsequent activities.
- Workflow Activity: The Workflow activity enables the execution of a child workflow from a parent workflow.
- XML Navigator: The XML Navigator activity is used to either locate or navigate to a specific record in a collection within an XMLIterator Variable.

BlockingOutput Activity

Activity Description

The BlockingOutput activity facilitates synchronous execution of workflow activities with an active form.

This is typically used in forms, whose fields need to be updated based on the output of multiple workflow activities of the same workflow, executed one after the other, without closing the form.

Activity Properties

The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

Specify the Output to be returned to the application that calls this workflow when this activity is encountered.

Note:
- This activity works only when the event is in process like Item Adding, Item Updating and not for the events like Item Added, Item Updated because once the process is completed the item cannot be blocked any more. This activity is useful when you want to prevent the users from performing specific tasks. For example: If you want to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

prevent users from updating an existing item.
- When you use the BlockingOutput activity for returning the blocking output value, ensure that all the activities being executed before this activity, do not have sleeping behavior. For example: There should not be any activities, such as human or scheduler activities, which go to the sleep mode. However, Workflow activity with some specific settings can be included before this activity. For more information about the Workflow activity, see Workflow Activity.

Database Activity

Activity Description

The Database activity enables execution of queries, stored procedures, and functions from the workflow. The database activity establishes connection with the database server and retrieves or updates data in the database. The activity gets the schema of the database table to an XML variable according to the query, stored procedures, or functions passed.

Application Scenario

Consider a scenario where a manager wants to send appraisal forms to all the employees. The manager can add the database activity with a query to select the email address column from the Employee Database. The Output XML will have the schema based on the query and this XML variable can used to assign employees to whom the appraisal forms are to be sent. When the workflow is initiated, the query in the database activity will be executed and all the employees will receive the appraisal form in their Inbox.

Activity Properties

You can configure the Database activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **Database** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

Note: Every time you input a value for a property, ensure to save the data. Click the **Save** button on the **Activity Properties** window. You need to save the property so that the subsequent properties in the activity can inherit the required information.

Name & Description

You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

You can use these properties to configure the functionality of the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Database Connection

Database connection property is used to get the connection to the Database Server. You can use this property to select the Database connection (which has been configured in **Enterprise Console > Settings > Database Connections**).

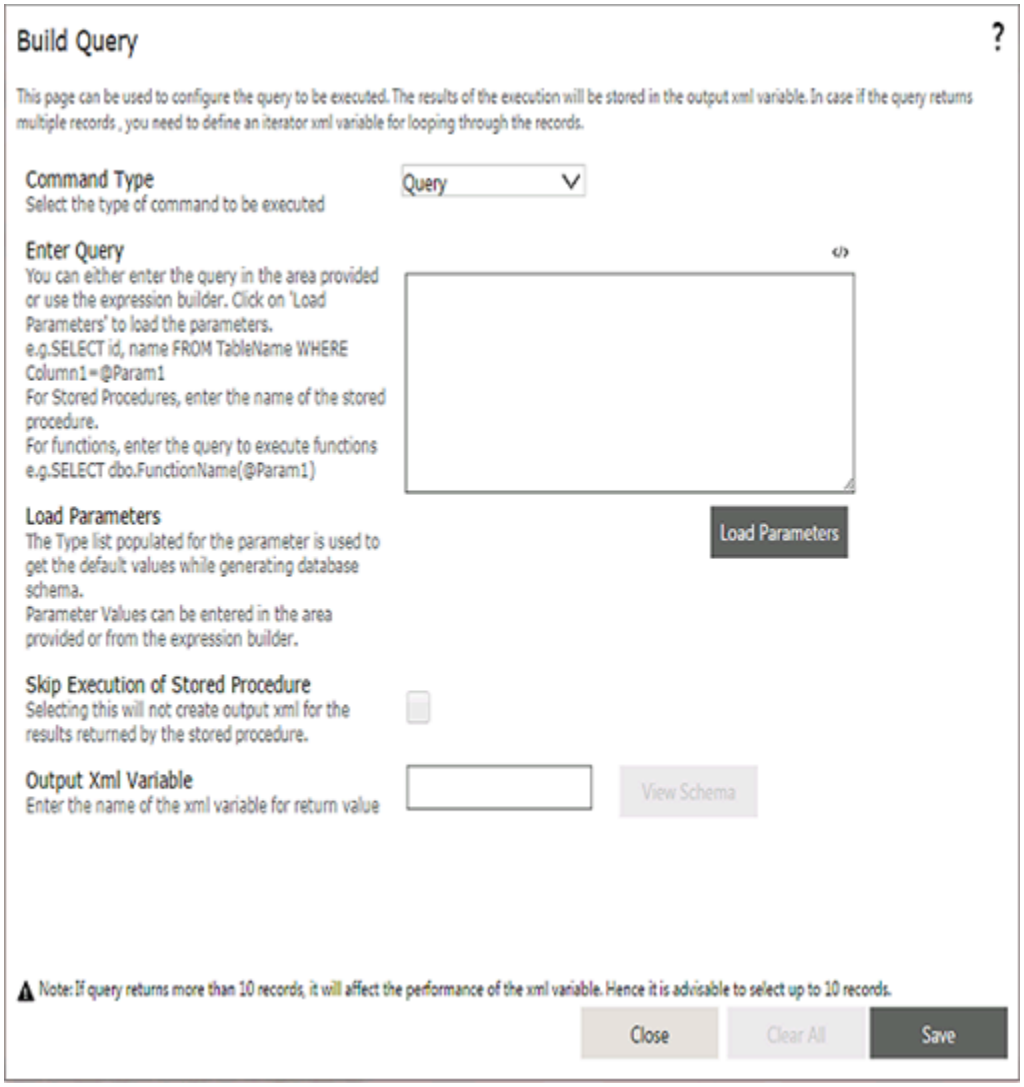
Property Type: Mandatory (This property must be set if the activity has to establish connection with the database server.)

Query Builder

To enter the query, click the **Query Builder** property to open the property window.

In this window, set the following properties:

1. Command Type
2. Query
3. Output XML variable



Command Type: The command types that can be selected

- Query

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Stored Procedure
- Functions

Enter Query: As the Command Type is selected, you can enter a query, Stored Procedure, or Function.

Note: The **Expression Editor <>** icon is displayed only for the **Command Type "Query ",** as the expressions set cannot be evaluated in design time for stored procedures and functions.

Query: Query can be entered in the text box or from the Expression Builder.

For example, the query can be **Select * from EmployeeTable** and if the query is to be passed with parameters then the query will be **Select * from EmployeeTable where EmployeeID=@Id**. Here @Id is the parameter. When you click **Load Parameters**, it will load the parameters within the query. In the Value field you can pass the value for the parameter.

Query with 'Order By', 'Group By' keywords are supported.

The following Parameter values can be saved with empty values:

- **Name**: Displays the name of the parameter.
- **Type**: Select the Parameter type from the drop-down list. This type helps you to execute the query with internally defined default values only while generating the database schema. The appropriate Type needs to be selected for the Query and Functions. For stored procedures the Types will be automatically selected.
- **Value**: Type the value of the parameter.

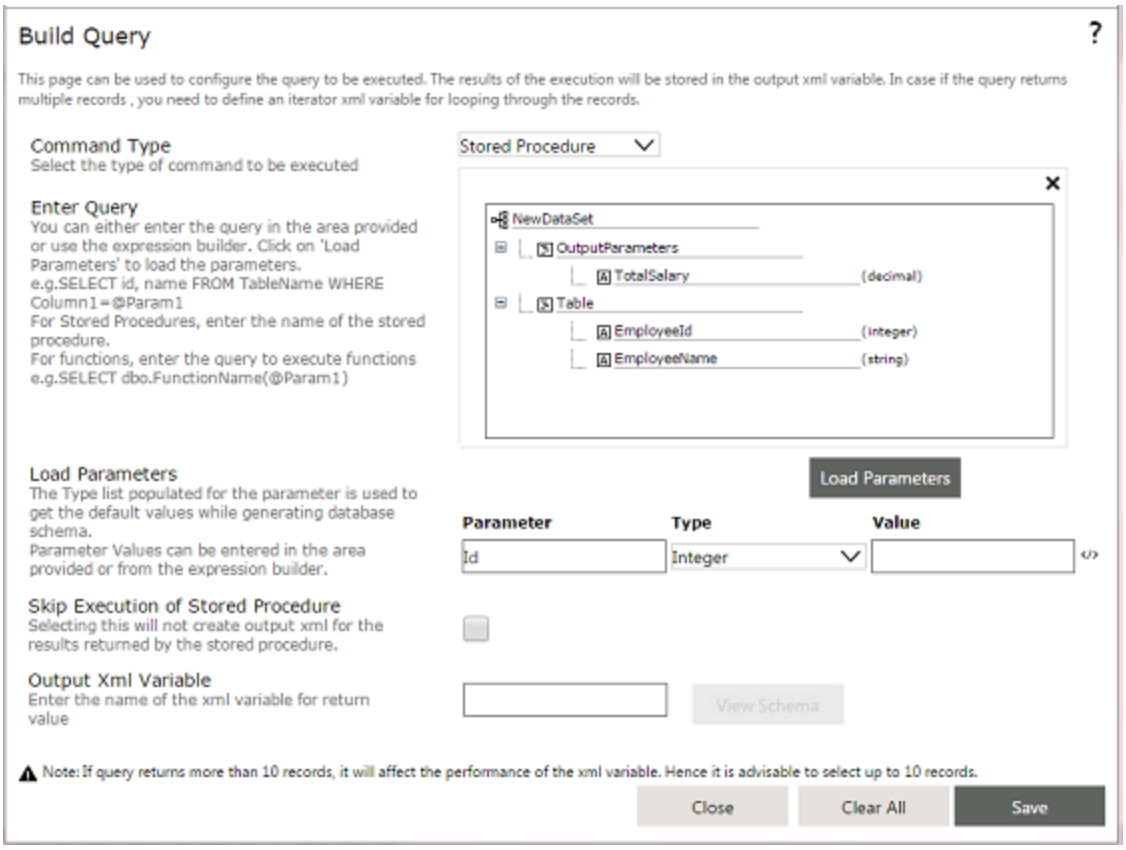
Parameter helps you retrieving values from the database where the value is null or empty.

If the query is to retrieve values from the database we have to specify the Output XML variable name. For more information, see the table *Database Activity*.

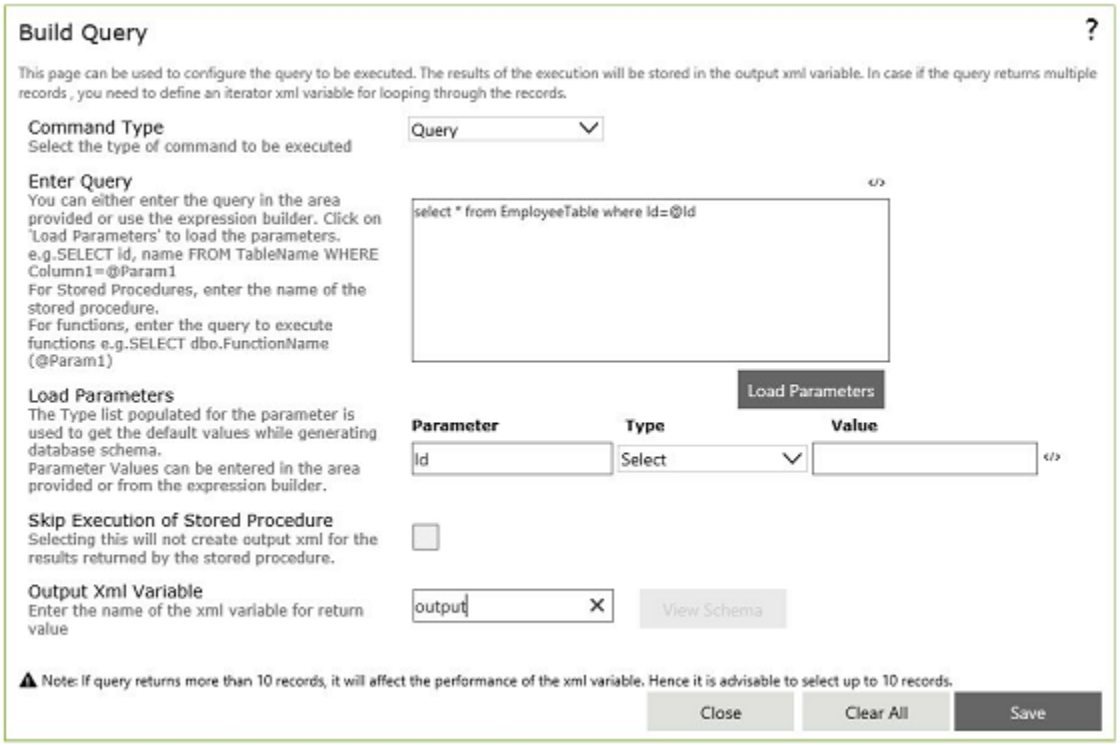
Multiple queries are not supported. If multiple queries are used, XML variable will carry the result of the last query written.

Click **View Schema** to view the schema of the output XML variable "outXML"

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



XML variable used in one activity cannot be reused within other database activities.

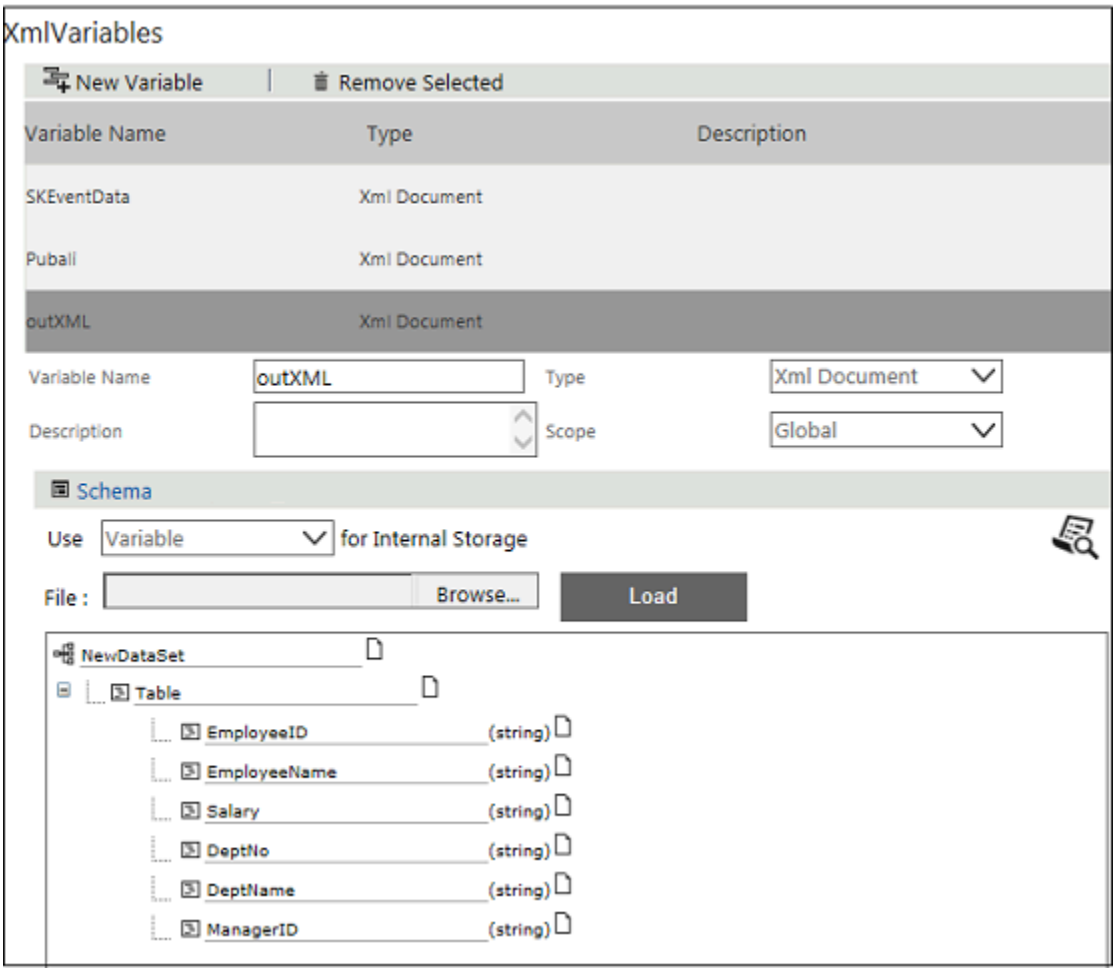


If the output schema containing return values have been modified after the property is saved, open the Query Builder property and click Save. The Schema will get updated with the latest values. Click **View Schema** to see

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the updated changes.

This XML Variable "outXML" will be added in the **Start > XML Variables** as shown below.



Parameter values cannot update data types like 'image', 'blob' and 'unique identifier' from XML variables or variables.

Stored Procedure

Stored procedures can be executed by simply specifying the name of the Stored Procedure (provided there is a stored procedure created in your database server). On the click of "Load Parameters" it will load the parameters present in the Stored Procedure. If you want to retrieve values on executing the Stored Procedure you can specify the name of the XML variable. If return values from the stored procedure are stored in output parameters, the activity will load the XML schema with the output parameters.

To discover the output XML schema, system internally executes stored procedure with parameter values as empty string or null. If a stored procedure has validations on parameter or data integrity constraints, you cannot configure a stored procedure.

If a stored procedure returns the values for return Result Set and output parameters, then both the values will be available in the XML variable.

Note: If there are multiple Return Result Sets, then only the first return Result Set will be considered.

- **Skip Execution of Stored Procedure**: To avoid the execution of stored procedure to get the output xml schema, select this check box so that you can configure stored procedure with parameter validation or data integrity constraints.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note:
- It is recommended to use proper parameter values/variables that has appropriate values at runtime to execute the stored procedure.
- To execute a stored procedure, which expects default values for execution, you can create a wrapper stored procedure with the same parameter. You can then call the actual stored procedure with default values passed to the stored procedure if the parameter values are empty or null.

Functions

Functions are executed in the same way as executed in the database server, for e.g. "select dbo.FunctionName". If the function contains parameters you should specify the exact parameters. For e.g. "select dbo.FunctionName(@param1, @param2)" (provided there is the function created in your database server). If you want to retrieve values on executing the function you can specify the name of the XML variable. If return values from the function are stored in output parameters, the activity will load the XML schema with the output parameters.

Note:
- Table valued functions are not supported.

Output XML Variable for return value:

Output XML variable will have the schema of the table as per the query entered. If the query is "Select * from EmployeeData" then the XML variable will have all the columns as nodes in the schema which can be looped through and used in the subsequent activities. Output XML Variable name should be unique, it cannot be repeated.

Note: To create an XML Iterator of the output XML Variable the node selected should always be the "Table" node.

Capture runtime exceptions in a variable

You can create a variable with the name **^<ActivityName>Error** in the **Start** activity. The exception message will be available in the variable if an exception occurs.

For example: For an activity named as "DBAct1", you have to create a variable with name as **^DBAct1Error** in the **Start** activity.

For more information on creating variables, see Start - Variables.

Property Type: Mandatory (This property must be set if the activity is to retrieving any value from the database (i.e. if query is of "select" type, else this field will be optional because it will not load any schema for 'insert', 'update' or 'delete' type of query)

Retry Connections: This property allows setting the maximum retries if a Database goes Offline at run time. By default the value set will be 1.

Property Type: Optional (This property needs to be set only if necessary.)

The following table shows the SQL database types and their corresponding parameter types for a database activity:

SQL Database Type	Database Activity Parameter Type
bigint	Integer
binary	Byte
bit	Boolean

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SQL Database Type	Database Activity Parameter Type
char	String
date	Date
datetime	DateTime
datetime2	DateTime
datetimeoffset	DateTime
decimal	Decimal
float	Double
int	Integer
money	Currency
nchar	String
numeric	Decimal
nvarchar	String
real	Single
smalldatetime	DateTime
smallint	Integer
smallmoney	Currency
sql_variant	Object
time	Time
timestamp	Binary
tinyint	Byte
uniqueidentifier	Guid
varbinary	Binary
xml	Xml

Note: If the Database connection is Windows authenticated, the Identity of the Quickflow Application Pool should be the user who has access to the same database.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Decision Activity

Activity Description

The Decision activity can be used to insert a decision in the workflow. The output of the activity can be used to determine the path of workflow execution.

Activity Properties

You can configure the Decision activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **Decision** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The property in the Configuration group has been described below. You can use this property to specify the decisions.

Decisions - The Decisions property allows the user to create complex rules to control the execution path of the workflow. In contrast to the Rule action, which only allowed a True/False kind of decision, the Decision property can be used to rules with multiple outputs based on the condition specified.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

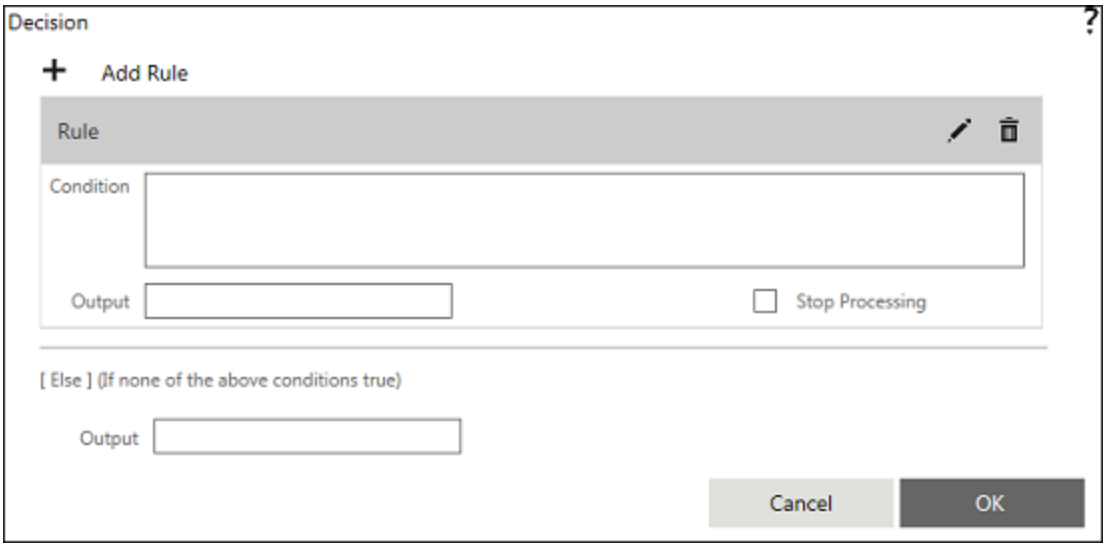
Steps to set the Decisions property

See Decision: Decisions for a detailed description of the Decision property window.

Decision: Decisions

You can create conditions for the decision action in this property window. To open this window, click the edit button for the 'Decisions' property. The following window shows the **Decision** property window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



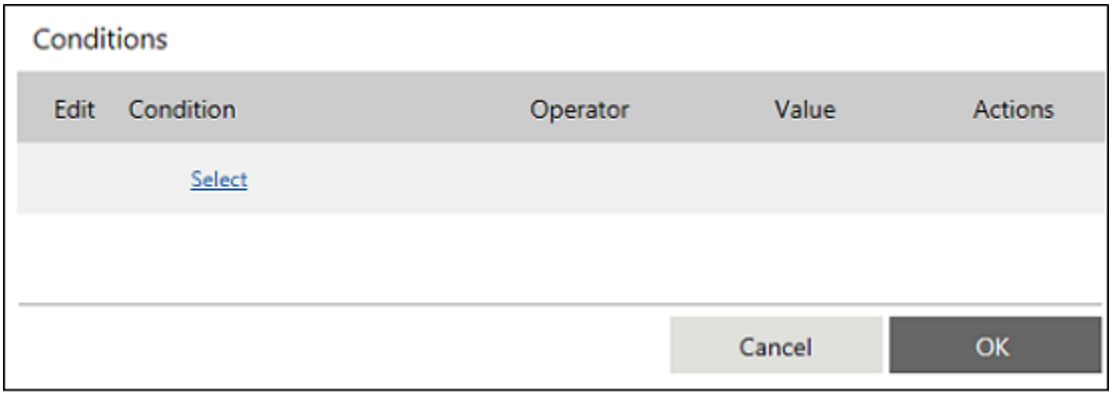
This **Decision** window has the following controls to specify the condition for a rule:

- **Add Rule**: Click **Add Rule** to add a new set of the above controls for adding another rule.
- **Condition**: Specify the expression for the condition in this text area.
- **Condition icon** : Click the condition icon to open the Condition window to build the condition expression.
- **Output**: Specify the output for the rule in this text box.
- **Stop Processing**: Select this check-box to enable the process to be stopped when this rule is "true".

The window also has the **Output** text box to specify the output for the exception, that is when none of the rule conditions are true, in the [**Else**] (**If none of the above conditions true**) field.

Condition window

You can build expressions for the rule condition in this window, which is opened when you click the Condition icon in the Decisions property window. This window has the Select link, which you can use to specify the left hand side of the expression. On mouse-over this link opens a combo, with a collection of objects that you can specify for the left hand side of the expression. The window has the **OK** button at the bottom to save the new expression. The **Cancel** option allows you to cancel the expression and return to the property window.



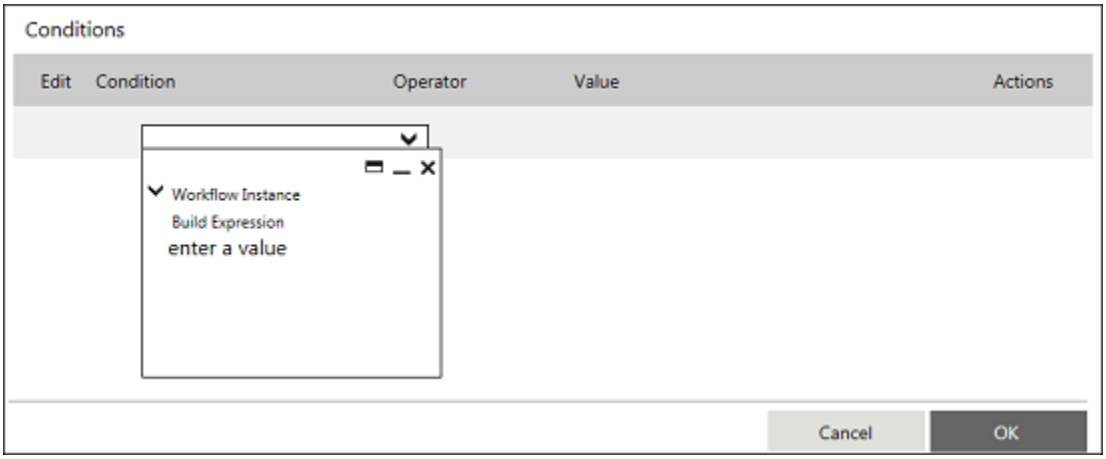
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Building an Expression for the Decision Condition

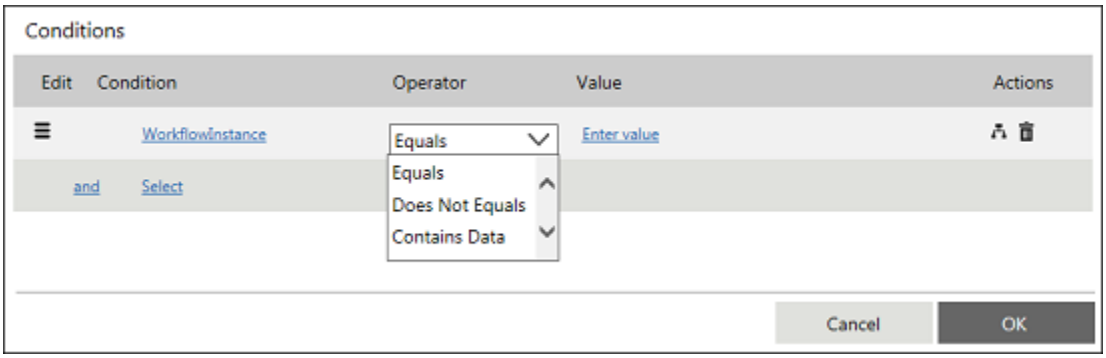
To illustrate the process of selecting an object for the right hand side of the expression, let us consider an XML Variable with "Employee" as a node and "FirstName" as an element under it. Specify this as the object for the left hand side of the expression. From the mouse over drop down, scroll down till you see the XML Variables node. Expand this node and the "Employee" node under it. Select the "FirstName" option.

Note: The C# code is not directly supported in the Expression editor for the Decision activity. If you want to return any value from the C# code, refer to the Returning Value from the C# Code topic.

The following window shows how to set an object for the left hand side of the expression:



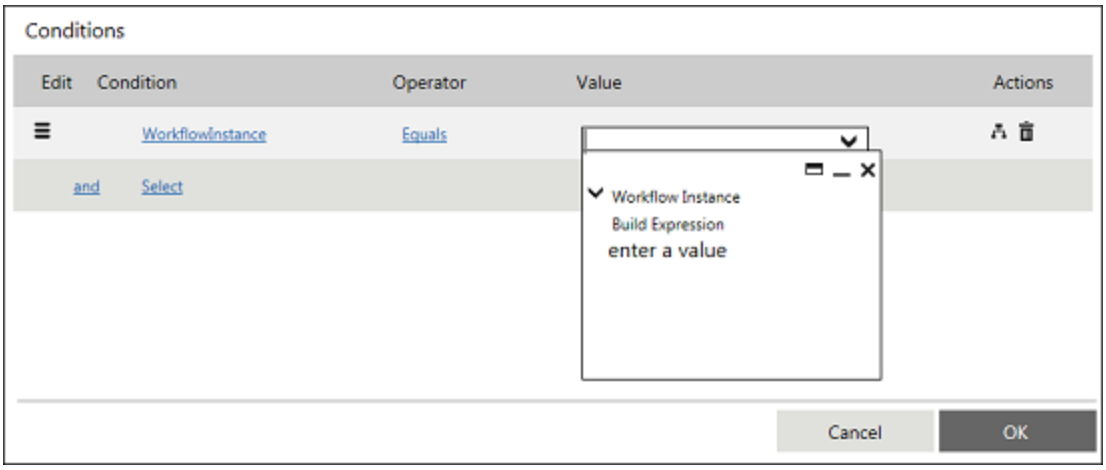
This will display the operator combo with operators corresponding to the data type of the selected object. In this case, the data type being string, the operators are string operators, shown in the image below. Select "Equals" as the operator.



Operators combo with string operators

The default control to specify the object for the right hand side of the expression, which is a text box, is displayed at the right hand side of the row, as shown in the image below. You can specify a matching value in this text box. As the object selected is First Name, specify "John" here.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



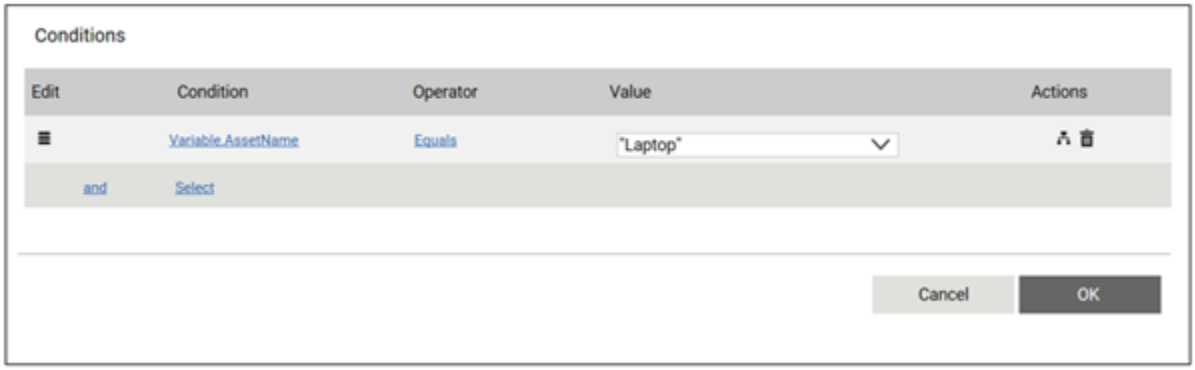
Default control for specifying the right hand side of the expression

This will complete the first expression and the settings will be displayed as shown below. You can mouse over any link to edit the value.

Using the Expression mode icon

Click the Expression mode icon, , to change the default text box to the Expression mode. In the Expression mode, you can select an object from the combo for the right hand side of the expression.

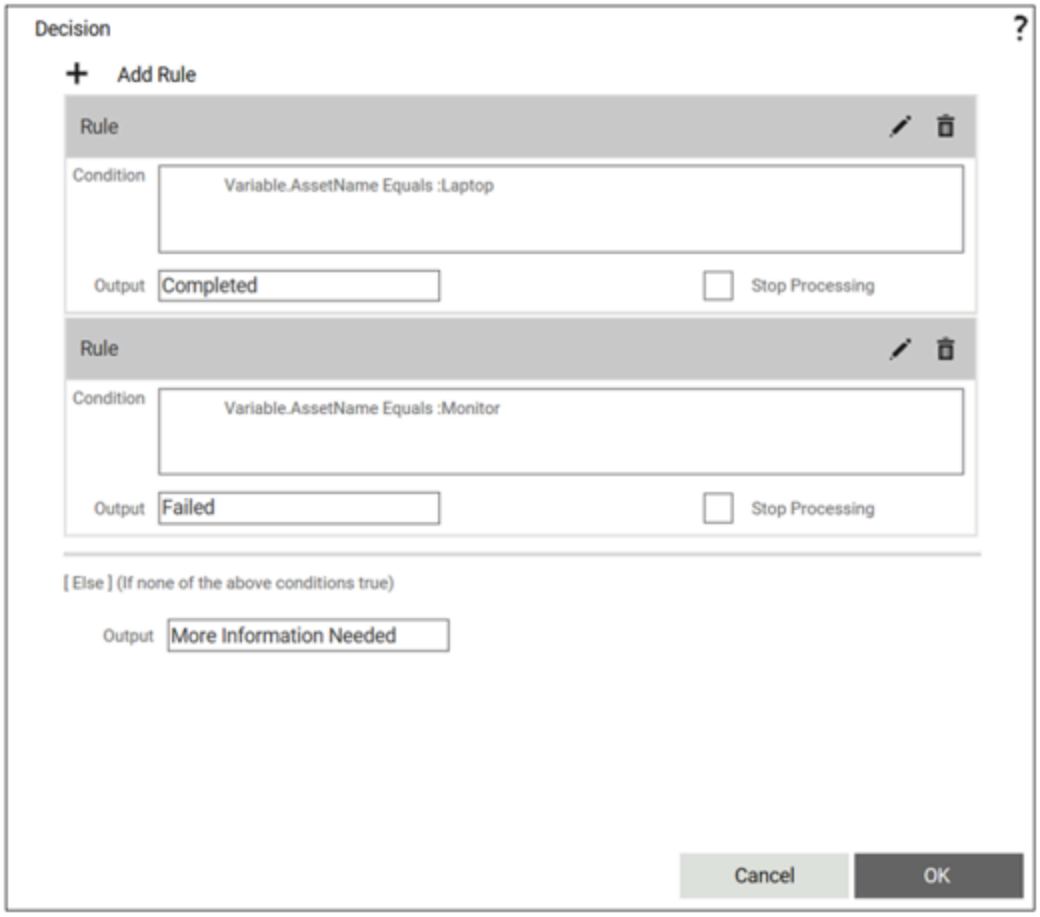
Consider that the left hand side of the expression is VirtualAssetName. You can assign the Variables.AssetName as the value for the right hand side.



You can select "Build Expression" in the Expression mode combo to open the Expression Editor and build an expression instead of specifying an object on either side of the expression. You can select "Enter a value" in the right hand side combo to return to the default mode, that is, the text box.

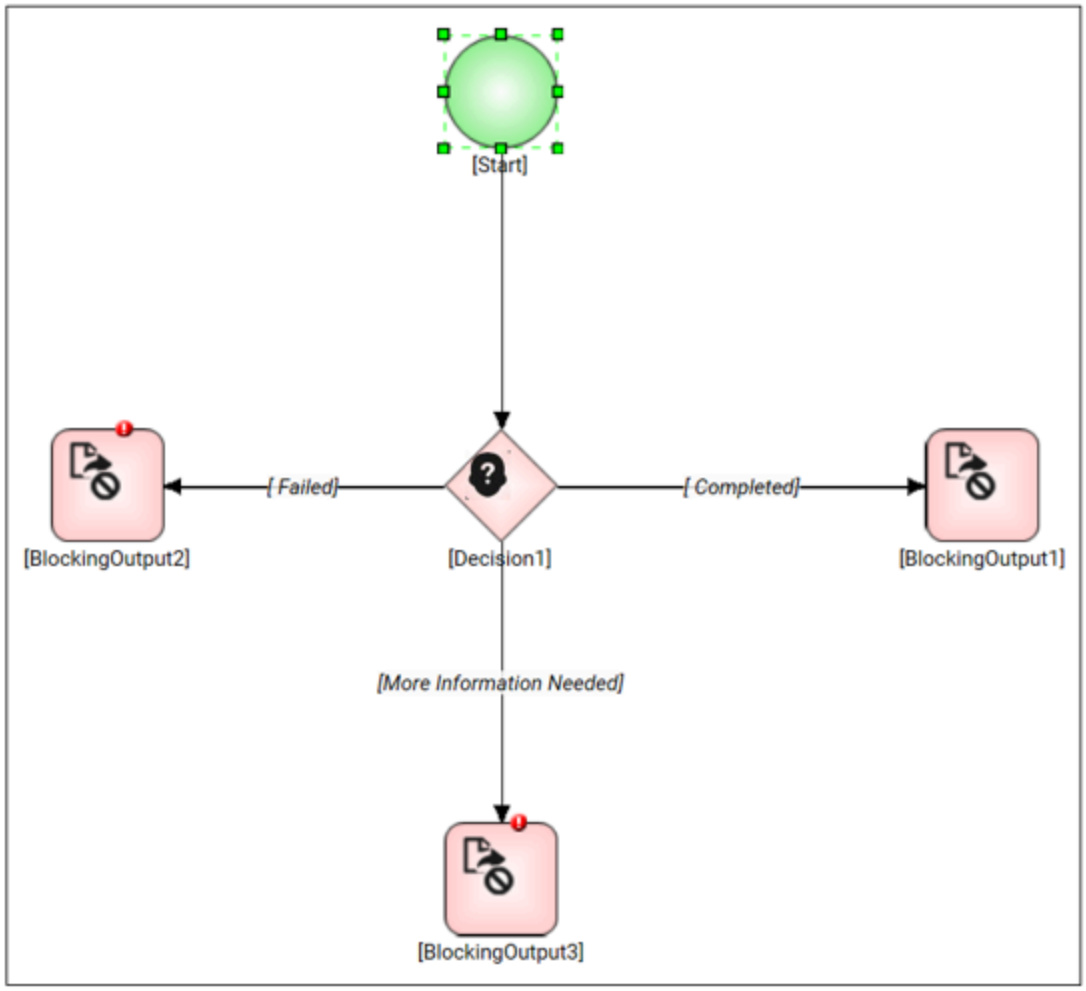
Click **OK** to save the expression and return to the **Decision** property window. The following image shows the window with Decision conditions added:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The Decision activity would be typically used in a workflow as shown below, with each decision output determining a different path for workflow execution.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Decision activity in a typical workflow

To return Value from the C# Code

You must follow the following steps to return any value from the C# code:

1. Declare a variable in the start activity.
2. Initialize the variable in Start activity or using update variable using the C# code.
3. This variable can be used in the Decision activity.

Note: In Decision Activity, when you specify a value for comparing numeric, date, time, or date, time type of variables, you must specify the value in Invariant format.

ForEach-Loop Activity

Activity Description

The ForEach-Loop activity is used to loop an activity through a collection within an XMLIterator Variable. It allows repeated execution of an activity or group of activities. It must always be used along with the Next Loop Activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

You can configure the ForEach-Loop activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **ForEach-Loop** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

Name & Description

Specify the name and description for the activity in this group.

Name - Enter the name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - Enter a brief description for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The Configuration group has a single property for selection of the XMLIterator Variable to be looped through.

XMLIterator - Select the XML Iterator variable to be looped through. All XMLIterator variables as declared in Start activity are available for selection.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Example of XMLIterator Variable in ForEach-Loop

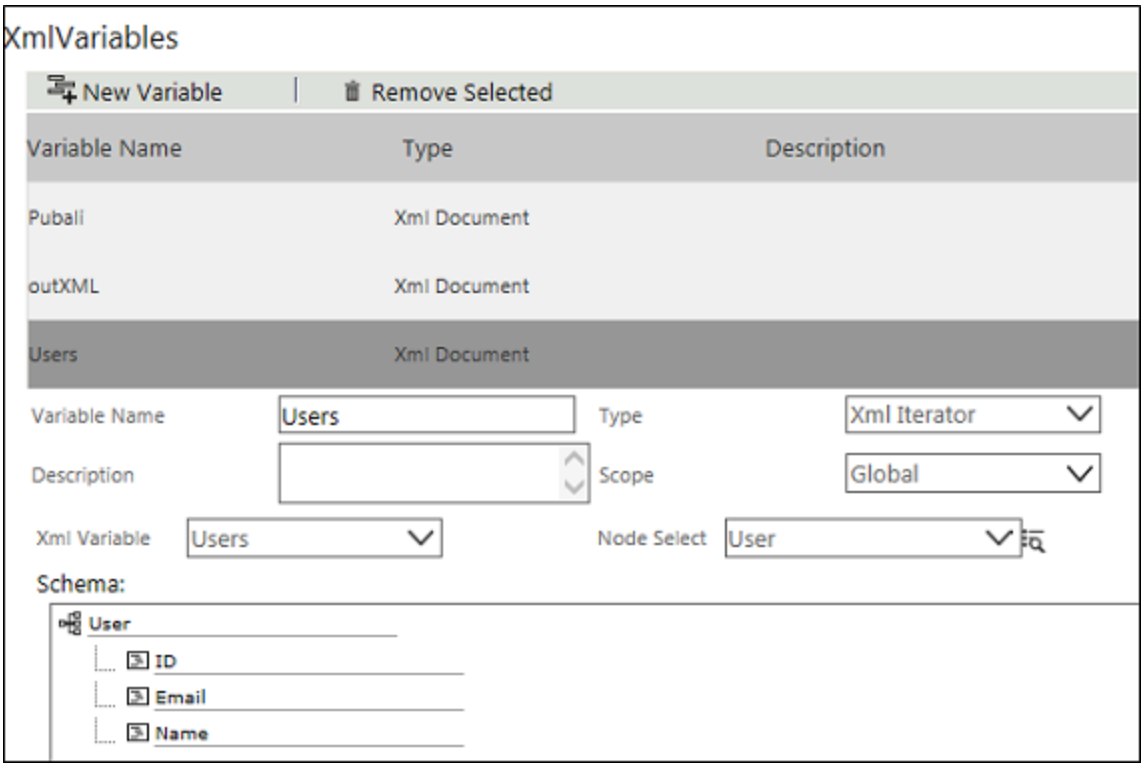
In this example, the XMLIterator Variable is used to get approval from all managers in the Managers.XML file containing the list of all users who are managers.

Managers.XML file

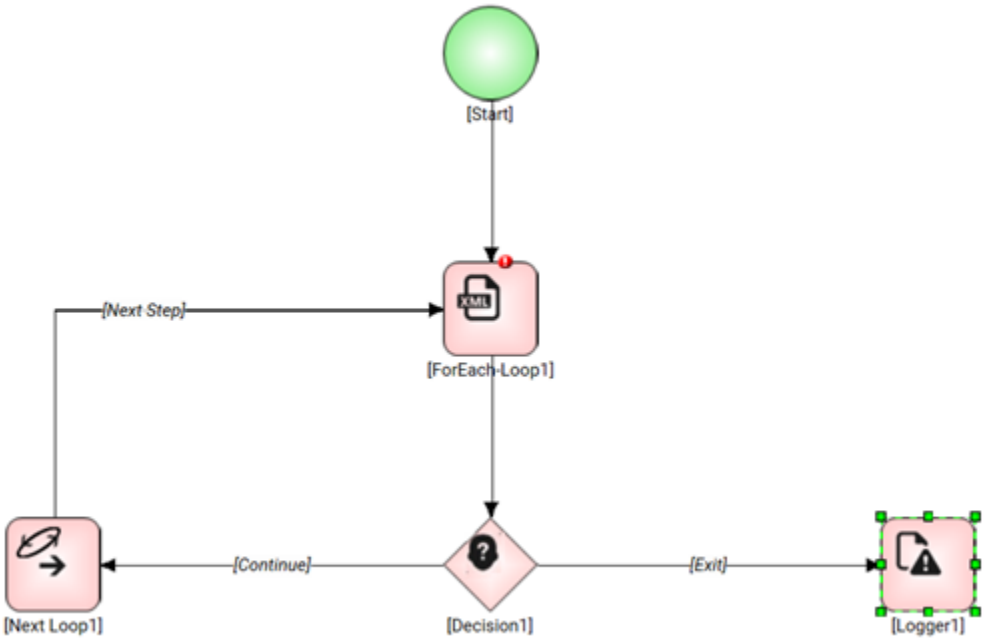
```
<Managers>
 <Users>
<User id=1>
 <Name>John</name>
 </User>
<User id=2>
 <Name>Jim</name>
</User>
<User id=3>
 <Name>Victor</name>
</User>
<User id=4>
 <Name>Andy</name>
</User>
 </Users>
</ Managers >
```

Step 1: XMLIterator Variable is defined for users. The node Users holds the collection of managers.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

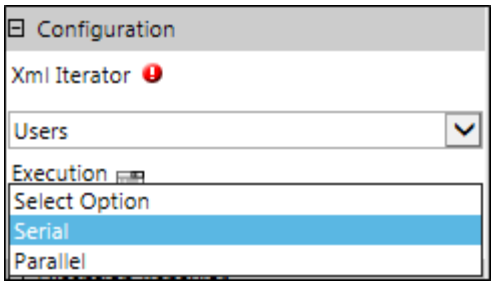


Step 2: The Decision activity is set within a ForEach-Loop activity.



Step 3: The XMLIterator Variable Users is defined in XMLIterator field of ForEach-Loop properties. The Execution type is set to Parallel as the decision is to be processed simultaneously.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Step 4: The XMLIterator Variable Users is specified in the condition for making a decision.

Output: When the above workflow is invoked, Quickflow Engine resolves "XMLVariables.user.users.ID".

For-Loop Activity

Action Description

The For-Loop activity can be used to start a loop within a workflow. It is useful for repeated execution of an activity or group of activities. It must always be used along with the Next Loop Activity.

Activity Properties

You can configure the For-Loop activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **For-Loop** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Steps to set the Loop Count property

1. To specify the loop count, click on the button for the 'Loop Count' property to open the property window.
2. In this window, enter the count value directly in the text editor.
3. If you want to assign the loop count dynamically during run-time, you can do so using the **Field** controls. For example, you can add a variable or content pointing to the loop count from the two drop downs for **Field**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

and click on the **Append** button. This will add the placeholder for the variable or content in the text editor. At run-time this placeholder will be replaced by the corresponding value, that is the loop count.

4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After specifying the count, click the Update button.
7. Click the Close button to close the window without saving the parameter.

See For - Loop Count for a detailed description of the Loop Count property window.

Activity outputs

The For-Loop Activity returns the following values -

Step: Displayed to indicate the loop step

Loop End: Displayed when the end of the loop is reached

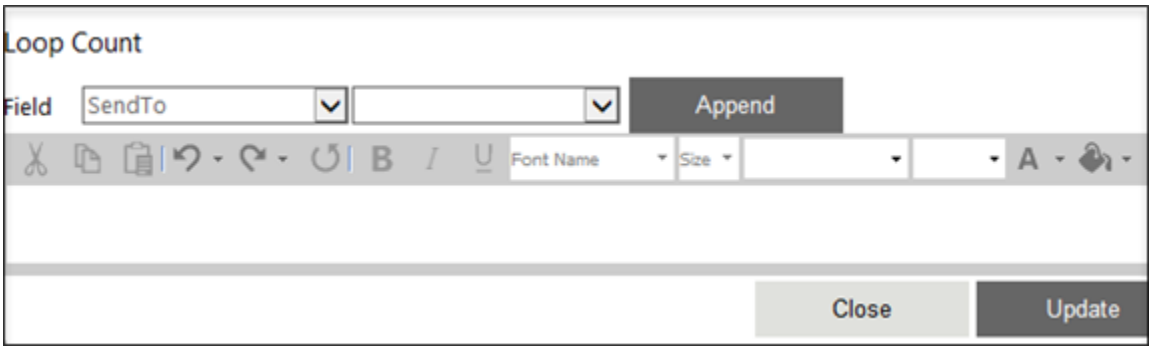
Variable Not Found: Displayed when the specified variable is not found

Invalid Count: Displayed when there is an invalid loop count

For-Loop Count

Loop Count Property Window

You can set the loop count that will be used to determine the iterations of the loop in this property window. To open this window, click the button for the 'Loop Count' property.



The window has a text editor to enter the loop count. You can do this either by entering a discrete value directly in the text editor or by using the **Field** controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify **Variable**, **Content**, **Value** or **XML Variable**.
- The Value text box/drop down - You can specify the actual value of the loop count. The control displayed depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the loop count in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

loop count.

- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the loop count details. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the loop count
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- **Update** - You can click this button to save the loop count
- **Close** - You can click this button to close this window

Logger Activity

Activity Description

The Logger activity logs messages like information, warnings, and errors. The messages are logged to the Logger Console from the workflow.

Activity Properties

You can configure the Logger activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **Logger** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name & Description

The properties in the Name & Description group is described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group is described below. You can use these properties to configure the functionality of the activity.

LogType - This property allows the user to select the type of message to be logged. The drop down lists the following options: Information, Warning, and Error.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

LogMessage - This property allows the user to specify the message to be logged.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Log Message property

See Log - Log Message for a detailed description of the Log Message property window.

Activity outputs

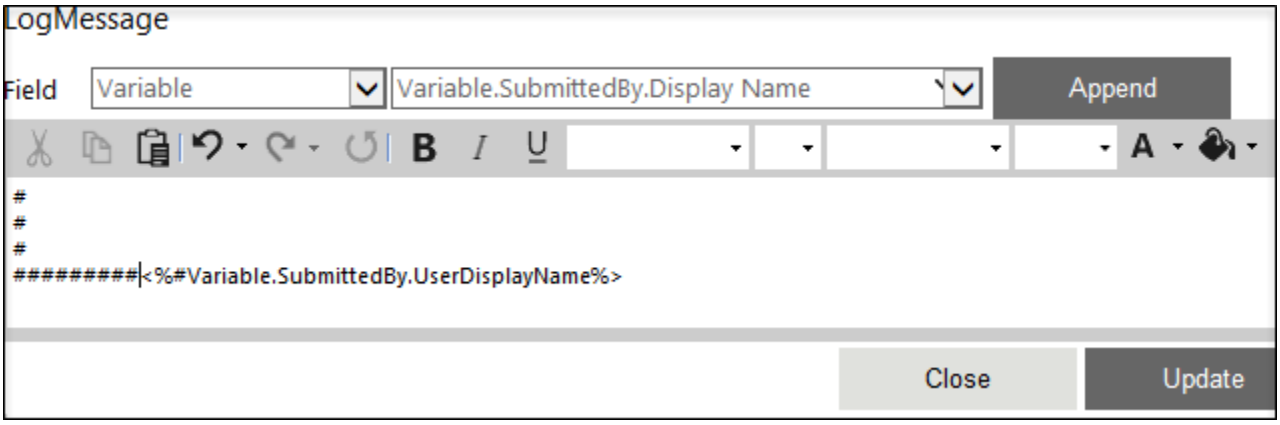
The Logger Activity does not return any value.

Example for a Logger:

Step 1: In the Activity Properties of the Logger1, select LogType as Information, and click Save button of Activity Properties.

Step 2: Log Message - Select the field as **Variable** in the first drop-down. In the second drop-down, select the Variable.SubmittedBy.DisplayName, and then click **Append**.

Step 3: The entry would be as this: <%#Variable.SubmittedBy.DisplayName%>. The '#' Symbol is just for quick identification of data in the Logger.



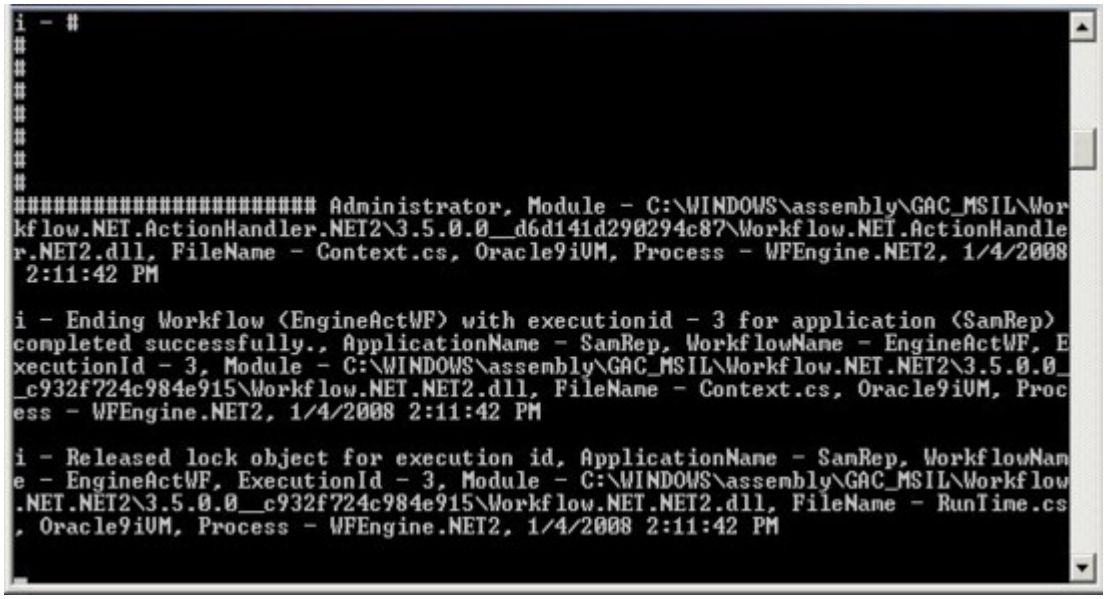
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: Before publishing the workflow, start the Logger Console.

Output:

In the Logger, you can see the contents of the variable Variable.SubmittedBy.UserName with the '#' symbols.

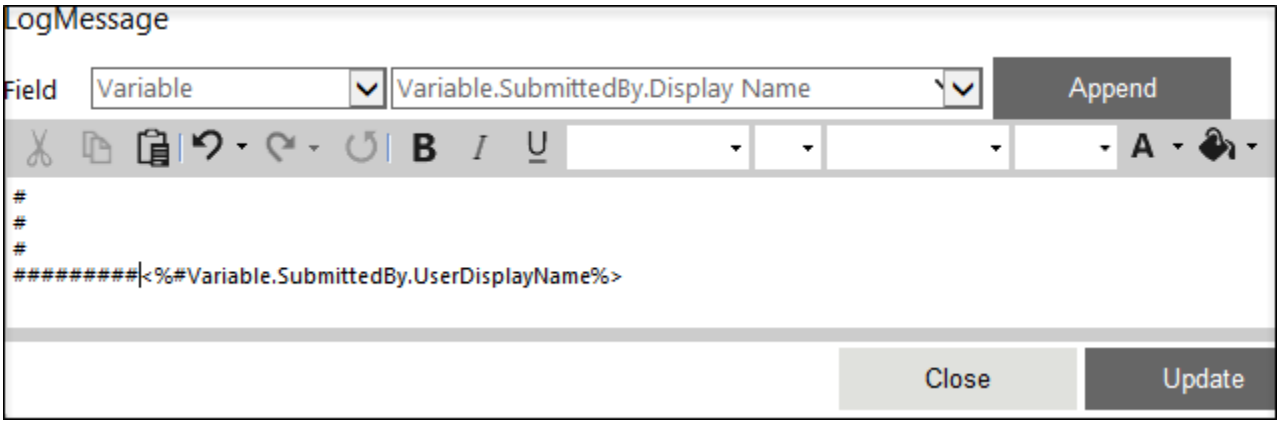
In the below figure you can see the name Administrator at the end of the # symbols.



Log - Log Message

Log Message Property window

You can specify the Log Message, which should be logged to the Log Console from the workflow, in this property window. To open this window, click the button for the 'Log Message' property.



The window has a text editor to enter the Log Message. You can do this either by entering a discrete value directly in the text editor or by using the Field controls at the top of the window. These controls are described below:

- The Value type drop down - You can select the type of value here. You can specify Variable, Content, Value or XML Variable here.
- The Value text box/drop down - You can specify the actual value of the Log Message. The control displayed

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

depends on the option selected in the first drop down. If you had selected "Value", it will display a text box here. You can enter the Log Message in this box. If you had selected "Variable", "Content", or "XMLVariables" instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option to assign the Log Message.

- **Append** - You can click this button to add the specified value, variable or content to the text editor.

The text tool bar above the text editor allows you to manage and format the Log Message details. It has the following text tools –

- Cut (Ctrl+X) - to cut text
- Copy (Ctrl+C) - to copy text
- Paste (Ctrl+V) - to paste text
- Undo (Ctrl+Z) - to undo the last action
- Redo (Ctrl+Y) - to undo the last action
- Repeat Last Command (F4) - to repeat the last command that was executed

It also has the following formatting & other tools –

- Bold (Ctrl+B) - to make text bold
- Italic (Ctrl+I) - to italicize text
- Underline (Ctrl+U) - to underline text
- Font Name - to select the font for the Log Message
- Size - to specify the font size
- Paragraph Style - to select a paragraph style
- Zoom - to zoom in and zoom out the view
- Foreground Color - to set text color
- Background Color - to set the background color
- Print - to print the text

At the bottom of the window you will find the following buttons:

- Update - You can click this button to save the Log Message
- Close - You can click this button to close this window

Next Loop Activity

Activity Description

The Next Loop activity can be used as the terminal activity in a loop initiated using a For-Loop Activity. It will check if the count value has been reached. If the value has not been reached it will increment the 'Loop Variable' set in the For-Loop Activity and repeat the execution of the activities in the loop.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

You can configure the Next Loop activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **Next Loop** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Activity outputs

The Next Loop Activity returns the following value -

Next Step: Displayed to indicate the next step in the loop

Rule Activity

Activity Description

The Rule activity allows complex rules or expressions to be built into the workflow. The expression will either result in 'true' or 'false'. The workflow engine evaluates the expression and assigns the result (true/false) to the output. The engine determines the path of the workflow from the output.

Activity Properties

You can configure the Rule activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **Rule** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration

The property in the Configuration group has been described below. You can use this property to specify the decisions.

Condition - This property allows the user to frame complex expressions for the workflow execution. The expression results either in 'true' or 'false'. The workflow engine, after evaluating the expression and getting the result, decides on the path for the activity, as per the process design.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the Condition property

1. To specify the condition for the Rule activity, click the button for the 'Condition' property to open the property window.
2. In this window, build a complex expression for the rule using the fields provided. Select a type of value (Variable, Content, XMLVariables) from the first drop down list, then select the corresponding value from the second drop down. This forms the left-hand side of the rule condition expression. Next, select the operator for the condition from the third drop down. Finally, select the type of value (Value, Variable, Content, XMLVariables), and the corresponding value for the property from the respective drop downs to add the right-hand side of the rule condition expression. Select "End" from the last drop down to complete the expression. If you are building a compound expression, you can select one of the logical operators to connect the different conditions that form the expression.
3. Add the condition to the expression by clicking **Add**. This will display the expression in the text area.
4. You can remove a condition already added to the expression by clicking **Undo**.
5. You can also clear an existing expression if necessary by clicking **Clear**. This is useful if you want to clear large expressions in the text area in order to build a new expression.
6. After building the expression, click **Update** to save it.

See Rule - Condition for a detailed description of the Condition property window.

See the Using XML Variables section in the About the XML Variable User Interface topic for details on how to use the XMLVariables to build the expression.

Activity outputs

The Rule Activity returns the following values -

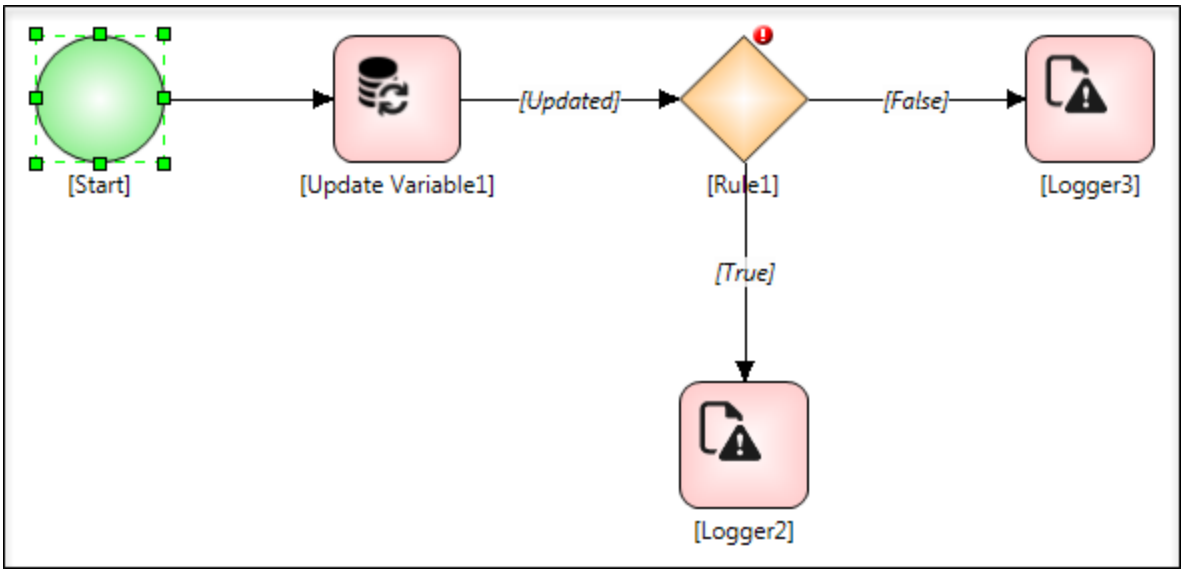
True: Displayed when the rule condition is true

False: Displayed when the rule condition is false

Example for a Rule Activity

Step 1: Design a workflow as shown in the following figure.

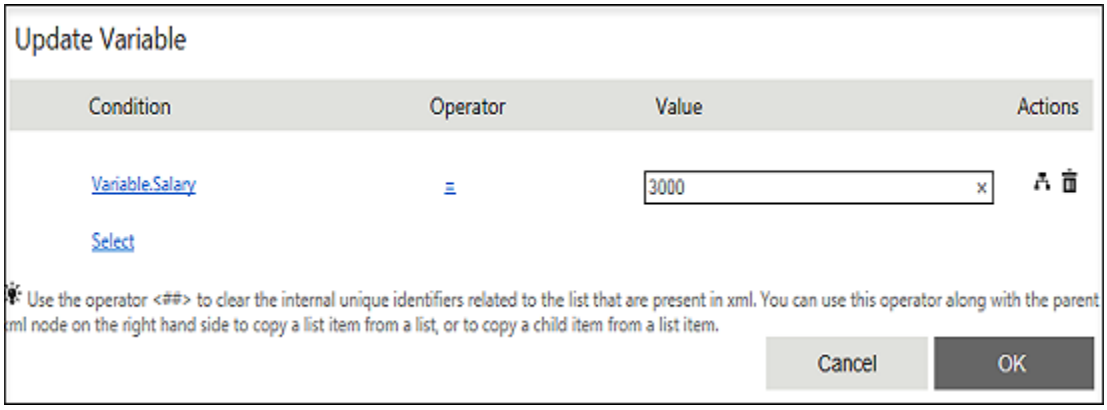
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Step 2: In the Start Activity declare a variable Salary.

Step 3: In the 'Set Variable' property of Update variable activity, perform the following actions:

- In the first drop-down, select Variable.Salary.
- Type a value. For Example, 3000.
- Click **OK**.



Step 4: In the Condition property of Rule Activity, perform the following actions:

- In the first drop-down, select Variable.Salary.
- Second drop-down, select '>' .
- Third drop-down, select 'Value'.
- In the adjacent text box, enter a variable. For Example, 2000.
- In the last drop-down, select AND.
- Click **Add**.
- Once again, in the first drop-down, select Variable.Salary.
- Second drop-down, select '<'.
- Third drop-down, select 'Value'.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- In the adjacent text box, enter a variable. For Example, 6000.
- In the last drop-down, select END.
- Click **Add**.
- Click **Update**. The entry would look as the following:

[Variable.Salary]>2000 And Variable.Salary<6000

Step 5: On the link connecting the right logger, select False and display an error message.

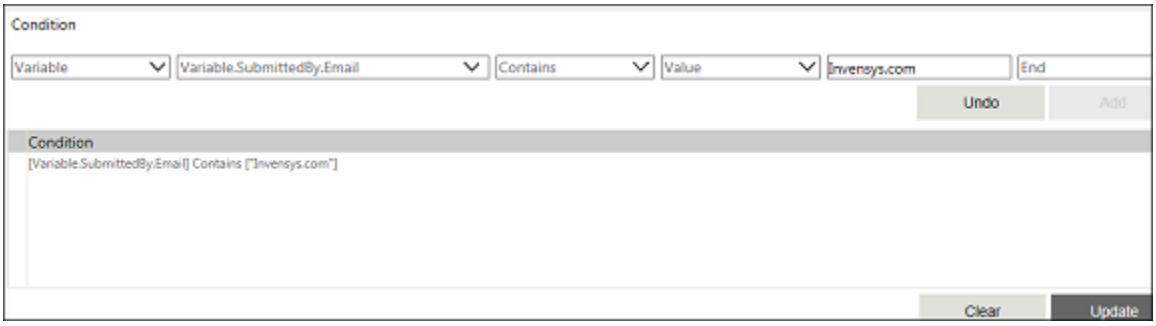
Step 6: On the link connecting the left logger, select True and display the value of the variable.Salary.

Output: The Variable.Salary will be updated to 3000, and in the rule condition the condition will be checked. The rule activity will return true and execute the logger at the bottom of the rule activity displaying the value of the variable Salary in the Logger Console.

Rule - Condition

Condition Property Window

You can set the condition corresponding to the Rule activity in this property window. To open this window, click the button for the **'Condition'** property.



The window has a set of drop downs at the top to select the different parameters required to build an expression for the condition. You can also find related buttons next to the drop downs.

- The first Value type drop down - You can select the type of value that will form the left-hand side the rule condition expression. You can select **Variable**, **Content**, or **XMLVariables** from this drop down.
- The first Value drop down - You can specify the actual value corresponding to the value type selected in the preceding drop down. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Operator drop down - You can select the operator for the expression. E.g., **=**, **<=**, **IN**, **Contains**.
- The second Value type drop down - You can select the type of value to be matched with the value specified in the left-hand side of the expression. You can specify **Variable**, **Content**, **Value**, or **XMLVariables**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The Value text box/ drop down - You can specify the actual value to assign to the attribute. The control displayed depends on the option selected in the preceding drop down. If you select **Value**, it displays a text box. You can enter a discrete value in this box to complete the expression. If you select **Variable**, **Content**, or **XMLVariables** instead, there will be a drop down instead of the field. This drop down will have the variable collection or content collection or XMLVariables collection from which you can select an appropriate option.
- The Logical operator drop down - You can select logical operators from this drop down to build compound expressions. The options available are **End**, **And**, **Or**, **)**, **(**. You can select **End** to complete the expression.
- **Add** - Click this button to add the new expression to the text area.
- **Undo** - Click this button to remove a condition you have added to the expression.

At the bottom of the window you will find the following buttons:

- **Clear** - Click this button to clear the expression shown in the text area. This is useful when you want to build a new expression.
- **Update** - Click this button to save the expression that has been added to the text area.

Set Workflow Output Variable

Activity Description

The Set Workflow output variable activity can be used to set the output of the parent workflow from the child workflow. You can use Set Workflow output variable of Quickflow to update a Workflow only when both the parent and child are of the same type (either Workflow or Quickflow).

Activity Properties

You can configure the Set Workflow output variable activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **Set Workflow output variable** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

Name & Description

You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

You can use this property to configure the functionality of the activity.

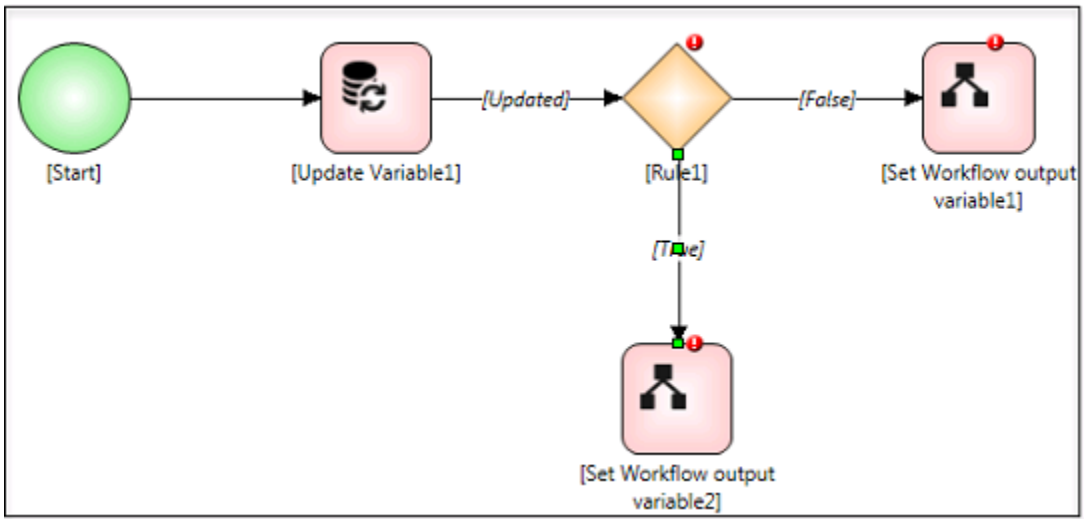
Set Workflow Output - This property specifies the output of the workflow. You can specify the output value directly here or click the icon to open the Expression Builder and build an expression for the output.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Example for setting Workflow Output Variable

1. Design a Quickflow as shown in the below figure and name it as ChildQF.

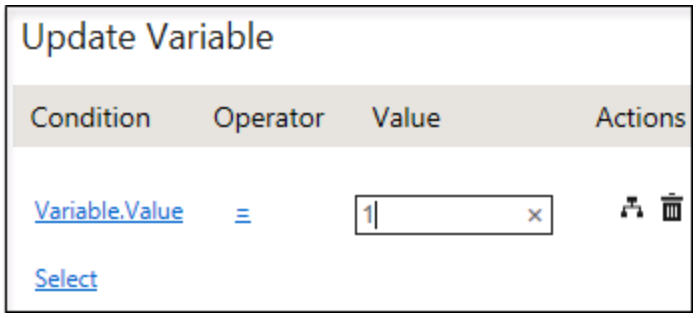


2. Perform the following actions:
   a. In the Start Activity, declare two variables Value and ParentWorkflowOutput as String.

   Note: The user must declare a same variable name in the child workflow which was declared for the Parent workflow. In the above example, user must declare by the name "ParentWorkflowOutput" of type "String" in the child workflow.

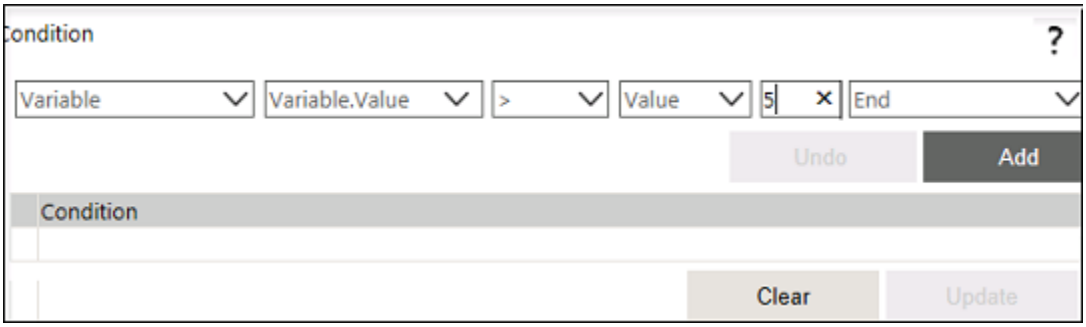
   a. In the Set Variable property of Update Variable set the value of variable Value as 1 as shown in the figure.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



b. On the link connecting Update Variable and Rule activity set the output as Updated.

c. In the Configuration property of Rule, set the condition [Variable.Value]>["5"] as shown in the below figure.



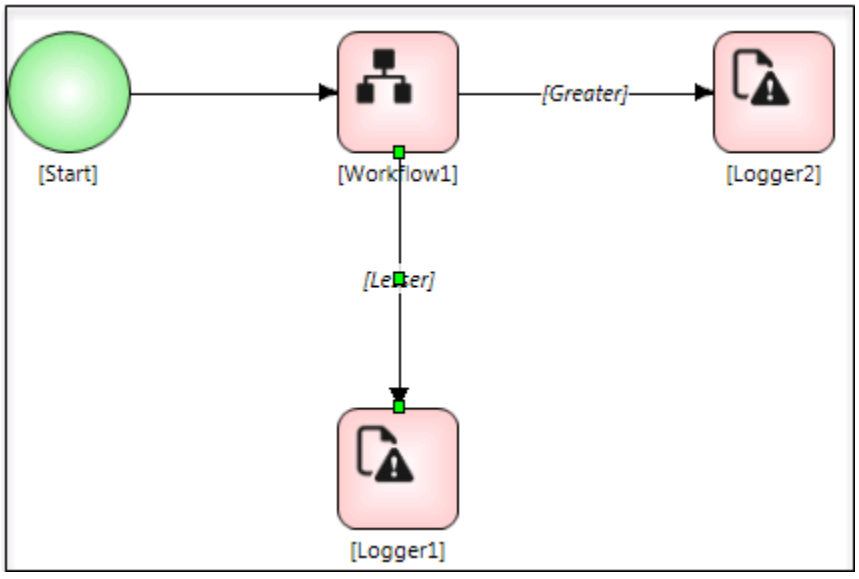
d. On the link connecting **Rule** and **Set Workflow output variable2** Activity set TRUE.

e. In the **Set Workflow Output** property of **Set Workflow output variable2** Activity set it as Greater.

f. On the link connecting Rule and **Set Workflow output variable1** Activity set FALSE.

g. In the **Set Workflow Output** property of **Set Workflow output variable1** Activity set it as Lesser.

3. Design a Quickflow as shown in the below figure and name it as ParentQuickflow.



4. Perform the following actions:

a. In the Repository property of Workflow Activity, enter Repository Name. For Example: SamRep.

b. In the Workflow property of Workflow Activity, select Previously created Workflow Name. For Example: ChildQuickflow.

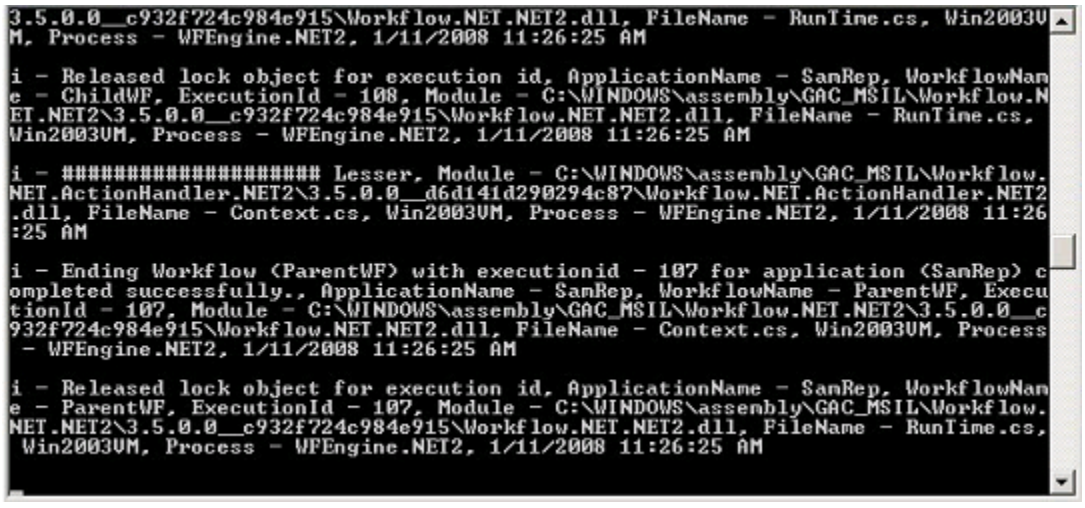
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

c. In the Wait for the Child Workflow property, select "YES".
d. In the Execution Mode property, select "Asynchronous".
e. In the Return Values property of Workflow Activity:
    a. Click Add Row and enter as "Greater"
    b. Click Add Row and enter as "Lesser"
    c. Click Update to save and click Close to close the window.
f. In the property LogType of Logger1, select Information.
g. In the Log Message of Logger1, enter as the following:
   '################ Lesser'
h. In the link connecting Logger1 and Workflow Activity1 set Lesser as output.
i. In the property LogType of Logger2, select Information.
j. In the Log Message of Logger2, enter as the following:
   '################ Greater'
k. In the link connecting Logger2 and Workflow Activity1, set Greater as output.

Summary: When you publish the parent workflow, the child workflow is also triggered and the path selected after the Rule activity is stored in the variable "ParentWorklfowOutput". The output of child workflow can be traced in the parent workflow.

Output: The ParentQF is published, and the workflow1 Activity invokes the ChildQF. Value of the variable Value is set to 1 in Update Variable Activity.

Since the value of Variable value is less then five, the rule activity output is False. So the Set Workflow Output Variable2 is executed and the control is passed to the ParentQF. The value updated in Parent Workflow variable is Lesser and hence the output of the Workflow Activity is Lesser and the Logger1 is executed.



Start Activity in BAM

Synchronize Activity

Activity description

The Synchronize Activity synchronizes the execution of different activities. The engine does not proceed with the execution of further actions until all the actions leading to this activity are completed.

Activity Properties

The Synchronize activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Synchronize activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

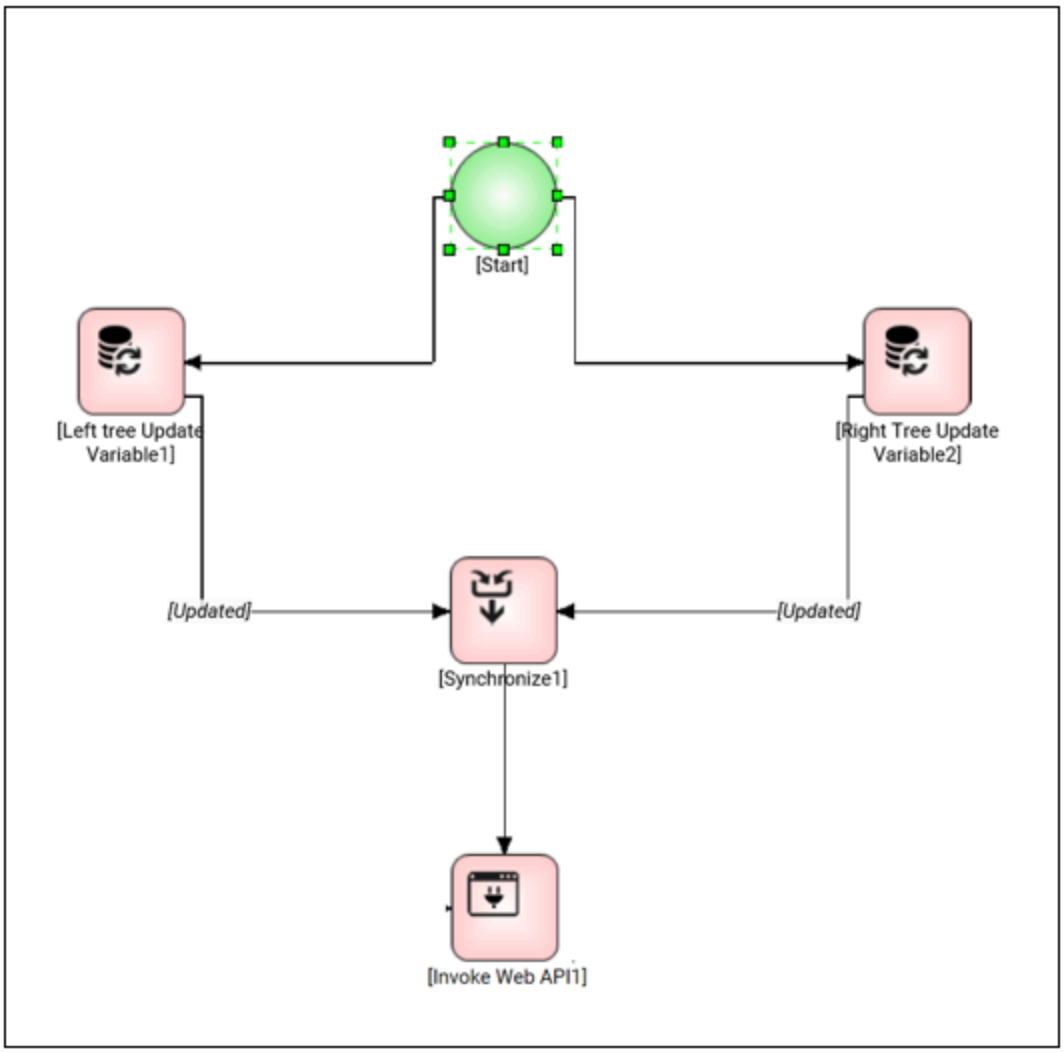
Activity outputs

The Synchronize Activity does not return any value.

Example for a Synchronize Activity:

Suppose you want to submit the updated value of the two variables which are executed at different branches to the WebAPI, then these two values has to be synchronized. In the following workflow, the two variables are connected to the synchronize activity. When both the variables are updated using the update variable activity, the value gets submitted to WebAPI only after the synchronize activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Update Parent Variables Activity

Activity description

In AVEVA Work Tasks, a parent workflow variable can be updated from a child workflow provided both child and parent workflow belong to the same repository. This can be achieved by using Update Parent variables activity.

Activity Properties

You can configure the Update Parent Variables activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **Update Parent Variables** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

Name & Description

Use these properties to specify the name and description for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

Use these properties to configure the functionality of the activity.

Parent Workflow Application Name - This property specifies the name of the application to which the parent workflow belongs. You can specify the application name directly here or click on the icon to open the Expression Builder and build an expression for the application name.

The parent workflow should belong to the same repository of the child workflow. This property of a child workflow is exposed for backward compatibility.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Parent Workflow Name - This property specifies the name of the parent workflow. You can specify the workflow name directly here or click on the icon to open the Expression Builder and build an expression for the workflow name.

The parent workflow should belong to the same repository of the child workflow.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

List Parent Variables - This property specifies the parent workflow variables to be updated. Click on the edit icon to open the

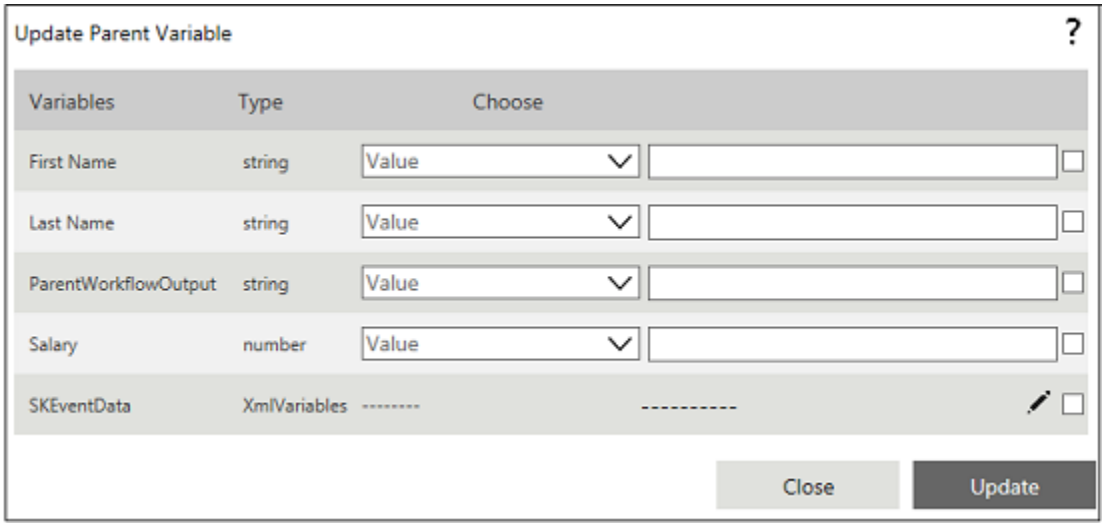
'List Parent Variables' property window.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Set the List Parent Variables property

To update the value of variable:

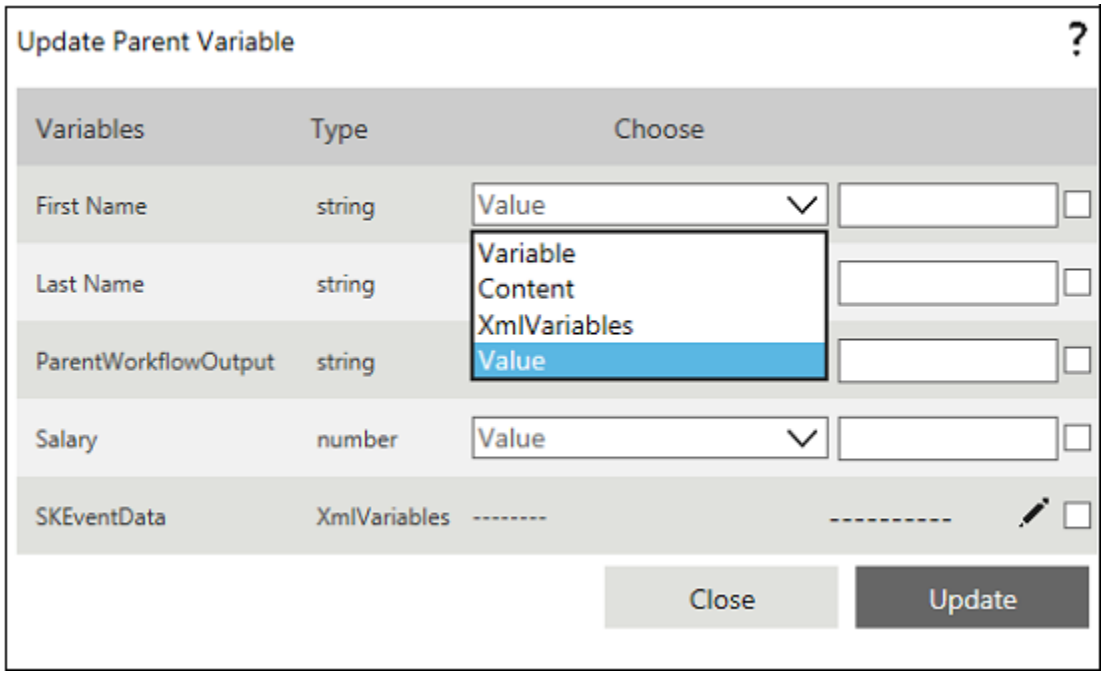
1. Click the edit button of the **List Parent Variables** property. The **Update Parent Variables** window appears. Specify the parent workflow variables in this window.
2. Select the check box of the respective parent variable.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Choose the option using which the parent variable to be updated. The parent variable values can be updated using the Value, Variable, Content, or XML Variable of the child workflow.
4. Depending on the choice, select the respective options or node, and then click **Update** to save.

Note: The value can also be hardcode using the Value option as shown in the following image.

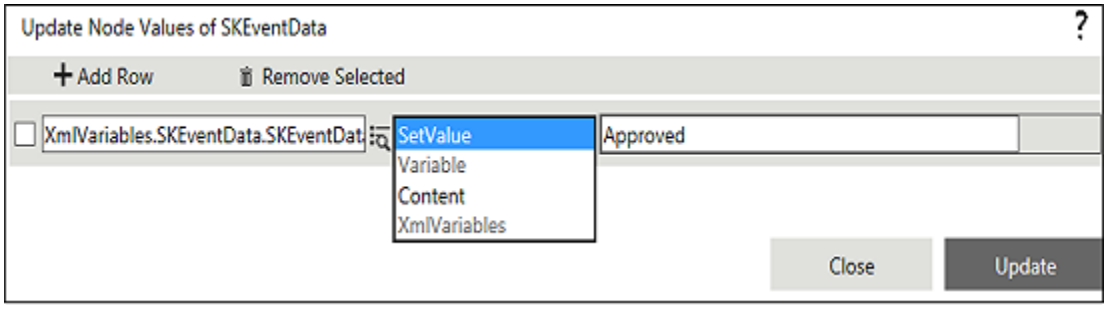


5. After selecting and assigning values to the variables, click **Update** to save.

To set the value of XML Variable

1. Select the check box of the respective parent variable.
2. Clicking the icon on the left hand side of the check box opens the window to specify the node to be updated of the respective parent XMLVariable.
3. Select the node to be updated from the tree view.
4. Choose the option using which the parent XML variable node to be updated. The parent XML variable node value can be updated from the variable, content or XML variable of the child workflow.
5. Depending on the choice select the respective option/node from the RHS.

   Note: The value can also be hardcoded using the SetValue option as shown in the following figure.



6. You can specify multiple nodes for updating by using the **Add Row** option.
7. In order to remove any node that is set from updating, select the respective entry by selecting the check box

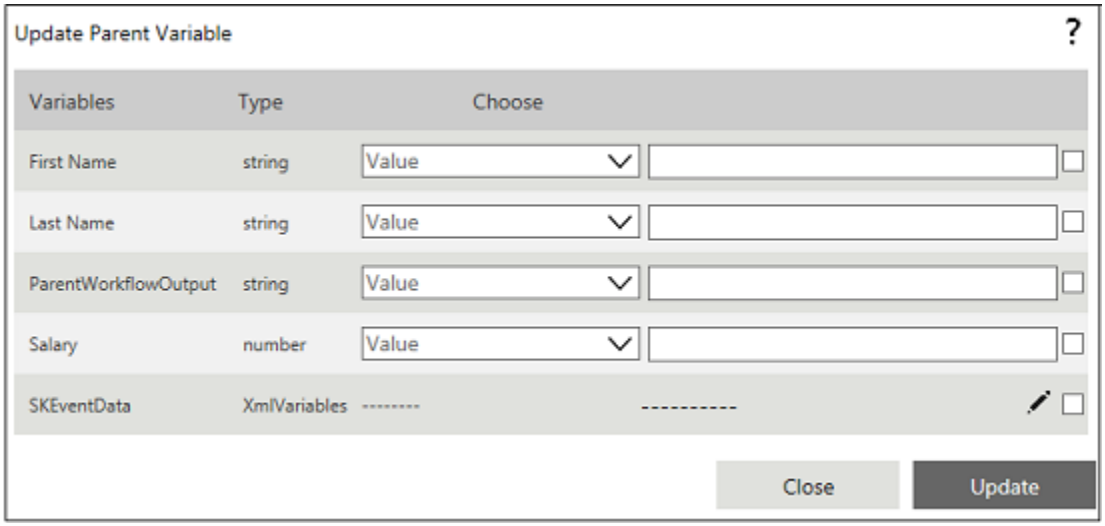
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

in the left hand side and click **Remove Selected**.

See Update Parent Variables - List Parent Variables for a detailed description of the List Parent Variables property window.

Update Parent Variables - List Parent Variables

You can set the List Parent Variables for this activity in the **Update Parent Variable** property window.



Update Parent Variable property Window

The **Update Parent Variable** property window has a grid that lists all the variables belonging to the parent workflow which are specified in the Parent Workflow Name property. Each row in the grid represents a parent workflow variable, showing the variable name and type under the respective columns. The window also contains the following controls to specify the value to update the variable with:

- The Value type drop-down menu: Select the type of value to be assigned to the parent variable. Values that you can specify are Variable, Content, Value, or XMLVariables.
- The Value text box/drop-down menu: Specify the actual value to assign to the parent variable. The control displayed depends on the option selected in the Value type drop-down menu. If you select "Value", a text box appears. You can enter a discrete value in this box to complete the expression. If you select "Variable", "Content", or "XMLVariables", a drop-down menu appears in this field. This drop-down menu contains variable collection, content collection, or XMLVariables collection from which you can select an appropriate option.
- The check box: Select this check box to update the value of the corresponding parent variable at the workflow execution time.
- To set values for an XML Variable, click the icon, and then enter the required values in the **Update Node Values** window. For more information, see How to Update a Parent Workflow Variable from a Child Workflow?.

Note:
- For number data types, the minimum and maximum values are not validated. Enter only valid numeric values for number data types. For numeric, DateTime, Date, or Time data types, ensure that the respective

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

value is based on the culture set. You can enter the input or use the Date and Time picker to enter the required date and time. The time format supports long data type to enable you to enter seconds. If you enter a valid value for a numeric, date, time, or datetime data type, and if you enter unwanted strings after the valid values, then while submitting the values, the extra strings at the end are truncated. For example, for a DateTime value entered as 01/31/2015 10:11:12ababa, then ababa is truncated by default.
- Only single instance of Update Parent Variables activity can be used in child Quickflow.

How to Update a Parent Workflow Variable from a Child Workflow?

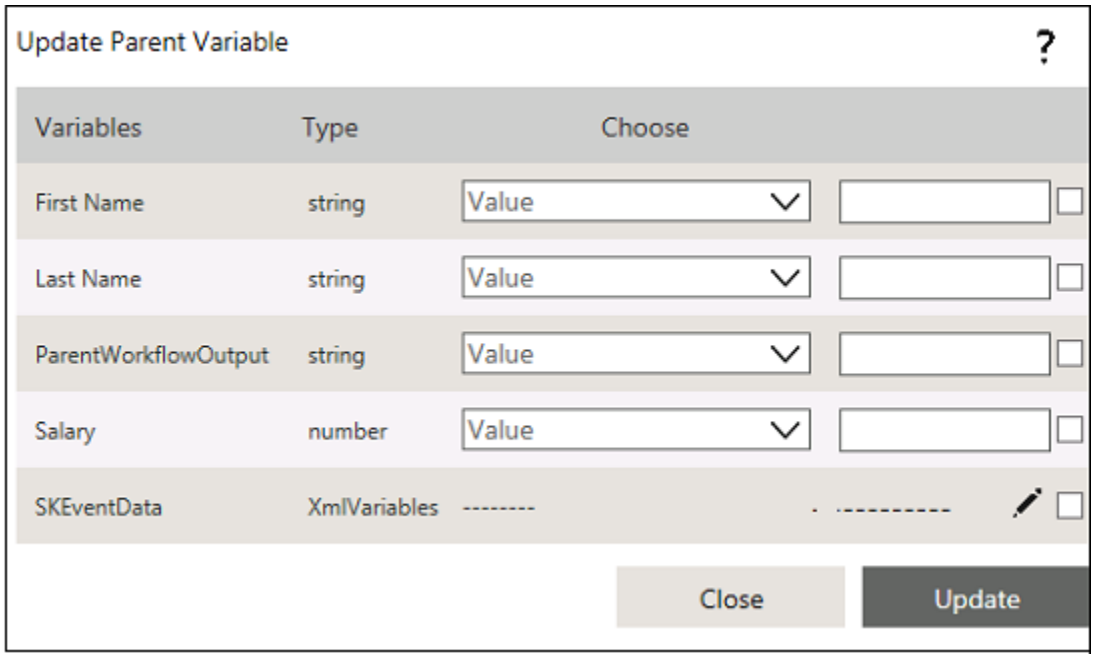
In AVEVA Work Tasks, a parent workflow variable can be updated from a child workflow provided both child and parent workflow belong to the same repository. This can be achieved by using **Update Parent Variables** activity.

To update parent workflow from a child workflow

1. Right-click **Update Parent Variables Activity** and select **Activity Properties**.
2. Enter the parent workflow's repository name in the **Parent Workflow Application Name** property. The parent workflow should belong to the same repository of the child workflow. This property of the Update Parent Variable activity is exposed for backward compatibility.
3. Enter the parent workflow name in the **Parent Workflow Name** property. The parent workflow should belong to the same repository of the child workflow.
4. Click **List Parent Variables** property to update the variables in the parent workflow.

To update the value of variable

1. To specify the parent workflow variables, click the button for the **'List Parent Variables'** property to open the property window.
2. In the **Update Parent Variables** window, select the check box of the respective parent variable.

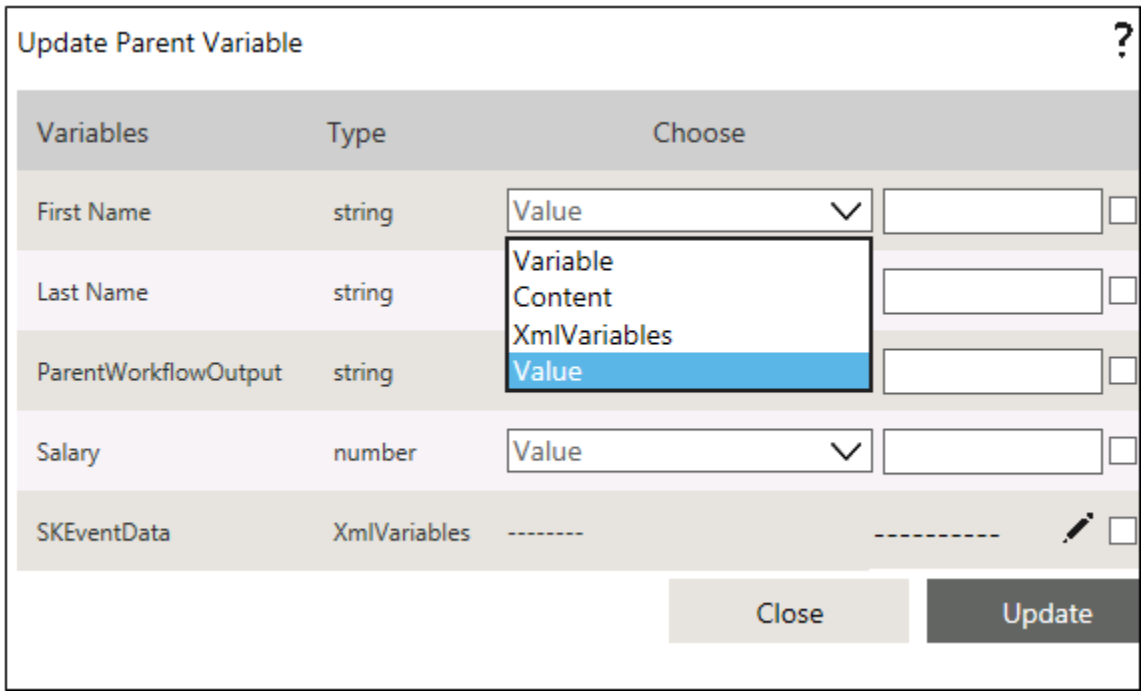


3. Choose the specific option from the list using which the parent variable to be updated. The parent variable value can be updated from the Value, Variable, Content, or XML Variable of the child workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Depending on the choice, select the respective text box/options/node from the RHS and click **Update** to save.

Note: The value can also be hard coded using the Value option as shown in the following figure.

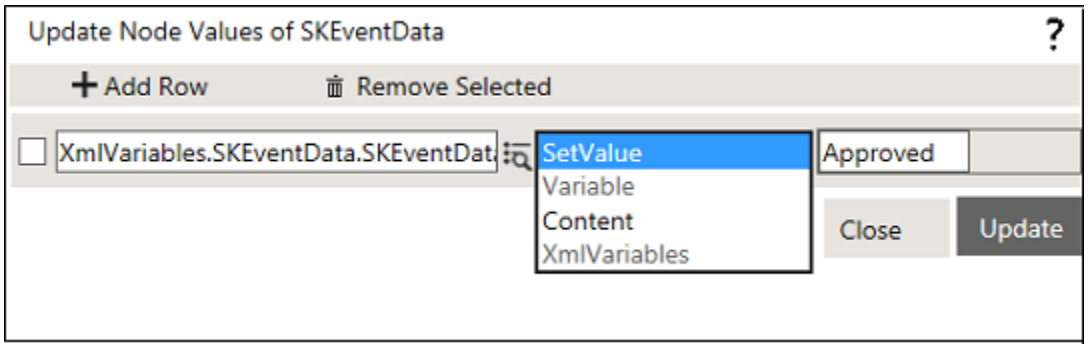


5. After selecting and assigning values to the variables, click Update to save.

To set the value of XML Variable

1. Select the check box of the respective parent variable.
2. Click the icon on the left hand side of the check box. The **Update Node Values** window appears. Specify the node to be updated for the respective parent XML Variable.
3. Select the node to be updated from the tree view.
4. Choose the option using which the parent XML variable node to be updated. The parent XML variable node value can be updated from the SetValue, Variable, Content, or XMLVariable of the child workflow. Depending on the choice, select the respective value/options/node from the RHS.

   Note: The value can also be hard coded using the SetValue option as shown in the following figure.



5. You can specify multiple nodes for updating by using the **Add Row** option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. To remove any node that is set from updating, click the respective check box of the entry to be deleted, and then click **Remove Selected**.

Update Variable Activity

Activity Description

The Update Variable activity can be used to update the value of Variables and XmlVariable that can be used in the subsequent activities. Using this activity, the variable for For-Loop activity can also be initialized.

Activity Properties

You can configure the Update Variable activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **Update Variable** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The property in the Configuration group has been described below. You can use these properties to configure the functionality of the activity.

Set Variable - This property allows the user to specify the values for existing Variables or XMLVariables.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

See Variables for updating Variables.

See Forms Xml Variables to work with Forms XMLVariables.

Workflow Activity

Activity Description:

In AVEVA Work Tasks, a workflow can be called from another workflow provided both workflows belong to the same repository. In this case, the calling workflow is termed as **Parent Workflow** and the workflow to be called is termed as **Child Workflow**.

The Workflow activity enables the execution of a second (child) workflow from a (parent) workflow. The

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Workflow activity can be used to call a child workflow from a parent workflow. The **Variables for the child workflow** property and **XMLVariables for the child workflow** property enable parent workflow to pass variable and XML variable information to the child workflow respectively.

Activity Properties:

You can configure the Workflow activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **Workflow** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The properties in the Configuration group have been described below. You can use these properties to configure the functionality of the activity.

Repository - This property specifies the application or repository name that has the workflow to be run. The child workflow should belong to the same repository of the parent workflow. The repository property of a child workflow is exposed for backward compatibility.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Workflow - This property specifies the workflow to execute. This is an editable combo, which drops down a list with the names of all available workflows for the specified application. You can select one of the workflows as the child workflow. Alternatively, you can enter a name in the field to create a new child workflow. Now when, you right-click the workflow activity icon and select the "Open Sub Process" option, a new Process Designer window will be opened with the Application name and Workflow name specified here. You can create the new sub-process in this window.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Version - This property specifies the version only if any specific version of the (child) workflow to be executed. Leave this as blank, if the latest published version of (child) workflow has to be executed.

Property Type: Optional (This property needs to be set only if required.)

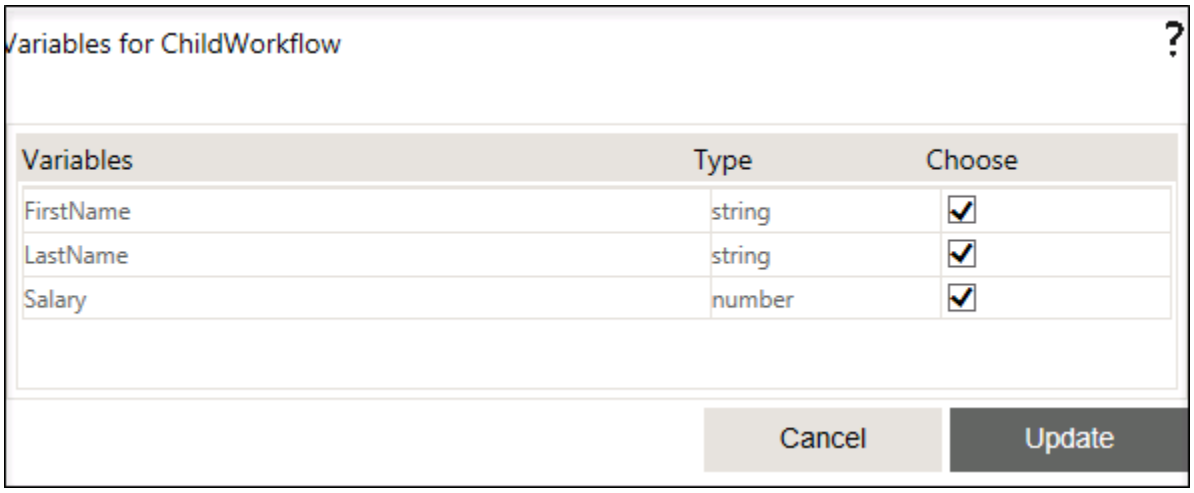
Variables for ChildWorkflow - This property specifies the variables to be passed on to the workflow. This window shows the list of variables defined for the current (parent) workflow. Select the variables that need to be passed to the child workflow.

Property Type: Optional (This property needs to be set only if required.)

Steps to set the Variables for ChildWorkflow property

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. To specify the variables to be passed to the child workflow, click the button for the **Variables for ChildWorkflow** property to open the property window.
2. In the **Variables for ChildWorkflow** window, select the required variables to be passed to the child workflow.



3. After specifying the data click the **Update** button.

   Note: These variables are expected to exist in the child workflow. Make sure to define variables with same name and type as defined in parent workflow.

   See Workflow - Variables for ChildWorkflow for a detailed description of the Variables for ChildWorkflow property window.

XMLVariables for ChildWorkflow - This property specifies the XML variables to be passed on to the child workflow. This window shows the list of XML variables defined for the current (parent) workflow. Select the XML variables that need to be passed to the child workflow.

Property Type: Optional (This property needs to be set only if required.)

Steps to set the XMLVariables for ChildWorkflow property:

1. To specify the XML variables to be passed to the child workflow, click the button for the 'XMLVariables for ChildWorkflow' property to open the property window.
2. In the XMLVariables for ChildWorkflow window, choose the required variables to be passed to the child workflow.
3. Click the **Update** button.

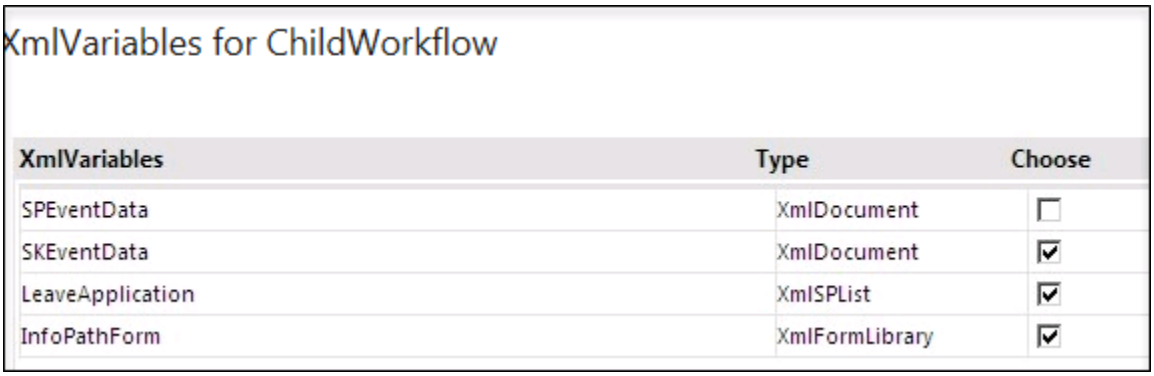
Note:
- These XML variables are expected to exist in the child workflow. Make sure to define XML variables with same name and type as defined in parent workflow.

- To work with any XML variables or resource activities, SKEventData XML variables must be passed in the child workflow, where SKEventData contains some events information related to parent workflow which needs to be passed to child workflow. If SKEventData variable is not created, user can create XML variable of type XMLDocument with the same name 'SKEventData' by locating the 'SKEventData.xml' from the following path:*[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\BPMUITemplates\Default\XMLSchemas*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example:

The following image shows that XMLVariables named SPEventData and LeaveApplication need to be passed to the child workflow. In this case, the child workflow is expected to have SPEventData and LeaveApplication XML variables defined.



See Workflow - Workflow - XmlVariables for ChildWorkflow for a detailed description of the XMLVariables for ChildWorkflow property window.

Output Values

The property in the Output Values has been described below. You can use this property to specify the output values of the activity.

Return Values - This property can be used to add all the possible output values from the child workflow, for conditional routing. The child workflow should set a value to the 'ParentWorkflowOutput' variable. This variable will hold the output value from the child workflow. The value of the 'Wait for the child workflow?' property should be set to 'Yes'.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Return Values property

1. To specify the Return Values, click the button for the 'Return Values' property to open the property window.
2. In this window, enter the return value in the Return Values field.
3. After entering the return value details, click Add Row to add this return value and display a new row for entering another return value.
4. Remove rows if necessary by selecting them and clicking Remove Selected.
5. After specifying all the return values, click Update.

See Workflow - Return Values for a detailed description of the Return Values property window.

Activity outputs:

The Workflow Activity does not have any standard return value. It will output the value specified by the user in the Return Values property.

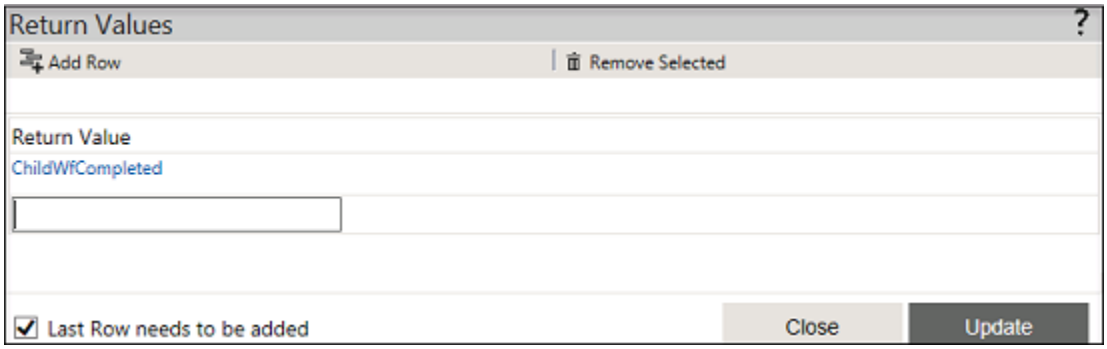
Example for a Workflow Activity:

Configuring Parent Workflow to wait till Child Workflow Completes Execution

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to be followed for Parent Workflow configuration:

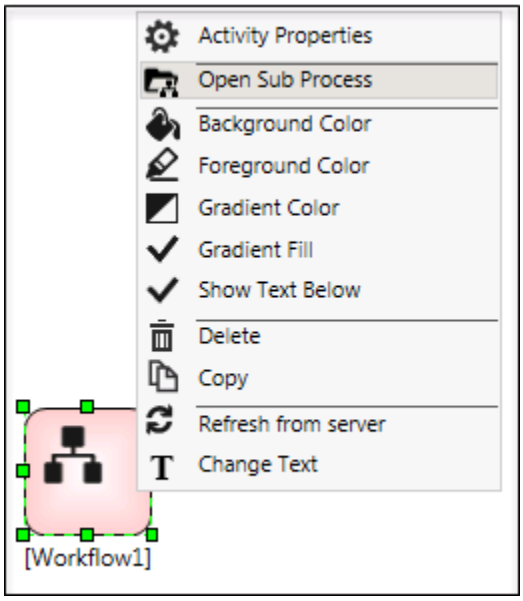
1. Set Wait for the child workflow property as Yes to wait for the child workflow to complete the execution.
2. Use Return Value property to set the routing condition after completion of child workflow. Example: ChildWfCompleted.



This will dynamically create a link output named 'ChildWfCompleted' for the activity. Once the child workflow complete its execution, it returns back to the parent workflow with the return value specified in the child workflow (In this case, child workflow should return 'ChildWfCompleted' value) and then it will continue with further execution.

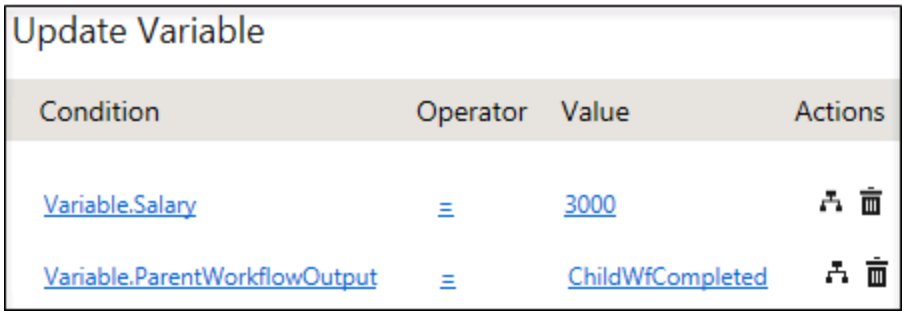
Steps to be followed for Child Workflow configuration:

1. Right-click the workflow activity to open child workflow using the context menu item Open Sub Process.



2. Declare a variable named 'ParentWorkflowOutput' of type string in the child workflow Start action.
3. Use Update Variable action to set the variable 'ParentWorkflowOutput' value as 'ChildWfCompleted' (This value should be same as the value for the Return Values property in parent workflow action properties).
4. The Update variable action to update the parent workflow output should be placed after the logical conclusion of child workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



After configuring child workflow, follow the steps given below:

1. Go back to the parent and set routing condition based on the output 'ChildWfCompleted'
   a. Parent workflow goes to sleep mode after the child is executed.
   b. Child completes execution with Update Variable as the last action.
   c. Once the child completes execution, the value set in Update variable is given as output for the workflow action in parent.

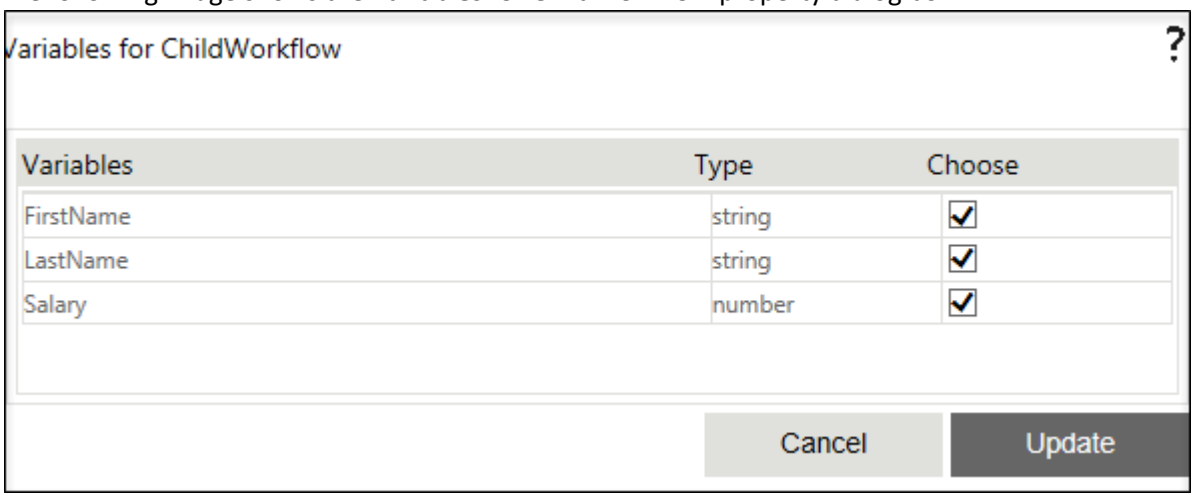
Note: If the child workflow needs to update any of the parent workflow variables, it is a must for Parent workflow to wait for the child workflow to complete.

Workflow - Variables for ChildWorkflow

Variables for ChildWorkflow Property Window

You can specify the variables to be passed to the child workflow in this property window. To open this window, click the button for the 'Variables for ChildWorkflow' property.

The following image shows the **Variables for ChildWorkflow** property dialog box:



The window has a grid that lists the parent workflow variables that can be passed to the child workflow. It has the following columns – **Variables**, **Type**, and **Choose**. Select the **Choose** check box to select the variable. Click **Update** to set the selected variables to be passed.

Note: You can create a local variable (that is, variables prefixed with '@', for example, @EmpId) which can be passed to the child workflow. For the child workflow to get this variable value, it should have a variable with the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

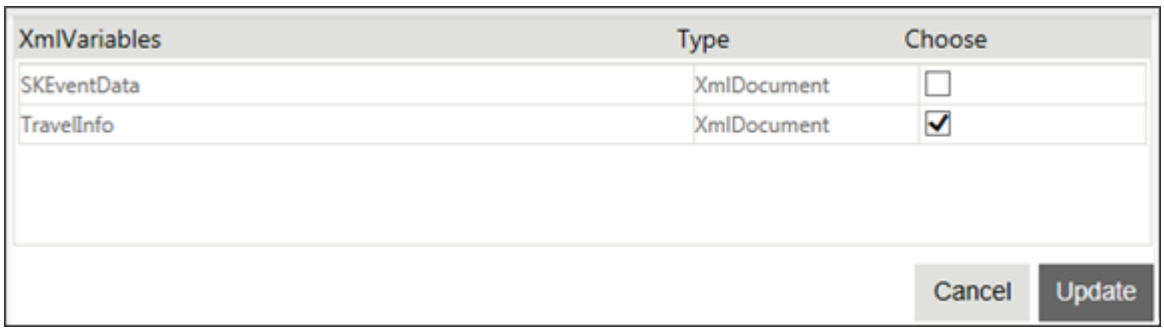
same name but without the '@'. For example, if a parent workflow has a local variable '@EmpId', then the child workflow should have a variable 'EmpId' to get its value.

Workflow - XmlVariables for ChildWorkflow

XmlVariables for ChildWorkflow Property Window

You can specify the XmlVariables to be passed to the child workflow in this property window. To open this window, click the button for the 'XmlVariables for ChildWorkflow' property.

The following image shows the **XmlVariables for ChildWorkflow** property dialog box:



The window has a grid that lists the parent workflow XMLvariables that can be passed to the child workflow. It has the following columns –**XmlVariables**, **Type**, and **Choose**. Select the **Choose** check box to select the XmlVariable(s). Click **Update** to set the selected XmlVariable(s) to be passed.

Note: For **XMLVariables** of type **XMLDocument**, the **Internal Storage** should be the same for both the parent and the child workflow.

How to Pass Variables from Parent Workflow/Quickflow to Child Workflow?

The Workflow Activity enables the execution of a second (child) workflow from a (parent) workflow/quickflow. The workflow activity can be used to call a child workflow from a parent workflow/quickflow. The **Variables for the child workflow** property and **XMLVariables for the child workflow** property enable parent workflow/quickflow to pass variable and XML variable information to the child workflow respectively.

To pass variables from parent workflow to child workflow, follow the steps given below:

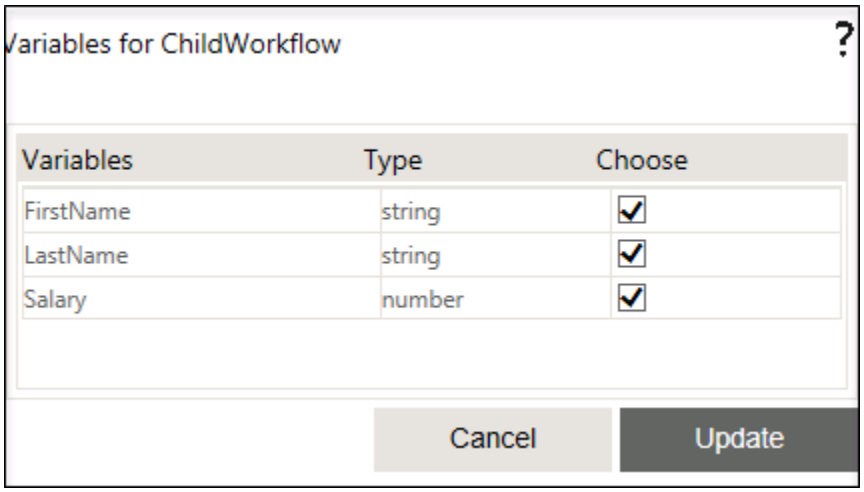
1. In the parent workflow/quickflow, right-click **Workflow Activity**, and then select **Activity Properties**.
2. Enter the repository name for **Repository** property. The child workflow should belong to the same repository of the parent workflow/quickflow. The repository property of a child workflow is exposed for backward compatibility.
3. Enter the name of the workflow to be executed in the **Workflow** property.
4. Enter the version only if any specific version of the (child) workflow to be executed in the Version property.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Leave this as blank, if the latest published version of (child) workflow has to be executed.

Steps to set the Variables for ChildWorkflow property:

1. To specify the variables to be passed to the child workflow, click the button for the 'Variables for ChildWorkflow' property to open the property window.
2. In the **Variables for ChildWorkflow** window, select the required variables to be passed to the child workflow.



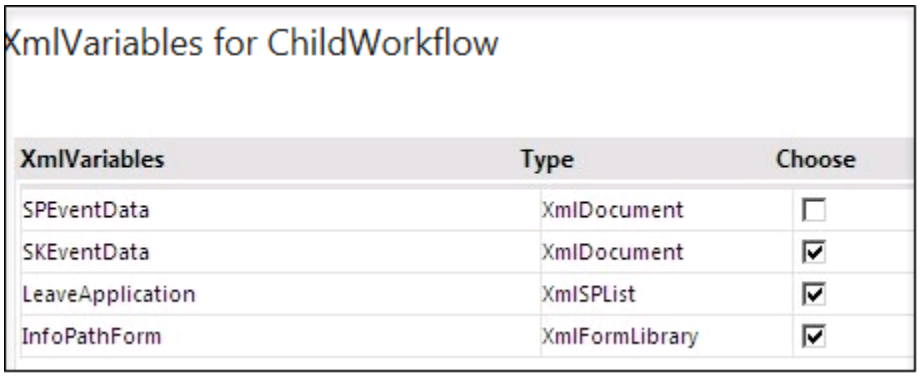
3. After specifying the data, click Update.

Note: These variables are expected to exist in the child workflow. Make sure to define variables with same name and type as defined in parent workflow/quickflow.

Select the XML variables that need to be passed to the child workflow from XMLVariables for ChildWorkflow property.

Steps to set the XMLVariables for ChildWorkflow property:

1. To specify the XML variables to be passed to the child workflow, click the button for the **'XMLVariables for ChildWorkflow'** property to open the property window.
2. In the **XMLVariables for ChildWorkflow** window, choose the required variables to be passed to the child workflow.



3. Click the Update button.

Note: These XML variables are expected to exist in the child workflow. Make sure to define XML variables with same name and type as defined in parent workflow/quickflow.

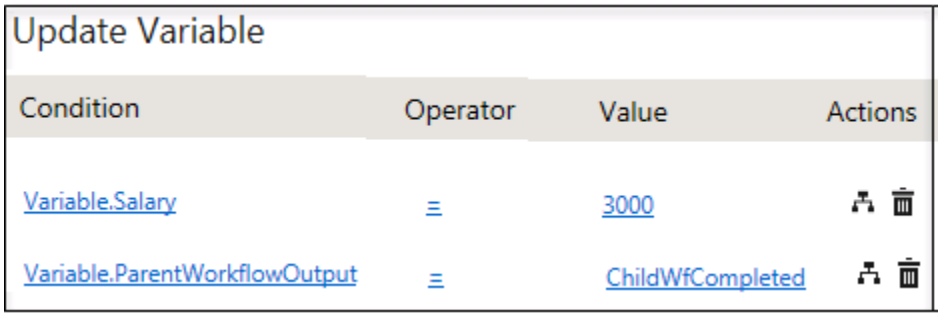
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To work with any XML variables or resource activities, SKEventData XML variables must be passed in the child workflow, where SKEventData contains some events information related to parent workflow/quickflow which needs to be passed to child workflow. If SKEventData variable is not created, user can create XML variable of type XMLDocument with the same name 'SKEventData' by locating the 'SKEventData.xml' from the following path: *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\BPMUITemplates\Default\XMLSchemas*

Configuring Child Workflow to route Parent Workflow/Quickflow

Steps to be followed for Child Workflow configuration:

1. Right-click the workflow activity to open child workflow using the context menu item Open Sub Process.
2. Declare a variable named 'ParentWorkflowOutput' of type string in the child workflow Start activity.
3. Use **Update Variable** activity to set the variable 'ParentWorkflowOutput' value as 'ChildWfCompleted' (This value should be same as the value for the Return Values property in parent workflow action properties).
4. The **Update Variable** activity to update the parent workflow output should be placed after the logical conclusion of child workflow.



Steps to be followed for Parent Workflow configuration:

1. Use Return Values property to set the routing condition after completion of child workflow. Example: 'ChildWfCompleted'.

   This will dynamically create a link output named 'ChildWfCompleted' for the activity. Once the child workflow complete its execution, it returns back to the parent workflow with the return value specified in the child workflow (In this case, child workflow should return 'ChildWfCompleted' value) and then it will continue with further execution.
2. Go back to the parent and set routing condition based on the output 'ChildWfCompleted'.
3. Parent workflow goes to sleep mode after the child is executed.
4. Child completes execution with Update Variable as the last action.
5. Once the child completes execution, the value set in Update variable is given as output for the workflow action in parent.

Getting Execution ID of the Child Quickflow

You can get Execution ID of the Child Quickflow from the Parent Quickflow as follows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To Access Execution ID of the Child Quickflow

1. Create a variable in the parent Quickflow with a name such as **"ChildQFExecutionId" + <<Child Quickflow Action Name>>**.

   For example: **ChildQFExecutionIdQuickflow1**
2. Access the variable **<%#Variable.ChildQFExecutionIdQuickflow1%>**.

   The variable will return the value of the Child Quickflow Execution ID.

XML Navigator

Activity Description:

The XML Navigator activity is used to either locate or navigate to a specific record in a collection within an XMLIterator Variable. This activity enables identification of a specific record for execution of an activity or group of activities.

See also *Example of XML Navigator Activity*

Activity Properties:

You can configure the XML Navigator activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **XML Navigator** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

Name & Description

Specify the name and description for the activity in this group.

Name - Enter the name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - Enter a brief description for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Configuration

The Configuration group has properties for selection of the XMLIterator Variable to be looped through.

XMLIterator - Select the XML Iterator variable to be navigated. All XMLIterator variables as declared in the Start activity are available for selection.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Location - This field identifies the location to be navigated to. It defaults to First. The options are:

First: Navigates to the first record in the collection.

Last: Navigates to the last record in the collection.

Next: Navigates to the next record based on the current location.

Previous: Navigates to the previous record based on current location.

Index: Navigates to the record identified in the Index field.

Property Type: Mandatory (This property must be set if the action is to be executed.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Index - Enter the index number of the record to navigate to. This field is mandatory if the Location field is set to Index.

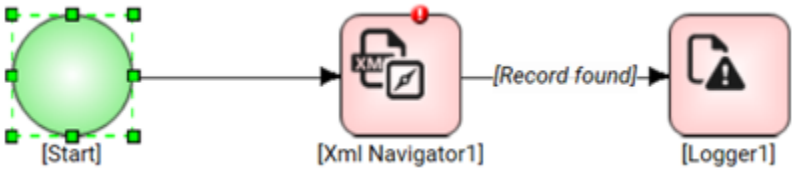
Property Type: Optional (This property needs to be set only if necessary.)

Example for XML Navigator

Consider already an XML file called Sample.XML is exists. The contents of it are as shown below.

```
<?xml version="1.0" encoding="utf-8"?>
<root>
<Item>
<itemdID>I001</itemdID>
<desc>some stuff1</desc>
<qty>10.20</qty>
</Item>
<Item>
<itemdID>I002</itemdID>
<desc>some other stuff2</desc>
<qty>20.20</qty>
</Item>
<Item>
<itemdID>I003</itemdID>
<desc>some more stuff3</desc>
<qty>30.20</qty>
</Item>
</root>
```

Step 1: Design a Workflow as shown in the below figure.



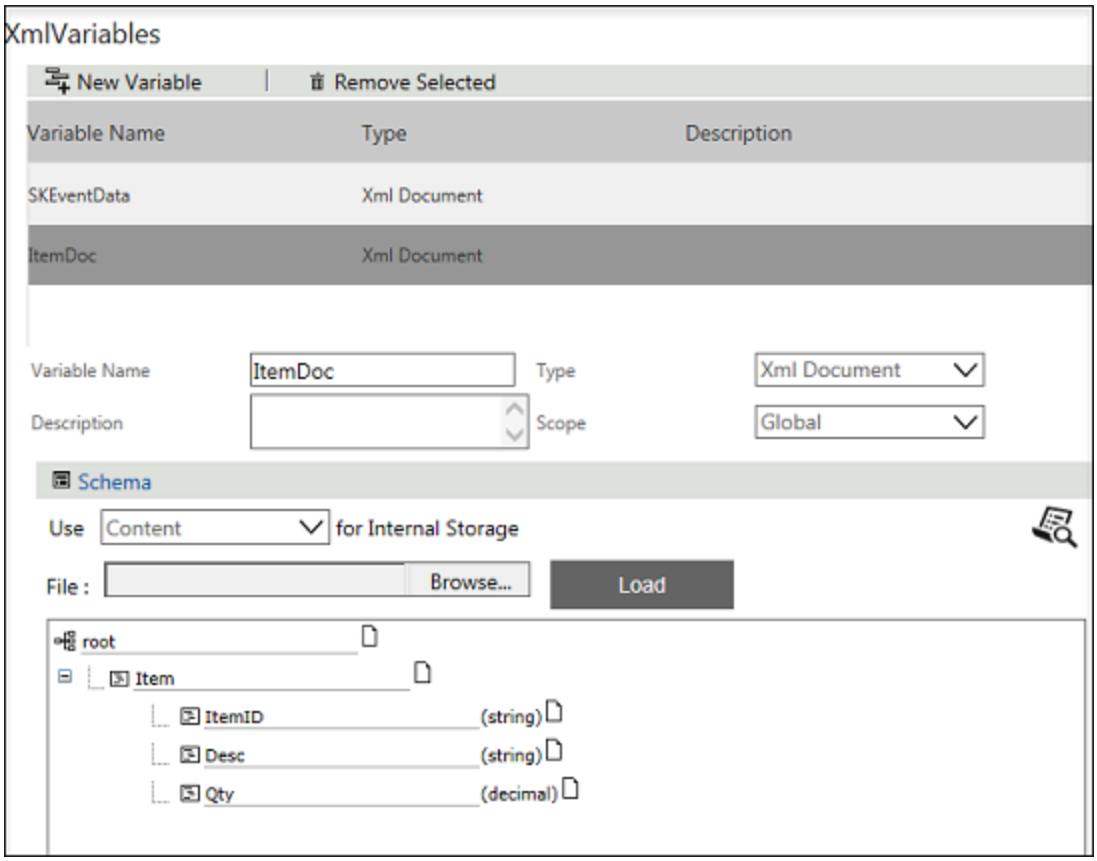
Step 2: In the Start Activity, declare two XML Variables.

1. Click the New Variable link. Under Schema enter the following details:

   Variable Name: ItemDoc, **Type**: XML Document, and **Scope**: Global

   Use **Content** for internal storage and browse the above created Sample.XML file and load it.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

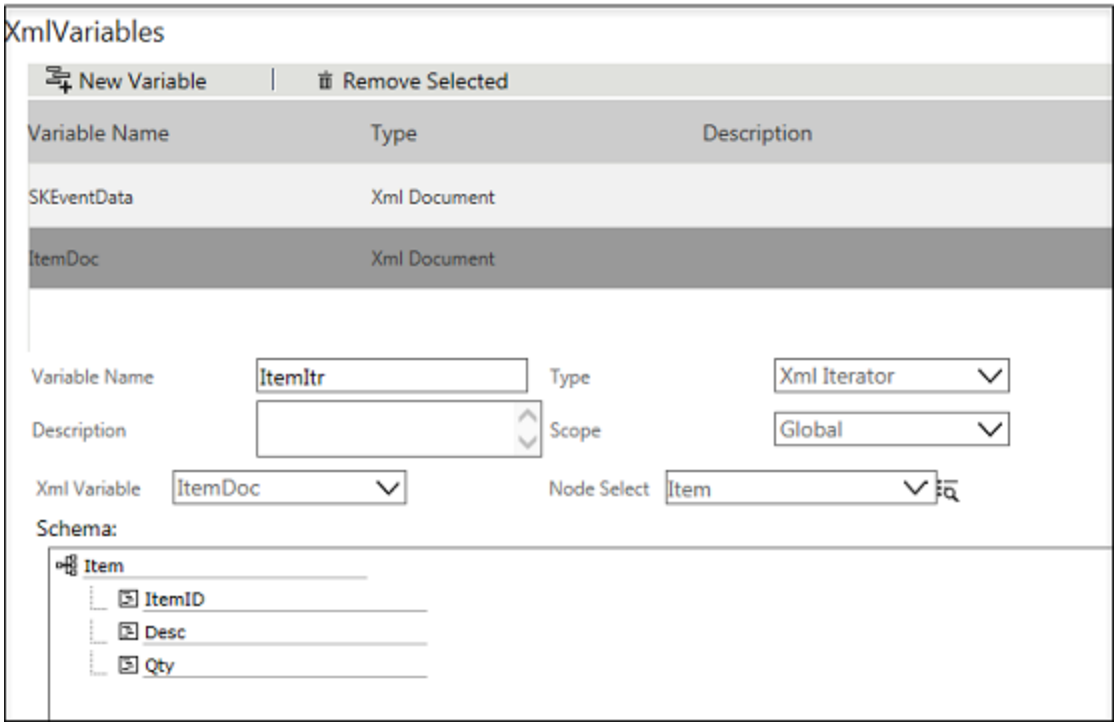


2. Click the **New Variable** link. Under Schema, enter the following details:

   Variable Name: ItemItr,
   Type: XML Iterator,
   Scope: Global,
   XML Variable: ItemDoc
   Node Select: Item

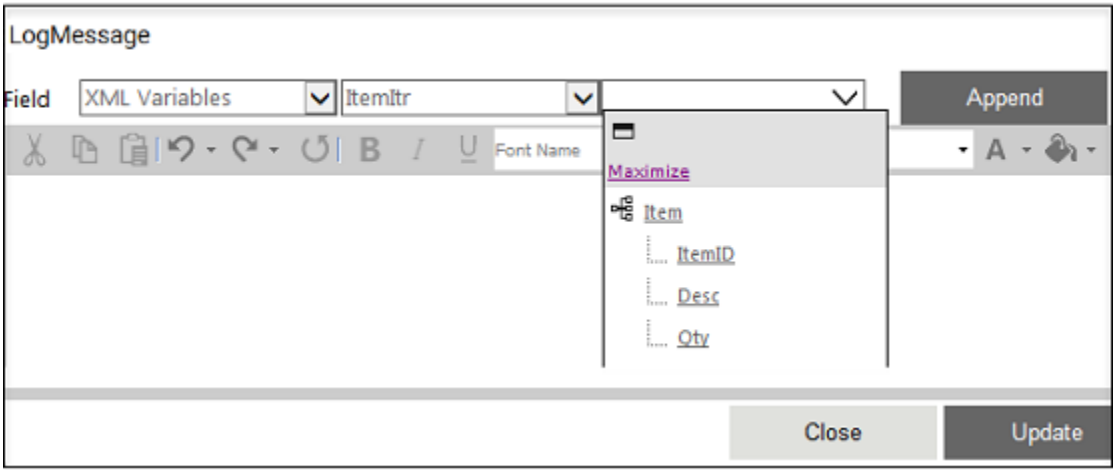
3. Click **Save Variable** and close the window

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Step 3: In the location property of XML Navigator Activity, select "Last". For the XML Iterator property, select the Iterator created that is, ItemItr. In the Logger Activity, the ItemItr is displayed in LogMessage column of the work item.

Step 4: Click the LogMessage property of Logger Activity, following window will open.



Select XML Variable form the first drop-down. In the second drop-down, select the Iterator created, that is ItemItr. In the third drop-down, select the Item ID from the tree displayed. Click **Append**, and then click **Update**.

Step 5: On the link connecting XML Navigator Activity and Logger Activity, select "Record Found".

Output:

The item ID will be displayed in the LogMessage Column of the Logger in work item.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Integration Activities

The following are the types of Integration activities:

- Invoke Web API Activity: The Invoke Web API activity is used to invoke a web API from the workflow.
- Script Activity: The Script Activity enables the execution of script written in languages, such as Jscript and VBScript, from the workflow.
- XML Action Activity: The XML Action Activity can be used to assign XML data for activity.

Invoke Web API Activity

Activity Description

You can use the Invoke Web API activity to invoke a web API from the workflow. Use the output of the activity to determine the path of workflow execution.

The output is triggered based on the http Status Code returned by the activity. Alternatively, the output Status Code can be saved in a AVEVA Work Tasks system variable.
The variable has to be prefixed with "^" followed by "Activity Name _StatusCode". For example, if the activity name is Invoke Web API1, then variable name should be "^Invoke Web API1_StatusCode" and the data type should be "string".

The Error Message can be saved in the AVEVA Work Tasks system variable.
The variable has to be prefixed with "^" followed by "Activity Name _WebAPIErrorMessage". For example, if the activity name is Invoke Web API1, then variable name should be "^Invoke Web API1_WebAPIErrorMessage" and the data type should be "string".

The additional error information (i.e. http custom content message) can be saved in the AVEVA Work Tasks system variable.
The variable has to be prefixed with "^" followed by "Activity Name _WebAPIErrorDetails". For example, if the activity name is Invoke Web API1, then variable name should be "^Invoke Web API1_WebAPIErrorDetails" and the data type should be "string".

You can use any HTTP client to invoke your web API. In fact, you can invoke it directly from a web browser. When the Web API framework receives a request, it routes the request to an action. To determine which action to invoke, the framework uses a routing table.

Activity Properties

You can configure the Invoke Web API activity by specifying appropriate values in the Activity Properties area. To access the Activity Properties, click the **Activity Properties** menu in the Tool Bar. Or, right-click the **Invoke Web API** activity and select the **Activity Properties** option. The Activity properties are organized under groups of related properties. The properties under each group are described in this topic.

Name & Description

Use the Name and Description properties to enter the the name and description for the activity. This property is optional, and can be set if required.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Name**: Specify a name for the activity.
- **Description**: Specifies a brief description to be displayed for the activity.

Configuration

Use the configuration properties to configure the functionality of the activity.

Configure Web API: Use this property to configure the Web API to be called. Web APIs are frameworks to build HTTP services for browsers and mobile devices.

For more information about this activity property, see Configure Web API.

Looping Behavior

Use this property to specify the looping behavior of the activity. This property is optional, and can be set if required.

Loop through this action if output is: Specify the condition for looping the activity. Select any one of the following activities from the list:

- No Loop
- BadGateway(502)
- BadRequest(400)
- Error Encountered
- Forbidden(403)
- GatewayTimeout(504)
- HttpVersionNotSupported(505)
- InternalServerError(500)
- MethodNotAllowed(405)
- NotAcceptable(406)
- NotFound(404)
- NotImplemented(501)
- ProxyAuthenticationRequired(407)
- RequestTimeout(408)
- ServiceUnavailable(503)
- Successful
- Unauthorized(401)
- Unsuccessful
- UnsupportedMediaType(415)

Note: For the Invoke Web API activity, the StatusCodes "OK(200)" and 'ConnectFailure(0)' is not saved in the system variable (i.e. "^Activity Name_StatusCode").

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Invoke Web API: Configure Web API

You can configure the Web APIs in the **Set Web API Configurations** window. This window lists all the Web APIs configured for the application or workflow.

Http Method

The **Invoke Web API** activity supports the following HTTP request methods:

- **GET**: The GET method retrieves information from the given server using a given URI. Requests using GET should only retrieve data and should have no other effect on the data.
- **POST**: A POST request sends data to the server, for example customer information, file upload, using HTML forms.
- **PUT**: A PUT request replaces all current representations of the target resource with the uploaded content.
- **DELETE**: A DELETE request removes all current representations of the target resource given by the URI.

Web API

Web APIs are frameworks to build HTTP services for browsers and mobile devices.

If the Web API is Windows authenticated, then the status of the Windows Authentication must be set to **Enabled** for the **EnterpriseConsole** site under **WonderwareSkeltaBPMSites** site in the **IIS Manager**.

If the Web API requires ArchestrA Security Token Service (ASTS) access token authentication, then the Workflow Engine Service must first be registered as a client in the ASTS server through **Central Configuration** site. Web API with the Access Token enabled Authentication gets listed in the Web API drop-down list, so that it can be used within the workflow.

Request URI

The Request URI is a Uniform Resource Identifier and identifies the resource upon which to apply the request.

Example:

- Request URI without parameters: **api/product/1** for **http://localhost/MySite/api/product/1**
- Request URI with parameters: **api/{product}/{ID}** for **http://localhost/MySite/api**

Use System Authentication

Select the **Use System Authentication** check box to use the access token of the Workflow Engine Service.

Content Type

You can configure the content type of the Post Data. The available options are **JSON**, **XML**, and **URL ENCODED**.

This field is displayed only when the value of **Http Method** is set to **POST** or **PUT**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

POST Data

Passing data to POST and PUT Methods

You can pass data to POST and PUT methods either through parameters or through the request body. If you pass data through request body, use the adjacent text box for the body content. If web API method uses [FromBody] attribute, select the **Yes** option for the **FromBody Attribute** property.

Output Settings

Save Output In

Use the options in this field to save the return value from the Web Method so that you can use it in subsequent activities. You can save the return value as either a **Variable** or as an **XML Variable**.

To save the output as a **Variable**, select the variable that you created in the **Start** activity. To save the output as an XML variable, select the **XML Variable** that you created in the **Start** activity. You can also create the XML variable using the **Create New** option.

Note: Create XML variable will work only if the web API returns valid data. Therefore, for Delete, Put, and Post, use an existing variable.

Invoke Web API: Configure OpenAPI

AVEVA Work Tasks allows you to configure OpenAPI, and it is compliant with Swagger 2.0 and Swagger 3.0.

To configure the OpenAPI

1. Right-click the **Web API Activity**, and then click **Activity Properties** option. In the Activity Properties window, click **Configure Web API**.

   The **Web API Activity Configuration** window opens.
2. In the **Web API** drop-down list, select the Web API list item, which is an OpenAPI.

   This loads the OpenAPI data, which gets stored when OpenAPI list item is created using OpenAPI.
3. In the **Operation Group** dropdown list, select the operation group provided in the JSON file of the selected OpenAPI. These groups are the tags or the logical groupings of the selected OpenAPI.

   Tags are used as Operation Group. Though Tag is an optional element in the OpenAPI Specification, if available, it will be considered as Operation Group item.

   If Tags is empty/not available, then it will not list out in Operation Group, but the operation will be directly listed under All (by default) Operation Group.
4. In the **Operation** drop-down list, select the operation ID of the OpenAPI defined for the selected Operation Group in the JSON file of the selected OpenAPI.

   The OperationId is considered as Operation and will be listed out in the drop-down.

   The OperationId is an optional, unique element as per the OpenAPI Specifications. But if any of the OperationId is duplicate, then the same will be logged in the Logger.

   If the OperationId is not present, then Path_HttpMethod will be displayed as Operation under the Operation dropdown.

   Based on the Operation Group selection, the Operation will be listed in the Operation dropdown.

   If there are no Tags available for some operations, then they will appear in All Operation Group along with all

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

other operations.

When the Operation is selected, the HTTP methods (GET, PUT, POST, DELETE, or PATCH) and the associated parameters are retrieved from the JSON file of the selected OpenAPI.

Note: If Operation ID is not available, the Operations Group tag is considered.

5. In the **HTTP Method**, the HTTP method is displayed when you select Operation, and this is a disabled field.
6. The **Headers** tab is displayed only if the Header Keys and Values are configured in the OpenAPI resource file. You cannot add or delete the Header Keys and Values for the OpenAPI.

   Note:
   - The **Show Header** option is available to hide/unhide the **Headers** tab in the **Web API Activity Configuration** page. Select **Yes** if you want to view, add, and delete the Header Keys and the Values, else select **No**. You can add the Value using Expression Editor.
   - You cannot set the **Optional** property of the **Header**. You cannot provide the Key, but you need to provide the Value. If the **Optional** property is **YES** and the Value is empty, the value will not be sent to the Web API and will be considered null. If the **Optional** property is **NO**, you need to provide the Value.
7. In the **Parameters** and **Body** tabs, enter the details given in the respective tables in this topic.
8. In the **Output settings**, configure the **Save output type** and **Save output in**.

   To save the output in a **Variable**, select the variable that you created in the **Start** activity. To save the output in an **XML Variable**, select the XML variable that you created in the **Start** activity. You can also create the XML variable using the **Create New** option from the **Save output in** dropdown.

   You can overwrite the XML Variable using the **Update XML Variable** option after modifying the OpenAPI configuration.

   Note: If OpenAPI specification JSON file does not have a response for the selected Operation, then it will prompt the user as "The selected operation does not return any value."
9. Click **Save**.

   The OpenAPI gets configured.

Parameters Tab

This tab is displayed if the selected Operation has parameters.

In the Parameter's grid, the following parameters are listed:

- Path parameters: the parameters' value is part of the operation’s URL
- Query parameters: the parameters that are appended to the URL

Note: Header and Cookie parameters are not supported.

The table describes the fields available under **Parameters** tab.

Fields	Description
No	It displays the serial number of the parameter and represents its sequence.
Optional	It displays **YES** or **NO** values. **YES**, denotes that you can either enter the value for

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Fields	Description
	the parameter in the **Value** field or leave it blank. **NO**, denotes that you must enter the value for the parameter in the **Value** field. **Note**: For the path parameter, the Optional field is always NO, but for query parameter it can be either YES or NO.
Name	It displays the name of the parameter.
Data type	It displays the data type of the parameter. The supported data types are boolean, decimal, numeric, and string. **Note**: The OpenAPI-specific datatype formats are not validated.
Value	Enter the value to be passed for the parameter. The value is validated against the data type. The value can be hard-coded or can be passed through the Expression Editor. **Note**: The value passed using Expression Editor is not validated for the data type.

Body Tab

This tab is displayed if the selected Operation is POST, PUT, or PATCH.

It is used to pass PostData to the OpenAPI, and the PostData can be passed as raw format or in the form of parameters, hence two options - **Parameters** and **Raw** are available with the Radio buttons.

Both Parameters and Raw are validated based on the selection of Content Type.

Note: In the **Body** tab, it is mandatory to provide data either in the **Parameters** or the **Raw** option.

Parameters:

The request body is populated in the form of the name, data type, and the value to map individual parameters with a hard-coded value or to a dynamic value that is build-up through the Expression Editor.

The table describes the fields available under **Body** tab for **Parameters**:

Fields	Description
No	It displays the serial number of the parameter and represents its sequence.
Optional	It displays **YES** or **NO** values. **YES**, denotes that you can either enter the value for the parameter in the **Value** field or leave it blank. **NO**, denotes that you must enter the value for the parameter in the **Value** field.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Fields	Description
	Note: For the path parameter, the Optional field is always NO, but for query parameter it can be either YES or NO.
Name	It displays the name of the parameter.
Data type	It displays the data type of the parameter. The supported data types are boolean, decimal, numeric, and string. **Note**: The OpenAPI-specific datatype formats are not validated.
Value	Enter the value to be passed for the parameter. The value is validated against the data type. The value can be hard-coded or can be passed through the Expression Editor. **Note:** The value passed using Expression Editor is not validated for the data type.

On the Body parameters, constitute the PostData, and pass it to the OpenAPI during execution.

Raw:

In this tab, you can provide raw data as PostData, either a hard-coded value or dynamic value that is built up through the Expression Editor.

The table describes the fields available under **Body** tab for **Raw** data:

Fields	Description
Post Data	Enter the value you want to pass to POST, PUT, and PATCH methods through the body. The value should be in the format based on the content type selected in the Content Type dropdown.

Note:
- For more information on PATCH method, see PATCH Method.
- Passing empty/null parameter in RAW JSON/XML format as PostData is not supported. The user needs to provide correct JSON/XML data in RAW format without null/empty values.
- During design, the value provided as raw data to pass to the POST or PUT method through the body is not retained when you change the operation (PUT or POST).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Script Activity

Activity Description

The Script Activity enables the execution of script written in languages, such as Jscript and VBScript, from the workflow. When the Script activity is included in the workflow, the activity calls the Run method in the script. The references to the assemblies in the script are taken from the activity properties. The string value returned from the Run method of the script is assigned to the Output parameter. The Script activity executes the script and gives the return values specified in the properties. The link matching this value is picked up to continue workflow execution.

Features of Script Activity

- Compilation of the script code is made at design time to enable discovery of syntax or other errors during design.
- Loading all scripts defined through script activities as a single assembly. All script activities are compiled as a single assembly and only one assembly is loaded during workflow execution. This significantly improves performance.
- When a workflow is published, the script details are stored in the SWScriptCode table to enable identification of source code and assembly references.

Note: Framework 4.0 has a library named System.Action and results in an ambiguity between the System.Action and Workflow.NET.Action. To avoid this ambiguity, it is recommended to name the Action class with complete namespace as 'Workflow.NET.Action' if it is used in the scripts inside script activity, while running BPM.NET 2011 SP2 in Framework 4.0.

Activity Properties

The Script activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the Tool Bar or by selecting the appropriate option from the right click menu for the Script activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

The following are the Script Activity Properties:

Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

The following image shows the Name & Description properties of Script Activity:

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Programming

The properties in the Programming group have been described below. You can use these properties to program the script activity.

The following image shows the Programming Properties of the Script Activity:

Language - This property specifies the language of the script to be run. This property can be set to 'C#.NET' or 'VBScript' depending on the scripting language required.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Code - This property specifies the code of the script to be run.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the Code property:

1. To enter the code, click on the button for the 'Code' property to open the property window.
2. In this window enter the code directly in the text editor.
3. If you want to assign the code dynamically during run-time, you can do so using the **Field** controls. For example, you can add a variable or content pointing to the code from the two drop downs for **Field** and click on the **Append** button. This will add the placeholder for the variable or content in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the code.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the code, click the **Update** button to save it
7. Click the **Close** button to close the window without saving the code.

See Script - Code for a detailed description of the Code property window.

Reference - This property specifies the global objects that can be referenced in the script.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the References property:

1. To specify the References, click on the button for the 'References' property to open the property window
2. In this window, enter the reference object in the **References** field
3. Next, enter the corresponding assembly path in the **Assembly Path** field
4. After entering the return value details, click the **Add Row** button to add this reference and display a new row for entering another reference
5. Remove rows if necessary by selecting them and clicking the **Remove Selected** button
6. After specifying the references, click the **Update** button.

See Script - References for a detailed description of the References property window.

Output Values

The properties in the Output Values group have been described below. You can use these properties to specify the output values for the activity.

The following image shows the Output Values Properties of the Script Activity:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Return Values - This property allows the user to specify the return values for this action. These values become the conditions for the workflow engine to pick up the next action to execute.

Property Type: Mandatory (This property must be set if the action is to be executed.)

Steps to set the Return Values property

1. To specify the Return Values, click on the button for the 'Return Values' property to open the property window
2. In this window, enter the return value in the **Return Values** field
3. After entering the return value details, click the **Add Row** button to add this return value and display a new row for entering another return value
4. Remove rows if necessary by selecting them and clicking the **Remove Selected** button
5. After specifying all the return values, click the **Update** button.

See Script: Return Values for a detailed description of the Return Values property window.

Action outputs:

The Script Action does not have any standard return value. It will output the value specified by the user in the Return Values property.

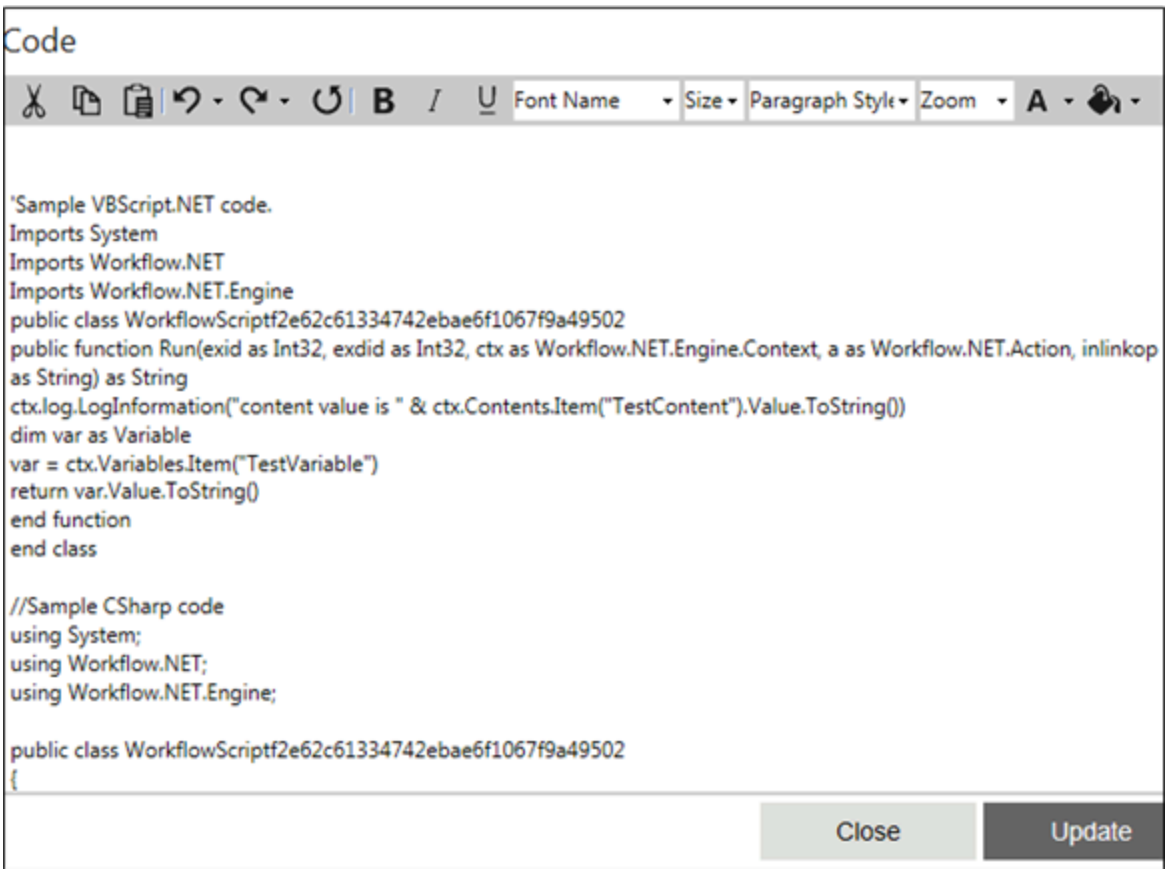
Script: Code

Code Property Window

You can set the code of the script in the **Code** property window. To open this window, click the button for the "Code" property.

The following image shows the script **Code** property window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The **Code** property window contains a text editor to enter the script code. You can do this either by entering a discrete value directly in the text editor. You can use the text tool bar in the text editor to manage and format the code.

The text tool bar contains the following options:

Options	**Shortcut Key**	**Description**
Cut	Ctrl+X	Cut text
Copy	Ctrl+C	Copy text
Paste	Ctrl+V	Paste copied text
Undo	Ctrl+Z	Undo the last action
Redo	Ctrl+Y	Redo an action that you undid
Repeat Last Command	F4	Repeat the last command that was executed
Bold	Ctrl+B	Make text bold
Italic	Ctrl+I	Italicize text
Underline	Ctrl+U	Underline text

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Options	Shortcut Key	Description
Font Name	-	Select the font for the parameter
Size	-	Enter the font size
Paragraph Style	-	Select a paragraph style
Zoom	-	Zoom in and zoom out the view
Foreground Color	-	Set text color
Background Color	-	Set the background color
Print	-	Print the text

The **Code** property window also contains the following tabs:

- **Update**: Use this tab to save the parameter.
- **Close**: Use this tab to close this window.

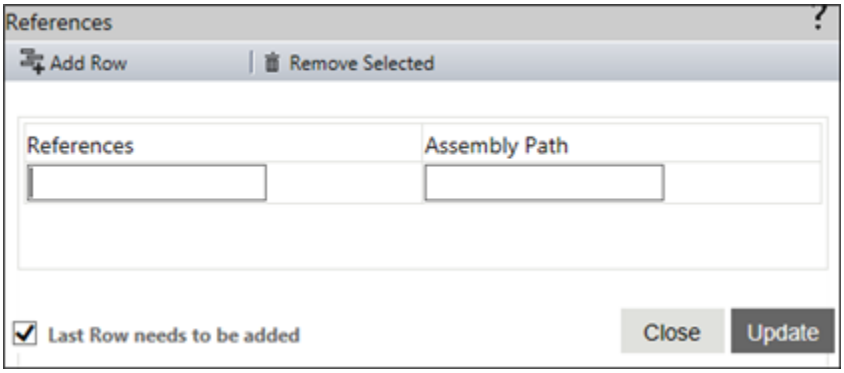
Script: References

References Property Window

You can set the references for the script in the **References** property window.

To open this window, click the button for the "References" property. It displays the references in a grid. The grid contains a blank row where you can enter the parameters for new references.

The following image shows the **References** property window:



The **References** property window contains the following fields and tabs:

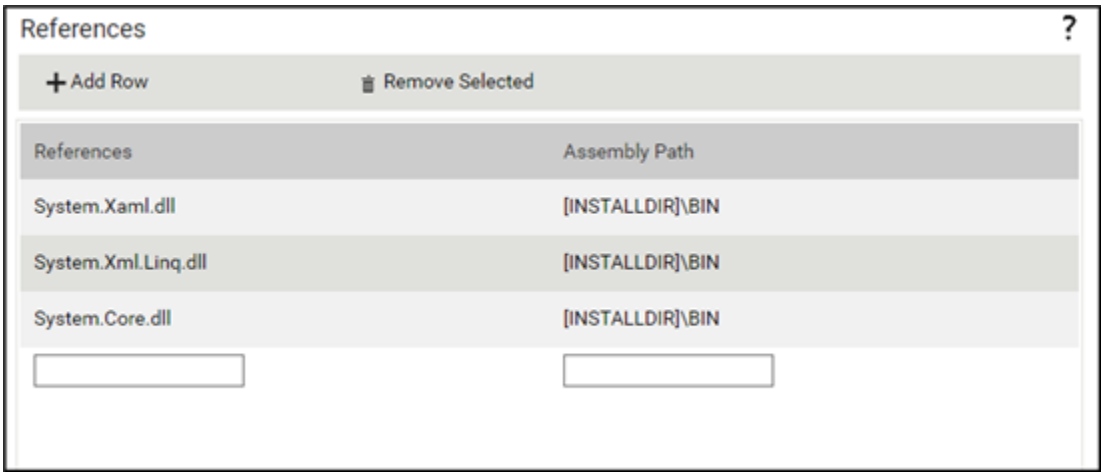
- **Add Row**: Use this tab to add the newly entered reference, and display a new row to the grid where you can add another reference.
- **Remove Selected**: Use this tab to remove the reference selected in the grid.
- **References**: Use this field to enter a new reference object.
- **Assembly Path**: Use this field to enter the assembly path for the new reference.
- **Update**: Use this tab to save the newly added reference(s).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Close**: Use this tab to close the property window without saving the newly added reference(s).
- **Last Row needs to be added**: Select this check box to save the last row added.

Enter the relative path, **[INSTALLDIR]\Bin** as the assembly path to refer to the external assemblies that are referenced in script action and are available in the AVEVA Work Tasks installed Bin folder.

The following image shows the external assembly relative path:



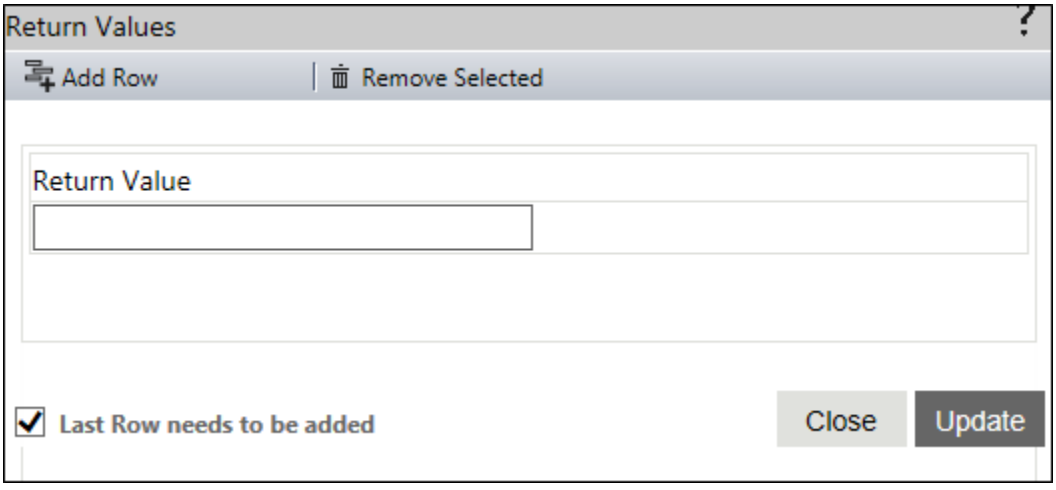
Script: Return Values

Return Values Property Window

You can set the return values for the Script in the **Return Values** property window.

To open this window, click the button for the "Return Values" property. It displays the values in a grid. The grid contains a blank row where you can enter a new return value.

The following image shows the **Return Values** property window:



The **Return Values** property window contains the following fields and tabs:

- **Add Row**: Use this tab to add the newly entered return value, and display a new row to the grid where you can add another value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Remove Selected**: Use this tab to remove the return value selected in the grid.
- **Return Values**: Use this field to enter the return value.
- **Update**: Use this tab to save the newly added return value(s).
- **Close**: Use this tab to close the property window without saving the newly added return value(s).
- **Last Row needs to be added**: Select this check box to save the last row added.

XML Action Activity

Activity Description

The XML Action Activity can be used to assign XML data for activity. This was possible earlier only by using Contents and Variables defined in the Start activity. The activity has been enhanced to accept XML data containing namespaces. The namespace manager that has been added to the activity handles namespaces within the XML data internally.

View an example of assigning XML data with namespaces to a variable

The namespaces in the following example used to illustrate the extraction of a particular data are highlighted in red.

```
<tr:travelRequest xmlns:xhtml="http://www.w3.org/1999/xhtml" xmlns:xsi="http://www.w3.org/
2001/XMLSchema-instance"
<tr:travelRequest xmlns:xhtml="http://www.w3.org/1999/xhtml" xmlns:xsi="http://www.w3.org/
2001/XMLSchema-instance">
<tr:description></tr:description>
<tr:date xsi:nil="true"></tr:date>
<tr:traveler>
<tr:name>
<tr:prefix></tr:prefix>
<tr:givenName>guru</tr:givenName>
<tr:middleName>nayak</tr:middleName>
<tr:surname></tr:surname>
<tr:suffix></tr:suffix>
<tr:singleName></tr:singleName>
</tr:name>
</tr:traveler>
</tr:travelRequest>
```

The XPath expression to retrieve the middle name and assign it to a workflow variable 'aa' is given below. The image shown below illustrates the actual setting of the variable with this XML data.

// tr:travelRequest/ tr:traveler/ tr:name/ tr:middleName

Application Scenarios

The XML Action can be used with other Activities to retrieve required XML data by defining XPath expressions. For example, it can be used with the Checklist activity to retrieve the Answers to Checklist Questions.

The XPath expressions for retrieving answers to Checklist Questions

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The XML Activity can be used with the Checklist Activity to retrieve the Answers to the Checklist Questions. The XML data format for the Checklist Activity to be declared in the Start activity is '^'+ activity name + 'AnswersXMLCheckList' , e.g. '^Checklist1AnswersXMLCheckList'.

