Welcome to AVEVA Work Tasks

AVEVA Work Tasks is an advanced Business Process and Workflow Management software to manage process flows that include people and systems.

You can model, execute, monitor, analyze, and improve processes that drive higher levels of efficiency, productivity, and responsiveness.

Users can interact with notifications, information, and tasks anytime anywhere in an access-controlled environment at the tip of their finger on phones, through emails, or using a browser on a Desktop computer.

The web-based architecture offers scalability and integration with business applications, third-party systems, and many data sources such as, Office Outlook, Azure Logic Apps, and AVEVA's industrial software platforms.

AVEVA Work Tasks is built for extensibility including connectors and can be integrated with industrial connectors like System Platform, MES, and has indirect integration through AMQP to AVEVA Production Management, AVEVA Batch Management, and AVEVA Recipe Management.

AVEVA Work Tasks offers the following features:

Central Configuration: Enables you to define, create and manage repositories for workflows and execute them. A Repository refers to a database that contains workflow definitions, queues, calendars, settings, and workflow execution data for an application.

Enterprise Console: A web-based interface that allows authorized users to build workflow-driven applications and to participate in these applications. The console enables central administration of all workflows associated with a repository. Activities that can be performed from the Enterprise Console include workflow categorization, workflow design, associating workflows with lists, events, initiating workflows for new workflow creation, publishing workflows, creation, management, and association of Forms with workflows and viewing reports. The Enterprise Console also enables administrators to set up and manage queues and calendars for use in workflows.

Repository: A database that contains workflow definitions, queues, calendars, settings, workflow execution data and Business Activity Monitoring (BAM) data. Data Sources for Repositories are defined in the Central Configuration. A Repository can also be created for each client in a hosted environment (Application Service Provider environment).

Repository Data Source: A Repository Data Source is connection information specific to a repository database. AVEVA Work Tasks services use a Repository Data Source to connect to the database.

Forms: The Forms is an easy to use drag and drop interface used for designing forms. You can use forms designer to quickly design forms, maintain form templates, and define business logic. The Forms are used to trigger Workflows.

This documentation is intended for the system administrators, process developers, system integrators, and AVEVA Work Task users. It assumes that you have basic knowledge of business process design and are familiar with Business Process Management Notation (BPMN).

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

chilkat-x64

Chilkat Software License

PLEASE READ THIS AGREEMENT BEFORE OPENING THIS SOFTWARE PACKAGE. IF YOU OPEN THIS PACKAGE OR KEEP IT FOR MORE THAN THIRTY (30) DAYS, YOU ACCEPT ALL THE TERMS AND CONDITIONS OF THIS AGREEMENT. IF YOU DO NOT AGREE TO THESE TERMS AND CONDITIONS, DO NOT OPEN THIS SOFTWARE PACKAGE. YOU MAY ONLY UNLOCK AND/OR USE THE SOFTWARE FOR WHICH YOU HAVE A PAID- UP LICENSE OR FOR WHICH YOU HAVE LEGALLY RECEIVED AN UNLOCK KEY.

(1) DEFINITION OF TERMS

"Documentation": any explanatory written or on- line material including, but not limited to, user guides, reference manuals and HTML files.

"Licensee": shall refer to the individual licensee, whether as an individual programmer, company, or other organization.

"Software": All material in this distribution including, but not limited to, one or more of the following: source code, object code, byte code, dynamic-link libraries, shared libraries, static libraries, header files, executables, scripts, sample programs, utility programs, makefiles and Documentation.

"Licensed Software": the Software for which Licensee has paid the applicable license fee and received an authorized unlock key.

"Software Application Programming Interface ("API")": the set of access methods, whether provided by Chilkat Software, third parties, or developed by Licensee, through which the programmatic services provided by the Licensed Software are made available.

"End-User Software Product": an application developed by Licensee intended for execution on a computer, that makes use of the Licensed Software in its implementation.

The Licensed Software contains certain runtime libraries and files intended for duplication and distribution by Licensee within End User Software Products to the user(s) of the End User Software Product(s) (the "Redistributable Components").

The Redistributable Components are those files specifically designated as being distributable as part of the Licensed Software.

SPECIAL LIMITED TERM EVALUATION LICENSE

If Licensee has been provided with a copy of the Software for evaluation purposes, Chilkat Software, Inc. ("Chilkat") grants to Licensee, subject to the terms of this Single User License Agreement (excluding Section 3, under which Licensee has no rights) a non-exclusive, non- transferable, non-concurrent limited internal use license for evaluation purposes only. This license is for a period of thirty (30) days, commencing upon receipt of the Software, or, if received electronically, from Licensee's initial downloading date, to evaluate the Software. If

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the Software is acceptable, Licensee agrees to promptly notify his Chilkat Sales Representative. Otherwise, Licensee shall immediately cease any further use of the Software and destroy all copies of the Software (including the original) and related Documentation provided to Licensee by Chilkat.

(2) GENERAL

The Software is owned by Chilkat Software, Inc. ("Chilkat") and is protected by U.S. copyright laws and other laws and by international treaties. It is intended for use by a software programmer who has experience using development tools and class libraries.

(3) LICENSE GRANTS

(a) Per-developer license. Subject to the terms and conditions of this Agreement, Chilkat grants to Licensee the perpetual, non-exclusive, non-transferable, world-wide license for one (1) developer to (i) install and use the Licensed Software on any number of computers, and (ii) use the associated user documentation and online help.

(b) Site-wide license. If you have purchased a site-wide license, the following rights apply notwithstanding section 3(a): Subject to the terms and conditions of this Agreement, Chilkat grants to Licensee the perpetual, non-exclusive, non-transferable, world-wide license for any number of developers at a single Licensee's office location to (i) install the Licensed Software on any number of computers across Licensee's enterprise, and (ii) use the associated user documentation and online help.

(c) Licensee may also:

(i) Make one backup copy of the Licensed Software solely for archival and disaster-recovery purposes, or transfer the Licensed Software to a hard disk and keep the original copy solely for archival and disaster-recovery purposes; and (ii) Reproduce and distribute the Redistributable Components directly or indirectly for any number of applications to any number of end users and Licensee's Authorized OEMs, VARs and Distributors, through customary distribution channels, world wide, on a royalty free basis provided that such distribution is (i) in conjunction with an End User Software Product developed by Licensee using the Licensed Software and (ii) the Licensed Software is not the sole or primary component of such End User Software Product.

(iii) The license rights granted under this Agreement do not apply to development and distribution of software development products or toolkits of any kind that are destined to be used by software developers other than Licensee(s) that are Authorized.

Licensee has no rights to use the Licensed Software beyond those specifically granted in this section.

(4) LICENSE RESTRICTIONS

EXPORT CONTROLS: If the Software is for use outside the United States of America, Licensee agrees to comply with all relevant regulations of the United States Department of Commerce and with the United States Export Administration Act to insure that the Software is not exported in violation of United States law.

Notwithstanding any provisions in this Agreement to the contrary, Licensee may not distribute any portion of the Software other than the Redistributable Components.

In addition, Licensee may not decompile, disassemble, or reverse engineer any object code form of any portion of the Software.

(5) TITLE

Licensee acknowledges and agrees that all right, title and interest in and to the Software, including all intellectual property rights therein, are the property of Chilkat, subject only to the licenses granted to Licensee under this

Agreement. This Agreement is not a sale and does not transfer to the Licensee any title or ownership in or to the Software or any patent, copyright, trade secret, trade name, trademark or other proprietary or intellectual property rights related thereto.

(6) NON-TRANSFERABILITY

Except for Licensee's rights to distribute the Redistributable Components, Licensee may not rent, transfer, assign,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

sublicense or grant any rights in the Software, in full or in part, to any other person or entity without Chilkat's written consent, except that this agreement may be assigned to a successor of Licensee in the case that all or substantially all of the assets or equity of Licensee are acquired by the successor.

(7) LIMITED WARRANTIES

Chilkat warrants to Licensee that the Licensed Software will substantially perform the functions described in the Documentation for a period of thirty (30) days after the date of delivery of the Licensed Software to Licensee. Chilkat's sole and exclusive obligation, and Licensee's sole and exclusive remedy, under this warranty is limited to Chilkat's using reasonable efforts to correct material, documented, reproducible defects in the Licensed Software that Licensee describes and documents to Chilkat during the thirty (30) day warranty period. In the event that Chilkat fails to correct a material, documented, reproducible defect during this period, Chilkat may, at Chilkat's discretion, replace the defective Licensed Software or refund to Licensee the amount that Licensee paid Chilkat for the defective Licensed Software and cancel this Agreement and the licenses granted herein. In such event, Licensee agrees to return to Chilkat all copies of the Licensed Software (including the original).

EXCEPT AS EXPRESSLY SET FORTH ABOVE, CHILKAT EXPRESSLY DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, RESULTS, OR OTHERWISE

(8) LIMITATION OF LIABILITY

IN NO EVENT SHALL CHILKAT BE LIABLE FOR ANY DIRECT, INDIRECT, PUNITIVE, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES (INCLUDING LOST PROFITS, REVENUES, DATA OR OTHER ECONOMIC ADVANTAGE) WHETHER BASED ON CONTRACT, TORT, OR ANY OTHER LEGAL THEORY, EVEN IF CHILKAT WAS ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. NOTWITHSTANDING THE FOREGOING, THE TOTAL AMOUNT OF CHILKAT'S LIABILITY TO LICENSEE SHALL BE LIMITED TO THE AMOUNT USER PAID FOR THE USE OF THE SOFTWARE, IF ANY.

(9) TERMINATION

Chilkat reserves the right, at its sole discretion, to terminate this Agreement upon written notice if Licensee has breached the terms and conditions hereof. Licensee may terminate this Agreement at any time by ceasing to use the

Licensed Software and by destroying all copies of the Licensed Software (including the original). Sections 4, 5, 6, 7, 8, 9 and 10 survive any termination of this Agreement and apply fully to any termination. Unless terminated as

provided herein by either party, this Agreement shall remain in effect. Termination will not affect end user licenses of the End User Software Product which contain the Redistributable Components which were distributed by

Licensee prior to termination.

(10) MISCELLANEOUS

Applicable Law and Jurisdiction. This Agreement will be governed by and construed in accordance with the laws of the State of Illinois without regard to conflict of laws principles and without regard to the 1980 U.N. Convention on Contracts for the International Sale of Goods. The federal and state courts of Illinois shall have exclusive jurisdiction and venue to adjudicate any dispute arising out of this Agreement, and Licensee expressly consents to (i) the personal jurisdiction of the state and federal courts of Illinois, and (ii) service of process being effected upon Licensee by registered mail.

Limitation of Actions. No action, regardless of form, may be brought by either party more than twelve (12) months after the cause of action has arisen. No such claim may be brought unless Chilkat has first been given commercially reasonable notice, a full written explanation of all pertinent details (including copies of all materials), and a good faith opportunity to resolve the matter.

Invalidity and Waiver. Should any provision of this Agreement be held by a court of law to be illegal, invalid, or unenforceable, the legality, validity, and enforceability of the remaining provisions of this Agreement will not be

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

affected or impaired thereby. The failure of any party to enforce any of the terms or conditions of this Agreement, unless waived in writing, will not constitute a waiver of that party's right to enforce each and every term and

condition of this Agreement.

U.S. Government Restricted Rights. The Licensed Software is provided with Restricted Rights. Use, duplication, or disclosure by the Government is subject to restrictions as set forth in subparagraph (c) (1) (ii) of The Rights in Technical Data and Computer Software clause at DFARS 52.227-7013 or subparagraphs (c) (1) and (2) of the Commercial Computer Software Restricted Rights at 48 CFR 52.227- 19, as applicable. Manufacturer is Chilkat Software, Inc., 1719 E Forest Ave, Wheaton, Illinois 60187 USA.

LICENSEE ACKNOWLEDGES THAT HE HAS READ THIS AGREEMENT, UNDERSTANDS IT AND AGREES TO BE BOUND BY ITS TERMS AND CONDITIONS. LICENSEE FURTHER AGREES THAT IT IS THE COMPLETE AND EXCLUSIVE STATEMENT OF THE AGREEMENT BETWEEN LICENSEE AND CHILKAT WHICH SUPERSEDES ANY PROPOSAL OR PRIOR OR CONTEMPORANEOUS AGREEMENT, ORAL OR WRITTEN, AND ANY OTHER COMMUNICATIONS RELATING TO THE SUBJECT MATTER OF THIS AGREEMENT

Apache License

Version 2.0, January 2004

http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Intersoft WebGrid

ACCEPTANCE

YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS AGREEMENT BY SELECTING THE "ACCEPT" OPTION IN THE INSTALLATION OF THE SOFTWARE. YOU MUST AGREE TO ALL OF THE TERMS OF THIS AGREEMENT BEFORE YOU WILL BE ALLOWED TO INSTALL THE SOFTWARE. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THIS AGREEMENT, YOU MUST SELECT "DECLINE" AND YOU MUST NOT INSTALL, OR USE THE SOFTWARE.

LICENSE GRANT

This Software License Agreement ("Agreement") is a legal agreement between You (an entity or a person) and Intersoft Solutions Corporation. ("Intersoft"). This Copy of Intersoft Premier Studio and accompanying documentation ("Software") is licensed and not sold. This software is protected by the copyright laws and treaties of the United States ("U.S.") and other countries and is subject to the terms of this Agreement.

The Software is licensed per developer seat. This Agreement entitles You to use one copy of the Software at any given time. You may install the Software on up to three computers such as on office PC, work laptop, and personal laptops, or to a virtual machine solely for testing purpose; however, You can only use one installation of the Software at a time. The Software is in "use" on a computer when it is loaded onto a development environment that is used to develop applications using the Software, or build source code that depends on the Software.

This Agreement does not permit the use of the Software on a system that allows shared used of applications, on a multi-user network, or on any configuration or system of computers that allows multiple users. Multiple copy use or installation is only allowed if You obtain an appropriate licensing agreement for each user and each copy of the Software. For further information regarding multiple copy licensing of the Software, please contact us directly via live chat.

This Agreement entitles You to deploy your applications built with the Software to any number of production server, devices or clients with no additional charges. The Software runtime files should not be modified in any ways prior to deploying and all copyright notices should be retain.

RESTRICTIONS ON EVALUATION LICENSE

If the Software is provided to You for evaluation purposes, then Your license to use the Software is limited solely to internal evaluation purposes, and in accordance with the terms of the evaluation offering under which You received the Software, and Your license expires 30 days from installation (or such other period as may be indicated within the Software). Upon expiration of the evaluation period, You must discontinue use of the Software and return to an original state any actions performed by the Software. The Software may contain an automatic disabling mechanism that prevents its use after a certain period of time.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

RESTRICTIONS ON TRANSFER

Without first obtaining the express written consent of Intersoft, You may not assign your rights and obligations under this Agreement, or redistribute, encumber, sell, rent, lease, sublicense, or otherwise transfer your rights to the Software.

RESTRICTIONS ON USE

You may not use, copy, or install the Software to be used by more than one user. If You hold multiple, validly licensed copies, You may not use, copy, or install the Software on any system with more than the number of computers permitted by the license, or permit the use, copying, or installation by more users than the number permitted by license.

You may not decompile, "reverse-engineer", disassemble, or otherwise attempt to derive the source code for the Software.

RESTRICTIONS ON ALTERATION

You may not modify the Software or create any derivative work of the Software or its accompanying documentation. Derivative works include but are not limited to translations. You may not alter any files or libraries in any portion of the Software.

RESTRICTIONS ON COPYING

You may not copy any part of the Software except to the extent that licensed use inherently demands the creation of a temporary copy stored in computer memory and not permanently affixed on storage medium. You may make one archival copy which must be stored on a medium other than a computer hard drive.

MAINTENANCE AND SUPPORT

Each license includes updates to the Software that Intersoft makes generally commercially available for a period of one (1) year from the date of Your License. If You renew the license before its expiration date, the maintenance and support for Your License is automatically extended to another one (1) year from the date of the renewal. For more information how to obtain support, please visit Intersoft Support. If You do not renew the license, You may continue to use the license in normal conditions according to the terms in this agreement; however Intersoft has no obligation to provide maintenance or support for You. You may participate in the Intersoft Community Forums or other community sites for discussion and insights. To access Intersoft Community Forums, visit Intersoft Community.

OWNERSHIP

No title to or ownership of the Software is transferred to You. Intersoft retains all right, title and interest in and to all intellectual property rights in the Software, including any adaptations or copies thereof. You acquire only a conditional license to use the Software.

USE OF INTERNET CONNECTION

You acknowledge and agree that the Software may make Internet connections in order to: 1) Check for updates; 2) Anonymously activating and deactivating licenses; 3) Anonymously validate license keys in order to prevent unauthorized use; and 4) Provide other services to You.

LIMITED SOFTWARE WARRANTY

For a period of 60 days from the date of shipment or from the date that You download the Software, as applicable, Intersoft warrants that when properly installed and used under normal conditions, the Software will perform substantially as advertised.

THE SOFTWARE IS NOT DESIGNED, MANUFACTURED OR INTENDED FOR USE OR DISTRIBUTION WITH ON-LINE CONTROL EQUIPMENT IN HAZARDOUS ENVIRONMENTS REQUIRING FAIL-SAFE PERFORMANCE, SUCH AS IN THE OPERATION OF NUCLEAR FACILITIES, AIRCRAFT NAVIGATION, COMMUNICATION, OR CONTROL SYSTEMS, DIRECT LIFE SUPPORT MACHINES, WEAPONS SYSTEMS, OR OTHER USES IN WHICH FAILURE OF THE SOFTWARE COULD

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

LEAD DIRECTLY TO DEATH, PERSONAL INJURY, OR SEVERE PHYSICAL OR ENVIRONMENTAL DAMAGE.

THE SOFTWARE IS ONLY COMPATIBLE WITH CERTAIN COMPUTERS AND OPERATING SYSTEMS. THE SOFTWARE IS NOT WARRANTED FOR NON-COMPATIBLE SYSTEMS. Contact Intersoft representative for information about compatibility.

DISCLAIMER OF WARRANTIES AND LIMITATION OF LIABILITY

UNLESS OTHERWISE EXPLICITLY AGREED TO IN WRITING BY INTERSOFT, INTERSOFT MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, IN FACT OR IN LAW, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OTHER THAN AS SET FORTH IN THIS AGREEMENT OR IN THE LIMITED WARRANTY DOCUMENTS PROVIDED WITH THE SOFTWARE.

Intersoft makes no warranty that the Software will meet your requirements or operate under your specific conditions of use. Intersoft makes no warranty that operation of the Software will be secure, error free, or free from interruption. YOU MUST DETERMINE WHETHER THE SOFTWARE SUFFICIENTLY MEETS YOUR REQUIREMENTS FOR SECURITY AND UNINTERRUPTABILITY. YOU BEAR SOLE RESPONSIBILITY AND ALL LIABILITY FOR ANY LOSS INCURRED DUE TO FAILURE OF THE SOFTWARE TO MEET YOUR REQUIREMENTS. INTERSOFT WILL NOT, UNDER ANY CIRCUMSTANCES, BE RESPONSIBLE OR LIABLE FOR THE LOSS OF DATA ON ANY COMPUTER OR INFORMATION STORAGE DEVICE.

UNDER NO CIRCUMSTANCES SHALL INTERSOFT, ITS DIRECTORS, OFFICERS, EMPLOYEES OR AGENTS BE LIABLE TO YOU OR ANY OTHER PARTY FOR INDIRECT, CONSEQUENTIAL, SPECIAL, INCIDENTAL, PUNITIVE, OR EXEMPLARY DAMAGES OF ANY KIND (INCLUDING LOST REVENUES OR PROFITS OR LOSS OF BUSINESS) RESULTING FROM THIS AGREEMENT, OR FROM THE FURNISHING, PERFORMANCE, INSTALLATION, OR USE OF THE SOFTWARE, WHETHER DUE TO A BREACH OF CONTRACT, BREACH OF WARRANTY, OR THE NEGLIGENCE OF INTERSOFT OR ANY OTHER PARTY, EVEN IF INTERSOFT IS ADVISED BEFOREHAND OF THE POSSIBILITY OF SUCH DAMAGES. TO THE EXTENT THAT THE APPLICABLE JURISDICTION LIMITS INTERSOFT'S ABILITY TO DISCLAIM ANY IMPLIED WARRANTIES, THIS DISCLAIMER SHALL BE EFFECTIVE TO THE MAXIMUM EXTENT PERMITTED.

LIMITATION OF DAMAGES

Any claims must be made within the applicable warranty period. All warranties cover only defects arising under normal use and do not include malfunctions or failure resulting from misuse, abuse, neglect, alteration, problems with electrical power, acts of nature, unusual temperatures or humidity, improper installation, or damage determined by Intersoft to have been caused by You. All limited warranties on the Software are granted only to You and are non-transferable. You agree to indemnify and hold Intersoft harmless from all claims, judgments, liabilities, expenses, or costs arising from your breach of this Agreement and/or acts or omissions.

GOVERNING LAW, JURISDICTION AND COSTS

This Agreement is governed by the laws of California, without regard to California's conflict or choice of law provisions.

SEVERABILITY

If any provision of this Agreement shall be held to be invalid or unenforceable, the remainder of this Agreement shall remain in full force and effect. To the extent any express or implied restrictions are not permitted by applicable laws, these express or implied restrictions shall remain in force and effect to the maximum extent permitted by such applicable laws.

ENTIRE AGREEMENT

This Agreement becomes effective on the date You legally acquire the Software and will automatically terminate if You breach any of its terms.

This Agreement sets forth the entire understanding and agreement between You and Intersoft regarding the subject matter of this Agreement, and it supersedes all prior agreements between You and Intersoft regarding the Software. This Agreement may only be amended or modified only by a written agreement agreed to by You

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

and an authorized representative of Intersoft. NO LICENSOR, DISTRIBUTOR, DEALER, RETAILER, RESELLER, SALES PERSON, OR EMPLOYEE IS AUTHORIZED TO MODIFY THIS AGREEMENT OR TO MAKE ANY REPRESENTATION OR PROMISE THAT IS DIFFERENT FROM, OR IN ADDITION TO, THE TERMS OF THIS AGREEMENT.

Apache License

Version 2.0, January 2004

http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "{}" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

GPL version 3

GNU GENERAL PUBLIC LICENSE

Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. http://fsf.org/ Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS

Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

"The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

Source Code.

The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

a) The work must carry prominent notices stating that you modified it, and giving a relevant date.

b) The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to "keep intact all notices".

c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7

additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

separately received it.

d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an "aggregate" if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or

b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or

c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or

d) Limiting the use for publicity purposes of names of licensors or authors of the material; or

e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or

f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered "further restrictions" within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

Patents.

A "contributor" is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's "contributor version".

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

A contributor's "essential patent claims" are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, "control" includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a "patent license" is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To "grant" such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. "Knowingly relying" means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is "discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

Apache License

Version 2.0, January 2004

http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

Telerik® UI for ASP.NET AJAX

Progress Telerik UI for ASP.NET AJAX 2021

Copyright © 2007-2021 Progress Software Corporation and/or one of its subsidiaries or affiliates. All rights reserved.

Portions of the Product include certain open source and commercial third-party components listed below ("Third-Party Components"). The authors of the Third-Party Components require Progress Software Corporation ("PSC") to include the following notices and additional licensing terms as a condition of PSC's use of such Third-Party Components. You acknowledge that the authors of the Third-Party Components have no obligation to provide support to you for the Third-Party Components or the Product. You hereby undertake to comply with all licenses related to the applicable Third-Party Components. Notwithstanding anything to the contrary, to the extent that any of the terms and conditions of the Product Agreement conflict, vary, or are in addition to the terms and conditions of the aforementioned third-party licenses for these technologies, such terms and conditions are offered by PSC alone and not by any other party.

NOTE: Progress Telerik UI for ASP.NET AJAX 2021 contains and MD5 (as part of TDP (for .NET Framework) 2021 R3), Google Charts for Asp.Net v1.0, DLINQ, and DotNet Color Quantization Code. These third-party technologies are licensed to PSC and are hereby distributed to User only under the terms of a third-party license, a copy of which is included herein below. PSC will, at Licensee's request, provide copies of the source code for these third-party technologies, including modifications, if any, made by PSC. PSC may charge reasonable shipping and handling charges for such distribution. Licensee may also obtain the source code for these third-party technologies through http://iue.progress.com/3dpartysoftwares/Pages/default.aspx by following the instructions set forth therein.

Progress Telerik UI for ASP.NET AJAX 2021 incorporates MD5 (as part of TDP (for .NET Framework) 2021 R3) and Google Charts for Asp.Net v1.0. These third-party technologies are licensed to PSC and are hereby distributed to User only under the terms of the Microsoft Public License (MS-PL) (copied herein below).

Progress Telerik UI for ASP.NET AJAX 2021 incorporates DLINQ. This third-party technology is licensed to PSC and is hereby distributed to User only under the terms of the MICROSOFT LIMITED PUBLIC LICENSE version 1.1 (copied herein below).

Progress Telerik UI for ASP.NET AJAX 2021 incorporates DotNet Color Quantization Code. This third-party technology is licensed to PSC and is hereby distributed to User only under the terms of The Code Project Open License (CPOL) 1.02 (copied herein below).

1. Special Notices Regarding Open-Source Third-Party Components incorporated into the Product:

(1) The Apache Software License, Version 2.0:

Progress Telerik UI for ASP.NET AJAX 2021 incorporates

pdf.js v1.4.20, PDFBox v2.0.21, and NPOI v2.4.1 (as part of TDP (for .NET Framework) 2021 R3) and

AWS SDK.Net v2.0.5.0.

Such technology is subject to the following terms and conditions:

Apache Software License Version 2.0. Copyright 2001-2004 The Apache Software Foundation. Such Apache Technology is subject to the following terms and conditions: The Apache Software License, Version 2.0, January 2004 http://www.apache.org/licenses/ TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. Definitions. "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. "Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity,

whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License. You may add Your own

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License. 5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions. 6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file. 7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License. 8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages. 9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability. END OF TERMS AND CONDITIONS APPENDIX: How to apply the Apache License to your work. To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives. Copyright [yyyy] [name of copyright owner] Licensed under the Apache License, Version 2.0 (the "License"); you may not use this file except in compliance with the License. You may obtain a copy of the License at http://www.apache.org/licenses/LICENSE-2.0 Unless required by applicable law or agreed to in writing, software distributed under the License is distributed on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied. See the License for the specific language governing permissions and limitations under the License.

- MD5 checks in the Windows Phone 8 variant of the SDK from Microsoft Corporation

Microsoft Public License (MS-PL)

This license governs use of the accompanying software. If you use the software, you accept this license. If you do not accept the license, do not use the software.

1. Definitions

The terms "reproduce," "reproduction," "derivative works," and "distribution" have the same meaning here as under U.S. copyright law.

A "contribution" is the original software, or any additions or changes to the software.

A "contributor" is any person that distributes its contribution under this license.

"Licensed patents" are a contributor's patent claims that read directly on its contribution.

2. Grant of Rights

(A) Copyright Grant- Subject to the terms of this license, including the license conditions and limitations in section 3, each contributor grants you a non-exclusive, worldwide, royalty-free copyright license to reproduce its contribution, prepare derivative works of its contribution, and distribute its contribution or any derivative works that you create.

(B) Patent Grant- Subject to the terms of this license, including the license conditions and limitations in section 3, each contributor grants you a non-exclusive, worldwide, royalty-free license under its licensed patents to make, have made, use, sell, offer for sale, import, and/or otherwise dispose of its contribution in the software or derivative works of the contribution in the software.

3. Conditions and Limitations

(A) No Trademark License- This license does not grant you rights to use any contributors' name, logo, or trademarks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

(B) If you bring a patent claim against any contributor over patents that you claim are infringed by the software, your patent license from such contributor to the software ends automatically.

(C) If you distribute any portion of the software, you must retain all copyright, patent, trademark, and attribution notices that are present in the software.

(D) If you distribute any portion of the software in source code form, you may do so only under this license by including a complete copy of this license with your distribution. If you distribute any portion of the software in compiled or object code form, you may only do so under a license that complies with this license.

(E) The software is licensed "as-is." You bear the risk of using it. The contributors give no express warranties, guarantees or conditions. You may have additional consumer rights under your local laws which this license cannot change. To the extent permitted under your local laws, the contributors exclude the implied warranties of merchantability, fitness for a particular purpose and non-infringement.

Such Apache Technology is subject to the following terms and conditions: The Apache Software License, Version 2.0, January 2004 http://www.apache.org/licenses/ TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. Definitions. "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. "Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.3. Grant of Patent License. Subject to the terms and conditions of this License,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License. You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License. 5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions. 6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file. 7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License. 8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages. 9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability. END OF TERMS AND CONDITIONS

(2) BSD-style licenses:

(3) The Code Project Open License (CPOL) 1.02

Progress Telerik UI for ASP.NET AJAX 2021 incorporates DotNet Color Quantization Code. This third-party technology is licensed to PSC and are hereby distributed to User only under the terms of a third-party license, a copy of which is included herein below:

The Code Project Open License (CPOL) 1.02

Preamble

This License governs Your use of the Work. This License is intended to allow developers to use the Source Code and Executable Files provided as part of the Work in any application in any form.

The main points subject to the terms of the License are:

•Source Code and Executable Files can be used in commercial applications;

•Source Code and Executable Files can be redistributed; and

•Source Code can be modified to create derivative works.

•No claim of suitability, guarantee, or any warranty whatsoever is provided. The software is provided "as-is".

•The Article accompanying the Work may not be distributed or republished without the Author's consent

This License is entered between You, the individual or other entity reading or otherwise making use of the Work licensed pursuant to this License and the individual or other entity which offers the Work under the terms of this License ("Author").

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

License

THE WORK (AS DEFINED BELOW) IS PROVIDED UNDER THE TERMS OF THIS CODE PROJECT OPEN LICENSE ("LICENSE"). THE WORK IS PROTECTED BY COPYRIGHT AND/OR OTHER APPLICABLE LAW. ANY USE OF THE WORK OTHER THAN AS AUTHORIZED UNDER THIS LICENSE OR COPYRIGHT LAW IS PROHIBITED.

BY EXERCISING ANY RIGHTS TO THE WORK PROVIDED HEREIN, YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS LICENSE. THE AUTHOR GRANTS YOU THE RIGHTS CONTAINED HEREIN IN CONSIDERATION OF YOUR ACCEPTANCE OF SUCH TERMS AND CONDITIONS. IF YOU DO NOT AGREE TO ACCEPT AND BE BOUND BY THE TERMS OF THIS LICENSE, YOU CANNOT MAKE ANY USE OF THE WORK.

1.Definitions. a."Articles" means, collectively, all articles written by Author which describes how the Source Code and Executable Files for the Work may be used by a user.

b."Author" means the individual or entity that offers the Work under the terms of this License.

c."Derivative Work" means a work based upon the Work or upon the Work and other pre-existing works.

d."Executable Files" refer to the executables, binary files, configuration and any required data files included in the Work.

e."Publisher" means the provider of the website, magazine, CD-ROM, DVD or other medium from or by which the Work is obtained by You.

f."Source Code" refers to the collection of source code and configuration files used to create the Executable Files.

g."Standard Version" refers to such a Work if it has not been modified, or has been modified in accordance with the consent of the Author, such consent being in the full discretion of the Author.

h."Work" refers to the collection of files distributed by the Publisher, including the Source Code, Executable Files, binaries, data files, documentation, whitepapers and the Articles.

i."You" is you, an individual or entity wishing to use the Work and exercise your rights under this License.

2.Fair Use/Fair Use Rights. Nothing in this License is intended to reduce, limit, or restrict any rights arising from fair use, fair dealing, first sale or other limitations on the exclusive rights of the copyright owner under copyright law or other applicable laws.