The XPath expressions to retrieve the Answers from the Checklist XML string are given below:

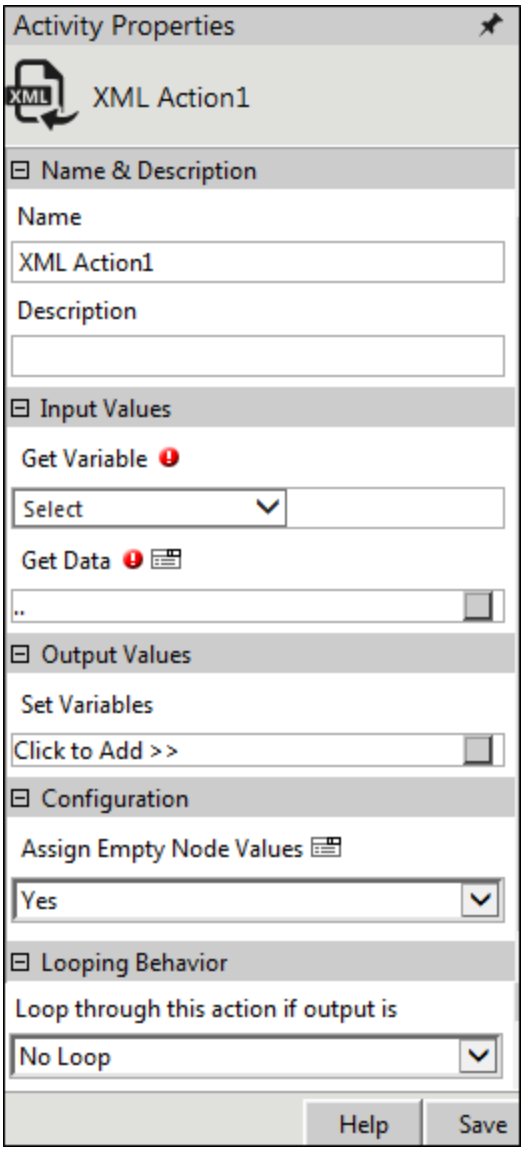
XPath with attribute:

```
//checklist/question[@name="RADIO"]/answer
//checklist/question[@name="DROPDOWN"]/answer
//checklist/question[@name="TEXTBOX"]/answer
//checklist/question[@name="MEMO"]/answer
//checklist/question[@name="CHECKBOX"]/answer
```

Activity Properties

The XML Activity has to be configured by specifying appropriate values for the different properties in the Activity Properties area. The Activity Properties can be accessed by clicking on the Activity Properties tool in the tool bar or by selecting the appropriate option from the right click menu for the XML Activity. The Activity Properties are organized under the following groups of related properties. The properties under each group are described in this topic.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Name & Description

The properties in the Name & Description group have been described below. You can use these properties to specify the name and description for the activity.

Name - This property can be used to specify a name for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Description - This property specifies a brief description to be displayed for the activity.

Property Type: Optional (This property needs to be set only if necessary.)

Input Values

The properties in the Input Values group have been described below. You can use these properties to specify the input values for the activity.

Get Variable - This property allows the user to specify the variable that holds the XML string. This variable is defined in the Start activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Optional (This property supports backward compatibility.)

Get Data - This property allows the user to pass the XML data. This data can be passed in one of two forms: (1) XML String, or (2) XML File (where the complete path of the XML file is specified).

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Get Data property

1. To specify the XML data, click the button for the 'Get Data' property to open the property window.
2. In this window enter the XML data directly in the text editor. You can either specify the file path to an XML file here or enter the XML data directly.
3. If you want to assign the parameter dynamically during run-time, you can do so using the **Field** controls. For example, you can add a variable or content pointing to the XML data from the two drop downs for **Field** and click on the **Append** button. This will add the placeholder for the variable or content in the text editor. At run-time this placeholder will be replaced by the corresponding value, i.e. the XML data.
4. You can manipulate the text using the appropriate tools from the tool bar. You can cut, copy and paste text, undo and redo changes, zoom in and zoom out the view as well as print the text.
5. You can format the text, if necessary, using the formatting tools. You can make text bold or italic or change the font or size, set text color or background color.
6. After adding the XML data, click **Update** to save it.
7. Click to close the window without saving the XML data.

See XML Action: Get Data for a detailed description of the Get Data property window.

Output Values

The properties in the Output Values group have been described below. You can use these properties to specify output values for the activity.

Set Variables - This property allows the user to set the XPath to retrieve the required XML attribute from the XML string that is set in the Get Variable property.

Property Type: Mandatory (This property must be set if the activity is to be executed.)

Steps to set the Set Variable property

1. To set the XML data to selected variables, click the button for the 'Set Variables' property to open the property window.
2. In this window, select the variable from the drop down for the **Variable Description** field.
3. Next select the variable type from the **Type** drop down.
4. Specify the XPath Expression for the XML data to be assigned to the selected variable in the **XPath Expression** field.
5. After entering the details, click **Add Row** to add this variable setting and display a new row for assigning XML data to another variable.
6. Remove rows if necessary by selecting them and clicking **Remove Selected**.
7. After setting the XML data to the variables, click **Update**.

See XML Action: Set Variables for a detailed description of the Set Variables property window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration

The property Assign Empty Node Values in the Configuration group has been described below. You can use this property to configure the functionality of the activity.

Assign Empty Node Values

This property allows the user to choose whether the XML node value can be updated with an empty value or not.

If this property is set as "Yes", then the variables can be updated with the "Empty" node values and the activity will complete with a "Successful" output.

If this property is set as "No", then the variables will not be updated with the "Empty" node values and the activity will complete with an "UnSuccessful" output.

Property Type: Optional (This property needs to be set only if necessary.)

Message Queue Activities

This section provides information on the SendMQData activity. This activity is used to publish messages to Message Queue.

SendMQData

Activity Description

Use SendMQData activity to publish message to Message Queue.

Activity Properties

To use SendMQData activity, follow the given steps:

1. In the **Process Designer** window, select **Message Queue** from the **Activities** drop-down list.
2. Drag and drop the **SendMQData** activity on the **Process Designer** window.
3. Right-click the **SendMQData** activity and then select **Activity Properties**.

Name & Description

Use the name and description properties to specify the name and description for the activity.

- **Name**: Use this property to enter a name for the activity.

  Property Type: Mandatory.
- **Description**: Use this property to enter a brief description to be displayed for the activity.

  Property Type: Optional. Set this property only if required.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration

Use these properties to configure the functionality of the activity.

- **Message Queue Connection**: Use this property to configure Message Queue connection. For more information, see Configuring Message Queue Connection.

  Property Type: Mandatory

Activity outputs

The SendMQData activity returns the following values:

Successful: Displayed when the activity publishes the message to Message Queue.

Unsuccessful: Displayed when the activity fails to publish the message to Message Queue.

Configure Message Queue Connection

Use Message Queue Connection Settings property to configure connections to Message Queue.

Based on the **Connection** type, **Message Name** and **Message Type** input fields are visible/invisible.

In case of **WM Object** connection type, these input fields are visible to the user, so that the user can pass this information. In case of other connection types, these fields are not needed, hence they are invisible.

1. Select the name of the Message Queue connection from the Connection list. Connections with Connection Type selected as Send would be listed in the list.
2. Select the Binding type for the Connection.

   The following fields appear based on the Binding Type selected for the Connection.

Binding Type for Connection	Field Name	Description
WM Object	Message Name	Enter the Message name or click the Expression Editor Icon to define an expression in the Expression Editor.
	Message Type	Enter the Message type or click the Expression Editor Icon to define an expression in the Expression Editor.
	Message Details	Enter the message in string format.
XML	Message Details	Enter the message in XML format.
JSON	Message Details	Enter the message in JSON format.

For more information about Expression Editor, see *User Guide > Process Designer > Setting Activity and Link*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Properties > Using the Expression Editor.

Note:
- It is recommended to use Expression Editor to enter or copy multi-line text in 'Message Details' of SendMQData Activity rather than directly copying into the input field.

- In Expression Editor the text has to be enclosed within double quotes " ".

Logic App Activities

This section provides information on the Call Logic App activity. This activity is used to call Logic App Workflows.

Call Logic App Activity

Activity Description

Use Call Logic App activity to call Logic App Workflows.

Activity Properties

To use Call Logic App activity, follow the given steps:

1. In the **Process Designer** window, select **Call Logic App** activity.
2. Drag and drop the **Call Logic App** activity on the **Process Designer** window.
3. Right-click the **Call Logic App** activity and then select **Activity Properties**.

Name & Description

Use the name and description properties to specify the name and description for the activity.

- **Name**: Use this property to enter a name for the activity.
  Property Type: Mandatory.
- **Description**: Use this property to enter a brief description to be displayed for the activity.
  Property Type: Optional. Set this property only if required.

Configuration

Use these properties to configure the functionality of the activity.

- **Logic App Connection and Data**: Use this property to get connections to Logic Apps and pass data, if required.
  Property Type: Mandatory

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity outputs

The Call Logic App activity returns the following values:

Successful: Displayed when the connection execution is successful.

Unsuccessful: Displayed when the connection execution is unsuccessful.

Configure Logic App Connection and Data

Use Logic App Connection and Data property to configure connections to Logic Apps and pass data.

To configure Logic App connection and pass data

1. Create a Logic App Connection. For more information, see Logic App Connections.
2. In the **Logic App Connection and Data** window, select a **Logic App Connection** created earlier.
3. Enter a variable for **Variable Name**.

   This variable stores the Logic App Alert Key.
4. Get the custom JSON schema from the Logic App to pass relevant data.

   For example:

```
{
"type": "object",
"properties": {
"id": {
"type": "number"
},
"machine": {
"type": "string"
},
"status": {
"type": "boolean"
}
}
}
```

5. Click **Add Logic App Data** to add a row of data.
6. Enter **Name** and select **Data Type** obtained from the custom JSON schema, and then enter a **Value**.

   For example:

   Name: id

   Data Type: Number

   Value: 9876

   Note:
   - The JSON keys are case-sensitive.
   - The supported data types are Boolean, Number, and String.
   - Click **Expression Builder** to generate value from an expression, if required.
   - Single level JSON structure is supported.
7. Repeat **Steps 4 to 5** to enter the required data.
8. Click **Save**, and then click **Close**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note:
- The data is not validated. Ensure name and data type are as specified in the custom JSON schema, and the value matches the data type.
-- In case of duplicate names, value passed is only for the first match.
-- In case of names from the standard JSON schema (e.g., ApplicationName), value passed will overwrite the default data.

Standard JSON Schema

Logic Apps must include the following standard JSON schema to interact with AVEVA Work Tasks.

```
{
"properties": {
"ApplicationName": {
"type": "string"
},
"ExecutionDetailsId": {
"type": "integer"
},
"ExecutionId": {
"type": "integer"
},
"LogicAppAlertKey": {
"type": "string"
},
"WorkflowName": {
"type": "string"
},
"UserName": {
"type": "string"
}
},
"type": "object"
}
```

AttributeReadWrite Activity

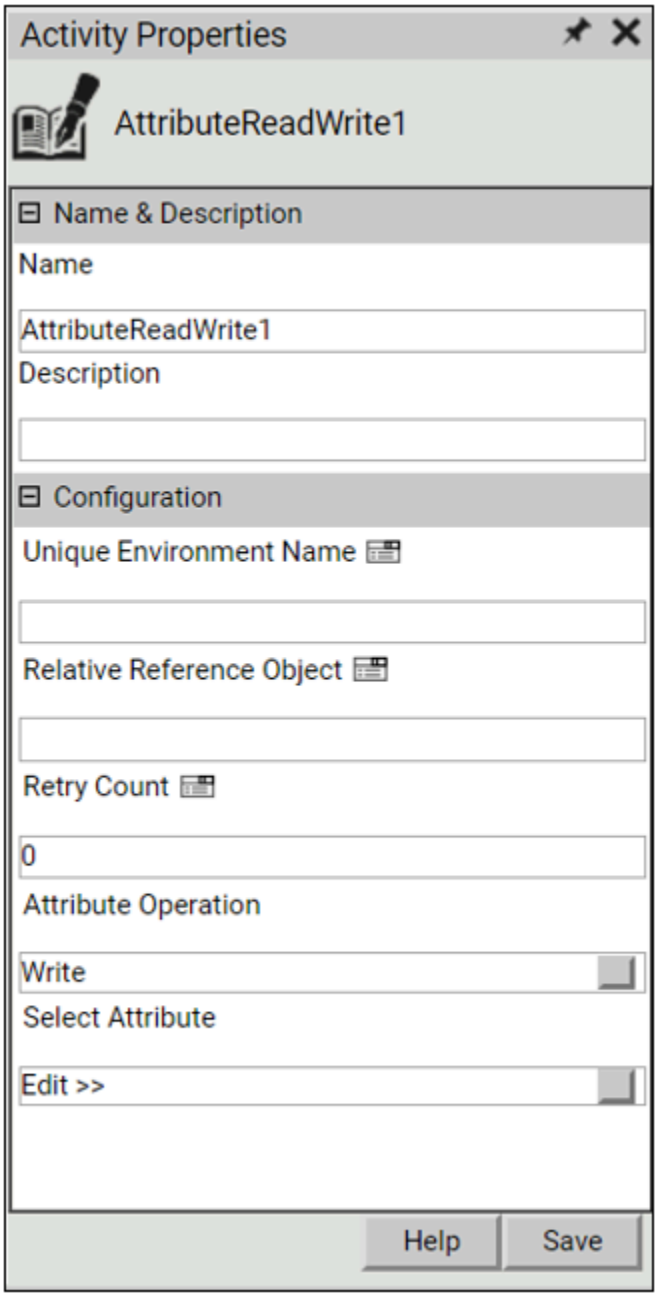
Use the **AttributeReadWrite** activity to perform the read and write operation between AVEVA Work Tasks and ArchestrA IDE.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Activity Properties

You can configure the **AttributeReadWrite** activity by specifying appropriate values for the properties in the **Activity Properties** area. Click **Activity Properties** in the toolbar or select the **Properties** option from the short-cut menu of the **AttributeReadWrite** to access the Activity Properties.

The following image shows the Activity Properties dialog box:



Name & Description

You can use these properties to specify the name and description for the activity.

- **Name**: Use this property to specify a name for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property Type: Mandatory

- **Description**: Use this property to add a brief description about the activity.

  Property Type: Optional. Set this property only if required.

Configuration

You can use these properties to configure the functionality of this activity.

- **Unique Environment Name**: Identifies the Galaxy and Runtime node on which the galaxy is deployed to perform the read or write operation on the System Platform attribute.
  - You can manually enter the value for this property. This value will be considered for further execution of the current activity.

    Or
  - If the property does not have a value, then the value defined for this property in the "ArchestrAXMLData" XML variable is used during the execution of the **AttributeRead/Write** activity. The "ArchestrAXMLData" XML variable is automatically created when you associate a workflow with an ArchestrA event.

    See also: Configure AttributeReadWrite Activity to Perform Read Operation and Configure AttributeReadWrite Activity to Perform Write Operation.
- **Relative Reference Object**: Relative references are especially useful in templates while passing context parameters to workflows.
  - You can manually enter the value for this property. This value will be considered for further execution of the current activity.

    Or
  - If the property does not have a value, then the value defined for this property in the "ArchestrAXMLData" XML variable is used during the execution of the **AttributeRead/Write** activity. The "ArchestrAXMLData" XML variable is automatically created when you associate a workflow with an ArchestrA event.

    For more information, see Relative Referencing.
- **Retry Count**: Use this property to enter the number of retries, in case of a communication error. If the error is due to invalid data, it will not be retried.

  Property Type: Optional. Set this property only if required.
- **Attribute Operation**: Define the attribute operation type. The attribute operation type defines whether the action should be read or write.
- **Select Attribute**: Select the attribute type for the Attribution Operation.

Configure AttributeReadWrite Activity to Perform Read Operation

You can read entire UDA of array type from System Platform and assign the same to variables of type array within a workflow. You can also read specific index of UDA of type array from System Platform and assign the same to variables within a workflow.

To read a specific index of UDA of type array from System Platform use Expression Builder.

Example: To read the 5th Element of the array , enter `return "UserDefined_001.Array1[4]";` in the

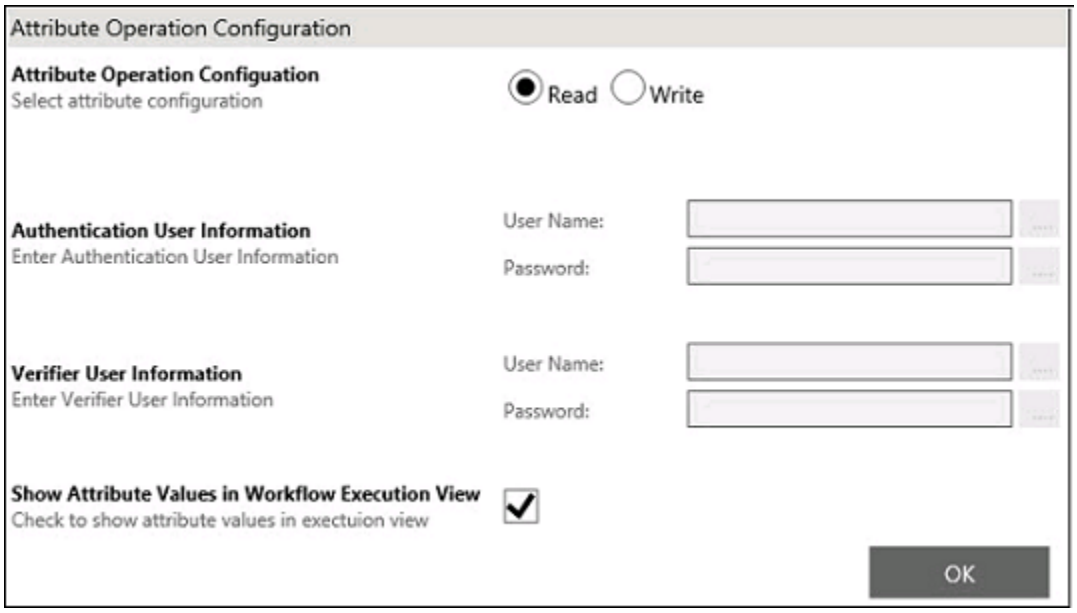
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

expression builder.

To configure AttributeReadWrite activity to perform a read operation

1. Drag-and-drop the **AttributeReadWrite** activity to the Process Designer window.
2. Set the unique environment name from Expression Editor.
3. Click the edit icon in the **Attribute Operation** property.

   The Attribute Operation Configuration dialog box appears.



Note: The **Show Attribute Values in Workflow Execution View** feature is not supported in Quickflow.

4. Select **Read**, and then click **OK**.
5. In the **Condition** drop-down menu, select a variable to store the attribute value.

   You can add the variable and type from **Variables** property in the **Start** activity.

   In a Remote Galaxy, the value of update variable for the **Select Attribute** is in the following format:

   Remote or Paired Galaxy_Name:ObjectName.UDA name

   In a local Galaxy, the value of update variable for the **Select Attribute** is in the following format:

   Me.UDA name
6. In the Actions tree menu, select the **Value** drop-down menu, and then select the Galaxy Browser attributes from which you want the read action to be performed.

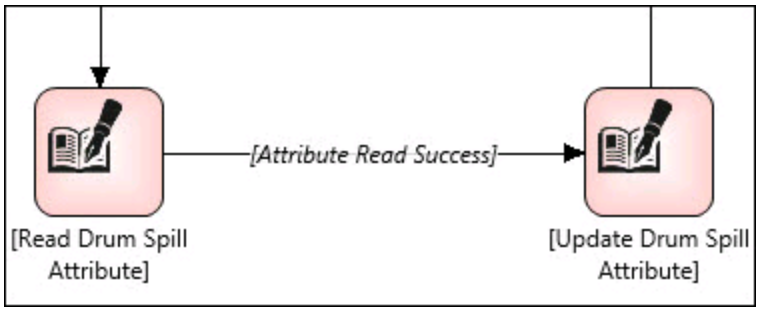
   The Galaxy Browser option appears only if you design the workflow in the IDE context.

   The Relative Reference dialog box appears.

   This dialog box displays support for relative referencing. Except for Me, you must manually enter all other relative references. For more details about relative referencing, see Relative Referencing.

   Create a link between the next activity based on the output options **Attribute Read Success** *or* **Attribute Read Failure**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



7. Publish the workflow.

   You can view the workflow in the Process Execution View dialog box.

   In the **Execution View**, the details of the Read/Write activity executed in a workflow appears in the **Step Details** tab. The **Execution View** page can be opened by double-clicking a top level row in any of the reports. The **View** represents the workflow up to the activity or execution status where the view is opened.

If any error occurs during Read operation, the error message will be logged with an appropriate error code generated from System Platform in the ArchestrA Logger.

For more information about the error logs, see *MxStatusDetail ValuesSystem* under the section *Status and Error Codes* of the *MXAccess Toolkit User's Guide* of *System Platform* documentation.

Configure AttributeReadWrite Activity to Perform Write Operation

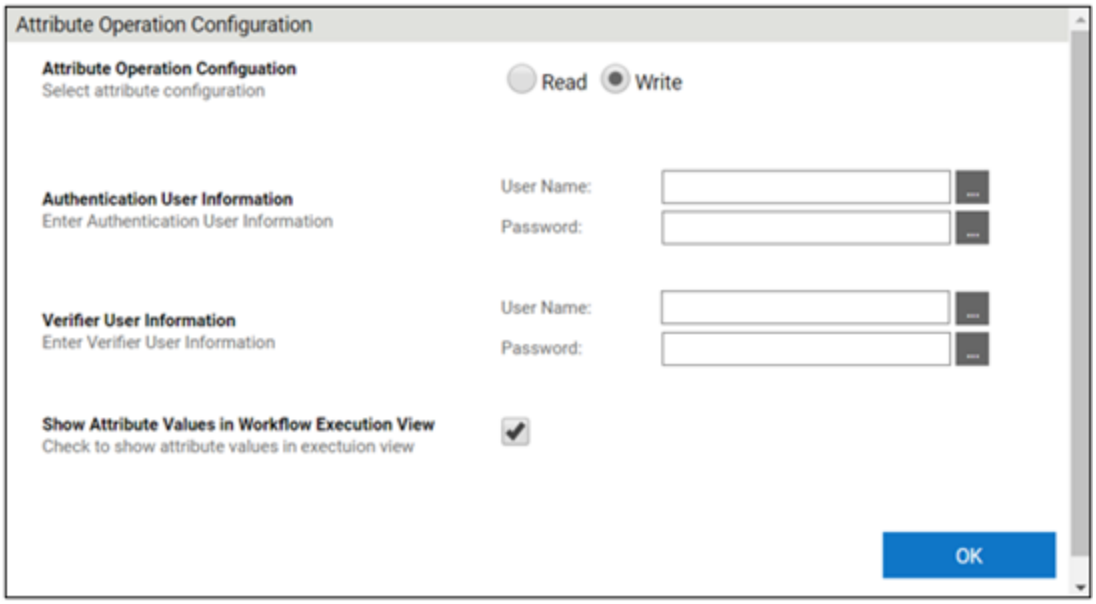
You can write entire UDA of array type to System Platform using a variable of array type within a workflow. However, unlike Read operation, you cannot write specific index of UDA of array type.

To configure AttributeReadWrite activity to perform a write operation

1. Drag-and-drop the AttributeReadWrite activity to the **Process Designer** page.
2. Set the unique environment name from Expression Editor.
3. Click the edit icon in the **Attribute Operation** property.

   The Attribute Operation Configuration window appears.
4. Select **Write** option in the Attribute Operation Configuration window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



5. Enter the **User Name** and **Password** for **Authentication User Information** to authenticate user information. This credential information is needed for **Operate**, **SecuredWrite**, and **VerifiedWrite** user accounts.
6. Enter the **User Name** and **Password** for **Verifier User Information** to verify user information. This credential information is needed for **VerifiedWrite** user account.
7. Click **OK**.

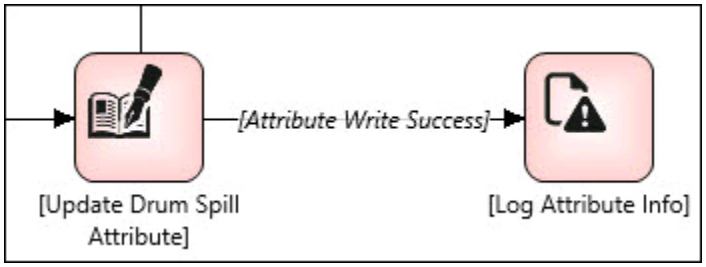
   Note: The **Show Attribute Values in Workflow Execution View** feature is not supported in Quickflow.
8. Set the authentication information from **Variable**, **Content**,or **XML variable**.

   Note: The **Content** option to set the authentication information is available, but not supported in Quickflow.
9. Select the desired **Type** from the drop-down list, and click **Update**.
10. Select the attribute to which the write action needs to be performed in the **Condition** drop-down list. Using expression builder or a variable get the value.

    The variable and type can be added from **Variables** property in **Start** activity.

    For write operation, the Galaxy Browser appears in the Condition drop-down list. The browser appears only if the workflow is designed in the IDE context.

    The Relative Reference dialog box appears. This dialog box displays support for relative referencing. Except for Me, you must manually enter all other relative references. For more details about relative referencing, see Relative Referencing.
11. Create a link between the next activity based on the output options **Attribute Write Success** or **Attribute Write Failure**.



12. Publish the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The workflow can be viewed in the Process Execution View page. In the **Execution View**, the details of the Read/Write activity executed in a workflow appears in the **Step Details** tab. The **Execution View** page can be opened by double-clicking a top level row in any of the reports. The **View** represents the workflow up to the activity or execution status where the view is opened.

If any error occurs during Write operation, the error message will be logged with an appropriate error code generated from System Platform in the ArchestrA Logger.

For more information about the error logs, see *MxStatusDetail ValuesSystem* under the section *Status and Error Codes* of the *MXAccess Toolkit User's Guide* of *System Platform* documentation.

Relative Referencing

Relative references are especially useful in templates while passing context parameters to workflows. You can use relative references like *MyContainer, MyPlatform, MyEngine, MyArea, and Me* to refer to contained objects within that container.

Relative referencing supports event context at the parameter level and the attribute read or write at the **AttributeReadWrite** activity level.

The following valid relative references refer to the current object:

- Me
- MyContainer
- MyArea
- MyPlatform
- MyEngine

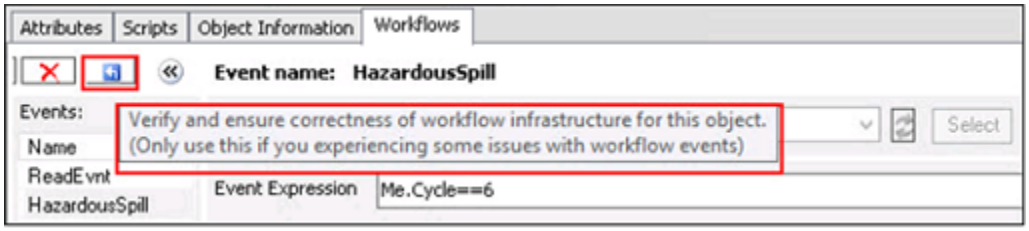
When you use relative references, like *MyContainer*, you can refer to contained objects within that container. For example, a reference to *MyContainer.InletValve.PV* is equivalent to *Tank1.InletValve.PV* in the following hierarchy:

- Tank1: Cannot reference at this level because this is not contained.
- InletValve: Can reference at this level because this object is contained.

Example:

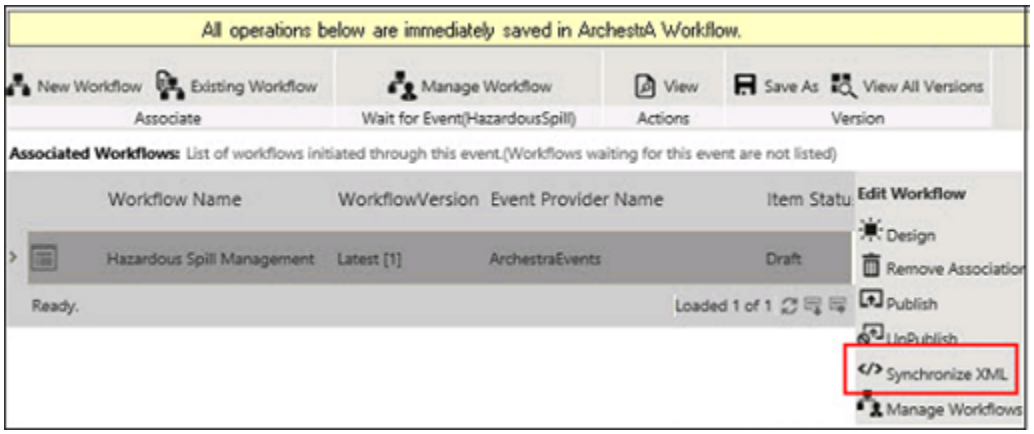
If System Platform-Workflow Connector Version 1.1.1222.0 is used and events to trigger workflows are configured, then do the following steps to use the relative referencing support in the **System Platform-Workflow Connector Version 1.5.1229** for the existing events:

1. Select an existing event, and then click **Verify** to ensure correctness of workflow infrastructure for this object icon.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Select a workflow, and then click the **Synchronize XML** option for that workflow.



3. Deploy the existing gateway object again.

Custom Activity

Follow the steps below to create Custom activity in Quickflow:

1. Modify the action xml or add the new action xml and then add the Quickflow related information as shown below

```
<action name="Custom Action" supportforquickflow="true">
<quickflow>
<definitionProvider class="CustomAction.CustomActivityQuickflowDefinitionHandler"
assembly="c:\CustomAction.dll" />
<runtimeHandler class="QuickflowCustomActivity.CustomActivity"
assembly="c:\netcoreapp2.2\QuickflowCustomActivity.dll" />
</quickflow>
<description>Execute Custom Act</description>
<image resourcename="dummyaction.png" />
<handler classname="CustomAction.CustomActionHandler" assembly="bin\CustomAction.dll"
/>
<properties>
<property category="cat_configuration" name="CustomProp" displayname="Custom
Property" type="string" helpstring="Build Property" mandatory="false"
supportforquickflow="true"></property>
</properties>
<return>
<value helpstring="Set">Set</value>
<value helpstring="Not Set">Not Set</value>
</return>
</action>
```

2. Create a class library targeting .Net Framework 4.8 which can read all the activity related information from the database. In the above example, CustomAction.CustomActivityQuickflowDefinitionHandler is a class which creates the parameters needed for the execution.
3. Decorate the class with the attribute DefinitionHandler(). Make sure the name passed as the argument to this attribute is same as the name mentioned in the action xml.
4. Refer the following assemblies. These can be found in the GAC & in the installation path (Bin)
   a. Skelta.Bpm.Actions.Core.dll

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

   b. Skelta.Bpm.Quickflow.Bridge.dll
5. Provide the class name and the assembly path under the definitionProvider node.
6. Create a class library targeting .Net 6 which executes the activity. In the above example, QuickflowCustomActivity.CustomActivity is a class which executes the activity.
7. Refer the following assemblies. These can be found under the <InstallPath>\Web\Quickflow folder.
   a. Skelta.Bpm.Actions.Core.dll
   b. Skelta.Bpm.Quickflow.Interfaces.dll
   c. Skelta.Bpm.QuickFlow.Logger.dll
8. Decorate the class with the attribute RuntimeHandler (). Make sure the name passed as the argument to this attribute is same as the name mentioned in the action xml.

Process Designer

This section provides information on how to export and import a process definition. It also explains how to use Expression Editor to build a wide variety of expressions with different types of objects.

- Export a process definition
- Import a process definition
- Build an expression

Export Process Definition

You can export a process definition as an XML file. This makes the process design portable and accessible from other applications.

To export process definition as an XML file

1. From the **Tools** menu, select the **Export** option.
2. Click **Save**.

   The **Windows Save As** dialog box appears
3. Click **Save** to save the XML file. You can also browse to a new location for saving the file or change its name before saving it.
4. In the **File Download** dialog, click **Open** to view the XML process definition.

See also, Export.

Import Process Definition

You can import a process design saved as valid XML files. This can be used to import and modify a process design to create a new process design.

To import process definition XML file

1. From the **Tools** menu, select the **Import** option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. In the window that opens, enter the name of the XML Process definition file in the field provided. Alternatively, click on the **Browse** button to select a valid process definition XML file.
3. After selecting a process definition XML file, click on the **Import** button to import it.

   This imports the selected XML process definition.

See also, Import

Note:
- The workflows with activities not supported in the Quickflow cannot be imported.
- The workflow with properties not supported in Quickflow can be imported.

Build Expression

Expression Editor

The Expression Editor is a web control, which is closely integrated with the Process Designer for building a wide variety of expressions with different types of objects. The Expression Editor supports only the C# syntax for building expressions.

Note: Ensure that you do not create or use any HTML tag in the Expression Editor.

The Expression Editor window is shown in the image below. It has the Object Browser at left. This panel can be displayed or hidden using the toggle at the top. A refresh button is also available to refresh the contents. The default objects available in the Object Browser are **Date**, **Math**, **String**, and **Workflow Instance (XmlVariables** and **Variables)**. Each node expands to display a list of methods, properties and functions that can be used to build expressions.

The Editor is located at the right of the window. It has buttons to add the following operators at the top: **+, -** , **/**, *****, **(**, **)**, **&**, and **|**.

The **OK** button at the bottom of the Expression Editor window can be used to save the expression.

The **Close** button can be used to exit the window without saving the expression.

The **Return Type** field to the right enables selection of the value type to be returned.

Support

This section provides information on how to run the diagnostics tests and determine if AVEVA Work Tasks is functioning properly. It also lists the limitations and provides troubleshooting information.

- Diagnostics
- Limitations
- Troubleshooting

Diagnostics

The **Diagnostics** feature allows you to run the diagnostics tests and determine if AVEVA Work Tasks is functioning properly.

You can select the services and run the diagnostics test to know the status of the selected services. The status of the selected services is displayed in the Logs section of the Diagnostics page. You can also filter the logs based on Pass or Fail status of the services, export the Logs, and maximize the Logs view.

You can select the Log levels to display the relevant messages. The following Log levels are available:

Level 1: This level shows minimal information in the Logs section. The Logs section displays information related to the start and end of a workflow. Error messages are also shown in this mode.

Level 2: This level provides detailed information of background activities. It will show all the messages logged from the actions.

Level 3: This level displays messages indicating whether an action is executed.

The following services can be diagnosed to check their availability in AVEVA Work Tasks:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Mobile Notification Service**: Tests whether Mobile Notification Service is running.
- **Azure Service Bus Relay**: Tests whether Azure Service Bus Relay is configured and the response is received from Http Web Request.
- **Message Broker (amqp/amqps)**: Tests whether the repository is provisioned and the Message Broker (amqp/amqps) exist in the repository.
- **Quickflow**: Tests whether Quickflow is deployed, AMQP protocol is validated on the Message Broker, and Quickflow Host is connected.
- **Service Communication**: Tests whether Enterprise Server service and all the AVEVA Work Tasks services are running.

To run the diagnostics test

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, point to **Work Tasks**, and then **Central Configuration**.

   The AVEVA Work Tasks **Central Configuration** page appears.
2. Click **Diagnostics Settings**.

   The **Diagnostics** page appears.
3. Select the check box against the items for which you want to run the diagnostics tests and then click **Test** button.

   After the diagnostic test is complete, the status of the selected items appears in the **Logs** section of the **Diagnostics** page.

To reset IIS

After you change the log level, click the **Reset IIS** button in the **Diagnostics** page to reset IIS and update the log level. On IIS reset all the AVEVA Work Tasks sites will get restarted.

To restart all services

After you change the log level, click **Restart Service** button in the **Diagnostics** page to restart all the AVEVA Work Tasks services and update the log level.

Note: If you modify the log level, ensure to restart services and reset IIS to update the log level.

Limitations

- Quickflow does not support XML Variables of XML List type. Hence, Archestra Workflow Information list will not be updated with the event information for Quickflow.

Troubleshoot

The following error message is displayed when Quickflow is not deployed properly.

Error while deploying Quickflow in one of the machines. For more information, refer the logger console and Troubleshooting section in Quickflow help document.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Possible Causes

- The certificate generated by System Management Server has been used for both Quickflow and AIM.
- The port number is used by other application.
- Connectivity to Message Broker must have failed.

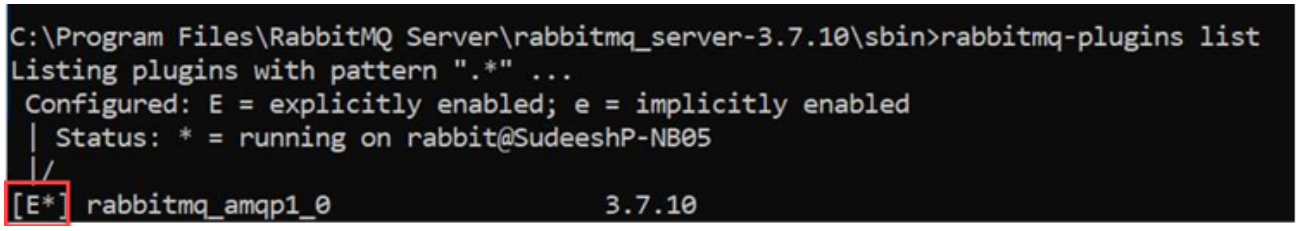
Resolution

- Ensure the AIM certificate and the Quickflow certificate are not same.
- Ensure the port number is not 443 if AIM is installed on the same machine.
- Ensure Message Broker Connection is proper. Refer, *Resolving Message Broker Connection* below to resolve the connectivity failure.

Resolving Message Broker Connection

- Verify whether the AMQP plugin is enabled. Run the command in the Command Prompt:

  `C:\Program Files\RabbitMQ Server\rabbitmq_server-3.7.10\sbin>rabbitmq-plugins list`

- If AMQP plugin is not enabled, run the command:

  `C:\Program Files\RabbitMQ Server\rabbitmq_server-3.7.10\sbin>rabbitmq-plugins enable rabbitmq_amqp1_0`

- Ensure all the listeners are listed in the **Configure RabbitMQ Listener Details** page. To ensure all the listeners are listed, run the command:

  `C:\Program Files\RabbitMQ Server\rabbitmq_server-3.7.10\sbin>rabbitmqctl status`

While executing the above commands displays any error like “node unreachable”, follow one of the steps:

- Restart the RabbitMQ windows service.
- Restart the machine where RabbitMQ is installed.
- If none of the above steps resolve the error, repair/reinstall RabbitMQ.

User Guide

The *User Guide* provides instructions how to create and manage AVEVA Work Tasks key components, such as workflow, calendars, queues, and work items. This guide also provides tips and warnings that you need to be aware of while using AVEVA Work Tasks.

It assumes you have a working knowledge of the principles and customary practices of your business area.

Administration

The *Administrator Guide* provides detailed instructions to:

- Install and activate the product
- Configure the product
- Set up repositories
- Common system administration procedures
- Uninstall the product and the connectors

For more information about installing and configuring AVEVA Work Tasks, see *Administrator Guide*.

Prerequisites

The prerequisites to access the features of **AVEVA Work Tasks** are as follows:

1. Install AVEVA Work Tasks.
2. Create Repository from the Central Configuration Site and define your organization as AVEVA Work Tasks Repository. For example, if you are designing workflows for Telematics organization, define your Repository as *Telematics*. A **Repository Database** contains workflow definitions, queues, calendars, settings, and workflow execution data for an application. For more information about Creating and Managing Repositories, see *Administrator Guide*.

Get Started

This section provides information that will help you to get started with using AVEVA Work Tasks by creating and using workflows and forms.

Create a Workflow

In this article you will learn how to create your first AVEVA Work Tasks workflow. The "Hello World” workflow that you create will send an information to the workflow initiator with the subject line “Hello World”.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Prerequisites

- Download and install the latest AVEVA Work Tasks version.
- Create a repository.
- Log on to the repository using Administrator credentials.

This topic can be broadly categorized into:

- Designing a Workflow
- Publishing and Executing a Workflow
- Viewing the information in the actors inbox

To design a Workflow

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, and then click **Workflows**.
   The **Workflows** page appears.
3. On the action bar, click **New,** and then click **Workflow.**
   The **New Workflow** wizard appears.
4. In the **Title** box, type a name for the workflow, and in the **Description** box, type a description for the workflow.
5. Click **Save & Continue**.
   The workflow is created, and the **Workflow Options** wizard appears.
6. Do one of the following.
   a. Design the workflow
      i. Click **Design the Workflow now**.
      ii. Click **Finish**. The **Process Designer** page appears.
      iii. Design the workflow.
   b. Cancel further operations.
      i. Click **No task to be performed now**.
      ii. Click **Finish**. The workflow is saved.
7. Open the workflow in **Process Designer**.
8. Drag an **Information** activity from the **Human Activities** to the design area.
9. Right-click **Information activity**, and then click **Activity Properties**.
   The **Activity Properties** window appears.
10. Configure the **Information** activity properties.
    a. Enter a **Name** and **Description** for the activity.
    b. Click the edit icon near the **Assign Actor(s)** property.
       The **Assign Actor(s)** appears.
    c. You have to assign the Information task to the user who has triggered the workflow. For this, you have to specify a small expression:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

i. Select the required provider from the **Providers** list.
ii. Select **ID** from the first drop-down list.
iii. Keep the operator as default "=".
iv. Select **Variable** from the next drop-down list.
v. Select **Variable.SubmittedBy.ID** in the last drop-down list and click **Add**.
vi. Click **Update** to save the property value.

d. Configure the **Subject** property:
i. Click the edit icon near the **Subject** property. The **Subject** appears.
ii. Enter the subject in the text area as "Hello World!".
iii. Click **Update**.

e. Configure the **Body** property:
f. Click the edit icon near the **Body** property. The **Body** page appears.
g. Enter the subject in the text area as "This is my first Information Activity", and then click **Update**.
h. Click **Update**.

11. Click **Save** in the **Activity Properties** pane to save all the data entered.
Every time you input a value for a property, ensure to save the data. Click the **Save** button on the **Activity Properties** window. You need to save the property so that the subsequent properties in the activity can inherit the required information.
Click the **Link** icon to add a link. The **Link Action** appears.
12. Select the **From Action** as **Start** (the name of the activity from which the link begins) and To Action as MyNewInformationActivity (the name of the activity at which the link ends).
13. Click **OK** to establish the link. Your first workflow is created.

To publish and execute the workflow

1. Click **Publish** from the menu of the Process Designer.
A message appears to confirm that the workflow is published successfully.
2. Click **Close**.
The **Process Designer** closes and the **Workflows list** appears. The list now displays one new workflow.
3. Right-click **MyFirstWorkflow**, and then click **Publish and Test Run**.
This option publishes the workflow and then test runs it. You can skip step 1 and directly proceed to this step.
4. The **Process execution view** appears where you can see the execution status.
You will notice that the **Start Activity** and the **Information Activity** are executed successfully.

Note: If the **Status** is **"Execution Pending"** in the Process execution view window, then click the **Refresh** button to get the latest status.

To view the Inbox

1. In the **Enterprise Console**, click menu icon, and then click **Inbox**.
In the **Inbox** you will find an information task with the Subject "Hello World!".

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Click on the **Information** task in the Inbox.

   The details of the work item appears.

   You have successfully created your first workflow.

Use Variables in Workflow

AVEVA Work Tasks supports storage types that are mainly categorized as **Variables**, **Contents**, and **XmlVariables.**

- Create a variable
- Assign a value to the variable
- Use the variable in an activity

Prerequisites

- Download and install the latest AVEVA Work Tasks version.
- Create a repository.
- Log on to the repository using Administrator credentials.

To create a Variable

1. Log on to the **Enterprise Console**.
2. In the **Enterprise Console**, click menu icon, and then click **Workflows**. The **Workflows** page appears.
3. On the action bar, click **New**, and then click **Workflow**. The **New Workflow** wizard appears.
4. In the **Title** box, type a name for the workflow, and in the **Description** box, type a description for the workflow.
5. Click **Save & Continue**. The workflow is created, and the **Workflow Options** wizard appears.
6. Select **Design the Workflow now**, and then click **Finish**. The **Process Designer** appears. While designing a workflow, if you get a pop-up blocker warning message, then to select Allow Blocked Contents to proceed further.
7. Right-click the **Start** activity, and then click **Activity Properties**. The **Activity Properties** appears.
8. Click the edit icon near the **Variables** property to declare the variable. The **Variables** dialog box appears. All Variables added to the workflow are displayed in rows in the grid.
9. Enter "EmployeeName" in the **Workflow Variables** text box, and then select the **Type** as "String".
10. Click **Update** to save the variable.
11. Click the **Save** button in the **Activity Properties** pane to save all the data entered.

To update the Variable

To update the value of the variable in the subsequent activities, we have to add the Update Variable activity from the Engine Activities list.

1. Select **Engine Activities** from the **Activities** drop-down list.
2. Drag the **Update Variable** activity to the Design area.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Right-click the **Update Variable** activity in the Design area, and then click **Activity Properties**.
4. Configure the Update Variable activity.
   a. Enter a **Name** and **Description** for the activity.
   b. Configure the *SetVariable* property.
      i. Click the edit icon in the Set Variable property to set a value for the variable. The Update Variable dialog box appears. Click Select. The tree view containing the list of Variables and XmlVariables is seen.
      ii. Click **Select**. The tree view containing the list of Variables and XmlVariables is seen.
      iii. Click the icon near the Variables view. You will see the variable that we created in the Start activity.
      iv. Click the variable “Variable.Employee” and enter a value for it. Enter the name “John”.
      v. Click **OK** to update the value assigned
   c. Click the **Save** button in the Activity Properties pane to save all the data entered.
5. Click the **Link** icon in the toolbar to link the two activities, that is the Start and the Update Variable.

   The **Link Action** appears.
6. Click **OK** to establish the link.

To use the variable in the activity

1. Select **Human Activities**.
2. Drag the **Information** activity to the Design area.
3. Right-click the **Information** activity in the Design area, and then click **Activity Properties**.
4. Configure the Information activity.
   a. Enter a **Name** and **Description** for the activity.
   b. Configure the Actor to whom you want to send the information:
      i. Click the edit icon near the **Assign Actor(s)** property. The **Assign Actor(s)** appears.
      ii. You have to assign the Information task to the user who has alerted the workflow. For this, you have to specify a small expression:
      iii. Select the required provider from the **Providers** list.
      iv. Select **ID** from the first drop-down list.
      v. Keep the operator as default "=".
      vi. Select **Variable** from the next drop-down list.
      vii. Select **Variable.SubmittedBy.ID** in the last drop-down list, and then click **Add**.
      viii. Click **Update** to save the property value.
   c. Configure the Subject property:
      i. Click the edit icon near the Subject property. The Subject appears.
      ii. Enter the subject in the text area.
      iii. To customize the subject and append the subject by selecting some XML variable and building an expression follow the next set of steps:
      iv. Type 'The Employees Name is:' in the text area.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

v. Select **Variables** from the first drop-down list.
vi. Select the Variable you had declared in the **Start** activity from the second drop-down list, that is EmployeeName.
vii. Click **Append**.
viii. Click **Update**

d. Click the **Save** button in the **Activity Properties** to save all the data entered.

5. Click the Link icon to add a new link between the two activities, "EmployeeVariableUpdation" and "DisplayingEmployeeInformation".
6. Click **OK** to establish the link.
7. Click **Publish and Test Run**. The **Process execution view** appears where you will notice the Start, Employee Variable Updation, and Display Information activity has been executed successfully.

Note: If the Status is "Execution Pending" in the Process execution view, then click the **Refresh** button to get the latest status.

To view the Inbox

To view the information task assigned to the actor who alerted the workflow.

1. Select the **Inbox** from the **Enterprise Console** menu. A task with the subject “The Employee name is John” is available in the users **Inbox**.
2. Click the **Information** task in the Inbox to view the details for the task. You have successfully created the **VariableWorkflow**.

AVEVA Work Tasks provides you other storage types, like Contents and XmlVariables.

For more information about using variables, see the *Start Variables* topic in the *Developer Guide*.

Use XML Variables in Workflow

You can create an XML Variable, loop through the XML across the document, and use XML Variable in an activity.

- Familiarizing with Workflow Management XML Variables
- Loop Through an XML Document

Prerequisites

- Download and install the latest AVEVA Work Tasks.
- Create a repository.
- Log on to the repository using administrator credentials.
- Basic knowledge of how to create a simple workflow.

Familiarize with XML Variables

Perform the following steps to familiarize with AVEVA Work Tasks XML Variables:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Create an XML Variable and define the schema
- Updating the XML Variable
- Display the value in an Information activity

To create an XML Variable and defining the schema

1. Create a workflow.
2. Open the **Process Designer**.
3. Right-click the **Start activity**, and then click **Activity Properties**. The **Start Activity Properties** appears.
4. Click the icon near the **XmlVariables** property in the activity properties to declare the variable.

   The XmlVariables window appears. All XML Variables added for the workflow are displayed in rows in the grid. The variable properties that are specific to an XML Variable are displayed in the Variable Properties section for an XML Variable.
5. Click **New Variable** to add a variable. The **Variable Name** is enabled.
6. Enter the name of the new XML Variable in the **Variable Name** field and a description in the **Description** field.
7. Select `XMLDocument` from the **Type** list. For more information about XML Variables and the different types, see XML Variables topic in *Developer Guide*.
8. Build the XML Schema in the XML Variable interface in the following format:

```
<Employee>
<Name>
</Name>
<Department>
</Department>
</Employee>
```

9. Click the icon near the “root” element. In the dialog box that appears, click **Edit** to edit the root element.
10. Enter the Name as “Employee”, and select the Type as “element”. Click **OK** to save the element value.
11. Click the icon near the **Employee** element, and then click **Add** to add the child elements.
12. Enter the *Name* in the **Name** field, and select **Type** as element. Click **OK** to save the data.
13. Similarly, add one more element **Department** to the XML Schema.
14. Select the type for **Internal Storage** as **Variable** since the value for this XML Variable has to be updated and stored as a variable.
15. Click **Save Variable** to save the newly created XML Variable.

To update the XML Variable

To update the value of the XML Variable for the subsequent activities you have to add the Update Variable activity from the Engine Activities list.

1. Select the **Engine Activities**.
2. Drag the **Update Variable** activity to the **Process Design** area.
3. Right-click the **Update Variable** activity, and then select **Activity Properties**.
4. Enter a **Name** and **Description** for the activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Configure the **Set Variable** property as explained:
   a. Click the icon near the **Set Variables** property. The **Update Variable** appears.
   b. Click **Select**. You can see a tree view containing the list of Variables and XmlVariables.
   c. Click on near XmlVariables. Now you will be able to see the XmlVariables that was created in the section **Creating XML Variables and defining XML Schema**.
   d. Click on the node **Name** and enter a value for the variable. For example, enter the name "John".
   e. Click on the node **Department** and enter a value for the variable. For example, enter the department as "Research".
   f. Click **OK** to update the values assigned
   g. Click **Save** in the **Activity Properties** pane to save all the data entered.

To display the XML Variable value

1. Select **Human Activities**.
2. Drag **Information** activity to the **Process Design** area.
3. Right-click the **Information** activity, and then select **Activity Properties**.
4. Enter a **Name** and **Description** for the activity.
5. Configure the Actor to whom the information has to be sent:
   a. Click the icon near the **Assign Actor(s)** property. The **Assign Actor(s)** appears. You have to assign the Information task to the user who has alerted the workflow. For this, you have to specify a small expression.
   b. Select the required provider from the **Providers** list.
   c. Select **ID** from the first drop-down list.
   d. Keep the operator as default =.
   e. Select **Variable** from the next drop-down list.
   f. Select **Variable.SubmittedBy.ID** in the last drop-down list, and click **Add.**
   g. Click **Update** to save the property value.
6. Configure the **Subject** property as explained:
   a. Click the icon near the **Subject** property. The **Subject** appears.
   b. Enter the subject in the text area. To customize the subject and append the subject by selecting some XML variable and building an expression follow the next set of steps.
   c. Type **'The Employees Name is:**' in the text area.
   d. Select **XML Variables** from the first drop-down list.
   e. Select the XML Variable you had declared in the **Start** activity from the second drop-down list, that is **Employee**.
   f. Select the **Name** node from the **XML Schema** in the third drop-down list, and click **Append**.
   g. Similarly, append the **Department** value. Now you have the Subject as:
   h. Click **Update**.
7. Click the **Save** button in the **Activity Properties** to save all the data entered.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. Click the **Link** icon in the tool bar to create the following links:
   a. Start Activity to **Employee XML Variable Updation** activity
   b. **Employee XML Variable Updation** activity to **Displaying Employee Information** activity.
9. Right-click on the link between **Employee XML Variable Updation** activity to **Displaying Employee Information** activity, and then select the set the link the output value as **Updated**.

To publish the Workflow

1. Click **Publish and Test Run** from the menu bar. The **Process Execution** page appears.
2. Verify all the activities that have been executed successfully.

Note: If the Status is "Execution Pending" in **Process execution**, then click the **Refresh** button to get the latest status.

View the Inbox

To view the Information task assigned to the actor who alerted the workflow, select the **Inbox** from the **Enterprise Console**. You have successfully created a workflow that uses an XML Variable and implemented it in your activity.

Reference topic

Loop Through an XML Document

Loop Through an XML Document

Perform the following steps to loop through the elements of an XML Document:

- Creating an XML Variable and loading a predefined schema
- Creating an XML Variable of type Xml Iterator and looping through the Schema
- Adding a script activity to create the XML and get the data
- Looping through the Elements of the XML Document
- Displaying the Value of the XML Iterator

To create an XML Variable and loading a predefined schema

1. Create a new workflow, *LoopXmlVariableWorkflow*.
   The **Process Designer** window appears.
2. Right-click the **Start** activity, and then click **Activity Properties**.
   The **Activity Properties** window appears.
3. Click on the edit icon near the **XmlVariables** property.
   The **XmlVariables** window appears.
4. Click **New Variable** to add a new variable.
5. In the **Variable Name** field, enter the name and description for the variable.
6. Select **XmlDocument** from the Type list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. Create an XML file **EmployeeData.XML**.

   This file is required to build the XML Schema.

8. Copy the following schema to create the XML file.

```
<Employees>
<Employee>
<Name>
</Name>
<Department>
</Department>
</Employee>
<Employee>
<Name>
</Name>
<Department>
</Department>
</Employee>
</Employees>
```

9. Click **Browse** and load **EmployeeData.XML** file from the folder where it is saved.
10. Click **Load** to load the schema.

    The XML Variable of type XML Document has been created.

    You will see the schema in the **Variable** properties area as in the XML document.

11. Click Save Variable to save the variable.

To create an XML Variable of type XmlIterator and looping through the Schema

Use XML Variable of type XmlIterator to define variables for repeating XML elements and attributes. In this scenario, *Employee*, *Name*, and *Department* are repeating elements.

1. Create an **XML Variable** of type **Xml Iterator**.
   a. Click **New Variable** and enter the name in the **Variable Name** field.
   b. Select the type as **Xml Iterator**.

      The **Xml Iterator** type option is available only if another variable of type Xml Document exists. Two additional properties appear.

   c. Select the parent **XML Variable** as *Employees*.

      The parent variable of an **Xml Iterator** variable can be another Xml Iterator Variable also.

   d. Select **Node** as *Employee*.

      The node should represent the variable. Only nodes in the parent variables (that is, Employees) are displayed.

   e. Click **Save Variable** to save the variable.

      The XML Variable has been created.

To add Script Activity

In a real time application, you can get XML Data by different means such as invoke form, from a Web Service, or through Script activity. In this scenario you will create an XML using a Script Activity.

1. Drag a **Script** activity from the **Integration Activities** list to the **Process Designer** area.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Right-click on the **Script** activity in the **Design** area and select **Activity Properties**. The **Activity Properties** appears.
3. Enter a **Name** and **Description** for the activity.
4. Select the **Programming Language** as **CSharp.NET** in the **Language** property.
   a. Click on the edit icon in the **Code property** to write the code.

   To set the value for the XML, you can use the following sample code:

```
//Sample CSharp code
using System;
using Workflow.NET;
using Workflow.NET.Engine;
public class WorkflowScript59e4b2aadf064757a8089c95c630794f
{
public void Run(int ExecutionId, int ExecutionDetailsId,
Workflow.NET.Engine.Context ctx, Workflow.NET.Action action, string inlink)
{
string XmlValues = "<Employees><Employee><Name>Tim</Name><Department>Sales";
XmlValues +=
"</Department></Employee><Employee><Name>John</Name><Department>Marketing";
XmlValues += "</Department></Employee></Employees>";
ctx.XmlVariables["Employee"].RawXml = XmlValues;
ctx.SaveVariables();
}
}
```

   a. In this script action you are building the values for XML Schema as per the Schema defined for the XML Variable *Employee* in the Start activity, that is,

```
string XmlValues =
"<Employees><Employee><Name>Tim</Name><Department>Sales";
XmlValues +=
"</Department></Employee><Employee><Name>John</Name><Department>Marketing";
XmlValues += "</Department></Employee></Employees>";
```

   a. *ctx* is the Workflow.NET.Engine.Context object which encapsulates all the information about the executing workflow. The Context object will have all the Variable, Content, XML Variable Details in the runtime.

   b. Assign the runtime value to the XmlVariable *Employee* as:

```
ctx.XmlVariables["Employee"].RawXml = XmlValues;
```

   ctx.SaveVariables(): Persists the assigned value to the XML variable to the database. After calling the *ctx.SaveVariables()*, the value of the XML Variable will be available in the runtime for the workflow.

   Now the XML Variable *Employee* will contain the details of two employees, Tim and John (in XML format) which can be used in the workflow.

   b. After writing the code, click **Update** to save it.

```
using System;
using Workflow.NET;
using Workflow.NET.Engine;
public class WorkflowScript50e4b2aadf064757a8089c95c630794f
{
public void Run(int ExecutionId, int ExecutionDetailsId,
Workflow.NET.Engine.Context ctx, Workflow.NET.Action action, string inlink)
{
string XmlValues = "<Employees><Employee><Name>Tim</Name></Department>Sales";
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
XmlValues +=
"</Department></Employee><Employee><Name>John</Name><Department>Marketing";
XmlValues += "</Department></Employee></Employees>";
ctx.XmlVariables["Employee"].RawXml = XmlValues;
ctx.SaveVariables();
}
}
```

To loop through the Elements of the XML Document

The **For-Each Loop Activity** is used loop through the collection within an **Xml Iterator Variable**. It allows repeated execution of an activity or a group of activities.

1. Drag the **For-Each Loop** activity from the **Engine Activities** list to the **Process Designer** area.
2. Right-click on the **For-Each Loop** activity in the **Design** area and click **Activity Properties** from the shortcut menu.

   The **Activity Properties** appears.
3. Enter a name and description for the activity
4. Select **EmployeeIterator** from the **XML Iterator** property list.
5. Click **Save** to save all the data entered.
6. Link the **Script** activity to the **For-Each Loop** activity.

To display the Value of the XML Iterator

To display the looped XML value, an Information activity is required.

1. Select **Human Activities**.
2. Drag **Information** activity to the **Design** area.
3. Right-click the **Information** activity in the Design area and click **Activity Properties** from the shortcut menu.

   The **Activity Properties** appears.
4. Enter a name and description for the activity.
5. Configure the **Actor** to whom the information has to be sent:
   a. Click the edit icon near the **Assign Actor(s)** property.

      The **Assign Actor(s)** appears.
   b. Assign the Information task to the user who has alerted the workflow.

      For this, you have to specify a small expression.
   c. Select the required provider from the **Providers** list.
   d. Select **Id** from the first drop-down list.
   e. Keep the operator as default "=".
   f. Select **Variable** from the next drop-down list.
   g. Select **Variable.SubmittedBy.ID** in the last drop-down list and click **Add**.
   h. Click **Update** to save the property value.
6. Configure the Subject property as explained:
   a. Click the **edit** icon near the **Subject** property.

      The **Subject** appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

b. Enter the subject in the text area.

   To customize the subject and append the subject by selecting some XML variable and building an expression follow the next set of steps.

c. Type **'The Employees Name is:'**. in the text area.

d. Select **XML Variables** from the first drop-down list.

e. Select the XML Variable you had declared in the **Start** activity from the second drop-down list that is, *Employee*.

f. Select the **Name** node from the XML Schema in the third drop-down list and click **Append**.

g. Similarly, append the **Department** value.

h. Click **Update**.

7. Click **Save** to save all the information you have entered.
8. Link the **For-Each Loop** activity and the **Employee Information** activity you have created.
9. Right-click on the link to select the link action. Select **Step** as you have to loop through the XML values and get the value in the **Information** activity.

To link to the Next-Loop Activity

Just as you use the for-loop in normal programming, check whether the count value has been reached. If not, then you have to increment the count.This task is achieved through the **Next-Loop** activity.

Note: For every For-Each loop activity, you need a Next-Loop activity.

The Next-Loop activity will check the count and repeat the execution within the loop. Since you have to loop through the XML variables, add a Next-Loop Activity to the workflow.

1. Drag the **Next-Loop** activity from the **Engine Activities** list to the Design area.
2. Link the **Employee Information** activity and the **Next-Loop** activity.
3. Add a link from the **Next-Loop Activity** to the **For-Each Loop Activity** which completes the loop.
4. Set the link action as **Next Step** which is needed to advance the loop.

To publish the LoopXmlVariableWorkflow

1. Click the **Publish** option from the menu bar.

   A message workflow published successfully appears.

2. Select and right-click the **LoopXMLVariableWorlfow** from the workflow list. Click **Publish and Test Run** from the shortcut menu.

   The **Process execution view** appears wherein you can see the execution status. You will notice that all the activities have been executed successfully.

Note: If the Status is "**Execution Pending**" in the **Process Execution**, then click the **Refresh** button to get the latest status.

To view the Inbox

1. Select the **Inbox** option from the **Enterprise Console** menu.
2. In the Inbox, you can find two Employee Information tasks with the Subject "*The Employee Name is John and Employee Department is Marketing"* and "*The Employee Name is Tim and Employee Department is Sales*. You

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

have successfully created the **LoopXmlVariableWorkflow**.

For more information about XML Variables and their types, see *XML Variables* topic in the *Developer Guide*.

Use Forms

Designing the User Interface is one of the most important aspects of developing a business application. Customized Forms are integral to process workflows and in fact often initiate various organizational workflows. AVEVA Work Tasks Forms simplifies the process of designing forms and linking them to a business process.

The forms that are created are mapped to relevant steps in the process workflow. Data mapping between the form fields and process attributes can easily be associated in the control property sheets. The end users interact with this while performing the tasks, and the data entered in these forms is passed back to and from the process seamlessly using XML.

For more information about Forms, see *Forms and Lists User Guide*.

Invoke Web Service from Workflows

You can invoke a web service from a workflow.

Complete the following steps to invoke a web service from a workflow:

- Invoking a Hello World web service
- Calling the HelloWorld () method from the web service
- Displaying the return value in the Information activity

Prerequisites

- Download and install the latest AVEVA Work Tasks version.
- Create a repository.
- Log on to the repository using Administrator credentials.
- Create a Hello World web service

Understanding Invoke Web Service Activity

Step 1: Creating a Workflow

1. In the **Enterprise Console**, click menu icon, and then click **Workflows**. The **Workflows** page appears.
2. On the action bar, click **New**, and then click **Workflow**. The **New Workflow** wizard appears.
3. In the **Title** box, type the name for the workflow, and in the **Description** box, type the description for the workflow.
4. Click **Save & Continue**. The workflow is created, and the **Workflow Options** wizard appears.
5. Select **Design the Workflow now**, which is the default option, and then click **Finish**. The **Process Designer** appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

In this example, you will invoke a web service that contains a method which displays “Hello World”. To store the return value of the web service, create a workflow variable.

The following steps show how to create a variable in a workflow:

Step 2: Creating a Variable

- Right click the **Start** activity, and then select **Activity Properties**.
- To declare the variable, click on the edit icon of the **Variables** property. The **Variables** dialog box appears.
- Enter the variable name as "NewVariable” and select the **Type** as “String”.
- Click **Update** to save the variable.
- Click **Save** in the Activity Properties pane to save all the data entered.

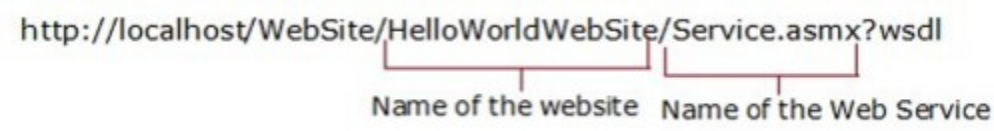
Step 3: Invoke Web Service Activity

To call a web service, you must add an InvokeWebService activity to the Process Designer.

1. Select **Integration Activities** from the **Activities** pane.
2. Drag and drop an **InvokeWebService** activity to the Process Designer.
3. Right click **InvokeWebService** activity to get the Activity Properties pane.

Adding a Web Service

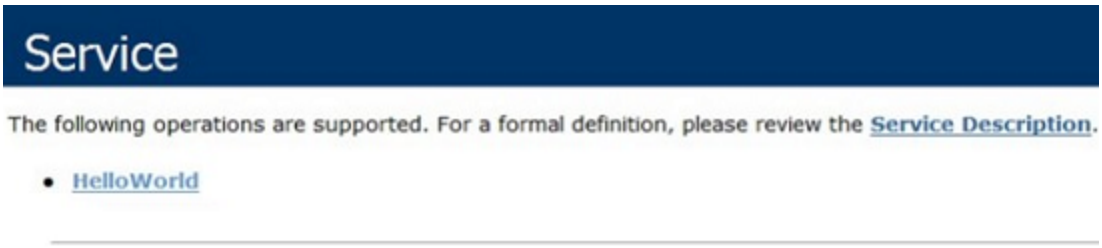
1. Click on the edit icon of the **Web Service Details** property. The **Web Services** dialog box appears. You can add or edit the web services to be invoked in this dialog box.
2. Click **Add** to add a web service.
3. Enter the **WebService Name**. As you would call this web service to display **"Hello World**", you can name the web service as **HelloWorldWebService**.
4. Enter the **WebService URL**. The URL must be the WSDL URL of the web service that you have created. For example, it can be as the following image:



5. If authentication is required, you must select the **Authenticated** check box. This displays additional authentication fields.fields, enter the Login Name, Password, Domain name, and Proxy URL. This step is necessary only if the web service being added requires authentication.
6. In the authentication fields, enter the **Login Name**, **Password**, **Domain name**, and **Proxy URL**. This step is necessary only if the web service being added requires authentication.
7. Click **Save**.

The method associated with the web service is **HelloWorld.** You can get this web method when you view the web service in a browser as shown below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



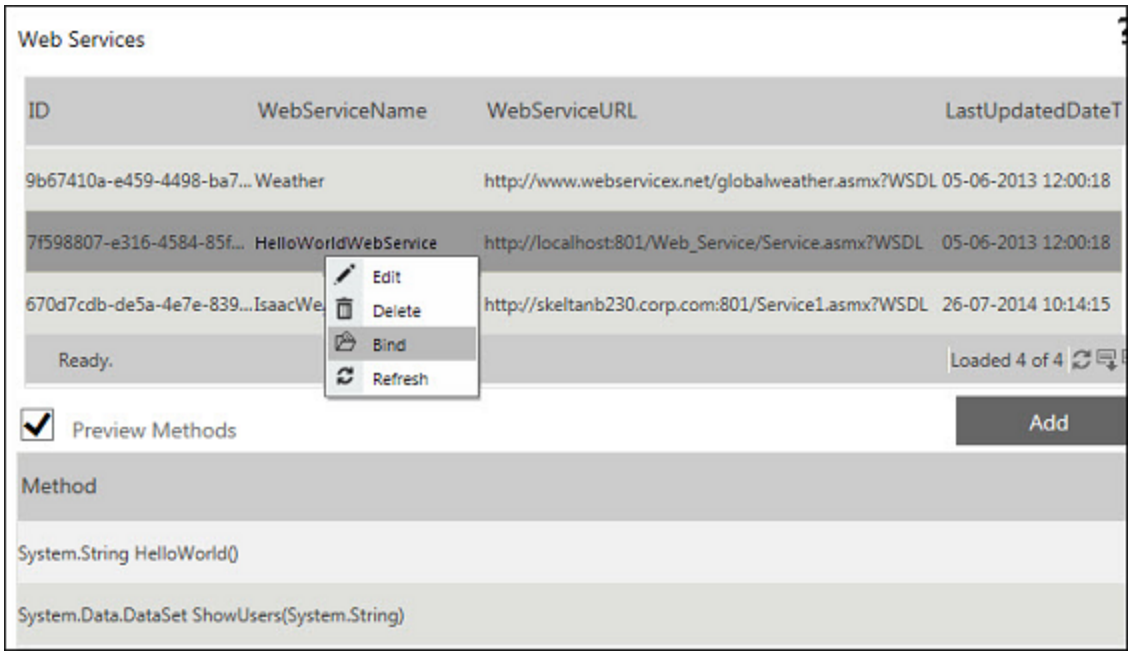
If you invoke this method, you get the output in an XML format as shown in the following image. You can display this in the **Information Activity**.

After you save the details, you can see the web service listed. Click the **Preview Methods** check box to preview the methods in the web service.

Binding a Web Service

1. Right click the web service that you have added. You get options like **Edit**, **Refresh**, **Delete**, and **Bind**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



2. Use the **Bind** option to bind the selected web service to the database. The **Method** list dialog box appears.
3. Click a **Method**, and click the **Bind Parameters**. A window appears which lists out the Parameters to be passed. As the current method just displays a value, the **Parameter** list will be empty.
4. You must save the return value from the Web Method to a variable so that you can use it in subsequent activities. So, select the output type as "Variable" from the Save Output in drop down. Select the variable created in the **Start activity**.
5. Give the **Login Name** and **Password**, if required.
6. Click **Update** to save all the data.
7. In the Activity Properties window, click **Save** to save all the details entered. The **Invoke Web Service** activity is added successfully.

Step 4: Displaying the return value of the Web Service method in the Information Activity

1. Select **Human Activities**.
2. Drag and drop an **Information** activity to the process design area.
3. Right-click the **Information** activity, and then select **Activity Properties**. The **Activity Properties** pane appears.
4. Configure the following properties:
   a. **Name & Description** of the activity. For example, enter name as Display Web Service Data.
   b. The **Actor** to whom this information should be sent. For example, select Id = Variable Variable.SubmittedBy.ID.
   c. The **Subject** of the actual information. For example, select *<%#Variable.NewVariable%>.*
5. Click **Save** in the Activity Properties pane to save all the data entered.
6. Link all the activities, **Start**, **InvokeWebService**, and **Display Web Service Data**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To publish InvokeWebServiceWorkflow

1. Click **Publish** from the menu bar. The **Publish** successful dialog box appears.
2. Clicking **Close**. You will be redirected to the page showing the Workflows list.
3. Run the published workflow. Right-click the workflow, and then click **Publish and Test Run**. The **Process execution view** window appears which shows the execution status of the workflow. You will notice that the **Start**, **InvokeWebService**, and **Display Web Service Data** activities are executed successfully.

Note: If the Status is **Execution Pending** in the Process execution view window, then click the **Refresh** button to get the latest status.

To view the Inbox

To view the information task assigned to the actor who alerted the workflow, see the activity in the Inbox.

1. in the **Enterprise Console**, click menu icon, and then click **Inbox**. The **Inbox** page appears.
2. In the **Inbox**, you can find the **Display Web Service Data** activity with the subject "Hello World".
3. Click the Information task in the Inbox to get a pop-up details view for the task.

   You have successfully created the **Invoke Web Service Workflow**.

Interfaces

AVEVA Work Tasks functions are performed through the following interfaces:

Workflow List: The Workflow List is a list of all workflows defined for a repository. This list provides options for categorizing, designing, and publishing the workflows. Options in the Workflow List are wizard-driven with wizards provided for all the core activities.

About the Process Designer: The Process Designer provides a Visio-type interface with drag and drop functionality for process modeling. For more information about the Process Designer, see About the Process Designer.

Configure Queue Management: The Queue Management window enables creation and management of queues for allocation of workflow activities. To learn more about Queues, see Working with Queues.

Calendar: The Calendar interface enables creation of hierarchical organization and resource calendars. Calendars are used to determine availability of resources, calculate time outs and perform other scheduling functions.

Work Items List: The Work Item List is a web-based interface to which workflow activities are delivered. To learn more about the Work Item List, see Working with Work Item List.

Business Activity Monitoring Alert: The BAM Dashboard enables monitoring of Workflow execution and provides an array of real-time reports on Workflow status and performance. To learn more about using the Business Activity Dashboard, see Working with the Business Activity Monitoring dashboard.

Access Features

AVEVA Work Tasks features and interfaces can be accessed through the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Enterprise Console

The Enterprise Console is a central portal with options for workflow design, workflow management, user creation, BAM analysis, work item lists, queues and calendar management. The Enterprise Console is mapped to one or more AVEVA Work Tasks Repositories. You can gain access to all the above-mentioned functions for a specified repository by logging into the Enterprise Console. The Enterprise Consoles are created from the Farm Server Configuration Manager and mapped to repositories in the Repository Settings page of the Central Configuration.

See *Administrator Guide* for detailed information about creating and configuring Enterprise Consoles and Repositories.

See Workflow Management Enterprise Console for working with the Enterprise Console.

Embedding controls in Applications

The Controls for Process Designer, Queue, Calendar, BAM, and Work List can be embedded into an ASP.NET application.

Enterprise Console

The Enterprise Console is a Web-based interface that allows authorized users to build workflow driven applications, and to participate in these applications. Organizations can create and access their business applications using Enterprise Console.

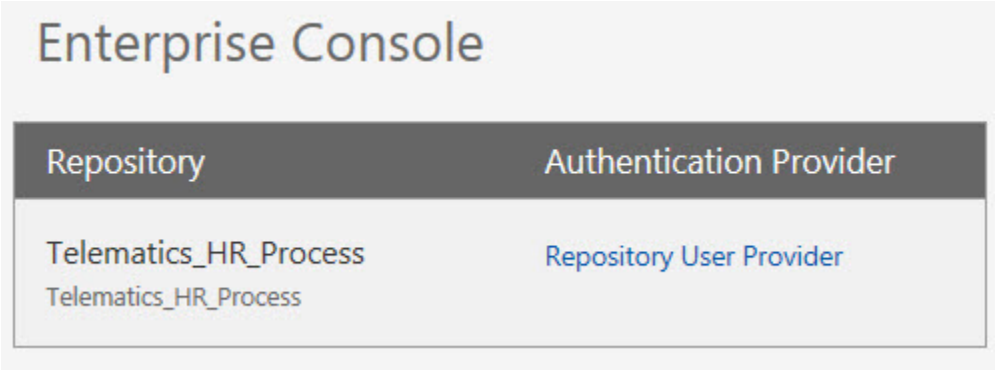
Enterprise Console Authentication

Users, who are a part of the user providers for a repository, can log on to any of the Enterprise Consoles mapped to the repository. For more information about setting up user providers for a repository, see *Administrator Guide*.

To log on to the Enterprise Console:

1. Select the user provider from which you would like to log on to the repository.

   For example, click **Repository User Provider**.



2. Enter **User Name** and **Password** in the **Login** page.

   For the default user name and password, contact the technical support team or refer the *Get Started Guide* in the ISO file of AVEVA Work Tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To protect from unauthorized access or to restrict security vulnerability, the password is not saved even if the remember password option of the browser used has the option to save passwords automatically.

3. Click **Login**.

Note:
- If the Active Directory is selected as Resource Provider and ASTS is also selected, then the authentication is performed by ASTS.
To access the same website from a different machine, you can use the IPv6 address without the scope ID in all the supported browsers.
Example:
- IPv6 with Scope ID = fe80::91fb:becc:2c79:948b%14
- IPv6 without Scope ID = fe80::91fb:becc:2c79:948b

Enterprise Console Home Page

The Enterprise Console home page comprises the following sections:

Work items list:

The Work items list displays a list of activities assigned to the logged in user by workflows in the repository which the user has logged into. The Work items list has an Inbox view and permits users (also known as actors) to respond to the activities assigned.

Enterprise Console menu:

Note: The new UI/UX enhancement to align with Skyline User Interface standard for the navigation menu is applicable to menu items only up to five levels.

The Enterprise Console left menu has the following options:

Dashboard:

This is the default view when a user logs on to the Enterprise Console using the administrator rights. The Dashboard provides an easy-to-read graphical display of webparts, such as the Inbox and Business Activity Monitoring. You can customize the Dashboard according to their specific business requirements.

Inbox:

This option shows the Work items list.

Workflows:

Selecting **Workflows** displays the workflow list which has options to create Workflow, List Workflow, FileWatcher Workflow, BAM Workflow, and Folder. The workflow list also provides options to view, delete, design, edit, publish, manage, and associate workflows and change owner information. You can also apply security at this list level.

Fill Form:

This option allows the user to fill form. It has a security feature that restricts access to the users who can fill the form.

Reports:

Selecting Reports displays the Business Activity Monitoring dashboard with real-time reporting on workflow execution.

Tools:
This option provides link to manage lists, forms, work items, and views. It also has the SOA assembly, form

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

controls, external connections, and ArchestrA Events links.

Settings:

The Settings group has options for Database Connections, Calendar, Queue Management, Users, Alternate Actor, Impersonation User, File Watcher, SOA Folder, Lookup Settings, Global Work Item Layout, Data Grid, and Reporting Service.

- The **Database Connections** option enables the user to create a new data source connection, edit and delete an existing data source connection, and manage security.
- The **Calendar** option enables setting up of multi-level organization and resource calendars.
- The **Queue Management** option enables setting up of queues.
- The **Alternate Actor** option enables assigning an alternate actor for acting on a task or an activity that was assigned to a primary actor. For more information about how to set an alternate actor, see Alternate Actors.
- The **Users** option enables user maintenance tasks such as adding new users to the Enterprise Console, editing and deleting existing users, and managing security.
- The **Impersonation User** option enables you to create new impersonation users which will have domain account users with full rights.
- The **File Watcher** option enables the user to continuously monitor one or more folders for incoming files and raises events like created, updated, renamed and deleted.
- The **SOA Folder** option enables user to register a folder, delete a folder, disable an enabled folder, enable a disabled folder, and manage security settings.
- The **Lookup Settings** option enables the user to create a new database.
- The **Global Work Item Layout** option enables the user to define and save a global or specific layout for the Work items list.
- The **Web Part Pages** option enables the user to access the three default home page templates and personalize web part settings in them. Note that when you click Web Part Pages > Page 3, you will always be redirected to Page.

Header:

The header of all the pages in the Enterprise Console displays the name of the logged on user, the repository, and the user provider.

Note:

- Do not add multiple queues, calendars, or BAMs in the home page as this might not render the controls correctly. Do not add multiple controls in a single web part. As a best practice, do not use Inbox, Queue, Calendar, and BAM controls in a smaller web-part zone of the home page as these controls might not render as expected.

- When you access Enterprise Console on Microsoft Edge and Google Chrome (Chromium based browsers), it lists the below errors related to Feature Policy:

```
Error with Feature-Policy header: Unrecognized feature: 'vibrate'.
Error with Feature-Policy header: Unrecognized feature: 'usermedia'.
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Workflow Management

Workflows are responsible for driving end-to-end business applications. Manage workflows of a AVEVA Work Tasks Repository with Workflow Lists.

What is a Workflow List

The Workflow List is a list of workflows and folders which contains workflows within it. The Workflow List provides a central interface that enables categorization of workflows.

Actions you can be perform for a Workflow list are:

- Create a folder
- Create and view workflow attributes
- Create new FileWatcher, List and BAM workflows
- Publish a workflow
- Associate a workflow with BAM, FileWatcher, and Enterprise Console Lists
- Organize workflow items by grouping them into folders
- Manage the version changes to a workflow
- Disable or delete a workflow
- Manage security settings

Group Workflow Items within a Folder

Folders enable you to categorize items in the Workflow List. For example, you can create folders and group the workflow items into separate folders using the Organize option.

To group Workflow Items with Folders

1. In the **Enterprise Console**, click menu icon, and then click **Workflows**. The Workflows page appears.
2. On the action bar, click **New**, and then click **Folder**. The **New folder** screen appears.
3. In the Title box, type a name for the folder, and in the Description box, type a description for the folder.
4. Click **Save & Close**. The folder is created.
5. Click **OK**. The new folder is added to the folders list.
6. Click **Organize** on the ribbon bar. The Organize Workflows window is displayed.

   Note: The Organize Workflows window arranges all the folders and workflows in a tree format. You can drag and drop the workflows into the required folders.
7. Drag and drop the required workflows into the folder and click **Close**.

   Note: You can also right-click the item (workflow or folder) in the tree menu and move it to the desired location using the Cut and Paste method.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create a Folder

To create a folder

1. On the action bar, click **New**, and then click **Folder**. The **New folder** screen appears.

   In the Title box, type a name for the folder, and in the Description box, type a description for the folder. Folder names cannot have special characters such as, **:"\\""'<>;|*/{}?**.
2. Click **Save & Close**. The folder is created.
3. Click **OK**. The new folder is added to the folders list.

Publish a Folder

You can publish the folder and all the workflows within that folder will be published.

To publish a folder

1. Select and right-click the folder to be published.
2. Click **Publish**. Alternatively, you can select the folder, and then click **Publish** in the ribbon.
   The selected folder and all workflows within the folder will be published.

Delete a Folder

You can delete a folder which is not published.

To delete a folder

1. Select and right-click the folder that you want to delete.
2. Click **Delete**. Alternatively, you can select the folder, and then click **Delete** in the ribbon. The selected folder will be deleted. A folder cannot be deleted if it contains workflows that are associated with Enterprise Console lists.

Enable or Disable a Folder

To disable a folder

1. Select and right-click the folder that you want to disable.
2. Click **Disable**. The selected folder will be disabled.
   The disabled folder appears grayed out in the list and cannot be accessed.

To enable a folder

1. Select and right-click the folder that you want to enable.
2. Click **Enable**. The selected folder will be enable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Change the Owner of the Folder

To change the owner of a folder

1. Select and right-click the folder for which you want to change the owner.
2. Click **Change Owner**. Alternatively, you can select the folder, and then click **Change Owner** in the ribbon. The **Change List Item Owner** page appears.
3. Select the user from the **User Lookup** window.
4. Click **Save**. The user information is saved successfully.

Apply Security Settings to a Folder

To set the security settings of a folder

1. Select and right-click the folder for which you want to set the security settings.
2. Click **Security Settings**. Alternatively, you can select the folder, and then click **Security Settings** in the ribbon. The **Security Settings** page appears.
3. Set the security settings.

Navigate to Different Folders in Workflows List

You can navigate back to the parent folder by clicking the Navigate icon available in the ribbon.

Create a Workflow

To create a Workflow

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**.

   The **Workflows** page appears.
2. On the action bar, click **New**, and then click **Workflow**.

   The **New Workflow** dialog box appears.
3. In the **Title** box, type a name for the workflow, and in the **Description** box, type a description for the workflow.
4. Click **Save & Continue**.

   The workflow is created, and the **Workflow Options** wizard appears.
5. Select **Design the Workflow** now, which is the default option, and then click **Finish**.

Workflow Options

The following table shows the available workflow options:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task	Action
Design the Workflow now	Select this option to open the Process Designer for the Workflow. For more details about the Process Designer, see About the Process Designer.
No task to be performed now.	Select this option to perform workflow actions later. Selecting this option takes you back to the Workflow list. You can return to the **Workflow Options** window by selecting Tasks from the shortcut menu of the workflow.

Create an Association for a Workflow

1. To create associations for a workflow, right-click on the workflow, and then select **Create Associations** from the context menu.
2. After you click **Create Associations**, the page appears to associate an event with workflow:

Associate Workflow with Enterprise Console Events

To associate the workflow with a new Enterprise Console list event

1. Select the workflow, and then click **Associate** from the ribbon.

   Alternatively, select and right-click the workflow, and then select **Create Associations**.
2. Click **Enterprise Console**.
3. Enter the following details:
4. **Type**: Select either **List** or **List** item.
   a. If **Type** is selected as List, the following needs to be done:
      a. **Event Details**: Select the event for which the workflow has to be associated.
      b. **List Name**: Enter the list name or select it from the List Explorer.
      c. **List Item Name**: Enter the list item name.
      d. **Effective From**: Select the date from which the association is effective.
      e. **Effective To**: Select the date till which the association is effective. Only the events occurring between this period will trigger the workflow.
      f. **Workflow Version**: Select the workflow version from the list
   b. If **Type** is selected as **List Item**, the following needs to be done:
      a. **Event Details**: Select the event for which the workflow has to be associated.
      b. **List Item Name**: Enter the list item name and click **List Explorer** icon, to access the List Explorer wherein you can select the required list: Select a List, for example Customer List i.e. the list to which you want to associate the workflow. Select the type of customer. The list item lookup will display the field which is set as the **Default Field** and the field and which has the options **Display in Grid** and **Display in Lookup** set as True.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

c. **Effective From**: Select the date from which the association is effective.

d. **Effective To**: Select the date till which the association is effective. Only the events occurring between this period will trigger the workflow.

e. **Workflow Version**: Select the workflow version from the list.

5. Click **Attach Event**, to associate the workflow with the new Enterprise Console list event.

   The confirmation message **Association saved successfully** appears.

BAM Events Associations

You use this feature to trigger a workflow using BAM Events.

To associate a workflow with a new BAM event, follow the steps given below

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**.

   The **Workflows** page appears.
2. Select an workflow.
3. On the action bar, click **Associate**.

   The **New Association** wizard appears.

   Alternatively, select and right-click the workflow to be associated. Click **Create Associations**.
4. On the action bar, click **BAM** to associate the BAM events.
5. In the **Workflow** drop-down list, select the workflow from which the BAM Events of Overdue and KPI are to be raised.
6. In the **Based** on drop-down list, select either **Overdue Analysis** or **KPI Analysis**.
   a. If you select **Overdue Analysis**, the **Select Overdue Slot** button appears. This is used to select the Overdue slot and the event associated with it.
   b. If you select **KPI Analysis**, then the **Select Slot** button appears. This is used to select the KPI name, attached KPI data points and the event associated with it.
7. Select the date range for **Event** execution using the **Effective From** and **Effective To** options.
8. Click **Attach Event** to trigger the Workflow when the BAM Report is being processed.

Associate Workflow with ArchestrA Events

Use the **Associate** option to associate a workflow with ArchestrA Events.

The ArchestrA Event association window appears.

To associate a workflow with an ArchestrA Event for a specific event

1. Select the workflow, and then click **Associate** from the ribbon.

   Alternatively, select and right-click the workflow, and then select **Create Associations**.
2. Click **ArchestrA Event** to associate the workflow with the ArchestrA Event list for a specific event.
3. Enter the following details:
   - **Event Provider**: Select the name of the event provider from which you want to poll for new events.

     The Event Provider field is mandatory, and the maximum length of the event provider name is 250

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

characters.

Based on the data available in the ArchestrA Event main list, the Event Provider list is populated. You can add other event providers to this main list, if required.

Example of Event Providers are InBatch Server or Avantis.

- **Event Type**: Select the Event Type of the Event Provider.

  It is the type of event which defines the properties the event will have.

  For InBatch Server, Batch is an event, and possible values for Batch events are such as, Batch, Equipment, UnitProcedure, Operation, Phase, MaterialInput, MaterialOutput, Custom, and BatchError.

  Based on the data available in the ArchestrA Event main list, the Event Type list is populated for the selected Event Provider. You can add other event types for the event provider, if required.
- **Source**: Type the Source property name of the event. It is the name of the event provider sending the event. For example, for a *Batch* event, *BatchMngr* is the source.

  Select the appropriate operator from the operator drop-down list.
- **Area**: Type the Area of the event. Areas provide a key organizational role in grouping alarm information and assigning it to users who use alarm and event clients to monitor their Areas of responsibility.

  The Area object plays a key role in alarm and event distribution. All objects belong to an Area. Areas can contain sub-Areas. Alarm and event clients are configured to subscribe to a set of Areas.
- **Priority**: Type the priority for each designated event.

  Priority, which is an integer value from 1 to 999 indicating the severity of the alarm which raises an event. An alarm priority of 1 is most urgent and 999 least urgent.
- **Workflow Version**: Select the version of the workflow to be associated with the ArchestrA Event. The workflow will be initiated only if the published version at the time of the occurrence of the event is the same as the version selected here. To trigger the currently published version of the workflow whenever the event occurs, select *Latest*. When a version is specified, the workflow alerts the latest published version of that version series. For example, if the specified version is 1.1 and the latest published minor version for 1.1 is 1.1.1.3, then 1.1.1.3 is alerted.
- **Properties**: Based on the **Event Type** that you enter, select values in the Properties section. For example, for a Batch event type, BatchServer is a property of the data type String. The Properties field is optional.

  Based on the data available in the ArchestrA Event main list, the properties of the Event Type list is populated. You can add other properties of the event type, if required.

4. Click **Attach Event** to associate the workflow with ArchestrA Event for that specific event.

   Click **Cancel** to abort.

   The confirmation message, *Successfully associated the workflow* appears.

Limitations

- The *Between* operator is not supported for **Priority** and **Properties**.
- The data type of the operators are not validated. Ensure to provide valid values to the property data type.
- Only one workflow with one event provider is supported. That is, different event providers for a workflow with different association is not supported.
- While creating a filter condition, duplicate properties are not supported.
- The *OR* condition is not supported while creating a filter condition.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Associate Workflow with Message Queue

Use the **Associate** option to associate a workflow with Message Queue.

To associate a workflow with Message Queue for a specific connection

1. Select the workflow, and then click **Associate** from the ribbon.
   Alternatively, select and right-click the workflow, and then select **Create Associations**.
2. Click **Message Queue** to associate the workflow with the Message Queue.
3. Select the name of the Message Queue connection from the **Connection** list.
   The following fields appear based on the **Binding Type** selected for the **Connection**:

Binding Type for Connection	Field Name	Description
WM Object	Message Type	Enter the message type that needs to be listened from Message Queue.
XML	XPath	Enter the XPath for the XML Message. For example, `/CATALOG/PLANT[1]/PRICE/text()`
	XPath Value	Enter the XPath Value for the XML Message. For example, `$2.44`
	XML Schema	Enter the XML Schema for the XML Message. For example, see XML Schema Example.
JSON	JSON Path	Enter the JSON Path for the JSON Message. For example, `topping[3].type`
	JSON Path Value	Enter the JSON Path Value for the JSON Message. For example, `Powdered Sugar`
	JSON Sample	Enter the sample for the JSON Message. For example, see JSON Sample Example.

4. Click **Save** to associate the workflow with Message Queue for that specific connection.

The Workflow is triggered based on only message type, irrespective of the queue or connection to which it is associated. Hence, the message type must be unique through out the repositories configured.

Example:

1. Create Message Queue Connection in **machine1** with queue name as **Q1** and **machine2** with queue name

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Q2.

2. Associate the workflow to the connection created in the above step and message type **M1**.
3. Publish the message in Message Queue queue **Q2** with message type **M1**.

   The Workflow will be triggered, even if it is not from the queue or machine configured in the Message Queue Connection.

Note:
- JSON of array type without a root node is not supported for Associating Workflow with Message Queue. To support this, the JSON should be embedded inside a root node.

For example:

The following JSON of array type without a root note is not supported:

```
[{
"Data1": false,
"Data2": 12,
"Data3": 54657.66
}, {
" Data1": true,
" Data2": 45,
" Data3": 4576
}]
```

```
The above JSON sample can be modified as below to be supported:
{
"DataParent":
[{
"Data1": false,
"Data2": 12,
"Data3": 54657.66
}, {
" Data1": true,
" Data2": 45,
" Data3": 4576
}]
}
```

- The associated Workflow may get executed even though the JSON or XML schema of the message received by the queue does not match the schema specified in the association. In such scenario, the Xml Variable may not be in the correct format.

- RMQEventData is the XML variable that gets created on associating to Message Queue Association.

- Associating multiple versions of same workflow to different Message Queue associations is not recommended.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

XML Schema Example

```
XPath: /CATALOG/PLANT[1]/PRICE/text()
XPath value: $2.44
Sample XML:
<CATALOG>
<PLANT>
<COMMON>Sphagnum Moss</COMMON>
<BOTANICAL>Sanguinaria canadensis</BOTANICAL>
<ZONE>4</ZONE>
<LIGHT>Mostly Shady</LIGHT>
<PRICE>$2.44</PRICE>
<AVAILABILITY>031599</AVAILABILITY>
</PLANT>
<PLANT>
<COMMON>Columbine</COMMON>
<BOTANICAL>Aquilegia canadensis</BOTANICAL>
<ZONE>3</ZONE>
<LIGHT>Mostly Shady</LIGHT>
<PRICE>$9.37</PRICE>
<AVAILABILITY>030699</AVAILABILITY>
</PLANT>
</CATALOG>
```

Enter below XML Schema in the XML Schema field to consume the above XML Sample.

```
<xs:schema attributeFormDefault="unqualified" elementFormDefault="qualified"
xmlns:xs="http://www.w3.org/2001/XMLSchema"> <xs:element name="CATALOG"> <xs:complexType>
<xs:sequence> <xs:element name="PLANT" maxOccurs="unbounded" minOccurs="0">
<xs:complexType> <xs:sequence> <xs:element type="xs:string" name="COMMON"/> <xs:element
type="xs:string" name="BOTANICAL"/> <xs:element type="xs:byte" name="ZONE"/> <xs:element
type="xs:string" name="LIGHT"/> <xs:element type="xs:string" name="PRICE"/> <xs:element
type="xs:short" name="AVAILABILITY"/> </xs:sequence> </xs:complexType> </xs:element>
</xs:sequence> </xs:complexType> </xs:element> </xs:schema>
```

JSON Sample Example

```
JSON Path: topping[3].type
JSON Path value: Powdered Sugar
JSON Sample :
{
"id": "0001",
"type": "donut",
"name": "Caramel Donut",
"ppu": 0.55,
"batters":
{
"batter":
[
{ "id": "1001", "type": "Regular" },
{ "id": "1002", "type": "Chocolate" },
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
{ "id": "1003", "type": "Blueberry" },
{ "id": "1004", "type": "Devil's Food" }
]
},
"topping":
[
{ "id": "5001", "type": "None" },
{ "id": "5002", "type": "Glazed" },
{ "id": "5005", "type": "Sugar" },
{ "id": "5007", "type": "Powdered Sugar" },
{ "id": "5006", "type": "Chocolate with Sprinkles" },
{ "id": "5003", "type": "Chocolate" },
{ "id": "5004", "type": "Maple" }
]
}
```

Associate Workflow with Logic App Events

Use the **Associate** option to associate a workflow with a Logic App event.

To associate a workflow with a Logic App event

1. Select the workflow, and then click **Associate** from the ribbon.

   Alternatively, select and right-click the workflow, and then select **Create Associations**.
2. Click **Logic App Event** to associate the workflow with a Logic App event.
3. Enter the following details:
   - **Enterprise Console**: Select an Enterprise Console site. The list shows Enterprise Console sites to which repositories are mapped, and for which Azure Service Bus (with Shared Access Signatures) are configured.
   - **URI**: The URI is automatically generated based on the selected Enterprise Console.
   - **Authorization Token**: The authorization token is automatically generated based on the selected Enterprise Console.
   - **Logic App Alert Key**: The default value is the name of the workflow being associated. You can enter any other value, if required.
   - **User**: The default value is the username of the logged-on user. You can select any other user, if required.
   - **Workflow Version**: The default value is the latest version of the workflow. You can select any other version, if required.
   - **Logic App JSON Data**: Enter the JSON schema to be passed from the Logic App.
   - **Logic APP XML Schema**: After entering the JSON schema for **Logic App JSON Data**, click **Get XML Schema** to auto generate the XML schema.
4. Click **Save** to associate the workflow with the Logic App event.

   The association is created, the **LogicAppAssociationData** XML variable is created for the schema, and an information message appears.
5. Click **Close**.

   The information message is closed.

Note: While posting alert from the Logic app, ensure the following are part of the HTTP request:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **URI** as generated based on the selected Enterprise Console.
- **Authorization Token**, as generated based on the selected Enterprise Console, is in the header.
- **ApplicationName** and **LogicAppAlertKey** in JSON schema are in the body.

View all Associations of a Workflow

To view all the associations of a workflow

1. Select and right-click the workflow for which you want to view associations.
2. Click **View Associations**.
   The associations of the workflow appears.
3. Right-click an association to **View Properties**, **Delete**, **Disable**, or define **Security Settings** of the association.
   If there are no associations for a workflow, the following message appears:
   There are No Events associated for the selected Workflow.

Delete Workflow Associations

To delete workflow associations

1. Select and right-click the workflow for which you want to delete associations.
2. Click **View Associations**.
   The associations of the workflow appears.
3. Right-click the association to be deleted, and then click **Delete**.
   The association is deleted.
4. Click **OK**.

Note: When you delete a workflow, the associations of that workflow gets deleted.

Disable Workflow Associations

To disable a workflow association

1. Select and right-click the workflow for which you want to disable associations.
2. Click **View Associations**.
   The associations of the workflow appears.
3. Right-click the association to be disabled, and then click **Disable**.
   The association is disabled.
   The disabled association appears grayed out and cannot be accessed.
4. Click **OK**.

Note: If a workflow is disabled, the event associated with it will not get triggered. You will be able to trigger the workflow only when the association is enabled.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create different versions of a Workflow

To create different versions of a workflow

1. Select and right-click the workflow for which you want to create different versions.
2. Click **Save As**, and then select the required available option. The available option are as follows:
   a. **Next Version:** Adds 1 to the lowest level of the last saved version of the workflow. If the last saved version is 1.1.1, then selecting this option saves the workflow as 1.1.2.
   b. **Next Major Version:** Next major version increments the workflow version by 1. If the last saved version is 1.1.1, selecting this option assigns 2 as the version number.
   c. **Next Minor Version:** Minor version for the last saved version. If the last saved version is 1, the next minor version would be 1.1. If the last saved version is 1.1, the next minor version would be 1.1.1.
   d. **Specific Version:** View a list of the next version numbers under the above three options.
3. In the **Save List Item** dialog box, enter the required comments, and then click **Save**.
4. A message appears to confirms that the item is saved successfully with the chosen option. Click **OK**.

When a workflow is first saved, the version number is set as 1.0 by default.

If all versions of the workflow are in **draft** status, then the version number in **Workflows** list is updated with the last saved version number.

If at least one version of the workflow is published, then the version number in the workflows list is updated with the published version of the workflow.

View All the Versions of a Workflow

To view all the versions of a workflow

1. Select and right-click the workflow for which you want to view different versions.
2. Click **Show All Versions**. All versions of the selected workflow appears.

The following workflow details appears:

- **Version:** Version of the workflow.
- **Comments:** Comments provided while saving the version.
- **Status:** Status of the version.
- **Is Archived:** Whether the workflow is archived or not.
- **Created On:** Date and time when the version was created.

Note: The **Publish and Test Run** option always executes the latest published version of the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Modify a Workflow Design

You can modify the design of the workflow.

Select the workflow and click **Design** from the ribbon. Alternatively, select and right-click the workflow, and then select **Design Workflow**. The **Process Designer for the Workflow** appears.

If you are designing a new workflow, the **Start** activity will appear in the **Process Designer** by default.

For more information about the Process Designer, see About the Process Designer.

Edit a Workflow

Use the **Edit** or **Edit Workflow** option to edit the description of an existing workflow.

To edit a workflow

1. Select the workflow you want to edit and click **Edit** from the ribbon. Alternatively, select and right-click the workflow, and then select **Edit Workflow**. The **Edit Workflow** window appears.
2. Change the **Description** of the workflow.
3. Click **Save & Continue** to save the changes. The workflow is updated, and the **Workflow Options** wizard appears.
4. Select an appropriate option, and then click **Finish**.

Note: Consider a scenario where an application level Work Item Field, which is set for a workflow, is not available in the repository. When you open or edit the workflow in the Design Mode, then the Work Item Field is recreated in the repository.

Delete a Workflow

You can delete a workflow which is in draft status.

To delete a workflow

1. Select the workflow you want to delete and click **Delete** from the ribbon. Alternatively, select and right-click the workflow, and then select Delete. A confirmation message to delete the workflow appears.
2. Click **OK**. The workflow is deleted.

Note: A workflow cannot be deleted if it has any child item. Only the user who has rights to delete will be able to delete a workflow.

On deleting the workflow, all the following information related to the workflow gets deleted:

- Work items
- Tasks
- History
- BAM and KPIs
    - BAM configurations

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

  - KPIs and KPI Data points
  - Performance Analysis
- Event Associations
  - Enterprise console
  - All the other associations
- Alternate Actor rules
- Work item layouts
- Work item fields
- Work items and Work item transactions
- Executions and Execution details

If a particular version of the workflow is deleted, only associations related to that specific version of the workflow are deleted. If the associations are not related to that particular version, then the associations are not deleted.

Example Scenario:

If a workflow has five versions and the third version gets deleted, then the information related only to the third version gets deleted. All the executions, work items, work item transactions, and execution history pertaining to the third version are deleted.

When the last version of a workflow is deleted, then all the associations and other related information of the workflow gets deleted. The following list shows the related information that gets deleted when deleting the last version of a workflow:

- Alternate Actor rules
- Work item layouts
- Work item fields (specific to this workflow)
- Event Associations
  - Enterprise console
  - All the other associations
- BAM and KPI
  - BAM configurations
  - KPIs and KPI Data points

When the last workflow of a repository gets deleted, then the information related to that workflow gets deleted. The following list shows the related information that gets deleted when deleting the last workflow in a repository:

- Alternate Actor rules
- Work Item Layouts
- Work Item Fields (defined at application level)
- BAM
  - Performance Analysis

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Publish a Workflow

Publish a workflow to deploy and activate the workflow.

To publish a workflow

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**.

   The **Workflows** page appears.
2. Right-click on a workflow, and then click **Publish** (or click on a workflow, and then on the **Action** bar, click **Publish**).

   The workflow is published and a message bar appears.
3. Click **Close**.

   The message bar is closed.

To publish multiple workflows

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**.

   The **Workflows** page appears.
2. Select multiple workflows, and then on the **Action** bar, click **Publish**.

   The workflows are published and a message bar appears.
3. Click **Close**.

   The message bar is closed.

Unpublish a Workflow

Unpublish a workflow to deactivate the workflow. When a workflow is unpublished, existing instances of the workflow are completed, and no new instances of the workflow are created.

To unpublish a workflow

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**.

   The **Workflows** page appears.
2. Right-click on a workflow, and then click **Unpublish** (or click on a workflow, and then on the **Action** bar, click **Unpublish**).

   The workflow is unpublished and a message bar appears.
3. Click **Close**.

   The message bar is closed.

To unpublish multiple workflows

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**.

   The **Workflows** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Select multiple workflows, and then on the **Action** bar, click **Unpublish**.

   The workflows are unpublished and a message bar appears.

3. Click **Close**.

   The message bar is closed.

Save Workflow as Quickflow

You can save the published workflow as Quickflow for faster execution. The **Save as Quickflow** option is available only for the published workflows.

Note: The workflows which have the activities and properties that are supported by Quickflow can only be saved as Quickflow.

To Save the Workflow as a Quickflow

- Select and right-click the workflow you want to save as Quickflow, and then select **Save as Quickflow**.

  The selected workflow gets saved as Quickflow.

Import a Workflow

You can import a workflow definition that has been saved as an XML file. You can import only unpublished workflows.

To import a workflow XML file

1. Select and right-click the workflow that you want to import from the workflow list.
2. Click **Import Workflow**. The **Import** dialog box appears.
3. Select the workflow definition which you want to save as an XML file.
4. Click **Import**. A message workflow successfully imported appears.
5. Click **Close**.

Export a Workflow

You can export a workflow definition as an XML file. This makes the workflow portable and accessible from other applications.

To export a workflow as an XML file

1. Select and right-click the workflow that you want to export from the workflow list.
2. Click **Export Workflow**. The **Export** dialog box appears.
3. Select the workflow definition which you want to export.
4. Click **Export**. Save the XML file.

Lock a Workflow for Editing

You can **Lock** or **Unlock** a Workflow, Process Designer, Forms Designer, and List designer while editing.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

When the designer or the list item is locked, other users are not allowed to edit or modify it. A lock icon will appear beside the list item if the designer is locked.

The following image shows the representations of different types of lock supported by AVEVA Work Tasks:

	Title	Description	Owner	Version
	Leave Details	Employee Leave Details	admin	1
	adminform1		admin	1
	adminWF		admin	1
	RS	RS	admin	1
	200941	200941	admin	1

Lock Legends

A locked list item can have one of the following **Lock** icon beside it:

: Item is manually locked by user who is currently logged in.

: Item it is locked by other users.

: Item is automatically locked by user who is currently logged in.

Functionality of Lock and Unlock

- You can select and right-click the list item to be locked and unlocked, and then select **Lock** or **Unlock** from the menu.
- Every list item opened for editing will get locked automatically, even though the item is not locked manually.
- Name of the user who has locked the list item can be viewed by placing the cursor on the **Lock** icon.
- Only the user who has locked the list item or the users from the administrative security group can **Unlock** the list item.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Enable and Disable Workflow

To enable a workflow

1. Right-click a disabled workflow that you want to enable, and then select **Enable**. A message about successful enable appears.
2. Click **OK**.

To disable a workflow

1. Right-click a workflow that you want to disable and select **Disable**. A message about successful disabling of the workflow appears.
2. Click **OK**.

All disabled workflows appear grayed out in the list and cannot be accessed.

Access BAM Configuration

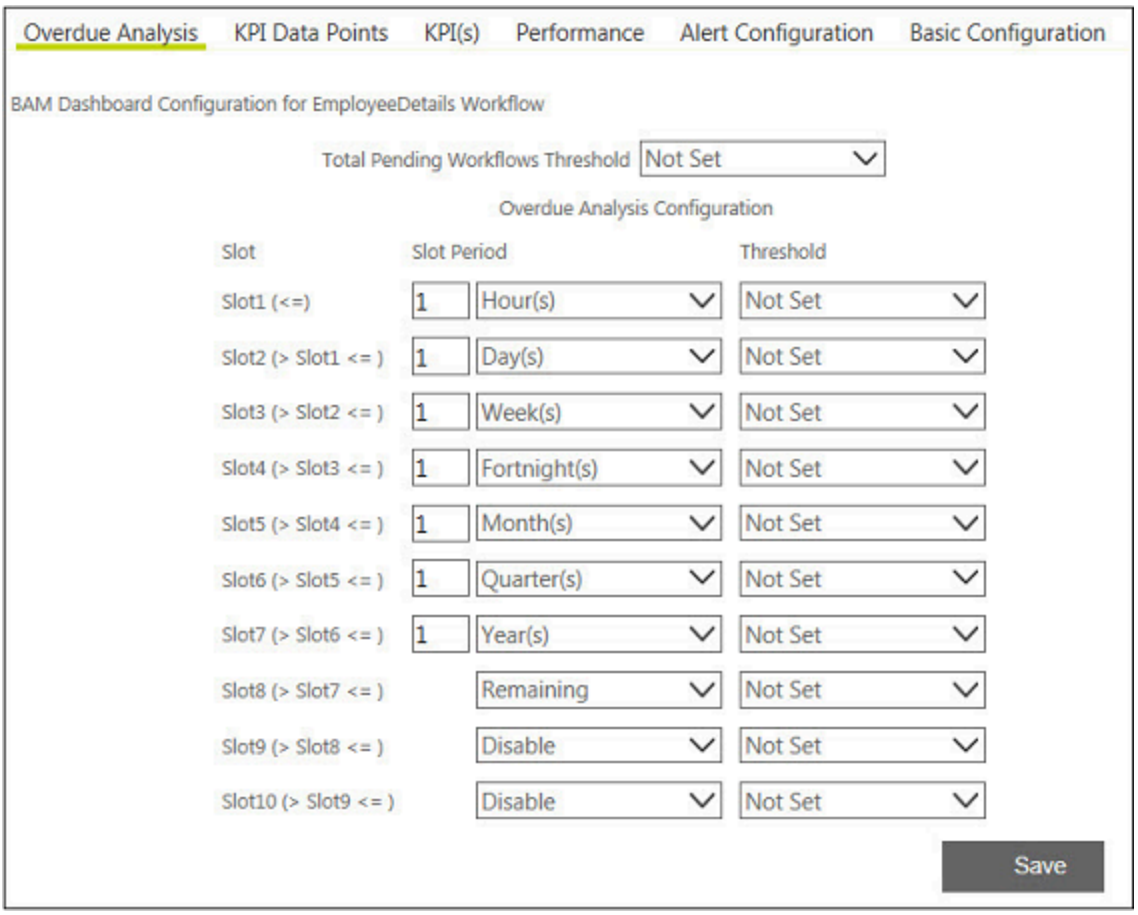
Use the BAM Configuration option to access the BAM Configuration of the workflow. The BAM Configuration option is available only if the logged in user has Process Designer level security rights.

To launch the BAM Configuration

1. Right-click a workflow, and then select **BAM Configuration**. The **BAM Configuration** window appears.
2. Select the required configurations, and then click **Save**. The modified configurations are saved.

   The following image shows the **BAM Configuration** window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Reference Topics:

Business Activity Monitoring Alert

BAM Configuration

Change Owner Information of a Workflow

You can change the owner of a workflow, if required. This feature is helpful if you want to to inherit workflows of a different user or you want to change the owner of a workflow. The **Change Owner** option is accessible only by the administrator.

To change the owner of a workflow

1. Right-click and select the workflow for which you want to change the owner information.
2. Click **Change Owner**. The **Changing Owner** window appears.
3. Select the new owner. Use the **User Lookup** window to select the user.
4. Click **Save**. A message confirming that the owner information is changed appears.
5. Click **OK**. The selected user will now be the owner of the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Access Workflow Tasks

To access Workflow Tasks

1. Right-click and select a workflow.
2. Click **Tasks**. The **Workflow Options** window appears.
3. Select the required **Workflow Tasks** option.

For more information about Workflow Tasks options, see Workflow Options.

Different Views Available in a Workflow List

This section shows the different views available in a Workflow List.

View a Workflow

You can view the design of the selected workflow in read-only mode by using the View Workflow.

To view a workflow

1. In the Enterprise Console, click the **Menu** button, and then click **Workflows**. The **Workflows** page appears.
2. Select and right-click a workflow, and then select **View Workflow** from the shortcut menu. The design of the selected workflow appears in read-only mode.

View the Execution of the Published Workflow

You can view a workflow when it is being published and test run. The workflow runs only if it is associated with any events.

To view the execution of the published workflow

- Select and right-click a workflow, and then click **Publish and Test Run**. The **Process execution view** appears.

View Child Items of a Workflow

Every workflow can have child items. The child items are either child workflows or folders.

To view the child items of a workflow

- Select and right click a workflow, and then click **Show ChildItem**. The child items of the selected workflow appears.

If the workflow has no child item, an empty list with the following message appears:

There are no rows in this view.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

View Audit History

You can view the history of a selected workflow to identify the action that was performed on the workflow and also the date and time when the action was performed.

To view Audit History

Select and right-click a workflow, and then click **View Audit History**. The **Audit History** window appears.

To view the audit history of a workflow, the logged-in user must have the **Can View Audit History** rights.

The Workflows list displays the latest version of the workflow in the grid. If all the versions are in Draft status, then the latest draft version of the workflow is listed or the latest published version of the workflow is listed in the grid.

Example:

Assume that the 'HR' workflow has up to 10 versions and all are in the 'Draft' state. The tenth version of 'HR' workflow gets displayed in the grid.

Consider that the 'Accounts Payable' workflow has the following versions 1, 1.1, and 1.2 and all are 'Published'. In such a case, the latest published version of the workflow that is, 1.2 is listed in the grid.

View the Properties of a Workflow

You can view the properties of a workflow using the **View Properties** option in the shortcut menu.

Column details in Workflow Properties window displays the following information:

- **Version:** Version of the workflow .
- **Status:** Status of the workflow
- **Is Archived:** States whether the workflow is archived or not

Child Items tab lists the child items of the selected workflow, details pertaining to the workflow which is added as a child item of the selected workflow is listed.

Grid details of Child Items tab displays the following information:

- **Title:** Title of the child workflow.
- **Description:** Description of the child workflow.
- **Version:** Latest version of the child workflow (if all the versions in draft status) or the status of the published version.
- **Status:** Status of the workflow.

View Exceptions

You can view all the exceptions and warnings of the corresponding workflow using the View Exceptions.

Select and right-click a workflow, and then click **View Exceptions**. The **Exception Details** window appears.

To enable exception persistence

1. To enable the persistence of exceptions and warnings in the database so that all these can be viewed using the “View Exceptions” option:

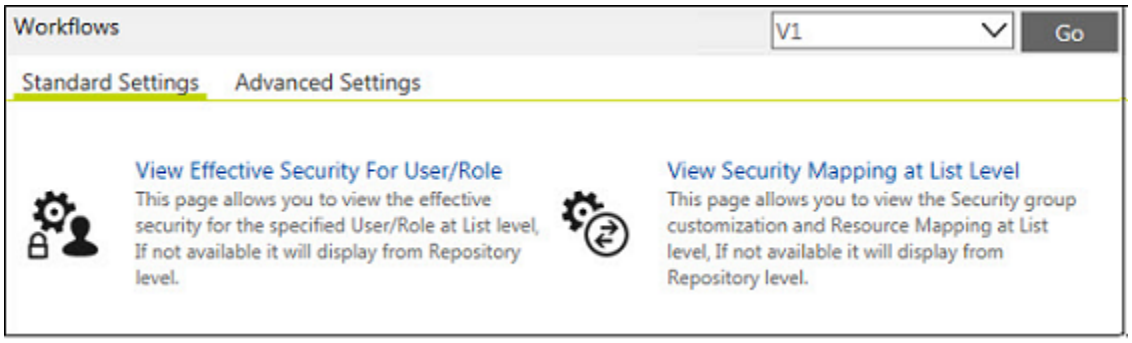
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Open the **Farm Configuration Wizard**.
3. Select **Service Settings**.
4. Click **Global Settings**, and then click **Log/Transaction** tab. The **Log/Transaction** tab window appears.
5. Select the appropriate values from drop-down to enable the persistence of the exceptions/warnings.

Set Security at Workflow Listitem Level

You define the security setting of a workflow at the listitem level using the Security Settings.

1. In the **Enterprise Console**, click menu icon, and then click **Workflows**. The **Workflows** page appears.
2. On the action bar, click **Settings**. The **Security Settings** page appears. The **Security Settings** page contains the **Standard Settings** and **Advanced Settings** tabs. You can configure the security settings for the selected workflow.



For detailed description about security settings, see Security Framework.

Calendars

AVEVA Work Tasks Calendar allows you to create multi-level and hierarchical calendars. You can define multiple child calendars that inherit from the parent calendars. For example, in an organization that spans across multiple geographical locations, you can define an organization-wide main calendar. You can define the work hours across the organization using the main calendar. You can create a separate child calendar for each work location to record the unique work hour requirements for that region. The child calendar inherits the settings of the main calendar and can be customized.

Additional levels of customized calendars, that inherit from the respective parent calendars, can be configured in this manner. The lowest level of calendars that can be defined by extending this process are called the Resource Calendars. See, About Resource Calendar.

For more information about configuring Resource Calendars, see Configure Resource Calendar by Administrator.

Working with Calendar Control

- Accessing the Calendar Control
- Adding a New Calendar
- Configuring the Calendar

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Configuring General Settings
- Configuring Day Settings
- Configuring Date Settings

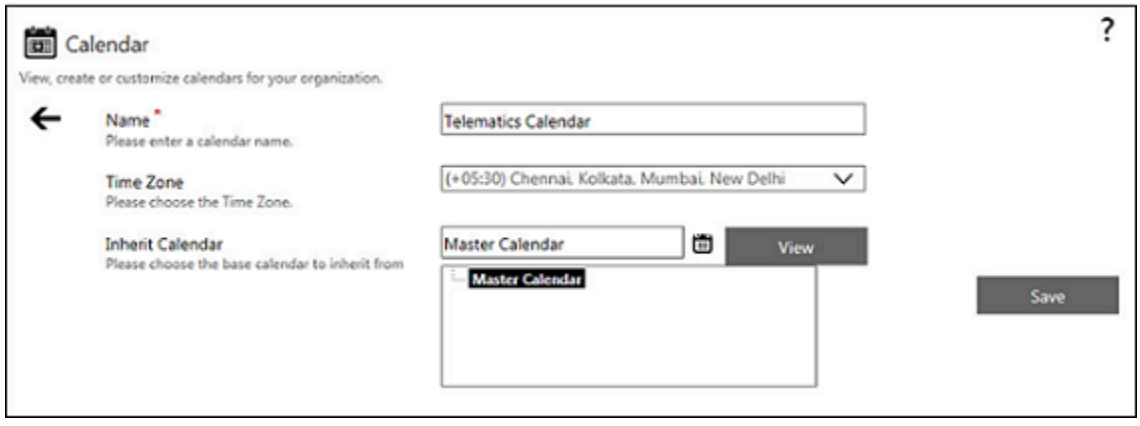
- Viewing the Parent Calendar

To access the Calendar Control

1. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Calendar**.
   The **Calendar Control** page appears.
2. On the **Calendar Control** page, you can view the list of all the available calendars.
   If no calendar has been configured, then only the **Add New Calendar** button is displayed.

To add a New Calendar

1. Click the **Add New Calendar** icon.
   The Calendar Control page is updated by the fields required to create a new calendar.
2. On the Calendar Control page, do the following:
   a. In the **Name** box, type a name for the new calendar.
   b. In the **Time Zone** list, select the time zone that you want to use for the new calendar.
   c. In the **Inherit Calendar** box, select the parent calendar from which you want the new calendar to inherit properties.
   d. Click the icon beside the **Inherit Calendar** box. A drop-down list appears with the names of all the parent calendars. Select one parent calendar from the list.
   e. In the **Provider** list, select the name of the **Calendar Provider** on which you want to create the new calendar.



Note: When a single provider is configured, then the Provider field is not available. Click save. The calendar Configuration section appears in the same page. Click View List to return to the calendar list view.

To configure the Calendar

After creating the new calendar you need to configure it with the required parameters. There are three grids in this section - **General**, **Days**, and **Date**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Click **Set Work Slot**. The **Set Work Slot** dialog box appears.
2. Update the work slot, and then click **Close**.

To configure General Settings

You can set the general work hours for the calendar in the General grid.

1. Click **Set Work Slot**. The **Set Work Slot** window appears.
2. In the **Set Work Slot** window, do the following:
   a. In the **Name** field, type a name for the work shift.
   b. In the **From** field, select the start time of the shift.
   c. In the **To** field, select the end time of the shift.

You can add more rows for setting shift details by pressing the <Tab> key or using the grid shortcut menu. After making the required work hour settings, click **Close**.

To configure Day Settings

You can set the work hours for specific days in the Day grid. For example, you can specify alternative work hours for Saturdays. You can also set Sundays or any other day of the week as the weekly day off.

1. Click **Set Work Slot**. The **Set Work Slot** window appears.
2. In the **Set Work Slot** window, do the following:
   a. In the **Day** list, select a day of the week. Click the **Get Details** button. The grid gets populated with existing shift details, if any. You can edit the existing shift details.
   b. In the **Consider as Holiday** option button, select **Yes** if you want to consider the selected day as holiday.
   c. In the **Name** column of the grid, type a name for the work shift.
   d. In the **From** column of the grid, specify a start time for the shift.
   e. In the **To** column of the grid, specify the end time of the shift.

You can add more rows for setting shift details by pressing the <Tab> key or using the grid shortcut menu. After making all the work hour settings, click **Close**.

To configure Date Settings

You can set the work hours for a specific date in the **Date** grid. For example, you can select a date and set it as a holiday.

1. Click the **Set Work Slot** grid. The **Set Work Slot** window appears.
2. In the **Set Work Slot** window, do the following:
   a. In the **Date** field, select a date. Click the **Get Details** button. The grid gets populated with existing shift details, if any. You can edit the existing shift details.
   b. In the **Consider as Holiday** option button, select **Yes** if you want to consider the selected day as holiday.
   c. In the **Name** column of the grid, type a name for the work shift.
   d. In the **From** column of the grid, specify a start time for the shift.
   e. In the **To** column of the grid, specify the end time of the shift.

You can add more rows for setting the shift details by pressing the <Tab> key or using the grid context menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

After configuring all the work hour settings, click **Close** to close the window.

Tip: These settings provides a great deal of flexibility in creating new calendars. If you inherit the settings from a parent calendar, you only need to change the parameters that need to be alerted. This saves the time and effort that would otherwise be required for setting all the parameters individually for a calendar.

To configure a Child Calendar

You can configure a child calendar that will inherit the settings of the specified parent calendar.

1. While creating the calendar, in the **Inherit Calendar** field, select the appropriate parent calendar. In this example, select **Main Calendar**.
2. Click **save**. Then configure the settings for this calendar in addition to the settings inherited from the **Main Calendar**.

To view the Parent Calendar

1. In the **Inherit Calendar** box, select the parent calendar.
2. Click the **View** button beside the **Inherit Calendar** box. The display of the view button is controlled by the **CanViewCalendar** property. The default value for this property is false. If it is set to **True**, the Calendar Control page appears as shown in the following image.

Inheriting from a Parent Calendar

You can create a new calendar by inheriting properties from an existing parent calendar. If it is not inherited from any parent calendar, the new calendar becomes the parent calendar. Taking the process of inheriting from a top-level calendar further, you can create a hierarchy of calendars.

For example, for an organization that operates in several countries you can have a separate calendar for each country. Under the parent calendar for a country, you can have a number of calendars for each of the region in the country. Under the calendar of each region, you can have a number of calendars for each department. Similarly, within each department calendar, you can have a resource calendar for each user in the department.

Sample Scenario

If a task is assigned to a user and there is no response after five working days (excluding holidays), a timeout reminder should be sent to the user. The following steps can be used to achieve this scenario:

1. Create a Calendar.
2. Add a General shift which covers 24 hours (Day Shift: 9 am to 6 pm; Night Shift: 6 pm to 9 am).
3. Set holidays as required.
4. Associate this Calendar to any human activity.

If you want to set timeout for a resource, you have to calculate the timeout based on the following:

- Shift timing of the resource
- Holidays/weekly off

The resource calendar can also be overridden based on the Calendar Property settings for the activity.

Consider the following example, where:

- Shift timing of the resource = 8 hours per day (working hours per shift)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The resource works on all the days of a month (considering 5 working days in a week) = 20 days

Timeout value = (8 hours * 20 days) /24 hours = 6 days

Resource Calendar

Configuring a Resource Calendar

Configure a resource calendar by inheriting the settings of a specified top-level calendar. A resource calendar is the lowest level calendar that you can create and it cannot have a child-calendar.

See Configure Resource Calendar by Administrator for more details.

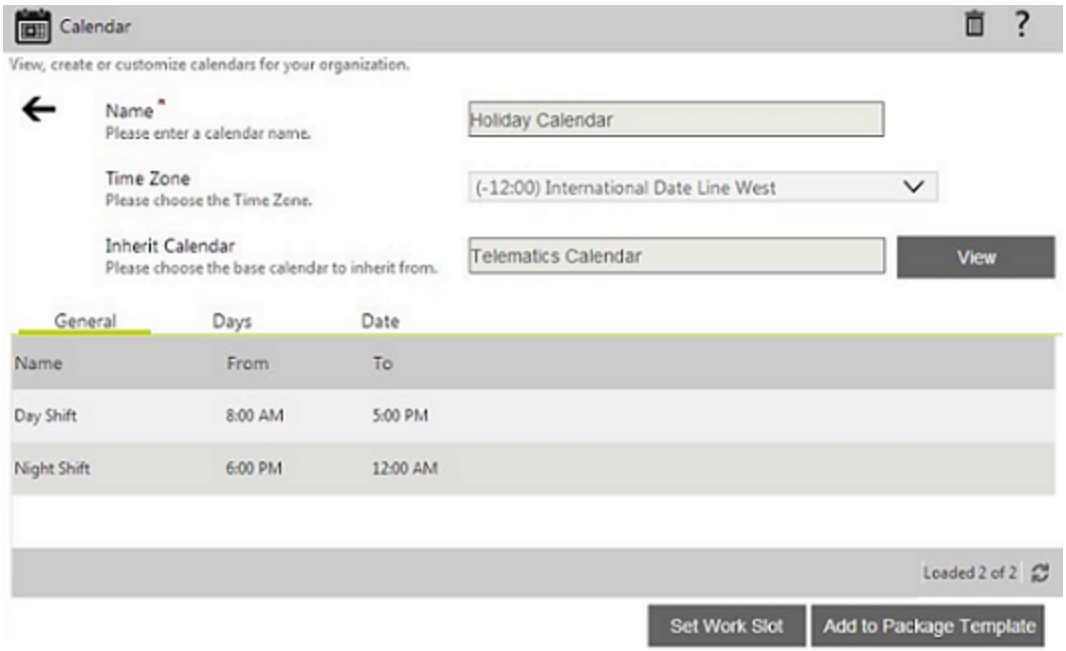
You must select the time zone for the resource in the **Time Zone** drop down. You also need to select the top-level calendar from which this resource calendar is to inherit properties in the Inherit **Calendar** field.

You can access the **Resource Calendar** feature from the Inbox.

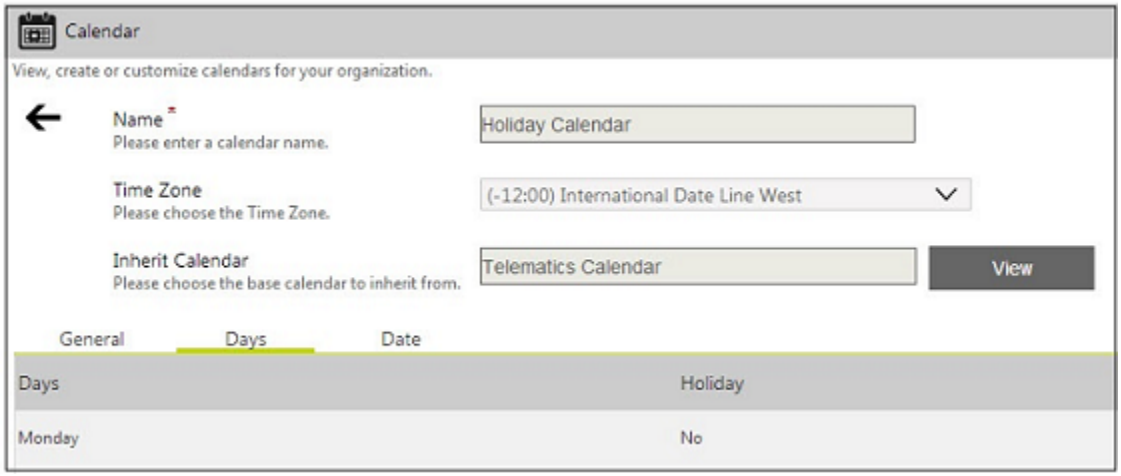
On clicking the icon, the Resource Calendar screen opens.

After configuring the settings, you can click the **Save** button to save the resource calendar. This displays the configuration window below the above one. You can configure the calendar using the same steps described for configuring the Calendar Control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



You can click on the **View List** button to return to the Calendar List view.



For more information about configuring Resource Calendars from the Work items list window. see Work Items List

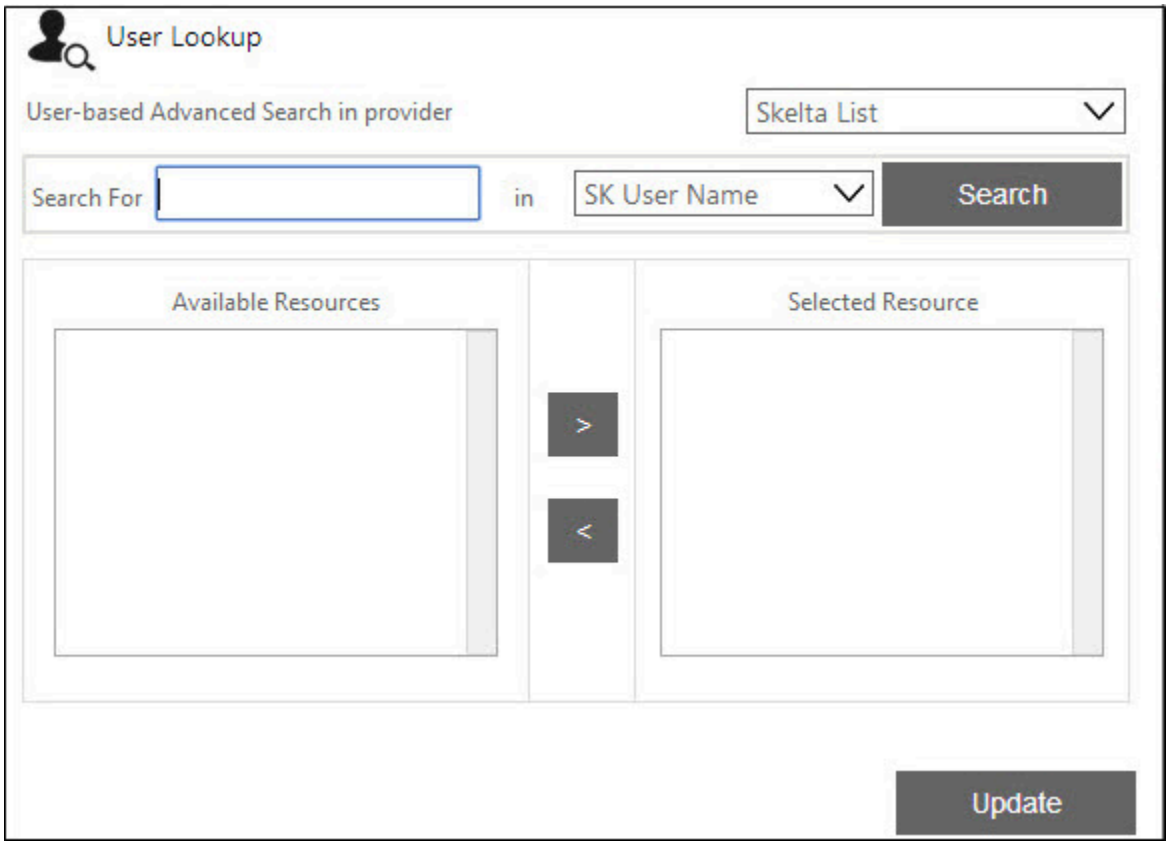
Configure Resource Calendar by Administrator

Users with administrative rights can configure the resource calendar for other users.

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **Calendar**.
   The **Calendar Control** page appears.
   One global calendar should be defined to set the Resource Calendar.
2. Click **Set Resource Calendar**.
3. Select the required provider from the Provider drop down.

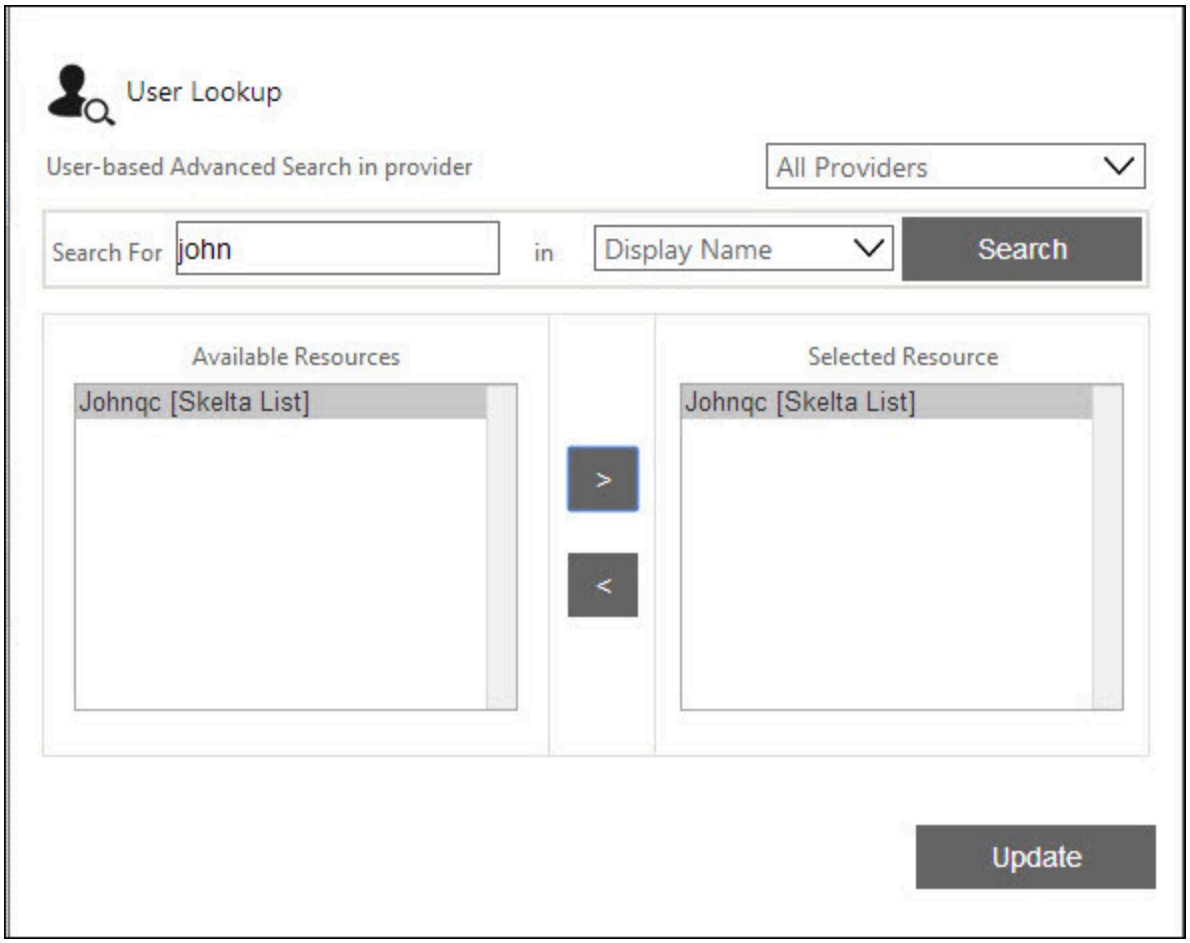
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Select the user for whom the Resource Calendar is to be set in the **User Lookup** pop-up.

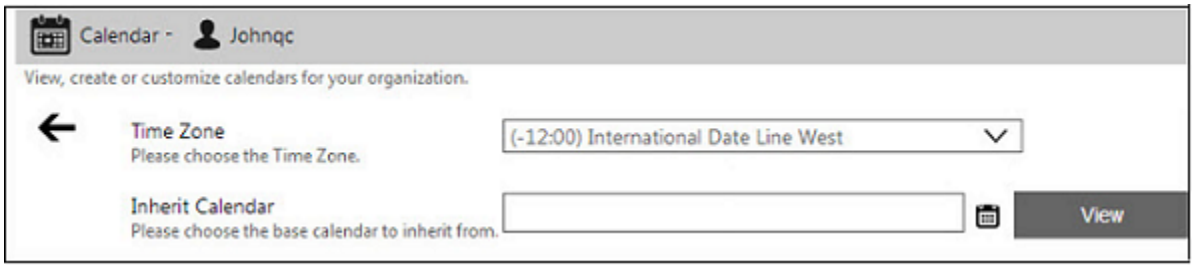


The following image shows user lookup with the selected resource:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

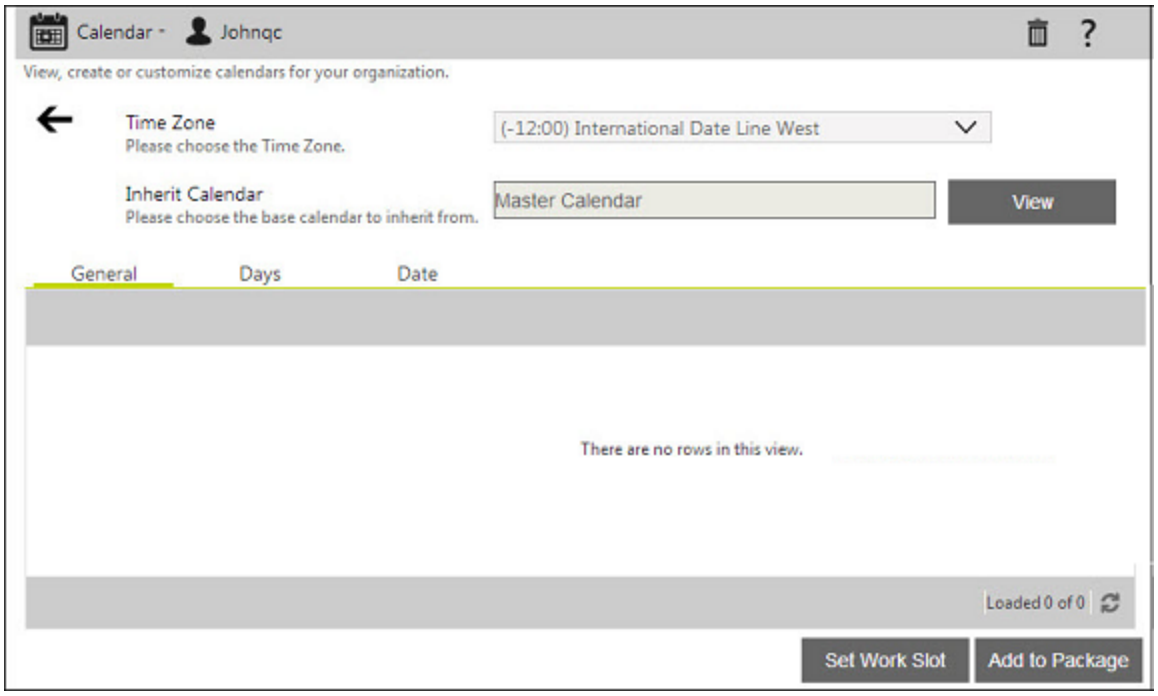


5. Calendar Control will be displayed for the selected user.

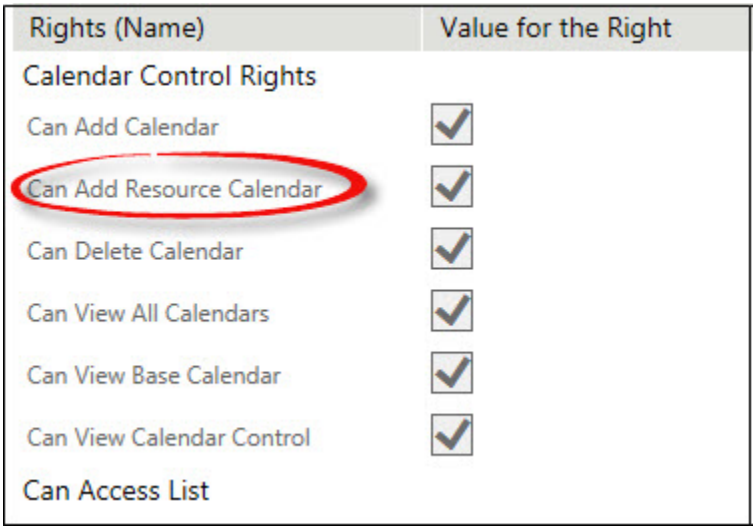


6. Save the calendar and then set the work slots.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Note: The right **Can Add Resource Calendar** is added to the **Calendar Control Rights** to set whether a user can configure Resource Calendars or not. By default, the administrator will have the **Can Add Resource Calendar** right checked.



Check Resource Availability

When the workflow process searches the calendar for work hour information, it begins at the lowest level calendar and works its way up to the top-level calendar.

- The lowest level is the resource calendar.
- If the required work hour information is not available in this calendar, the process looks in the calendar at the next higher level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- This could be the department calendar.
- If the information is not available even in this calendar, the search moves up to the next level, and so on.
- This process continues till the required information is found or till the top-level calendar is reached, whichever is earlier.

See *Finding the Resource Availability from the Resource Calendar* in the *API Scenarios Guide*.

Queue Management

You can use the Queue to assign tasks to groups of actors and to include queues comprising participants as part of their process. The queue feature is generally used by the **AVEVA Work Tasks** process administrators and owners. The queue feature provides a greater level of flexibility in the assignment of tasks to the participants.

Queue Features

Queue Management has the following features:

- Supports push-pull patterns
- Specify Role or User as Participants
- Access rights for Role or User
- Queue level escalations
- Allocate tasks to actors automatically or manually

You can perform the task allocation on the following basis:

- **Automatic:** The allocation is done automatically using defined algorithms. The assignment is done using the Round Robin, Random, or Least Used methods. This push pattern is the default setting.
- **Manual:** The task allocation is done manually. In this case, you can view and pick a task from the queue. Alternatively, the users can be allowed to use a button in the Work items list to get the next available task in the queue. In this case, the users cannot view the tasks in the queue but can click the button to get the next available task in the queue. This is the "pull" pattern as opposed to the "push" pattern where the queue assigns tasks.
- **Combination:** The task allocation is done using a combination of automatic and manual methods.

Significance of Queues

You can use Queues in workflows to set the recipient(s) of activities in the following manner:

- Assign tasks to resource(s) directly using the Assign Actor(s) property
- Assign tasks to Queues using the Assign Queue(s) property
- Assign tasks using both properties.

  Note: If both the properties are set, both the resource(s) and the queue(s) are assigned the task directly. The resource getting the task from the queue will have to act on it. In each case, the respective escalation or timeout setting will apply.

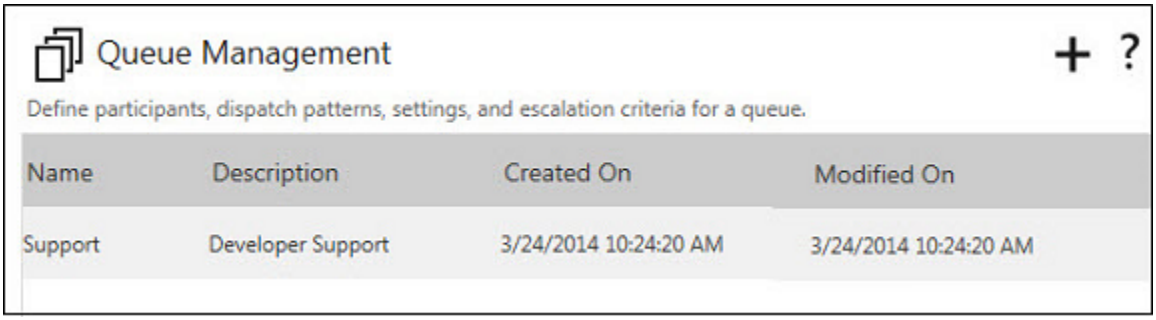
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configure Queue Management

You use the **Queue Management** window to define the queue.

The Queue Control displays the following image when launched. It lists all the queues that have already been added in a grid.

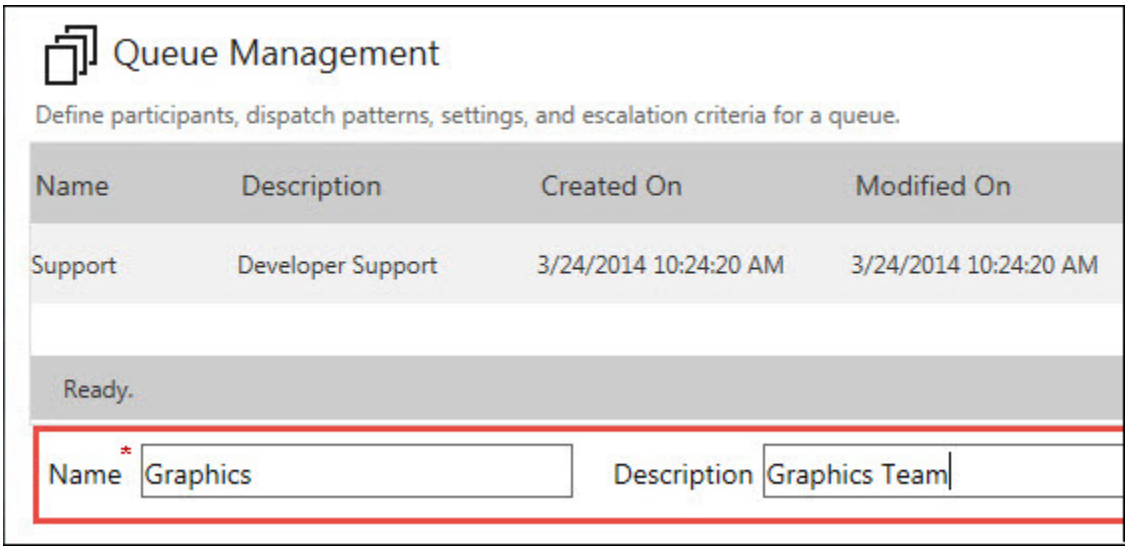
The following image shows the Queue Management window:



You can click the **New Queue** button to add a new queue. When you click the **New Queue** button in the previous window to add a new queue, it displays the **Name** and **Description** fields below the queue list, to enter a name and description for the new queue. You can enter the name and description and click on the Add button. This will add the new list and open the settings view of the Queue Management window.

Note: Ensure that the **Queue Name** that you enter does not exceed 250 characters, and the **Queue Description** does not exceed 150 characters.

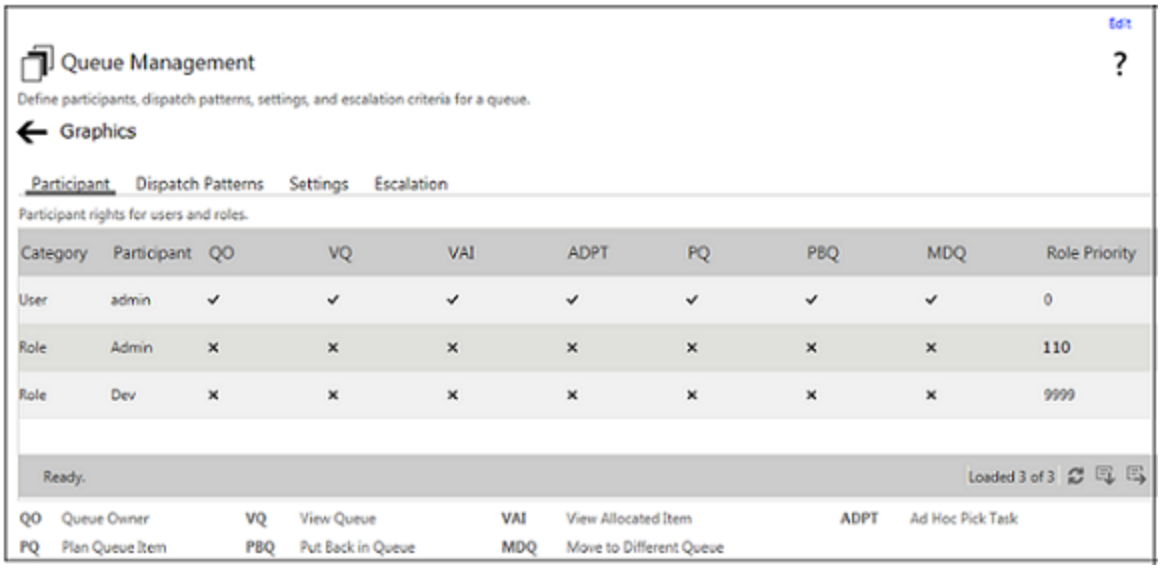
The following image shows Queue Management window with fields for adding new queue:



Queue Management Configuration View:

The following image shows the Configuration view of the Queue Management window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



You see this window when you click **Add** after specifying the name and description for a new queue. You can configure the different queue settings here for the new queue. This window has the following tabs, which opens the corresponding view.

- Participants Tab: Configure the settings related to the participants in the queue. This is the default tab.
- Dispatch Patterns Tab: Configure the settings for the dispatch of tasks from the queue.
- Settings Tab: Configure the queue settings.
- Escalation Tab: Configure the escalation settings for the queue.

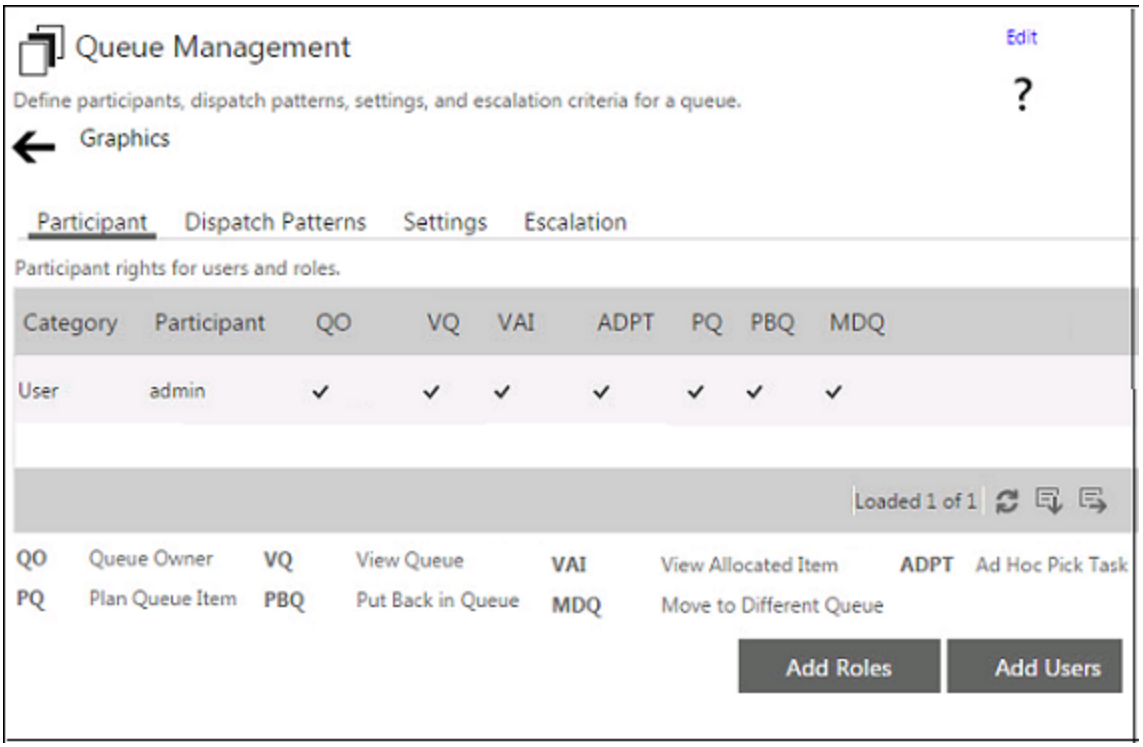
After you configure all the settings, click the **View List** button to return to the main Queue Management window. The new queue is added to the **Queue List**. Right-click on the row corresponding to the new queue, and select the **Edit** option from the context menu to open the configuration view to edit its settings, if required. Alternatively, double-click on the queue row to open this view.

Participants Tab

Configure the different settings for a new queue or edit the settings for an existing queue in this view of the Queue Management window. You can access these settings using the different tabs in the window. The first tab, **Participants**, is selected by default.

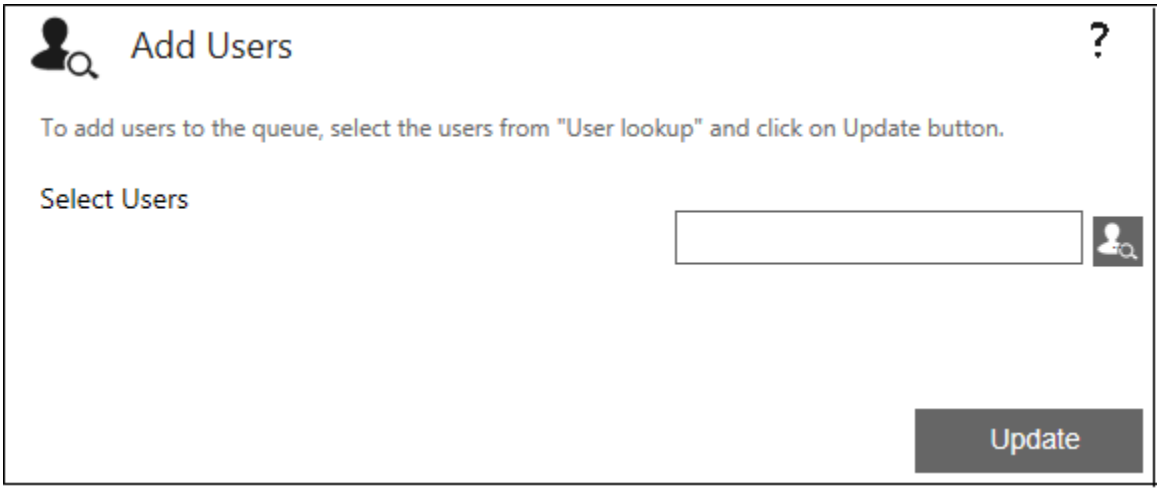
The **Participants** tab displays a list of all the existing participants along with their access rights. The following image shows **Participants** tab of the **Queue Management** window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

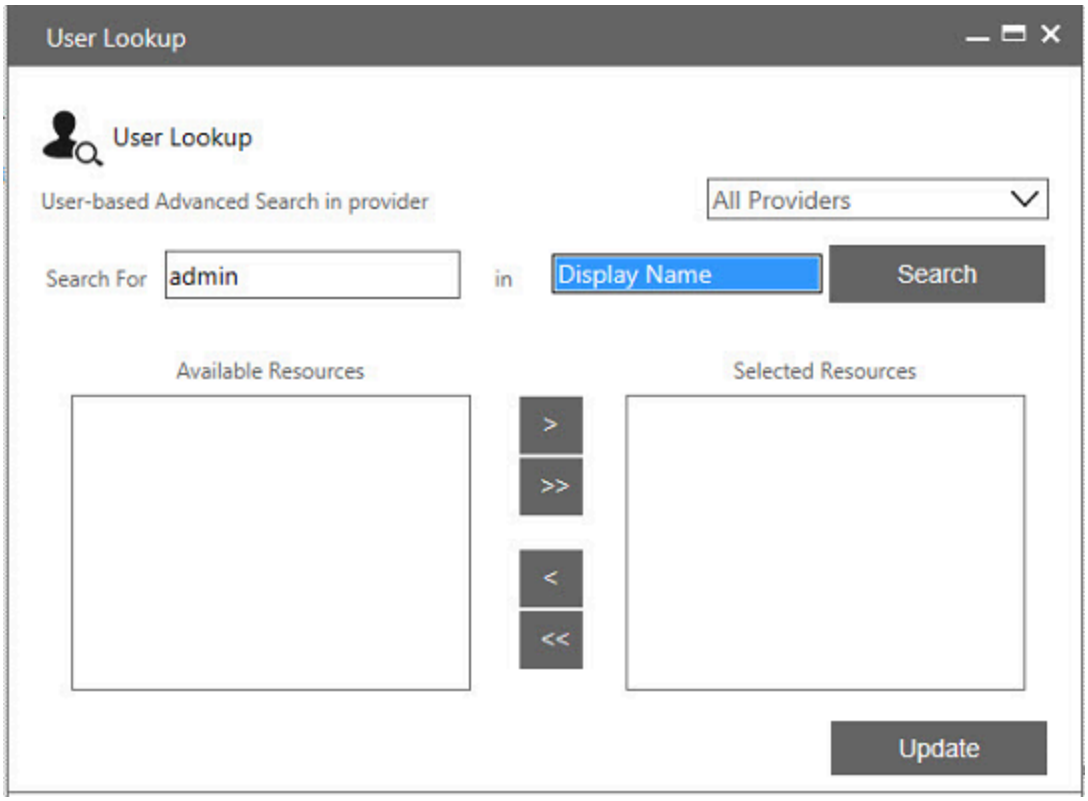


Adding Participants

Click **Add Users** to add a new participant to the queue. The **Add Users** window opens where you can add new users



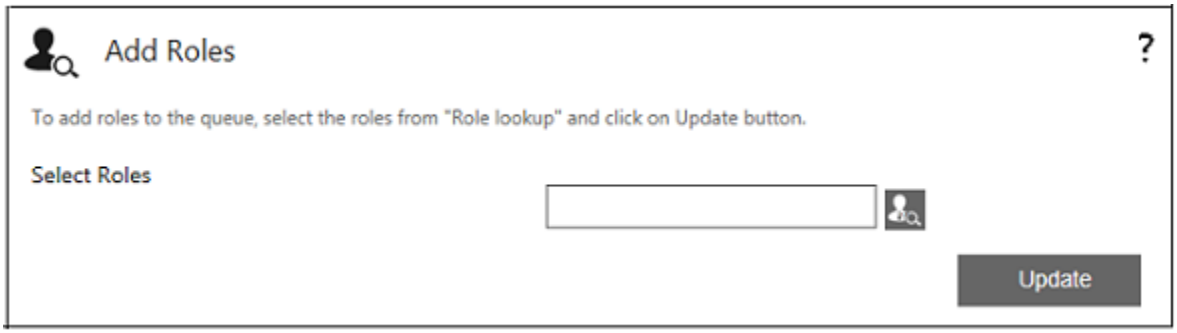
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



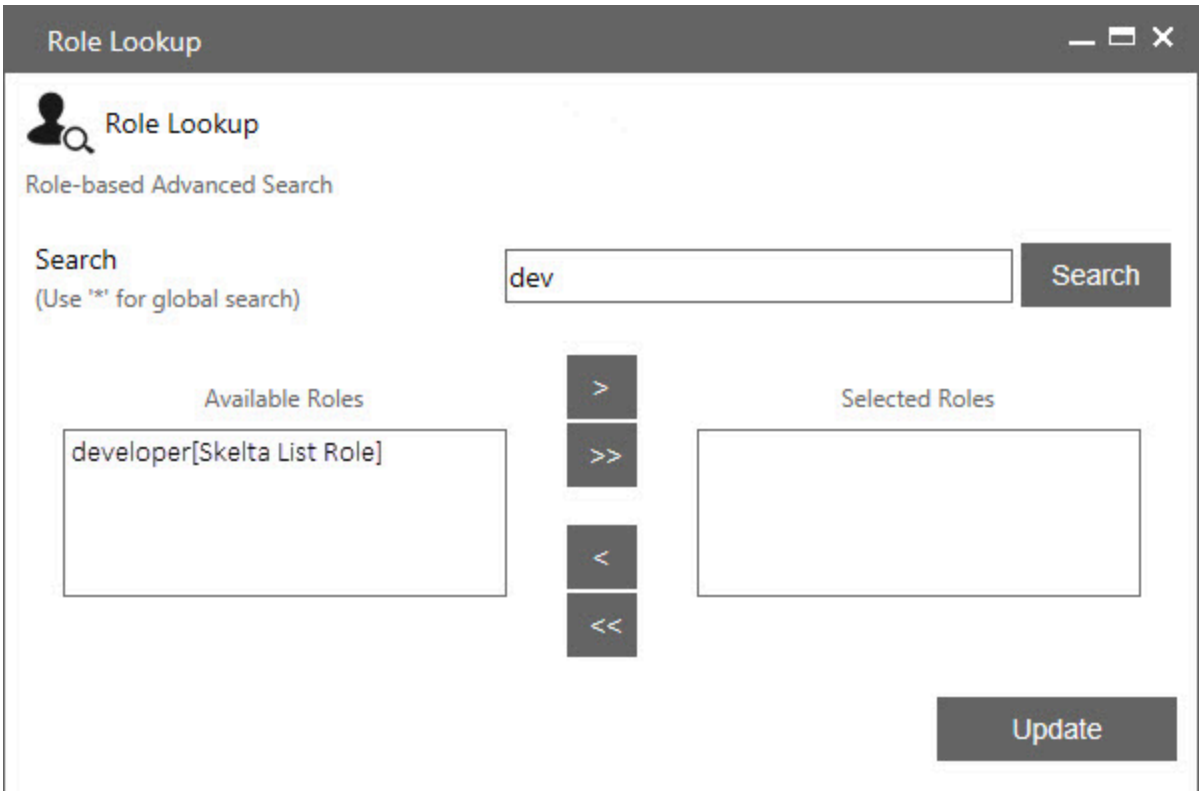
You can specify a search string to **Search for** resources from the desired provider. The resources matching the search parameter are extracted by the resource handler and displayed in the **Available Resources** list. You can select the resource names from this list and click the [>] button to move it into the **Selected Resources** list. You can click the [>>] button to move all the available resources into the selected resources list. After selecting the resources click **Update** to save the selection.

Adding Roles

Click the **Add Roles** button to add roles to the queue. You can add the new roles in the Add Roles window that is opened. The available roles extracted by the role handler are displayed in the **Available Roles** list. You can select the role names from this list and click the [>] button to move it into the **Selected Roles** list. You can click the [>>] button to move all the available roles into the selected roles list. After selecting the roles, click **Update** to save the selection.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

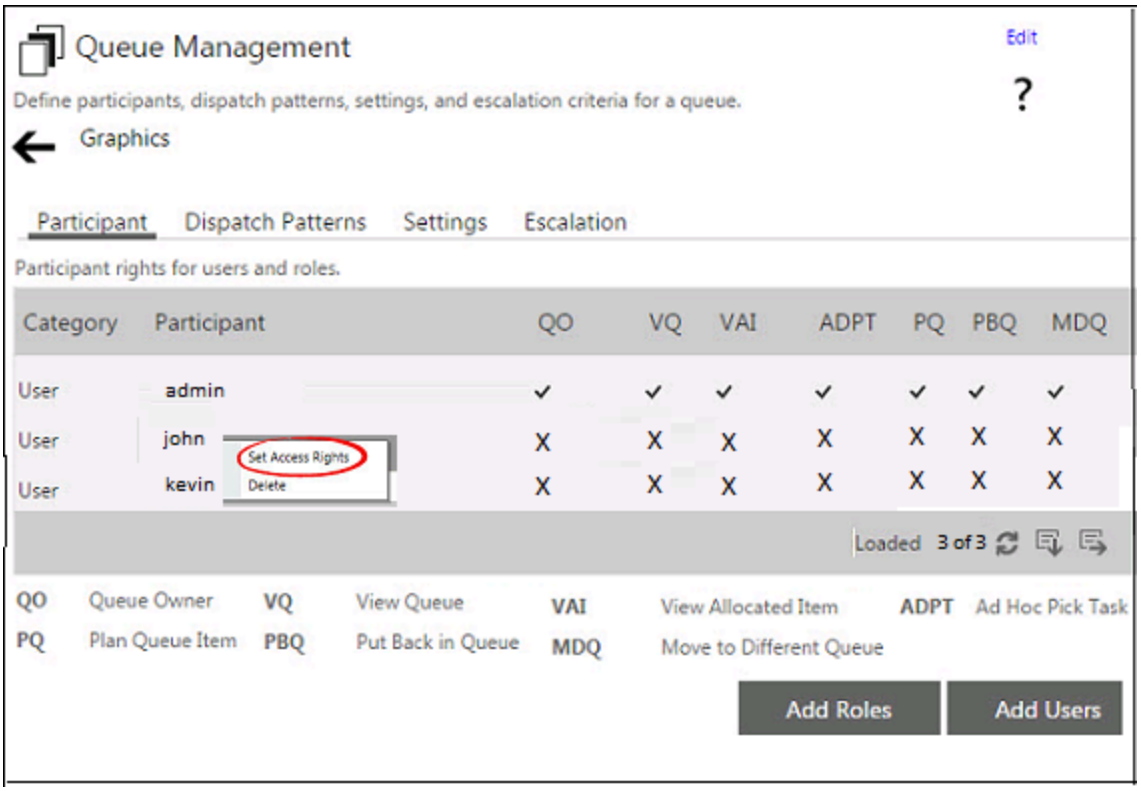


Note: The providers drop down will be available only if the repository has multiple providers.

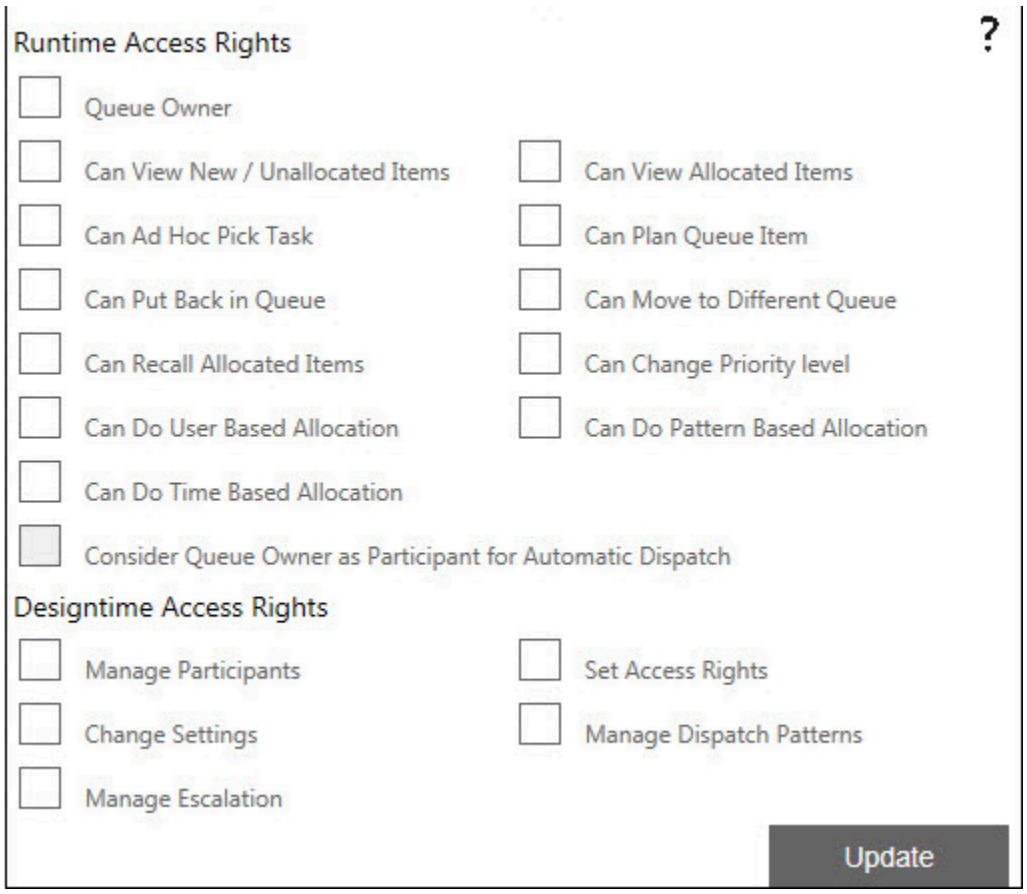
Setting Access Rights

You will need to set access rights for the various participants of a queue so that each person can perform only the permitted actions in the queue. You can right-click on any participant name or role name in the main Participants tab window, and then select **Set Access Rights** to open the Access Rights window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



After you select **Set Access Rights**, the **Runtime Access Rights** dialog box appears:



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

You can use the **Runtime Access Rights** window to set the access rights for the selected participants. You can set both Runtime and Design time Access Rights here.

Runtime Access Rights: The run-time access rights that can be set in this section allow administrators to set the access rights of participants during the execution of the queue.

- **Queue Owner** - You can set the participant as an owner of the queue.
- **Can View New/Unallocated Items** - Allow the participants to view new or unallocated items in the queue.
- **Can View Allocated Items** - You can allow the participant to view only the items that have been allocated.
- **Can Ad Hoc Pick Task** - You can allow the participant to pick up a task on an ad hoc basis
- **Can Plan Queue Item** - You can allow the participant plan to pick up a task
- **Can Put Back in Queue** - You can allow the participant to put back a task in the queue.
- **Can Move to Different Queue** - You can allow the participant to move the task to a different queue.
- **Can Recall Allocated Items** - You can allow the participant to recall a queue item that has been allocated.
- **Can Change Priority level** - You can allow the participant to change the priority level of the allocated queue item.
- **Can Do User Based Allocation** - You can allow the participant to allocate tasks based on users
- **Can Do Pattern Based Allocation** - You can allow the participant to allocate tasks based on patterns
- **Can Do Time Based Allocation** - You can allow the participant to allocate tasks based on time
- **Consider Queue Owner as Participant for Automatic Dispatch** - You can set the queue owner to be treated as a regular participant for the purpose of automatic dispatch.

Design time Access Rights: The design time access rights that can be set in this section allow administrators to set the access rights of participants during the configuration of the queue.

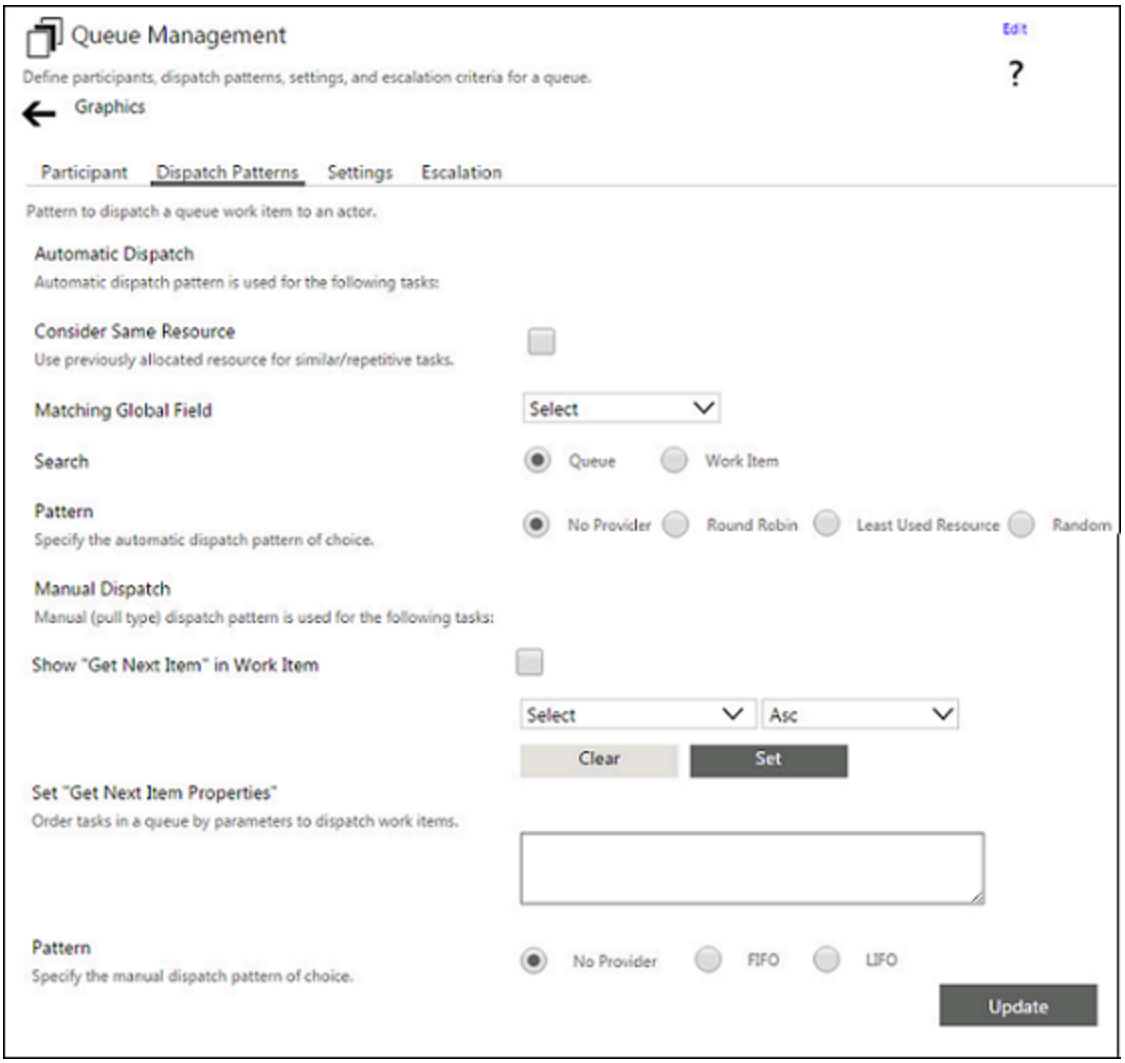
- **Manage Participants** - You can allow the participant to manage other participants
- **Set Access Rights** - You can allow the participant to set access rights for other participants.
- **Change Settings** - You can allow the participant to change the queue settings.
- **Manage Dispatch Patterns** - You can allow the participant to manage dispatch patterns.
- **Manage Escalation** - You can allow the participant to manage escalation.

Dispatch Patterns Tab

Click the **Dispatch Patterns** tab to open the dispatch patterns setting view of the Queue Management window. You can either configure automatic dispatch settings or manual dispatch settings here.

The following image shows the **Dispatch Patterns** tab of the **Queue Management** window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Automatic Dispatch

You can configure the following settings for automatic (or push type) dispatch of tasks:

- **Consider Same (Previous Allocated) Resource For Similar/Repetitive Tasks** - You can check this option to allocate a task, which is similar to a previously allocated task, to the same user to whom it was allocated in the first case. This can also be used to consider the same user for tasks that are repeated.
- You must specify the global field to be used to identify if a task is similar to an earlier one or is repeated by selecting from the **Matching Global Field** drop down.
- Specify the location to search for the matching task using the Search In radio buttons.
  - **Queue** - If you select this option, a matching task will be searched for in the queues.
  - **Work item** - If you select this option, a match will be searched for in the Work items list.
- Specify the automatic dispatch pattern next by selecting one of the following radio buttons in the **Specify Dispatch Pattern** option:
  - **No Provider** - This option specifies that no provider is available for dispatch. This option cannot be selected for both Automatic and Manual dispatch. The Dispatch Pattern has to be set for at least one

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

mode.

- **Least Used Resource** - This option ensures that the queue control identifies the participant who has the lowest work load to assign the task to.
- **Round Robin** - This option enables round robin task allocation where the participants will be allocated tasks by rotation.
- **Random** - This option sets the queue to allocate the tasks in a random fashion.

Manual Dispatch

You can configure the following settings for manual (or pull type) dispatch of tasks:

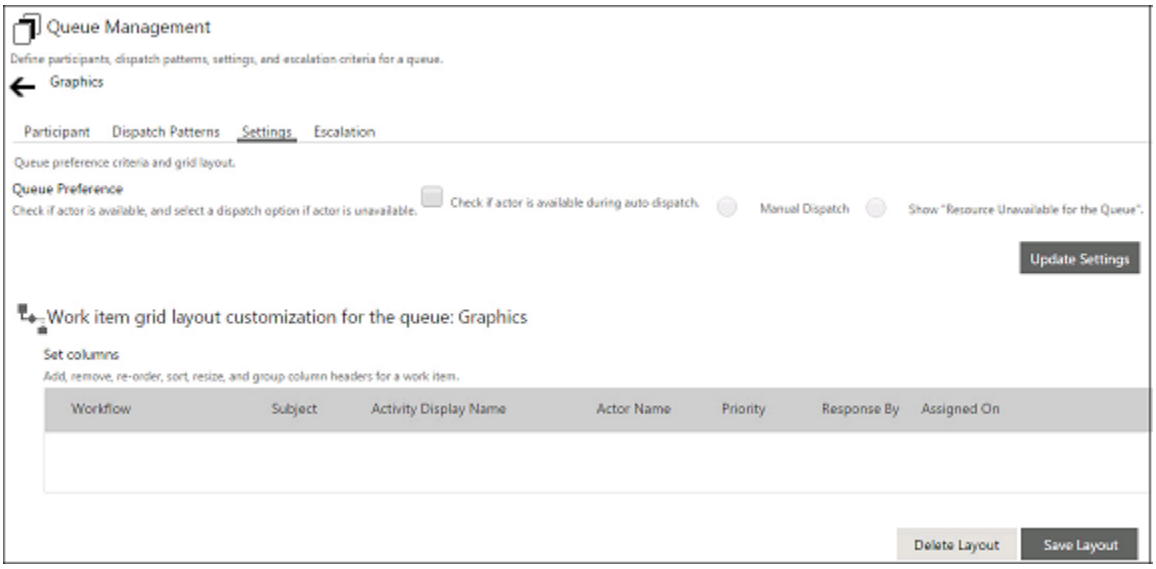
- **Show "Get Next Item" in Work item** - You can check this option to enable the display of the Get Next Item option in the Work items list. Participants can click this option after completing the allocated task to get the next task in the queue. You must set the following properties for the Get Next Item option:
- **Do OrderBy** - You must specify the order in which tasks in the queue must be sorted by selecting the parameters from the **Do OrderBy** drop-down and clicking Set. The parameters are separated by commas and can be applied in ascending or descending order by selecting **Asc** or **Desc** from the drop-down provided.
- Specify the manual dispatch pattern by selecting one of the following radio buttons in the Specify Dispatch Pattern option:
  - **No Provider** - This option cannot be selected for both Automatic and Manual dispatch. Dispatch pattern has to be set for at least one mode.
  - **LIFO** - This option sets the queue to allow users to access the tasks on a Last In First Out basis.
  - **FIFO** - This option sets the queue to allow users to access the tasks on a First In First Out basis.

After setting the Dispatch Patterns, click **Update Dispatch Patterns** to save the settings.

Settings Tab

Click the **Settings** tab to open the corresponding view of the Queue Management window.

The following image shows the **Settings** tab of the **Queue Management** window:



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

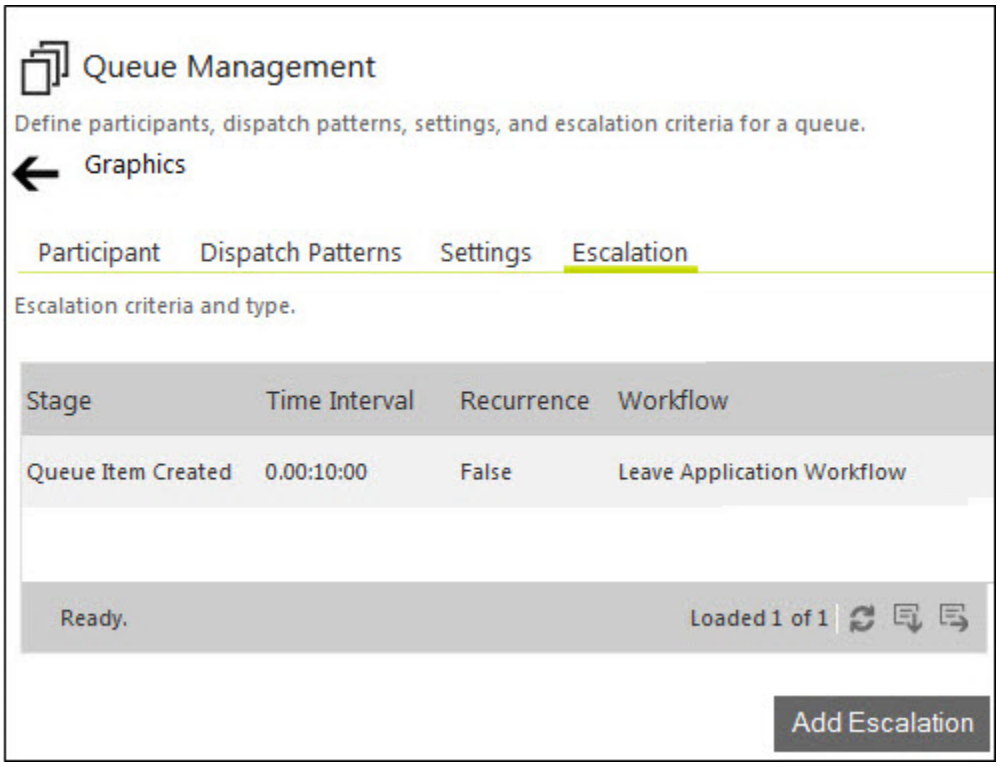
This view has the **Check if actor is available during auto dispatch**. You can select this check box to set the queue control to first check for the availability of actors before an auto dispatch of tasks is done. If you enable this option, you will need to select one of the two follow-on actions to be performed if the actor is unavailable. You can enable manual dispatch of the task by selecting the **Manual Dispatch** button. Alternatively, you can have the control generate the action output "Resource Unavailable For Queue" by selecting the second button **Show "Resource Unavailable for the Queue".** Click **Update Settings** to save the new settings.

The WorkList Customization for Queues section enables you to customize the view of work items displayed in the queue folder. For more information about worklist customization, see Define Layouts for Queues.

Escalation Tab

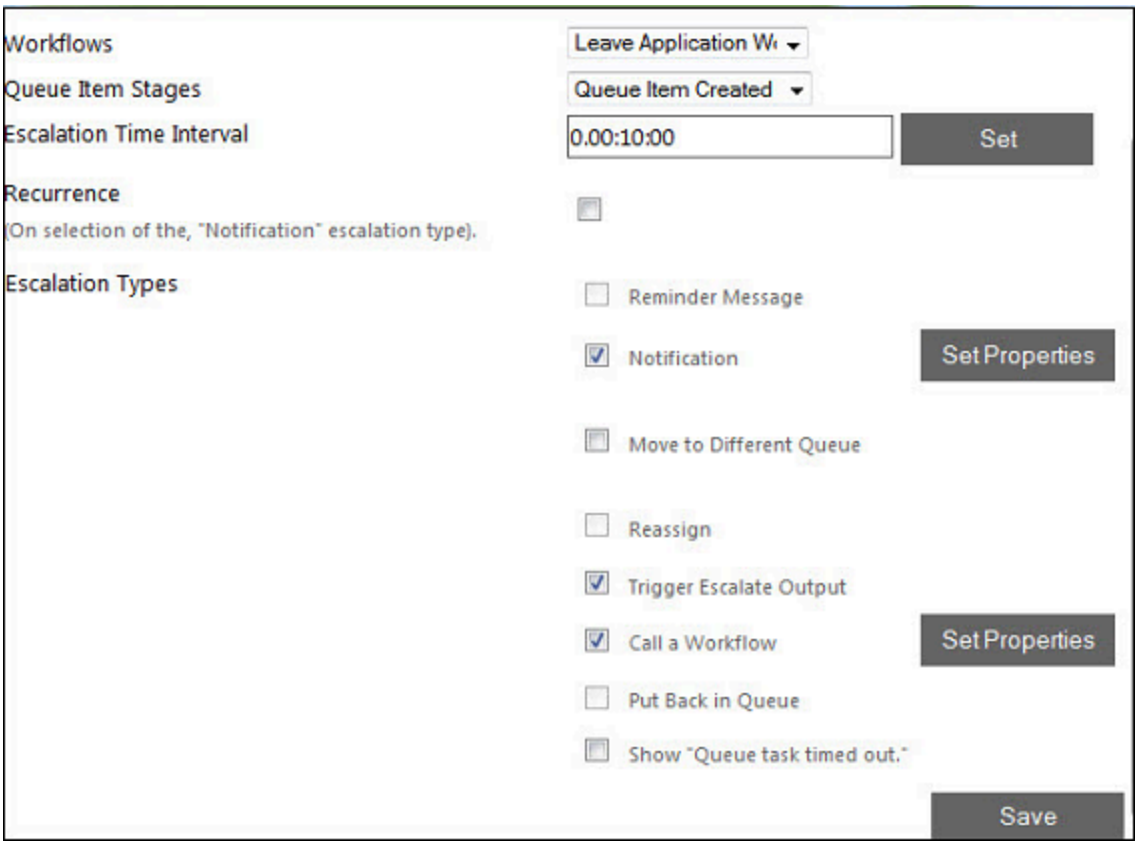
Click the **Escalation** tab to open the window for setting escalation properties.

The following image shows the **Escalation** tab of the **Queue Management** window:



This window displays escalations that have already been set in a grid. The details displayed include the escalation stage, time interval, whether the escalation should recur or not, and the escalation type. You can click on the **Add Escalation** button to add a new escalation. This will open the window shown below, where you can specify the escalation settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



You can specify the name of the Workflow corresponding to the queue. Next specify the stage in the queue at which the escalation should be triggered. You can select these two options from the respective drop down. Now, enter the Escalation Time Interval in the corresponding field. Select the Recurrence check box to set the escalation to recur.

After specifying the escalation settings, you need to specify and configure the escalation type using the controls under Escalation Types. The following check boxes corresponding to the different escalation types are available for selection:

- Reminder Message
- Notification
- Move To Different Queue
- Reassign
- Trigger Escalate Output
- Call a Workflow
- Put Back In Queue
- Trigger action output "TimeOut for Queue Task"

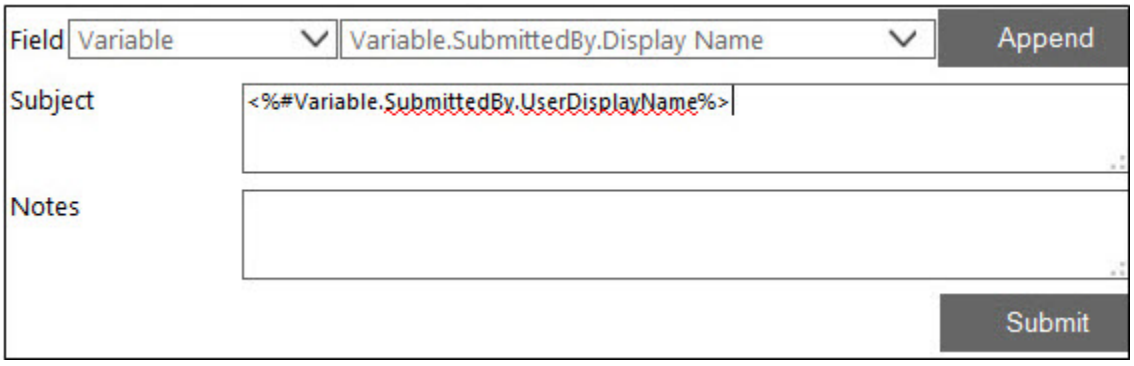
The options that can be accessed depend on the Queue stage selected earlier. For example, if the Queue stage selected is “Queue Item Created” then the options available are Notification, Move To Different Queue, Trigger Escalate Output, and Call a Workflow.

Reminder Message: To set the Reminder Message, click on the corresponding check box to select it and then click on the **Set Properties** button. This opens the window shown below.

Notification: To set the Notification escalation type, click on the corresponding check box to select it. Then click

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

on the **Set Properties** button to set the properties. This opens the following window:



Use Queue Control to Create and Manage Queues

You can add and define queue from the Queue Management page.

To add and manage a new queue

1. In the Enterprise Console, click menu icon, click **Settings**, and then click **Queue Management**. The **Queue Management** page appears.
2. Click **New Queue** to add a new queue.
3. In the **Name** box, type the unique name for the queue.
   Ensure that the **Queue Name** does not contain more than 250 characters, and does not contain the following special characters: [#~&+\"\'<>|@!$%*()=/{}?]\
4. In the **Description** box, specify the description for the queue.
   Ensure that the **Queue Description** does not contain more than 150 characters.
5. Click **Add**. The Queue is added and a new page appears that allows you to manage participants by adding the Users or Roles for the queue and setting their access rights. You can allow the users to view work items, pick up one, or pick the next available task without being able to view it, or put back a task in the queue.

You need to specify the Queue settings, set dispatch rules, and set escalations using the appropriate tabs in this window. For more information, refer to Configure Queue Management.

Add Participants to the Queue

You can add Users or Roles as participants in the queue. You can also set the priority for a role.

To add users to the queue

1. In the **Participants** tab, click **Add Users**. The **Add Users** page appears.
2. Click the **User Lookup** icon. The **User Lookup** page appears.
3. In the **Search for** box, specify the name or part of the name. A list of user(s) is displayed in the **Available Resources** box.
4. From the **Available Resources** list, select the required user name and then click the [>] icon to add the name to the **Selected Users** list.
5. Repeat the steps 3 and 4 to add more users.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Click **Update**.

To add roles to the queue

1. In the **Participants** tab, click **Add Roles**. The **Add Roles** page appears.
2. Click the **Role Lookup** icon. The **Role Lookup** page appears.
3. In the **Search** box, specify the role that you want to add. A list of role(s) is displayed in the **Available Roles** box.
4. From the **Available Roles** list, select the required role and then click the [>] icon to add the role to the **Selected Roles** list.
5. Repeat the steps 3 and 4 to add more roles.
6. Click **Update**.

Note: AVEVA Work Tasks requires a database setting to synchronize the users who are participants of a queue by virtue of their role, if the role changes in the resource database. For more information, *see* the *Synchronizing Roles of Queue Participants topic* in the *Developer Guide*.

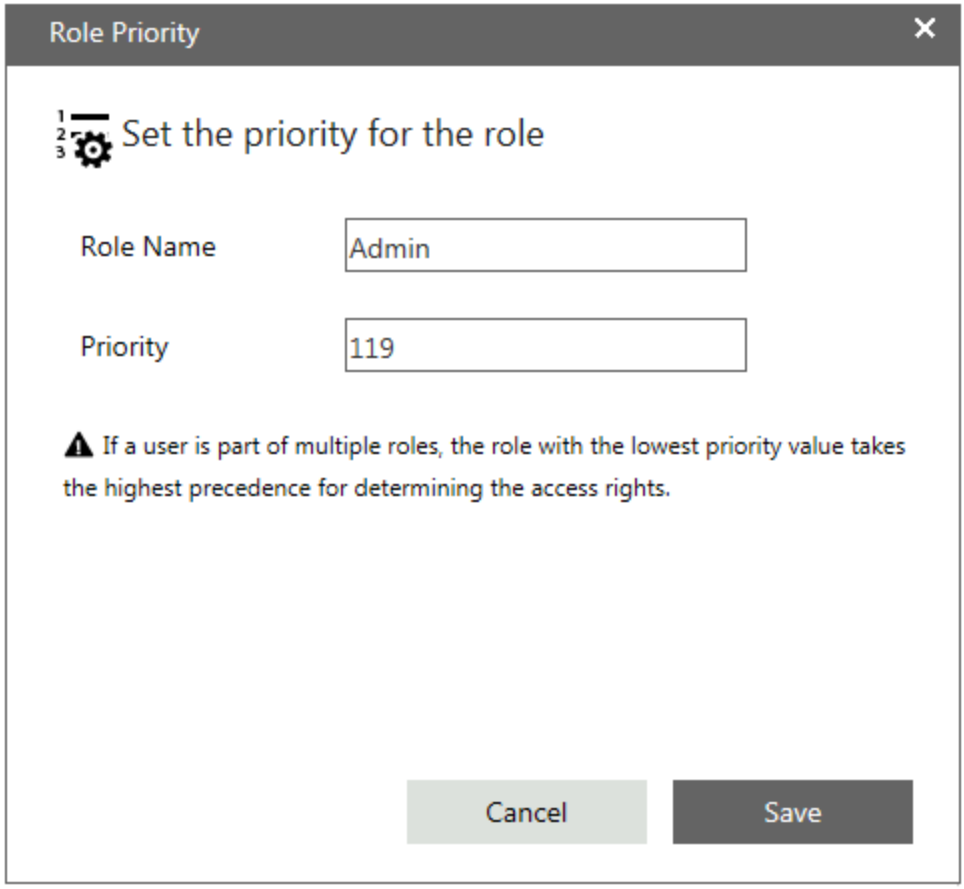
Tip: You can add all the users (or all the roles) at once by clicking the **[>>]** icon in the respective window.

To set the priority for roles

When you associate a user to a role, the user gets the access rights configured for the role. If the user is associated to multiple roles, you can define the priority for a role. The role priority determines which role takes precedence. The user gets the access rights of the role with the lowest priority value.

1. In the **Participants** tab, select the role for which you want to set the priority.
2. Right-click the role and select **Set Priority** from the context menu. The **Role Priority** dialog box appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



In the **Role Name** field, the name of the role for which you want to set the priority is displayed.

3. In the **Priority** field, type the value to indicate the priority of the role.

   You can specify the value from "1" to "9999". The default priority value for a role is "9999" and for a user is "0".

   Set the value to a lower number if you want the role to have a higher priority.

   Note:
   - It is recommended to specify the priority value in multiples of 10.
   - If a user is part of multiple roles, the role with the lowest priority value takes the highest precedence for determining the access rights.
   - If a user is added as a direct participant to the queue, then the access rights defined for the user take precedence, even if the user is associated to a different role.
   However, if the user is not added as a direct participant to the queue, the access rights for the user are based on the priority value of the roles.

4. Click **Save**. The priority is set for the role.

Configure Dispatch Patterns

You can configure the Dispatch Patterns for the queue from the Queue Management interface. You can set rules for both automatic Dispatch (push type) and manual Dispatch (pull type).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To specify the automatic dispatch pattern

1. Open the queue for which you want to specify the automatic dispatch pattern.

   The **Queue Management [Queue Name]** page appears.
2. Click the **Dispatch Patterns** tab.
3. In the **Automatic Dispatch** section, select the **Consider Same (Previous Allocated) Resource For Similar/ Repetitive Tasks** check box.

   This will assign the task that is a repetition or resembles an earlier task to the same resource who had handled the similar task earlier.
4. In the **Matching Global Field** list, select the global field.

   If you select the same resource, you will need to specify the global field that you want to use to identify if a task is similar to an earlier one or is repeated.
5. In the **Search In** option, specify whether the queue should search for a matching task by selecting one from **Queue** or from **Work item**.
   a. **Queue**: Click **Queue** if you want to search for the matching task in queues.
   b. **Work item**: Click if you want to search for the matching task in work items.**Work item**
6. In the **Specify Dispatch Pattern** option, click any of the following to assign tasks to the participants:
   a. **No Provider**: Click **No Provider** if you do not want any provider for automatic dispatch. If you select this, you must select a manual dispatch pattern other than No Provider.
   b. **Least Used Resource:** Click **Least Used Resource** if you want to assign the task to the participant with the lowest number of tasks assigned from the queue.
   c. **Random:** Click **Random** if you want to assign the task in a random order.
   d. **Round Robin**: Select **Round Robin** if you want to assign the task on a round robin basis to each participant.

To specify the manual dispatch pattern

1. Open the queue for which you want to specify the manual dispatch pattern.

   The **Queue Management [Queue Name]** page appears.
2. Click the **Dispatch Patterns** tab.
3. In the **Manual Dispatch** section, select the **Show Get Next Item in Work Item** check box.

   This option allows you to display the **Get Next Item** button and drop-down in the Work items list of participants. The participants can use this button to get the next item in the queue if the corresponding access rights have been set for them.
4. In the **Set "Get Next Item Properties"** option, select the item and specify the order in which tasks in the queue must be sorted by selecting from the **Do OrderBy** list.
5. Click **Set**.
6. In the **Specify Dispatch Pattern** option, click any of the following to assign tasks to the participants:
   a. **No Provider:** Click **No Provider** if you do not want any provider for manual dispatch. You can select this only when you have not specified the automatic dispatch pattern as **No Provider**.
   b. **LIFO:** Click **LIFO** if you want to assign the task to the participant on a Last In First Out basis.
   c. **FIFO**: Click **FIFO** if you want to assign the task to the participant on a First In First Out basis.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. After configuring the dispatch patterns, click **Update Dispatch Patterns** to save the automatic and manual dispatch patterns.

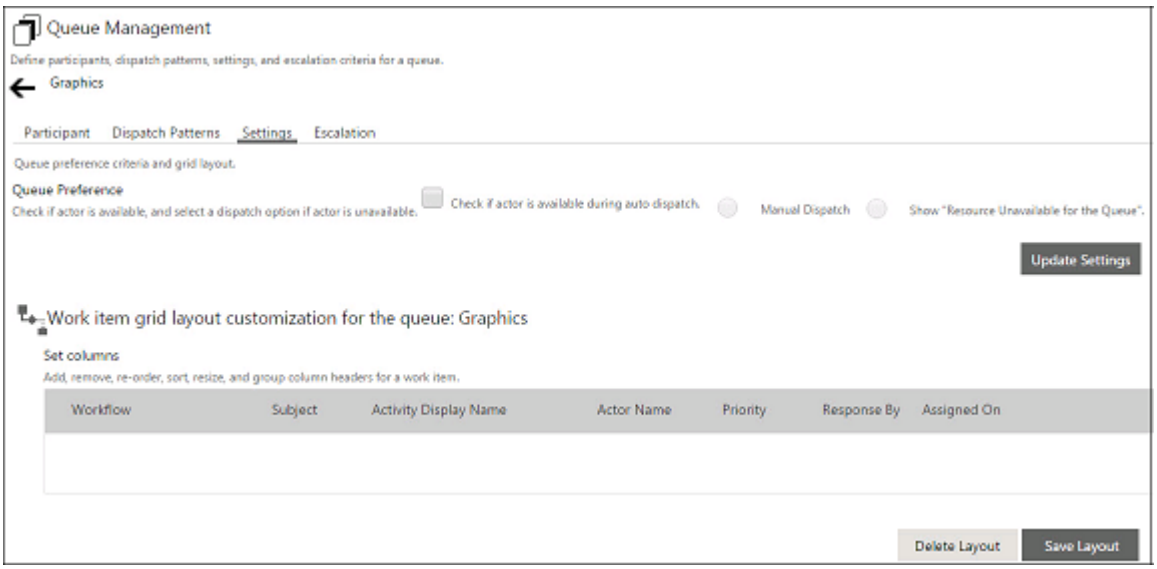
Set the Queue Preference

You can set the queue preference criteria and customize the grid layout for the queue work items.

To set the queue preference

1. Open the queue for which you want to specify the automatic dispatch pattern.

   The Q**ueue Management [Queue Name]** page appears.



2. Click the **Settings** tab.
3. In the **Queue Preference** section, select the **Check actor availability during auto dispatch** i**n case actor could not be identified** check box.

   You can select this check box to set the queue control to first check for the availability of actors before an auto dispatch of tasks is done. If you select this option, you must select any of the following follow-on actions to be performed if the is unavailable.

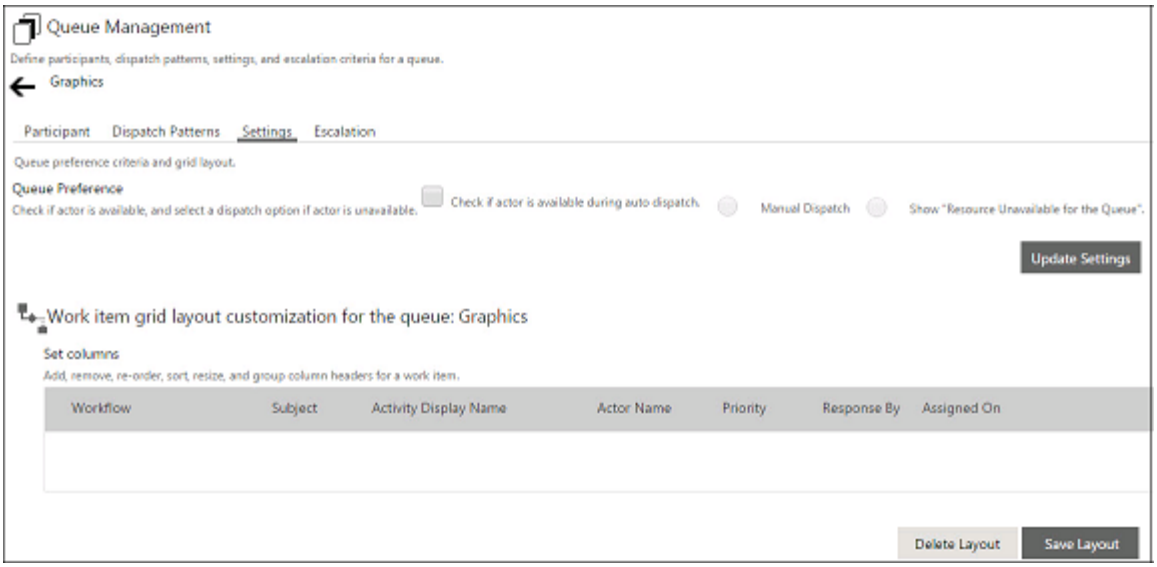
   a. Do a **Manual Dispatch**: Click **Do a Manual Dispatch** if you want to do manual dispatch of the task
   b. **Fire action output "Resource Unavailable For Queue":** Click **Work item** if you want the control to generate the action output "Resource Unavailable For Queue".
4. Click the **Update Settings**.

To customize work item for the queue

1. Open the queue for which you want to specify the automatic dispatch pattern.

   The **Queue Management [Queue Name]** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



2. Click the **Settings** tab.
3. The WorkList Customization for Queues section enables you to customize the view of work items displayed in the queue folder.

   For more information on worklist customization, see Define Layouts for Queues.

Set Escalations for Queues

You can set the Escalation for the queue from the **Escalation** tab of the queue management interface.

To set the escalation

1. In the **Escalation** tab, click **Add** to open the Escalation settings window.
2. In this window, specify the name of the workflow corresponding to the queue. Select the required workflow from the list for the **Workflows** field.
3. Next, specify the stage in the queue at which the escalation should be triggered. Select this from the **Queue Items Stages** list. Choose either **Queue Item Created** or **Queue Item Picked**.
4. Enter the **Escalation Time Interval** in the corresponding field.
5. Select the **Recurrence** check box to set the escalation to recur.
6. Select the required escalation type check box, under the **Escalation Type** section.
   a. If you select **Reminder Message**, it will generate a reminder message to be sent to the participant assigned a task from the queue
   b. If you select **Notification**, it will send a notification to the participant that the assigned task has not been acted upon
   c. If you select **Move To Different Queue**, it will move the task that has not been acted on to a different queue
   d. If you select **Reassign**, it will reassign the task that has not been acted on to a different participant
   e. If you select **Trigger Escalate Output**, it will trigger the "Escalate" output for the task that has not been acted on
   f. If you select **Call a Workflow**, it will execute the specified Workflow when the task has to be escalated

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

g. If you select **Put Back In Queue**, it will put the task that is not acted on back in the queue.

The following steps provide information to set the different Escalation Types.

Setting Reminder Message or Notification Properties

1. Select the **Reminder Message** or **Notification** escalation type check box.
   The **Set Properties** button appears next to it.
2. Click **Set Properties**.
   The **Escalation Properties** window appears.
3. Specify the subject of the Reminder Message or Notification either by entering a discrete value in the **Subject** box or by selecting an option from the **Field** list and then click **Append**.
4. Specify the message of the Reminder Message or Notification in the **Notes** box.
5. Click **Submit** to save the Reminder Message or Notification.

Setting Reassign properties

1. Select the **Reassign** check box.
   The **Set Properties** button appears next to it.
2. Click **Set Properties**.
   The **Escalation Properties** window appears.
3. Select the participant to whom you want to reassign the task.
4. Click **Submit.**

To set Call a Workflow properties

1. Select the **Call a Workflow** check box.
   The **Set Properties** button appears next to it.
2. Click **Set Properties**.
   The **Escalation Properties** window appears.
3. Specify the following:
   a. In the **Application Name** box, type the application name.
   b. In the **Workflow Name** box, specify the workflow name.
   c. In the **Version** box, specify the version details.
4. Specify the contents to be passed to the called Workflow by selecting the value type (variable, content, or value) from the first list for **Field** and selecting the corresponding variable or content collection from the second drop-down list.
5. Click **Append** to add the selection to the **Contents** text area.
6. Click **Submit**.

Use Queues in Workflows

In the Activity Properties pane of all activities, which require human intervention, there is an option called Assign

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Queue(s). You can use this property to specify a queue to which the corresponding work item will be assigned.

To assign a queue for an activity

1. In the **Process Designer for Workflow**, right-click the resource activity, and then select **Activity Properties**.
2. In the **Activity Properties** pane, click the button for the **Assign Queue(s)** property.
3. In the window that opens, select the queue(s) from the Available Queues list box.

   You can select multiple queues by selecting with the <Ctrl> key pressed.
4. After selecting the required queue(s) click the [>] button to move it to the Selected Queues list box. You can click the **[>>]** button to select all the queue(s) and move them to the **Selected Queues** list box.
5. You can remove any queue from the selected list. Selecting the queue and then click the **[<]** button. You can remove all the queues by clicking the **[<<]** button.
6. After adding the required queue(s), click the **Assign** button to assign the activity to the selection.
7. Click the **Close** button to close the window without saving the selection.

Difference between direct task assignment and task assignment through queue:

A task can get assigned to multiple resources directly whereas only one resource will get the task from a queue.

Access Queues in the Work Items List

The work items corresponding to activities assigned to queues will be delivered in the Work items list of all the actors who are participants in the respective queues. The Work items list will show separate folders for each queue that the logged in user belongs to. The tasks assigned directly to the user are listed for view in the Inbox.

To access work items assigned to the queues

1. For each queue, you can open a list of all tasks available for selection by clicking on the corresponding folder, provided you have the rights to view and select tasks. The task selected from the queue will be added to the Inbox.
2. If you have the rights to pick tasks from queues, you can select the queue from the drop-down list at the top and click on the **Next Item** button to retrieve the next available task from the queue. This task will get listed in the Inbox. The task is assigned on the basis of the dispatch provider algorithm selected during configuration. AVEVA Work Tasks has two dispatch providers, First-In-First-Out (FIFO) and Last-In-First-Out (LIFO). Users can create their own dispatch providers and configure them for use. The Next Item button is displayed even for participants who have been assigned no access rights.

Database Connections

This section provides information on how to create a database connection within AVEVA Work Tasks.

Create a Database Connection

You can create a new database connection to connect to either a repository datasource or an external datasource.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To create a Database Connection for a repository datasource

1. Log on to the Enterprise Console.
2. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Database Connections**.
   The Connection List page appears.
3. Click **New**.
   The **New Connection** dialog box appears.
4. In the **Title** box, type the name of the database connection.
5. In the **Description** box, type any additional details for the database connection.
6. Select the **Connect to repository datasource** check box to connect to the current repository database.
   A database connection for the repository datasource is successfully created and is displayed in Connection List page.

To create a Database Connection to external datasource

1. Log on to the Enterprise Console.
2. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Database Connections**.
   The Connection List page appears.
3. Click **New**.
   The **New Connection** dialog box appears.
4. In the **Title** box, type the name of the database connection.
5. In the **Description** box, type any additional details for the database connection.
6. Clear the **Connect to repository datasource** check box to connect to an external database.
7. Perform the steps mentioned in the following tables.

Field	Description
Database type	Select SQL Server or Oracle. If the database type is Oracle, ensure to install Oracle Client on your machine.
Connection type	Select either Connection string or Connection provider.

If Connection type is Connection string

Field	Description
Server name	Perform one of the following: • Enter the name of the datasource server. • Click the **Refresh** icon to get a list of the available datasource servers and then select the required

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
	server. If the database type is Oracle, ensure that you enter the Oracle Service name, which is used to connect to the Oracle database server.
Authentication type	Provide information on the process used to validate a user. Both Windows, and Microsoft SQL Server authentication process is supported. • For Microsoft SQL Server, the authentication type can be either Microsoft SQL Server or Windows.
User Id	Enter the Microsoft SQL Server user ID for Microsoft SQL Server type of authentication. For Windows Authentication, **User Id** is disabled.
Password	Enter the Microsoft SQL Server password for Microsoft SQL Server type of authentication. For Windows Authentication, **Password** is disabled.
Advanced settings	(Optional). You can enter any additional connection information, such as connection timeout. For example, Connection Timeout = 20 While creating a data source for a repository, use the following custom settings to set properties for connection pool: `encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;` where, • **encrypt**:Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption. • **enableltm**: Internally light weight transaction mode is implemented by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
	connection is used within the transaction, the transaction distribution is reduced to a great extent. With this feature the transaction is controlled from being escalated to a distributed transaction which is very expensive. The above property can be used to turn off this feature. The default value is set as *True*. • **connectionretrywaittime**: While opening a new connection, if the database server is not available, the default behavior is to retry the connection. This setting can be used to set the wait time to retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds. • **maxconnectionretries**: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite. • **sqlcommandtimeout:** Sets the wait time before terminating the attempt to execute an SQL command and generating an error. The default value is set as 300. **Note:** These settings are case sensitive and should be mentioned only in lower case.
Database	Perform one of the following: • Enter the name of the database. • Click the **Refresh** icon to get a list of the available databases and then select the required database.

If Connection Type is Connection Provider

Field	Description
Assembly path	Enter the path of the connection dll. In a client-server environment, the dll must be present on the machine that hosts the Enterprise Console site. All requests of install and uninstall are sent to the host site.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Work Items List

The Work items list provides enhanced usability features. Workflow actors can view and respond to work items assigned in a user-interface that is similar to Microsoft Office Outlook. Work items are delivered to the actor's Inbox with a detailed view available on selection of the item. The name of the logged-in user is displayed at the top right corner of the window.

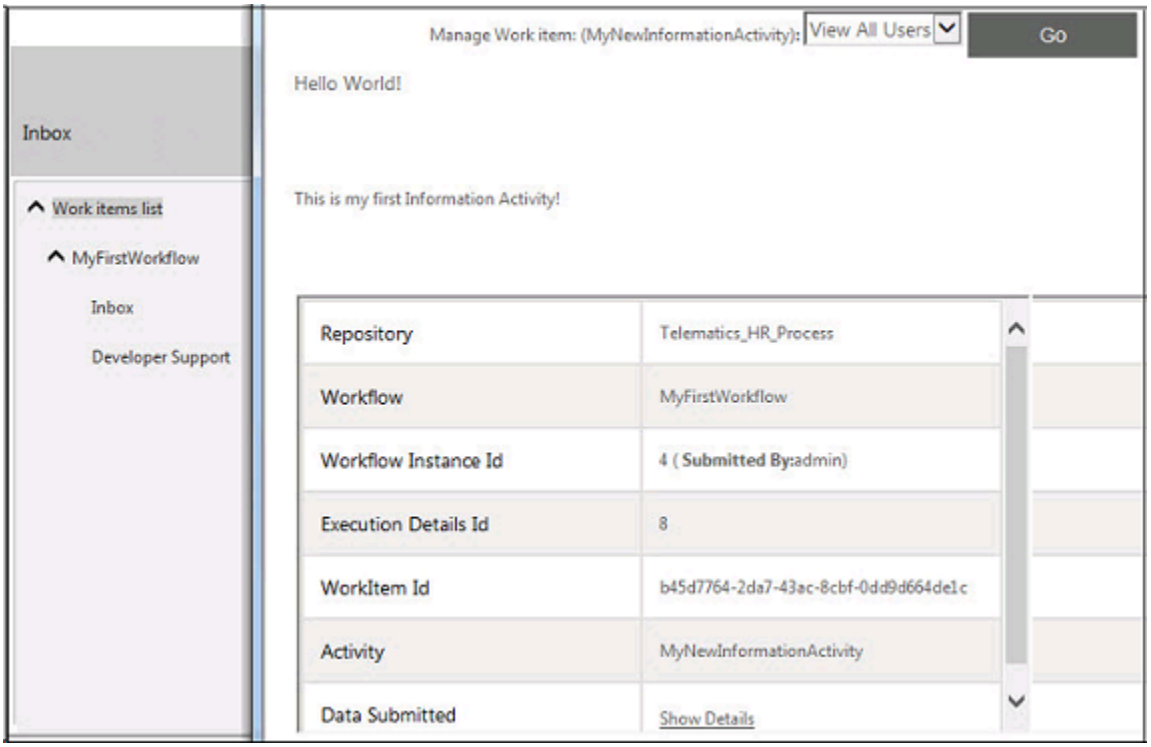
The detail view of the Work items list has the following user interface elements:

- Worklist Folders
- Work items list
- Work item details
- Toolbar

The Work items list also provides properties that enable customization and configuration of elements of the user interface. For details on customizing the view, see Customizing Work Items List Views.

The Work items list allows participants in queues to manage items in their queues. A separate Manager View forms a part of the Work items list. It allows actors who are also managers to administer activities assigned to their team members.

Work items list - Detail View



Note: When you click a work item to edit, the editor appears in a modal window. You have to close the modal window to access the parent window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

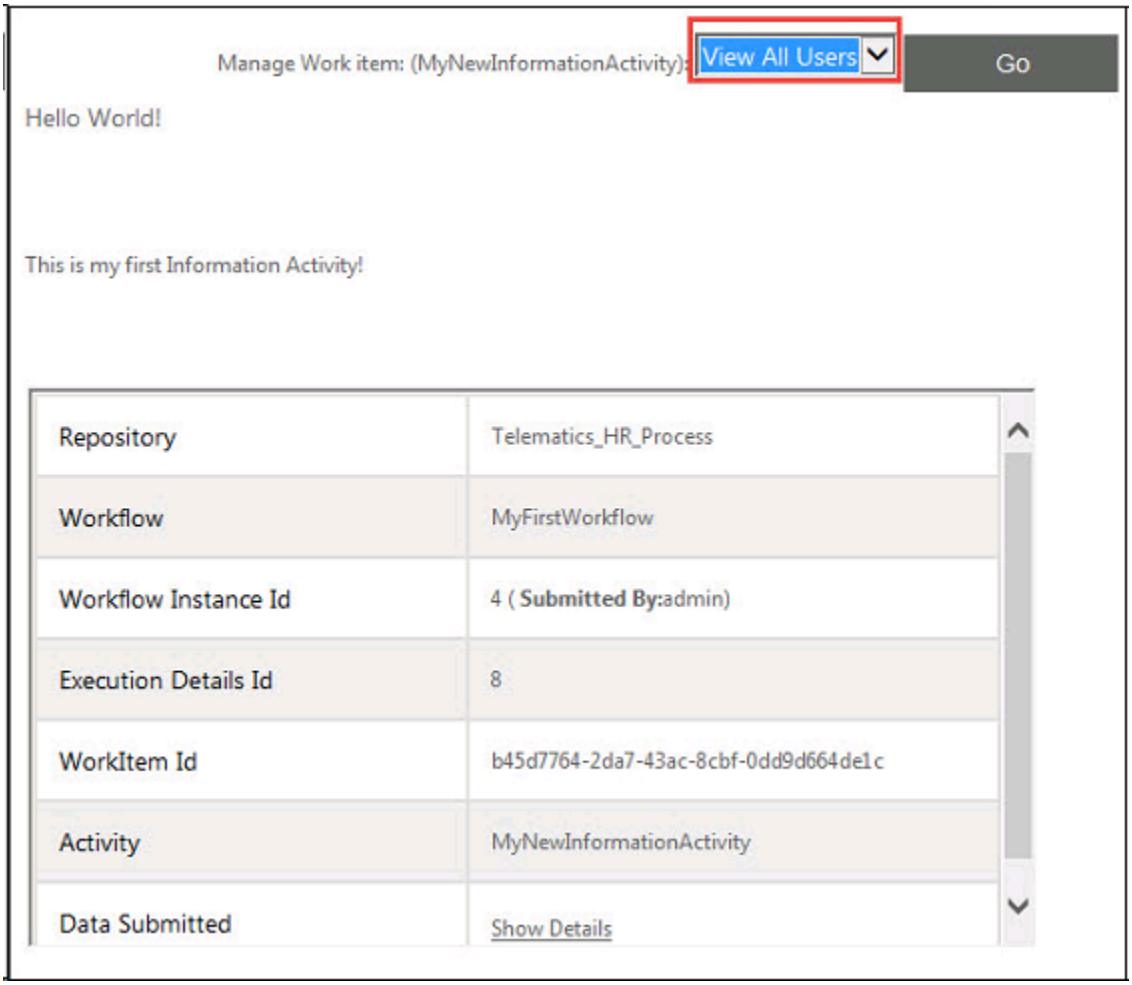
Manage Work Item - View All Users

The **View All Users** screen from the Work items list captures the comments given by all users and also groups them under Action Taken categories.

Consider a leave approval scenario where the approval task is assigned to three users, namely John, Ben, and Ken.

Suppose that the approval task has been acted upon by John, Ben has taken ownership of the work item, and Ken's status is awaiting.

After Ben takes ownership of the work item, the **View All Users** option in the **Manage Work item** drop-down is seen.



Work Items List User Interface Elements

The Work items list provides enhanced usability features. Workflow actors can view and respond to work items assigned in a user-interface that is similar to Microsoft Outlook. Work items are delivered to the actor's Inbox with a detailed view available on selection of the item. The name of the logged-in user is displayed at the top right corner of the window.

The detail view of the Work items list has the following user interface elements:

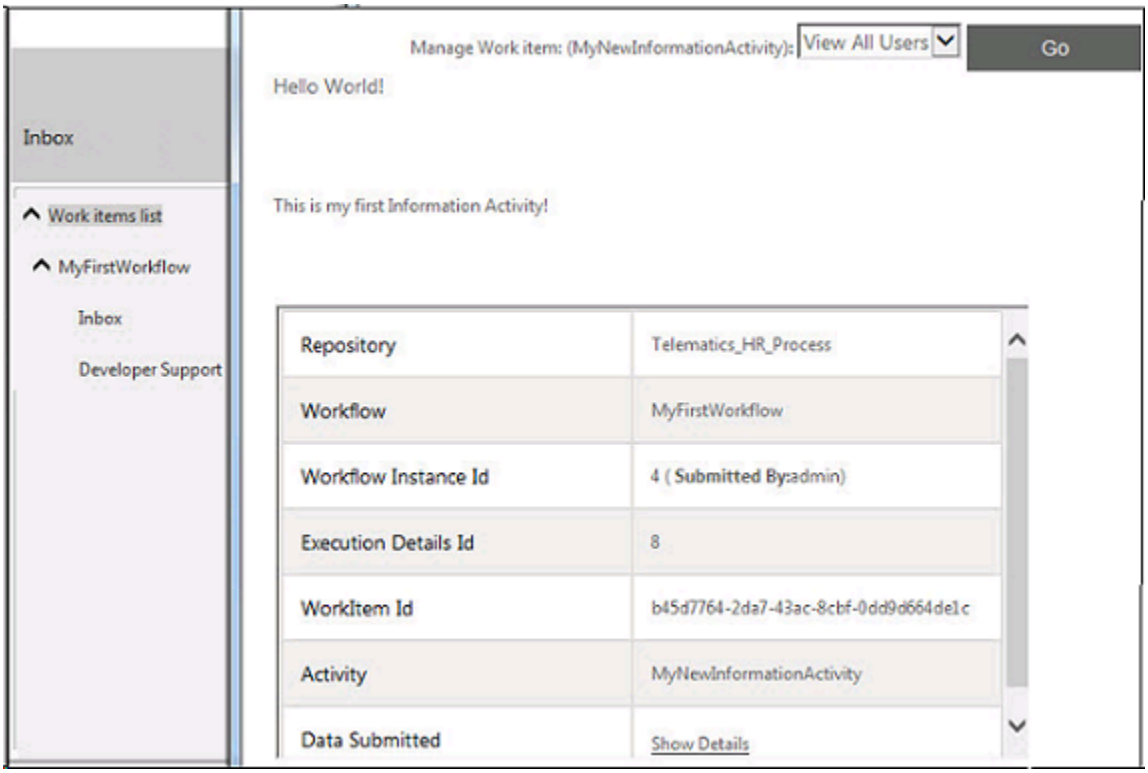
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Work Items List Folders
- Work Items List View
- Work Item Details
- Work Items List Toolbar

The Work items list also provides properties that enable customization and configuration of elements of the user interface. For details on customizing the view, see Customize Work Items List.

The Work items list allows participants in queues to manage items in their queues. A separate Work Items List Manager View forms a part of the Work items list. It allows actors who are also managers to administer activities assigned to their team members.

Work items list - Detail View



Note: When you click a work item to edit, the editor appears in a modal window. You have to close the modal window to access the parent window.

Work Items List Folders

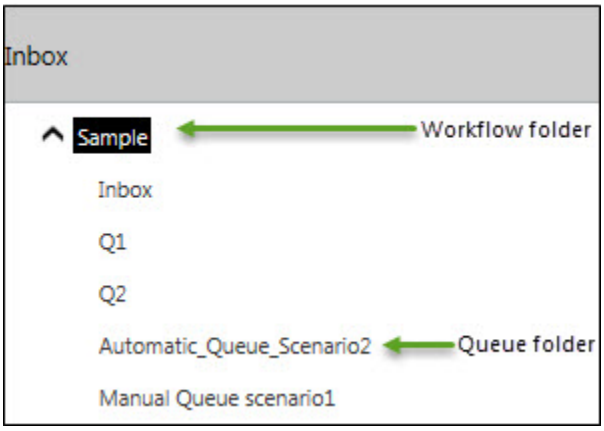
The worklist folders list all folders that contain work items. The **Work items list** folder is the top-level folder. In the default view, the Work items list folder contains sub-folders for each workflow from which tasks have been assigned.

The workflow folder has an **Inbox** folder and a folder for each queue in the workflow that the actor is a participant of.

The default layout of items in the Inbox can be customized and saved as a personalized folder. All items in the Inbox will also be available in the personalized folder with the specified layout. See Customizing Inbox View for

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

more information.



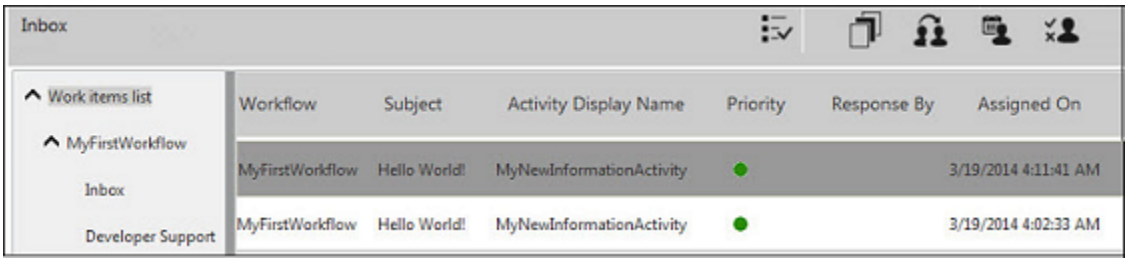
Work Items List View

The Inbox lists all open work items assigned to the user that awaiting action or response. The columns displayed in the default view are:

- Workflow
- Subject
- Activity Display Name
- Priority
- Response By
- Assigned On
- Approver1

The **Subject** column lists work items in bold type. When the user takes ownership of the item, its display changes from bold to normal. Double-clicking on an item displays its details in Work Item Details.

Default columns in the Work items list



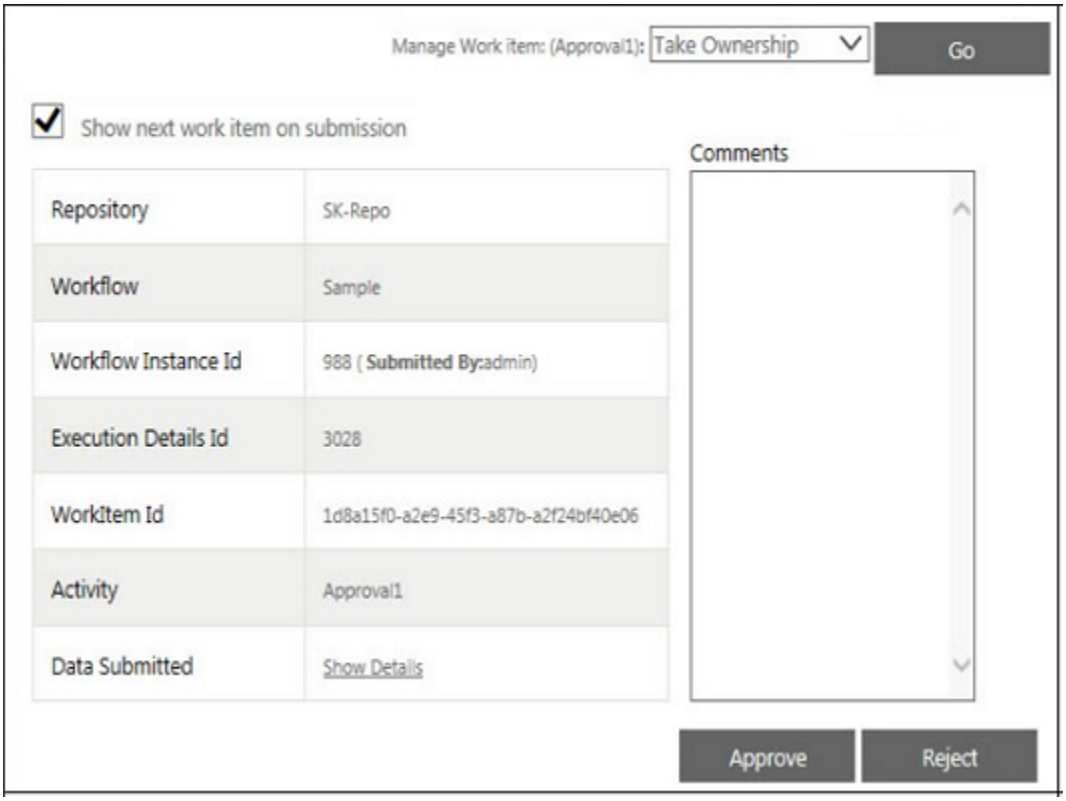
See also: Customize Work Items List Views

Work Item Details

The following image shows the Work Item Details for a selected work item in a Work items list. You can view and respond to work items using the **Work Item Detail View** modal window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Work Item Details



The **Work Item Detail View** dialog box displays the following items:

Manage Work Item: The Manage Work item drop-down has options to handle the work item. Select Take Ownership to take ownership of the item. Alternatively, you can select the **Hold** option to put it on hold. Click **Go** to submit the response. By setting the **AllowAutoownershipOnRowClick** property, you can allow users to take ownership on selection of the work item. See Preferences for Work Item Management for more information.

After you take ownership of a work item, you can have the option to view all user responses through the **View All Users option**. The Work items list property of **Hide Response** should be set as **No** to view all users responses. See *Manage Work Item - View All Users* for more information.

Custom Document View: The Custom Document View is at the left of the detailed view. It displays information on Execution Details.

Work Item Action Controls: The Work Item action controls are located at the right of the detailed view. The controls and the content depend on the activity type. The figure given below displays controls for the Approval work item with a field for comments. The controls and information displayed for an activity also depend on the properties of the activity as set in the process. For example, if the property Hide Responses for a group approval activity is set to False, users will also be presented with a link to view comments from other approvers.

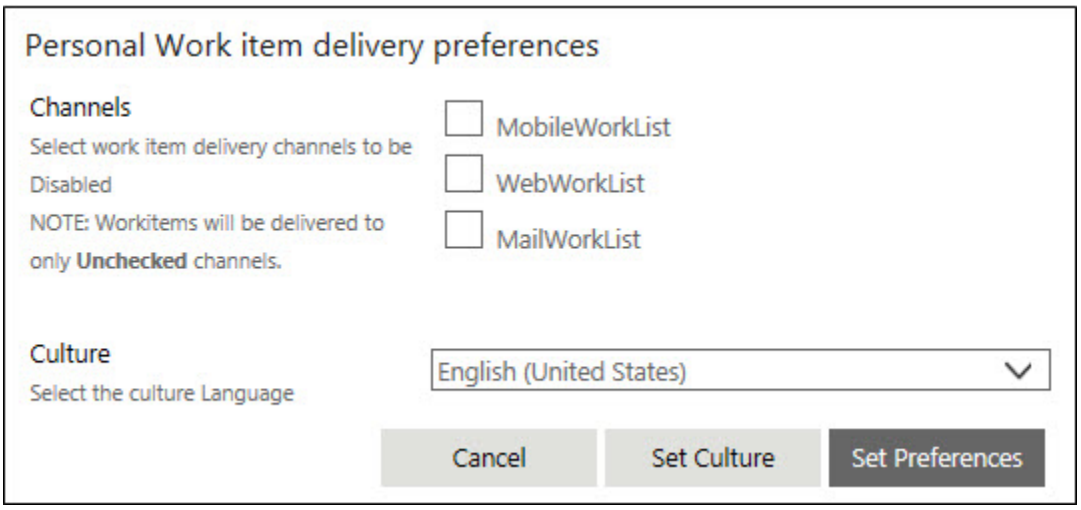
Work Items List Toolbar

The Work items list toolbar has options that enable users to manage how work items are delivered, when they are delivered and to assign alternate actors in their absence. An additional option for queue enables queue owners to access the settings to their queues.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

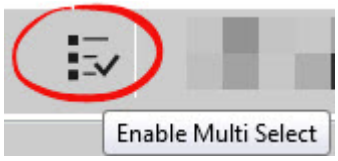
- **Show Queue:** This option opens the appropriate Queue Control window for the folder from which it is accessed. To open the main Configure Queue Management window with the list of all queues, select Inbox and click the Show queue icon. To open the Participants Tab window for a queue, select the queue folder and click the icon.
- **Show alternate actor:** This option opens the **Alternate Actors** setting window, which can also be accessed from the Process Designer. See Alternate Actors for more details.
- **Show resource calendar:** This option opens the **Resource Calendar** window for the active resource. You can set the resource calendar preferences here. See Resource Calendar for more details.
- **Set preferences:** This option allows actors to set preferences for the delivery of work items. It opens the Personal Work item delivery preferences window, where you can disable the delivery channels that you do not wish to receive the work items on.
- To disable a channel, select the check box corresponding to it. For example, if you are traveling and may not have access to the web, select the **WebWorkList** option to stop work items from being delivered in the Work items list. Click **Set Preferences** to save.

This option also allows users to specify the language settings for the user interface. In **Select the culture language**, select the language. Click **Set Culture** to set the language preference.



Note: The **Culture** drop-down displays a list of languages. However, for the preference to take effect, the language strings for the corresponding language must be available in AVEVA Work Tasks folders. AVEVA Work Tasks does not provide default support for all languages in the drop-down.

Enable Multi Select - The Enable Multi Select button provides users with options of acting on items as a batch. An additional option is made available when the items are grouped.



The Multi Select option is not supported for **Resource Set** activity and **Information** activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Work Items List Manager View

The **Manager View** folder displays a list of all work items of all users reporting to the logged in user. This view enables managers to quickly access the status of the work items assigned to reporters. Work item details are not displayed in this view.

Manager View Options

The following options are available from the right-click menu for an item:

- **Reassign Work Item** - Enables work items to be reassigned to a different user. Reassigning the work item will remove it from the current user's work item list and transfer the item to the user to whom it has been reassigned.
  Once the work item is reassigned to a different user, the pop-up window will be closed automatically and the user will not be able to act upon the work item by reopening it.
- **Delegate Work Item** - Enables work items to be delegated to a different actor. When a work item is delegated, it continues to appear in the list of the original user.

Queue Multi-Select and Reassign Queue Work Items

Queue Multi Select

The queue multi-select feature allows you to select multiple queue items. You can pick the queue items from the work item Inbox and assign them to actors. You can plan the queue items so that they are scheduled for the time specified and assigned to actors once the time elapses. You can also recall already allocated items so that they get back to the respective queues.

Showing the multi select capability for the Queue item tasks in Work items list control is controlled by the Work item list Control Property - **EnableMultiSelectByDefaultForQueue**. Based on this property, the set user can control the visibility of the multi-select check boxes for the queue view.

If the property **EnableMultiSelectByDefaultForQueue** is set to False for the Work items list control, then the queue multi-select option is controlled by the **DisplayGroupUI** property of the Work items list control. On click of the **Enable Multi Select** icon, check boxes will be enabled for selecting multiple queue items.

The following image shows the Queue multi-select option in Work items list control:

Note: The options for performing queue operations are displayed in the **Inbox,** based on the runtime access rights defined for a role in Queue Management. For more information about setting role priority, see Set Role Priority.

Reassigning Queue Work Items

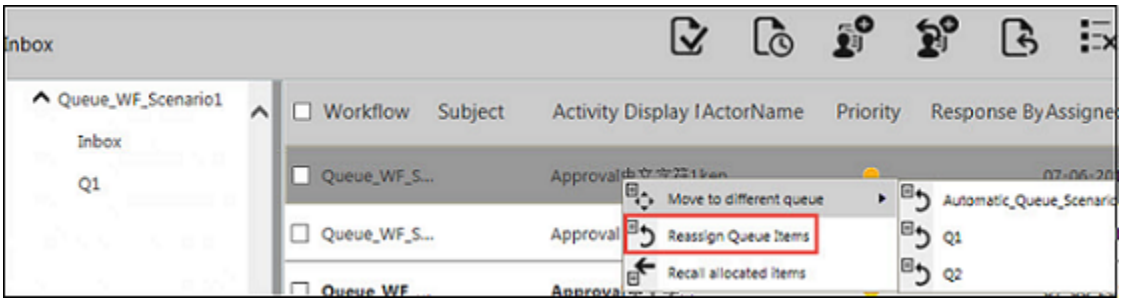
This option enables you to reassign queue work items through the context menu. Also, the scenario of reassigning multiple queue work items is achieved by clicking Reassign Queue Items in the multi-select mode.

Reassigning of queue work items functionality is achieved through the context menu of the queue work items

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

list.

The following image shows reassigning queue work items:



Multiple reassigning of queue work items is achieved by clicking the **Reassign Queue Item** button with the multi select mode enabled.

Access Queue Items

The work items list shows a separate folder for every queue that the user is a participant in. When a work item from the queue is assigned to the actor, it is moved to the Inbox. The folder displays all items that are assigned to the queue. However, the display of all queue items is subject to the rights assigned to the user for the queue.

When the queue is configured for manual dispatch and the actor has access rights to pick the next item from the queue, the actor can view the **Next Item** button at the top of the Work items list along with the corresponding drop down. After completing the current assigned task, the actor can select the queue from the drop down and click on the button to pick the next item for action.

For more information about setting rights for queue participants, see Participants Tab.

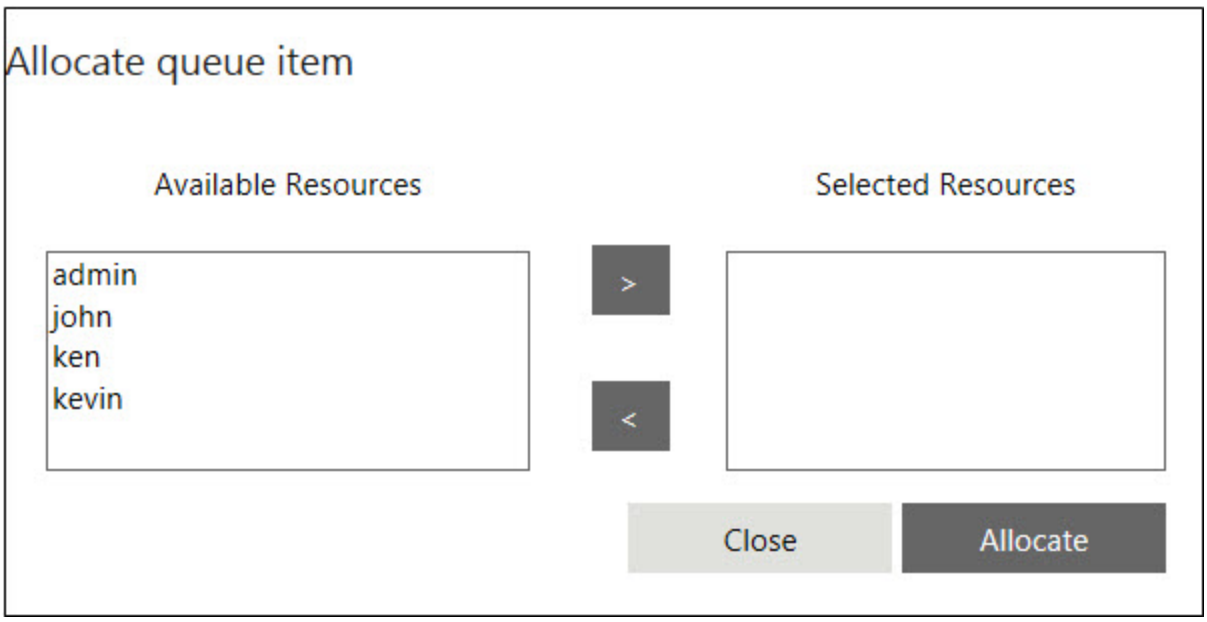
Queue Item Options

Depending on the queue configuration and the participants, the context-sensitive menu for the queue item lists the following options:

Allocate queue item

Allocates the item to a participant. This option brings up the **Allocate Queue Item** window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



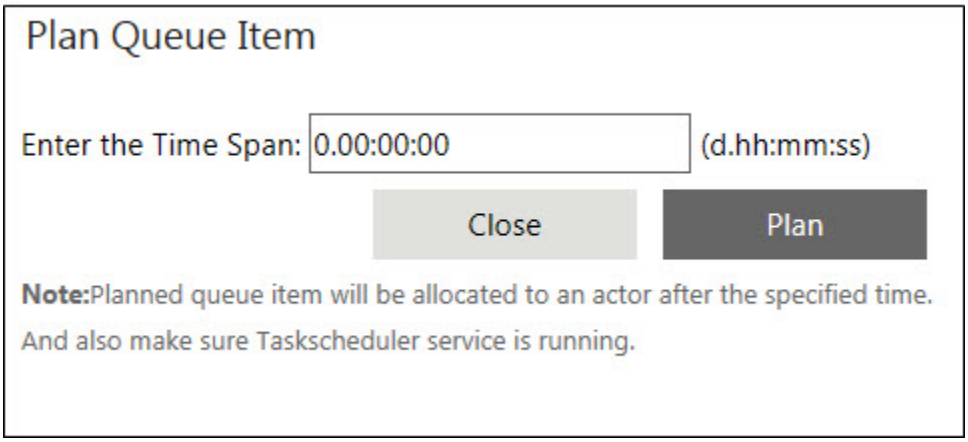
Move to different queue

Moves the item to a different queue. This option will drop another menu with a list of available queues.

Set Priority: Set the priority of the queue item by selecting the required priority level (High, Medium, or Low) from the secondary menu.

Pick: Allows selection of the participant who will act on the queue item. The actor is picked based on the dispatch pattern that has been set.

Plan: Allows users to plan to get the queue item at a specified time. Selecting this option opens the **Plan Queue Item** window to enter the lead time for picking up the item.



Cancel Planned Queue Work Item

- Allows users to cancel the planned queue work item and move the work item back to the queue.
- This option is displayed in the context menu only for the queue work items that are already planned.
- If the user wants to cancel a planned queue work item, the user needs to right-click the planned work item and select **Cancel Planned Item** from the context menu. The work item will be moved back to the queue.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Customize Work Items List

AVEVA Work Tasks allows the following types of customization:

- Customize Work Items List Views
- Customization of Layouts
- Preferences for Work Item Management

Customize Work Items List Layouts

The field layouts in Work items list can be defined at the following levels:

- Global - Work items list layouts can be specified for the entire application programmatically.
- Define Layouts at Workflow Level - The layout for a Workflow can be specified in the Process Designer while designing the Workflow.
- Define Layouts for Queues - The layout for work items assigned to the queue can be specified in the Queue Management window.
- User - Users can further personalize the work item list views and save layouts.

Global layouts are applied only to those workflows and queues that do not have Workflow/queue specific layouts defined and can be saved with a specific name.

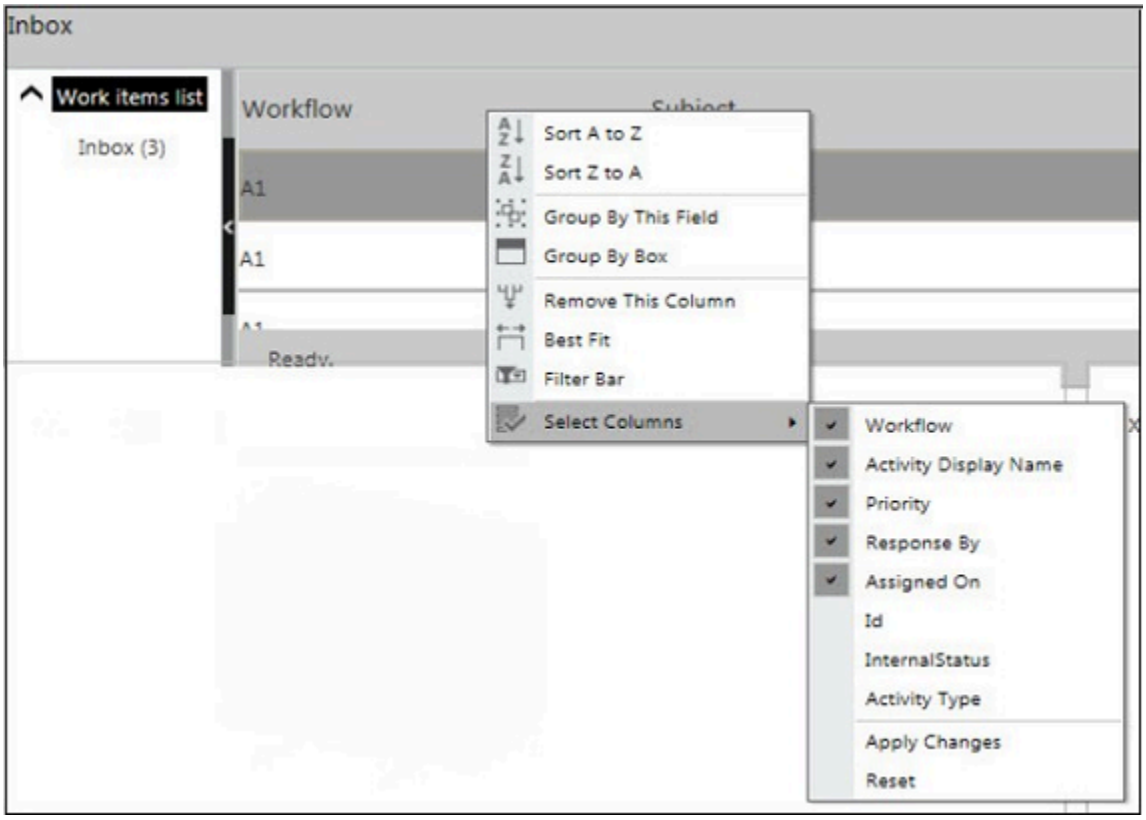
The Work items list also enables filtering of data (see Filtering Data in Work Items List) within a list.

Work Items List Layout Customization

The Work items list view provides list management features for sorting, grouping, column selection, filtering and rearranging. Right-clicking on any column in the column header bar brings up a menu with the available options.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

List Management Options



A description of the available options follows:

- **Sort A to Z** - Sorts the list on the selected column in ascending order
- **Sort Z to A** - Sorts the list on the selected column in descending order
- **Group By This Field** - Groups the list by the selected column
- **Group By Box** - Displays the Group By box at the top. You can drag and drop a column header in this box to group the list by that field. This is an alternative way to group the list.
- **Remove This Column** - Removes the selected column. The removed column can be restored by reselecting the column from the Select Columns option.
- **Best Fit** - Changes the column width to best fit
- **Filter Bar** - Toggles the filter bar from on and off
- **Select Columns** - Provides a selection list with all available column headers. Columns displayed in the view are checked. Click Apply Changes for the new settings to take effect. Click Reset to revert to the previous settings. You can also rearrange the columns by dragging and dropping them to a new position.

Define Layouts at Workflow Level

The layout for the Work items list can be defined for a Workflow in the **Process Designer** by selecting the Work item list Layout option from the **Settings** menu. Selecting this option brings up the **WorkList Layout Customization** window. The Worklist Layout can be customized for the following:

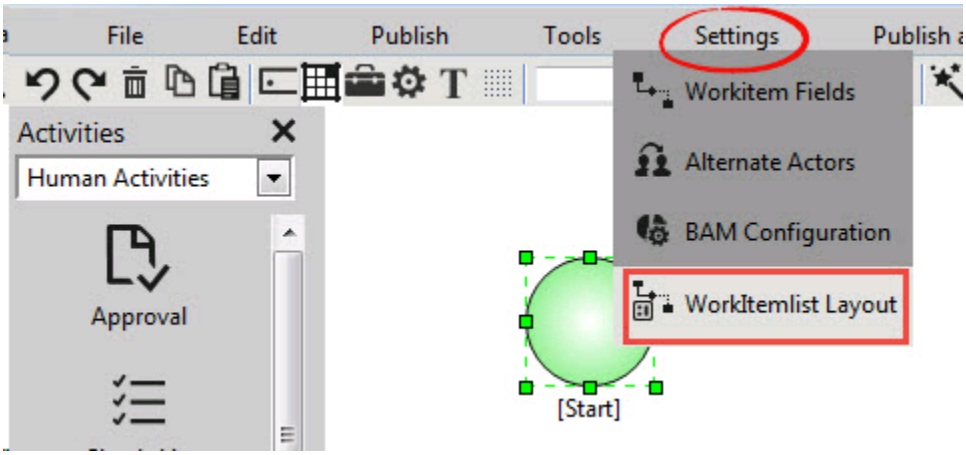
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Column positions
- Column selection
- Grouping a column
- Sorting a column

If you set the **ShowInboxViewonly** property to true, Workflow layouts will not be applied.

The default view of Work items list in the Enterprise Console cannot be customized. The above customization applies only to work item lists created by embedding the Work Item List Control in an ASPX page. For more information about using AVEVA Work Tasks Controls as a part of a project, see *Using Controls in Applications* in the *Developer Guide*.

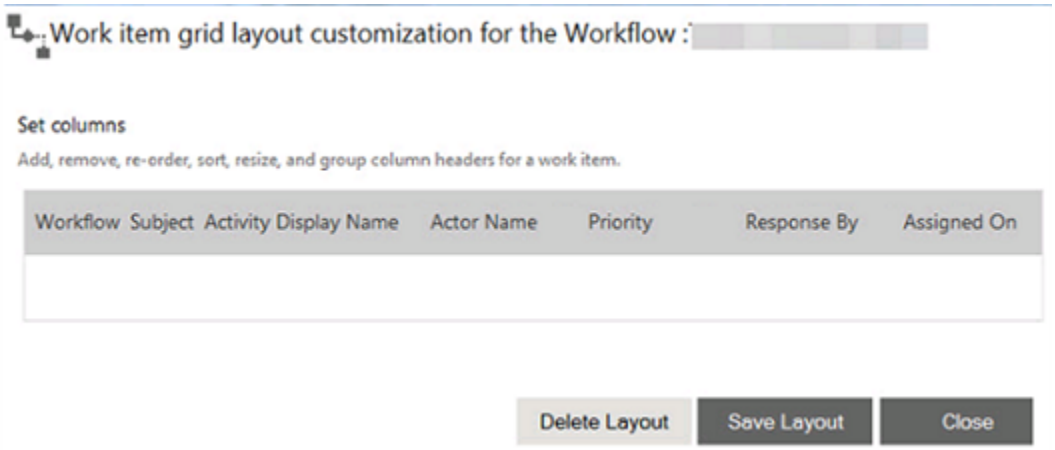
Work items list Layout Option in Process Designer



WorkList Layout Customization

The WorkList Layout Customization window allows you to customize the layout of Work items lists assigned from the Workflow. For more information on customization options, refer to Work items list Customization Options.

WorkList Layout Customization for Workflow Window



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Define Global Layouts

AVEVA Work Tasks enables Work items list layouts to be defined for the entire application. If the property GlobalLayout is set to true, the Work item list layout can be defined at the global level.

To add a Work items list layout using a panel

1. Drag and drop a panel.
2. In the underlying code, create a new instance of control and add the instance to the panel as in the following example:

```
Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject("Telematics");//Repository name
object loggedinUserId = "2d52b2c0-4cf8-4af6-acad-a0c9908eeab5";
Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext(loggedinUserId,
application, "skeltalist");
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl WIL = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
WIL.ApplicationName = uContext.Repository.ApplicationName;
WIL.UserIdString = uContext.LoggedInUserId;
WIL.ID = "WorkItemListControl";
WIL.DisplayGroupUI = true;
WIL.Height = Unit.Percentage(100);
WIL.ReadingPaneInPopupWindow = true;
Panel1.Controls.Add(WIL);//add control to the panel
```

3. To load all the AVEVA Work Tasks controls separately on aspx page, set the user context first.For example:

```
Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext(loggedinUserId,
application, "skeltalist")
In the underlying code, create a new instance of control and add the instance to the
panel in the OnInit as shown in the following example:
Skelta.Core.ApplicationObject application = new
Skelta.Core.ApplicationObject("Telematics");//Repository name
object loggedinUserId = "2d52b2c0-4cf8-4af6-acad-a0c9908eeab5";
Skelta.Entity.UserContext uContext = new Skelta.Entity.UserContext(loggedinUserId,
application, "skeltalist");
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl WIL = new
Skelta.HWS.WorkListChannel.Web.WorkItemListControl.WorkItemControl();
WIL.ApplicationName = uContext.Repository.ApplicationName;
WIL.UserIdString = uContext.LoggedInUserId;
WIL.ID = "WorkItemListControl";
WIL.DisplayGroupUI = true;
WIL.Height = Unit.Percentage(100);
WIL.ReadingPaneInPopupWindow = true;
Panel1.Controls.Add(WIL);//add control to the panel
```

Note: The default view of the Work items list in the **Enterprise Console** can be customized. For more information about using **Controls** as a part of a project, see *Using Controls in Applications* in the *Developer Guide*.

Define Layouts for Queues

The layout for the Work items list for items assigned to a queue can be defined in the **Settings** tab of the **Queue Management** window. The Worklist Layout can be customized for the following:

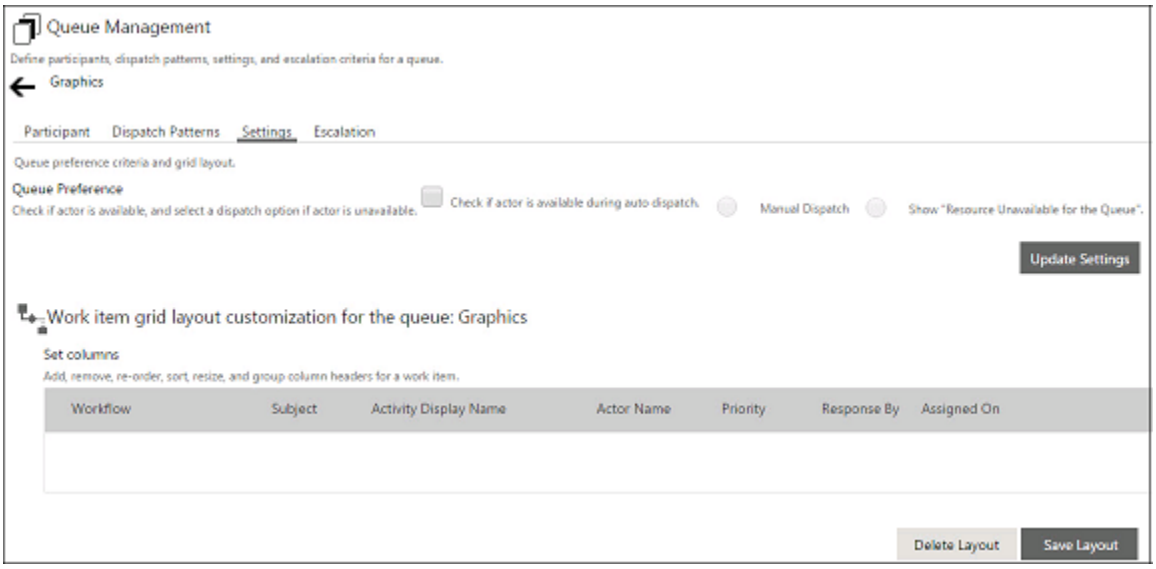
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Column positions
- Column selection
- Grouping a column
- Sorting a column

For more information on customization options, see Work Items List Layout Customization.

Note: The default view of the Work items list in the Enterprise Console cannot be customized. The above customization applies only to Work items lists created by embedding the Work Item List Control in an ASPX page. For more information about using Controls as a part of a project, see *Using Controls in Applications* in the *Developer Guide*.

WorkList Layout Customization for the Queue



Define Work Items List Layouts for a User

Individual users can perform the following activities to customize Work items list layouts:

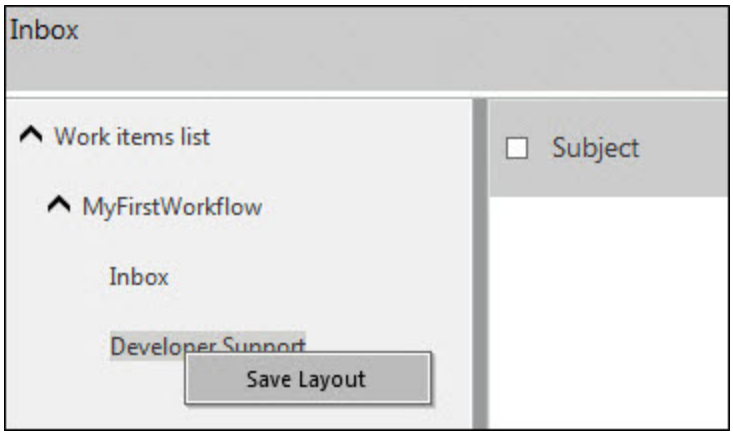
- Customize layout (For more information about customization options, see Work Items List Layout Customization.)
- Save a customized layout
- Delete a customized layout

To save Customized Layouts

Customized views of a Work items list can be saved under a personalized name. To save the custom settings:

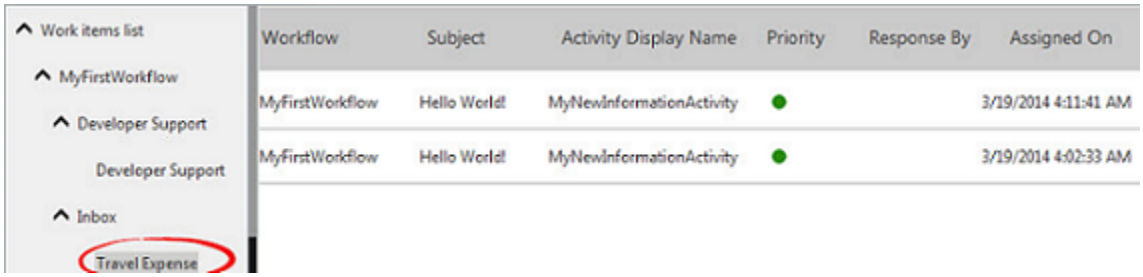
1. Right-click the folder name that contains the customized view. For example, if you have customized the Work items list for Inbox, right-click **Inbox**.
2. Select **Save Layout**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Enter the name of the new layout at the **Enter the view name** prompt. The name of the saved layout appears in the folder list under the folder.

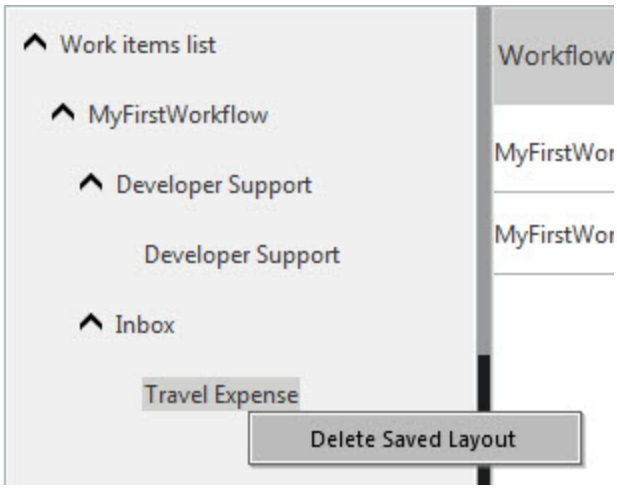
4. The new folder displays the same list of items as the default folder that was customized. The work items will also be displayed in the default folder. For example, in the following figure, Inbox has been customized and the layout saved as **Travel Expense**.



To delete Customized Layouts

- Right-click the folder name for the layout, and then select **Delete saved Layout**. The layout is deleted.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Customize Work Items List Views

The Work items list view and interface can be customized by setting appropriate properties for the Work items list control. The properties that enable customized views are as follows:

- **DisplayLeftTreeMenuAtApplicationLevel**: This property enables all work items to be grouped by the parent application instead of the default grouping by Workflow.
- **WorkflowNames**: This property enables you to list only work items assigned by the specified workflows.
- **ShowQueueNames**: This property enables you to display work item folders for only the specified queues.
- **ShowInboxViewOnly**: This property enables you to display only the Work items list for the Inbox folder without the view of the folder structure.
- **ShowManagerViewOnly**: This property enables you to display only the Work items list for the Manager View.

The default view of the Work items list in the Enterprise Console cannot be customized. The above customization applies only to work item lists created by embedding the Work items list control in an ASPX page.

Display Work Items List by Application

The Work items list property **DisplayLeftTreeMenuAtApplicationLevel** enables all work items to be grouped by the parent application. If this property is set to false, then the default view of work items grouped by workflow applies.

Work items list Grouped by Application

DisplayLeftTreeMenuAtApplicationLevel = **True**

Display Work Items List Grouped by Workflows

The Work items list property **DisplayLeftTreeMenuAtApplicationLevel** enables all work items to be grouped by the parent application. If this property is set to false, then the default view of work items grouped by workflow applies.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Work items list grouped by Workflows

DisplayLeftTreeMenuAtApplicationLevel = **False**

Display Work Items List for Specified Workflows

The property WorkflowNames enables you to display work items assigned by specified workflows. For example, if work items are assigned by workflows for Invoice Processing and Expense claims, you can create two controls for Work items list with the first set to display only items assigned from Invoice Processing and the other set to display only Expense work items.

Note: This property is effective only when the DisplayLeftTreeMenuAtApplicationLevel property is set to False.

Display Work Items List for Specified Queues

The property **ShowQueueNames** enables you to display only specified queue folders. For example, if work items are assigned to Finance queue and Purchase Department queue, you can create two controls for Work items list with the first set to display only the Finance queue folder and the other set to display only the Purchase Department queue folder.

The display of queue folder is subject to the participants right to View Queue Items for the queue. For more information on participant rights, see Participants Tab.

Display Inbox View

The **ShowInboxViewOnly** property enables you to display only the Work items list for the Inbox folder without the view of the folder structure. If this property is set to true, users will not be able to save customized layouts or view work items in queue folders.

Display Manager's View

The **ShowManagerViewOnly** property enables you to display only the Work items list for the **Manager View** folder without the view of the folder structure. If this property is set to true, users will not be able to save customized layouts, view work items in queue folders or view other Inbox items. This property is useful to create a separate control for the manager's view.

Preferences for Work Item Management

When the volume of work items is high, it is essential to minimize the processing time as much as possible. **AVEVA Work Tasks** provides properties at the control level to set preferences for work item management. These properties enable you to expedite processing by defining how the work items can be managed and acted upon.

The two properties for work item management are as follows:

- Auto-ownership on Row Click: This property enables you to allow users to take ownership of a work item by clicking on the item in the Work items list. If this property is set to true, the option Take Ownership in the Manage Work Items field in **Work Item Details** will not be available.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Enable Multi-Select Option in Work Item List: This property provides users with an option to select multiple work items for processing in a batch. For example, selecting multiple work items for approval.

  Note: The default view of the Work items list in the Enterprise Console cannot be customized. The above customization applies only to the work items lists are created by embedding the Work Item List Control in an ASPX page. For more information about using Controls as a part of a project, see *Using Controls in Applications* in the *Developer Guide*.

Auto-ownership on Row Click

The property **AllowAutoOwnershipOnRowClick** enables you to allow users to take the ownership of a work item by clicking on the item in the Work items list. If this property is set to true, the option **Take Ownership** in the **Manage Work Items** field in Work Item Details will not be available.

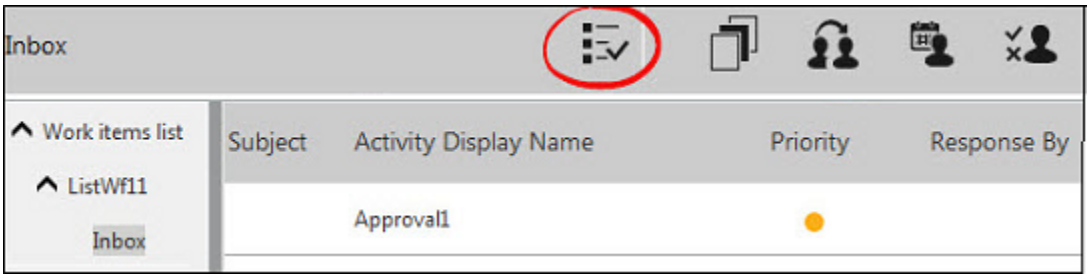
Setting this property to true is useful in scenarios that require strict adherence to performance indicators, which measure the time when a work item is assigned to the time when a user takes ownership of it.

Enable Multi-Select Option in Work Item List

When the **DisplayGroupUI** property is enabled, an additional button **Enable Multi Select** is displayed in the Work items list. This property is a powerful feature that expedites processing of similar items in a batch.

The **Enable Multi Select** button provides users with options of acting on items as a batch. An additional option is made available when the items are grouped.

Enable Multi Select Option in Work items list



Note: The Multi Select option is not supported for **Resource Set** activity and **Information** activity.

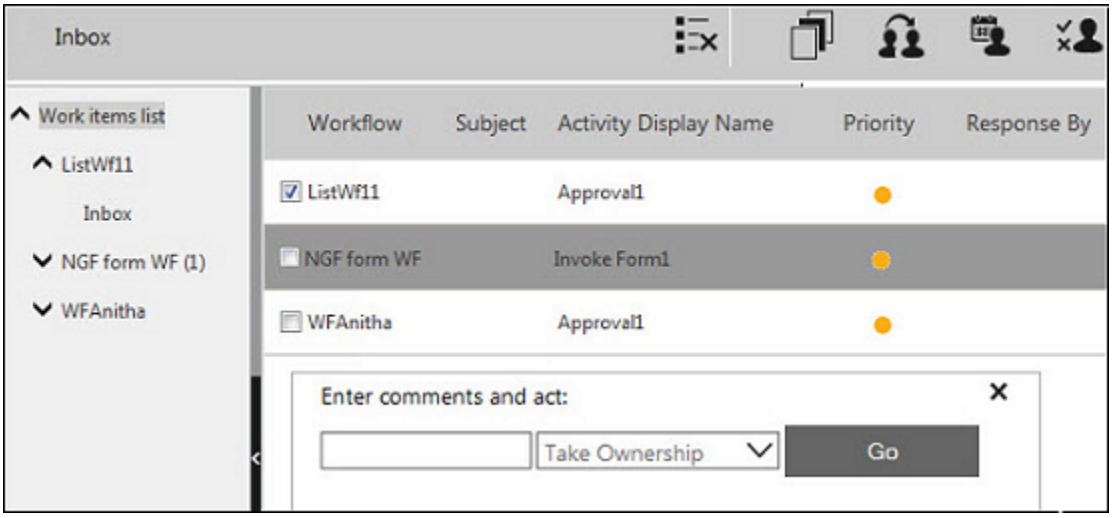
Work Item List in Multi Select Mode

On clicking the **Enable Multi Select** button, the Work items list interface is displayed in the multi-select mode with check boxes for each item. The user can enter comments that are applied to all the selections. The options for acting upon the selection depend on the type and stage of processing that the selected items are in.

Example 1: A user has multiple new work items that have the subject Approval of Vendor Invoices. The user can enable multi-select, then select all the items that they want to take the ownership of. They can then select the **Take Ownership** option in the drop-down to take the ownership of the selected items in a single click.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Work Item List with Multi-Select Enabled



Selecting Similar Work Items from the Work Items List

You can select all the similar work items in the **Work items list** based on the activity type of the selected work item. For example, if you select the work item with **Approval** activity, then all the other work items with the Approval activity will be selected.

To select similar work items from the Work items list

1. Select the work item and then right-click to view the context menu.
2. Click **Select all similar items** option in the context menu.

   Based on the activity type of the selected work item, all the similar items in the Work items list get selected.

To deselect the work items, click **UnSelect all similar items** option in the context menu.

To select similar work items from the grouped Work items list

1. Right-click on the column and then click **Group By This Field** to group the work items based on the selected column.
2. Select the work item from the grouped list and then right-click to view the context menu.
3. Click **Select all within group** option in the context menu.

   Based on the activity type of the selected work item, all the similar work items listed in the group get selected. If the group has items with different activity, an error message is displayed.

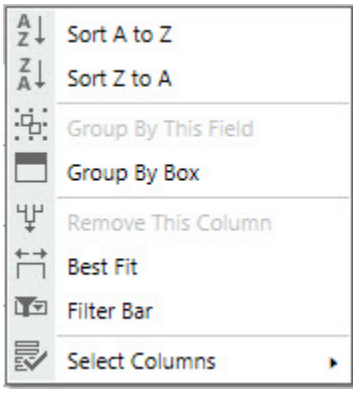
To deselect the work items within the group, click **UnSelect all within group** option in the context menu.

Filter Data in Work Items List

The **Filter Bar** in the Work items list is displayed when the Filter Bar option is selected from the right-click menu for the columns. This option allows users to filter the list for specific data.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

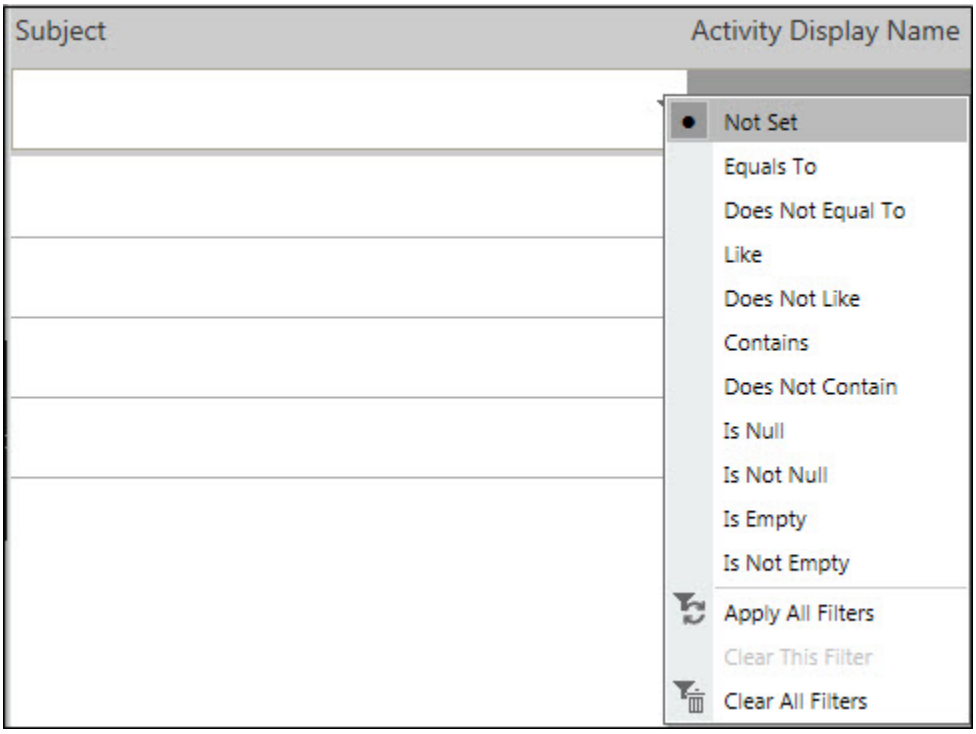
Toggle Filter Bar Option



To set filters

1. Enter the filter criteria for the column in the filter bar.
2. Click the filter icon to select the appropriate condition from the filter menu.

Filter Menu



When you have finished setting all the required conditions for the various columns, click the filter icon and select **Apply All Filters**.

To clear a particular filter

1. Click the filter icon on the column whose filter needs to be cleared.
2. Select **Clear This Filter**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To clear all filters

1. Click the filter icon on any column.
2. Select **Clear All Filters**.

Manage Work Items

Manage Work Items in AVEVA Work Tasks by the following ways:

- Forward: Forward work items among different security groups.
- Abort: Abort or kill work items, as long as the user has permission to abort the work item.
- Remove: Remove a workflow item without aborting the workflow instance.

Forward Work Items

In AVEVA Work Tasks, you can view the work items in two different modes.

- **Normal View**: In the normal view, you can see all the assigned work items.
- **Manager View**: In the manager view, you can see all the assigned work items in addition to all the work items assigned to the users reporting to the reportees.

In both these views, you have the provision to forward the work items.

Apart from **Inbox**, the following users should be able to view and forward the work items from the **Manage Work items** in the **Enterprise Console**:

- Owner of the workflows
- Users who are not owners of the workflows, but part of the default Administrator security group.

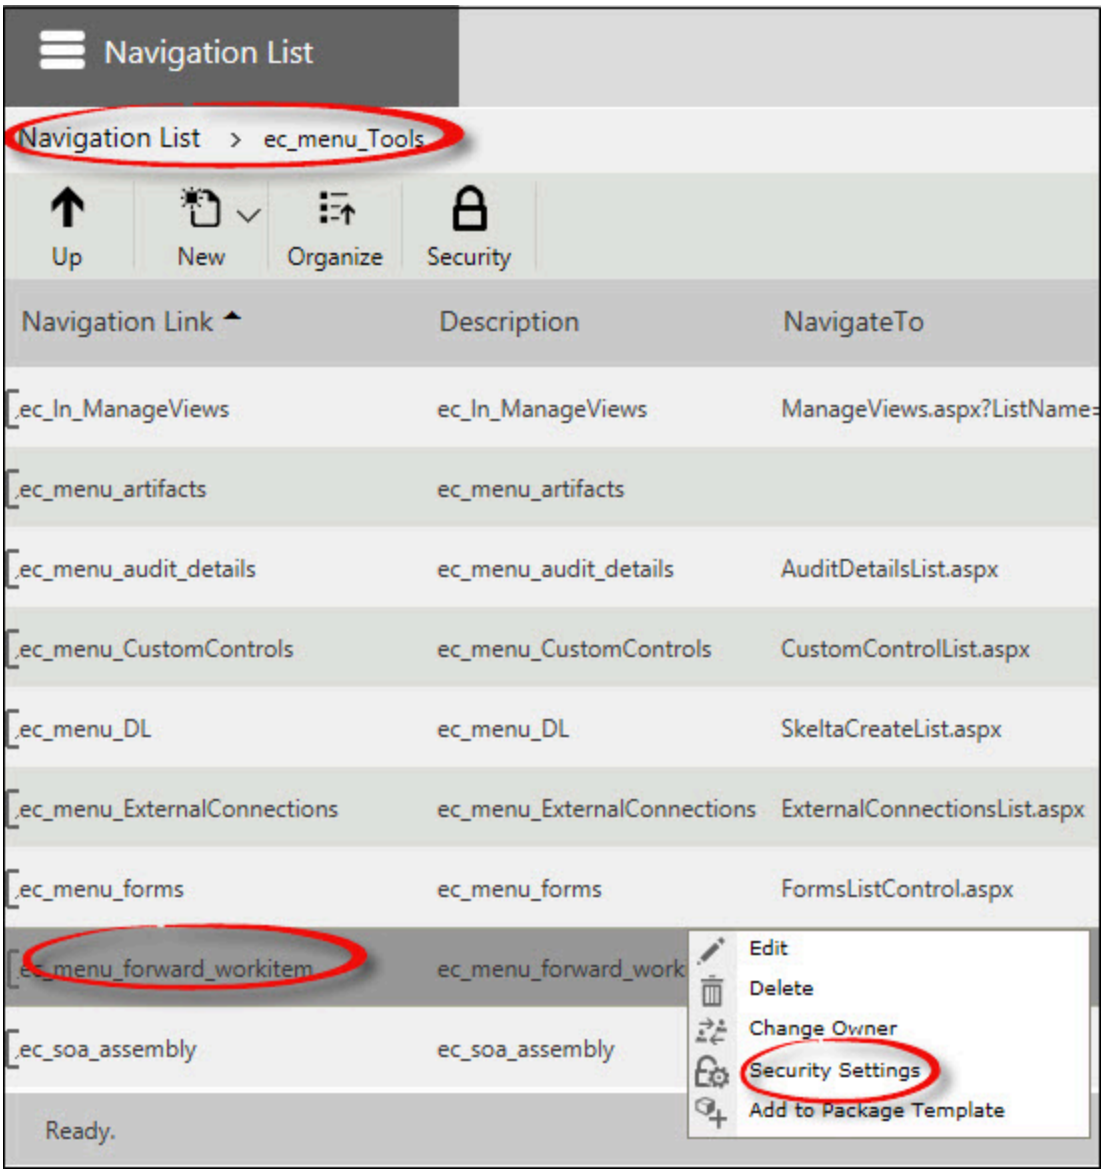
To open Manage Work Items

1. In the **Enterprise Console**, click the **Menu** icon, click **Tools**, and then click **Manage Work items**.
2. By default repository configuration, only the users who belong to the Administrator security group will be able to see this menu item.

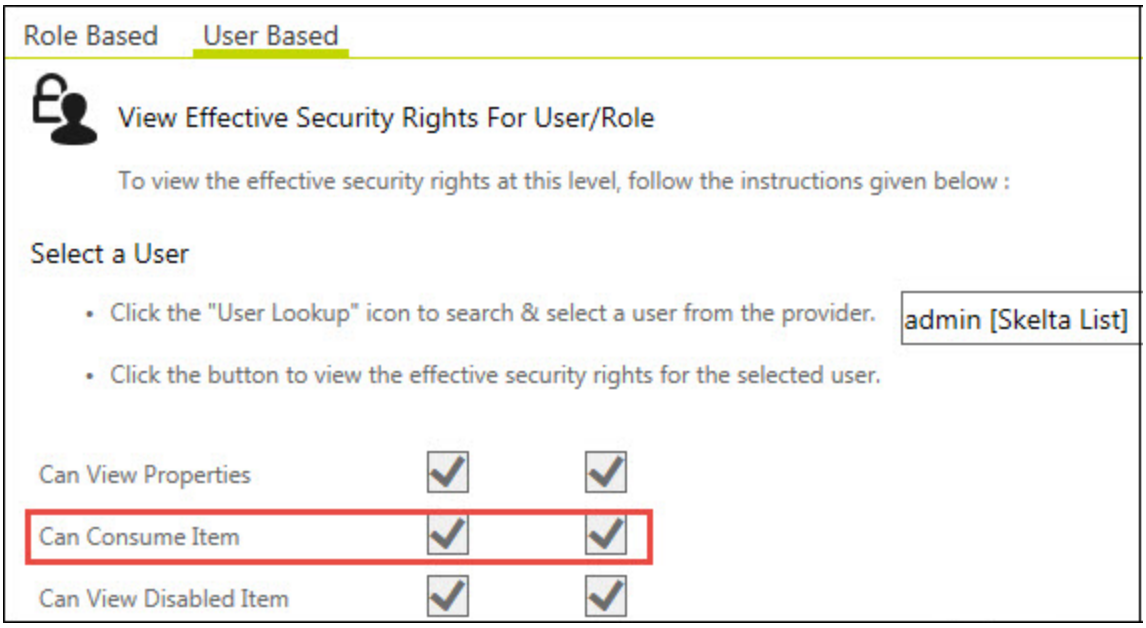
To View 'Manage Work items' in the Enterprise Console

To view the **Manage Work items** option in the **Enterprise Console** menu, you must have the **Can Consume Item** right for **Manage Work item** list item (**ec_menu_forward_work item**) in the **Manage Navigation List** of repository settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



For details about the Manage Navigation List, see Manage Navigation List.

Forward Work Items

To forward work items, you must have the **Can Forward Work Item** right. For example, if the user belongs to the security group **Administrator**, the **Can Forward Work Item** right should be enabled for the Administrator security group.

To forward work items to other users

1. In the **Enterprise Console**, click the **Menu** icon, click **Tools**, and then click **Manage Work items**. The **Manage Work items** page appears.
   In the **Manage Work items** page, you can see the work items of all the workflows owned by you.
2. Select the required work item(s) to forward to a different user.
3. Click **Forward**. Alternatively, right-click the work item and then click **Forward**. The **Select a user and forward the work item(s)** dialog box appears.
4. Click the **User Lookup** icon to select a user. The **User Lookup** dialog box appears. Select only one user at a time to forward work item(s).
5. Search and enter the user name.
6. Click **Update**.
7. Click **Forward**. The selected work item gets assigned to the selected user and the information is updated in the grid.

Kill Work Items

To kill or abort work items, the user should have the **Can Kill Work Item** right. For example, if the user belongs to the security group **Administrator**, the **Can Kill Work Item** right should be enabled for the Administrator security group.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Abort Work Items

You can abort or kill work items in the Manage Work items window. To abort work items, the logged in user should have the permission to abort the work items. For this, the **Can Kill Work Item** right should be checked.

To abort a work item

1. In the **Enterprise Console**, click the **Menu** icon, click **Tools**, and then click **Manage Work items**. The **Manage Work items** page appears.
   All work items appear in a grid showing the information about work items assigned to different users within the application.
   The **Manage Work items** is visible only to users who have the right to forward work items.
2. Select the work item(s) that you want to abort. You can select multiple work items at a time by selecting the check box in the grid.
3. Click **Abort**. Alternatively, right-click the work item, and then select Abort. A confirmation message to abort the work item appears.
4. Click **Yes** to confirm the abort, or **No** to cancel the abort. The message about successful abort appears.
5. Click **OK**.

Remove Work Items

You can remove the work item of a workflow instance without aborting the workflow instance. To remove work items, the logged in user must have the **Can Kill Work Item** security rights.

The **Manage Work items** option is visible only to users who have the right to remove or forward work items.

The work item does not get removed under the following conditions:

- If the work item to be removed is the only work item of the activity
- If the ownership of the work item is taken by the logged in user

To remove a work item

1. In the **Enterprise Console**, click the **Menu** icon, click **Tools**, and then click **Manage Work items**. The **Manage Work items** page appears.
2. Select the workflow instance that you want to remove. You can select multiple work items at a time by selecting the check box in the grid.
3. Click **Remove**. Alternatively, right-click the work item, and then select **Remove**.
4. Click **Yes** to remove the work item.
5. Click **OK**.

Alternate Actors

An actor is a user who is responsible for acting on a task or an activity. An alternate actor is another user who can be given the required rights to act on the task or activity on behalf of the actor.

You can set an alternate actor in the **Alternate Actor** menu item in the **Settings** tab of the **Enterprise Console**.

To set an alternate actor, refer to the section Alternate Actors.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Alternate Actors

An actor is a user who is responsible for acting on a task or an activity. An alternate actor is another user who can be given the required rights to act on the task or activity on behalf of the actor.

You can set an alternate actor for an user in one of the following ways:

- Use the **Alternate Actor** menu item in the **Settings** tab of the **Enterprise Console**. This **Alternate Actor** menu item is visible by default for *Administrator* and *Contributor* security groups. For Custom or customized Security Group, set the permissions **Can Design Workflow** and **Can Set Alternate Actor** for that group.
- Assign alternate actors to a workflow. This alternate actor will have rights to approve or reject an activity in the absence of the original actor. For more information about how to set an alternate actor in the Process Designer, see Steps to set an Alternate Actor in the Process Designer.
- Set an alternate actor in the **Inbox**.

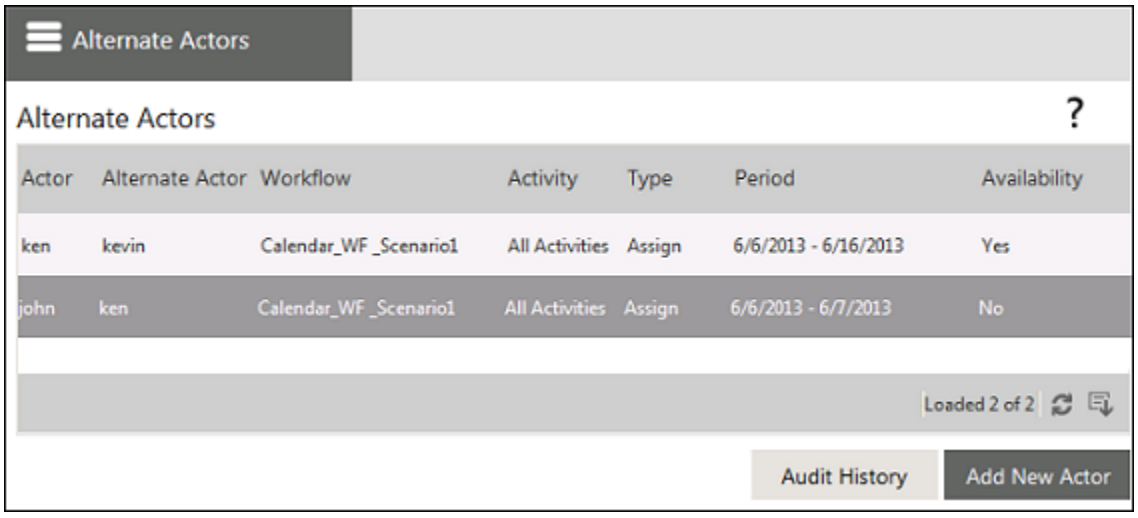
To set an Alternate Actor in the Enterprise Console

1. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Alternate Actors**.

   The Alternate Actors page appears.

   This page lists the alternate actors set for the particular repository.

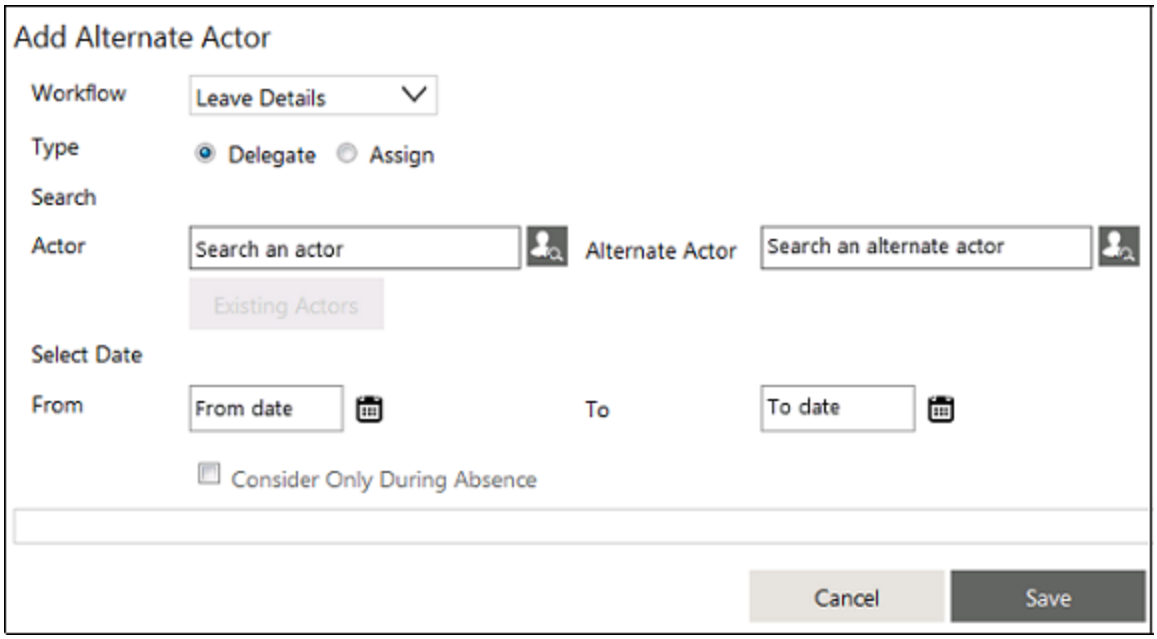
   The following image shows the Alternate Actor page:



2. Click **Add New Actor** to add a new alternate actor.

   The Add Alternate Actor dialog box appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Enter the required inputs for each work item field:
   a. **Workflow**: Specify the workflow for which the alternate actors are being added.
   b. **Activities**: Specify the activity for which the alternate actors are being added. The field will be displayed to the actor with this label name in the Work items list.
   c. **Type**: Specify the type of activity transfer from the original actor to the alternate actor.
      a. **Delegate**: Delegate the task to the alternate actor.
      b. **Assign**: Shift the task assignment to the alternate actor.

      Only one type of setting (**Delegate** or **Assign**) is allowed for an Actor, Alternate Actor, and Workflow combination.

      In an upgraded environment where **Delegate** and **Assign** is already set for an actor, **Delegate** takes precedence over **Assign**.

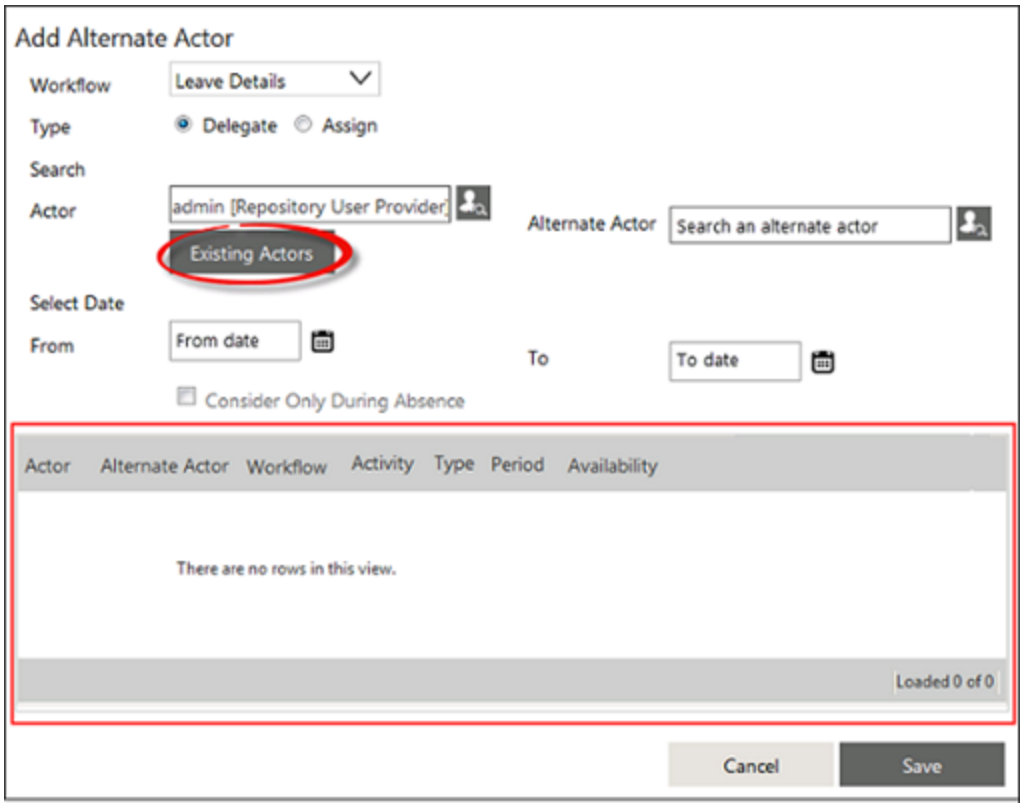
      Note: At runtime, only a single level of delegation or assignment occurs at any given point of time. For example, consider an actor *Jim.* An alternate actor, *John* is configured with delegation type as *Delegate*. Again, an alternate actor, *Kevin* is configured considering *John* as an actor with delegate type as *Assign*. Then, the task goes to *John* from *Jim*.
   d. **Search**: Specify the actor and the alternate actor.
      i. Click the **User Lookup** button to select the **Actor** or the **Alternate Actor.**

      The User Lookup dialog box appears.
      ii. Select the required users, and click **Update**.

      The same user cannot be set for both Actor and Alternate Actor.

      Click **Existing Actors** to view the list of all the existing alternate actors of the selected actor. The list of existing actors and the associated details get populated in the grid at the bottom section of the dialog box as shown in the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



e. **Select Date**: Specify the period for which the alternate actor is being assigned to the original actor.

   i. **From**: Click the calendar to select the start date.

   ii. **To**: Click the calendar to select the end date.

   iii. **Consider Only During Absence**: Select to specify that the alternate actor is to be considered only during the absence of the original actor.

   Note that the **From** date cannot be older than the current date.

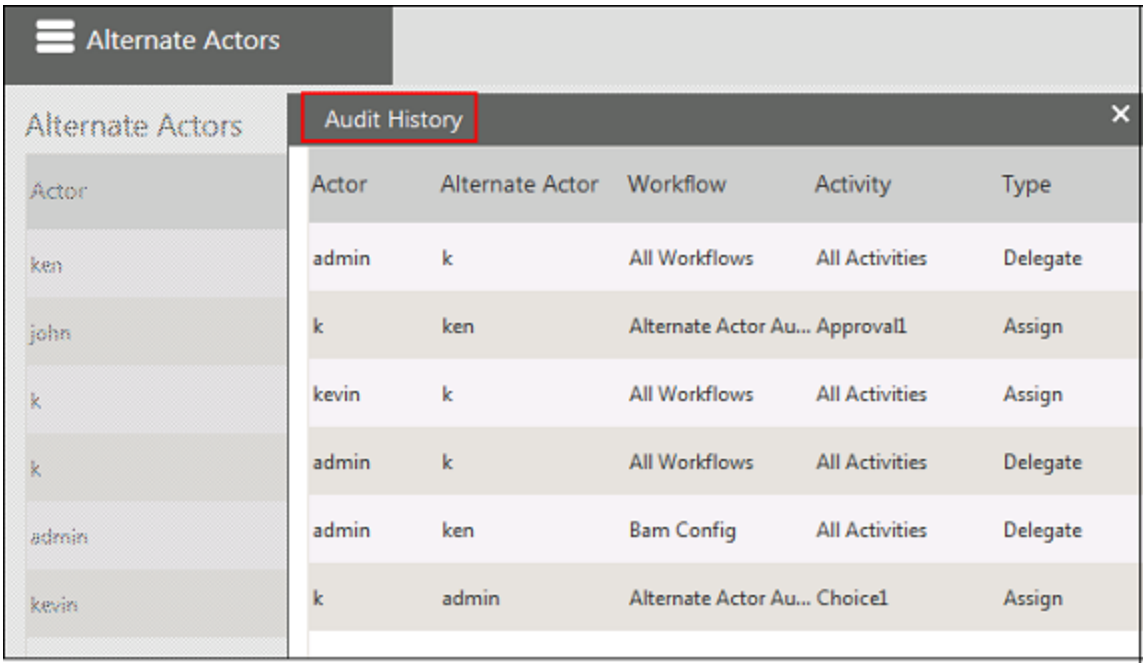
4. Click **Save** to add the new alternate actor.

   The **Alternate Actors** window opens showing the newly added alternate actor.

Audit History

You can view the complete change history for an actor, when the alternate actor settings were added or deleted.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



- Click **Audit History**.

  The Audit History dialog box appears.

  The Audit History dialog box contains the complete change history when an alternate actor was added or deleted. You cannot edit the audit history.

By default, the audit history is enabled. To disable the audit history, do the following:

1. Go to **SKRepository** table in the **Farm Database.**
2. In the **Properties Column**, set the property key **isDeletedListItemsTraceEnabled** to *False*.

   After upgrading to the required version of AVEVA Work Tasks, if the **Audit History** button is not visible, then set the property key **isDeletedListItemsTraceEnabled** to *True*.

   For more information about enabling and disabling the audit history, see Enable or Disable Deleted List Items feature for a Repository.

See Also: To set the security rights for showing an alternate actor, see Secure Work Item Control - Show Alternate Actor.

Configuration Scenarios

Consider the following:

Actor = Jim

Alternate Actors = Richard and John

The following configuration scenarios for alternate actor are possible:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Scenario 1: For all workflows and all activities of all workflows with delegation type as *Delegate*

In this scenario, either one of the following combinations are possible.

When **Option 1** is set for an alternate actor, **Option 2(a)** and **Option 2(b)** cannot be set. When **Option 1** is not set, both **Option 2(a)** and **Option 2(b)** can be set to co-exist provided the **From** date and **To** date in both **Option 2(a)** and **Option 2(b)** does not *overlap*.

- **Option 1**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard*. The delegation type is set as **Delegate**. The **From** date and **To** date is empty provided the **Date Configuration Flag for Alternate Actors** is set as false in the **Central Configuration** site for the repository. The **Consider Only During Absence** is set as *True* or *False*.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	Richard	-	-	Yes/No

- **Option 2 (a)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard.* The delegation type is set as **Delegate**. The **From** date and **To** date are set. **Consider Only During Absence** is set as *True* or *False*.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	Richard	13/01/23	15/01/20	Yes/No

- **Option 2 (b)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *John.* The delegation type is set as **Delegate**. The **From** date and **To** date are set. **Consider Only During Absence** is set as *True* or *False*. The alternate actor in this option is different from the alternate actor set in **Option 2(a)**. The **From** date and **To** date in this option does not overlap with the **From** date and **To** date of **Option 2 (a)**.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	John	16/01/23	21/01/23	Yes/No

Scenario 2: For all workflows and all activities of all workflows with delegation type as *Assign*

In this scenario, either one of the following combinations are possible.

When **Option 1** is set for an alternate actor, **Option 2(a)** and **Option 2(b)** cannot be set. When **Option 1** is not set, both **Option 2(a)** and **Option 2(b)** can be set to co-exist provided the **From** date and **To** date in both **Option 2(a)** and **Option 2(b)** does not *overlap*.

- **Option 1**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard*. The delegation type is set as **Assign**. The **From** date and **To** date is empty provided the **Date Configuration Flag for Alternate Actors** is set as false in

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the **Central Configuration** site for the repository. The **Consider Only During Absence** is set as *True* or *False*.

The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	Richard	-	-	Yes/No

- **Option 2 (a)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard.* The delegation type is set as **Assign**. The **From** date and **To** date are set. **Consider Only During Absence** is set as *True* or *False*.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	Richard	13/01/23	15/01/23	Yes/No

- **Option 2 (b)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *John.* The delegation type is set as **Assign**. The alternate actor in this option is different from the alternate actor set in **Option 2(a).** The **From** date and **To** date are set. **Consider Only During Absence** is set as *True* or *False*. The **From** date and **To** date in this option does not overlap with the **From** date and **To** date of Option 2 (a).

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	John	16/01/23	21/01/23	Yes/No

Scenario 3: For a particular workflow and all activities of the workflow with delegation type as *Delegate*

In this scenario, either one of the following combinations are possible.

When **Option 1** is set for an alternate actor, **Option 2(a)** and **Option 2(b)** cannot be set. When **Option 1** is not set, both **Option 2(a)** and **Option 2(b)** can be set to co-exist provided the **From** date and **To** date in both **Option 2(a)** and **Option 2(b)** does not *overlap*.

- **Option 1**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard*. The delegation type is set as **Delegate**. The **From** date and **To** date is empty provided the **Date Configuration Flag for Alternate Actors** is set as false in the **Central Configuration** site for the repository. The **Consider Only During Absence** is set as *True* or *False*.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	Richard	-	-	Yes/No

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Option 2 (a)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard.* The delegation type is set as **Delegate**. The **From** date and **To** date are set. **Consider Only During Absence** is set as *True* or *False*.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	John	16/01/23	21/01/23	Yes/No

- **Option 2 (b)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *John.* The delegation type is set as **Delegate**. The alternate actor in this option is different from the alternate actor set in **Option 2(a).** The **From** date and **To** date are set. **Consider Only During Absence** is set as *True* or *False*. The **From** date and **To** date in this option does not overlap with the **From** date and **To** date of **Option 2 (a)**.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	John	16/01/23	21/01/23	Yes/No

Scenario 4: For a particular workflow and all activities of the workflow with delegation type as *Assign*

In this scenario, either one of the following combinations are possible.

When **Option 1** is set for an alternate actor, **Option 2(a)** and **Option 2(b)** cannot be set. When **Option 1** is not set, both **Option 2(a)** and **Option 2(b)** can be set to co-exist provided the **From** date and **To** date in both **Option 2(a)** and **Option 2(b)** does not *overlap*.

- **Option 1**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard*. The delegation type is set as **Assign**. The **From** date and **To** date is empty provided the **Date Configuration Flag for Alternate Actors** is set as false in the **Central Configuration** site for the repository. The **Consider Only During Absence** is set as *True* or *False*.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	Richard	-	-	Yes/No

- **Option 2 (a)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard.* The delegation type is set as **Assign**. The **From** date and **To** date are set. **Consider Only During Absence** is set as *True* or *False*.

  The following table depicts the scenario:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	Richard	13/01/23	15/01/23	Yes/No

- **Option 2 (b)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *John.* The delegation type is set as **Assign**. The alternate actor in this option is different from the alternate actor set in **Option 2(a).** The **From** date and **To** date are set. **Consider Only During Absence** is set as *True* or *False*. The **From** date and **To** date in this option does not overlap with the **From** date and **To** date of **Option 2 (a)**.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	John	16/01/23	21/01/23	Yes/No

Scenario 5: For a particular workflow and a particular activity of the workflow with delegation type as *Delegate*

In this scenario, either one of the following combinations are possible.

When **Option 1** is set for an alternate actor, **Option 2(a)** and **Option 2(b)** cannot be set. When **Option 1** is not set, both **Option 2(a)** and **Option 2(b)** can be set to co-exist provided the **From** date and **To** date in both **Option 2(a)** and **Option 2(b)** does not *overlap*.

- **Option 1**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard*. The delegation type is set as **Delegate**. The **From** date and **To** date is empty provided the **Date Configuration Flag for Alternate Actors** is set as false in the **Central Configuration** site for the repository. The **Consider Only During Absence** is set as *True* or *False*.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	Richard	-	-	Yes/No

- **Option 2 (a)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard.* The delegation type is set as **Delegate**. The **From** date and **To** date are set. **Consider Only During Absence** is set as *True* or *False*.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	Richard	13/01/23	15/01/23	Yes/No

- **Option 2 (b)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *John.* The delegation type is set as **Delegate**. The alternate actor in this option is different from the alternate actor set in **Option 2(a).** The **From** date and

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To date are set. **Consider Only During Absence** is set as *True* or *False*. The **From** date and **To** date in this option does not overlap with the **From** date and **To** date of **Option 2 (a)**.

The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	John	16/01/23	21/01/23	Yes/No

Scenario 6: For a particular workflow and all activities of the workflow with delegation type as *Assign*

In this scenario, either one of the following combinations are possible.

When **Option 1** is set for an alternate actor, **Option 2(a)** and **Option 2(b)** cannot be set. When **Option 1** is not set, both **Option 2(a)** and **Option 2(b)** can be set to co-exist provided the **From** date and **To** date in both **Option 2(a)** and **Option 2(b)** does not *overlap*.

- **Option 1**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard*. The delegation type is set as **Assign**. The **From** date and **To** date is empty provided the **Date Configuration Flag for Alternate Actors** is set as false in the **Central Configuration** site for the repository. The **Consider Only During Absence** is set as *True* or *False*.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	Richard	-	-	Yes/No

- **Option 2 (a)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *Richard.* The delegation type is set as **Assign**. The **From** date and **To** date are set. **Consider Only During Absence** is set as *True* or *False*.

  The following table depicts the scenario:

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	Richard	13/01/23	15/01/23	Yes/No

- **Option 2 (b)**: Here the **Actor** is *Jim* and the **Alternate Actor** is *John.* The delegation type is set as **Assign**. The alternate actor in this option is different from the alternate actor set in **Option 2(a).** The **From** date and **To** date are set. **Consider Only During Absence** is set as *True* or *False*. The **From** date and **To** date in this option does not overlap with the **From** date and **To** date of **Option 2 (a)**.

  The following table depicts the scenario:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Actor	Alternate Actor	From Date	To Date	Consider only During Absence
Jim	John	16/01/23	21/01/23	Yes/No

Order of Precedence

When you set an alternate actor for an actor, the order of precedence is as follows:

1. A workflow with a specific activity
2. A workflow with all activities
3. All workflows with all activities

Business Activity Monitoring Alert

Business Activity Monitoring (BAM) Alert provides information regarding the process status, activity status, and gives more access to the status information or exceptions through email. BAM alert enables the events for critical data change in the process against the threshold value (maximum or minimum) set by the user. Thus BAM alert notifies the user about the current status of the process and enables the user to control it.

BAM features

- **Alerts for Business Activity Thresholds**
  This feature enables to configure an alert for Business Activity threshold and sends KPI/Overdue alerts as emails with embedded graphs. See Alerts for Business Activity Thresholds for more details.
- **BAM Events Associations**
  This feature provides the user to associate the workflow with a new BAM event based on settings made on Overdue Analysis or KPIs. These settings will be executed when the BAM Report is being processed. Decisions can be made effectively by using this. See BAM Events Associations for more details.
- **BAM Workflow**
  This feature allows the user to create a BAM workflow. On creation of the BAM workflow, BAMData and SKEventData Xmlvariables are created in the Start action. When user attaches the BAM Event to trigger the BAM workflow then these XML variables are populated with the data that can be used further. See BAM Workflow for more details.

Set the Threshold Value in BAM

To set the threshold value in BAM

1. In the Process Designer, point to **Settings**, and then click **BAM Configuration**. The **BAM Configuration** window appears.
2. Define the required threshold value.
   a. Threshold value settings for Overdue
   b. Threshold value settings for KPI Data Points level

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

c. Threshold value settings for KPI(s) level

To set the threshold value settings for Overdue

1. In the **Overdue Analysis** tab, set the threshold value for the total pending count or for a specific period of time.
2. In the **Total Pending Workflows Threshold** drop-down, set the threshold value for the total pending workflows.
3. In the **Slot Period** drop-down, select the slot period for defining the threshold values in each slot.
4. In the **Threshold** drop-down, select the threshold value.
5. Click **Save**

To set the threshold value settings for KPI Data Points level

1. Click the **KPI Data Points** tab to define the data points. The **KPI Data Point(s) Data Point** page appears.
2. Click **New**.
3. In the dialog box that appears, type a name for the KPI Data Points in the **Name** box.
4. Create a condition based on the requirements.
5. Click **Insert** to enter the condition.
6. Click **Save**.

Threshold value settings for KPI(s) level

1. Click the **KPI(s)** tab to define thresholds for the created KPI Data Points. The **Key Performance Indicators for the Workflow** page appears.
2. Click **New KPI**.
3. In the **Name** box, type a name for the KPI.
4. Click **Add New** to add a new Data Point.
5. From the **KPI Data Point** drop-down, select a data point to attach.
6. From the **Threshold** drop-down, select **Value**.
7. Click the **Insert** icon.
8. Click **Save**.

Set BAM Alert for Overdues and KPIs

To set a BAM alert for Overdues and KPI(s)

Step 1: In the BAM Configuration window, click the **Alert Configuration** tab to set the rule for the workflow.

The Overdue and KPI(s) settings can be configured to create a rule.

- Overdue: Create a rule to check pending workflows. Configure the following fields:
  - Total Workflow count is: The total number of pending workflow instances is compared with the value given by the user in the Threshold value.
  - Count in each slot is: The total number of pending workflow instances in the selected slot.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- KPI(s): Create a rule for a specific type of work. Configure the following field:
- Count in each datapoints of KPI(s) is: The number of workflow instances in each datapoint attached to the selected KPI.

  Step 2: In this step, you specify the duration for the rule to execute.

- Recurring: The configured rule will be executed regularly at a specific time.
- Only between: The configured rule will be executed at a specified time interval.
- Always: The configured rule will be executed every time the BAM report is being processed.
- Disable Alert: The configured rule will be disabled.

  Step 3: In this step, you specify the behavior of the alert.

1. Select the **Send an Email** to check box, and then type the recipient's Email Id(s) or select the Email Id(s) by clicking **Select**.
2. Select the **Send the chart(s) as a mail attachments** check box to attach the chart in the mail.
3. The email content entered can be customized using the formatting toolbar.
4. Click **Save** to save the alert settings.

BAM Events Associations

You use this feature to trigger a workflow using BAM Events.

To associate a workflow with a new BAM event, follow the steps given below

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**.

   The **Workflows** page appears.
2. Select an workflow.
3. On the action bar, click **Associate**.

   The **New Association** wizard appears.

   Alternatively, select and right-click the workflow to be associated. Click **Create Associations**.
4. On the action bar, click **BAM** to associate the BAM events.
5. In the **Workflow** drop-down list, select the workflow from which the BAM Events of Overdue and KPI are to be raised.
6. In the **Based** on drop-down list, select either **Overdue Analysis** or **KPI Analysis**.
   a. If you select **Overdue Analysis**, the **Select Overdue Slot** button appears. This is used to select the Overdue slot and the event associated with it.
   b. If you select **KPI Analysis**, then the **Select Slot** button appears. This is used to select the KPI name, attached KPI data points and the event associated with it.
7. Select the date range for **Event** execution using the **Effective From** and **Effective To** options.
8. Click **Attach Event** to trigger the Workflow when the BAM Report is being processed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

BAM Workflow

To create a BAM workflow

1. In the **Enterprise Console**, click the **Menu** button, and then click Workflows. The **Workflows** page appears.
2. On the action bar, click **New**, and then click **BAM**. The **New BAM Workflow** wizard appears.
3. In the **Title** box, type a name for the workflow, and in the **Description** box, type a description for the workflow.
4. Select the BAM event type by which the newly created workflow has to be triggered. You can also do this using the **Associate** option in the Enterprise Console site.
5. Select the date range for event execution using the **Effective From** and **Effective To** options.
6. Click **Save & Continue** to design the workflow. The workflow is created, and the **Workflow Options** wizard appears.

Usage of BAM Workflow

After creating the BAM workflow, the following XML variables get created automatically:

- **SKEventData**: Contains the values related to Overdue or KPI(s) with the Event Types.
- **BAM**: Contains the values related to the BAM Data (Overdue/KPI(s)) with the runtime and threshold values.

When the user attaches the BAM Event to the workflow, the XML Variables get updated with the appropriate data and can be used further in the workflow.

Example to Configure BAM Alerts

Example:

An Administrator for the Travel Desk Process needs to monitor the following:

- The count of domestic bookings that exceed the threshold value defined by him. This can be achieved by setting BAM alerts.
- The total number of pending workflows or the number of pending workflows for a specific period.

The first scenario can be achieved by creating a KPI with the data point ‘Domestic’ with the Threshold Value set. The second scenario can be achieved by setting the threshold value for the Overdue total count or for a specific period of time.

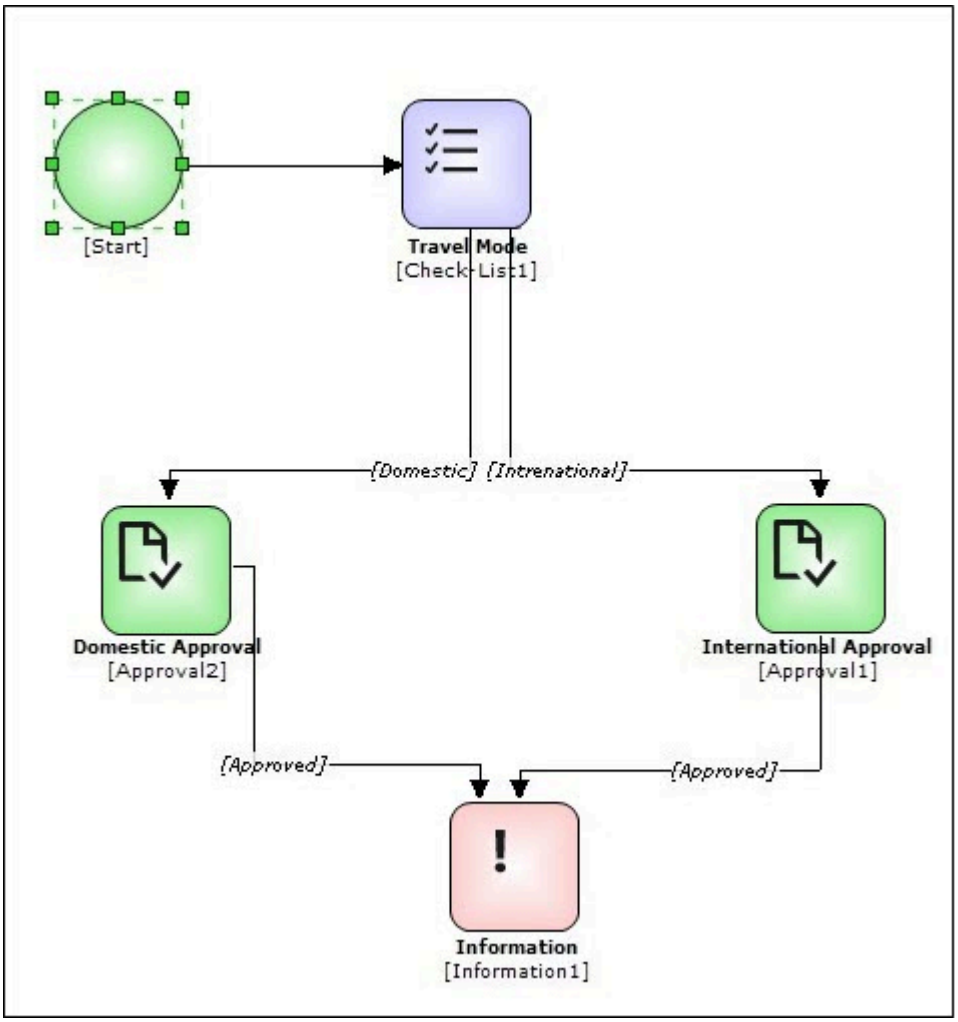
BAM Alert Settings

The following example demonstrates BAM alert settings for a sample travel desk process workflow.

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**. The **Workflows** page appears.
2. On the action bar, click **New**, and then click **BAM**. The **New BAM Workflow** wizard appears.
3. In the **Title** box, type a name for the workflow, and in the **Description** box, type a description for the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click **Save & Continue**. The workflow is created, and the **Workflow Options** wizard appears.
5. Select **Design the Workflow now**, which is the default option, and then click **Finish**. The **Process Designer** appears.
6. Design the workflow. For example, *Travel Desk Process*.



7. Set **Activity Properties** for all activities. Refer *Developer Guide* to configure.
8. Click **Publish** to publish this Workflow. The message about successfully publishing the workflow appears.
9. Click **Close**.
10. In the Workflow list page, right-click the *Travel Desk Process* workflow, and then click **Design Workflow**. The **Process Designer** appears.
11. Click **Settings**, and then click **BAM Configuration**. The **BAM Configuration** window appears.

Enabling and Disabling SOA Folder

To set the threshold value in Overdue level

1. Click the **Overdue Analysis** tab to set the threshold value for the total pending count or for a specific period of time.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. In the **Total Pending Workflows Threshold** drop-down, set the threshold value for total pending workflows. In this example, set the threshold value as 2 for the total pending workflows.
3. In the **Slot Period** drop-down, select the slot period for defining the threshold values in each slot. In this example, define the Slot1 period as 1 Hour.
4. In the **Threshold** drop-down, select the threshold value. In this example, enter a threshold value for the number of pending Workflows for the Slot1 period as 2.
5. Click **Save**.

These settings display a graphical view of the pending workflows against threshold.

Create KPI Data Points

To create KPI Data Points

1. Click the **KPI Data Points** tab to define the data points that monitor **Overdue Analysis**. The **KPI Data Point(s) Data Point** window appears.
2. Click **New**. For this example, create '**Domestic**' and **'International**' Data Points.

To create Domestic Data Point

1. In the **Name** box, enter the name for the Data Point as Domestic.
2. In the **Condition based on** drop-down list, select **Activity Inlink Condition**.
3. In the **If Activity** drop-down list, select **Approval2**.
4. In the **has started because of Incoming Link having Condition** drop-down list, select **IN**.
5. Check **Domestic** from the list of check boxes.
6. Click **Insert** to insert the condition in the Condition text area.
7. Click **Save**.

To create International Data Point

1. Click **New.**
2. In the **Name** box, enter the name for Data Point as International.
3. In the **Condition based on** drop-down list, select **Activity Inlink Condition**.
4. In the **If Activity** drop-down list, select **Approval1**. (Approval1 is for International)
5. In the **has started because of Incoming Link having Condition** drop-down list, select IN.
6. Check **International** from the list of check boxes.
7. Click **Insert** to insert the condition in the Condition text area.
8. Click **Save**.
9. The two Data Points are created.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create KPI(s) and Set the Threshold Value

To set the threshold value in KPI Level

1. Click the **KPI(s)** tab to define thresholds for the created KPI Data Points.
2. Click **New KPI**.
3. In the **Name** box, enter the name Travel Desk KPI for the KPI.
4. Click **Add New** to add a Domestic Data Point.
5. In the **KPI Data Point** drop-down, select Domestic data point to attach.
6. In the **Threshold** drop-down, select Value, and then enter 5 in the text box.
7. Click the **Insert** icon.
8. Click **Add New** to add International Data Point.
9. In the **KPI Data Point** drop-down, select International data point to attach.
10. In the **Threshold** drop-down, select **Not Set**.
11. Click the **Insert** icon.
12. Click **Save**.

BAM Alert Configuration Settings

There are the following three **Alert Configuration** settings:

- **Rule**: Create rules for both Overdue and KPI based on the threshold value set.
- **Time**: Set the time for the alert to be triggered.
- **Action**: Set an action, if the rule is satisfied.

BAM Rule Settings

To create a rule for pending Workflow (Overdue)

1. In the **Alert Configuration** tab, click **Rule** to create rules for both Overdue and KPI. By default, the **Rule Settings** window appears.
2. Check **Total Workflow count is**, and then select **GreaterThan**.
3. Check **Count in each slot is**, and then select **GreaterThan**.
4. Click **Select Slots** to set the rule for slots. The **Select Slot** dialog box appears.
5. Select the slot, and then click **OK**.

To creating rule for specific type of work (KPI)

1. Check **Count in each datapoints of KPI(s) is**, and then select **GreaterThan**.
2. Click Select KPI(s) to set the rule for KPI(s) that need to be monitored. The Select KPI(s) dialog box appears.
3. Select the KPI, and then click **OK**.
4. Click **Save**. A message about successfully creating alert appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Click **OK**. This alert is triggered when the BAM report is being processed.

BAM Time Settings

To configure time settings for a BAM workflow

1. In the **Alert Configuration** tab, click **Time** to set the time preference for the alert to be triggered.
2. Select the **Always** option to trigger an alert every time the BAM Report is being processed.
3. Click **Save**. A message about successfully creating alert appears.
4. Click **OK**.

BAM Action Settings

To configure action settings for a BAM workflow

1. In the **Alert Configuration** tab, click **Action** to set the notification email when the rule is triggered.
2. Check **Send an Email to**, and then type the recipient's Email Id(s). Alternatively, click **Select** to select Email Id(s) from the User Lookup. Multiple email addresses can be specified by separating the emails with semicolons.
3. Check **Send the chart(s) as a mail attachments** check box to be embedded in the mail.
4. Type a personalized message as email content to be sent along with the mail.
5. Click **Save**. A message about successfully creating alert appears.
6. Click **OK**.

BAM Events in Enterprise Console Site

To associate a BAM event to trigger a workflow

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**. The **Workflows** page appears.
2. Select the workflow to be associated.
3. On the action bar, click **Associate**. The **New Association** wizard appears.
4. Alternatively, select and right-click the workflow to be associated. Click **Create Associations**.
5. Click **BAM** to associate the workflow with BAM events.
6. In the Workflow drop-down list, select the **Travel Desk Process** workflow.
7. In the **Based On** drop-down list, select either **Overdue** Analysis or KPI Analysis. In this example, select **KPI Analysis**.
8. Click **Select Slot**.
9. Select the **Travel Desk KPI** option.
10. In the **Domestic** drop-down list, select **GreaterThan**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

11. Click **Select**.
12. Select the date range using the **Effective From** and **Effective To** options.
13. Click **Attach Event**. A message about successfully associating the event appears.
14. Click **OK**.

The event gets associated to the workflow. When the **BAM Report** of selected workflow is being processed or the event is raised, the workflow gets triggered.

Trigger a BAM Alert

You can trigger an alert by processing the BAM Report manually, or by clicking **Process Now** in Basic Configuration, or by scheduling the BAM Report process.

To trigger an alert manually

1. In the **BAM Configuration** window, click **Basic Configuration**.
2. Click **Process Now** to trigger the alert manually. A message about successfully completing the BPM updating process appears.
3. Click **OK**.

Business Activity Monitoring and Reports

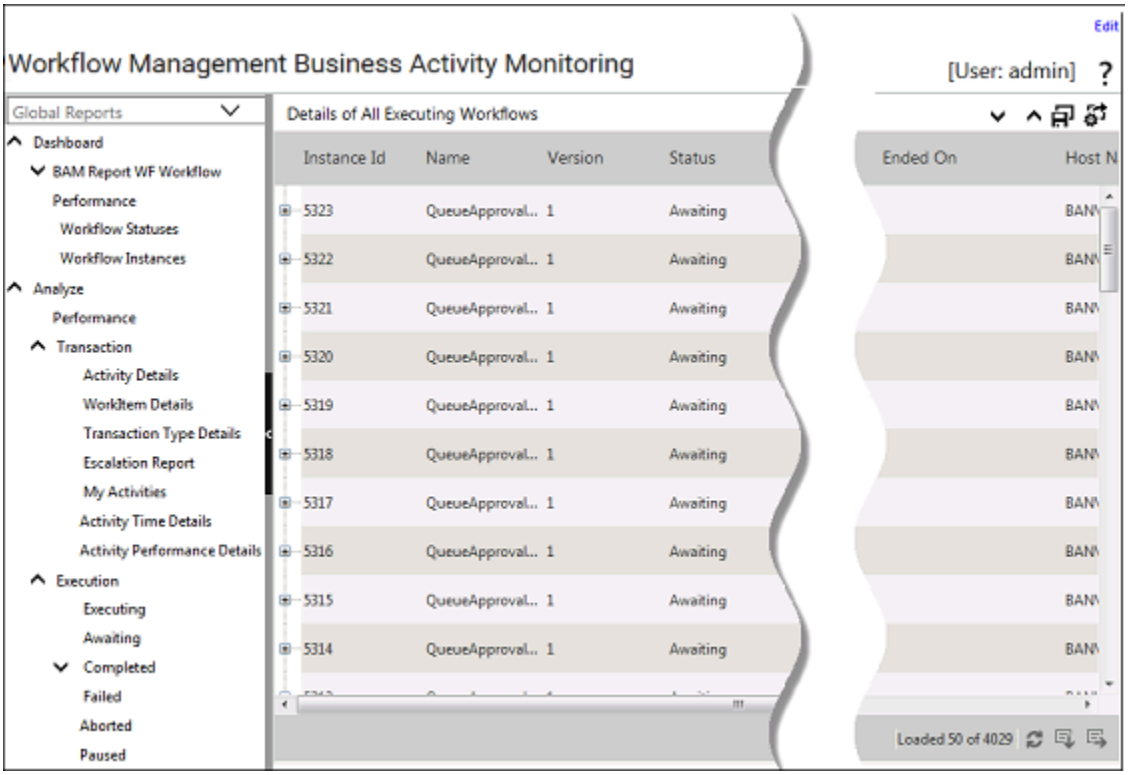
The BAM Control provides extensive reporting capability and true BAM functionality. It provides users with several out-of-the-box reporting and activity monitoring views. In addition, it allows users to configure Data Points and KPIs for comprehensive business activity monitoring. It is one of the crucial controls in AVEVA Work Tasks.

You can see a three-dimensional view of the following BAM Reports by rotating the axis of the graphs:

- KPI Bar Chart
- KPI Pie Chart
- Overdue Analysis
- Workflow instances
- Workflow status

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Default Report View



The BAM Control page displays the following default report view when the Control is executed. You can set the application name and workflow name to the respective property of the BAM Control. If no workflow name is set then the BAM Reports are shown for the entire application, covering all the workflows in it. This constitutes the "Global Reports". At the top right of the Report window are the [+] and [-] icons to expand and collapse all the nodes respectively.

Report Type Tree View

The Default Report window represents the general layout of the BAM Control user-interface, which it shares with all other report windows. The user-interface elements and functionality described in this topic apply to all the other report windows. The window has the **Workflow** list at the upper left. It lists all the workflow names in the application along with the "Global Reports" option. When any workflow name is selected from the list, all the reports will display information related to the selected workflow.

The Report Type tree has the following nodes:

- **Dashboard**: This report type represents the activity monitoring dashboard of the BAM Control. It has two dashboard views, **Workflow Status** and **Workflow Instances**.
- **Analyze**: This report type represents a number of out-of-the-box reports grouped under two sub-types, **Transaction** and **Execution,** each with a set of reports.

Note: The BAM tree in the Business Activity Monitoring interface, by default, shows a one level expanded view instead of a fully expanded tree view.

The report view is on the right of the window. It presents the report information in several columns, with the column displayed depending on the type of report selected. You can right-click a column name to open the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

shortcut menu, where you can perform report list management operations such as sorting and grouping on the columns.

- **Sort Ascending:** Select this option to sort the list on this column in the ascending order
- **Sort Descending:** Select this option to sort the list on this column in the descending order
- **Group By This Field:** You can use this option to group the list by this column
- **Group By Box:** You can use this option to display the Group By box at the top. You can drag-and-drop a column header in this box to group the list by that field. This is an alternative way to group the list.
- **Remove This Column:** You can use this option to remove the selected column
- **Best Fit:** You can use this option to change the column width to best fit
- **Filter Bar:** You can use this option to turn on or turn off the filter bar
- **Select Columns:** You can use this option to expand a menu with all the column headers as shown in the following image. Each column name has a check box that you can use to select it or to remove the selection. After making any change to the column selection, you can click the **Apply Changes** option for the new settings to take effect. You can click the **Reset** option.

Save Layout

You can customize the view and save the layout by clicking the **Save Layout** icon. This opens a window where you can specify a name with which the customized report layout will saved.

You can enter the file name for the saved layout in the **Layout Name** box. After specifying the name, click **OK** to save the layout. You can click **Cancel** to close the window without saving the layout. Any layout saved in this window will be added under the node corresponding to the report type being saved as a custom layout (for example, Executing). You can select it from here to view the report in the customized layout.

In addition to the other icons, a **Delete** icon is displayed when you open a custom layout. You can click the delete icon to delete the open custom layout.

Export Settings

Use the **Export Settings** icon to set the number of records to export.

1. When you click the **Export Settings** icon, the **Export Settings** dialog box appears.
2. Enter the number of records that you want to export.

   You can enter only valid positive integer values.
3. Click **Update**.

   The Reports grid refreshes and displays the number of records entered in the **Export Settings** dialog box.
4. Click the **Export Grid** icon to export the report.

When you enter a value for export, the number of records exported will be the first record to the number entered. For example, if the grid contains 25 records and you want to export 12 records, records from 1 to 12 will be displayed in the refreshed grid and can be exported. You cannot enter a value range for export. Also, if the number entered exceeds the maximum records present, the highest number of records present will be exported.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Export Grid

You can export the contents of the report to different formats using the Export grid tool at the lower right of the window.

Clicking the export tool opens the export type selector, which lists all the available types with radio buttons to select them.

There are three sets of options. The first has the **Export root table,** which can be clicked to select the root table for export. The second set lists all the common file formats, such as HTML, PDF, XML, Excel, TIFF, RTF, and TEXT. The last set has the **Portrait** and **Landscape** options to select the orientation of the exporter report. After making the export settings you need to click Export now to export the file.

Escalation Report:

Description:

The Escalation Report gives in-depth details about escalations. It shows the user name, date, timeout settings, escalation type (Recurring or Non-Recurring), task details, and workflow and application details. The report has a drill down feature which shows the **Process Execution** view for the instance. Double-click the data to view the Process execution details.

Location:

On **Enterprise Console**, clicking the **left <Analysis>** button brings up the **Business Activity Monitoring** (BAM). In the BAM Left Panel Tree view, click the **<Analyze>** node. Under this, you can locate the **<Transaction** > node which has the **Escalation Report** option. See the following image to identify the report.

Report Parameters:

By selecting the 'From' and 'To' dates, the user can get the details of the escalations that occurred for the given date range. To see the 'Process execution view' for the instance, double-click the data.

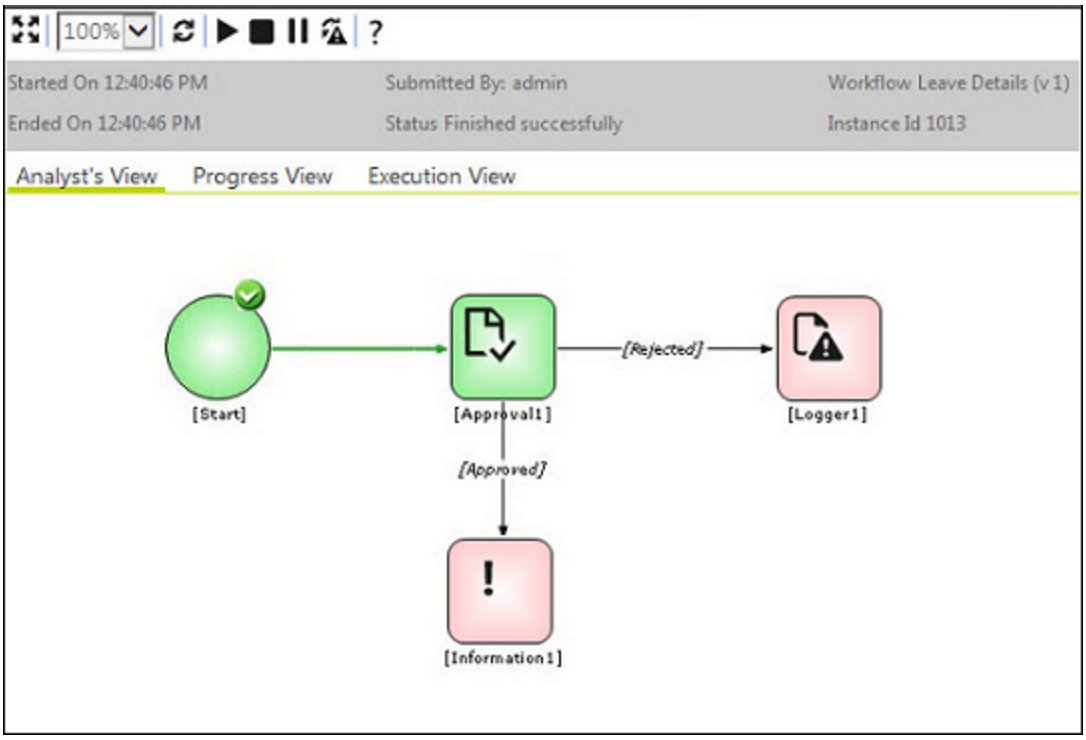
Report view:

It shows the user name, date, timeout settings, escalation type (Recurring or Non-Recurring), task details, and workflow and application details. Escalation report also has the column filter features available in other reports.

Double-click the data for the instance to view the **Process execution** view.

Process execution view:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Scenario:

John Smith works as the Administrator for 'XYZ' organization and wants to monitor the Escalations that occurred in the workflow for a given date range. By using the escalation report, Smith can get the details of the same and can take the necessary steps.

BAM Dashboard View

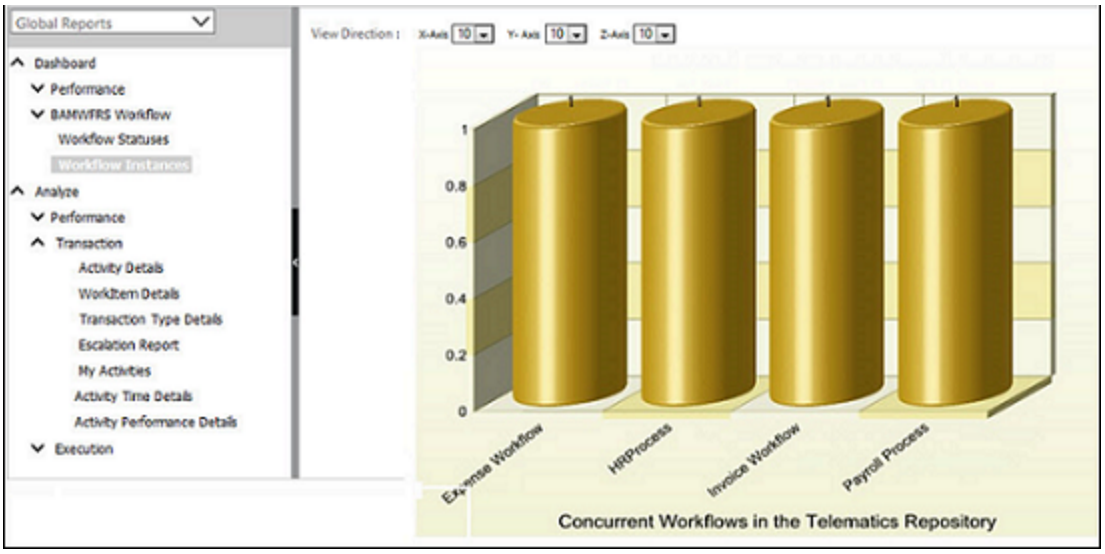
The **Business Activity Monitoring** Dashboard presents an activity monitoring dashboard to the users. It has two default dashboard views - **Workflow Statuses** and **Workflow Instances**, which retrieve workflow execution data dynamically and display it in the respective charts.

The dashboard also shows Overdue Analysis reports if overdue analysis configuration has been set for the workflow. For more information, refer to the BAM Configuration and Overdue Analysis Reports.

Workflow Statuses - This view shows a pie-chart representing the status of workflows being executed by the application.

Workflow Instances - This view shows a pie-chart representing the workflow instances being executed in the application.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



BAM Execution Reports

For token-based repositories such as AIM repository, Azure Active Directory repository, and AVEVA Connect repository, the Human Activities assigned to **Workflow Initiator** will not receive work items in the Inbox for the following events:

- Scheduler
- File Watcher
- BAM
- ArchestrA Event
- Message Queue
- Logic App Event (only for AVEVA Connect)

For non-token-based repositories, the **initiator** will be the user who executed the workflow or the one who created the event.

Execution Reports

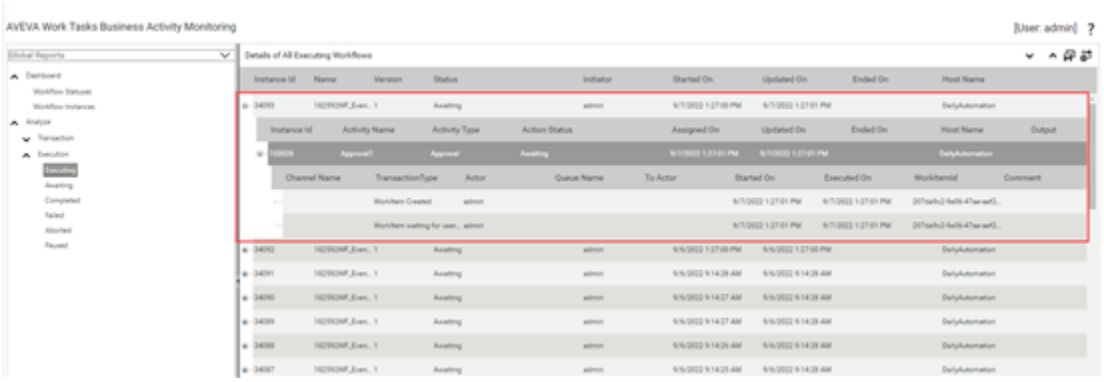
This type of report presents workflow execution information related to execution status. There are four types of reports in this group.

- Executing
- Awaiting
- Completed
- Failed
- Aborted
- Paused

Executing

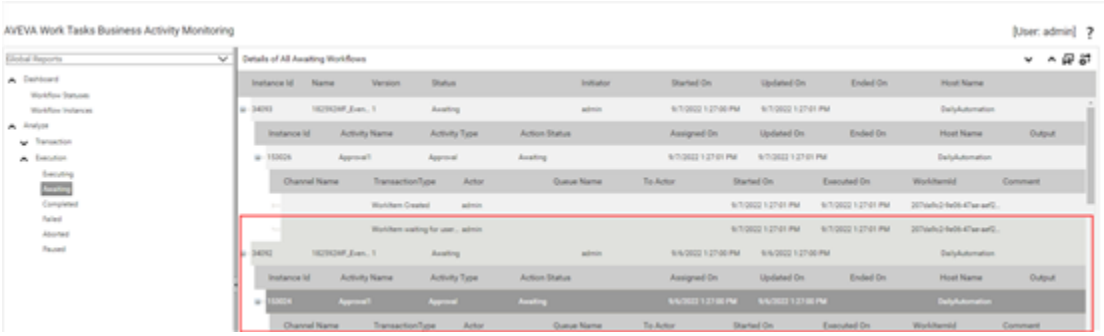
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

This report presents details related to executing workflows. The following image shows the **Executing** report. It has been split into two for convenience.



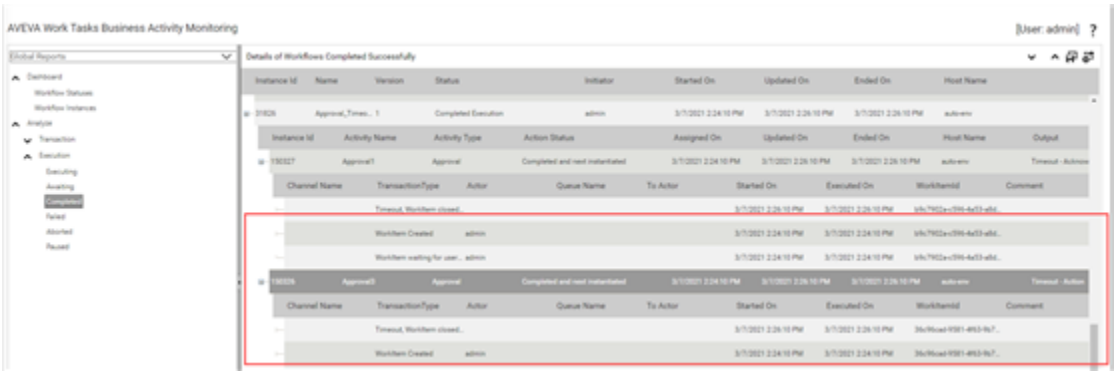
Awaiting

This report presents details related to workflows awaiting execution. The following image shows the **Awaiting** report. It has been split into two for viewing convenience.



Completed

This report presents details related to completed workflows. The following image shows the **Completed** report view. There are no rows in the report because there are no completed workflows to represent.



Failed

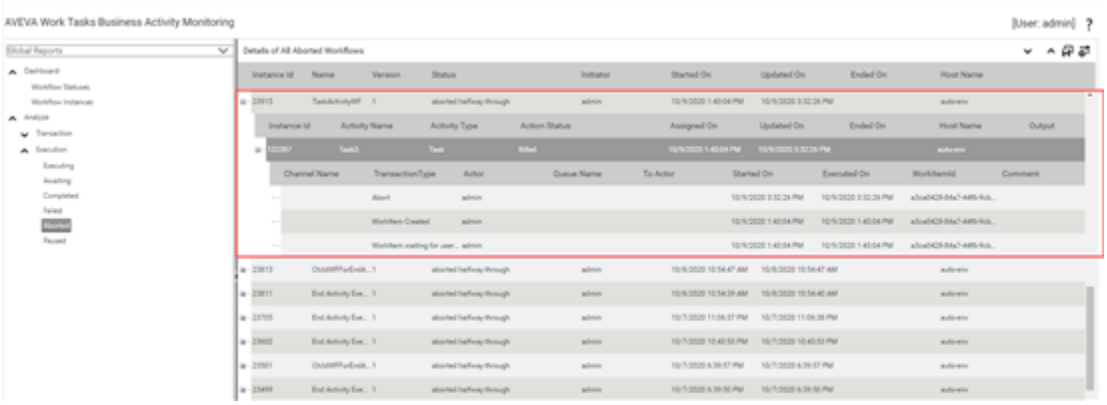
This report presents details related to the failed workflows. The following image shows the **Failed** reports.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Aborted

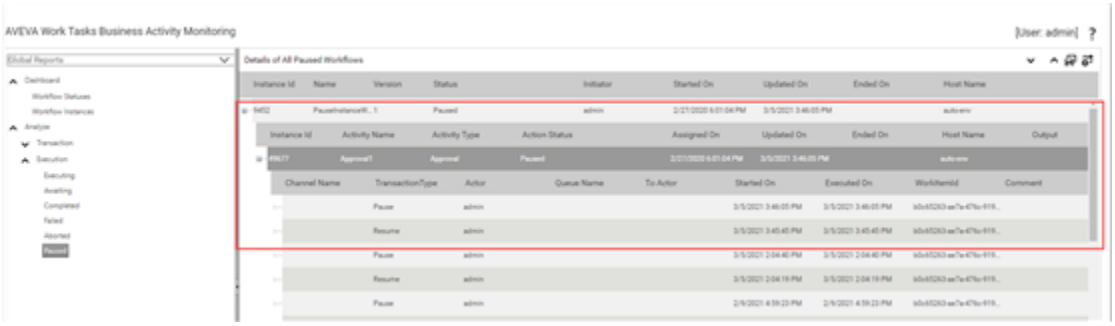
This report presents details related to the aborted workflows. The following image shows the **Aborted** report view.

Quickflows completed with errors is listed under **Aborted** instead of getting listed under **Failed**.



Paused

This report presents details of the paused workflows. The following image shows the **Paused** report view.



BAM Analyze Reports

The Analyze reports constitute the reports available out-of-the-box in AVEVA Work Tasks. It has two sets of reports, Transaction and Execution.

The Analyze section also shows **Performance Analysis** reports if the performance analysis configuration has been set for the workflow. For more information, refer to BAM Configuration and Performance Analysis Reports.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

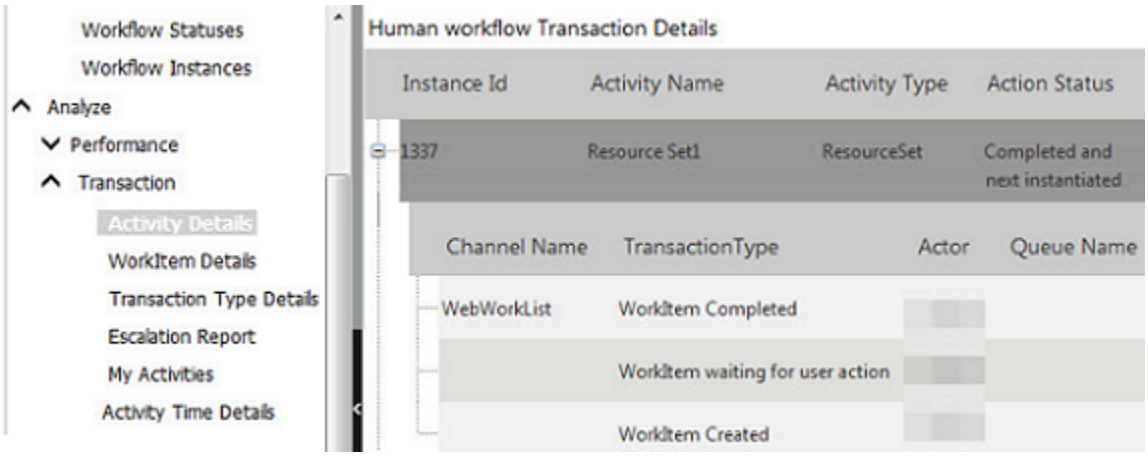
Transaction Reports

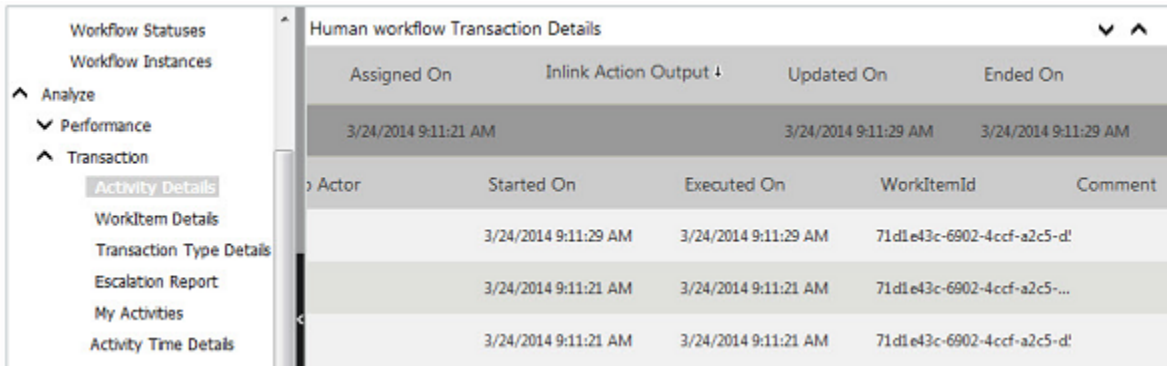
These reports present workflow execution information related to transactions in the workflow. There are seven types of reports in this group:

- Activity Details
- Work Item Details
- Transaction Type Details
- Escalation Report
- My Activities
- Activity Time Details
- Activity Performance Details

Activity Details

This report presents details related to activity-level transactions. The following image shows an **Activity Details** report. It has been split into three for convenience.

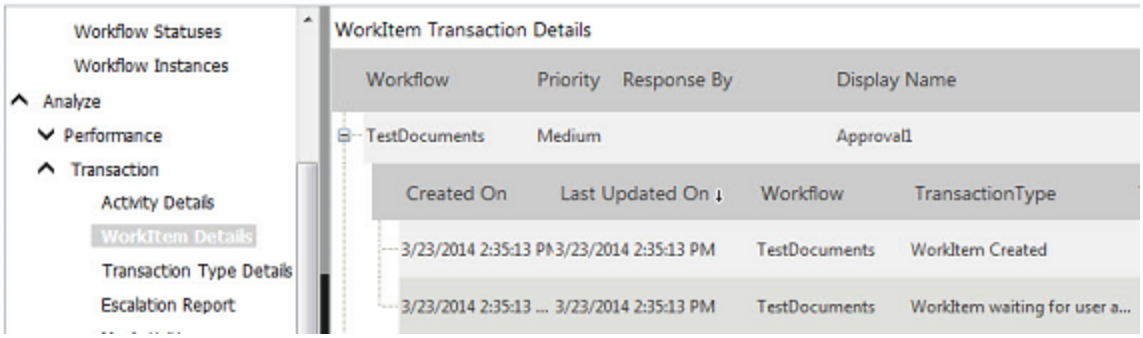


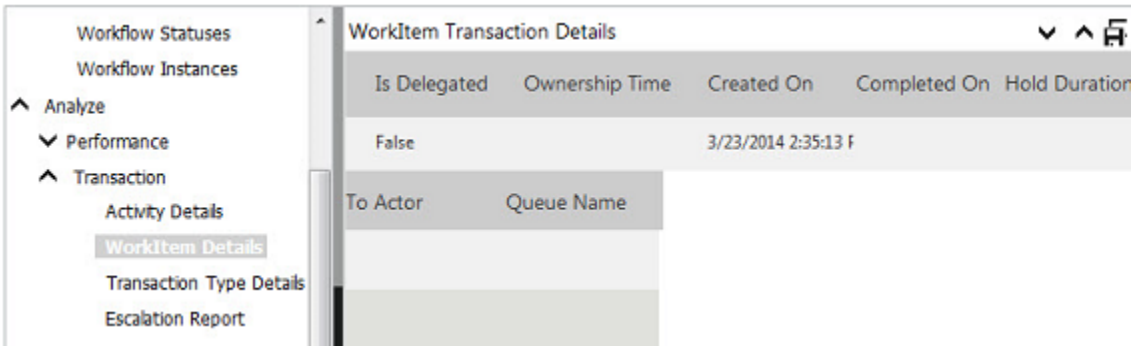


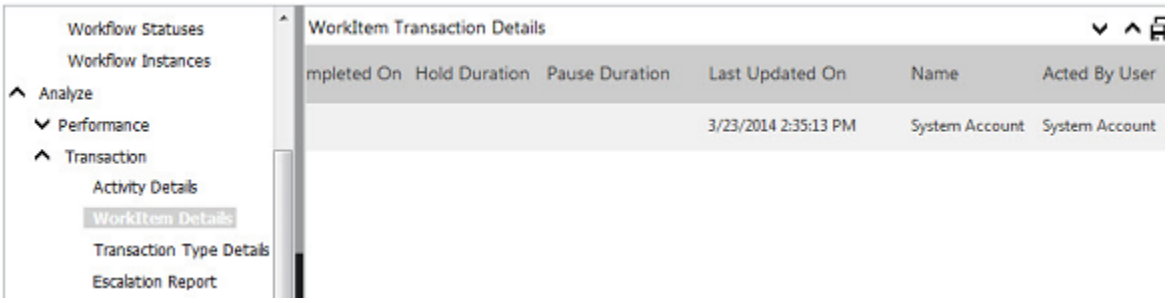
Work Item Details

This report presents details related to work item-level transactions. The following image has been split into three for viewing convenience.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

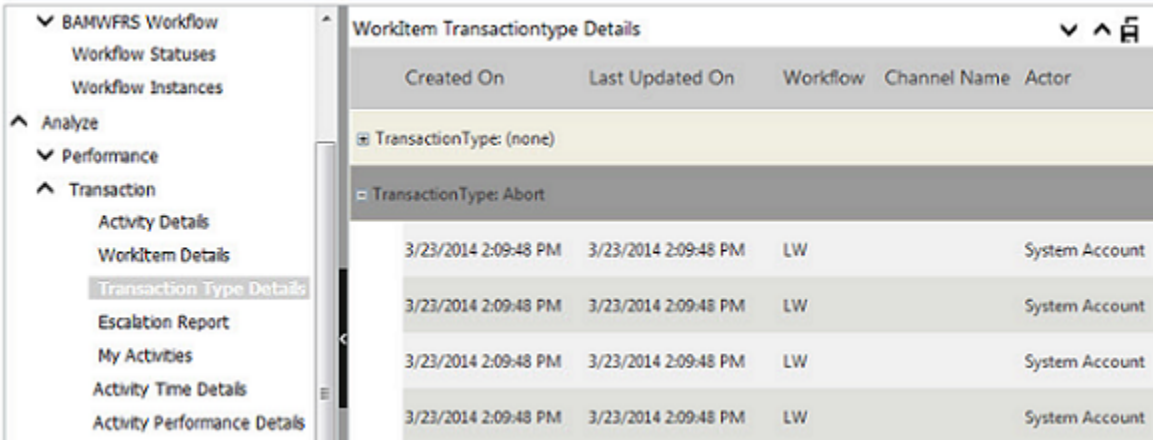






Transaction Type Details

This report presents details of different transaction types as shown in the following example.



Escalation Report

Description:

The Escalation Report gives in-depth details regarding escalations. It shows the user name, date, timeout settings, escalation type (Recurring or Non-Recurring) and task, workflow, and application details. The report has

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

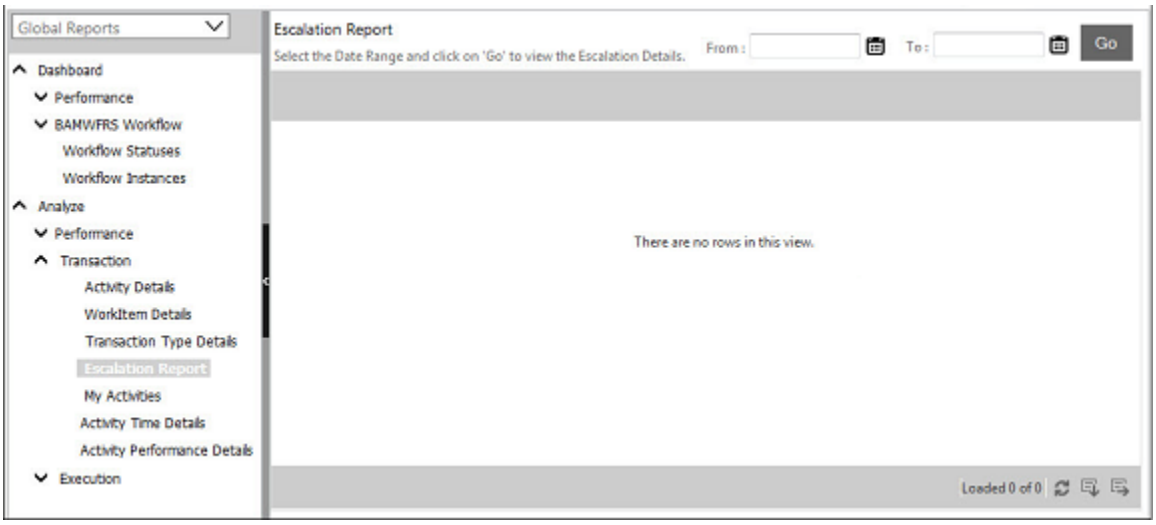
a drill down feature which shows the Process execution view for the instance. Double-click the data displays the Process execution view.

Location:

Selecting Reports from the **Enterprise Console** menu displays the **Business Activity Monitoring** (BAM) interface. In the BAM left panel tree view, click **Analyze** and then **Transaction**. Finally, click **Escalation Report**.

Report Parameters:

By selecting the 'From' date and 'To' date, one can get the details of the escalations that occurred for the given date range. You can see the Process execution view for the instance by double-clicking the data.



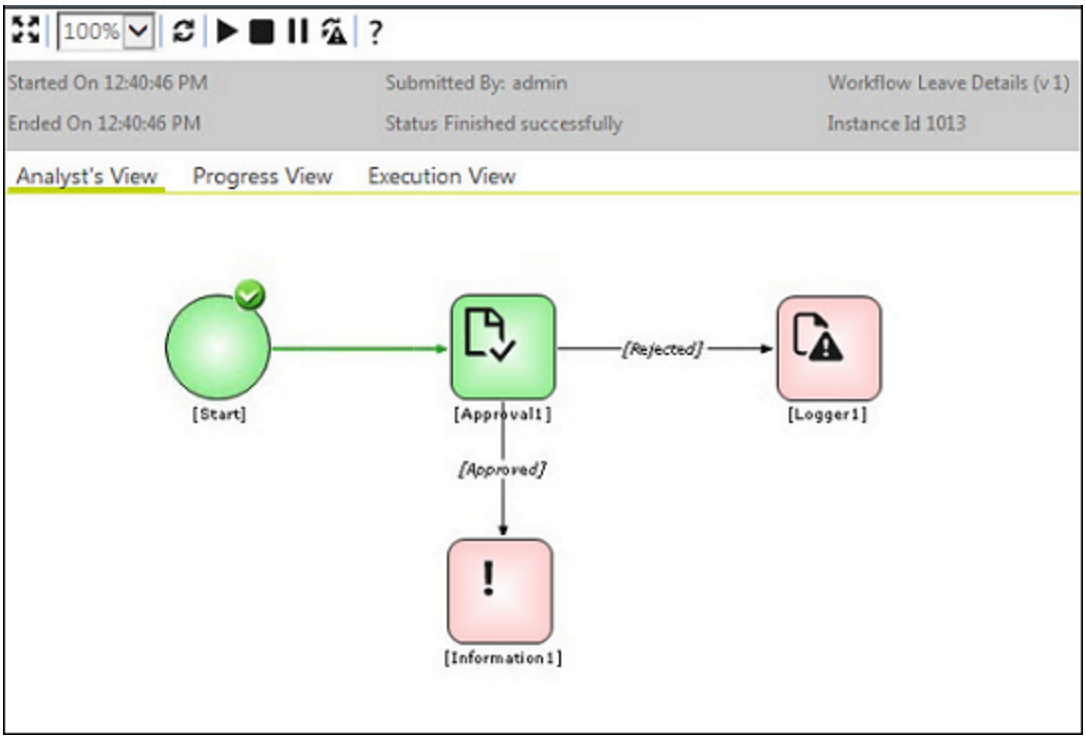
Report view:

It shows the user name, date, timeout settings, escalation type (Recurring or Non-Recurring) and task, workflow, and application details. The **Escalation Report** has the column filter feature available in the other reports.

Double-clicking the data for the instance displays the Process execution view.

Process execution view:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Scenario:

John Smith works as an Administrator for 'XYZ' organization and wants to monitor the escalations that occurred in the workflow for a given date range. By using the Escalation Report, they can get the details of the same and take the necessary steps.

My Activities

Description:

Do you ever want to see the activities that have been acted upon? The My Activities option is useful to keep track of the activities that you have acted on. By default, AVEVA Work Tasks keeps a copy of workflow history that you have acted on in My Activities. Based on security rights, the My Activities option is displayed.

Location:

Selecting Reports from the Enterprise Console menu displays the Business Activity Monitoring (BAM) interface. In the BAM left panel tree view, click Analyze and then Transaction. Finally, click My Activities.

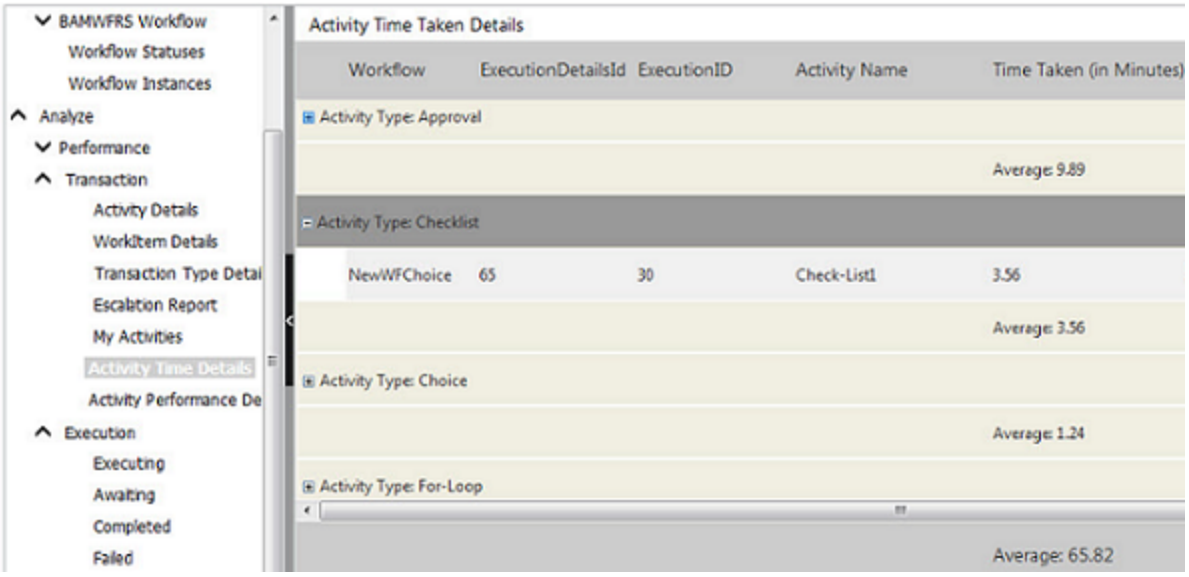
My Activities will give in-depth details regarding activities. It shows the Instance Id, Activity Name, Activity Type, Action Status, Assigned On, Inlink Action Output, Updated On, Ended On, Output, and Workflow details.

It has a drill-down feature which shows the 'Process execution view' for the instance. Double-clicking the data brings up the Process execution view for the workflow.

Activity Time Details

This report presents details related to **Activity Time** transactions, as shown in the following image. The report displays the time taken by each activity and its average time. This is related to all the Activities.

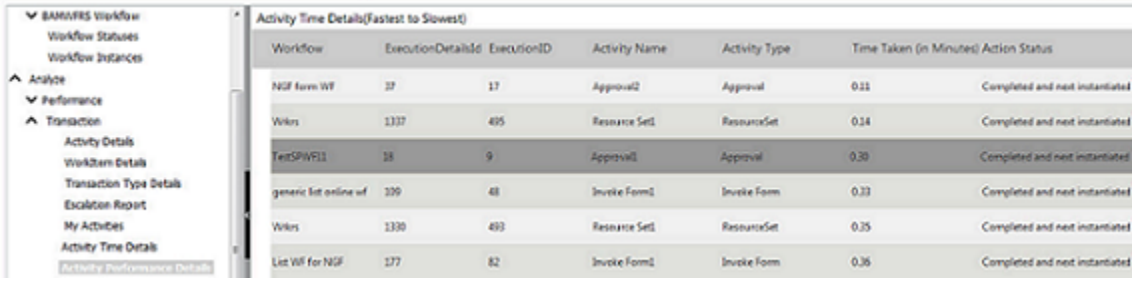
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Activity Performance Details

This report presents details related to Activity Performance transactions, as shown in the following image. This is only related to the **Human Activities**.

The report displays in descending order, from Best Time (least time taken to execute a particular activity) to Slow Time (most time taken to execute a particular activity).



BAM Process Execution View

The **Process Execution Views** show the workflow execution status graphically. You can view the **Execution View** window by double-clicking a top level row in any of the reports. The View represents the workflow up to the activity or execution status where the View was opened.

The toolbar at the top of the Execution View window has the following tools:

- **Full Screen** - Click this tool to toggle between normal and full-screen modes
- **Zoom** - Use this tool to zoom in and out of the process definition image
- **Refresh** - Use this tool to refresh the image
- **Resume paused workflows** - Use this tool to resume paused workflows
- **Abort executing workflows** - Use this tool to abort workflows that are being executed
- **Pause executing workflows** - Use this tool to pause workflows that are being executed
- **Resume workflows finished with errors** - Use this tool to resume paused workflows

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Tip: The Process Execution Views are very useful in navigating through large process definitions. You can click any activity in the View window to open the process definition in the Process Designer, at that point.

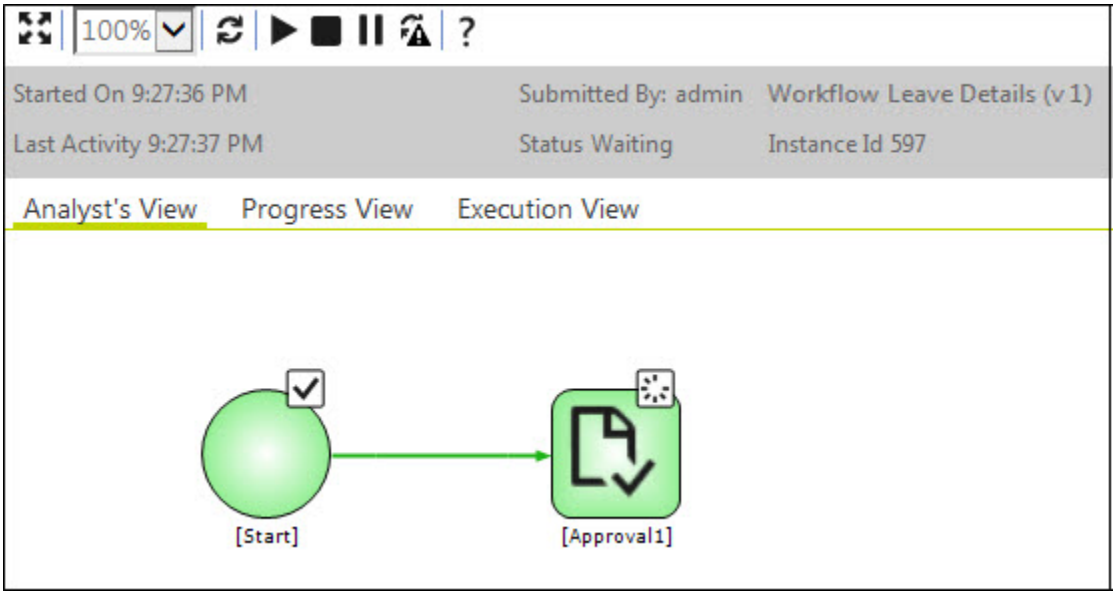
Note: A green circle, with a white check mark superimposed, is used to denote a completed activity or process. It is displayed on the top edge of the activity icon for all completed activities. This icon is displayed at the top right corner of the page on the title bar to denote a completed process.

There are three tabs at the bottom to navigate between the following three views:

- Analyst's View
- Progress View
- Execution View

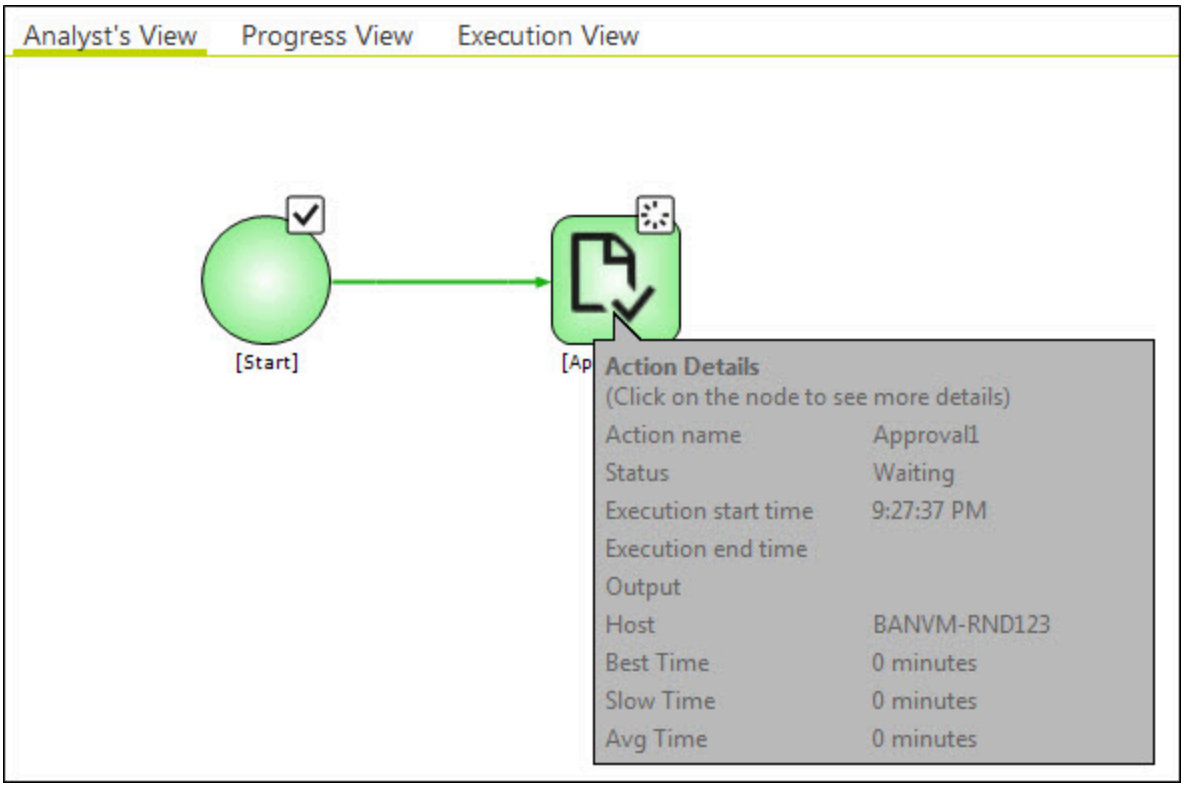
Analyst's View

The Analyst's View is a simplified view of the process design intended for end-users. It shows the process model that was saved as the Business Analyst's View after the business process modeling was completed and before the automation steps were added in the Process Designer. At this stage, the model would have been saved to a file. This file should be assigned to the **Analyst's Process Model Filename for Execution View** property of the Start activity to enable this view. In the following example shown, the Analyst's View has been opened by double-clicking the first row, which has been highlighted.



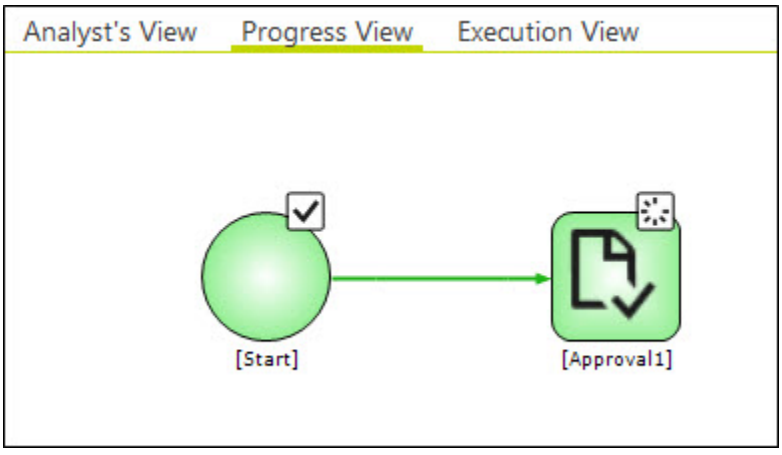
When you hover the cursor over a workflow activity in the Process execution view screen, it shows the Action Details, Best Time, Slow Time, Average Time taken by the activity for a workflow instance, as shown in the following image.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Progress View

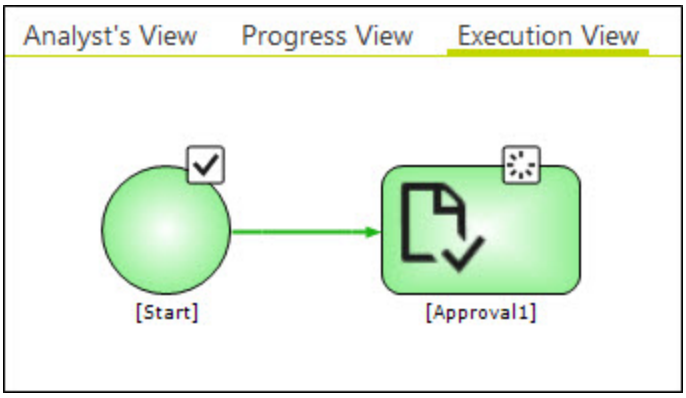
The **Progress View** shows the workflow progress on the **Process Diagram**, up to the point that the **Execution View** is selected. It consists of the execution view mapped on to the Process Diagram. You can click on a completed activity to view the **Step Details Window**. You can view the step details, variables, contents, and content (raw content passed to the workflow) using the corresponding tabs. The links that have already been traversed are represented by thick lines.



Execution View

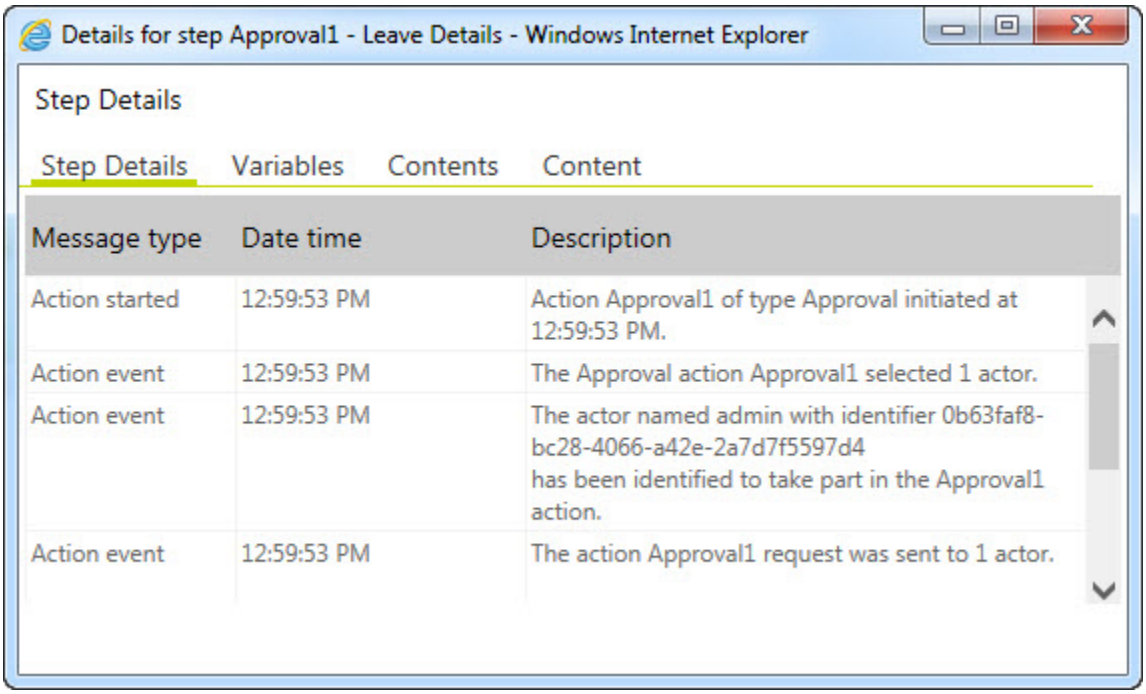
The Execution View shows the workflow execution status up to the point that the **Execution View** is selected. This View is identical to the Graphical View of Workflow Execution that was available in the Report Control of the earlier versions.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



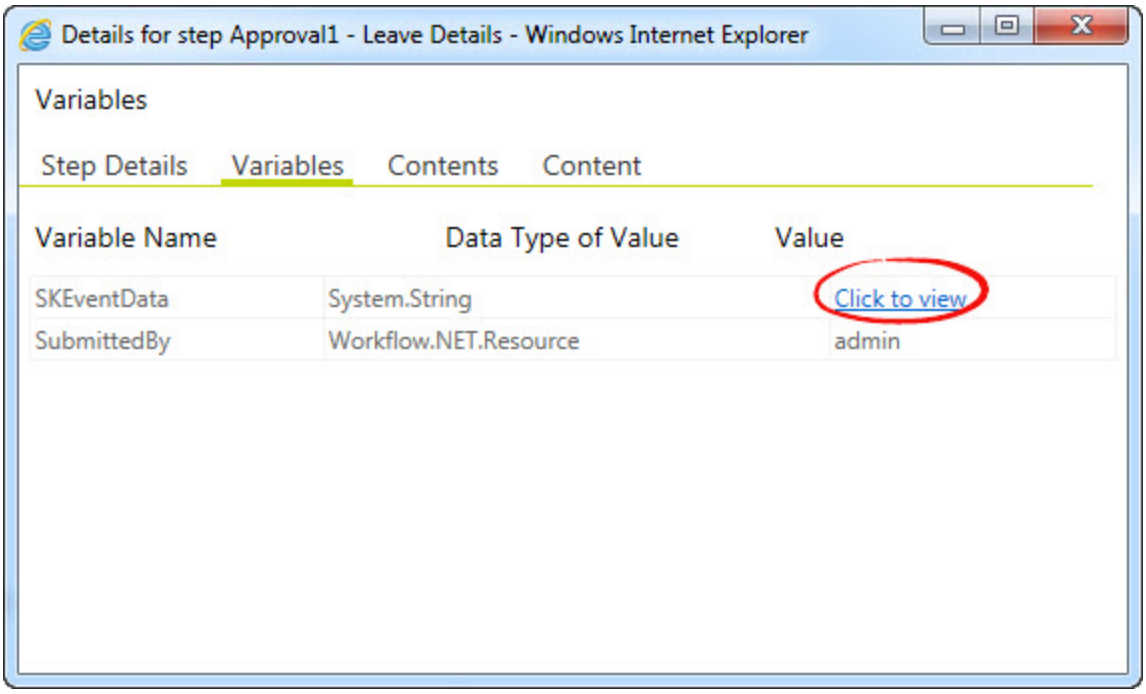
When you click the **Approval** activity, the **Details** page appears and displays the Step Details of the activity. The details screen shows information under the following five tabs - **Step Details**, **Variables**, **Contents**, **Content**, and **Submitted Form Details**.

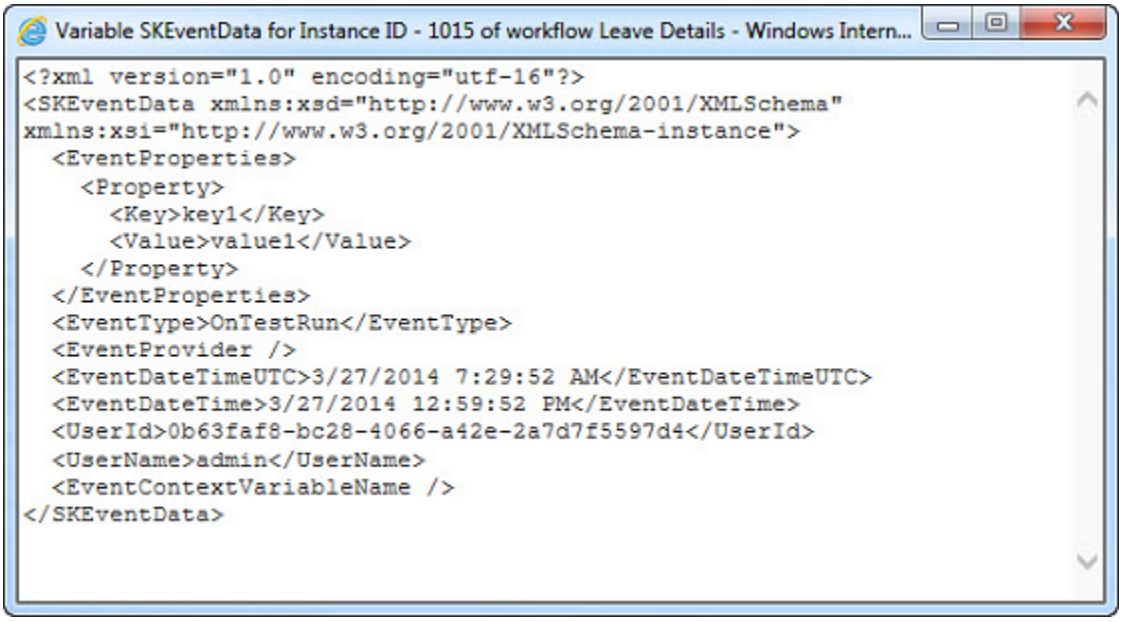
In the **Step Details** tab, the user can view all the details related to the **Approval** activity, such as the time of the action, type of action, name of the actor to whom this action has been assigned to, and the action performed by the actor



When you click the **Variables** tab, the screen showing the details of all the variables used in this activity will be displayed. You can view the runtime values of the XML variable by clicking the **Click to view** link.

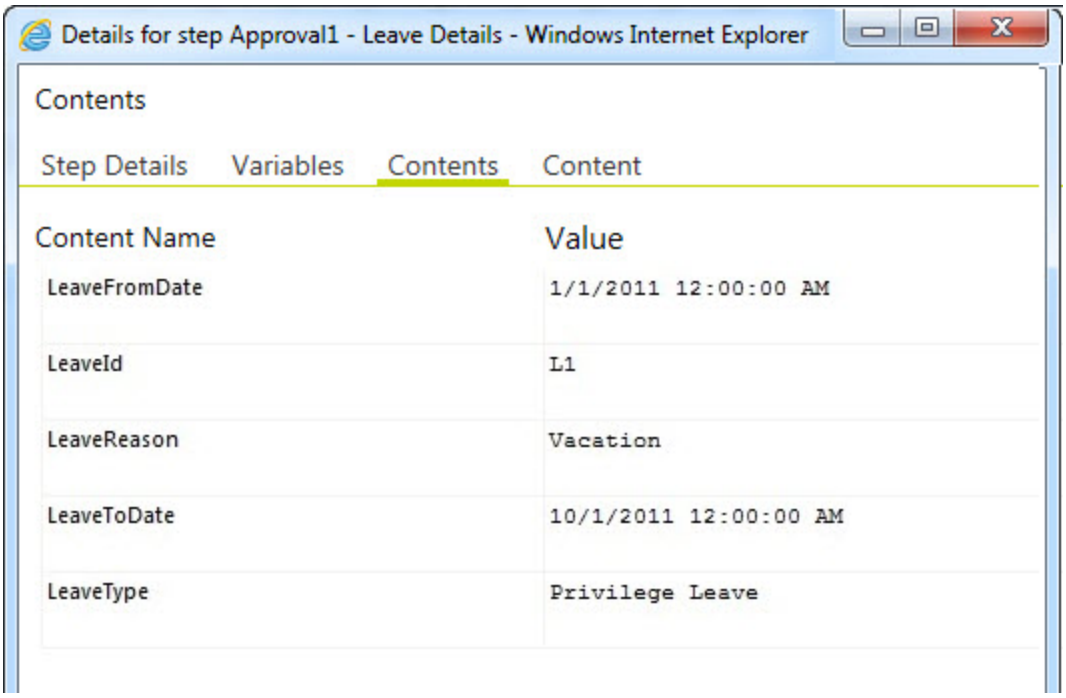
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



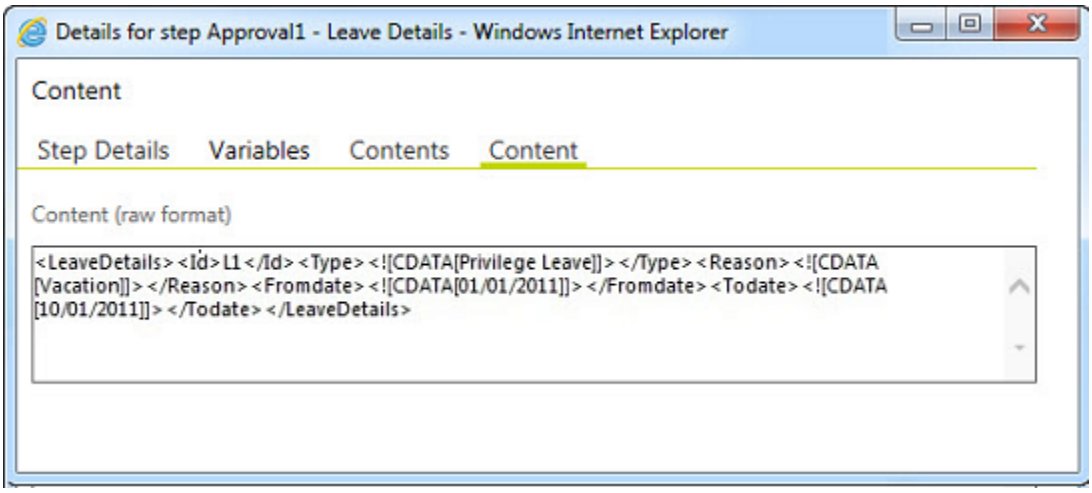


When you click the **Contents** tab, the contents specified in the activity will be displayed. The Contents are the data which can be passed to the workflow while calling Client. Execute API as an XML. They have to be declared in the Start activity along with the Xpath expression.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

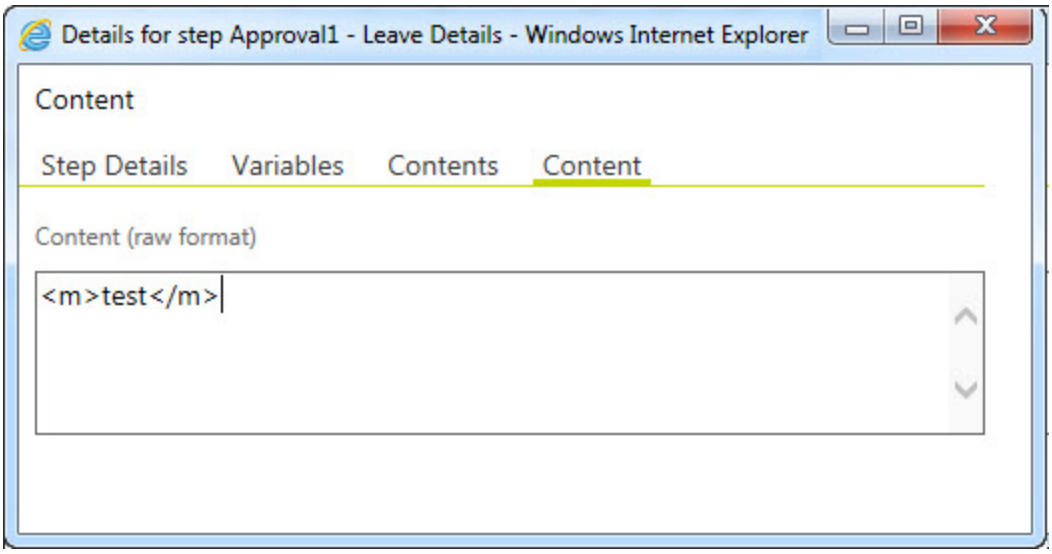


The raw format of the information given in the **Contents** tab will be displayed in the **Content** tab.



When you click the **Content** tab, the data which will be passed to the workflow while calling **Client**. Execute API as an XML will be displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



File Watcher

The **File Watcher** can be quite useful in application integration, by monitoring incoming data files and raising events. It listens to the file system change notifications and raises events when a file(s) in a directory changes. The component can watch files on a local computer or a network drive.

The **File Watcher** raises events when a file is created, renamed, updated or deleted from the specified folder. The File Watcher continuously monitors one or more folders and raises events whenever the above mentioned file activities occur.

The **File Watcher** applications:

1. It can be configured to watch for new files, renames, changes and deletes.
2. Quickly and easily triggers workflows which are associated to the **File Watcher Event**.
3. It can watch multiple files at the same time.
4. Multiple folders can be added to the **File Watcher** list.
5. It can watch folders which present in the local system or in the network path.
6. It raises four events namely **Created**, **Changed**, **Deleted,** and **Renamed**.

See File Watcher Events for more details.

File Watcher Operations

The File Watcher List is the basic component of the File Watcher that contains details of the folders that have to be watched. It has options for maintenance of folders such as adding a new folder, editing an existing folder and deleting a folder.

Security rights are set for adding, editing and deleting a folder. Only the logged in user with rights will be able to add, edit or delete the folder for file monitoring.

To open the File Watcher List

In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **File Watcher**. The **FileWatcher**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

List page appears.

File Watcher Operations

- Add Folder: On the action bar, click **New**. The **Add Folder** wizard appears. Use this option to create a new folder.
- Edit Folder Configuration Settings: On the action bar, click **Edit**. The **Edit** wizard appears. Use this option to set the folder configuration.
- Delete: On the action bar, click **Delete**. A message to confirm the folder deletion appears.

Add Folder

Use the **Add Folder** option to specify a particular folder which has to be watched by "FileWatcher" for various events.

To add a folder

1. Create a folder in any local drive.

   For example, create a folder called FileWatcher in C:\ drive.
   The folder name should not contain the following special characters:
   [#~&+\"'<>|@{}(),;^=!$]
   However, a folder name can contain a space or an underscore.
2. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **File Watcher**.
   The **FileWatcher List** page appears.
3. On the action bar, click **New**. The **Add Folder** wizard appears.
4. In the **Title** box, type a unique title for the folder to be watched. For example, enter the title as 'HR'.

   Note:
   - Ensure that the title is unique for a repository.
   - Ensure that the title does not contain the following special characters:
   [#~&+\"'<>|@{}(),;^=!$]
   However, a title can contain a space or an underscore.
5. In the **Physical Path** box, specify the path to store the folder. For example, type C:\FileWatcher.

   Note:
   - If the physical path is a Network path, then enter the path in the following format: *servername**<shared folder name>*.

   - Ensure that the value specified for **Physical Path** is unique for a data source. If multiple repositories use a single data source, then the same physical path can be used in only one repository.

   - Consider the following scenario where:
   - Multiple data sources point to a single File Watcher folder path.
   - The same path is associated with multiple workflows of different repositories for File Watcher events.
   In this scenario, the File Watcher events will be captured only for one repository, among the multiple data sources available.
6. In the **Buffer Size** box, specify the buffer size. By default, the buffer size is 16000.
7. In **Notify Filter** field, choose either the Maximum or Minimum option. By default, Maximum is chosen.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. Choose either **Yes** or **No** for the **Created** option. By default, the **Yes** option is chosen to consume the **Created** event.
9. Choose either **Yes** or **No** for the **Changed** option. By default, the **Yes** option is chosen to consume the **Changed** event.
10. Choose either **Yes** or **No** for the **Deleted** option. By default, the **Yes** option is chosen to consume the **Deleted** event.
11. Choose either **Yes** or **No** for the **Renamed** option. By default, the **Yes** option is chosen to consume the **Renamed** event.
12. Click **Save** to update the changes. A message about successfully saving the new folder appears.
13. Click **OK** to save the new folder.

Edit Folder Configuration Settings

Use the **Edit** option to modify the configuration settings of an existing folder.

To edit a folder

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **File Watcher**.
   The **FileWatcher List** page appears.
2. On the action bar, click **Edit**. The **Edit** wizard appears.
   Alternatively, select and right-click a folder, and then select **Edit**. The **Edit** wizard appears.
   The **Title** and **Physical Path** appears disabled while editing the configuration settings of a folder.
3. Modify the **Buffer Size**, **Notify Filter**, **Created**, **Changed**, **Deleted**, and **Renamed** fields according to the requirement.

Folder Configuration Options	Description
Buffer Size	Sets the size of the internal buffer. The default value is **16000** bytes and must not exceed 64000 bytes. For best performance, use a multiple of 4000 on Intel-based computers. File Watcher keeps track of the file changes, and stores those changes in a buffer and passes them to the APIs. Each file change event can use up to 16 bytes of memory, not including the file name. If there are many changes in a short time, the buffer can overflow. This causes the File Watcher to lose track of the changes in the directory, and it will only provide blank notification. Increasing the size of the buffer can prevent missing file system change events. We recommend you to increase the buffer size to prevent the buffer overflow. Increasing buffer size is expensive because it comes from a non-paged memory that cannot be swapped out to disk. So it is advised to keep the buffer as small as possible. To avoid a buffer overflow, you can use the NotifyFilter property to filter out unwanted

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Folder Configuration Options	Description
	change notifications. **Note:** File watcher internally sets the include subdirectories property to False to filter out unwanted change notifications. See FileSystemWatcher.InternalBufferSize Property for more details.
Notify Filter:	Filters unwanted change notifications in the folder and helps to avoid buffer overflow. The default setting is **Minimum** to get optimum change notifications. The **Minimum** setting includes only created, deleted, and renamed events. Select the **Maximum** option to capture all the events fired which includes created, deleted, renamed, and also the changed events.
Created	Choose the **Yes** option to consume the Created event and the **No** option if you do not want it to be consumed.
Changed	Choose the **Yes** option to consume the Changed event and the **No** option if you do not want it to be consumed.
Deleted	Choose the **Yes** option to consume the Deleted event and the **No** option if you do not want it to be consumed.
Renamed	Choose the **Yes** option to consume the Renamed event and the **No** option if you do not want it to be consumed.

4. Click **Update**. The message "*Folder Configuration updated successfully*. *Please restart the service.*" appears.
5. Click **OK**.
6. Restart the Workflow Engine service to activate the modified settings.

Delete Folder

Use the **Delete** option to delete an existing folder from the folder list.

Note: Ensure that the folder is not associated with any workflow. You will not be able to delete the folder if it is associated with a workflow.

To delete an existing folder

1. In the **Enterprise Console**, click the **Menu** button, click **Settings**, and then click **File Watcher**.
   The **FileWatcher List** page appears.
2. Select the folder to be deleted.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. On the action bar, click **Delete**. For example, select 'HR' with the path C:\FILEWATCHER\ to be deleted. Alternatively, select and right-click a folder, and then select **Delete**.
4. A message to confirm the folder deletion appears.
5. Click **Yes** to delete. The confirmation message about successful deletion of the folder appears.
6. Click **Close**.

Though the 'HR' folder will be present on the C drive, the File Watcher will not watch it for any events.

File Watcher Events

The File Watcher fires events when a file is created, changed, renamed or deleted from the specified folder. Following are the four events:

- Created Event
- Changed Event
- Renamed Event
- Deleted Event

Created Event

The **Created** event gets triggered when the following actions are performed:

- A new file is created in the folder to be monitored.
- A new file is copied to the folder to be monitored.

To trigger a created event

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**. The Workflows page appears.
2. Select the workflow to be associated, and then click **Associate**.
3. Click **FileWatcher** to associate the workflow with a new file watcher event.
4. In the **Event Type** drop-down list, select **Created**.
5. In the **Event Folder** drop-down list, select the folder to be monitored.
6. In the **File Name/Pattern** box, enter a file type. For example, .txt, .doc. Use * for all file patterns. You can also mention a specific file, such as sample.txt.
   If the file pattern is mentioned, then the File Watcher triggers an event only for files that match with the file pattern and ignores all other files that might arrive at the same time. This field is not mandatory. If the file pattern is not mentioned, File Watcher triggers an event for all file patterns.
7. Click the **calendar** icon to select the **Effective From** and **Effective To** dates. The event will be triggered for changes in the folder to be monitored only during this period. These two field are not mandatory.
8. In the **Workflow Version** drop-down list, select version of the workflow which should get triggered for the **Created** event. By default, **Latest** is selected. This field is not mandatory.
9. Click **Attach Event**.
10. Click **OK** in the confirmation dialog box.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example 1:

In the following example, the file type is not specified. So the **Created Event** will be triggered for all file types.

1. Create a new folder in the local drive. For example, create a folder called **FileWatcher** in 'C' drive.
2. Add the folder to the **File Watcher** list through **Add Folder**.
3. Create a workflow called **CreatedEventWF**.
4. Design the **CreatedEventWF** workflow with an Approval activity. Configure the Activity Properties for the same.
5. Publish the workflow.
6. Select **CreatedEventWF** from the Workflows list, and then click **Associate**.
7. Click **FileWatcher** to associate the workflow with a new file watcher event.
8. In the **Event Type** drop-down list, select **Created**.
9. In the **Event Folder** drop-down list, select the monitoring folder 'C:\FileWatcher'.
10. Leave the **File Name/Pattern** box empty.
11. Click the calendar icon to select the **Effective From** and **Effective To** dates if you want the event to be triggered only for a specific period. These two fields are not mandatory.
12. Click **Attach Event**.
13. Click **OK**.
14. Create a new file called sample.txt and save the same to C:\FileWatcher.
15. As soon as a new file is saved (created event) in 'C:\FileWatcher', the 'CreatedEventWF' workflow gets triggered. The approval activity will be assigned to the specified actor.
16. To check the Work items list, click **Inbox**.

Example 2:

In the following example, the file name and type is specified. The Created event will be triggered only for the specified file.

1. Create a new folder in the local drive. For example, create a folder called **FileWatcher** in 'C' drive.
2. Add the folder to the File Watcher list through **Add Folder**.
3. Create a workflow called **CreatedEventWF**.
4. Design the **CreatedEventWF** workflow with an **Approval** activity. Configure the **Activity Properties** for the same.
5. Publish the workflow.
6. Select **CreatedEventWF** from the Workflows list, and then click **Associate**.
7. Click **FileWatcher** to associate the workflow with a new file watcher event.
8. In the **Event Type** drop-down list, select **Created**.
9. In the **Event Folder** drop-down list, select the monitoring folder 'C:\FileWatcher'.
10. In the **File Name/Pattern** text box, enter 'File.txt'.
11. Click **Attach Event**.
12. Click **OK**.
13. Go to C:\FileWatcher and create a new file called 'File.txt'.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

14. As soon as a text file with the name 'File' is created in 'C:\FileWatcher', the workflow gets triggered. The approval activity will be assigned to the specified actor.
15. To check the Work items list, click **Inbox**.

Changed Event

The **Changed** event gets triggered when an existing file is replaced in the folder to be monitored.

To trigger changed event

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**. The **Workflows** page appears.
2. Select the workflow to be associated, and then click **Associate**.
3. Click **FileWatcher** to associate the workflow with a new file watcher event.
4. In the **Event Type** drop-down list, select **Changed**.
5. In the **Event Folder** drop-down list, select the folder to be monitored.
6. In the **File Name/Pattern** box, enter a file type. For example, .txt, .doc. Use * for all file patterns. You can also mention a specific file, such as sample.txt.
   Note: If file pattern is mentioned, the **File Watcher** triggers an event for only those files that match with the file pattern and ignores all other files that might arrive at the same time. This field is not mandatory. If the file pattern is not mentioned, the **File Watcher** triggers an event for all file patterns.
7. Click the calendar icon to select the **Effective From** and **Effective To** dates. The event will be triggered for changes in the folder to be monitored only during this period. These two field are not mandatory.
8. In the **Version** drop-down list, select the version of the workflow which should get triggered for the **Changed** event. By default, Latest is selected. This field is not mandatory.
9. Click **Attach Event**.
10. Click **OK** in the confirmation dialog box.

Example 1:

In this example, the file type is not specified. So the **Changed Event** gets triggered for all file types.

1. Create a new folder in the local drive. For example, create a folder called **FileWatcher** in 'C' drive.
2. Add the folder to the File Watcher list through **Add Folder**.
3. Create a workflow called **ChangedEventWF**.
4. Design the **ChangedEventWF** workflow with an **Approval** activity. Configure the **Activity Properties** for the same.
5. Publish the workflow.
6. Select **ChangedEventWF** from the Workflows list, and then click **Associate**.
7. Click **FileWatcher** to associate the workflow with a new file watcher event.
8. In the **Event Type** drop-down list, select **Changed**.
9. In the **Event Folder** drop-down list, select the folder to be monitored 'C:\FileWatcher'.
10. Click **Attach Event**.
11. Click **OK**.
12. Go to C:\FileWatcher. Copy a file with the same name, that is 'sample.txt'. A file called sample.txt should

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

exist in the folder.

13. As soon as the new file overwrites the existing file in 'C:\FileWatcher', the workflow gets triggered. The approval activity will be assigned to the specified actor.
14. To check the Work items list, click **Inbox**.

Example 2:

In this example, the file name and type is specified. The **Changed Event** gets triggered only for the specified file.

1. Create a new folder in the local drive. For example, create a folder called 'FileWatcher' in 'C' drive.
2. Add the folder to the File Watcher list through **Add Folder**.
3. Create a workflow called '**ChangedEventWF'**.
4. Design the 'ChangedEventWF' workflow with an Approval activity. Configure the Activity Properties for the same.
5. Publish the workflow.
6. Select 'ChangedEventWF' from the Workflows list, and then click **Associate.**
7. Click FileWatcher to associate the workflow with a new file watcher event.
8. In the Event Type drop-down list, select **Changed.**
9. In the Event Folder drop-down list, select the folder to be monitored 'C:\FileWatcher'.
10. In the File Name/Pattern box, enter the file name as '**File.txt'.**
11. Click **Attach Event**.
12. Click **OK.**
13. Go to C:\FileWatcher and overwrite a file with the name 'File' which is of type .txt.
14. As soon as the new file overwrites the existing 'File.txt' in 'C:\FileWatcher', the workflow gets triggered. The approval activity will be assigned to the specified actor.
15. To check the Work items list, click **Inbox**.

Renamed Event

The Renamed event gets triggered when an existing file has been renamed in the folder to be monitored.

To trigger a renamed event

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**. The Workflows page appears.
2. Select the workflow to be associated, and then click **Associate**.
3. Click **FileWatcher** to associate the workflow with a new file watcher event.
4. In the **Event Type** drop-down list, select **Renamed**.
5. In the **Event Folder** drop-down list, select the folder to be monitored.
6. In the **File Name/Pattern** box, enter a file type. For example, .txt, .doc. Use * for all file patterns. You can also mention a specific file, such as sample.txt.
   If file pattern is mentioned, then the File Watcher triggers an event for only those files that matches with the file pattern and ignores all other files that might arrive at the same time. This field is not mandatory. If file

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

pattern is not mentioned, File Watcher triggers for all file patterns.

7. Click the calendar icon to select the **Effective From** and **Effective To** dates. The event will be triggered for changes in the monitoring folder only during this period. These two field are not mandatory.
8. In the **Version** drop-down list, select version of the workflow which should get triggered for the 'Renamed' event. By default, Latest is selected. This field is not mandatory.
9. Click **Attach Event**.
10. Click **OK** in the confirmation dialog box.

Example 1

In this example, the file type is not specified. So the Renamed Event gets triggered for all file types.

1. Create a new folder in the local drive. For example, create a folder called 'FileWatcher' in 'C' drive.
2. Add the folder to the File Watcher list through Add **Folder**.
3. Create a workflow called 'RenamedEventWF'.
4. Design the 'RenamedEventWF' workflow with an Approval activity. Configure the **Activity Properties** for the same.
5. Publish the workflow.
6. Select 'RenamedEventWF' from the Workflows list, and then click **Associate**.
7. Click FileWatcher to associate the workflow with a new file watcher event.
8. In the **Event Type** drop-down list, select Renamed.
9. In the **Event Folder** drop-down list, select the monitoring folder 'C:\FileWatcher'.
10. Leave the **File Name/Pattern** box empty.
11. Click **Attach Event**.
12. Click **OK** in the confirmation dialog box.
13. Go to C:\FileWatcher path and rename a file called 'Sample.txt' to 'Sampletest.txt'.
14. As soon as a existing file is renamed in 'C:\FileWatcher', the workflow gets triggered. The approval activity will be assigned to the specified actor.
15. To check the Work items list, click **Inbox**.

Example 2

In this example, the file name and type is specified. The Renamed Event gets triggered only for the specified file.

1. Create a new folder in the local drive. For example, create a folder called 'FileWatcher' in 'C' drive.
2. Add the folder to the File Watcher list through **Add Folder**.
3. Create a workflow called 'RenamedEventWF'.
4. Design the 'RenamedEventWF' workflow with an Approval activity. Configure the Activity Properties for the same.
5. Publish the workflow.
6. Select 'RenamedEventWF' from the Workflows list, and then click **Associate**.
7. Click FileWatcher to associate the workflow with a new file watcher event.
8. In the **Event Type** drop-down list, select **Renamed**.
9. In the **Event Folder** drop-down list, select the monitoring folder 'C:\FileWatcher'.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

10. In the **File Name/Pattern** box, enter the file name as 'File.txt'.
11. Click **Attach Event**.
12. Click **OK**.
13. Go to C:\FileWatcher path, rename any file to 'File.txt' .
14. As soon as a file is renamed with 'File.txt' in the 'C:\FileWatcher', the workflow gets triggered. The approval activity will be assigned to the specified actor.
15. To check the Work items list, click **Inbox**.

Deleted Event

The Deleted event gets triggered, when a file is deleted from the folder to be monitored.

To trigger the deleted event

1. In the **Enterprise Console**, click the **Menu** button, and then click **Workflows**. The **Workflows** page appears.
2. Select the workflow to be associated, and then click **Associate**.
3. Click **FileWatcher** to associate the workflow with a new file watcher event.
4. In the **Event Type** drop-down list, select **Deleted**.
5. In the **Event Folder** drop-down list, select the folder to be monitored.
6. In the **File Name/Pattern** box, enter a file type. For example, .txt, .doc. Use * for all file patterns. You can also mention a specific file, such as sample.txt.
   If the file pattern is mentioned, then the File Watcher triggers an event only for files that match with the file pattern and ignores all other files that might arrive at the same time. This field is not mandatory. If the file pattern is not mentioned, File Watcher triggers an event for all file patterns.
7. Click the calendar icon to select the **Effective From** and **Effective To** dates. The event will be triggered for changes in the folder to be monitored only during this period. These two field are not mandatory.
8. In the **Workflow Version** drop-down list, select version of the workflow which should get triggered for the 'Deleted' event. By default, Latest is selected. This field is not mandatory.
9. Click **Attach Event**.
10. Click **OK** in the confirmation dialog box.

Example 1

In this example, the file type is not specified. So the **Deleted Event** will be triggered for all file types.

1. Create a new folder in the local drive. For example, create a folder called 'FileWatcher' in 'C' drive.
2. Add the folder to the File Watcher list through Add Folder.
3. Create a workflow called 'DeletedEventWF'.
4. Design the 'DeletedEventWF' workflow with an **Approval** activity. Configure the **Activity Properties** for the same.
5. Publish the workflow.
6. Select '**DeletedEventWF'** from the Workflows list, and then click **Associate**.
7. Click **FileWatcher** to associate the workflow with a new file watcher event.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. In the **Event Type** drop-down list, select **Deleted**.
9. In the **Event Folder** drop-down list, select the monitoring folder 'C:\FileWatcher'.
10. Leave the **File Name/Pattern** box empty.
11. Click the calendar icon to select the **Effective From** and **Effective To** dates if you want the event to be triggered only for a specific period. These two fields are not mandatory.
12. Click **Attach Event**.
13. Click **OK**.
14. Go to C:\FileWatcher, delete a file Sample.doc'.

    As soon as the 'Sample.doc' file is deleted in 'C:\FileWatcher', the workflow gets triggered. The approval activity will be assigned to the specified actor.
15. To check the **Work** items list, click **Inbox**.

Example 2

In this example, the file name is specified. The **Deleted** event will be triggered only for the specified file.

1. Create a new folder in the local drive. For example, create a folder called **FileWatcher** in 'C' drive.
2. Add the folder to the File Watcher list through Add **Folder**.
3. Create a workflow called **DeletedEventWF**.
4. Design the **DeletedEventWF** workflow with an **Approval** activity. Configure the **Activity Properties** for the same.
5. Publish the workflow.
6. Select '**DeletedEventWF**' from the Workflows list, and then click **Associate**.
7. Click **FileWatcher** to associate the workflow with a new file watcher event.
8. In the **Event Type** drop-down list, select **Deleted**.
9. In the **Event Folder** drop-down list, select the monitoring folder 'C:\FileWatcher'.
10. In the **File Name/Pattern text** box, enter the file name as 'File.txt'.
11. Click **Attach Event**.
12. Click **OK**.
13. Go to C:\FileWatcher path, delete a file 'File.txt'.

    As soon as a file 'File.txt' is deleted in the 'C:\FileWatcher', the workflow gets triggered. The approval activity will be assigned to the specified actor.
14. To check the Work items list, click **Inbox**.

Limitations of File Watcher

File Watcher has the following limitations:

1. If you add more number of files at the same time, there are chances of missing some events in the added files.
2. When you open a file from the folder to be watched, modify it, and then save it, proper events might not get triggered.
3. To modify the file in the Watching folder:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

a. Create a copy of the file in a different location.
b. Modify the file.
c. Copy and paste the modified file in the monitoring folder.

4. When the same file is copied more than once to the monitoring folder, then File Watcher checks for the last modified date time. If the date time is same, then no event is raised. If the last modified date time is different, then the **Changed Event** is raised. If you copy the same file after sometime, the **Changed Event** is raised.
5. File Watcher does not support desktop files.
6. File Watcher does not support sub-folders. If you create, change, rename, or delete a file in another folder in the folder to be watched, no event gets triggered.
7. Folder names with special characters, other than underscore '_' and space, are not allowed.
8. You can add a network folder to the folders list. To enable to watch the network path, the Workflow Engine service should start with a user account who has network access. Local user account cannot watch the network path.

Frequently Asked Questions

Q1: How to add an FTP folder to the File Watcher?

Ans: File Watcher can be configured to a network path which is mapped to the FTP folder.

For example, consider the network path \\ServerName\Sharedfolder is an FTP folder. You can associate this folder path to the File Watcher, and then can use the FTP folder for file operations. If the FTP site for the share folder is ftp://220.227.90.135/Sharedfolder/, then you can add the network path (UNC format) to the list. When external users perform any file operations on this FTP folder through FTP access, then the workflow gets triggered.

Since FTP access is not direct, authentication is not required as the Folder (Network/Local) access rights are enough.

Q2: Is it possible to give more than one file pattern?

Ans: Only one file pattern can be specified but the user can add multiple associations with different file patterns.

Q3: Are special characters are allowed for folder names?

Ans: Yes. The only special characters you can use in folder names are space and underscore.

Object Access

In a business environment, different softwares and processes are in place for varied business functions. Most of the information is interchange between software and departments. In certain cases, this information is manually incorporated in the software. This process is time consuming and prone to human errors. To make the environment fully automated, these software need to interact with each other.

AVEVA Work Tasks provide this facility through Integration Activities but the user is expected to know the respective area. The inbuilt security feature called SOA (AVEVA Work Tasks Object Access) enables the product to interact with other applications.

SOA allows users to use their existing .net assemblies with AVEVA Work Tasks's built in security features. Only privileged users are authorized to access critical information.

To enable the feature, certain configuration needs to be done to the setup in AVEVA Work Tasks such as SOA

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Folders and SOA Assemblies. Also, one needs to instantiate a class in a workflow to use the methods and properties in workflow activities via the expression editor.

Configuration

SOA configuration consists of SOA repository registration such as SOA Folders and SOA Assemblies. In SOA Folders, users can register a path or folder which consists of assemblies and reference assemblies.

Existing .net assembly methods or properties can be used in AVEVA Work Tasks by following a few steps. First register the Folder in which the assembly resides, and then register the methods or properties using Assemblies. Once the assembly is registered, the class will be available in AVEVA Work Tasks to create an instance. Once the instance is created, the method and properties etc will be available using the expression editor and SOA activities.

In SOA assemblies, users can register an assembly from a registered folder or from System GAC. Registered assembly methods can be accessed in AVEVA Work Tasks, using the following SOA features:

Features

In the SOA feature, you use an existing .NET object directly inside a workflow to specify business logic or to access object properties. These features are light weight and are activated JIT when accessed. They are not serialized and hence do not add up to the workflow footprint and allow using high level Business objects for Decisions and Actions. They are integrated in expressions hence can be used to specify the runtime value of any of the properties in AVEVA Work Tasks.

- **SOA in expression builder:** SOA registered assembly methods can be accessed in the expression builder as normal functions. Users can choose and drop functions into the expression editor and can also supply parameters also from the tree view. The expression editor allows simple scripts as well as function calls. All the activities which have the expression editor interface will have SOA enabled.
- **Others:**
  - An SOA Assembly can be registered multiple times, with different method/parameter selection to use the AVEVA Work Tasks security features, expose methods/properties to different users based on security privileges.
  - SOA Static Objects - All static methods of registered assemblies will be listed to use as instance object.
  - Users can write scripts to make small business rules.
  - Users can even update variables which are defined in workflows.

Enterprise Server

In the Enterprise Server scenario, the assembly and its referenced assemblies that are registered should be on all servers.

Prerequisites

AVEVA Work Tasks has the following prerequisites:

- The registered assemblies should be on Server machines folder.

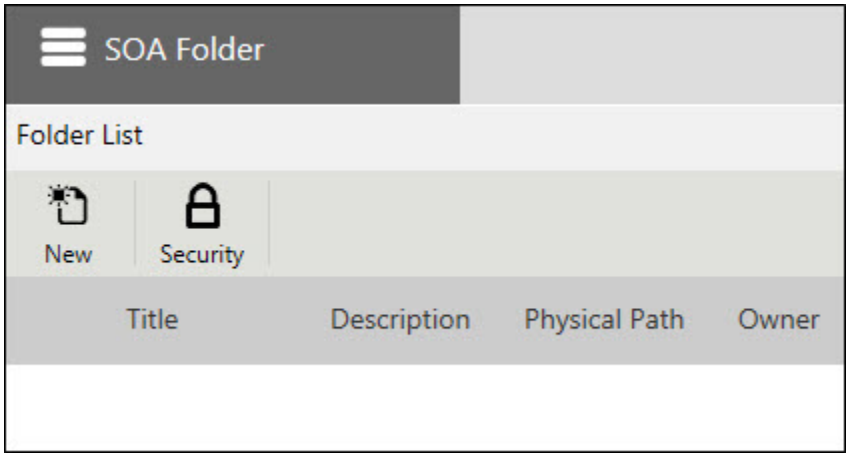
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SOA Folders

SOA Folder is the basic component of SOA configuration and contains the list of folders. Folders may contain assemblies which can be accessed in AVEVA Work Tasks using the expression editor or SOA activities. There are options for maintenance of folders such as adding a new folder, viewing the details of a registered folder, removing or deleting a folder, disabling a folder, enabling a folder, and managing security settings.

To configure SOA folder

- In the **Enterprise Console**, click menu icon, click Settings, and then click **SOA Folder**. The **Folder List** page appears.



- To know about adding a folder, see Adding New SOA Folder Details.
- To know about viewing an existing folder, see Viewing Registered SOA Folder Details.
- To know about deleting a folder, see Deleting an SOA Folder.
- To know about disabling and enabling a folder, see Enabling and Disabling SOA Folder.
- To know about defining security settings at List and ListItem level, see Security Settings for SOA Folder.

Add New SOA Folder Details

To add new SOA folder details

1. On the Action bar, click **New**. The **Folder Configuration** - **New** window appears.
2. In the Title box, type a name for the folder, and in the Description box, type a description for the folder. SOA Folder does not support the following special characters for folder name:

   ~`|!@#$%^&*.,?\":;{}[]()-_+-/\\='
3. In the **Physical Path** box, type the physical path.
   Physical Path provides the actual physical path where the assemblies reside. For example, C:\SOA\Dlls. The physical path must exist on the server. The physical path must exist in all the machines which are part of the Farm and must contain the assemblies which are configured in SOA assemblies.
4. Click **View Assemblies** to verify the assemblies which you want to include.
5. Click **Save** to register the new assembly. You can click **Cancel** to cancel or ignore the entries made.

Note: When you create a folder or item in AVEVA Work Tasks, the Item Status is Published. However, this is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

not applicable for Forms and Workflows folders and items.

View Registered SOA Folder Details

Use the **View** option to view the information about the registered folder.

To view an SOA folder details

1. Select the folder to be viewed.
2. On the Action bar, click **View**. The **Folder Configuration** - **View** window appears.
   Alternatively, select and right-click a folder, and then click **View**.

Delete an SOA Folder

Use the **Delete** option to delete the existing configured folder details.

To delete an SOA folder

1. Select the folder to be removed.
2. On the Action bar, click **Delete**. A confirmation message to delete the folder appears.
   Alternatively, select and right-click a folder, and then click **Delete**.
3. Click **OK** to delete the selected folder. A confirmation dialog box appears.
4. Click **Close** to exit.

Enable and Disable SOA Folder

You can enable and disable an SOA folder.

To enable Folder

1. Select and right-click the disabled folder to be enabled, and then click **Enable**. A confirmation message about successfully enabling the folder appears.
2. Click **OK**.

To disable Folder

1. Select and right-click the folder to be disables, and then click **Disable**. A confirmation message about successfully disabling the folder appears.
2. Click **OK** to disable the selected folder. Disabled folders are shown in faded background.

Note: The **Disable** option acts as a toggle button. Once you disable a folder, this option changes to Enable.

ResourceSet - Subject

Security Settings for SOA Folder

Use the **Security** option to configure security features. You can use this option to define security at List and ListItem level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To configure security for a folder

1. Select the folder in which you would like to assign security at ListItem level.
2. On the action bar, click the **Security** icon to define security at SOA Folder list level. The security settings page for the folder list appears.
   Alternatively, select and right-click a folder, and then click **Security Settings**.
3. Define the security settings at Folder ListItem level.

Assemblies

This section provides information on the different ways of registering, viewing, editing, organizing, and deleting assemblies.

Register Assemblies From GAC

Use the **From GAC** option to list assemblies from the GAC. You can choose assemblies from GAC which you want to use in AVEVA Work Tasks.

To give alias names to classes and assemblies using the From GAC option

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **SOA Assembly**. The **Assembly List** page appears.
2. On the Action bar, click **New**, and then click **From GAC**. The **Select an Assembly** wizard appears.
3. Select an Assembly, and then click **Next** to view details of the selected assembly. The Objects-Accessibility dialog box appears.
4. Select either a Class or a Method from the left pane to display its details.
5. Type an alias for the selected Class or Method in the **Enter Alias For** box.
6. Click **OK** to save the settings.
8. Click **Finish & Publish** to complete the Object selection.

GAC Assembly Fields

- **Assembly:** Lists the available assemblies. You can sort assemblies in ascending or descending order, by clicking the row head.
- **Version:** Displays the list of versions of the particular assembly. You can sort the versions in ascending or descending order by clicking the row head.

Register Assemblies From Assembly Folder

Use the **From Assembly Folder** option to select an assembly from the SOA registered folders. The the SOA registered folders appears under the tree view that shows folders, and the assemblies under each folder as nodes or branches of the tree. You can select all registered folders.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To give alias names to classes and assemblies using the From Assembly Folder option

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **SOA Assembly**. The **Assembly List** page appears.
2. On the Action bar, click **New**, and then click **From Assembly Folder**. The **Select an Assembly** wizard appears.
3. Select an Assembly to register, and then click **Next** for object selection. The Objects Setup dialog box appears.
4. Select either a Class or a Method from the left pane to display its details.
5. Type an alias for the selected Class or Method in the **Enter Alias** For box.
6. Click **OK** to save the settings.
7. Click **Finish & Publish** to complete the Object selection.

Register Assemblies From Web

Use the From Web option to register a web service to use in AVEVA Work Tasks. The registered web service method can be used in the expression editor and in API.

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **SOA Assembly**. The **Assembly List** page appears.
2. On the Action bar, click **New**, and then click **From Web**. The **Specify the Web Uri** wizard appears.
3. Type the required information.

Parameters	Description
Name	Name of the web service.
Web Uri	Valid web URI. For example, http://ws.cdyne.com/psaddress/addresslookup.asmx?wsdl
Description	Description for the Web URI. For example, Web service for accessing address or address validation.
User Name	User name for web service authentication.
Password	Password for the web service authentication.
Domain	Domain for the web service authentication.

4. Click **Test Connection** to validate the URI. If the URI is valid, a test connection succeeded message appears. You can then can save the entry.
5. Click **Save** to save the valid entries.

Create Folder for Registered Objects

Use the **Folder** option to create a folder and register objects in that folder.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To create a folder for registered objects

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **SOA Assembly**. The **Assembly List** page appears.
2. On the Action bar, click **New**, and then click **Folder**. The **New Folder** wizard appears.
3. In the **Title** box, type a name for the folder, and in the **Description** box, type a description for the folder. Folder names must not allowed contain special characters, such as :"\\"'"<>;|*/{}?.

View Registered Assembly Details

Use the **View** option to view the registered objects in the SOA Assemblies. If the selected item is an assembly type, you can view the details of the registered assembly. If it is web type, you can view the details of the web service.

The View option allows the user to view all entries except the password. The password will be hidden.

To view the registered objects

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **SOA Assembly**. The **Assembly List** page appears.
2. Select the folder that you want to view.
3. On the Action bar, click **View**. The **Summary** dialog box appears.
   Alternatively, right-click the selected folder, and then click **View**.

Edit an Object in SOA Assembly

Use the Edit option to edit an existing registered object in the SOA assemblies and SOA web services. In case of SOA assemblies, you can choose different methods or properties based on their requirements.

To edit a registered object

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **SOA Assembly**. The **Assembly List** page appears.
2. Select the folder you want to edit.
3. On the Action bar, click **Edit**. The Object setup dialog box appears.
   Alternatively, right-click the selected folder, and then click **Edit**.
4. Select either a Class or a Method from the left pane to display its details.
5. Enter an alias for the selected Class or Method in the **Enter Alias For** text box.
6. Click **Finish & Publish** to complete the **Object** selection.
7. If the item selected is of web type, you can modify the web service registration details. Use the **Edit** option to edit **URI**, **Description**, **User Name**, **Password**, and **Domain** of a web service entry in the **Assembly List**.

Organize SOA Assembly

Organize an SOA Assembly by performing one of the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Moving the SOA Assembly to a folder.
- Making the SOA Assembly a child item of another SOA Assembly.

To organize an SOA Assembly by moving the SOA Assembly to a folder

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **SOA Assembly**. The **Assembly List** page appears.
2. On the Action bar, click **Organize**. The **Organize SOA Assembly** dialog box appears.
3. Drag an SOA Assembly to a folder. The SOA Assembly is moved to the folder.
4. Click **Close**. The **Organize SOA Assembly** dialog box is closed.

To organize an SOA Assembly by making the SOA Assembly a child item of another SOA Assembly

1. In the **Enterprise Console**, click the **Menu** button, click **Tools**, and then click **SOA Assembly**. The **Assembly List** page appears.
2. On the action bar, click **Organize**. The **Organize SOA Assembly** dialog box appears.
3. Drag an SOA Assembly to another SOA Assembly. The SOA Assembly is now a child item of another SOA Assembly.
4. Click **Close**. The **Organize SOA Assembly** dialog box is closed.

Delete a Registered Assembly

Use the **Delete** option to delete a registered assembly. Use this option with caution since it might affect the workflows where the assembly is used or else where. We recommend to use the Disable option instead of the Delete option.

To delete a registered assembly

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **SOA Assembly**. The **Assembly List** page appears.
2. Select the registered assembly to be deleted.
3. On the Action bar, click **Delete**. A confirmation message to delete the registered assembly appears. Alternatively, right-click the registered assembly, and then click **Delete** from the context menu.
4. Click **Yes** to delete the selected assembly. A message about successful deletion of the item appears.
5. Click **Close** to exit.

Manage Security for a Assembly

Use the **Security** option to configure the security feature.

To configure security for an assembly

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **SOA Assembly**. The **Assembly List** page appears.
2. Select an assembly in which you would like to define security at the List and ListItem level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Click **Security**. The security settings page appears. You can define the security rights at Global, Repository, Across List, and List Specific levels.
   Alternatively, right-click the registered assembly, and then click Security Settings from the context menu.

   Example: Assume that the 'Human Resources' folder consists of three classes called 'Company', 'Employee', and 'Leave'. There are three users called 'Allen', 'Kim', and 'Jim'. Allen has Admin rights and has defined the security rights at the ListItem level. Allen gives Kim the rights to view only the Employee class and Jim can view only the Company class.

   This means that only the Admin user is able to view all the classes of the Human Resources folder. If Kim logs in, Kim can view only the Employee class and if Jim logs in, Jim can view only the Company class.

Instantiate an Assembly Class in Workflow

To instantiate a class in a workflow, use the Start activity and SOA Object Instances property. This will provide you the interface to create an instance of a class for further use in a workflow. You can create multiple instances of a class if required.

To instantiate an assembly class

1. Design a workflow.
2. Right-click the Start activity, and then click **Activity Properties**.
3. Click SOA Object Instances to set the property. See SOA Object Instances for more details.

SOA Object Instances in SOA Property

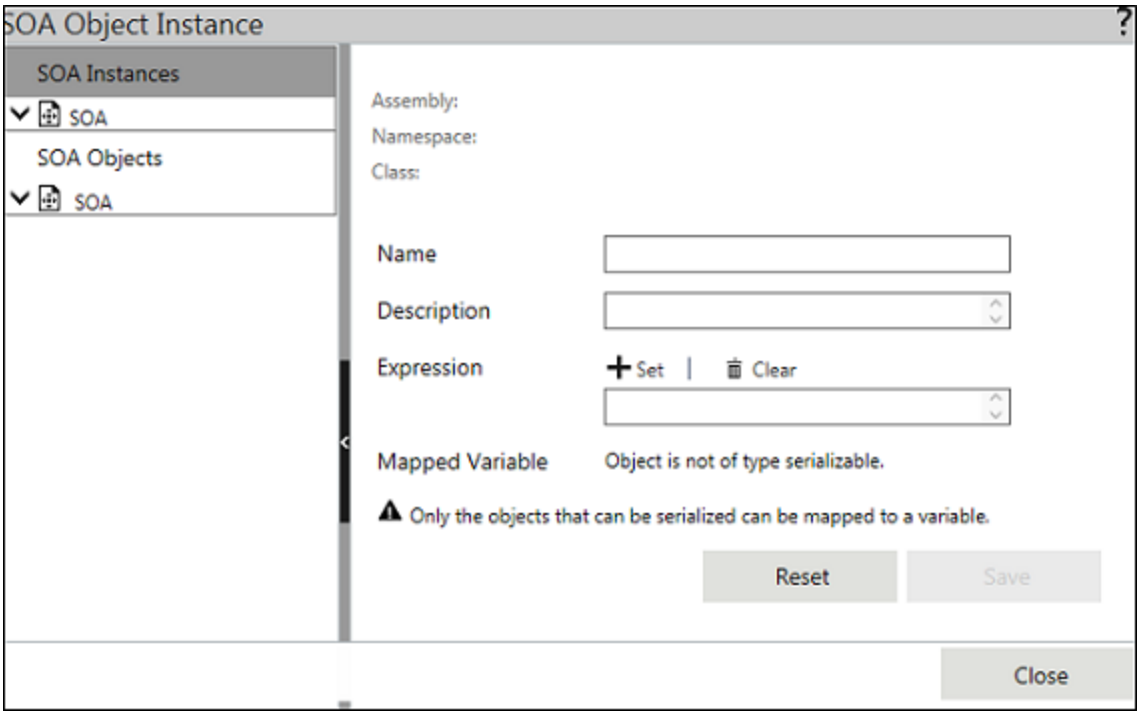
The **SOA Object Instances** property is an important property for SOA. Without starting an instance of a class, you cannot use the methods available in a class that are not static. The static members of the class can be used without creating any instance.

You can create multiple instances of a class. Creating instances of classes sometimes requires parameters. You can use the object instance property editor to select objects, method, or functions for constructor parameters.

You can drag and drop the constructor (.cntr) into the editing area and update the constructor parameters, if any. You can select the parameters from workflow instance properties or from other registered SOA classes. If type casting or conversion are required, then you can opt for functions available under Date, Math, or String in the object browser.

The following image shows the SOA Object Instance property window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The **SOA Object Instance** window contains the following fields:

Fields	**Description**
SOA Instances	Displays the already registered instances and also allows the user to edit or delete an instance.
SOA Objects	Displays the registered objects and allows the user to drag and drop or click and drop a constructor to instantiate a new class.
Object Browser	The Object Browser shows the available AVEVA Work Tasks Objects that can be used as parameters for instantiating a class by selecting them as parameters for the constructor. Users can edit or delete already created constructors from this option.
Reset	Clears the editor and constructor information from the Editor.
Name	A name for the instance.
Description	A descriptive name can be given for the instance of the class.
Expression	Expressions to be set.

SOA Instances

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To instantiate an Assembly class in a workflow

1. From **SOA Objects**, drag and drop or click and drop a constructor to create an instance.
2. Using **Object Browser**, pass the parameters to the constructor.
3. Click **Save**. You can view the saved instances in **SOA Instances**.

To edit an existing instance

1. Click the SOA Instances tab on the left hand side of the SOA Property Editor.
2. Right-click the saved instance which needs to be edited, and then click **Edit** from the context menu.
3. **Update** and **Delete** buttons, which allow the user to update or delete the selected instance, will be visible.

To delete an existing instance

1. Select an instance in the SOA Instances tab.
2. Click **Delete** to delete the instance. This will prompt for confirmation of deletion.
3. Click **OK**.

SOA Instance Members

The SOA property window comes with a new node with the instance name as node text for an already created instance. It shows all the available methods or properties of that instance. Members of each instance can be used to build the expression in the SOA property page. For example, the ‘Employee’ instance has been created here. Members of this instance are displayed in the **Object Browser**.

SOA Static Members

To use static members, no need to create an instance of the class. After an assembly is registered in the SOA Assembly list, all the static members of the registered class get loaded in the SOA Property Editor/Expression editor and can make use the same for passing the parameter.

For example, the ‘Employee’ class has the 'GetCompanyName()' static method. After the class is registered in the SOA Assembly list, 'GetCompanyName()' will be displayed in the **Object Browser** under **SOAStaticObjects**. The user can work with these static methods without creating an instance of Employee class.

Note: Static properties in SOA: SOA, in the normal behavior of having an instance of class, does not support static properties. It works fine with SOA static objects. Example: The assembly ‘Employee.dll’ has a static property called ‘Company Name’ to get the name of the company. If an instance is created for the class ’Employee’ in SOA, the use of static property by utilizing a created instance throws a compilation error in the Expression Editor. Static property needs to be called by using the **type name** where as the static property in **SOAStaticObjects** will work normally.

SOA Objects

All saved instances will be listed in Object **Browser/Workflow Instances/SOA Objects**. The user can make use of these objects and build an expression in the **SOA Property page** or the **Expression Editor**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SOA Object Instances in Expression Editor

You can create simple expressions with the help of the Expression editor which is a user interface for creating expressions in AVEVA Work Tasks. With SOA integration, the Expression editor comes with a new node that shows all the instances created and methods available under each instance.

You can work with these methods or properties in the expression. With the new feature, even the update variable functionality can be achieved in expression just by choosing the workflow instance and ensuring that the variable name is equal to the method or property.

To use a method, just click on the method in the object browser and drop it in the editor area, if the method has a parameter which can be replaced from the object browser or the workflow instance.

SOA Web Objects in Expression Editor

After a web service is registered, the web methods are accessible in Expression editor and can be used in the same way as the rest of the SOA Objects.

Difference Between Integration and SOA

The following are the differences between integration and SOA:

- Script activity object life cycle is limited to the script. In SOA, the object life cycle is automatically managed by AVEVA Work Tasks and there are activities using JIT.
- Use methods and properties of object without using intermediate variables.
- Using SOA activity is easier than using Script activity.
- SOA is security enabled whereas Script activity security is not enabled.

Security Features for Folders and Assemblies

Security privileges can be set for both folders and assemblies. Assemblies can be registered in AVEVA Work Tasks with different method or property selection and access can be given to different groups.

Limitations of SOA

The SOA has the following limitations:

- Supports only .net assemblies.
- Does not support remote assemblies.
- Does not support call back mechanism.
- Does not support expression as parameter to the method which is used as constructor parameter in the SOA Property Editor.
- Does not support complex expressions, such as an expression inside an expression.
- Does not support unmanaged assembly.
- Does not support 32-bit built dll in a 64-bit machine.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Method with 'Void' as the return type cannot be used as the last statement in the Expression Editor as the last statement expects a return type. Void type can be used above the last statement and the last statement will execute and return the value.

Example

Wrong

```
Int a=10;
Variable.Variable1 = a;
UpdateDatabase();  //Method with Void as return type
```

Correct

```
Int a=10;
Variable.Variable1 = a;
UpdateDatabase();  //Method with Void as return type
a;  //Return some value after the execution of  the method with void as return type.
```

- If Push Notification is enabled in Framework 4.0 environment, SOA is not supported.

SOA Activity

AVEVA Work Tasks provides the **SOA Execute Activity**. Use the **SOA Execute Activity** to directly use SOA in the expression editor. Based on the status, **SOA Execute Activity** returns successful or unsuccessful result.For more information about **SOA Execute Activity**, see *Developer Guide*.

Use SOA Execute Activity in Workflows

SOA Execute is **Object Access** activity supported by AVEVA Work Tasks. The SOA functionality of AVEVA Work Tasks eliminates the need for custom coding to a great extent by allowing stored data within processes to be easily accessed and reused. This activity is used to access a particular method from a registered Assembly. This section contains information about:

- Registering the Assembly in a folder
- Adding the Assembly folder into the SOA Folder
- Adding the Assembly to the SOA Assembly
- Create SOA Object Instance in the workflow
- And finally, displaying the value in an Information activity

Prerequisites

- Download and install the latest AVEVA Work Tasks.
- Create a repository.
- Successfully log on to the repository using administrator credentials.
- Basic knowledge of how to create a custom assembly.
- Basic knowledge of how to create a workflow.

Understanding SOA Execute Activity

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Step 1: Creating a Custom Assembly

1. Open **Microsoft Visual Studio**.
2. In the **File** menu, click **New**, and the select Project from the menu.
   The **New Project** dialog box appears.
3. In the right pane, select **Class Library**.
4. Create a **.net** Class Library.
   Example: In the Name text box, enter '**SOATest**'.
5. Set the path to save the project.
   Example: In the Location drop-down, set the location as C:\SOA using the Browse button.
6. In the **Solution Name** text box, give the directory name.
   By default, it displays the directory name as a specified project name.
7. Click **OK**.

Sample code for creating the class

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
namespace SOATest
{
public class Test
{
public Test()
{

}
public string GetName()
{
return "Welcome to SOA";
}
}
}
```

When you build the project, the dll gets created in the **C:\SOA\SOATest\SOATest\bin\Debug** folder.

Step 2: Adding the Assembly Folder to the SOA Folder

1. Log on to the **Enterprise Console** using administrator credentials.
2. On the Enterprise Console, click **Menu** icon, point to **Settings**, and then click **SOA Folder**.
   The **Folder List** page appears.
3. Click **New** to add a new folder.
4. In the **Folder Configuration** window, enter the Title as "**SOAFolder**" and Description as **"My first SOA**".
5. Specify the Physical Path, that is the path where the folder exists.
6. Give the path and click on the **View Assemblies** button.
   We can now see our dll file listed in the **List of Assemblies**.
7. Click **Save** to save all the information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. After you save, you can see the dll listed in the SOA Folder window.

Step 3: Adding the Assembly to SOA Assembly Repository

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **SOA Assembly**.
   You can use any of the following options to add the assembly:
   - From GAC
   - From Assembly Folder
   - From Web
2. Consider adding **From Assembly Folder**.
3. Click **New**, and then click **From Assembly Folder**.
   The **Select an Assembly** window appears.
4. Select the dll file which we had created, that is SOATest.dll, and then click **Next**.
5. After you select the assembly, you can browse through the namespaces, classes, and methods of the assembly. There is an option to give alias name for the selected methods in the next window, that is Object Setup.
6. Select the methods for which you want to give the alias name, else click **Finish & Publish**.
7. The Assembly will get added to the Assembly list. Now create a workflow and implement this SOA Assembly in it.

Step 4: Creating a Workflow

1. If you are familiar with the steps of creating a workflow, you can directly navigate to Step 5.
2. In the **Enterprise Console**, click menu icon, and then click **Workflows**.
   The **Workflows** page appears.
3. On the action bar, click **New**, and then click **Workflow**.
   The **New Workflow** wizard appears.
4. In the **Title** box, type a name for the workflow, and in the **Description** box, type a description for the workflow.
5. Click **Save & Continue**.
   The workflow is created, and the **Workflow Options** wizard appears.
6. Select **Design the Workflow now**, which is the default option, and then click **Finish**.
   The **Process Designer** appears.

Step 5: Creating Object Instance

You have to instantiate an **SOA Object Instance** to use it in the **SOA Execute** activity.

1. Right-click the **Start** activity, and then select **Activity Properties**.
2. Click on the edit icon near the SOA Object Instances property to instantiate a class for the specific purpose.
3. The **SOA Object Instance** window appears. Select the appropriate constructor for the specified class.
4. Expand the tree view for the SOA from the SOA Objects in the left pane.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Expand till Test, and then click on **Actor**. It will display the details in the right pane.
6. Click **Set**.

   It opens a new window which displays the constructor.
7. Click **OK** to save the Constructor.

   The constructor will be saved as shown below:
8. Then click **Save** to save the SOA Instance.

   We now have to display the return value from the method as we specified in the Assembly.
9. To create a variable, click on the **edit** icon near the **Variables** property in the properties of the **Start** activity.
10. Create a new variable of **Type** "String" and click **Update** to save the variable.
11. Click the **Save** button in the Activity Properties pane to save all the data entered.

Step 6: SOA-Execute Activity

To use an SOA, add an **SOA-Execute** activity to the Process Designer.

1. Select **Integration Activities** from the Activities pane on the left.
2. Drag and drop an **SOA-Execute** activity to the Process Designer as shown below.
3. Right-click the SOA-Execute activity to get the Activity Properties pane as shown below.

Execute an SOA Expression

1. The SOA-Execute activity uses the SOA through the Expression Editor.
2. Click on the icon near the **Execute an SOA Expression** to execute the expression.
3. Now we can see the **Expression Editor** where we will build the expression.
4. Expression Editor comes up with a new node which shows all the available methods or properties.
5. We will build a small expression to get the return value from the method.
6. Drag and drop the GetName() method from the Test node to the right hand side pane and build the expression: string result = Test.GetName();
7. Now we have to save the result to some variable. We save it to the variable that we created in the Start Activity, that is the SOAVariable.
8. Drag and drop the SOAVariable from the Variables node in the left pane to the expression on the right hand side and build the expression:

   ```
   string result = Test.GetName();
   ```

   Variable.SOAVariable = result;Click OK to save the expression.
9. Click **OK** to save the expression.
10. Click the **Save** button in the Activity Properties pane to save all the data.
11. We have successfully added the **SOA-Execute Activity**.

Step 7: Display the Return Value of the SOA Method in the Information Activity

1. To add **Information activity**, select Human Activities from the Activities pane on the left.
2. Drag and drop an Information activity to the Process Design area.
3. Right-click the Information activity in the Design area and select Activity Properties from the context menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Now the **Activity Properties** pane appears on the right side using which we need to configure the following:
   - Name of the activity: Specify a Name
   - The Actor to whom this information should be sent: **Select the Actor** to whom this activity will be assigned. For this example, we will send the information to the Actor who submitted the workflow. Click the icon edit in the Assign Actor(s) property. The Assign Actor(s) window pops up. We have to assign the Information task to the user who has alerted the workflow. For this, we have to specify a small expression: Id = Variable Variable.SubmittedBy.ID
     - Select the required provider from the **Providers** drop down.
     - From the first drop down, select **Id.**
     - Keep the operator as default "=".
     - From the next drop down, select **Variable**
     - In the next drop down, select **Variable.SubmittedBy.ID** and click the **Add** button as shown in the following image:
     - Click **Update** to save the property value.
   - The subject of the actual information.
     - Click **edit** near the **Subject** property to enter the subject for the Information which appears in the actor's **Inbox**.
     - To customize the **Subject**, we can use the **Field** controls. Select **Variable** from the first drop down. Select the variable we had declared in the **Start** activity from the second drop down that is, **Variable.SOAVariable** as shown below and click **Append**.
     - You will get the **Subject** line in this format:
     - Click **Update** and then the **Save** button in the Activity Properties pane to save all the data entered.

- Now, we have to link all the activities that is, **Start**, **SOA Execute1**, and **Display SOA Output**.

  Set the output value from the **SOA Execute1 to Display SOA Output** as "**Successfu**l".

Publish the SOAWorkflow

1. To publish the workflow, click the **Publish** option from the menu bar on the top.

   A message box pops up indicating that the workflow has been published successfully.
2. On clicking **Close** you will be redirected to the page showing the Workflows list.
3. Run the published workflow. Select the listed workflow and right-click it.
4. Select the **Publish and Test Run** option from the context menu.

   The **Process** execution view window appears showing the execution status. You will that notice the **Start**, **SOA Execute1 and Display SOA** output activities have been executed successfully.

Note: If the Status is "Execution Pending" in the Process execution window, then click the Refresh button to get the latest status.

You can also view the result value by clicking on any of the activities in the **Process** execution window and then clicking on the **Variables** tab.

View the Inbox

You have to view the information task assigned to the actor who alerted the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. To see the activity in the **Inbox**, select the **Inbox** option from the **Enterprise Console** menu.
2. In the **Inbox** you can find the **Display Web Service Data** activity with the Subject "**Welcome to SOA**".
3. Click on the Information task in the Inbox to open a pop up details view for the task.

   You have successfully created the **SOAWorkflow**.

Security Framework

Security means that the information is protected from unauthorized users. Security also encompasses the concept of integrity, that is, the assurance that information is protected from unauthorized modification or corruption.

In an organization, a security policy is how an organization plans to protect the information from the employees who are categorized based on their designations or roles. The security rights provided to different users depend on the organizational hierarchy.

The need for security is to assign access rights to this hierarchy. If there is no hierarchy in the organization, then there would be no need for a assigning security rights. But most organizations have many hierarchies that have different access rights. The security mechanism in the organization provides restricted access to data. By making access decisions, the security mechanism enforce rules about who can access what.

For example, an administrator and a developer cannot have the same access rights, because obviously, the administrator is superior and has access to most or all of the rights. Similarly, an employee with a higher designation, say a Project Manager, should ideally have more rights as compared to a Team Lead. It is for this very purpose that access rights have to be clearly defined.

AVEVA Work Tasks Security

AVEVA Work Tasks has enterprise rights and security features. The rights and security can be defined for groups and users can be mapped to these groups. The user will be entitled to perform only those tasks for which the right has been given to the respective user.

AVEVA Work Tasks allows effective collaboration during workflow creation and process and allows you to define user-based access rights for workflow design functions. You can define security for the items, forms or folders at the list level and also define security for the forms or lists residing under a folder. It also offers comprehensive security for reporting Work item, Calendar, Queue, and BAM.

The Security Framework allows the administrative user to administer, manage and provide access rights and define roles and responsibilities for the user, based on their individual role or based on the ‘group’ they are part of. It makes managing users across various features of AVEVA Work Tasks much easier and makes applications more secure.

AVEVA Work Tasks Security provides all the features for implementing security at different levels for users and groups and has in-built security groups and rights, which can be extended and customized.

AVEVA Work Tasks Security Features

The following are the features of AVEVA Work Tasks security:

1. AVEVA Work Tasks security has pre-defined security groups. These groups can be used to provide access rights to roles or users. Users can create new security groups if required.
   For example, map a user who belongs to HR to one group and map a user who belongs to Finance to another

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

group. This allows them to view only the items or folders related to their work inside the list.

2. AVEVA Work Tasks security has a set of pre-defined rights. For example, Can Consume Item, Can Manage Item, Can Create Item.
3. There are mainly three levels where security can be applied. They are- Repository Level, List Level and ListItem Level. The List level security allows you to secure the access to various lists available in a AVEVA Work Tasks Repository. The ListItem level security settings allow you to secure the access to various items available in a list.
4. AVEVA Work Tasks security allows the user to secure the Process Designer. This can be done by providing security to its elements as mentioned below:
    a. Provide security for each Category, Action, and Property to ensure that only the authorized user is able to access each of these elements.
    b. Provide security for each menu item to restrict the users for each action on the design. For example: Importing or Exporting workflows, validating and publishing them, settings, running the wizards, testrun.
5. AVEVA Work Tasks security allows you to secure the work items. This can be done by restricting whether a user can forward or kill work items, can set an alternate actor or preferences, can view resource calendar, and queue.
6. AVEVA Work Tasks security allows you to secure the Queue. This can be done by restricting whether a user can view the queue control, add a new queue.
7. AVEVA Work Tasks security allows you to secure the Calendar control: Restricting whether the user can view, add, delete Calendar.
8. The user can exclude options from the Enterprise Console menu. Options like Inbox, Workflows, Reports, Fill Form, Tools (Manage Forms, Manage List and SOA Assembly) and Settings (User, Calendar, Queue) can be excluded.

Example: An organization has 'Manager', 'Designer', 'Technical Consultant', 'Employee', 'Finance team', 'HR team', 'Support team', and 'Other User' roles. These roles having the following responsibilities:

- Manager - Monitor the representatives' reports
- Designer - Design workflows and assign task to others
- Technical Consultant - Create lists and forms
- Employee - Fill forms created by the Technical Consultant and design cases
- Finance team - Fill and view only finance related lists
- Support team - Work on the assigned task
- HR team - Fill and view only HR related lists
- Other User - Create only forms or lists.

In the above case, security can be used to exclude various options from the Enterprise Console menu.

The **Support team** should have access only to the **Inbox** option, so that they can act only on the work items assigned to them.

The **Designer** should have access the **Inbox** and **Workflows** options, so that these users can design workflows, assign the tasks to some other user to act on the assigned work items.

The **Technical Consultant** should have access only **Manage Forms** and **Manage Lists**, so that these users can design

list or forms. For example, 'Expense List', 'Manage List', 'Leave Application List' and 'Travel List'.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Employees** should have access to only the **Fill Form** option, so that these users can fill forms like 'Leave List', 'Expense List' and 'Travel List'.

The **HR team** should have access only to the **Workflows** option, so that these users can view only HR related workflows. For example, 'Employee Details' and 'Leave Application List'.

The **Finance team** should have access only to the **Workflows** option, so that these users can view only Finance related workflows. For example, 'Expense List' and 'Travel List'.

The **Manager** should have access only to the **Reports** option, so that the manager can access reports. This user does not design any process and only monitors the representatives' reports.

Other users should have access only to the **Manage Forms** or **Manage List** option, depending on whether they are responsible for designing the forms or for designing lists.

Introduction to Security Framework

AVEVA Work Tasks introduced the security framework to secure the repository in various ways.

Security framework uses security group, security rights, and security group resource mapping to control the access to features in the repository.

- Security rights: CanCreateItem, CanDeleteItem, and CanDesignWorkflow etc.
- Security groups: Administrator, Contributor, Reader, and Limited Access.
- Security Group Resource Mapping: Security Group Resource Mapping is mapping users or roles to security groups.

Roles can be mapped to Security Groups along with the Priority. Users can also be explicitly mapped to Security Groups.

On logging in to the repository, the user will have the privileges given to the security group to which they belong.

Example:

If the user logs in and belongs to the administrator security group, they will have all the privileges of the administrator security group.

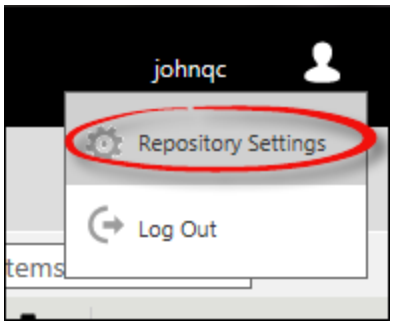
View Security Mapping at Repository Level

You can view mapping between resources and security groups at the Repository level. This displays the resources mapped for the security group.

To view security mapping at repository level

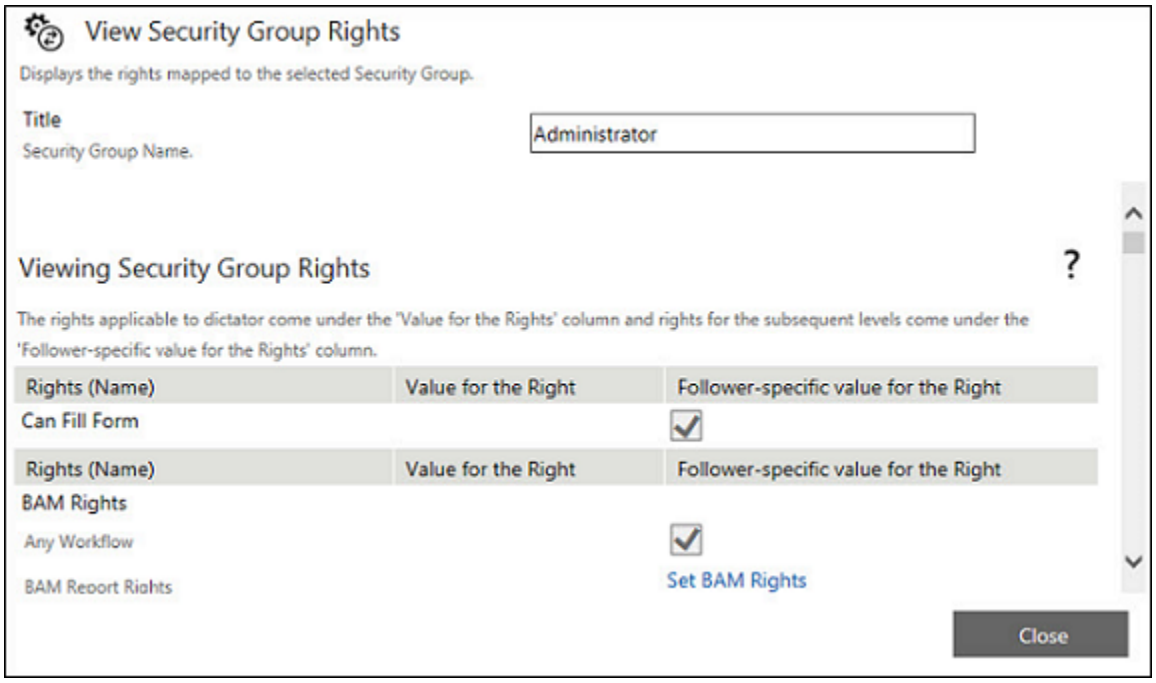
1. Log on to the **Enterprise Console**.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Click the **Standard Settings** tab. The **View Effective Security Rights For User/Role** and **View Security Mapping at Repository Level** options appears.
4. Click **View Security Mapping at Repository Level**. The View Security Mapping at Repository Level page appears. This page displays the User or Role mapped with the security group.

   Click a security group name to view the rights mapped to it. The **View Security Group Rights** page appears.



Components of Security Framework

The security framework contains the following components:

- Security Rights
- Security Group
- Security Resource Mapping

Security Rights

Rights are of vital importance in an application.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Definition

Each feature in the Repository, to which you can control the access, can be defined as right.

Security Rights in AVEVA Work Tasks

There is a set of pre-defined rights in the repository to which you can control the access. These rights define the user privileges at various levels. Apart from the standard rights available in the repository, the user can create custom rights. The user can also create new security rights at the repository level. These rights can be extended and modified at different levels (List and ListItem).

For example: Creating an item inside a list is a feature of a list. You can control access to this feature by defining a right called 'Create Item'. If this right is enabled, the user can create an item inside a list.

Examples of Repository features that can be controlled using Security Rights

- Add, Delete, Edit, Publish, Unpublish, Disable, and Enable items inside a List
- Viewing All Versions, Child Items, Properties, and Associations of an item inside a List
- Saving different Versions and Creating Associations of an item
- Design Workflow, View Workflow, and Perform tasks on an item
- Viewing Others' Draft items, Viewing Pending items, and Viewing Folder
- Settings Security at Repository, List and ListItem levels
- All features of AVEVA Work Tasks Server Controls

For more information about security rights, see:

Security Rights Available for a Repository

Types of Security Rights

Difference between Value for the Rights and Follower Specific Value for Rights

Dictator and Follower

Manage Security Rights

Security Rights Available for a Repository

The following table summarizes the AVEVA Work Tasks standard rights available for a Repository with categorization:

Right Name	Description
BAM Rights	
Workflowscope_Any	This right controls the access to view all workflow reports.
BAM Report Rights	This right controls the access to BAM Report Rights to specify the rights for BAM Tree Menu Rights, Views,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Right Name	Description
	Actions and BAM Configuration.
Can View BAM Control	This right controls the access to view the BAM Report section.
Can View Global Reports	This right controls the access to view the Global Reports option in the drop-down of the BAM Report section.
Workflowscope_InitiatedWorkflow	This right controls the access to view the report of the triggered workflow in the BAM Report section.
Workflowscope_OwnedWorkflow	This right controls the access to view the reports of the workflows that are triggered by another user who is logged in.
Calendar Control Rights	
Can Add Calendar	This right controls the access to add a new calendar.
Can Add Resource Calendar	This right controls the access to add a new resource calendar.
Can Delete Calendar	This right controls the access to delete an existing calendar.
Can View All Calendars	This right controls the access to view all calendars.
Can View Base Calendar	This right controls the access to view the base calendar.
Can View Calendar Control	This right controls the access to view the calendar control.
Generic List Actions	
Can See All Versions	This right controls the access to view all versions of the selected item.
Can Change Owner	This right control the access to the change owner option of the selected item.
Can View Child Items	This right controls the access to view the child items of the selected item.
Can Create Item	This right controls the access to create an item at the list level and to create a child item inside another item at the ListItem level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Right Name	Description
Can Create Folder	This right controls the access to create a new folder.
Can Delete Item	This right controls the access to delete items.
Can Disable Item	This right controls the access to disable items.
Can Edit Item	This right controls the access to edit items.
Can Enable Item	This right controls the access to enable the disabled listitems.
Package Item	This right controls the access to add artifacts to a package template.
Can Publish Item	This right controls the access to publish items.
Can Save As	This right controls the access to save items.
Can Save As Next Major Version	This right controls the access to save the next major version of an item.
Can Save As Next Minor Version	This right controls the access to save the next minor version of an item.
Can Save As Next Version	This right controls the access to save the next version of an item.
Can Save As Specific Version	This right controls the access to save a specific version of an item.
Can TestRun	This right controls the access to view the execution of the published workflow and also the execution view of an item.
Can UnPublish Item	This right controls the access to unpublish the published listitems.
Can View Audit History	This right controls the access to view the audit history of an item. Currently, this is implemented for the workflow list and dynamic lists only.
Can View Item Details	This right controls the access to view the item details in the dynamic list in the read-only mode. This right control is a drop-down list with allow, disallow and owned items only at the dynamic list and list items levels. For the rest of the levels (repository, other list and list item levels), this right control is a check box.
Can View Properties	This right controls the access to view the properties of

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Right Name	Description
	an item.
Can Consume Item	This right controls the access to consume an item (it may be in lookups or any place where list items get consumed).
Can View Disabled Item	This right controls the access to view disabled items.
Can View Item	This right controls the access to view an item.
Can View Others' Draft Folder	This right controls the access to view others' drafted folders.
Can View Others' Draft Item	This right controls the access to view others' draft items. By default, the user can see the items published by others but not their draft items.
Show Only Owned Item	This right controls the access to view only owned listitems. **Note:** This right will take the highest preference. For example, if the logged-in user has some other rights like CanViewPendingItem, CanViewDisabledItem, CanViewOthersDrafItem set to true then in that case, the CanViewPendingItem, CanViewDisabledItem, CanViewOthersDrafItem etc. rights will not be useful for the logged in user because the user can view only the owned listitems.
Show Work In Progress Item	This right controls the access to view work in progress items.
Manage Package List Rights	
Install	This right controls the access to install the package.
Uninstall	This right controls the access to uninstall the package.
Package Template List Rights	
Export	This right controls the access to export the package template.
Generate	This right controls the access to generate the package template.
Mark as Shipped	This right controls the access to mark the package template as shipped.
Queue Control Rights	

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Right Name	Description
Can Add New Queue	This right controls the access to add a new queue.
Can View Queue Control	This right controls the access to view queue control.
Manage Queues	This right controls the access to modify/delete queues.
Web Parts Rights	
Add Web Parts	This right controls the access to add web parts to the home page.
Delete Web Parts	This right controls the access to delete the web parts properties of the home page.
Edit BAM Personalization Scope	This right controls the access to change the personalization scope for the BAM control page.
Edit Calendar Personalization Scope	This right controls the access to change the personalization scope for the Calendar control page.
Edit Home Page Personalization Scope	This right controls the access to change the personalization scope for the logged-in user.
Edit Queue Personalization Scope	This right controls the access to change the personalization scope for the Queue control page.
Edit Web Parts	This right controls the access to edit the web parts properties of the home page.
Edit Personalization Scope	This right controls the access to change the personalization scope for the Work items list control page.
Default HWorkitemhome Page	This right controls the access to specify the default home page for the security group.
Personalize BAM Control	This right controls the access to personalize the BAM control.
Personalize Calendar Control	This right controls the access to personalize the Calendar control.
Personalize Queue Control	This right controls the access to personalize the Queue control
Personalize Work item Control	This right controls the access to personalize the Work items list control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Right Name	Description
Reset User Personalization Scope	This right controls the access to reset the personalization data for “user scope”.
Show Home Page Web Part Settings	This right controls the access to see the home page web parts setting.
Show Ribbon Bar	This right controls the access to make visible/invisible the ribbon bar of the list control web part.
Workflow List Rights	
Can Create Associations	This right controls the access to create associations for list items.
Can Create BAM Workflow	This right controls the access to create BAM Workflow.
Can Create FileWatcher Workflow	This right controls the access to create File Watcher Workflow.
Can Create List Workflow	This right controls the access to create List Workflow.
Can Design Workflow	This right controls the access to design Workflow.
Can Overwrite Published Workflow	This right controls the access to modify (re-design) the published workflow. It is specific to the “Workflow List” and set to false for all security groups by default.
Can Overwrite Published Form	This right controls the access to modify (re-design) the published Form. It is set to false for all security groups by default.
Can Provision Now	This right controls the provisioning feature of workflow.
Can Run Workflow Wizard	This right controls the access to the wizard feature to create workflow.
Can Do Tasks	This right controls the access to tasks like design workflow, start workflow wizard, provision now etc on an item in the workflow list.
Can View Associations	This right controls the access to view the associations of an item in the workflow list.
Can View Workflow Design	This right controls the access to view the process definition (design) of an item in the workflow list.
Can View Exceptions	This right controls the access to view the exceptions of an item in the workflow list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Right Name	Description
Process Designer Rights	This right controls the access to set the action rights and menu rights. See Process Designer Rights for more details.
Work Item Rights	
Can Forward Work Item	This right controls the access to forward a work item to another actor which is assigned.
Can Kill Work Item	This security right is to grand/deny permission to abort workflow instances.
Can Set Alternate Actor	This right controls the access to set an alternate actor.
Can Set Preferences	This right controls the access to set preferences.
Can View Queue	This right controls the access to queue control.
Can View Resource Calendar	This right controls the access to view resource calendar.
Can View Work Item Control	This right controls the access to view the work item control itself.
AVEVA Work Tasks Pro App	
Default Home Page	This right controls the access to specify the default home page for the security group in the AVEVA Work Tasks Pro app. **Note:** Ensure that you log off from and log in to the Work Tasks Pro app after you make any changes in the dashboard form or its configuration.
Other Rights	
Can Fill Form	This right controls to access the form to fill.
Can Access List	This right can be used to control the access to lists that are available in the repository.
Can Manage Security	This right controls the access to define security. If the Can Manage Security right is set to false then the Repository Settings option is not displayed at the right corner.

See Types of Security Rights for more information on security rights.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Types of Security Rights

There are three types of Security rights. These security rights have to be added for each action or functionality which requires restricted access.

- **Allow/Disallow** - If the Allow option is selected, the users belonging to the particular security group will be able to perform the action. If the Disallow option is selected, the users will not be able to perform the action. See Example for Allow or Disallow for more details.
- **Requires Approval** - If the Requires Approval option is selected, the users belonging to a particular security group need approval from their manager to perform that action. For sending an approval, it triggers the workflow that is specified as its rights value. The action will be performed after the request is approved. See Example for Requires Approval and Requires Approval With Prompt for more details.
- **Requires Approval With Prompt** - If the Requires Approval With Prompt option is selected, the users belonging to a particular security group need an approval from their manager. For sending an approval, it will prompt before triggering the workflow that is specified. The action will be performed after the request is approved. See Example for Requires Approval and Requires Approval With Prompt for more details.

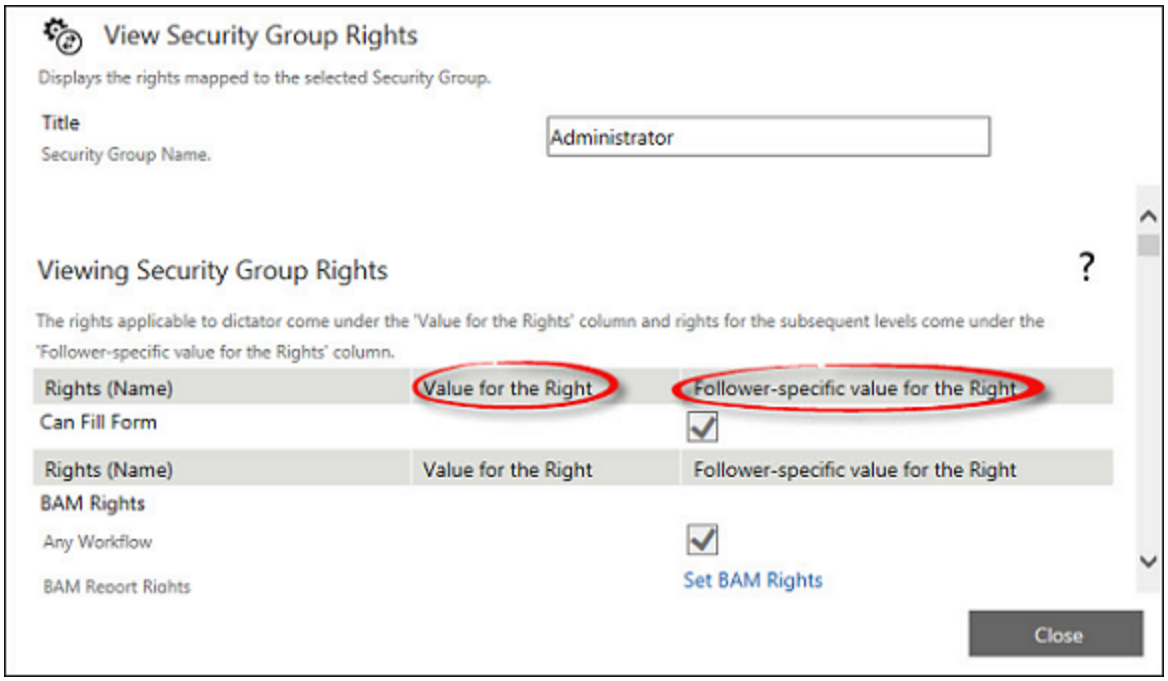
Difference between Value for the Rights and Follower Specific Value for Rights

Every Security Right has two properties that need to be set. These are **Value** and **Follower Value**.

- **Value** - This is the value that you want to set for the Security Right. This value is applicable for the right to which you set it for, and is applied for the current level.
- **Follower Value** - This is the value that you want the right to hold for the follower. If there is no security defined at a particular entity level then that entity will inherit Follower Value from its immediate dictator. First a check is be done to view if the current level has a security definition. If there is no security defined at this level, then the security defined for the immediate dictator will be considered. See Dictator and Follower for more information.

  Even if the child items are granted permission, it will not be accessible unless its parent has the required permission. For example, if a user does not have permission for a folder then user will not have access to the items under that.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Example:

Let us assume that the 'HR Process', 'Leave Process' and 'Holiday Process' are items inside Workflow Lists. 'Leave Process' and 'Holiday Process' are child items of 'HR Process'.

Assume that there is an explicit ListItem level security is applied for 'HR Process' and 'Holiday Process' and there is no explicit ListItem level security applied for 'Leave Process'.

The 'HR Process' and 'Holiday Process' will use the rights specified to apply security at their levels. Since no security is set for 'Leave Process', it will inherit the security defined for its parent item. Here, 'Leave Process' inherits the security settings from 'HR Process'. Hence, the follower value rights that are defined at 'HR Process' will be applied to 'Leave Process'.

The 'Leave Process' is called the follower of the 'HR Process' (in security context) and 'Holiday Process' is called a **child** of the 'HR Process', not its follower.

Dictator and Follower

Dictator - It is the level (Repository, List, or ListItem) where the security is defined. If a list or list item does not have security defined then the security applied at the parent (Repository) level will be implemented. Here, the Repository is a dictator to list and listitem when list and listitem do not have their own security.

Follower - It is the level (List or ListItem) where the security is not defined. It cannot apply its own security and therefore has to inherit from its immediate dictator, that is, its immediate parent level where the security is defined.

- **Example 1**: Security is available at the Repository level. The security is defined for some lists like Workflow list and Forms list. When the logged-in user comes to the Workflow or Forms list, the list level security gets applied. When the user comes to the User list or some other list where no security definition is available at the list level, security is inherited from the above level i.e. the Repository level.
- **Example 2**: At Workflow list, the security is defined but it is not defined at the list item level. In this scenario,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

when the logged-in user comes to the Workflow list, the security rights available at the Workflow list will be applied for the user. When the user is at the list item level, there is no security definition. Hence, the listitem will inherit security from its dictator (in this case, the list).

- **Example 3**: Security is defined at the listitem level but the child items do not have a security definition. When the logged-in user comes to the listitem level, the security definition available at this level gets applied for the user. When the user comes to the child items where security is not defined, the security definition will be inherited from its immediate dictator; here it is the parent item.

Security Group

Security Definition

The set of rights defined for a group is termed as Security Definition.

Security Group

A **Security Group** is a combination of rights along with their values and used to privilege or restrict the users.

AVEVA Work Tasks Security Groups

AVEVA Work Tasks security feature comes with pre-defined security groups that can be mapped to users as well as to roles at different levels. Once a resource is mapped to the security group, the resource will have the privileges and restrictions which are set in the security group in the form of rights. The definition of security groups can be customized at different levels.

User can also create new security groups at the Repository level that can be extended and modified at different levels (List and ListItem). Security groups will be created with different combinations of rights set.

AVEVA Work Tasks has come up with the following four standard security groups which can be extended and modified to various level, but cannot be deleted or renamed. These security groups shipped along with the product are:

- Administrator
- Contributor
- Limited Access
- Reader

The Administrator group has the highest privilege of security rights followed by the Contributor and Reader groups. The Limited Access group has the least privilege rights, with minimum security rights.

The security groups are created with a set of permissions assigned for entities like List, List Item, Application, Menu etc. Different security groups will be created for different combinations of permission sets.

While creating a security group, all the global permission sets will be defined. If any permission sets are required at the list level, they will also be defined here. For example, the Association permission set for the process list.

Example: Security groups will be created at the Repository level but their definition can be modified at List or List Item level. So for an ‘Administrator’ security group which has the “Can Delete List item” right enabled at the Repository level, this delete right can be disabled at the List or List item level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Security groups and their permissions

- Administrator - This group will have view, add, modify and delete rights to the entities.
- Reader - This group will have only view rights to the entities.
- Contributor - This group will have view and add rights to the entities.
- Limited Access - This group will have limited rights to the entities.

Note: The Create item security right, if assigned to a custom group, does not work for Workflow and Forms.

Manage Security Groups

Security Group is a list which lets the user create a new security group and modify, view or delete an existing security group. It also lets the user view the effective mapping for a particular security group. Effective mapping displays the information about the security group and its mappings, shows where all the security group is mapped to the resource and modified. While adding a new security group, value for the rights can be set.

To open the Manage Security Groups window

1. Log on to the **Enterprise Console**.
2. Click **Repository Settings**. The **Repository Settings** page appears.
3. Click **Advanced Settings** tab.
4. Click **Manage Security Groups**. The **Security Groups** page appears.

- Modifying Security Group
- Delete Resource Mapping
- Viewing Security Group
- Effective Mapping

Create Security Group

Create Security Group

Use the **New** option to create custom security groups with the required permutations and combinations, apart from the existing security groups. A security group can be created only at the repository level.

Note: To set the Default Home page for the security group, enable the permissions for **Can Fill Form** and **Can Consume Item**.

To create a new security group

1. Log on to the **Enterprise Console**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Click **Repository Settings**. The **Repository Settings** page appears.
3. Click **Advanced Settings** tab.
4. Click **Manage Security Groups**. The **Security Groups** page appears.
5. On the action bar, click **New**. The **Create Security Group** window appears.
6. Select the desired option.
   - New Security Group: Select **New Security Group** to create a security group from scratch. This screen displays the rights with default values. The user can edit them and create a new security group altogether.
   - Copy From Existing Security Group: Select **Copy From Existing Security Group** to create a security group by coping the rights from an existing security group. The user can customize this group later.

To create a new security group

1. Select **New Security Group**, and then click **Continue**.
2. In the **Title** box, type a name for the security group, and in the **Description** box, type a description for the security group.
3. In the **Viewing Security Group Rights** section, set the rights for the new security group.
4. Click **Save** to assign rights to the security group. A message about successfully creating the security group appears.
5. Click **OK** to save the security group.

To copy from existing security group

1. Select **Copy From Existing Security Group**.
2. Select a security group from the drop-down list, and the click **Continue**. The new security group will have the set of rights and predefined values of the selected security group.

   Note: This will inherit the existing security group from the repository level only and not from other levels (e.g. List and List Item level).
3. In the **Title** box, type a name for the security group, and in the **Description** box, type a description for the security group.
4. In the **Viewing Security Group Rights** section, modify the **Value for the Rights** and **Follower-specific value for the Rights** according to the requirements.
5. Click **Save** to assign rights to the security group. A message about successfully creating the security group appears.
6. Click **OK** to save the security group.

Note: The *LastUpdatedDateTime* column in the Security Group list displays the modified date and time of a particular security group, only when it is updated at the Repository level.

To view security mapping, see View Security Group.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Modify Security Group

Modify Security Group

Use the Edit option to edit the existing settings of a security group. You can also synchronize the edited settings.

To edit a security group

1. Log on to the **Enterprise Console**.
2. Click **Repository Settings**. The **Repository Settings** page appears.
3. Click **Advanced Settings** tab.
4. Click **Manage Security Groups**. The **Security Groups** page appears.
5. Select the security group to be modified, and then click **Edit**. The **Modify a Security Group** window appears. Alternatively, select and right-click the **Security Group**, and then click **Edit**.
6. In the **Viewing Security Group Rights** section, modify the security rights.
7. Click **Save**. The **Synchronizing the Security Group** window appears.
8. Click **Yes** to synchronize the edited settings, else click **No**.
9. Click **Submit**. The *Security Group is modified successfully* message appears.
10. Click **OK**.

Note: The **LastUpdatedDateTime** column in the Security Group list displays the modified date and time of a particular security group, only when it is updated at the Repository level.

Example for Allow or Disallow

Example for Allow or Disallow

Consider a scenario where a user called 'Rose' belongs to the 'Reader' security group. The 'Can Delete Item' right is initially set as 'Disallow' for 'Reader'. The example shows how to set this right to 'Allow' so that this user will be able to delete the Item.

To set the right to Allow

1. Log on to the **Enterprise Console** as 'Rose'.
2. Select Workflows.
3. Select any workflow, and click **Delete**. The following warning message gets displayed:

   You do not have rights to perform this action.
4. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. You now have to edit the security group definition of the 'Reader' to allow deleting an item.
6. To edit the Reader security group, log on as **Administrator**.
7. Click **Repository Settings** (top-right corner).
8. Click the **Advanced Settings** tab.
9. Click **Manage Security Groups**. The **Security Group** page is displayed.
10. Select **Reader**, and click **Edit**. In the **Generic List Actions** rights (name), the **'Can Delete Item'** is selected as **Disallow**.
11. Select **Allow**.
12. Click **Save**. The **Synchronization** screen is displayed. Click **Yes** to synchronize the security groups to the below levels. Click **OK** in the confirmation window.
13. Log on as 'Rose'.
14. Select **Workflows** from the **Enterprise Console** menu.
15. Select any workflow and click **Delete**.
16. Click **Yes** and then click **Close** to delete the item successfully.

Example for Requires Approval and Requires Approval With Prompt

Example for Requires Approval and Requires Approval With Prompt

Requires Approval

Consider the Can Delete Item right - If a user belonging to a particular group deletes an item, it will trigger the security approval workflow and only on the approval of the security workflow, the item will get deleted. If the **security approval workflow** is rejected then the item will not get deleted.

Requires Approval With Prompt

Consider the Can Delete Item right - If a user belonging to a particular group deletes an item, the user will be prompted that an approval workflow will be triggered to perform the particular action and the item will get deleted only on the approval of the security workflow. If the security approval workflow is rejected then the item will not get deleted.

Example: On the List level, John who is a manager, initiates a approval process for deletion of an item in the workflow list. John has to enable the approval workflow. The manager must import the security approval workflow from AVEVA\WorkTasks\security_approval_workflow.xml and the select the user for the approval activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To set up Security Approval Workflow

1. Set up the security approval workflow. See Set up Security Approval Workflow to setup.
2. Right-click the **Request for Approval** activity and select **Activity Properties**. Set the **Assign Actor(s)** property. In this example, the administrator user is set as a actor.
3. In the **Publish** menu, select Publish to publish this workflow.
4. Click **Repository Settings > Advanced Settings > Manage Security Groups**.
5. Select the **Contributor** security group and click **Edit** to edit the security group.
6. For **Can Delete Item**, select **Requires Approval With Prompt** from the drop-down list.
7. Open the **Workflow Lookup** screen. Select the **Workflow** and **Version**.
8. Click **Select**.
9. For the **Can Publish Item** right, select **Requires Approval** from the drop-down list.
10. Open **Workflow Lookup** screen. Select the **Workflow** and **Version**.
11. Click **Select**. The Modify a Security Group screen is displayed.
12. Click **Save**.
13. Click **Yes** to synchronize the security groups to the below levels.
14. Login into the **Enterprise Console** as a user who has Contributor rights. Here, George has Contributor rights.
15. Select any item and click **Publish** to publish this item. For example, **DraftFolder**.
16. Click **Close** and then click **Publish**. The message shown below is displayed. Click **OK**.
    The security approval workflow that is attached to the item is pending, you cannot perform this action now.
17. Login as the administrator because the assigned actor in the security approval workflow is the administrator.
18. Click **Inbox**. The Work items list comes to the administrator's Inbox. If the administrator approves, a user who has administrator rights will be able to publish the item. If the administrator rejects, the contributor will not be able to publish the **DraftFolder** item.
19. Login as George.
20. Select HR Process workflow and click **Delete**. When the user belonging to the Security Group tries to delete an Item in any of the Lists, for example an item in the Workflows list, the Security workflow will be initialized. The user will be prompted with a message and the action will result as per the workflow result. The confirmation message is displayed. Click **OK**.
21. Click **Close**.
22. Login as an administrator user because the assigned actor in security approval workflow is 'Administrator'.
23. Click **Inbox**. The Work items list comes to the administrator user's Inbox. If the administrator approves, a user with administrator rights will be able to delete the item. If the administrator user rejects, the contributor will not be able to delete the **Holiday Process** workflow item.

View Security Group

View Security Group

Use the View option to view the security group rights for the selected security group.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To view the security group

1. Log on to the **Enterprise Console**.
2. Click **Repository Settings**. The **Repository Settings** page appears.
3. Click **Advanced Settings** tab.
4. Click **Manage Security Groups**. The **Security Groups** page appears.
5. Select the security group to be viewed, and then click **View**. The **View Security Group Rights** window appears.
   Alternatively, select and right-click the security group, and then click **View**.
6. Click **Close**.

Delete Security Group

Delete Security Group

Use the **Delete** option to delete the selected security group. After you delete a security group, it is removed from all the places where the security definitions are created. In addition, the users mapped to these deleted security groups will have only limited access.

To delete a security group

1. Log on to the **Enterprise Console**.
2. Click **Repository Settings**. The **Repository Settings** page appears.
3. Click **Advanced Settings** tab.
4. Click **Manage Security Groups**. The **Security Groups** page appears.
5. Select the security group to be deleted, and then click **Delete**. The **Delete Security Group** dialog box appears.
   Alternatively, select and right-click the security group, and then click **Delete**.
6. Click **Yes** to delete the security group, else click **No**. The *Security Group is deleted successfully* message appears.
7. Click **OK**.

You cannot delete the default security groups of **AVEVA Work Tasks**. You can delete only the user-defined security groups.

Effective Mapping of a Security Group

Effective Mapping of a Security Group

Use the Effective Mapping option to view the resources mapped for the security groups at different levels.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To view effective mapping

1. Log on to the **Enterprise Console**.
2. Click **Repository Settings**. The **Repository Settings** page appears.
3. Click **Advanced Settings** tab.
4. Click **Manage Security Groups**. The **Security Groups** page appears.
5. Select a security group and then click **Effective Mapping**. The **View Effective Mapping** window appears. Alternatively, select and right-click a security group, and then click **Effective Mapping**.
6. Click a **List/Item Name** to view the rights mapped to the selected **Security Group** at the repository level. The **View Security Group Rights** window appears.
7. Click **Close**.

To view the effective mapping at list level

1. To view the effective mapping at list level, enable security at the list level. If there is no security at this level, first enable it. For more information about enabling security at the list level, see Enabling Security at List Level.
2. Go to any list using the menu icon in the **Enterprise Console**. For example, assume that security is already enabled at the Workflow list level. In the Enterprise Console, click menu icon, and then click Workflows. The Workflows page appears.
3. On the action bar, click **Security**. The security settings page appears.
4. Click **View Security Mapping at List Level** to view security mapping at the workflow list level. The **View Security Mapping at List Level** appears.
5. Click any security group to display the rights mapped to the group.

To view the effective mapping at listitem level

1. To view effective mapping at listitem level, enable security at the listitem level. If there is no security at this level, first enable it. For more information about enabling security at the list level, see Enabling Security at ListItem Level.
2. Go to any list using the menu icon in the **Enterprise Console**. For example, assume that security is already enabled at the Workflow list level. In the Enterprise Console, click the Menu icon, and then click **Workflows**. The Workflows page appears.
3. Right-click the required workflow list item, and then select **Security Settings** from the context menu. For example, right-click the 'FileWatcher' workflow and then select **Security Settings** from the context menu. The security settings page appears.
4. Click **View Security Mapping at List Item Level** to view the security mapping at workflow listitem level.

   The **View Security Mapping at ListItem Level** appears.
5. Click any security group to display the rights mapped to the group.

Security Resource Mapping

Resource Mapping are pre-defined groups with their own set of rights that are applicable to the users, who are a

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

part of these groups. Resources can be added to the groups either individually or added based on their roles.

Mapping users or roles in the security groups defined for that repository is known as security resource mapping.

A repository can be mapped to any of the following Resource Provider:

- Active Directory
- Forms
- ASP.NET membership
- List

Default Resource Mapping to Security Groups

- Administrator Mapping - Admin should be configured while creating repository.
- Default Mapping - By default, the Admin is mapped to Administrator security group and all created users are mapped to Limited Access security group.
- If the resource mapping does not exist for a user then that user will be a part of the 'Everyone' role.
- By default, the 'Everyone' role is mapped to Limited Access security group. If resource mapping does not exist for a user then the rights defined for limited access will be applied to that user.
- Role(s)/Individual user(s) can be mapped to different Security Groups at the Global, List or List Item level. The users will have access rights to the entities as defined in the Security Group.
- While mapping Roles to Security Groups, there is an option to set a priority number. In case a user is part of multiple roles and these roles are mapped to different Security Groups, then the security will take effect based on the priority number. The Role mapping with the least priority number to the security group will the effective security group for the user.
- The mapping defined at the lower level will take precedence over any mapping defined above it. Hence, a mapping done at the List level will override any mapping done at the Repository level. Similarly, mapping done at the List item level will override any mapping done at the List or Repository level.

Manage Security Group - Resource Mapping

Security Groups are mapped to different AVEVA Work Tasks Role(s) or individual user(s) at the Global, List or List Item level. The users will have access rights to the entities as defined in the Security Group.

Security Groups allow the user to set priority if the user has multiple roles and if these roles are mapped to different security groups. While defining the Security Group to Role mapping, there is an option to set a priority number. If the user is a part of multiple roles, which are mapped to different Security Groups, then the security will take effect based on the lowest priority number given to the roles.

To open the Security Group Mapping:

1. Log on to the **Enterprise Console**.
2. Click **Repository Settings**. The **Repository Settings** page appears.
3. Click **Advanced Settings** tab.
4. Click **Manage Security Group - Resource Mapping**. The **Security Group Mapping** page appears.

See Create a Resource Mapping, Edit Resource Mapping, Delete Resource Mapping to add, modify, or delete a

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

security group.

Create a Resource Mapping

Create a Resource Mapping

Use the **New** option to map roles, map users, or map specific users from a role to different security groups. If you map a role to a security group, then all the users of that role will be mapped to the assigned Security Group. You can also map specific users from a role to a security group.

Mapping Roles: This allows the user to map a role to a specific security group.

To map role with a security group:

1. In the **Security Group Mapping** page, click **New** on the action bar. The **Security Group Resource Mapping** page appears.
2. Click the **Map Roles** tab to map the selected role with a security group.
3. In the **Role Lookup** field, enter the role to map the selected role with a security group. Use the Role Lookup window to search for the required role.
4. In the **Security Group** drop-down list, select the security group to map with the selected role. For example, select 'Contributor' from the Security Group drop-down list.
5. In the **Priority** text box, enter the priority. For example, enter the priority as '4'.
6. Click **Save** to map the resource. The message *Resource mapping is saved successfully appears*.
7. Click **OK**. The selected role is mapped with the security group, and all the rights of the group are applied.

Note: If the logged-in user belongs to multiple roles, the least priority will be considered

Mapping Users: This allows the user to map an individual user to a specified security group.

To map users with a security group

1. In the **Security Group Mapping** page, click **New** on the action bar. The **Security Group Resource Mapping** page appears.
2. Click the **Map Users** tab to map the user with a security group. The **Mapping : User to a Security Group** page appears.
3. In the **User Lookup** field, enter the user to map the selected user with a security group. Use the **User Lookup** window to search for the required role.
4. In the **Security Group** drop-down list, select the security group to map with the selected user. For example, select 'Limited Access'.
5. Click **Save** to map the resource. The message Resource mapping is saved successfully appears.
6. Click **OK**. The selected user is mapped with the security group, and all the rights of the group are applied.

Note:
- The same user cannot be mapped with multiple security groups at the same level.
- The users with special characters **^ ( ) ' <** cannot be mapped with the security group.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Mapping Users from Role: This allows the user to map specific users from a role to a specified security group.

To map users from a role with a security group

1. In the **Security Group Mapping** page, click **New** on the action bar. The **Security Group Resource Mapping** page appears.
2. Click the **Map Users from Role** tab to map the user from a specific role with a security group. The **Mapping : User from Role to a Security Group** page appears.
3. In the **Role Lookup** field, select the role from which the users need to be mapped with a security group and then click **List Users**.
4. In the the **Select Users from Role** list box, select the users to be mapped with the security group.
5. In the **Security Group** drop-down list, select the security group to map with the selected user. For example, select 'Limited Access'.
6. Click **Save** to map the resource. The message Resource mapping is saved successfully appears.
7. Click **OK**. The selected user is mapped with the security group, and all the rights of the group are applied.

Note:
- The same user cannot be mapped with multiple security groups at the same level.
- The users with special characters **^ ( ) ' <** cannot be mapped with the security group.

Edit Resource Mapping

Edit Resource Mapping

Use the **Edit** option to edit security group mapping settings for the individual user or a specified role.

To modify a security group:

1. In the **Security Group Mapping** page, select the security group name to be modified. For example, select the 'Limited Access' security group, and the user name 'John'.
2. On the action bar, click **Edit**. The **Mapping : User to a Security Group** page appears.
3. Change the required parameter, such as **User Name**, **Security Group**, or the **Provider Name**.
4. Click **Save** to edit the resource. The message *Resource mapping is saved successfully* appears.
5. Click **OK**. The selected user is mapped with the security group, and all the rights of the group are applied.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Delete Resource Mapping

Delete Resource Mapping

Use the **Delete** option to delete the resource mapping for the selected user or role.

To delete a security group:

1. In the **Security Group Mapping** page, select the security group name that you want to delete.
2. On the action bar, click **Delete**. A confirmation message to delete the security group appears.
3. Click **OK** to delete, else click **Cancel** to **cancel** the operation. The confirmation message about successfully deleting the resource mapping appears.
4. Click **OK**

View Effective Security Rights for User or Role

You can use the **View Effective Security Rights for User or Role** page to view the effective security group and its definition, based on the selected role or user.

To view Security Rights for User or Role

1. Log on to the **Enterprise Console**.
2. Click **Repository Settings**. The **Repository Settings** page appears.
3. Click **Standard Settings** tab.
   - Click **View Effective Security Rights For User/Role** to view the effective security for a specified user or role at Repository level.
   - Click **View Security Mapping at Repository Level** to view the security mapping for all users or roles at Repository level.

See View Effective Security Rights for Roles and View Effective Security Rights for User/Role for more details.

View Effective Security Rights for Roles

You can search for a role to view the security group and rights assigned to it.

To view security and its rights for the role

1. In the **Standard Settings** tab, click **View Effective Security Rights For User/Role**. The **Role Based** and **User Based** tabs appear.
2. Click **Role Based** tab. The **View Effective Security Rights For Role** section appears.
3. Select a role using the **Role Lookup** dialog box.
4. Click **View Rights** to view the effective security group and rights for the selected role.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Click **Security Snapshots** to view the role name along with the security group to which the selected role belongs.

View Effective Security Rights for User/Role

You can search for a particular user and view the security group and its rights assigned to the user.

To view security and its rights for the role

1. In the **Standard Settings** tab, click **View Effective Security Rights For User/Role**. The **Role Based** and **User Based** tabs appear.
2. Click **User Based** tab. The **View Effective Security Rights For User/Role** section appears.
3. Select a user using the **User Lookup** dialog box.
4. Click **View Rights** to view the effective security group and rights for the selected user.
5. Click **Security Snapshots** to view the user name, roles mapped for the user along with priority, user mapping and effective security group for the selected role.

Levels of Security

AVEVA Work Tasks provides security at different levels across which the user privilege can be managed.

You can set the security at the following three levels:

- Repository Level
- List Level
- ListItem Level

Repository Level Security Settings

The security settings set at this level are applied to the entire repository. This can be overwritten at the List Level and Item Level.

The following are the right privileges given to the user at the Repository level:

- Manage Security Group
- Manage Security Right
- Allow Security Group- Resource Mapping
- Manage Left Navigation
- View Audit Trails
- Delete Audit Trails

See Setting Security at Repository Level for more details.

List Level Security Settings

The security settings at this level can be applied only to that list. In case there are user defined security settings

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

for the Workflow list, they are applicable only to that workflow list. The security settings of other lists will not be affected. A user can navigate to a list only if the user is given top level access rights for that list. For example, Workflow list, User List, Navigation List.

See Setting Security at List Level for more details.

ListItem Level Security Settings

The security settings at this level can be applied only to that item. If the ListItem has any child item and there is no value set for the rights, then the follower security settings will be rendered at the item level.

See Setting Security at ListItem Level for more details.

Set Security at Repository Level

The security rights can be applied at all levels that is, Repository Level, List Level and List Item Level through **Repository Settings**. Only the **Administrator** can view the Repository Settings option. All other security groups cannot view this option as they do not have access rights.

- If the user has **Administrator** rights, then the **Repository Settings** option will be displayed at the right corner along with the **Log Out** option. For other group rights like **Contributor**, **Limited Access** and **Reader**, the Repository Settings option will not be displayed.
- If the **Can Manage Security** is set to **True** for any of the Security Groups then the **Repository Settings** option will be displayed at the right corner. If the **Can Manage Security** right is set to **False** to any of the Security Groups then the Repository Settings option will not be displayed at the right corner.

To apply security setting

1. Log on to the **Enterprise Console**.
2. Click **Repository Settings**. The **Repository Settings** page appears.
3. The **Repository Settings** page displays the following two tabs:
   a. **Standard Settings** tab shows the standard settings options.
   b. **Advanced Settings** tab shows the advanced settings options.

Set Security at List Level

To apply security settings at the List level

1. Log on to the **Enterprise Console**.
2. In the Enterprise Console, click menu icon, and then select any list.
   For example, select the **Workflows** list. The **Workflow** page appears.
3. On the Action bar, click **Security** to set security at the List level. The security settings page appears.
   By default, the **Standard Settings** tab is selected. Click the **Advanced Settings** tab to view the advanced settings options.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

See Enabling Security at List level by enabling resource mapping for more details.

See Enabling Security at List level by customizing the security group definition for more details.

Set Security at ListItem Level

To apply security settings at ListItem level

1. Log on to the **Enterprise Console**.
2. In the Enterprise Console, click menu icon, and then select any list item.
   For example, select the **Workflows** list, and then click any workflow name.
3. On the Action bar, click **Security** to set security at the List level. The security settings page appears.
   By default, the **Standard Settings** tab is selected. Click the **Advanced Settings** tab to view the advanced settings options.
   Alternatively, select and right-click a workflow, and then select **Security Settings** from the context menu to set security at the ListItem level.

See Enabling Security at ListItem level by enabling resource mapping for more details.

See Enabling Security at ListItem level by customizing the security group definition for more details.

Overwrite Definitions from Above Level

The mapping defined at the lower level will take precedence over any mapping defined above it. So, a mapping done at the List level will override any mapping done at the Global (Repository) level. Similarly, the mapping done at the List item level will override any mapping done at the List level if available or else will override at the Global (Repository) level.

Choose between Mapping and Customization

You can choose both or any one of the following options to apply the security settings:

Resource Mapping

Choose this option if you want to privilege or restrict the user(s) at one level, and want to retain the definition at other levels.

For example, the user 'John' is a Contributor access rights user at the Repository level. You want him to provide him Reader rights at the Workflow list level but want retain the security defined at the repository level. To do this, choose **Resource Mapping** while enabling security at the Workflow list level, select this user and map him to the Reader security group.

Once Resource Mapping is enabled at the list level, the user should be able to identify that mapping is enabled at the list level.

Security Group Customization

Choose this option if you want to modify or customize the definition of a security group.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For example, you want all reader (Reader access rights) users who do not have rights at the repository level to create and edit items in any list. You want all reader users to have rights at the Workflow list level to create and edit an item, you should choose **Security Group Customization** and modify the reader security group definition so that all reader users can add and edit an item.

Once Security Group Customization is enabled at the list level, the user should be able to identify that customization is enabled at the list level.

Enable Security at List Level

You can enable list level security in the following ways:

- By enabling Resource Mapping
- By customizing the Security Group definitions

What happens when List level or List Item level mapping is enabled?

The resource mapping available at its parent level is nothing but Repository level copied to the list level. Once the resource mapping is copied to the list level, the user can add, modify, and delete the mapping.

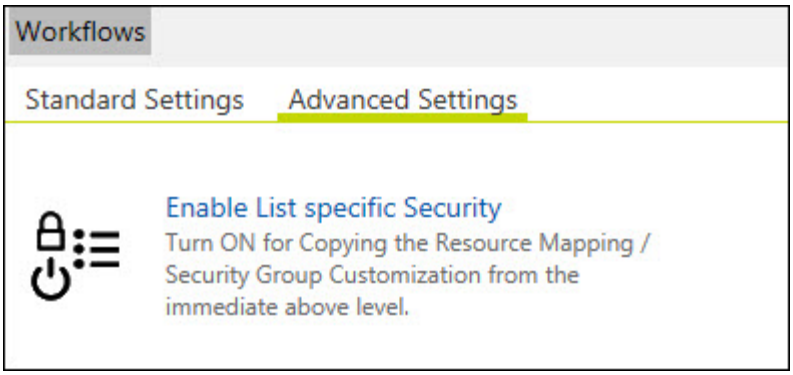
Note: Before mapping is enabled, the changes done at the Repository or Dictator level will not effect the list level mapping. For example, assume that there are 10 user mapping at the repository level. After enabling mapping at the list level, all 10 users will be copied to the list level. If you add a one extra user mapping at the repository level, the newly added mapping at the repository level will not be available at the List level.

Enable Security at List Level by Enabling Resource Mapping

To enable resource mapping at the List level

1. Log on to the **Enterprise Console**.
2. In the Enterprise Console, click menu icon, and then select any list.
   For example, select the **Workflows** list. The **Workflow** page appears.
3. On the action bar, click **Security** to set security at the List level. The security settings page appears.
   By default, the **Standard Settings** tab is selected.
4. Click the **Advanced Settings** tab to enable list level security at the Workflow list level.
   The **Enable List Specific Security** indicates that the Workflows list does not have list specific security.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



5. Click **Enable List Specific Security**. The **Enable Security Wizard** page appears.
6. Check **Resource Mapping** to change the mapping of the role or user at the Workflows list level.
7. Click **Next**. The **Enable Security Wizard** page appears.
8. Click **Next**. The **Security Group Mapping** page appears. You can add a resource mapping, edit a resource mapping, or delete a resource mapping.

Add a Resource Mapping

Add a Resource Mapping

To add a new resource mapping at the List level

1. Log on to the **Enterprise Console**.
2. In the Enterprise Console, click ☰ menu icon, and then select any list.
   For example, select the **Workflows** list. The **Workflow** page appears.
3. On the Action bar, click **Security** to set security at the List level. The security settings page appears.
   By default, the **Standard Settings** tab is selected.
4. Click the **Advanced Settings** tab to enable list level security at the Workflow list level.
   The **Enable List Specific Security** indicates that the Workflows list does not have list specific security.
5. Click **Enable List Specific Security**. The **Enable Security Wizard** page appears.
6. Check **Resource Mapping** to change the mapping of the role or user at the Workflows list level.
7. Click **Next**. The **Enable Security Wizard** page appears.
8. Click **Next**. The **Security Group Mapping** page appears. You can add a resource mapping, edit a resource mapping, or delete a resource mapping.
9. On the action bar, click **New** to add a new resource mapping. The **Mapping : Role to a Security Group** appears.
10. Follow the same steps as explained in Create a Resource Mapping for mapping role and user.

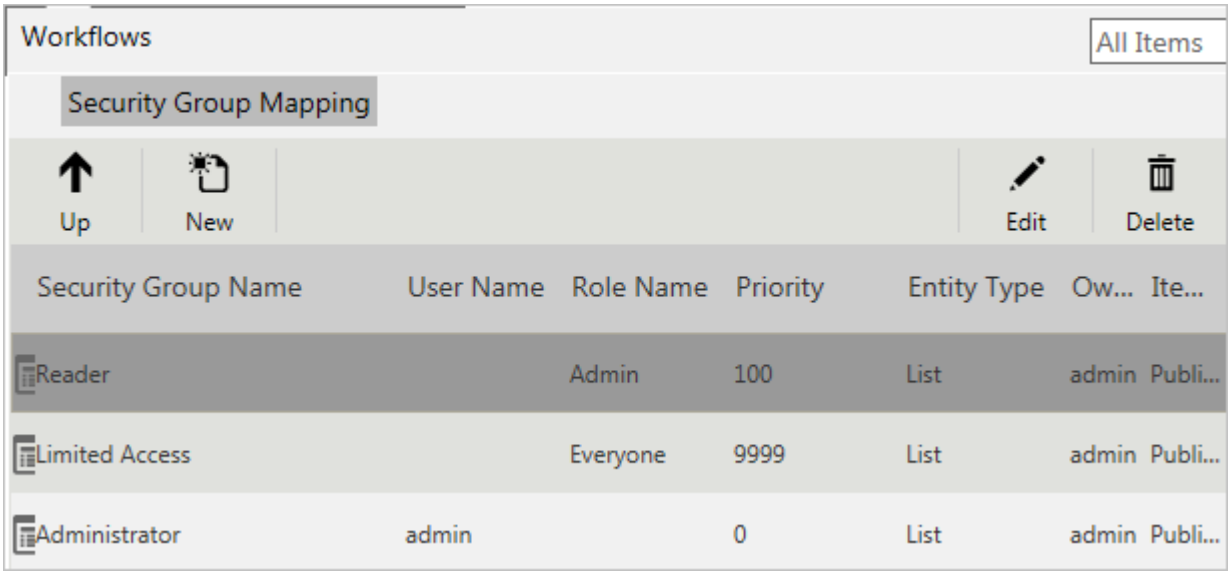
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Edit a Resource Mapping

Edit a Resource Mapping

To edit a existing resource mapping at List level

1. Log on to the **Enterprise Console**.
2. In the Enterprise Console, click menu icon, and then select any list.
   For example, select the **Workflows** list. The **Workflow** page appears.
3. On the Action bar, click **Security** to set security at the List level. The security settings page appears.
   By default, the **Standard Settings** tab is selected.
4. Click the **Advanced Settings** tab to enable list level security at the Workflow list level.
5. Click **Security Group - Resource Mapping for this List**. The **Security Group Mapping** page appears. You can add a resource mapping, edit a resource mapping, or delete a resource mapping.



6. Select the required user or role to be modified, and then click **Edit** to modify a resource mapping.
   The **Mapping : Role to a Security Group** appears.
7. Follow the same steps as explained in Edit Resource Mapping.

Delete a Resource Mapping

Delete a Resource Mapping

See Delete Resource Mapping.

Enable Security at List Level by Customizing the Security Group Definition

List Level Customization

The security group definition available at the repository level can be customized at the list level by copying all the security groups available at the repository level to the list level.

You can change the definition available for a security group and customize the security group definitions at the list level and various item levels.

Note: Do not update the security definition at levels if it is explicitly customized at those levels.

Security Group Customization

Example: The example shows you how to customize the security group definition at list level. The Contributor security group at the repository level is customized at the List level (here, Workflow list item is considered). Considered that the contributor user is able to create an item, folder and delete an item at the repository level. But the contributor user cannot create an item or folder and delete an item only at the workflow list level.

To customize Security Group

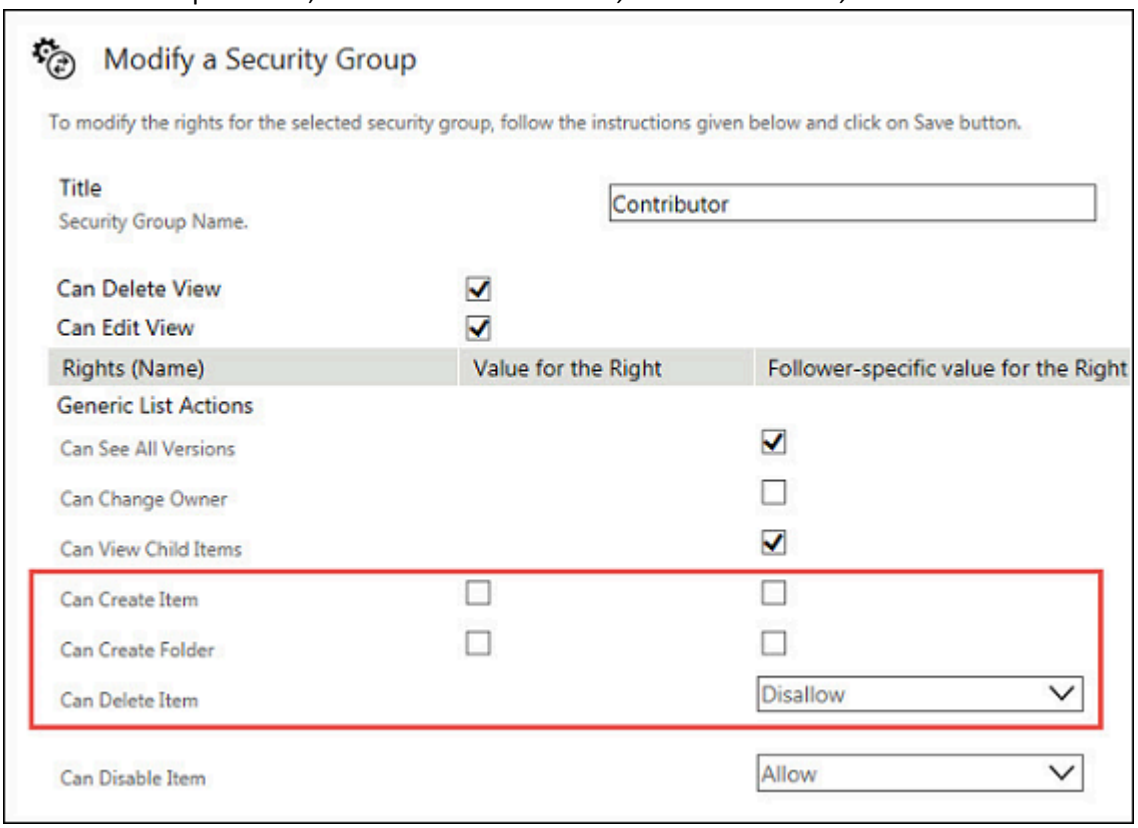
1. Log on as a user who belongs to the **Contributor** security group.
2. In the **Enterprise Console**, click menu icon, and then click **Workflows**. The **Workflows** page appears.
3. Before security settings, the contributor is able to create an item or folder or delete an item by using the options available in **New Workflow** > **New Folder** and **Actions > Delete** in the ribbon bar.
4. To customize this security group definition at the Workflows list level, log on as the administrator user.
5. Click **Repository Settings**. The **Repository Settings** page appears.
6. Click **Standard Settings** tab, and then click **View Security Mapping at Repository Level**. The **View Security Mapping at Repository Level** page appears. This page shows the mapping at the repository level before enabling security at the list level.
7. Click the **Contributor** security group name to view the rights mapped to the security group at the repository level.

   In the Enterprise Console, click menu icon, and then click Workflows. The Workflows page appears.
8. On the Action bar, click **Security**.
9. Click **Advanced Settings** tab.
10. Click **Enable List Specific Security**. The **Enable Security Wizard** page appears.
11. Check **Security Group Customization**.
12. Click **Next**.
13. Click **Next** to continue. The **Workflows** page displays the Security Group information.
14. Select the **Contributor** security group name, and click **Edit** on the action bar. The **Modify a Security Group** page appears.
    Alternatively, select and right-click the **Contributor** security group name, and then click **Edit** from the context

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

menu to customize the security definition.

15. Based on the requirement, uncheck *Can Create Item, Can Create Folder, and Disallow Can Delete Item*.



16. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
17. Choose **Yes** to apply the changes to all its later levels, else click **Cancel**.
18. Click **Submit**. The Security Group is modified successfully message appears.
19. Click **OK**.
20. Click the *Contributor* security group to view the rights mapped to the security group at the list level.
21. Click **View** to check the security rights of the user. The **View Security Group Rights** page appears.
22. Log on as the *Contributor* user.
23. In the **Enterprise Console**, click menu icon, and then click **Workflows**. The **Workflows** page appears.

Now if the Contributor user tries to create an item or folder, or delete an item, the following warning message appears as the Contributor security group is customized only at the Workflow list level.

You do not have rights to perform this action.

The contributor user can still create an item or folder, or delete an item at other list levels such as, Users List, SOA Folder, and File Watcher list.

The Workflows list has its own security. Other list levels such as, Users List, SOA Folder, File Watcher list do not have any security enabled at their list level. Whatever security is defined at the repository level applies to these lists also.

You can enable Resource Mapping and customize the security group at the same time.

The *LastUpdatedDateTime* column in the Security Group list displays the modified date and time of a particular security group, only when it is updated at the Repository level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Remove Mapping Available at List Level

To remove the mapping available at the workflow list level

1. Log on to the **Enterprise Console** as an administrator.
2. Click menu icon, and then click **Workflows**. The **Workflows** page appears.
3. Click **Security**. By default, the **Standard Settings** tab is selected.
4. Click the **Advanced Settings** tab. If the resource mapping is enabled at list level, you can also see the following links in the **Advanced Settings** page.
   a. Security Group - Resource Mapping for this List
   b. Remove Security from this List
   c. Customize Security Group for this List
5. Click **Remove Security from this List** to delete the mapping from the immediate above level. The **Remove Security Wizard** appears.
6. Click **Resource Mapping**, and then click **Next**.
7. Click **Next** for confirmation. The mapped resources are deleted.

Remove Customization Available at List Level

To remove the customization available at the list level

1. Log on to the **Enterprise Console** as an administrator.
2. Click menu icon, and then click **Workflows**. The **Workflows** page appears.
3. Click **Security**. By default, the **Standard Settings** tab is selected.
4. Click the **Advanced Settings** tab. If the resource mapping is enabled at list level, you can also see the following links in the **Advanced Settings** page.
   a. Security Group - Resource Mapping for this List
   b. Remove Security from this List
   c. Customize Security Group for this List
5. Click **Remove Security from this List** to delete the mapping from the immediate above level. The **Remove Security Wizard** appears.
6. Click **Security Group Customization**, and then click **Next**.
7. Click **Next** for confirmation. The mapped resources are deleted.

Enable Security at ListItem Level

By enabling security at listitem level, you can overwrite the security definition at the list or repository level. For example, the user who has contributor rights at the 'Workflow' list level can have administrator rights at the 'Workflow' listitem level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

There are two ways to enable security at the listitem level:

- By enabling Resource Mapping
- By customizing the Security Group definitions

What happens when Listitem level mapping is enabled?

From this point, first it will look at the resource mapping available at the Listitem level. It will not look at the mapping available for the List level or Repository level because Listitem has its own security.

The list item security will copy from the resource mapping available at the List level, if the mapping is available, otherwise it will copy from the repository level.

To apply security settings at the ListItem level

1. Log on as the administrator user.
2. In the Enterprise Console, click menu icon, and then select any list item. For example, select any list item inside the **Workflows** list.
3. Click the listitem, and then click **Security Settings** from the context menu to set security at the ListItem level. The security settings page appears. By default, the **Standard Settings** tab is selected.
4. Click the **Advanced Settings** tab to view the advanced settings options. You can enable list item specific security here.

Enable Security at ListItem Level by Enabling Resource Mapping

Let us understand how to enable security at the ListItem level with a working scenario.

Assume the following exists:

- Two folders, 'HR List' and 'Finance List' in a workflow list
- Two workflows, 'Leave Policy' and 'Employee Details' in the 'HRList' folder
- Three workflows, 'Travel Policy', 'Domestic Policy', and 'International Policy' in the 'Finance List' folder
- Two users, Daniel and Jim. Both users have administrator rights.
  - 'Daniel' belongs to the HR department in the repository
  - 'Jim' belongs to the Finance department in the repository

The intention is to allow the user 'Daniel' to view only HR related workflows while restricting the user 'Jim' from viewing HR related workflows.