3.License Grant. Subject to the terms and conditions of this License, the Author hereby grants You a worldwide, royalty-free, non-exclusive, perpetual (for the duration of the applicable copyright) license to exercise the rights in the Work as stated below:

a.You may use the standard version of the Source Code or Executable Files in Your own applications.

b.You may apply bug fixes, portability fixes and other modifications obtained from the Public Domain or from the Author. A Work modified in such a way shall still be considered the standard version and will be subject to this License.

c.You may otherwise modify Your copy of this Work (excluding the Articles) in any way to create a Derivative Work, provided that You insert a prominent notice in each changed file stating how, when and where You changed that file.

d.You may distribute the standard version of the Executable Files and Source Code or Derivative Work in aggregate with other (possibly commercial) programs as part of a larger (possibly commercial) software distribution.

e.The Articles discussing the Work published in any form by the author may not be distributed or republished without the Author's consent. The author retains copyright to any such Articles. You may use the Executable Files and Source Code pursuant to this License but you may not repost or republish or otherwise distribute or make available the Articles, without the prior written consent of the Author.

Any subroutines or modules supplied by You and linked into the Source Code or Executable Files of this Work shall not be considered part of this Work and will not be subject to the terms of this License.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4.Patent License. Subject to the terms and conditions of this License, each Author hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, import, and otherwise transfer the Work.

5.Restrictions. The license granted in Section 3 above is expressly made subject to and limited by the following restrictions:

a.You agree not to remove any of the original copyright, patent, trademark, and attribution notices and associated disclaimers that may appear in the Source Code or Executable Files.

b.You agree not to advertise or in any way imply that this Work is a product of Your own.

c.The name of the Author may not be used to endorse or promote products derived from the Work without the prior written consent of the Author.

d.You agree not to sell, lease, or rent any part of the Work. This does not restrict you from including the Work or any part of the Work inside a larger software distribution that itself is being sold. The Work by itself, though, cannot be sold, leased or rented.

e.You may distribute the Executable Files and Source Code only under the terms of this License, and You must include a copy of, or the Uniform Resource Identifier for, this License with every copy of the Executable Files or Source Code You distribute and ensure that anyone receiving such Executable Files and Source Code agrees that the terms of this License apply to such Executable Files and/or Source Code. You may not offer or impose any terms on the Work that alter or restrict the terms of this License or the recipients' exercise of the rights granted hereunder. You may not sublicense the Work. You must keep intact all notices that refer to this License and to the disclaimer of warranties. You may not distribute the Executable Files or Source Code with any technological measures that control access or use of the Work in a manner inconsistent with the terms of this License.

f.You agree not to use the Work for illegal, immoral or improper purposes, or on pages containing illegal, immoral or improper material. The Work is subject to applicable export laws. You agree to comply with all such laws and regulations that may apply to the Work after Your receipt of the Work.

6.Representations, Warranties and Disclaimer. THIS WORK IS PROVIDED "AS IS", "WHERE IS" AND "AS AVAILABLE", WITHOUT ANY EXPRESS OR IMPLIED WARRANTIES OR CONDITIONS OR GUARANTEES. YOU, THE USER, ASSUME ALL RISK IN ITS USE, INCLUDING COPYRIGHT INFRINGEMENT, PATENT INFRINGEMENT, SUITABILITY, ETC. AUTHOR EXPRESSLY DISCLAIMS ALL EXPRESS, IMPLIED OR STATUTORY WARRANTIES OR CONDITIONS, INCLUDING WITHOUT LIMITATION, WARRANTIES OR CONDITIONS OF MERCHANTABILITY, MERCHANTABLE QUALITY OR FITNESS FOR A PARTICULAR PURPOSE, OR ANY WARRANTY OF TITLE OR NON-INFRINGEMENT, OR THAT THE WORK (OR ANY PORTION THEREOF) IS CORRECT, USEFUL, BUG-FREE OR FREE OF VIRUSES. YOU MUST PASS THIS DISCLAIMER ON WHENEVER YOU DISTRIBUTE THE WORK OR DERIVATIVE WORKS.

7.Indemnity. You agree to defend, indemnify and hold harmless the Author and the Publisher from and against any claims, suits, losses, damages, liabilities, costs, and expenses (including reasonable legal or attorneys’ fees) resulting from or relating to any use of the Work by You.

8.Limitation on Liability. EXCEPT TO THE EXTENT REQUIRED BY APPLICABLE LAW, IN NO EVENT WILL THE AUTHOR OR THE PUBLISHER BE LIABLE TO YOU ON ANY LEGAL THEORY FOR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR EXEMPLARY DAMAGES ARISING OUT OF THIS LICENSE OR THE USE OF THE WORK OR OTHERWISE, EVEN IF THE AUTHOR OR THE PUBLISHER HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

9.Termination. a.This License and the rights granted hereunder will terminate automatically upon any breach by You of any term of this License. Individuals or entities who have received Derivative Works from You under this License, however, will not have their licenses terminated provided such individuals or entities remain in full compliance with those licenses. Sections 1, 2, 6, 7, 8, 9, 10 and 11 will survive any termination of this License.

b.If You bring a copyright, trademark, patent or any other infringement claim against any contributor over infringements You claim are made by the Work, your License from such contributor to the Work ends automatically.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

c.Subject to the above terms and conditions, this License is perpetual (for the duration of the applicable copyright in the Work). Notwithstanding the above, the Author reserves the right to release the Work under different license terms or to stop distributing the Work at any time; provided, however that any such election will not serve to withdraw this License (or any other license that has been, or is required to be, granted under the terms of this License), and this License will continue in full force and effect unless terminated as stated above.

10.Publisher. The parties hereby confirm that the Publisher shall not, under any circumstances, be responsible for and shall not have any liability in respect of the subject matter of this License. The Publisher makes no warranty whatsoever in connection with the Work and shall not be liable to You or any party on any legal theory for any damages whatsoever, including without limitation any general, special, incidental or consequential damages arising in connection to this license. The Publisher reserves the right to cease making the Work available to You at any time without notice

11.Miscellaneous a.This License shall be governed by the laws of the location of the head office of the Author or if the Author is an individual, the laws of location of the principal place of residence of the Author.

b.If any provision of this License is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this License, and without further action by the parties to this License, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

c.No term or provision of this License shall be deemed waived and no breach consented to unless such waiver or consent shall be in writing and signed by the party to be charged with such waiver or consent.

d.This License constitutes the entire agreement between the parties with respect to the Work licensed herein. There are no understandings, agreements or representations with respect to the Work not specified herein. The Author shall not be bound by any additional provisions that may appear in any communication from You. This License may not be modified without the mutual written agreement of the Author and You.

(4) MICROSOFT LIMITED PUBLIC LICENSE version 1.1:

Progress Telerik UI for ASP.NET AJAX 2021 incorporates DLINQ. This third-party technology is licensed to PSC and is hereby distributed to User only under the terms of a third-party license, a copy of which is included herein below:

MICROSOFT LIMITED PUBLIC LICENSE version 1.1

This license governs use of code marked as “sample” or “example” available on this web site without a license agreement, as provided under the section above titled “NOTICE SPECIFIC TO SOFTWARE AVAILABLE ON THIS WEB SITE.” If you use such code (the “software”), you accept this license. If you do not accept the license, do not use the software.

1. Definitions

The terms “reproduce,” “reproduction,” “derivative works,” and “distribution” have the same meaning here as under U.S. copyright law.

A “contribution” is the original software, or any additions or changes to the software.

A “contributor” is any person that distributes its contribution under this license.

“Licensed patents” are a contributor’s patent claims that read directly on its contribution.

2. Grant of Rights

(A) Copyright Grant - Subject to the terms of this license, including the license conditions and limitations in section 3, each contributor grants you a non-exclusive, worldwide, royalty-free copyright license to reproduce its contribution, prepare derivative works of its contribution, and distribute its contribution or any derivative works that you create.

(B) Patent Grant - Subject to the terms of this license, including the license conditions and limitations in section

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3, each contributor grants you a non-exclusive, worldwide, royalty-free license under its licensed patents to make, have made, use, sell, offer for sale, import, and/or otherwise dispose of its contribution in the software or derivative works of the contribution in the software.

3. Conditions and Limitations

(A) No Trademark License- This license does not grant you rights to use any contributors' name, logo, or trademarks.

(B) If you bring a patent claim against any contributor over patents that you claim are infringed by the software, your patent license from such contributor to the software ends automatically.

(C) If you distribute any portion of the software, you must retain all copyright, patent, trademark, and attribution notices that are present in the software.

(D) If you distribute any portion of the software in source code form, you may do so only under this license by including a complete copy of this license with your distribution. If you distribute any portion of the software in compiled or object code form, you may only do so under a license that complies with this license.

(E) The software is licensed "as-is." You bear the risk of using it. The contributors give no express warranties, guarantees or conditions. You may have additional consumer rights under your local laws which this license cannot change. To the extent permitted under your local laws, the contributors exclude the implied warranties of merchantability, fitness for a particular purpose and non-infringement.

(F) Platform Limitation - The licenses granted in sections 2(A) and 2(B) extend only to the software or derivative works that you create that run directly on a Microsoft Windows operating system product, Microsoft run-time technology (such as the .NET Framework or Silverlight), or Microsoft application platform (such as Microsoft Office or Microsoft Dynamics).

(5) Microsoft Public License (MS-PL):

Progress Telerik UI for ASP.NET AJAX 2021 incorporates MD5 (as part of TDP (for .NET Framework) 2021 R3) and Google Charts for Asp.Net v1.0. These third-party technologies are licensed to PSC and are hereby distributed to User only under the terms of a third-party license, a copy of which is included herein below:

Microsoft Public License (Ms-PL)

This license governs use of the accompanying software. If you use the software, you accept this license. If you do not accept the license, do not use the software.

1. Definitions

The terms "reproduce," "reproduction," "derivative works," and "distribution" have the same meaning here as under U.S. copyright law.

A "contribution" is the original software, or any additions or changes to the software.

A "contributor" is any person that distributes its contribution under this license.

"Licensed patents" are a contributor's patent claims that read directly on its contribution.

2. Grant of Rights

(A) Copyright Grant- Subject to the terms of this license, including the license conditions and limitations in section 3, each contributor grants you a non-exclusive, worldwide, royalty-free copyright license to reproduce its contribution, prepare derivative works of its contribution, and distribute its contribution or any derivative works that you create.

(B) Patent Grant- Subject to the terms of this license, including the license conditions and limitations in section 3, each contributor grants you a non-exclusive, worldwide, royalty-free license under its licensed patents to make, have made, use, sell, offer for sale, import, and/or otherwise dispose of its contribution in the software or derivative works of the contribution in the software.

3. Conditions and Limitations

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

(A) No Trademark License- This license does not grant you rights to use any contributors' name, logo, or trademarks.

(B) If you bring a patent claim against any contributor over patents that you claim are infringed by the software, your patent license from such contributor to the software ends automatically.

(C) If you distribute any portion of the software, you must retain all copyright, patent, trademark, and attribution notices that are present in the software.

(D) If you distribute any portion of the software in source code form, you may do so only under this license by including a complete copy of this license with your distribution. If you distribute any portion of the software in compiled or object code form, you may only do so under a license that complies with this license.

(E) The software is licensed "as-is." You bear the risk of using it. The contributors give no express warranties, guarantees or conditions. You may have additional consumer rights under your local laws which this license cannot change. To the extent permitted under your local laws, the contributors exclude the implied warranties of merchantability, fitness for a particular purpose and non-infringement.

(6) MIT-Style Licenses:

(a) Progress Telerik UI for ASP.NET AJAX 2021 incorporates Cecil v0.9.6.0. Such technology is subject to the following terms and conditions:

Mono.Cecil is licensed under the MIT/X11:

Copyright (c) 2008 - 2011, Jb Evain

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

The MIT/X11 is a permissive license, which is GPL compatible, and allows usage within proprietary software as long as this license is distributed along with the software.

(b) Progress Telerik UI for ASP.NET AJAX 2021 incorporates Json.Net v7.0.1.18622. Such technology is subject to the following terms and conditions:

Copyright (c) 2007 James Newton-King

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

(c) Progress Telerik UI for ASP.NET AJAX 2021 incorporates Jquery v1.12.4. Such technology is subject to the following terms and conditions:

Copyright jQuery Foundation and other contributors, https://jquery.org/

This software consists of voluntary contributions made by many individuals. For exact contribution history, see the revision history available at https://github.com/jquery/jquery

The following license applies to all parts of this software except as documented below:

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

All files located in the node_modules and external directories are externally maintained libraries used by this software which have their own licenses; we recommend you read them, as their terms may differ from the terms above.

(d) Progress Telerik UI for ASP.NET AJAX 2021 incorporates Pako v1.0.1. Such technology is subject to the following terms and conditions:

(The MIT License)

Copyright (C) 2014-2016 by Vitaly Puzrin

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

(e) Progress Telerik UI for ASP.NET AJAX 2021 incorporates CsQuery v1.3.5.200 and (as part of TDP (for .NET Framework) 2021 R3). Such technology is subject to the following terms and conditions:

Code use license for CsQuery

Copyright (c) 2012 James Treworgy

LICENSE (MIT License)

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

WiX Toolset

The WiX toolset is released under the Microsoft Reciprocal License (MS-RL). A reciprocal license is used to ensure that others who build on the effort of the WiX community give back to the WiX community. Specifically the license requires that fixes and improvements to the WiX toolset must be published using the same license.

Sometimes the reciprocal license is incorrectly interpreted to also apply to bundles, packages, and custom actions built using the WiX toolset. The Outercurve Foundation has previously provided this statement below to clarify which now the .NET Foundation reaffirms:

The WiX toolset (WiX) is licensed under the Microsoft Reciprocal License (MS-RL). The MS-RL governs the distribution of the software licensed under it, as well as derivative works, and incorporates the definition of a derivative work provided in U.S. copyright law. OuterCurve Foundation (and the .NET Foundation) does not view the installer packages generated by WiX as falling within the definition of a derivative work, merely because they are produced using WiX. Thus, the installer packages generated by WiX will normally fall outside the scope of the MS-RL, and any of your source code, binaries, libraries, routines or other software components that are incorporated in installer packages generated by WiX can be governed by other licensing terms.

The full text of the MS-RL license is reproduced below. It can also be found in the LICENSE.TXT file included with the source code.

Microsoft Reciprocal License (MS-RL)

This license governs use of the accompanying software. If you use the software, you accept this license. If you do not accept the license, do not use the software.

Definitions

The terms "reproduce," "reproduction," "derivative works," and "distribution" have the same meaning here as under U.S. copyright law.

A "contribution" is the original software, or any additions or changes to the software.

A "contributor" is any person that distributes its contribution under this license.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

"Licensed patents" are a contributor's patent claims that read directly on its contribution.

Grant of Rights

(A) Copyright Grant- Subject to the terms of this license, including the license conditions and limitations in section 3, each contributor grants you a non-exclusive, worldwide, royalty-free copyright license to reproduce its contribution, prepare derivative works of its contribution, and distribute its contribution or any derivative works that you create.

(B) Patent Grant- Subject to the terms of this license, including the license conditions and limitations in section 3, each contributor grants you a non-exclusive, worldwide, royalty-free license under its licensed patents to make, have made, use, sell, offer for sale, import, and/or otherwise dispose of its contribution in the software or derivative works of the contribution in the software.

Conditions and Limitations

(A) Reciprocal Grants- For any file you distribute that contains code from the software (in source code or binary format), you must provide recipients the source code to that file along with a copy of this license, which license will govern that file. You may license other files that are entirely your own work and do not contain code from the software under any terms you choose.

(B) No Trademark License- This license does not grant you rights to use any contributors' name, logo, or trademarks.

(C) If you bring a patent claim against any contributor over patents that you claim are infringed by the software, your patent license from such contributor to the software ends automatically.

(D) If you distribute any portion of the software, you must retain all copyright, patent, trademark, and attribution notices that are present in the software.

(E) If you distribute any portion of the software in source code form, you may do so only under this license by including a complete copy of this license with your distribution. If you distribute any portion of the software in compiled or object code form, you may only do so under a license that complies with this license.

(F) The software is licensed "as-is." You bear the risk of using it. The contributors give no express warranties, guarantees or conditions. You may have additional consumer rights under your local laws which this license cannot change. To the extent permitted under your local laws, the contributors exclude the implied warranties of merchantability, fitness for a particular purpose and non-infringement.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

What's new in AVEVA Work Tasks?

AVEVA Work Tasks 2023 SP1 provides enhanced features and functionalities to further support users in the creation of simple and complex use scenarios and composite applications rapidly.

The following are the new features and enhancements available in AVEVA Work Tasks 2023 SP1:

- Remote Farm Configuration.
- Passphrase migration tool to migrate passphrase and configuration settings from one machine to another.
- Supports editing the details of Scheduler Associations in workflows.
- Supports exporting and deleting list items from Custom List.
- Supports multiple Unique Environment Name (UEN) when the Workflow Gateway Objects are provisioned to different repositories.
- Added localization support for Dutch language in AVEVA Work Tasks Pro.

The following are the other enhancements for **AVEVA Work Tasks 2023 SP1** release:

- Enhanced Token refresh mechanism for workflow engine so that workflows run smoothly.
- Supports column name with spaces in Web API preview.
- Supports Fully Qualified Domain Name (FQDN) for the Active Directory DataSource field while creating Repository for Active Directory provider.
- Supports Alias Name in the domain while creating Active Directory Provider repository.
- Users can log in with the Secondary Authentication Provider when the Primary Authentication Provider is not accessible.
- Binary Serialization used for sending and receiving messages in the Enterprise Server scenario has been changed to Json Serialization.
- Supports AIM authentication to access:
  - AVEVA Work Tasks controls in InTouch HMI
  - Enterprise Console in System Platform IDE
- Supports second-level Object type parameters in the Web API.
- Supports reconfiguring Workflow Gateway Object (WGO) to reset **LoggedInUserID** to the currently logged-in user and allows that user to execute the workflow.
- Compatibility enhancement to support Workflow tab for older AOT objects.
- Safeguard against blank or incorrect object definition in Web API configuration.
- Lookups can be configured using Web APIs without adding dummy data.
- Usage of Microsoft Edge WebView2 control instead of IE Web Browser control in AVEVA Work Tasks 2023 SP1 Connectors for System Platform and AVEVA InTouch.
- Optimized Form page load.
- Enhanced Base Form with **Display Mode** as **Grid** to show the columns in proper format when present inside an Embed Form control and in the main form.
- Security fixes and third-party components updates.

2023 Releases

The key features and enhancements are available for the following release:

- AVEVA Work Tasks 2023 SP1 Release Notes

AVEVA Work Tasks 2023 SP1 Release Notes

This section provides information about important features, resolved issues, and known issues for **AVEVA Work Tasks 2023 SP1**. The product and the documentation are subject to change without notice.

Important:There are unsigned third-party components that are shipped with AVEVA Work Tasks. It is advised to verify that the File names, SHA1 and SHA256 Hash details matches with those installed on the server. For details, refer Other Components under **Acknowledgements** section in the online Help.

System Requirements

The hardware and software requirements to install AVEVA Work Tasks 2023 SP1 are as follows:

- Hardware Requirements
  - Windows Requirements
  - SQL Server Requirements
- Software Requirements
  - Operating System Requirements
  - Database Requirements
  - Browser Requirements
- Other Requirements

Hardware Requirements

Windows operating systems and SQL Server versions may impose hardware requirements that exceed the minimum requirements for AVEVA Work Tasks 2023 SP1. Refer to the following Microsoft Web sites for Windows and SQL Server hardware requirements.

Windows requirements

- Windows Server 2022 System Requirements
- Windows Server 2019 System Requirements
- Windows Server 2016 System Requirements
- Windows 11 System Requirements
- Windows 10 System Requirements

SQL Server requirements

- Hardware and Software Requirements for installing Azure SQL

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Hardware and Software Requirements for Installing SQL Server 2022
- Hardware and Software Requirements for Installing SQL Server 2019
- Hardware and Software Requirements for Installing SQL Server 2016 and 2017

Software Requirements

Operating System Requirements

AVEVA Work Tasks runs on the following 64-bit Windows Operating System versions. We recommend applying all the critical updates pertaining to the version of the server.

Software Requirements Matrix	**Windows 10***	**Windows 11****	**Windows Server (Standard or Data Center)**		
-	-	-	**2016**	**2019**	**2022**
AVEVA Work Tasks 2023 SP1	Y	Y	Y	Y	Y
AVEVA Work Tasks 2023 SP1 Extension for System Platform	Y	Y	Y	Y	Y
AVEVA Work Tasks 2023 SP1 Connector for System Platform	Y	Y	Y	Y	Y
AVEVA Work Tasks 2023 SP1 Extension for OPC UA	Y	Y	Y	Y	Y
AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook	Y	Y	Y	Y	Y

* The supported Windows 10 version includes 1903, 1909, 2004, 20H2, 21H1, 21H2, 22H2.

** The supported Windows 11 version includes 21H2, 22H2.

Database Requirements

AVEVA Work Tasks is compatible with the following SQL Server versions installed on 64-bit Windows Operating System. We recommend applying all the critical updates pertaining to the version of the SQL Server.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Software Requirements Matrix	SQL Server 2016 SP3 CU17-KB5003279 (Standard or Enterprise)	SQL Server 2017 CU 31-KB5016884 (Standard or Enterprise)	SQL Server 2019 CU 21-KB5025808 (Standard or Enterprise)	SQL Server 2022 CU 6-KB5027505 (Standard or Enterprise)	SQL Azure

Component	Requirement
Internet Information Services (IIS)	IIS must be installed and configured.
Supported Languages for Operating Systems	• US English • Chinese (Simplified) • French • German • Japanese • Portuguese (Brazilian)

Supported Operating Systems for Work Tasks Pro	• iOS
	  • iOS 14.x, iOS 15.x, iOS 16.x
	• Android
	  • Android 13, 12, 11, 10
	  • Pie
	• Windows
	  • Windows 11 Pro version 21H2 and later
	  • Windows 10 version 20H2 and later

Supported Languages for AVEVA Work Tasks Pro	• US English • Chinese (Simplified) • Dutch • French • German • Greek • Hindi • Italian • Korean • Norwegian Bokmål • Polish • Portuguese (Brazilian) • Russian • Spanish • Turkish • Vietnamese

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Product Compatibility

- **AVEVA Work Tasks 2023 SP1** with SQL Server is compatible with the following virtualization environment:
  - VMware ESXi 6.7: Virtualization with High Availability and Disaster Recovery
- **AVEVA Work Tasks 2023 SP1** is compatible with *SQL Server AlwaysOn Availability Groups* for SQL Server 2016, 2019, and 2022.

AVEVA Work Tasks 2023 SP1 is compatible and can coexist with the following connectors and extensions:

Connectors and Extensions	Compatibility	Coexistence	Can be Applied on
AVEVA Work Tasks 2023 SP1 Extension for OPC UA	Y	Y	• AVEVA Work Tasks 2023 SP1
AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook	Y	Y	• Microsoft Office Outlook 2016 (64-bit) • Microsoft Office Outlook 2019 (64-bit) • Office 365 (64-bit)

AVEVA Work Tasks 2023 SP1 Connectors for System Platform is compatible and can coexist with the following products:

Product	Version	Compatibility	Coexistence
AVEVA Recipe Management	2023	Y	Y
AVEVA Batch Management	2023	Y	Y
AVEVA Application Server	2023 P03	Y	Y
AVEVA InTouch HMI	2023 P03	Y	Y
AVEVA InTouch OMI	2023 P03	Y	Y

ISO Details

The following folders are created after you extract the ISO file of **AVEVA Work Tasks 2023 SP1**:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **AVEVA Enterprise Licensing**:
  - Installer for AVEVA Enterprise License Server and related Licensing documentation
  - Installer for AVEVA Enterprise License Manager and related Licensing documentation
- **AVEVA Work Tasks 2023 SP1**:

  - WorkTasksConnectorsExtensionsGuide
  - WorkTasksFormsGuide
  - WorkTasksQuickflowGuide
  - WorkTasksUserGuide
  - WorkTasksAPIReferenceGuide
- **AVEVA Work Tasks 2023 SP1 – Connectors**: Installation executable for AVEVA Work Tasks 2023 SP1 Connector for System Platform
- **AVEVA Work Tasks 2023 SP1 Release Notes.htm**: Release notes for the AVEVA Work Tasks 2023 SP1 release.

Installation Instructions

The following prerequisites are installed by the setup program before AVEVA Work Tasks 2023 SP1 gets installed:

- Microsoft .NET Framework 4.8
- Enable IIS Feature
- Microsoft .Net 6.0.7 - Windows Server Hosting
- VS C++ Redistributable2022
- Operations Control Logger
- Platform Common Services 7.1.0
- Common Licensing API Framework

Note:
- AVEVA Work Tasks 2023 SP1 requires a product License version 23.0 or higher.

- If you are planning to install any application on the same machine that installs an earlier version of the above mentioned prerequisites (for example, PCS 7.0), then make sure to install that application before installing AVEVA

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Work Tasks 2023 SP1.

- AVEVA Work Tasks needs .NET Core 6.0.7 or a newer version to be installed on the machine. Although the Work Tasks installer tries to install it as a prerequisite, if the .NET Core installation encounters any issues, the installation process will continue. However, it will be incumbent upon the customer to manually install .NET Core in such instances.

- While .Net 6.0.7 is being installed, if an installer screen with **Repair**, **Uninstall**, or **Close** option appears, select **Repair** option to proceed installation. This will restart the machine after repair and then the installation setup resumes.

- During AVEVA Work Tasks installation, if installation of **VS C++ Redistributable2022**, **Operations Control Logger**, **Platform Common Service**, and **Common Licensing API Framework** prompt to restart the machine, you can ignore and do a restart after completing installation.

Extract the ISO file of AVEVA Work Tasks 2023 SP1 to get the executable files. Run the following executable files to install and use AVEVA Work Tasks 2023 SP1.

1. **To install AVEVA Work Tasks 2023 SP1**

   Run *AVEVA Work Tasks 2023 SP1.exe* located in **AVEVA Work Tasks 2023 SP1** folder.

   For detailed installation instructions, refer to *WorkTasksAdministrativeGuide* located at **AVEVA Work Tasks 2023 SP1 - Documentation** folder.

2. **To install AVEVA Work Tasks 2023 SP1 Connector for System Platform**

   Run *AVEVA Work Tasks 2023 SP1 Connector for System Platform.exe* located in **AVEVA Work Tasks 2023 SP1 - Connectors** folder.

   For detailed installation instructions, refer to *Installing AVEVA Work Tasks Connectors for System Platform* in the *WorkTasksConnectorsExtensionsGuide* located at **AVEVA Work Tasks 2023 SP1 - Documentation** folder.

3. **To install AVEVA Work Tasks 2023 SP1 Extension for System Platform**

   Run *AVEVA Work Tasks 2023 SP1 Extension for System Platform.exe* located in **AVEVA Work Tasks 2023 SP1\Server Extensions** folder.

   For detailed installation instructions, refer to *Installing AVEVA Work Tasks Extension for System Platform* in the *WorkTasksConnectorsExtensionsGuide* located at **AVEVA Work Tasks 2023 SP1 - Documentation** folder.

4. **To install AVEVA Work Tasks 2023 SP1 Extension for OPC UA**

   Run *AVEVA Work Tasks 2023 SP1 Extension for OPC UA.exe* located in **AVEVA Work Tasks 2023 SP1\Server Extensions**.

   For detailed installation instructions, refer to *Installing AVEVA Work Tasks Extension for OPC UA* in the *WorkTasksConnectorsExtensionsGuide* located at **AVEVA Work Tasks 2023 SP1 - Documentation** folder.

5. **To install AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook**

   Run *AVEVA Work Tasks 2023 SP1 Outlook Add-in.exe* located in **AVEVA Work Tasks 2023 SP1\ Addins** folder.

   Note: *AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook* is supported for Microsoft Office 2016, 2019, and Office 365. Based on the installed version of Microsoft Office, the respective Add-in components will be installed on the system.

   For detailed installation instructions, see *Installing AVEVA Work Tasks Add-in for Microsoft Outlook* in the *WorkTasksAdministrativeGuide* located at **AVEVA Work Tasks 2023 SP1 - Documentation** folder.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Upgrading to AVEVA Work Tasks 2023 SP1

Upgrading Scenarios

You can upgrade to AVEVA Work Tasks 2023 SP1 from the AVEVA Work Tasks 2023.

However, if you want to upgrade from versions earlier than AVEVA Work Tasks 2023, you must first upgrade to AVEVA Work Tasks 2023, and then to AVEVA Work Tasks 2023 SP1.

The upgrade will overwrite all files. Therefore, we recommend that you back up the files before upgrading the product.

Make sure that the user has appropriate rights for installing and upgrading software on the machine.

Note:
- Customizations to files in Locales, Web, and WorkflowElements folders need to be applied again to the newly created files after an upgrade.

Steps to Upgrade

1. Run *AVEVA Work Tasks 2023 SP1.exe* located in **AVEVA Work Tasks 2023 SP1** folder.

   The installer splash screen, and then the Prerequisites installation screen appears.
2. Install the Prerequisites.
3. Click **Next** after installing the prerequisites.
4. Click **Finish** on the InstallShield Wizard Completed dialog box.

   The system prompts you for the restart.
5. Click **OK** if you want to restart the machine.
6. The **Upgrade Manager** automatically gets launched and performs the following tasks:
   - Stops the services and Application Pools.
   - Deletes the **WorkTasksTemp** and **Work Tasks Cache** files from the machine.

     For more information on how to run the Upgrade Manager, see Run Upgrade Manager in the *WorkTasksAdministrativeGuide*.

     Notes:
     - During AVEVA Work Tasks upgrade, if **Platform Common Service** prompt to restart the machine, you can ignore and do a restart after completing installation. If you opt to restart the machine, the installation does not resume after a restart. You will have to run the installer to continue the installation.

     - After the upgrade completes, the Work Tasks services and Application Pools start automatically.

     - It is recommended to clear the browser cache on the machines where Enterprise Console site is accessed to get the (js, css, images, etc. files) changes to take effect after the upgrade. For more information on how to clear cache, see the Cache Refresh Settings section in the *WorkTasksAdministrativeGuide*.

Key Features

AVEVA Work Tasks 2023 SP1 provides enhanced features and functionalities to further support users in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

creation of simple and complex use scenarios and composite applications rapidly.

The following are the new features and enhancements available in AVEVA Work Tasks 2023 SP1:

- Remote Farm Configuration.
- Passphrase migration tool to migrate passphrase and configuration settings from one machine to another.
- Supports editing the details of Scheduler Associations in workflows.
- Supports exporting and deleting list items from Custom List.
- Supports multiple Unique Environment Name (UEN) when the Workflow Gateway Objects are provisioned to different repositories.
- Added localization support for Dutch language in AVEVA Work Tasks Pro.