To enable security at the ListItem level

1. Double-click **HR List**, and then create the two workflows, 'Leave Policy' and 'Employee Details'.
2. Click **Workflow**. Open 'Finance List', and then create three workflows, 'Travel Policy', 'Domestic Policy', and 'International Policy'.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. In the Enterprise Console, click menu icon, click **Settings**, and then click **Users**.
4. Create users, 'Daniel' and 'Jim'. 'Daniel' belongs to the HR department and 'Jim' belongs to the Finance department.
5. By default, these users have Limited Access rights. Map both 'Daniel' and 'Jim' to the **Administrator** security group.
6. Restrict the user 'Daniel' [HR department] to view only HR related workflows.
   Before enabling security at the List Item level, both users are able to view both folders.
   The HR department user needs to view only the HR related workflows. Also, map the Finance department user to the limited access security group at this item level so that this user cannot view HR related workflows.
7. In the Enterprise Console, click menu icon, and then click **Workflows**. The Workflow page appears.
8. Select and right-click the **HR List** workflow, and then click **Security Settings** from the context menu. The security settings page appears.
   Alternatively, select the 'HR List' workflow, and then click **Security** from the action bar to customize the security definition.
9. Click **Advanced Settings** tab.
10. Click **Enable ListItem Specific Security**. The Enable Security Wizard appears.
11. Click **Resource Mapping**, and then click **Next**.
12. Click **Next**. You will be redirected to the **Security Group Mapping** page.
13. Select the user 'Jim', and then click **Edit** on the action bar. Alternatively, select and right-click the user 'Jim', and then click **Edit** from the context menu.
14. Map 'Jim' to the Limited Access security group.
15. Click **Save** to save the mapping.
16. Log on to the Enterprise Console as 'Daniel' to verify the security configurations. As 'Daniel' belongs to the HR department, they can view only HR related workflows. Similarly, you can map roles to the security groups.

Add a Resource Mapping

Add a Resource Mapping

To add a new resource mapping at the ListItem level

1. Log on as the administrator user.
2. From the **Enterprise Console** menu, select any list.
3. Right-click any item inside the list, and select **Security Settings** to set security at the list item level.
4. Click the **Advanced Settings** tab.
5. Click **Enable ListItem Specific Security** to enable security at the list item level.
6. Check **Resource Mapping** to change the mapping of the role or user, and then click Next.
7. Click **Next**. You will be redirected to the **Security Group Mapping** page.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. On the action bar, click **New** to add a new resource mapping. The **Mapping: Role to a Security Group** page appears.
9. Follow the steps explained in Create a Resource Mapping for mapping role and user.

Edit a Resource Mapping

Edit a Resource Mapping

To edit a existing resource mapping at List item level

1. Log on as the administrator user.
2. From the **Enterprise Console** menu, select any list.
3. Right-click any items in the list, and the select **Security Settings** to set security at the list item level.
4. Click the **Advanced Settings** tab.
5. Click **Enable ListItem Specific Security** to enable security at the list item level.
6. Check **Resource Mapping** to change the mapping of the role or user, and then click Next.
7. Click **Next**. You will be redirected to the **Security Group Mapping** page.
8. Select the required user or role to be modified, and click Edit on the action bar. The **Mapping: Role to a Security Group** page appears.
   Alternatively, select and right-click a listitem, and then click Edit from the context menu to modify an existing resource mapping.
9. Select the user 'Daniel', and then click **Edit**.
10. Select a security group from the drop-down list to change the security group for the selected user. For example, 'Daniel' is a Reader. Now map him to the Contributor security group.
11. Click **Save** to apply the security settings only to this workflow at the list item level. This mapping will not apply to the other lists. The confirmation message to save the resource mapping appears.
12. Click **OK**. Now security is enabled at the Workflow list item level.

Delete a Resource Mapping

Delete a Resource Mapping

To delete an existing resource mapping at the List item level

1. Log on as the administrator user.
2. From the **Enterprise Console** menu, select any list.
3. Right-click any items in the list and select **Security Settings** to set security at the list item level.
4. Click the **Advanced Settings** tab.
5. Click **Enable ListItem Specific Security** to enable security at the list item level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Check **Resource Mapping** to change the mapping of the role or the user, and then click **Next**.
7. Click **Next**. You will be redirected to the **Security Group Mapping** page.
8. Select the resource mapping to be deleted, and click **Delete**. For example, select 'Jim' and click the **Delete** option available in the ribbon bar. Alternatively, select and right-click the resource mapping, and then select Delete from the context menu.
9. Click **OK** to confirm deletion.
10. Click **Yes** in the **Delete Resource Mapping** window.
11. Click **OK** in the confirmation window. A message about successfully deleting the user appears.

Enable Security at List Item Level by Customizing the Security Group Definition

ListItem Level Customization

The security group definition available at the Repository level and List level can be customized at the List Item level by copying all the security groups available at the immediate parent level to the list item level.

You can change the definition available for a security group and customize the security group definitions at the list item level.

Note: Do not update the security definition at levels if it is explicitly customized at that levels.

Security Group Customization

Example: This example shows how to customize the Contributor security group definition at the list item level. The Contributor security group at the repository level is customized at the List level and List Item level. (Here the Workflow listitem is considered). The contributor user can design and publish workflows at the repository level but cannot create workflow associations at the repository level.

The intention here is to allow association at the workflow list level for the contributor user and restrict the contributor user to publishing the item at item level.

Considered that a user called 'Kevin', who belongs to the contributor security group, exists in the repository.

To accomplish the scenario described above, perform the following steps:

1. Log on as the administrator.
2. In the **Enterprise Console**, point to admin, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Standard Settings** tab, click **View Security Mapping** at **Repository Level**. The **View Security Mapping** at **Repository Level** page appears. This page shows the mapping at the repository level before enabling security at the list level. The following image shows that the user 'Kevin' belongs to the contributor security group:
4. Click the Contributor security group to view the rights mapped to this security group at the repository level. The following image shows the contributor user behavior at the repository level. At the repository level, the contributor user can design and publish workflows, but cannot associate the workflows at the repository level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Login as 'Kevin' who belongs to the Contributor security group.
6. Go to **Workflows**.
7. Before the security settings are changed, the contributor can design and publish the workflow. If this user tries to associate an event with the workflow, the following warning message appears: You do not have the rights to perform this action.
8. To enable security at the **Workflow** list level, log on as the administrator.
9. Go to Workflows.
10. Click **Security** to set security at the List level. By default, the **Standard Settings** tab is selected.
11. In the Advanced Settings, click **Enable List Specific Security** to enable security at the **Workflow** list level, and click **Next**.
12. Click **Next**. The **Security Group** page appears.
13. Select the Contributor security group, and then click **Edit** on the ribbon bar, or right-click and then click **Edit** from the context menu to customize the security definition of the group. The Modify a Security Group page appears.
14. Check the **Can Create Association** right, and then click **Save**. The Synchronizing the Security Group dialog box appears. Click **Yes** to synchronize the changes to its below level, or click **Cancel**. The following message appears: Security Group has been modified successfully.
15. Click **OK**.
16. After changing the security settings, click the **Navigation** icon to check what is the behavior of this user.
17. Click **View Security Mapping** at List Level. The mapping at list level after security is enabled at the list level.
18. Click the Contributor security group to view the rights mapped to this group at the list level. At the list level, the contributor user can design workflow and publish. After changing the security settings, the Contributor user can also associate events with workflow.
19. To check, log on as 'Kevin' who belongs to the Contributor security group.
20. Go to **Workflows**.
21. After security settings at the list level, the contributor can design a workflow, publish the workflow and also associate the workflow with events.
22. Before enabling security at the list item level, the same security settings will be available for the list item too. If no security is enabled at the list item level, it will copy the security settings available at the immediate parent level. To enable security at the Workflow list item level, login as the administrator user.
23. Go to Workflows.
24. Select any workflow.
25. In the **Advanced Settings** tab, click **Enable ListItem Specific Security**. The following Enabling Security Wizard page appears.
26. Select the Security Group Customization check box, and then click **Next**.
27. Click **Next**. Select the Contributor security group, and click **Edit** on the ribbon bar, or right-click the security group and click **Edit** from the context menu to customize its security definition.
28. Disallow the Can Publish Item right for the Value for the Rights column, and the Follower specific value for the Rights column.
29. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
30. Click **Yes** to synchronize the changes to its below level, or click **Cancel**. The following message appears: *Security Group has been modified successfully*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

31. Click **OK**.
32. After changing the security settings, click the Navigation icon to check the behavior of this user.
33. Click **View Security Mapping at List Item Level**.
34. Click the Contributor security group to view the rights mapped to the security group at list level. At the list level, the contributor user can design workflow and associate events with workflow but will not be able to publish the workflow.
35. To check, log on as 'Kevin' who belongs to the Contributor security group.
36. Go to **Workflows**.
37. Double-click a workflow. For example, Design a workflow called 'TestWF'. Associate this workflow with events, and then publish this workflow. The following warning message appears: *You do not have permission to perform this* action.

After the security settings at the list item level, the contributor will not be able to publish the workflow. The contributor user can still design and publish a workflow and associate an event with other workflow list items.

Here, the Workflows list has its own security and other list levels like Users List, SOA Folder, File Watcher list etc do not have security enabled at their list level. Whatever the security defined at the repository level will apply to these lists.

Note: You can enable Resource Mapping and customize the security group at the same time. The LastUpdatedDateTime column in the Security Group list displays the modified date and time of a particular security group, only when it is updated at the Repository level.

Remove Mapping Available at ListItem Level

To remove the mapping available at list item level

1. Log on as an administrator user.
2. Select **Workflows** from the **Enterprise Console** menu.
3. Right-click the workflow where security is enabled at the item level and select **Security Settings** from the context menu. By default, the **Standard Settings** tab is selected.
4. Click the **Advanced Settings** tab.
5. Click **Remove Security from this ListItem** to delete the mapping from the immediate above level. The following **Remove Security Wizard** page appears.
6. Check **Resource Mapping**, and then click **Next**.
7. Click **Next** to delete the resources mapped at this item level.
8. To check, click the **Advanced Settings** tab. The Advanced Settings tab contains only the **Enable ListItem specific Security**.

Remove Customization Available at ListItem Level

To remove the customization available at the list item level

1. Log on as an administrator user.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Select **Workflows** from **Enterprise Console** pull-down menu.
3. Select the Workflow for which you want to remove customization.
4. Click **Security**. By default, **Standard Settings** tab is selected.
5. Click **Advanced Settings** tab.
6. Select the **Security Setting** you want to remove.
7. Click **Remove Security** from this ListItem to delete the mapping from the immediate above level. The following **Remove Security Wizard** page appears.
8. Check **Security Group Customization**, and then click **Next**.
9. Click **Next** to delete the customization at this item level.
10. To check, click **Advanced Settings** tab. The **Advanced Settings** tab contains only the **Enable ListItem specific Security**.

Effect on Resource Rights after Deleting the Mapping

The example in this section explains the effect on resource rights after deleting the resource mapping at the item level.

Consider a Workflow listitem. A user belongs to the Contributor security group at the repository level, and to the Limited Access security group at the ListItem level. This example shows the resource rights, if the user deletes the mapping done at the listitem level.

Assume that there are four users in a repository with the following resource mapping at the repository level:

Users	**Security Group Mapping**
John	Administrator
Kevin	Contributor
Bob	Reader
Mac	Limited Access

Here John, Kevin, and Bob are mapped to the Administrator, Contributor, and Reader security groups respectively.

1. Log on as the Administrator user to map the Contributor user 'Kevin' to the Limited Access security group at the workflow listitem level.
2. Go to **Workflows**.
3. Right-click a workflow, for example, 'Sale Workflow', and the select **Security Settings** from the context menu.
4. Click **View Effective Security for User/Role**.
5. Select the **User Based** tab, and search for the user 'Kevin' to view mapping at the listitem level.
6. Before security is enabled at the listitem level, 'Kevin' has Contributor rights at the 'Sale Workflow' item level.
7. Click **Security Snapshots** to view the mapping details at the repository level.
8. Go to **Advanced Settings** tab, and click **Enable ListItem Specific Security** to enable the security at the List level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Check **Resource Mapping** to change the mapping of the user 'Kevin', and then click **Next**.
10. Click **Next**.
11. Select 'Kevin', and click **Edit** from the ribbon bar, or right-click the user and select Edit from the context menu.
12. The Mapping : User to a Security Group appears.
13. Map the user 'Kevin' to the Limited Access security group at the list level.
14. Click **Save**. The resource mapping saved successfully message appears.
15. Click **OK**. You will be redirected to the Security Group Mapping page.
16. Now the user 'Kevin' has Limited Access rights at the Workflow listitem level.
17. After changing the security settings, check the behavior of this user.
18. Click **View Effective Security for User/Role**.
19. Select the **User Based** tab and search for 'Kevin' to view the mapping at the listitem level.
20. After enabling security at the listitem level, the user 'Kevin' has Limited Access rights at the 'Sale Workflow' item level.
21. Click **Security Snapshots** to view mapping details.
22. Now, remove the mapping at this list item level. To do this, click **Advanced Settings** tab, and then click **Remove Security from this ListItem**.
23. Select **Resource Mapping**, and click **Next** to remove mapping at this level.
24. Click **Next**.
25. Click **View Effective Security for User/Role** to view after deleting mapping at the 'Sale Workflow' item level.
26. Select the **User Based** tab and search for 'Kevin' to view the mapping at the listitem level.
27. After removing security at the listitem level, the user 'Kevin' has Contributor rights at the 'Sale Workflow' item .
28. Click **Security Snapshots** to view mapping details.

Synchronization

Synchronization is the option that lets the user synchronize the security group at all the levels below the current level to propagate the changes wherever the Sync (synchronization flag) is ON, in a hierarchical order.

As soon as the Sync flag is found OFF at a particular level, it will not move further to synchronize the Security Group definition.

You can implement security at the following levels in a repository:

1. List
2. ListItem -This level can have n number of levels, parent item > child item > child item

Scenario 1: The user makes changes (edits) in a security group at the Repository level

The user should be allowed to synchronize the security group at all available lists and the listitems wherever security is enabled and the sync flag is ON for that security group.

If the security is not enabled at the list level then it should search for its items to find whether security is enabled at any item. If it is there and the sync flag is ON then it should propagate the changes at that level and its child items in a hierarchical order. Once the sync flag is found OFF, it will not move further to synchronize.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Scenario 2: The user makes changes in a security group at the List (Workflow) level

The user has the option to propagate the changes to all the listitems wherever security is enabled and the sync flag is ON in a hierarchical order. Once the sync flag is found to be OFF, it will stop moving further to synchronize the below items.

Scenario 3: The user makes changes in a security group at the List Item level

The user has the option to propagate the changes to all the child items wherever security is enabled and the sync flag is ON in a hierarchical order. Once the sync flag is found to be OFF, it will stop moving further to synchronize the child items.

If a new security group is created at the Repository level, it will synchronize its definition at all levels irrespective of the Sync (synchronize flag) option.

Secure Repository Using Security Framework

Using the AVEVA Work Tasks security framework, you can secure the repository by controlling the List and ListItems which are a part of that repository and features like Process Designer, Business Activity Monitoring (BAM), Work item, Calendar, and Queue.

See Securing List and ListItems and Securing Workflow Management Server Controls for more information.

Secure List and ListItems

We assume that you have basic knowledge about AVEVA Work Tasks list.

List

List security is required to control the access to list.

ListItem

The ListItem security is required to control the access to items inside the list. The security settings at this level can be applied only to that item. The ListItem features like create, delete, edit, publish, unpublish, disable, and enable can be secured.

Secure AVEVA Work Tasks Server Controls

AVEVA Work Tasks list has the following controls:

Process Designer

This control is used to design workflows. You can secure the Process Designer by controlling the access to categories, actions, properties and menus.

See Process Designer Rights for more information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Business Activity Monitoring (BAM)

This control is used to monitor reports. You can secure the BAM control by controlling the access to reports based on workflows scope like who initiated a workflow, who owns a workflow, and the workflows owned by others.

You can control the menus like Dashboard, Analyze, and Execution etc. based on user privileges.

You can also control the views like Analysts, Progress and Execution based on user privileges.

See BAM Security for more information.

Work Item

This control is used to view and act on all the work items assigned to the user. You can secure work items by controlling access to the work item features like forwarding work item, setting alternate actor, setting preference, viewing queue, viewing resource calendar, and viewing work item control.

See Securing Work Item Control for more information.

Calendar

This control is used to set the calendar details of the organization like working hours, holidays and etc. You can secure the Calendar by controlling the access to adding new calendars, deleting calendars, viewing calendars, viewing base calendars, and viewing calendar control.

See Securing Calendar Control for more information.

Queue

You can secure queue by controlling the access to adding new queues and viewing the queue control.

See Securing Queue Control for more information.

Secure Menus

This section provides information on how to manage a navigation list. Use the **Manage Navigation List** option to create a new navigation, Form, List, Dashboard, and other folder items in the Enterprise Console, and also to modify existing items.

Manage Navigation List

Use the **Manage Navigation List** option to create a new navigation (Left menu), Form, List, Dashboard, and folder items in the Enterprise Console, and also to modify existing items. Using this option, you can set security rights at the List and ListItem level.

Use the **Manage Navigation List** option to create a new Navigation link, Forms link, List link, Dashboard link, and folder. You can edit existing links and define security at the List and ListItem level.

To open the Manage Navigation List

1. Log on to the Enterprise Console.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Point to **admin**, and then click **Repository Settings**.

   The **Repository Settings** page appears.
3. Click the **Advanced Settings** tab.
4. Click **Manage Navigation List**.

   The **Navigation List** page appears.

Create Folder

Use the **New Folder** option to create a folder. You can create Navigation link, Form link, List link, and sub folders under the folder, and also can edit the Navigation list details. You can set the security definition at List and ListItem level.

To create a folder

1. On the action bar of the **Navigation List** page, click **New**, and then click **Folder**.

   The **New Folder** page appears.
2. In the **Title** box, type a name for the folder.

   A folder name should not have **:"\\""'<>;|*/{}?** special characters.
3. In the **Description** box, type a description for the folder.
4. In the **Image Name** box, type a name for the image.

   The image should be available in the path *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**BPMUITemplates**Default**Repository**Site**images**MenuIcons*.
5. In the **Menu Order** box, type a number to position the folder in the **Enterprise Console** menu.
   - By default, the **Menu Order** number will be one more than the highest **Menu Order** number entered for the links in the **Navigation List**.
   - You can enter either a positive or a negative integer. Negative **Menu Order** numbers take precedence over positive **Menu Order** numbers.
   - If you clear the **Menu Order** number, then the system will set the **Menu Order** to **0**.
   - The link with the lowest **Menu Order** number appears first in the menu followed by other links in the ascending order of their **Menu Order** number.
   - In case of links with the same **Menu Order** number, the first saved link takes precedence and appears before the other links with the same **Menu Order** number.
   - You must log out and log on to the **Enterprise Console** to see changes in the order of the menu items.
   - If you manually add any menu item in the system defined menus, then after upgrade, the menu order will not be retained as defined. You must again reset the menu order based on your preference.
6. Click **Save**.

   The folder is created.

   Note: When you create a new folder or item in AVEVA Work Tasks, the Item Status will be Published. However, this is not applicable for Forms and Workflows folders and items.

Create Navigation Link

Use the **Navigation** option to create a new menu item in the Enterprise Console menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To create a new navigation list

1. On the **Action** bar of the **Navigation List** page, click **New**, and then click **Navigation**.

   The New Navigation Link page appears.
2. In the **Title** box, type a unique name for the navigation link, and in the **Description** box, type a description for the folder.
3. In the **Navigate To Page** box, enter the path of the aspx file name.

   The aspx file must be available in the following path:

   ```
   ..\AVEVA\Work Tasks\Web\BPMUITemplates\Default\Repository\Site
   ```

   If you save this aspx file in some other location, mention the path with the aspx file name. For example, if the aspx file is in the Repository folder, then mention the path in the **Navigate To Page** box as follows:

   ```
   \Repository\<file name.aspx>
   ```
4. In the **Image Name** box, enter the image name.

   The image must be available in the following path:

   ```
   [AVEVA Work Tasks Installation Path]\Web\BPMUITemplates\Default\Repository\Site\
   images\MenuIcons
   ```

   If you save this image file in some other location, mention the path with the image file name. For example, if the image is in the Repository folder, then mention the path in the **Image Name** box as follows:

   ```
   [AVEVA Work Tasks Installation Path]\Web\BPMUITemplates\Default\Repository\<image
   file name>
   ```

   If you have applied default theme to the repository, then the image must be available in the following path:

   ```
   [AVEVA Work Tasks Installation Path]\Web\BPMUITemplates\Default\Themes\Default\
   Repository\Site\Images\MenuIcons
   ```

   If the new theme is applied to the repository, then the image must be available in the following path:

   ```
   [AVEVA Work Tasks Installation Path]\Web\BPMUITemplates\Default\Themes\<New
   Theme>\Repository\Site\Images\MenuIcons
   ```
5. In the **Menu Order** box, type a number to position the link in the **Enterprise Console** menu.
   - By default, the **Menu Order** number will be one more than the highest **Menu Order** number entered for the links in the **Navigation List**.
   - You can enter either a positive or a negative integer. Negative **Menu Order** numbers take precedence over positive **Menu Order** numbers.
   - If you clear the **Menu Order** number, then the system will set the **Menu Order** to **0**.
   - If you create a new List using **Tools** > **Manage List**, you must set the menu order for that list from the **Repository Settings** > **Advanced Settings** > **Manage Navigation List** page. If you do not set the menu order for the list manually, the menu order of the list will be considered as 0, and the list will appear at the top of the Enterprise Console menu.
   - The link with the lowest **Menu Order** number appears first in the menu followed by other links in the ascending order of their **Menu Order** number.
   - In case of links with the same **Menu Order** number, the first saved link takes precedence and appears before the other links with the same **Menu Order** number.
   - You must log out and log on to the **Enterprise Console** to see changes in the order of the menu items.
   - If you manually add any menu item in the system defined menus, then after upgrade, the menu order will not be retained as defined. You must again reset the menu order based on your preference.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Click **Submit**.

   The navigation link is created.

7. Click **OK** to create the new left menu item.

Examples

1. Create two aspx pages. Create one aspx page with the main page and another aspx page without the main page.
   - BPM.aspx(With Main Page)

```
<%@ Page Language="C#" MasterPageFile="~/BPMUITemplates/Default/Repository/
Site/MasterPage.main" AutoEventWireup="true"
Inherits="Skelta.Repository.Web.CodeBehind.WorkFlowList" Title="Untitled Page"
%>
<asp:Content ID="Content1" ContentPlaceHolderID="Cont" Runat="Server">
<div>
<font color="purple"> <center><b>Welcome to AVEVA Work Tasks
</b></center></font>
</div>
</asp:Content>
```

   - BPMWithoutMaster.aspx

```
<%@ Page Language="C#" AutoEventWireup="true"
CodeFile="BPMWithoutMaster.aspx.cs" Inherits="BPMWithoutMaster" %>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
<html xmlns="http://www.w3.org/1999/xhtml" >
<head runat="server">
</head>
<body>
<form id="form1" runat="server">
<div>
<font color="purple"> <center> <b>Welcome to AVEVA Work Tasks </b>
</center></font>
</div>
</form>
</body>
</html>
```

2. Save these two aspx pages in the following path:

```
..\AVEVA\AVEVA Work Tasks\Web\BPMUITemplates\Default\Repository\Site
```

3. On the action bar of the **Navigation List** page, click **New**, and then click **Navigation**.

   The New Navigation Link page appears.

4. Enter the **Title** as **AVEVA Work Tasks Menu**.
5. Enter a description.
6. In the **ImageName** box, type image name as **External-Service.jpg**.

   This image must be available in the following path:

```
..\AVEVA\AVEVA Work Tasks\Web\BPMUITemplates\Default\Repository\Site\images\MenuIcons
```

7. Click **Submit**, and then click **OK** on the confirmation window.
8. Double-click **AVEVA Work Tasks Menu**, and click **Navigation** to create a sub-menu item called **BPM Without Main Page**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

a. Enter the sub-menu name **BPM Without Main Page** in the **Title** box.
b. Enter a description.
c. Enter the navigation link name **BPMWithoutMaster.aspx** in the **NavigateToPage** box.

   This file is available in the following path:

   ```
   ..\AVEVA\AVEVA Work Tasks\Web\BPMUITemplates\Default\Repository\Site
   ```

d. Enter the image name, **icon-manage-forms.gif** in the **ImageName** box.

   This file is available in the following path:

   ```
   ..\AVEVA\Wonderware\AVEVA Work Tasks\Web\BPMUITemplates\Default\Repository\
   Site\images\MenuIcons
   ```

e. Click **Submit**, and then click **OK** on the confirmation window.
f. Now the sub-menu item, **BPM Without Main Page** is created under **AVEVA Work Tasks Menu**.

9. Similarly, create another sub-menu item called **BPM With Main Page**.
10. Log out from the Enterprise Console, and then log on again.

    The newly created menus get reflected in the **Enterprise Console** menu.
11. Click **AVEVA Work Tasks Menu**, and then click **BPM Home With Main Page**.

    This redirects you to the **BPM Home With Main Page**.
12. In the **Enterprise Console** menu, select **BPM Without Main Page**.

    Here you will not be able to view the **Enterprise Console** menu, **Repository, Provider**, and **Logged In** information.
13. To go back to the **Enterprise Console** menu, close this window, and then log on to the **Enterprise Console** again.

    Use the following code in all the user created aspx pages to **avoid logging in** to the **Enterprise Console** again:

    ```
    <%@ Page Language="C#" MasterPageFile="~/BPMUITemplates/Default/Repository/Site/
    MasterPage.main" AutoEventWireup="true"
    Inherits="Skelta.Repository.Web.CodeBehind.WorkFlowList" Title="Untitled Page" %>
    ```

Note: Ensure the size of the image (icon) is 25x25 pixels.

Create Form Link

You can create form links in the **Enterprise Console** menu for the forms created in the **Forms** section. This option is especially useful when the number of forms in **Forms** is very high. Use the **Form Link** to easily navigate to the required form using links in the **Enterprise Console** menu.

To create a form link

1. On the **Action** bar of the **Navigation List** page, click **New**, and then click **Form Link**.

   The **New Form Link** page appears.

   You can also create a folder here using the folder option and create the form links under it for better readability.
2. In the **Title** box, type a unique name for the form link, and in the **Description** box, type a description for the form link.
3. In the **Select a Form** box, select the form to be linked from the available list.
4. In the **Image Name** box, type the image name.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If the image is not mentioned, a default image will be inserted. The default image is located in the following path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\BPMUITemplates\Default\Repository\Site\images\MenuIcons

You must save your image files in this path.

5. If the **Window Mode** for the form link is set to **Pop-up**, the form appears as a pop-up in the **Enterprise Console**.
   If the **Window Mode** for the form link is set to **Inline**, the forms appears inline in the **Enterprise Console**.
6. Under **Show in Navigation List**, select as follows:
   - Select **Web** to show form link in the navigation menu of the **Enterprise Console**.
   - Select **Mobile** to show form link in the navigation menu of the **AVEVA Work Tasks Pro** app.

   Note:
   - The **Show in Navigation List** property is applicable only when the **Window Mode** property is set to **Inline**.
   - By default, the **Show in Navigation List** is set to **Web**.
   - The **Form Link** navigation items created under **Folder** navigation item will not be available in AVEVA Work Tasks Pro app.
7. In the **Menu Order** box, type a number to position the link in the **Enterprise Console** menu.
   - By default, the **Menu Order** number will be one more than the highest **Menu Order** number entered for the links in the **Navigation List**.
   - You can enter either a positive or a negative integer. Negative **Menu Order** numbers take precedence over positive **Menu Order** numbers.
   - If you clear the **Menu Order** number, then the system will set the **Menu Order** to **0**.
   - The link with the lowest **Menu Order** number appears first in the menu followed by other links in the ascending order of their **Menu Order** number.
   - In case of links with the same **Menu Order** number, the first saved link takes precedence and appears before the other links with the same **Menu Order** number.
   - You must log out and log on to the **Enterprise Console** to see changes in the order of the menu items.
   - If you manually add any menu item in the system defined menus, then after upgrade, the menu order will not be retained as defined. You must again reset the menu order based on your preference.
8. Click **Save**.

   The form link is created.
9. Log out of the **Enterprise Console**.
10. Log on to the **Enterprise Console** again, and view the form link created in the **Enterprise Console** menu.

    Before accessing the form link, you must log out and then log on to the Enterprise Console again to refresh the Enterprise Console menu.

Note: While designing non workflow initiator forms, you can hide the **Submit** button and the title bar using the **Show Submit button** and **Show top level title** properties of the form.

For more information, see *Forms and List User Guide*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create List Link

Use this option to create a new list link.

To create a new list link

1. On the **Action** bar of the **Navigation List** page, click **New**, and then click **List Link**.

   The **New List Link** page appears.
2. In the **Title** box, type a unique name for the list link, and in the **Description** box, type a description for the list link.
3. In the **Select a List Name** drop-down, select the required list.
4. In the **Image Name** box, type the image name.

   If the image is not mentioned, a default image will be inserted. The default image is located in the following path:

   *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**BPMUITemplates**Default**Repository**Site**images**MenuIcons*

   You must save your image files in this path.
5. In the **Menu Order** box, type a number to position the link in the **Enterprise Console** menu.
   - By default, the **Menu Order** number will be one more than the highest **Menu Order** number entered for the links in the **Navigation List**.
   - You can enter either a positive or a negative integer. Negative **Menu Order** numbers take precedence over positive **Menu Order** numbers.
   - If you clear the **Menu Order** number, then the system will set the **Menu Order** to **0**.
   - If you create a new List using **Tools** > **Manage List**, you must set the menu order for that list from the **Repository Settings** > **Advanced Settings** > **Manage Navigation List** page. If you do not set the menu order for the list manually, the menu order of the list will be considered as 0, and the list will appear at the top of the Enterprise Console menu.
   - The link with the lowest **Menu Order** number appears first in the menu followed by other links in the ascending order of their **Menu Order** number.
   - In case of links with the same **Menu Order** number, the last saved link takes precedence and appears before the other links with the same **Menu Order** number.
   - You must log out and log on to the **Enterprise Console** to see changes in the order of the menu items.
   - If you manually add any menu item in the system defined menus, then after upgrade, the menu order will not be retained as defined. You must again reset the menu order based on your preference.
6. Click **Save**.

   The link list is created.
7. Click **OK**.

   You will be redirected to the linked list page.

   The newly created form link appears in the **Enterprise Console** menu. If you click the link list, it redirects you to the link list page.
8. Click **New** to insert list items.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create Dashboard Link

Create a dashboard link to add a tabbed page as a link in the **Enterprise Console** menu. This page can have one or more forms (except list forms) with each form appearing in its own tab. You can also set this tabbed page as the home page.

To create a dashboard link

1. On the **Action** bar of the **Navigation List** page, click **New**, and then click **Dashboard**.

   The **New Dashboard Link** dialog box appears.
2. In the **Title** box, type a name for the dashboard link, and in the **Description** box, type a description for the dashboard link.
3. In the **Menu Order** box, type a number to position the link in the **Enterprise Console** menu.

   Note:
   - By default, the menu order number will be one more than the highest menu order number entered for the links in the **Navigation List**.
   - The menu order number should be **0** or a positive integer.
   - The link with the lowest menu order number appears first in the menu followed by other links in the ascending order of their menu order number.
   - In case of links with the same menu order number, the last saved link takes precedence and appears before the other links with the same menu order number.
   - You must log out and log on to the **Enterprise Console** to see changes in the order of the menu items.
4. In the **Tab Order** box, type a number to position the tab in the tabbed page.
5. In the **Type** list, select **Forms**.
6. In the **Title** box, type a name for the tab.
7. In the **Navigation** list, select a form.
8. To select form parameters, if required, click the **Form Parameters** icon.

   The **Form Parameters** dialog box appears.
9. In the **Value** box against each parameter, type the values for the parameters, and then click **Finish**.
10. To add another tab, click **Add Record**.

    A new record appears.

    Note:
    - A minimum of 1 tab is required for the tabbed page.
    - A maximum of 10 tabs are supported by the tabbed page.
    - To delete a tab, click the **Delete** icon.
11. Repeat **Steps 4 to 9** for each added tab
12. Click **Save**.
13. The dashboard link is saved and an information message appears.
14. Click the **Close** button.

    The information message and the **New Dashboard Link** dialog box are closed.

For more information on **Forms** and **Form Parameters**, see *Forms and Lists User Guide*.

Note: Ensure forms added to tabs are available. If a form is deleted, then the tab containing the deleted form must be updated with an available form.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To set a dashboard link as the home page

1. In the **Enterprise Console**, Click the **User** icon, and then click **Repository Settings**.

   The **Repository Settings** page appears.
2. Click the **Advanced Settings** tab, and then click **Manage Security Groups**.

   The **Security Group** page appears.
3. Right-click on a security group, and then click **Edit** (or click on a security group, and then on the **Action** bar, click **Edit**).

   The **Modify a Security Group** dialog box appears.
4. In the **Default Home Page** list, click a dashboard link.
5. Click **Save**.

   The security group settings are saved, the **Modify a Security Group** dialog box is closed, and the **Synchronization** dialog box appears.
6. Under **Do you want to Synchronize it?**, click **Yes**, and then click **Submit**.

   The synchronization settings are saved and an information message appears.
7. Click the **Close** button.

   The information message and the **Synchronization** dialog box are closed.

Edit Navigation List Items

To edit a navigation list item

1. In the **Navigation List** page, select a navigation list item.
2. Click **Edit** on the ribbon.

   The **Edit <navigation list item>** appears.

   Alternatively, select and right-click a navigation list item, and then click **Edit**.
3. Modify the desired field.
4. Save the modifications.

Change Owner Information

You can change the owner of a list item. You might need this feature to inherit another user's items to make it own item, or change owner of that item. Only an administrator can change the owner of a list item.

To change owner of the navigation list

1. In the **Navigation List** page, select a navigation list item.
2. Click **Edit** on the ribbon.

   The **Change List Item Owner** page appears.

   Alternatively, select and right-click a navigation list item, and then click **Edit**.
3. In the **Select a User** box, enter the user name using the **User Lookup** window.
4. Click **Save**.

   The owner information is changed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Click **OK** in the confirmation window.

Organize Navigation List

As new folders, navigation links, form links, list links get added under the Enterprise Console menu, there is a need to organize them. The **Organize** option in the Navigation List ribbon bar enables you to organize and categorize the Navigation List items. For example, you can create folders and group the list items into separate folders using the Organize option.

Consider a scenario, where we have four form links, Leave Approval, Leave Summary, Mark Attendance, and On Duty Request under the Enterprise Console menu as shown in the image given below. As all these menu items are related to Leave Management, we would like it to group it under Leave Management section. The steps given below explain how to organize the menu items using Organize feature of the Navigation List.

To group navigation list items within folders:

1. In the **Navigation List** page, click **Organize** on the ribbon.

   The **Navigation Details** page appears.

   Alternatively, select and right-click a navigation list item, and then click **Edit**.

   The Organize Navigation Details window arranges all the folders and links in a tree format. You can modify the list items organization in two ways, either Drag and Drop or use the context menu.
2. You can drag and drop the navigation list items to organize.
3. Click **Close**.

   You can see that the Enterprise Console menu changes when you log on the next time.

Secure Event Providers

The Event Provider is the component of Event Framework which handles a specific events.

Manage Event Providers by editing, changing owner information, and securing the Event Provider.

Manage Event Providers

Use the **Manage Event Providers** option to manage the event providers such as, creating a new event provider, editing an existing event provider, changing owner information, or securing event provider.

To open Manage Event Providers

1. Log on to the **Enterprise Console**.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. Click the **Advanced Settings** tab.
4. Click **Manage Event Providers**. The **Event Provider** page appears.

Create an Event Provider

Use the New option to create an event provider.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To create a new event provider

1. On the Action bar of the **Event Provider** page, click **New**. The **New Event Provider** page appears.
2. In the **Title** box, type a name for the event provider, and in the **Description** box, type a description for the event provider.
3. In the **Provider Type** box, enter the type of provider. This field is mandatory.
4. In the **Display Priority** box, enter the priority. This field is mandatory. As the name indicates, the event providers are displayed in the **Association** page based on the priority specified for the event providers. We recommend you to specify the display priority from 11 onwards because AVEVA Work Tasks might introduce new event providers which might be assigned priority from six to 10.
5. Click **Save & Continue**. The event provider is created.
6. Click **OK**.

The following table shows the order in which the AVEVA Work Tasks event providers are displayed in the **Association** page. You can change the priority order.

Event Provider	Display Priority
Enterprise Console	2
BAM	4
File Watcher	5

Note:
When you create a new event provider, an entry is created in the **SKEEventProviders** table. However, the entry does not appear in the Association page. You must manually add the event name to the SKAddInProviders table.

If the event provider is already assigned a priority, no error message appears at the time of creation. However, there regarding which event provider to be displayed first. You might get a page crash while opening the association page.

To display the newly created event provider, you have to write an Event Provider class and the functionality for it.

Edit an Event Provider

The **Edit** option provides detailed steps for editing an existing event provider.

To edit an Event Provider

1. Select the event provider to be modified.
2. On the Action bar, click **Edit**. The **Edit Event Provider Details** page appears.
   Alternatively, right-click and select **Edit** from the context menu. You can modify the title, description, provider type, and display priority of the selected event provider.
3. Click **Save & Close**. The modifications are saved, and a confirmation message appears.
4. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Change Owner Information

The **Change Owner** option helps the user to change the owner of an event provider based on user requirements. This may be needed when the user wants to inherit someone else's items or change the owner of items.

The Change Owner capability is restricted to the Administrator user.

To change the owner of the navigation list

1. Select the event provider in which the owner information has to be changed.
2. On the Action bar, click **Change Owner**. The **Changing Owner** page appears.
3. Alternatively, select and right-click an event provider, and then select **Change Owner** from the context menu.
4. Select the user from the **User Lookup** window.
5. Right-click and select **Change Owner** from the context menu or click **Change Owner** on the ribbon bar.
6. Click **Save**. The owner information is saved.

Secure Event Provider

Use the **Security** option to prevent the event providers from being displayed in the **Association** window for users of certain security groups.

Example:

The scenario describes how a user who has Contributor rights should not be allowed to view the Enterprise Console option in the Association screen.

Procedure

1. Select the event provider in which the owner information has to be changed.
2. Select and right-click an event provider, and then select **Security Settings** from the context menu. The security settings page appears.
3. In the **Advanced Settings**, click **Customize Security Group for this List Item**.
4. Select a **Security Group Name**. For example, **Contributor**.
5. On the Action bar, click **Edit**. The **Modify a Security Group** page appears. Alternatively, right-click **Contributor,** and then select **Edit** from the context menu.
6. The **Can Consume Item** is checked at both the levels. Uncheck this so that the Contributor security group cannot view the **Enterprise Console** list.
7. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
8. Click **Yes** to synchronize all the listitems. A message about successfully modifying the security group appears.
9. Click **OK**.
10. Log on as a user who has **Contributor** rights. For example, AVEVA Work Tasks provides a default user, George with contributor rights.
11. Go to **Workflows**.
12. Select any workflow, and then click **Associate** on the action bar. The **Association** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

13. The contributor user cannot view the Enterprise Console in the **Association** page.
    Ensure that the **Can Create Association** right is set to **True** to perform this action.
14. Log on as the administrator user.
15. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
16. In the **Advanced Settings** tab, click **Manage Navigation List**.
17. Select a **Navigation Link**, and then click **Security**.
18. In the **Advanced Settings** tab, click **Remove Security from this ListItem** to remove security from this list item.

    Ensure that the **Can View Item** right is checked for all the levels. If this right is unchecked, then this option will be removed from the navigation list.

Secure Queue Control

You can use the **Queue Management** window to define the security of a queue. Only administrators can define the security for a queue.

To open the Queue Management window

In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Queue Management**. The **Queue Management** page appears.

The Queue Management window lists all the queues that have already been added in a grid. The **Queue Management** window can be controlled using **Queue Control Right**.

The following table summarizes the Queue Control rights available for a repository:

Queue Control Rights	
Can Add New Queue	This right controls the access to add a new queue.
Can View Queue Control	This right controls the access to view queue control.
Manage Queues	This right controls the access to modify/delete queue.

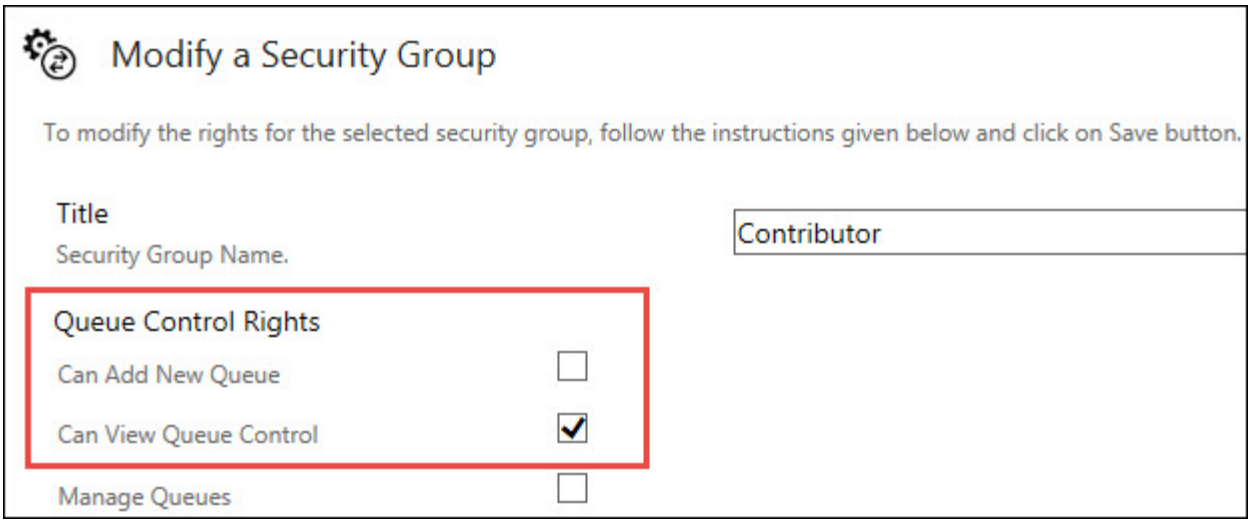
Control New Queue Addition

A contributor user cannot add a new queue. Only the Administrator user can add a new queue. The **New Queue** option is not available for the Contributor user.

The following example demonstrates how the **Queue Control** rights can be used to allow a contributor user to add a new queue.

1. To control the access to add a new queue for a **Contributor** user, log on as an **Administrator** user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Select a **Security Group Name**, and then click **Edit**. The **Modify a Security Group** page appears. For example, select the Contributor security group.
   The following image shows that the **Contributor** user cannot add a new queue even though this user can view the **Queue Management** window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



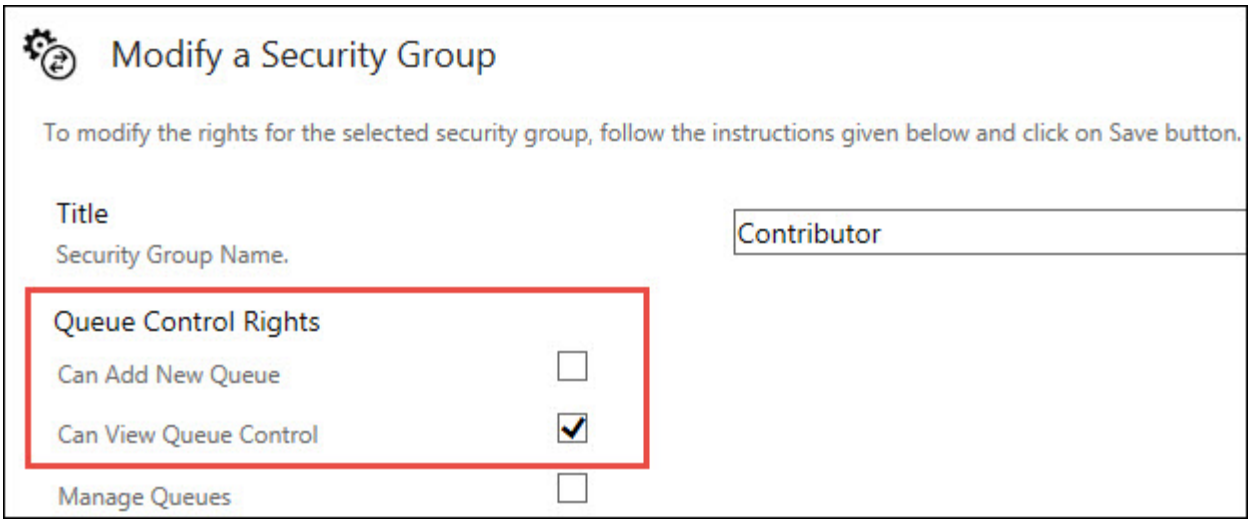
5. Check the **Can Add New Queue** to provide permissions to the **Contributor group** to **New Queue**.
6. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
7. Click **Yes**, if you want to synchronize the changes to its below levels, or else click **Submit**.
8. Click **OK** on the confirmation window.
9. Log on as a user who belongs to the Contributor security group.
10. Go to the **Queue Management** page. Now, the contributor user will be able to view the button to add a queue in the **Queue Management** window.

Control Queue View

The following example demonstrates how to prevent a contributor user from viewing the Queue Management window.

1. Log on as an administrator user to control the **Queue Management** window for the contributor user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Select a **Security Group Name**, and then click **Edit**. The **Modify a Security Group** page appears. For example, select the **Contributor** security group.
   The following image shows that the **Contributor** user cannot add a new queue even though this user can view the **Queue Management** window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

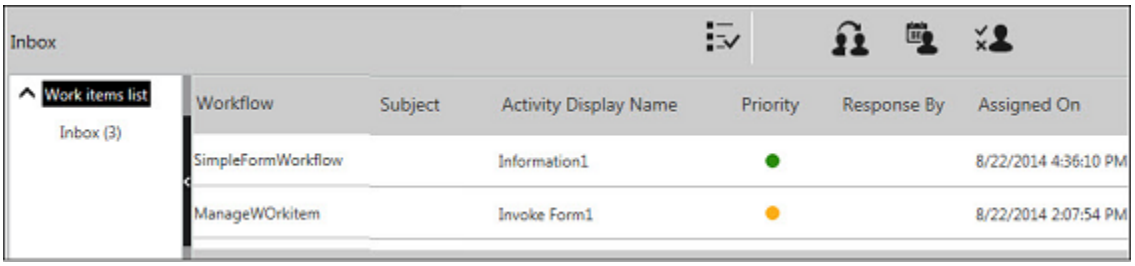


5. Uncheck the **Can View Queue Control** right to control to the access to view the Queue control.
6. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
7. Click **Yes** if you want to synchronize the changes to the below levels, or else click **Submit**.
8. Click **OK** on the confirmation window.
9. Now log on as a user who belongs to the Contributor security group.
10. Click **Queue Management**. A warning message about no permissions to view the Queue control appears.
11. Click **OK**.

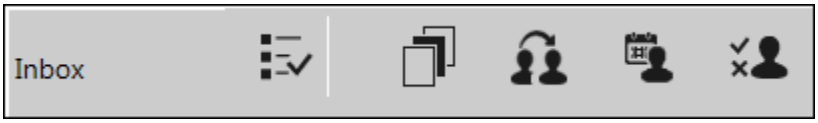
Secure Work Item Control

The work item control has options that enable users to manage how work items are delivered, when they are delivered, and to assign work items to alternate actors in their absence. An additional option enables queue owners to access the settings to their queues.

The following figure shows the Work items list window:



The following image shows the work item control toolbar where the user can secure the features of work item controls

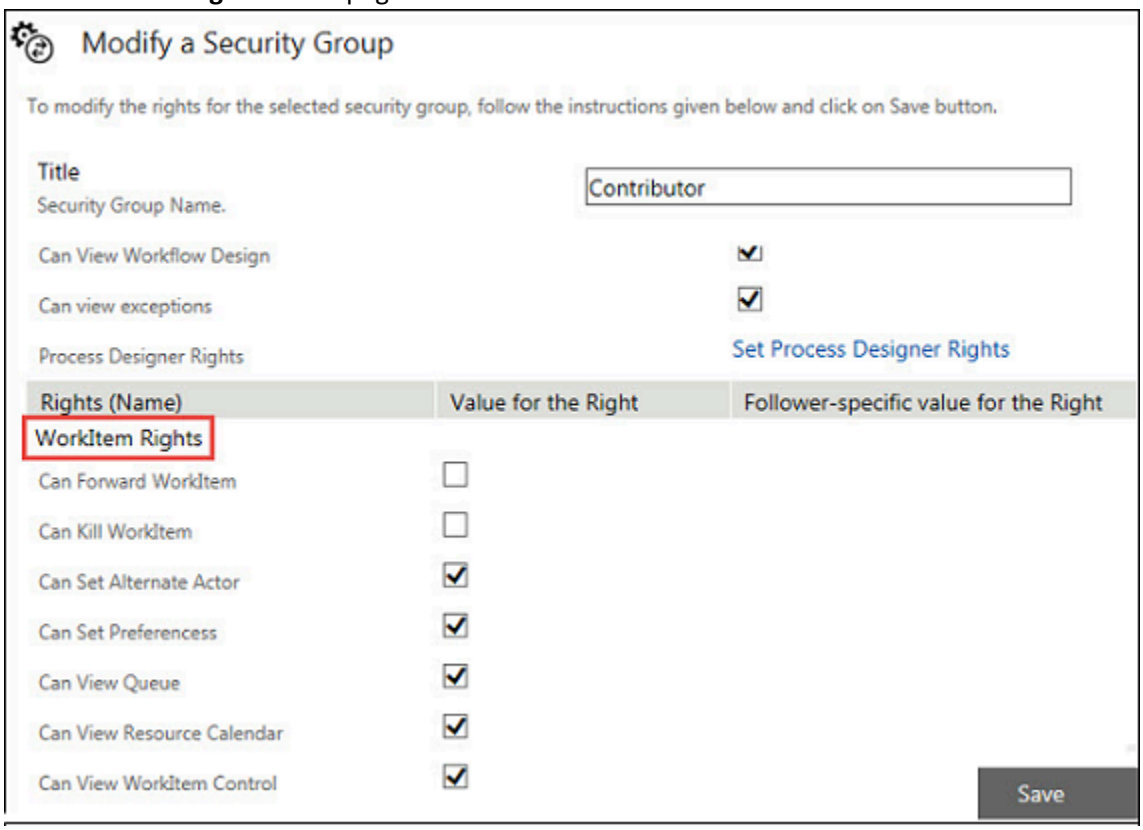


To view the work item control rights

1. Log on as the Administrator user.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Point to admin, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Select any **Security Group**, and then click **Edit**. The **Modify a Security Group** page appears. You can see the **Work Item Rights** in this page.



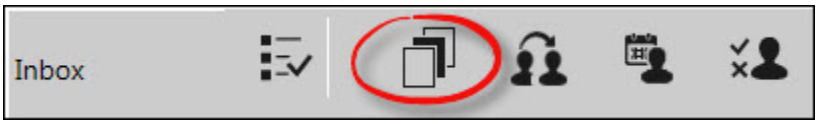
The following table summarizes the Rights available for a repository:

Work Item Rights Work Item	
Can Forward Work Item	This right controls access to forward the work item to another actor which is assigned. The Reassign and Delegate option will be displayed only when reassigned allowed is 'Yes' for that particular activity.
Can Kill Work Item	This right controls the access to kill work items.
Can Set Alternate Actor	This right controls the access to set alternate actor.
Can Set Preferences	This right controls the access to set preferences.
Can View Queue	This right controls the access to queue control.
Can View Resource Calendar	This right controls the access to view the resource calendar.
Can View Work Item Control	This right controls the access to view the work item control itself.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Secure Work Item Control - Show Queue

You can secure the **Show Queue** work item control in the Work items list window.

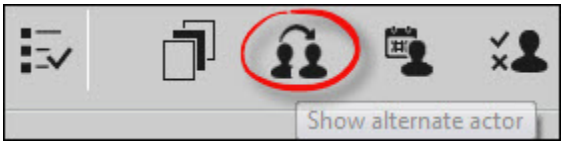


To secure the Show Queue control for the Contributor user

1. Log on as the Administrator user.
2. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Users**. The **Users** page appears.
3. On the action bar, click **New**. The **Users wizard** appears.
4. Create a user. For example, create a user called Tom.
5. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
6. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Groups** page appears.
7. On the Action bar, click **New** to map '*Tom*' to the **Contributor** security group. To know more about mapping users, see Create a Resource Mapping.
8. Log on as 'Tom' who is a contributor user now. Tom can now view the **Show Queue** control.
9. To secure the **Show Queue** control for the contributor user, log on to the Enterprise Console as the Administrator user.
10. Point to admin, and then click **Repository Settings**. The **Repository Settings** page appears.
11. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
12. Select any **Security Group**, and then click **Edit**. For example, select Contributor security group. The Modify a Security Group page appears. You can see the Work Item Rights in this page.
13. Uncheck the Can View Queue right to control the **Show Queue** control.
14. Click **Save**. The Synchronizing the **Security Group** dialog box appears.
15. Click **Submit**. As the work item control rights cannot be customized other than at the repository level, you do not need to synchronize.
16. Click **OK** in the confirmation window.
17. Log on as '*Tom*' user. Now, Tom cannot view the **Show Queue** control.

Secure Work Item Control - Show Alternate Actor

You can secure the **Show Alternate Actor** work item control in the Work items list window



To secure Show Alternate Actor control for the Contributor user

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears. Right-click the **Contributor** security group, and then click **Edit**. The **Modify a Security Group** page appears.
4. Uncheck the Can Set Alternate Actor right.
5. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
6. Click **Submit**. As the work item control rights cannot be customized other than at the repository level, there is no need to synchronize.
7. Click **OK** in the confirmation window.
8. Log on as a user who belongs to the Contributor security group. This user is now cannot view the **Show Alternate Actor** control.

Secure Work Item Control - Show Resource Calendar

You can secure the Show Resource Calendar work item control in the Work items list window.

To secure the Show Resource Calendar control for the Contributor user

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the **Contributor** security group, and then click **Edit**. The **Modify a Security Group** page appears.
5. Uncheck the **Can View Resource Calendar** right.
6. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
7. Click **Submit**. As the work item control rights cannot be customized other than at the repository level, there is no need to synchronize.
8. Click **OK** in the confirmation window.
9. Log on as a user who belongs to the Contributor security group. This user is now unable to view the **Show Resource Calendar** control.

Secure Work Item Control - Set Preferences

You can secure the **Set Preferences** work item control in the Work items list window

To secure the Set Preferences control for the Contributor user

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the **Contributor** security group, and then click **Edit**. The **Modify a Security Group** page appears.
5. Uncheck the **Can Set Preferences** right.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
7. Click **Submit**. As the work item control rights cannot be customized other than at repository level, there is no need to synchronize.
8. Click **OK** in the confirmation window.
9. Log on as a user who belongs to Contributor security group. This user is now unable to view the **Set Preferences** control.

Secure Work Item Control - View

To secure work item control for the Contributor user

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the **Contributor** security group, and then click Edit. The **Modify a Security Group** page appears.
5. Uncheck the **Can View Work Item Control** right.
6. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
7. Click **Submit**. As the work item control rights can not be customized other than at the repository level, there is no need to synchronize.
8. Click **OK** in the confirmation window.
9. Log on as the user who belongs to the Contributor security group.
10. In the **Enterprise Console**, click menu icon, select **Inbox**. You will get no permission related warning message.

Secure Work Item Control - Forward

To secure the re-assigning work item task to another actor for a Administrator user

1. Log on as the administrator user.
2. Assume that the 'SupportWF' workflow is designed and the **Re-Assign Allowed** property of the **Approval** Activity is set as **Yes**. Associate this workflow with an event. Once the associated event is triggered, the work item will be displayed in the **Inbox**.
3. Right-click on the 'SupportWF' task. Now the administrator user will be able to view the **Reassign Work Item** and **Delegate Work Item** options in the context menu.
4. To control these options, click **Repository Settings**, click **Advanced Settings** tab, click **Manage Security Groups**, and then select **Administrator** security group.
5. Click **Edit**. The **Modifying a Security Group** page appears.
6. Uncheck the **Can Forward Work Item** right to control the **Reassign Work Item** and **Delegate Work Item** options in the Work items list window.
7. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
8. Click **Cancel**. As the work item control rights cannot be customized other than at the repository level, there is no need to synchronize.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

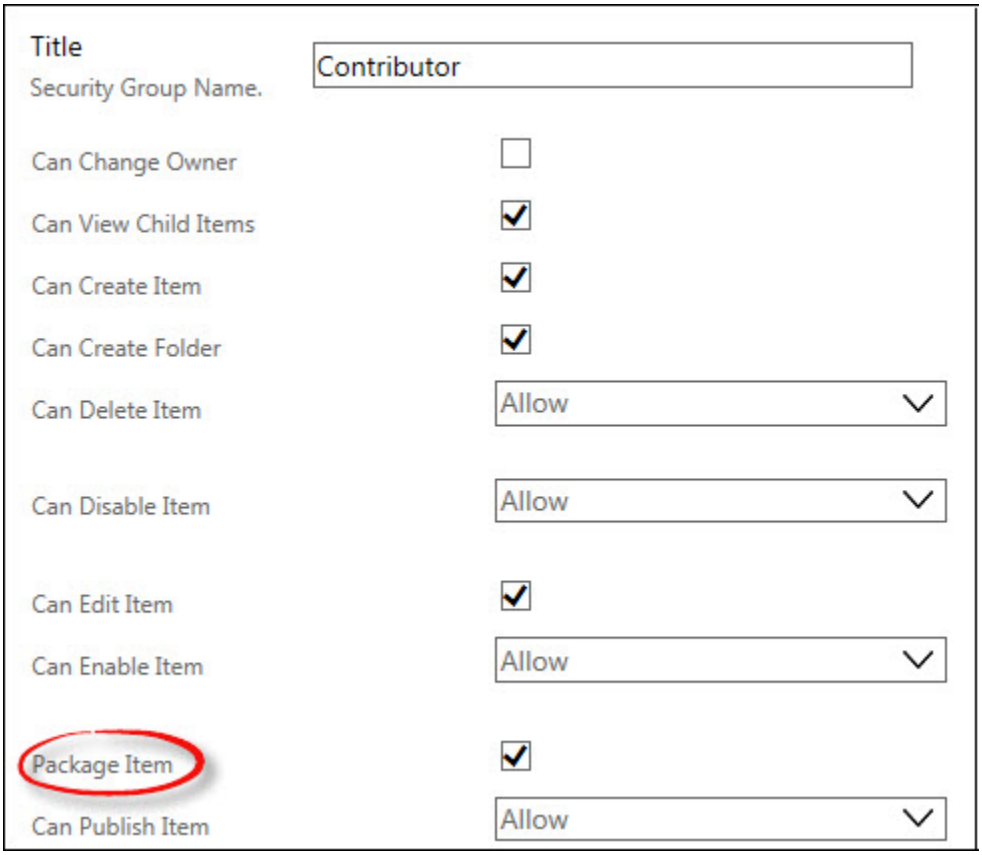
9. Click **OK** in the confirmation window.
10. In the **Enterprise Console**, click menu icon, and then select **Inbox**.
11. Right-click on the grid. The user will not get the **Reassign Work Item** and **Delegate Work Item** context menu options. The **Work Item Detail View** window of the selected workflow appears.

Secure Package

Use the Package feature to convert the tedious and complex task of deploying one or more artifacts (Database Lookup, List Lookup, and Database Connection) along with its dependencies from one environment/repository to another, easy and simple.

In addition to the rights specific mentioned in Secure Package Template List and Secure Actions in Manage Package, the Package Item right specific to the Package is available in the Generic List Actions rights.

Package Item: Controls the list items like workflow and forms from being added to the Package Template.



Secure Actions in Package Template

In the **Package Template** list, you can perform various actions such as, create, publish, generate, and export a Package Template.

- In the **Enterprise Console**, click menu icon, click **Package**, and then click **Package Template**.

  The **Package Template** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using the Package Template List Rights, you can control the user from exporting, generating, and marking the package template as shipped.

The following table summarizes the Package Template List Rights:

Package Template List Rights	
Export	This right controls the access to export the package template.
Generate	This right controls the access to generate the package template.
Mark as Shipped	This right controls the access to mark the package template as shipped.

Control Generation of Package Template

In the Package Template list, you can control the user from generating the package template.

To generate a package template

1. Log on as a user who belongs to the **Contributor** security group.
2. Open **Package Template** page.
3. Select a published package template, and click **Generate**. A message about successful generation of a package template appears.
4. Click **OK**.

To control the user from generating the package template

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the **Contributor** security group, and then click **Edit**. The **Modify a Security Group** page appears.
5. In the **Package Template List Rights** section, uncheck the Generate right to restrict the contributor from generating the package template.
6. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
7. Click **Yes** if you want to synchronize the changes to the below levels, or else click **Submit**.
8. Click **OK** in the confirmation window.
9. To verify if the a user who belongs to the Contributor security group can generate a package template or not, log on as a user who belongs to the Contributor security group.
10. Open Package Template page.
11. Select a published package template, and click Generate. The following message appears:
You do not have rights to perform this action.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Control Package Template Export

In the Package Template list, you can control the user from exporting the package template.

To export a package template

1. Log on as a user who belongs to the Contributor security group.
2. Open **Package Template** page.
3. Select a generated package template, and click **Export**.

   The **Export** dialog box appears.
4. Select **Save**.

   A message about successful export of the package template appears.
5. Click **OK**.

To control the user from exporting the package template

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**.

   The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**.

   The **Security Group** page appears.
4. Right-click the **Contributor** security group, and then click **Edit**.

   The **Modify a Security Group** page appears.
5. In the **Package Template List Rights** section, uncheck the **Export** right to restrict the contributor from exporting the package template.
6. Click **Save**.

   The **Synchronizing the Security Group** dialog box appears.
7. Click **Yes** if you want to synchronize the changes to the below levels, else click **Submit**.
8. Click **OK** on the confirmation window.
9. To verify if the a user who belongs to the **Contributor** security group can export a package template or not, log on as a user who belongs to the Contributor security group.
10. Open the **Package Template** page.
11. Select a generated package template, and click **Export**.

    The following message appears:

    You do not have rights to perform this action.

Control Package Template Marking

In the Package Template list, you can control the user from marking a package template as shipped.

To mark a package template as shipped

1. Log on as a user who belongs to the **Contributor** security group.
2. Open **Package Template** page.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Select and right-click an exported package template, and click **Mark as Shipped**.
   The **Mark as Shipped** dialog box appears.
4. Click **Yes** to confirm, else click **No**.

To control the user from marking the package template as shipped

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**.
   The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**.
   The **Security Group** page appears.
4. Right-click the **Contributor** security group, and then click **Edit**.
   The **Modify a Security Group** page appears.
5. In the **Package Template List Rights** section, uncheck the **Mark As Shipped** right to restrict the contributor from marking the package template.
6. Click **Save**.
   The **Synchronizing the Security Group** dialog box appears.
7. Click **Yes** if you want to synchronize the changes to the below levels, else click **Submit**.
8. Click **OK** on the confirmation window.
9. To verify if the a user who belongs to the **Contributor** security group can mark a package template or not, log on as a user who belongs to the Contributor security group.
10. Open the **Package Template** page.
11. Select and right-click a published package template.
    The **Mark As Shipped** option is not available in the shortcut menu as the user has no rights.

Secure Actions in Manage Package

In the **Manage Package List** in the target environment, you can import, edit, run, install, update, and uninstall a package.

- In the **Enterprise Console**, click menu icon, click **Package**, and then click **Manage Package**.
  The **Manage Packages** page appears.

Using the Manage Package List rights, you can control the user from installing and uninstalling the package.

The following table summarizes the Manage Package List Rights:

Manage Package List Rights	
Run	This right controls the access to install the package.
Uninstall	This right controls the access to uninstall the package.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Control Package Install

In the Manage Package list, you can control the user from installing a package.

To install a package

1. Log on as a user who belongs to the **Contributor** security group.
2. Open **Manage Package** page.
3. Select a package, and click **Install**. The **Package Configurations** page appears.
4. Specify the required configurations.
5. Click **Install Package**. The **Package History** page appears, and then package installed successfully message appears.
6. Click **OK**.

To control the user from installing the package

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the **Contributor** security group, and then click **Edit**. The **Modify a Security Group** page appears.
5. In the **Manage Packages List Rights** section, uncheck the Install right to restrict the contributor from installing the package.
6. Click **Save**. The Synchronizing the Security Group dialog box appears.
7. Click **Yes**, if you want to synchronize the changes to the below levels, else click Submit.
8. Click **OK** on the confirmation window.
9. To verify if the a user who belongs to the Contributor security group can install a package or not, log on as a user who belongs to the Contributor security group.
10. Open **Manage Packages** page.
11. Select a package and click Install. The following message appears: *You do not have rights to perform this action.*

Control Package Uninstall

In the Manage Package list, you can control the user from uninstalling a package.

To uninstall a package

1. Log on as a user who belongs to the **Contributor** security group.
2. Open **Manage Package** page.
3. Select a package, and click **Uninstall**. The **Uninstall** page appears.
4. Specify the required configurations.
5. Click **Uninstall**. The **Package History** page appears, and then package uninstalled successfully message appears.
6. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To control the user from uninstalling the package

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the Contributor security group, and then click Edit. The **Modify a Security Group** page appears.
5. In the **Manage Packages List Rights** section, uncheck the **Uninstall** right to restrict the contributor from uninstalling the package.
6. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
7. Click **Yes**, if you want to synchronize the changes to the below levels, else click Submit.
8. Click **OK** on the confirmation window.
9. To verify if the a user who belongs to the Contributor security group can install a package or not, log on as a user who belongs to the Contributor security group.
10. Open **Manage Packages** page.
11. Select a package and click **Uninstall**. The following message appears:
You do not have rights to perform this action.

Secure Calendar Control

Calendars enable creation of multiple, multi-level, hierarchical calendars. In addition, you can define a number of lower-level calendars that inherit from one of the top-level calendars. As a result, an organization with a number of geographical locations can define an organization-wide main calendar, which will broadly define the work hours across the organization. It can then allow each location to define a separate calendar with its own work hours to accommodate the unique work hour requirements of that region. This calendar will inherit the settings of the main calendar and the custom settings can be added on top of them.

Additional levels of customized calendars can be configured by inheriting from the corresponding higher-level calendar. The lowest level of calendars that can be defined by extending this process are the Resource calendars.

To open Calendar Control

In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Calendar**. The **Calendar** page appears.

The **Calendar Control** user interface opens with a window that displays all the available calendars. If no calendar has been configured then this window shows only the Add New Calendar icon.

Using **Calendar Control** rights, the user can control the access to add a new calendar, delete existing calendar, view all the calendars, view base calendar and view the calendar control.

The following table summarizes the Queue Control rights available for a Repository:

Calendar Control Rights	
Can Add Calendar	This right controls the access to add a new calendar.
Can Delete Calendar	This right controls the access to delete existing calendar.
Can View All Calendars	This right controls the access to view all the calendars.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Calendar Control Rights	
Can View Base Calendar	This right controls the access to view the base calendar.
Can View Calendar Control	This right controls the access to view the calendar control.

Control Adding a New Calendar

The following example demonstrates how to secure adding a new calendar by using **Calendar Control** rights for a contributor user.

To control the access to add a new calendar for a contributor user

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the **Contributor** security group, and then click **Edit**. The **Modify a Security Group** page appears.
5. In the **Calendar Control Rights** section, uncheck the **Can Add Calendar** right to restrict the contributor from adding a calendar.
6. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
7. Click **Yes** if you want to synchronize the changes to the below levels, or else click Submit.
8. Click **OK** in the confirmation window.
9. To verify if the a user who belongs to the Contributor security group cannot add a new calendar, log on as a user who belongs to the Contributor security group.
10. Open **Calendar** page. The contributor user cannot view the **Add New Calendar** icon in the **Calendar Control** page.

Control Deleting an Existing Calendar

The following example demonstrates how to secure the deleting an existing calendar option using Calendar Control rights for a contributor user.

To control the access to delete a calendar for a contributor user

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the **Contributor** security group, and then click **Edit**. The **Modify a Security Group** page appears.
5. In the **Calendar Control Rights** section, uncheck the **Can Delete Calendar** right to restrict the contributor from deleting a calendar.
6. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
7. Click **Yes** if you want to synchronize the changes to the below levels, or else click Submit.
8. Click **OK** in the confirmation window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. To verify if the a user who belongs to the Contributor security group cannot delete a calendar, log on as a user who belongs to the Contributor security group.
10. Open **Calendar** page.
11. Click any existing calendar. The contributor user cannot view the **Delete** option in the **Calendar Control** page.

Control Viewing All Calendars

The following example demonstrates how to secure viewing all calendars using the Calendar Control rights for a contributor user.

To control the access to view all calendars for a contributor user

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the **Contributor** security group, and then click **Edit**. The **Modify a Security Group** page appears.
5. In the **Calendar Control Rights** section, uncheck the **Can View All Calendars** right to restrict the contributor from deleting a calendar.
6. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
7. Click **Yes** if you want to synchronize the changes to the below levels, or else click **Submit**.
8. Click **OK** in the confirmation window.
9. To verify if the a user who belongs to the Contributor security group cannot view all calendars, log on as a user who belongs to the Contributor security group.
10. Open **Calendar** page. The contributor user cannot view any calendar in the **Calendar Control** page.

Control Viewing Base Calendar

The following example demonstrates how to secure viewing the base calendar using Calendar Control rights for a contributor user.

To control the access to view the base calendar for a contributor user

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the Contributor security group, and then click **Edit**. The **Modify a Security Group** page appears.
5. In the **Calendar Control Rights** section, uncheck the **Can View Base Calendar** right to restrict the contributor from deleting a calendar.
6. Click **Save**. The Synchronizing the **Security Group** dialog box appears.
7. Click **Yes** if you want to synchronize the changes to the below levels, or else click Submit.
8. Click **OK** in the confirmation window.
9. To verify if the a user who belongs to the Contributor security group cannot view all calendars, log on as a user who belongs to the Contributor security group.
10. Open **Calendar** page.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

11. Click any existing calendar. The Contributor user cannot see the **View** button in the **Calendar Control** window. The user is unable to view the details of the base calendar.

Control Viewing Calendar Control

The following example demonstrates how to secure viewing the Calendar Control for a contributor user.

To control the access to view the base calendar for a contributor user

1. Log on as the Administrator user.
2. Point to **admin**, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the **Contributor** security group, and then click **Edit**. The **Modify a Security Group** page appears.
5. In the **Calendar Control Rights** section, uncheck the **Can View Calendar Control** right to restrict the contributor from deleting a calendar.
6. Click **Save**. The **Synchronizing the Security Group** dialog box appears.
7. Click **Yes** if you want to synchronize the changes to the below levels, or else click Submit.
8. Click **OK** in the confirmation window.
9. To verify if the a user who belongs to the Contributor security group cannot view all calendars, log on as a user who belongs to the Contributor security group.
10. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Calendar**. The following message appears: *You do not have permission for this control*

Secure BAM Control

You can implement security for the Business Activity Monitoring (BAM) control.

The BAM security has the following rights:

- BAM Report Rights
- Can View Global Reports
- Workflowscope OwnedWorkflow (Can View Owned Reports)
- Workflowscope_InitiatedWorkflow (Can View Triggered Reports)
- Workflowscope_Any (Can View Others Report)
- Can View BAM Control

Use BAM Security

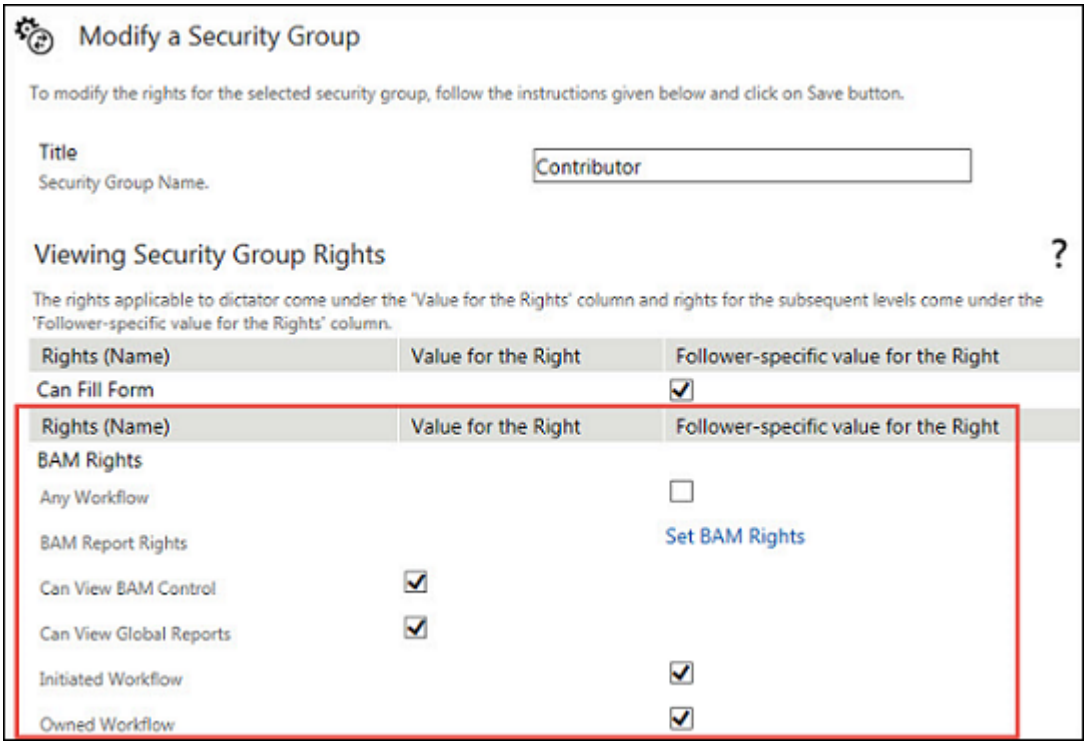
Only the administrator can grant or deny permissions.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To use the BAM Security

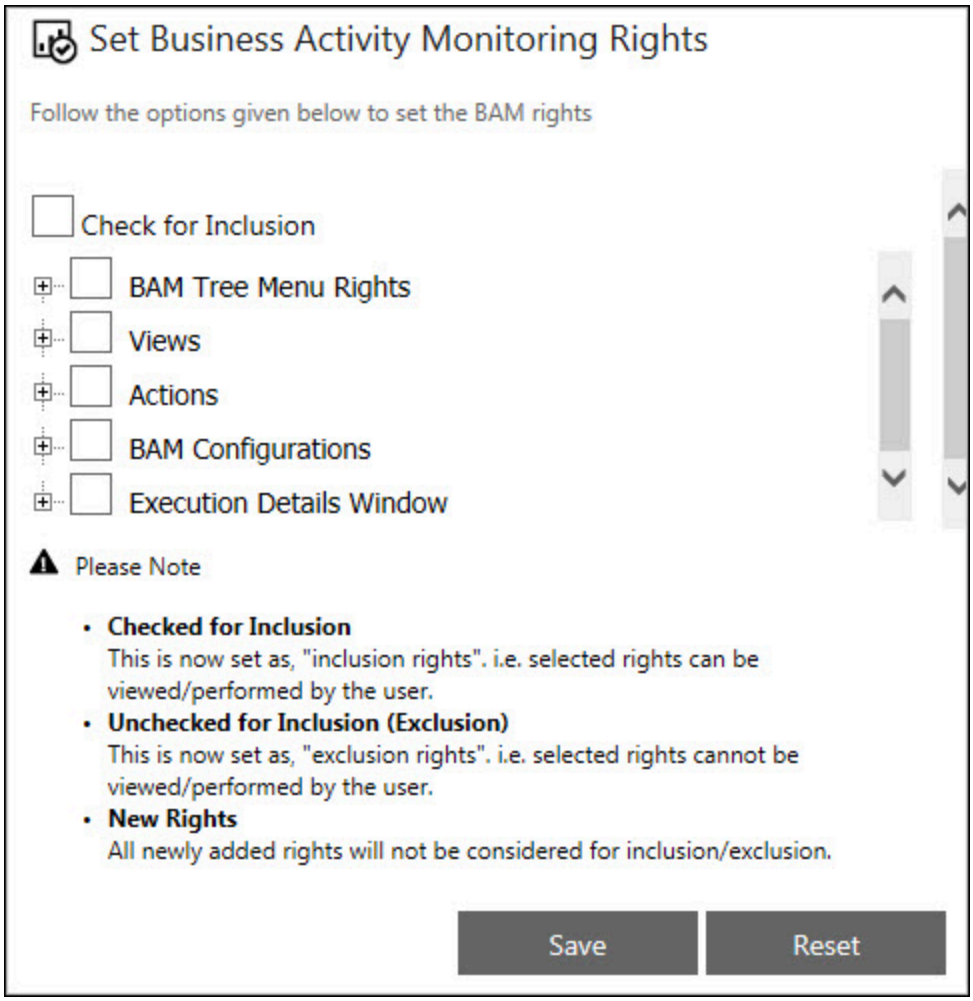
To set permissions at the Repository Level

1. Log on as the Administrator user.
2. Point to admin, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the security group to be customized, and then click **Edit**. The **Modify a Security Group** page appears. Modify the BAM rights.



5. Click the **Set BAM Rights** link to set the BAM rights. The **Set Business Activity Monitoring R**ights dialog box appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



6. Check **BAM Tree Manu Rights**, **Views**, **Actions**, and **BAM Configuration**. Note that the **Check for Inclusion** check box is available on the top. If you select the Check for Inclusion check box, the selected **BAM Tree Menu Rights**, **Views**, Actions, and BAM Configurations options are included in the rights value and saved in the database. If the Check for Inclusion check box is not selected, the selected BAM Tree Menu Rights, Views, Actions, and BAM Configurations options will be excluded from the rights value and all the unselected options will be saved in the database.
7. Click **Save**. The Set **Business Activity Monitoring Rights** dialog box closes.
8. To set the **Any Workflow**, **Can View BAM Control**, **Can View Global Reports**, **Initiated Workflow**, and **Owned Workflow rights**, select the corresponding check boxes, and then click **Save**.

To set BAM security at the List Item level

1. Go to the **Workflows** list.
2. Select an item and click **Security**. The security settings page appears.
3. Alternatively, select and right-click an item, and then click Security Settings from the shortcut menu.
4. In the **Advanced Settings** tab, click **Customize Security Group for this List**.
5. Right-click the security group to be customized, and then click **Edit**. The **Modify a Security Group** page appears. Modify the BAM rights.
6. Follow Step 5 to Step 8 to set BAM security at the List Item level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Default Rights for Different Security Groups

- **Administrator** - A user who belongs to the Administrator group can view the “Global Reports”, “Owned Reports”, “Triggered Reports” and “Others Report”.
  Only an “Administrator” can set the BAM Security either at the Repository level or List Item level.
- **Contributor** - A user who belongs to the Contributor group can view the “Global Reports”, “Owned Reports” and “Triggered Reports”.
- **Reader** - A user who belongs to the Reader group, can view only the “Triggered Reports”.
- **Limited Access** - A user who belongs to the Limited Access group, cannot view the BAM Configuration.

Default Rights for Different Security Groups

The following table lists default rights for different security groups.

Security Group Name	Can View Global Reports	Can View Owned Reports	Can View Triggered Reports	Can View Others Report	Can View BAM Control
Administrator	Yes	Yes	Yes	Yes	Yes
Contributor	Yes	Yes	Yes	No	Yes
Reader	No	No	Yes	No	Yes
Limited access	No	No	No	No	No

BAM Report Rights

The BAM Report Rights, specifies the rights for the following:

- BAM Tree Menu Rights
- Views
- Actions
- BAM Configuration

To set view BAM Report rights

1. Log on as the Administrator user.
2. Point to admin, and then click **Repository Settings**. The **Repository Settings** page appears.
3. In the **Advanced Settings** tab, click **Manage Security Groups**. The **Security Group** page appears.
4. Right-click the security group to be customized, and then click **Edit**. The **Modify a Security Group** page appears. Modify the BAM rights.
5. Click the **Set BAM Rights** link to set the BAM rights.

See BAM Tree Menu Rights, Views, Actions and BAM Configuration for more details.

The following table lists the rights and their scope to implement security for BAM:

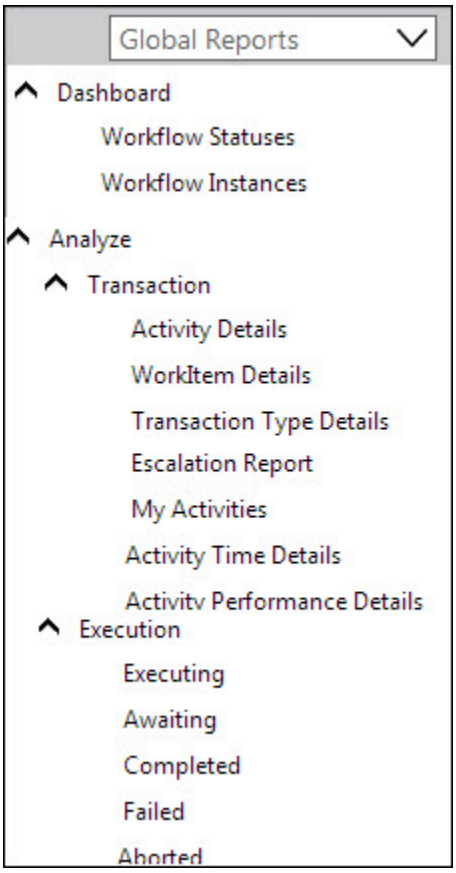
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Right Name	Scope
BAM Report Rights	ListSpecificForListItemLevel
Can View Global Reports	Repository
Workflow_OwnedWorkflow	ListSpecificForListItemLevel
Workflowscope_InitiatedWorkflow	ListSpecificForListItemLevel
Workflow_Any(Can View Others Report)	ListSpecificForListItemLevel
Can View BAM Control	Repository

BAM Tree Menu Rights

What is BAM Tree Menu Rights?

The BAM Tree Menu rights specify the nodes of the tree structure in the BAM Report. The tree structure is shown below.



AVEVA Work Tasks security provides the BAM Report Rights to control or restrict the access to these tree nodes (either privilege or restrict) in the BAM Report.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

How to Access BAM Tree Menu Rights?

To access or set the BAM Tree Menu Rights, the user must have administrative privileges.

To view the BAM Tree Menu rights, follow the steps given below:

1. Login as an Administrator user.
2. Select **Reports** from the **Enterprise Console** menu.
   The BAM Tree Menu Rights appears.

Purpose

AVEVA Work Tasks provides the **BAM Tree Menu Rights** to control the tree nodes (either privilege or restrict) in the BAM Report. In the BAM Tree Menu Rights, only those nodes for which a user has permission will be displayed in the BAM Report while the user is accessing the BAM Report.

Scenario

Scenario Description: Restricting the user from viewing some nodes in the tree structure of the BAM control.

Business Scenario: This scenario describes how to prevent the contributor user from viewing some nodes in the tree structure of the BAM control. Here, the Administrator user can restrict the contributor user from viewing the Workflow Statuses and Workflow Instances nodes of the tree structure in the BAM Control.

Roles: To understand this scenario effectively, assumed that there are two users in a repository. The first user belongs to the Administrator security group and the other user belongs to the Contributor security group.

1. admin - Will have Administrator access rights.
2. UserC - Will have Contributor access rights.

The following table depicts the users and their security groups:

User Name	Security Group
admin	Administrator
UserC	Contributor

Overview

Both the admin and UserC (Contributor) are able to see all the nodes in the tree structure of BAM Control.

The admin (Administrator) wants to restrict UserC (Contributor) to viewing some nodes in the tree structure of BAM Control. The same is depicted in the following table:

User Name	Report Menu Item	BAM Tree Menu Rights
admin	Yes	Yes
UserC	Yes	No

Scenario Solution:

To achieve the same, perform the following steps:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Login as the Contributor user. Here, login as 'UserC'.

   Before the security settings, the Contributor user can see all the nodes of the tree structure in the BAM Control. As mentioned above, the user must be an administrator to configure the security settings. As the admin user belongs to Administrator security group, this user can set the security settings to restrict the UserC to viewing some of the nodes in the tree structure in the BAM Control.
2. To restrict the UserC to viewing some of the nodes in the tree structure in BAM Control, login as an administrator user. Here, login as 'admin'.
3. Click **Repository Settings > Advanced Settings > Manage Security Groups**. You will be redirected to the Security Group list.
4. As the 'admin' user wants to restrict the contributor user, either select 'Contributor' and click **Actions > Edit** or right click 'Contributor' and then select Edit from the context menu.
5. A pop-up window appears with the assigned security rights. Click the **Set BAM Rights** link. Another pop-up window appears to set the BAM Rights.
6. Expand the **BAM Tree Menu Rights**.
7. The administrator user wants to prevent the other user from viewing the Workflow Statuses and Workflow Instances nodes under the Dashboard node. Unselect the **Check for Inclusion** check box. It means the selected rights should be excluded (restricted). So select the Workflow Statuses and Workflow Instances nodes under the Dashboard node.
8. After selecting the nodes to restrict, click **Save**. The window will be closed and you will be redirected to the security rights page. Click **Save**.
9. The **Synchronization** dialog box is displayed. Click **Yes** to synchronize the changes to the below level.
10. A message stating that “Security Group has been modified successfully” will appear. Click **OK**. Now the admin user has restricted the UserC (contributor) from viewing Workflow Statuses and Workflow Instances nodes of the tree structure in the BAM Control.
11. To check the same, login as a user who belongs to the contributor security group. Here, login as 'UserC'.
12. Select **Reports** from the **Enterprise Console** menu to access the BAM control. Observe that the Workflow Statuses and Workflow Instances nodes are not visible in the tree structure of the BAM control.

Views

The following are the three kinds of BAM available:

- Analysts View
- Progress View
- Execution View

AVEVA Work Tasks security provides the BAM Rights to control the access to or restrict these views (either privilege or restrict) in the BAM Report.

To open Process execution view, follow the step given below:

1. Login as the Administrator user.
2. Select **Reports** from the **Enterprise Console** menu.
3. In right panel, double-click any workflow to open the **Process execution view** window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example: The following example demonstrates how to prevent a contributor user from seeing the **Execution View** in the **Process execution view** window.

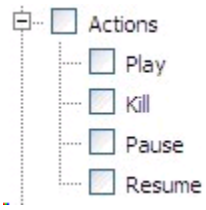
To achieve the same, follow the steps given below:

1. Login as a user who belongs to the Contributor security group.
2. Select **Reports** from the **Enterprise Console** menu.
3. In right panel, double-click any workflow to open the **Process execution view** window. Before the security settings, the contributor user is able to see all the views in the **Process execution view** window.
4. To prevent the contributor user from seeing the **Execution View** in the **Process execution view** window, login as the administrator user.
5. Click **Repository Settings > Advanced Settings > Manage Security Groups**.
6. Select the Contributor security group and click **Edit** or right-click Contributor and select **Edit** from the context menu.
7. Click **Set BAM Rights**.
8. Unselect the **Check for Inclusion** check box to exclude.
9. Select **Execution View**.
10. Click **Save**. The Reset button is used to reset the previous settings.
11. Click **Save** in the Modify Existing Security Group window.
12. Click **Yes** in the Synchronization window if you want to apply these settings to the below levels or else click **Submit**.
13. Click **OK** in the confirmation window.
14. Login as the contributor user to check.
15. Select **Reports** from the **Enterprise Console** menu.
16. Double-click any workflow instance in the right panel. The Process execution view window is displayed. Now this user is not able to see the execution view.

Actions

In BAM, there are actions to control the workflow execution. These actions are provided in the form of image buttons in the Process Execution window.

AVEVA Work Tasks provided BAM rights to control these actions.



See BAM Process Execution Viewfor more details.

Example: The following example demonstrates how to prevent a contributor user from viewing the Kill action option.

To do this, follow the steps given below:

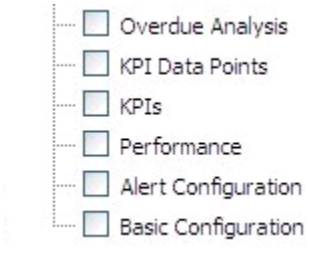
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Login as a user who belongs to the Contributor security group.
2. Select **Reports** from the **Enterprise Console** menu.
3. In the right panel, double-click any workflows to open the **Process execution view** window. Before the security settings, the contributor user is able to see all the actions in the **Process execution view** window.
4. To prevent the contributor user for viewing the **Kill** action in the **Process execution view** window, login as an administrator user.
5. Click **Repository Settings > Advanced Settings > Manage Security Groups**.
6. Select the Contributor security group and click **Edit** or right-click Contributor and select **Edit** from the context menu.
7. Click **Set BAM Rights**.
8. Unselected the **Check for Inclusion** check box to exclude.
9. Click **Set BAM Rights**.
10. Select **Kill** action.
11. Click **Save**.
12. The Reset button is used to reset the previous settings.
13. Click **Save** from the **Modify Existing Security Group** window.
14. Click **Yes** in the Synchronization window if you want to apply these settings to the below levels or else click **Submit**.
15. Click **OK** in the confirmation window.
16. Login as a contributor user to check.
17. Select **Reports** from the **Enterprise Console** menu.
18. Double-click any workflow instance in the right panel. The **Process execution view** window is displayed. Now this user is not able to see the **Kill** option in the tool bar.

BAM Configuration

In BAM, there are some configuration settings which allow the user to set Overdue Analysis, KPI(s), Performance, Alerts, and Time settings to schedule the BAM reports.

AVEVA Work Tasks provided BAM rights to control these configurations:



To open BAM configuration window, follow the step given below:

1. Login as an **Administrator** user.
2. Select **Workflows** from the **Enterprise Console** menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Select any workflow and click **Design** on the ribbon bar or right-click and select **Design Workflow** from the context menu. This will redirect you to the **Process Designer** window.
4. Select **BAM Configuration** from the **Settings** menu. Before the security settings, the contributor user is able to see all the BAM configuration tabs in the **Process Designer** window.

The **BAM Configuration** window for the selected workflow is displayed.

Example: The following example demonstrates how to prevent a contributor user from viewing the Performance and Basic Configuration tabs in the BAM Configuration window.

To achieve the same, follow the steps given below:

1. Login as a user who belongs to the Contributor security group.
2. Select **Workflows** from the **Enterprise Console** menu.
3. Select any workflow and click **Design** from the ribbon bar or right-click and select **Design Workflow** from the context menu. This redirects you to the **Process Designer** window.
4. Select **BAM Configuration** from the **Settings** menu.
5. To prevent the contributor user from viewing the **Performance** and **Basic Configuration** tabs in the BAM Configuration window, login as the administrator user.
6. Click **Repository Settings > Advanced Settings > Manage Security Groups**.
7. Select the Contributor security group and click Edit or right-click Contributor and select Edit from the context menu.
8. Click **Set BAM Rights**.
9. Unselect the **Check for Inclusion** check box to exclude.
10. Click **Set BAM Rights**.
11. Select **Performance** and **Basic Configuration**.
12. Click **Save**. The Reset button is used to reset the previous settings.
13. Click **Save** in **Modify Existing Security Group** window.
14. Click **Yes** in the Synchronization window if you want to apply these settings to the below levels or else click **Submit**.
15. Click **OK** in the confirmation window.
16. Login as a contributor user.
17. Select **Workflows** from the **Enterprise Console** menu.
18. Right-click any workflow and select **Design Workflow** from the context menu. The **Process Designer** will be displayed.
19. From the **Settings** menu, select **BAM Configuration**. Now the logged in user is not able to view the Performance and Basic Configuration tabs in the BAM Configuration window.

Execution Details Window

What is Execution Details Window?

Execution Details Window displays the selected activity details like Step details, Variables, Contents and Content.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

How to Access Execution Details Window?

To access the **Execution Details Window**, click any activity in the **Process execution view** window.

The **Process execution view** window can be accessed in two ways:

From the **Enterprise Console** menu, select **Reports**. Double-click any instance of a workflow in the Execution section of the BAM Report. This will open the **Process Execution View** window.

or

From the **Enterprise Console** menu, select **Workflows**. Right-click any published workflow in the Workflows list and select **Publish and Test Run** from the context menu. This will open the **Process execution view** window.

Note: If you are not able to see the Reports menu item in the application menu, it means that the Can Consume right is set as false for whatever security group you belong to at the repository level.

Purpose

AVEVA Work Tasks implements security for this Execution Details Window. This window is accessible only if the user has the permission to view this page. Otherwise, the system will prompt the user stating “You do not have rights to view this page”.

This section explains the how to set or configure the security for the Execution Details Window.

Predefined Security Groups - Permissions

The default value of this right for the different predefined security groups is as follows:

Security Group Name	Have Permission to access execution details window?
Administrator	Yes
Contributor	Yes
Reader	No
Limited Access	No

To implement the security for the **Execution Details Window**, the user has to select/unselect the Execution Details Window check box in the BAM Rights section.

Inclusion & Exclusion Scenarios

If the “Check for Inclusion” check box not selected, the selected rights are excluded. Similarly, if the “Check for Inclusion” check box is selected then the selected rights are included. In the Inclusion scenario (When the "Check for Inclusion" check box is selected), if the “Execution Details Window” check box is selected then the user can view the Execution Details Window.

In Exclusion scenario (When the "Check for Inclusion" check box not selected), if the “Execution Details Window” check box is not selected then the user can view the Execution Details Window.

Note: As the **Execution Details Window** is accessible from the **Process execution view** window, the user must have at least one view selected in the Views of the BAM Rights section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Users who belong to either the administrator or the contributor security groups are able to view the execution details. Users who belong to either the reader or limited access security group are not able to view the execution details. See Predefined Security Groups - Permissions

Scenario

Scenario Name: Restricting the user from viewing the Execution Details Window.

Business Scenario: This scenario describes how to prevent the contributor user from viewing the Execution Details Window in the Process execution view window.

Roles: To understand this scenario effectively, assumed that there are two users in a repository. One user belongs to the Administrator security group and the other user belongs to the Contributor security group.

1. **UserA** - Has Administrator access rights.
2. **UserC** - Has Contributor access rights.

The following table depicts the users and their security groups:

User Name	Security Group
UserA	Administrator
UserC	Contributor

Overview

As mentioned in Predefined Security Groups - Permissions, the users who belong to either the Administrator or Contributor security groups have the rights to view the execution details by default. So Both UserA & UserC have the right to view the execution details window.

Here UserA (Administrator) wants to prevent UserC (Contributor) from viewing the execution details window. The same is depicted in the following table:

User Name	Can View Execution Details
UserA	Yes
UserC	No

Scenario Solution:

To achieve the same, perform the following steps:

1. Login as a Contributor user. Here, login as 'UserC'.
2. From the **Enterprise Console** menu, select **Reports**. Before the setting security, UserC can view the Execution Details Window option in the Process execution view window.
3. To prevent the Contributor user from accessing the Execution Details Window, login as the Administrator user. Here login as 'UserA'.
4. Click **Repository Settings > Advanced Settings > Manage Security Groups**. You will be redirected to the Security Group list.
5. Select the **Contributor** security group and click **Edit** on the ribbon bar or right-click the security group and select Edit from the context menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. A pop-up window will appear with the assigned security rights. Click **Set BAM Rights**.
7. The BAM Rights window opens. Select the Execution Details Window check box and click Save. The BAM Rights window will be closed. Click **Save** in the Modify Existing Security Group window.
8. The **Synchronization** dialog box is displayed. Click **Yes** to synchronize the changes to the below level.
9. You will be prompted with a message stating that “Security Group has been modified successfully”. Click OK.
10. To check, login as a user who belongs to the contributor security group i.e 'UserC'.
11. From the **Enterprise Console** menu, select **Reports**. As UserC does not have the rights to view the execution details window.

Can View Global Reports

What is Global Reports?

In the BAM control, the Global Reports option in the drop-down is used to monitor all triggered workflow details like executing instances, awaiting instances, completed instances, failed instances and aborted instances at a time, instead of monitoring individual workflow details.

How to Access Global Reports?

To access Global Reports, click **Reports** from the **Enterprise Console** (application) menu. BAM Control will be displayed. If the user has the right to view **Global Reports**, the Global Reports option will selected by default in the drop-down.

Note: If you are not able to see the **Reports** menu item in the application menu, it means the **Can Consume** right is set as false for whatever security group you belong to at the repository level.

Purpose

AVEVA Work Tasks implemented a security right named **Can View Global Reports** at the repository level to control the Global Reports. This right can have either the true or false value (check box).

Predefined Security Groups - Right Value

The default value of this right for different the predefined security groups is as follows:

Security Group Name	Right Name	Right Value
Administrator	Can View Global Reports	True
Contributor	Can View Global Reports	True
Reader	Can View Global Reports	False
Limited Access	Can View Global Reports	False

If this right is set to **True** for a specific user only then will the user be able to see the **Global Reports** item in the drop-down of BAM control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For example, the users who belong to the either the administrator or the contributor security group are able to see the Global Reports item in the drop-down of BAM control.

If this right is set to **False** for a specific user, the user will not be able to see the Global Reports item in the drop-down of BAM control.

For example, the users who belong to either the Reader or Limited Access security group are not able to see the Global Reports item in the drop-down of BAM Control.

Note: Even though the **Can View Global Reports** right is set as **False**, the user will be able to view the **Reports** menu item in the application menu (Enterprise Console). This right will not restrict the user from viewing this menu but if the user tries to access the BAM Control, the user will be redirected to the BAM control page where the **Global Reports** option will not be available in the drop-down.

Scenario

Scenario Name: Preventing the user from accessing the Global Reports item in the drop-down of the BAM control.

Business Scenario: This scenario describes how to prevent the contributor user from accessing the Global Reports item in the drop down of the BAM control.

Roles: To understand this scenario properly, assumed that there are two users in a repository. One of the user belongs to the **Administrator** security group and the other user belongs to the **Contributor** security group.

1. UserA - Has Administrator access rights.
2. UserC - Has Contributor access rights.

The following table depicts the users and their security groups:

User Name	Security Group
UserA	Administrator
UserC	Contributor

Overview

As mentioned in Predefined Security Groups - Right Value, the users who belong to either the Administrator or Contributor security groups have the rights to view the BAM control by default. So Both UserA and UserC have the right to view the BAM control.

Here UserA (Administrator) wants to prevent the UserC (Contributor) from viewing the Global Reports item in the drop-down of the BAM control. The same is depicted in the following table:

User Name	Report Menu Item	Can View Global Reports
UserA	Yes	Yes
UserC	Yes	No

It means that UserC is able to see the **Reports** menu in the application menu (Enterprise Console) after logging in. But when UserC clicks the **Reports** menu item, the BAM Control page will be displayed without the **Global Reports** item in the drop-down.

Scenario Solution:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To arrive at a solution for this scenario, perform the following steps:

1. Login as a user who belongs to the Contributor security group. Here, login as 'UserC'.
2. From the **Enterprise Console** menu, select **Reports**. Before setting security, UserC can see the BAM Control and the Global Reports item in the drop-down.
3. To prevent the contributor user from viewing the Global Reports item in the drop-down of the BAM control, login as the administrator user. Here login as 'UserA'.
4. Click **Repository Settings > Advanced Settings > Manage Security Groups**. You will be redirected to the Security Group list.
5. Select the **Contributor** security group and click **Edit** on the ribbon bar or right-click the security group and select **Edit** from the context menu.
6. A pop-up window appears with the assigned security rights. Uncheck the **Can View Global Reports** right and click **Save**.
7. Click **Save**.
8. The **Synchronization** dialog box is displayed. Click Yes to synchronize the changes to the below level.
9. You will be prompted with a message stating that “Security Group has been modified successfully”. Click **OK**.
10. To check, login as a user who belongs to the contributor security group i.e 'UserC'.
11. From the **Enterprise Console** menu, select **Reports**. The user is redirected to the BAM Control page but the **Global Reports** item is not available in the drop-down.
12. The 'UserC' (Contributor security group user) does not have any owned workflow or workflows that are triggered by 'UserC'. The user will get the screen shown below while accessing BAM Control (**Reports** menu item in the application menu) since this user does not have the permission to view the workflows owned and triggered by others.

Observe that 'UserC' (Contributor security group user) does not have the permission to view others' workflows (Workflowscope_Any is false).

As per the above screen, the rights of “UseC” (Contributor security group) are as follows:

Right Name	**Right Value**
Workflowscope_Any (Others workflows)	False
Can View BAM Control	True
Can View Global Reports	False
Workflowscope_InitiatedWorkflow (Triggered workflows)	True
Workflowscopre_OwnedWrokflow (Owned workflows)	True

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Workflowscope_InitiatedWorkflow

What is Workflowscope_InitiatedWorkflow?

In the BAM control, apart from Global Reports, the logged in user can see the reports of the workflows that the user triggered.

Example: Consider that the user "John" triggered "Workflow1". Even though "John" is not the owner of this workflow, they will be able to see the details of "Workflow1" in the BAM Report because they triggered it.

You can prevent "John" from viewing "Workflow1" details in the BAM Report, even though they triggered it, using the right called **Workflowscope_InitiatedWorkflow**.

How to Access Initiated Workflows?

To access the initiated workflow reports, the logged in user must have the right to view triggered workflows i.e. the **Workflowscope_InitiatedWorkflow** right value must be **True** at the item level.

Note: If you are not able to see the **Reports** menu item in the application menu, it means the **Can Consume** right is set as false for whatever security group you belong to at the repository level.

Purpose

AVEVA Work Tasks implemented a security right named **Workflowscope_InitiatedWorkflow** at ListSpecificForListItemLevel to control the initiated (triggered) workflows. This right can have either the True or False (check box) value.

Predefined Security Groups - Right Value

The default value of this right for the different predefined security groups is as follows:

Security Group Name	Right Name	Right Value
Administrator	Workflowscope_InitiatedWorkflow	True
Contributor	Workflowscope_InitiatedWorkflow	True
Reader	Workflowscope_InitiatedWorkflow	True
Limited Access	Workflowscope_InitiatedWorkflow	False

If this right is set to **True** for a specific workflow, then the user who triggered any instance of the workflow can view the report of the workflow in the BAM Report.

For example, users who belong to either the administrator, contributor or reader security group are able to see their initiated (triggered) workflows in the BAM Report by default.

If the right is set to **False** for a workflow and the user who triggered it logs in, the user will not be able to view the report of the workflow in the BAM Report section.

For example, the users who belong to the Limited Access security group are not able to see their initiated (triggered) workflows in the BAM Report by default.

Note: Even though the **Workflowscope_InitiatedWorkflow** right is set as **False**, the user can view the **Reports** menu item in the application menu (Enterprise Console).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Scenario

Scenario Name: Preventing the user from viewing the initiated workflows in the BAM control.

Business Scenario: This scenario describes how to prevent the Reader user from viewing the initiated workflows in the BAM control.

Roles: To understand this scenario clearly, assumed that there are two users in a repository. One user belongs to the Administrator security group and the other user belongs to the Reader security group.

1. admin - Has Administrator access rights.
2. UserR - Has Reader access rights.

The following table depicts the users and their security groups:

User Name	Security Group
admin	Administrator
UserR	Reader

Overview

As mentioned in Predefined Security Groups - Right Value, the users who belong to either the Administrator, Contributor or Reader security group have the rights to view initiated workflows in the BAM control by default. So both, 'admin' and 'UserR' have the right to view initiated workflows in the BAM control.

The users who belong to the Limited Access security group does not have the right to view initiated workflows in the BAM control by default.

Assume that there are two workflows named adminWF and readerWF (both created by admin – owner is admin) in the repository.

Assume that the 'adminWF' is triggered by the admin user and 'readerWF' is triggered by UserR (Reader security group).

After logging in, the admin user can see the details of both the workflows (adminWF and readerWF) apart from the Global Reports in the BAM Report. This is because the admin user has the rights to view both owned workflows and initiated workflows and also the right to view the Global Reports.

After logging in, UserR cannot see the Global Reports option in the drop-down. This is because UserR is a part of the Reader security group and does not have the permission to view Global Reports. UserR can see only the 'readerWF' in the BAM Report as this user has the right to view initiated workflow, by default.

Here admin (Administrator) wants to prevent the UserR (Reader) from viewing UserR's initiated workflow details in the BAM control. The same is depicted in the following table:

User Name	Report Menu Item	Workflowscope_InitiatedWorkflow
admin	Yes	Yes
UserR	Yes	No

It means that when UserR (Reader) logs in, UserR will be able to see the Reports item in the application menu (Enterprise Console). If UserR clicks the Reports menu item, the user will be redirected to the BAM page and will

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

not be able to see the initiated workflow in the BAM Report.

Scenario Solution:

To prevent the reader from viewing initiated workflow in the BAM Report, perform the following steps:

1. Login as a user who belongs to the Reader security group. Here, login as 'UserR'.
2. From the **Enterprise Console** menu, select **Reports**.
3. Here, 'UserR' is not the owner of readerWF even though UserR triggered readerWF.
4. To prevent 'UserR' from viewing readerWF details in the BAM Report, login as an administrator user. Here, login as 'admin'.
5. From the **Enterprise Console** menu, select **Workflows**. You will be redirecting to the **Workflows** list page.
6. As the 'admin' user wants to restrict access to the "readerWF" details in the BAM control (because readerWF is triggered by UserR), right click **'readerWF**' and select **Security Settings** from the context menu.
7. You will be redirected to the ListItem security settings page. Click the **Advanced Settings** tab.
8. Click **Enable List Item Specific Security**.
9. Select the **Security Group Customization** option in the Enable Security Wizard and click **Next**.
10. Click **Next**.
11. The user will be redirected to the **Security Group** customization at list item level page.
12. As 'admin' wants to restrict 'UserR' (Reader Security Group), select the Reader security group and click **Actions > Edit** or right click the **Reader security** group and select Edit from the context menu.
13. A pop-up window is displayed with assigned security rights. Uncheck the Workflowscope_InitiatedWorkflow right and click Save.
14. Before clicking **Save**, ensure that the required BAM tree menu rights are set.
15. The **Synchronization** dialog box is displayed. Click **Yes** to synchronize the changes to the below levels.
16. You will be prompted with a message stating that "*Security Group has been modified successfully*." Click **OK**.
17. To check the same, login as a user who belongs the **Reader** security group. Here, login as 'UserR'.
18. To access the BAM control, select Reports from the **Enterprise Console** menu. The 'UserR' will be redirected to the BAM control page and will not be able to view the 'readerWF' details in the BAM control.

Workflowscope_OwnedWorkflow

What is Workflowscope_OwnedWorkflow?

In BAM control, apart from Global Reports, the logged in user is able to see the reports of the workflows that the logged in user triggered.

Example: Consider that user "Tim" is the owner of the "workflow1" and the user "John" logged-in and triggered the "workflow1". The user "John" only can view the report of the "workflow1" in the BAM Report. Even though "Tim" is the owner of "workflow1", if they log in, they cannot view the report of "workflow1" in the BAM Report.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

How to Access Owned Workflow's?

To access the owned workflow reports, the logged in user must have the right to view owned workflow i.e. the **Workflowscope_OwnedWorkflow** right value must be **True** at the item level.

Note: If you are not able to see the **Reports** menu item in the application menu, it means the **Can Consume** right is set as false for whatever security group you belong to at the repository level.

Purpose

AVEVA Work Tasks implemented a security right named **Workflowscope_OwnedWorkflow** at **ListSpecificForListItemLevel** to control the owned workflows. This right can have either the True or False (check box) value.

Predefined Security Groups - Right Value

The default value of this right for the different predefined security groups is as follows:

Security Group Name	Right Name	Right Value
Administrator	Workflowscope_OwnedWorkflow	True
Contributor	Workflowscope_OwnedWorkflow	True
Reader	Workflowscope_OwnedWorkflow	False
Limited Access	Workflowscope_OwnedWorkflow	False

If this right is set to **True** for a workflow for a specific user and the user is the owner of the workflow and has not triggered any instances of the workflow, the user can see the workflow details in the BAM Report.

For example, users who belong to either the administrator or contributor security group are able to see their owned workflows in the BAM Report by default.

If this right set to **False** for a workflow for a specific user and the user is the owner of the workflow and has not triggered any instance of the workflow, the user will not be able to see details of the workflow in the BAM Report (despite being the owner of the workflow).

For example, users who belong to either the Reader or Limited Access security group are not able to see their owned workflows in the BAM Report by default.

Note: Even though the **Workflowscope_OwnedWorkflow** right is set as **False**, the user can view the **Reports** menu item in the application menu (Enterprise Console).

Scenario

Scenario Name: Privileging the user to view owned workflows in the BAM control.

Business Scenario: This scenario describes how to provide access to the Reader user to view owned workflows in the BAM control.

Roles: To understand this scenario clearly, assume that there are two users in a repository. One user belongs to the Administrator security group and the other user belongs to the Reader security group.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. admin - Has Administrator access rights.
2. UserR - Has Reader access rights.

The following table depicts the users and their security groups:

User Name	Security Group
admin	Administrator
UserR	Reader

Overview

As mentioned in Predefined Security Groups - Right Value, the users who belong to either the Administrator or Contributor security group have the rights to view owned workflows in the BAM control by default. So the 'admin' user has the right to view owned workflow in the BAM control.

The users who belong to either the Reader or Limited Access security group do not have the right to view owned workflows in the BAM control by default. So 'UserR' does not have the right to view owned workflow in the BAM control.

Assume that there are two workflows named adminWF (created by admin – owner is admin) and readerWF (created by UserR (Reader) – owner is UserR) in the repository.

Assume that both the workflows are triggered by 'admin' user.

After logging in, 'admin' can see the both workflow names and the Global Reports item in the drop-down of the BAM control.

After logging in, 'UserR' cannot see the Global Reports option in the drop-down (because UserR is a Reader and does not have permission to view the Global Reports) and readerWF details in the BAM Control (as UserR is the owner of readerWF).

Here, admin (Administrator) wants to privilege UserR (Reader) to view UserR's owned workflow details in the BAM control. The same is depicted in the following table:

User Name	Report Menu Item	Workflowscope_OwnedWorkflow
admin	Yes	Yes
UserR	Yes	Yes

It means that after logging in, UserR (Reader) is able to see the **Reports** item in the application menu (Enterprise Console). If UserR clicks the Reports menu item, the user will be redirected to the BAM page and be able to see owned workflow in the BAM Report.

Scenario Solution:

To privilege the reader to view owned workflow in the BAM Report, perform the following steps:

1. Login as a user who belongs to the Administrator security group. Here, login as 'admin'.
2. From the **Enterprise Console** menu, select **Workflows**. You will be redirected to the Workflows list page.
3. As admin wants to give the privilege for the 'readerWF' (UserR is the owner of this workflow), right-click

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

'readerWF' and select **Security Settings** from the context menu.

4. You will be redirected to the ListItem security settings page. Click the **Advanced Settings** tab.
5. Click **Enable List Item Specific Security**.
6. Select the **Security Group Customization** option in the **Enable Security Wizard** and click **Next**.
7. Click **Next**.
8. The user will be redirected to the **Security Group** customization at list item level page.
9. To give privilege to 'UserR' (Reader security group), select the **Reader** security group and click **Actions > Edit** or right-click the **Reader** security group and select **Edit** from the context menu.
10. A pop-up window is displayed with the assigned security rights. Check the **Workflowscope_OwnedWorkflow** right and click **Save**.
11. Before clicking **Save**, ensure that the required **BAM** tree menu rights are set.
12. The **Synchronization** dialog box is displayed. Click **Yes** to synchronize the changes to the below level.
13. You will be prompted with a message stating that "**Security Group has been modified successfully**." Click **OK**.
14. To check the same, login as a user who belongs the **Reader** security group. Here, login as 'UserR'.
15. To access the **BAM** control, select **Reports** from the **Enterprise Console** menu. Now the 'UserR' will get the BAM control page and will be able to view owned workflow.

Workflowscope_Any

What is Workflowscope_Any?

In BAM control, apart from the Global Reports, the logged in user can see the reports of the workflows that the logged in user triggered and owns.

Example: Consider that user "Tim" is not the owner of the "workflow1" and has not triggered "workflow1". But we want "Tim" to view "workflow1" details in the BAM Report.

How to Access Others Workflows?

To access others' workflow reports, the logged in user must have the right to view others workflows i.e. the **Workflowscope_Any** right value must be true at the item level.

Note: If you are not able to see the **Reports** menu item in the application menu, it means the **Can Consume** right is set as false for whatever security group you belong to at the repository level.

Purpose

AVEVA Work Tasks implemented a security right named **Workflowscope_Any** at "ListSpecificForListItemLevel" to control others owned or triggered workflows. This right can have either the True or False (check box) value.

Predefined Security Groups - Right Value

The default value of this right for the different predefined security groups is as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Security Group Name	Right Name	Right Value
Administrator	Workflowscope_Any	True
Contributor	Workflowscope_Any	False
Reader	Workflowscope_Any	False
Limited Access	Workflowscope_Any	False

If this right is set to **True** for a specific workflow for a user (who is not the owner or has not triggered any instances of the workflow), then that user is able to see the report of the workflow in the BAM Report after logging in.

For example, the users who belong to the administrator security group are able to see others owned or triggered workflows in the BAM Report by default.

If this right is set to **False** for specific workflow for a user (who is not the owner or has not triggered any instances of the workflow), then that user cannot see the report of the workflow in the BAM Report after logging in.

For example, users who belong to either the contributor, reader or limited access security group are not able to see others owned or triggered workflows in the BAM Report by default.

Note: Even though the **Workflowscope_Any** right is set as **False**, the user is able to view the **Reports** menu item in the application menu (Enterprise Console).

Scenario

Scenario Name: Privileging the user to view others owned workflows in the BAM control.

Business Scenario: This scenario describes how to privilege the Reader user to view the workflows owned by the contributor user in the BAM control.

Roles: To understand this scenario clearly, assumed that there are three users in a repository. The first user belongs to the **Administrator** security group, the second user belongs to the **Reader** security group, and the third user belongs to the **Contributor** security group.

1. admin - Has Administrator access rights.
2. UserR - Has Reader access rights.
3. UserC - Has Contributor access rights.

The following table depicts the users and their security groups:

User Name	Security Group
admin	Administrator
UserR	Reader
UserC	Contributor

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Overview

As mentioned in the Predefined Security Groups - Right Value, the users who belong to the Administrator security group have the rights to view others owned and triggered workflows in the BAM control by default. So 'admin' has the right to view others owned and triggered workflows in the BAM control.

As mentioned in Predefined Security Groups - Right Value, the users who belong to either the Contributor, Reader or Limited Access security group do not have the right to view others owned and triggered workflow in the BAM control by default. So both UserR (Reader security group) and UserC (Contributor security group) cannot view others owned or triggered workflows in the BAM control.

Assume that a workflow 'GenericWF' is created by UserC (Contributor security group) and triggered by UserC.

The Admin user can see the 'GenericWF' details in the BAM Report by default. As mentioned in Predefined Security Groups - Right Value, users who belong to the Administrator security group have the right to view others owned and triggered workflows in the BAM control by default.

UserC (Contributor) can see the 'GenericWF' details in the BAM Report by default because UserC is the owner of that workflow and triggered it. Users who belong to the Contributor security group have the right to view the owned workflows (Workflowscope_OwnedWorkflow) and initiated workflows (Workflowscope_InitiatedWorkflow).

UserR (Reader) is not able to see the 'GenericWF' details in the BAM Report by default. As mentioned in Predefined Security Groups - Right Value, users who belong to either the Contributor, Reader or Limited access security groups do not have the rights to view others owned and triggered workflows in the BAM Report by default.

User Name	Report Menu Item	Workflowscope_Any
admin	Yes	Yes
UserC	Yes	Yes
UserR	Yes	Yes

It means after logging in, UserR (Reader) will be able to see the Reports item in the application menu (Enterprise Console). On clicking Reports, UserR will be redirected to the BAM page and will be able to see others owned workflow in the BAM Report.

Scenario Solution

To achieve the same, perform the following steps:

1. Login as an Administrator user. Here, login as 'admin'. Before the security settings, the 'admin' user can see the 'GenericWF' details in the BAM Report.
2. Login as a Contributor user. Here, login as 'UserC'. Before the security settings, the Contributor user see the 'GenericWF' details in the BAM Report.
3. Login as a Reader user. Here login as 'UserR'. Before the security settings, the Reader user cannot view the 'GenericWF' details in the BAM Report. The screen given below will be displayed as UserR (Reader) does not have the right to view Global Reports and there are no workflows owned and triggered by UserR.
4. As 'admin' wants to privilege 'UserR' to view the GenericWF in the BAM Report, login as 'admin'.
5. From the **Enterprise Console** menu, select **Workflows**. You will be redirected to the Workflows list page.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. As the 'admin' user wants to give the privilege to 'UserR' to view 'GenericWF' details in the BAM control, right-click '**GenericWF'** and select **Security Settings** from the context menu.
7. You will be redirected to the ListItem security settings page. Click the **Advanced Settings** tab.
8. Click **Enable List Item Specific Security**.
9. Select the **Security Group Customization** option in the **Enable Security Wizard** and click **Next**.
10. Click **Next**.
11. You will be redirected to the **Security Group** customization at list item level page.
12. To give privilege to 'UserR' (Reader Security Group), select the **Reader** security group and click **Actions > Edit** or right-click the **Reader** security group and select **Edit** from the context menu.
13. A pop-up window is displayed with the assigned security rights. Check the **Workflowscope_Any** right and click **Save**.
14. Before clicking **Save**, ensure that the required BAM tree menu rights are set.
15. The **Synchronization** dialog box is displayed. Click **Yes** to synchronize the changes to its below level.
16. You will be prompted with a message stating that *"Security Group has been modified successfully."* Click **OK**.
17. To check the same, login as a user who belongs the Reader security group. Here, login as 'UserR'.
18. To view "GenericWF" details in the BAM control, select **Reports** from the **Enterprise Console** menu. Now the 'UserR' will get the BAM control page and will be able to view owned workflow.

Can View BAM Control

What is BAM Control?

BAM control is used to monitor all triggered workflows details like executing instances, awaiting instances, completed instances, failed instances and aborted instances and so on.

How to Access BAM Control?

To access BAM control, click Reports from the Enterprise Console (application) menu.

Note: If you not able to see the Reports menu item in the application menu, it means the Can Consume right is set as false for the security group you belong to at the repository level.

Purpose

AVEVA Work Tasks has implemented a security right named Can View BAM Control at the repository level to control the BAM Control. This right can have either the true or false (check box) value.

Predefined Security Groups - Right Value

The default value of this right for the different predefined security groups is as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Security Group Name	Right Name	Right Value
Administrator	Can View BAM Control	True
Contributor	Can View BAM Control	True
Reader	Can View BAM Control	True
Limited Access	Can View BAM Control	False

If this right is set to **True** for a specific user, only then that user can see the BAM control. For example, users who belong to either the Administrator, Contributor or Reader security groups are able to see the BAM control.

If this right set to **False** for a specific user, the user is not able to see the BAM control. For example, users who belong to the Limited Access security group are not able to see the BAM control.

Note: Even though the Can View BAM Control right is set as False, the user can view the Reports menu item in the application menu (Enterprise Console). This right will not restrict the user from viewing this menu but if the user tries to access the BAM Control, the user will be prompted with a message stating that “You do not have rights to view BAM Control”.

Scenario

Scenario Name: Preventing the user from accessing the BAM Control.

Business Scenario: This scenario describes how to prevent the contributor user from accessing the BAM control.

Roles: To understand this scenario clearly, assumed that there are two users in a repository. One user belongs to the Administrator security group and the other user belongs to the Contributor security group.

1. UserA - Has Administrator access rights.
2. UserC - Has Contributor access rights.

The following table depicts the users and their security groups:

User Name	Security Group
UserA	Administrator
UserC	Contributor

Overview

As mentioned in Predefined Security Groups - Right Value, users who belong to either the Administrator, Contributor or Reader security groups have the rights to view the BAM control by default. So both UserA and UserC have the right to view the BAM control.

Here, UserA (Administrator) wants to prevent the UserC (Contributor) from viewing the BAM control. The same is depicted in the following table:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

User Name	Report Menu Item	Can View BAM Control
UserA	Yes	Yes
UserC	Yes	No

It means that after logging in, UserC (Contributor) is able to see the Reports menu in the application menu (Enterprise Console). This user has to be prevented from accessing the BAM Control when the user clicks the Reports menu item.

Scenario Solution:

To arrive at a solution for this scenario, perform the following steps:

1. Login as a user who belongs to the Contributor security group. Here, login as 'UserC'.
2. From the **Enterprise Console** menu, select **Reports**.
3. Before setting security, UserC can see the BAM Control.
4. To prevent the Contributor user from accessing the BAM Control, login as an Administrator user. Here, login as 'UserA'.
5. Click **Repository Settings > Advanced Settings > Manage Security Groups**. You will be redirected to the Security Group list.
6. Select the **Contributor** security group and click **Edit** from the ribbon bar or right-click the Contributor security group and select **Edit** from the context menu.
7. A pop-up window will appear with assigned security rights. Uncheck the **Can View BAM Control** right and click Save.
8. Click **Save**.
9. The **Synchronization** dialog box is displayed. Click **Yes** to synchronize the changes to the below level.
10. You will be prompted with a message stating that “Security Group has been modified successfully.” Click **OK**.
11. To check, login as a user who belongs to the Contributor security group i.e 'UserC'.
12. From the **Enterprise Console** menu, select **Reports** menu. The following message appears: *You do not have rights to view the BAM control.*

Secure Process Designer

AVEVA Work Tasks security allows the user to secure the Process Designer. The security mechanism provides access to the Process Designer, rights to users and informs the user about who can access the Process Designer rights.

- Users can avail the security feature to secure the Process Designer in their business process management. The Process Designer can be secured in different ways. Users can control all most all features in the Process Designer.
- You can provide restricted access to a set of users to view, new folder, delete, design, publish, unpublish, associate and security settings features in the Process Designer.
- You can provide restricted access to a set of users to Save As different versions, Disable/Enable Item, View Associations features in the Process Designer.
- You can provide restricted access to a set of users to access all activities category (Human, Integration,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Communication) and can restrict them to some activities and properties in the activities category.

- You can give control to a set of users to access menus (File, Edit, Publish, Tools, Settings, Wizard, Test Run and Help) and their sub-menus.

Process Designer Rights

To set Process Designer rights, perform the following steps:

1. Login to the **Enterprise Console**.
2. Click **Repository Settings**.
3. Click **Advance Settings** > **Manage Security Group**.
4. Click the required security group for customization and click **Actions** > **Edit** from the ribbon bar or right-click the security group and select Edit from the context menu.
5. For example, select Administrator security group and select **Edit** or right-click this group and select **Edit** from the context menu. The **Modify a Security Group** page appears.
6. Scroll down and click the **Set Process Designer Rights** link to set the Process Designer rights. Once you click the **Set Process Designer Rights** link, the **Set Process Designer Rights** page appears where you can set the rights for actions and menus. This page displays all the action categories and menus that are available for the repository.
7. Select the **Check for Inclusion** check box to include the selected categories, activities, properties and menu items or unselect the **Check for Inclusion** check box for excluding the selected categories, activities, properties and menu items for the **Process Designer**.
8. After selecting the **Categories**, **Activities**, **Properties** and Menus, click **Save** to include/exclude the rights for the Process Designer.
9. Click **Save**. This will redirect you to the main Security Group window.

   Note: The Reset button is used to reset the previous settings.
10. Click **Save** to reflect the changes made in **Set Process Designer Rights** window. The main window gets closed and the **Synchronization** window is displayed.
11. Click **Yes** to synchronize the changes to the below level or click the Submit button to not to synchronize.
12. An alert message will pop up saying *Security Group has been modified successfully*. Click **OK** to close this window.
13. Open the **Process Designer** window to view the effects of the security settings on the action and menu rights.

    Note: If the **Check for Inclusion** option is selected, the selected action rights and menu rights will be available in the **Process Designer** window. The user will have access to all the actions and menus which are selected. If the **Check for Inclusion** option is not selected, the selected action rights and menu rights **will not be available** in the **Process Designer** window. The User will not have access to the actions and menus which are selected. See Inclusion and Exclusion for more information.

The following are the Process Designer rights:

1. **Action Rights** - Rights for controlling the categories, actions and properties. The user can control the categories, actions, properties that are displayed in the Process Designer. See Action Rights for more details.
2. **Menu Rights** - Rights for controlling the Process Designer menus like can export, can import, can validate

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

definition, can set work items fields. See Menu Rights for more details.

Inclusion and Exclusion

Inclusion-Exclusion is the facility provided for the user to grant privileged access or restrict the access that users have, to the selected rights. It is provided in the form of a check box in the BAM Rights/Process Designer Rights window. It decides whether the selected rights have to be included (privileged) or excluded (restricted) for the security group.

Examples:

Inclusion:

Assume that the **Check for Inclusion** is selected. This means the selected rights are included (privileged) for the selected security group user.

In this example, categories like Human Activities, Integration Activities, Engine Activities & Scheduler Activities are included (privileged) and some activities from Human Activities category like Approval, Check-List, Choice and Information are included.

To achieve the same, perform the following steps

1. Login to the **Enterprise Console**.
2. Click **Repository Settings**.
3. Click **Advance Settings** > **Manage Security Group**.
4. Select **New** or **Edit** a security group. For example, select **Administrator** security group and select **Edit**.
5. Click **Set Process Designer Rights**.
6. Select the **Check for Inclusion** check box.
7. Select **Human Activities**, **Integration Activities**, **Engine Activities** & **Scheduler Activities** categories. Also select some **Human Activities** like **Approval**, **Check-List**, **Choice** and **Information**.
8. Click **Save**.
9. Click **Save** to reflect the changes made in the **Set Process Designer Rights** window.
10. Click **Yes** to synchronize the changes to the below level or click **Submit** if you do not want to synchronize.
11. An alert message will pop up saying *Security Group has been modified successfully*. Click **OK** to close this window.
12. To see the effect, open the **Process Designer** window. Only the selected categories and selected activities from the **Human Activities** are included in the **Activities** drop-down list.

Exclusion

Assume that the **Check for Inclusion** is box is not selected. This means the selected rights are excluded (restricted) for the selected security group user.

The this example, categories like Human Activities, Integration Activities, Engine Activities & Scheduler Activities are excluded (restricted) and some activities from the Human Activities category like Approval, Check-List, Choice and Information are excluded.

To achieve the same, perform the following steps:

1. Navigate to the security group definition and open Set Process Designer Rights window to set the rights.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

(Perform the steps 1 to 5 from the above 'Inclusion' example).

2. Unselect the **Check for Inclusion** check box.
3. Select **Human Activities**, **Integration Activities**, **Engine Activities & Scheduler Activities** categories. Also select some Human activities like **Approval**, **Check-List**, **Choice and Information**.
4. Perform the steps 8 to 11 from the above 'Inclusion' example.
5. To see the effect, open the **Process Designer** window. The selected categories and activities from the Human Activities are excluded from the **Activities** drop down list.

Note: If a new Category, Activity, Property and Menu is added after setting the **Process Designer Rights** then it will not be included and will not get affected.

Action Rights

This option enables the user to select the actions (Categories, Activities and Properties) to exclude from the Process Designer. The selected actions will not be rendered when the Process Designer is loaded.

Similar to the one for Categories, there are options to select the Activities and Properties to exclude from the Process Designer. The selected Activities and Properties will not be rendered when the Process Designer is loaded.

See Also:

- Securing Categories
- Securing Activities of Categories
- Securing Properties of Activities

Secure Categories

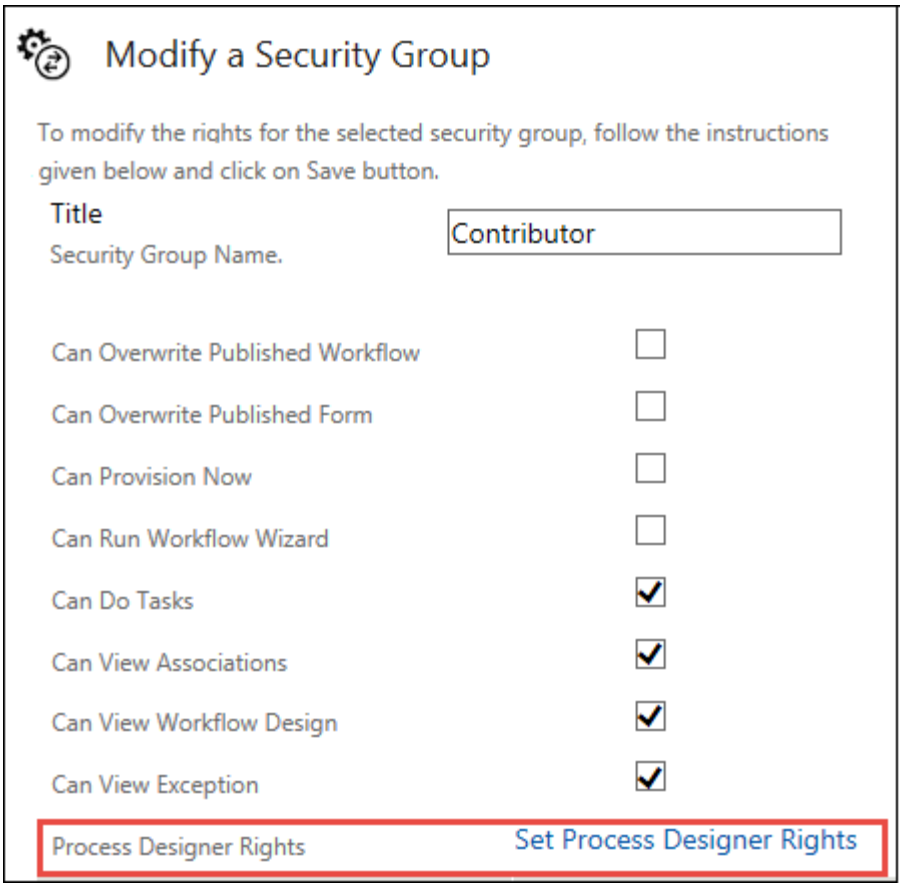
You can secure the categories to access and then you can select the required categories to include or exclude from the **Process Designer** window.

Example: The following example illustrates how to exclude the Custom Activities, BPMN Elements, Wizards and Other Actions categories for a Contributor user.

To achieve the same, perform the following steps:

1. Login as a user who belongs to the Contributor security group.
2. From the **Enterprise Console** menu, select **Workflows**.
3. To open the **Process Designer** window, select any workflow and click **Design** on the ribbon bar or right-click and select **Design Workflow** from the context menu.
4. Before the security changes are made, the **Contributor** user can access all categories.
5. As per the example, this user should not have access to **Custom Activities**, **BPMN Elements**, **Wizards** and **Other Actions** categories. To apply security for the categories in the **Process Designer** window, login to the application as an Administrator user.
6. Click **Repository Settings** > **Advanced Settings** > **Manage Security Groups**.
7. Select the Contributor security group and click **Edit**, or right-click **Contributor** and select **Edit** from the context menu.
8. Click **Set Process Designer Rights** to set action rights. The **Set Process Designer Rights** dialog box appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



9. Unselect the **Check for Inclusion** checkbox.
10. Select **Custom Activities**, **BPMN Elements**, **Wizards**, and **Other Actions**.
11. Click **Save**.
12. Click **Save** to save the **Security Group** definition and synchronize it, if required.
13. To see the effect of security provided to the categories for the **Contributor** user, login as a user who belongs to the **Contributor** security group.
14. Open the **Process Designer** window.
15. Click the **Activities** drop-down menu. Now the **Contributor** user is not able see the **Custom Activities**, **BPMN Elements**, **Wizard** and **Other Action** categories.
16. After security is applied, the **Contributor** user is able to view categories other than the selected categories.

Secure Activities of Categories

You can secure activities of categories, then expand the required category and select the required activities under it to include or exclude in the **Process Designer** window.

Example: The following example illustrates how to exclude the Task and Work activities from the Human Activities for a Contributor user.

To achieve the same, perform the following steps:

1. Login as a user who belongs to the Contributor security group.
2. From the **Enterprise Console** menu, select **Workflows**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. To open the **Process Designer** window, select any workflow and click **Design** on the ribbon bar or right-click the workflow and select **Design Workflow** from the context menu.
4. Before the security settings are changed, the **Contributor** user can access the **Task** and **Work** activities from **Human Activities**.
5. As per the example, this user should not have access to the **Task** and **Work** activities. To apply security for these activities in the **Process Designer** window, login to the application as an **Administrator** user.
6. Click **Repository Settings** > **Advanced Settings** > **Manage Security Groups**.
7. Select the **Contributor** security group and click **Edit** or right-click **Contributor** and select **Edit** from the context menu.
8. Click **Set Process Designer Rights** to set action rights.
9. Unselect the **Check for Inclusion** check box.
10. Select **Task** and **Work** activities to exclude from the **Process Designer**.
11. Click **Save**.
12. Click **Save** to save the **Security Group** definition and synchronize it, if required.
13. To see the effect of the security provided to the Activities for the Contributor user, login as a user who belongs to the **Contributor** security group.
14. Open the **Process Designer** window.
15. Select Human Activities from the **Activities** drop-down menu. Notice that the **Task** and **Work** actions are not displayed in **Human Activities**.
16. After security is applied, the **Contributor** user can view all activities other than the selected activities.

Secure Properties of Activities

You can secure the properties of activities, expand the required category and activity under that, and select the properties to include or exclude in the Process Designer window.

Example: The following example illustrates how to exclude the 'Re-Assign Allowed?' and 'Alternate Actor Allowed?' properties from the Approval actions for a Contributor user.

To achieve the same, perform the following steps:

1. Login as a user who belongs to the Contributor security group.
2. From the **Enterprise Console** menu, select **Workflows**.
3. To open the **Process Designer** window, select any workflow and select **Design** from the ribbon bar or right-click and select Design Workflow from the context menu.
4. Before security settings are applied for the properties of **Approval** activity, the Contributor user can access the **'Re-Assign Allowed?**' and **'Alternate Actor Allowed?**' properties of the Approval activity.
5. As per the example, this user should not have access to the 'Re-Assign Allowed?' and 'Alternate Actor Allowed?' properties of the Approval activity. To apply security for the properties in the Process Designer window, login to the application as an Administrator user.
6. Click **Repository Settings** > **Advanced Settings** > **Manage Security Groups**.
7. Select the **Contributor** security group and click **Edit** or right-click **Contributor** and select **Edit** from the context menu.
8. Click **Set Process Designer Rights** to set action rights.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Unselect the **Check** for Inclusion check box.
10. Select the **Re-Assign Allowed?** and **Alternate Actor Allowed?** properties to exclude from the **Process Designer**. These two properties will come under the Approval activity which is under the **Human Activities** category.
11. Click **Save**.
12. Click **Save** to save the **Security Group** definition and synchronize it, if required.
13. To see the effect of the security provided on the properties for the contributor user, login as a user who belongs to the **Contributor security group**.
14. Open the **Process Designer** window.
15. Select **Human Activities** from **Activities** drop-down menu. Drag and drop an **Approval** activity if it is not there in the existing workflow and right-click the **Approval** activity and select **Activity Properties**.
16. You will notice that the **Re-Assign Allowed?** and **Alternate Actor Allowed?** properties are not displayed in the **Approval Activity Properties**.
17. After security is applied, the contributor user can view all properties other than the selected properties.

Menu Rights

This option enables the user to select the menus from the Process Designer. The selected menus and menu items will be rendered when the Process Designer is loaded.

Example: The following example illustrates how to restrict the menus for a Contributor user. Here, the Contributor user has privilege to access File, Edit, Publish, Help and Tools > Export menus.

To achieve the same, perform the following steps:

1. Login as a user who belongs to the Contributor security group.
2. From the **Enterprise Console** menu, select **Workflows**.
3. To open the **Process Designer** window, select any workflow and click **Design** on the ribbon bar or right-click and select **Design Workflow** from the context menu.
   Before the menus are controlled by applying security settings, the **Contributor** user can access all the menus.
4. Here the user is privileged for **File**, **Edit**, **Publish**, **Help** and **Tools** > **Export** menu items. To apply security for the properties in the **Process Designer** window, login to the application as an Administrator user.
5. Click **Repository Settings** > **Advanced Settings** > **Manage Security Groups**.
6. Select the **Contributor** security group and click **Edit** or right-click **Contributor** and select **Edit** from the context menu.
7. Click **Set Process Designer Rights** to set action rights.
8. Select the **Check for Inclusion** check box.
9. Expand the **Set Menu Rights** node and select the **File**, **Edit**, **Publish**, **Tools**, **Export**, and **Help** menus.
10. Click **Save**.
11. Click **Save** to save the **Security Group** definition and synchronize it, if required.
12. To see the effect of the security provided to the menus for the **Contributor** user, login as a user who belongs to the **Contributor security** group.
13. Open the **Process Designer** window.
14. The **Contributor** user is able to access **Settings**, **Wizards**, **Test Run**, **Tools** > **Import and Tools** > **Import from**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Visio.

15. After security is applied, the **Contributor** user is able to view only the selected menus and menu items.

Import Behavior for Restricted Activities and Activity Properties

If user has access rights for the activities of a workflow which has to be imported, then all the **Activities** and Activity Properties will be displayed with the respective activities for the user.

While importing the workflow, if some of the activities are restricted for the user then those activities will be replaced with **Dummy Actions**.

Example:

The following example illustrates how the user is prevented from accessing the activities and activity properties while importing a workflow.

The administrator user has access rights for all the activities and activity properties in the Process Designer. The contributor user cannot access activities like the Check-List and Information activities. These activities are under the Human Activities category.

What happens when a contributor user imports a workflow?

The 'Travel Desk' workflow is designed using the Start, Approval, Check-List and Information activities. If the administrator user imports the 'Travel Desk.xml' in the Process Designer window, this user will be able to see all the activities. When the contributor user imports the same xml, this user will not be able to see the Check-List and Information activities. These two activities will be replaced by Dummy actions.

What happens when a contributor user opens a workflow designed by an administrator user?

If the contributor user wants to open the existing 'Travel Desk' workflow which is designed by the administrator user in design mode then the contributor user is able to see the Check-List and Information activities but cannot set the Activity Properties for these activities. Since this user does not have access rights to these activities, the user will not be able to perform the actions.

To achieve the same, perform the following steps:

1. Login as a user who belongs to the Administrator security group.
2. In the Enterprise Console, click menu icon, and then click **Workflows**. The Workflows page appears.
3. On the action bar, click **New**, and then click **Workflow**. The **New Workflow** wizard appears.
4. Enter the title **Travel Desk** and a description for the workflow.
5. Click **Save & Design**. Select **Design the Workflow** now and click **Finish**.
6. The Process Designer window will be displayed. Select Tools > Import from the menubar.
7. The **Import AVEVA Work Tasks Process Definition** window appears. Locate the 'Travel Desk.xml' by clicking **Browse**.
8. Click **Import** to import the 'Travel Desk.xml' file. It will redirect you to the **Process Designer** window.
9. To restrict the activities like **Check-List** and **Information**, you need to customize the security definition of the contributor user.
10. Click **Repository Settings** > **Advanced Settings** > **Manage Security Group**.
11. Select the **Contributor** security group and click **Edit** on the ribbon bar or right-click and select **Edit** from the context menu.
12. In the **Modify Existing Security Group** window, click **Set Process Designer Rights** to restrict the activities

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Check-List and **Information**.

13. Click **Save** to save the changes.
14. Click **Save** to save the **Security Group** definition and synchronize it, if required.
15. Login as a user who belongs to the **Contributor** security group to see the effect of the security provided for the contributor user.
16. Open the **Process Designer** window. (Perform the steps 2 to 5 to open the Process Designer)
17. Import the 'Travel Desk.xml' file by clicking **Tools** > **Import**. The imported xml appears.
    Here, the Check-List and Information Activities are restricted for the Contributor user. Hence, these two activities will not be displayed in the Human Activities category list. These activities are replaced with Dummy Actions. If the user tries to edit their properties, a message saying “You do not have right for this activity” will be displayed and the Activity Properties will be empty.
18. Right-click Check-List activity and then select **Activity Properties**. The message "*You do not have right for this activity*" appears, and the *Activity Properties* will be empty.
19. Right-click Information activity and then select **Activity Properties**. The message "*You do not have right for this activity*" appears, and the *Activity Properties* will be empty.

Design Behavior for Restricted Activities and Activity Properties

While opening the existing workflow, if some of the activities are restricted for the user then those activities will be displayed but can not be able to set the Activity Properties.

Example:

The following example illustrates, how the user is restricted for the activities and activity properties while opening the existing workflow.

Here assumed that the administrator user has access rights for all the activities and activity properties in the Process Designer. Where as the contributor user has restricted to activities like Check-List and Information activities. These activities are under Human Activities category.

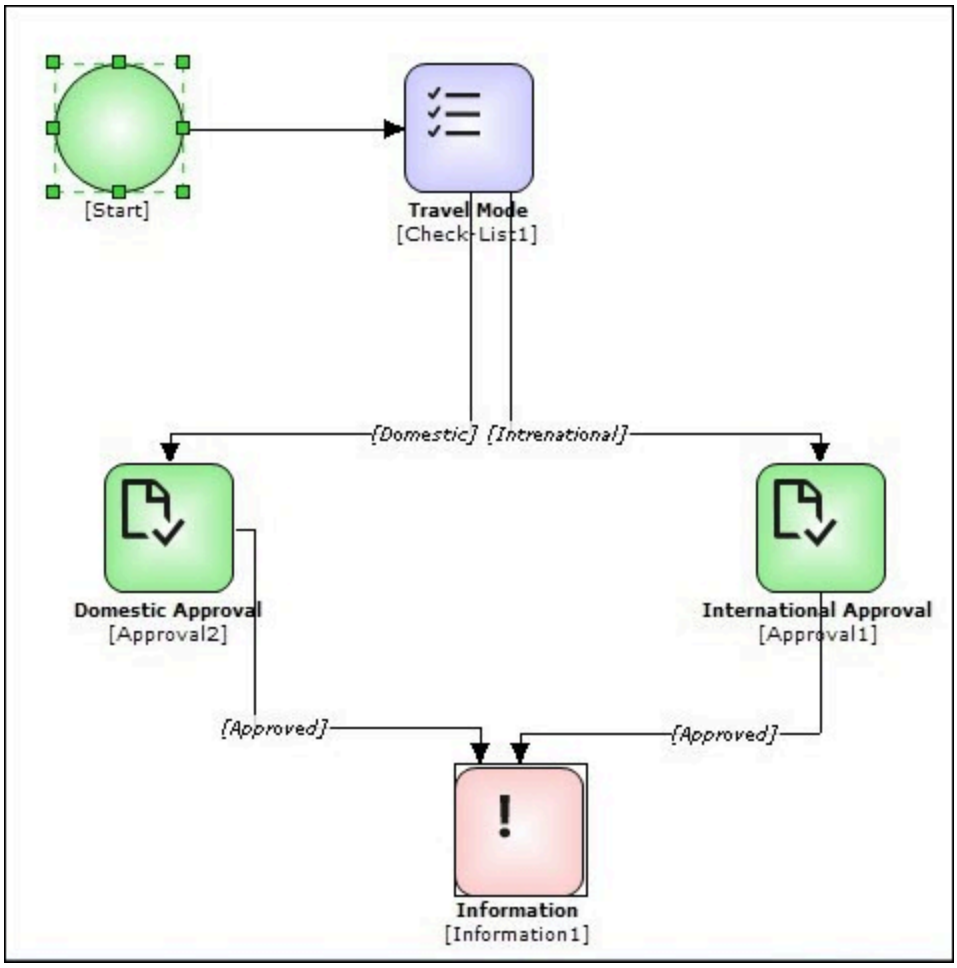
What happens when contributor user opens the Workflow designed by administrator user?

If the contributor user wants to open the existing 'Travel Desk' workflow which is designed by administrator user in design mode then the contributor user can able to see Check-List and Information activities but can not set the Activity Properties for these activities. Since this user does not have access rights to these activities and will not be able to perform the actions.

To achieve the same, perform the following steps:

1. Login as a user who belongs to the **Administrator** security group.
2. From the **Enterprise Console** menu, select **Workflows**.
3. Select the drafted **'Travel Desk'** workflow which is designed by administrator user by clicking on **Design** from the ribbon bar or **Design Workflow** from the right-click context menu.
4. The following screen is displayed. Here contributor user can able to view the **Check-List** and **Information** activities.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



5. Right-click **Check-List** activity and then select **Activity Properties**. The message "*You do not have right for this activity*" appears, and the **Activity Properties** will be empty.
6. Right-click Information activity and select Activity Properties. The message "*You do not have right for this activity*" appears, and the **Activity Properties** will be empty.

Note: You cannot re-design or open the published workflow. If you want to re-design or open the published workflow, the Can Overwrite Published Workflow right should be set as True for that security group.

See Can Overwrite Published Workflow right for more information.

Secure Process Designer Control at Workflow Level

The Process Designer Control can be secured at Repository, List, or ListItem (Workflow) level.

Example:

This example illustrates how the Repository level security will be applicable at listitem level and how to customize the security group definition at listitem level to meet the requirement of a particular workflow for a contributor user.

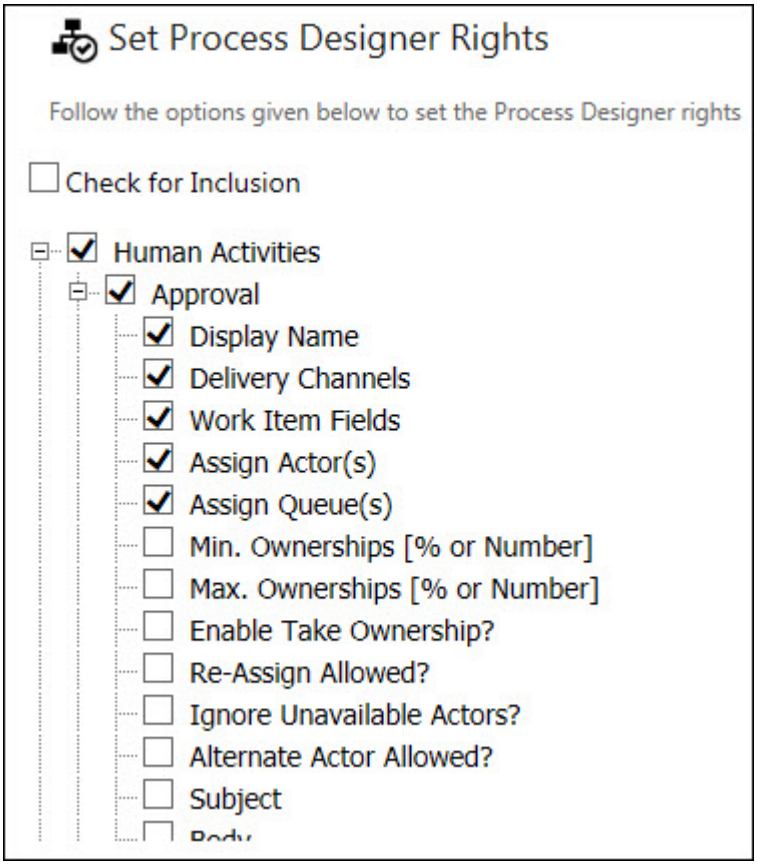
Consider three workflows 'Sales Domain', 'HR Domain' and 'Finance Domain'. Under the 'HR Domain' workflow, there are two child workflows called 'Employees Induction' and 'Leave Process' at the repository level.

The following steps explains how to secure the Process Designer control at Repository and ListItem level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To set Process Designer rights at Repository Level

1. To customize the Contributor security group definition to set the Process Designer rights at repository level, login as a user who belongs to the Administrator security group.
2. Click **Repository Settings** > **Advance Settings** > **Manage Security Group**.
3. Select the **Contributor** security group and click **Edit** on the ribbon bar or right-click and select **Edit** from the context menu.
4. In the **Modify Existing Security Group** window, click **Set Process Designer Rights** to restrict to access the categories, activities and properties.
5. Select the **Check for Inclusion** check box.
6. Select the categories, activities and properties at the repository level.
   Here, only two categories – **Human Activities** & **Engine Activities** are privileged. The others are restricted for the contributor user.
   In the following screen a few properties are privileged and the others are restricted for the contributor user:



7. Click **Save** to save the changes.
8. Click **Save** to save the **Security Group** definition and synchronize it, if required.
9. Login as a user who belongs to the **Contributor** security group to see the effect of the security provided for the contributor user at the repository level.
10. From the **Enterprise Console** menu, select **Workflows**.
11. As there is no security is enabled at **Workflow** list and **Workflow** listitem level, the workflow list will inherit the security from the Repository level, and the Repository level security rights for the **Process Designer Control**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

12. Select '**HR Domain**' and click **Design** on the ribbon bar or select Design Workflow from the context menu. You will find the same categories, activities and properties for all the workflows, because none of them have security enabled. They inherit security from the repository level.
13. Select '**Finance Domain**' and click **Design** on the ribbon bar or select Design Workflow from the context menu. You will find the same categories, activities and properties for all the workflows, because none of them have security enabled. They inherit security from the repository level.
14. Select 'Sales Domain' and click Design on the ribbon bar or select Design Workflow from the context menu. You will find the same categories, activities and properties for all the workflows, because none of them have security enabled. They inherit security from the repository level.

Enabling ListItem Level Security for 'Sales Domain' Workflow

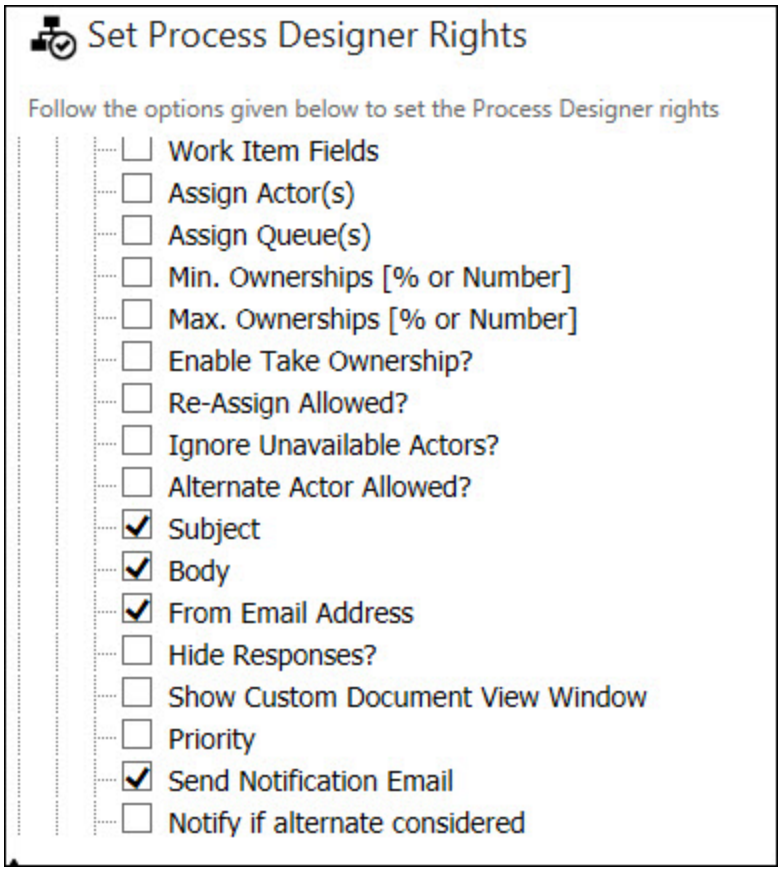
Here giving more privilege to access Integration activities (Category), Human Activities > Task (Activity), Human Activities > Approval > Subject, Body, From Email Address and Send Notification Email (Properties) along with above action rights at the 'Sales Domain' workflow listitem level.

For this, you need to customize the security definition at 'Sales Domain' workflow listitem level.

To achieve the above, perform the following steps:

1. Login as an **Administrator** user to customize the **Contributor** security group.
2. Select **Workflows** from the **Enterprise Console** menu.
3. Right-click the 'Sales Domain' workflow and then select Security Settings from the context menu.
4. Click the **Advanced Settings** tab to enable security at the list item level.
5. Click **Enable** ListItem specific Security.
6. Select **Security Group Customization**, click **Next** and again **Next**.
7. Select the **Contributor** security group and click **Edit** from the ribbon bar or select **Edit** from the context menu.
8. To open the **Process Designer Rights** window, use the **Set Process Designer Rights** link from value column.Note: Use the Set Process Designer Rights link from Follower specific value for the Rights column. It is for follower items not for the current item.
9. Select the **Check for Inclusion** check box.
10. Select the categories, activities and properties at item level as shown in the following figures.
11. Here only three categories – Human Activities, Human Activities > Approval, Check-List, Choice, Information and Task, Engine Activities and Integration are privileged the others are restricted for the contributor user.
12. In the following screen, four properties of Notification Contents of Approval activity are privileged along with the other properties. The others are restricted for the contributor user.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



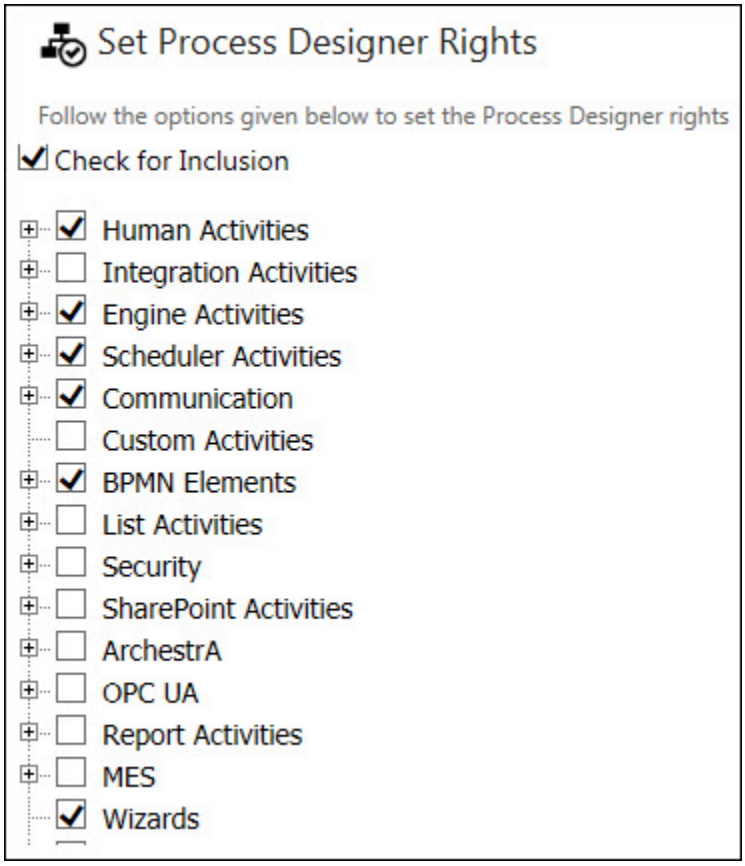
13. Click Save to save the changes.
14. Click Save to save the Security Group definition and synchronize it, if required.
15. Login as a user who belongs to the Contributor security group to see the effect of security provided for the contributor user at repository level.
16. From the Enterprise Console menu, select Workflows.
17. Select 'Sales Domain' and click Design on the ribbon bar or select Design Workflow from the context menu.

To enable ListItem Level Security for 'HR Domain' Workflow

1. Here, giving more privilege to access:
2. Scheduler Activities, Communication, BPMN Elements, and Wizard along with other categories mentioned above.
3. Human Activities > All Activities
4. Human **Activities > All Properties** along with above categories at the 'HR Domain' workflow listitem level.
5. For this, you need to customize the security definition at the 'HR Domain' workflow listitem level.
6. To achieve the above, perform the following steps:
7. Login as an **Administrator** user to customize the **Contributor** security group.
8. Select Workflows from the **Enterprise Console** menu.
9. Right-click 'HR Domain' workflow and select **Security Settings** from the context menu.
10. Click the **Advanced Settings** tab to enable the security at list item level.
11. Click **Enable ListItem** specific **Security**.

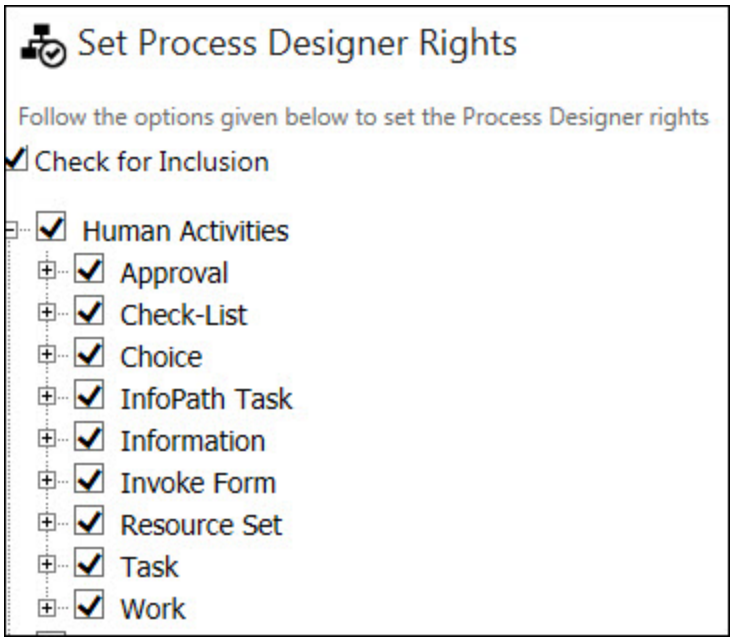
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

12. Select **Security Group Customization**, click **Next** and again **Next**.
13. Select the **Contributor** security group and click **Edit** on the ribbon bar or select **Edit** from the context menu.
14. To open the **Process Designer Rights** window, use the **Set Process Designer Rights** link from value column.
15. Select the **Check for Inclusion** check box.
16. Select the categories, activities and properties at the item level as shown in the following figures.
17. Here only six categories – **Human Activities**, **Engine Activities**, **Scheduler Activities**, **Communication**, **BPMN Elements** and **Wizards** are privileged. The others are restricted for the contributor user.

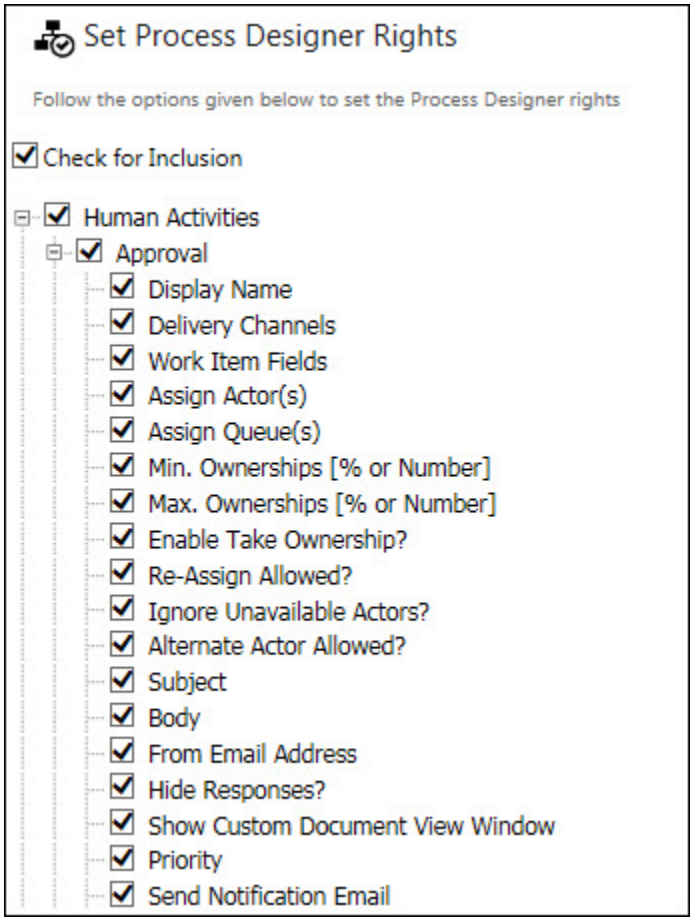


18. All activities of the Human Activities category are privileged. The others are restricted for the contributor user.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



19. All properties of the Approval Activity of Human Activities category are privileged. The others are restricted for the contributor user.



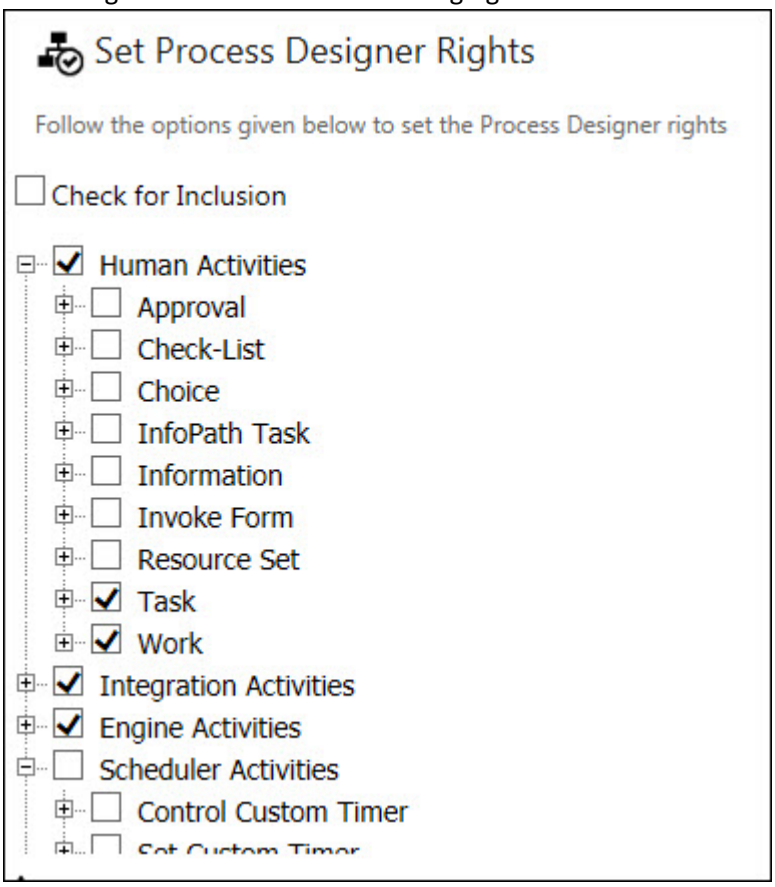
20. Click Save to save the changes.
21. Click Save to save the Security Group definition and synchronize it, if required.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

22. Login as a user who belongs to the Contributor security group to see the effect of security provided for the contributor user at repository level.
23. From the Enterprise Console menu, select Workflows.
24. Select 'HR Domain' and click Design from the ribbon bar or select Design Workflow from the context menu.
25. Here, you have set the Process Designer Rights for value, not for the follower specific value. So, if you have to navigate and view the Process Designer Control at child item then these changes will not be found there.
26. Select any child item of the 'HR Domain' workflow and click Design on the ribbon bar or select Design Workflow from the context menu. The changes are not applicable at its child item level.
27. This child item does not have any security enabled. It will inherit from its immediate Dictator. In this case, the parent item is 'HR Domain'.

To enable Security at Child Item Level for 'HR Domain' Workflow

1. To enable security at child item level, follow the steps given below:
2. Perform the steps 1 to 7 (See Enabling ListItem Level Security for 'HR Domain' Workflow steps).
3. To open the Process Designer Rights window, use the Set Process Designer Rights link from Follower specific value column.
4. Set the rights as shown in the following figure:



5. Click Save to save the changes.
6. Click Save to save the Security Group definition and synchronize it, if required.
7. Login as a user who belongs to the Contributor security group to see the effect of the security provided for

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the contributor user at the repository level.

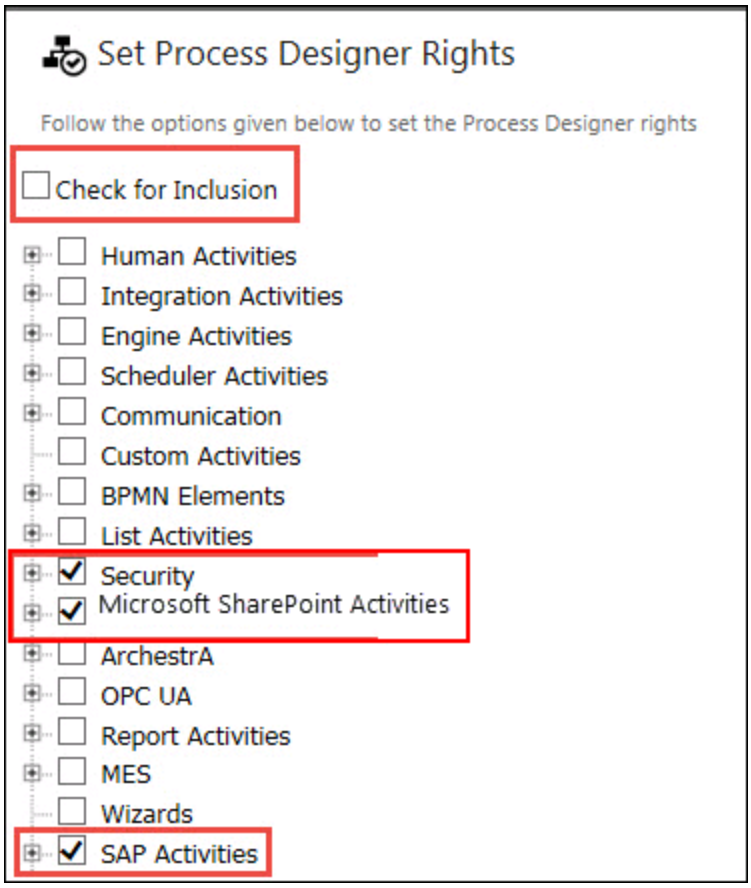
8. From the Enterprise Console menu, select Workflows.
9. Double-click 'HR Domain' and select any child item (Employee Induction or Leave Process).
10. Select Design from the ribbon bar or select Design Workflow from the context menu to see the effect.
11. Here, both the child workflows (Employees Induction and Leave Process) do not have the security enabled. Hence, they will inherit the security set by their immediate dictator. In this case, their parent workflow (HR Domain).

To enable Child Item Level Security for 'HR Domain' Workflow

The following example demonstrates that the security has been enabled at one child item i.e 'Employees Induction' and shows the effect for both the child items.

1. Go to the Employees Induction workflow and enable the listitem level security. To know more about how to enable security at the listitem level, click “Enabling Security at ListItem Level” and customize the Process Designer rights for the security group.
2. To enable security for child items, follow the steps given below:
3. Login as an Administrator user to customize the Contributor security group.
4. Select Workflows from the Enterprise Console menu.
5. Double-click the 'HR Domain' workflow and then select 'Employees Induction' workflow.
6. Right-click and select Security Settings from the context menu.
7. Click the Advanced Settings tab to enable the security at list item level.
8. Click Enable ListItem specific Security.
9. Select Security Group Customization, click Next and again Next.
10. Select the Contributor security group and click Edit from the ribbon bar or select Edit from the context menu.
11. To open the Process Designer Rights window, use the Set Process Designer Rights link from the Follower specific value column.
12. Select the Check for Inclusion check box.
13. Select the categories, activities and properties at item level.
14. The screen shows that the categories (Security and SAP Activities) are excluded/restricted.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



15. Click Save to save the changes.
16. Click Save to save the Security Group definition and synchronize it, if required.
17. Login as a user who belongs to the Contributor security group to see the effect of security provided for the contributor user at the repository level.
18. From the Enterprise Console pull-down menu, select Workflows.
19. Double-click 'HR Domain' and select any child item i.e. Employee Induction.
20. Select Design from the ribbon bar or select Design Workflow from the context menu to see the effect.

    The Employees Induction Process Designer will open with all the categories except the restricted ones.
21. For the 'Employees Induction' workflow, the administrator user has enabled and customized the security as mentioned above. For another child workflow called 'Leave Process', the administrator user has not enabled and customized the security. So, it will inherit from its immediate dictator. In this case, the 'HR Domain' workflow.
22. Right-click the 'Leave Process' workflow and select Design workflow and see the effect.

Can Overwrite Published Workflow Right

Can Overwrite Published Workflow right is introduced to prevent any changes to a published workflow that can intervene with any running instances of a workflow. This right can be assigned to the user's security group to allow the user to make modifications to a published workflow. By default, this right is restricted to all the security groups including the Administrator. This is because when this right is assigned, the user can make changes to a published workflow and thereby intervene with any running instances of the workflow. This will have an effect

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

on the new instances of the same workflow in the production environment. Hence, the user is recommended to create a minor version of the workflow, make the necessary modifications, and then publish it.

To be able to overwrite a published workflow, a user with **Manage Security** rights can enable this right either from Repository Settings or from the workflow specific Security Settings.

Behavior of a list item when Can Overwrite Published Workflow right is not assigned

1. Right-click the published workflow which needs to be edited. Since this workflow is published, the **Design Workflow** option is not available in the context menu.
2. If the user selects the **Design Workflow** option from the ribbon bar, the following message appears:
   You do not have rights to edit a published Workflow

To design this workflow, the **Can Overwrite Published Workflow** right needs to be assigned from the Repository Settings.

To assign 'Can Overwrite Published Workflow' right through Repository Settings

1. Point to **admin**, and then click **Repository Settings**. The Repository Settings page appears.
2. Click the **Advanced Settings** tab.
3. Click **Manage Security Groups** option. The Security Group screen displays all the security groups.
4. Select the required security group and click the **Edit** option on the ribbon bar, or right-click the group and select the **Edit** option from the context menu. The **Modify a Security Group** screen appears.
5. In the **Modify a Security Group** screen, scroll down to view the "**Can Overwrite Published Workflow**" under the **Workflow List Rights**.
6. Check the '**Can Overwrite Published Workflow**' option.
7. Click **Save** to assign the right to the security group. The Synchronization screen appears. Users can synchronize the changes made to the security group to the below levels as well. For more information, go to the Synchronization topic.
8. Check the **Yes** radio button to synchronize changes for the lists displayed.
9. To avoid synchronizing the changes, do not select the **Yes** option.
10. Click **Submit**. The confirmation message about successfully modifying the security group appears.
11. Click **OK**.

    Now, the user can edit any published workflows either through the context menu or the ribbon bar.

Behavior of the list item after the 'Can overwrite Published Workflow' right is assigned

Go to the Workflow list screen from the Enterprise Console menu and right-click the workflow to see the Design Workflow option enabled in the context menu.
If the user selects this option, the process designer with the workflow design opens and the user can edit the design of the workflow.

Note: It is recommended to set this right to false in the production environment to avoid any modifications to the design of the workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Advanced Options

To assign 'Can Overwrite Published Workflow' right at the List item level

Prerequisite: The security group customization should be enabled for this list item.

1. Right-click a published workflow and select **Security Settings** from the context menu.
2. Click the **Advanced Settings** tab in the settings screen.
3. Click **Customize Security Group for this List Item** option. The **Security Group** screen appears.
4. Select the required security group and click the **Edit** option on the ribbon bar, or right-click the group and select the **Edit** option form the context menu. The **Modify a Security Group** screen appears.
5. In this screen, scroll down to the **Workflow List Rights** and check both the boxes against the **Can Overwrite Published Workflow** option. The option under **Value for the Right** column should be checked for the current workflow. The option under the **Follower-specific value for the Right** should be checked for the child workflows.
6. Click **Save** to assign the right to the user. The next few steps are similar to the ones given under the Repository Level section.
   Once the right is assigned, the user can edit any published workflows either through the context menu or the ribbon bar.

Advanced Security Options

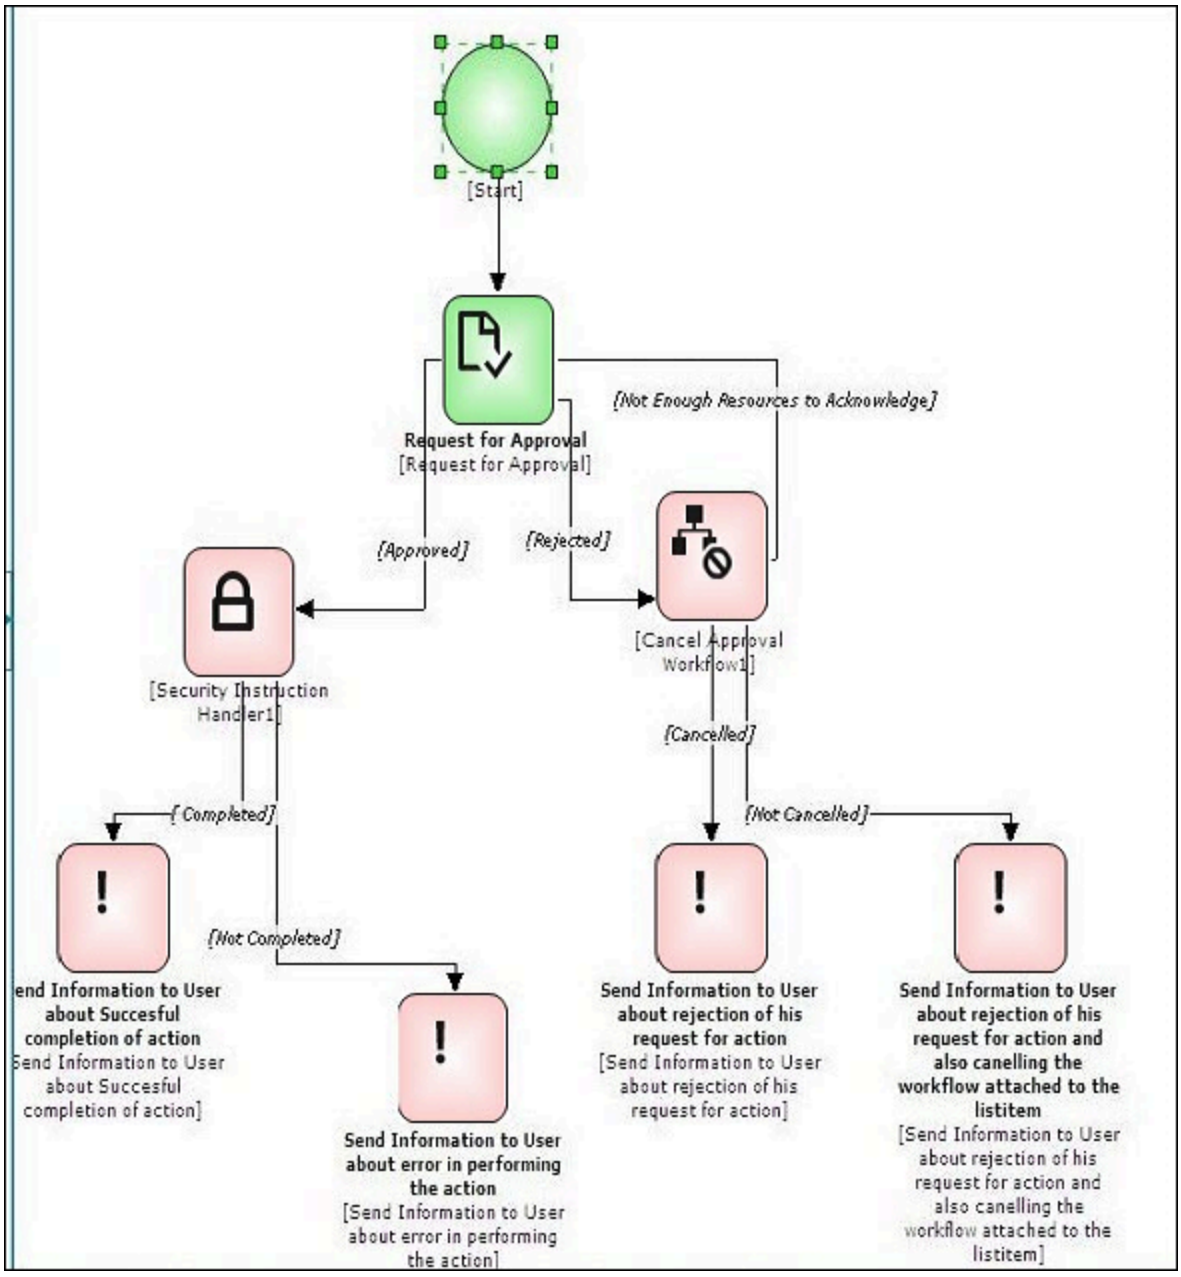
Set up security approval workflow in AVEVA Work Tasks.

Set up Security Approval Workflow

To setup security approval workflow

1. Login as an administrator user.
2. In the **Enterprise Console**, click menu icon, and then click **Workflows**. The **Workflows** page appears.
3. On the action bar, click **New**, and then click **Workflow**. The **New Workflow** wizard appears.
4. In the **Title** box, type a name for the workflow, and in the **Description** box, type a description for the workflow. For example, create **Security Workflow** workflow.
5. Click **Save & Continue**. The workflow is created, and the **Workflow Options** wizard appears.
6. Select **Design** the Workflow now, which is the default option, and then click **Finish**. The **Process Designer** appears.
7. Click **Tools** > **Import**.
8. Click **Browse** and then select the security approval workflow from *..\AVEVA\AVEVA Work Tasks\security_approval_workflow.xml*, as shown in the following figure:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



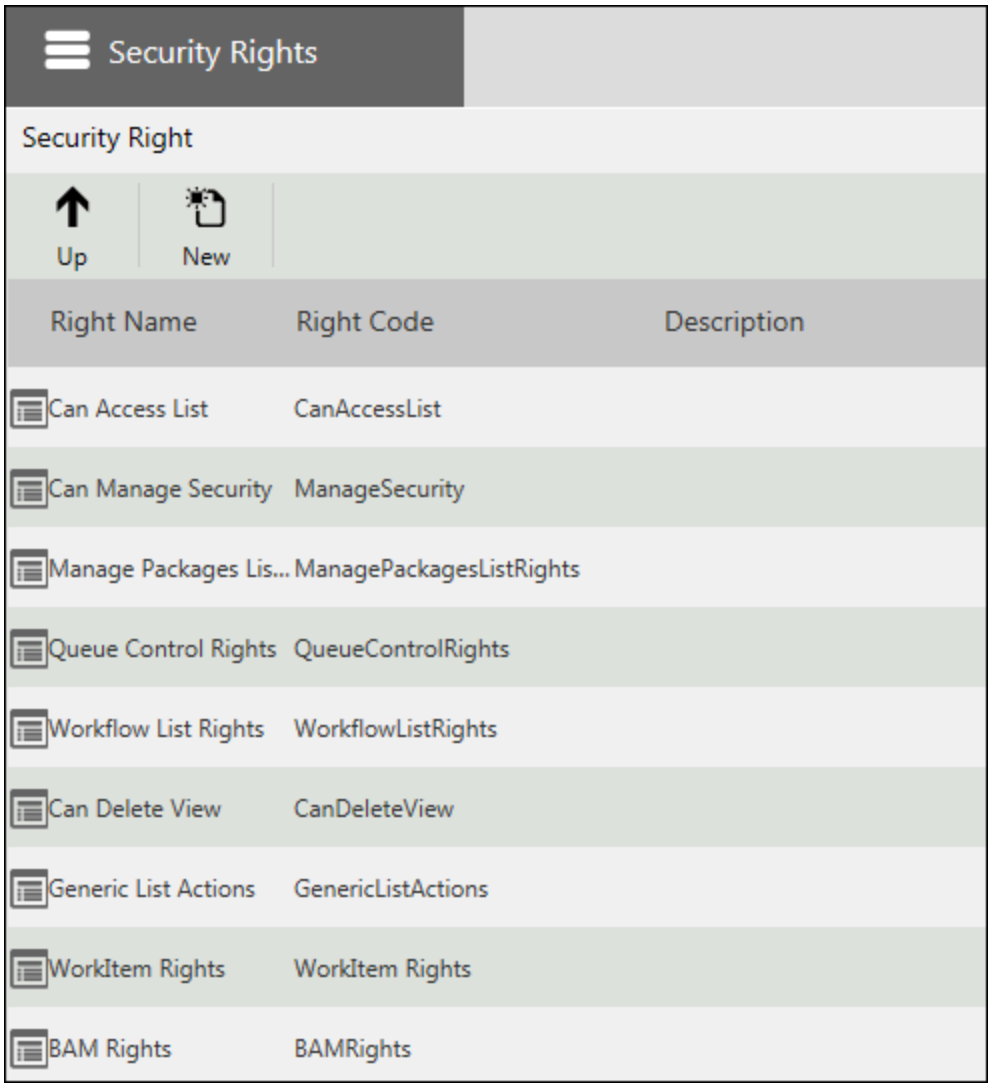
Manage Security Rights

This option allows user to Add, Modify, View and Delete Security Rights. Security Rights which are part of Security Groups are used to set for Lists and List Items. Users will have access rights as defined in the Security Group definition, that they belong to. The page lists all the standard rights that are provided.

To open Manage Security Rights

1. Login to the **Enterprise Console**.
2. Point to admin, and then click **Repository Settings**. The **Repository Settings** page appears.
3. Click the **Advance Settings** tab.
4. Click **Manage Security Rights**. The **Security Right** window displays all the security rights.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Note: If a user is assigned with additional privileges while the user is logged on to the Enterprise Console site, these privileges will not have an immediate effect. The user must log out of the Enterprise Console site and wait for five minutes for the changes to take effect.

- Viewing a Security Right

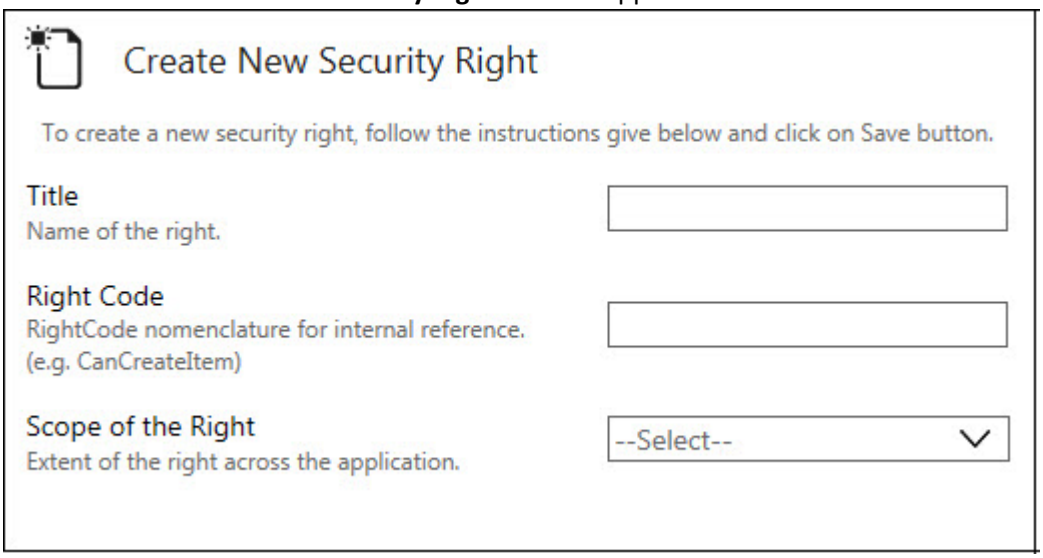
Create a Security Right

The new option can be used to create and add a new security right that can be later used within a security group.

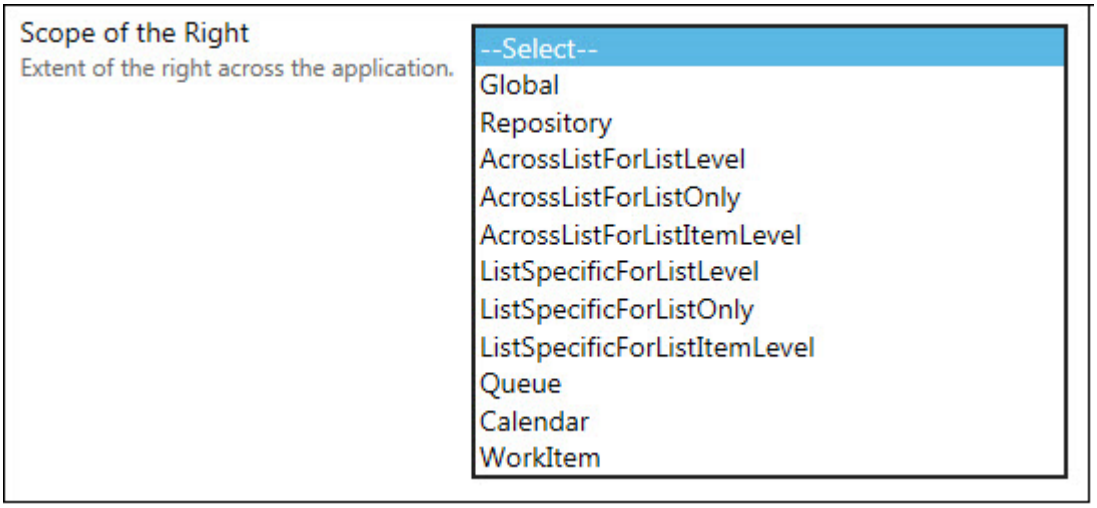
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To create a new security right, follow the steps given below

1. Log on to the **Enterprise Console**.
2. Point to admin, and then click **Repository Settings**. The **Repository Settings** page appears.
3. Click the **Advance Settings** tab.
4. Click **Manage Security Rights**. The **Security Right** window displays all the security rights.
5. Click **New**. The **Create New Security Right** window appears.

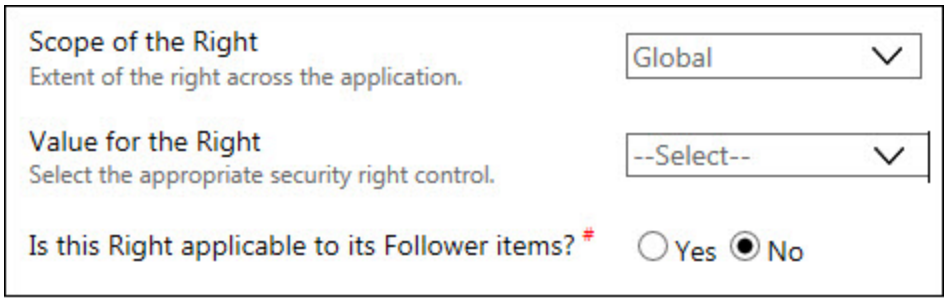


6. In the **Title** text box, enter a name for the right.
7. In the **Right Code** text box, enter a code name for the right.
8. In the **Scope** of the **Right** drop-down list, select the scope for the right created. Scope for the right can be **Global**, **Repository**, **List Specific**, **ListItem Specific**. Depending on the level selected, different fields will get displayed.

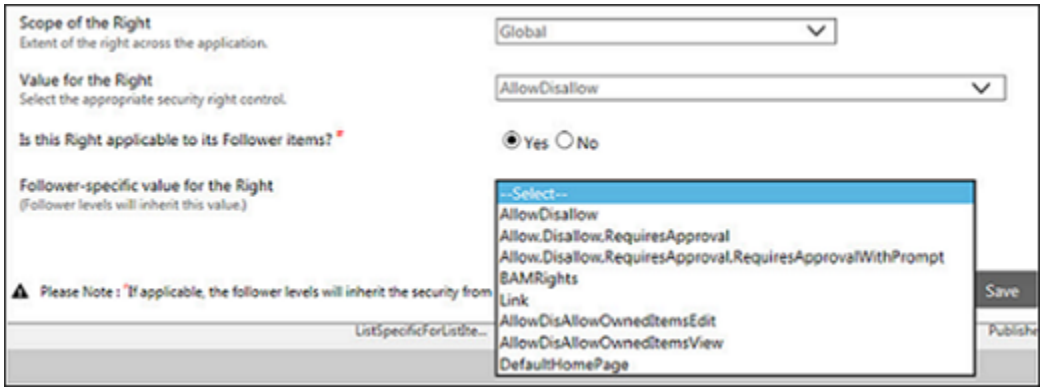


9. The following options appear if you select **Global**, **AcrossListForListLevel**, **AcrossListForListOnly**, or **AcrossListForListItemLevel**:

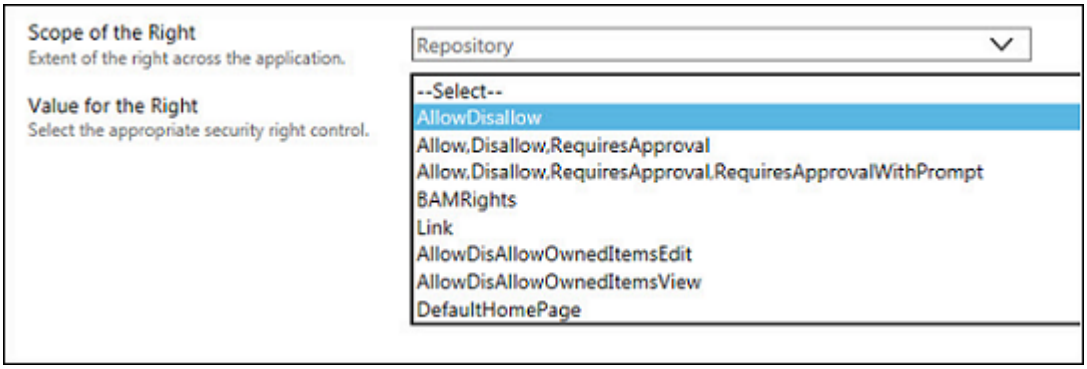
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



10. If you select the **Yes** radio button, the options shown below will get displayed. This allows you to set the values for the right created.



11. The option shown below will get displayed, if you select the scope for the right as **ListSpecificForListLevel**, **ListSpecificForListOnly** and **ListSpecificForListItemLevel**. This allows the user to select the **Lists** for which the new right can be applied. Value for the new right can also be set.
12. The following options will get displayed, if you select the scope for the right as **Repository**, **Queue**, **Calendar** or **Work Item**. This page opens the list of values that can be set for the right.



13. After selecting the relevant scope for the new security right and setting the values for it, click **Save** to finish and to save the new security right.

Modify a Security Right

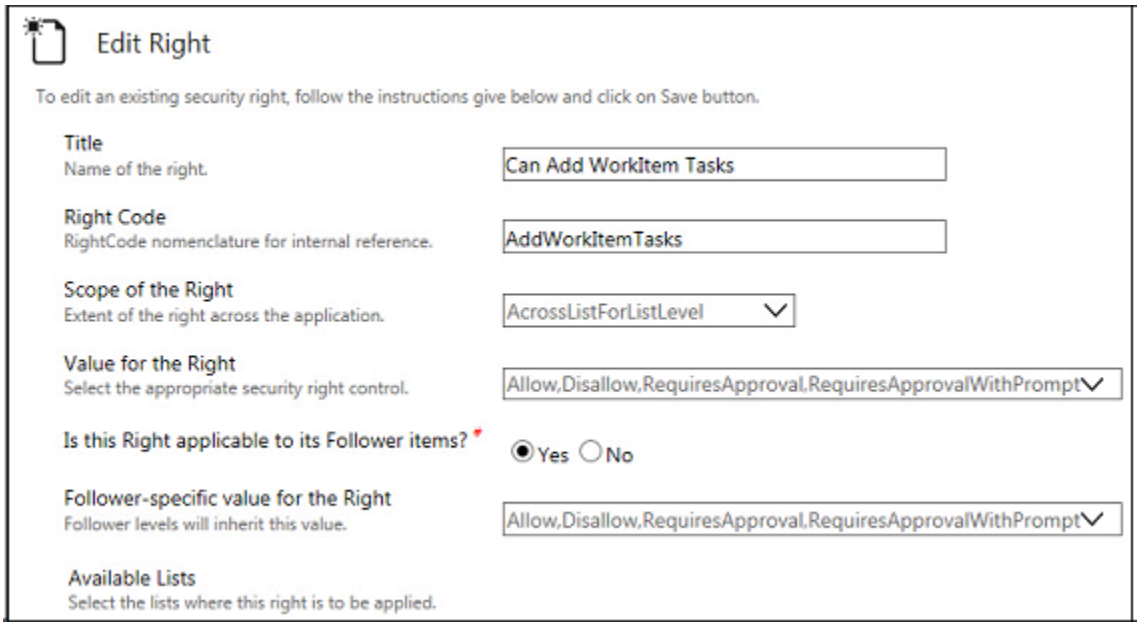
This option allows us to modify the scope, values and follower values for an existing security right.

To edit the security right

1. Log on to the **Enterprise Console**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Point to admin, and then click **Repository Settings**. The Repository Settings page appears.
3. Click the **Advance Settings** tab.
4. Click **Manage Security Rights**. The Security Right window displays all the security rights.
5. Select the security group to be modified from the list. For example, select the 'Can Add Work Item Tasks' right.
6. Click **Edit**. The following page is displayed:



7. Edit the required fields.
8. Click **Save** to update the changes.

Note: The user cannot modify the settings of Standard Rights. Only the settings of the user created security rights can be modified.

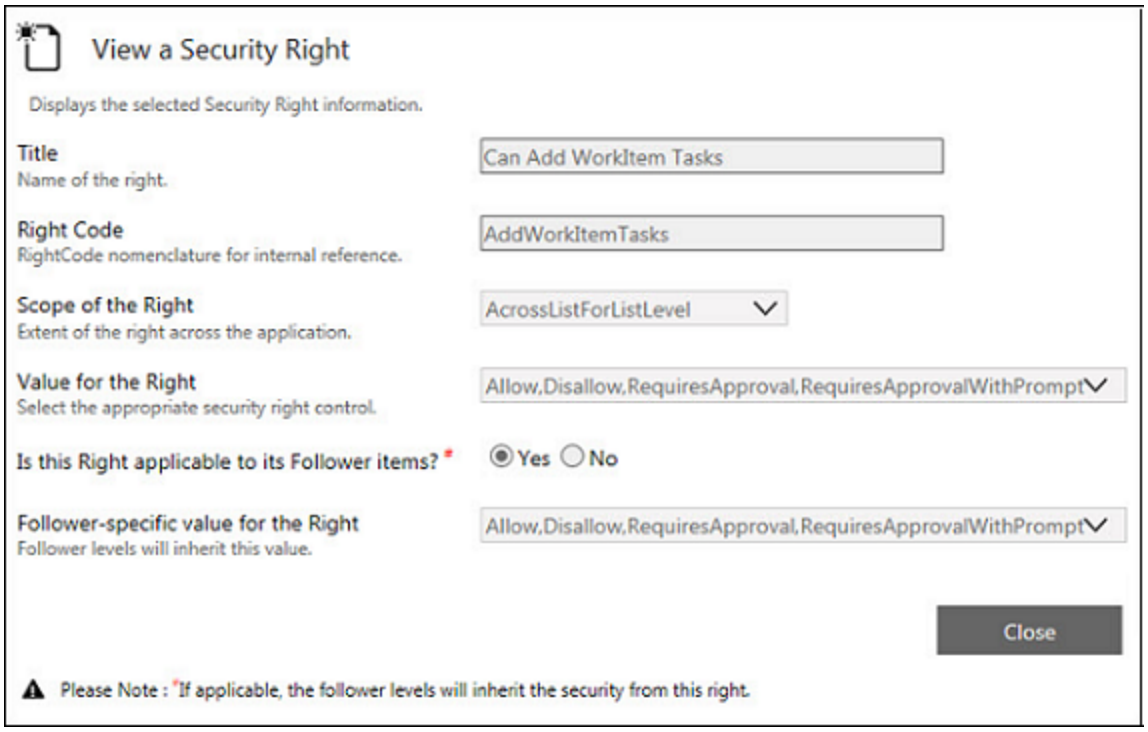
View Security Right

View option can be used to view the security right for the selected security right.

To view the security right

1. Log on to the **Enterprise Console**.
2. Point to admin, and then click **Repository Settings**. The **Repository Settings** page appears.
3. Click the **Advance Settings** tab.
4. Click **Manage Security Rights**. The **Security Right** window displays all the security rights.
5. Select the security group to be viewed.
6. Click **View**. The following window is displayed:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



7. Click **Close**.

Delete a Security Right

Delete option can be used to delete the selected security right.

To delete the security right

1. Log on to the **Enterprise Console**.
2. Point to admin, and then click Repository Settings. The Repository Settings page appears.
3. Click the **Advance Settings** tab.
4. Click **Manage Security Rights**. The Security Right window displays all the security rights.
5. Select the security group to be deleted.

   Note: It is not possible to delete the standard security rights. User defined rights can be deleted.
6. Click **Delete**.
7. Click **Yes** to delete the selected security right.

   Note: The user cannot delete the Standard Security Rights. Only the user defined security rights can be deleted.

Scope of Rights

Scope for Security Rights

Some rights will be applicable only at the repository level which are of scope:

- **Repository**- If it is a Repository scope, the rights will appear at the Repository level. For example: Calendar

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

rights, Work items list rights, Queue rights.

- **Queue** - If it is a Queue scope, the rights can be applied only at Queue.For example: Can Add New Queue and Can View Queue Control
- **Calendar** - If it is a Calendar scope, the rights can be applied only at Calendar.For example: Can Add Calendar, Can Delete Calendar, and Can View All Calendars.
- **Work Item** - If it is a Work Item scope, the rights can be applied only at Work Item.For example: Can Forward Work Item, Can Set Alternate Actor, and Can View Work Item Control.

Some rights will be applicable at only at the list level which are of scope:

- **AcrossListForListOnly** - If it is a **AcrossListForListOnly** scope, the rights can be applied only at the List level not at the ListItem level across all lists.
- **ListSpecificForListOnly** - If it is a **ListSpecificForListOnly** scope, the rights can be applied at only at the List level not at the ListItem level for a specific list.

Some rights are applicable only at the listitem level which are of scope:

- **AcrossListForListItemLevel** - If it is a **AcrossListForListItemLevel** scope, the rights can be applied only at the ListItem level across all lists. For example: Can Publish an Item
- **ListSpecificForListItemLevel** - If it is a **ListSpecificForListItemLevel** scope, the rights can be applied only at the ListItem level for a specific list. For example: Queue, Calendar and Work Item

Some rights are applicable both at the list level as well as the listitem level which are of scope:

- **AcrossListForListLevel** - If it is a **AcrossListForListLevel** scope, the rights can be applied at the List level and ListItem level across all lists. For example: The Can Add Item right can be applied at the List level and ListItem level.
- **ListSpecificForListLevel** - If it is a **ListSpecificForListLevel** scope, the rights can be applied at the List level and ListItem level for a specific list. For example: The Can Design Workflow right can be applied at the List level and ListItem level for list Workflow.

Some rights are applicable at all the levels which are of scope:

Global – If it is a Global scope, the rights will appear at all levels in the site. For example: Manage Security

Create User Defined Operations and Rights

AVEVA Work Tasks has set of custom operations and set of custom rights on Repository, List and ListItem level. The custom operations like add, edit, delete and security etc. AVEVA Work Tasks has provided an option to user to add own custom operation(menu item) in context menu and also can define own custom rights based on the requirements and can use these rights and operations in the application.

For example, user wants to create a 'order' operations in context menu in the enterprise console application to see order details by clicking on the 'order' operator from context menu.

Adding a New Custom Operations and Custom Rights

The following example demonstrates creating a new custom operation in a context menu and as well as adding new rights for the created custom operation to control this action.

Example: The user wants to add a new custom operation called 'View Orders' in the context menu of the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

'Product Categories' List.

The following steps explain the process to be followed:

1. Create a aspx page called 'Products' as shown below.

```
<%@ Page Language="C#" AutoEventWireup="true" CodeFile="Products.aspx.cs"
Inherits="Orders" %>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w3.org/TR/
xhtml1/DTD/xhtml1-transitional.dtd">
<html >
<head runat="server">
<title>Untitled Page</title>
</head>
<body>
<form id="form1" runat="server">
<div>
<table width="100%" cellpadding="0" cellspacing="5" border="1">
<tr>
<td> Sl.No </td>
<td> Product </td>
</tr>
<tr>
<td>1</td>
<td>Books</td>
</tr>
<tr>
<td>2</td>
<td>Computer and Peripherals</td>
</tr>
<tr>
<td>3</td>
<td>Consumer Electronics</td>
</tr>
<tr>
<td>4</td>
<td>Kitchen and Home Appliance</td>
</tr>
<tr>
<td>5</td>
<td>Memory cards, pen drives and Harddisk</td>
</tr>
<tr>
<td>6</td>
<td>Mobiles and Accessories</td>
</tr>
<tr>
<td>7</td>
<td>Musical Instruments</td>
</tr>
<tr>
<td>8</td>
<td>Tools and Hardware</td>
</tr>
<tr>
<td>9</td>
<td>Video and Computer Games</td>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
</tr>
<tr>
<td>10</td>
<td>Services</td>
</tr>
</table>
</div>
</form>
</body>
</html>
Note: Place 'Products.aspx', and 'Products.aspx.cs' in the  [AVEVA Work Tasks
Installed Path]\AVEVA\AVEVA Work Tasks\Web\BPMUITemplates\Default\Repository\Site
folder.
```

2. Create one more aspx page called 'Custom Operations' as shown below.

   Implementation part is outlined below:

   a. First you have to create the list definition object by passing the Application Name (Repository name) and List Name to get the actions which are associated with the list definition. In this example, Application name set as 'ListSecurityRepo' and List name as 'NavigationDetails'.
   b. After creating the list definition object, you will get the existing actions associated with that list.
   c. Store all existing actions to new object.
   d. Create a new action and set the new action properties like name, type, pagepath, iconpath, DisplayValidRightValues, and ActionAllowValidRightValues.

   Name - Mention a name for the context menu. Here name is mentioned as 'View Products'.

   Type - Mention a type. Here type is mentioned as 'MenuItem'.

   PagePath - Mention a path of the aspx page to navigate by clicking on 'View Products' custom operation.

   IconPath - Mention a image path. Here icon path mentioned as 'Edit'. Which is a class under *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\BPMUITemplates\Default\Repository\ListControl\Scripts\JsdoMenu\themes\office_xp*. Here edit image is used for newly created context menu.

   DisplayValidRightValues - Mention right code. Here Right code is mentioned as 'ActionOrders' and set as true value for Value for the Rights.

   ActionAllowValidRightValues - Mention right code. Here Right code is mentioned as 'ActionOrders' and set as true value for Follower specific value for the rights.

   a. Add new action to the object which is created.
   b. Finally call the save method on list definition object.
   c. Right-click on 'Custom Operation' aspx page and then click on View in Browser. You will get a message like 'New action added successfully'.

   See the Developer's Guide for more implementation about creating a new context menu.

}
}
```

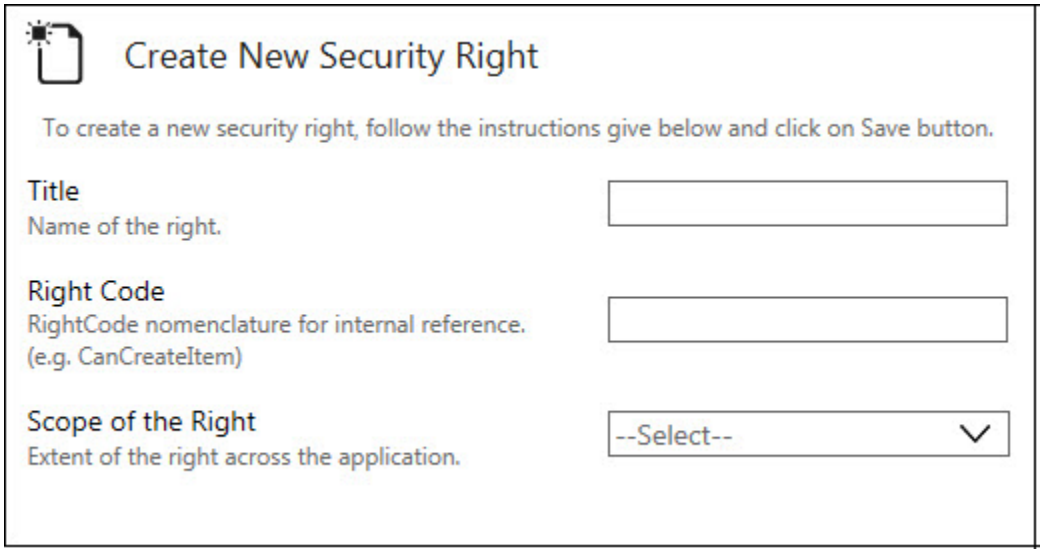
3. Login as an administrator user.
4. Click **Repository Settings (top-right corner)** > **Advanced Settings** > **Manage Navigation List**.
5. Right-click on any **Navigation** link and check the newly added context menu. 'View Products' is not added in the context menu.
6. Here, you need to define security settings at this level. Before defining security settings at this level, you need to create security rights for the created action to control.
7. To create a security right for this item, click **Repository Settings (top-right corner)** > **Advanced Settings** > **Manage Security Rights** > **New** . The following screen is displayed:



8. In the **Title** text box, enter right name as **Can View Products**.
9. In the **Rights Code** text box, enter right code as **Action Orders**.
10. From Scope for the Rights drop-down list, select scope as 'ListSpecificforListItemLevel'. See List Level Security Settings for more information on scope.
11. After selecting the relevant scope for the new security right and setting the values for the right. This allows the you to select the **Lists** to which the new right can be applied for and you can also set the value for the new right.
12. From **Value** for the Right drop-down list, select **AllowDisallow** from the list.
13. Select **Yes** for **Is this Right applicable to the Follower Rights?**
14. Select **AllowDisallow** from the **Follower** specific value for the Right drop-down list.
15. Select list from the available list. Here you have to select **Navigation List**.
16. Click **Save**. The right has been created.
17. Click **Repository Settings (top-right corner)** > **Advanced Settings** > **Manage Security Group**.
18. You have to customize administrator security group because only administrator user has rights to update the security rights. Select Administrator security group and then click **Edit** on the ribbon bar or else right-click and then click **Edit** from the context menu. The **Modify a Security Group** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

19. Select **Can View Products** from the **Follower** specific value for the **Rights** column and then click **Save**.
20. Click **Cancel** from the **Synchronization** window.
21. Click **OK**.
22. Click **Repository Settings (top-right corner)** > **Advanced Settings** > **Manage Navigation List**.
23. Right-click any navigation list and check the newly created menu is displayed.
24. Click **View Products**, this will redirect you to the **Product Details** page.
25. Right-click and then select **Back**.
26. For some of the list menus, the newly created context menu is not displayed. For example, right-click the **Inbox** menu. Here, the newly created menu item is not displayed. This is because security settings have been defined at this list item level.
27. Right-click the **Inbox** menu list and click **Security Settings** to enable the created custom operation.
28. Click **Advanced Settings** > **Enable List specific Security**.
29. Click **Customize Security Group** for this List Item. The **Security Group** screen is displayed.
30. You have to customize the administrator security group because only the administrator user has rights to update the security rights. Select the **Administrator** security group and then click **Edit** on the ribbon bar or else right-click and then click **Edit** from the context menu. The **Modify a Security Group** page appears.
31. Select **Can View Products** for both **Value** for the **Rights** and the Follower specific value for the Rights column and click Save.
32. Click **Cancel** from the **Synchronization** window.
33. Click **OK**.
34. Click **Repository Settings (top-right corner)** > **Advanced Settings** > **Manage Navigation List**. The **Navigation Details** page appears.
35. Now you are able to see the **View Products** context menu for the Inbox menu list.

Enable and Disable Security at List/List item level

A List is a storage place where a user can store groups of information that possess some common attributes. It has the provision to add new information, edit and delete existing information, and publish/unpublish the information.

In a real-time enterprise application, the user stores expense list, travel claims, leave details, employee details, product details, order details in a list structure. In a typical organization, lists store employee details, product details, and expense details. These lists contain some common attributes. For example, the product list stores information including the product name, price, manufacture date, and expiry date. The order list stores information like the order ID, order date, order item pertaining to the order.

ListItem

Each row or record of information inside a specific list can each be treated as a ListItem. These rows or records possess some common attributes. For example, each item inside a product list is called a ListItem of the product list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

List Operations

The list operations are add, edit, view, and delete. For example, add a new product, modify information about an existing product, delete a product, and publish or unpublish information about a product.

List

To provide the operations mentioned previously, AVEVA Work Tasks has the List infrastructure where you can create a list and store list information. You can perform custom operations like add, edit, view and delete for that list.

AVEVA Work Tasks has implemented the list infrastructure to manage and store lists like Process list, Repository list, Event Provider list, Workflows list, Navigation list, User list, SOA Assembly Folder list, Database connection list, File Watcher list, Lookup list and user defined custom list.

Workflow List - Workflows are maintained as a list. Each workflow has a name, description, owner, version information, item status information, workflow status information and last modification information. The user can perform operations like creating a new workflow, editing the workflow using the Process Designer, viewing workflow, deleting workflow, publishing workflow, unpublishing workflow, saving workflow with different versions, disabling or enabling workflow and associating workflow with events like File watcher.

Users List - Each user has information like name, email information, department information, role and owner. The User Management maintains this information as a list and allows you to add a new user, view user information, edit user information and delete a user.

Menu List - The menus are also maintained as a list to store the information in a list infrastructure.

AVEVA Work Tasks has a new feature called **Forms Designer** and **List Designer**. The **List Designer** is used to create enterprise specific list, product list, orders list, customer details list, and so on. Each list can be used to render the forms specific to that list to create items inside the list.

In a enterprise specific list like **Product List**, which has fields such as Product ID, Manufacturing Date, Warranty Period, Price. Users can add product details, delete/update the existing details.

Security

AVEVA Work Tasks also has the Security feature in the list infrastructure. Using the Security feature, the list as well as each item inside the list can be secured to ensure, certain actions like add, edit, delete can be performed only by authorized users (users who have the rights to perform these actions).

Why List Specific Security?

The List specific security is required when you need to restrict the access to the list and the operations that can be performed on that list. The List Level security provides features that allow you to maintain and manage user privileges across the list.

The **List** level security allows the user to secure access to the various lists available in a Repository.

AVEVA Work Tasks defines a set of rights that can be set for users at the List Level. List level rights can be grouped as follows:

- General Rights - These rights are common across lists.
- List Specific Rights - Rights that are specific to lists. [Workflow, User list, Inbox – Work items list]
- List Level - General Rights: A set of rights that are applicable across all lists
- The user can control the following actions across all lists:
- Can add item - Whether a user can create a new item in the list or not

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Can delete item - Whether a user can delete an item from the list or not
- Can edit item - Whether a user can edit an item in the list or not
- Can publish item - Whether a user can publish an item in the list or not
- Can unpublish item - Whether a user can unpublish an item in the list or not
- Can enable/disable - Whether a user can enable/disable an item in the list or not

  Note: This option is available only for the below lists:
  - Workflow
  - Forms
  - SOA Assembly
  - SOA Folder
  - Event Association
  - SSRS
- Package Item - Whether a user can add the artifact in the list to a package template or not
- Can manage security - Whether a user can manage the security of an item in the list or not
- Can see all versions - Whether a user can see all versions of an item in the list or not
- Can view item - Whether a user can view an item in the list or not
- Can view others draft item - Whether a user can see the items that are in draft mode but owned by other users or not
- Can view pending item - Whether a user can see the pending item (for which work is in progress) in the list or not
- Can consume item - Whether a user can consume an item in the list (it may be in lookups or any place where list items gets consumed) or not
- Show all folder - Whether a user can see all folders in the list or not
- Show only owned items - A user can see only the items that they own and cannot see the items owned by others
- Can save as next major version - Whether a user can create a next major version of an item in the list or not
- Can save as next minor version - Whether a user can create a next minor version of an item in the list or not
- Can save as next version - Whether a user can create a next version of an item in the list or not
- Can save as specific version - Whether a user can create a specific version of an item in the list or not

List Specific Rights

Each list is unique and has a different set of actions which can be performed on it. Hence every list can have a specific set of rights appropriate to it.

For example the actions that can be performed on a Workflow list are: Design, Edit, View Workflows etc, whereas the actions which can be performed on a user list are: add , edit, delete users. In the above case, the design operation is specific only to the workflow list. Hence workflow list has a specific right Can design workflow. Similarly, for every list user can define specific rights appropriate to that list.

The following rights are the Workflow List Specific Rights:

- Can design workflow - Whether a user can design the process definition of an item in the workflow list
- Can do tasks - Whether a user can do tasks like design workflow, start workflow wizard, provision now etc on an item in the workflow list

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Can view properties - Whether a user can see the properties of an item in the workflow list
- Can view Design - Whether a user can see the process definition (design) of an item in the workflow list
- Listed below are the Manage Package List Specific Rights
- Run - Whether a user can install the package or not
- Uninstall - Whether a user can uninstall the package or not
- Can Manage Security - Whether a user can manage security at list item or list level of a Manage Package List or not
- Listed below are the Package Template List Specific Rights
- Export- Whether a user can export the package template or not
- Generate - Whether a user can generate the package template or not
- Mark as Shipped - Whether a user can mark the package template as shipped or not
- Can Manage Security - Whether a user can manage security at list item or list level of a Package Template List or not

Process Interface Specific Rights

AVEVA Work Tasks Security also allows process interface specific rights. It offers specific rights for different process interfaces [Process Designer, Web Work items list]. These rights allow or disallow a user to access specific features of the process interfaces.

- Process Designer Specific Rights: For controlling the Process Designer menus
- Can Export - Allows or disallows a user to export a process definition
- Can Import - Allows or disallows a user to import a process definition
- Can Validate Definition - Permits a user to validate a process definition
- Can Set Work Items Fields - Permits a user to define a custom work item field etc

Rights for controlling categories, actions, and properties:

- Can View Categories - Allows or disallows a user to view and use specific categories of Activities in the Process Designer actions toolbox. The user will be able to select the categories that can be viewed or not by a particular user.
- Can View Actions - Allows or disallows user to view and use specific activities in a particular category. The user will be able to select the actions from a particular category that can be viewed and used or not by a particular user.
- Can View Properties - This will allow the user to view, use and configure different properties of an activity. The user will be able to select the properties that can be viewed and used or not by a particular user.

Web Work Items List Control Rights

Rights that are specific to the Work items list control, the rights defined for the Work items list that are applicable at the Repository level:

- Can Set Alternate Actor - Whether a user can set an alternate actor

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Can Set Preferences - Whether a user can set preferences
- Can See Queue - Whether a user can access the queue control
- Can View Resource Calendar - Whether a user can see the resource calendar
- Can View Work Item Control - Whether a user can see the work item control itself
- Calendar Control Rights

This section contains the rights related to the calendar control. The scope of these rights is the Repository level:

- Can Add Calendar - Whether a user can add a new calendar
- Can Add Calendar Workslot - Whether a user can create a new work slot in a calendar
- Can Delete Calendar - Whether a user can delete an existing calendar
- Can Delete Calendar Workslot - Whether a user can delete a work slot of a calendar
- Can See All Calendars - Whether a user can see all the existing calendars
- Can View Calendar - Whether a user can see the calendar control itself
- Queue Control Rights:
- Specific to the Queue Control, these rights are at the Repository level:
- Can View Queue - Whether a user can see the queue control itself
- Can Add New Queue - Whether a user can add a new queue
- Manage Queue - Whether a user who is not the owner of a queue can modify/delete the queue

BAM Control Security Rights

The BAM Control now comes with enhanced security features that allow business users to restrict permissions for various features in BAM. Some of the BAM rights have Repository level scope and some rights are at the List and List Item level.

- Can View Global Reports - Whether a user can view global reports. Scope – Repository level.
- Can View Others Reports - Allows a user to view other users' reports. Scope – List Specific for List Item level.
- Can View Owned Reports - Whether users can view their owned item reports. Scope – List Specific for List Item level.
- Can View Triggered Reports - Whether users can view reports of their own triggered workflows. Scope – List Specific for List Item level.

Dynamic Form Rendering Based on Security

Based on the security applied, different users can render different forms in the dynamic list to edit and also to view details.

Can Edit Item

This **Can Edit Item** right used to specify the whether logged in user can able to edit an item or not. Earlier this right was checkbox. If this right is checked then user have permission to edit an item otherwise the user doesn't have permission to edit an item. Where this is applicable for all levels. Because of this behavior different users

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

were not able to access different forms at List and List Item level.

To avoid the above behaviour, AVEVA Work Tasks has changed the **Can Edit Item** right values to drop-down list with three options **Allow**, **Disallow** and **OwnedItemsOnly** at List and List Item level.

Note: The **Can Edit Item** right displayed as check box at repository level.

The following are **'Can Edit Item'** right value options:

Allow: On selection of this option, it allows the user to edit an item. At the same time, the admin user can do the following:

1. Specify the form name and version to edit
2. Specify any number of forms with different versions
3. Specify the default form for both owned and non owned forms

   Note: User has a provision to select a form and version to render while editing an item, if admin user specified more than one form with different versions.

Disallow: On selection of this option prevents the user from editing an item.

OwnedItemsOnly: On selection of this option allows the user to edit an item, if the logged in user is the owner of that item. At the same time admin user can do the following:

1. Specify the form name and version to edit
2. Specify any number of forms with different versions
3. Specify the default form for owned items

Note: User has a provision to select a form and version to render while editing an item, if admin specified more than one form with different versions.

The above new right descriptions are summarized in a table format as shown below:

S.No	Right Value	Description
1	Allow	If the user has allow permission, then the user can able to edit all items (both owned and others items).
2	Disallow	If the user has disallow permission, then the user not able to edit any items.
3	OwnedItemsOnly	If the use has OwnedItemsOnly permission, then the user can able to edit their owned items only.

Note: When you select either Allow or OwnedItemsOnly options, small image will be shown on the right side of the control. On clicking this image, the admin user can set the form to render while editing.

The Can Edit Item right with the above options are useful in following scenarios:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Scenario 1

Scenario Description

The Administrator wants a user to:

1. View all the items (owned by the logged in user and as well as owned by others) in the list/grid
2. Allow the user to edit their owned items only.

Scenario Quick Solution

With this new enhancement in Can Edit Item right control, the first scenario can achievable with "OwnedItemsOnly" option. If this option set for a user either at list or list item levels, then the user can able to edit owned items only even though the user able to view other user items or non owned items.

Roles

To describe this scenario effectively, assumed that, there are two users 'Admin' and 'John' are existing in a repository and these users are mapped to different security groups at repository level:

The following table depicts the users and their security groups:

User Name	Security Group
Admin	Administrator
John	HR Security Group (new security group)

Scenario Requirements

The admin user creates a new dynamic list named 'EmployeeDetails' list. Within this list, the admin user creates one item and the user John creates one item.

Now, both 'Admin' and 'John' are able to view the both items in the list or grid because **Show Only Owned Items** for both users set to false and both users can able to edit the items because **Can Edit item** set to **True** at repository level with default form (The form which was used to create the list item).

Scenario Solution

As per the scenario, the user 'admin' wants the user 'John' to edit his owned items only in this list. To do the same, follow the steps given below:

1. Login as the administrator user.
2. Go to **Enterprise Console** > **Lists** > **"Employee Details".**
3. In the Employee Details list, click the Security option in the ribbon bar.
4. Select **Advanced Settings** > **Enable List specific Security** link to enable the security for this List.
5. On click of **Enable List specific Security** link, the Enable Security Wizard window is displayed.
6. Select both **Security Group customization** and **Resource Mapping** and then click **Next**.
7. Select **Security Group** customization and then click Next.
8. In the Security Group list, select the HR Security Group (because John belongs to HRSecurityGroup) or right click and select Edit option from the context menu or click **Edit** in the ribbon bar.
9. The **Modify Existing Security group** screen is displayed. Set **Can Edit Item** as **OwnedItemsOnly** and click **Save**.

   Note: On selecting the **OwnedItemsOnly** option, a small image is shown on the right side of the control. But

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

you are not setting any specific form to render while editing, if not set the default form will be rendering while editing.

10. 'John' will able to edit his owned items only. If this user tries to edit the non-owned items, then system will prompt the user stating that "You can edit owned items only".
11. To test the same, login as 'John'.
12. Go to EmployeeDetails list. Try to edit a non-owned item. Select a non-owned item and click **Edit** option in the ribbon bar. The following message appears:

    You can edit your own items only.
13. Right-click the non-owned item. The **Edit** option will not be displayed in the context menu.
14. Now try to edit the owned item. Select owned item and click **Edit** option in the ribbon bar. You can edit the item.
15. Try to right click on the owned item. Select owned item and right click, in the context menu the **Edit** option is available.

Scenario 2

Roles

To describe this scenario effectively, assumed that there are two users 'Admin' and 'Kevin' in a repository and these users are mapped to different security groups at the repository level.

The following table depicts the users and their security groups:

User Name	Security Group
admin	Administrator
kevin	NetworkSecurityGroup (new security group)

Scenario Requirements

The admin user creates a new dynamic list named employee list with the following fields:

- First Name
- Middle Name
- Last Name
- Address 1
- Address 2
- Phone
- DOB
- DOJ
- System Name
- IP Address
- Email
- Salary
- Salary Advance and TDS

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Also created an item in the list. The Administrator wants a user 'kevin' who belongs to Network team to edit list item (network related details) under this list, and at the same time administrator user do not want to show confidential information like Salary, Salary Advance and TDS in the list item while editing. So administrator user decided and created a new form with network related fields to be rendered for the 'Kevin' user while editing.

Note: admin user created a new form with network related fields with different versions as follows:

Form Name: Network_Employee_Details

Versions: 1, 2, 3

Version 1: available fields

Fields
Title
First Name
Middle Name
Last Name
System Name
IP Address

Version 2: available fields

Fields
Title
First Name
Middle Name
Last Name
System Name
IP Address
Email

Version 3: available fields

Fields
Title
First Name
Middle Name
Last Name

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Fields
Phone
System Name
IP Address
Email

All these versions have been published. Now admin user wants the user 'Kevin' edit all the items (both owned and non-owned) within the employee list. But while editing owned items user can use form with any version of the available versions. While editing non owned items user can use the form with version 1 only. By default, form for owned items is the form with version 3 and default form for non owned items is the form with version 1.

Scenario Solution

To do the same, follow the steps below:

1. Login as the administrator user.
2. Go to **Enterprise Console** > **Lists** > "**Employee Details**".
3. In the Employee Details list, click the **Security** option in the ribbon bar.
4. Select **Advanced Settings** > **Enable List specific Security** link to enable the security for this List.
5. On click of **Enable List specific Security** link, the Enable Security Wizard window is displayed.
6. Select both **Security Group customization** and **Resource Mapping** and then click **Next**.
7. Select **Security Group customization** and then click **Next**.
8. In the **Security Group** list, select the NetworkSecurityGroup (because kevin belong to this security group) either right click and select **Edit** option from the context menu or click **Edit** in the ribbon bar.
9. The **Modify Existing Security group** screen is displayed. Set **Can Edit Item** as Allow and then click **Save**. On selecting the allow option small image will appear on the right side on the control, click on the image.
10. On clicking of this image, the **Form Lookup** screen is displayed.
11. In the above **Form Lookup** page, the first section (Forms) specifies the forms to render both owned and non owned items. Select a form and version and click on add (>) button, the selected form will be added in the selected forms section on the right side. If a form selected with the "Form for Owned Items" option checked then that meant for owned items.

    The second section (Default Form for Owned Items) specifies the default form for owned items. The form which was used to create an item is populated by default.

    The last section (Default Form for Non-Owned Items) specifies the default form for non-owned items. The form which was used to create an item is populated by default.

    Note: In this **Form Lookup**, only published forms only available.
12. In this scenario, admin user wants the user 'Kevin' edit all items (both owned and non-owned) and while editing owned items user can use the form (Network_Employee_Details) with any version of the available 3 versions, and while editing non owned items user can use the form (Network_Employee_Details) with version 1 only. And default form for owned items is the form with version 3 and default form for non owned items is the form with version 1.
13. First, set the form with versions 1, 2 and 3 for owned items.
14. Similarly add the version 2 and 3.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

15. Now for owned items, you have selected 3 versions and for non-owned items. You need to select only the version 1. Select the form name and select version 1 and add the form with out "Form for Owned Items" option checked.
16. Next, set the default form for owned items. In our scenario, default form for owned items is Network_Employee_Details form with version 3. So select the form name and version and click on add (>) in the "Default form for owned items" section.
17. Finally, you have to select the default form for non owned items. In our scenario the default form for non owned items is Network_Employee_Details form with version 1. So select the form name and version and click on add (>) in the "Default form for Non-Owned Items" section.
18. After selecting all required forms click on **Continue** button. This window will be closed and again you will be getting the "Modifying Existing security group" screen click on **Save** and **Synchronize**.
19. Now login with the 'Kevin' user credentials and go to 'EmployeeDetails' list.
20. For our example, in the employee list, you have 2 items. For one item admin is the owner and for another item 'Kevin' is the owner.
21. As per our scenario, 'Kevin' user able to edit both owned and non-owned items. First, try to edit the owned items. Select the owned item and right click on that item.
22. As per our scenario, while editing owned items user can use the form Network_Employee_Details form with version 1, 2 and 3. So when the user right clicks on owned item user will get the edit form name versions.
23. When the user with out selecting the form version clicks on **Edit** option in the context menu then the default form for owned items will be rendered.
24. Similarly, when the user selects an owned item and clicks on the Edit option in the ribbon bar then the default form for owned items will be rendered.
25. Now we will try to edit non-owned items. As per our scenario while editing non-owned items user can use Network_Employee_Details form with version 1 only.
26. Select a non-owned item and right click on that item.
27. As there is only one version, the sub menu for "Form name" will not appear. On clicking the form name, version 1 opens.
28. On clicking **Edit** in the context menu, the default form for non-owned items will be rendered.
29. Similarly, on selecting non-owned item and clicking **Edit** on the ribbon bar, the default form for non-owned items opens.

Enable and Disable Security for a Repository

Introduction

This section explains how to enable or disable the security at repository level. Before you enable/disable security, you must know what is security and how the security will effect the application.

How Does Security Affect the Application?

AVEVA Work Tasks has new enterprise rights and security features. The rights and security can be defined for groups and users can be mapped to groups. The user will be entitled to perform only those tasks for which the right has been given to respective user.

AVEVA Work Tasks has some pre-defined security groups and each security group has default security rights.Pre-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Defined Security Groups:

Security Group Name
Administrator
Contributor
Reader
Limited Access

In AVEVA Work Tasks, while creating a repository: user will be asked to set the administrator at repository level. Once you select a user, then the selected user has been added with administrative privileges. This user can create new users, new roles, and new security groups, mapping users/roles with different security groups at different levels (either repository or list or list item levels) and setting security rights for different security groups at different levels.

How to Check Whether Security is Enabled or Disabled for a Repository?

Whether security is enabled or disabled for a specific repository, depends on the **Properties** Column (properties collection) of **SKRepository** table in the Farm Database.

For example, find below the **Properties** column (properties collection) data for a repository.

```
<properties>
<property key="sourceelements">
<![CDATA[WORKFLOWELEMENTS\Default]]>
</property>
<property key="fromemail"><![CDATA[admin@domain.com]]></property>
<property key="toemail"><![CDATA[admin@domain.com]]></property>
<property key="alertuser"><![CDATA[False]]></property>
<property key="filewatcher"><![CDATA[]]></property>
<property key="enablesecurity"><![CDATA[True]]></property>
<property key="isadminconfigured"><![CDATA[True]]></property>
<property key="theme"><![CDATA[Default]]></property>
</properties>
```

The line highlighted in red in the above code, is used to identify whether security is enabled or disabled for a repository. In this line, you can identify the following:

<property>	**defines the property tag**
key	Attribute of property tag, describes the property name (enablesecurity is name of the property)
<![CDATA[True]]>	It is the value of the property (True- security is enabled)
</property>	Closing tag of property

Enabling security for a repository

In AVEVA Work Tasks, once you create a repository, the security will be enabled by default for that repository.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If you want to enable security for a repository, then open the SKRepostiory table in the Farm Database and find out the required repository entry (row) and in that specific row in properties column data (properties collection) find out the enablesecurity key and update the <![CDATA[False]]> to <![CDATA[True]]>.

Note: If the enablesecurity key is not found for a repository entry in the properties column then add the following line between <properties> & </properties> tags.

```
<property key="enablesecurity"><![CDATA[True]]></property>
```

Now the security is enabled for that repository. If you want to enable security for another repository do the same as mentioned above.

Disabling security for a repository

In AVEVA Work Tasks, once you create a repository security will be enabled by default for that repository.

If you want to disable security for a repository, for which the security already enabled, then open the SKRepostiory table in the Farm Database and find out the required repository entry (row) and in that specific row in properties column data (properties collection) find out the enablesecurity key and update the <![CDATA[True]]> to <![CDATA[False]]>.

Note: If the enable security key not found for a repository entry in the properties column then add the following line between <properties> & </properties> tags in case if you want to enable security in future.

```
<property key="enablesecurity"><![CDATA[False]]></property>
```

Default Behavior of Repositories Created in AVEVA Work Tasks

In AVEVA Work Tasks, if you create a repository, then security will be enabled by default for that repository. While creating repository user will be asked to set the administrator for that repository, once the user select the user for administrator, the selected user will be added with administrative privileges for that repository.

Once the administrator user is logged in, they can access the security settings (Repository Settings – top right corner). Any user other than the one belonging to the **Administrator** security group cannot access the security settings page

Http Strict Transport Security Enforcement

You can enforce a Http Strict Transport Security to Enterprise Console sites in AVEVA Work Tasks for secured access. When the security is enforced, only the secured sites will be loaded.

To enforce Http Strict Transport Security, add the code in the Enterprise Console **web.config** file available in <Installed path>\Web\BPMUITemplates\Default> as given below:

```
<system.webServer>
    <httpProtocol>
        <customHeaders>
           <add name="Strict-Transport-Security" value="max-age=31536000"/>
        </customHeaders>
    </httpProtocol>
</system.webServer>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Access-Control-Allow-Origin

By default, the Access-Control-Allow-Origin tag value in the Enterprise Console Site of AVEVA Work Tasks is * to allow all Origins.

To restrict, provide the specific Origin values instead of *.

You need to update the Origin values in case AVEVA Work Tasks is connected through Azure Relay.

Security Vulnerabilities

A security vulnerability is a flaw in a product that could allow an attacker to compromise the integrity, availability, or confidentiality of that product. For the software security industry, a vulnerability is a security exposure that results from a product weakness that the product developer did not intend to introduce and should fix once it is discovered.

There are various known security threats such as, XSS - Cross site scripting, SQL injection, and URL Spoofing. AVEVA Work Tasks tries to mitigate most of the security vulnerabilities through SDL approaches.

Verbose HTTP header is another type of security vulnerability. To mitigate this security vulnerability, see Removing Unwanted HTTP Response Headers.

Remove Unwanted HTTP Response Headers

Verbose logging tracks all changes and settings applied using Group Policy and its extension to the local computer and to users who log on to the computer. The log file is located at SystemDrive\Debug. This folder is a hidden folder.

To enhance security measures and remove the unwanted HTTP response headers, you can use the following available provisions:

- Web Configuration Changes
- Native HTTP Module

Web Configuration Changes

```
In the Enterprise Console Web configuration file, add the following code inside the
System.WebServer tag
<system.webServer>
<validation validateIntegratedModeConfiguration="false" />
<modules runAllManagedModulesForAllRequests="true">
<add name="HideServerHeaderModule"
type="Wonderware.Workflow.SecurityConfig.HideServerHeaderModule,
Wonderware.Workflow.SecurityConfig, Version=4.0.0.0, Culture=neutral,
PublicKeyToken=1add7d6ea5a31926" />
</modules>
```

Native HTTP Module

```
After installing AVEVA Work Tasks, ensure to have the following StripHeaders entries in the
application configuration in the following path:
C:\Windows\System32\inetsrv\config\applicationHost
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<location path="WonderwareSkeltaBPMSites/CentralConfig">
    <system.webServer>
        <stripHeaders>
                <header name="Server" />
                <header name="X-Powered-By" />
                <header name="X-Aspnet-Version" />
        </stripHeaders>
        <security>
            <authentication>
                <basicAuthentication enabled="false" />
                <anonymousAuthentication enabled="false" />
                <windowsAuthentication enabled="true" />
            </authentication>
        </security>
        <handlers accessPolicy="Read, Write, Execute, Script" />
    </system.webServer>
</location>
<location path="WonderwareSkeltaBPMSites/EnterpriseConsole">
    <system.webServer>
        <stripHeaders>
          <header name="Server" />
          <header name="X-Powered-By" />
          <header name="X-Aspnet-Version" />
        </stripHeaders>

        <security>
            <authentication>
                <basicAuthentication enabled="false" />
                <anonymousAuthentication enabled="false" />
                <windowsAuthentication enabled="true" />
            </authentication>
        </security>
        <handlers accessPolicy="Read, Write, Execute, Script" />
    </system.webServer>
```

```
StripHeaders is a third party module that you can download from the Internet.
```

Prevent Clickjacking Attack

Clickjacking is a malicious technique of tricking a web user into clicking on something different from what the user perceives they are clicking on. This potentially reveals the users confidential information. It is a browser security issue and is a vulnerability across a variety of browsers and platforms. The **X-Frame-Options** header is known to be a good measurement against the Clickjacking attacks.

AVEVA Work Tasks is secured against **Clickjacking** attacks as **X-Frame-Options** are set for **SAMEORIGIN** value. **SAMEORIGIN** means that the page can only be displayed in a frame on the same origin as the page itself.

For custom pages, we recommend that the page load event must have commands to remove the **X-Frame-Options** header if other application references are in the page. Use the following command to remove the **X-Frame-Options** header:

```
   Page_Load()
   HttpContext.Response.Headers.Remove("X-Frame-Options");
```

Alternatively, add appSettings key in Repository *web.config* file available in <Installed path>\Web\BPMUITemplates\Default as given below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<add key="X-Frame-Options_SameOrgin" value="OFF"/>
```

SDL Cookie with Secure Flag

AVEVA Work Tasks uses cookies for various purposes. However, these cookies might be utilized by unauthorized parties and might be prone to security vulnerabilities. Therefore, to secure the cookies, it is recommended to use the **httpOnly** attribute in case of Http protocol for most of the cookies.

To ensure that the application is more secure, it is recommended to use the **https** protocol for AVEVA Work Tasks web application.

1. Browse to the location *<Install Path>\Web\EnterpriseConsole*.
2. Edit the **web.config** file.
3. Add the following tag.

```
<system.web>
<httpCookies httpOnlyCookies="true" requireSSL="true" lockItem="true" />
</system.web>
```

4. Save the file
5. Browse to the location *<Installed Path>\Web\CentralConfig*.
6. Repeat steps 2 to 4.

Troubleshoot Security Issues

This section tells you how to troubleshoot security problems.

View Others Items in the Lookup Control

Why user is not able to view other user items in Lookup Control?

Problem: User is unable to view the list items in Lookup Input control.

Resolution: Check the following steps to view the other list items in Lookup Input.

1. Check user security group and rights.
2. Make sure that **Show Only Owned Item** right is set to **False** for that user.
3. Make sure that **Can Consume Item** and **Can View Others Draft Items** right is set to **True** for that user.

Example: This example demonstrates why the user is not able to view items in the Lookup Input control and how to resolve this issue.

Let assume that there is a List called 'Employee List'. Consider that the Employee list consists the Employee name, Employee Id, Department, and Designation Fields. Where Employee name and Employee Id fields are Textfields and Department and Designation Fields are Lookup Input controls. Say Department field fetches the list items from 'Department' list and Designation field fetches the list items from 'Designation' list.

The problem is that user is not able to see all the items in 'Department' and 'Designation' lookup input controls.

The solution is to login as the administrator user and check the group to which the user belongs and what are the security rights defined for the user. Ensure if **Can Consume Item** is selected or not? If not, set this right to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

True. If the user is still not able to view, then uncheck **Show Only Owned Item** right. If the user is not able to view other's draft items, then select **Can View Others Draft Item** right also. Now the user should be able to view all the Department and Designation items in the lookup input controls.

View Others Items in the Grid Control

Why the user is not able to view other user items in the Grid?

Problem: The user is unable to view the list items in the grid.

Resolution: Follow the steps given below to view the other list items in the grid:

1. Check the user security group and rights.
2. Ensure that the **Show Only Owned Item** right is set to False for the user.
3. Ensure that the **Can Consume Item** and **Can View Others Draft Items** rights are set to **True** for the user.

View Others Items in the List

Why the user is not able to view items of other users in the list?

Problem: The user is unable to view the list items in the list.

Resolution: Follow the steps given below to view the others list items in the list:

1. Check the user security group and rights.
2. Ensure that the **Show Only Owned Item** right is set to **False** for the user.
3. Ensure that the **Can Consume Item** and **Can View Others Draft Items** rights are set to **True** for the user.

View Others Items Irrespective of Status

Why the user is not able to view others items irrespective of status?

Problem: The user is not able to view others items even though the Can Consume Item and Can View Others Item is checked for the user.

Resolution: Follow the steps given below to view others items:

1. Ensure that the **Show Only Owned Item** right is set to **False** for the user.
2. Ensure that the **Can Consume Item** and **Can View Others Draft** Items rights are set to **True** for the user.
3. In this case, the **Show Only Owned Item** right takes precedence over the **Can Consume Item** right. That is why the user is unable to view others items.

Navigation List Menus

1. Why the user who belongs to the Reader Security group is not able to consume menu items in the Enterprise Console pull-down menu?

The user is not able to consume menu items in the Enterprise Console pull-down menu even though the Can Consume Item right is checked.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Resolution

This problem usually happens when the users create their own menu and submenu items and would like to define security for those menus and submenus. In security, by default, the newly created menus and submenus will be considered as draft mode.

To view the others items:

Ensure that the **Can View Others Draft Items** right is set to **True** for the user.

2. Upgrade Manager has detected some duplicate entries in the Navigation list. Re-create the entries with unique titles.

Resolution

While upgrading **AVEVA Work Tasks**, if the **Upgrade Manager** detects some duplicate entries in the **Navigation** list, this message is logged in the **Logger**. You can re-create the existing duplicate link entries with unique titles.

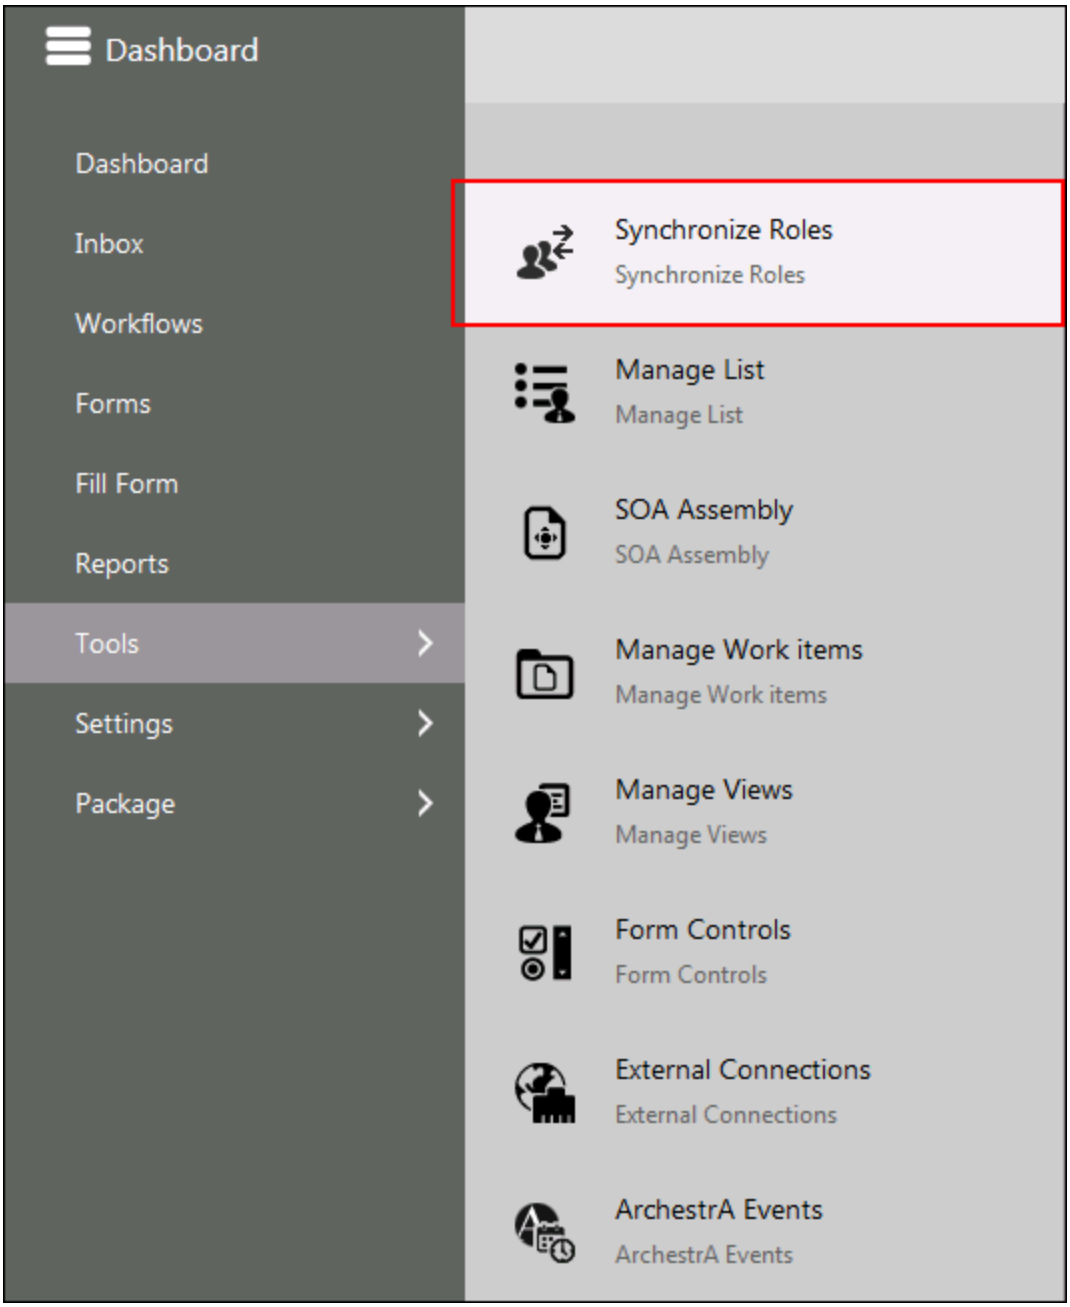
Synchronize Roles

If you want cross domain users and roles mapping across active directory provider, then use the **Synchronize Roles** option to map the roles.

Example: Users 'John' and 'Jim' of domain 'TelematicsUS' and users 'Mike' and 'Bob' from the domain 'TelematicsAU' are added to the role "Team HR" of the domain 'TelematicsMain'.

You can see the Synchronize Roles list item in the Enterprise Console menu that you can use to map the cross domain provider roles. This list item is not available by default in the Enterprise Console menu. While creating a repository, if you choose **Resource Provider** as **Active Directory** and enable the **'Is Cross Domain Role Provider'** option for cross domain users and roles mapping, then the **Synchronize Roles** sub-menu appears in **Enterprise Console** > **Tools**. This menu is available only for users with administrative rights.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



To synchronize roles

1. In the Enterprise console, click the **menu** icon, click **Tools,** and then click **Synchronize Roles**.
   The Synchronize Roles window appears.
2. Enter the role name in the **Search Role** text box.
3. Click **Search**.
   The available roles will be listed in **Choose Roles**.
4. Choose the required role to be synchronized.
   For example, search for 'team' role and it will list the available roles.
5. Click **Synchronize**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

After the synchronization of the selected role(s) is complete, a confirmation message about successful synchronization appears.

Delete Synchronization Cross Domain Tasks

To delete synchronization cross domain tasks

1. Go to Repository Data Source Database.
2. Open **SWTaskList** table.
3. Delete the required synchronization cross domain tasks for repository.

Note: Delete only those records whose Description column is 'Cross domain Role Refresh Task' for that repository.

Web Parts

Web Parts is an integrated set of controls for creating Web sites that enable end users to modify the content, appearance, and behavior of Web pages directly from a browser. The modifications can be applied to all users on the site or to individual users. When users modify pages and controls, the settings can be saved to retain a user's personal preferences across future browser sessions, a feature called personalization. These Web Parts capabilities mean that developers can empower end users to personalize a Web application dynamically, without developer or administrator intervention.

Personalization

Personalization is the core behavior of WebParts. You can modify or personalize the layout, appearance, and behavior of WebParts controls. Personalized settings are persisted for future browser sessions.

Web Parts Manager

Manages all Web Parts on a page, enables or disables personalization, and manages the life cycle of personalization data. One (and only one) WebPartManager control is required for every Web Parts page. Web Part Manager also handles security for the Web Pages including the Adding, Moving, and Deleting the web parts.

Personalization Scope

Personalization scope refers to how personalization data is applicable to different sets of users. Some personalization data is applicable to only a specific user and control on a page. Other personalization data is applicable to all users who view a site.

Web Part Zone

The WebPartZone control serves as the primary control in the Web Parts control set for hosting ASP.NET server side controls on a Web page.

In addition to web parts that inherit from the WebPart class, a WebPartZone control can host controls that do

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

not derive from the WebPart class, by wrapping them with a GenericWebPart control at run time. Consequently, virtually any ASP.NET server control or user control can function as a web part when used inside a WebPartZone control.

The EditorZone control represents the means through which end users may modify and personalize Web pages according to their preferences. Personalizing a Web site includes such things as setting up personal information (such as work item list control, calendar, queue control, etc.). Other kinds of personalization involve setting up appearance and layouts. The EditorZone helps manage this functionality as well as saves and loads those settings so they're available the next time the user logs on.

AppearanceEditorPart

This is used to edit properties that affect the appearance of an associated WebPart or GenericWebPart control.

The properties listed under the Appearance tab are:

Property	Description
Title	This field displays the title of the web part. If the user wants to change the title of the web part, it can be changed in this field.
Chrome Type	This property is used to specify the appearance of the title and border of the web parts. Users can choose to show only the title of the web part or only the border of the web part or none of the two.
Direction	The Direction field is used to set the direction of the web part.
Height	This property is used to set the height of the web part. Users can give the height specifications in percent, pixel, points, picas, inches, millimeters, centimeters, percent, em, ex.
Width	This property is used to set the width of the web part. Users can use this property to change the width specifications in percent, pixel, points, picas, inches, millimeters, centimeters, percent, em, ex.
Hidden	This property can be used when the user wants to hide the view of any web part. The user can check the Hidden property check box and that particular web part will be hidden for the users.

LayoutEditorPart

The LayoutEditorPart is used to edit properties that affect the layout of an associated WebPart or GenericWebPart control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Chrome State	This property is used to specify the layout of the web part. Users can choose to display the web part either in Normal scope or minimized scope.
Zone	This property can be used to specify the zone for a web part. If the user wants to change the zone of a web part, them you can select a zone from the drop-down list.
Zone Index	This property is to be used when the user has put multiple web parts in a zone. Users can specify the order of appearance of the web part by giving a number for each web part in that zone. By default, the numbering begins from 0. The first web part to appear in the zone should be numbered 0 and the second web part should be numbered 1.

PropertyGridEditorPart

The PropertyGridEditorPart provides a generic user interface (UI) that enables users to edit custom properties on WebPart controls. In contrast, the other EditorPart controls, such as the AppearanceEditorPart and BehaviorEditorPart controls, edit only existing, UI-oriented properties from the WebPart class.

Each web part has custom properties which are listed under the respective web parts.

Use Web Parts Infrastructure

The Enterprise Console provides a rich set of tools and user controls to manage, control workflows, users. All the Controls can be accessed inside the Enterprise console based on the security rights.

Personalization of the controls play an important role in many of the scenarios where in which user can configure their configuration or settings for the control overriding the global or public configuration or view.

And also in many scenarios, there is a requirement of setting the customized home page for the application site where the Controls should be able to place inside a specific layout and configure properties for the same.

Web Parts Framework

The Web Part Framework allows the users of Enterprise Console to be able to customize the content by selecting, removing, and rearranging the contents in the web page(Home Pages).

The Web Parts Framework provides the infrastructure and the building blocks required for creating modular web pages, which can be easily customized by the users. You can use Web Parts to create portal pages that aggregate different types of content, such as Work Item List, BAM, Calendar, Queue, List controls, and the contents that can change at runtime. The users can also change the layout of the Web Parts by dragging and dropping them from one place to another and providing a rich user experience.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

By taking advantage of Web Parts, the EC users can perform the following operations:

- Users can personalize page content.
- Users can personalize the page layout by allowing the users to drag Web Parts from one. zone to another zone, or change its appearance, look and feel, and so on.
- Users can share the page content with others.

Apart from the out-of-the-box Home pages, users can create their own custom web part pages, with different layouts by providing the Web part zones, to meet their business requirement.

Similarly, the user can include their own custom Web Parts as well, to use in the Enterprise console. They can use these custom web parts along with the controls in a single page, without providing a single line of code.

Out-of-the-Box Web Parts

AVEVA Work Tasks provides the following six out-of-the-box web parts:

BAM

The Business Activity Monitoring Dashboard is a key AVEVA Work Tasks Server Control. It enables you to monitor the execution of a workflow and provides an array of real-time reports. This report includes status and performance of workflows.

Property	**Description**
Hide Categories	To specify multiple categories to be hidden. Use semicolon to separate the categories. Example: Dashboard;Analyze
Displays the table border for individual report	To specify the table border for individual reports.
Instances To Be Shown	To specify multiple instances. Use semicolon to separate the instances. Example: 123;124
Show Individual Report	To show individual reports in the BAM.
Report Description	To provide description of a report. This is applicable for individual report mode only.
To show an individual report ['Id' field of 'SKBAMMenu' Table]	To show an individual report. Example: *Id* field of *SKBAMMenu* table
To show an individual report [Report Name with hierarchy.]	To provide a name to a report. Example: Analyze/Executing
Report title	To provide a report title for an individual report. This is applicable for individual report mode only.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
To toggle the visibility of the report border	To change between the visibility of the report border. This is applicable for individual report mode only.
Number of records to export	To set the number of records to export in a grid. This setting is applicable for all grids in the Report page for any instance. If this field is left blank, it takes the default size of 50 records. For the settings to take effect, save the details and then navigate back to the Reports page from the **Enterprise Console** menu. You can also set the *number of records to export* at a grid level using the **Export Settings** icon on the **Reports** page. Setting the number of records to export using the **Export Settings** icon on the **Reports** page takes precedence over the Web part level setting for a particular instance. For example, if you set the number of records to export as 10 using this option, and then for a particular grid, if you set the number of records to export as 20 using the **Export Settings** option, then 20 records will be exported for that particular grid for that particular instance. For more information about **Export Settings**, see Business Activity Monitoring and Reports.
Workflow Name	To specify multiple workflows. Use semicolon to separate multiple workflow names. Example: workflow1;workflow2

Calendar

You can use the Calendar interface to create hierarchical organization and resource calendars. Use Calendars to determine availability of resources, calculate timeouts, and perform other scheduling functions.

Property	Description
Calendar Name	To give a name to the calendar
Can Add calendar	Right to add a new calendar
Can Add calendar workslot	Right to add a calendar workslot
Can Add Resource Calendar	Right to add a resource calendar

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Can Delete calendar workslot	Right to delete a calendar workslot
Can Delete calendar	Right to delete a calendar

Queue Management

You can use the Queue Management to create and manage queues for allocating workflow activities. This is done using the Queue control.

Queue control consists of only **Appearance** and **Layout** properties. It does not comprise of any property grid.

Work Items List

The Work items list is a Web-based interface which lists the various workflow activities in AVEVA Work Tasks. The Work items list provides detailed information of an activity. You can view and respond to work items from an interface similar to Microsoft Office Outlook.

Property	Description
Allow ownership on row click automatically	To take ownership of the work item on clicking the row.
Display the columns with autofit	Display the columns with autofit in the layout.
Enable Multi Select	To select multiple work items.
Display left tree menu without grouping the workflow(s)	To view the Work items list page without grouping the workflow(s).
Enable Move to the next work item after submitting the work item from the detail view	To move to the next work item as soon as you submit a work item from the detailed view. **Note:** When the **Show reading pane in pop-up window** option is checked, and when an Invoke Form work item (configured with **Save as draft** option as yes), is opened and the **Save as draft** button is clicked, then the pop-up window closes. When the **Show reading pane in pop-up window** option is unchecked, and when you click on **Save as draft** button, the form is saved as draft, but the form content is still displayed inline.
Display Classic Paging	To display the Classic Paging properties.
Enable Export	To control the visibility of the **Export** icon in the work

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	item details grid status bar.
Enable Hold	To put work items on hold. The **Hold** button would be visible for a work item if hold is enabled.
Display Next and Previous buttons in the work item detail view	To navigate to the next or previous work item from the work item detailed view page.
Display multi-select option, by default, for queue items	To display queue items with the multi select option enabled by default.
Enter the average column name	To calculate the average of columns when the grouping operation is performed on columns. You can specify multiple column names with semicolon. Example: Expense Amount,true;Leave Days,false
Enter the group count column name	To calculate the count of the columns when the grouping operation is performed on columns. You can specify multiple column names with semicolon. Example: Leave Days;Expense Type
Enter the group total column name	To calculate the total of the column names when the grouping operation is performed on columns. You can specify multiple column names with semicolon. Example :Expense Amount,true;Leave Days,false
Show inbox details without left grid view	To display only the **Inbox** view without the folder list to the left tree menu.
Layout View Name	To load a specific layout. Multiple workflow names can be specified with semicolon. Example:Leave Application;HRProcess.
Show Manager View	To display only the **Manager View** for the list.
Show reading pane in pop-up window	To display the work item details in a separate window and not in the **Reading Pane** after the **Inbox**.
Record Size	To display the number of messages in the work items based on this property. For example, assume that there are 35 messages. If this property is set as 20, then 20 messages out of 35 are displayed in the work items.
Retain the sort column	To retain the selection of recently sorted column after submitting the work item and also while expanding the left tree menu view items. If this is set to true,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
	then selection of the recently sorted column is retained. If set to false, then the selection of the recently sorted column is not retained.
Display the count on the left side of the grid view	To display the work items count in the left-hand-side grid view.
Show a custom link on the left side of the grid menu	To display a custom link in the left pane of Work items Web Part.
Show detail view on row double-click	To open the work item details page (Custom ASPX page) on double-click.
Show detail view as modal window	To choose the detail view to appear as a modal window or a modeless window when you click a work item to edit.
Show detail view with multi-select option enabled	To display the detail view with the multi-select option enabled by default.
Show filter bar always	To display or hide the filter bar.
Show multi select window in the center	To display a multi-select window in the center of the page.
Show queues	To display a folder for queues that the user is a participant in.
Show queue detail view without picking	To act on a work item without picking it.
Queue Name	To display the queue name in the left tree menu of the **Work items Web Par**t. If the queue name is not specified, all available queues appears in the left tree menu. Multiple queue names can be specified with semicolon. Example: Manager;Support
Show queues on the left-side of grid view menu only if the queues have work items	To show queues in the left-hand-side grid view menu only if they have work items.
Show standard columns	To displays the work item fields columns based on the **Workflow Name** property of work item control.
Workflow Name	To display the workflow name in the left tree menu of the Work items Web Part. If the workflow name is not specified, all available workflows appears in the left tree menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Show Work Item Fields	To display work item fields.
Display pop-up messages while acting on a Queue item in Inbox	To enable or disable pop-up messages in the inbox while performing actions on queue work items in inbox. For example, if you do not enable this option, and when you pick and recall an allocated item, the pop-up window with information message does not appear. By default, this field is enabled.

Forms

A Form is used as an interface to enter data in the Lists. The Forms Designer is an intermediate layer between a user and the Forms Engine. The Forms Designer is an interface that you can use to design, customize, and maintain form templates, and define the business logic specific to a form. Forms are associated with workflows. These workflows are responsible for driving end-to-end business applications. A form triggers a business process.

You can use the Forms web part to fill a published form by using the Fill Form in the Enterprise Console menu. To access the Forms Web Part page, you must have **Can Fill Form** permissions in AVEVA Work Tasks.

The following table explains the properties of Form Web Part:

Property	Description
Form Name	To specify a name for the form.
Form Display Mode	To select the display mode from the drop-down list. By default, Form Display Mode property is set as *Tree* mode.
Show Fill form as Pop-up	To view the Fill Form as a pop-up on the screen. If this option is not checked, the form is loaded inline to the tree view.
Inline Form Height	To specify the height of the inline form.
Tree View Height	To specify the height of the tree view of the web part.

List

The List is a collection of items such as Task lists or Item lists captured using Forms. It acts as a logical table (similar to a database table) but involves a more complicated structure to represent an entire entity with links to child tables. The data entered in the List is stored in the Repository. It stores application-level data thus facilitating generation of business reports. AVEVA Work Tasks lists group related information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Property	Description
Menu Control Path	To specify the path for the Menu Control. Example: /Repository/ListControl/WorkflowRibbonBar.ascx
List Name	To provide a name to the list.
Enter List ViewName to the view	To provide a name to the view.
Show header	To display the header.
Show ListViews	To display the list views.
Show ribbon bar	To display the ribbon bar for the lists.

Other Web Part Properties

While creating a web part, the user can access the Editor zone and specify the web part properties. To view the editor zone, click the drop-down arrow in the right-end corner of the home page.

The Appearance and Layout properties are common for all the web parts. The properties and their descriptions are given below:

Appearance

- Title: The **Title** field displays the title of the web part. If the user wants to change the title of the web part, it can be changed in this field.
- Chrome Type: This property is used to specify the appearance of the title and border of the web parts. Users can choose to show only the title of the web part or only the border of the web part or none of the two.
- Direction: The Direction field is used to set the direction of the web part.
- Height: This property is used to set the height of the web part. Users can give the height specifications in percent, pixel, points, picas, inches, millimeters, centimeters, percent, em, ex.
- Width: This property is used to set the width of the web part. Users can use this property to change the width specifications in percent, pixel, points, picas, inches, millimeters, centimeters, percent, em, ex.
- Hidden: This property can be used when the user wants to hide the view of any web part. The user can check the Hidden property check box and that particular web part will be hidden for the users.

Layout

- Chrome State: This property is used to specify the layout of the web part. Users can choose to display the web part either in Normal scope or minimized scope.
- Zone: This property can be used to specify the zone for a web part. If the user wants to change the zone of a web part, them you can select a zone from the drop-down list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Zone Index: This property is to be used when the user has put multiple web parts in a zone. Users can specify the order of appearance of the web part by giving a number for each web part in that zone. By default, the numbering begins from 0. The first web part to appear in the zone should be numbered 0 and the second web part should be numbered 1.

Authentication and Personalization

For the users to be able to personalize the web parts, they have to ensure that the Anonymous Authentication is disabled and the Windows Authentication is enabled. If the Anonymous Authentication is enabled, then the user will be able to view the web parts only in browse mode and will not be able to add, edit, or delete a web part.

To be able to Add, Edit, or Delete the Web Parts

1. Click Start.
2. Point to **Administrative Tools** > **Internet Information Services (IIS) Manager**. The **Internet Information Services (IIS) Manager** screen appears.
3. Expand **Sites** and select **Enterprise Config** site. Then select **Authentication** from the right pane.
4. Ensure that the authentication settings are as follows:
   - Anonymous Authentication: Disabled
   - ASP.NET Impersonation: Disabled
   - Basic Authentication: Disabled
   - Forms Authentication: Disabled
   - Windows Authentication: Enabled

If the Anonymous Authentication has been changed to 'Enabled' instead of the default 'Disabled' state as shown in the image given below, then the user has to disable Windows Authentication and enable Forms Authentication.

Follow the steps given below to change the Windows Authentication:

1. Right-click the **Windows Authentication** Mode and select **Disable**.
2. Right-click the **Forms Authentication** Mode and select **Enable**.

Note: This always works in the above mentioned combination. If the Forms Authentication is enabled then the Windows Authentication must be disabled and the Anonymous Authentication must be enabled in the IIS Manager. If in the above scenario, the Anonymous Authentication is not enabled, then the Auto-redirection for Active Directory will skip the login page and load the web parts only in Browse mode. In order to be able to add, edit, or delete the web parts, the user has to enable the Anonymous Authentication.

If the user changes the authentication mode to Forms, then the code given below should be added to the web.config file:

```
<authentication mode="Forms">
<forms timeout="500000" loginUrl="~/BPMUITemplates/Default/Repository/Site/Login.aspx">
</forms>
</authentication>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create Custom Web Parts

AVEVA Work Tasks provides six out of the box web parts. However, you can also create your own custom web parts to be used in the Enterprise Console.

For example, consider a scenario where you would like to see time zone information on the dashboard. The time zone information can be displayed on the dashboard by creating a custom web part and then adding it to the dashboard web part settings. You can select it from the dashboard web part settings and add it to the specified web part zone.

Note: You can customize the following sample code to create your own custom web parts.

To create custom web parts

Code to create a class library:

Note: In the class libarary, ensure that you add a reference to Skelta.WebParts and also inherit BaseWebPart as Skelta.WebParts.BaseWebPart.

```
using System.Data;
using Workflow.NET.Interfaces;
using Workflow.NET.Storage;
namespace CustomWebPart
{
public class TimeZone : Skelta.WebParts.BaseWebPart
{
protected override void CreateChildControls()
{
base.CreateChildControls();
System.Web.UI.WebControls.GridView gridView = new System.Web.UI.WebControls.GridView();
gridView.DataSource = this.GetData();
gridView.DataBind();
this.Controls.Add(gridView);
}
private DataTable GetData()
{
DataTable table = new DataTable();
IDataHandler dbHandler = DataHandlerFactory.GetDataHandler(new Workflow.NET.Config(Applicat
ionName));
using (dbHandler)
{
string query = "Select RegionalSetting, UTCDifference from SKTimeZones";
table = dbHandler.ReadData(query, null);
}
return table;
}
}
}
```

Place the dll in *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Bin* and AVEVA Work Tasks*Web**EnterpriseConsole**Bin* folders.

Note: If the assembly is strong named, place it in GAC and also add an entry in the web.config file.

Add a row in the SKAddinProvider table using the script given below: INSERT INTO [dbo].[SKAddInProviders] (Type,[Name],ClassName,Assembly) VALUES ('WebPart','<WebPartName>','<ClassName>','Bin\ProjectName.dll')

Navigate to **Enterprise Console** > **Settings** > **Web Part Pages**. Select any AVEVA Work Tasks home page.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Click the expand (+) icon of the Webparts Settings. The Webparts Settings pane expands.

In the **Select Web Part** list, select **TimeZone**.

In the **Select Zone** list, select **Web Part Zone Left**. Click **Add Web Part**. The TimeZone web part appears on the left zone of AVEVA Work Tasks home page.

Web Part Display Modes

AVEVA Work Tasks provides three display modes:

Browse: The **Browse** mode is a view-only mode.

Design: The **Design** mode allows the user to even delete the web part along with the **Minimize** and **Restore** options.

Edit: The **Edit** mode allows the user to edit the properties of web part.

Browse Mode

AVEVA Work Tasks provides three display modes - Browse, Design, and Edit in their home pages.

The Browse mode allows the user to only view the web page. The user can either minimize or restore the web page view. The user will not be able to delete or edit the web part in this mode.

To view the Browse mode

1. Go to **Enterprise Console** > **Settings** > **Web Part Settings** > **Page 1**.
2. Expand the **Webparts Settings** bar.
3. Click the **Browse** mode from the Web Part Display Mode drop-down list.
   By default, the home page is in **Browse** mode. You can see that the browse mode allows the user only to minimize the web part view. The user can neither edit nor delete the web part.

Design Mode

The Design mode allows the user to even delete the web part along with the Minimize and Restore options. The user can also move custom web parts into any of the web part zones.

For more information on adding a web part to the zones, refer to Adding Web Part to the Web Part Zone.

To view the Design Mode

1. Go to **Enterprise Console** > **Settings** > **Web Part Settings** > **Page 1**.
2. Expand the **Web Parts Settings** bar.
3. In the **Web Part Display Mode** drop-down list, select the Design mode.
   The Design mode is displayed on the screen.

You can see that in the design mode the Web part Zones are displayed as Web Part Zone Header, Web Part Zone Left, and Web Part Zone Right. The user can also use the minimize zone option and also delete the zone option. On using the minimize option, the user can click the Restore option in the same drop-down list to restore the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

web part zone.

Edit Mode

In addition to the Minimize/Restore and Delete options, the Edit mode allows the user to edit the properties of web part. In this mode the user can open the Editor Zone pane and select the required properties and customize the web parts according to their preferences. Even in this mode, the user can move the web parts across different zones and even add new web parts to any of the zones.

To view the Edit Mode

1. Go to **Enterprise Console** > **Settings** > **Web Part Settings** > **Page 1**.
2. Expand the Webparts Settings bar.
3. In the Web Part Display Mode drop-down list, select **Edit** mode.

   Now you can even see the Edit Web Part drop-down field with all the options – Minimize, Delete, and Edit.
4. Click the **Edit** option in the drop-down list, the Editor zone pane opens. Here, the user can select any of the properties to change the nature of the web part.

Web Part Enabled Home Pages

In the Enterprise Console, users can see four web parts - Inbox, BAM, Calendar, and Queue. In addition to these, AVEVA Work Tasks also provides three default home pages to work with.

Home page is like any other web page, a web part enabled page, to which AVEVA Work Tasks has provided multiple webpartzones, where the user can place web parts. A home page can also be used as the landing page based on the security group rights.

By default, AVEVA Work Tasks provides three home page templates. Based on the security group, the home page will be set as the landing page for the users who belong to that security group. Also, the users can change the personalization settings of the home pages based on security rights.

See Web Part Rights for more information.

Let us understand the Home Pages using a scenario. In a typical IT organization, we can find three levels of employees - Senior Developers, Division Head, and CEO. AVEVA Work Tasks home pages are assigned to each of these levels, based on the four default security groups. The Senior Developer is assigned to the Reader security group; Division Head is assigned to the Contributor group; and CEO is assigned to the Administrator group. However, the fourth security group, Limited Access, is not attached to any home page. Users assigned to this group can only view the Inbox.

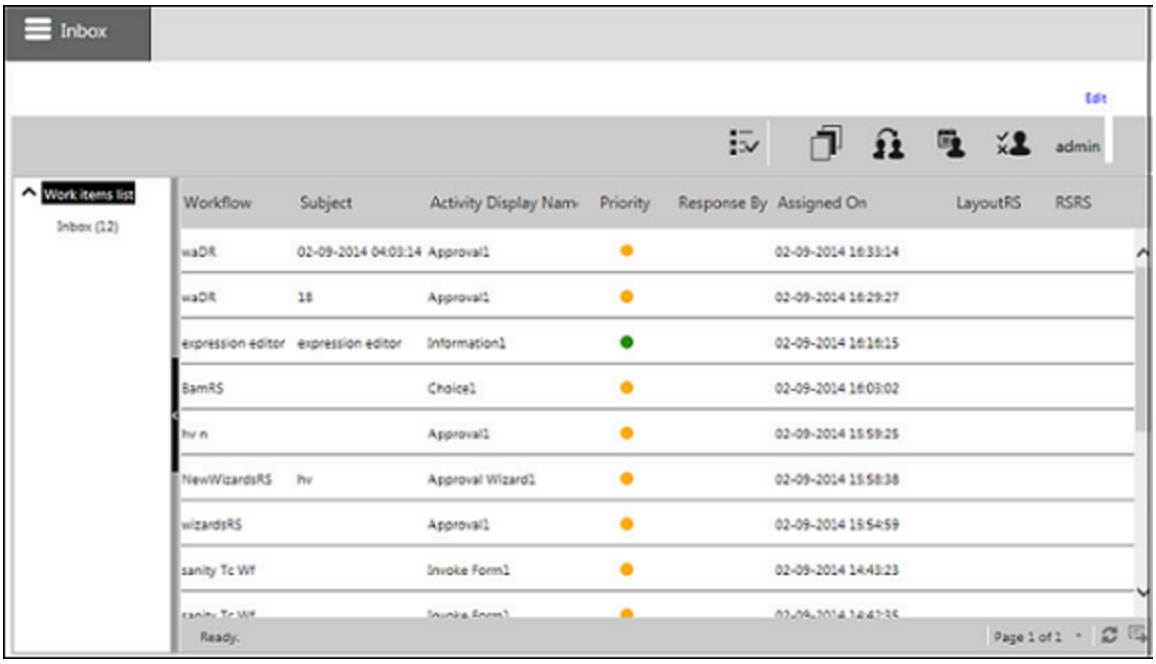
Even the default web parts are placed in these home pages according to the security group the user belongs to. However, the Inbox or work item web part is common for all security groups and will be a user-specific Inbox.

Inbox

Inbox

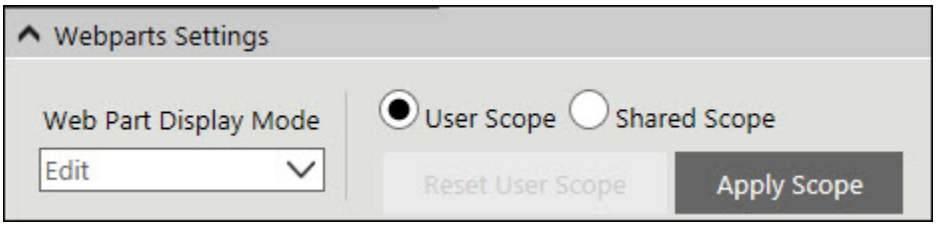
The Inbox web part page provides enhanced usability features. Workflow actors can view and respond to work items assigned in a user-interface that is similar to Microsoft Office Outlook. Work items are delivered to the actor's Inbox with a detailed view available on selection of the item. The name of the logged in user is displayed at the top right corner of the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

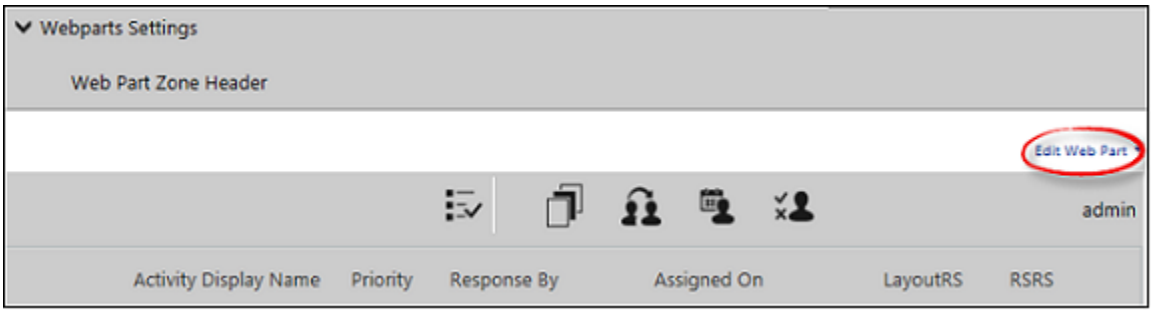


Based on the security provisions given, you can change the personalization settings.

To change the settings, expand **Webparts Settings** tab. Set the User Scope or Shared Scope in this tab. You can also reset the user scope.

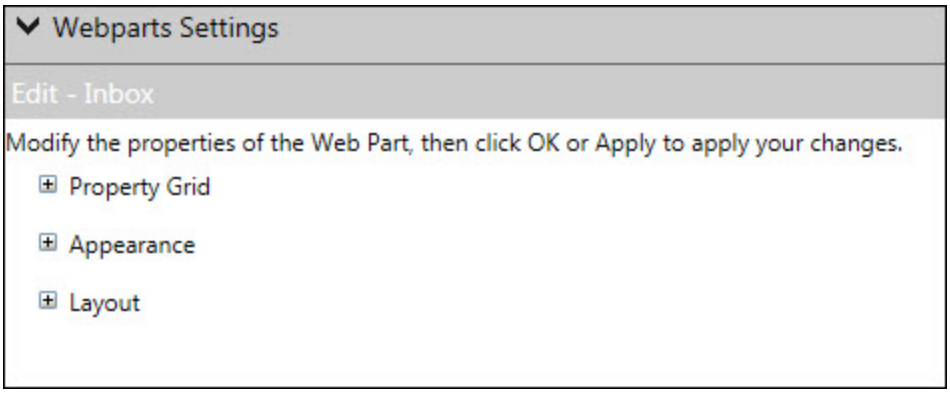


You can edit the web part from this page. Click **Edit Web Part**, and then select **Edit** to edit the web part



The editor zone appears. Select any of the properties under the Property Grid, Appearance, or Layout properties to change the web parts.

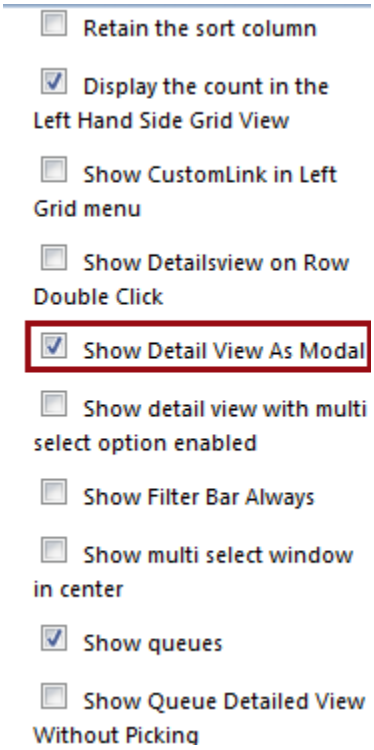
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



For more information, see Out-of-the-Box Web Parts page.

Modal or Modeless Window Property

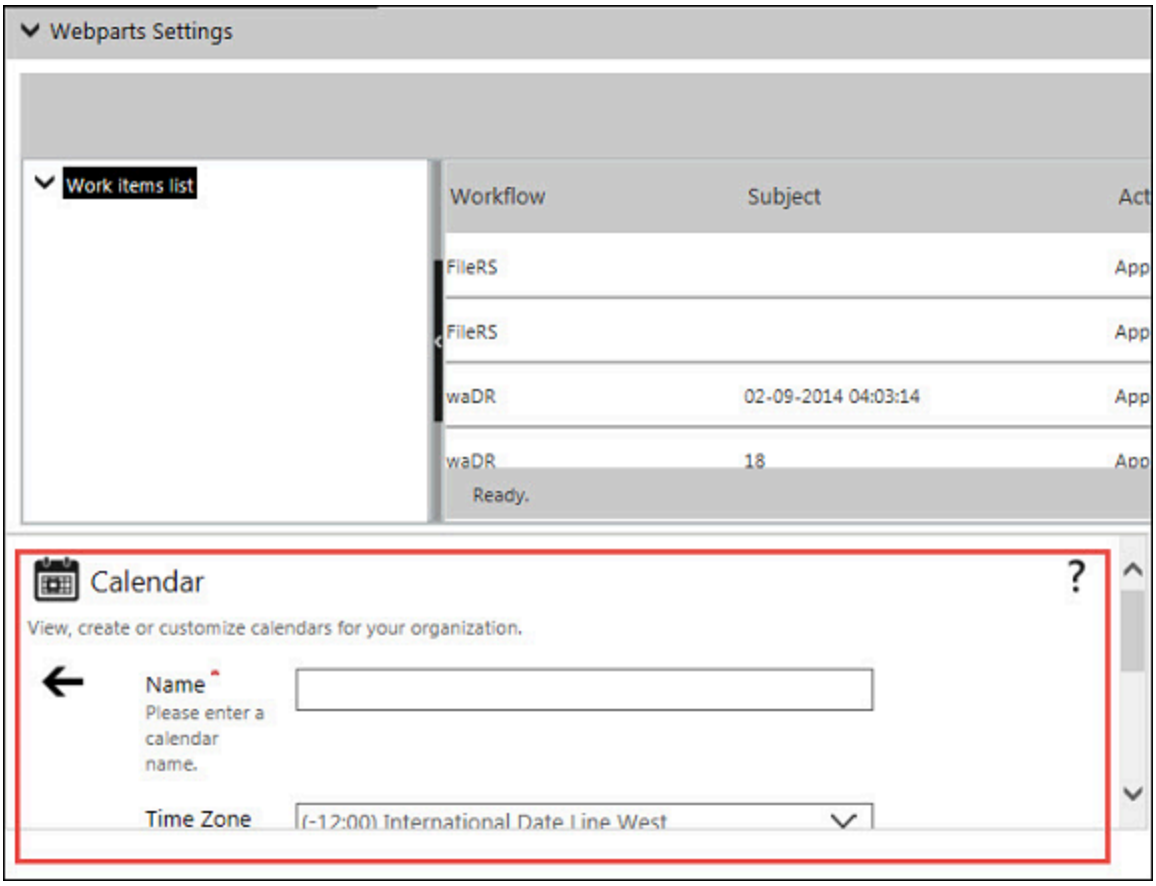
When you click a work item to edit, you can choose the editor to appear as a modal window or a modeless window. Select the Show Detail View As Modal option in the editor as shown in the following image:



Calendar

The AVEVA Work Tasks Calendar interface enables the creation of hierarchical organization and resource calendars. The Calendars are used to determine availability of resources, calculate time outs and perform other scheduling functions.

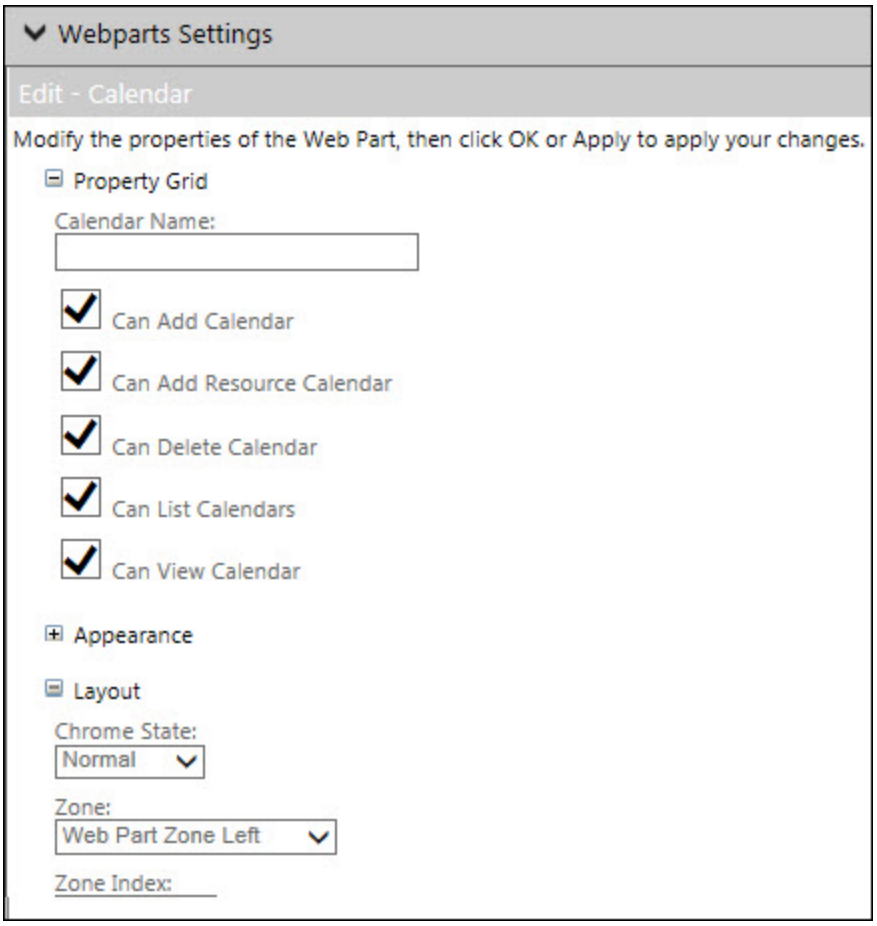
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The user can add a new calendar or set the resource calendar.

The personalization settings for the Calendar are the same as that of the Inbox we part page, but the properties in the editor zone differs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



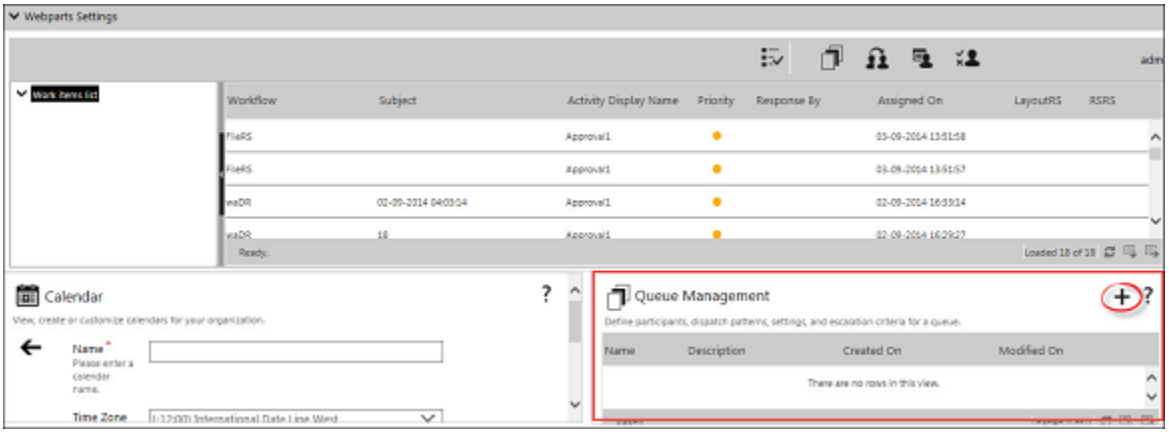
The user can edit any of the properties given here and change the web part.

For more information, see Out-of-the-Box Web Parts page.

Queue Management

The Queue Management enables you to create and manage queues for allocating workflow activities. This is done using the Queue control.

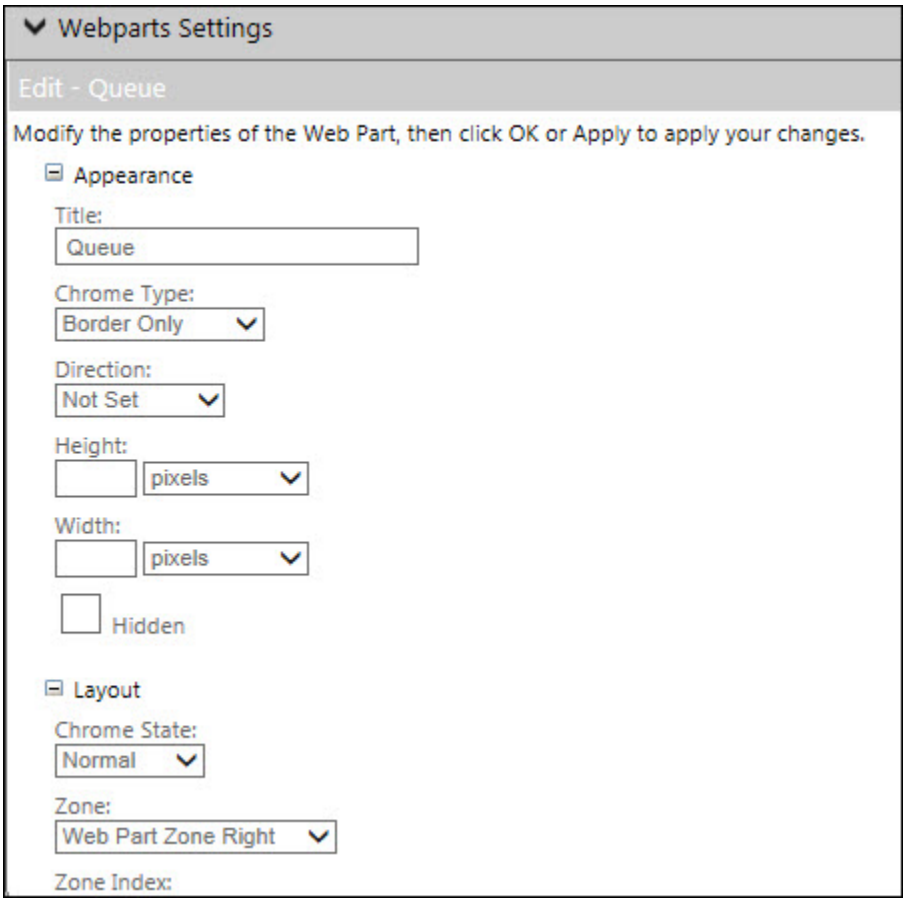
Queue control consists of only Appearance and Layout properties. It does not comprise of any property grid.



The users can add a new queue by clicking the **New Queue** button.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The personalization scope for **Queue Management** remains the same as the Inbox and Calendar Web Part pages but the editing properties differ.

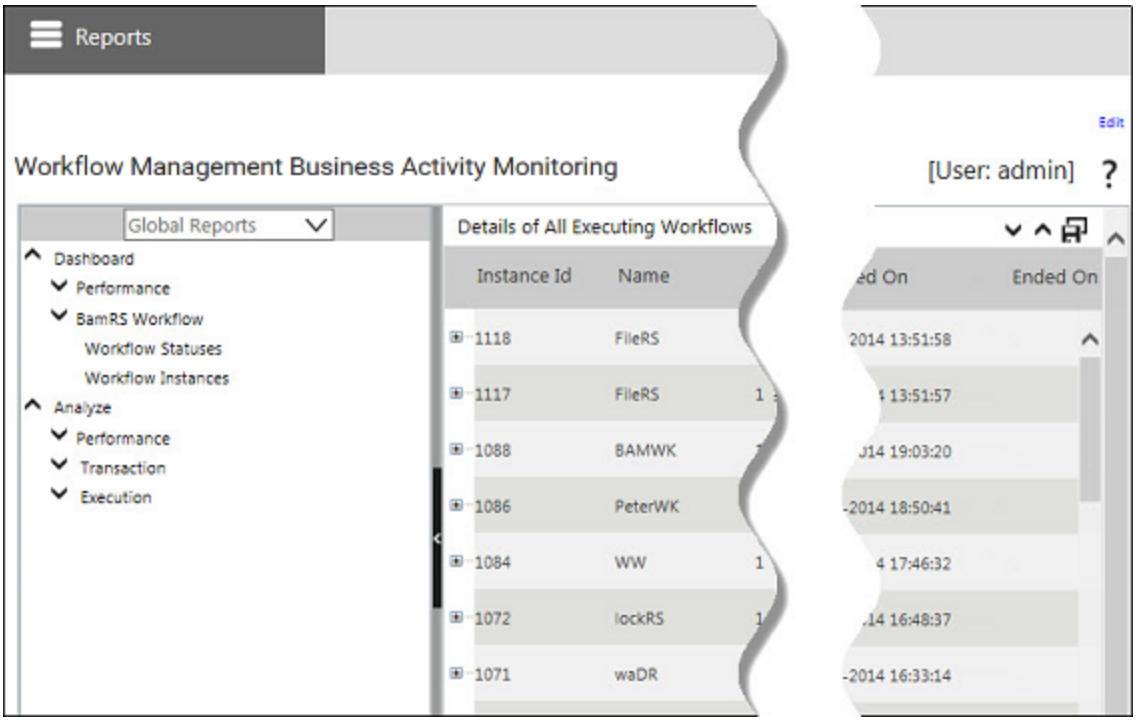


For more information, see Out-of-the-Box Web Parts page.

Business Activity Monitoring

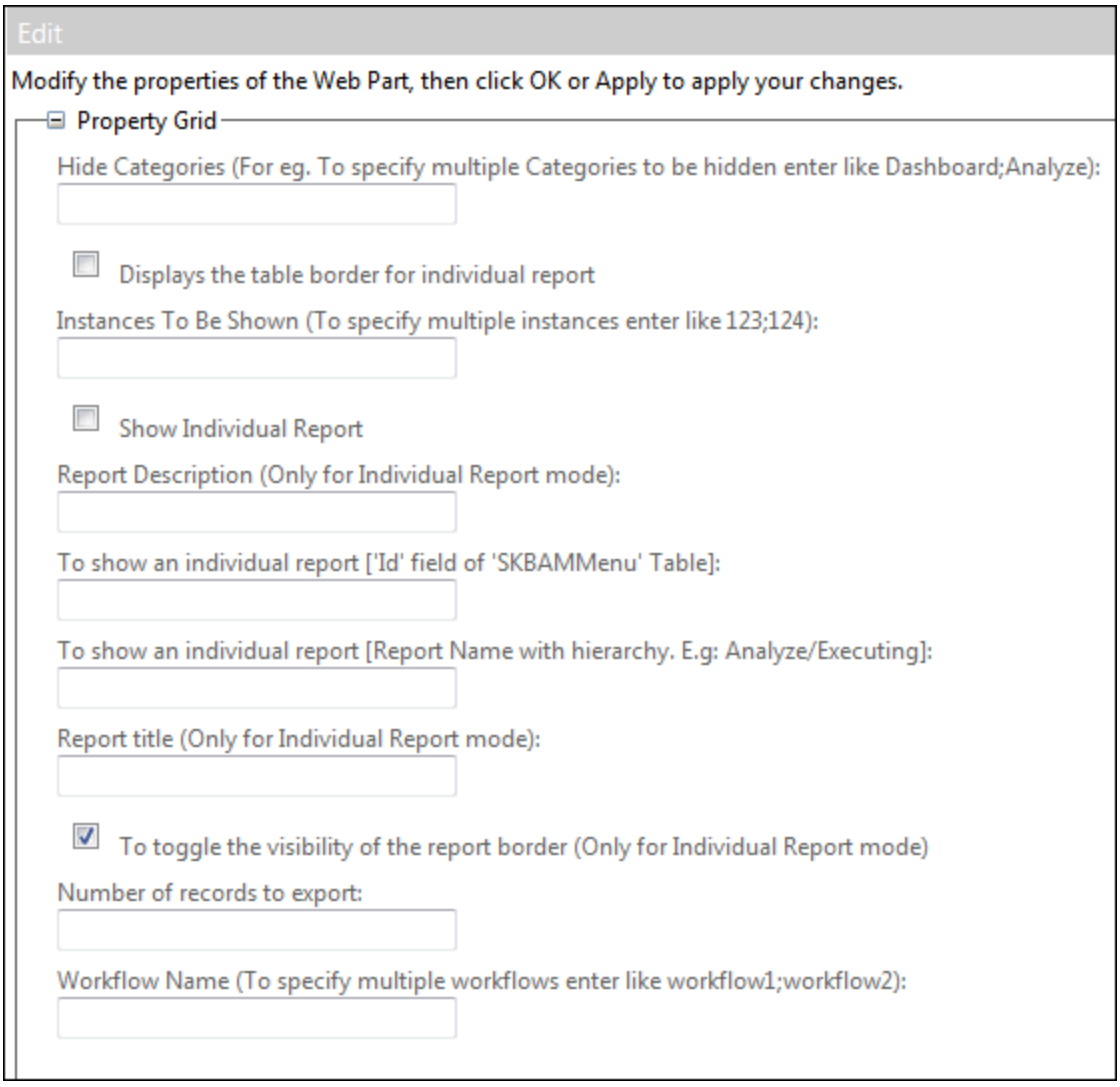
The **Business Activity Monitoring** Dashboard is a key AVEVA Work Tasks Server Control. You can use the dashboard to monitor the execution of a workflow and provides an array of real-time reports. This report includes status and performance of workflows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



You can edit the way the reports are displayed in the BAM by using the editor zone.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



For more information on editing the BAM properties, see Out-of-the-Box Web Parts page.

Page 1

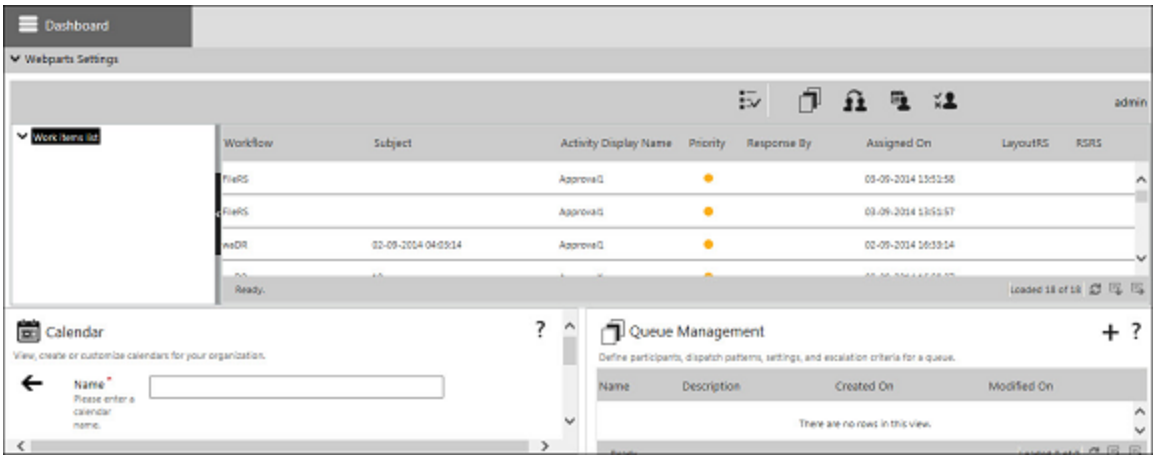
This Home Page is basically designed for the users who for example play the role of a Senior Developer. Home Page 1 has three web part zones.

AVEVA Work Tasks provides default web parts located in the above web part zones for Home Page 1 as shown below:

- Web Part Zone Header
  In this zone, the Work Item List web part is added.
- Web Part Zone Left
  In this zone, the Calendar web part is added.
- Web Part Zone Right

In this zone, the **Queue** web part is added.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

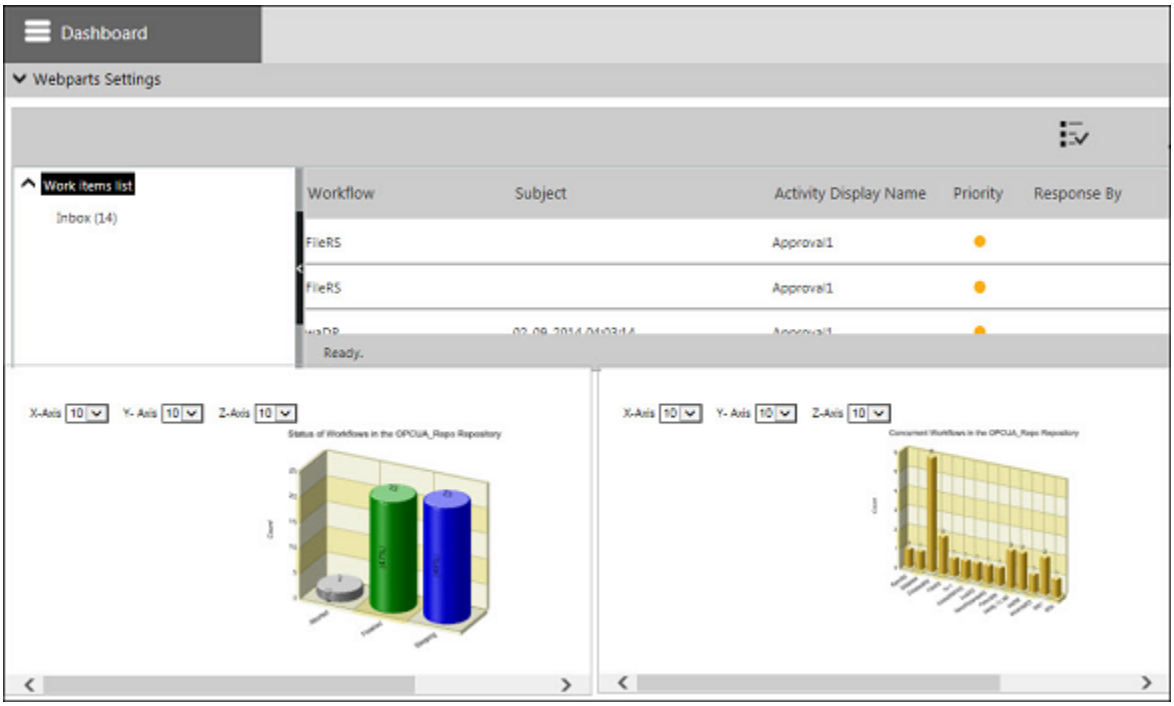


Users can add additional controls to the same zone, provided they have the required security rights.

Home Page 1 is the landing page for the users who belong to the Reader security group. For more information on Security rights, refer to Web Part Rights.

Page 2

This Home Page is basically designed for users who for example play the role of a Division head. Hence, this home page is provided with three default web parts - Inbox and Business Activity Monitoring reports. Home Page 2 has three web part zones.



AVEVA Work Tasks provides default web parts located in the above web part zones for Home Page 2 as show below:

- Web Part Zone Header - In this zone, the Work Item List web part is added.
- Web Part Zone Left - In this zone, the BAM Workflow Statuses web part is added.
- Web Part Zone Right - In this zone, the BAM Workflow Instances web part is added.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Users can add additional controls to the same zone, provided they have the required security rights.

Home Page 2 is the landing page for the users who belong to the Contributor security group. For more information on Security rights, refer to Web Part Rights.

Page 3

When you click **Web Part Pages > Page 3,** you will always be redirected to **Page 2**.

Create Custom Page

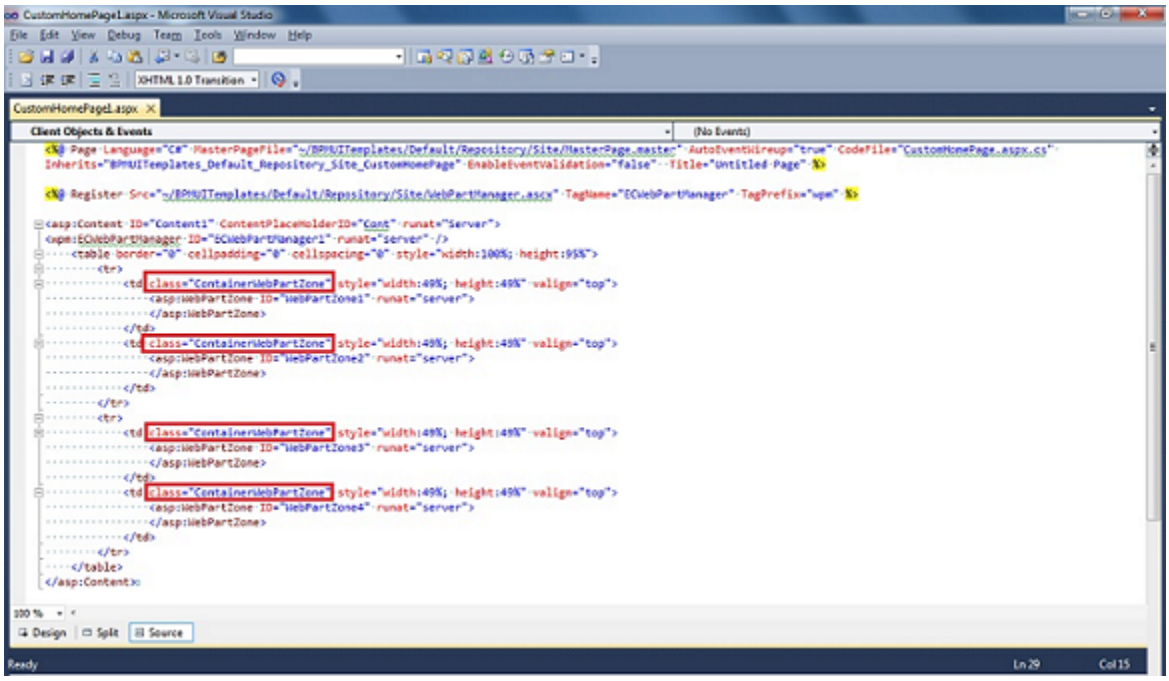
Custom home pages can be created according to the organizational requirements and needs. The section below gives details on how to create Custom Home Page.

To create a new custom home page

1. Right click on the folder in solution explorer, where you want to create a new custom home page, or click on **File** > **New** > **File** in Visual Studio.
2. Specify the page name, for example CustomHomePage.aspx, and click **Add**.
3. Include the following Register directive for the WebPartManager.

   <%@ Register Src="~/BPMUITemplates/Default/Repository/Site/WebPartManager.ascx" TagName="ECWebPartManager" TagPrefix="wpm" %>
4. Provide the html for the page layout and place the web part zones in an appropriate order.
5. Apply the styles and specify names and labels for them.

   Create a table to define the web part zones in an appropriate order. Add the class "ContainerWebPartZone" to the container of the web part zone, refer image below. This class will ensure that the height and width of the web part is adjusted to the height and width of its web zone .



In the above image <td> is the container of the web part zone and the class within the container is highlighted.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Specify the below property to the Page directive:

   EnableEventValidation="false"

7. The ECWebPartManager user control should be the first control in the page:

   <wpm:ECWebPartManager ID="ECWebPartManager1" runat="server" />

8. Create a navigation menu for the new home page
   a. Navigate to **Repository Settings** > **Advanced Settings** > **Manage Navigation List**.
   b. Click on **Navigation** and specify the details.
9. Log out and Login, as the Enterprise Console menu is cached.
10. Drill down the menu and click on it.
11. A blank page with only the Webparts Settings option will be displayed.

    The page is blank, as only the web part zone(place holders) have been added and not the web parts. Web Parts have to be added through the Webparts Settings option, the following steps will give you details on how to add web parts:
12. Expand Webparts Settings at the top left corner, to view the toolbar.
13. Select the Web Part, which you want to add to the page from the Select Web Part drop down.
14. Select the Web Part Zone, to which you want to add the selected web part from the Select Zone drop down. Click **Add Web Part** button.

The web part will be added to the selected web part zone.

Similarly you can add other web parts to the other web part zones.

Setting up the custom home page as the landing page (Dashboard) for the logged-in user:

We need to make an entry into the SKEWebPartTemplates and SKEWebPartLayouts tables to reflect the custom home page in 'Default Home Page' right.

```
insert into SKEWebPartTemplates values(NEWID(), '<ApplicationName>', '<HomePage Name>',
'<HomePage Path>', 'User')
insert into SKEWebPartLayouts values(NEWID(), '<TemplateId>', '<HomePage Name>', null,
 '<ApplicationName>', GETUTCDATE())
```

Example:

```
insert into SKEWebPartTemplates values(NEWID(), 'Bata7Repo', 'Custom home page',
'~/BPMUITemplates/Default/Repository/Site/CustomHomePage.aspx', 'User')
insert into SKEWebPartLayouts values(NEWID(), '980D6D0E-137C-46AF-8417-81BD7F1D52A7',
'Custom home page', null,  'Bata7Repo', GETUTCDATE())
```

After that we can edit the security group and set the custom home page as the Default Home page. Then when the user logs-in Enterprise Console, they will be landed to the Custom home page.

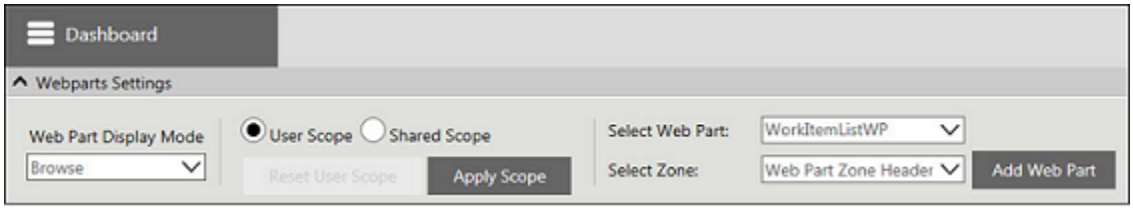
Note: To use the **Fill Form** web part in the custom ASPX page include the following script in that page.

```
<script>
function open_win(path)
{
OpenWindow(path);
}
</script>
```

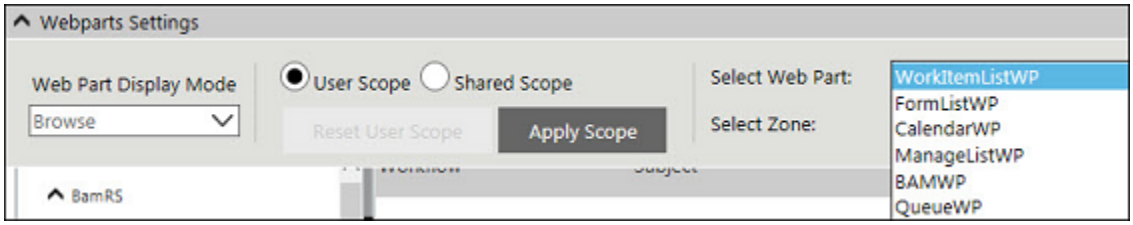
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Add a Web Part to the Web Part Zone

1. Go to **Enterprise Console** > **Settings** > **Web Part Settings** > **Page 1**.
2. Expand Webparts Settings.

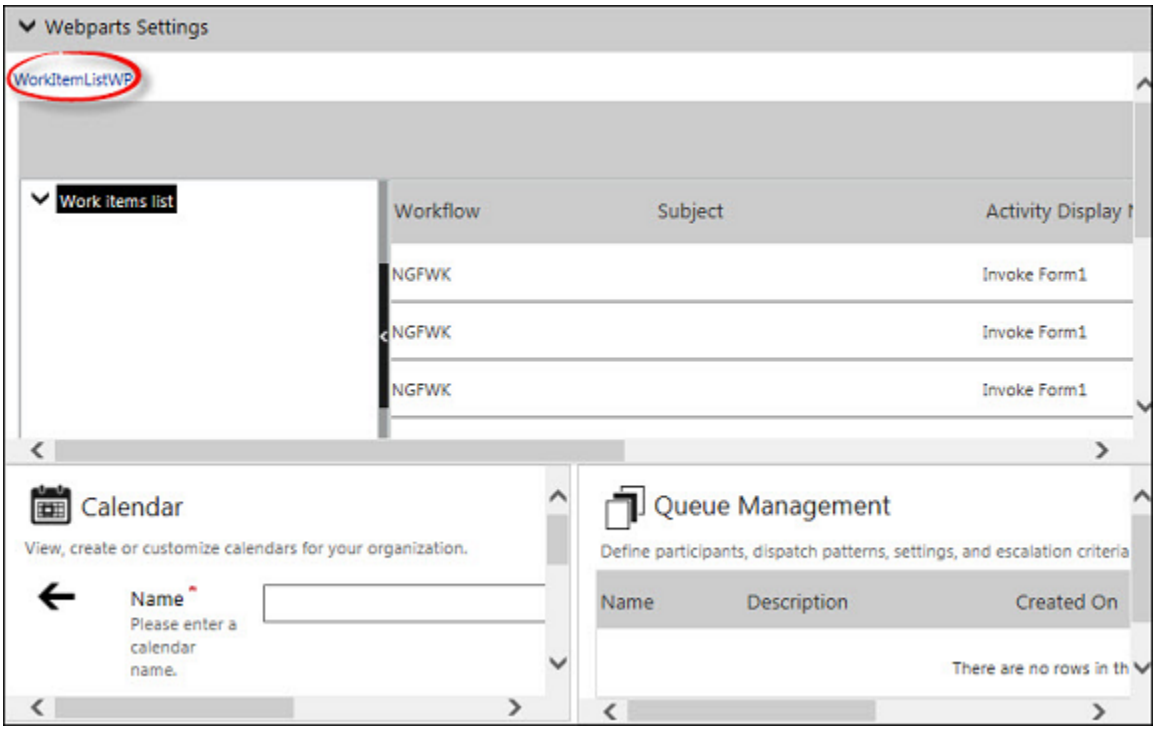


3. Select **WorkItemListWP** from the **Select Web Part** drop-down list.



4. You can see that all the default web parts and the custom web parts are listed in this drop-down list.
5. Select the **Web Part Zone Header** for the web part from the **Select Zone** drop-down list. Since you have selected Home Page 1, you can add the web part in any one of the three default zones - Header, Left, and Right.
6. Click **Add Web Part**.

After adding the web part to the selected zone, the home page will look like the image displayed below.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Delete Web Part

Users can delete a web part by going to the design mode or edit mode in the Web Part Settings ribbon bar.

To delete a web part

1. Open a home page from which you want to delete a web part..
2. Go to the **Design** or **Edit** mode in the **Web Part Settings** ribbon bar.
3. Select the **Delete** option in the Edit Web Part drop-down list of the web part you want to delete.
4. A message from the web page appears asking you if you want to delete this web part permanently.
   You can see that the **My Inbox Web Part** is deleted from the header zone and only the Work Item List web part is retained.

Edit a Web Part

Users can edit a web part by accessing the editor zone pane. To enable editing, you have to make sure that the web part is in the Edit mode.

To edit a web part

1. Go to the Edit mode in the Web part Settings ribbon bar.
2. Select the **Edit** option in the drop-down list of the web part you want to edit. The editor zone pane opens.
3. In the **Appearance** section of editor zone pane, select the **Title Only** property in the **Chrome Type** drop-down list of the Appearance properties. By selecting this property, only the title of the web part will be displayed and the border will be hidden.
4. Click **Apply** and **OK**.
   You can see that the borders of the Calendar web part are hidden and only the title is displayed.

Minimize and Restore Web Parts

Users can minimize or restore the web part. On using the minimize option, the user can click the Restore option in the same drop-down list to restore the web part zone.

To minimize the web part

1. Open a home page in any of the modes.
2. Click the **Minimize** option given in a drop-down list at the right - end of the web part.

To restore the minimized web parts

- Click the **Restore** option given in a drop-down list at the right - end of the web part.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Web Part Rights

AVEVA Work Tasks provides a set of web part rights to enable you to use the web parts more effectively.

Security Rights for Web Parts

Name of Web Part Right	Description
Web Parts Rights	It is the parent right for grouping the below rights.
Add Web Parts	Authorizes the user to add the web parts to the home page.
Delete Web Parts	Authorizes the user to delete the web parts properties of the home page.
Edit BAM Personalization Scope	Authorizes the user to change the personalization scope for the BAM control page.
Edit Calendar Personalization Scope	Authorizes the user to change the personalization scope for the Calendar control page.
Edit Home Page Personalization Scope	Authorizes the user to change the personalization scope for the logged-in user.
Edit Queue Personalization Scope	Authorizes the user to change the personalization scope for the Queue control page.
Edit Web Parts	Authorizes the user to edit the web parts properties of the home page.
Edit Work Item Personalization Scope	Authorizes the user to change the personalization scope for the Work items list control page.
Default Home Page	This right gives the provision to specify the default home page for the security group.
Personalize BAM Control	Authorizes the user to personalize the BAM control.
Personalize Calendar Control	Authorizes the user to personalize the Calendar control.
Personalize Queue Control	Authorizes the user to personalize the Queue control
Personalize Work Item Control	Authorizes the user to personalize the Work items

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name of Web Part Right	Description
	list control.
Reset User Personalization Scope	Authorizes the user to reset the personalization data for “user scope”.
Show Home Page Web Part Settings	This right authorizes the user to see the home page web parts setting, so the user can change the settings based on the individual web parts setting rights.
Show Ribbon Bar	Authorizes the user to make visible/invisible the ribbon bar of the list control web part.

This table shows the different web part rights given to the security groups:

Right Code	Administrator	Contributor	Reader	Limited Access
WebPartsRights	Yes	Yes	Yes	No
HomePage	Yes	Yes	No	No
ShowHomePageWebPartSettings	Yes	Yes	No	No
EditHomePageScope	Yes	Yes	No	No
ResetUserScope	Yes	No	No	No
AddWebParts	Yes	No	No	No
EditWebParts	Yes	Yes	No	No
DeleteWebParts	Yes	No	No	No
PersonalizeWorkitemControl	Yes	No	No	No
EditWorkitemScope	Yes	Yes	No	No
PersonalizeCalendarControl	Yes	No	No	No
EditCalendarScope	Yes	Yes	No	No
PersonalizeQueueControl	Yes	No	No	No
EditQueueScope	Yes	Yes	No	No

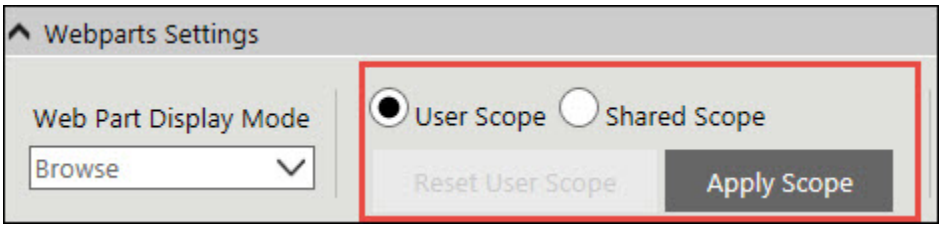
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Right Code	Administrator	Contributor	Reader	Limited Access
PersonalizeBAMControl	Yes	No	No	No
EditBAMScope	Yes	Yes	No	No
ShowRibbonBar	Yes	Yes	No	No

Note: If security flag is disabled, then the above given rights for the web parts will not be effective.

Personalize Scope in Web Parts

In the AVEVA Work Tasks Web Parts, users can use two scopes – User scope and Shared scope.



By default, all the home pages are in the User scope. When the user selects the Shared scope, by default the home page will be empty. On clicking the Reset User Scope option, the existing controls will be deleted and the default controls will be added.

- **User:** Individual users can not personalize properties scoped as Shared. They can personalize User-scoped properties, and their values for these properties take precedence over the property values assigned when the page was in Share scope. If the user-specific personalization data on a control is lost or reset, User-scoped properties revert to the values they had when the page was in Shared scope.
  Individual users can close a shared control for themselves, which adds it to the Page Catalog, but they cannot permanently delete it.
  Individual users can personalize both Shared and User scoped personalizable properties on the control for themselves, because the control instance is completely private.
  Individual users can also permanently delete the control.
- **Shared:** WebPart controls are shared by default. An authorized user can personalize both Shared and User scoped properties on the control for all users.
  In the case of a dynamic control (a control that is added to the page programmatically, or from a catalog of controls), an authorized user can permanently delete it for all users.
  In the case of a static control (a control that is declared in the markup of an .aspx page), it cannot be deleted, although an authorized user can close the control for all users.
- **Per-user control:** The control cannot be personalized with the page in Shared scope, because the control does not even appear on the page. The control only appears when the page is in User scope.

Recommendations in Web Parts

- Security Group Mapping in List Control Web Part should be used at List level and ListItem level.
- Show Content from Multiple Lists
  Mandatory configurations for Adding Multiple List Control Web Part in Dashboard:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Disable the properties Show Header and Show Ribbon Bar
- Use unique list view names across all the List Control Web Part
- Create list views with All items enabled
- Let us assume a scenario where the user creates similar list in multiple list control web parts placed in one home page. In such a scenario, the user may not be able to view the list views properly

- Users are recommended to refresh the grid manually after creating items or folders in a grid.
- Users can specify height and width in percentage or in pixels for all the web parts except the Queue Control web part. However, for the FormsList web part the users can specify the height and width in pixels alone.
- In Firefox Dashboard, the users can move the web parts across the zones by using the Web Editor.
- Users are recommended to use the below mentioned Web Parts only once in a home page:
  - Calendar controls
  - Queue

  Note: When multiple lists are present in the Web Parts, changes done to the lists like adding new list item or modifying/deleting an existing list item may not be reflected in the lists present in the web parts. User needs to manually refresh the grid.

Report Service

AVEVA Work Tasks Reports are hosted using the SQL Server Reporting Services. These reports are generated using the templates deployed in the reporting server. The reporting server contains several report templates from which the user selects an appropriate template and generates the required reports. The **Report Generator** activity provides an execution facility for those reports and enables the user to send the report as an Email attachment, a link, or as an embedded report using the viewer control in **AVEVA Work Tasks Form**.

The AVEVA Work Tasks, by default, does not have ArchestrA reporting server information. Hence, AVEVA Work Tasks workflow requires the ArchestrA reporting service information, to execute the ArchestrA report from the workflow.

To send the reports through AVEVA Work Tasks, use the Report Generator activity and the following AVEVA Work Tasks lists:

- **Report Generator Activity:** Use this activity to configure a Report Template and also to save the generated report in the Reports list. For more information, see *Report Generator Activity* in the *Developer Guide*.
- **Connections:** This list contains the report server information, report execution credentials, and the default path. Use this information to connect to the SSRS web service to fetch the report template information in order to execute the report. For more information, see Configuring Report Connection.
- **Templates:** This list contains report templates that runs at run time using the report server information mentioned above. For more information, see Configuring Report Templates.
- **Reports:** This list contains reports which are generated using the Report Generator activity. You can manually import the previously created reports. For more information, see Configuring Reports.

  Note: An error message *ASP.NET session has expired or could not be found* is displayed by SQL Server Reporting services when a Form has Report Viewer control and is open for a long time.
  For Report Server, the default session timeout is 600 seconds (10 minutes). You can increase this timeout to any value and based on these settings, session timeout will occur.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Sample Business Case Study

Using AVEVA Work Tasks, we can configure a production report on completion of different stages of production and also send the report as an email attachment based on which the 'officer in charge' approves the finalization of the product. This enhances the discrete manufacturing line of AVEVA MES.

Perrot's manufacturing unit is involved in production of Perrot airplanes (Boeing 787 Dream Liner). AVEVA MES is configured to represent a discrete manufacturing line, where completing every stage is monitored and recorded. Due approval is required for the finalization of airplanes and hence, AVEVA Work Tasks can be used for managing this whole process. AVEVA Work Tasks is capable of the following functions:

- Generate a production report which resides on the AVEVA Information Server as an AVEVA Workflow MES report.
- The report uses AVEVA's MES Database and AVEVA Alarm Database to connect production time, production line with the Aircraft ID and other context parameters which can go upto 256.
- The generated report is sent as an email attachment to different departments, including Quality Management, Aircraft control, production planning, shipment and customer management.
- Copies of the same email can be sent to the CEO and CFO of Perrot as the completion of an aircraft is an event to be celebrated.
- Officer-in-charge of each department reviews the report received and approves the finalization.
- On obtaining the approvals the Customer Management arranges for FAT (Acceptance Test).
- On obtaining FAT, the procurement departments issues the invoice

Once the invoice is issued, AVEVA Work Tasks scenario ends. AVEVA Work Tasks facilitates the generation of a detailed production report and intimate the approver, officer's in charge or heads of different departments and the company, obtain required approval and manage the process till the invoice is issues by the procurement department.

Connections

This section provides information on how to create, configure, modify, or delete a Report Connection.

Configure Report Connection

To configure a Report Connection, do the following steps:

1. Log on to the **Enterprise Console**.
2. In the Enterprise Console, click menu icon, click **Settings**, click **Reporting Service**, and click **Report Connections**.

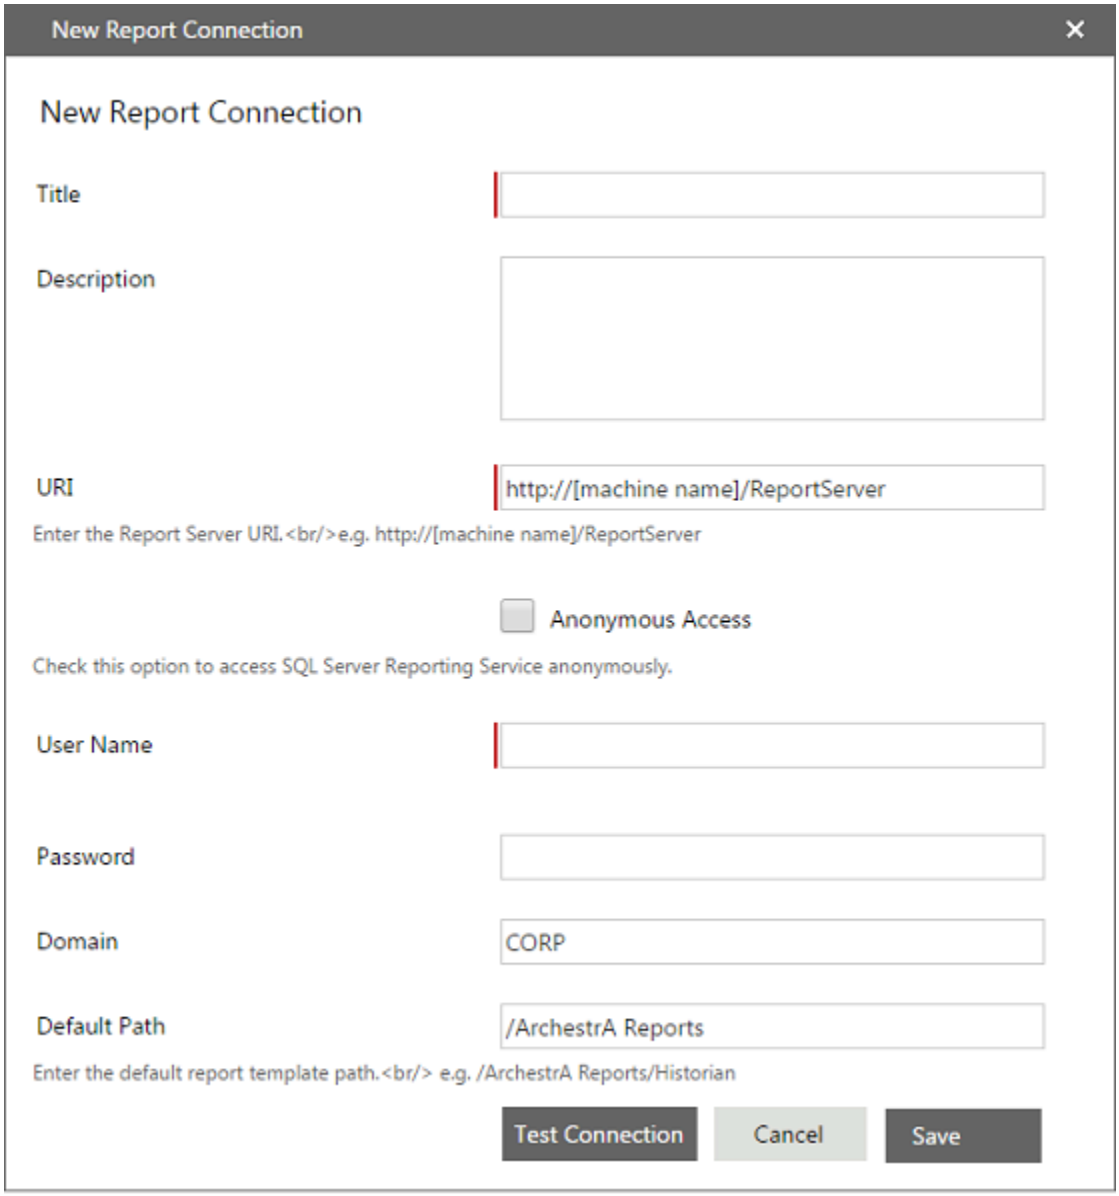
   The **Report Connections** page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create a New Report Connection Item

To create a new report connection item

1. On the action bar, click **New**. The **New Report Connection** wizard appears.



New Report Connections - Properties:

- **Title:** Title for a new Report Connection. The text entered in this text box cannot be edited as this is a unique text box.

  Note: Title cannot contain special characters such as # ~ & + \ " ' < > | @ ! $ % * ( ) = / { } ?

- **Description**: Description of the new Report Connection.

  Note: Title cannot contain special characters such as # ~ & + \ " ' < > | @ ! $ % * ( ) = / { } ?

- **URI**: Report Server URI. For example, http://

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Unique Resource Identifier (URI) is the URL of the web service to which the user needs to connect to execute a report.

- **Anonymous Access**: Check this option if the URI specified above is configured to be accessed anonymously. The test connection succeeds only if the URI is accessible anonymously. The user need not specify the user credentials if this option is checked.

  Note: The **Anonymous Access** option would not work for SSRS 2008, as it is not supported out of the box.

- **User Name**: User name to access the above URI. If the Anonymous Access option is not checked, then enter the user name in this text box to access the above mentioned URI.
- **Password**: Password for User Name.
- **Domain**: Name of the domain in which the above mentioned user exists.
- **Default Path**: Enter the default report template path. This information is required to locate a specific group of report templates that have been deployed in the reporting server. For example, the templates are stored in this location - /ArchestrA Reports/Historian
- **Save**: Save option is for saving the entries made.
- **Test Connection**: To test whether the report connection is valid or not.

2. Click **Test Connection**. If you have not provided valid URI and connections, then the test connection fails. If the connection is successful, then test connection successful message appears.
3. Click **Save** to store the details. By clicking the **Save** option, the connection will be tested with all the given information and then will save it. The new connection appears in the **Report Connections** list window.

Modify Report Connection Item

The **Edit** option allows you to modify an existing report connection list item.

To edit an existing report connection item

1. Select the report connection item to be modified.
2. Select **Edit** from the right-click context menu or click **Edit** from the ribbon bar.

   The **Edit Report Connection** window appears.
3. Edit the information given in all the text boxes except the Title text box. This text box is unique and non-editable.
4. Click **Test Connection**.
5. Click **Save** to store the details.

Delete Report Connection Item

The **Delete** option enables you to delete an existing report connection item.

To delete a report connection item

1. Select the report connection item to be deleted.
2. Select **Delete** from right-click context menu or click **Delete** from ribbon bar.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. In the pop-up window, click **Yes** to delete the selected report connection item.

   If the connection is being used by any of the **Report Template** list items, then the connection cannot be deleted.

   If the report connection is deleted successfully, then the successful deletion message appears.

Report Templates

This section provides information on how to create, configure, modify, or delete a Report Template.

Configure Report Templates

To configure Report Templates

1. Log on to the **Enterprise Console**.
2. In the Enterprise Console, click menu icon, click **Settings**, click **Reporting Service**, and then click **Report Templates**.

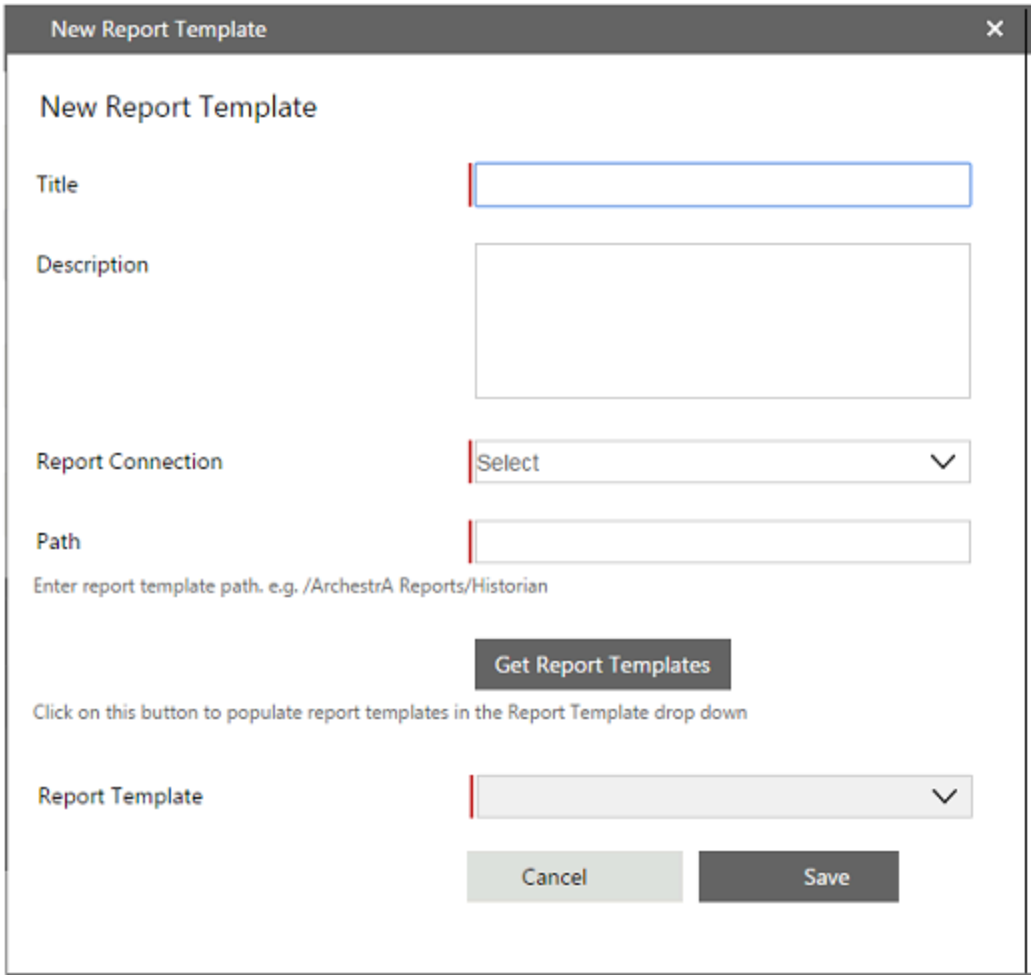
   The **Report Templates** page appears.

Create a New Report Template Item

To create a new report template item

1. On the action bar, click **New**. The **New Report Template** wizard appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



New Report Templates - Properties

- **Title**: Title for a new Report Template. The text entered in this text box cannot be edited as this is a unique text box.

  Note: Title cannot contain special characters such as # ~ & + \ " ' < > | @ ! $ % * ( ) = / { } ?

- **Description**: The description for the Report Template.

  Note: Description cannot contain special characters such as # ~ & + \ " ' < > | @ ! $ % * ( ) = / { } ?

- **Connection**: Select the required Report Connection from the drop-down list of available connections created in the Report Connection list.
- **Path**: Enter the path where all the report templates are stored. If the path has been mentioned while creating a Report Connection, then the path is populated in this text box upon selecting that Report Connection. The user can change this path and give a different path.
- **Get Report Template**: By clicking on the Get Report Template button, the available report templates will be populated in the Report Template text box.
- **Report Template**: Select the required report template.
- **Save**: This property is to save the entries made.

2. Click **Save** to store the details. If the report connection is successful, then the report template will be saved successfully. The new report template appears in the Report Template list window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Modify a Report Template Item

The **Edit** option allows you to modify an existing report template item.

To edit an existing report template item

1. Select the report template item to be modified.
2. Select **Edit** from the right-click context menu or click **Edit** from the ribbon bar.
3. The **Edit Report Template** window appears.
4. Edit the information in all the text boxes except the **Title** text box. This text box is unique and non-editable.
5. Click **Save** to store the details.

Delete a Report Template Item

The **Delete** option enables you to delete an existing report template item.

To delete a report template item

1. Select the report template item to be deleted.
2. Select **Delete** from right-click context menu or click **Delete** from ribbon bar.
3. In the pop-up window, click **Yes** to delete the selected report template item.

Reports

This section provides information on how to create, configure, modify, organize, or delete a Report Item.