General Enhancements

The following are the other enhancements for **AVEVA Work Tasks 2023 SP1** release:

- Enhanced Token refresh mechanism for workflow engine so that workflows run smoothly.
- Supports column name with spaces in Web API preview.
- Supports Fully Qualified Domain Name (FQDN) for the Active Directory DataSource field while creating Repository for Active Directory provider.
- Supports Alias Name in the domain while creating Active Directory Provider repository.
- Users can log in with the Secondary Authentication Provider when the Primary Authentication Provider is not accessible.
- Binary Serialization used for sending and receiving messages in the Enterprise Server scenario has been changed to Json Serialization.
- Supports AIM authentication to access:
  - AVEVA Work Tasks controls in InTouch HMI
  - Enterprise Console in System Platform IDE
- Supports second-level Object type parameters in the Web API.
- Supports reconfiguring Workflow Gateway Object (WGO) to reset **LoggedInUserID** to the currently logged-in user and allows that user to execute the workflow.
- Compatibility enhancement to support Workflow tab for older AOT objects.
- Safeguard against blank or incorrect object definition in Web API configuration.
- Lookups can be configured using Web APIs without adding dummy data.
- Usage of Microsoft Edge WebView2 control instead of IE Web Browser control in AVEVA Work Tasks 2023 SP1 Connectors for System Platform and AVEVA InTouch.
- Optimized Form page load.
- Enhanced Base Form with **Display Mode** as **Grid** to show the columns in proper format when present inside an Embed Form control and in the main form.
- Security fixes and third-party components updates.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Issues Resolved

The following are improvements and resolved issues in the AVEVA Work Tasks 2023 SP1 release:

- The LDAP Test Connection fails while configuring repository with Active Directory provider when Username contains the hyphen (-) character
- Unable to insert decimal value through Database activity when AVEVA Work Tasks is running on French Operating System.
- The character (\) in the cookie name used for Client Connection License causes issue in the custom application rendering.
- When the **Invoke Workflow** button is clicked several times within a second, then multiple executions of workflows occur rather than single execution.
- If you have a parent folder having two child folders (say A and B) consisting of forms and you create a package that includes child folder A having the form and its associated artifacts. When you try to package the parent folder to the existing package, the child folder B and its child artifacts gets missing in the package.
- The packages created for versions earlier than AVEVA Work Tasks 2023 SP1 has following limitation:

  The standard widgets like Base Grid and Hierarchy Selector get packaged and when package is uninstalled, the widgets also get uninstalled with files associated with them.
- The inherited events from derived template instances in System Platform are not displayed.
- Sometimes import fails for Forms that contain more number of Invoke Workflow controls.
- Auto Logoff does not happen when a timer-based refresh grid script is present in the form.
- Data Grid page information appears arbitrarily.
- When you log in to Work Tasks Pro app with an invalid username, the license is acquired.
- The Inbox Workitems do not reflect the Iterator activity based context values for the local variables in the AVEVA Work Tasks Pro App.

Known Issues

You might come across the following issues when you work with AVEVA Work Tasks:

- When a workflow is scheduled to trigger after a specific time duration and the system experiences downtime, the system may create more workflow instances than expected once it resumes.
- Prolonged use of the Web Logger results in CPU utilization spikes. Immediate closure is crucial to restore CPU to normal levels and maintain application stability.
- Entering GET as instance name is not supported while designing a workflow in Process Designer or while creating Forms and Lists.
- Work Tasks supports OAuth-based authentication for POP3 and SMTP emails. A valid email address must be used for POP3 or SMTP configuration.
- Entering or editing values in **Rich Text** control is not supported in **Mozilla Firefox** browser.
- A colon character (:) is not supported for the Activity Name while designing a workflow in Process Designer.
- Role condition set through Filter Condition of To property in the Human Activity is not supported for CONNECT user provider.
- When installing a package, if Folder A already exists in the Forms List of the target environment and the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

package contains a Forms List with the same folder name (i.e., Folder A), the system logs the following message in the package history:

Folder title is not unique, or it contains special characters like \\,/, #&[]; ...*

- When Quickflow application is integrated with AVEVA Work Tasks, the enabling and disabling persistence of exceptions and warnings into the database requires a restart of the **Quickflow Status Monitor** service to apply the changes.
- RFID scan is not supported for Work Tasks Pro Universal Windows Platform (UWP) app.
- Wonderware Skelta BPM 2017 server version is not compatible with the AVEVA Work Tasks Pro application.

AVEVA Work Tasks Pro

The AVEVA Work Tasks Pro release notes details the version and resolved issues introduced in the release.

Version 8.2.302

The following are the enhancements and resolved issues delivered as part of this release.

Enhancements:

- Support for Modern JavaScript - ES2021 ECMAScript standard.
- Support for a Redundant Single-Sign-On (RSSO) server in Work Tasks enables seamless user authentication, specifically for Active Directory with Token Service.

Resolved Issues:

- Barcode scanning cannot be performed in landscape mode.
- Unable to upload attachments when the Encryption Security Mode is set for the Attachment control.

Version 8.1.214

The below resolved issue is delivered as part of this release.

- Fix for the login to the provider that displays a loading icon on the iPad.

Version 8.1.212

Note: This note is applicable for versions 8.1.212 and onwards.
- Select the latest AVEVA Work Tasks Pro app only if you have either **AVEVA Work Tasks 2020 Update 2** with **Hotfix 7.2.3020.12** or A**VEVA Work Tasks 2023 SP1** with **Hotfix 8.1.2030.4**. Users with other versions should not choose the latest app. This is applicable only for Android.
- To ensure push notifications work properly after applying the hotfix and upgrading the AVEVA Work Tasks Pro app, log out and log back in. If notifications still don't appear, restart your device and/or uninstall and reinstall the app.

The following are the resolved issues delivered as part of this release.

Resolved Issues:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Migrated the legacy FCM APIs to the FCM v1 APIs to ensure continued functionality of AVEVA Work Tasks and maintain notification message delivery despite the deprecation of the legacy FCM APIs.
- Resolved an issue where the AVEVA Work Tasks Pro application would crash when launching the RFID scanner on Android 13 devices. Users can now scan NFC tags seamlessly, allowing them to perform RFID scanner features without interruptions.
- Resolved an issue where users were unable to upload attachments when the Encryption Security Mode was set for the Attachment control. Users can now successfully attach photos in the Attachment control with Encryption Security Mode enabled, ensuring smooth use in their business processes.
- Enhanced overall security measures.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Administrator Guide

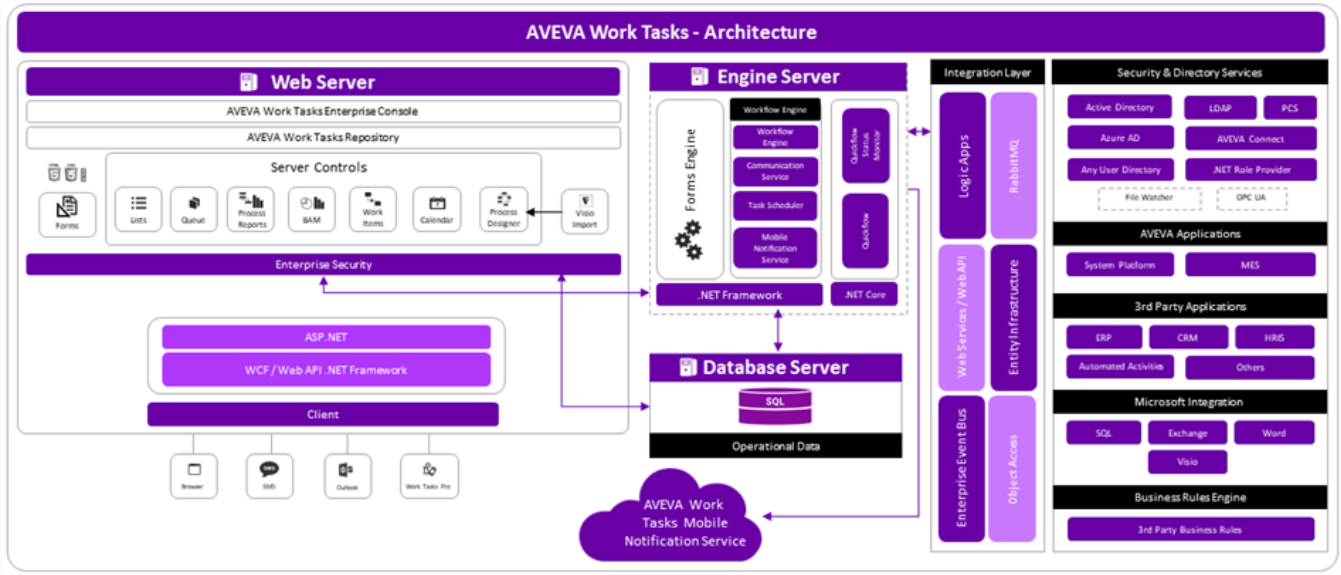
This section is for **AVEVA Work Tasks** users. It contains information you need to manage the domain and security and assumes that you have basic working knowledge of **AVEVA Work Tasks**.

Architecture

The **AVEVA Work Tasks** architecture helps you understand the various features of the product. It helps you to effectively plan and deploy the product in your environment.

Structural Parts

The following image shows the AVEVA Work Tasks Architecture:



The following table describes the different structural components of **AVEVA Work Tasks**:

Architecture

Structural Components	Description
Enterprise Console	This is a Web-based interface that allows authorized users to build workflow driven applications, and to participate in these applications. Organizations can create and access their business applications using Enterprise Console.
Repository	A Repository is a container that holds Business Process Management (BPM) and application-related data. It

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Structural Components	Description
	has a unique name and description. The Repositories are stored within the Database. You can also maintain each Repository on a different Database and isolate the information from each other. AVEVA Work Tasks typically requires that you create one repository for an organization. However, sometimes there may be a need for more than one Repository. For example, you may have separate development and production environments or have a need to completely isolate applications from each other. One more compelling scenario for creating more than one Repository is that of hosted solutions, where each client needs a secure data store and isolation. In such a case, you will need to create multiple Repositories. Repositories are maintained using Enterprise Console.
Server Controls	Server Controls are user interface layers provided by AVEVA Work Tasks. These easy-to-use controls can be reused and embedded in a custom ASP.NET application. You can extend the functionality of AVEVA Work Tasks in your application by simply dragging and dropping these controls onto the ASP.NET page. These are required only for custom ASP.NET development where a context-sensitive workflow UI has to be embedded inside the application. The following controls are available in Server Controls: • **Workflow List**: This lists all workflows defined for a AVEVA Work Tasks Repository. The Workflow List provides options for categorizing, designing, and publishing workflows. • **Process Designer**: The Process Designer is an interface used to model processes. Similar to other workflow designing tools, like Microsoft Visio, it includes popular drag and drop functions that enable you to quickly and easily draw workflows for your business processes. For example, you can use Process Designer to design a process for support request. This process involves creation of workflows and defining business logic. • Queue Management: The Queue Management enables you to create and manage queues for allocating workflow activities. This is done using

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Structural Components	Description
	the Queue control. A queue consists of a pool of resources with shared characteristics. The Queue control offers advanced level resource optimization. Queue Management supports industry standard algorithms for automatic task allocation of resources belonging to a common pool. • **Calendar**: The Calendar interface enables the creation of hierarchical organization and resource calendars. The Calendars are used to determine availability of resources, calculate time outs and perform other scheduling functions. • **Business Activity Monitoring (BAM) Dashboard**: The BAM Dashboard is a key Server Control. It enables you to monitor the execution of a workflow and provides an array of real-time reports. This report includes status and performance of workflows. It is also instrumental in generating alerts and events, providing reports in graphical format, ensuring secured access and providing details for tracking workflows. You can use Process Reports to schedule reports and generate alerts. Business managers and Process administrators can monitor, track, fine tune processes, and make pro-active decisions. • **Work Item List**: The Work Item List is a Web-based interface which lists the various workflow activities in AVEVA Work Tasks. The Work Item List provides detailed information of an activity. You can view and respond to Work items from an interface similar to Microsoft Outlook.
Forms Designer	The Forms Designer is an intermediate layer between a user and Forms Engine. It provides an interface that assists you to design, customize, maintain form templates and define a business logic specific to a form. Forms are associated with workflows. These workflows are responsible for driving end-to-end business applications. A form triggers a business process. For example, you can use Forms Designer to design a Leave Application form for your organization. The

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Structural Components	Description
	designed form can be used as a template by all the employees while submitting leave requests.
Lists	A List is a collection of items such as Task lists or Item lists captured using Forms. It acts as a logical table (similar to a database table), but involves more complicated structure to represent an entire entity with links to child tables. The data entered in the Lists are stored in a Repository. It stores application-level data thus facilitating generation of business reports. AVEVA Work Tasks lists group related information. A Form is used as an interface to enter data in the Lists. For example, you can define a List to store all the leave requests submitted by employees in your organization. Your list can include parameters (columns or fields) such as From Date, To Date, Leave Type, and Reason.
Delivery Channel	A Delivery Channel is an interface for users to interact with workflows. AVEVA Work Tasks provides multiple delivery channels which include: • **Browsers**: AVEVA Work Tasks provides controls that can be embedded in Web-based applications to view or respond to Work items. • **Messenger Services**: AVEVA Work Tasks uses this channel to send tasks or information to messenger applications. • **Mobile Phones**: AVEVA Work Tasks allows both SMS and e-mail communication. You can send and receive messages using AVEVA Work Tasks. The two-way e-mail channel within AVEVA Work Tasks is used to deliver and act on tasks directly using mobile phones. • **E-mail**: AVEVA Work Tasks also supports two-way e-mail communication. A Work Item can be delivered to both email and Web channel based on a user's preference. The user can act on the work item from either of the channels. AVEVA Work Tasks synchronizes this information. • **Microsoft Outlook Applications**: AVEVA Work Tasks provides a Microsoft Outlook plug-in to respond to tasks. It enables work items to be delivered to the Inbox of your mail client such as

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Structural Components	Description
	Microsoft Office Outlook 2016 or Microsoft Office Outlook 2019. For more information, see Microsoft Outlook Integration. • **Desktop Applications**: AVEVA Work Tasks provides extensive APIs and Web services that can be called from various desktop applications to work with Work item.
Forms Engine	The Forms Engine is responsible for every activity starting from the time a form is opened till a form is closed. It captures all the real-time user inputs, processes the inputs, and displays this information in terms of controls, business logic, and usability. The Forms Engine is triggered when a form is submitted. The submitted form will follow a workflow based on the business logic defined for the form. For example, the Forms Engine makes the Leave Application form available to an employee when the employee wants to apply for a leave.
Services	The Server controls various service requests using Services. The Services comprises the following: • **Workflow Engine Service**: This service needs to be running for the execution and control of workflows. • **Task Scheduler Service**: This service handles the execution of all tasks that have not taken place as scheduled (escalations). • **Communication Service**: This service handles incoming e-mail and SMS communication. • **Advance Server Service**: This service provides load balancing and failover support. This service is available only if Load Balanced Server is installed. • **Client Service**: This is used internally by AVEVA Work Tasks for provisioning and deployment. • **Mobile Notification Service**: This service is used to send notifications to the Work Tasks Pro mobile application. The Workflow Engine Service can exist on a single machine or on multiple machines. For Load Balancing and Failover support to function,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Structural Components	Description
	Workflow Engine Services must be installed on multiple machines and Advance Server Service must also be enabled on these machines. For more information on Load Balancing and Failover support, see Load Balanced Server.
Operational Data	The data created while working with AVEVA Work Tasks are stored in SQL databases. These databases are defined while installing the solution. The Server Controls, Delivery Channel, Services, and Forms Engine connect to the database to store or retrieve data.
Integration Layer	The integration layer acts as an interface between AVEVA Work Tasks and third-party applications. The various objects within the integration layer include: • Entity Infrastructure: Entity Infrastructure is used to manage users across different platforms. An Entity has two categories - User Entity and Role Entity. A User Entity manages all the information for the users across different data sources. A data source can be an active directory, an SQL provider, or more. A Role entity manages users in roles. • Web Services: AVEVA Work Tasks provides out-of-the-box activities that can be used to call a third-party Web Service from a workflow. • AVEVA Work Tasks Object Access (SOA): This object allows reuse of third-party .NET objects in AVEVA Work Tasks, thus avoiding custom coding. AVEVA Work Tasks allows registration of third-party object assemblies. Example: An organization has a Human Resources (HR) system developed using Microsoft.NET technology. This HR system has information related to employee, such as salary, leave, promotions. To strengthen the process, the organization integrates its existing process with AVEVA Work Tasks. While designing a workflow for the appraisal process using AVEVA Work Tasks, there is a need to get employee information and accordingly route the workflow based on the experience level and the grade of an employee. The need is to reuse the existing employee object

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Structural Components	Description
	inside the AVEVA Work Tasks process and avoid custom coding. This objective is achieved by using AVEVA Work Tasks Object Access. • Enterprise Event Bus: This is a mechanism that handles third-party events and these events are used to trigger a workflow. The third-party events can include updating files and receiving e-mails. Example: An organization has implemented AVEVA Work Tasks to automate their invoicing process. The organization wants to monitor changes made to a folder that stores scanned copies of invoices as files. As soon as any modification is made to the folder, the workflow triggers the accounts payable process and a notification is sent to the respective person. Modifications to a folder can include activities, such as adding an invoice, updating an invoice, renaming an invoice, or deleting an invoice. All these objects work collectively to ensure smooth information exchange.
Security and Directory Services	AVEVA Work Tasks does not force you to create new user accounts and passwords. Instead, it assumes that you already have some means to authenticate a user name and password. This allows AVEVA Work Tasks to use the existing user name and password, without creating replicas of those user accounts in specific tables. The solution thus supports external Security and Directory Services. This is a service that allows AVEVA Work Tasks to use and manage a user's identity stored in an external database. AVEVA Work Tasks supports the following Security and Directory Services: • Active Directory • Lightweight Directory Access Protocol (LDAP) • Any User Directory • .NET Role Provider **Note**: You can create user accounts using AVEVA Work Tasks. These user accounts are stored in User List.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Structural Components	Description
File Watcher	A File Watcher constantly monitors activities in a folder. Whenever there is an activity, such as a file creation or a file update, File Watcher raises events that are used to initiate a workflow. Example: An organization has implemented AVEVA Work Tasks solution to automate their invoicing process. The organization wants to monitor changes made to a folder that stores scanned copies of invoices as files. The File Watcher feature monitors all changes made to the folder. As soon as any modification is made to the folder the workflow triggers the accounts payable process and a notification is sent to the respective person. Modifications to a folder can include activities like creating or adding a new invoice, updating an existing invoice, renaming an invoice, or deleting an invoice.
Third-party Applications	AVEVA Work Tasks can integrate with different third-party applications, such as Enterprise Resource Planning (ERP), Customer Relationship Management (CRM), and Human Resources Information System (HRIS) using the integration components, such as Web service, custom activities, and API.
Microsoft Integration	The open architecture of AVEVA Work Tasks assists you to derive maximum benefits by integrating it with various Microsoft applications. The Microsoft applications that are integrated comprise: • **Microsoft Exchange**: AVEVA Work Tasks integrates with Microsoft Exchange to provide alerts and notifications. • **Microsoft Word**: AVEVA Work Tasks integrates with Microsoft Office applications like Microsoft Word to participate in content-driven business processes. • **SQL**: SQL integrates with AVEVA Work Tasks to store records. • **Microsoft Visio**: AVEVA Work Tasks can integrate with Microsoft Visio and import diagrams created using Microsoft Visio.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Structural Components	Description
Business Rules Engine	For common process related scenarios, AVEVA Work Tasks provides basic rules capabilities using rule activity, decision activity, and expression builder. You can also integrate AVEVA Work Tasks with other third-party business rules engine using the integration components, such as Web services, Custom activities, and Event API.

Core Components

The core components of AVEVA Work Tasks are as follows:

Server

A Server is a machine on which the Client Service, Advance Server Service, Communication Service, Task Scheduler, Mobile Notification Service, and Workflow Engine are installed. If the load balancing feature is enabled during the Farm configuration, the Load Balanced Server License is acquired and the Advance Server service is installed and enabled. These services can be installed on a single server or on multiple servers. In the case of Developer and Professional Editions, all services are installed on the same server, whereas in the case of Load Balanced Server, the services are installed on multiple servers.

The primary role of the Server is to control workflow execution and schedule tasks. The Workflow Engine and the Task Scheduler are services that control workflow execution. The Communication service manages communication and notifications. The Advance Server service enables load balancing.

Client

A Client is a machine in which the Central Configuration and the Enterprise Console are enabled. If the load balancing feature is enabled during the Farm configuration, the Load Balanced Server License is acquired and the Advance Server service is installed and enabled.

Farm Database

A Farm Database is a machine that contains information about the Enterprise Console, location of the Central Configuration, and configuration settings at a global and server (machine) level. These settings are specified in the Farm Configuration Wizard database.

Central Configuration

The Central Configuration enables you to define, create and manage repositories for workflows and execute them. A Repository refers to a database that contains workflow definitions, queues, calendars, settings, and workflow execution data for an application.

The location and settings for the Central Configuration are specified from the Farm Configuration Wizard. The

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Repository settings are stored in the database specified for the repository.

Enterprise Console

This is a Web-based interface that allows authorized users to build workflow driven applications and also allows users to participate in these applications. The console enables central administration of all workflows associated with a repository. Activities that can be performed from the Enterprise Console include workflow categorization, workflow design, associating workflows with lists, events, initiating workflows for new workflow creation, publishing workflows, creation, management and association of Forms with workflows and viewing reports. The Enterprise Console also enables administrators to set up and manage queues and calendars for use in workflows.

- One Enterprise Console can be mapped to one or more Repositories; however users can login only to their respective Repositories.
- One or more Enterprise Consoles can be configured for the same repository.
- The Enterprise Console can be configured for more than one repository.
- The Enterprise Console is defined and managed using the Farm Configuration Wizard.

Repository

A Repository is a database that contains workflow definitions, queues, calendars, settings, workflow execution data and Business Activity Monitoring (BAM) data. Data Sources for Repositories are defined in the Central Configuration.

A Repository can also be created for each client in a hosted environment (Application Service Provider environment).

Note: Workflows existing in two different Repositories cannot interact with each other. User Sources (also known as User Providers) are specific to a repository although multiple user providers are possible per repository. A User Provider is a user data source such as Active Directory or an application's custom data source.

Example: If you are defining workflows for your organization, the organization must be defined as a AVEVA Work Tasks Repository. Repositories are created from the Central Configuration.

Repository Data Source

A Repository Data Source is connection information specific to a repository database. AVEVA Work Tasks services use a Repository Data Source to connect to the database.

Forms

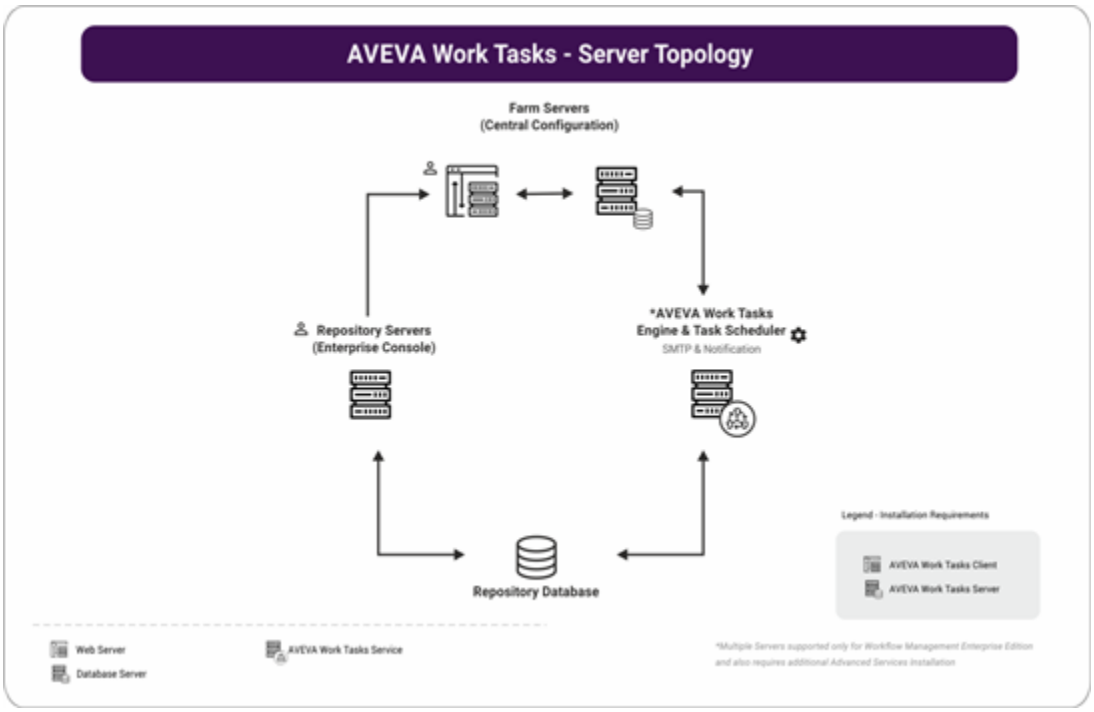
The Forms is an easy to use drag and drop interface used for designing forms. You can use forms designer to quickly design forms, maintain form templates, and define business logic. The Forms are used to trigger Workflows.

Farm

A Farm is a collection of Servers and Client services working as a single logical entity to provide the AVEVA Work Tasks solution. The Farm configuration is achieved through the Farm configuration wizard.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The following image displays the various components of AVEVA Work Tasks and how these components interface with each other.



Microsoft Outlook Integration

AVEVA Work Tasks supports two-way communication via e-mail. It provides a Delivery Channel for users to interact with workflows. Also provides multiple delivery channels which include:

Browsers: AVEVA Work Tasks provides controls that can be embedded in Web-based applications to view or respond to the work items.

Messenger Services: AVEVA Work Tasks uses this channel to send tasks or information to messenger applications.

Mobile Phones: AVEVA Work Tasks allows both SMS and e-mail communication. You can send and receive message s using AVEVA Work Tasks. The two-way e-mail channel within AVEVA Work Tasks is used to deliver and act on tasks directly using mobile phones.

E-mail: AVEVA Work Tasks also supports two-way e-mail communication. A Workitem can be delivered to both e-mail and Web channel based on a user's preference. The user can act on the Workitem from either of the channels. AVEVA Work Tasks synchronizes this information.

Microsoft Outlook applications: AVEVA Work Tasks provides a Microsoft Outlook plug-in to respond to tasks. It enables work item to be delivered to the Inbox of your mail client, such as Microsoft Office Outlook 2016 and Microsoft Outlook 2019.

Desktop Applications: AVEVA Work Tasks provides extensive APIs and Web services that can be called from various desktop applications to work with Workitem.

You can act on a workflow task from any mail client. AVEVA Work Tasks Outlook Integration is required for providing any advanced options through Microsoft Outlook.

The AVEVA Work Tasks Outlook Integration utility is a plug-in for AVEVA Work Tasks. It enables work item to be delivered to the Inbox of your mail client, such as Microsoft Office Outlook 2016 and Microsoft Outlook 2019.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

This is an alternative option provided to reply to e-mails related to your activity. This integration thus allows you to respond to work item from within Microsoft Outlook. The Outlook follow up functionality helps you to mark a mail as follow up. This functionality is used to set reminders and perform tasks at the scheduled time.

AVEVA Work Tasks Outlook integration utility automatically detects the installed Microsoft Office version and accordingly adds the plug-in. The tasks appear on the Outlook Ribbon bar. The plug-in menu options include:

- Approval
- CheckList
- Choice
- Task

Note:
- Currently rendering of AVEVA Work Tasks Forms is not supported.

System Requirements to Install Outlook Integration

The system requirements to install AVEVA Work Tasks Microsoft Outlook Integration is same as AVEVA Work Tasks.

Refer to any of the installation scenarios in the section AVEVA Work Tasks Products.

The system requirements to install AVEVA Work Tasks Outlook Integration utility are:

- Windows operating system
- Microsoft Visual Studio 2015 Tools for Office Runtime
- Microsoft Framework 3.5 and above
- Microsoft office Outlook 2016 or Microsoft Office Outlook 2019

Outlook Integration Best Practices

- If you want to add comments to **Human Activities** through **Mail Channel**, then you can manually reply to the AVEVA Work Tasks Mail Channel mails without using add-ins.
- It is a best practice to not use Outlook Add-ins if you want to use localized mail channel templates.

Outlook Integration Licensing Information

AVEVA Work Tasks Microsoft Outlook integration plug-in is distributed free with the core product license.

Scalability and Availability

This section provides information on the high availability and load on the AVEVA Work Tasks Web servers and services.

High Availability and Load on AVEVA Work Tasks Web Servers

High Availability and Load on the Services

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

High Availability and Load on the Services and Web Servers
High Availability of the Services and High Load on Web Servers

High Availability and Load on AVEVA Work Tasks Web Servers

In this scenario, installation includes a AVEVA Work Tasks Web Farm besides AVEVA Work Tasks Server, and AVEVA Work Tasks Databases. All these components are installed on different machines and the Web Farm on multiple web servers.

A Web Farm is a group of two or more Web Servers. All the web servers in the Web Farm will have the Central Configuration and the Enterprise Console installed. The Services and the Databases are installed on two different machines.

This scenario is recommended when you require a quick response from web servers under heavy load situations.

See Also: AVEVA Work Tasks Web Server Farm, Work Tasks Server, and AVEVA Work Tasks Database Server on Different Machines

High Availability and Load on the Services

In this scenario, you have a Web Server and Services installed on the same machine. You can host this set up on multiple computers to form a Web Farm with clustered the Services. The Databases are installed on a machine by itself. While scaling out, ensure that the machine has both the Web Server and the Services installed.

See: Web Server Farm with Clustered Work Tasks Services and Databases on Different Machines

In this scenario, you can maintain a Web Farm with the Web Servers and Services cluster on separate machines while the Databases are installed on a different machine. This deployment provides scalability and high availability of the Workflow Engine and the Web Servers. This is achieved by distributing the load equally among all the machines in the cluster and the Web Farm.

Multiple servers in the Web Farm or the cluster run the same services. Failure of a server does not impact other servers. You can take the affected server offline while the other servers maintain the service. This type of installation provides Failover. Thus allowing you to easily add or remove machines from the Web Farm or from the cluster without affecting the execution of workflows.

This is the optimal scenario for heavy load conditions and can be considered if you anticipate heavy load on the Workflow Engine or the Web Server.

See: Web Farm Connecting to Separate Services Cluster with Database on a Different Machine

High Availability and Load on the Services and Web Servers

In this scenario, you can maintain a Web Farm with Web Servers and a AVEVA Work Tasks Services cluster on separate machines while the Databases are installed on a different machine. This deployment provides scalability and high availability of the Workflow Engine and Web Servers. This is achieved by distributing the load equally among all the machines in the cluster and the Web Farm.

Multiple servers in the Web Farm or the cluster run the same services. Failure of a server does not impact other servers. You can take the affected server offline while the other servers maintain the service. This type of installation provides Failover. Thus allowing you to easily add or remove machines from the Web Farm or from the cluster without affecting the execution of workflows.

Setting up Intranet and Extranet Web Fronts

Usage with the Single Server

This scenario can be deployed in both the Single Server and the Load Balanced Server. In this scenario, one Web Server will be set up in a private network whereas the other Web Server will be set up in a public environment. AVEVA Work Tasks Services and the Databases are installed on two different machines.

For License related information, see About AVEVA Enterprise Licensing.

You might consider this deployment to configure multiple servers to host the same content accessible to a private network of your organization as well as to a secured, external Web Site.

Partitioning Database

The database partition feature can be enabled while creating or upgrading a SQL Server data source. Therefore, for multiple repositories based on the same data source, all the repositories will be partitioned. Ideally, each repository should be in a separate data source to avoid partitioning of the same.

Overview

AVEVA Work Tasks stores application data in Microsoft SQL Server. This data is very important as it is required for analytical or legal purposes. However, keeping all data in transactional database increases the size of the database enormously. Although, the latest relational database management systems and allied hardware are optimized to handle such data, it still might affect the overall performance of the business application.

AVEVA Work Tasks can be used across different business domains. Business requirements may require workflows to run continuously, and thus increases the size of some of the database tables. These database tables are critical for optimal performance of the workflow engine, and further to the performance of the business application.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Microsoft SQL Server supports table partitions to move completed transactions to a different partition. The active transactions can be kept in one partition and the completed transactions can be moved to a different partition. This optimizes workflow engine performance as queries are run on the lean partition. Database tables that grow based on workflow instances are considered for partition on completion of workflow instances, the data is moved to the secondary database partition.

Partition Feature

The partition feature can be enabled while creating or upgrading a SQL Server data source. The partition feature is at the database level. Therefore, for multiple repositories based on the same data source, all the repositories will be partitioned. Ideally, each repository should be in a separate data source to avoid partitioning of the same.

Note:
- The partition feature is available only on Microsoft SQL server versions and editions that support table partition feature. Refer to the Microsoft documentation to check the availability of the partition feature.
- The partitioning of the database is recommended only for those business applications that run large number of workflow instances.
- Enabling and disabling partition is a maintenance activity which requires closing the application. So, plan it in advance before you enable or disable partition.
- Enabling and disabling partition must be done with precaution, considering the following points:
- Enable or disable partition under the supervision of database expert, preferably a Database Administrator (DBA)
- Take the Database backup to avoid any eventuality
- Stop the Workflow services and Web application before enabling or disabling partition

For a data source, partition can be enabled either from the **DataSource** settings in the **Central Configuration** or from the **AVEVAWorkTasksPartitionManager.exe** (Partition Manager tool).

Partitioning with Central Configuration

Enabling Partition

For a data source, partition can be enabled from the **DataSource** settings in the **Central Configuration as follows:**

1. Enable partitioning by selecting a data source, and then selecting **Enable Table Partitioning**.
2. Enter appropriate path for **Database Secondary Data File Path**.

Database Secondary Data File Path

Ideally, the secondary database file should be on a separate file group on a different drive for optimal performance. That benefits in keeping the least used partition in a different path.

The database secondary data file path should be on a Microsoft SQL Server machine with sufficient rights to create files on the specified path. Ensure, you provide a valid path as it is not validated by the business application. If the path is not specified, then the secondary database file will be created at the default path, where the primary database file exists.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Enabling Partition on an Existing Data Source

For an existing data source, partition can be enabled from the **DataSource** settings in the **Central Configuration** as follows:

1. Enable partitioning by selecting an existing data source, and then selecting **Enable Table Partitioning.**
2. Enter appropriate path for **Database Secondary Data File Path**.

For more information on **Database Secondary Data File Path**, see *Database Secondary Data File Path*.

Partitioning with Partition Manager

Partition Manager (**AVEVAWorkTasksPartitionManager.exe**) is a Windows application available in the installation path. This application allows you to enable partition on an existing non-partitioned SQL Server data source, and to move data to the secondary database partition.

We recommend enabling or disabling partition only when no users are logged on to the system. That is perform partition activities during a scheduled maintenance lock out period. Also, ensure to restart the system after performing partition activities.

Enabling Partition

For an existing data source, partition can be enabled from the **Partition Manager** tool as follows:

1. Select an existing data source.
2. Enter appropriate path for **Database Secondary Data File Path**.
3. Click **Enable Table Partitioning**.
4. Click **Yes** to move data automatically or click **No** to move data later manually.

For more information on **Database Secondary Data File Path**, see *Database Secondary Data File Path*.

Moving Data

For an existing data source, after partition is enabled, data can be moved using the **AVEVAWorkTasksPartitionManager.exe** as follows:

1. Select an existing data source.
2. Right-click on the data source, and then click **Move Data**.

Note: Moving data to the secondary database partition consumes time and resources on the server. Therefore, ensure you move data only when there is no load on the server.

Disabling Partition

For an existing data source, after partition is enabled, the partition can be removed using the **AVEVAWorkTasksPartitionManager.exe** as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Select an existing data source.
2. Click **Disable Table Partitioning**.

Note:
- Disabling database partition may take some time based on the size of the database.
- Disabling removes the archived file from SQL Server, but by default SQL Server does not remove the associated file until a log backup is performed. Therefore, ensure to perform a transaction log backup.

If **AVEVAWorkTasksPartitionManager.exe** fails to disable the partition, then follow these steps:

1. Open **Microsoft SQL Server Management Studio**.
2. Create a new query for the data source.
3. Run `[RemoveSkeltaPartition]` stored procedure using `Exec [RemoveSkeltaPartition]`SQL script.
4. Use the Farm database and update the **IsPartitioned** column of the **SKDataSource** table. Use the following SQL query by providing Data source name.

   ```
   Update [SKDataSource]
   set IsPartitioned = 0
   Where Name = '< Data Source Name>'
   ```

5. Check the **ARCHIVED files** and **ARCHIVED scheme** of **Files** and **Filegroups** under Database Properties to verify that the partition is completely removed. The system should not show the **ARCHIVED file** and **ARCHIVED scheme** under **Filegroups**.
6. If the above items are shown, manually delete them using SSMS:
   - Select `[<Database Name>_ARC.NDF]` from **Files** and then click **Remove**.
   - Select **ARCHIVED scheme** from the **Filegroups** and then click **Remove**.

   OR

   Execute the below script:

   ```
   ALTER DATABASE [<Database Name>] MODIFY FILEGROUP [PRIMARY] DEFAULT
   ALTER DATABASE [<Database Name>] REMOVE FILE [<Database Name>_ARC.NDF]
   ALTER DATABASE [<Database Name>] REMOVE FILEGROUP ARCHIVED
   ```

7. Take the transaction log backup.

Verifying Partition

The following steps will help you to verify the status of Enabling/Disabling of partition.

To verify the enabled partition status

1. Open **SQL Server Management Studio**.
2. Select the **Database** of **AVEVA Data source**.
3. Right-click the **Menu** and select **Properties** option.

   When the partition is enabled, you will see the following items in the **Database Properties** of the system:
   - The **ARCHIVED file** in **Files** page
   - The **ARCHIVED scheme** in **Filegroups** page

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- File with *<DataSource Name _ARC.ndf>* under the secondary selected folder path

To verify the disabled or removed partition status

1. Open **SQL Server Management Studio**.
2. Select the **Database** of **Work Tasks Data source**.
3. Right-click the **Menu** and select **Properties** option.

   When the partition is disabled or removed, you will not see the following items in the **Database Properties** of the system:

   - The **ARCHIVED file** in **Files** page
   - The **ARCHIVED scheme** in **Filegroups** page
4. After disabling partition, run the following query and see if the file still exist in the database:

   ```
   SELECT * FROM sys.master_files WHERE name = '<DatabaseName>_ARC'
   ```

   If the file still exists, take a transaction log backup before you proceed to enable partition.

Maintenance Activities

The following maintenance activities are recommended before and after partitioning the table. These activities may take some time (30 minutes to a few hours) based on the size of the database.

Before partitioning

- Backup the database.

After Partitioning

- Improve overall performance by optimizing the database as follows:

1. Shrink the primary database file.
2. Shrink the log file.
3. Rebuild indexes.

Backup and Restoring Partitioned Database

Backup and restoring steps for partitioned database is slightly different from the standard database backup and restoration. Please follow the Microsoft documentation for details.

Following references may help for backup and restoration of Database with Partition:

https://docs.microsoft.com/en-us/sql/relational-databases/backup-restore/restore-and-recovery-overview-sql-server?view=sql-server-2017

https://docs.microsoft.com/en-us/sql/relational-databases/backup-restore/example-piecemeal-restore-of-only-some-filegroups-simple-recovery-model?view=sql-server-2017

Editions

AVEVA Work Tasks provides you the following editions:

- Single Server
- Load Balanced Server

Single Server

A single server is used to host applications in a live environment. You can install single server in one of the following scenarios:

- Deployment of AVEVA Work Tasks Web Server, AVEVA Work Tasks Server, and AVEVA Work Tasks Database Server on a Single Machine
- AVEVA Work Tasks Web Server and AVEVA Work Tasks Server on Different Machines
- AVEVA Work Tasks Web Server, AVEVA Work Tasks Server, and AVEVA Work Tasks Database Server on Different Machines
- AVEVA Work Tasks Web Server Farm, Work Tasks Server, and AVEVA Work Tasks Database Server on Different Machines

Deployment of AVEVA Work Tasks Web Server, AVEVA Work Tasks Server, and AVEVA Work Tasks Database Server on a Single Machine

In this scenario, all AVEVA Work Tasks components are installed on the same machine. This scenario is preferred in a User Acceptance Test (UAT) environment. However, for UAT load testing and for better performance in a production environment, it is recommended to host the Databases on a different machine. In such scenarios, you must consider AVEVA Work Tasks Web Server and AVEVA Work Tasks Server on Different Machines.

For License related information, see AVEVA Enterprise Licensing.

Role	**Components Installed**

AVEVA Work Tasks Server	• Services
	  • Client Service
	  • Advance Server Service (Disabled)
	  • Mobile Notification Service
	  • Communication Service
	  • Task Scheduler
	  • Workflow Engine
	• Databases
	  • Farm Database
	  • Repository Database

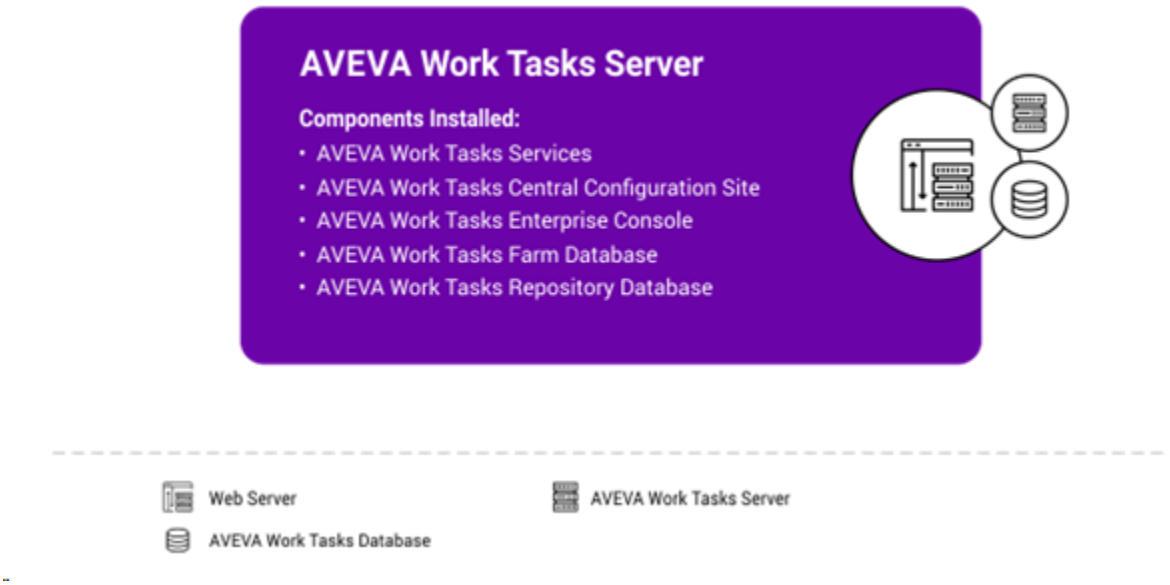
Role	Components Installed
	• Central Configuration • Enterprise Console

System Landscape



Advantages

- Cost-effective deployment as machine requirement is minimal
- Easy to configure

Disadvantages

- May not scale well
- Failover and Clustering support not provided

System Requirements

The hardware and software requirements apply to both AVEVA Work Tasks Client and AVEVA Work Tasks Server systems. The system requirements are classified based on the requirements of the physical server.

Hardware Requirements

For information on AVEVA Work Tasks Hardware Requirements, see *AVEVA Work Tasks 2023 SP1 Release Notes*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Software Requirements

For information on AVEVA Work Tasks Software Requirements, see *AVEVA Work Tasks 2023 SP1 Release Notes*.

AVEVA Work Tasks Web Server and AVEVA Work Tasks Server on Different Machines

In this scenario, the Services and the Database Server will be installed on the same machine while the Central Configuration and the Enterprise Console will exist on a different machine. This deployment is recommended for a Production environment.

For License related information, see AVEVA Enterprise Licensing.

Role	**Components Installed**
AVEVA Work Tasks Web Server	• Central Configuration • Enterprise Console

AVEVA Work Tasks Server	• Services
	  • Client Service
	  • Advance Server Service (Disabled)
	  • Mobile Notification Service
	  • Communication Service

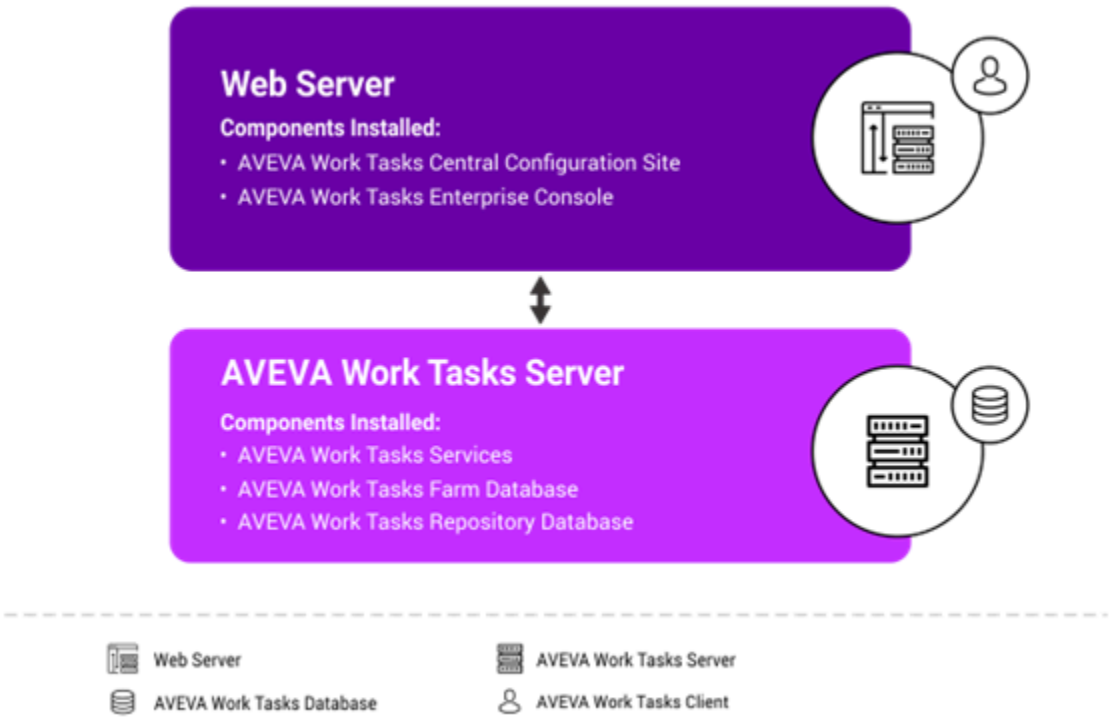
	  • Workflow Engine
	• Databases
	  • Farm Database
	  • Repository Database

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

System Landscape



Advantages

- It is possible to secure AVEVA Work Tasks Databases behind a firewall
- Better performance is obtained from the database-intensive AVEVA Work Tasks Solution by hosting AVEVA Work Tasks Databases on a different machine

Disadvantages

- Load Balancing is not supported
- High CPU utilization due to load on Web applications affects the performance of AVEVA Work Tasks Workflow Engine
- Scale-Out is not possible

System Requirements

The hardware and software requirements apply to AVEVA Work Tasks Client and AVEVA Work Tasks Server systems. The system requirements are classified based on the requirements of the physical server.

Single Server Licensing Information

There is no count limit for the Concurrent workflow execution for a Single Server license.

Load Balanced Server

The Load Balanced Server provides Failover and Clustering support. It provides the following features:

Active Load Balancing

This feature of the product causes the Workflow Engine and the Task Scheduler services on different servers to form a cluster and share the load. The workflow client always requests the least used server in the cluster for workflow execution. During the execution of a workflow, the Workflow Engine identifies a least used server and forwards the execution of that workflow to this server. However, this is true only for workflows executed in asynchronous mode. The load is shared uniformly by all the servers in the cluster leading to a true Active-Active load balancing environment.

Scalability

The number of servers running the Workflow Engine in a cluster can be increased or decreased depending on

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the number of workflow execution requests. After the configuration is done and the Workflow Engine is started, it automatically joins the cluster and starts sharing the load immediately.

Failover Capabilities

Any server running the Workflow Engine in the cluster can be safely shutdown or restarted without interrupting the execution of any workflows that may have been using that server. When a service is stopped or the server goes out of the network (following a shutdown or restart), all requests to that server are stopped. The other Workflow Engine services in the cluster will resume all pending tasks for the shutdown server.

Load Balanced Server Architecture

AVEVA Work Tasks uses its own clustering technology which allows real-time load balancing based on load on the server. It is managed either using the Multicast mode or the Database mode depending on the configuration done at the Farm level.

- Multicast mode: This uses multicasting UDP protocol to share the server status with other servers over a multicast IP and port at a regular interval.
- Database mode: This uses a database to store the server status of all the Enterprise Servers at a regular interval. All the servers keeps polling the data from the database to get the latest status of each server.

The Enterprise Server installation has a service called "Advance Server service" on each machine running the Load Balanced Server. This service acts as a Load Balancing coordinator between all the servers in the cluster, and continuously keeps communicating with the other Advance Server service running on other machines in the cluster. Services such as Workflow Engine, Task Scheduler, ArchestrA Mobile Notification Service, and Communication Service register themselves internally with this service to get health information about the cluster and provides their own health information to this service. This service performs the following operations:

- Monitoring CPU utilization of the server
- Monitoring health of each service such as Workflow Engine and Task scheduler in the given machine
- Broadcasts the health of each service to the entire cluster over a Multicast based UDP group using the Multicast mode or stores the information in the database using the Database mode. This broadcasting happens at a regular interval which is referred as the “Heart Beat”. So essentially the heart beat is important to determine how fast the cluster can respond to failures or respond to load pattern changes on the server (for example, high CPU utilization on the server).
- Whenever a new workflow execution is requested, one of the servers in the cluster decides which machine will execute it; based on the load on each of the servers. This server is called the “Authority server”. The Authority server role is not bound to any specific machine in the cluster, and any machine can become an Authority server in the cluster. This helps in scenarios where the Authority server itself goes down, since in such cases some other machine can play the role of an Authority server dynamically. The Authority server also makes some more decisions related to coordination of load balancing and failover in the entire cluster.
- If you select the Multicast option, it is recommended that a dedicated Network Interface Card (NIC) be present in the system as AVEVA Work Tasks uses Multicast-based UDP protocol for the cluster coordination. To have a dedicated Network Interface Card, UDP multicasting in the group and all the machines should be part of the same subnet. Network Switch used to connect all the servers for UDP multicasting must be configured to allow multicast packets.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Use of multicast or database to share the server status with other servers for such frequent messages greatly reduces load on the network and also allows the cluster to scale over multiple machines. The cluster can easily scale to even 4-5 machines and still allow true active-active load balancing.
- Each machine in the cluster communicates with the other machine in two modes. One mode of communication is the regular TCP/IP and the other mode is either by sending Multicast messages or polling data from the database at an appropriate point in time to exchange more specific data as and when required. In case a firewall exists between the servers it should allow broadcasting of both TCP/IP as well as multicast messages.

  Note: We do not recommend to have a firewall between machines in a cluster. The cluster can be setup behind a firewall.

- On AVEVA Work Tasks client machines (such as AVEVA Work Tasks Web Servers which are not having AVEVA Work Tasks Engine services installed, and are going to consume Workflow Engine services in a cluster), the Advance Server service plays the role of an assistant. The Advance Server service assists client APIs to determine which machine to connect in the cluster for the request. This allows fast identification of machine, rather than checking the health of cluster for each call, and also it has the most current state of the cluster. But this means in addition to machines which are participating in the cluster as Workflow Engine Role, even the client machine needs to have additional NIC and supporting network infrastructure to allow them to be part of the same Multicast group for consuming services from the cluster, when using the Multicast mode.

AVEVA Work Tasks Client Notification service which is responsible for monitoring incoming emails and SMS messages and File system events.

Database server can be a point of failure. It is recommended that the Database server is available with optimum performance.

Note: For Enterprise Server deployment, it is mandatory to have the date and time synchronization in all the Enterprise Servers running.

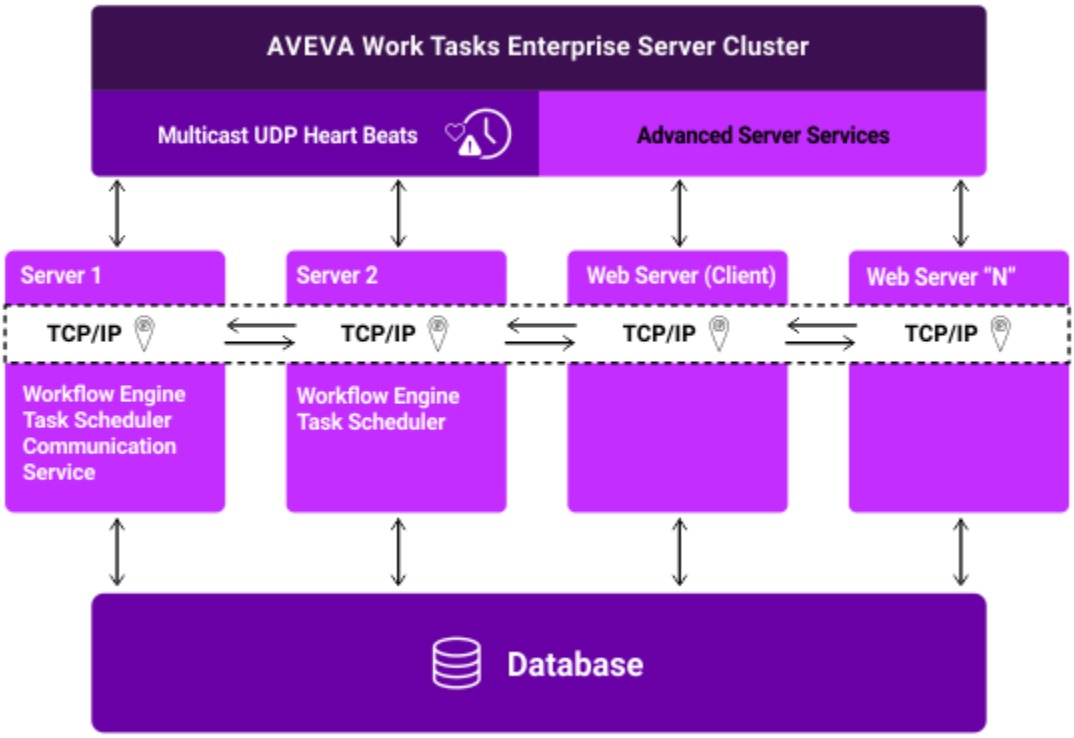
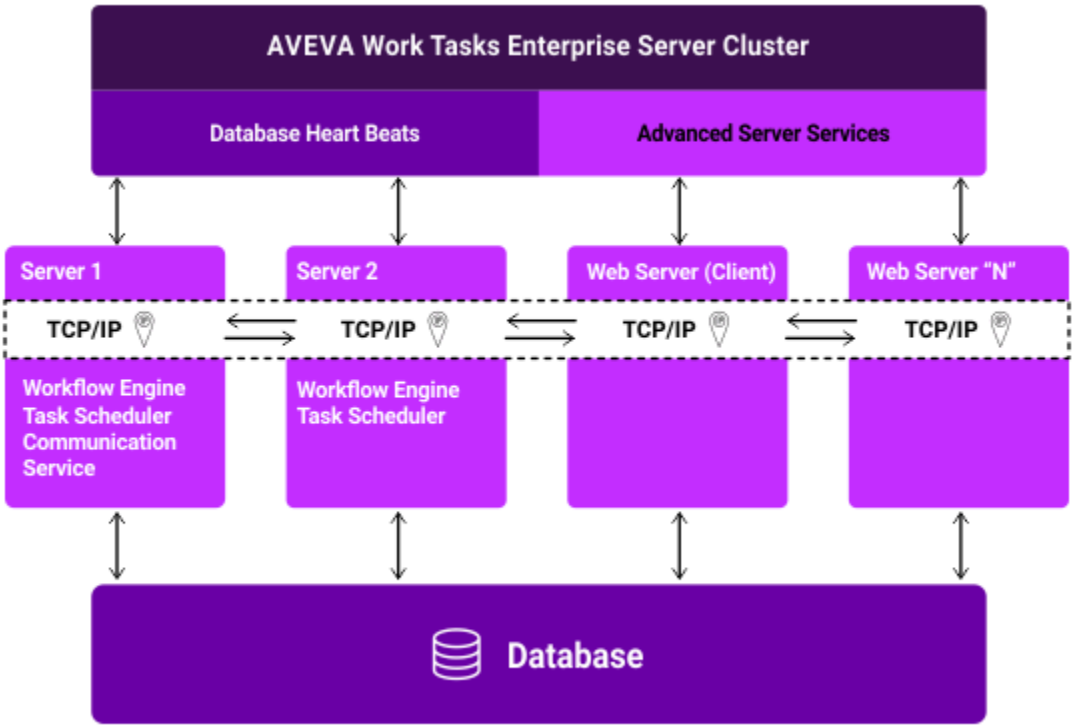
Multicast Mode



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Database Mode



Note:

- In a virtualization environment, the following conditions hold good for the Load Balanced Server:

- While performing the disaster recovery scenarios, you must configure the recovery plan for the virtual machines in the following order, the first being with the highest priority:
a. Server1
b. Server2
c. Client

Load Balanced Server Installation Scenarios

This topic lists the scenarios in which the Load Balanced Server can be installed. See one of the following scenarios to understand its description, the system landscape, advantages and disadvantages, and system requirements.

The scenarios are listed below:

- Web Server Farm with Clustered Work Tasks Services and Databases on Different Machines
- AVEVA Work Tasks Web Server Farm Connecting to AVEVA Work Tasks Services with AVEVA Work Tasks Databases on a Different Machine
- Single Server Capable of Adding Machines at Any Time

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Single Server Capable of Adding Machines at Any Time

In this scenario all the AVEVA Work Tasks components will be installed on the same machine. This setup supports scale-out and you can add more machines depending on the number of workflows that need to be processed.

Use this scenario if you want to scale your deployment gradually as and when the load on the AVEVA Work Tasks Server increases. This deployment also allows you to provide Failover and Load Balancing support after additional servers are added in the cluster.

For License related information, see About AVEVA Enterprise Licensing.

Role	Components Installed	Remarks

AVEVA Work Tasks Server	• Services

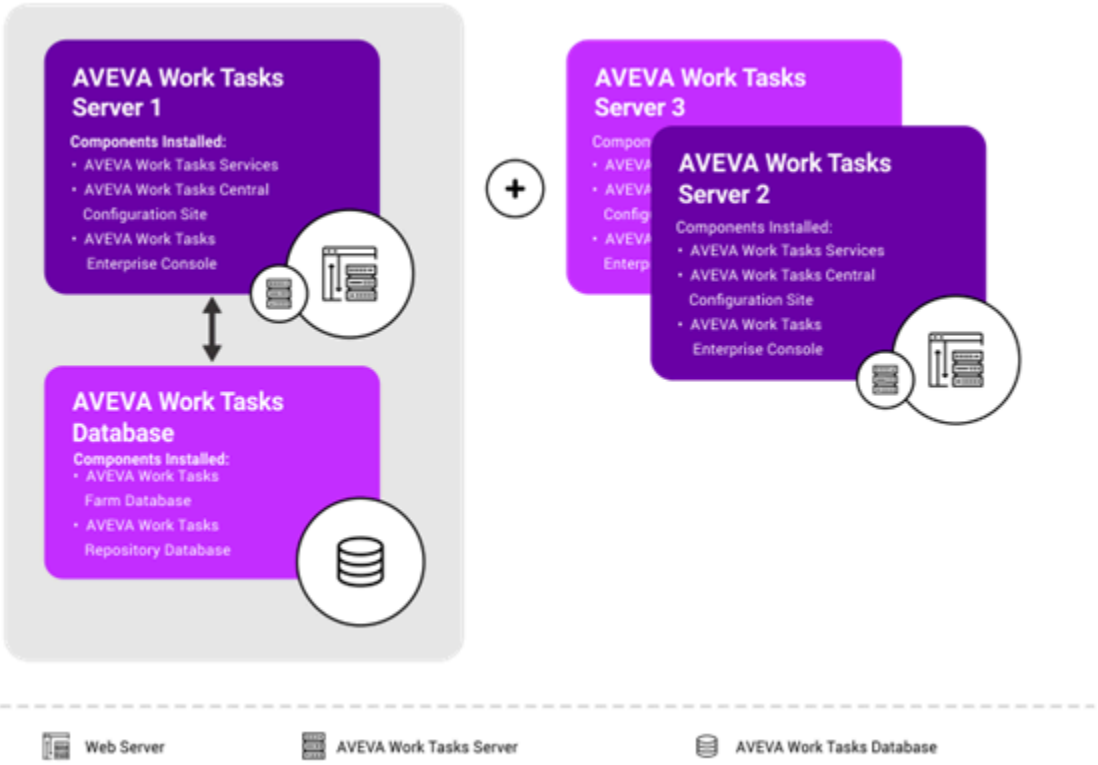
System Landscape



Advantages

- Cost-effective as machines with AVEVA Work Tasks Workflow Engine are added gradually depending on the load in a Production environment
- Supports Load Balancing if more than one machine is added

System Requirements

The hardware and software requirements apply to AVEVA Work Tasks Client and AVEVA Work Tasks Server systems. The system requirements are classified based on the requirements of the physical server.

Hardware Requirements

For information on AVEVA Work Tasks hardware requirement, see *AVEVA Work Tasks 2023 SP1 Release Notes*.

Software Requirements

For information on AVEVA Work Tasks software requirements, see *AVEVA Work Tasks 2023 SP1 Release Notes*.

Web Server Farm with Clustered Work Tasks Services and Databases on Different Machines

In this scenario, you have a AVEVA Work Tasks Web Server and AVEVA Work Tasks Services installed on the same machine. You can host this set up on multiple computers to form a AVEVA Work Tasks Web Server Farm with clustered AVEVA Work Tasks Services. The Databases are installed on a machine by itself. While scaling out, ensure that the machine has both the AVEVA Work Tasks Web Server and the AVEVA Work Tasks Services installed.

A AVEVA Work Tasks Cluster is a group of servers running AVEVA Work Tasks Services as a single logical entity. In a AVEVA Work Tasks Cluster setup only a single Communication service must be running.

For License related information, see About AVEVA Enterprise Licensing.

AVEVA Work Tasks Web Server Farm Connecting to AVEVA Work Tasks Services with AVEVA Work Tasks Databases on a Different Machine

In this scenario, you can maintain a AVEVA Work Tasks Web Server Farm with AVEVA Work Tasks Web Servers and a AVEVA Work Tasks Services cluster on separate machines while the the Databases are installed on a different machine. This deployment provides scalability and high availability of AVEVA Work Tasks Server and AVEVA Work Tasks Web Servers. This is achieved by distributing the load equally among all the machines in the cluster and the AVEVA Work Tasks Web Server Farm.

Multiple servers in the AVEVA Work Tasks Web Server Farm or the cluster run the same AVEVA Work Tasks services. Failure of a server does not impact other servers. You can take the affected server offline while the other servers maintain the service. This type of installation provides Failover. Thus allowing you to easily add or remove machines from the AVEVA Work Tasks Web Server Farm or from the cluster without affecting the execution of workflows.

This is the optimal scenario for heavy load conditions and can be considered if you anticipate heavy load on the Workflow Engine or the AVEVA Work Tasks Web Server.

For License related information, see About AVEVA Enterprise Licensing.

Role	Components Installed	Remarks

Software Requirements

For information on AVEVA Work Tasks Software Requirements, see *AVEVA Work Tasks 2023 SP1 Release Notes*.

Behavior of AVEVA Work Tasks Services on Enterprise Server

This section provides information on the activity of AVEVA Work Tasks Services when installed on the Load Balanced Server.

Workflow Engine and client

Whenever a workflow execution is requested by a client, the Advance Server service running on the client machine determines the least used AVEVA Work Tasks Engine machine and routes the request to that machine.

For workflow dehydrating from a sleep state, the execution request is actually sent to the machine where the last execution for that workflow had happened, if that machine is not active in the cluster at that point the event is routed to the least used machine using the Advance server service.

If a machine running a Workflow engine goes down in the cluster, the machine acting as an Authority Server takes over the pending workflows of that machine. Thus the Authority server provides high availability and maintains uninterrupted workflow execution.

Task Scheduler

Task scheduler engine has two main components, one which is responsible for monitoring the task for next possible execution and other being actual execution of these tasks.

Task scheduler service running on acting Authority server is the only instance of task scheduler service which is responsible for fetching tasks. Fetching tasks does not require any load balancing. However, failover is provided whenever the active Authority server goes down in the cluster. Another machine in the cluster takes the role of the Authority server and starts monitoring the task again.

For execution of tasks real load balancing is used, and execution is scheduled on the least used machine. This machine provides active-active load balancing with failover support.

Communication Service

AVEVA Work Tasks Service makes use of communication service settings for the following activities:

Wait for E-mail: The Workflow processes can be designed to be initiated or processed on receipt of email matching specified parameters. The Communication service monitors the specified port and IP for incoming emails that could be used in the Workflows. If default option is selected, email should be forwarded to all the Enterprise servers. Authority server will process the message and other servers will ignore it.

Note: In the Enterprise Server environment, Wait for Email activity can read file from the network shared path or from the Map network drive. To read the files, you must provide the relevant access rights for the Communication Service on network shared path or Map Network drive.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Wait for SMS: The communication service can be setup to monitor incoming SMS.

Note: Device must be connected to the authority server.
Sending SMS: The Workflows can send SMS through a Global System for Mobile communication (GSM) device. The Communication Service uses settings and configuration specified in this screen for sending SMS.

Communication service running as an acting Authority server is the only instance of communication service which is responsible for processing the email and SMS notifications. Failover is provided whenever the active Authority server goes down in the cluster. Another machine in the cluster takes the role of the Authority server and starts processing the notifications.

If you want to run the Communication Service under the Enterprise Server mode and the services are installed on different paths in the servers, you must do the following modifications at the database level:

1. Query the Communication Service Configuration property from the database:

```
SELECT Properties FROM dbo.SKServiceMapping with (nolock)
WHERE Name = 'SMTPNotificationEngine2' AND Id = 'XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX'
```

Update the properties of the XML returned as shown in the following query, removing the directory path.

Actual XML:

```
<properties><property key="listnerip"><![CDATA[ServerName]]></property><property
key="listnerport"><![CDATA[8770]]></property><property
key="taskhandlerpath"><![CDATA[C:\Program Files\AVEVA\Work Tasks\Bin\
Workflow.NET.EmailReceiver.NET2.dll]]></property><property
key="taskhandlerclass"><![CDATA[Workflow.NET.EmailReceiver.CDecisionHandler]]></property
><property key="mailserver"><![CDATA[Default]]></property><property
key="blockedmailaddresses"><![CDATA[]]></property><property
key="smtpserverip"><![CDATA[ServerName]]></property><property
key="smtpserverport"><![CDATA[25]]></property><property
key="pophost"><![CDATA[ServerName]]></property><property
key="popmailport"><![CDATA[110]]></property><property
key="popusers"><![CDATA[user1@domain.com|pwd]]></property><property
key="provideencryptedpwd"><![CDATA[false]]></property><property
key="poptimeinterval"><![CDATA[0.00:00:15]]></property><property
key="smsinterval"><![CDATA[0.00:01:00]]></property><property
key="smsreciever"><![CDATA[false]]></property><property
key="smstaskpath"><![CDATA[C:\Program Files\AVEVA\Work Tasks\Bin\
Workflow.NET.SMSReceiver.NET2.dll]]></property><property

><property key="mailserver"><![CDATA[Default]]></property><property
key="blockedmailaddresses"><![CDATA[]]></property><property
key="smtpserverip"><![CDATA[ServerName]]></property><property
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
key="smtpserverport"><![CDATA[25]]></property><property
key="pophost"><![CDATA[ServerName]]></property><property
key="popmailport"><![CDATA[110]]></property><property
key="popusers"><![CDATA[user1@domain.com|pwd]]></property><property
key="provideencryptedpwd"><![CDATA[false]]></property><property
key="poptimeinterval"><![CDATA[0.00:00:15]]></property><property
key="smsinterval"><![CDATA[0.00:01:00]]></property><property
key="smsreciever"><![CDATA[false]]></property><property
key="smstaskpath"><![CDATA[Workflow.NET.SMSReceiver.NET2.dll]]></property><property
key="smstaskclass"><![CDATA[Workflow.NET.SMSReceiver.SMSTimeoutTaskHandler]]></property>
<property key="smsprovider"><![CDATA[GSM|
Workflow.NET.SMS.Messenger.NET2.dll|Workflow.NET.SMS.Messenger.SMSReceiver|]]></property
><property key="isPOP3passwordencrypted"><![CDATA[false]]></property></properties>
```

2. Update the database entry with the modified XML.

```
Update dbo.SKServiceMapping
SET Properties = '<properties><property
key="listnerip"><![CDATA[ServerName]]></property><property
key="listnerport"><![CDATA[8770]]></property><property
key="taskhandlerpath"><![CDATA[Workflow.NET.EmailReceiver.NET2.dll]]></property><property
key="taskhandlerclass"><![CDATA[Workflow.NET.EmailReceiver.CDecisionHandler]]></property><prope
key="mailserver"><![CDATA[Default]]></property><property
key="blockedmailaddresses"><![CDATA[]]></property><property
key="smtpserverip"><![CDATA[ServerName]]></property><property
key="smtpserverport"><![CDATA[25]]></property><property
key="pophost"><![CDATA[ServerName]]></property><property
key="popmailport"><![CDATA[110]]></property><property
key="popusers"><![CDATA[user1@domain.com|pwd]]></property><property
key="provideencryptedpwd"><![CDATA[false]]></property><property
key="poptimeinterval"><![CDATA[0.00:00:15]]></property><property
key="smsinterval"><![CDATA[0.00:01:00]]></property><property
key="smsreciever"><![CDATA[false]]></property><property
key="smstaskpath"><![CDATA[Workflow.NET.SMSReceiver.NET2.dll]]></property><property
key="smstaskclass"><![CDATA[Workflow.NET.SMSReceiver.SMSTimeoutTaskHandler]]></property><proper
key="smsprovider"><![CDATA[GSM|
Workflow.NET.SMS.Messenger.NET2.dll|Workflow.NET.SMS.Messenger.SMSReceiver|]]></property><prope
key="isPOP3passwordencrypted"><![CDATA[false]]></property></properties>'
WHERE Name = 'SMTPNotificationEngine2' AND Id = 'XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX'
```

3. Restart the Communication service on all the servers.

Note: It is recommended that the Communication services for all the Enterprise Servers should have similar configuration.

Tools Used in Enterprise Server

In the Load Balanced Server, it is mandatory to check if all the machines (AVEVA Work Tasks Server and the Client) are able to communicate with each other before installation using **Multicast** protocol.

AVEVA Work Tasks provides a tool called **Multicast tool** which you can use to verify the multicast communication between machines on the same subnet. The Multicast tool ensures that all machines used for AVEVA Work Tasks Server installation are able to communicate with each other. This test ensures that all the Server machines involved can actively support Load Balancing and Failover support feature of the Enterprise Server.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Multicast tool can be copied on your local hard disk. To check communication between machines, the Multicast tool must be run simultaneously on all the machines.

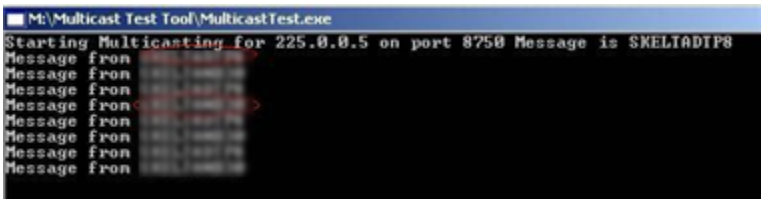
Messages received from all the machines are displayed by the Multicast tool indicating that the machines are able to communicate with each other. A machine not able to receive or display messages from other machines indicates that the machine is not able to communicate with other machines.

More details are provided in specific installation scenarios on how to use this tool.

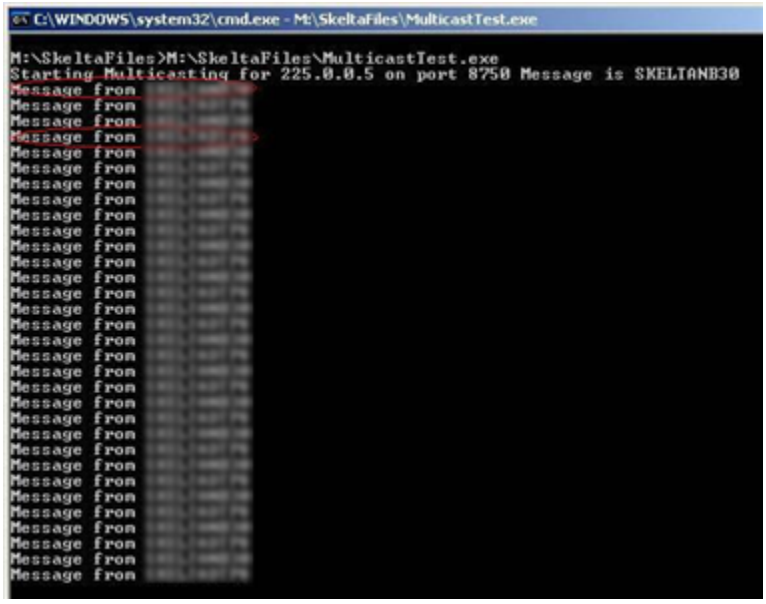
Example

The following example illustrates after running the Multicast tool from machines <ServerName1> and <ServerName2>.

The following image shows message from <ServerName1>:



The following image shows message from <ServerName2>:



The above figures indicate that there is a successful communication between <ServerName1> and <ServerName2> machines.

Load Balanced Server Limitations

The Load Balanced Server has the following limitations:

- File transfer action should not be used with the local path. Universal Naming Convention (UNC) path should be used in the load balanced environment.
- For Create Office - Document action, destination path should be UNC, FTP, or http. These destination paths ensure that all the Workflow Engines can perform file transfers without any issues.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Load Balanced Server Licensing Information

- All machines running the AVEVA Work Tasks Engine Service in a cluster will require a valid Load Balanced Server license. In a cluster environment, the AVEVA Work Tasks Client installation does not require a license.
- There is no count limit for the Concurrent workflow execution for a Load Balanced Server license.

Installing Different Editions

The following table lists the types of installation scenarios that you can use to identify your installation requirements and map them to the best-suited deployment.

Requirement	**Recommended Deployment**
Need to implement AVEVA Work Tasks solution in a production environment and at the same time secure the database.	For this requirement, you can consider any of the following scenarios: • Web server and AVEVA Work Tasks Server on computer1 and database on computer2. • Web server, AVEVA Work Tasks Server, and database on different machines For more information on these scenarios, refer to the scenarios section of Single Server.
Need fast response from Web servers under heavy load situations.	Web Farm (Multiple Web servers), AVEVA Work Tasks Server, and database on different machines is the scenario used for heavy load situations. For more information on this scenario, refer to the scenarios section of Single Server.
Heavy load anticipated on the AVEVA Work Tasks Server or on Web server - there is also a need to provide Load balancing and fail-over support.	Web Farm connecting to separate Services cluster with database on a different machine is the scenario best-suited for heavy load with load balancing and fail-over support. For more information on this scenario, refer to the scenarios section of Load Balanced Server Installation Scenarios.

Layout Editing Modes

Before you install AVEVA Work Tasks, ensure the following conditions are met

- Identify the roles to be performed by each server in your network. For more information, see Identifying Server Roles.
- Identify the authentication requirements for each server.
- List servers that are behind a firewall. Access to such servers would require the relevant ports to be opened.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

See Prerequisites before continuing with the installation.

Identifying Server Roles

A Server Farm comprises physical servers that run logical services. Physical servers are tangible machines. Logical services are installed on physical servers. Some logical services run on Web servers and others run on AVEVA Work Tasks Servers. Logical services are installed on one or more physical servers. The logical services running on a physical server determines the role of the server in the server farm.

Example:

The server running a database is called the database server.

The following table lists the server roles based on the application/services running on a server:

Applications/Services running on a Server	**Server Role**
Database applications	Farm Database Server and Repository Database Server
Workflow Engine, Task Scheduler, and Communication services	AVEVA Work Tasks Server
Advance Server service,Workflow Engine, Task Scheduler, and Communication services	Enterprise Server or Clustering Server
Central Configuration and Enterprise Console	Web Server

The number and kind of servers required to perform a particular role depend on many factors, such as the number of users, volume of data, and performance of the solution required.

Identifying User Source

A User Source is an external user database used to manage a user's identity. AVEVA Work Tasks supports the following User Source, which is an out of the box solution for user authentication:

- **Windows Active Directory Server**: This user source allows you to retrieve user related information from the active directory.
- **ASP.NET Membership**: This user source allows you to retrieve user related information from an ASP.NET membership provider. The ASP.NET membership provides a built-in option to validate and store user accounts. This user source thus helps you manage user authentication.
- **Forms**: Forms make it possible to retrieve user related information from another application database.
- **List**: These are out-of-the-box user sources provided by AVEVA Work Tasks. The Lists use the database for storing user information.

Apart from the above listed user providers, you can use a custom User Source too. User authentication enables users to participate in human activities that form a part of the AVEVA Work Tasks Workflow.

See Also

Architecture

Making Database Selection

For information on Database requirements, see *AVEVA Work Tasks 2023 SP1 Release Notes*.

Setting up Communication

AVEVA Work Tasks uses a variety of communication protocols such as e-mails to communicate with actors. An actor is a user who is responsible for a task or an activity.

AVEVA Work Tasks workflows can be initiated on receipt of e-mails. The workflows can also trigger e-mails, thus allowing actors to operate on processes from an email interface.

Integrating Email

The mail delivery channel in AVEVA Work Tasks allows the action items of human activities like Approval and Checklist to be sent by email to the intended recipient(s). The recipient of these emails can perform the required action from the Inbox of email clients like Microsoft Outlook.

See Also

Microsoft Outlook Integration

Setting up Ports

When AVEVA Work Tasks is configured with default settings, it installs Enterprise Console and Central Configuration on a default port. You can configure the solution to use other port numbers through the custom settings option using the the Farm Configuration Wizard. Ports configured for AVEVA Work Tasks must be opened for access through firewalls.

For more information, refer to Enable and Verify MSDTC.

You must configure the ports manually for Central Configuration and Enterprise Console to work in Mozilla Firefox. To configure the ports, add the line prefix ("`network.security.ports.banned.override`", "`port1,port2`") to "`C:\Program Files\Mozilla Firefox\defaults\pref\firefox.js`", where `port1` and `port2` represent the ports you need to browse.

The following table lists the default ports used by various services while running AVEVA Work Tasks:

Services	Port Type	Default Port number	Description
Advance Server Services with Multicast IP address 225.0.0.10	multicast port	8850	This port is used to check the connectivity between all the machines while running the Load Balanced Server.
	tcp port	8853	Communication between the Workflow Engine and the Advance Server

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Services	Port Type	Default Port number	Description
			service is established through this port. This port is used to get the status of the least used server, and also analyze server performance.
Workflow Engine	load balance server port	8853	This is the port on which the Advance Server service listens to the registration from other services.
	load balance client port	8859	This is the port on which the Advance Server client services listen to the events.
	port	8855	This is the port on which the Workflow Engine listens to client requests.
SMTP services	smtp port	25	This is the default port for sending e-mails.
Communication services	listener port	8770	-
	pop-mail port	110	This is the default port for receiving emails.
Task Scheduler services	load balance server port	8853	This is the default port for the Load Balanced Server.
	load balance client port	8860	This is the default port for the Load Balanced Client.
	port	8856	-
Service Monitor EXE	port	8866	This is the default port used by the AVEVA Work Tasks Service Monitor EXE.
License Server Port	port	55555	This is the default port used by the License Server. Ensure that you enter a valid port number.
Client service	listener port	8863	Default listener port for

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Services	Port Type	Default Port number	Description
			the Client service. This can be changed in **CentralConfig.xml** file located at the root of the installation folder.

The following table lists the ports used by AVEVA Work Tasks services, when the AVEVA Work Tasks Pro application is used outside Corporate Network.

Services	Port Type	Default Port number	Description
Workflow Engine	SB Over TCP	9350, 9351, 9352, 9353	This is the port on which the Workflow Engine communicates with Service Bus for the AVEVA Work Tasks Pro application.
Communication services	SB Over TCP	9350, 9351, 9352, 9353	This is the port on which the Workflow Engine communicates with Service Bus for the AVEVA Work Tasks Pro application.
Push Notification service	http port	80	This is the port on which AVEVA Work Tasks communicates with the Push Notification servers.
	https port	443	

Cookies Created by Web Application

The cookies created by Aveva Work Tasks Web application are listed in the table:

Name	Description
_instanceName	The cookie having the provider name information with encrypted value to which the user is logged in to the web application
_prov	The cookie having the provider internal name information with encrypted value to which the user is logged in to the web application
_provtext	The cookie having the provider display name information with encrypted value to which the user is logged in to the web application

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name	Description
_repo	The cookie having the repository or application name with encrypted value to which the user is logged in to the web application
_userinfo	The cookie having user information with encrypted value
skdatecorrectionfactor	The cookie created on the client-side to list the grid data based on the client's offset time
skpointerucontextinfo	The cookie created on server side with a dummy GUID. Used by the client-side for handling the closing of windows when a user logs-out of the application. This cookie is a pointer to the dynamic cookie skucontextinfo2token (in the current context), which can be referred to check whether the user is logged out of the application.
skucontextinfo2	The dynamic cookie created on server side for user context information with encrypted value
skucontextinfo2token	The dynamic cookie created on server side with a dummy GUID. Used by the client-side for handling the closing of windows when a user logs out of the application

Notes:

- All the cookies are HTTP Only, except for skdatecorrectionfactor, skpointerucontextinfo, and skucontextinfo2 (cookie name might vary as it is dynamic), as they are needed on the client-side and do not have any sensitive information.

- All cookies are secured if the web application is in a secure state.

Prerequisites

Before installing AVEVA Work Tasks, the installer installs the following system-specific prerequisites:

- Microsoft .NET Framework 4.8
- Enables IIS Feature
- Microsoft .Net 6.0.7 - Windows Server Hosting
- VS C++ Redistributable2022
- Operations Control Logger
- Platform Common Services 7.1.0
- Common Licensing API Framework

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- AVEVA Enterprise Licensing 3.7.002

AVEVA Work Tasks utilizes a server-based licensing subsystem that provides centralized license management. Licenses must be activated before use.

- License Manager and License Server should be installed separately from the **License Manager** and **License Server** folders respectively. These folders are available in the **AVEVA Enterprise Licensing** folder in the ISO file.
- The Configuration utility, which will be prompted after the 'AVEVA Enterprise Licensing API Framework' is installed, can be used for connecting to the AVEVA License Server. For more information, see AVEVA Enterprise License documentation.

Note:
- Copy the Installation EXE and ISSetupPrerequisites folder to the machine where you want to install AVEVA Work Tasks 2023 SP1 and then start the installation.

- If any of the above mentioned system-specific prerequisites are already installed, the installer skips installing that particular prerequisite component and proceeds with other prerequisites.

- If you install AVEVA Work Tasks on a system where prerequisite Microsoft .NET Framework 4.8 is not already installed, then the system will restart automatically after the installation of this prerequisite. To avoid system restart, install each of these prerequisites separately using the respective installers from the **ISSetupPrerequisites** folder.

- AVEVA Work Tasks needs .NET Core 6.0.7 or a newer version to be installed on the machine. Although the Work Tasks installer tries to install it as a prerequisite, if the .NET Core installation encounters any issues, the installation process will continue. However, it will be incumbent upon the customer to manually install .NET Core in such instances.

- If you are planning to install any application on the same machine that installs earlier version of the above prerequisites, then ensure to install that application before installing AVEVA Work Tasks.

- While installing AVEVA Work Tasks, if you opt to restart the machine after **Operations Control Logger**, **Platform Common Service**, or **Common Licensing API Framework** prerequisite installation,
-- Installation does not resume after a restart. Run the installer to continue the installation.
-- Common Licensing API Framework prerequisite installation might get skipped if you restart the machine after Platform Common Service prerequisite installation.
It is recommended not to restart the machine while installing Operations Control Logger, Platform Common Service, or Common Licensing API Framework prerequisites.

- PCS 4.7 is dependent on the following components in case PCS is getting installed. Regardless of which method you choose for integration, you need to ensure that the following components are installed before attempting to install the PCS Framework.
-- .NET Framework 4.8 Full or later
-- Visual C++ 2015 - 2022 Redistributable (x86 and x64). Use Universal C Runtime. (https://docs.microsoft.com/en-US/cpp/windows/latest-supported-vc-redist?view=msvc-170)
-- windowsdesktop-runtime-6.0.x-win-x64.exe (https://dotnet.microsoft.com/en-us/download/dotnet/6.0)
-- aspnetcore-runtime-6.0.x-win-x64.exe (https://dotnet.microsoft.com/en-us/download/dotnet/6.0)

Before you install AVEVA Work Tasks, ensure the following conditions are met:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- System requirements are met as mentioned in the respective installation scenarios of Editions.
- AVEVA License Server is available.
- A user profile with a dbcreator account has been created for configuring the product. A Database Connection Errors while Installing Farm is required for the server on which the Workflow Engine service is installed.
- Microsoft Distributed Transaction Coordinator (MSDTC) service and configurations are enabled on your system. This is a mandatory process before installing AVEVA Work Tasks. For enabling this service, see Enable and Verify MSDTC.
- The various scenarios for installing AVEVA Work Tasks Products have been read and understood. For information about the various scenarios, see Editions.
- The computer name does not contain underscore(_). See http://support.microsoft.com/kb/909264 to view the list of characters that are not allowed for naming conventions of the computer.
- The **ISSetupPrerequisites** folder is copied along with the Installation EXE.

Additional Prerequisite for Enterprise Server

Ensure that the multicast tool is running on your computer. This tool is required to test your computer before installing the Load Balanced Server. For more information about the multicast tool, see Tools Used in Enterprise Server.

Prerequisite for Connecting to Oracle using Database Connection

You can connect to Oracle Database 12c, 18c, or 19c using the Database Connection option. However, ensure to install Oracle Client on your machine.

Note: When you upgrade the product from earlier versions to AVEVA Work Tasks 2023 SP1, copy **TNSNAME.ORA** file from <Oracle Installation path>\NETWORK\ADMIN folder to the folders:
- *C:\Program files\AVEVA\Work Tasks\Bin*
- *C:\Program files\AVEVA\Work Tasks\Web\EnterpriseConsole*
- *C:\Program Files\AVEVA\Work Tasks\Web\EnterpriseConsole\Bin*

Configure Internet Information Services

Before you install AVEVA Work Tasks, you must install and configure Internet Information Service (IIS).

IIS must have the following features enabled:

- .NET Extensibility
- ASP.NET
- ISAPI Extensions
- ISAPI Filters
- Request Filtering
- Windows Authentication
- Static Content
- HTTP Activation

Note: HTTP Activation option is enabled automatically upon installation of Microsoft .NET Framework 4.0

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

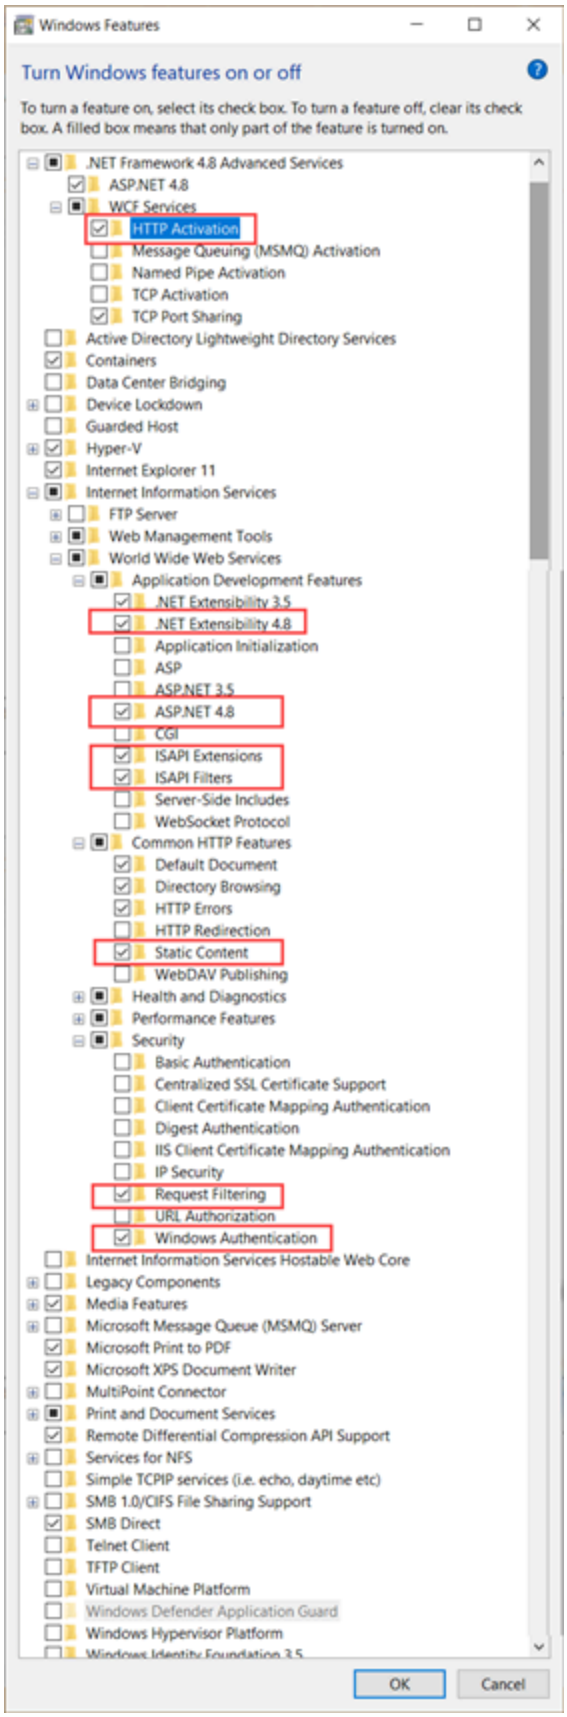
and above versions. If it is disabled, then you must enable this option manually.

Enabling features to configure IIS

Note: The above listed features are enabled when you run the Farm Configuration Wizard to configure the server/client machines for AVEVA Work Tasks. However, if those features are not enabled, you need to enable manually in the **Windows Features** dialog box.

- To enable features, open the **Control Panel**, click **Programs and Features**, and then click **Turn Windows Features on or off**. Select the features in **Windows Features** dialog box to configure IIS.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Enable and Verify MSDTC

AVEVA Work Tasks internally uses System Transactions APIs of Microsoft to perform transactions. These transactions require the MSDTC service to be configured between the database server machine and all other machines in the farm. The MSDTC service ensures that a transaction succeeds or fails as a complete unit. This is a mandatory step. AVEVA Work Tasks must be installed only after enabling the MSDTC service on your computer. Enabling MSDTC is a two-step process. You need to enable the MSDTC service before enabling MSDTC settings.

Steps to Enable MSDTC Service

1. On the Windows **Start** menu, click **Control Panel.**

   The Control Panel Items window appears.
2. Click **Administrative Tools**.
3. Click **Component Services**.

   The Component Services dialog box appears.
4. Select **Services**.

   The right pane lists all the services on the computer.
5. In the **Name** column, select **Distributed Transaction Coordinator**.
6. Check the status of the service.
7. If the **Status** column shows blank, right-click the selected service, and then click **Start**.

   The service gets started.

Note: Enable MSDTC service and MSDTC settings on the Database Server computer and on all the computers used to connect to the database server.

DTCTester Tool

The MSDTC connection settings can also be checked using the DTCTester tool. This tool is provided by Microsoft. Check for the availability and download from Microsoft download site.

The DTCTester tool does the following:

Establishes a connection to SQL Server using a data source name (DSN), User Name, and Password. You can establish this connection via a command line, using the default network library.

1. Creates a temporary table.

1. Enlists the connection in a transaction.
2. Does an insert on the temporary table.
3. Commits the distributed transaction.
4. Selects inserted value to make sure it was committed.
5. Closes the connection.

Steps to Use the DTCTester Tool:

1. Create an ODBC data source for your SQL Server through the ODBC utility in Control Panel.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Run the following from the command line:

   ```
   dtctester <dsn name><user name><password>
   ```

3. Replace the values in brackets as appropriate for your environment.

   The following table lists the ports to be opened for DTC:

Port Number	Purpose
135	RPC EPM (end point mapper)
1433	TDS SQL traffic when using TCP/IP
1434	SQL 2000 Integrated Security
5100 - 5200	MSDTC (Dynamically assigned a port by the EPM)

See the Microsoft website for updated list of suggested ports.

MSDTC Troubleshooting Articles

1. How to troubleshoot connectivity issues in MSDTC using the DTCPing tool?

   http://support.microsoft.com/kb/918331

   This article describes how to troubleshoot connectivity issues in Microsoft Distributed Transaction Coordinator (MSDTC) by using the DTCPing tool.

2. How to use DTCTester tool?

   DTCTester tests a distributed transaction against a specified Microsoft SQL Server. This tool helps to test distributed transactions across firewalls or against networks. DTCTester performs distributed transactions by using ODBC API against a SQL Server database.

3. Distributed Transactions Operations Guide

   This operations guide provides administering, configuring, managing, and monitoring information for distributed transactions in Microsoft Windows operating systems.

   See the following pages in the *Distributed Transactions Operations Guide*:

   Administering Distributed Transactions

   Troubleshooting and Resolving Transactions

4. Configuring Microsoft Distributed Transaction Coordinator (DTC) to Work through a Firewall

   http://support.microsoft.com/kb/250367

   This article describes how to configure Microsoft Distributed Transaction Coordinator (DTC) to work through firewalls. You can configure DTC to communicate through firewalls, including network address translation firewalls.

For more information on MSDTC troubleshooting, refer https://stackoverflow.com/questions/673806/msdtc-how-many-ports-are-needed.

Configure Oracle Data Handler

Before connecting to Oracle Database 12c, 18c, or 19c using the Database Connection option, you should install Oracle Client on your machine and configure AVEVA Work Tasks Oracle data handler as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Copy **TNSNAME.ORA** from **<Oracle Installation path>\NETWORK\ADMIN** folder to
   - **<AVEVA Work Tasks Installation Path>\Bin** folder
   - **<AVEVA Work Tasks Installation Path>\Web\EnterpriseConsole** folder
   - **<AVEVA Work Tasks Installation Path>\Web\EnterpriseConsole\Bin** folder
2. Include **TNSNAME** configuration in the Enterprise Console **web.config** file (this is applicable for all Enterprise Consoles where Oracle data access is required).

```
</system.web.extensions>
<oracle.manageddataaccess.client>
<version number="*">
<dataSources>
<dataSource alias= "<Connection name/SID> descriptor="(DESCRIPTION=(ADDRESS_LIST
=(ADDRESS = (PROTOCOL = TCP)(HOST = < Fully qualified host name as in TNSNAME.ORA>)(PORT
= 1521)))(CONNECT_DATA =(SERVICE_NAME = < Fully qualified service name as in
TNSNAME.ORA>)))" />
</dataSources>
<edmMappings>
<edmMapping dataType="number">
<add name="bool" precision="1"/>
<add name="byte" precision="2" />
<add name="int16" precision="5" />
</edmMapping>
</edmMappings>
</version>
</oracle.manageddataaccess.client>
</configuration>
```

If the above configuration gives error while loading Enterprise Console, then include the following configuration in the Enterprise Console **web.config** file:

```
<configSections>
    <section name="oracle.manageddataaccess.client"
     type="OracleInternal.Common.ODPMSectionHandler, Oracle.ManagedDataAccess,
Version=4.122.18.3, Culture=neutral, PublicKeyToken=89b483f429c47342"/>
  </configSections>
```

Note:
- In case of multiple Enterprise Consoles or the Enterprise Server, ensure you configure for each Enterprise Console and Server.

- When you upgrade the product from earlier versions to AVEVA Work Tasks 2023 SP1, copy **TNSNAME.ORA** file to the folder:
- *C:\Program files\AVEVA\Work Tasks\Bin*
- *C:\Program files\AVEVA\Work Tasks\Web\EnterpriseConsole*
- *C:\Program Files\AVEVA\Work Tasks\Web\EnterpriseConsole\Bin*

Install Single Server

Complete the installation tasks for the scenario that matches your configuration.

The Single Server supports the following scenarios:

- Single Machine Installation

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Web Server and AVEVA Work Tasks Server on Different Machines
- Web Server, AVEVA Work Tasks Server, and Database Server on Different Machines
- Web Farm (Multiple Web servers), AVEVA Work Tasks Server, and Database on Different Machines
- Intranet and Extranet Web Servers on Different Machines

Single Machine Installation

This section describes the activities involved while installing the Single Server for the Single Machine scenario.

Before installing ensure that all the Prerequisites are taken care of.

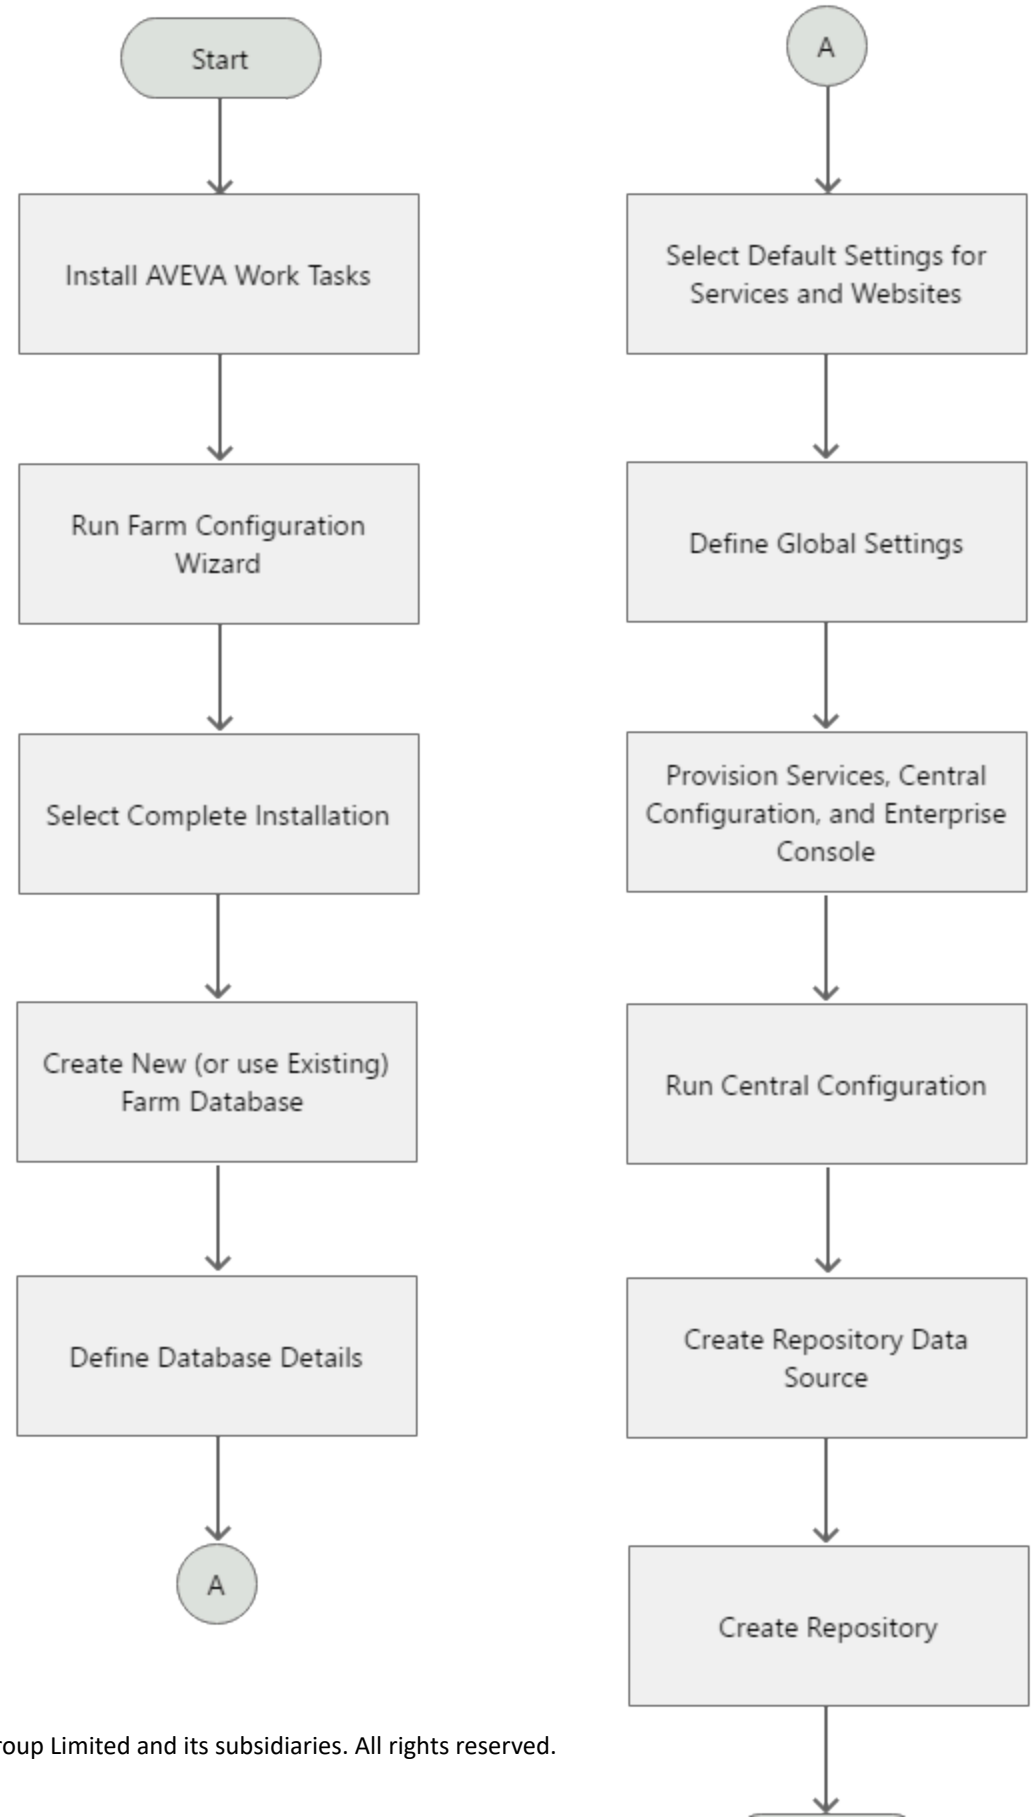
See Also: Deployment of AVEVA Work Tasks Web Server, AVEVA Work Tasks Server, and AVEVA Work Tasks Database Server on a Single Machine

High-Level View of Installation

Before continuing with the installation it is presumed, that you have read and understood the Prerequisites section.

The following flowchart illustrates a high-level view of the various installation steps with an overview of the various activities involved while installing AVEVA Work Tasks . Using this flowchart you can visually keep track of your activities while following the sequence of tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation

This section provides installation steps for the Single Machine scenario.

In this scenario, AVEVA Work Tasks Server is installed on a single machine.

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
4. Click **Next**.

   The License Server details are configured successfully.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.
4. Click **Next**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Edit Farm Settings** window appears.

5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.

6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.

9. Click **Next**.

   The License Server details are configured successfully.

Select the type of installation

To select the type of installation:

1. In the Select the type of installation page, select **Complete Installation (Server)**.

   A Complete Standalone Deployment does not require a client installation.

2. Under **Create AVEVA Work Tasks Farm**:
   - Click **Create AVEVA Work Tasks Farm database** to create a new Farm database.
   - Click **Use existing AVEVA Work Tasks Farm database (Creates AVEVA Work Tasks Farm tables only if they do not exist)** to use an existing database as the Farm database.
3. Click **Next**.

Create Farm Database

Use the Create AVEVA Work Tasks Farm Database page to provide **New Database** details. Select the **Connection String** option to establish a connection with the database. This connection information is encrypted and stored.

You can enter either Windows or Microsoft SQL Server user settings for authentication.

Note:
- The Farm database password does not support **&** and **;** special characters.
- While setting up **Farm Database** with **Windows Authentication**, do not enter **FQDN** in the **Domain Name** field.

To Create Farm Database

1. Enter **Database Title**.
2. Select **Connection String**.

   See *Connection Provider* later in this topic, if you have selected the **Connection Provider** option.

   - Enter the following details:

     Server Name:

     Provide information about the database server on which the Farm database can be installed.

     If the **Database Type** is **SQL Server**, then you can specify an IPv6 address for the **Server Name**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If SQLExpress Instance need to be used as a Database instance of the Farm database, then **Server Name** should be <server name>\SQLExpress.

To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

- **Authentication Type**

  This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports Windows and SQL Server authentication process.

  Example: Windows
  If Windows Authentication is selected, the user configured for the Farm configuration will be used to access the database. This is the authentication recommended by AVEVA Work Tasks.

- **Login**

  This field is used to enter the SQL login credential for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

- **Password**

  This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

- **Advanced Settings**

  This is an optional field. It is used to enter any additional connection information, such as connection Timeout. Example: Connection Timeout = 20.

  While creating a data source for repository, use the following custom settings to set properties for connection pool. These settings are case sensitive and should be mentioned only in lower case.

  ```
  encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
  ```

  encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

  enableltm: AVEVA Work Tasks internally implements light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive. This property can be used to turn off this feature. The default value is set as True.

  connectionretrywaittime: While opening a new connection, if the data base server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

  maxconnectionretries: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

  sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

3. Click **Test Connection** to ensure database connectivity.
4. Click **Next**.

   The message *AVEVA Work Tasks Farm is Created* appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Click **OK**.

AlwaysOn Availability Groups feature of Microsoft SQL Server

The **AlwaysOn Availability Groups** feature of Microsoft SQL Server is a high-availability and disaster-recovery solution that provides an enterprise-level alternative to database mirroring. Introduced in Microsoft SQL Server 2012, AlwaysOn Availability Groups maximizes the availability of a set of user databases for an enterprise.

After you configure the AVEVA Work Tasks, you must add the created Farm Database to the SQL Server AlwaysOn Availability Groups. Contact your Database Administrator to add the database to SQL Server AlwaysOn Availability Groups.

Notes:

- The authentication user needs different rights assigned for different scenarios. If a user wants to create database (Farm or Repository Data Source Database), Authentication User needs to have minimum 'dbcreator' access rights on Database Server Instance.

- If database is already created, user needs to have following permissions on Database Server:

- SELECT, INSERT, UPDATE, and DELETE permissions.

- EXECUTE permission for Stored Procedures.

To choose Connection Provider

Complete the following steps to choose a connection provider:

1. Enter **Database Title**.
2. In the **Database Type** box, select a database type.
3. Select **Connection Provider**.

   This option is used to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.
4. Enter the following details:
   - **Assembly Path**:

     Click the icon to browse and choose the required dll file.

     If custom properties (enableltm, connectionretrywaittime, maxconnectionretries and sqlcommandtimeout) are required to be used in Assembly connection string, then user should select **Use existing Farm database** while creating a the Farm. See Creating or Using an Existing Database.

     See the topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub chapter in the *Build Business Process* section for creating the assembly. Make sure that, there should be only one class implementing *IDBConnectionString* interface within this assembly.
5. Click **Test Connection** to ensure database connectivity.
6. Click **Next**.
7. The message *AVEVA Work Tasks Farm is created* appears.
8. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Define Security Settings

You can define the Security Settings using the Farm Configuration Wizard.

For more information on Security settings, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client.

To define the Security Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Security Settings** and **Service Settings** and then, click **Next**.
4. Select **Secure Communication** to establish secured communication between the AVEVA Work Tasks services through HTTPS.
5. Select **Secure Web Sites** check box to configure secured web sites. Uncheck the **Secure Web Sites** check box to use HTTP sites. By default the sites are created in HTTPS mode.
6. Enter the Port number. The default port for the HTTPS site is 8001, and for the HTTP site is 8000. You can enter any port number that IIS accepts. But if any other services or applications are already using the entered port number, AVEVA Work Tasks will not start.
7. Select the available certificate from the **Certificate** list. If your certificate is not listed, click the **Refresh** icon to repopulate the list.

   Note: If the required certificate is not listed, generate one using the System Management Server (Configurator tool). Do not use a self-signed certificate without a proper root chain.
8. Click the **Validate** button to validate the certificate before configuring the security settings.

   Note: An Internet connection is needed to validate the certificate.
9. Click **Configure**, then **Next**, and then **Finish** to apply the new security settings.

Note:
- To update the port number, certificate, and websites from unsecure to secure or vice-versa, select **Security Settings** and **Service Settings** check box in **Edit AVEVA Work Task Farm Settings** window before updating the values. After the required details are provided, these settings get updated only when you click **Configure**, then **Next**, and then **Finish** as you navigate through the Farm Configuration Wizard..
- If the Quickflow is already deployed on a machine, you need to deploy it again after you update the security settings. If secured web site is configured, then you cannot change the server configuration for Quickflow in Central Configuration. However, if the **Secure Web Sites** checkbox is not selected, you can make the changes to the server configuration.
- Advance Server communication cannot be configured on HTTP/HTTPS.
- For resources of Load Balanced Server, ensure to configure all services with the same protocol (HTTP or HTTPS).
- It is recommended to use Standard SSL certificate instead of self-signed SSL certificate.

Using ASB Certificate for Secured Communication

ASB Certificate is a PCS-managed SSL certificate and renews automatically every 30 days when the certificate is still valid. The certificate is valid for two years. The PCS watchdog service on the runtime node checks the validity

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

of the SSL certificate within 5 minutes from when it starts and once a day. PCS also renews the SSL certificate if it is expired.

If the runtime node is offline and later back online, the PCS watchdog service regularly checks the certificate validity and renews it if it is required. Consider restarting the PCS watchdog service to enforce the SSL certificate validity check within 5 minutes from the restarting time.

Furthermore, when the SSL certificate is renewed, PCS binds it to port 443 (by default) and changes the SslThumbprint PCS registry value. If AVEVA Work Tasks sites are hosted on port 443, certificate binding will be auto-renewed when the SSL certificate is renewed. It is recommended to check the bindings in IIS with every certificate renewal to ensure the application is running seamlessly.

To disable the certificate renewal, consider disabling the **ArchestrA Certificate Renewal Service** windows service.

Note: Client Service will try to automatically bind the renewed certificate. If there are any issues in browsing the website or starting the services after certificate renewal, users need to reconfigure the secure communication in Farm Configuration. To reconfigure, see the steps mentioned in above section *To define the Security Settings*.

Securing Communication between Services

To have a secure communication between the services, apply the below changes to the Windows registry and reboot the server:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
```

For more information on securing communication, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client and

https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2015/2960358.

Define Services and Global Settings

You can define the Services and Global Settings using the Farm Configuration Wizard or through Configuration XMLs.

To define Services

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: You can also customize the settings for these services and websites using the **Custom Settings** option. For more information about Service-related changes and Website-related changes, see Advanced Settings and Administering Web Servers respectively.

2. Click **Next**.

   The Global Settings dialog box appears.

3. In the **Communication** tab, enter key fields in **Email Settings** and **Exception Email settings** to configure exception e-mails.

   The following are the details:

   - **Host**: Enter information related to mail server.
     Example: Enter details related to Microsoft Exchange Server (IP address of the exchange server).
   - **Port**: Enter the port number for the mail server. The default port number is 25.
   - **From email**: Enter the from e-mail address.
     Example: admin@telematics.com
   - **To email**: Enter the to e-mail address.
     Example: alex@telematics.com

4. Click **OK**.

Note: To confirm the exception e-mail settings, click **Test SMTP**. An e-mail will be generated and sent to the **To email** address confirming successful configuration of the e-mail. The advanced settings like **Secure Socket Layer (SSL), Email Timeout, User Name,** and **Password** for the e-mail account holder, **Password Encrypted** flag will differ based on the mail server settings.

Provision Services

While the installation is in progress, you can view the services that will be installed. This provides information on the progress of installation. At the end of the installation, a status indicating the completion of installation appears.

- Click **OK** to complete the installation.

Create a Repository DataSource

A **Repository DataSource** is used to store all repository related data. The **Repository DataSource** must be created on a machine where the **Central Configuration** site is installed.

Example

A TelematicsDataSource is created for TelematicsHR Repository.

A Repository contains Workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating the repository.

To create a Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**.

   The Central Configuration web page appears.

2. Click **DataSource Settings**.

   The Datasource List page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Click **Add**.

   The Manage Datasource page appears.

4. Enter the required details.

   a. **Name**: Enter a valid data source name. Example: *TelematicsDataSource*.

   b. **Description**: Enter a description for the data source. Example: *This data source is used to store connection details*.

   c. **Connection String**: Select this option to establish a connection with the database. The connection string contains fields that that defines the connection. The connection information is encrypted and stored.

   Server Name

   To use a database on the local machine, enter "localhost", ".", or the local computer's name for the **Server Name**.

   Note: Server Name can be machine name/IP address/SQL Server AlwaysON/SQL Server instance name. Instead of entering "local host", it is preferable to give the local machine name.

   If the **Database Type** is **SQL Server**, then specify an IPV6/IPV4 address for the **Server Name**.
   To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: *localhost,1455*
   To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be *<server name>\SQLExpress*.

   Authentication Type

   Use this field to determine the process to validate a user who is trying to connect to the database. AVEVA Work Tasks uses Windows and SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. The **User ID** and **Password** field is disabled if Windows Authentication is selected. Example: *Windows*

   Advanced Settings

   Use this field to define advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection.
   Example: *Connection Timeout = 20*
   or
   For defining maximum connections that can be opened in a connection pool.
   Example: *max pool size = 250*
   Default connection pool is set as 250. We recommend to enter a higher value on heavily loaded environment.
   While creating a data source for a repository, use the following custom settings to set properties for the connection pool.
   encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
   encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.
   enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature, AVEVA Work Tasks controls the transaction from escalating to an expensive distributed transaction.
   The above property can be used to turn off this feature. The default value is set as *True*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is 30 seconds. The value should be set in seconds.
maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is infinite.
sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.
These settings are case sensitive and should be mentioned only in lower case.

Database:

Specify or select a database that can be used as a repository database. This database stores all repository related data. The repository database is created if it does not exist on the database server instance.
Example: *TelematicsDB*

Enable Table Partitioning:

Select to enable database table partitioning. For more information, see Partitioning Database.

d. **Connection Provider**: Use this to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.

The selected dll must be copied to all the machines, all servers and all clients, that are connected to the current Farm.

Assembly Path

Click to browse and choose the required dll file.
To use custom properties (enableltm, connectionretrywaittime, maxconnectionretries, and sqlcommandtimeout) in the Assembly connection string, the database must be created before.
See *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Developer Guide* for creating the assembly. Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.

   A message about successful test connection appears.

6. Click **OK**.

   A message about successful creation of the data source appears.The message also states that the required tables will be created in the data source after a repository is associated with the data source.

When a data source is saved, an entry is created for the data source in the **Farm Database**. When a first repository is created for the data source, AVEVA Work Tasks tables are added to the data source. While creating a data source, the archival database is created with the same database name suffixed by *_BI*. This database is used for archival in future use.

Note: After you configure the AVEVA Work Tasks, you must add the created **Farm Database** to the **SQL Server AlwaysOn Availability Groups**. Contact your Database Administrator to add the database to **SQL Server AlwaysOn Availability Groups**.

To view the data source created, click **DataSource Settings** link.

Create a Repository

A **Repository** contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

To create a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The Central Configuration page appears.
2. Click **Repository Settings**.
   The Repository List page appears.
3. Click **Add**.

   Note: If the number of repositories exceeds the permitted limit for the license, then the message "You have exceeded the maximum number of repositories" appears, and the repository creation is stopped. Click **Close**.

   The **Manage Repository** page appears.
4. Enter the required details.
5. Click **OK**.
   The **Config Administrator** page appears.
6. Click to configure an administrator.
   The User Lookup dialog box appears.
7. Select the provider from the provider drop-down list.
8. Enter the details to search the administrator for the repository that is created.

   Note: You can also search a user based on *ObjectSID* and *objectGUID* (applicable only for Active Directory provider).
9. Click **Search**.
   The user is listed under **Available Resources**.
10. Select and click the arrow to list the user under **Selected Resource**.
11. Click **Update**.
    The selected user is displayed in **User Lookup**.
12. Click **OK**.
    A message confirming the successful creation of an administrator appears.
13. Click **OK**.
    The **Repository List** page appears.
    For more information about configuring the system user, see Configure System User.

Manage Repository Window Fields

The following table explains the fields of the Manage Repository window:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Repository DataSource	Lists all the data sources created in a Farm. The selected data source will be used to store data for the current repository.	TelematicsDatasource
Attach DataSource	Select Attach DataSource checkbox and then select a repository from the selected DataSource .Data associated with the selected repository will be copied to the new repository. The version of the installed product and destination DataSource should be the same as that of the DataSource from which the repository data is to be copied. For example, in an upgraded environment, from build Work Tasks version 1 to Work Tasks version 2, you cannot attach a DataSource created in build Work Tasks version 1 to build Work Tasks version 2. To match the build version of the installed product to the version of the DataSource: 1. If the DataSource was created in build Work Tasks version 1, then the entire build Work Tasks version 1 must be upgraded to Work Tasks version 2 by running the product installer in the upgrade mode. 2. All the Farm, DataSources, Repositories, and Lists of build Work Tasks version 1 must be upgraded to build Work Tasks version 2 by running the AVEVAWorkTasksUpgradeManager.exe located at the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder. 3. After upgrading all the AVEVA	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	Work Tasks components to build Work Tasks version 2 build, that DataSource can be used in any machine that has same version by using this feature.	
Repository Name	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the repository name.	Telematics Repository
Description	Provide a description for the repository.	This stores Telematics Employee Leave Details.
From mail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might occur in the Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be sent to the mail ID defined in **Exception to mail**. The From address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To avoid this, restart the Workflow Engine Service and Communication Service.	Provide the valid email id that is specified in the **User Name** field while configuring **SMTP Settings** in the **Mail Server Settings** page. For more details, see Mail Server Setting.
Exception to mail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails is sent to the email ID specified in **Exception to mail**.	Provide the valid email id.
Alert initiator of the Workflow	Determines if the status of a	A process with a rule to check the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	workflow should be sent as a notification mail to the initiator of the workflow.	pending leave available for the employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
Servers	Lists the servers available in the Farm. Repository will be available only to the mapped servers.	Work Tasks Server Name
Enterprise Consoles	Lists all the Enterprise Consoles for a selected AVEVA Work Tasks Server. Repository will be available only to the mapped Enterprise Console.	http://worktaskservername:8001/EnterpriseConsole
Enable Theme	Select this checkbox to enable the defined theme.	-
Theme Name	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. It provides **Default** and **Lite** themes.	-
Resource Provider	Lists the various default resource providers supported by AVEVA Work Tasks. Resource providers are also termed as User Provider. A User Provider is a data store containing information about the user. AVEVA Work Tasks also supports custom resource provider. For more information about Resource Provider, see User Providers. AVEVA Connect and Azure Active Directory resource providers are also available after you configure them. To configure these providers, see AVEVA Connect Settings and Azure Active Directory Settings. AVEVA Work Tasks allows secured LDAP configuration. The default	AVEVA Work Tasks Lists or Active Directory

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	port number for LDAPS is 636. You can map the repository in IDE and use the Secured LDAP. The logged-in Active Directory is displayed by default, and **Active Directory Datasource** expects **LDAP://** or **Fully Qualified Domain Name** as value.	
Custom Application Folder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with a semicolon.	-
Hide Repository	Select this option to make the repository unavailable to the Farm.	-
Source path	Enter the path to the Source Elements Folder.	-
Attachment Storage Path	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an absolute path. - The default path is the **Attachments** folder in *C:\ProgramData\AVEVA Work Tasks*. - The default path is used when no path is specified. - Ensure appropriate rights are set to the folder, where attachments are stored, for the following identities: -- The application pool identity for **Central Configuration** and **Enterprise Console(s)**. -- The account configured for the **Workflow Engine** service. - In case of mapped drives, ensure they are available to the identities. - In multiple-server environments, the path specified must be in a shared location.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Auto Log Off Settings for Enterprise Console	Automatically logs out the logged in user after the designated period of inactivity. Enter the time in minutes. This field accepts only valid integer values between 0 to 360. 0 minute means the user will not get automatically logged off. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. The default value for automatic log off is 30 minutes. You use this field to define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML.	0 to 360 (minutes)
Auto Log Off Settings for AVEVA Work Tasks Pro	Request for user credentials for AVEVA Work Tasks Pro app after the set time is elapsed. Enter the time in minutes. This field accepts only valid integer values between 0 to 2880. 0 minute means the user will not get automatically logged off. The default value is 30 minutes. If AVEVA Work Tasks Pro app is offline, the Auto Log Off will not get active, and the user will not be automatically logged off as per the defined settings.	0 to 2880 (in minutes)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Offline Support	Select this option to enable offline submission of items in AVEVA Work Tasks Pro app.	-
Refresh on Work Item submission	Select this option to enable Inbox refresh on Work Item submission in AVEVA Work Tasks Pro . Refresh option is enabled by default.	-
Timeout	Enter the time in seconds to set the timeout. If the value is set as 0, then there is no timeout. Default value is 60 seconds.	-
Label for Fill Form	Enter the label for Fill Form. The customized label will be displayed for the Fill Form in AVEVA Work Tasks Pro.	Work Tasks
Date Configuration Flag for Alternate Actors	Select the **Enable Date Settings** option to set the **From** date and **To** date as mandatory while creating alternate actors. For more information about creating alternate actors, see *Alternate Actors* topic in the *User Guide*.	-
Display Domain name with User Name	Select this checkbox to display the domain name along with the user name in the Enterprise Console and the List. The domain name will be displayed only: • If this checkbox is selected. • If the **Resource Provider** is selected as **Active Directory**.	-

User Providers

AVEVA Work Tasks supports the following User Providers by default:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Active Directory

When you select **Active Directory** as the **Resource Provider**, details such as **Active Directory datasource** and the **Active Directory search base** are populated by default.

Authentication User, **Authentication Password**, **User Log-on ID**, and **User Log-on Display Name** are optional fields. Access to the active directory might not be available for all users. In such cases, provide the active directory authentication user name and the active directory authentication password with which you can connect to the Active Directory.

AVEVA Work Tasks considers *SAM-Account-Name* as **User Log-on ID** by default. If you want to use active directory attributes other than the *SAM-Account-Name* user, then enter the desired active directory attribute details in the **User Log-on ID** field and **User Log-on Display Name** field. **User Log-on Display Name** is the user friendly display name of the active directory attribute. This **User Log-on Display Name** is referred in the User Lookup dialog box against the **User Log-on ID**.

Steps

1. When you select **Active Directory** as the **Resource Provider**, then the **Use Token Service** field appears. In this field, select one of the following:
   - If you do not want to use AIM authentication, select **Without Token Service**.
   - If you want to use AIM authentication, then select a server from the list of alias server names.
2. Enter **Active Directory datasource**.
3. Enter **Active Directory search base**.
4. Enter **Domain Name**.

   The domain name is case-sensitive.
5. Enter **Authentication User**.
6. Enter **Authentication Password**.
7. Check **Is Cross Domain Role Provider** checkbox, if cross domain users and roles mapping is required.

   Example: Users *John* and *Jim* of domain *TelematicsU* and users *Mike* and *Bob* from domain *TelematicsAU* are added to role Team HR of domain *TelematicsMain*.
8. Enter **User Log-on ID** if you want to use another Active Directory attributes instead of *SAM-Account-Name*.

   We recommend to use attributes of type *string* as input for **User Log-on ID.** However, *ObjectSID* and *objectGUID* are also supported.

   After you set the **User Log-on ID**, you cannot change it later.
9. Enter the **User Log-on Display Name**.

   After you set the **User Log-on Display Name**, you cannot change it later.

   This is the default display name of the user account of the active directory user used. **User Log-on Display Name** is used in user lookups.
10. Click **Test LDAP**.

    A message about successful LDAP test appears.

Note:
- Some of the active directory attributes or properties are not indexed. If you use an active directory attribute that is not indexed, it might impact the log-on validation performance based on the active directory entries. We recommend to use indexed attributes as **User Log-on ID** or index the attributes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- For an upgraded repository, you cannot change both **User Log-on ID** and **User Log-on Display Name**.
- You cannot localize **User Log-on ID** and **User log-on Display Name** fields.
- Disabled users will not be shown in user lookup search.

Using Forms

For Forms Resource Provider:

- If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.

1. In the **Resource Provider** drop-down list**,** select **Forms.**
2. In the **User Entity properties** field, enter XML data.

   Click **Sample Code** to get the XML Schema Template.

   Example

   ```
   <properties>
   <property name="userid" type="string" purpose="identifier" />
   <property name="username" type="string" purpose="name" />
   <property name="pwd" type="string" purpose="password" />
   </properties>
   ```
3. In the **User Provider Properties** field, enter the same XML Schema.

   There must be at least one identifier in the XML Schema. For example, UserID
4. In the **Datasource** field, enter a valid data source or specify a dll.

   The value for the data source can be specified as **Physical path of the dll** or **Physical path of the dll::param. Param** is not mandatory.

   See topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Build Business Process* section for creating the assembly.

   Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly, whereas one class can return multiple connection strings.

   Examples of data source parameter:

   - c:\DLLStore\GetConnectionString.dll
   - c:\GetConnectionString.dll::Leave

   If there are two data sources, *Leave* and *Licensing*, and only one DLL is used to return a connection string based on the data source selected. The parameter can be specified as **c:\GetConnectionString.dll::Leave** or **c:\ GetConnectionString.dll::Licensing**. The connection string can be returned from the connection dll based on this parameter.
5. Enter a proper table name or view name which holds the User Name and Password for the Authentication purpose.

   Example: Passmast (the table which is available in IMS_NEW Database)
6. Click **Test SQL Connection**.

   A message about successful test connection appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using ASP.NET Membership

This resource provider lists users defined in the asp.net membership database.

Lists

This resource provider lists users created using AVEVA Work Tasks Users Creation. If you are unable to determine a User Provider to create a repository, use AVEVA Work Tasks Lists.

To verify successful creation of the Repository:

1. Click **Enterprise Console** URL from the site path column.
   The repository created is listed.
   Add the created Enterprise Console link into "Add to Favorites" to easily navigate in future.
2. Click **Repository User Provider** link to logon to the repository.
   The Enterprise Console log-on page appears.
3. Enter the logon details, and then click **Login**.
   The Enterprise Console home page appears. This indicates successful creation of a Repository.
   All features can only be available for a user with administrative privileges.

Note: Consider you created the Repository and then deleted it. If you create the same Repository again immediately and try to log into it through Enterprise Console, the Provider does not list the Repository. You need to access IIS and recycle AVEVA Work Tasks from the Application Pool to get the Repository listed in the Provider list..

Verify the Installation

After you install AVEVA Work Tasks, verify that the product is installed successfully. To verify successful installation, create a simple Workflow using Process Designer. The tasks includes the following:

- Creating a Workflow
- Publishing the Workflow
- Testing the Workflow

Creating a Workflow

1. Log on to the **Enterprise Console**.
2. If the Repository is configured for Active Directory provider, go to step 4.
3. Enter the **User Name** and **Password**.
   The **User Name** and **Password** will be validated with the user provider selected while creating the repository.
   The default authentication provider is the Repository User Provider List.
4. In the **Enterprise Console**, click menu icon.
   All features can only be available for a user with administrative privileges.
5. From the menu, select **Workflows**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Workflow window appears.

6. On the Action bar, click **New**, and then click **Workflow**.
   The New Workflow window appears.
7. Enter **Title** and **Description**.
8. Click **Save & Continue**.
   The successful message appears.
9. Select **Design the Workflow now**.
   This is the default option.
10. Click **Finish**.
    The Process Designer window appears.
11. From the activities pane on the left, drag the Information activity to the Process Designer window.
12. The activity *Information1* is created.
    Click to create a link between two activities.
    The Link Action window appears.
    a. Select from the **From Action** drop-down box.
    b. Select from the **To Action** drop-down box.
    c. Click **OK**.
       The link is established.
13. Right-click *Information1*.
14. Select **Activity Properties** from the context menu.
    The Activity Properties pane appears.
    a. Enter **Name** and **Description**.
    b. Click to **Assign Actor(s)**.
       The Assign Actor(s) window appears.
    c. Select the required provider from the **Providers** drop-down list.
    d. Select values from the drop-down list.
    e. Click **Add**.
    f. Click **Update**.
15. Click to enter the **Subject** for Notification Contents.
    The window to enter subject for notification appears.
16. Click **Update**.
17. Click to enter the **Body** for Notification Contents.
    The window to enter the Body content appears.
18. Click **Update**.
19. From the Activity Properties pane, click **Save**.

Publishing the Workflow

1. On the **Publish** menu, click **Publish**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Published successful message appears.

2. Close the dialog box.

   The Enterprise Console screen lists the workflow created.

Testing the Workflow

1. Select the listed workflow.
2. Right-click the selected workflow.
3. Click **Publish and Test Run**.

   The **Status Finished successfully** appears.

   If Status is **Execution Pending** in the Process Execution window, then click on the **Refresh** button to get the status.
4. In the **Enterprise Console** menu, select **Inbox**.

   The Inbox lists the work item.
5. Click to view the work item listed.

   This indicates that the installation is successful.

Web Server and AVEVA Work Tasks Server on Different Machines

This section describes the activities involved while installing the Single Server for the scenario Web Server and AVEVA Work Tasks Server on Machine1 and Database on Machine2.

In this scenario, AVEVA Work Tasks Server is installed on Machine 1 and the Database is installed on Machine 2.

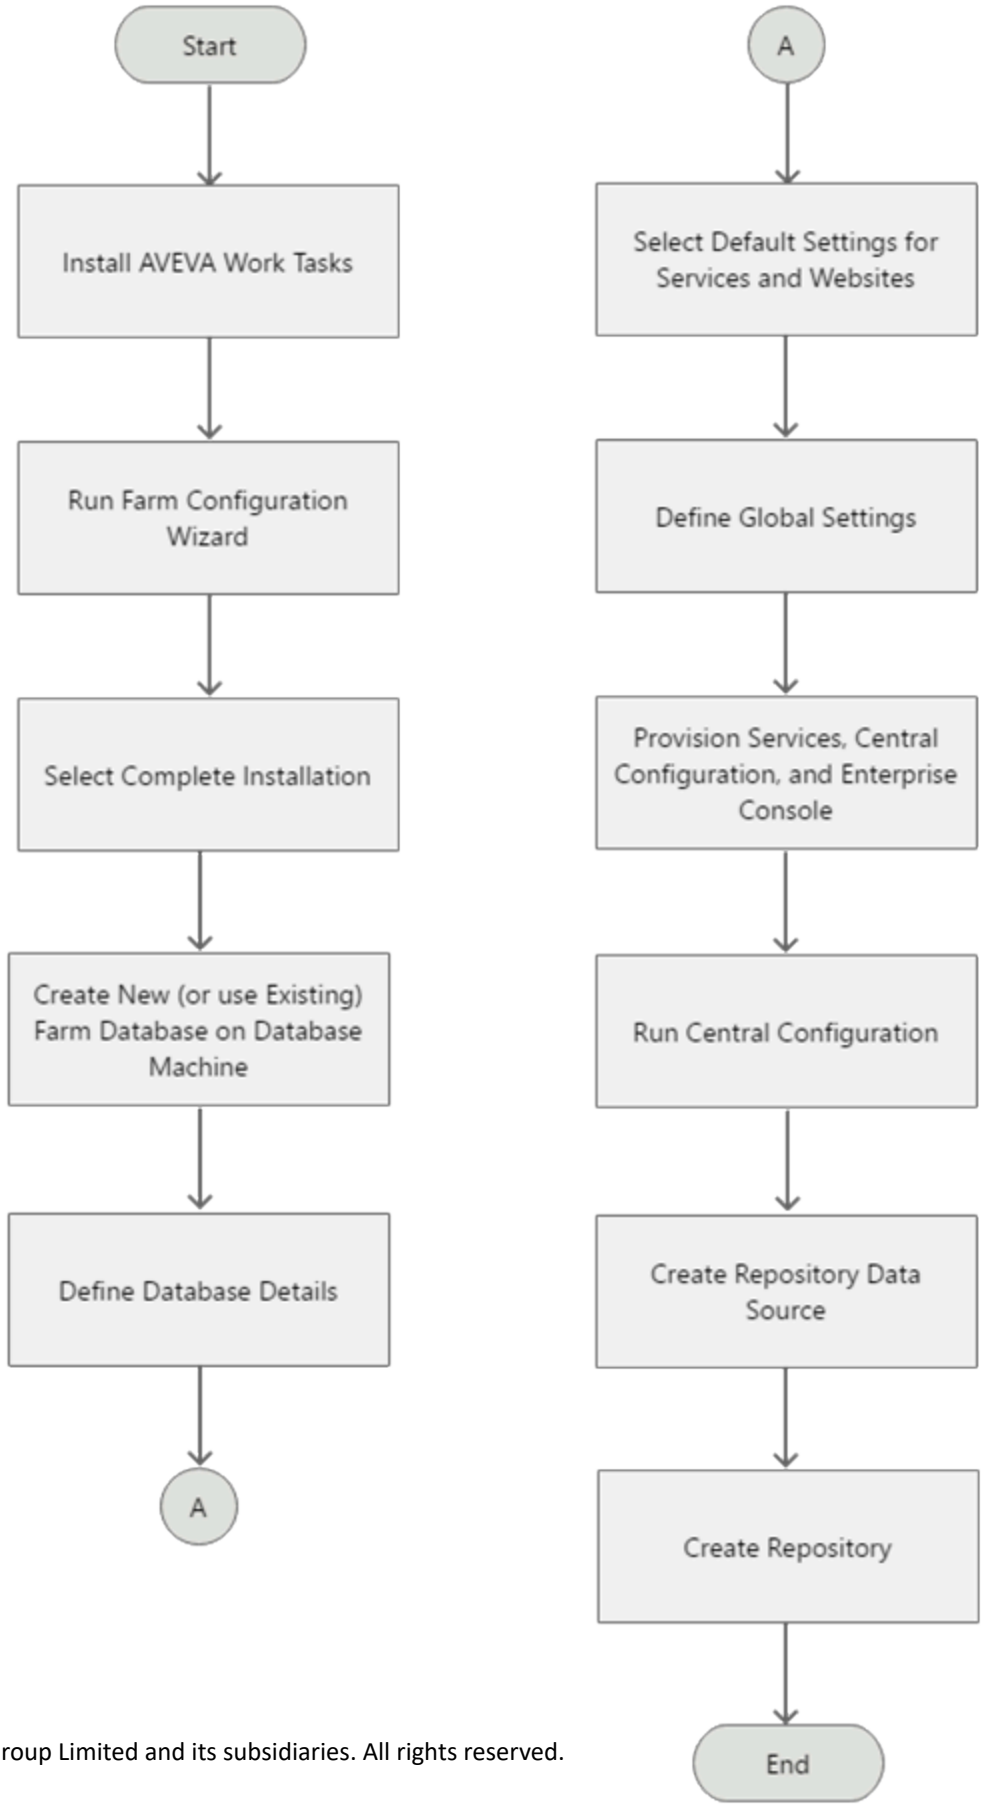
See Also: AVEVA Work Tasks Web Server and AVEVA Work Tasks Server on Different Machines

High-Level View of the Installation

Before continuing with the installation, it is presumed that you have read and understood the Prerequisites section.

The following flowchart illustrates a high-level view of the various installation steps with an overview of the various activities involved while installing AVEVA Work Tasks. Using this flowchart you can visually keep track of your activities while following the sequence of tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation

This section provides installation steps for the scenario the Web Server and the AVEVA Work Tasks Server on Machine 1 and the Database on Machine 2.

In this scenario the AVEVA Work Tasks Server is installed on Machine 1 and the Database is installed on Machine 2.

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
4. Click **Next**.

   The License Server details are configured successfully.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Click **Next**.

   The **Edit Farm Settings** window appears.

5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.

6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.

7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.

8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.

9. Click **Next**.

   The License Server details are configured successfully.

Select the type of installation

To select the type of installation:

1. In the Select the type of installation page, select **Complete Installation (Server)**.

   A Complete Standalone Deployment does not require a client installation.

2. Under **Create AVEVA Work Tasks Farm**:
   - Click **Create AVEVA Work Tasks Farm database** to create a new Farm database.
   - Click **Use existing AVEVA Work Tasks Farm database (Creates AVEVA Work Tasks Farm tables only if they do not exist)** to use an existing database as the Farm database.

3. Click **Next**.

Create Farm Database

Use the Create AVEVA Work Tasks Farm Database page to provide **New Database** details. Select the **Connection String** option to establish a connection with the database. This connection information is encrypted and stored.

You can enter either Windows or Microsoft SQL Server user settings for authentication.

Note:
- The Farm database password does not support **&** and **;** special characters.
- While setting up **Farm Database** with **Windows Authentication**, do not enter **FQDN** in the **Domain Name** field.

To Create Farm Database

1. Enter **Database Title**.
2. Select **Connection String**.

   See *Connection Provider* later in this topic, if you have selected the **Connection Provider** option.

   - Enter the following details:

     Server Name:

     Provide information about the database server on which the Farm database can be installed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If the **Database Type** is **SQL Server**, then you can specify an IPv6 address for the **Server Name**.

If SQLExpress Instance need to be used as a Database instance of the Farm database, then **Server Name** should be <server name>\SQLExpress.

To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

- **Authentication Type**

  This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports Windows and SQL Server authentication process.

  Example: Windows
  If Windows Authentication is selected, the user configured for the Farm configuration will be used to access the database. This is the authentication recommended by AVEVA Work Tasks.

- **Login**

  This field is used to enter the SQL login credential for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

- **Password**

  This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

- **Advanced Settings**

  This is an optional field. It is used to enter any additional connection information, such as connection Timeout. Example: Connection Timeout = 20.

  While creating a data source for repository, use the following custom settings to set properties for connection pool. These settings are case sensitive and should be mentioned only in lower case.

  ```
  encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
  ```

  encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

  enableltm: AVEVA Work Tasks internally implements light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive. This property can be used to turn off this feature. The default value is set as True.

  connectionretrywaittime: While opening a new connection, if the data base server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

  maxconnectionretries: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

  sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

3. Click **Test Connection** to ensure database connectivity.
4. Click **Next**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The message *AVEVA Work Tasks Farm is Created* appears.

5. Click **OK**.

AlwaysOn Availability Groups feature of Microsoft SQL Server

The **AlwaysOn Availability Groups** feature of Microsoft SQL Server is a high-availability and disaster-recovery solution that provides an enterprise-level alternative to database mirroring. Introduced in Microsoft SQL Server 2012, AlwaysOn Availability Groups maximizes the availability of a set of user databases for an enterprise.

After you configure the AVEVA Work Tasks, you must add the created Farm Database to the SQL Server AlwaysOn Availability Groups. Contact your Database Administrator to add the database to SQL Server AlwaysOn Availability Groups.

Notes:

- The authentication user needs different rights assigned for different scenarios. If a user wants to create database (Farm or Repository Data Source Database), Authentication User needs to have minimum 'dbcreator' access rights on Database Server Instance.

- If database is already created, user needs to have following permissions on Database Server:

- SELECT, INSERT, UPDATE, and DELETE permissions.

- EXECUTE permission for Stored Procedures.

To choose Connection Provider

Complete the following steps to choose a connection provider:

1. Enter **Database Title**.
2. In the **Database Type** box, select a database type.
3. Select **Connection Provider**.

   This option is used to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.
4. Enter the following details:
   - **Assembly Path**:

     Click the icon to browse and choose the required dll file.

     If custom properties (enableltm, connectionretrywaittime, maxconnectionretries and sqlcommandtimeout) are required to be used in Assembly connection string, then user should select **Use existing Farm database** while creating a the Farm. See Creating or Using an Existing Database.

     See the topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub chapter in the *Build Business Process* section for creating the assembly. Make sure that, there should be only one class implementing *IDBConnectionString* interface within this assembly.
5. Click **Test Connection** to ensure database connectivity.
6. Click **Next**.
7. The message *AVEVA Work Tasks Farm is created* appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. Click **OK**.

Define Security Settings

You can define the Security Settings using the Farm Configuration Wizard.

For more information on Security settings, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client.

To define the Security Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Security Settings** and **Service Settings** and then, click **Next**.
4. Select **Secure Communication** to establish secured communication between the AVEVA Work Tasks services through HTTPS.
5. Select **Secure Web Sites** check box to configure secured web sites. Uncheck the **Secure Web Sites** check box to use HTTP sites. By default the sites are created in HTTPS mode.
6. Enter the Port number. The default port for the HTTPS site is 8001, and for the HTTP site is 8000. You can enter any port number that IIS accepts. But if any other services or applications are already using the entered port number, AVEVA Work Tasks will not start.
7. Select the available certificate from the **Certificate** list. If your certificate is not listed, click the **Refresh** icon to repopulate the list.

   Note: If the required certificate is not listed, generate one using the System Management Server (Configurator tool). Do not use a self-signed certificate without a proper root chain.
8. Click the **Validate** button to validate the certificate before configuring the security settings.

   Note: An Internet connection is needed to validate the certificate.
9. Click **Configure**, then **Next**, and then **Finish** to apply the new security settings.

Note:
- To update the port number, certificate, and websites from unsecure to secure or vice-versa, select **Security Settings** and **Service Settings** check box in **Edit AVEVA Work Task Farm Settings** window before updating the values. After the required details are provided, these settings get updated only when you click **Configure**, then **Next**, and then **Finish** as you navigate through the Farm Configuration Wizard..
- If the Quickflow is already deployed on a machine, you need to deploy it again after you update the security settings. If secured web site is configured, then you cannot change the server configuration for Quickflow in Central Configuration. However, if the **Secure Web Sites** checkbox is not selected, you can make the changes to the server configuration.
- Advance Server communication cannot be configured on HTTP/HTTPS.
- For resources of Load Balanced Server, ensure to configure all services with the same protocol (HTTP or HTTPS).
- It is recommended to use Standard SSL certificate instead of self-signed SSL certificate.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using ASB Certificate for Secured Communication

ASB Certificate is a PCS-managed SSL certificate and renews automatically every 30 days when the certificate is still valid. The certificate is valid for two years. The PCS watchdog service on the runtime node checks the validity of the SSL certificate within 5 minutes from when it starts and once a day. PCS also renews the SSL certificate if it is expired.

If the runtime node is offline and later back online, the PCS watchdog service regularly checks the certificate validity and renews it if it is required. Consider restarting the PCS watchdog service to enforce the SSL certificate validity check within 5 minutes from the restarting time.

Furthermore, when the SSL certificate is renewed, PCS binds it to port 443 (by default) and changes the SslThumbprint PCS registry value. If AVEVA Work Tasks sites are hosted on port 443, certificate binding will be auto-renewed when the SSL certificate is renewed. It is recommended to check the bindings in IIS with every certificate renewal to ensure the application is running seamlessly.

To disable the certificate renewal, consider disabling the **ArchestrA Certificate Renewal Service** windows service.

Note: Client Service will try to automatically bind the renewed certificate. If there are any issues in browsing the website or starting the services after certificate renewal, users need to reconfigure the secure communication in Farm Configuration. To reconfigure, see the steps mentioned in above section *To define the Security Settings*.

Securing Communication between Services

To have a secure communication between the services, apply the below changes to the Windows registry and reboot the server:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
```

For more information on securing communication, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client and

https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2015/2960358.

Define Services and Global Settings

You can define the Services and Global Settings using the Farm Configuration Wizard or through Configuration XMLs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To define Services

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.

   Note: You can also customize the settings for these services and websites using the **Custom Settings** option. For more information about Service-related changes and Website-related changes, see Advanced Settings and Administering Web Servers respectively.

2. Click **Next**.

   The Global Settings dialog box appears.

3. In the **Communication** tab, enter key fields in **Email Settings** and **Exception Email settings** to configure exception e-mails.

   The following are the details:

   - **Host**: Enter information related to mail server.
     Example: Enter details related to Microsoft Exchange Server (IP address of the exchange server).
   - **Port**: Enter the port number for the mail server. The default port number is 25.
   - **From email**: Enter the from e-mail address.
     Example: admin@telematics.com
   - **To email**: Enter the to e-mail address.
     Example: alex@telematics.com

4. Click **OK**.

Note: To confirm the exception e-mail settings, click **Test SMTP**. An e-mail will be generated and sent to the **To email** address confirming successful configuration of the e-mail. The advanced settings like **Secure Socket Layer (SSL), Email Timeout, User Name,** and **Password** for the e-mail account holder, **Password Encrypted** flag will differ based on the mail server settings.

Provision Services

While the installation is in progress, you can view the services that will be installed. This provides information on the progress of installation. At the end of the installation, a status indicating the completion of installation appears.

- Click **OK** to complete the installation.

Create a Repository DataSource

A **Repository DataSource** is used to store all repository related data. The **Repository DataSource** must be created on a machine where the **Central Configuration** site is installed.

Example

A TelematicsDataSource is created for TelematicsHR Repository.

A Repository contains Workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating the repository.

To create a Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Central Configuration web page appears.

2. Click **DataSource Settings**.

   The Datasource List page appears.

3. Click **Add**.

   The Manage Datasource page appears.

4. Enter the required details.

   a. **Name**: Enter a valid data source name. Example: *TelematicsDataSource*.

   b. **Description**: Enter a description for the data source. Example: *This data source is used to store connection details*.

   c. **Connection String**: Select this option to establish a connection with the database. The connection string contains fields that that defines the connection. The connection information is encrypted and stored.

   Server Name

   To use a database on the local machine, enter "localhost", ".", or the local computer's name for the **Server Name**.

   Note: Server Name can be machine name/IP address/SQL Server AlwaysON/SQL Server instance name. Instead of entering "local host", it is preferable to give the local machine name.

   If the **Database Type** is **SQL Server**, then specify an IPV6/IPV4 address for the **Server Name**.
   To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: *localhost,1455*
   To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be *<server name>\SQLExpress*.

   Authentication Type

   Use this field to determine the process to validate a user who is trying to connect to the database. AVEVA Work Tasks uses Windows and SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. The **User ID** and **Password** field is disabled if Windows Authentication is selected. Example: *Windows*

   Advanced Settings

   Use this field to define advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection.
   Example: *Connection Timeout = 20*
   or
   For defining maximum connections that can be opened in a connection pool.
   Example: *max pool size = 250*
   Default connection pool is set as 250. We recommend to enter a higher value on heavily loaded environment.
   While creating a data source for a repository, use the following custom settings to set properties for the connection pool.
   encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
   encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.
   enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

distributed is reduced to a great extent. With this feature, AVEVA Work Tasks controls the transaction from escalating to an expensive distributed transaction.
The above property can be used to turn off this feature. The default value is set as *True*.
connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is 30 seconds. The value should be set in seconds.
maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is infinite.
sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.
These settings are case sensitive and should be mentioned only in lower case.

Database:

Specify or select a database that can be used as a repository database. This database stores all repository related data. The repository database is created if it does not exist on the database server instance.
Example: *TelematicsDB*

Enable Table Partitioning:

Select to enable database table partitioning. For more information, see Partitioning Database.

d. **Connection Provider**: Use this to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.

The selected dll must be copied to all the machines, all servers and all clients, that are connected to the current Farm.

Assembly Path

Click to browse and choose the required dll file.
To use custom properties (enableltm, connectionretrywaittime, maxconnectionretries, and sqlcommandtimeout) in the Assembly connection string, the database must be created before.
See *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Developer Guide* for creating the assembly. Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.

   A message about successful test connection appears.

6. Click **OK**.

   A message about successful creation of the data source appears.The message also states that the required tables will be created in the data source after a repository is associated with the data source.

When a data source is saved, an entry is created for the data source in the **Farm Database**. When a first repository is created for the data source, AVEVA Work Tasks tables are added to the data source. While creating a data source, the archival database is created with the same database name suffixed by *_BI*. This database is used for archival in future use.

Note: After you configure the AVEVA Work Tasks, you must add the created **Farm Database** to the **SQL Server AlwaysOn Availability Groups**. Contact your Database Administrator to add the database to **SQL Server AlwaysOn Availability Groups**.

To view the data source created, click **DataSource Settings** link.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create a Repository

A **Repository** contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

To create a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The Central Configuration page appears.
2. Click **Repository Settings**.
   The Repository List page appears.
3. Click **Add**.

   Note: If the number of repositories exceeds the permitted limit for the license, then the message "You have exceeded the maximum number of repositories" appears, and the repository creation is stopped. Click **Close**.

   The **Manage Repository** page appears.
4. Enter the required details.
5. Click **OK**.
   The **Config Administrator** page appears.
6. Click to configure an administrator.
   The User Lookup dialog box appears.
7. Select the provider from the provider drop-down list.
8. Enter the details to search the administrator for the repository that is created.

   Note: You can also search a user based on *ObjectSID* and *objectGUID* (applicable only for Active Directory provider).
9. Click **Search**.
   The user is listed under **Available Resources**.
10. Select and click the arrow to list the user under **Selected Resource**.
11. Click **Update**.
    The selected user is displayed in **User Lookup**.
12. Click **OK**.
    A message confirming the successful creation of an administrator appears.
13. Click **OK**.
    The **Repository List** page appears.
    For more information about configuring the system user, see Configure System User.

Manage Repository Window Fields

The following table explains the fields of the Manage Repository window:

Field Name	Description	Example
Repository DataSource	Lists all the data sources created in	TelematicsDatasource

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	a Farm. The selected data source will be used to store data for the current repository.	
Attach DataSource	Select Attach DataSource checkbox and then select a repository from the selected DataSource .Data associated with the selected repository will be copied to the new repository. The version of the installed product and destination DataSource should be the same as that of the DataSource from which the repository data is to be copied. For example, in an upgraded environment, from build Work Tasks version 1 to Work Tasks version 2, you cannot attach a DataSource created in build Work Tasks version 1 to build Work Tasks version 2. To match the build version of the installed product to the version of the DataSource: 1. If the DataSource was created in build Work Tasks version 1, then the entire build Work Tasks version 1 must be upgraded to Work Tasks version 2 by running the product installer in the upgrade mode. 2. All the Farm, DataSources, Repositories, and Lists of build Work Tasks version 1 must be upgraded to build Work Tasks version 2 by running the AVEVAWorkTasksUpgradeManager.exe located at the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder. 3. After upgrading all the AVEVA Work Tasks components to	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	build Work Tasks version 2 build, that DataSource can be used in any machine that has same version by using this feature.	
Repository Name	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the repository name.	Telematics Repository
Description	Provide a description for the repository.	This stores Telematics Employee Leave Details.
From mail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might occur in the Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be sent to the mail ID defined in **Exception to mail**. The From address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To avoid this, restart the Workflow Engine Service and Communication Service.	Provide the valid email id that is specified in the **User Name** field while configuring **SMTP Settings** in the **Mail Server Settings** page. For more details, see Mail Server Setting.
Exception to mail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails is sent to the email ID specified in **Exception to mail**.	Provide the valid email id.
Alert initiator of the Workflow	Determines if the status of a workflow should be sent as a	A process with a rule to check the pending leave available for the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	notification mail to the initiator of the workflow.	employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
Servers	Lists the servers available in the Farm. Repository will be available only to the mapped servers.	Work Tasks Server Name
Enterprise Consoles	Lists all the Enterprise Consoles for a selected AVEVA Work Tasks Server. Repository will be available only to the mapped Enterprise Console.	http://worktaskservername:8001/EnterpriseConsole
Enable Theme	Select this checkbox to enable the defined theme.	-
Theme Name	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. It provides **Default** and **Lite** themes.	-
Resource Provider	Lists the various default resource providers supported by AVEVA Work Tasks. Resource providers are also termed as User Provider. A User Provider is a data store containing information about the user. AVEVA Work Tasks also supports custom resource provider. For more information about Resource Provider, see User Providers. AVEVA Connect and Azure Active Directory resource providers are also available after you configure them. To configure these providers, see AVEVA Connect Settings and Azure Active Directory Settings. AVEVA Work Tasks allows secured LDAP configuration. The default port number for LDAPS is 636. You	AVEVA Work Tasks Lists or Active Directory

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	can map the repository in IDE and use the Secured LDAP. The logged-in Active Directory is displayed by default, and **Active Directory Datasource** expects **LDAP://** or **Fully Qualified Domain Name** as value.	
Custom Application Folder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with a semicolon.	-
Hide Repository	Select this option to make the repository unavailable to the Farm.	-
Source path	Enter the path to the Source Elements Folder.	-
Attachment Storage Path	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an absolute path. - The default path is the **Attachments** folder in *C:\ProgramData\AVEVA Work Tasks*. - The default path is used when no path is specified. - Ensure appropriate rights are set to the folder, where attachments are stored, for the following identities: -- The application pool identity for **Central Configuration** and **Enterprise Console(s)**. -- The account configured for the **Workflow Engine** service. - In case of mapped drives, ensure they are available to the identities. - In multiple-server environments, the path specified must be in a shared location.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Auto Log Off Settings for Enterprise Console	Automatically logs out the logged in user after the designated period of inactivity. Enter the time in minutes. This field accepts only valid integer values between 0 to 360. 0 minute means the user will not get automatically logged off. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. The default value for automatic log off is 30 minutes. You use this field to define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML.	0 to 360 (minutes)
Auto Log Off Settings for AVEVA Work Tasks Pro	Request for user credentials for AVEVA Work Tasks Pro app after the set time is elapsed. Enter the time in minutes. This field accepts only valid integer values between 0 to 2880. 0 minute means the user will not get automatically logged off. The default value is 30 minutes. If AVEVA Work Tasks Pro app is offline, the Auto Log Off will not get active, and the user will not be automatically logged off as per the defined settings.	0 to 2880 (in minutes)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Offline Support	Select this option to enable offline submission of items in AVEVA Work Tasks Pro app.	-
Refresh on Work Item submission	Select this option to enable Inbox refresh on Work Item submission in AVEVA Work Tasks Pro . Refresh option is enabled by default.	-
Timeout	Enter the time in seconds to set the timeout. If the value is set as 0, then there is no timeout. Default value is 60 seconds.	-
Label for Fill Form	Enter the label for Fill Form. The customized label will be displayed for the Fill Form in AVEVA Work Tasks Pro.	Work Tasks
Date Configuration Flag for Alternate Actors	Select the **Enable Date Settings** option to set the **From** date and **To** date as mandatory while creating alternate actors. For more information about creating alternate actors, see *Alternate Actors* topic in the *User Guide*.	-
Display Domain name with User Name	Select this checkbox to display the domain name along with the user name in the Enterprise Console and the List. The domain name will be displayed only: • If this checkbox is selected. • If the **Resource Provider** is selected as **Active Directory**.	-

User Providers

AVEVA Work Tasks supports the following User Providers by default:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Active Directory

When you select **Active Directory** as the **Resource Provider**, details such as **Active Directory datasource** and the **Active Directory search base** are populated by default.

Authentication User, **Authentication Password**, **User Log-on ID**, and **User Log-on Display Name** are optional fields. Access to the active directory might not be available for all users. In such cases, provide the active directory authentication user name and the active directory authentication password with which you can connect to the Active Directory.

AVEVA Work Tasks considers *SAM-Account-Name* as **User Log-on ID** by default. If you want to use active directory attributes other than the *SAM-Account-Name* user, then enter the desired active directory attribute details in the **User Log-on ID** field and **User Log-on Display Name** field. **User Log-on Display Name** is the user friendly display name of the active directory attribute. This **User Log-on Display Name** is referred in the User Lookup dialog box against the **User Log-on ID**.

Steps

1. When you select **Active Directory** as the **Resource Provider**, then the **Use Token Service** field appears. In this field, select one of the following:
   - If you do not want to use AIM authentication, select **Without Token Service**.
   - If you want to use AIM authentication, then select a server from the list of alias server names.
2. Enter **Active Directory datasource**.
3. Enter **Active Directory search base**.
4. Enter **Domain Name**.

   The domain name is case-sensitive.
5. Enter **Authentication User**.
6. Enter **Authentication Password**.
7. Check **Is Cross Domain Role Provider** checkbox, if cross domain users and roles mapping is required.

   Example: Users *John* and *Jim* of domain *TelematicsU* and users *Mike* and *Bob* from domain *TelematicsAU* are added to role Team HR of domain *TelematicsMain*.
8. Enter **User Log-on ID** if you want to use another Active Directory attributes instead of *SAM-Account-Name*.

   We recommend to use attributes of type *string* as input for **User Log-on ID.** However, *ObjectSID* and *objectGUID* are also supported.

   After you set the **User Log-on ID**, you cannot change it later.
9. Enter the **User Log-on Display Name**.

   After you set the **User Log-on Display Name**, you cannot change it later.

   This is the default display name of the user account of the active directory user used. **User Log-on Display Name** is used in user lookups.
10. Click **Test LDAP**.

    A message about successful LDAP test appears.

Note:
- Some of the active directory attributes or properties are not indexed. If you use an active directory attribute that is not indexed, it might impact the log-on validation performance based on the active directory entries. We recommend to use indexed attributes as **User Log-on ID** or index the attributes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- For an upgraded repository, you cannot change both **User Log-on ID** and **User Log-on Display Name**.
- You cannot localize **User Log-on ID** and **User log-on Display Name** fields.
- Disabled users will not be shown in user lookup search.

Using Forms

For Forms Resource Provider:

- If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.

1. In the **Resource Provider** drop-down list**,** select **Forms.**
2. In the **User Entity properties** field, enter XML data.

   Click **Sample Code** to get the XML Schema Template.

   Example

   ```
   <properties>
   <property name="userid" type="string" purpose="identifier" />
   <property name="username" type="string" purpose="name" />
   <property name="pwd" type="string" purpose="password" />
   </properties>
   ```
3. In the **User Provider Properties** field, enter the same XML Schema.

   There must be at least one identifier in the XML Schema. For example, UserID
4. In the **Datasource** field, enter a valid data source or specify a dll.

   The value for the data source can be specified as **Physical path of the dll** or **Physical path of the dll::param. Param** is not mandatory.

   See topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Build Business Process* section for creating the assembly.

   Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly, whereas one class can return multiple connection strings.

   Examples of data source parameter:

   - c:\DLLStore\GetConnectionString.dll
   - c:\GetConnectionString.dll::Leave

   If there are two data sources, *Leave* and *Licensing*, and only one DLL is used to return a connection string based on the data source selected. The parameter can be specified as **c:\GetConnectionString.dll::Leave** or **c:\ GetConnectionString.dll::Licensing**. The connection string can be returned from the connection dll based on this parameter.
5. Enter a proper table name or view name which holds the User Name and Password for the Authentication purpose.

   Example: Passmast (the table which is available in IMS_NEW Database)
6. Click **Test SQL Connection**.

   A message about successful test connection appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using ASP.NET Membership

This resource provider lists users defined in the asp.net membership database.

Lists

This resource provider lists users created using AVEVA Work Tasks Users Creation. If you are unable to determine a User Provider to create a repository, use AVEVA Work Tasks Lists.

To verify successful creation of the Repository:

1. Click **Enterprise Console** URL from the site path column.
   The repository created is listed.
   Add the created Enterprise Console link into "Add to Favorites" to easily navigate in future.
2. Click **Repository User Provider** link to logon to the repository.
   The Enterprise Console log-on page appears.
3. Enter the logon details, and then click **Login**.
   The Enterprise Console home page appears. This indicates successful creation of a Repository.
   All features can only be available for a user with administrative privileges.

Note: Consider you created the Repository and then deleted it. If you create the same Repository again immediately and try to log into it through Enterprise Console, the Provider does not list the Repository. You need to access IIS and recycle AVEVA Work Tasks from the Application Pool to get the Repository listed in the Provider list..

Verify the Installation

After you install AVEVA Work Tasks, verify that the product is installed successfully. To verify successful installation, create a simple Workflow using Process Designer. The tasks includes the following:

- Creating a Workflow
- Publishing the Workflow
- Testing the Workflow

Creating a Workflow

1. Log on to the **Enterprise Console**.
2. If the Repository is configured for Active Directory provider, go to step 4.
3. Enter the **User Name** and **Password**.
   The **User Name** and **Password** will be validated with the user provider selected while creating the repository.
   The default authentication provider is the Repository User Provider List.
4. In the **Enterprise Console**, click menu icon.
   All features can only be available for a user with administrative privileges.
5. From the menu, select **Workflows**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Workflow window appears.

6. On the Action bar, click **New**, and then click **Workflow**.
   The New Workflow window appears.
7. Enter **Title** and **Description**.
8. Click **Save & Continue**.
   The successful message appears.
9. Select **Design the Workflow now**.
   This is the default option.
10. Click **Finish**.
    The Process Designer window appears.
11. From the activities pane on the left, drag the Information activity to the Process Designer window.
12. The activity *Information1* is created.
    Click to create a link between two activities.
    The Link Action window appears.
    a. Select from the **From Action** drop-down box.
    b. Select from the **To Action** drop-down box.
    c. Click **OK**.
       The link is established.
13. Right-click *Information1*.
14. Select **Activity Properties** from the context menu.
    The Activity Properties pane appears.
    a. Enter **Name** and **Description**.
    b. Click to **Assign Actor(s)**.
       The Assign Actor(s) window appears.
    c. Select the required provider from the **Providers** drop-down list.
    d. Select values from the drop-down list.
    e. Click **Add**.
    f. Click **Update**.
15. Click to enter the **Subject** for Notification Contents.
    The window to enter subject for notification appears.
16. Click **Update**.
17. Click to enter the **Body** for Notification Contents.
    The window to enter the Body content appears.
18. Click **Update**.
19. From the Activity Properties pane, click **Save**.

Publishing the Workflow

1. On the **Publish** menu, click **Publish**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Published successful message appears.

2. Close the dialog box.

   The Enterprise Console screen lists the workflow created.

Testing the Workflow

1. Select the listed workflow.
2. Right-click the selected workflow.
3. Click **Publish and Test Run**.

   The **Status Finished successfully** appears.

   If Status is **Execution Pending** in the Process Execution window, then click on the **Refresh** button to get the status.
4. In the **Enterprise Console** menu, select **Inbox**.

   The Inbox lists the work item.
5. Click to view the work item listed.

   This indicates that the installation is successful.

Web Server, AVEVA Work Tasks Server, and Database Server on Different Machines

This section describes the activities involved while installing the Single Server for the scenario Web Server, AVEVA Work Tasks Server, and Database Server on Different Machines.

In this scenario, Server is installed on Machine 1, Database is installed on Machine 2 and Client is installed on Machine 3.

Ensure that you install the product in the following sequence:

- High-Level View of Server Installation
- High-Level View of Client Installation

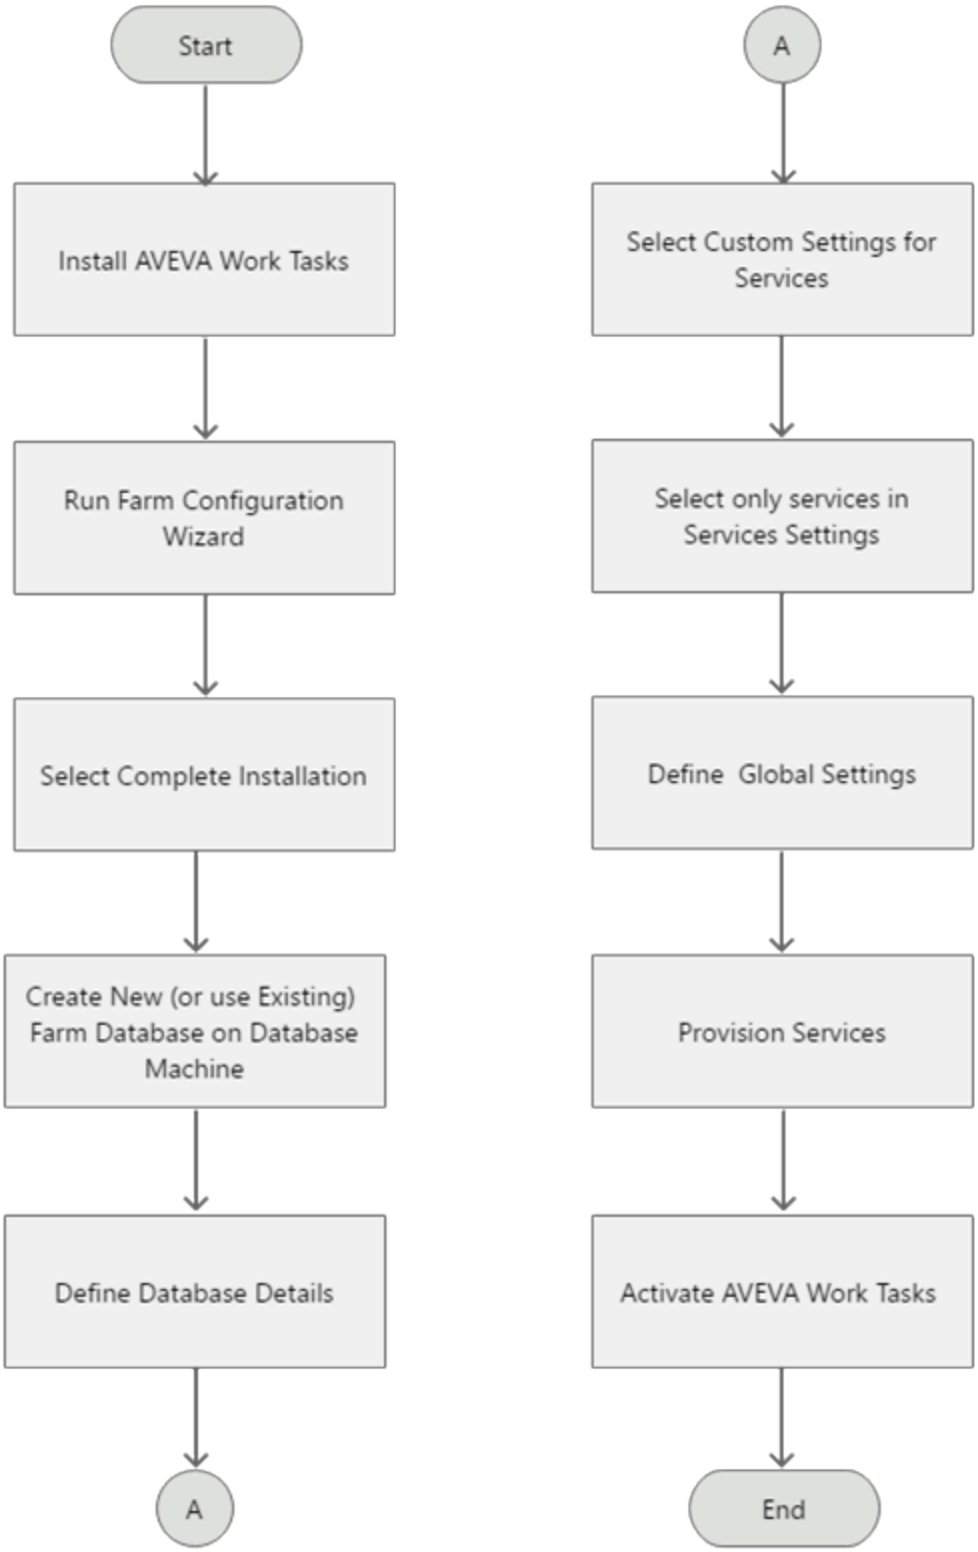
See Also: AVEVA Work Tasks Web Server, AVEVA Work Tasks Server, and AVEVA Work Tasks Database Server on Different Machines

High-Level View of Server Installation

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

The following flowchart illustrates a high-level view of the various installation steps with an overview of the various activities involved while installing AVEVA Work Tasks. Using this flowchart you can visually keep track of your activities while following the sequence of tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



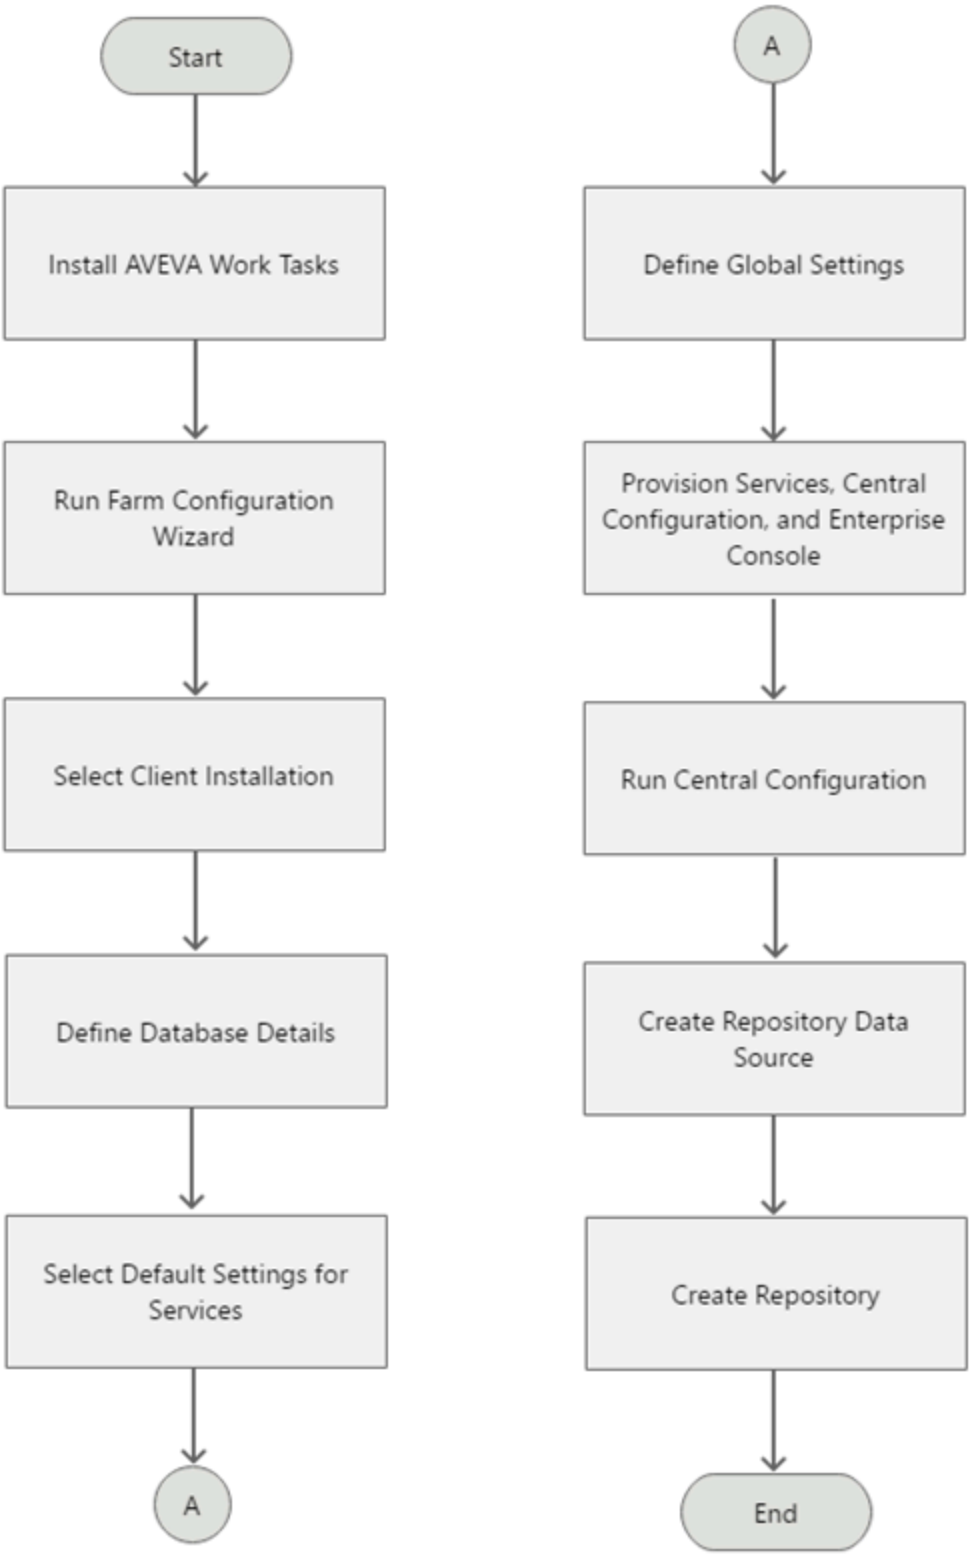
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

High-Level View of Client Installation

This section provides a high-level view of AVEVA Work Tasks Client installation. The Client components are installed on Web Servers. For more information on this scenario, see Single Server.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation

This section provides installation steps for the scenario Web Server, AVEVA Work Tasks Server, and Database on Different Machines.

The installation includes the following:

- Installing AVEVA Work Tasks Server
- Installing AVEVA Work Tasks Client

AVEVA Work Tasks Server has to be installed before installing the Client. In this scenario, the Client has to be installed on a single machine.

AVEVA Work Tasks Server

This section describes the activities involved while installing AVEVA Work Tasks on a server machine.

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
4. Click **Next**.

   The License Server details are configured successfully.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.
4. Click **Next**.

   The **Edit Farm Settings** window appears.
5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.
6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
9. Click **Next**.

   The License Server details are configured successfully.

Select the type of installation

To select the type of installation:

1. In the Select the type of installation page, select **Complete Installation (Server)**.

   A Complete Standalone Deployment does not require a client installation.
2. Under **Create AVEVA Work Tasks Farm**:
   - Click **Create AVEVA Work Tasks Farm database** to create a new Farm database.
   - Click **Use existing AVEVA Work Tasks Farm database (Creates AVEVA Work Tasks Farm tables only if they do not exist)** to use an existing database as the Farm database.
3. Click **Next**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create Farm Database

Use the Create AVEVA Work Tasks Farm Database page to provide **New Database** details. Select the **Connection String** option to establish a connection with the database. This connection information is encrypted and stored.

You can enter either Windows or Microsoft SQL Server user settings for authentication.

Note:
- The Farm database password does not support **&** and **;** special characters.
- While setting up **Farm Database** with **Windows Authentication**, do not enter **FQDN** in the **Domain Name** field.

To Create Farm Database

1. Enter **Database Title**.
2. Select **Connection String**.

   See *Connection Provider* later in this topic, if you have selected the **Connection Provider** option.

   - Enter the following details:

     Server Name:

     Provide information about the database server on which the Farm database can be installed.

     If the **Database Type** is **SQL Server**, then you can specify an IPv6 address for the **Server Name**.

     If SQLExpress Instance need to be used as a Database instance of the Farm database, then **Server Name** should be <server name>\SQLExpress.

     To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

   - **Authentication Type**

     This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports Windows and SQL Server authentication process.

     Example: Windows
     If Windows Authentication is selected, the user configured for the Farm configuration will be used to access the database. This is the authentication recommended by AVEVA Work Tasks.

   - **Login**

     This field is used to enter the SQL login credential for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Password**

     This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Advanced Settings**

     This is an optional field. It is used to enter any additional connection information, such as connection Timeout. Example: Connection Timeout = 20.

     While creating a data source for repository, use the following custom settings to set properties for connection pool. These settings are case sensitive and should be mentioned only in lower case.

     ```
     encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
     ```

     encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

certificate is installed on the SQL Server for SSL encryption.

enableltm: AVEVA Work Tasks internally implements light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive. This property can be used to turn off this feature. The default value is set as True.

connectionretrywaittime: While opening a new connection, if the data base server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

maxconnectionretries: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

3. Click **Test Connection** to ensure database connectivity.
4. Click **Next**.

   The message *AVEVA Work Tasks Farm is Created* appears.
5. Click **OK**.

AlwaysOn Availability Groups feature of Microsoft SQL Server

The **AlwaysOn Availability Groups** feature of Microsoft SQL Server is a high-availability and disaster-recovery solution that provides an enterprise-level alternative to database mirroring. Introduced in Microsoft SQL Server 2012, AlwaysOn Availability Groups maximizes the availability of a set of user databases for an enterprise.

After you configure the AVEVA Work Tasks, you must add the created Farm Database to the SQL Server AlwaysOn Availability Groups. Contact your Database Administrator to add the database to SQL Server AlwaysOn Availability Groups.

Notes:

- The authentication user needs different rights assigned for different scenarios. If a user wants to create database (Farm or Repository Data Source Database), Authentication User needs to have minimum 'dbcreator' access rights on Database Server Instance.

- If database is already created, user needs to have following permissions on Database Server:

- SELECT, INSERT, UPDATE, and DELETE permissions.

- EXECUTE permission for Stored Procedures.

To choose Connection Provider

Complete the following steps to choose a connection provider:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Enter **Database Title**.
2. In the **Database Type** box, select a database type.
3. Select **Connection Provider**.

   This option is used to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.
4. Enter the following details:
   - **Assembly Path**:

     Click the icon to browse and choose the required dll file.

     If custom properties (enableltm, connectionretrywaittime, maxconnectionretries and sqlcommandtimeout) are required to be used in Assembly connection string, then user should select **Use existing Farm database** while creating a the Farm. See Creating or Using an Existing Database.

     See the topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub chapter in the *Build Business Process* section for creating the assembly. Make sure that, there should be only one class implementing *IDBConnectionString* interface within this assembly.
5. Click **Test Connection** to ensure database connectivity.
6. Click **Next**.
7. The message *AVEVA Work Tasks Farm is created* appears.
8. Click **OK**.

Define Security Settings

You can define the Security Settings using the Farm Configuration Wizard.

For more information on Security settings, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client.

To define the Security Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Security Settings** and **Service Settings** and then, click **Next**.
4. Select **Secure Communication** to establish secured communication between the AVEVA Work Tasks services through HTTPS.
5. Select **Secure Web Sites** check box to configure secured web sites. Uncheck the **Secure Web Sites** check box to use HTTP sites. By default the sites are created in HTTPS mode.
6. Enter the Port number. The default port for the HTTPS site is 8001, and for the HTTP site is 8000. You can enter any port number that IIS accepts. But if any other services or applications are already using the entered port number, AVEVA Work Tasks will not start.
7. Select the available certificate from the **Certificate** list. If your certificate is not listed, click the **Refresh** icon to repopulate the list.

   Note: If the required certificate is not listed, generate one using the System Management Server

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

(Configurator tool). Do not use a self-signed certificate without a proper root chain.

8. Click the **Validate** button to validate the certificate before configuring the security settings.

   Note: An Internet connection is needed to validate the certificate.

9. Click **Configure**, then **Next**, and then **Finish** to apply the new security settings.

Note:
- To update the port number, certificate, and websites from unsecure to secure or vice-versa, select **Security Settings** and **Service Settings** check box in **Edit AVEVA Work Task Farm Settings** window before updating the values. After the required details are provided, these settings get updated only when you click **Configure**, then **Next**, and then **Finish** as you navigate through the Farm Configuration Wizard..
- If the Quickflow is already deployed on a machine, you need to deploy it again after you update the security settings. If secured web site is configured, then you cannot change the server configuration for Quickflow in Central Configuration. However, if the **Secure Web Sites** checkbox is not selected, you can make the changes to the server configuration.
- Advance Server communication cannot be configured on HTTP/HTTPS.
- For resources of Load Balanced Server, ensure to configure all services with the same protocol (HTTP or HTTPS).
- It is recommended to use Standard SSL certificate instead of self-signed SSL certificate.

Using ASB Certificate for Secured Communication

ASB Certificate is a PCS-managed SSL certificate and renews automatically every 30 days when the certificate is still valid. The certificate is valid for two years. The PCS watchdog service on the runtime node checks the validity of the SSL certificate within 5 minutes from when it starts and once a day. PCS also renews the SSL certificate if it is expired.

If the runtime node is offline and later back online, the PCS watchdog service regularly checks the certificate validity and renews it if it is required. Consider restarting the PCS watchdog service to enforce the SSL certificate validity check within 5 minutes from the restarting time.

Furthermore, when the SSL certificate is renewed, PCS binds it to port 443 (by default) and changes the SslThumbprint PCS registry value. If AVEVA Work Tasks sites are hosted on port 443, certificate binding will be auto-renewed when the SSL certificate is renewed. It is recommended to check the bindings in IIS with every certificate renewal to ensure the application is running seamlessly.

To disable the certificate renewal, consider disabling the **ArchestrA Certificate Renewal Service** windows service.

Note: Client Service will try to automatically bind the renewed certificate. If there are any issues in browsing the website or starting the services after certificate renewal, users need to reconfigure the secure communication in Farm Configuration. To reconfigure, see the steps mentioned in above section *To define the Security Settings*.

Securing Communication between Services

To have a secure communication between the services, apply the below changes to the Windows registry and reboot the server:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
```

For more information on securing communication, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client and https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2015/2960358.

Define Services and Global Settings

You can define the Services and Global Settings using the Farm Configuration Wizard or through Configuration XMLs.

To define Services

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.

   Note: You can also customize the settings for these services and websites using the **Custom Settings** option. For more information about Service-related changes and Website-related changes, see Advanced Settings and Administering Web Servers respectively.

2. Click **Next**.

   The Global Settings dialog box appears.

3. In the **Communication** tab, enter key fields in **Email Settings** and **Exception Email settings** to configure exception e-mails.

   The following are the details:

   - **Host**: Enter information related to mail server.
     Example: Enter details related to Microsoft Exchange Server (IP address of the exchange server).
   - **Port**: Enter the port number for the mail server. The default port number is 25.
   - **From email**: Enter the from e-mail address.
     Example: admin@telematics.com
   - **To email**: Enter the to e-mail address.
     Example: alex@telematics.com

4. Click **OK**.

Note: To confirm the exception e-mail settings, click **Test SMTP**. An e-mail will be generated and sent to the **To email** address confirming successful configuration of the e-mail. The advanced settings like **Secure Socket Layer (SSL), Email Timeout, User Name,** and **Password** for the e-mail account holder, **Password Encrypted** flag will differ based on the mail server settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Define Central Configuration

1. Run **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Farm Configuration Wizard window appears.
2. Click **Next**.
3. The Edit Farm settings window appears.
4. Select **Service Settings**.
5. Click **Next**.

   The Services/Global Settings window appears.
6. Click against **Central Configuration** to edit AVEVA Work Tasks **Central Configuration settings**.

   The Central Configuration Settings page appears.
   - **http/https**: This option enables you to determine if you want a secured (https) or a non-secured site (http).
   - **Authentication Type**: This option allows you to provide the authentication type to access the Central Configuration. The available authentication types are Windows, AVEVA Connect, and Azure Active Directory.

     Note: The AVEVA Connect and Azure Active Directory authentication types are available only if these user providers are configured in the system.
     To configure AVEVA Connect user provider, see AVEVA Connect Settings.
     To configure Azure Active Directory user provider see Azure Active Directory Settings.
   - **Create at**: This field allows you to provide the Internet Information Service (IIS) path where the new site is created.
   - **Port Number**: This field is used to provide a port number for the Central Configuration.
7. Click against **Create at** to change the path of the Central Configuration.

   A message indicating that if the path has been changed the Central Configuration will no longer be accessible appears.
8. Click **Yes**.

   The IIS structure screen is displayed. Select the desired IIS path for the Central Configuration.
9. Click **OK**.

   The selected URL appears in the **Central Configuration Settings** screen.
10. Click **OK**.

Note:

- The default IIS path for Central Configuration is displayed. Click the edit icon to change the site path.

- If you want to update the authentication type to AVEVA Connect or Azure Active Directory of the already configured Central Configuration, you need to reconfigure the AVEVA Connect and Azure Active Directory user providers for the Central Configuration. For information on configuring user providers, see AVEVA Connect Settings and Azure Active Directory Settings.

- Central Configuration cannot be accessed in Chrome browser when configured with unsecured access (http://)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

for Azure Active Directory and AVEVA Connect authentication types.

Provision Services

While the installation is in progress, you can view the services that will be installed. This provides information on the progress of installation. At the end of the installation, a status indicating the completion of installation appears.

- Click **OK** to complete the installation.

AVEVA Work Tasks Client

This section describes the activities involved while installing AVEVA Work Tasks on a client machine.

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.
   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.
   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.
   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.
   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.
   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.

2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.

3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.

5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.

6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.

4. Click **Next**.

   The License Server details are configured successfully.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.
4. Click **Next**.

   The **Edit Farm Settings** window appears.
5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.
6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
9. Click **Next**.

   The License Server details are configured successfully.

Select Client Installation

1. In the Select the type of installation page, select **Client**.
2. Click **Next**.

   The Database User Settings page appears.

Connect to an Existing Farm Database

You can use the Connect to existing database dialog box to connect to the existing Farm. You can select the Connection String or Connection provider for the new database.

1. Select the computer name on which the Farm Database is installed from the **Server Name** field.
2. Select **Connection String**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Enter the following details:
   a. **Authentication Type**: This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports both Windows and SQL server authentication process. Example: Windows.
   b. **User ID**: This field is used to enter the SQL user ID for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   c. **Password**: This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   d. **Advanced Settings**: This is an optional field. It is used to enter any additional connection information such as connection Timeout etc. Example: Connection Timeout = 20.

      While creating a data source for repository, use the following custom settings to set properties for the connection pool.

      encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;

      encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

      enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks controls the transaction from escalating to a distributed transaction which is very expensive.

      The above property can be used to turn off this feature. The default value is set as True.

      connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

      maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

      sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

      Note: These settings are case sensitive and should be mentioned only in lower case.
   e. **Database**: This field is used to select the machine with database installed. Example: FarmDB.

      AVEVA Work Tasks will validate if at least one server is installed.
4. Click **Test Connection** to ensure database connectivity.

   You must have the following permissions on the Database Server:

   SELECT, INSERT, UPDATE, and DELETE permissions.

   EXECUTE permission for Stored Procedures.
5. Click **Next** to continue with the wizard.
6. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Define and Provision the Enterprise Console

You can define the required AVEVA Work Tasks services.

Steps to Define Enterprise Console

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.
2. Click **Next**.

   The **Installing Services** screen appears, indicating the progress of installation.

   A message *Installation is Complete* appears after all the services are installed.
3. Click **OK**.

Create a Repository DataSource

A **Repository DataSource** is used to store all repository related data. The **Repository DataSource** must be created on a machine where the **Central Configuration** site is installed.

Example

A TelematicsDataSource is created for TelematicsHR Repository.

A Repository contains Workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating the repository.

To create a Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**.

   The Central Configuration web page appears.
2. Click **DataSource Settings**.

   The Datasource List page appears.
3. Click **Add**.

   The Manage Datasource page appears.
4. Enter the required details.
   a. **Name**: Enter a valid data source name. Example: *TelematicsDataSource*.
   b. **Description**: Enter a description for the data source. Example: *This data source is used to store connection details*.
   c. **Connection String**: Select this option to establish a connection with the database. The connection string contains fields that that defines the connection. The connection information is encrypted and stored.

      Server Name

      To use a database on the local machine, enter "localhost", ".", or the local computer's name for the **Server Name**.

      Note: Server Name can be machine name/IP address/SQL Server AlwaysON/SQL Server instance name. Instead of entering "local host", it is preferable to give the local machine name.

      If the **Database Type** is **SQL Server**, then specify an IPV6/IPV4 address for the **Server Name**.
      To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: *localhost,1455*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be *<server name>\SQLExpress*.

Authentication Type

Use this field to determine the process to validate a user who is trying to connect to the database. AVEVA Work Tasks uses Windows and SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. The **User ID** and **Password** field is disabled if Windows Authentication is selected. Example: *Windows*

Advanced Settings

Use this field to define advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection.
Example: *Connection Timeout = 20*
or
For defining maximum connections that can be opened in a connection pool.
Example: *max pool size = 250*
Default connection pool is set as 250. We recommend to enter a higher value on heavily loaded environment.
While creating a data source for a repository, use the following custom settings to set properties for the connection pool.
encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.
enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature, AVEVA Work Tasks controls the transaction from escalating to an expensive distributed transaction.
The above property can be used to turn off this feature. The default value is set as *True*.
connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is 30 seconds. The value should be set in seconds.
maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is infinite.
sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.
These settings are case sensitive and should be mentioned only in lower case.

Database:

Specify or select a database that can be used as a repository database. This database stores all repository related data. The repository database is created if it does not exist on the database server instance.
Example: *TelematicsDB*

Enable Table Partitioning:

Select to enable database table partitioning. For more information, see Partitioning Database.

d. **Connection Provider**: Use this to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The selected dll must be copied to all the machines, all servers and all clients, that are connected to the current Farm.

Assembly Path

Click to browse and choose the required dll file.
To use custom properties (enableltm, connectionretrywaittime, maxconnectionretries, and sqlcommandtimeout) in the Assembly connection string, the database must be created before.
See *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Developer Guide* for creating the assembly. Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.

   A message about successful test connection appears.

6. Click **OK**.

   A message about successful creation of the data source appears.The message also states that the required tables will be created in the data source after a repository is associated with the data source.

When a data source is saved, an entry is created for the data source in the **Farm Database**. When a first repository is created for the data source, AVEVA Work Tasks tables are added to the data source. While creating a data source, the archival database is created with the same database name suffixed by *_BI*. This database is used for archival in future use.

Note: After you configure the AVEVA Work Tasks, you must add the created **Farm Database** to the **SQL Server AlwaysOn Availability Groups**. Contact your Database