Configure Reports

To configure a Reports Connection

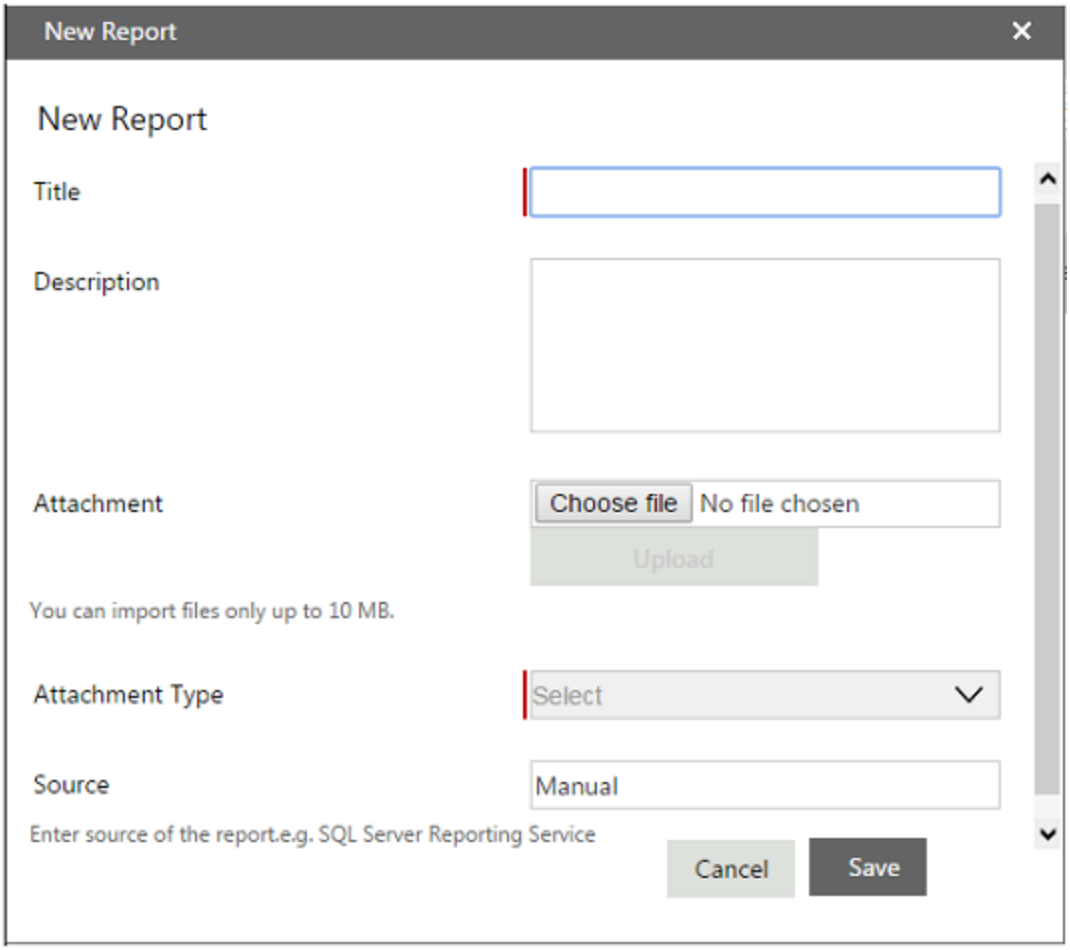
1. Log on to the **Enterprise Console**.
2. In the Enterprise Console, click menu icon, click **Settings**, click **Reporting Service**, and then click **Reports**. The **Reports** page appears.
3. To create a new report item, see Create a New Report.

Create a New Report Item

To create a new report item

1. On the Action bar, click **New**, and then click **Report**. The **New Report** wizard appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



New Report - Properties

- **Title**: Title for a new Report. The text entered in this text box cannot be edited as this is a unique text box.

  Note: Title cannot contain special characters such as # ~ & + \ " ' < > | @ ! $ % * ( ) = / { } ?

- **Description**: Description of the new Report.

  Note: Title cannot contain special characters such as # ~ & + \ " ' < > | @ ! $ % * ( ) = / { } ?

- **Attach Report**: This property allows the user to select the required report to be attached. Upon clicking the Click here to Attach link, the required report can be browsed and attached. The user can even detach the report and attach a different report in this property.
- **Attachment Type**: This property allows the user to select the type of attachment for the report to be attached. The attachment formats supported are PDF, Excel, Image, and others.
- **Source**: This property allows the user to give the source of the report to be attached. The default value in this text box is Manual. If a report is stored in the List using Report Generator activity, then the source would be "Report - Workflow Name".
- **Save**: This property is to save the entries made.

2. Click **Save**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Modify a Report Item

The **Edit** option allows you to modify an existing report item.

To edit an existing report Item

1. Select the report item to be modified.
2. Select **Edit** from the right-click context menu or click **Edit** from the ribbon bar.
3. The **Edit Report** screen appears.
4. Edit the information in all the text boxes except the **Title** text box. This text box is unique and non-editable.
5. Click **Save** to store the details.

Delete a Report Item

The **Delete** option enables you to delete an existing report item.

To delete a report item

1. Select the report item to be deleted.
2. Select **Delete** from right-click context menu or click **Delete** from ribbon bar.
3. In the pop-up window, click **Yes** to delete the selected report item.

Organize Reports

Organize a report by moving the report to a folder or by making the report a child item of another report.

To organize a report by moving the report to a folder

1. In the **Enterprise Console**, click menu icon, click **Settings**, click **Reporting Service**, and then click **Reports**. The **Reports** page appears.
2. On the action bar, click **Organize**. The **Organize Reports** dialog box appears.
3. Drag a report to a folder. The report is moved to the folder.
4. Click **Close**. The **Organize Reports** dialog box is closed.

To organize a report by making the report a child item of another report

1. In the **Enterprise Console**, click menu icon, click **Settings**, click **Reporting Service**, and then click **Reports**. The **Reports** page appears.
2. On the action bar, click **Organize**. The **Organize Reports** dialog box appears.
3. Drag a report to another report. The report is now a child item of another report.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click **Close**. The **Organize Reports** dialog box is closed.

Configure Reports for Reporting Service

Given below are the steps to configure AVEVA Work Tasks Reports for Reporting Service. This is a five-step process which comprises of:

Prerequisites

1. AVEVA Information Server should be configured.
2. The Historian and Alarm applications should also be configured before configuring Reports.

To configure Reports

1. After configuring the AVEVA Information Server, open the **Configurator** from the **Start** > **All Programs** > **AVEVA** > **Information Server**
2. Select **Archestra Reporting** in the Configurator window.
3. Create a Data Source for Historian Sample Reports and Alarm Sample Reports.
4. Click the **Configure** button to configure Reports.

To verify Reports Configuration

1. After configuring the Reporting, open browser and enter the following URLs:
   a. http://[Machine Name]/ReportServer (You can use the IP address instead of the [Machine Name])
   b. http://[Machine Name]/Reports (You can use the IP address instead of [Machine Name])

   If the Reporting is configured properly, then the following paths will be available in the SQL Server Reporting Service (SSRS): /AVEVA Workflow Report/Historian
   a. By browsing the **Home** > **AVEVA Workflow Reports** > **Historian** folder, you can see the reports deployed in this folder. /AVEVA Workflow Report/Alarm
   b. By browsing the **Home** > **AVEVA Workflow Reports** > **Alarms** folder, you can see the reports deployed in this folder. (Here the report template is named as Alarm History Report.)

To test Reporting Connectivity from the Server

Perform the same steps as given in the previous section from the server. If the host name is not accessible from this server, then you can use the Internet Protocol (IP) address instead of the machine name to connect.

To create a Connection in the Reporting Service

1. Login to Enterprise Console.
2. From the Enterprise Console pull-down menu, select **Settings** > **Reporting Services** > **Connections**.
3. Click **New** to create a new connection.
4. Enter all the mandatory information.

   Note: The format of the given path must be followed as given in this document. It should start with “/” and there should be no “/” at the end of the path.
5. Click the **Test Connection**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. When the connection succeeds, click **Save** to save the connection.

To create a Template

1. Login to Enterprise Console.
2. From the Enterprise Console pull-down menu, select **Settings** > **Reporting Services** > **Templates**.
3. Click **New** to create a new template.
4. Click **Save** to store the details.

User Tools

In AVEVA Work Tasks, the **User Tools** feature helps you identify the artifacts where the user needs to be replaced, when a particular user is no longer associated with the organization or the process. It also helps you identify the occurrences of the workflow where the user's direct reference is used and view and unlock list items locked by a particular user.

Importance of Replace User

To ensure the process is not affected and all tasks are completed on time, it is important to replace an user who is no longer associated with the organization or process with an alternate user. Listed below are some of the scenarios where user needs to be replaced.

- List item owned by the User to be Replaced.
- User to be Replaced is a participant of the queue and also has some work items assigned.
- User to be Replaced is as an alternate actor for any user.
- User to be Replaced is a repository administrator.
- User to be Replaced is mapped to a security group at repository, list or list item level.
- User to the Replaced is configured in the exception mail settings of the repository.

For more details, see Replace User.

Importance of View Workflow User Reference

This option of User Tools helps you search for an Actor's direct references in the published versions of the workflow.

For more details, see View User Reference.

Importance of View and Unlock Locked Items:

This option of User Tools helps you view the list items locked by the selected user and unlock it if required.

For more details, see Unlock Locked Items.

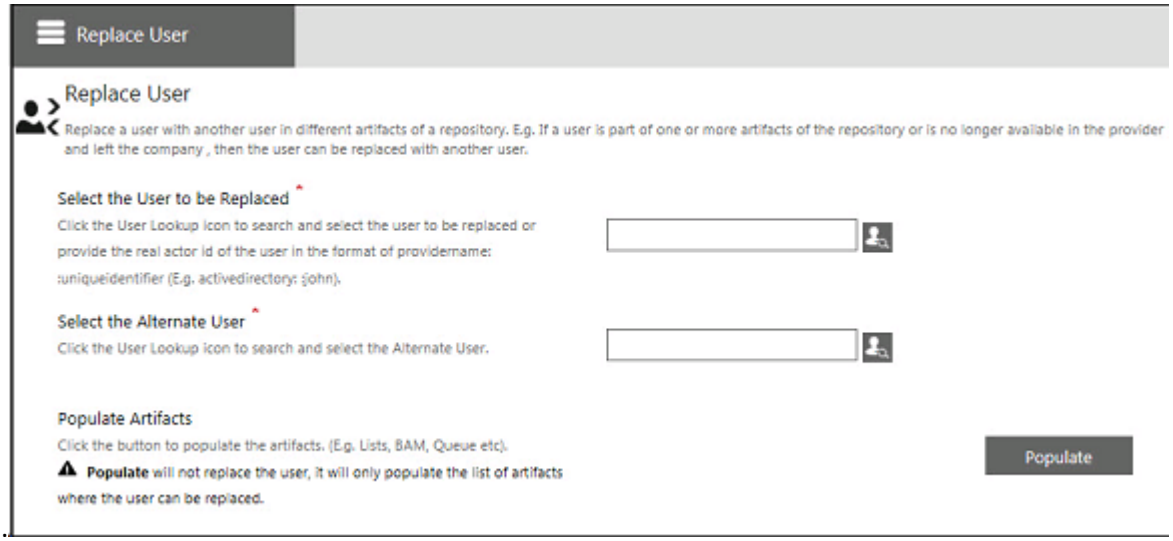
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Replace User

Replace User accessed from **Enterprise Console > Tools > User Tools** menu, enables you to replace an user (who is no longer associated with an organization or process) with an alternate user in different artifacts (Lists, Queue) of a repository.

To replace user

1. Log on to **Enterprise Console** and go to **Tools > User Tools > Replace User**. The **Replace User** page appears. You can select *an User to be Replaced and Alternate User* for different artifacts of a repository.



2. In the **Select the User to be Replaced** field, click the **User Lookup** icon. The **User Lookup** dialog box appears.
3. Search and select the user to be replaced, and then click **Update**.

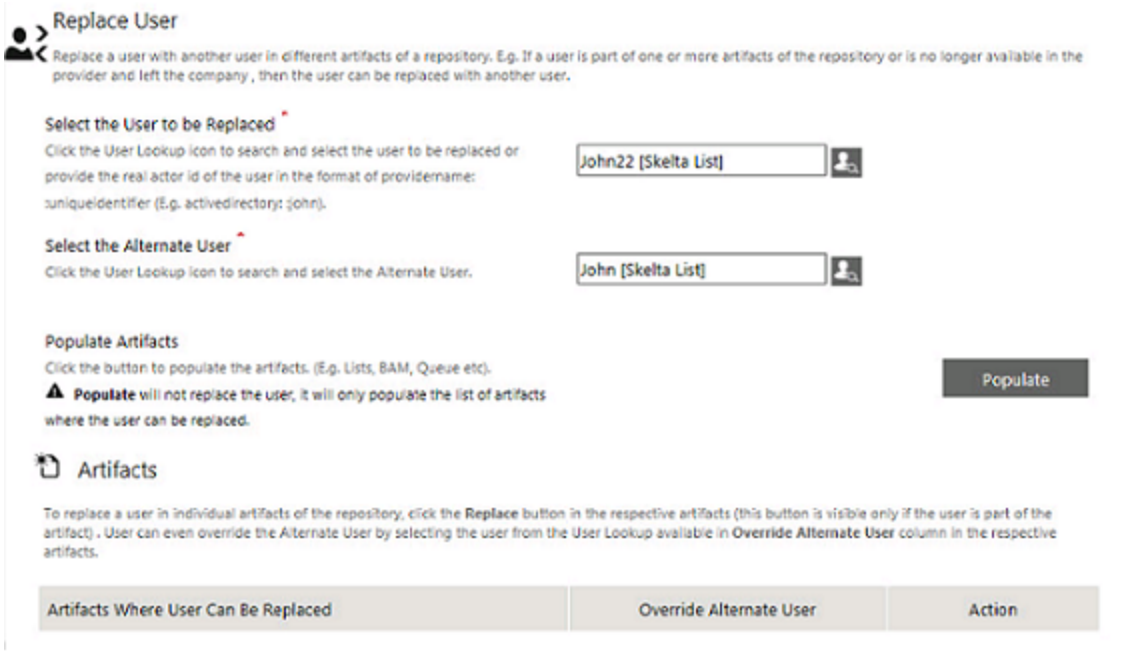
   Or

   Enter the **Real Actor Id** of the user as specified in the examples below:

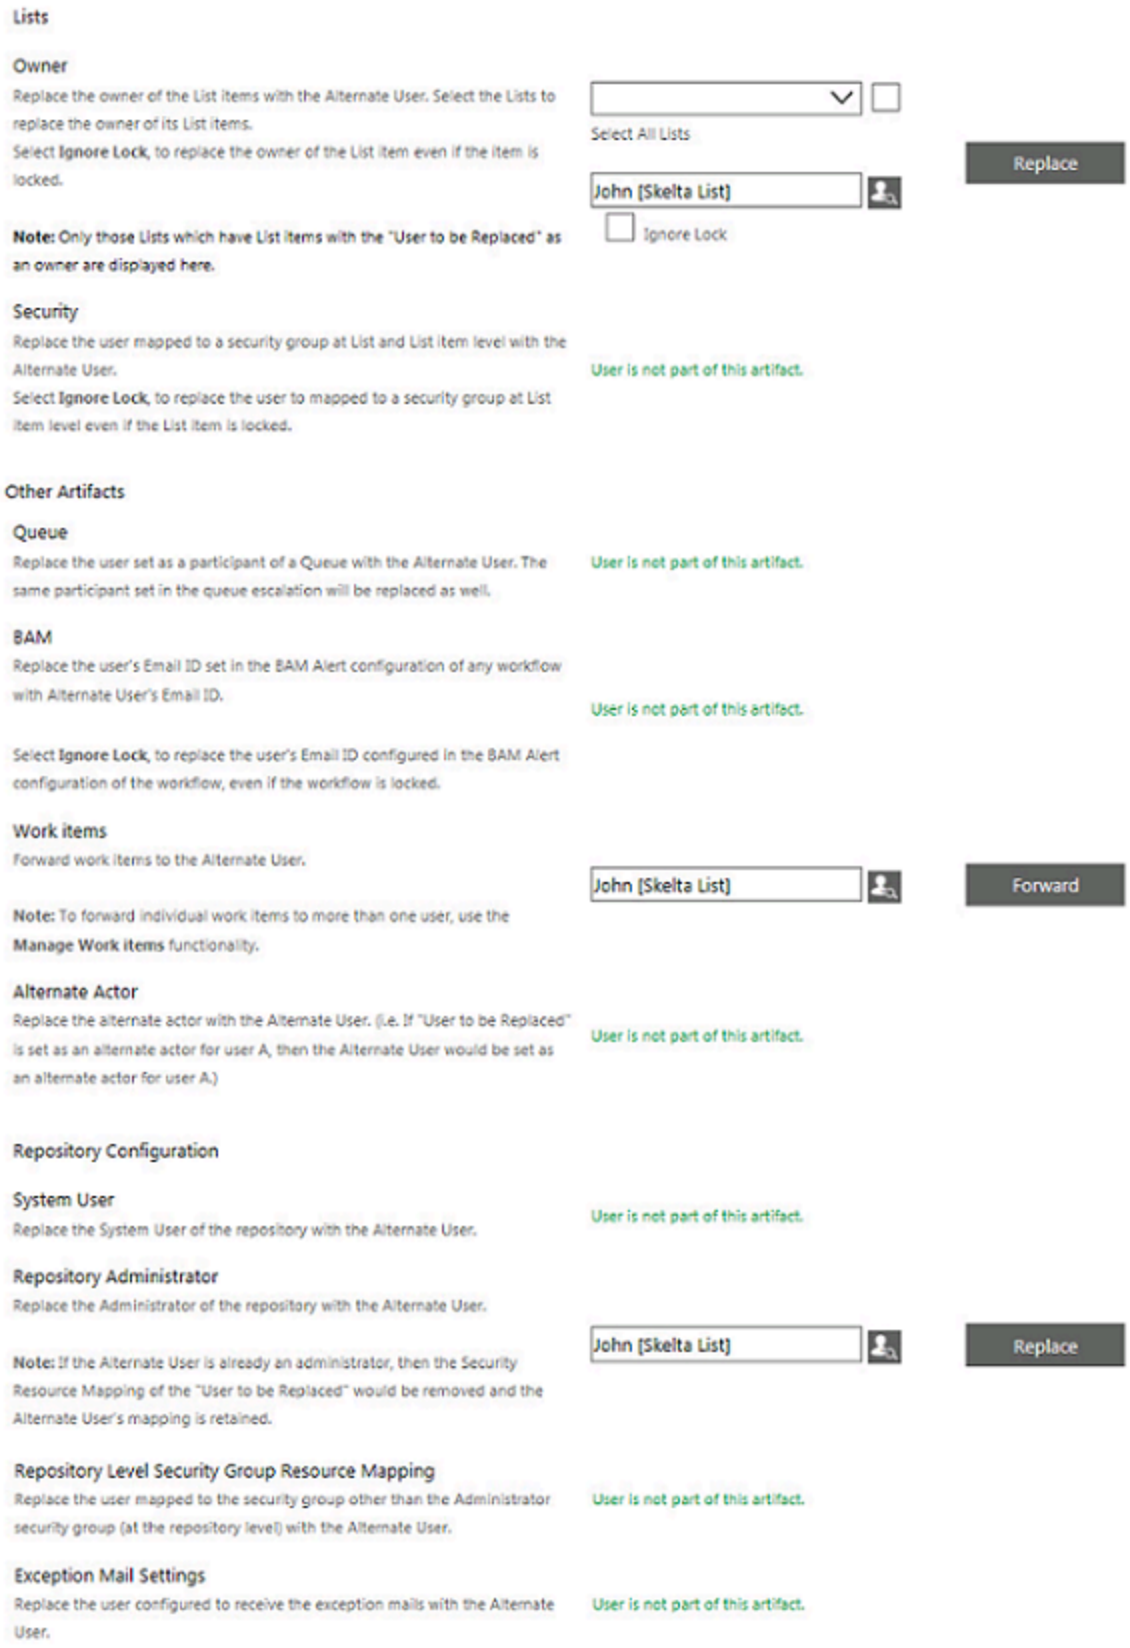
   - For Active Directory: **activedirectory::john22**
   - For the List Provider: **skeltalist:: C99B4110-C8CC-410B-BF70-93F3A7E34EDF**
   - For SQL Provider: **sqlprovider::6fb03011-68b7-437e-972e-21c67e4e2fe7**
   - For ASP.NET membership: **membershipprovider::a9bfc969-cc82-4c4b-99b9-50d9e1a91c01**
4. In **Select the Alternate User field**, click **User Lookup**. The **User Lookup** dialog box appears.
5. Search and select for an user who will be used as an alternate user, and then click **Update**. The selected user will be updated in the **Select the Alternate User** field. The user John22 will be updated as an Alternate User for John in all the artifacts of the repository.

   Note: In the Select the Alternate User field, you cannot enter the Real Actor Id, the Alternate User has to be selected through the User lookup.
6. Click **Populate**. The Replace User dialog will be refreshed and the section **Artifacts** will be displayed. By default the John will be populated as an Alternate User for each of the artifacts.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Note: You can override the Alternate User which is populated for each of the artifacts.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Replace User in Artifacts of a Repository

You can replace a user in the artifacts of a repository in AVEVA Work Tasks.

Lists

This section provides information on how to replace list item owners or users in security resource mapping.

Replace List Item Owners

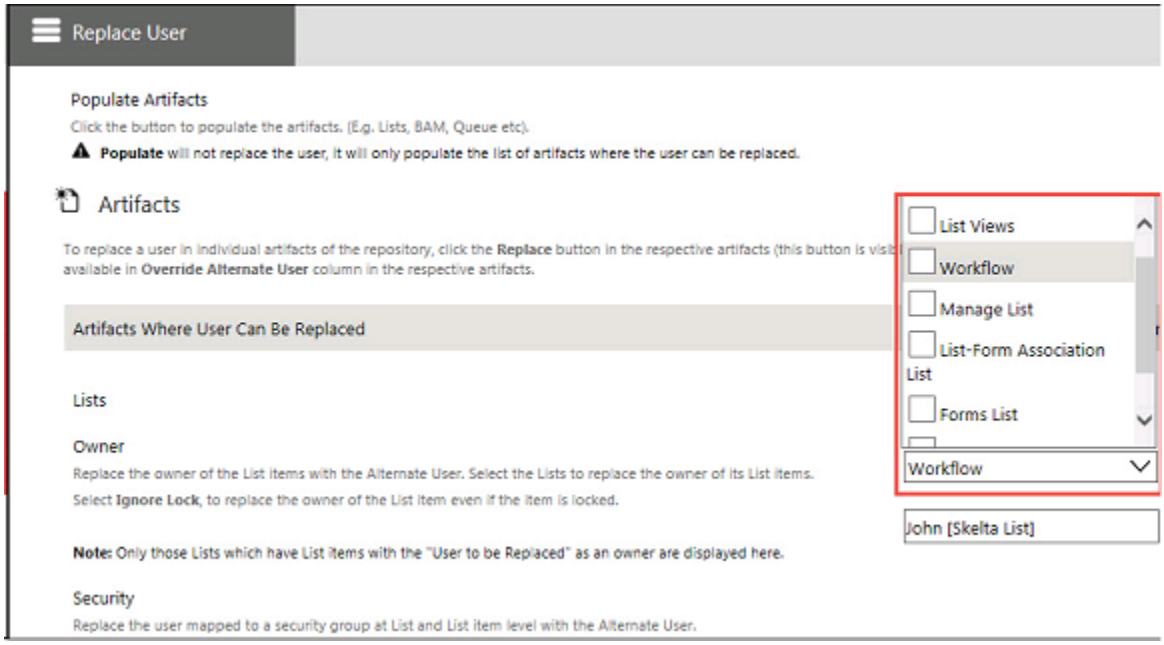
Replace List Item Owners

The **Owner** option in the Lists Artifacts helps you replace an user who owns list items. By default the user selected in the Alternate User field will be populated for this field. However, you can override this and select another user as an Alternate User.

To Replace Owner of List items

1. In the **List** drop down, select one or more lists.

   This drop down will list only those lists which have list items wherein the User to be Replaced (Rick) is a owner.



2. To select all the lists which are displayed in the drop down check the option **Select All Lists** .
3. The Alternate User for Owner Artifacts is populated by default (for more information on how this information is populated click here), if you want to override it click on the **User Lookup** icon to search and select the required user.
4. Select the option **Ignore Lock**, if you want to change the owner for the list item which is locked. Here the lock

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

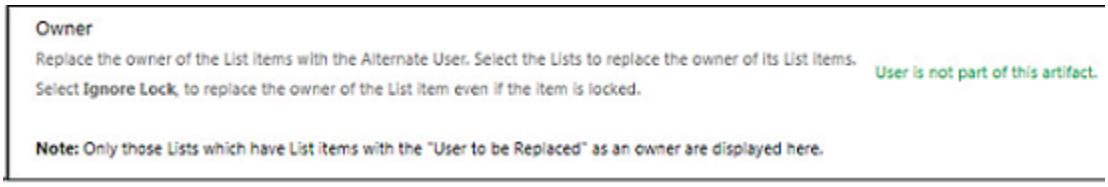
applied on the list item will not be considered and the owner information will be updated even though the list item is locked.

If the option **Ignore Lock** was not selected, then on replacing the owner a message error occurred while replacing user, check logger for more details will be displayed and the Owner for the locked list items will not be changed.

5. Click **Replace**, a message 'Are you sure you want to Replace is displayed', click **OK** to replace the User to be Replaced (Rick) with Kevin.

   This will replace the owner of the list items where *Rick* is the owner, with the **Alternate User** Kevin for all the selected lists.

   Note: If the User to be Replaced is not an owner for any of the list items, then the Owner Artifact will be updated as *User is not part of this Artifact*



Replace User in Security Resource Mapping

Replace User in Security Resource Mapping

The **Replacing User in Security Resource Mapping** option in the Lists Artifacts helps you replace the user mapped to a security group at List and List item level with an Alternate User.

- Viewing the report and replacing the security group resource mapping of Lists where User to be Replaced Rick is mapped and alternate user John is not mapped. From this option you can access the **Security Group - Resource Mapping Report** dialog, wherein you can select a list and view the security group mapping of the User to be Replaced for the selected list and/or list item level.
  - Select the check box beside each of items, click **Replace**. The selected Alternate User will be mapped to the **User to be replaced Security Group** for the selected list or list item level.
  - If the check box at the header level is selected, all the items will be selected.
- Viewing the report and replacing the security group resource mapping of Lists where both User to be Replaced Rick and alternate user John are mapped. From this option you can access the **Security Group - Resource Mapping Report** dialog, wherein you can select a list and view the security group mapping where both the User to be Replaced and Alternate User are mapped to the same list or list item level.
  - Select the check box beside each of items, click **Replace**. The selected Alternate User will be mapped to the **User to be Replaced Security Group** for the selected list or list item level.

Scenario 1

If both the users are mapped to the same security group

Consider Rick (User to be Repalced) and John (Alternate User) are mapped to the security group Contributor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The security group mapping of Rick (User to be replaced) done for the selected list/list item level will be removed.
- The security group mapping of John (Alternate User) will be retained for the selected list or list item level.

Scenario 2

If the User to be Replaced and Alternate User are mapped to different security groups

Consider Rick (User to be Replaced) is mapped to security group Administrator and John (Alternate User) is mapped to the security group Contributor.

- The security group mapping of Rick (User to be replaced) done for the selected list/list item level will be removed.
- The security group mapping of John (Alternate User) will be changed to Administrator for the selected list or list item level.

Consider Rick (User to be Replaced) is mapped to security group Reader and John (Alternate User) is mapped to the security group Administrator.

- The security group mapping of Rick (User to be replaced) done for the selected list/list item level will be removed.
- The security group mapping of John (Alternate User) will be changed to Reader (security group of User to be Replaced) for the selected list or list item level.

Note: This dialog is displayed to ensure the user can view that the User to be Replaced and Alternate User belong to different security groups. As we have no defined hierarchy among security groups the administrator needs to take the required action to ensure the Alternate User gets all the required privileges.

Other Artifacts

This section shows the different ways to replace a user:

- Queue: This option in **Replace User** allows you to replace the participants of a queue with an alternate actor.
- BAM: This option allows you to replace the email address of the user who is configured to receive BAM alerts of a workflow with an alternate user's email address.
- Work Items: The **Work Items** option allows you to replace an actor to whom the work item is assigned with an alternate actor.
- Alternate Actors: The **Alternate Actor** option allows you to replace an actor who is set as an alternate actor with an alternate user.

Queue

Queue

This option in Replace User allows you to replace the participants of a queue with an alternate actor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Functionality

- If the *User to be Replaced* is not a participant of any Queue, then the message *User is not a part of this artifact* will be displayed.
- If the *User to be Replaced* has picked up any work items, then it has to be manually forwarded to another user. In case the work items picked up by the User to be Replaced are not forwarded before replacing the user, a message indicating the same will be displayed and an entry will be logged in the logger.
- When both the *User to be Replaced and Alternate User* are the participants of the Queue, then the entry for the *User to be Replaced* will be removed and the entry for Alternate User will be retained.
- When only the User to be Replaced is a participant of the queue and the Alternate User is not a participant of the same queue, the Alternate User will be added as a participant of the queue and the entry for the User to be *Replaced* will be removed.
- When replacing the queue participant, the rights of the *Alternate User* will be updated to the rights of the *User to be Replaced*.

Example

1. Let the User to be *Replaced be Lee and the Alternate User* be Royan.
2. Lee has higher rights compared to Royan.
3. On replacing the *User to be Replaced (Lee)* with Alternate User (Royan), rights of Royan will be updated and will be the same as Lee. This action will also remove Lee from the Queue. Therefore, Royan will now have higher rights. In the above case, if Royan had higher rights when compared to Lee, Royan's rights will be updated and would be updated to what Lee had. Therefore, now Lee will have lesser rights.

BAM

BAM

The **BAM** option, allows you to replace the email address of the user who is configured to receive BAM alerts of a workflow, with an alternate user's email address.

Functionality

- If the email address of the *User to be Replaced* is not configured to receive any BAM Alerts, then the message *User is not a part of this artifact* is displayed.
- If both the *User to be Replaced and the Alternate User* are configured to receive BAM Alerts, then the entry for the *User to be Replaced* will be removed and the entry for *Alternate User* will be retained.
- If the *Alternate User* has no email address defined, then a message *Error occurred while replacing the user configured in the BAM Alert configuration of workflow(s).Check logger for more details is displayed. In the logger you will find a message, that the email address is not configured. To proceed you have to configure the email address of the Alternate User*.
- If the option **Ignore Lock** is selected, then the email address of the *User to be Replaced* **will be replaced** with

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the email of the Alternate User even for locked workflows having BAM Alerts configured.

- When the option **Ignore Lock** is not selected, then the email address of the *User to be Replaced* **will not be replaced** with the email of the *Alternate User* for locked workflows having BAM Alerts configured.
- When the option **Ignore Lock** is not selected, then the email address of the *User to be Replaced* **will not be replaced** with the email of the Alternate User for locked workflows having BAM Alerts configured, even if the logged in user has locked the workflows.

Work Items

Work Items

The option Work Items, allows you to replace an actor to whom the work item is assigned with an alternate actor.

Functionality

- If no work items are assigned to the User to be Replaced either through Web Channel or Mail Channel, then a message User *is not a part of this artifact* is displayed.
- To re-assign the work items of the User to be Replaced to different users, you have to user the Manage Work Items feature available through **Tools > Manage Work items**.
- To re-assign the work items of the User to be Replaced to the same user, you can use this **Replace User** feature.

Alternate Actor

Alternate Actor

The option Alternate Actor, allows you to replace an actor who is set as an alternate actor with an alternate user.

Functionality

- If the *User to be Replaced* is not set as an alternate actor, then a message User not part of this *artifact* is displayed.
- If both the *User to be Replaced and the Alternate User* are set as an alternate actor, then the entry for the *User to be Replaced* will be removed and the entry for the *Alternate User* will be retained.
- If the *Alternate User* is set as the alternate actor for the *User to be Replaced*, then the rule of alternate actor will be removed for the User to be Replaced. For more details read the scenario below:
- **Scenario:**
  - *User to be Replaced is Lee*
  - *Alternate actor set for Lee is Kevin*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- *Alternate User is Kevin*

- In this scenario since the Kevin who is the Alternate User is already set as the alternate actor for Lee, the rule of Alternate Actor for Lee will be removed and Lee will not have any alternate actor set.

Repository Configuration

You can replace a user at different levels of repository configuration:

- System User: The **System User** option allows you to replace an actor who is the system user with an alternate user.
- Repository Administrator: The **Repository Administrator** option allows you to replace the repository administrator with an alternate user.
- Repository Level Security Group Resource Mapping:The **Repository Level Security Group Resource Mapping** option allows you to replace the user who is mapped to a security group other than the administrator with an alternate actor.
- Exception Mail Settings: The **Exception Mail Settings** option allows you to replace an user who is configured to receive exception mails with the Alternate User.

System User

System User

The option **System User**, allows you to replace an actor who is the system user with an alternate user.

Functionality

If the *User to be Replaced* is not a system user, than the message *User is not a part of this artifact* is displayed.

Repository Administrator

Repository Administrator

Repository Administrator option allows you to replace the repository administrator with an alternate user.

Functionality

- If the *User to be Replaced* is mapped to a security group other than the administrator (for example contributor or reader), then a message *User is not part of this artifact* is displayed.
- If the *Alternate User* is not an administrator at repository level, than the security rights of the *Alternate*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

User will be updated and the security rights of the *User to be Replaced* will be applicable.

- If the *Alternate User* is an administrator at repository level, than the entry of the *User to be Replaced* will be removed and the *Alternate Actor* will be replaced.

Repository Level Security Group Resource Mapping

Repository Level Security Group Resource Mapping

Repository Level Security Group Resource Mapping allows you to replace the user who is mapped to a security group other than the administrator with an alternate actor.

Functionality

- If the *User to be Replaced* is mapped to a security group other than the administrator (for example: mapped to security group contributor or reader), a message *User is not part of this artifact* is displayed.
- If the *User to be Replaced* has higher security rights than the Alternate User, then the security rights of *Alternate User* will be updated and the security rights of the *User to be Replaced* will be applicable to the *Alternate User*.
- If the *Alternate User* has higher security rights than the *User to be Replaced* , then the security rights of *Alternate User* will be updated and the security rights of the *User to be Replaced* will be applicable to the Alternate User. In this scenario the *Alternate User's* security rights will now be lower. For example: If the *Alternate User* (Royan) is an administrator and the *User to be Replaced* (Lee) is a contributor, then the *Alternate Users's* (Royan) security right will be updated as contributor.

Note: A report to view the security group resource mapping done for the User to Replaced is not available for this artifact like Replacing User in Security Resource Mapping.

Exception Mail Settings

Exception Mail Settings

The **Exception Mail Settings** option allows you to replace an user who is configured to receive exception mails with the Alternate User.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Functionality

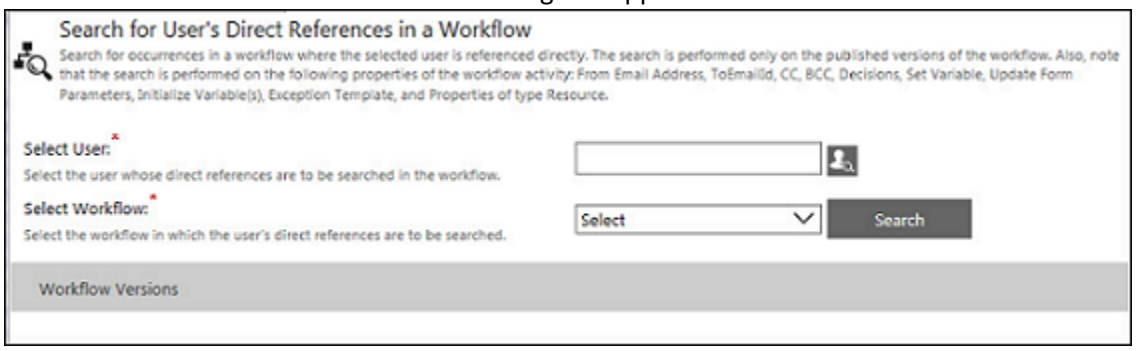
- If the *User to be Replaced* is not configured for any exception mails, then a message *User is not a part of this artifact* is displayed.
- If the *User to be Replaced* is the only user configured for exception mails, then the entry for the *User to be Replaced* will be removed and an entry for the Alternate User will be added.
- If both the *User to be Replaced* and the *Alternate User* are configured for exception mails, then the entry for the *User to be Replaced* will be removed and the entry for the *Alternate User* will be retained.

View User Reference

This option of **User Tools** helps you search for an Actor's direct references in the published versions of the workflow.

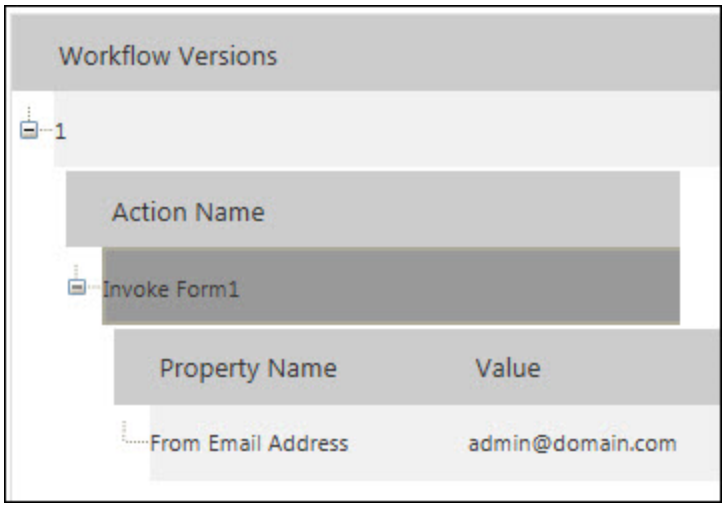
To Search for an actor's direct references in a Workflow

1. Log in to **Enterprise Console** and navigate to **Tools** > **User Tools** > **View User Reference**. The **Search for User's Direct References in a Workflow** dialog box appears.



2. Click on the **User Lookup** icon beside the **Select Actor** field. The **User Lookup** dialog is displayed.
3. Search and select the User.
4. Click **Update**. The selected actor will be updated in the **Select Actor** field.
5. Click on the drop down in the **Select Workflow** field and select a workflow to check if the actor *Rick* is directly referenced in it.
6. Click **Search**. The **View Workflow User Reference** dialog will be refreshed and all published versions of the selected workflow where the selected actors direct reference is used will be displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Published versions of the workflow will be displayed here when the actors direct reference is present in any one of the following activity properties in the workflow:

- Property of type resource is used like:
  - Assign Actor in Human Activities.
  - Communication Activities:
    - To in Email Activity
    - CCResource in Email Activity
    - BCCResource in Email Activity
    - RecipientResource in Send SMS Activity
  - Engine Activity
    - Actors in Resource Variable Activity
- From Email Address, ToEmailId, CC, BCC properties across all activities
- Decision property of Decision Activity
- Set Variable property of Update Variable Activity
- Set Form Parameters of Invoke Form Activity
- Initialize Variable(s)and Exception Template in Start Activity

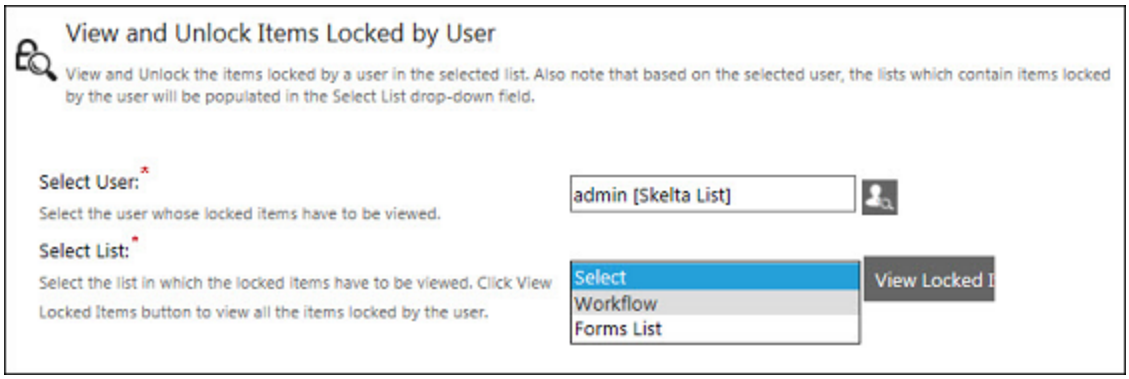
Unlock Locked Items

The **Unlock Locked Items** option in **User Tools** allows you to view the list items locked by the selected user and also unlock it if required.

To View and Unlock Locked Items

1. Log in to **Enterprise Console** and navigate to **Tools** > **User Tools** > **Unlock Locked Items**. The **View and Unlock Items Locked by User** window is displayed.
2. To select an user to view the items locked click on the **User Lookup** icon in the **Select User** field. The **User Lookup dialog** is displayed, select the user, for example Kirsten.
3. In the **Select List** drop down, select the List to view the locked items.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



4. Click **View Locked Items**, the **View and Unlock Locked Items** window will be refreshed and the items locked by the selected user for the selected list will be displayed in the **Items Locked By User** section.

   In the image above the selected user is admin and the selected list is Workflow. Hence the **Items locked by User** section displays the workflows locked by *admin*.

5. Select the items to be unlocked and click **Unlock**.
   - To unlock all the items of the List select the parent node, in our example selecting workflow will ensure all the locked items displayed in this window are selected.
   - To unlock individual items select the check box beside the appropriate one.
   - If the parent workflow is not locked and only the child workflow is locked, the Items locked by User section will display only the locked child workflows.

Deleted List Items

The **Deleted List Items** feature of AVEVA Work Tasks contains a record of all the deleted list items from lists such as the Workflow List, Forms List, Navigation List and also other dynamic lists.

It records details such as the Date Time, List Type, List Owner, and other relevant details. There is a provision to export the Definition Xml for the lists where it is applicable.

Introduction

Most of the process centric organizations are required to protect and maintain the information of deleted or discontinued records.

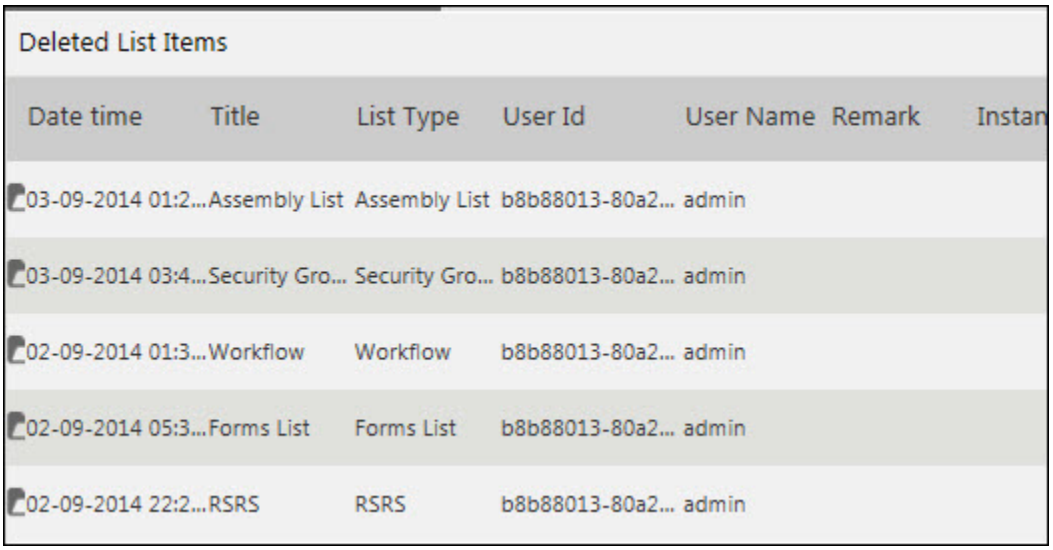
Say, for example in scenarios where a process has to be discontinued due to a business requirement, AVEVA Work Tasks allows you to delete the workflow which controls that process. Similarly, list items can be deleted from other lists such as Forms List, Navigation List and other dynamic lists. However, a record of the deleted information can now be maintained in a separate list that is, the **Deleted List Items**.

The **Deleted List Items** feature of AVEVA Work Tasks contains a record of all the deleted list items from lists such as the Workflow List, Forms List, Navigation List and also other dynamic lists. It records details such as the Date

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Time, List Type, List Owner, and other relevant details. There is a provision to export the Definition Xml for the lists where it is applicable.

The deleted list items information is stored under folders of the respective list type. Say, if a workflow is deleted, a list item is added to the **Deleted List Items** list under the Workflow folder. If a Form is deleted, a list item is added to Deleted List Items list under the Forms folder.



Click here for a scenario to understand the use of **Deleted List Items** in a business environment.

Use Deleted List Items

Consider a scenario from a pharmaceutical company, say Telematics Pharma which has a set of critical business processes being controlled through the use of workflows.

Workflows are designed to automate the business processes. So, whenever any workflow is removed or deleted from the system, the company wishes to maintain a record of that. The record maintained must have details such as the Workflow Owner, Modified Date Time etc. Also there should be a provision to retrieve the deleted workflows in the form of Definition XML whenever required.

The **Deleted List Items** feature helps the company to achieve the above scenario.

Steps to achieve the scenario

1. Telematics Pharma has a workflow named WF_Check_Ingredients, which has to be discontinued due to some business requirements. However, a deletion record has to be maintained for the deleted workflow. Right-click and select **Delete** to delete the workflow.
2. Open **Deleted List Items** from the Enterprise Console menu.
3. A folder **Workflow** gets created in the **Deleted List Items** list.
4. Double-click the Workflow folder to see the record of the deleted workflow.

   Find below a brief description of some of the important fields being displayed for the deleted list item:

Column Name	Description
Title	This field contains the title of the list item which has

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Column Name	Description
	been deleted.
List Type	This field contains the type of the list item which has been deleted. For example, Workflow, Form.
User Id	The user id field is populated based on the provider configured for the repository: • **Active Directory provider: Name** is populated as the User Id. • **Forms Provider: GUID** is populated as the User Id. • **ASP.NET Membership: Name/GUID/ Integer** (depending on the provider configuration)
Instance Xml	This field contains the form instance XML of the deleted list item. **Note:** Each list has been internally mapped to a form and each list item is mapped to a run-time instance of the form. The Form Instance XML contains the run-time information of the form associated with the list.
Item Details	This field contains information about the list item like Title, Owner, Version History, Created Date Time, and Last Modified Date Time.
Audit Details	This field contains the audit history of the deleted list item.
Definition Xml	This field is applicable only for list types such as workflows, forms, and lists. The exported definition XML of the deleted list item can be used to restore the list item in any repository.

You can export the definition XML of the workflow using the option available in the context menu. The exported XML can then be used to import the workflow definition in any repository, if required.

Enable or Disable Deleted List Items feature for a Repository

This section explains how to enable or disable the Deleted List Items at the repository level.

Default Behavior of Repositories Created in AVEVA Work Tasks

In AVEVA Work Tasks, Deleted List Items will be enabled by default for a repository that is created. Whenever any list item of any list type is deleted, a new list item is added to the Deleted List Items under the respective folder.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: For a fresh installation of AVEVA Work Tasks, the Deleted List Items is enabled by default. However, after upgrading an existing installation of AVEVA Work Tasks, the Deleted List Items feature is disabled by default.

How to Check Whether Deleted List Items is Enabled or Disabled for a Repository?

To check whether **Deleted List Items** is Enabled or Disabled for a Repository verify the Properties Column (properties collection) of SKRepository table in the Farm Database. When the value of the property key **"isDeletedListItemsTraceEnabled"** is **True**, **Deleted List Items** is enabled for the repository. If the value of the key is **False**, **Deleted List Items** is disabled for the repository.

For example, find below the Properties column (properties collection) data for a repository.

```
<properties>
<property key="sourceelements">
<![CDATA[WORKFLOWELEMENTS\Default]]>
</property>
<property key="fromemail"><![CDATA[admin@domain.com]]></property>
<property key="toemail"><![CDATA[admin@domain.com]]></property>
<property key="alertuser"><![CDATA[False]]></property>
<property key="filewatcher"><![CDATA[]]></property>
<property key="enablelock"><![CDATA[True]]></property>
<property key="isadminconfigured"><![CDATA[True]]></property>
<property key="isDeletedListItemsTraceEnabled"><![CDATA[True]]></property>
<property key="theme"><![CDATA[Default]]></property>
</properties>
```

The line highlighted in red in the above code, is used to identify whether **Deleted List Items** is enabled or disabled for a repository. In this line, you can identify the following:

<property>	**Defines the property tag**
key	Attribute of property tag, describes the property name (isDeletedListItemsTraceEnabled is name of the property)
<![CDATA[True]]>	It is the value of the property (True- Deleted List Items is enabled)
</property>	Closing tag of property

Enabling Deleted List Items for a repository

In AVEVA Work Tasks, once you create a repository, **Deleted List Items** will be enabled by default for that repository.

If you want to enable **Deleted List Items** for a repository, then open the SKRepository table in the Farm Database and find out the required repository entry (row). In that specific row in properties column data (properties collection) find out the **isDeletedListItemsTraceEnabled** key and update the `<![CDATA[False]]>` to `<![CDATA[True]]>`.

If the i**sDeletedListItemsTraceEnabled** key is not found for a repository entry in the properties column then add the following line between <properties> & </properties> tags.

```
<property key="isDeletedListItemsTraceEnabled"><![CDATA[True]]>
</property>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Now **Deleted List Items** will be enabled for that repository. If you want to enable Deleted List Items for another repository perform the steps mentioned above.

Disabling Deleted List Items for a repository

In AVEVA Work Tasks, once you create a repository **Deleted List Items** will be enabled by default for that repository.

If you want to disable **Deleted List Items** for a repository, for which the **Deleted List Items** is already enabled, then open the SKRepository table in the Farm Database and find out the required repository entry (row). In that specific row, in properties column data (properties collection) find out the **isDeletedListItemsTraceEnabled** key and update the `<![CDATA[True]]>` to `<![CDATA[False]]>`.

If the **isDeletedListItemsTraceEnabled** key is not found for a repository entry in the properties column, then add the following line between <properties> & </properties> tags in case if you want to enable Deleted List Items in future.

```
<property key="isDeletedListItemsTraceEnabled"><![CDATA[False]]>
</property>
```

Package

Using the **Package** feature of AVEVA Work Tasks, you can deploy one or more artifacts from one environment or repository to another in a easy and simple manner.

The artifacts can be deployed along with its associated and child artifacts, configuration state and containment state from one environment or repository to another.

Prerequisites

- Ensure that the **AVEVA Work Tasks-Client Service** is running while installing or uninstalling the package.
- In an environment that consists of multiple servers and clients, ensure that the **AVEVA Work Tasks-Client Service** is running on the machine which has the Enterprise Console site configured.

Note: If you have created and exported a package in the previous version of AVEVA Work Tasks, then ensure that you use the previous version to import the package. Otherwise, you must upgrade to the latest version of AVEVA Work Tasks, create new package template, add the artifacts again to the package template, and then export the package.

For more information about package, see *Packages* section in the *Developer Guide*.

Advantages of Package

Currently, packaging and deploying one or many artifacts from one environment or repository to another is done either by exporting and importing the artifacts. You can use the recovery task of packaging to deploy one or many artifacts from one environment or repository to another.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Package Versus Export Import

- Export and import feature is helpful when you want to deploy a single artifact in a different environment.
- You can export and import only one artifacts at a time.
- An imported artifact is not always valid on the target environment, if the associated artifacts are not present.

Example:

Create a '*LeaveWorkflow*' add an Information activity and assign it to a queue say 'UsersQueue'.

Export the '*LeaveWorkflow*' from the source environment and import it to the target environment. The target environment has no queues created.

Since '*UsersQueue*' does not exist in the target environment, the '*LeaveWorkflow*' is invalid.

You have to manually create the 'UsersQueue' in the target environment.

Package Versus Recovery

The recovery feature allows you to replicate the entire repository with all the artifacts in the target environment. A choice to add only few artifacts to the target environment is not available. This option is beneficial when the entire repository needs to be deployed in another environment.

About Package

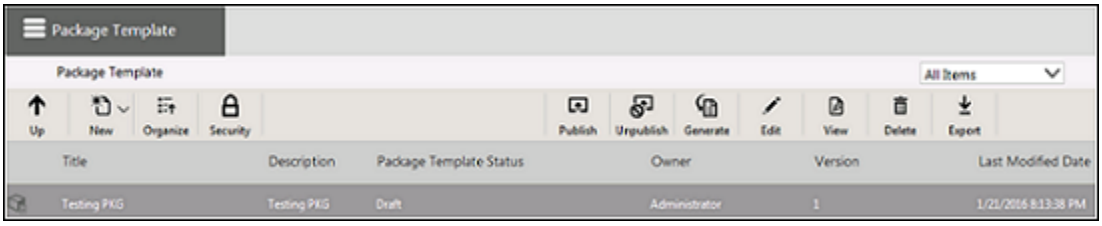
A proper understanding of the **Package** interface allows you to use the various features effectively. The Package interface consists of the following components:

- Package Template: Use to design a Package, define artifacts to the template, and complete the entire process of designing and building a Package to exporting the package file.
- Manage Package: Use to import packages that are exported from the Package Template of source environment, and install it in the target environment.

Note: Access to the above mentioned functionalities is based on the rights given to the users. The functionality will either be disabled or it will not be visible if the user does not have rights to execute them.

Package Template

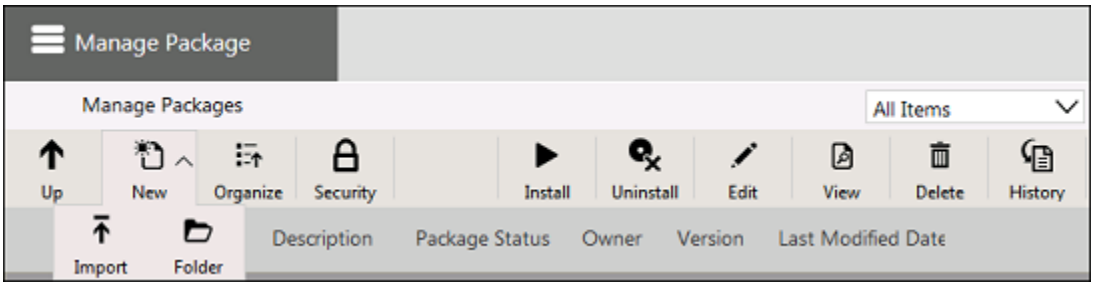
You can use the **Package Template** list in the source environment to create and design a package template. You can add artifacts and update the configuration settings to the created package template. You can complete the entire process of designing, publishing, generating, and exporting the package file. The behavior of the package at the time of installation is defined in a **Package Template**.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Manage Package

You can use the **Manage Package** list in the target environment to import packages that are exported from the Package Template of source environment, and install, update, or uninstall the package in the target environment. You can also change the pre-defined configuration that affects the behavior of package at the time of installation, updates, or uninstallation.



ArchestrA Events

You can create ArchestrA applications that generate alarms and events to provide the status of a running application. ArchestrA Events is such an application of AVEVA Work Tasks which you can use to consume events from the event providers of the ArchestrA Event Services platform. The ArchestrA Event Services platform uses the ArchestrA Service Bus (ASB) for sending and receiving data. When an event occurs, a notification is reported to the event distributor. Then based on the filtering conditions, the required the workflow is triggered.

Alarms warn about process conditions that can potentially cause problems. Typically, you set up an alarm to become active when a process value exceeds a defined limit. For example, you can set an alarm for a pump that warns when no fluid pressure is detected.

Events represent normal system, application, or user occurrences that produce status messages. A typical event occurs when an operator logs on to an application at the beginning of a work shift. Application Server can detect events, store them as historical data, and report them to client applications.

ArchestrA objects include built-in event and alarming reporting capabilities. You must configure alarms for each object in the IDE to use the event and alarm functions.

Application Server creates several types of run-time event messages, which are saved as historical data.

- System events
- Security-audit (operator change) events
- Application (or process) related events

For more information about these ArchestrA events, see *AVEVA Application Server User Guide*.

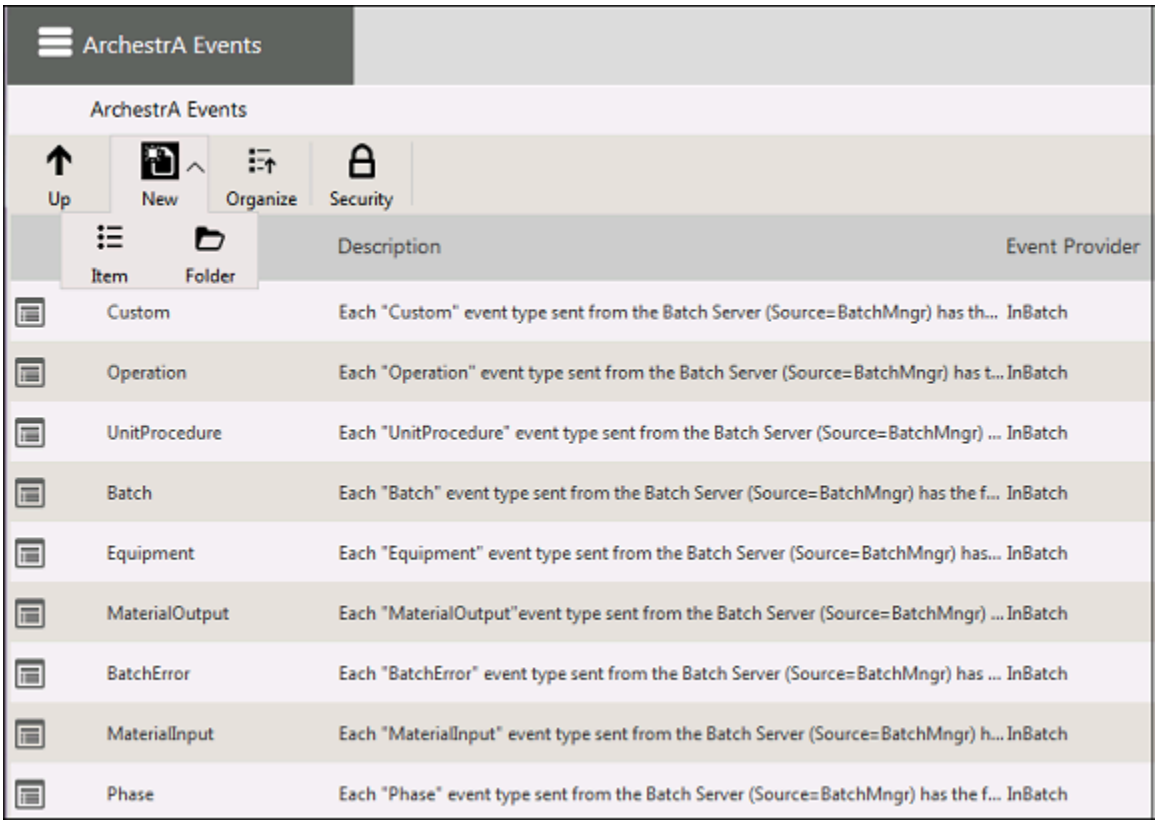
ArchestrA Events and AVEVA Work Tasks

You can use the ArchestrA Events window to create an *ArchestrA Events List Item* in the Enterprise Console to store ArchestrA Event Type and the relevant context data properties associated with the event type. When the set filter conditions are met, based on the tasks scheduled, the workflow is triggered.

The following image shows the main list of ArchestrA Events available by default for InBatch. This main list contains the predefined event types of InBatch event provider. You can use this main list while associating a

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

workflow to an ArchestrA Event. For more information about workflow and ArchestrA Events association, see Associate Workflow with ArchestrA Events.



Actions Executable in the Ribbon Menu

The following table lists the actions that you can perform from the ribbon of the ArchestrA Events list:

Icon	Description
	Navigate icon to navigate from the current folder to the parent folder. This feature is helpful when you are accessing a folder within the ArchestrA Events and you want to navigate back to the parent folder of the ArchestrA Events List.
	New ArchestrA Events List Item icon to create an ArchestrA Events List Item.
	**Folder** icon to group and categorize the ArchestrA Events List Item.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Icon	Description
	Edit icon to modify the ArchestrA Events List Items.
	**View** icon to view the ArchestrA Events List Items in read-only mode.
	**Delete** icon to delete the selected ArchestrA Events List Items.
	Organize icon to organize the ArchestrA Events List Items and group it in specific folders.
	Security Settings icon to define security at the List Item level.

Actions Executable in the Shortcut Menu

The following table lists the shortcut menu items of all the actions that you can perform from the shortcut menu of the ArchestrA Events window:

Menu Item	Description
Edit	**Edit** option to modify the ArchestrA Events List Items.
Delete	**Delete** option to delete the selected ArchestrA Events List Items. .
Security Settings	**Security Settings** option to define security at the List Item level.

Associate Workflow with ArchestrA Events

Use the **Associate** option to associate a workflow with ArchestrA Events.

The ArchestrA Event association window appears.

To associate a workflow with an ArchestrA Event for a specific event

1. Select the workflow, and then click **Associate** from the ribbon.
   Alternatively, select and right-click the workflow, and then select **Create Associations**.
2. Click **ArchestrA Event** to associate the workflow with the ArchestrA Event list for a specific event.
3. Enter the following details:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Event Provider**: Select the name of the event provider from which you want to poll for new events.

  The Event Provider field is mandatory, and the maximum length of the event provider name is 250 characters.

  Based on the data available in the ArchestrA Event main list, the Event Provider list is populated. You can add other event providers to this main list, if required.

  Example of Event Providers are InBatch Server or Avantis.
- **Event Type**: Select the Event Type of the Event Provider.

  It is the type of event which defines the properties the event will have.

  For InBatch Server, Batch is an event, and possible values for Batch events are such as, Batch, Equipment, UnitProcedure, Operation, Phase, MaterialInput, MaterialOutput, Custom, and BatchError.

  Based on the data available in the ArchestrA Event main list, the Event Type list is populated for the selected Event Provider. You can add other event types for the event provider, if required.
- **Source**: Type the Source property name of the event. It is the name of the event provider sending the event. For example, for a *Batch* event, *BatchMngr* is the source.

  Select the appropriate operator from the operator drop-down list.
- **Area**: Type the Area of the event. Areas provide a key organizational role in grouping alarm information and assigning it to users who use alarm and event clients to monitor their Areas of responsibility.

  The Area object plays a key role in alarm and event distribution. All objects belong to an Area. Areas can contain sub-Areas. Alarm and event clients are configured to subscribe to a set of Areas.
- **Priority**: Type the priority for each designated event.

  Priority, which is an integer value from 1 to 999 indicating the severity of the alarm which raises an event. An alarm priority of 1 is most urgent and 999 least urgent.
- **Workflow Version**: Select the version of the workflow to be associated with the ArchestrA Event. The workflow will be initiated only if the published version at the time of the occurrence of the event is the same as the version selected here. To trigger the currently published version of the workflow whenever the event occurs, select *Latest*. When a version is specified, the workflow alerts the latest published version of that version series. For example, if the specified version is 1.1 and the latest published minor version for 1.1 is 1.1.1.3, then 1.1.1.3 is alerted.
- **Properties**: Based on the **Event Type** that you enter, select values in the Properties section. For example, for a Batch event type, BatchServer is a property of the data type String. The Properties field is optional.

  Based on the data available in the ArchestrA Event main list, the properties of the Event Type list is populated. You can add other properties of the event type, if required.

4. Click **Attach Event** to associate the workflow with ArchestrA Event for that specific event.

   Click **Cancel** to abort.

   The confirmation message, *Successfully associated the workflow* appears.

Limitations

- The *Between* operator is not supported for **Priority** and **Properties**.
- The data type of the operators are not validated. Ensure to provide valid values to the property data type.
- Only one workflow with one event provider is supported. That is, different event providers for a workflow with different association is not supported.
- While creating a filter condition, duplicate properties are not supported.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- The *OR* condition is not supported while creating a filter condition.

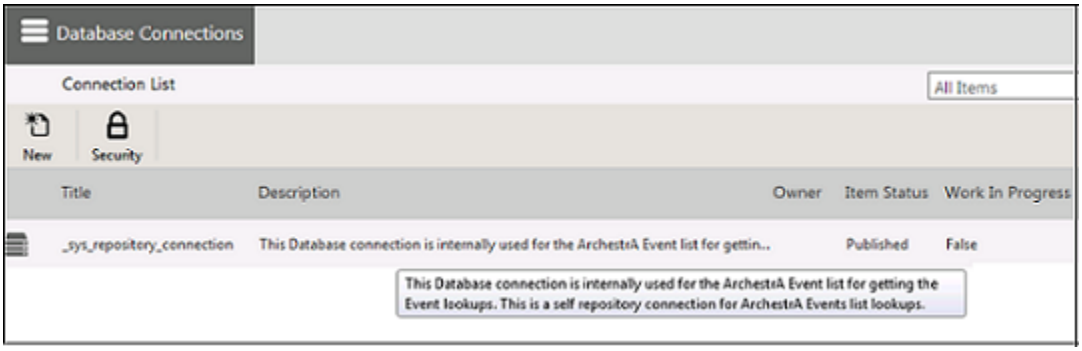
ArchestrA Events Lookup List

When you create a repository, the following system Lookup List items are created:

_sys_repository_connection:

This database connection is used internally by the ArchestrA Event List for getting the Event lookups. It is a system generated lookup, and we recommend to not delete it. This lookup does not have any owner as it a system generated connection.

The following image shows the **-sys_repository_connection** lookup list item:



Database Lookup Lists

A **System** folder with the following Lookup Lists item is created. This **System** folder is internally used by the ArchestrA Event list for getting the Event details. This is a system generated folder for ArchestrA Events list lookups, and we recommend to not delete the folder and its contents.

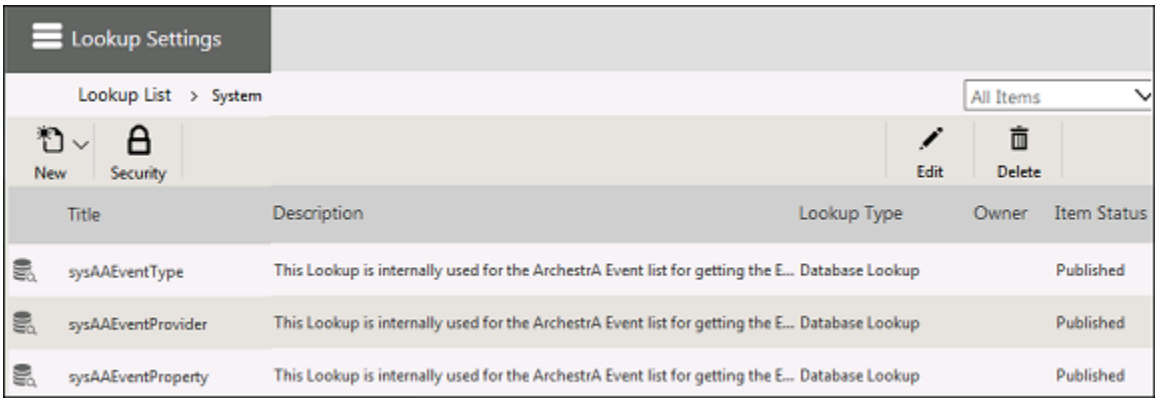
The **System** folder contains the following Lookup List items:

- **sysAAEventProvider**: Lookup item internally used by the ArchestrA Event list for getting the Event Providers.
  .
- **sysAAEventProperty**: Lookup item internally used by the ArchestrA Event list for getting the Event Properties.
- **sysAAEventType:** Lookup item internally used for the ArchestrA Event list for getting the Event Types.

The following image shows the **System** folder:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The following image shows the system generated Lookup items in the **System** folder:



Create ArchestrA Events List Item

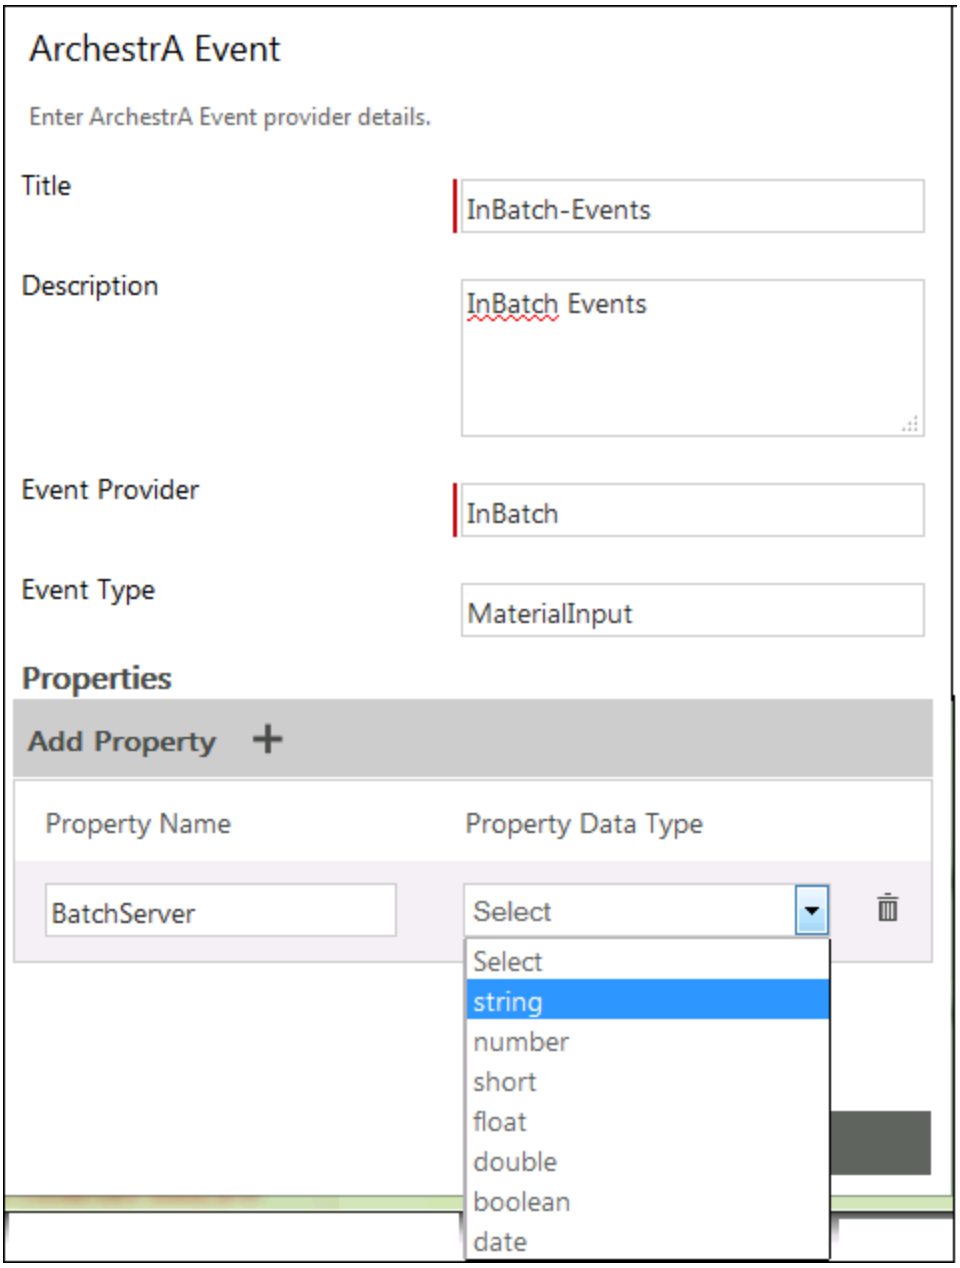
You can create an **ArchestrA Events List Item** in the **Enterprise Console** to store ArchestrA Event Type and the relevant context data properties associated with the event type. You can then use this list to populate the ArchestrA Event details received through the ArchestrA Service Bus (ASB) when an event occurs. When an ArchestrA Event occurs, and if the event conditions meet the filter conditions set by AVEVA Work Tasks, then a workflow triggers.

By default, the ArchestrA Event main list lists the event types and related properties of InBatch server. You can add more event types and properties to the existing list, edit the event types and properties, or even delete unwanted event types and properties.

You can also add other Event Providers, if required.

The following image shows the window to create an **ArchestrA Events List Item:**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



To create ArchestrA Events List Item

1. In the **Enterprise Console**, select menu icon, select **Tools**, and then select **ArchestrA Events**.
   The ArchestrA Events page appears.
2. On the action bar, click **New**, and then click **ArchestrA Events**.
   The New ArchestrA Events window appears.
3. In the **Title** box, type a name for the ArchestrA Events List Item, and in the **Description** box, type a description for the ArchestrA Events List Item.
4. In the **Event Provider** box, type the name of the event provider from which you want to poll for new events.
   Example of Event Providers are InBatch Server or Avantis.
   The **Event Provider** field is mandatory, and the maximum length of the event provider name is 250

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

characters.

5. In the **Event Type** box, type the Event type of the Event Provider.

   It is the type of event which defines the properties the event will have. For InBatch Server, *Batch* is an event, and possible values for *Batch e*vents are such as, *Batch, Equipment, UnitProcedure, Operation, Phase, MaterialInput, MaterialOutput, Custom*, and *BatchError*.

   The maximum length of the event type is 250 characters.

6. Based on the **Event Type** that you enter, type values in the **Properties** section. For example, for a *Batch* event type, *BatchServer* is a property name of the data type *String*.

   The **Property Name** field is optional. However, if you enter a property name, then the data type of the property is mandatory.

   The maximum length of the **Property Name** is 250 characters.

7. Click **Submit**.

   The ArchestrA Events List Item is saved successfully.

Edit ArchestrA Events List Item

Edit an ArchestrA Events list item to change description and Event Provider related information.

To edit an ArchestrA Events list item

1. In the **Enterprise Console**, click menu icon, click **Tools**, and then click **ArchestrA Events**.

   The ArchestrA Events page appears.

2. Right-click on an ArchestrA Event, and then click **Edit** (or click on an ArchestrA Event, and then on the action bar, click **Edit**).

   The Edit ArchestrA Event dialog box appears.

3. Change the ArchestrA Event details as desired.
4. Click **Save**.

   The ArchestrA Event details are saved.

Delete ArchestrA Events List item

Delete an ArchestrA Event List item when it is no longer required.

To delete an ArchestrA Event List item

1. In the **Enterprise Console**, select menu icon, select **Tools**, and then select **ArchestrA Events**.

   The ArchestrA Events page appears.

2. Right-click an **ArchestrA Event**, and then click **Delete** (or click on an ArchestrA Event, and then on the action bar, click **Delete**).

   A confirmation message appears.

3. Click **OK**.

   The confirmation message is closed, the ArchestrA Event is deleted, and an information message appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click **Close** (or click the Close button).

   The information message is closed.

Process Designer

About the Process Designer

The **Process Designer** provides the interface to model workflow processes. Workflows can be modeled, designed, and deployed from this window. It opens when the Process Designer control is executed from a web form in the web application.

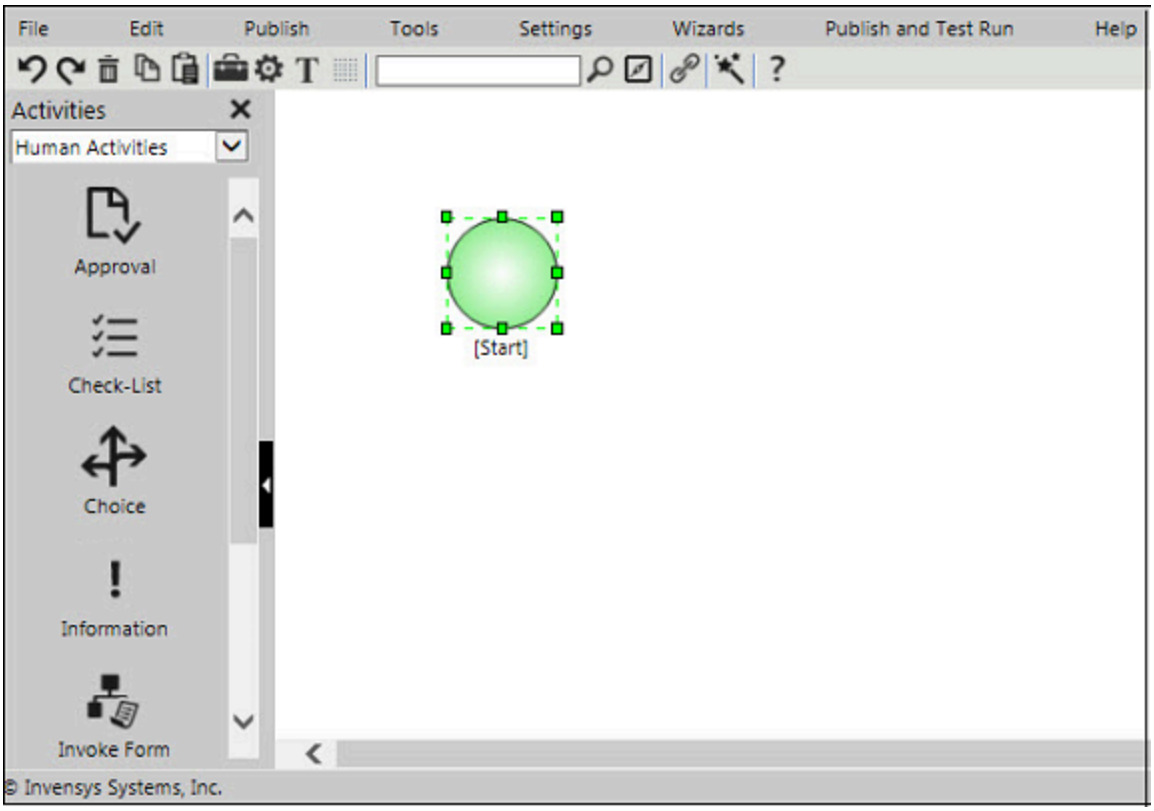
The **Process Designer** is an AJAX based ASP.NET server control that can be embedded in any web based product, ASP Engine, or web page. It is a browser based application that requires no plug-in or IDE. It provides a comprehensive set of standard activities, which can be easily dragged and dropped on a design mosaic and linked to design processes.

The **Process Designer** user interface has the following parts:

- Menu bar
- Tool bar
- Design Mosaic
- Activities
- Activity Properties

The following image shows the Process Designer window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Menu bar

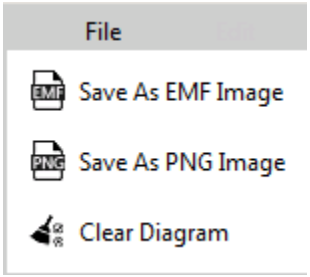
The following image shows the menu bar of the Process Designer window:

Note: To change the Menu in the Process Designer, edit the **pdmenu.txt** file under the **Locales** folder.

The menu bar has the following menus.

File

The **File** menu has the following options to perform various activities on the files in which workflow process designs are saved:



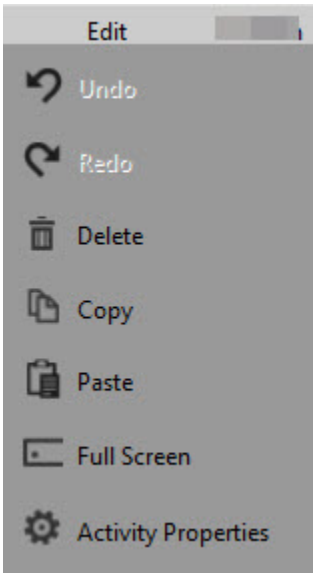
- Save As EMF Image: Use this option to save the current process design as an image file in the Enhanced Windows Metafile (EMF) format. This is the ideal format for printing the process or to embed it in MS Office files.
- Save As PNG Image: Use this option to save the current process design to a PNG image file.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Clear Diagram: Use this option to clear the current process design from the design area.

Edit

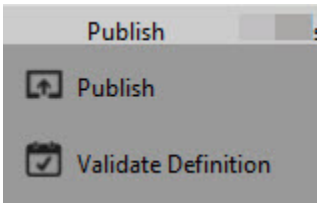
The **Edit** menu has the following options to perform various activities on the Workflow process design:



- **Undo:** Use this option to undo the previous actions.
- **Redo:** Use this option to redo the previous actions.
- **Delete:** Use this option to delete the selected activity.
- **Copy:** Use this option to copy the selected activity.
- **Paste:** Use this option to paste the activity copied using the **Copy** command.
- **Full Screen:** Use this option to switch between the full screen and normal display modes.
- **Activity Properties:** Use this option to open the **Activity Properties** window to set the properties for the selected activity.

Publish

A workflow is deployed and activated only if it is published.

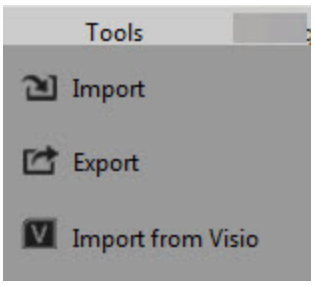


- **Publish**: Use this option to publish the workflow design.
- **Validate Definition**: Use this option to validate the workflow definition.

Tools

The **Tools** menu has the following options to export and import workflow definitions:

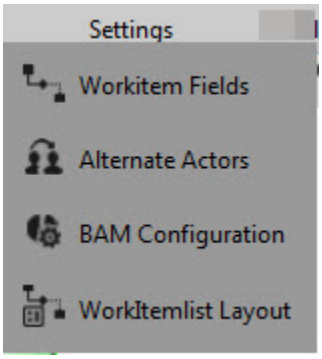
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



- Import: Use this option to import process definition XML files, which were exported earlier, into the Process Designer.
- Export: Use this option to export a workflow definition to an XML file. The exported XML definition can be manually edited or moved to another database.
- Import from Visio: Use this option to import a workflow process model XML file created using IT Pearls BPMN Stencil for Visio.

Settings

The **Settings** menu has the following options to configure different process level settings for other AVEVA Work Tasks Controls:



- Work Item Fields: Use this option to add and configure work item fields.
- Alternate Actors: Use this option to specify alternate actors to the actual assigned actors.
- BAM Configuration: Use this option to setup critical performance measurement criteria for a workflow.
- Work Item List Layout: Use this option to display all the work item fields that have been added.

Tool bar

The tool bar is located just below the menu bar at the top of the **Process Designer** window. It has the following tools:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Undo

The **Undo** tool can be used to undo the previous actions that were performed in the Process Designer.

Redo

The **Redo** tool can be used to repeat the previous actions that were performed in the Process Designer.

Delete

The **Delete** tool can be used to delete an activity from the workflow.

Copy

The **Copy** tool can be used to copy an activity in a workflow to paste it elsewhere.

Paste

The **Paste** tool can be used to paste a cut or copied activity in the workflow.

Activities Toolbox

The **Activities Toolbox** tool can be used to show or hide the Activities Toolbox (AVEVA Work Tasks activities), which has the list of activities.

Activity Properties

The **Activity Properties** tool can be used to show or hide the properties area for the selected activity.

Edit Text

The **Edit Text** tool can be used to edit the text corresponding to the selected element on the design mosaic. It could be an activity or a link.

Show Grid

The **Show Grid** tool can be used to show or hide the grid pattern on the design mosaic.

Search

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Search** tool can be used to search for a specific value in the workflow. You can enter the value to be searched in the field and click the magnifying glass icon next to it to start the search.

Zoom

The **Zoom** tool can be used to zoom in or out on the workflow design in the design mosaic. You can do this by specifying the percentage of zoom using the Zoom Level drop-down in the window that opens. You can also use this image to navigate through the process diagram.

See Also: Using the Process Map Image for Navigation

This feature is browser dependent. FireFox is not supported.

Link

The Link tool can be used to create a new link between two activities. You can do this by specifying the two activities to be linked in the window that is displayed.

Wizards

The Wizards tool wizards allow you to create and define workflows in an easy way.

Help

The **Help** tool can be used to access help content for the Process Designer and its elements.

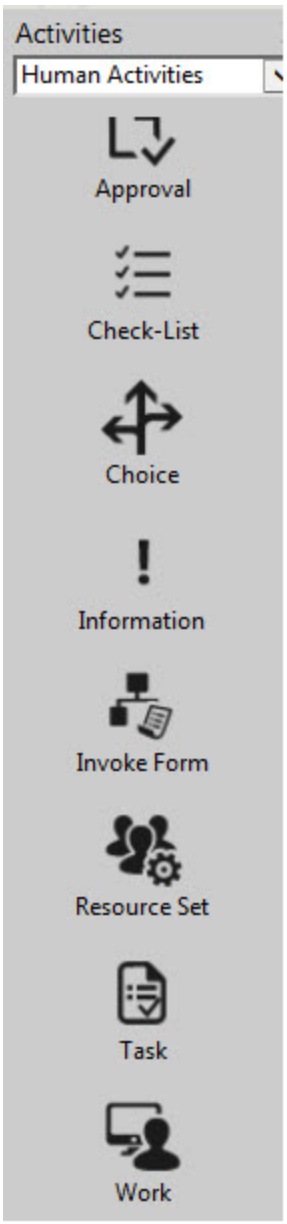
Activities

You can use the AVEVA Work Tasks activities area to access the different activities that can be used to design the workflow process in the Process Designer. There are several activities organized under different groups, which you can access from the drop-down list. These correspond to the standard workflow activities available with AVEVA Work Tasks.

Human Activities

When this option is selected from the drop-down list, it displays all the activities in this group. They can be used to enable human-workflow interaction. These activities include Approval, Check-List, Choice, Invoke Form, Resource Set, Information, Resource Set, Task, and Work.

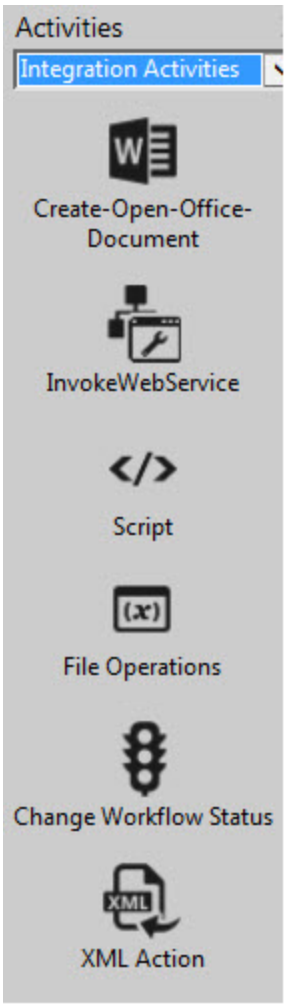
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Integration Activities

This option displays the activities that can be used to integrate workflows with external applications, scripts and databases. Activities include Create-Open-Office-Document, InvokeWebService, Script, File Operations, Change Workflow Status, and XML Action.

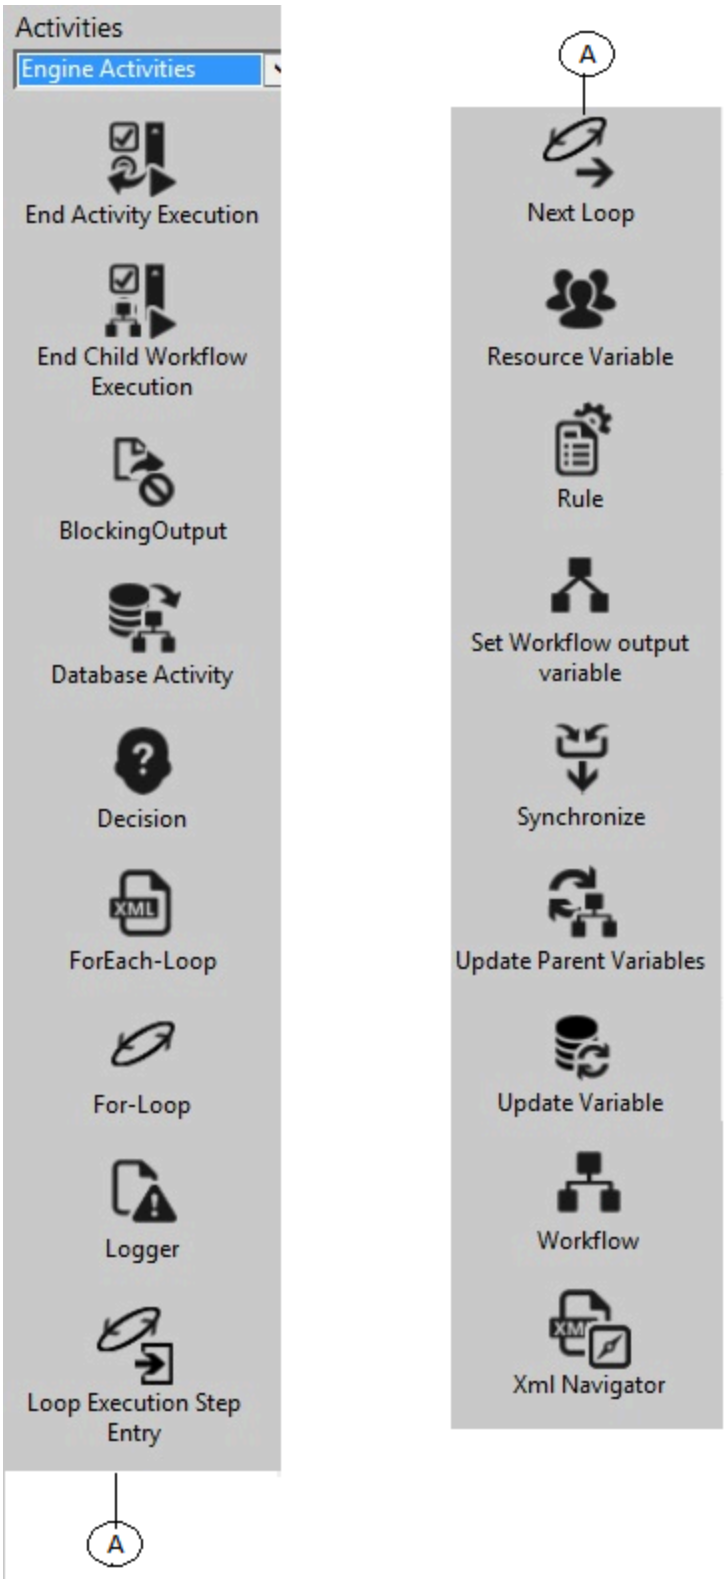
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Engine Activities

This option displays the workflow-engine related activities. These include BlockingOutput, Database Activity, Decision, ForEach-Loop, For-Loop, Logger, Next-Loop, Resource Variable, Rule, Set Workflow output variable, Synchronize, Update Parent Variables, Update Variable, Workflow, and Xml Navigator.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Scheduler Activities

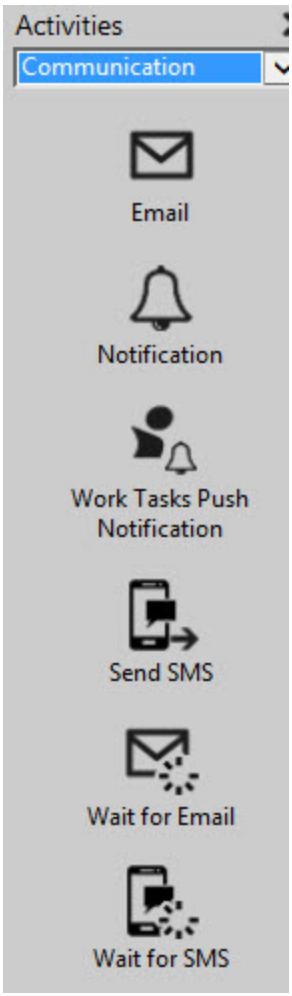
This option displays the activities that can be used to schedule the execution of other workflow activities. These include Control Custom Timer, Set Custom Timer, Scheduler, and Time Trigger.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Communication

This option displays the activities that can be used to enable communication from the workflows. These activities include Email, Notification, Send SMS, Wait for Email, and Wait for SMS.

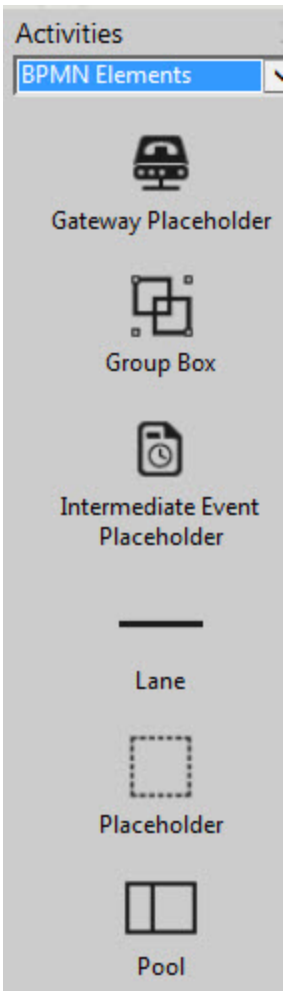
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



BPMN Elements

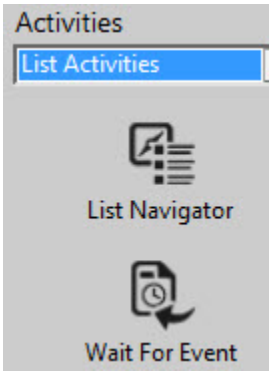
This option displays the different BPMN elements available in AVEVA Work Tasks. These activities include Gateway Placeholder, Group Box, Intermediate Event Placeholder, Lane, Placeholder, and Pool.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



List Activities

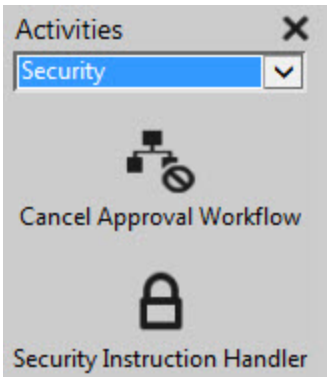
This option displays the activities that can be used to change the scope of the Xml List xml variable during workflow execution. These activities include List Navigator and Wait For Event.



Security

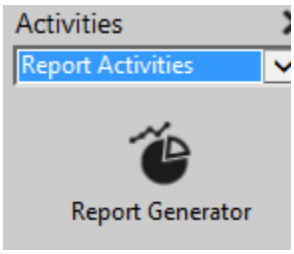
This option displays the activities that can be used for security. These include Cancel Approval Workflow and Security Instruction Handler.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



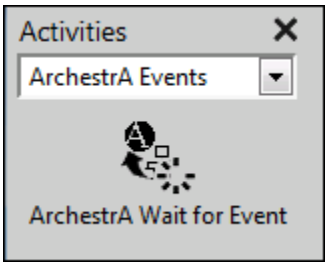
Report Activities

You use the Report Generator activity to run a report template and save the report in the Reports list.



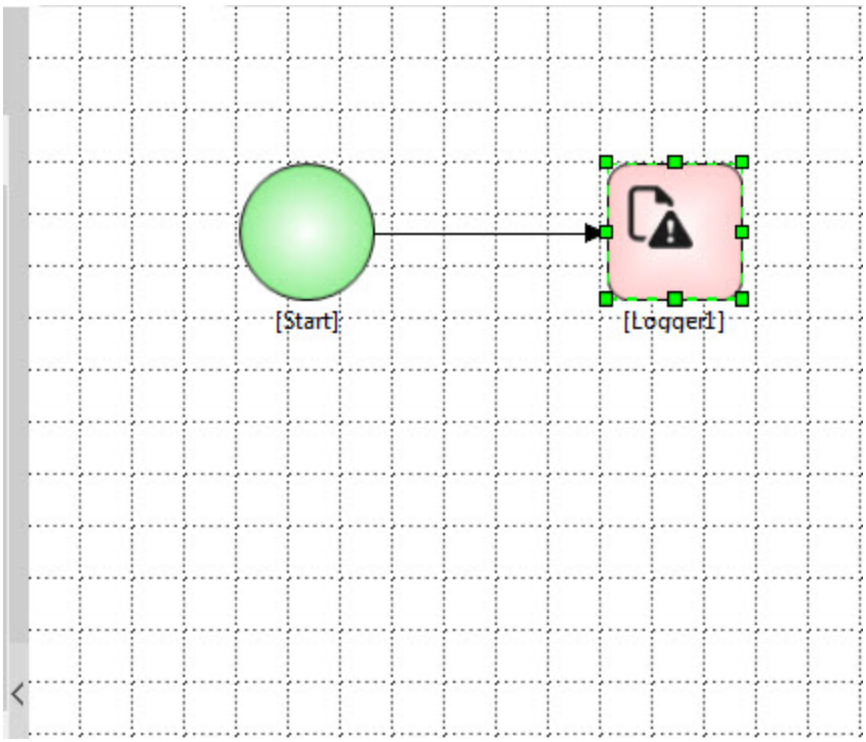
ArchestrA Events

Use the ArchestrA Wait for Event activity to wait for a number of events from ArchestrA Event Services platform for a particular time period, and then consume the events in a defined workflow. You can set the number of events and the time period in the properties of that activity. It can store the event context details in the specified XML variables.



Design Mosaic

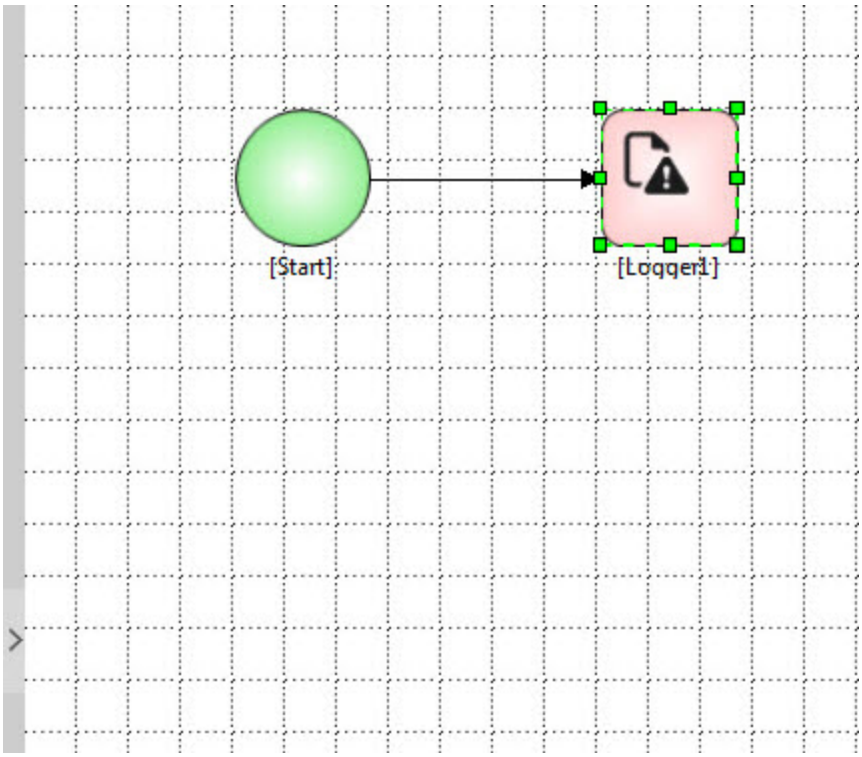
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



You can create and edit workflows in the Design Mosaic. Initially, it displays only the icon for the Start activity. You can click and drop different activities from the list of activities to the Design Mosaic. This will display the icons corresponding to the selected activities, on the Design Mosaic. These activity icons can be lined to one another.

A splitter has been provided on the left side of the Design Mosaic. You can click this splitter to hide the Activities pane and enlarge the Design Mosaic in that direction. The following image shows the Process Designer with the splitter clicked to enlarge the design area:

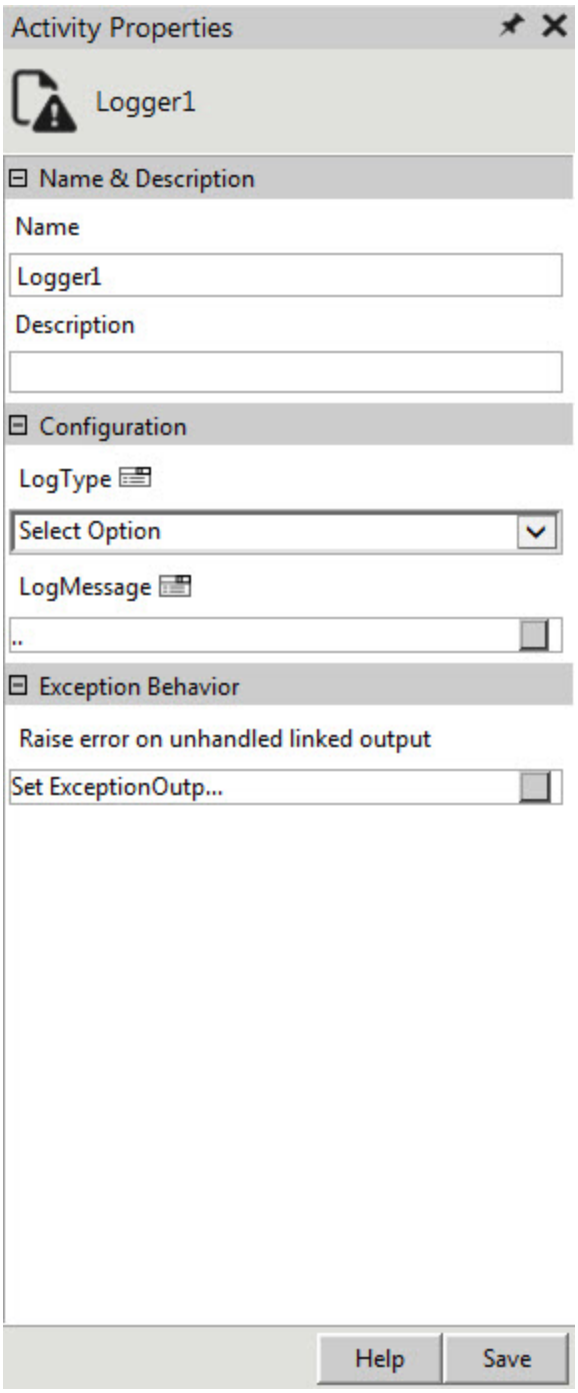
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Activity Properties

The **Activity Properties** pane at the right of the screen shows the property fields corresponding to the selected Activity. The following image shows the Activity Properties for the Logger activity:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

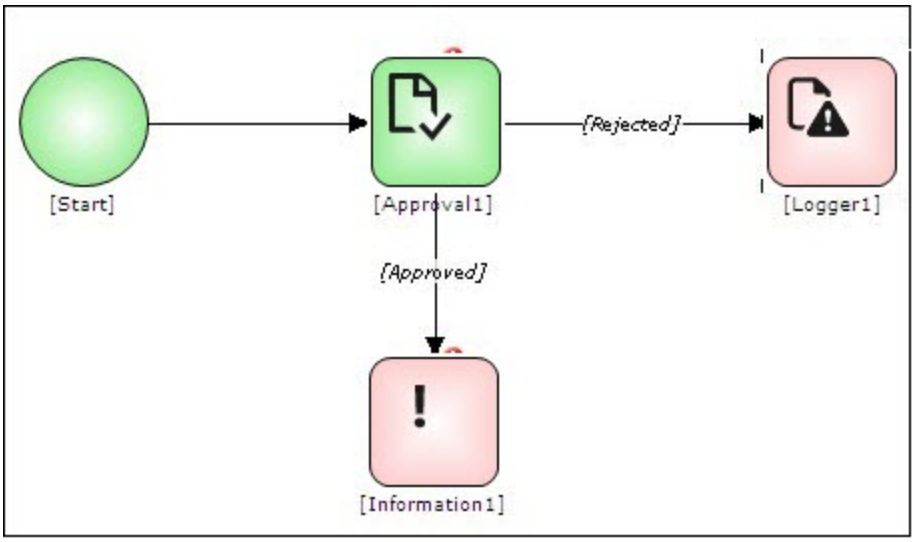


Save File as EMF Image

When you select the **Save As EMF Image** option from the File menu, the windows **File Download** dialog box appears. Click **Open** to open the image file or click **Save** to save the image file as an EMF image.

The following images shows the EMF image of process definition:

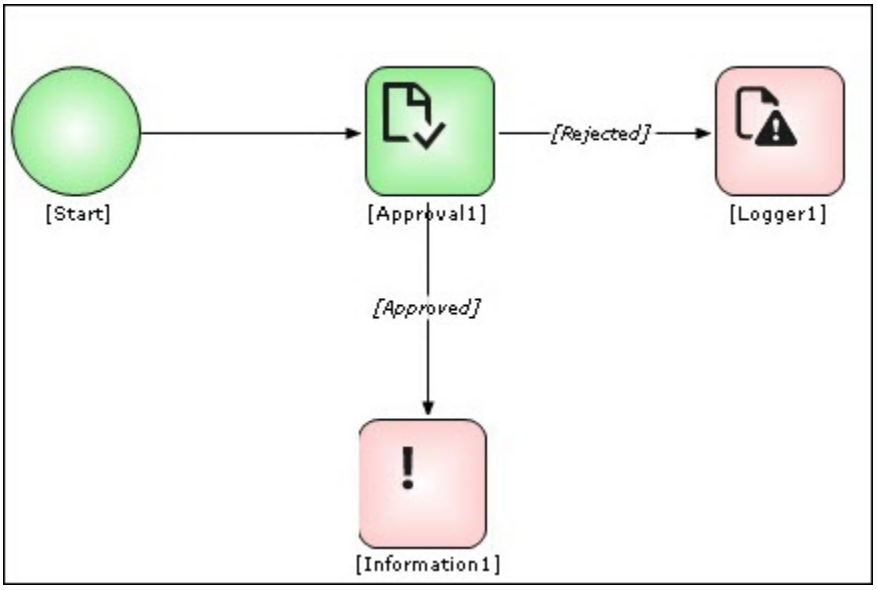
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Save File as PNG Image

When you select the **Save As PNG Image** option from the **File** menu, the windows **File Download** dialog box appears. Click **Open** to open the image file or click **Save** to save the image file as a PNG image.

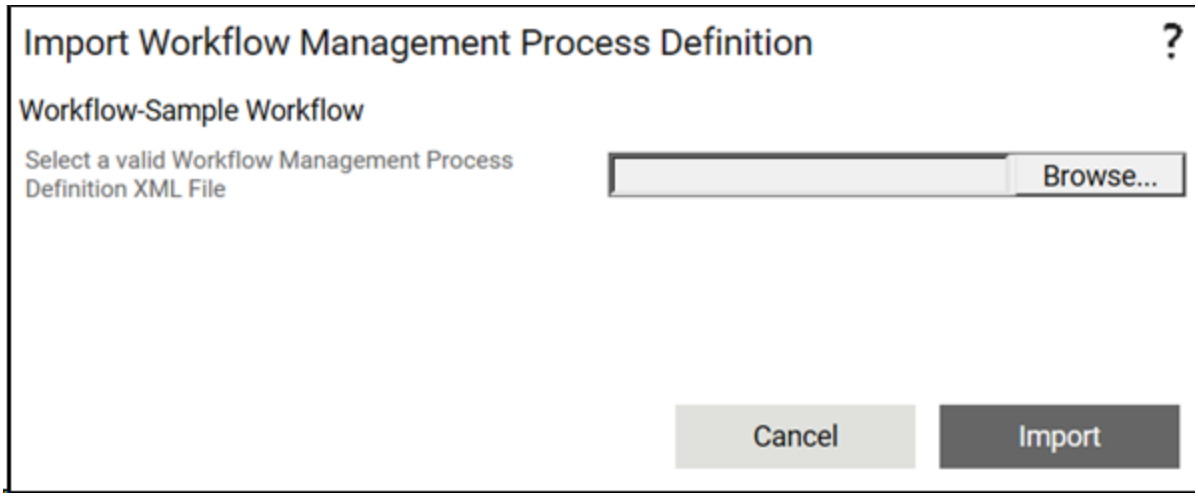
The following images shows the PNG image of process definition:



Import Process Definition XML File

This window is opened when you select the **Import** option from the **Tools** menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



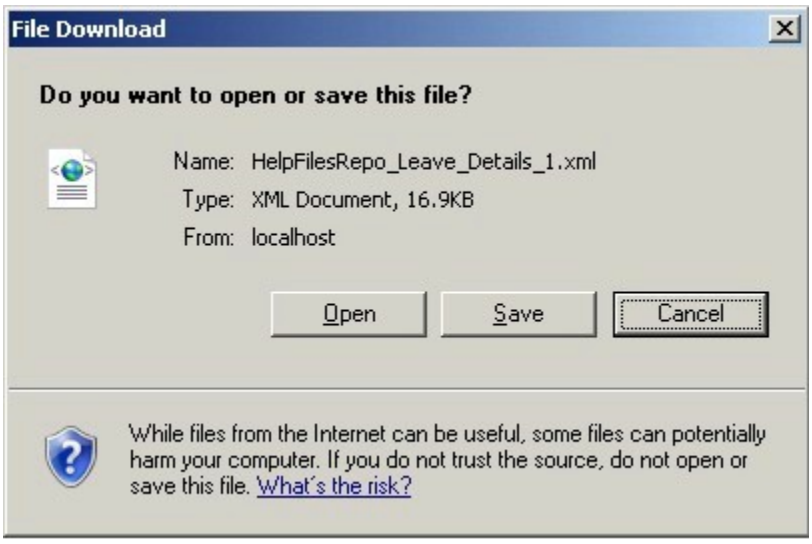
Import XML Process Definition window

You can use the following controls to import a valid process definition that has been saved as an XML file editing and/or execution.

- **Select a valid AVEVA Work Tasks Process Definition XML File** - You can enter the name of the XML Process definition file in this field or click **Browse** to select a valid process definition XML file.
- **Import** - After selecting a process definition XML file, you can click this button to import the file.
- **Cancel** - You can click this button to cancel the selection and close this window.

Export Process Definition XML file

The Windows File Download dialog opens when you select the **Export** option from the **Tools** menu.

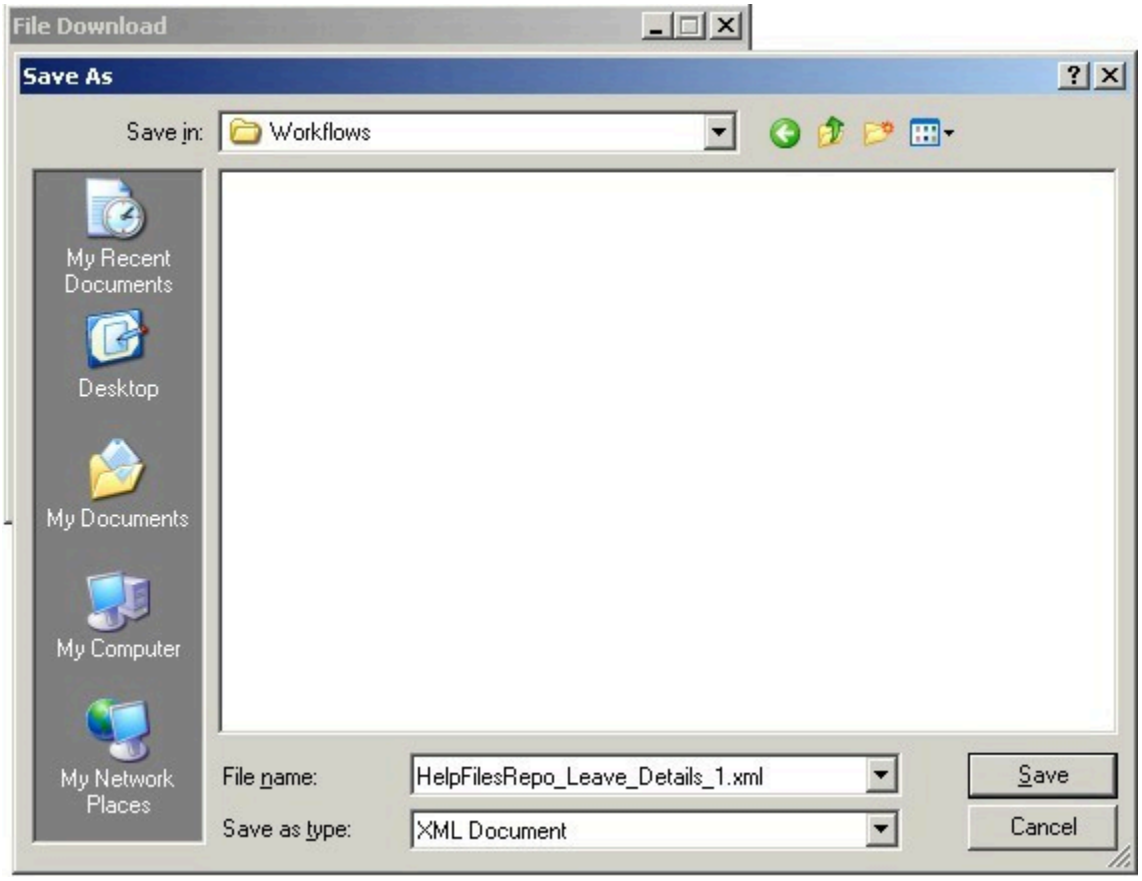


File Download dialog displayed for Process Definition Export

You can use the following controls in the dialog to export a AVEVA Work Tasks process definition as an XML file.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Open** - Click this button to open the XML file
- **Save** - Click this button to open the Windows Save As dialog to save the exported process definition XML file
- **Cancel** - Click this button to cancel the export and close this window



Save As dialog for saving the exported XML file

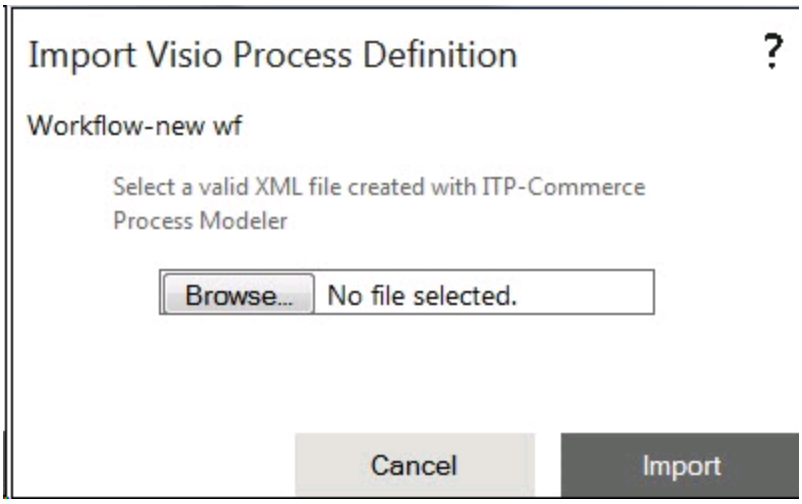
            </filter>
```

Exported Process Definition XML file

Import Process Definition from Visio

This window opens when you select the **Import from Visio** option from the **Tools** menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Import Visio Process Definition window

You can use the following controls to import a process definition created with the ITP-Commerce Process Modeler for Visio.

- **Select a valid XML file created with ITP-Commerce Process Modeler** - You can enter the name of a valid XML Process definition file from the Visio stencil in this field or click **Browse** to select the XML file.
- **Import** - After selecting a Visio process definition XML file, you can click this button to import it.
- **Cancel** - You can click this button to cancel the selection and close this window.

  Note: The import routine maps Visio BPMN activities to native AVEVA Work Tasks activities. You should configure the necessary properties after import.

Add Work Item Fields

This window is displayed when you select **Work Item Fields** from the **Settings** menu of the Process Designer. It lists all the work item fields that have been added. The application data available in contents or variables can be displayed in the Work items list using work item fields. You can map the contents and variables with the work item fields in this window.

The 'Work Item Fields' property of the Human activities can be used to specify the work item fields to be used for a particular activity.

This field will automatically be displayed in the Work items list once the activity gets executed and the task is assigned to a resource. When the activity is executed, the values of the custom fields are persisted to the database (SKWork Item Fields table).

The **Work Item Field** window has the following buttons:

- **Add New** - You can click this button to add new work item fields. This will open the second window in the **Work Item Field** user interface where you can add the new work item fields.
- **Close** - Click this button to close the window.

Add/Set Work Item Field window

The **Add/Set Work Item Field** window is used for adding work item fields. This interface is displayed after the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

actor clicks **Add New** button in the Work Item Field window.

For each work item field, the following parameters can be set:

- **Name** - You can enter the name of the new work item field in this text box.
- **Display Name**- You can specify a display name for the new work item field in this text box. The field will be displayed to the actor with this label name in the Work items list.
- **Type** - You can specify the data type corresponding to this work item field by selecting an option from this drop down. The options available are "datetime", "decimal", "number" and "string". For datetime option, the supported format is DD/MM/YYYY.
- **Default Value Type** - You can specify the type of value corresponding to the new work item field by selecting an option from this drop down. The options available are "SetValue", "Variable", "Content", "Xml Variables" and "Value".
- **Default Value** - You can specify the value for the new work item field.
- **Application Level** - You can select this check box to configure the work item fields to be displayed at Application Level.
- **AVEVA Work Tasks Pro** - You can select this check box to configure AVEVA Work Tasks Pro grouping and view the work items in groups. The **AVEVA Work Tasks Pro** check box is enabled only when **Application Level** check box is enabled.

  AVEVA Work Tasks Pro scope can be enabled for only one work item field.

  Note: The value of the Work Item Field is displayed based on the AVEVA Work Tasks server language setting.

This window has the following buttons:

- **Add** - You can click this to add the new work item field.
- **Cancel** - Click this to cancel the settings for the new work item field and close the window.

When you click **Add**, the Work Item Field window opens with the new field added to it.

Alternate Actors

An actor is a user who is responsible for acting on a task or an activity. You can assign alternate actors to a workflow who will have rights to approve or reject an activity in the absence of the original actor.

You can configure an alternate actor in one of the following three different ways:

- Inbox
- Enterprise Console menu
- Process Designer

While configuring an alternate actor in Inbox or Enterprise Console menu, the Add Alternate Actor dialog box does not contain the **Activities** field. While configuring an alternate actor in Inbox, the logged in user is considered as the actor.

Steps to set an Alternate Actor in the Process Designer:

1. In the **Process Designer** window, point to **Settings**, and then click **Alternate Actors**.

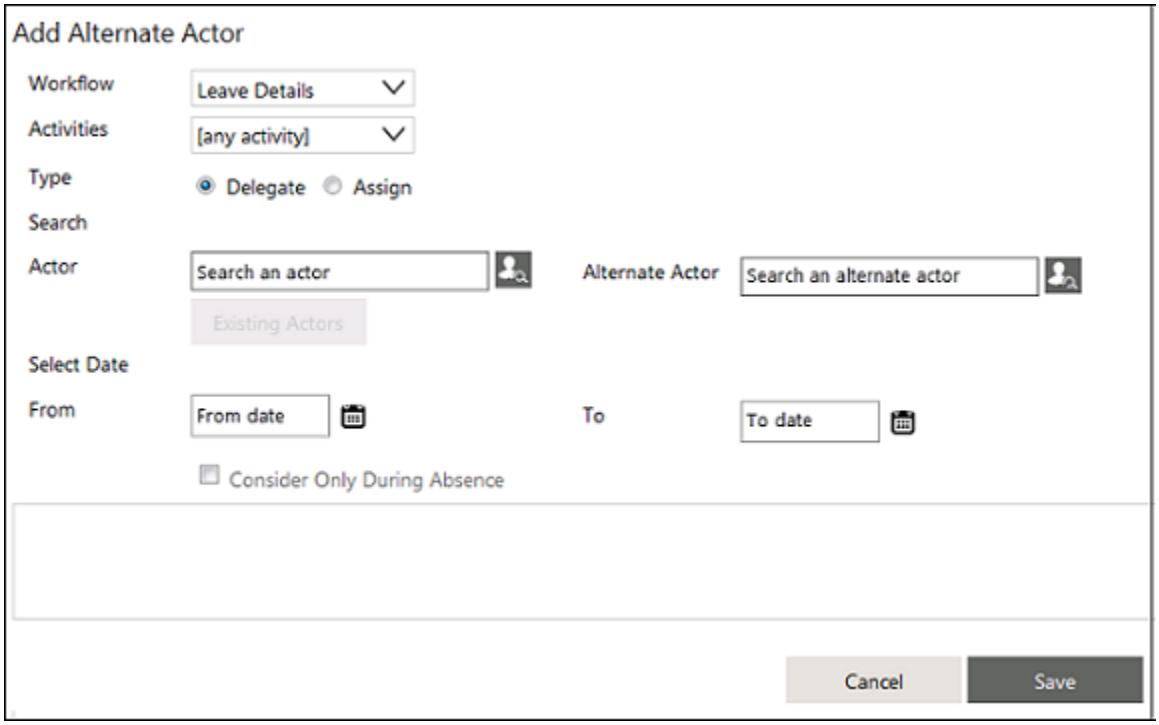
   The Alternate Actors dialog box appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

This window lists all the alternate actors that are added.

2. Click **Add New Actor** to add new alternate actors.

   The Add Alternate Actor dialog box appears.



3. Enter the required inputs for each work item field:
   a. **Workflow**: Specify the workflow for which the alternate actors are being added.
   b. **Activities**: Specify the activity for which the alternate actors are being added. The field will be displayed to the actor with this label name in the Work items list.
   c. **Type**: Specify the type of activity transfer from the original actor to the alternate actor.
      a. **Delegate**: Delegate the task to the alternate actor.
      b. **Assign**: Shift the task assignment to the alternate actor.

         Only one type of setting (**Delegate** or **Assign**) is allowed for an Actor, Alternate Actor, and Workflow combination.

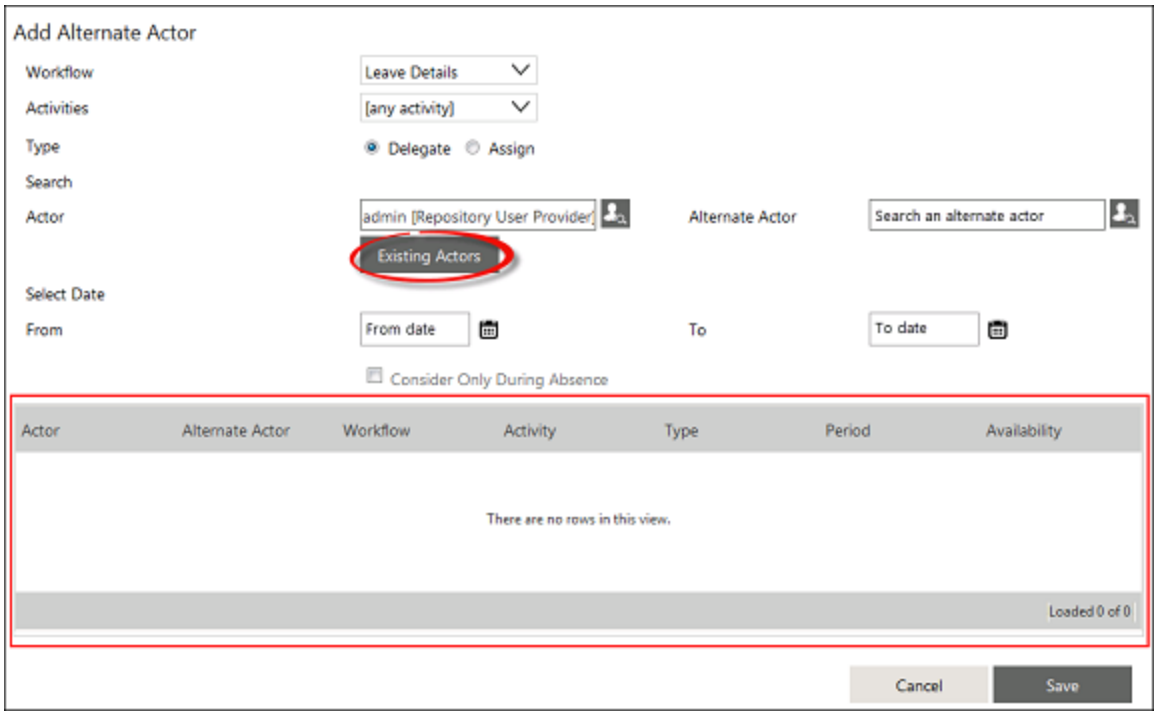
         In an upgraded environment where **Delegate** and **Assign** is already set for an actor, **Delegate** takes precedence over **Assign**. .
   d. **Search**: Specify the actor and the alternate actor.
      i. Click the **User Lookup** button to select the **Actor** or the **Alternate Actor.**

         The User Lookup dialog box appears.
      ii. Select the required users, and click **Update**.

         The same user cannot be set for both Actor and Alternate Actor.

         Click **Existing Actors** to view the list of all the existing alternate actors of the selected actor. The list of existing actors and the associated details get populated in the grid at the bottom section of the dialog box as shown in the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



e. **Select Date**: Specify the period for which the alternate actor is being assigned to the original actor.
   i. **From**: Click the calendar to select the start date.
   ii. **To**: Click the calendar to select the end date.
   iii. **Consider Only During Absence**: Select to specify that the alternate actor is to be considered only during the absence of the original actor.

   Note that the **From** date cannot be older than the current date.

4. Click **Save** to add the new alternate actor.

   The **Alternate Actors** window opens showing the newly added alternate actor.

For more information about assigning Alternate Actors from the Work items list window, see *Work items list Control*.

For more information about how to set an Actor to perform a human task, see *Human Activities* in the *Developer Guide*.

See Also: *Alternate Actors* topic in *User Guide*.

BAM Configuration

The Business Activity Monitoring Configuration enables business analysts to setup critical performance measurement criteria for a workflow.

Performance criteria can be setup to provide the following information:

- Overdue Analysis
- Performance Analysis

The BAM Configuration window has the following five tabs:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Overdue Analysis**: Use this tab to setup thresholds for total pending workflows and pending in different time slots.
- **KPI Data Points**: Use this tab to set up KPI data points such as activities pending, workflow status, and other measurement points.
- **KPI(s)**: Use this tab to set up threshold limits for each data point.
- **Performance**: Use this tab to specify work types that must be measured for performance analysis.
- **Alert Configuration**: Use this tab to create rules for both Overdue and KPI based on the threshold value set, set the time for the alert to be triggered, and set an action, if the rule is satisfied.
- **Basic Configuration**: Use this tab to schedule the analysis. You can also select Process Now for immediate reporting.

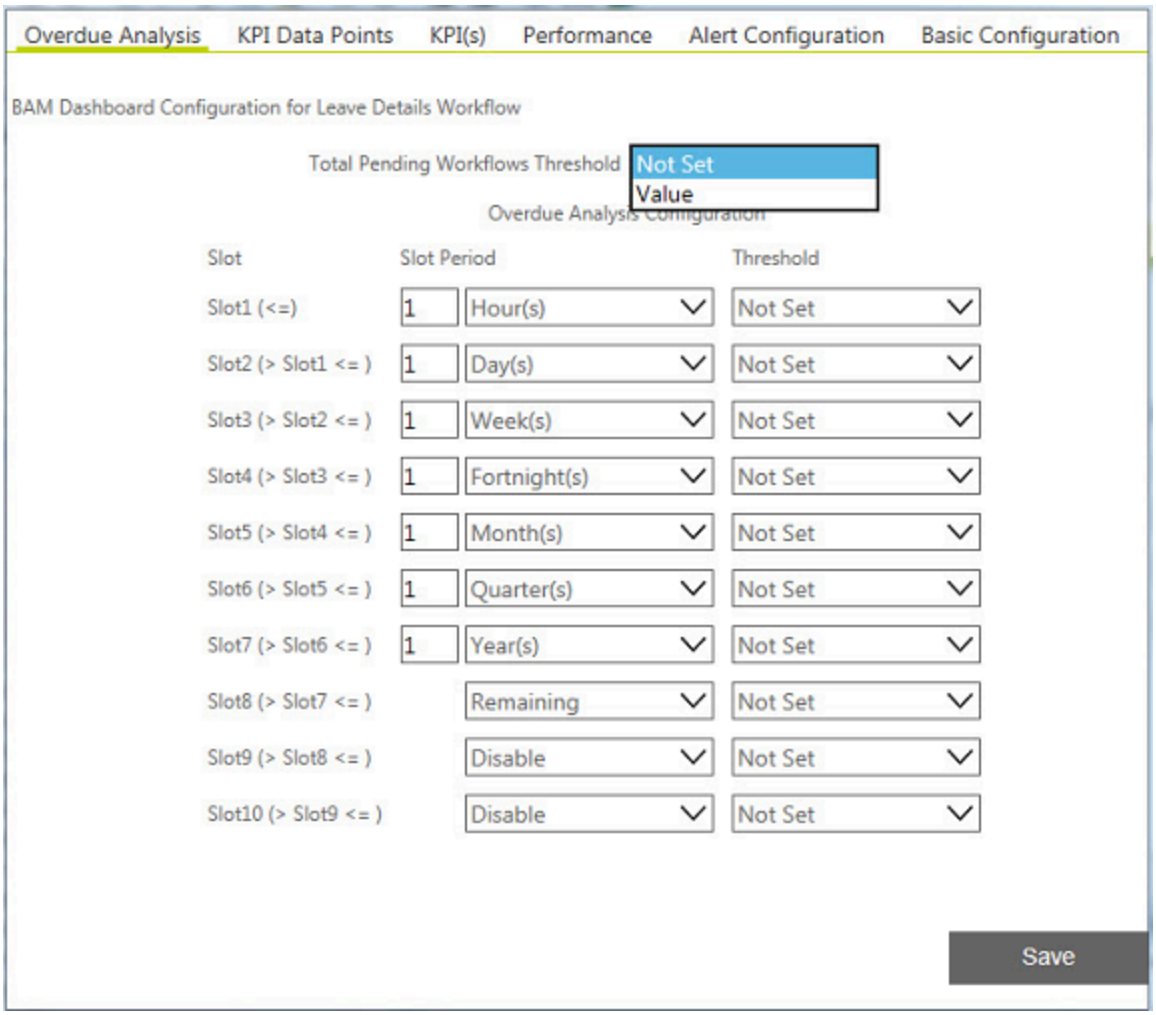
Steps to Configure BAM

1. Define the schedules at which the analysis on workflow execution must be performed.
2. Configure Overdue Analysis:
   a. Define threshold limits for all pending workflows for Overdue Analysis.
   b. Define data points for Key Performance Indicators to measure.
   c. Define threshold levels for each KPI at different time slots.
3. Configure Performance Analysis:
   a. Define type of work to be measured, the type of work to be analyzed .
   b. Identify work item fields to compute averages for comparative analysis .
4. Use the BAM Dashboard to view the Overdue Analysis.
5. Use the BAM dashboard to analyze Performance. You can also set benchmarks for a resource or an activity to measure resource performance against the benchmark.

Overdue Analysis

You can use the **Overdue Analysis** tab to setup the threshold for total pending workflow instances at any time and for selected time slots.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Total Pending Workflows Threshold: Select **Value** to set a limit on the total workflows that may be pending at any time.

Overdue Analysis Configuration

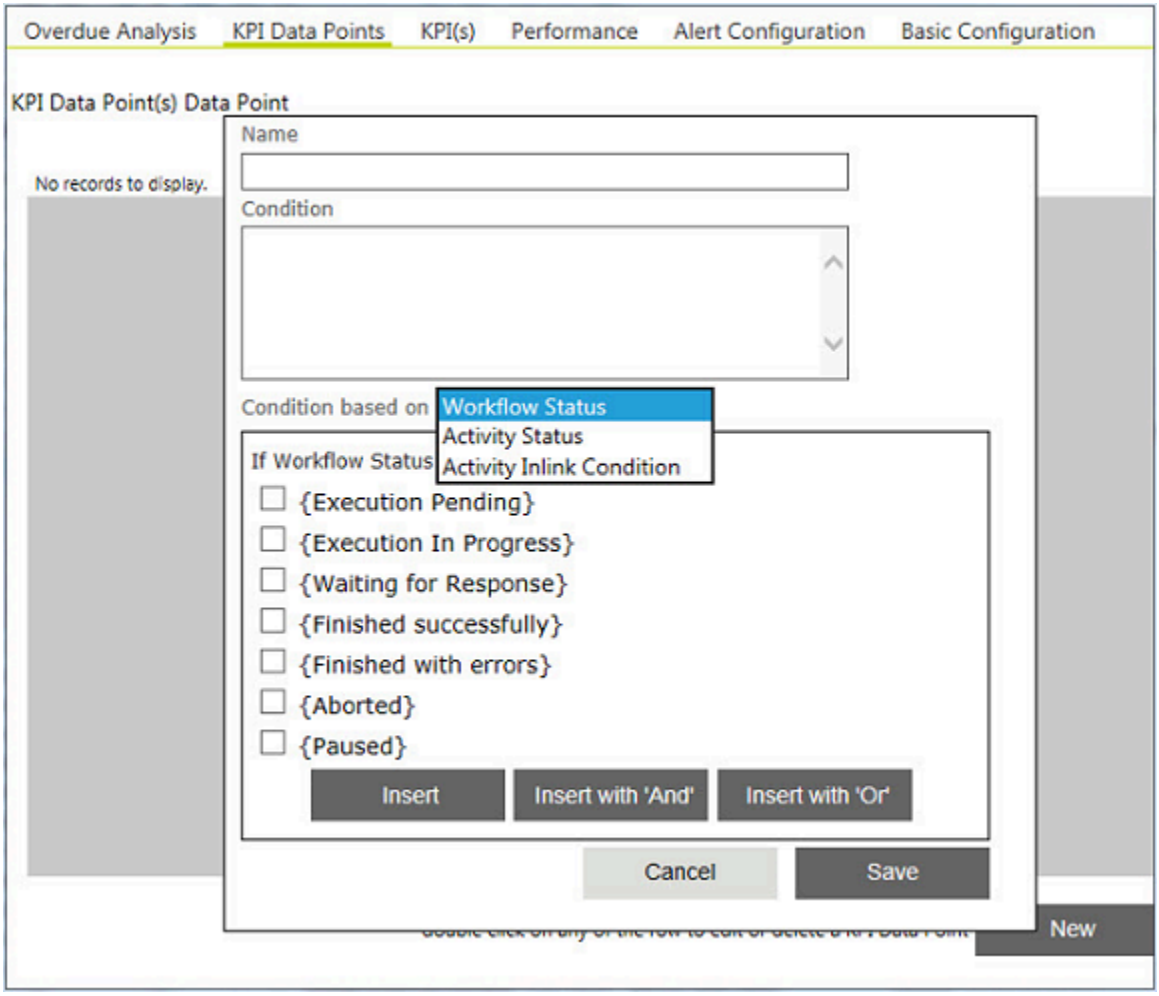
Overdue workflows may be analyzed in 10 time slots.

- *Slot Period*: Select the time period for defining threshold values in each slot.
- *Threshold*: Select the threshold option.
  - Not Set: This indicates there is no threshold.
  - Value: Select this option and enter a threshold value for the number of pending workflows in the time slot.
  - % of Total: Select this option to enter the threshold of pending workflows as a percentage of total active workflows in the time slot.
- Click **Save**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

KPI Data Points

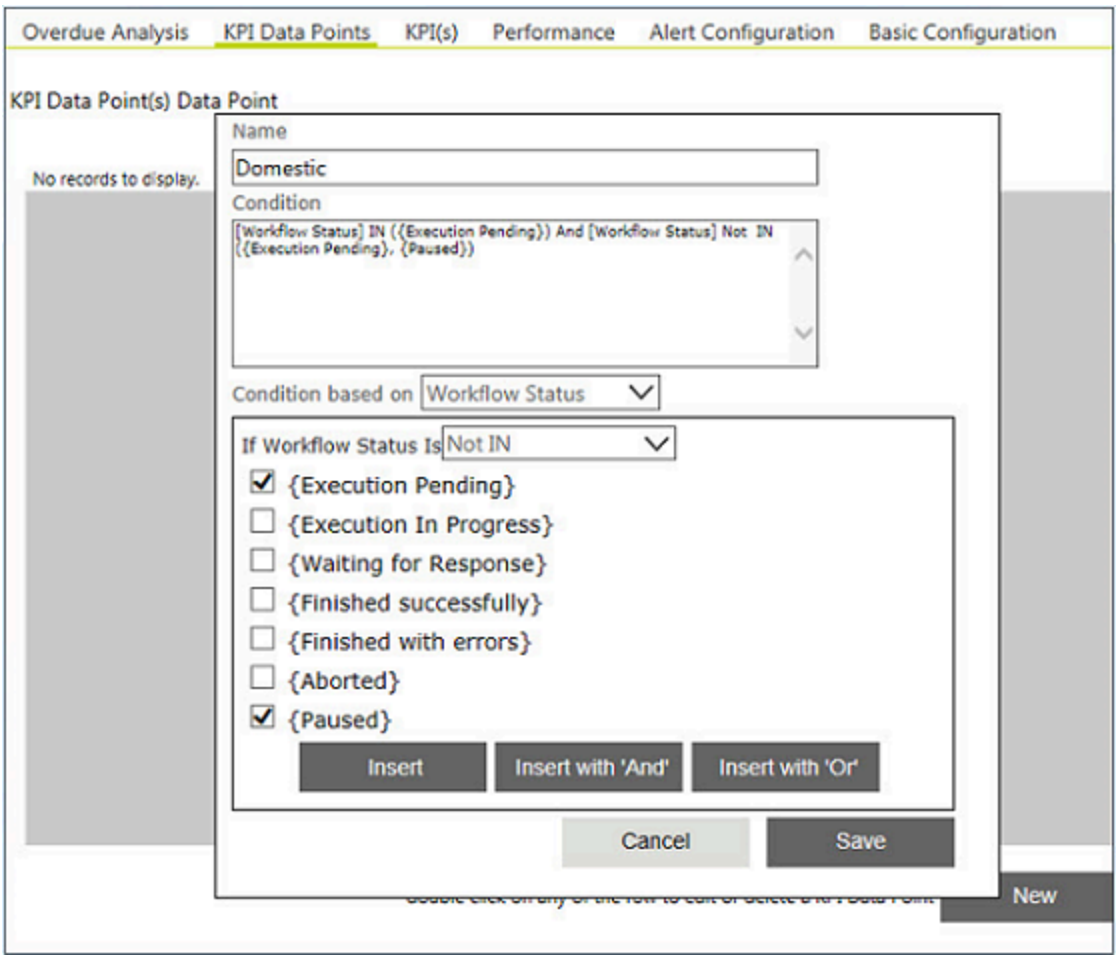
You can use the KPI Data Points to define the data points that you want to monitor for overdue analysis. These data points are monitored in addition to the thresholds set for the overall pending workflows in the Overdue Analysis tab.



KPI Data points may be defined for conditions that include one or more of the following:

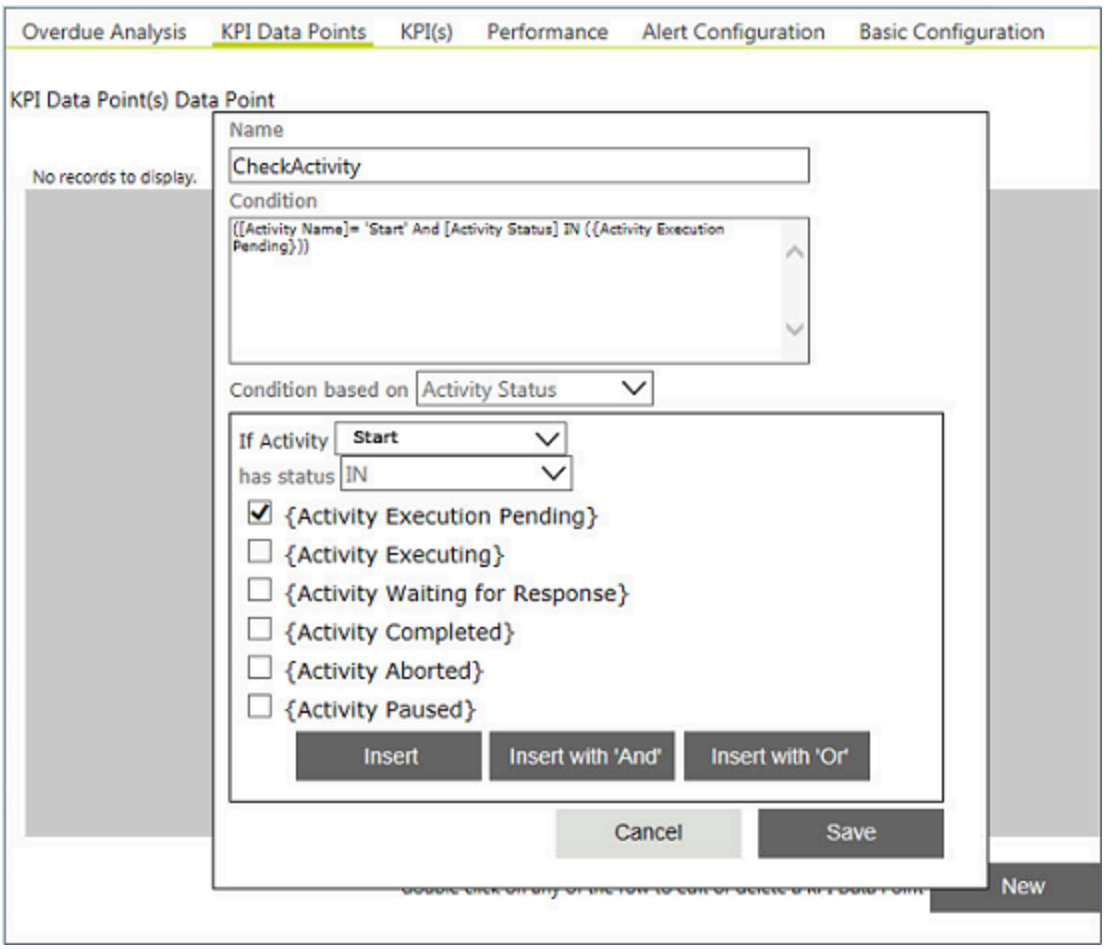
Workflow status

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Activity status

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Activity Inlink Condition where the link to the activity has a specified condition.

Example

In a customer support workflow, you would like to monitor all workflows that have status as Workflow Pending and in which the Close Support Ticket activity has the status Activity Execution Pending and the result of the previous activity Get Customer Feedback is not No Feedback Received from Customer.

Setting KPI Data Points

1. Click **New**. A dialog box appears.
2. Enter the following information:
   a. **Name**: Name for the Data Point.
   b. **Condition based on**: Select the condition type from **Workflow Status**, **Activity Status**, or **Activity Inlink Condition**.
3. Select the condition for the **Workflow Status**, **Activity Status**, or **Activity Inlink Condition** selected.
4. Click **Insert**.
5. Select another condition type, if required.
6. Click **Insert with 'And'** or **Insert with 'Or'** to add the new condition with and/or to the existing condition.
7. Click **Save**.

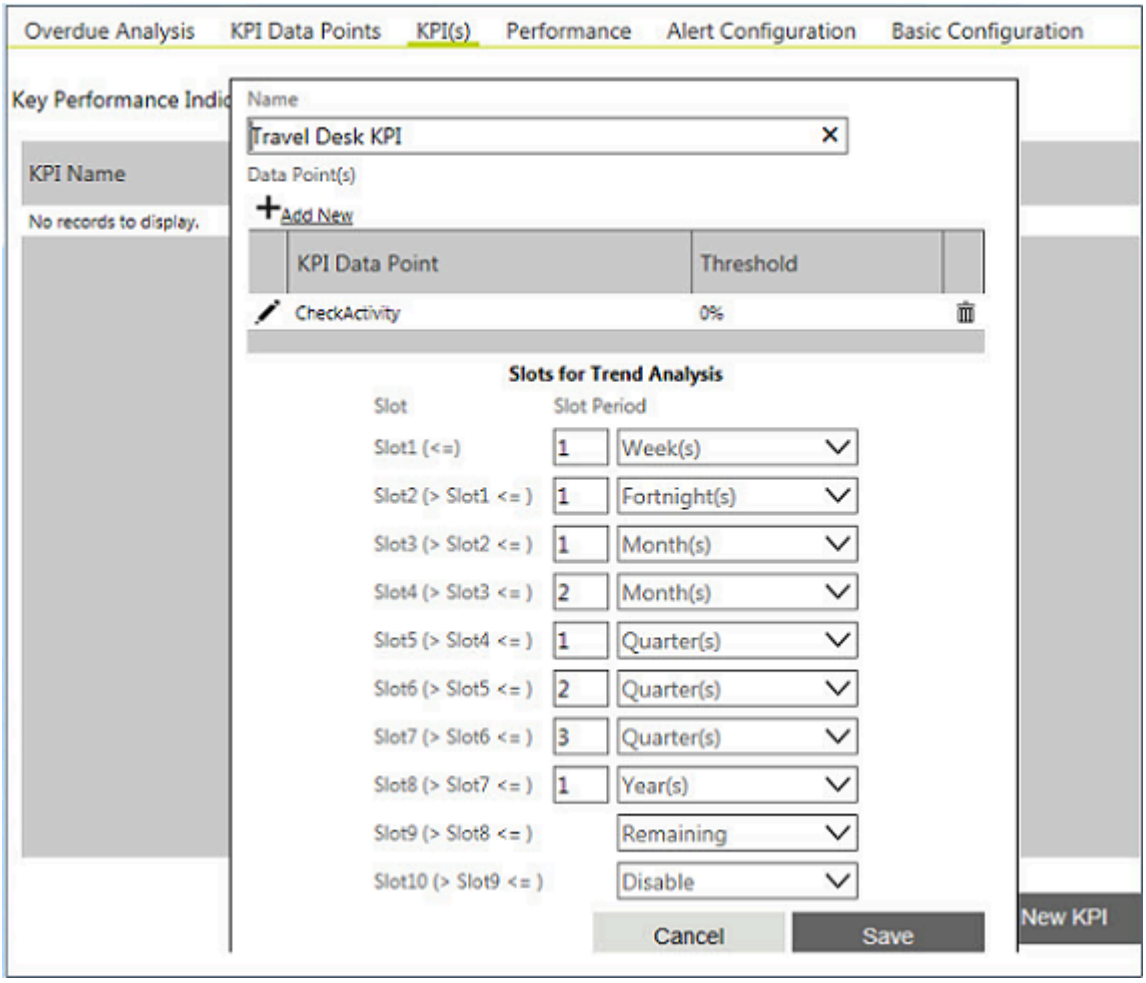
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

KPI(s)

You can use the KPI(s) tab to define thresholds for the KPI data points identified in the previous tab.

To add a KPI:

1. Click **New KPI**. A dialog box appears.
2. Enter the following information:
   a. **Name**: Name for the new KPI.
   b. **Data Point(s)**: Click **Add New** to add a Data Point, and enter the overall Threshold for it.



3. Slots for Trend Analysis: Select the time periods for trend analysis.
4. Click **Save**.

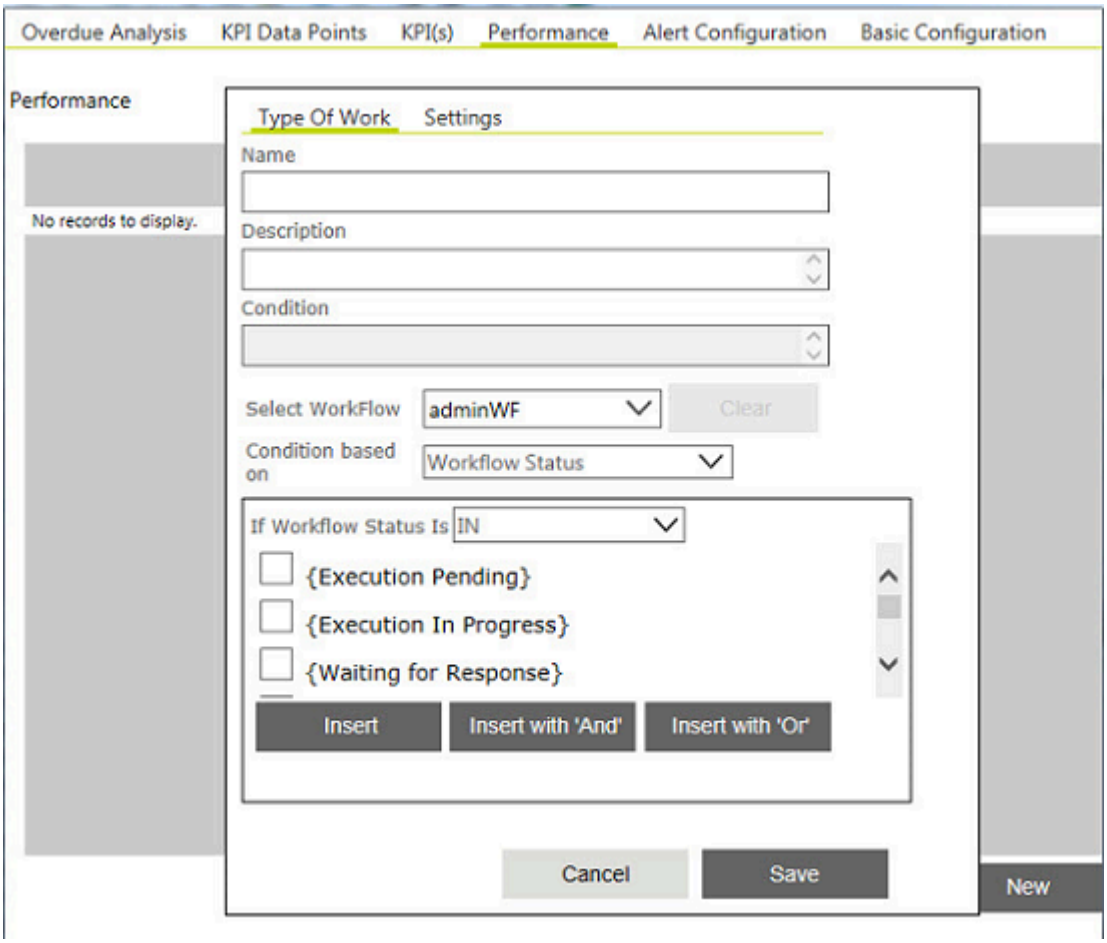
Performance

You can use the Performance Analysis configuration tab to define criteria for work to be monitored for resource analysis, work, and resource performance.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to configure Performance Analysis:

1. Define **type of work** to be monitored. To add a new work type, click New Type of Work.
2. Enter the name for the type of work.
3. Setup conditions for monitoring the work. Work types can be configured to include conditions that comprise workflow status, activity status, activity in link conditions, work item fields and queues.
4. The options displayed below the 'Condition based on' field depend on the condition type.
5. Click **Insert with And** or **Insert with Or** to build the condition further.



6. In Settings tab, select **the Work Item** fields to be monitored. All work item fields in the activities and workflows selected in **Type of Work are available for selection**.
7. Select **Consider Acknowledgment Date for Work Item** to consider the time for the work item from the acknowledgment date and not on assignment date.
8. Select a date range for measuring performance. Select Apply date range for weighted average to use the same period for calculating weighted average. A resource performance is compared with the weighted average and slotted accordingly.
9. Select the date range for calculating the weighted average of the performance for this work type.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Alert Configuration

Use this tab to create rules for both Overdue and KPI based on the threshold value set, set the time for the alert to be triggered, and set an action, if the rule is satisfied.

For more information about Alert Configuration, see BAM Alert Configuration Settings.

Basic Configuration

You use the **Basic Configuration** tab to define the schedules at which the analysis must be run. You can also run the BAM reports for the workflow immediately with the **Process Now** option available in this window.

You can process the BAM Reports in one of the following two ways:

- Manual proce**ss**
- Scheduled process

In the manual process, click the **Process Now** button to synchronize the report data. You can achieve similar output by scheduling the process through the BAM Scheduler.

BAM Web Services Configuration

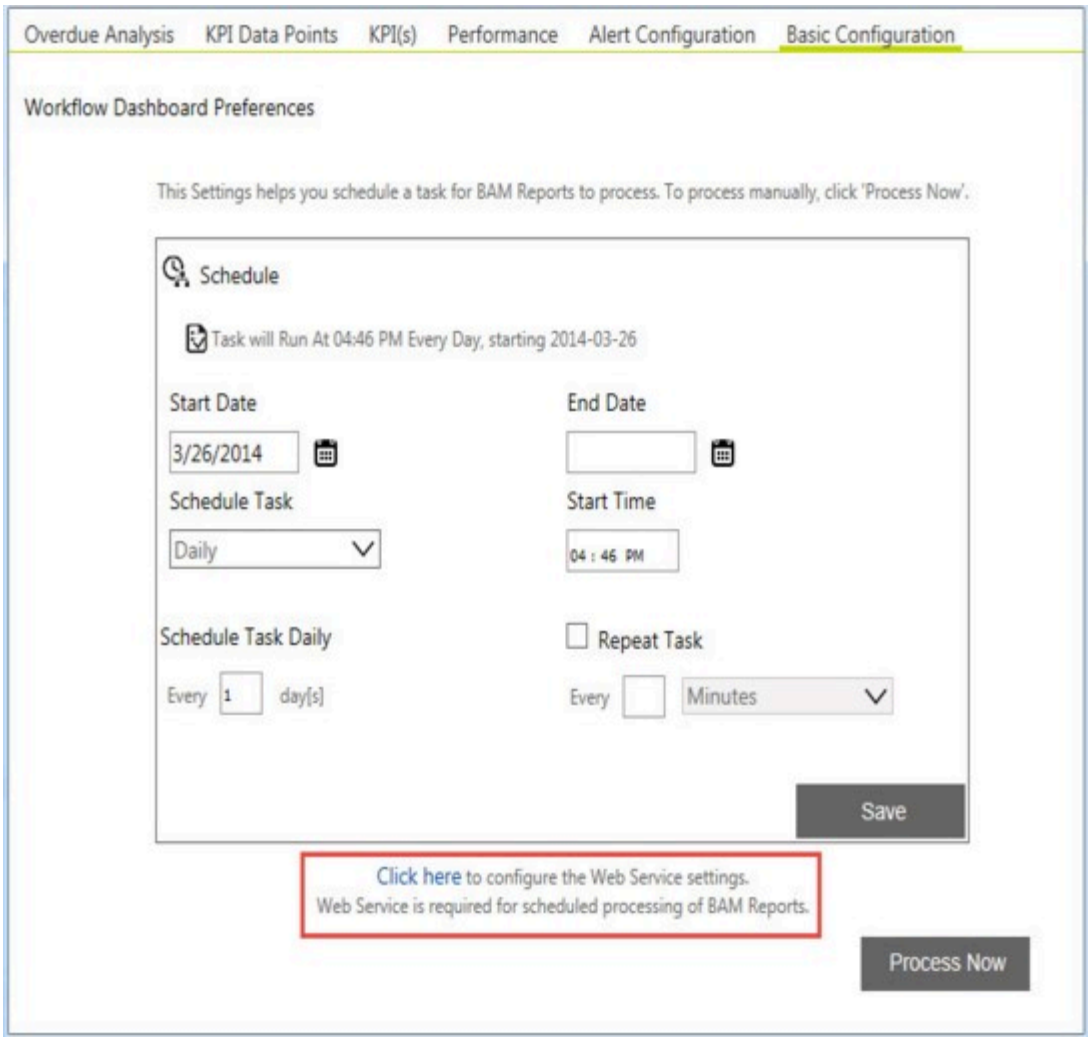
Configure the web services for scheduling the BAM Process using which you can send and email with the embedded graph. Use the BAM Configuration page for this configuration. DO the following to access the configuration page:

1. Right-click on any workflow, and click **BAM Configuration.**

   The BAM Configuration page appears.

   - Alternatively, go to **Process Designer,** click **Settings**, and then click **BAM Configuration.**
2. Click the **Basic Configuration** tab.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

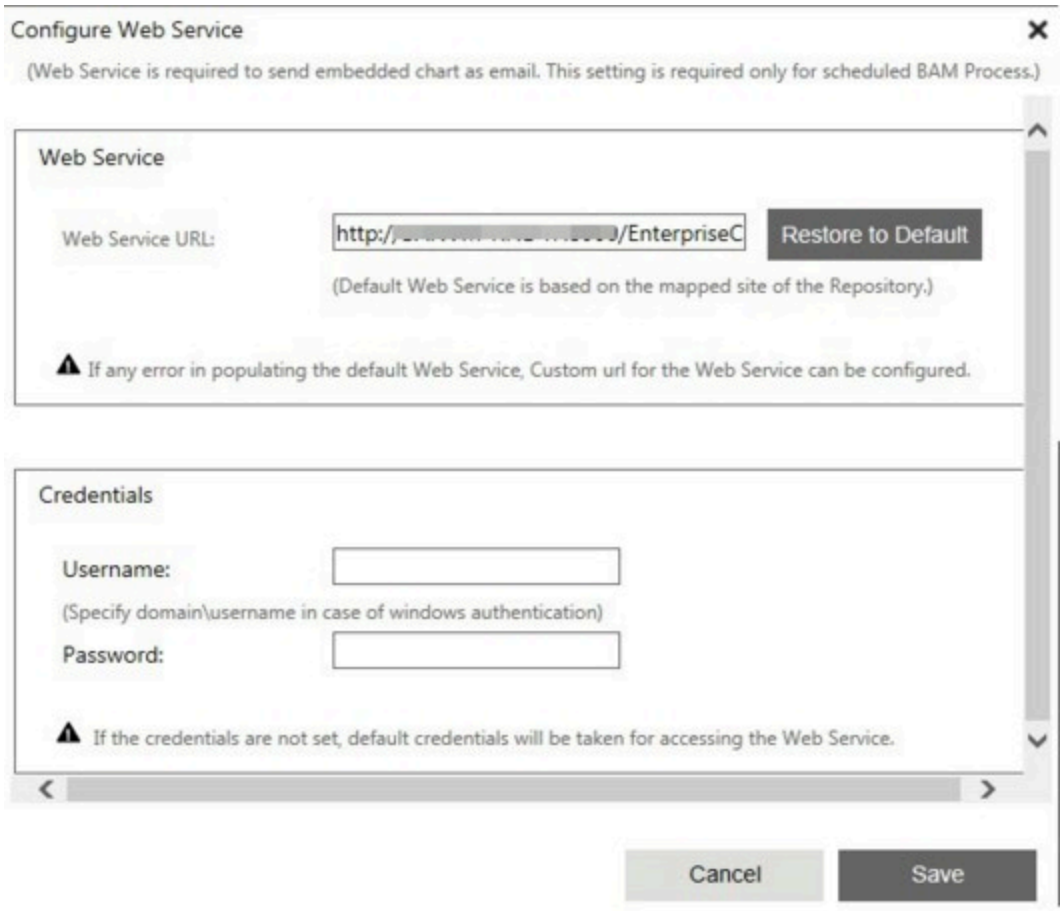


3. Click the **Click here** link.

   The Configure Web Service section appears.

   The Configuration Web Service section contains the default web service URL in the **Web Service URL** field. The default web service URL is based on the mapped repository.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



You can change the default Web Service by entering the Web Service URL in the **Web Service URL** field. Enter a valid and accessible Web Service URL. Enter the username and password as the credentials for the Web Service. In case of Windows authentication, specify the user name with the domain name. For example domain\username.

Click **Restore to Default** to restore the default URL.

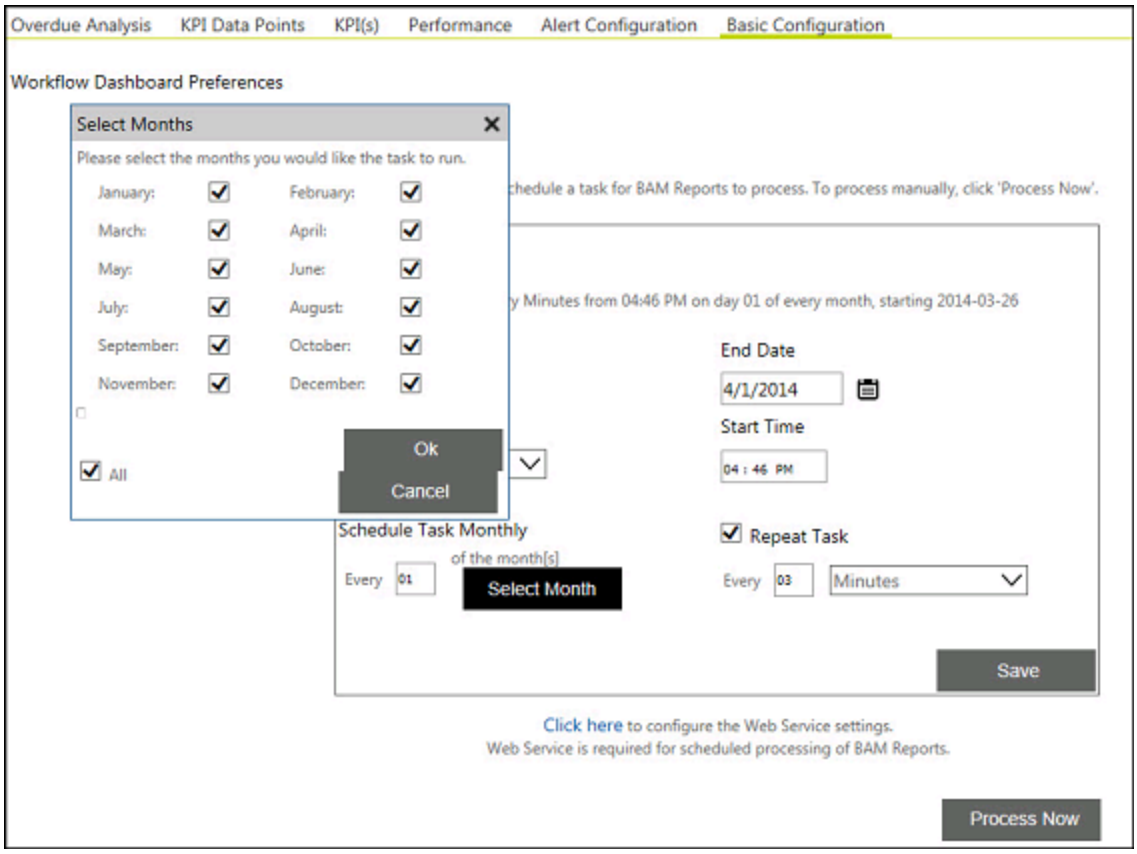
In case of any difficulty in populating the Web Service, create a Web Service with the *ProcessBAMService.asmx* specified in the following path:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\BPMUITemplates\Default\BAM\WS\ProcessBAMService.asmx.

To schedule the analysis:

1. Define the start and end dates. To run the reports indefinitely, leave the end date empty.
2. Select the **Schedule Task**. Tasks can be scheduled on daily, weekly or monthly basis.
3. Select the months, days or weeks in which the analysis task must run.
4. Select the day of the month or week or the hour of day when the task must be run.
5. Click **Save**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

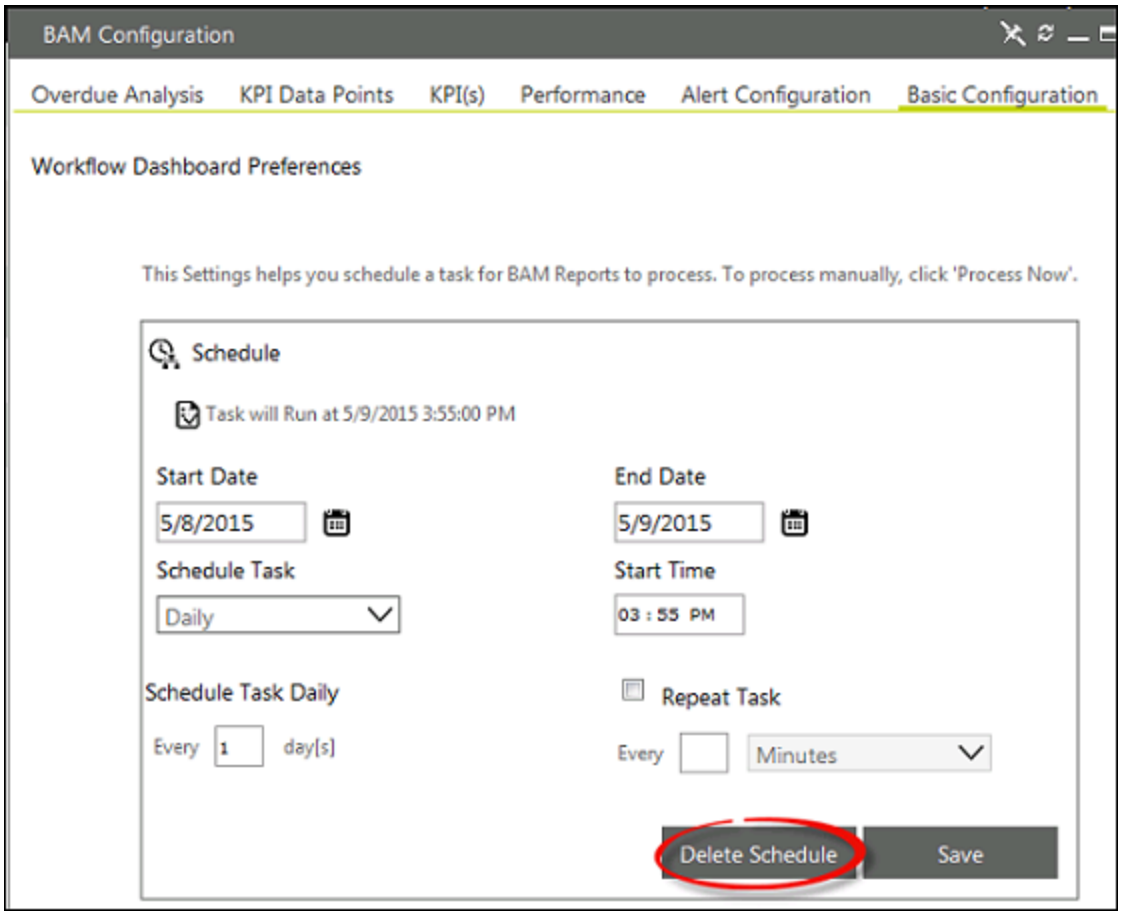


6. To delete a BAM schedule, click the **Delete Schedule** button.

   The schedule is deleted, and the respective database entries are removed.

   The **Delete Schedule** button appears only after you save a schedule. If you do not see the **Delete Schedule** button even after saving the schedule, refresh the page, or close the page and open the page again.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Overdue Analysis Report

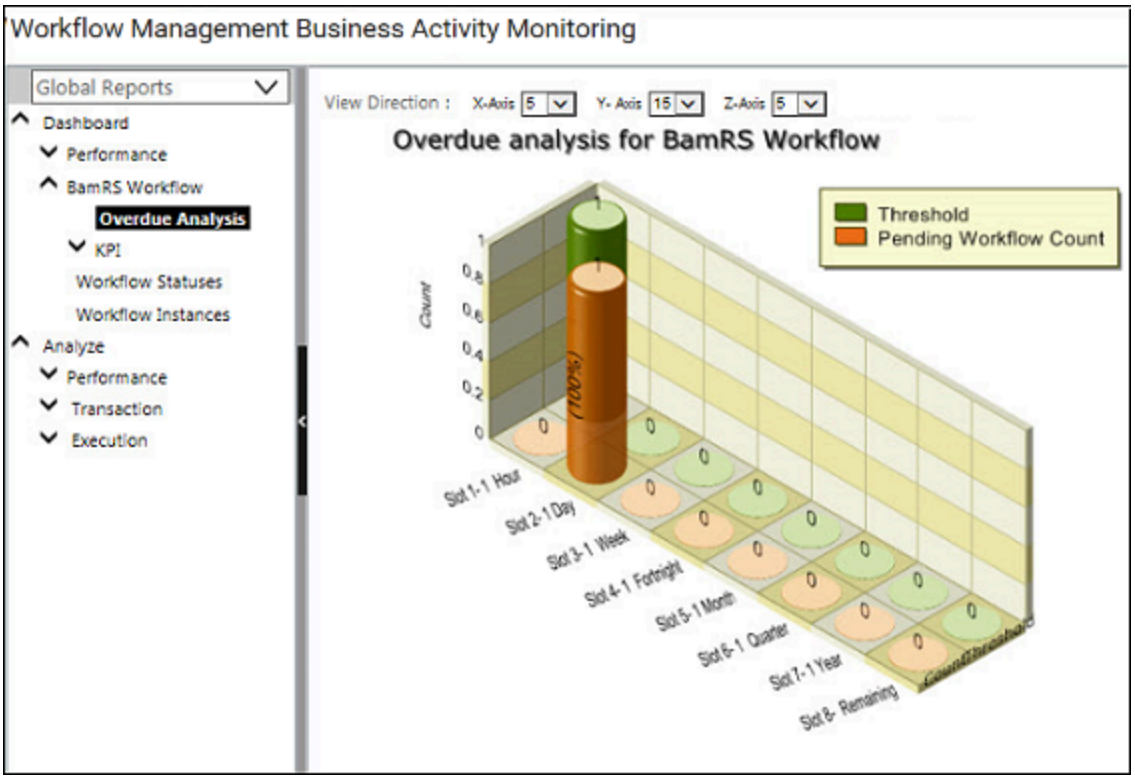
The Overdue Analysis Report in the BAM Dashboard is displayed at two levels:

- KPI(s): The trend analysis for each KPI defined in the BAM Configuration is provided as a pie chart and bar graph.
- Overdue Analysis: The Overdue Analysis report shows a graphical view of the pending workflows against the threshold.

Overdue Analysis

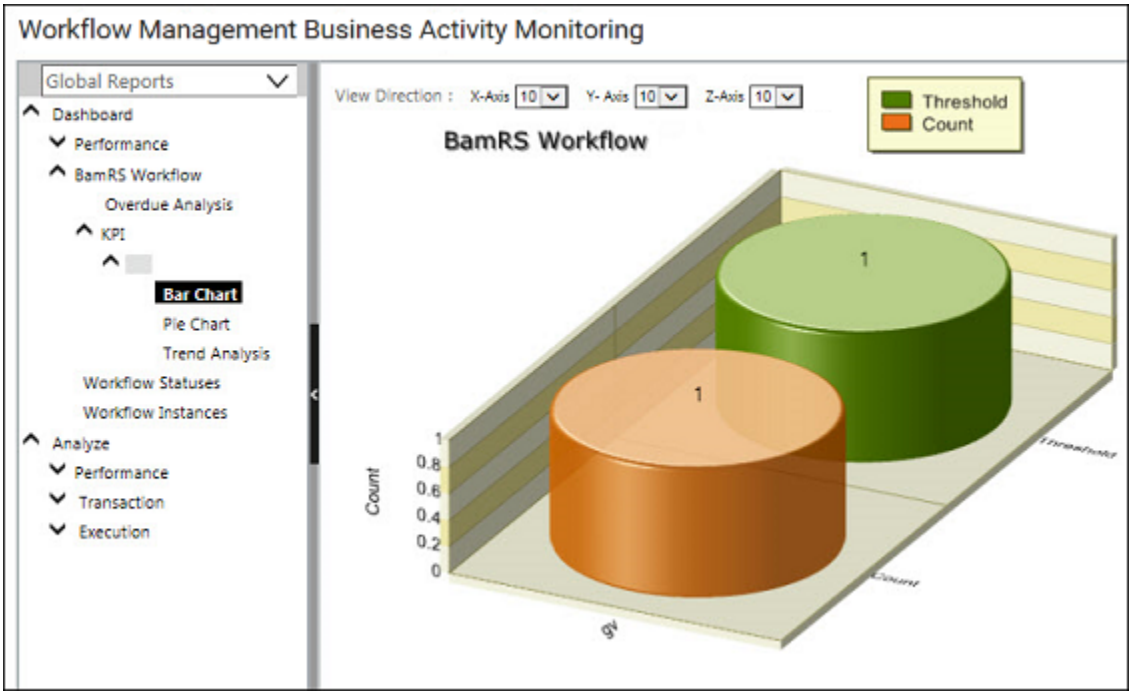
This graphical view shows how the pending workflow count stacks up against the prescribed thresholds in each time slot as defined.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



KPI Analysis

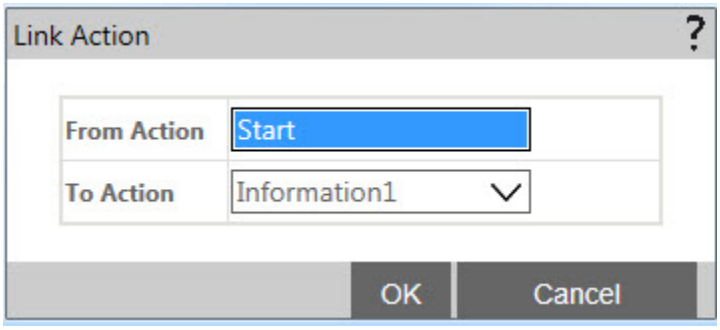
The bar chart view shows the KPI against the threshold defined for it.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Link Actions

This window is opened when you click the Link tool in the toolbar.



Link Actions window

You can use the following controls to link two activities in the design mosaic:

- **From Action** - Specify the first action to link by selecting it from this drop-down
- **To Action** - Specify the second action to link by selecting it from this drop-down
- **OK** - After selecting the two activities, click this button to link them
- **Cancel** - Click this button to cancel the selection and close this window

Process Designer File Operations

AVEVA Work Tasks allows you to create new process designs with existing diagrams, clear process diagrams, and save them as images.

Reuse Existing Process Designs by Renaming Them

AVEVA Work Tasks allows you to use an existing process diagram as the basis for creating new process designs. In scenarios where there are a number of similar process designs, this helps reduce the time required to design all the processes. It will be enough to design one process and reuse its diagram for creating all the other process diagrams.

To reuse an existing process diagram

1. Open the process design file to be reused.
2. From the **File** menu, select the **Rename File** option.
3. Specify the new name for the process design file in the window that opens.
4. Proceed to modify the process diagram as required and save the modified process diagram.

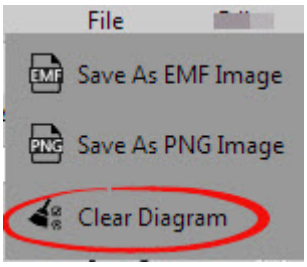
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Clear the Process Diagram

In AVEVA Work Tasks you can clear the entire process diagram. You do not have to delete the diagram activity-by-activity. This is very useful when you are modeling the process. You may have to redo the process diagram many times until you arrive at the correct process model.

To clear an existing process design

1. From the **File** menu, select the **Clear Diagram** option.



2. Proceed to create a fresh process diagram from scratch.

Save the Process Diagram as Image

AVEVA Work Tasks allows you to save the process diagrams as images in different formats from the menu. In the earlier versions, you could right-click on the process diagram and save it as a BMP image.

- You can select **Save As EMF** Image to save the diagram as an image in the EMF (Enhanced Meta File) format. This is a vector format, which is ideal for printing or embedding in MS Office applications.
- You can select **Save As PNG Image** to save the diagram as a PNG image. This is useful when you need to capture the process diagram images for use on the web.

See also, Save As EMF Image and Save As PNG Image.

Process Designer Edit Operations

The following editing actions are allowed in the Process Designer:

- Copy and Paste
- Undo and Redo
- Set Properties

Copy and Paste Activities

In the **Process Designer,** you can copy and paste activities of AVEVA Work Tasks. You can use this feature when you are designing large process diagrams.

If the same activity occurs at many places in the process design, you can copy the first instance and paste it at the new location. When you copy an activity all the configured property settings are also copied. However the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

links between the activities are not copied. You can modify the settings as required.

You can copy and paste activities within the same workflow in all the supported browsers.

When you copy and paste BPMN elements, only the BPMN elements are copied and pasted, and not the activities enclosed within the BPMN elements.

To copy and paste activities

1. Click on the activity to be copied to select it.
2. From the **Edit** menu, select **Copy**.
3. Position the mouse cursor at the location where you wish to place the copy.
4. From the **Edit** menu, select **Paste**.

Alternatively, you can do the following

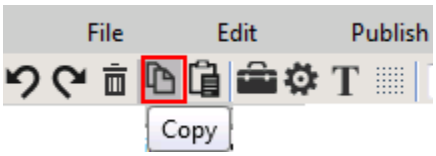
1. Right-click the activity and select **Copy** from the menu.
2. Right-click at the location where you wish to place the copy.
3. From the right-click menu, select **Paste**.

You can also use the copy and pastes icons in the toolbar to copy and paste the activities.

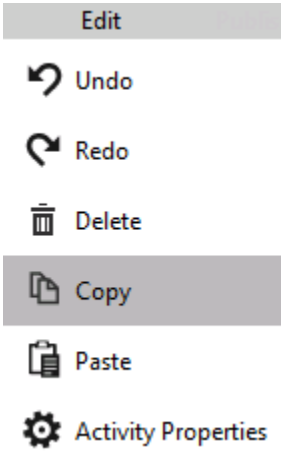
You can select to copy and paste multiple activities together. To copy and paste multiple activities at the same time use the copy and paste options in the Edit menu or in the toolbar.

The following images shows different copy options in the Process Designer:

Copy option in the toolbar:

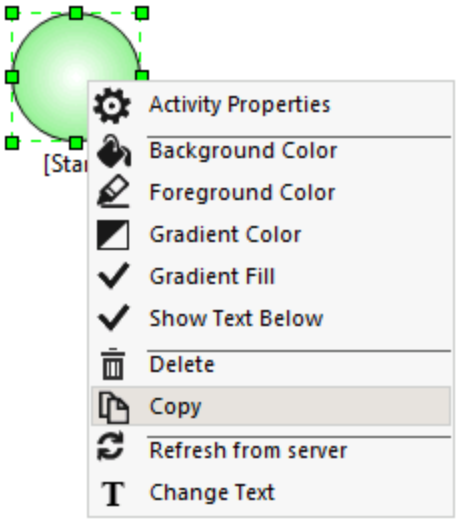


Copy option in the menu:



Copy option in the context sensitive menu:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Undo and Redo Actions

The Process Designer is very user-friendly and simplifies the task of designing of process diagrams. The Undo and Redo options are one of the many new features that are helpful to the designers.

- To undo any action, select **Undo** from the Edit menu. For example, you can undo an accidental deletion of an activity.
- To redo any action, select **Redo** from the Edit menu. For example, you may need to add two Information activities after an Approval activity to inform the user submitting a request, about its approval or rejection. After adding the first Information activity you can select Redo to add the second Information activity.

Set Properties in the Activity Properties Window

AVEVA Work Tasks allows you to open the Activity Properties area to set the properties. You can open the Activity Properties in different ways. One of these is the Activity Properties option in the Edit menu.

Also see Method 2: Select activity and then select Activity Properties from Edit menu

Import and Export Functions in Process Designer

You can import and export process designs saved as valid XML files.

You can also import a process definition created with the ITP-Commerce Process Modeler for Visio.

Import from XML

You can import process designs saved as valid XML files. This can be used to import and modify a process design to create a new one.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To import a process definition XML file

1. From the **Tools** menu, select the **Import** option.
2. In the window that opens, enter the name of the XML Process definition file in the field provided. Alternatively, click on the **Browse** button to select a valid process definition XML file.
3. After selecting a process definition XML file, click on the **Import** button to import it.

This imports the selected XML process definition.

See also, Import

Refer to chapter *Importing BPMN Process Models from Microsoft Visio* in the *Developer Guide*.

Export to XML

You can export a process definition as an XML file. This makes the process design portable and accessible from other applications.

To export a process design as an XML file

1. From the **Tools** menu, select the **Export** option.
2. In the **Windows File Download** dialog that opens, click the **Save** button.
3. This opens the **Windows Save As** dialog, where you can click the **Save** button to save the XML file. In this dialog, you can browse to a new location for saving the file or change its name before saving it.
4. In the **File Download** dialog you can click on the **Open** button to view the XML process definition.

See also, Export.

Import from Visio (BPMN Stencil)

You can import a process definition created with the ITP-Commerce Process Modeler for Visio.

To import a Visio process model

1. From the **Tools** menu, select the Import from **Visio Stencil**.
2. In the window that opens, enter the name of a valid XML process definition file from the Visio stencil in the field provided. Alternatively, click on the **Browse** button to select the XML file.
3. After selecting a Visio process definition XML file, click on the **Import** button.
4. This will import the Visio process definition into AVEVA Work Tasks.

See also, Import from Visio stencil

Refer to the topic *Overview of Visio Process Import* under chapter *Importing BPMN Process Models from Microsoft Visio* in the .*Developer Guide*.

Add Activities in Process Designer

There are two ways to add activities in Process Designer:

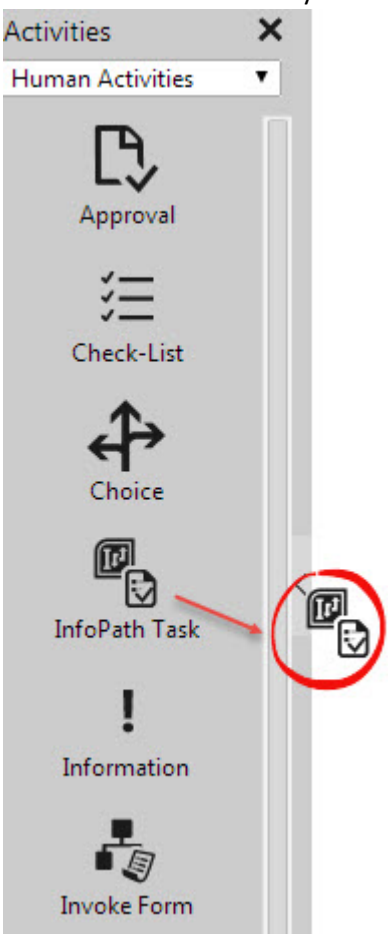
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Drag and drop activities
- Add activities from Context Menu

Drag and Drop Activities

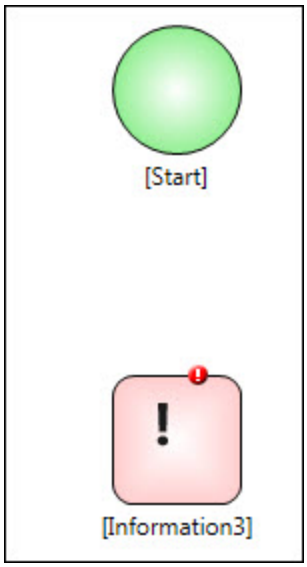
In the Process Designer, you can add an activity to the design mosaic by dragging and dropping it. For a detailed explanation of activity properties, see Using Activities.

1. Open the group to which the desired activity belongs by selecting it in the Activities area.
2. Click on the activity icon in the Activities area.
3. While holding down the mouse key, move the mouse pointer to the desired location on the design mosaic and release the mouse key.



This will drop the icon for the selected activity at the desired location. Note the red marker indicating that the properties have not been set for this activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



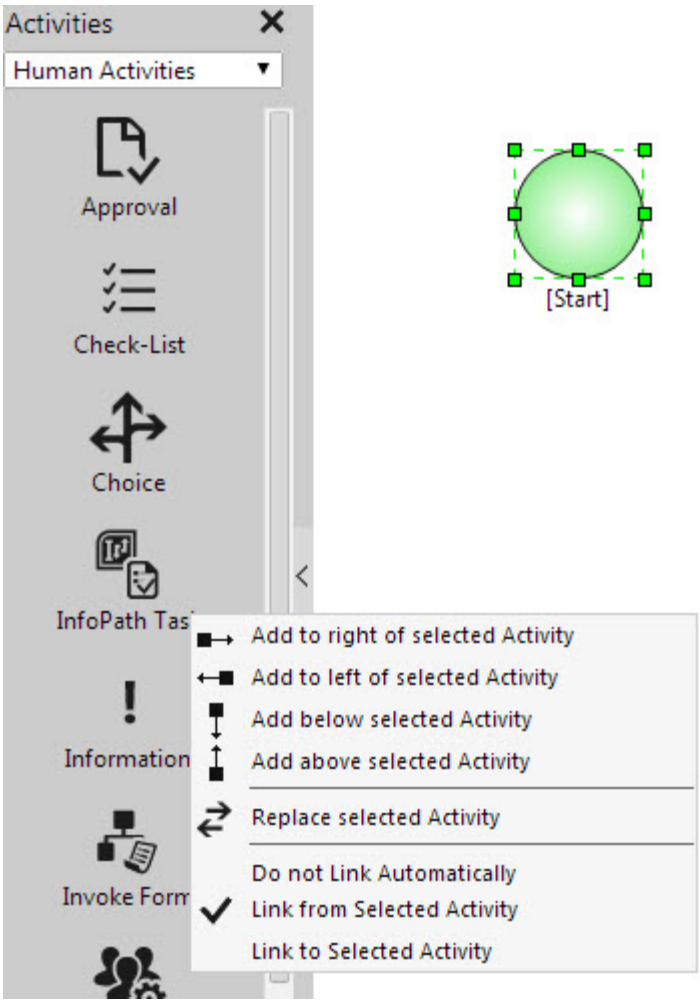
Add Activities Using the Context Menu

An alternative method to add activities to the design mosaic is to use the context menu option.

To add an activity in this way

1. Select an activity on the design mosaic with which you want to link the new activity.
2. Right-click the icon for the activity to be added to open the context menu shown below.
3. From the menu, select the appropriate **Add Activity** option. This will add the new activity to the design mosaic and link it to the selected activity.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Tip: You can specify the position of the new activity relative to any activity that is currently selected on the design mosaic using one of the relevant options in the menu. For example, you can select the "Add above selected Activity" option to add the new activity icon above the selected activity.

You can replace the selected activity with the new one by selecting the "Replace selected Activity" option. You can also set link options in the context menu. The "Link from Selected Activity" option will link the new activity from the selected activity. The "Link to Selected Activity" option will link the new activity to the selected activity. Select the "Don't Link Automatically" option if you do not want the new activity to be linked automatically to the selected activity. In this case, you can link the new activity manually to any activity on the design mosaic.

Link Activities in Process Designer

There are three ways to link activities in Process Designer:

- Click and link
- Use the **Link** tool
- Set link options in the Activities **Context Menu**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Link Activities by Clicking and Linking

Two activities can be linked by clicking on one and dragging and dropping the connector on the other.

To link two activities in this way

1. Click on the icon of the first activity to be linked.

   This will display a red box with arrows radiating on all sides as shown. As you move the mouse cursor away from the activity icon you will find a connector line following the mouse movement.

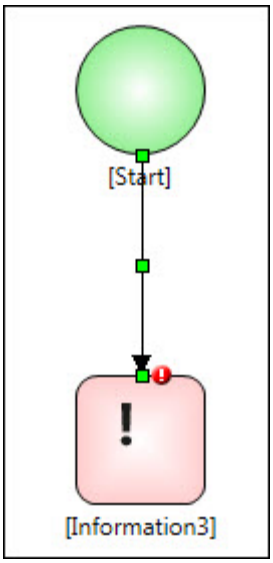
   Origin of the link selected

2. Now, place the cursor over the icon of the second activity to be linked and click the mouse button. This will attach the connector line starting from the first activity to the second activity completing the link between them.

   Terminus of the link selected

3. You can click the connector line to configure the link.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Link completed

Link Activities Using the Link Tool

Another method for linking two activities is to use the **Link** tool available in the **Tool** bar of the **Process Designer**.

To link two activities in this way

1. Click the **Link** tool in the tool bar.
2. In the **Link Actions** window that opens, specify the first activity to be linked in the **From Activity** field.
3. Next specify the second activity to be linked in the **To Activity** field.
4. Click **OK**.

   This will add a link connecting the two activities in the design mosaic.

See also: Link Actions.

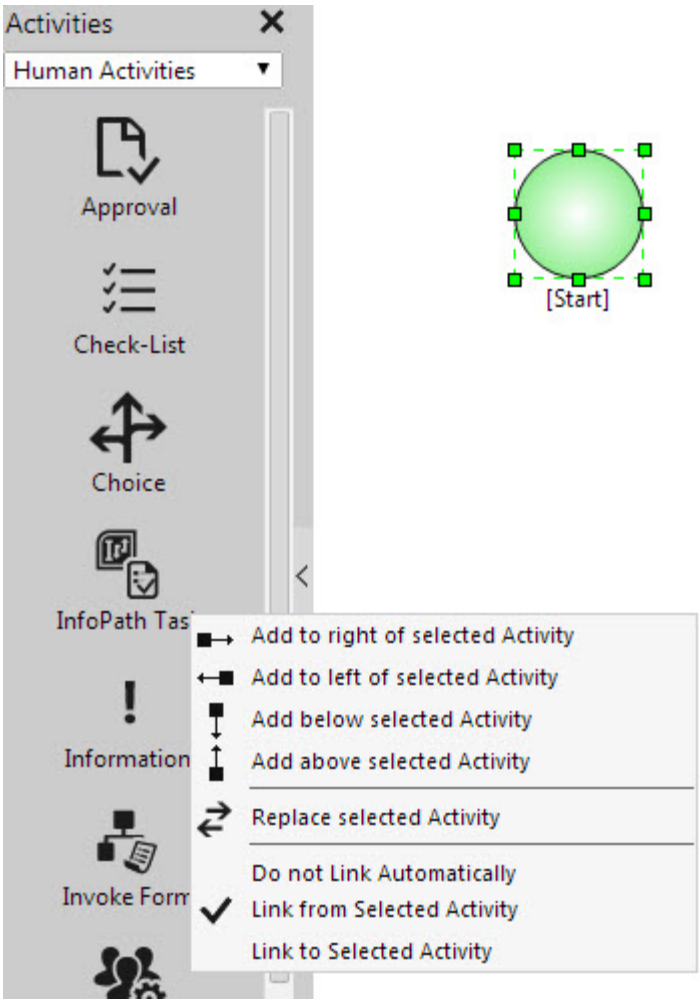
Set Link Options in the Activities Context Menu

When you add an activity using the options in the activities context menu, you can set the option for automatically linking the activity to the selected activity in the design mosaic.

To set the link property for automatic linking

1. Select an activity on the design mosaic with which you want to link the new activity.
2. Next, right-click the icon of the new activity to be linked. This will display the context menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



AVEVA Work Tasks activities context menu

3. In this menu, click the "**Link from Selected Activity**" option. This will display a check mark before the option to show selection.
4. Right-click the activity icon again to display the context menu and select one of the Add Activity options, say "**Add to right of selected Activity**".

   This will add the new activity to the right of the selected activity with a link from this activity to the new one.

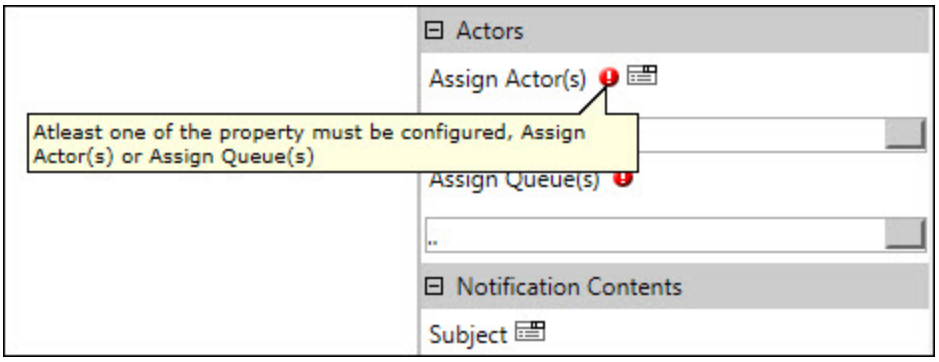
Set Activity and Link Properties

Set Activity and link properties in Process Designer. You need to set some properties of all Activities as they are essential for the execution of the activities.

Identify Mandatory Properties

You need to set some properties of all Activities as they are essential for the execution of the activities. These mandatory properties can be identified by the red icon with a white exclamation mark superimposed on the red circle that is placed next to the property labels.

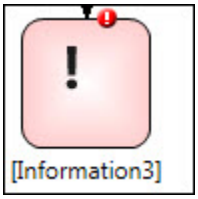
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Mandatory properties

In the above example, you can see two mandatory properties for the Checklist activity. The first property – Questions – helps configure the functionality of the activity. The second property that is visible – Assign Actor(s) – determines the actors to whom the activity will be assigned. Both these properties cannot be left empty. To ensure that users are aware of the importance of setting the mandatory properties, a message stating that the value cannot be left empty is displayed on placing the mouse over the mandatory icon. This icon is removed once the mandatory properties have been set to some value.

The mandatory icon is also superimposed on the outline of the Activity icon when it is added, indicating that its properties have not been set. The icon is removed after all mandatory properties have been set for this activity.



Checklist Activity indicating that properties have not been set.

Method 1: Right Click and Select Activity Properties

In AVEVA Work Tasks, you only need to open the Properties area when you are going to set the properties for the selected activity. This is in contrast to the earlier versions, where the Activity Properties area was always displayed, even if the properties had already been set. This change results in more space in the Process Designer UI for the design mosaic.

You can open the Activity Properties area for a selected activity by right-clicking the activity icon and selecting the Activity Properties option from the context menu. This is one of the three ways in which you can access the **Activity Properties** area.

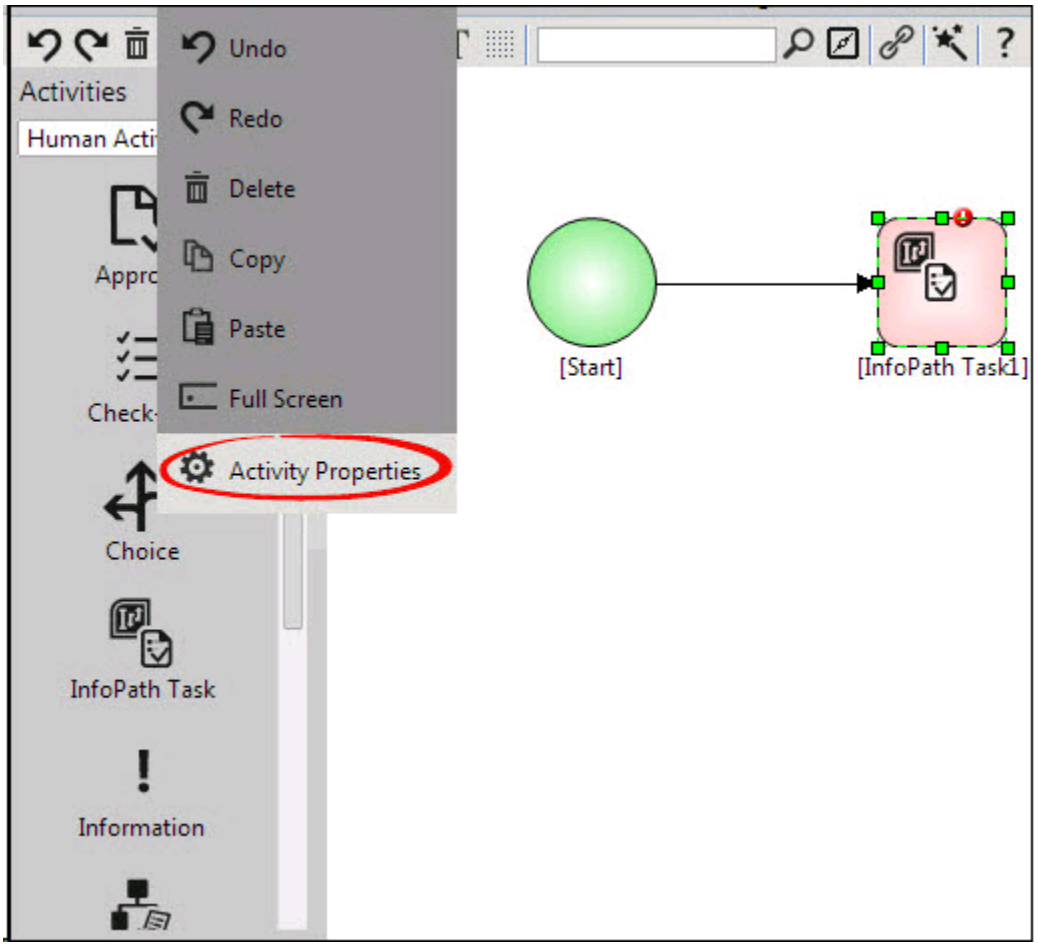
1. Right-click the icon of the activity for which you need to set the properties.
2. In the context menu, select **Activity Properties**, which is the first option.
3. This will display the **Activity Properties** area, with all the properties of the selected activity. You can set the required properties and click **Save** to close the **Activity Properties** area.

Method 2: Select Activity and then Select Activity Properties from Edit Menu

You can also open the Activity Properties area for a selected activity by clicking the activity icon and selecting the Activity Properties option from the Edit menu. This is the second method to access the Activity Properties area.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Click the icon of the activity for which you need to set the properties.
2. In the **Edit** menu, select **Activity Properties.**



3. This will display the **Activity Properties** area, with all the properties of the selected activity. You can set the required properties and click **Save** to close the **Activity Properties** area.

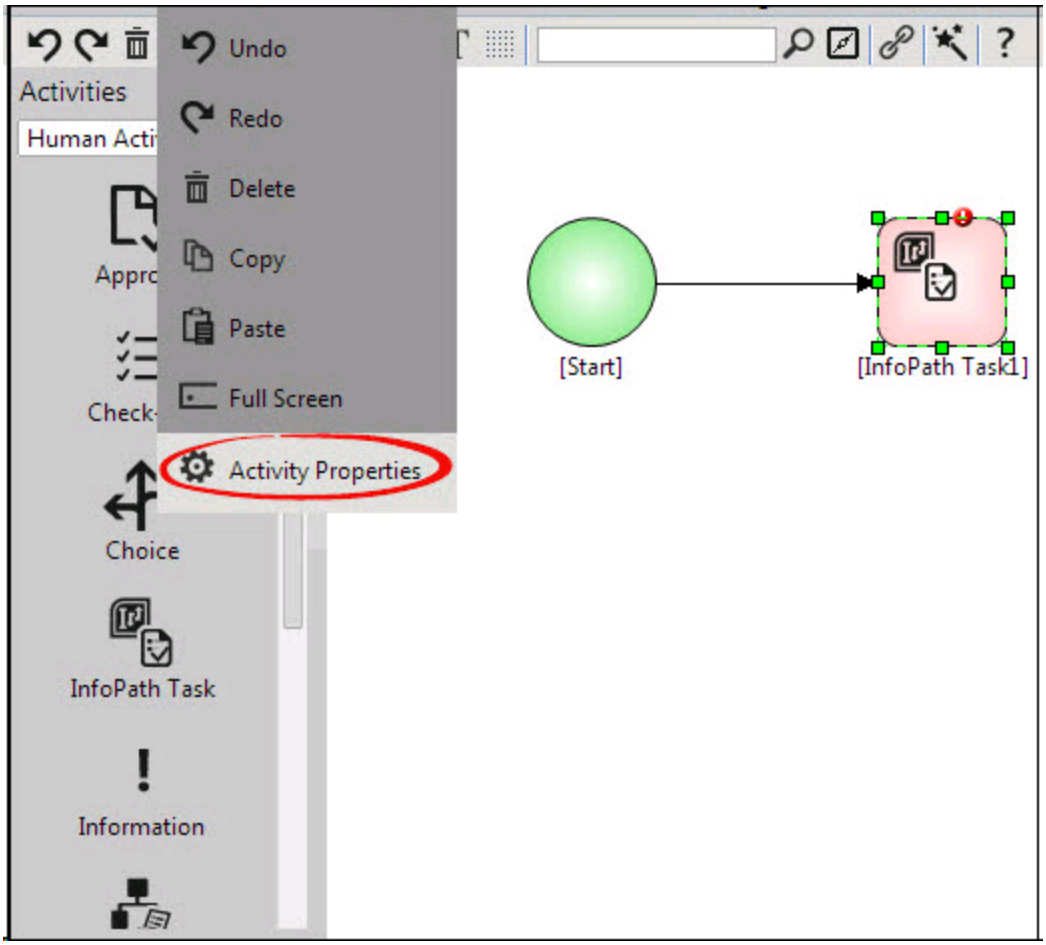
Note: You can also click the **Activity Properties** icon on the tool bar instead of selecting the option from the **Edit** menu to open the **Activity Properties**.

Method 3: Use Wizards For Resource Activities (where applicable)

You can also open the **Activity Properties** area for a selected activity by clicking on the activity icon and selecting the **Activity Properties** option from the **Edit** menu. This is the second method to access the **Activity Properties** area.

1. Click the icon of the activity for which you need to set the properties.
2. In the **Edit** menu, select **Activity Properties.**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. This will display the **Activity Properties** area, with all the properties of the selected activity. You can set the required properties and click **Save** to close the **Activity Properties** area.

   Note: You can also click the **Activity Properties** icon on the **Tool** bar instead of selecting the option from the **Edit** menu to open the **Activity Properties**.

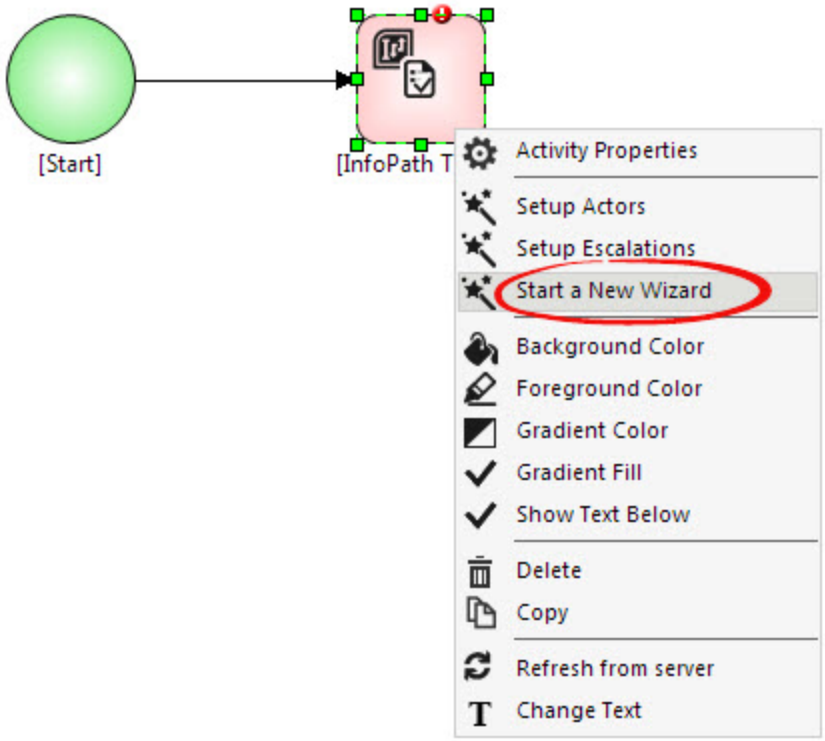
Introduction to Property Setting Wizards

AVEVA Work Tasks comes with significant improvements in terms of user-friendliness in designing the workflow. A totally new Visio-like user-interface for the Process Designer allows users to drag and drop activities and link them by dragging and dropping links. In addition to the normal method of property setting, there is an Expression Editor to create expressions for specifying the values of activity properties. Besides these, the new version comes with Wizards, which present a third mode of property setting. The Wizards are intuitive and guide the user through the different steps involved in setting key properties. There are two property wizards - Actors Selection Wizard and Escalation Email Wizard - that can be used to set the different properties related to each.

Accessing the Wizards

You can access the wizards to set the corresponding properties by right-clicking on the property icon in the Designer and selecting the appropriate wizard option in the menu. These options are only displayed in the right-click menu of the activities that have wizards.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

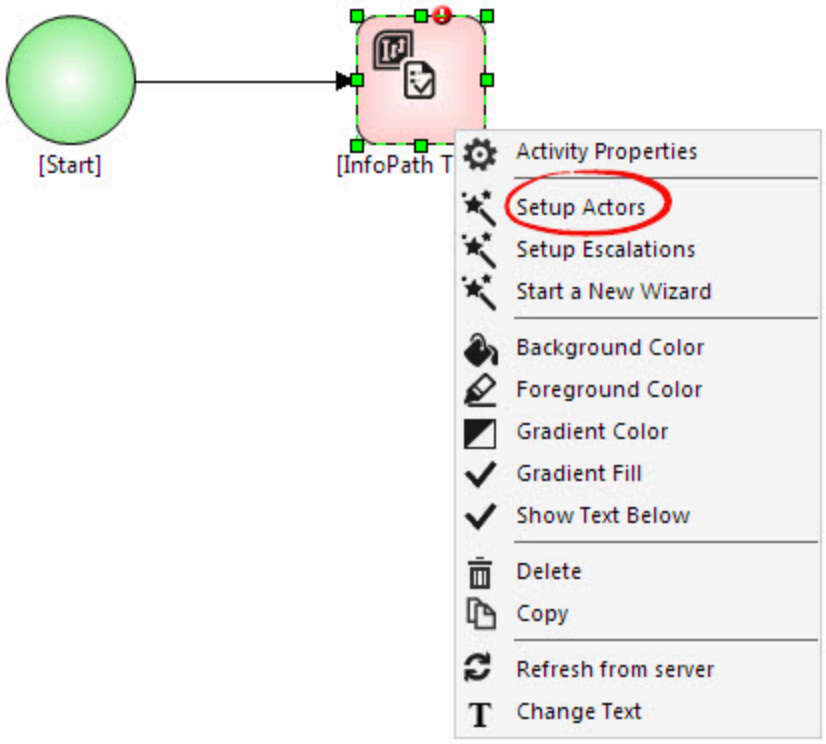


Use the Actors Selection Wizard

The Actors Selection Wizard can be used to set the properties related to the actors who will take part in the workflow process. You can access this wizard by selecting the Setup Actors option from the context menu of Human Activities, such as, Approval, Checklist.

The following image shows the wizard to launch the Setup Actors:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

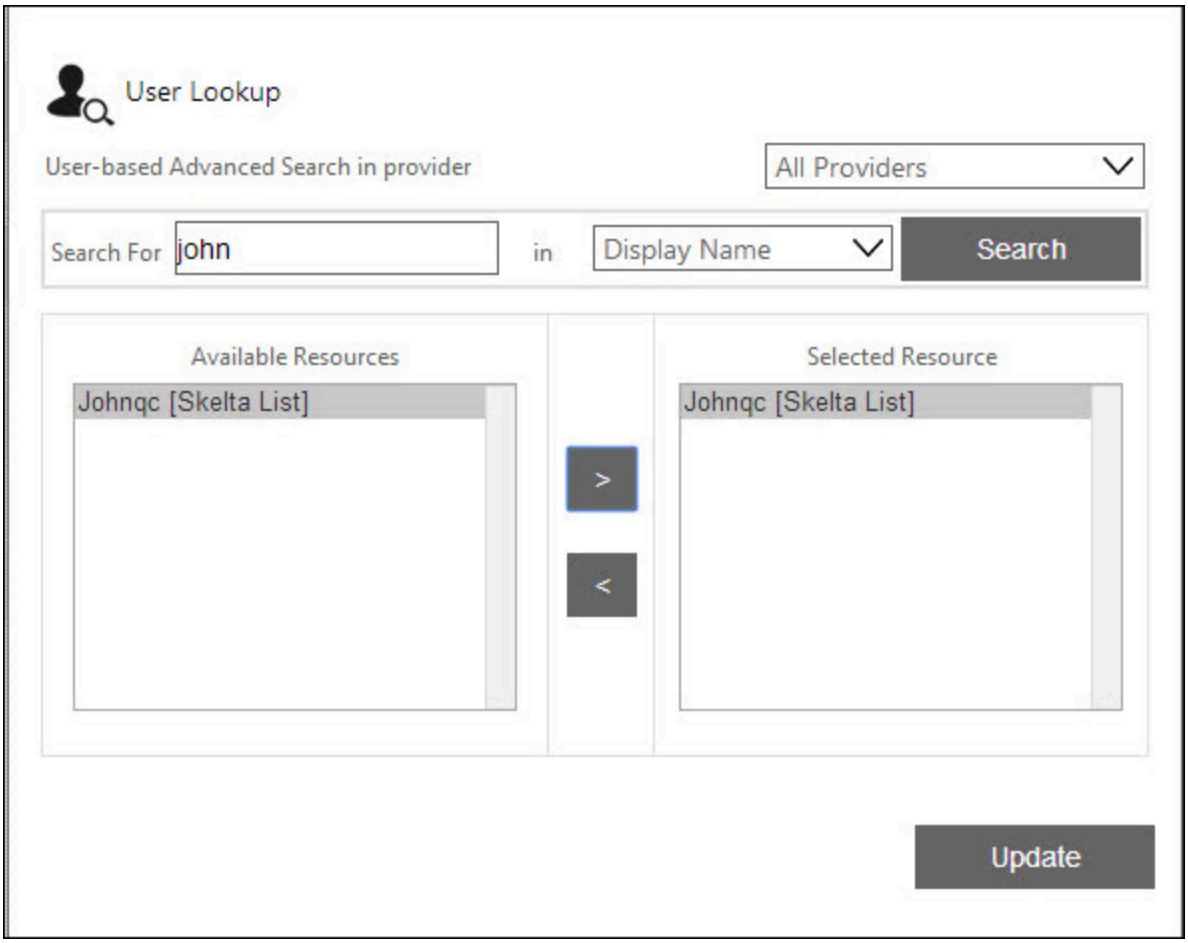


Setting the Properties through the Wizard

Step 1: Selecting the Actors

When you right-click a resource action and select the "Actors Selection Wizard" option from the menu, the window shown below, corresponding to the first step of the wizard, is displayed. In this step, the wizard guides you through the selection of resources to set as the actors. You can search for resources by specifying a search parameter. You can specify a value corresponding to user-related parameters like "Employee Name" or "Role in Project" partially or fully in the field provided and click the **Search** button to start the search. You can change the parameter by selecting from the drop-down here. The resources brought up in the search are displayed in the **Available Resources** list box. You can add a resource to the Selected Resources list by selecting the resource name in the first list and clicking the [>] button. To add all resources, click the [**>>**] button. Similarly, you can use the [<] button to remove a resource from the selected resources list or the [<<] button to clear all the selected resources. After selecting the resources, click the **Next** button to go to the next step in the Actors Selection Wizard.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

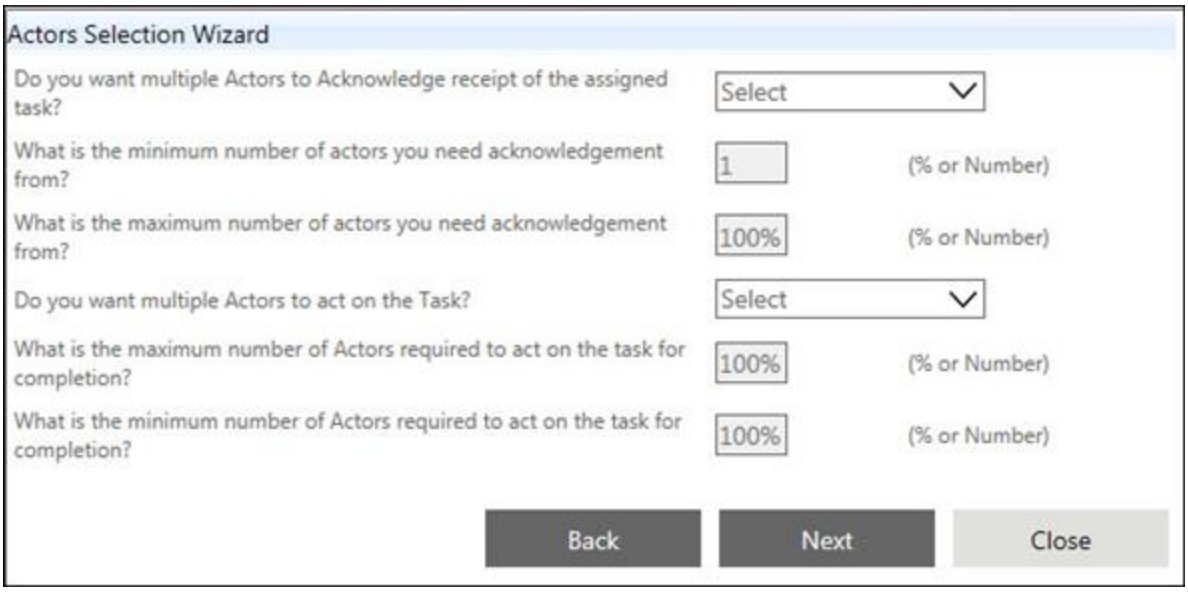


Step 2: Setting Limits for Actors and Activities

When you click the **Next** button in the first window of the Actors Selection Wizard, the window shown below is displayed. In this step the wizard guides you through the process of setting limits for the actors and activities through a series of intuitive steps. The first limit to be set is the number of actors who need to acknowledge receipt of the activity. First, specify whether or not multiple actors must acknowledge the activity by selecting "Yes" from the corresponding drop-down. After making the selection, you can set the minimum and maximum number of actors who will have to acknowledge in the next two fields. You can specify either the number of actors or the percentage of the total number of actors. Next, specify whether multiple actors will act on the task by selecting "Yes" from the corresponding drop-down. After making the selection, you can set the maximum and minimum number of actors who will have to act in the next two fields. You can specify either the number of actors or the percentage of the total number of actors. After setting the limits, click **Next** to go to the next step. If you need to make any changes to the values specified in the previous step, click the **Previous** button.

The following image shows how to set the limits:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Step 3: Overwriting Values Set through the Action Properties

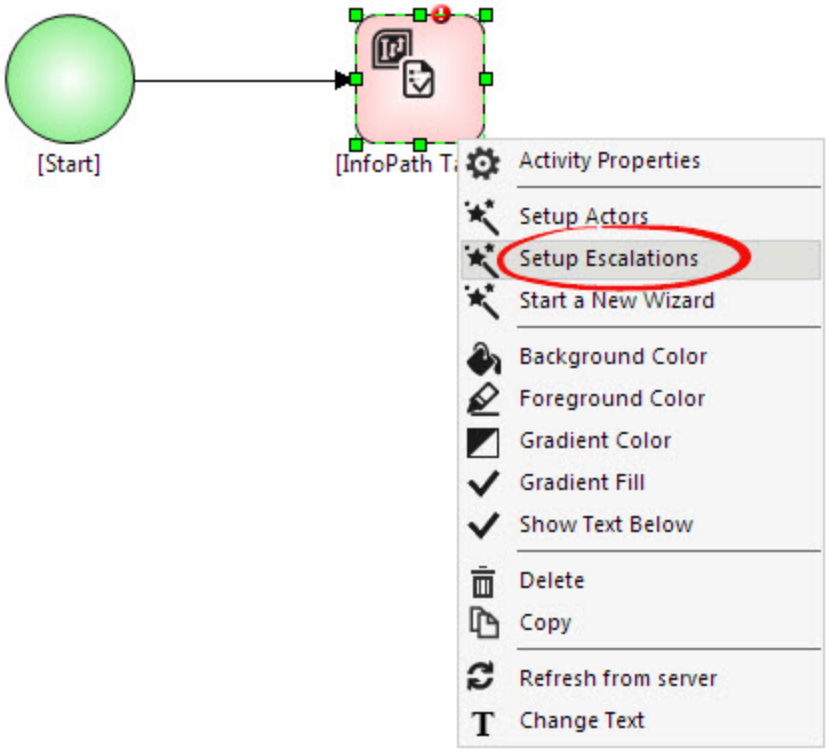
When you click **Next** in the second window of the Actors Selection Wizard, the window shown below is displayed. In this step the wizard asks you whether you would like to overwrite the values set through the Action Properties for the activity. If you choose to overwrite the existing values with the new settings, click **Finish**. This will save the new values and close the wizard. If you prefer not to overwrite the values, you can click **Close** to exit the wizard. If you need to make any changes to the values specified in the previous step(s), click **Previous**.

Use the Escalation Email Wizard

The **Escalation Email Wizard** can be used to set the escalation properties for the activity. You can access this wizard by selecting the **Setup Escalations** option from the context menu of Human Activities, such as like Approval, Checklist.

The following image shows launching setup Escalations Wizard:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



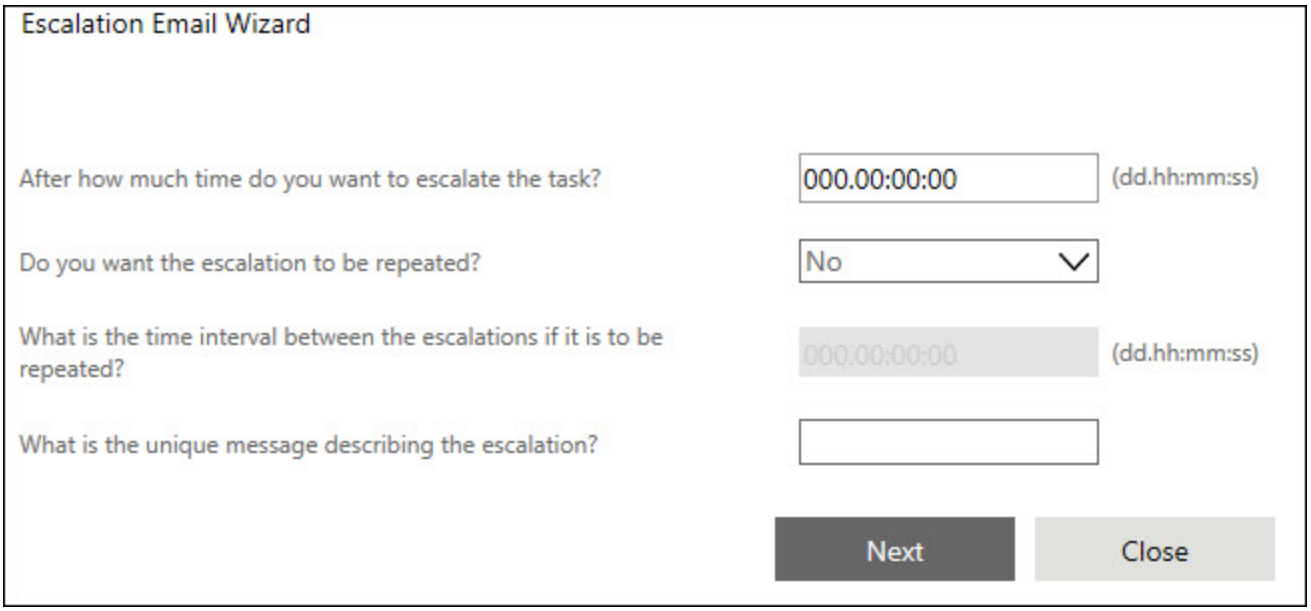
Setting the Properties through the Wizard

Step 1: Setting the Escalation Conditions

When you right-click a resource activity and select the "Escalation Email Wizard" option from the menu, the window shown below, corresponding to the first step of the wizard, is displayed. In this step the wizard guides you through the process for setting the escalation conditions for the activity. These conditions will determine at what point the task will be escalated. You can set the time limit for escalation in the first field. Specify the value in the "dd.hh:mm:ss" format. The task will be escalated after this time elapses without any action by the assigned actor. You can choose to repeat the escalation by selecting "Yes" in the corresponding drop down. In this case, you must also specify the time interval between the two escalations in the corresponding field, again in the "dd.hh:mm:ss" format. If you select "No" in the repeated escalation drop down, this field cannot be accessed. Finally, you must specify the unique message describing the escalation in the last field in this window. This can be any meaningful message that clearly describes the escalation. The example in the image below shows "Escalated to PM". After selecting the resources, click the **Next** button to go to the next step in the Actors Selection Wizard.

The following dialog box shows how to set the Escalation Conditions:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

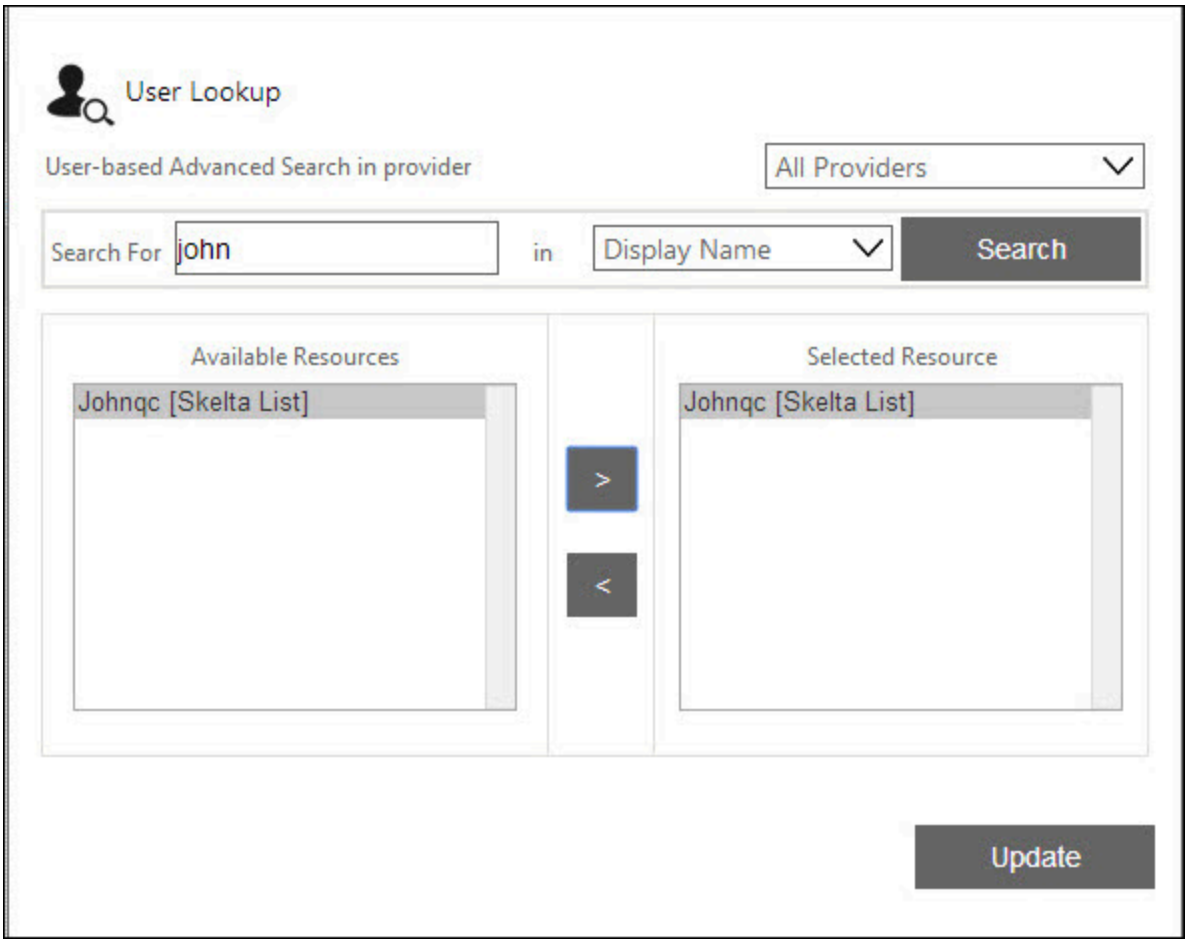


Step 2: Selecting the Actors for the Escalation

When you click the **Next** button in the first window of the Escalation Email Wizard, the window shown below is displayed. In this step, the wizard guides you through the process of selecting the actors to whom the task will be escalated. You can search for resources by specifying a search parameter. You can specify a value corresponding to user-related parameters like "Employee Name" or "Role in Project" partially or fully in the field provided and click the Search button to start the search. You can change the parameter by selecting from the drop down here. The resources brought up in the search are displayed in the **Available Resources** list box. You can add resources to the **Selected Resources** list by selecting the resource name in the first list and clicking the [>] button. To add all resources, click the [>>] button. Similarly, you can use the [<] button to remove a resource from the selected resources list, or the [<<] button to clear all the selected resources. After setting the limits, click the **Next** button to go to the next step. If you need to make any changes to the values specified in the previous step, click the **Previous** button.

The following dialog box shows how to selecting the actors:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

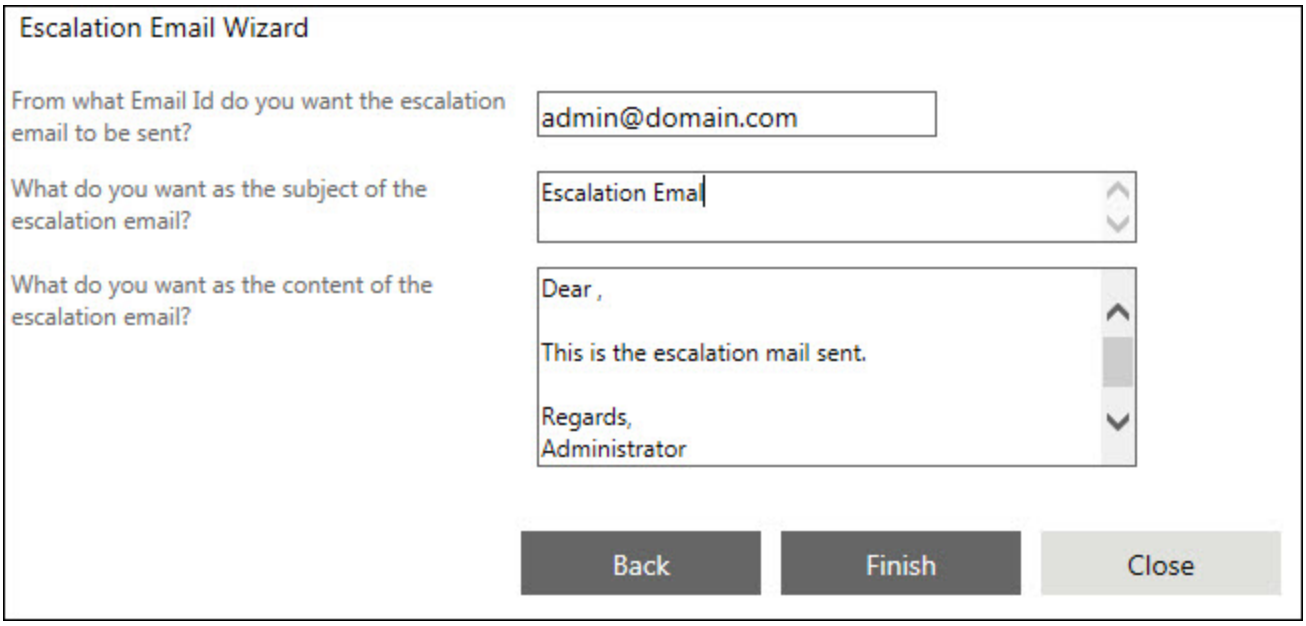


Step 3: Setting up the Escalation Email

When you click **Next** button in the second window of the Escalation Email Wizard, the window shown below is displayed. In this step, the wizard guides you through the setting of the senders Email Id, the subject of the email and its content in the corresponding fields. To save the escalation values that you have set in the wizard, click **Finish**. This will save the new values and close the wizard. If you prefer not to save the values, click **Close** to exit the wizard. If you need to make any changes to the values specified in the previous step(s), click **Previous**.

The following dialog box shows how to set up the Escalation Email:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Use the Expression Editor

The **Expression Editor** is an alternative method to set properties. It is a web control integrated with the Process Designer for building expressions with different types of objects.

Use the Expression Editor to build expressions for properties.

Note:
- Do not create or use any HTML tag in the Expression Editor.
- In Expression Editor, a hard coded value with $ symbol is not supported.

About the Expression Editor

The Activity Properties in AVEVA Work Tasks are specified by entering the actual values or by building conditions or filters using the variable and content collection. These properties are either specified in text boxes or in pop-up windows corresponding to the different properties. AVEVA Work Tasks introduces the Expression Editor as an alternative method to set properties. You can specify the expression corresponding to a property using the Expression Editor feature.

Expression

An expression is defined as any legal combination of symbols that can be evaluated to produce a value.

Expression Editor

The Expression Editor is a web control, which is closely integrated with the Process Designer for building a wide variety of expressions with different types of objects. The Expression Editor supports only the C# syntax for building expressions.

Note: Ensure that you do not create or use any HTML tag in the Expression Editor.

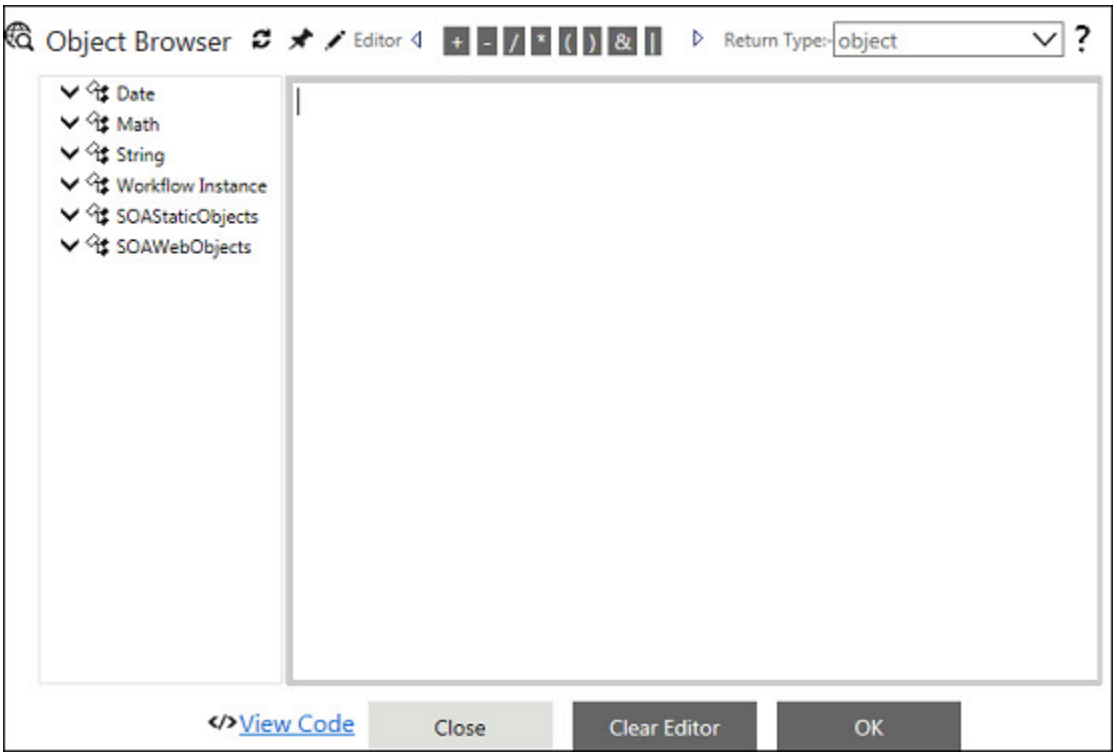
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Expression Editor window is shown in the image below. It has the Object Browser at left. This panel can be displayed or hidden using the toggle at the top. A refresh button is also available to refresh the contents. The default objects available in the Object Browser are **Date**, **Math**, **String**, **Workflow Instance**, and **SOAStaticObjects**. Each node expands to display a list of methods, properties and functions that can be used to build expressions.

The Editor is located at the right of the window. It has buttons to add the following operators at the top: **+, -** , **/**, *****, **(**, **)**, **&**, and **|**. The OK button at the bottom of the Expression Editor window can be used to save the expression.

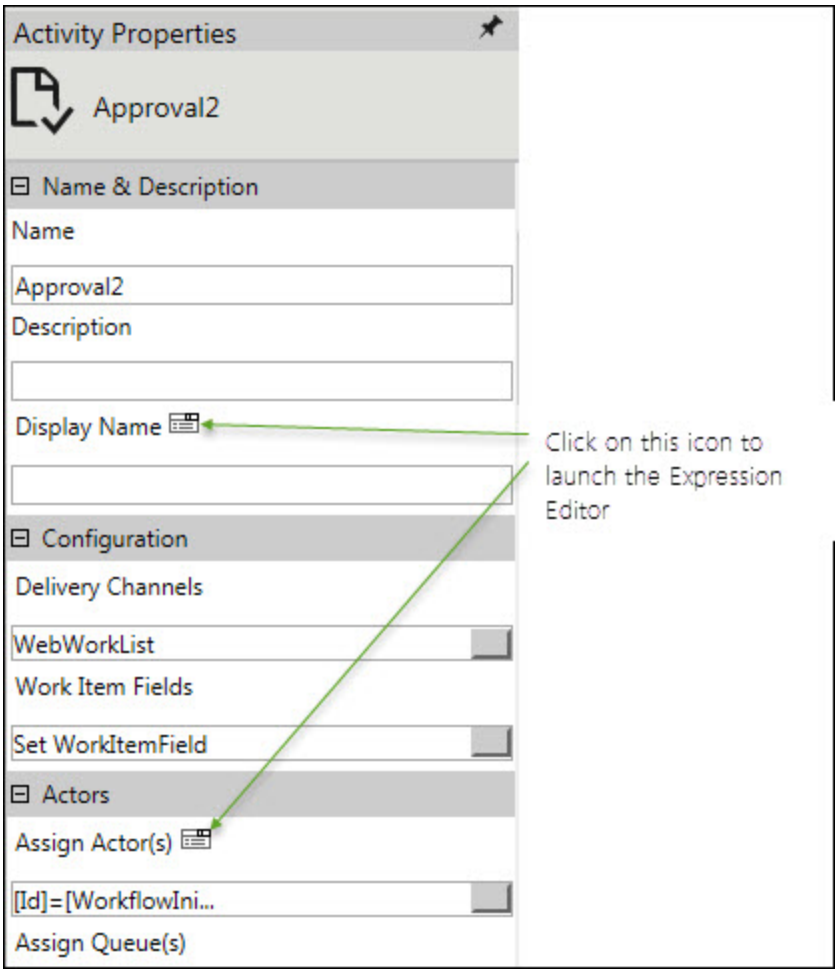
The Cancel button can be used to exit the window without saving the expression.

The **Return Type** field to the right enables selection of the value type to be returned.



You can access the Expression Editor by clicking the Expression Editor icon next to property names in the Activity Properties section of the Process Designer. In the following image, the Expression Editor icon is highlighted:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



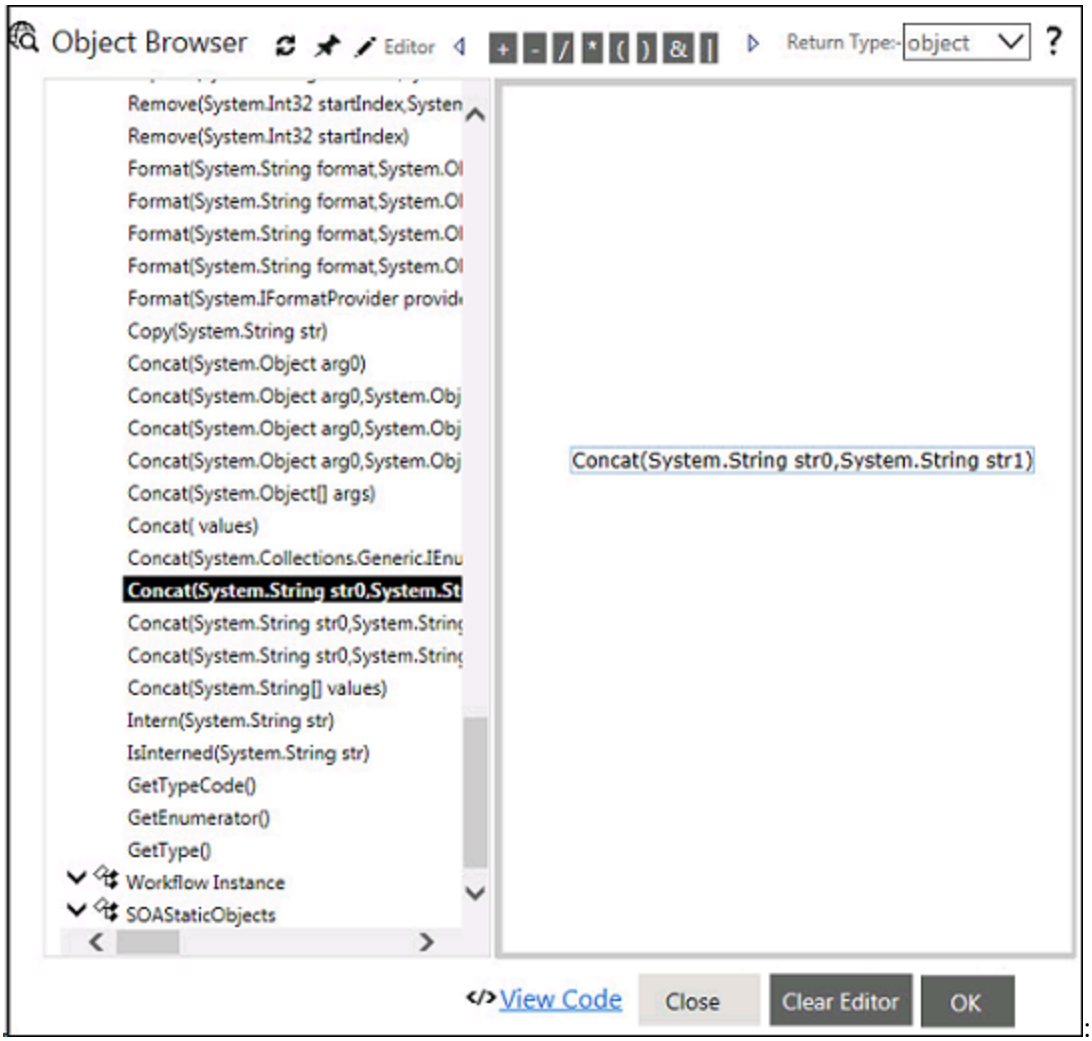
Use Expression Editor to Build Expressions for Properties

Building an expression

1. Drag and drop the methods or properties of the different objects from the Object Browser to the Editor panel. In the following example image, the **Concat(System.String str0,System.String str1)** is being dragged and dropped. The next image shows the method in the Editor. The parameters are shown as hypertext and can be replaced by actual values.

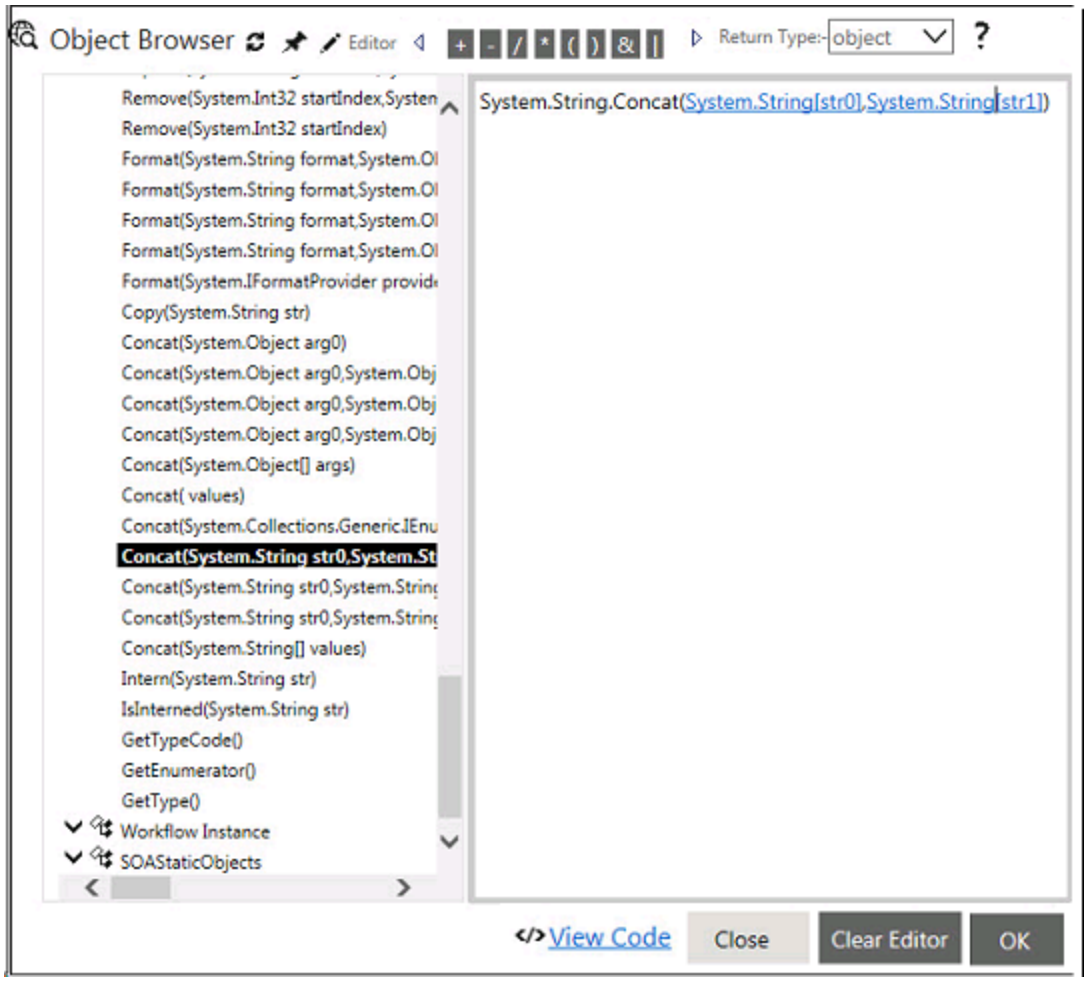
   The following image shows how to drag and drop a method to the Editor:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The following image shows method dropped on the editor:

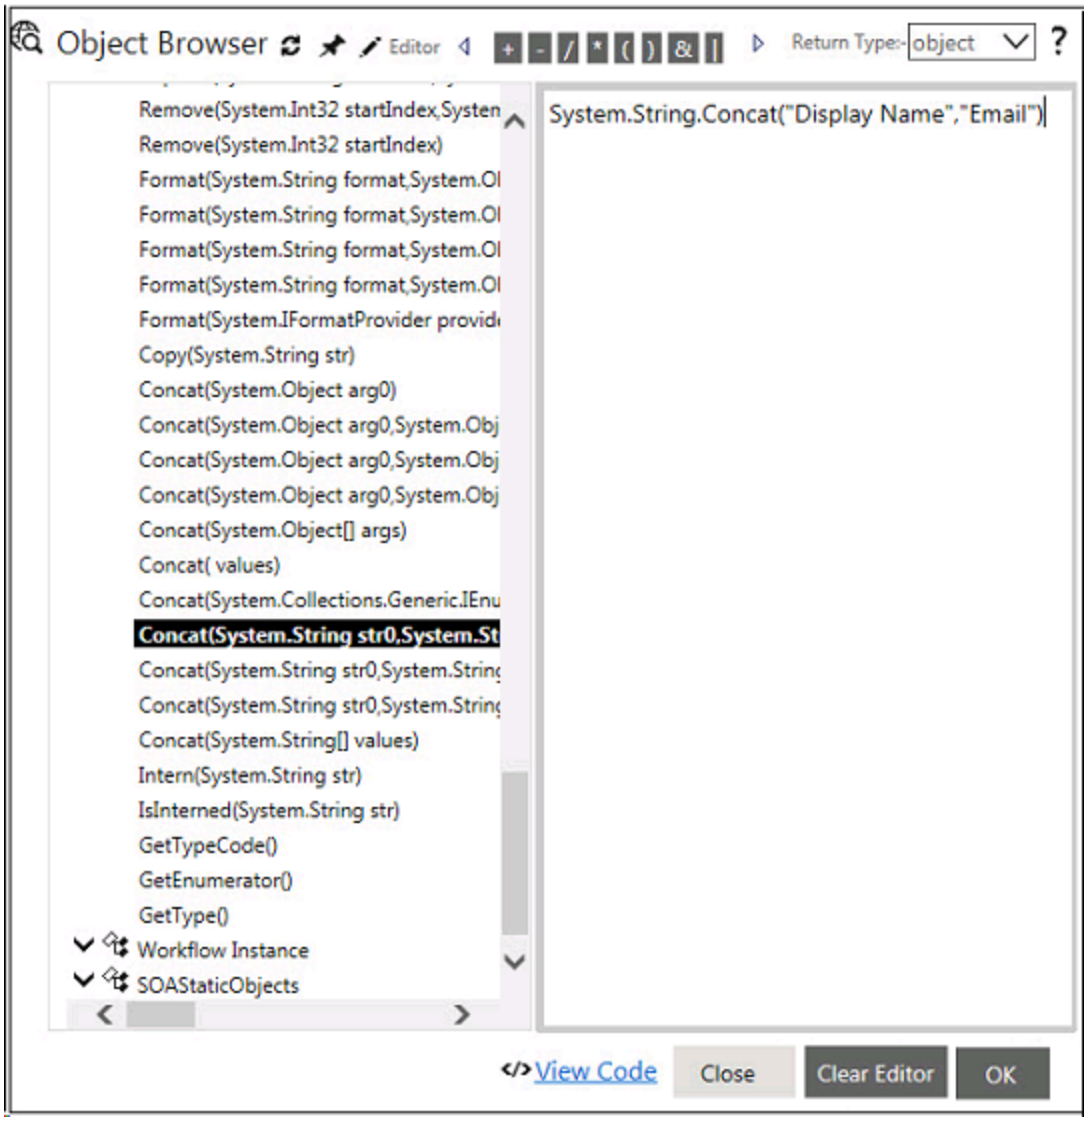
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



2. After dropping the System.String.Concat method on the Editor, you must replace its parameters. You can do so by typing text on the parameters. The text that is typed must be enclosed in double quotes as shown here.

   The following image shows how to replace method parameters by typing in text:

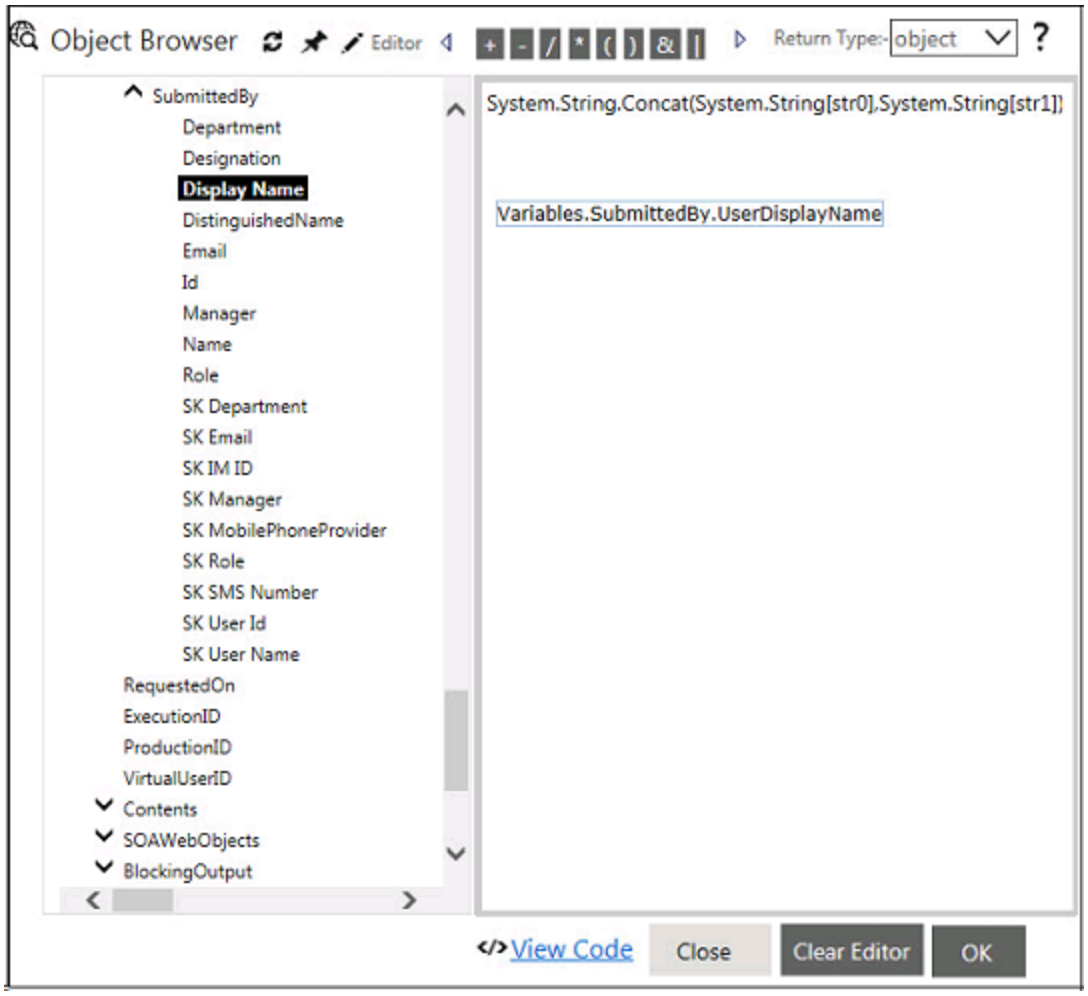
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Alternatively, you can replace the parameters by placing string objects on the parameters by dragging and dropping them on to the method parameters that are shown in hypertext format. You can also use the existing variables or contents of the application by exploring the Workflow Instance node and dragging and dropping variables on to the parameters as shown in the image below. The result is shown in the image following the one below.

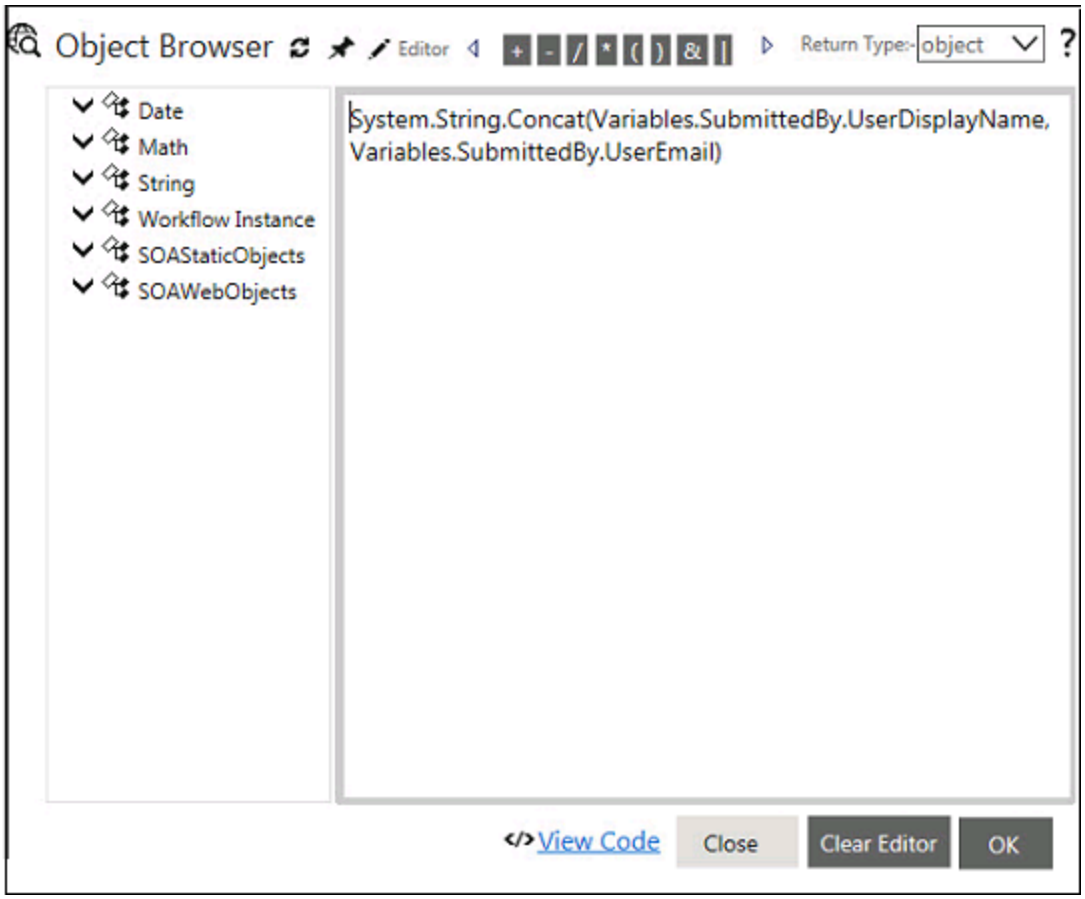
   The following image shows how to replace method parameters by dragging and dropping Workflow Instance object nodes:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The following image shows how to replace method parameters by dragging and dropping:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



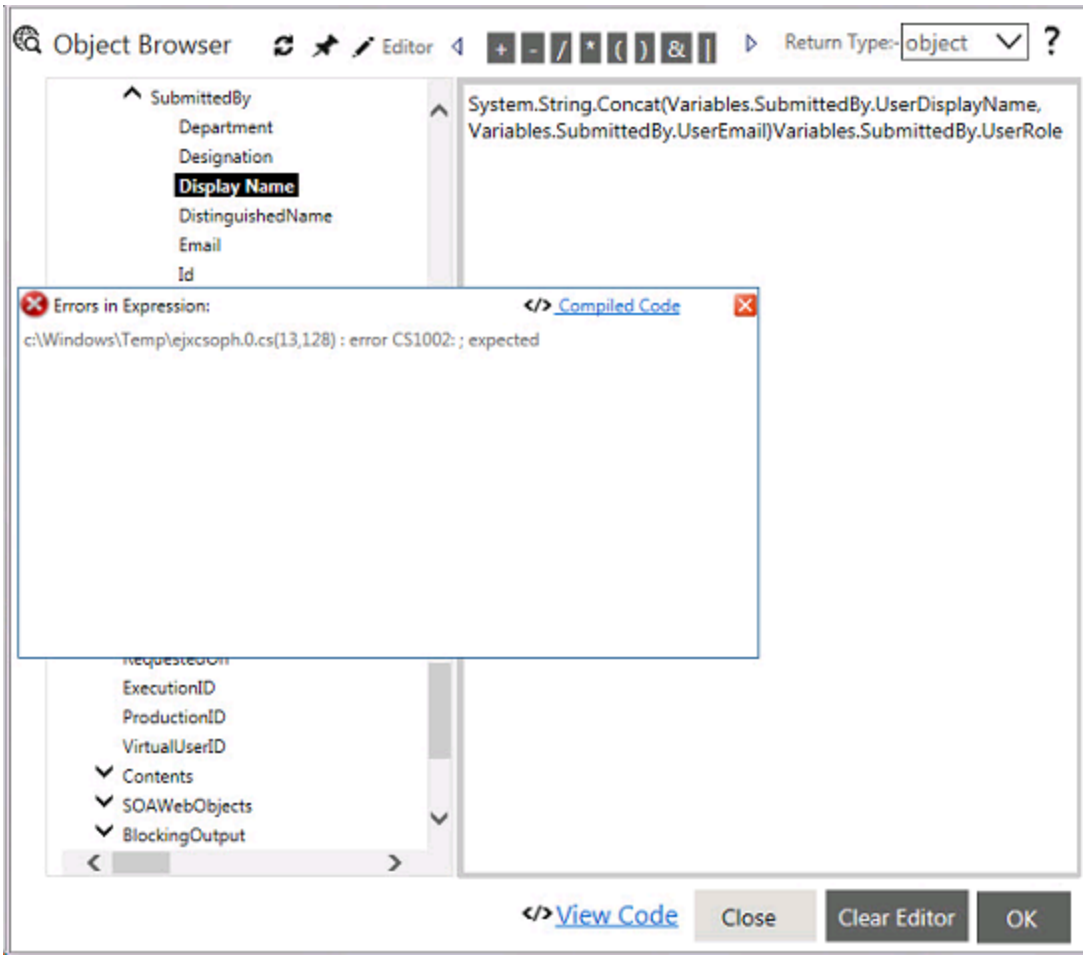
4. After completing the expression, you must click the OK button to save it. The submitted expression will be compiled and saved using the C# code compiler. If any error is present in the expression, a message box appears.

   Note: Copy-paste of variable texts from notepad will not parse the actual variable value as the referenced functions are not available. Referenced functions are available only in case of drag and drop of variable node, available from the left tree.

Debugging the expression

You can view the errors if any in an expression in the **Error List** and debug the expression. First, you need to click the **OK** button in the error message box to close it. You will find the **Error List** link at the bottom left of the Expression Editor window. You can move the mouse over this link to open the Error List shown below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

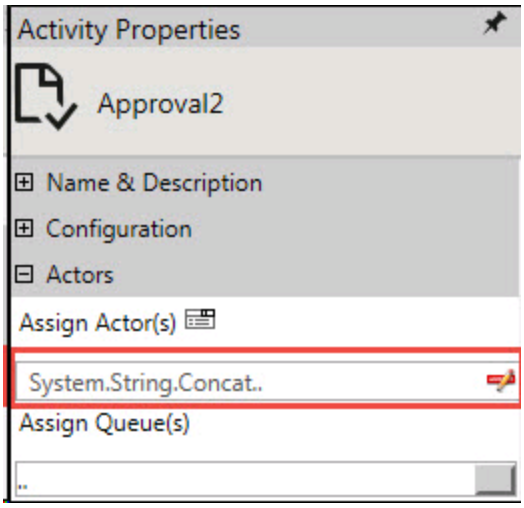


Expression added to the property

After the expression is completed without errors, it is added to the text box of the corresponding property in the Action Properties section. In the example shown below, the expression that was built in the previous steps is displayed as the value for the **Action Display Name** property. You can edit the expression by clicking on the Expression Editor icon. A "Clear Expression" icon will be displayed next to the expression. You can click on this icon to clear the expression in order to specify a different value.

The following image shows the saved expression displayed in the action properties:

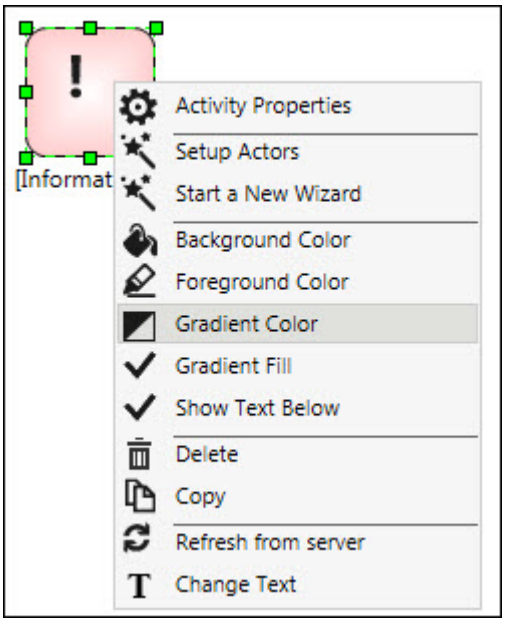
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Set Appearance Properties for Activity Icons

You can change the appearance of activity icons using the appearance properties in the context menu.

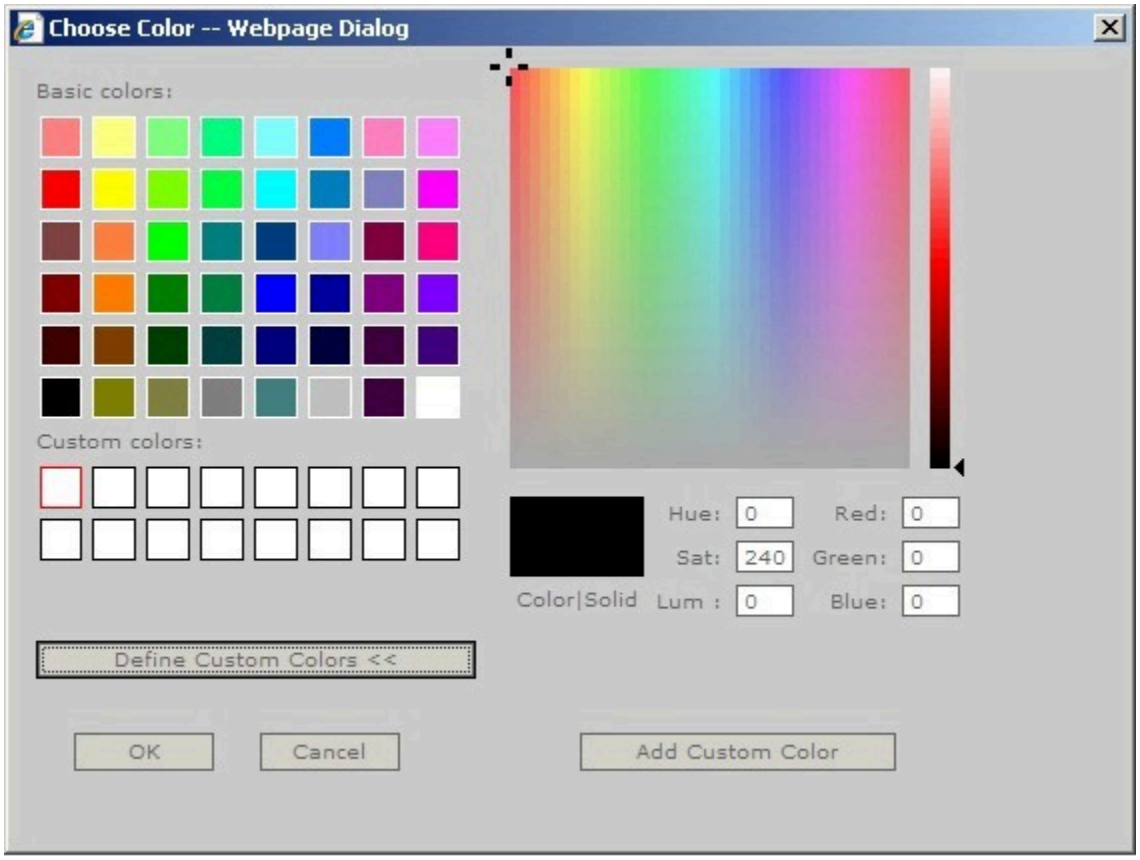
1. Right-click the icon of the activity for which you want to set appearance properties to open the context menu.



2. In the menu, select the "**Background Color**" option to open the **Choose Color** window shown below, where you can set the background color, that is fill color. You can select a color and click **OK** to set it as the background color. You can click **Define Custom Color** to expand the window to show the custom color definition controls. You can define a custom color and click **Add Custom Color** to add it to the palette.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Choose Color window with the **Custom Color** definition controls:



3. You can select "**Foreground Color**" to open the **Choose Color** window and set the foreground color, that is,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

outline color.

4. You can select "**Gradient Color**" to set the gradient color in the **Choose Color** window.
5. You can click "**Gradient Fill**" to enable gradient fill in the icon. A check mark before the option indicates that it is enabled.
6. You can click "**Show Text Below**" to enable the display of the **Activity Name** and **Description** text below the icon. A check mark before the option indicates that it is enabled.

Search for Content in Workflow

AVEVA Work Tasks has a provision to search for content in the workflow. This is a useful tool to navigate large and complex workflow process diagrams.

To find a particular activity in a large process diagram

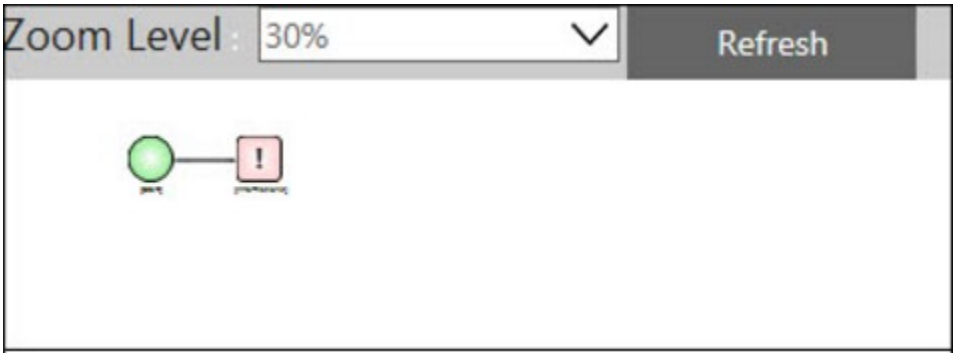
1. Enter the name or part of the name of the activity in the **Search** text box.
2. Click the magnifying glass icon to start the search.

The search will display the activity that matches the search string on the design mosaic.

Use the Process Map Image for Navigation

AVEVA Work Tasks displays a **Process Map Image**, which you can use to navigate large processes. You can access this process map by clicking the **Zoom** tool in the **Process Designer** tool bar.

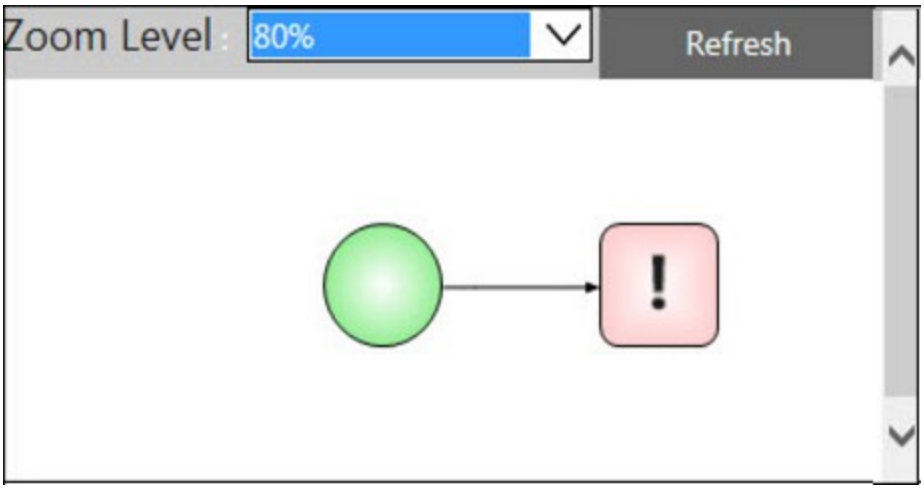
The following image shows the **Process Map** image for navigation:



The **Process Map Image** shows the process diagram as an image. You can save the displayed image as a PNG or BMP file. You can navigate large and complex processes using the click-able activity icons in this **Process Map** image. You can click any icon and go to the corresponding activity in the design mosaic of the Process Designer. You can zoom in and out of the Process Diagram by selecting the appropriate percentage from the **Zoom Level**. The image shown below is displayed at 50% zoom. You can click **Refresh** to refresh the Process Image displayed in this window.

The following image shows the Process image zoomed:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Process Modeling and Saving the Analyst's View

The **Process Designer** comes with a modeling layer over the process design layer. In the earlier versions, the Process Designer could only be used to design a process definition for automation. The new Process Modeler/ Designer, with its visually-rich user-interface like Visio – a tool familiar to Business Analysts – allows them to easily model business processes. In addition, the BPMN activities like Lanes and Pools allow better modeling.

With these new features you can try out various approaches to model the business process and arrive at the optimum model. At this point, you can save the model to a file. This file can be set as the Business Analyst's model, which will be shown in the Process Execution View window when you click the **Analyst's View** tab.

Alternatively, you can save a copy of the completed process design as the Analyst's View and remove the automation activities, retaining only the business model.

Lock and Unlock Designers

You can use the **Lock** and **Unlock** feature of AVEVA Work Tasks to lock the designers such as Process Designer, Forms Designer, and List designer while editing. When the designer is locked, other users will not be allowed to edit or modify it. A lock icon appears beside the locked designers as shown in the following image:

Title	Description	Owner	Version
Leave Details	Employee Leave Details	admin	1
adminform1		admin	1
adminWF		admin	1
RS	RS	admin	1
200941	200941	admin	1

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Functionality of Lock and Unlock

- You can lock or unlock a list item from the context menu.
- Every list item that you open for editing gets locked automatically.
- You can view the name of the user who has locked the list item. Place the mouse pointer on the lock icon to view the user name.
- Only the user who has locked the list item or the users of administrative security group can unlock the list item.
- You can see a lock icon beside each locked list items. The lock icons have the following significance:
  - : This lock icon indicates that the list item is locked by other users.
  - : This lock icon indicates that the list item is manually locked by the logged on user.
  - : This lock icon indicates that the list item is automatically locked by the logged on user.

Enable and Disable Lock for Repository

You can enable or disable the lock at repository level. Before you enable or disable a lock, we recommend that you understand how a lock affects the application.

Default Behavior of Repositories Created in AVEVA Work Tasks

In AVEVA Work Tasks, lock is enabled by default for a repository that is created. The Process Designer, List Designer, Forms Designer, and the User Defined Lists (if lock is enabled) gets locked while editing to ensure that other users do not modify or edit the list item.

How to Check Whether Lock is Enabled or Disabled for a Repository?

To check whether lock is enabled or disabled for a Repository, verify the Properties Column (properties collection) of SKRepository table in the Farm Database. If the value of the property key, **"enablelock"** is **True**, lock is enabled for the repository. If the value of the property key, **"enablelock"** is **False**, lock is disabled for the repository.

For example, the following code snippet shows the Properties column (properties collection) data for a repository:

```
<properties>
<property key="sourceelements">
<![CDATA[WORKFLOWELEMENTS\Default]]>
</property>
<property key="fromemail"><![CDATA[admin@domain.com]]></property>
<property key="toemail"><![CDATA[admin@domain.com]]></property>
<property key="alertuser"><![CDATA[False]]></property>
<property key="filewatcher"><![CDATA[]]></property>
<property key="enablelock"><![CDATA[True]]></property>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<property key="isadminconfigured"><![CDATA[True]]></property>
<property key="theme"><![CDATA[Default]]></property>
</properties>
```

The highlighted line is used to identify whether a lock is enabled or disabled for a repository. In this line, you can identify the following properties:

<property>	**defines the property tag**
key	Attribute of property tag which describes the property name. enablelock is name of the property.
<![CDATA[True]]>	Value of the property. True indicates that the lock is enabled.
</property>	Closing tag of property.

Enabling lock for a repository

In AVEVA Work Tasks, after you create a repository, lock is enabled by default for that repository.

If you want to enable lock for a repository, open the SKRepostiory table in the Farm Database. Locate the required repository entry or row. In the properties column data (properties collection) of the particular row, locate the enablelock key. Update the `<![CDATA[False]]>` to `<![CDATA[True]]>`.

If the *enablelock* key is not found for a repository entry in the properties column, then add the following line between `<properties>` and `</properties>` tags.

```
<property key="enablelock"><![CDATA[True]]></property>
```

The lock will be enabled for that repository.

Disabling lock for a repository

In AVEVA Work Tasks, after you create a repository, lock is enabled by default for that repository.

If you want to disable a lock for a repository, then open the SKRepostiory table in the Farm Database. Locate the required repository entry or row. In the properties column data (properties collection) of the particular row, locate the enablelock key. Update the `<![CDATA[True]]>` to `<![CDATA[False]]>.`

If the enablelock key is not found for a repository entry in the properties column, then add the following line between `<properties>` and `</properties>` tags if you want to enable lock in future.

```
<property key="enablelock"><![CDATA[False]]></property>
```

Different Types of Locks

You can use the **Lock** and **Unlock** feature of AVEVA Work Tasks to lock the designers such as Process Designer, Forms Designer, and List designer while editing.

There are two types of Locks and Unlocks:

- Auto Lock and Unlock
- Manual Lock and Unlock

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Manual Lock and Unlock

List item can be locked for editing either manually or it can be auto locked. The section below gives you detailed information on how to manually Lock or Unlock a List item.

To lock the Designers

1. Select the list item to be locked.
2. Right-click on it and select the option **Lock** from the context menu.
3. A message **'The item is locked successfully'** is displayed, click **OK**.

The selected list item will be locked and a lock icon will appear beside the list item.

To unlock the Designers

Locked designers can be unlocked only by the lock owner, administrator and the list item owner.

1. Select the list item which needs to be unlocked.
2. Right-click on it and select the **Unlock** option in the context menu.
3. A message **'The item is unlocked successfully'** is displayed, click **OK.**

The locked list item will get unlocked and the lock icon beside the item item will no longer be present.

Auto Lock and Unlock

When editing or designing a list item, the designers like Process Designer, Forms Designer, and List Designer will get auto locked and the auto lock icon , will be displayed beside the locked list item. Designers which are auto locked will get unlocked automatically when you save or discard the changes done.

Note: The designers which are accessed for editing or designing will not get locked if the Designer window is closed using the window close icon. Only the user who had locked the list item, users of administrative security group and the list item owner can unlock the list item.

Use Lock and Unlock on Designers

This section gives you in-depth details of using the Lock and Unlock feature on AVEVA Work Tasks Designers. The Lock and Unlock feature can be used for the following lists:

- Process Designer is used to design Workflows
- Forms Designer is used to design Forms
- List Designer is used to design and manage List infrastructure

Process Designer

This section gives you details on how to lock and unlock a workflow and the functionality of Workflow when the feature Lock and Unlock is used.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

How to lock and unlock Workflow

Workflow can be locked and unlocked manually or the auto lock and unlock feature can be used. Access the links below for more details on:

Manually Locking a workflow

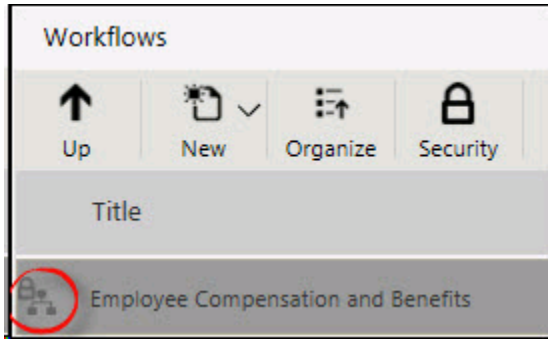
A Workflow can be locked by selecting the Lock option from the context menu. The section below gives detailed instructions of how to lock and unlock a workflow:

To Lock and Unlock a Workflow

Consider a scenario where Jack wants to lock the workflow 'Employee Compensation and Benefits' to ensure that no other user edits or modifies it.

1. Access Workflow List from the **Enterprise Console**.
2. Select workflow **'Employee Compensation and Benefits'**.
3. Right-click on the workflow and select the option **Lock** from the context menu.

   Workflow **'Employee Compensation and Benefits'** gets locked and a lock icon is visible beside the workflow in the **Workflow List**.



4. Perform all required actions on the Workflow, such as designing, editing, defining/updating activity properties, publish.

   Note: Jack can design/edit the workflow multiple times, as the workflow is locked by him. Workflow 'Employee Compensation and Benefits' will be locked even after Jack exits the Process Designer as they had explicitly locked the workflow from the context menu options. Jack has to Unlock the workflow, in order to allow others to edit it.

5. To unlock the workflow, select the workflow **'Employee Compensation and Benefits'**.
6. Right-click on the workflow and select the option **Unlock** from the context menu.
7. A message **'Item has been Unlocked'** will be displayed. Click **OK**.

   Workflow **'Employee Compensation and Benefits'** will get unlocked and the lock icon beside the workflow will not longer be displayed. Other users will be able to modify the workflow.

To Auto Locking of a workflow

A workflow gets auto locked when the options Edit or Design is selected. The workflows which get locked automatically will get unlocked when you save the changes or when the Process Designer is closed.

Consider a scenario where Jack is editing the workflow 'Employee Compensation and Benefits'.

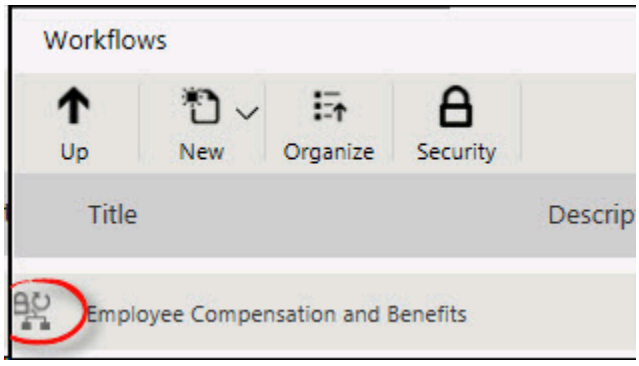
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Access Workflow List from the **Enterprise Console**.
2. Select workflow **'Employee Compensation and Benefits'**.
3. Right-click on the workflow and select the option **Edit Workflow** from the context menu.

   Or

   Select the **Edit** option from the ribbon bar.

   The Edit Workflow window of **'Employee Compensation and Benefits'** is displayed.
4. Select the option **Design a workflow** and click **Save & Continue**. The **Process Designer** is displayed.
5. Minimize the Process Designer window and refresh the workflow list. An lock icon is visible beside workflow 'Employee Compensation and Benefits', which indicates the workflow was auto locked on selecting the edit option.



6. Click **Publish** and **Test Run**, save the changes and close the **Process Designer**.
7. Verify the workflow **'Employee Compensation and Benefits'** in the workflow list.

   Workflow **'Employee Compensation and Benefits'** is unlocked automatically as Jack closed the Process Designer and the lock icon beside the workflow is no longer present.

Actions which are allowed or restricted on a locked Workflow at a glance

The table below lists out the actions which are allowed and which are restricted for a Locked workflow:

Actions allowed	Actions restricted
Organize	Design
Show All Versions	Edit
Show ChildItem	Delete
View Workflow	Publish
View Associations	Un Publish
View Exceptions	Change Owner
View Audit History	Associate
View Properties	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: User will be allowed to perform the above mentioned actions only if they have appropriate rights.

The table below categorizes the actions which locks the workflow and which do not lock the workflow

Actions which auto lock the workflow	Actions which do not auto lock the workflow
Edit	Delete
Design	Publish
Task	Unpublish
-	Change Owner
-	Associate
-	Organize
-	Show All Versions
-	Show Child Items
-	View Workflow
-	View Exceptions
-	View Associations
-	View Audit History
-	View Properties

Impact of locking a workflow on the ribbon bar actions

When a workflow is locked by an user, any action performed from the ribbon bar which leads to modification of the workflow will be restricted for all other users. Only the lock owner will be able to perform all the actions from the ribbon bar. The scenario given below explains the behavior of the ribbon bar options when a workflow is locked:

Scenario:

John locks the workflow **'Employee Compensation and Benefits'** to make some changes to it. Kevin logs-in to the **Enterprise Console** , accesses the Workflow list and selects the workflow **'Employee Compensation and Benefits'** which is locked by John. Kevin will not be able to perform any action which leads to modification of the workflow, **'Employee Compensation and Benefits'** as John has locked the workflow.

This section explains the behavior of the ribbon bar options when Kevin performs the actions given below:

- **Design**: When Kevin selects the workflow **'Employee Compensation and Benefits'** and clicks on the Design option, a message '**Item is currently locked by another user, John'**, will be displayed.
- **Edit**: When Kevin clicks on the **Edit** option in the ribbon bar with the workflow **'Employee Compensation and Benefits'** selected, a message '**Item is currently locked by another user, John'**, will be displayed.
- **Delete**: When Kevin tries to delete the workflow **'Employee Compensation and Benefits'** using the ribbon

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

option **Delete**, a message '**Item is currently locked by another user, John'**, will be displayed.

- **Publish**: With the workflow **'Employee Compensation and Benefits'** selected, if Kevin clicks on the **Publish** icon in the ribbon bar, a message **'Item is currently locked by another user, John'** will be displayed.
- **Change Owner**: Kevin will not be allowed to change the owner of the workflow **'Employee Compensation and Benefits'**, using the **Change Owner** option in the ribbon bar, as the workflow is locked by John and a message '**Item is currently locked by another user, John** will be displayed.
- **Associate**: Kevin be allowed to Associate the workflow '**Employee Compensation and Benefits**' to Share Point Enterprise console, File watcher etc, even though it is locked by John.
- **Organize**: Kevin can use this feature, and re-organize the workflow list items, as Lock will not be considered for Organize.

Note: John who locked the workflow **'Employee Compensation and Benefits'** will be able to perform all the above mentioned actions as no restrictions will be levied for the lock owner.

Impact of locking a workflow on the Context Menu options

When a workflow is locked by an user, all the context menu options of the locked workflow will not be available for the other users. The scenario in the section below explains the behavior of the context menu options when a workflow is locked:

Scenario

John locks the workflow **'Employee Compensation and Benefits'** to make some changes to it. Kevin logs in to the **Enterprise Console** , accesses the Workflow List and selects the workflow **'Employee Compensation and Benefits'** which is locked by John. However, Kevin will not be able to perform any action which leads to modification of the workflow, '**Employee Compensation and Benefits'**. Context menu options which Kevin can view and use for the locked workflow '**Employee Compensation and Benefits'** are:

- View Workflow
- Export Workflow
- Create Associations
- Dissociate
- View Associations
- Unlock
- Show Child Item
- Show All Versions
- View Audit History
- View Properties
- View Exceptions

Context menu options which Kevin cannot view and use for the locked workflow **'Employee Compensation and Benefits'** are:

- Design Workflow
- Edit Workflow
- Publish

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Publish and Test Run
- Import Workflow
- Lock
- Save As
- Disable
- Delete
- BAM Configuration
- Change Owner
- Tasks
- Security settings

Tasks

The table below explains whether the workflow will remain locked or will get unlocked on selecting the options available in the **Workflow Tasks** window if the selected workflow is auto locked.

Action performed	**Lock Status of the Workflow**
Design the Workflow now	Workflow will remain locked till the lock owner completes the designing or editing process and saves the changes done or discards it.
Provision Now	Workflow will remain locked till the lock owner completes the provisioning process
Start the Workflow Wizard	Workflow will remain locked till the lock owner completes the Workflow wizard
No task to be performed now	The workflow will get unlocked as the lock owner decides that no task will be performed for the selected workflow.

Context menu options available for Lee who is an administrator at repository level are:

- View Workflow
- Export workflow
- Create Associations
- Dissociate
- View Associations
- Unlock
- Show Child Item
- Show All Versions
- View Audit History
- View Properties
- View Exceptions

Note: Since Lee is a administrator at repository level, they can see the Unlock option in the context menu

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

and can use it to Unlock the workflow.

Features

- Workflow will get auto locked only when the options **Design** or **Edit** are selected.
- When a workflow is locked, the child workflows will not get locked and other users can work on it.

  Scenario

  Consider a workflow **Finance - Fiscal year 2011- 2012**, which has the following child items

  - Incentive / Bonus
  - Contract employee's compensation
  - Employee Provident Fund calculator and contribution

    Login to Enterprise Console as John, access Workflow list .

    Select the workflow **Finance - Fiscal year 2011-2012** and lock it by selecting the Lock option from the context menu.

    Log out and login as Kristen and navigate to the workflow list.

    Workflow Finance - Fiscal year 2011-2012 is locked and a red lock icon beside it indicates it is locked by a different user.

    Double click **workflow Finance - Fiscal year 2011-2012** to access its child workflows.

    A list of child workflows of **Finance - Fiscal year 2011-2012** is displayed. Verify the lock status of the child workflows.

    The child workflows of **Finance - Fiscal year 2011-2012** are not locked though the parent workflow is locked. Hence, Kristen will be allowed to modify it if required.
- When a workflow is locked, all the versions of that particular workflow will get locked.Scenario

  Consider a workflow Leave Approval Workflow, which has four versions

  Scenario

  Log into Enterprise Console as Lee and access Workflows List.

  Select the workflow **Leave Approval Workflow** which has four versions and lock it.

  Log out and log in as Lan, access Enterprise Console > Workflows List.

  Select the locked workflow **Leave Approval Workflow**, right click on it and select the option **Show All Versions**.

  All the versions of Leave Approval Workflow is displayed, wherein you cannot see the Lock icon and determine if the versions are locked or not.

  Select a version and click the **Edit** icon in the ribbon bar.

  A message **'Item cannot be edited because it is locked by the user Lee'** is displayed. This indicates the versions are also locked, though a lock icon is not present beside the workflow versions.

Forms Designer

This section gives you details on the behavior of the **Forms Designer** when Lock and Unlock is used.

Manually Locking a Forms Designer

A Form Designer can be locked by selecting the **Lock** option from the context menu. The section below gives detailed instructions of how to lock and unlock a forms designer:

To Lock and Unlock a Forms Designer

1. In the **Enterprise Console**, click menu icon, and then click **Forms**. The **Forms** page appears.
2. Select and right-click a form.
3. Select **Lock** from the shortcut menu.
4. The Forms Designer gets locked and a lock icon is visible beside it in the Forms window.
5. Perform all required actions, such as designing, editing, defining, adding controls, saving and publishing the form.

   Note: After you lock a form, you can design or edit the Form multiple times. You must unlock the Forms Designer so that other users can use the form.
6. Select and right-click the form to be unlocked.
7. Click **Unlock** on the shortcut menu. A message *'Item has been Unlocked'* will be displayed.
8. Click **OK**. The **Forms Designer** gets unlocked and the lock icon beside it will not longer be displayed. Other users will be able to modify it.

Auto Locking Forms Designer

A Forms Designer gets auto locked when the options Edit or Design is selected. The forms designer which get locked automatically will get unlocked when the user saves the changes or when the Forms Designer is closed.

The table below lists out the actions which allowed and which are restricted for a Locked form:

Actions that can be performed	Actions which are restricted
Show All Versions	Edit Form
Show Child Item	Delete
View Workflow	Publish
View Associated Workflows	Associate
Preview Form	Dissociate
Export Form	Import Form
-	Save As
-	Security settings

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Behavior of the ribbon bar options when a Form Designer is locked:

When a **Form Designer** is locked by an user, any action performed from the ribbon bar which leads to modification of the form design will be restricted for all other users. Only the lock owner will be able to perform all the actions from the ribbon bar. The scenario given below explains all the behavior of the ribbon bar options when a form is locked:

Scenario:

Lee locks the form **'Leave Approval Form'** to make some changes to it. Lan logs in to the **Enterprise Console** , accesses the Forms list and selects the form **'Leave Approval Form'** which is locked by Lee. Lan will not be able to perform any action which leads to modification of the form, **'Leave Approval Form'** as the form is locked by Lee.

This section explains the behavior of the ribbon bar options when Lee performs the actions given below:

- **Design**: When Lan clicks on the Design in the ribbon bar with the form **'Leave Approval Form'** selected, a message *'Item is currently locked by another user, Lee'*, will be displayed.
- **Edit**: When Lan clicks on the **Edit** in the ribbon bar with the form **'Leave Approval Form'** selected, a message *'Item is currently locked by another user, Lee'*, will be displayed.
- **Publish**: With the form **'Leave Approval Form'** selected, if Lan clicks on the **Publish** icon in the ribbon bar, a message *'Item is currently locked by another user, Lee*' will be displayed.
- **Unpublish**: With the form **'Leave Approval Form'** selected, if Lan clicks on the **Unpublish** icon in the ribbon bar, a message *'Item is currently locked by another user, Lee'* will be displayed.
- **Delete**: When Lan tries to delete the form **'Leave Approval Form'** using the ribbon option **Delete**, a message *'Item is currently locked by another user, Lee'* will be displayed.
- **View**: Lan can use this feature, and view the forms designer, as **Lock** will not be considered.
- **Associate**: Lan can use this feature, and associate the form to an existing or a new workflow, as Lock will not be considered.
- **Organize**: Lan can use this feature, and re-organize the forms list items, as Lock will not be considered for Organize.
- **Change Owner**: Lan will not be allowed to change the owner of the form, a message *'Item Owner cannot be changed because it is Locked by the user, Lee'*

Note: Lee who locked the form 'Leave Approval Form' will be able to perform all the above mentioned actions as no restrictions will be levied for the lock owner.

Behavior of Context Menu options when a Form is locked

When a Form Designer is locked by an user, all the context menu options of the locked Form Designer will not be available for the other users. The scenario in the section below explains the behavior of the context menu options when a form is locked:

Scenario

Lee locks the form **'Leave Approval Form'** to make some changes to it. Lan logs in to the **Enterprise Console** , accesses the Forms list and selects the form **'Leave Approval Form'** which is locked by Lee. Lan will not be able to perform any action which leads to modification of the form, **'Leave Approval Form'** as the form is locked by Lee.

Context menu options which Lan can view and use for the locked form 'Leave Approval Form' are:

- Show Child Item

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Show All Versions
- View associated Workflow
- Preview Form
- Export Form

Context menu options which Lan cannot view and use for the locked form 'Leave Approval Form' are:

- Publish
- Delete
- Associate
- Dissociate
- Edit Form
- Import Form
- Save As
- Security settings

Features:

- When a Form Designer is locked, the child items will not get locked and other users can work on it. Consider a Forms Designer **Physical Inventory of Systems**, which has the following child items
  - Physical Inventory of Peripherals
  - Physical Inventory of External HDD

Scenario:

1. Login to **Enterprise Console** as Kevin, access **Forms window**.
2. Select **Physical Inventory of Systems** from the list and lock it by selecting the **Lock** option from the context menu. The **Physical Inventory of Systems** forms designer will be locked by Kevin.
3. Log out and login as Lee and navigate to the Manage Forms window. Forms Designer **Physical Inventory of Systems** is locked and the red lock icon beside it indicates it is locked by a different user.
4. Double click **Physical Inventory of Systems** to access its child items.
5. A list of child items of **Physical Inventory of Systems** is displayed. Verify the lock status of the child items. The child items of **Physical Inventory of Systems** are not locked though the parent form designer is locked. Hence, Lee will be allowed to modify it if required.

List Designer

Actions which are allowed or restricted on a locked List at a glance

The table below lists out the actions which allowed and which are restricted for a Locked list:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Actions allowed	Actions restricted
Organize	Design List
View	Edit List
Preview List	Delete
Export List	Import List
Show Child items	Regenerate Form
View Audit History	

Note: User will be allowed to perform the above mentioned actions only if they have appropriate rights.

The table below categorizes the actions which locks the list and which do not lock the list

Actions which auto lock the list	Actions which do not auto lock the list
Edit	Delete
Design	Change Owner
	Show Child Items
	View Audit History
	Regenerate Form
	Import List

Impact of locking a list on the ribbon bar actions

When a list is locked by an user, any action performed from the ribbon bar which leads to modification of the list will be restricted for all other users. Only the lock owner will be able to perform all the actions from the ribbon bar. The scenario given below explains the behavior of the ribbon bar options when a list is locked:

Scenario:

John locks the list **'Inventory Purchase Order'** to make some changes to it. Kevin logs in to the Enterprise Console , accesses the Manage List window and selects the list **'Inventory Purchase Order'** which is locked by John. Kevin will not be able to perform any action which leads to modification of the list, **'Inventory Purchase Order'** as John has locked it.

This section explains the behavior of the ribbon bar options when Kevin performs the actions given below:

- **Design:** When Kevin selects the list **'Inventory Purchase Order'** and clicks on the Design option, a message **'Item is currently locked by another user, John',** will be displayed.
- **Edit:** When Kevin clicks on the Edit option in the ribbon bar with the list **'Inventory Purchase Order'** selected, a message **'Item is currently locked by another user, John'**, will be displayed.
- **Delete:** When Kevin tries to delete the list **'Inventory Purchase Order'** using the ribbon option Delete, a message **'Item is currently locked by another user, John'**, will be displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Change Owner:** Kevin will not be allowed to change the owner of the list **'Inventory Purchase Order'**, using the Change Owner option in the ribbon bar, as the list is locked by John and a message **'Item is currently locked by another user, John'** will be displayed.
- **Organize:** Kevin can use this feature, and re-organize the list items, as Lock will not be considered for Organize.

Note: John who locked the list **'Inventory Purchase Order'** will be able to perform all the above mentioned actions as no restrictions will be levied for the lock owner.

Impact of locking a list on the Context Menu options

When a list is locked by an user, all the context menu options of the locked list will not be available for the other users. The scenario in the section below explains the behavior of the context menu options when a list is locked:

Scenario

John locks the list **'Inventory Purchase Order'** to make some changes to it. Kevin logs in to the Enterprise Console , accesses the Manage List window and selects the list **'Inventory Purchase Order'** which is locked by John. However, Kevin will not be able to perform any action which leads to modification of the list **'Inventory Purchase Order'**.

Context menu options which Kevin can view and use for the locked list **'Inventory Purchase Order'** are:

- Unlock
- Preview List
- Export List
- Show Child item
- View Audit History

Context menu options which Kevin cannot view and use for the locked list **'Inventory Purchase Order'** are:

- Design List
- Edit List
- Preview List
- Import List
- Delete
- Change Owner
- Regenerate Form

Features

- Editing or Designing the **Manage List** updates the List item
- When a list is locked, the child items (lists) will not get locked and other users can work on it.

Use Lock and Unlock on User Defined Lists

The **Lock** and **Unlock** features available for the Workflow, Forms and List Designers can be extended to the User

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Defined lists as well.

Enabling Lock for User Defined List

The Lock and Unlock feature available for the Workflow, Forms and List Designers can be extended to the User Defined lists as well. In the section below you will learn how to enable lock for User Defined list .

To enable Lock for list items within User defined list

1. Log in to the **Enterprise Console** and navigate to **Tools** > **Manage Lists**.
2. Access a list, for example **Inventory Purchase Order** and edit it either by:

   Selecting the **Edit** option in the ribbon bar.

   Or

   Selecting the **Edit List** option from the context menu.
3. The Edit List dialog is displayed, click **Save and Continue**.
4. The List Designer window for **Inventory Purchase Order** is displayed. Click **Edit**.
5. The Inventory Purchase Order Properties dialog is displayed. Navigate to the **Advanced** tab.
6. Set the **Enable Lock** option as **Yes**. The default setting is **No**.

This will enable lock for list items within User Defined list, which will enable you to Lock feature.

Effects of Lock and Unlock on User Defined List

The **Lock** option in the context menu will be available for the list items of a User Defined list only if the option **Enable Lock** is set to **Yes** for the respective User Defined List. When lock is enabled, the user defined list can be locked and other users will not be able to edit or modify it.

For more details, refer to User Defined List when Lock is Enabled.

The **Lock** option in the context menu will not be available for the list items of a User Defined List when the option **Enable Lock** is set to **No** for the respective User Defined List. When lock is disable, the User Defined List cannot be locked and other users will be able to edit or modify it.

For more details, refer to User Defined List when Lock is Disabled.

User Defined List when Lock is Enabled

The lock option in the context menu will be available for the list items of a User Defined list only if the option **Enable Lock** is set to **Yes** for the respective User Defined List. When lock is enabled, the user defined list can be locked and other users will not be able to edit or modify it.

Scenario:

Consider a list **Inventory Purchase Order** for which lock is enabled. Kevin locks one of the the list item **Purchase of Laptops** of **Inventory Purchase Order**. When Lan access the list item **Purchase of Laptops**, he will not be able to edit or modify it.

The table below shows the actions which Lan can perform on the list item **Purchase of Laptops** which is locked by Kevin.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Ribbon Bar options

Actions that can be performed	Actions which are restricted
View	Edit
Organize	Delete

Context menu options

Actions that can be performed	Actions which are restricted
View Item Details	Edit
Show Child Item	Unlock
	Delete
	Security Settings

All the context menu options will be available for Kevin, the Lock owner of list item Purchase of Laptops and there will be no restrictions on the actions they can perform through the ribbon bar.

Context menu options available for Lock owner Kevin

Features:

When a list item is locked, the child items of the locked list item will not get locked and other users can work on it.

User Defined List when Lock is Disabled

The **Lock** option in the context menu will not be available for the list items of a User Defined List when the option **Enable Lock** is set to **No** for the respective User Defined List. When lock is disable, the User Defined List cannot be locked and other users will be able to edit or modify it.

Scenario

Consider a list **Inventory Purchase Orde**r for which lock is disabled. Kevin opens the list item **Purchase of Laptops** of Inventory Purchase Order. When Lee logs in and accesses the list item **Purchase of Laptops**, he will be able to edit or modify it and all options available for Kevin will be available for Lee as well since the list item is not locked.

The table below shows the actions which Kevin and Lee can perform on the list item **Purchase of Laptops** which is locked by Kevin.

Update a Locked List Item Through Workflows

List items can be updated from the Invoke Form Activity option or from the Engine Activity option.

Update a Locked List Item from Invoke Form Activity

List items can be updated through **Workflow > Invoke Form activity** irrespective of whether it is locked or not. Lock will not be considered while updating the list items through Invoke Form activity.

Scenario

Consider a list item **New Employee Details** which is associated to a workflow **Employee Induction workflow** on event creation. In the **Invoke Form Activity**, Lan is assigned to update the employee details.

1. Login to the **Enterprise Console** as Rick, create a new employee Peter Botham. Workflow **Employee Induction** is triggered and a mail is sent to Lan who is the assigned actor in Invoke Form activity.
2. Login as John and lock the list item **New Employee Details**.
3. Login as Lan and access the Inbox to view the work item assigned.
4. From the work item, open the form and update Peter Botham's email address.
5. Verify the list item **New Employee Details**.

List item **New Employee Details** is updated with the new employee Peter Botham's email address even though it is locked.

Update a Locked List Item from Engine Activity

List items can be updated through **Workflow Update variable activity** irrespective of whether it is locked or not. Lock will not be considered while updating the list items through Engine Activity.

Scenario

Consider a list item **New Employee Details** which is associated to a workflow **Employee Induction workflow** on event creation. **Employee Induction workflow** has a Update Variable activity to assign the Employee ID.

1. Login to Enterprise Console as Rick, create a new employee Peter Botham. Workflow **Employee Induction** is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

triggered.

2. Login to Enterprise Console as John and lock the list item **New Employee Details**.
3. In the **Employee Induction** workflow at run time the Employee ID will be updated.
4. Verify the list item **New Employee Details**.
5. List item **New Employee Details** is updated with the new employee Peter Botham's Employee ID even though it is locked.

View Lock and Unlock History of List Items

Every time a list item is locked or unlocked an entry is logged in View Audit History of the list item. View Audit History of the list item is accessed through the context menu.

- Lock and Unlock details of a list item displayed in View Audit History:
- Date when the list item was locked or unlocked
- Name of the user who unlocked the List item
- An explicit log when an user of the administrative security group locks or unlocks the item
- An explicit log when the list item owner locks or unlocks the list item.

AVEVA Work Tasks Pro

AVEVA Work Tasks Pro is a premium mobile application for AVEVA Work Tasks. It is designed for business professionals who use a mobile phone or a tablet device to access the app while on the move. AVEVA Work Tasks Pro can view and act on tasks, fill the form that initiates a process, and submit forms offline, among other capabilities.

You need to install the application on your device and configure specific settings for this application.

Note:
- Select the latest AVEVA Work Tasks Pro app only if you have either AVEVA Work Tasks 2020 Update 2 with Hotfix 7.2.3020.12 or AVEVA Work Tasks 2023 SP1 with Hotfix 8.1.2030.4. Users with other versions should not choose the latest app.
- After applying the hotfix and upgrading the AVEVA Work Tasks Pro app, log out and log back in to ensure push notifications function correctly. If notifications do not appear, uninstall and reinstall the app to enable receiving notifications.
- AVEVA Work Tasks supports JavaScript based on the ES5 (ES2014) standard, applicable for Forms.

Introduction

AVEVA Work Tasks Pro are premium mobile applications for AVEVA Work Tasks. It is designed for business professionals who use a mobile phone or a tablet device to access the app while on the move. It is an easy-to-use application that provides a quality visual experience. AVEVA Work Tasks Pro application provides support for major mobile operating systems.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Capabilities

- View and act on tasks
- Receive real time notifications
- Fill form that initiates a process
- Approve or reject requests/events
- Flag tasks based on importance
- View work items based on categories
- Search for the assigned tasks
- Submit forms offline

Get Started with AVEVA Work Tasks Pro

To get started with AVEVA Work Tasks Pro, you need to install the application on your device and configure specific settings for this application.

Once the application is installed and configured, you can view the Inbox with work items that can be acted upon or fill a form to initiate the process.

Note:
-To access AVEVA Work Tasks Pro in localized language, configure/add the desired language in your device settings.
- Pressing the <Tab> or <Shift>+<Tab> keys does not move the focus to the next or previous element on Work Tasks Pro UWP App pages. As a possible workaround, try minimizing the Work Tasks Pro App window and/or opening another application like File Explorer. Then, return to the UWP App window. This may resolve the issue with the tab keys.

Install and Configure AVEVA Work Tasks Pro Application

This topic gives you step by step instructions to install and configure the AVEVA Work Tasks Pro application in a mobile device.

To install AVEVA Work Tasks Pro Application

1. Download the **AVEVA Work Tasks Pro** application from the relevant store. The **AVEVA Work Tasks Pro** icon appears on the device screen.
2. Tap **Accept** to agree to the **End User License Agreement** and configure the Work Tasks Pro application.

Note:
- Ensure all permissions the app requests are granted, otherwise one or more functionalities of the app may be disabled, or the app may not work as expected.
- The app should be relaunched if the permissions are changed.

Configuring AVEVA Work Tasks Pro Application

To get started with using the AVEVA Work Tasks Pro app, you need to set the configuration.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Accessing Account

If you are opening the application for the first time, the **Manage Account** screen appears automatically.

- To access the **Manage Account** screen, swipe from the left edge of the screen, and then tap **Manage Account**.

Configuring Server

- **Server Path:** Enter the URL of the Enterprise Console. For using the application with Azure, enter the Azure URL of the Enterprise Console.

  Note: The Enterprise Console must be set up with anonymous authentication. For more information, see *Accessing AVEVA Work Tasks Pro* in the *Administrator Guide*.
- **Repository:** In the Repository list, tap on a repository name. When you tap on the repository control, the repositories and providers are populated.
- **Provider:** In the Provider list, tap on a provider name.

Configuring Credentials

- **User Name**: Enter your user name.
- **Password**: Enter your password.

  Note: These credentials are not applicable for accessing AVEVA Connect and AIM authentication.

Accessing through AVEVA Connect

If your account is added as a federated user account to AVEVA Connect, you are automatically navigated to the AVEVA Login page (company login page).

To access AVEVA Connect,

1. In the **Email** box, type your email ID.
2. Click **Sign In**.

   The AVEVA Connect Home page appears.

Note: If you do not have the privileges to access AVEVA Connect, an error message appears indicating that you are not authorized to access this account.

Accessing through Azure Active Directory

You can log into the app using Azure Active Directory authentication. Select the repository that is created with Azure Active Directory user provider and then click **Sign In** to access the app.

Note: If you access Enterprise Console and Central Configuration sites from the same browser, the sites get clashed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Accessing through AVEVA Identity Manager

To access the AVEVA Work Tasks Pro app using AIM authentication, enter the following details in the **AVEVA Identity Manager** login page:

- **User Name**: Enter the user name.
- **Password**: Enter the password.

Saving Configuration

- **LOG ON:** Tap to save the configuration information and log in to the application.

Scan Account Settings using the QR Code

You can generate a QR code in the Farm Configuration Wizard to store settings such as Server Path, Repository, and Provider. You can then scan this QR code in the AVEVA Work Tasks Pro app to automatically fill these settings in the Manage Account screen.

1. Tap the **Scan QR Code** icon.
2. Scan this QR Code in the AVEVA Work Tasks Pro app.

   The values configured for the following settings in the Farm Configuration wizard are considered by default.
   - **Server Path**
   - **Repository**
   - **Provider**
3. Enter the user name and password.

Note: If QR code image appears to be bigger in Farm Configuration and you are getting an invalid QR code message, download the QR code and then scan it.

Delete Account

You can clear all the settings configured for an account.

1. In the **Manage Account** screen, tap the Overflow Menu.
2. Tap **Delete Account**.

   All the settings configured for the account are cleared.

Note: When you delete an account or log off, you need to kill the app and launch it again. The app needs to be killed and relaunched when AVEVA Connect, Azure Active Directory, and AVEVA Identity Manager provider is configured.

Mobile Device Management

You can configure settings in AVEVA Work Tasks Pro app using Mobile Device Management applications (example, Airwatch, Soti).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

In Mobile Device Management application, the configurations can be configured in Key-Value pairs. The keys are fixed but values can be dynamic based on the user's need.

Before you install the AVEVA Work Tasks Pro app, configure the following keys in the Mobile Device Management application.

- For Configuration screen:
  - ServerPath: Specify the server path.
  - Repository: Specify the Repository name.
  - Provider: Specify the Providers.

    Use the following instance name values for the respective providers:
    - 'skeltalist' for Repository User Provider
    - 'activedirectory' for Active Directory
    - 'sqlprovider' for Forms
    - 'membershipprovider' for ASP.NET Membership
    - 'aadprovider' for Azure Active Directory Provider
    - 'connectuserprovider' for Aveva Connect User Provider
  - UserName: Enter the user name of the Repository.
- For Settings screen:
  - ShowInboxInGroups: Enable or disable to show work items in groups
  - SyncAllWorkItems: Enable to sync all the work items in the Inbox
  - WorkItemsToSync: Specify the number of work items (50 to 1000) to be synced in the Inbox
  - ItemsToSyncForLookupAndDataGrid: Specify the number of lookups to be fetched
  - BatteryThresholdValueForSync: Specify minimum device battery level for Sync
  - MemoryThresholdValueForSync: Specify minimum device memory for Sync
  - SaveAsDraft: Enable or disable the Draft option
  - SentItems: Enable or disable the SentItems option
  - OfflineSupport: Enable to submit the items in the offline mode
  - SaveSettings: Enable to save settings in the mobile device.
- For Fill Form label
  - FillFormLabel: Specify the label for the Fill Form.

When you install the AVEVA Work Tasks Pro app for first time, all the configurations that have been set in the Mobile Device Management application will be available in AVEVA Work Tasks Pro app .

Note: These configurations can be done only in the Managed Profile of the device.

To configure the keys in iOS, you need to upload the XML having the key configurations.

For example, you need to import the XML file with the script given below:

```
<managedAppConfiguration>
<version>1</version>
<bundleId>com.vmware.gss.AirWatchAppConfigSample</bundleId>
<dict>
<string keyName="ServerPath">
<defaultValue>
```

</defaultValue>
</integer>
<boolean keyName="OfflineSupport">
<defaultValue>
<value>true</value>
</defaultValue>
</boolean>
<string keyName="FillFormLabel">
<defaultValue>
<value>Custom Label for Fill Form</value>
</defaultValue>
</string>
</dict>
</managedAppConfiguration>
```

View the Demo of AVEVA Work Tasks Pro App

Before you log on to the AVEVA Work Tasks Pro or AVEVA Work Tasks Pro+app, you can view the demonstration of the app to understand more about its features.

To access the Demo Mode

- On the **Manage Account** screen, slide the **Demo Mode** setting to activate the Demo Mode.

  The Demo Mode is activated.

  You can view the sample data such as Fill Forms and Work Items.

Note: Demo Mode is not supported in ARM-based Windows mobile devices.

Log On and Log Off

Users can view and act on the tasks assigned by logging on to the AVEVA Work Tasks Pro application using the Log On screen. If the mobile device is shared amongst different users, it is recommended to log on and log off after accessing the application.

User can log on to the application only if the mobile device has server connectivity.

To log out of the application, navigate to the sliding menu, and click **Log Off**.

After you are logged off, you will not receive any notifications and the offline work items will not be available the next time you log on.

Note:
- User credentials are required after the time specified, under **Require User Credentials** property in the repository settings, is elapsed.
-- When the user is logged off after the time elapses, the fill forms are automatically saved as drafts.
-- The items in **Drafts**, **Sent Items**, and **Outbox** are available only if subsequently logged on by the same user.
- We recommend to either log off or clear the settings before deleting the application from your mobile device.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Online and Offline Support for Controls and Containers

If the mobile device is not connected to the server when you submit a form, then the form is stored in the queue, and is listed in the Outbox. When the mobile device gets connected to the server, the forms in the queue are submitted and the corresponding workflows are triggered.

The table below lists online and offline support for all controls and containers:

Controls and Containers	**Online Support**	**Offline Support**
Attachment	Yes	• Supports only uploading of attachments.
Arc	Yes • Supports both parameterized and non-parameterized DB-Query, Stored Procedure, Repository and Web API.	Partial • Supports non-parameterized DB-Query, Stored Procedure, and Repository lookup. • Does not support both parameterized and non-parameterized Web API lookups.
Base Form	Yes	Yes
Boolean	Yes	Yes
Button	Yes • Does not support the **Print Button Type** property.	Yes • Does not support the **Print Button Type** property.
Card	Yes	No
Chart	Yes	Partial • Supports only non-parameterized data lookups.
Check Box	Yes	Yes
Data Grid	Yes • Does not support hierarchical grid.	Partial • Supports only non-parameterized data grids.

Controls and Containers	Online Support	Offline Support
	• Does not support Widget Type - Form.	• Based on the selected Widget, the support may vary. See the Widget specific documentation for more details.

Note: Action bar and MQTT topics are not supported in Work Tasks Pro App.

Inbox

In the AVEVA Work Tasks Pro view, you can view work items, work item details, act on work items, and refresh the work items list.

When you log in to the application, the latest work items are automatically downloaded. You can also pull down on the device screen to refresh the work items list.

On receiving notification, you can see the updated work items without manually refreshing the work items list.

You can swipe to quickly act on the work items without opening it. You can swipe left the work item to Approve, Reject, Remove, Flag/Unflag, and View the details. You can also put back the work item in the same Queue.

On tapping the work item, you can view the details page.

The work items are color based on the priority (0-99) and help you to quickly recognize high priority items (0-33 for Low, 34-66 for Medium, or 67-99 for High). You can also sort the work item based on time, the latest being at the top of the list.

To view Inbox

- Swipe in from the left edge of the screen, tap **Inbox**.

  The **All Items** screen appears.

To view More Work Items

- To view more work items, scroll down through the work items list, and tap **LOAD MORE**.

To set Work Items Sorting Order

You can sort the work items by priority or time.

1. Swipe in from the left edge of the screen, tap **Inbox**.

   The **All Items** screen appears.
2. In the **All Items** screen, tap the **Overflow Menu** and then tap **Sort by Priority** to sort the work items by priority.

   The work items are listed in the descending order of priority.
3. In the **All Items** screen, tap the **Overflow Menu** and then tap **Sort by Time** to sort the work items by time.

   By default, the work items are sorted by time.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Work Item Categories

The work items categorization helps you to view items based on the category. For more information about categories, see Categories.

To view Categorized Work Items

1. Swipe in from the left edge of the screen, tap **Inbox**.
   The **All Items** screen appears.
2. From the **Categories** drop-down list, tap a category to view items based on that category.
   The work items are listed based on the selected category.

To update Work Items List

You can pull down on the device screen to refresh the work items list.

To flag/unflag Work Items

You can flag or unflag the work items that you want to follow up based on importance.

- Swipe left the work item to flag or unflag the work item.
  The *Updating work item flag* message appears and the selected work item is flagged.

To view Flagged Work Items

1. Swipe in from the left edge of the screen, and tap **Inbox**.
2. Tap **Categories** drop-down list on the header and then tap **Flagged**.
   All the flagged work items are listed.

To view Work Items in Groups

You can enable **Show in Groups** to group work items based on the value of the work item field created.The **Show in Groups** is disabled by default.

1. Swipe in from the left edge of the screen, tap **Settings,** and then tap **Inbox**.
   The **Show in Groups** screen appears.
2. Tap the **Show in Groups** toggle switch to enable it.
   The work items are listed based on the value of the work item field created.

   Note: The value of the Work Item Field is displayed based on the server language setting.

To search for Work Items/Groups

You can search for a specific work item or a group.

1. On the **Action** bar, tap the **Search** icon.
2. In the **Search** box, type the keyword for the work item or the group you want to search.
   The work items/groups containing the specified keyword are listed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Categories

You can filter and view the work items based on the **Categories**. The work items are categorized into five categories: All Items, Approval, Invoke Form, Information, and Flagged.

To navigate to each of the categories, tap the **Categories** drop-down list in the header.

The following table provides details on the categories available in the AVEVA Work Tasks Pro application:

Category	**Description**
All Items	This category displays work items of all categories, this includes Information, Approval, Invoke Form, and Flagged work items.
Approval	All the work items that requires the user to either approve or reject a work item appear in the Approval category. The Approval details page has the **Approve** and **Reject** button to approve or reject the work item. You can also swipe left the work item and tap **Approve** or **Reject** to approve or reject the work item.
Invoke Form	Displays the forms generated from Invoke Form Activity. The detailed view does not show the work item subject and body. You can also swipe left the work item and tap **View** to view the details of the work item.
Information	All the work items having information to the user appear in the Information category. The Information details page contains the **Remove** button to remove the work item after reading the information. You can also swipe left the work item and tap **Remove** to remove the work item.
Flagged	All the work items that are flagged appear in the Flagged category. You can also swipe left the work item and tap **Flag/ Unflag** to flag or unflag the work item.

All Items

You can view all the work items at a time. To view more work items, scroll down in the work items list.

To view all Work Items

1. Swipe in from the left edge of the screen, and tap **Inbox**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Tap **Categories** drop-down list on the header and then tap **All Items**.
   All the work items are listed.

Approval

You can view a list of the work items, which needs approval.

To view Approval Work Items

1. Swipe in from the left edge of the screen, and tap **Inbox**.
2. Tap **Categories** drop-down list on the header and then tap **Approval**.
   The work items for which approvals are pending are listed.

Invoke Form

In the Invoke Form activity, an activity from the workflow is mapped to a form. Accordingly, the mobile user views this task in the mobile device and fills the form in response. AVEVA Work Tasks Form simplifies the process of designing forms and linking them to a business process. These forms can now be rendered in the Work Tasks Pro mobile application as well. Users can design a single form and deploy it in both Web and mobile applications.

You can also view the attachments present in the Invoke Form when the device is offline. The device should have the software that supports viewing the downloaded attachment files in offline mode.

The supported attachment file types for UWP are .txt, .log, .pdf, .jpeg, .png, .xls, .mp4, .mp3, .docx, .tiff, .jpg, .rtf, .doc, .html, .htm, .ppt, .pptx, .csv, .gif, .xlsx

To view Invoke Form Work Items

1. Swipe in from the left edge of the screen, and tap **Inbox**.
2. Tap **Categories** drop-down list on the header and then tap **Invoke Form**.
   The work items categorized as Invoke Form are listed.

Information

The Information Activity is included in the Process Designer when there is a need to provide some information to a set of actors. The actor(s) to whom the information is to be sent can be selected on the basis of various factors like first name, department, designation, email etc.

To View Information Work Items

1. Swipe in from the left edge of the screen, and tap **Inbox**.
2. Tap **Categories** drop-down list on the header and then tap **Information**.
   The work items categorized as Information are listed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Queue

The Queue displays the work items that are assigned to the queue. However, the display of the work items is subject to the rights assigned to the user for the queue.

To view Queue

- Swipe from the left edge of the screen and tap **Queue**.

  The Queues containing work items are listed.

To pick a Work Item

You can pick a work item from the Queue to take the appropriate action.

1. Swipe from the left edge of the screen and tap **Queue**.

   The Queues containing work items are listed.
2. Tap the Queue, tap the work item to be picked, and then tap **Pick**.

   The picked work item is move to the Inbox and are displayed as assigned work items.

   Note: You can pick the work item only if you have the permission. Contact the Administrator if you do not have the permission.

To recall a Work Item

You can recall already allocated work items so that they get back to the respective queues.

1. Swipe from the left edge of the screen and tap **Queue**.

   The Queues containing work items are listed.
2. Tap the Queue, tap the assigned work item to be recalled and, then tap **Recall**.

   The assigned work item is moved to the Queue.

   Note: You can recall the work item only if you have the permission. Contact the Administrator if you do not have the permission.

To allocate a Work Item

You can allocate a work item to the user so that it gets assigned to the user.

1. Swipe from the left edge of the screen and tap **Queue**.

   The Queues containing work items are listed.
2. Tap the Queue, tap the work item to be allocated, and then tap **Allocate**.

   The users that are participants of the selected queue get listed.
3. Select the user and then tap **Allocate**.

   The work item is assigned to the selected user.

   Note: You can allocate the work item only if you have the permission. Contact the Administrator if you do not have the permission.

To move a Work Item

You can move a work item from a Queue to another Queue.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Swipe from the left edge of the screen and tap **Queue**.

   The Queues containing work items are listed.
2. Tap the Queue, tap the work item to be moved, and then tap **Move**.

   The list of Queues gets listed.
3. Select the Queue and then tap **Move**.

   The work item is moved to the selected Queue.

   Note: You can move the work item only if you have the permission. Contact the Administrator if you do not have the permission.

To set Priority for a Work Item

You can set priority for a work item so that you can quickly recognize high priority items.

1. Swipe from the left edge of the screen and tap **Queue**.

   The Queues containing work items are listed.
2. Tap the Queue, tap the work item to be prioritized, and then tap **Prioritize**.

   The **Priority Slider** appears.
3. Move the Slider to select the desired priority and then tap **Prioritize**.

   The work item is prioritized for the selected Queue.

   Note: You can prioritize the work item only if you have the permission. Contact the Administrator if you do not have the permission.

Fill Form

Through the AVEVA Work Tasks Pro app, you can fill an item using the **Fill Form** option available in the sliding menu. When a form is filled and submitted, a process is initiated.

Forms accessed through Fill Form feature displays the Form Name as the Form header.

To view Fill Form

1. Swipe from the left edge of the screen, tap **Fill Form**.

   The available Fill Forms are listed.
2. Tap a form.

   The selected Fill Form screen appears.
3. Fill the form.
4. Tap **FINISH** to submit the form.

   When you fill a form, a process is initiated.

To search a Fill Form

You can search for a specific Fill Form.

1. On the **Action** bar, tap the **Search** icon.
2. In the **Search** box, type the keyword for the Fill Form you want to search.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Fill Forms containing the specified keyword are listed.

To save a Fill Form as Draft

1. Swipe from the left edge of the screen, tap **Fill Form**.
   The available Fill Forms are listed.
2. Tap a form.
   The selected Fill Form screen appears.
3. Tap the Draft icon.
   The selected Fill Form is saved as a draft.

Note:
- Fill Forms are automatically saved as Drafts every 30 seconds. You can enable Drafts to save Fill Forms as drafts. Drafts is disabled by default. To configure drafts, see Configure Drafts.
- When you open a popup form in the Fill Form and tap the **Draft** icon, the popup form content is not saved as a draft until you submit the popup form and then tap the **Draft** icon.

Drafts

You can save Fill Forms in the Drafts mode.

To view Drafts

- Swipe in from the left edge of the screen, tap **Drafts**.
  The **Drafts** screen appears, with a list of all Fill Forms saved as drafts.

To delete Drafts

1. In the **Drafts** screen, tap the Fill Form that you want to delete.
2. Tap the **Overflow** menu, and then tap **Delete**.
   The selected Fill Form is deleted from Drafts.

To clear Drafts

You can clear all the Fill Forms in the **Drafts** folder.

1. In the **Drafts** screen, tap the **Overflow** menu.
2. Tap **Clear All**.
   All the Fill Forms in **Drafts** are deleted.

Note: Drafts will not be available if it is disabled in **Settings**.

Sent Items

You can view the items, which are already sent. You can also forward the item, if required.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To view Sent Items

- Swipe from the left edge of the screen, and tap **Sent Items**.
  The sent work items are listed.

To clone Sent Items

You can clone and edit a sent item and then submit the item again.

1. Select the check box corresponding to the item that you want to clone.
2. In the menu bar, tap the **Clone** icon.
3. Edit the required information.
4. Submit the form.

To search for Sent Items

You can search for a specific sent item.

1. On the **Action** bar, tap the **Search** icon.
2. In the **Search** box, type the keyword for the sent item you want to search.
   The sent items containing the specified keyword are listed.

To delete Sent Items

You can also delete the sent items.

1. Select the check box corresponding to the item that you want to delete.
2. Tap the **Overflow** menu, and then tap **Delete**.
   The selected sent item is deleted.

To clear Sent Items

You can clear all the items in the **Sent Items** folder.

1. In the **Sent Items** screen, tap the **Overflow** menu.
2. Tap **Clear all**.
   All the sent items are deleted.

Note: Sent Items option will not be available if it is disabled in **Settings**. To enable or disable **Sent Items** option, see Configuring Sent Items.

Outbox

When the mobile device is not connected to the server while you submit an item, then this item is stored in the queue and is listed in the Outbox. When the mobile device gets connected to the server, the items in the queue are submitted and the corresponding workflows are triggered.

The attachments of the image file format can be viewed in the outbox.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To view Items in Outbox

- Swipe from the left edge of the screen, and tap **Outbox**.
  The items which are in the queue are listed.

To edit Items in Outbox

1. Swipe from the left edge of the screen, and tap **Outbox**.
   The items which are in the queue are listed.
2. Tap the item that you want to edit.
   The respective item appears.
3. Edit the item.
4. Re-submit the item.

To search for Outbox Items

You can search for a specific Outbox item.

1. On the **Action** bar, tap the **Search** icon.
2. In the **Search** box, type the keyword for the Outbox item you want to search.
   The Outbox items containing the specified keyword are listed.

To delete Items from Outbox

1. In the **Outbox** screen, tap the item that you want to delete.
2. Tap the **Overflow** menu, and then tap **Delete**.
   The selected item is deleted from the Outbox.

To clear Outbox

You can clear all the items in the **Outbox** folder.

1. In the **Outbox** screen, tap the **Overflow** menu.
2. Tap **Clear all**.
   All the items in the **Outbox** are deleted.

Sync

If the mobile device is not connected to the server when you add, edit, or delete any items, then the items are not synced to the Work Tasks Pro app. You can sync these items to the app when the mobile device gets connected to the server.

To sync all items

- Swipe in from the left edge of the screen, and tap **Sync**.
  A dialog box appears indicating the connection to the server and the progress of the download.
  All the items are synced to the app.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Save Settings

You can save the Settings in the mobile device so that it is available even after you log off from the device and log on again.

To enable Save Settings

- On the **Settings** screen, select **Save Settings**.

  The **Save Settings** option is enabled.

To disable Save Settings

1. On the **Settings** screen, clear **Save Settings**.
2. Click **OK**.

   The **Save Settings** option is disabled, and the the existing Settings are removed.

Note: If the same user is accessing the same repository, the settings get saved even after logging off.

Change Notification Tone for iOS Devices

You can change the notification or alert tone, if required.

To change notification tone

1. On the **Settings** screen, tap **Notification**.

   The **Notification** screen appears.
2. From the list of available tones, tap the tone that you want to configure for notification.
3. Tap the **Save** icon.

   The selected tone is configured for notifications.

Note: When you minimize AVEVA Work Tasks Pro App running on iOS (version 15.4), the Notification tone is not played even if the notification is successfully received.

Configure Save Settings

You can enable **Save Settings** to save the settings in the mobile device. **Save Settings** is enabled by default.

To enable Save Settings

- On the **Settings** screen, select **Save Settings**.

  The **Sent Items** option is enabled.

To disable Save Settings

1. On the **Settings** screen, clear **Save Settings**.

   A confirmation message appears.
2. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Save Settings** option is disabled and it removes the saved settings in the device.

Configure Number of Items to Sync for the Lookup Control

You can configure the number of items to sync for the Lookup control.

To configure number of items to sync for the Lookup control

1. On the **Settings** screen, tap **Sync**.

   The **Sync** screen appears.
2. In the **Number of items to sync for Lookup control** box, type the number of items to sync for the Lookup control.

   The minimum value is **50** and the maximum value is **1000000**. The default value is **2000**.

Configure Thresholds

You can configure the threshold levels for battery power and total free memory for data transfer when sync is initiated.

Battery

Configure the threshold level for the battery power in percentage for data transfer when sync is initiated.

The default value is **20**, and the range is between **10** and **70**.

Note: Even if the device is charging and the charge is below the threshold level the data will be transferred when sync is initiated.

Memory

Configure the threshold level for total free memory in megabytes for data transfer when sync is initiated.

Many factors influence the memory level in terms of space available: apps running, memory capacity, unit configuration, memory-savings options enabled, and so on. Use experimentation and observation to determine the appropriate value for this setting. However, the value should be set high enough to safely complete the longest data transfer session.

The default value is **100**, and the range is between **100** and **1000**.

Configure Drafts

You can enable Drafts to save Fill forms as drafts. Drafts is disabled by default.

To enable drafts

- On the **Settings** screen, select **Drafts**.

  The **Drafts** option is enabled.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To disable drafts

1. On the **Settings** screen, clear **Drafts**.

   A confirmation message appears.
2. Click **OK**.

   The **Drafts** option is disabled, and the the existing draft items are deleted.

Configure Sent Items

You can enable **Sent Items** to save the submitted Fill forms as well as the existing sent items. **Sent Items** is enabled by default.

To enable Sent Items

- On the **Settings** screen, select **Sent Items**.

  The **Sent Items** option is enabled.

To disable Sent Items

1. On the **Settings** screen, clear **Sent Items**.

   A confirmation message appears.
2. Click **OK**.

   The **Sent Items** option is disabled and it disables saving the submitted Fill forms and deletes the exiting sent items.

Configure Inbox Settings

You can configure Inbox settings to view the list of work items in groups. You can sync all the work items in the Inbox and also set the number of work items to sync.

To enable and disable Show in Groups

The **Show in Groups** feature is disabled by default. You need to enable it to group work items based on the value of the work item field created.

To enable it,

- On the **Settings** screen, tap **Inbox** and then tap the **Show in Groups** toggle switch.

  The **Show in Groups** feature is enabled and you can view the work items in groups.

To disable it,

- On the **Settings** screen, tap **Inbox** and then tap the **Show in Groups** toggle switch.

  The **Show in Groups** feature is disabled, and the default work items list is displayed.

To enable and disable Sync All Work Items

The **Sync All Work Items** feature is disabled by default. You need to enable it to sync all the work items in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Inbox.When it is disabled, only 50 to 1000 work items is synced.

To enable **Sync All Work Items**,

- On the **Settings** screen, tap **Inbox** and then tap the **Sync All Work Items** toggle switch.

  The **Sync All Work Items** feature is enabled and all the work items in the Inbox are synced.

To disable **Sync All Work Items**,

- On the **Settings** screen, tap **Inbox** and then tap the **Sync All Work Items** toggle switch.

  The **Sync All Work Items** feature is disabled, and only 50 to 1000 work items are synced.

Configure Offline Support

You can enable the offline support to submit the items when the device is offline. By default the Offline Support feature is enabled.

Note: If the **Offline Support** feature is disabled in AVEVA Work Tasks, you cannot enable it in the AVEVA Work Tasks Pro app. If the feature is enabled, you can disable or enable it in the app.

To enable offline support

- On the **Settings** screen, select **Offline Support**.

  Offline Support is enabled.

To disable offline support

- On the **Settings** screen, clear **Offline Support**.

  Offline Support is disabled.

Use Themes

AVEVA Work Tasks supports themes that you can use to change the look and feel of AVEVA Work Tasks Pro app. Ensure that the theme for AVEVA Work Tasks Pro app is present in the install path *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**BPMUITemplates**Default**Themes**Default**WorkTasksPro*

When you change the theme, the app must to relaunched to reflect the change.

Apply Theme to AVEVA Work Tasks Pro App

You can apply themes to the AVEVA Work Tasks Pro app by enabling the **Enable Theme** option available in the **Manage Repository** page of the **Central Configuration**.

To apply theme at repository level

1. Create a copy of the **Default** folder located at *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**BPMUITemplates**Default**Themes* and rename it (e.g. Purple).
2. Update the *palette.json* file located at *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**BPMUITemplates**Default**Themes/Purple/WorkTasksPro* with the purple palette.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For example,

```
{
"50": "F3E5F5", //// for toggle switch and icon
"100": "E1BEE7",
"200": "CE93D8",
"300": "BA68C8",
"400": "AB47BC", //// for header band
"500": "9C27B0",
"600": "8E24AA",
"700": "7B1FA2",
"800": "6A1B9A",
"900": "4A148C",
"A100": "EA80FC",
"A200": "E040FB",
"A400": "D500F9",
"A700": "AA00FF", //// for action buttons, check box,and user input
"contrastDefaultColor": "light",
"contrastDarkColors": [ "50", "100", "200", "300", "400", "A100" ]
}
```

3. Update this theme name in **Central Configuration**.

   To update theme name,

   a. Log on to the **Central Configuration**.
   b. Click **Repository Settings**. The **Repository List** page appears.
   c. Click **Add**. The **Manage Repository** page appears.
   d. Enter the **Repository Name** and **Description**.
   e. Check the **Enable Theme** check box. By default, the theme name is **Default**. If you want to apply **Purple** theme, you can specify theme name as **Purple** in the **Theme Name** text box.
   f. Click **OK**. The theme gets applied to the created repository.

      To verify, log on to the **Enterprise Console**.

4. Resynchronize the app and relaunch it.

Change Style

If the Repository is mapped to themes, then take the style sheet based on themes path. The themes path is as follows:

[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\BPMUITemplates\Default\Themes\Purple\WorkTasksPro\app.styles.css

The app level styles like font, font-size, background color, etc. can be changed using this CSS. To reflect the change, you need to sync the app and and relaunch it.

Logs

Logs are files with a specific set of information as configured in the level for troubleshooting the app.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Log Levels

Level is the information required for troubleshooting the app. Each log level collects a specific set of information.

Error

Error level log has information about irreconcilable errors. Only error information is included in the log.

Warning

Warning level log has information about the processes beginning or ending, or the parameters for such processes. Error information is also included in the log.

Information

Information level log has information about the work being done. Warning and error information are also included in the log. These logs help in determining the time taken to complete a process.

The default value is **Error.**

Sync

Sync log has information about the total time taken during the sync activity.

To select a logging level

1. On the **Settings** screen, tap **Logging**.

   The **Logging** screen appears.
2. Tap any or all of the following check boxes to select the log levels.
   - **Error**
   - **Warning**
   - **Information**
   - **Sync**

     The logs are displayed based on the log level selected.

Logs Location

The location of the logs in the external memory of the mobile device is as follows:

For an Android app:

- In case of Emulated storage, navigate to the path <**disk drive**>:/**Internal storage/Android/data/com.schneiderelectric.worktaskspro/files/Logs/**
- In case of SD card, navigate to the path <**disk drive**>:/**SD card/Android/data/com.schneiderelectric.worktaskspro/files/Logs/**

For an iOS app:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Install iTunes on your system.
2. Connect your iPhone to the system.
3. Login through Apple ID.
4. Navigate to **iTunes** >**File Sharing**>**WorkTasksPro**>**logs**.

For Windows App:

1. Navigate to the **Documents** of the logged-in user.
2. Open **WorkTasksPro\logs** in the Documents folder.

Troubleshooting

- **Connection Errors**
  - If you come across errors while connecting to the repository, it could be due to one of the following reasons:
    - Network errors or slow connectivity error.
    - The Enterprise Console uses Windows authentication, and Anonymous authentication is disabled.
- **Loss of Device**
  - Contact the administrator to block your application in order to prevent unauthorized access of the application. Note that once the application is blocked, the work items that have not been acted upon are cleared and no more notifications will be received. However, when you activate the application on another device, you can retrieve all the work items.
- **Error while loading the Forms**
  - In the iOS app, error occurs while loading the Forms due to the following reasons:
    - Unicode characters are not supported. Avoid using them in Forms scripts.
    - Synchronous calls made to the server are timed out after 10 seconds (for Safari browser).
- **Outbox items not sent to server**
  - Sometimes the outbox items are not sent to the server even though the app is connected to the server. To send the outbox items to server, first turn-off the Wi-Fi of your mobile device or disconnect VPN (Virtual Private Network) connection in the device.
    When the server is shown as not available in the app, turn on the Wi-Fi or VPN connection. As soon as the connection to the server is established in the app, the outbox items get pushed to the server.

Debugging

To debug AVEVA Work Tasks Pro, use the following methods:

- AVEVA Work Tasks Pro App is a mobile application and not a wrapper around the Enterprise Console website. Because of this, relative URLs used in Form scripts, etc. would not work. We recommend you to use the full URL in such cases.

  To get server name in mobile device and web, use the below script:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
var serverName = "";
if (skelta.forms.utilities.isWorkTasksPro())
{
serverName =
skelta.utilities.getUriObjectFromString(skelta.forms.utilities.getServerUrl("")).host
name;
}
else
{
serverName = window.location.hostname;
}
```

- Use SFU.logMessageToWMLogger() method to see log messages in AVEVA Work Tasks Logger. For more information, see SFU.logMessageToWMLogger().
  - AVEVA Work Tasks Pro App needs to be online for logging the log messages to server.
  - These logs will only be available in the server and not in the device.
- Use mobile device logging mechanism to see logs in the external memory of the mobile device. For more information, see Logs.
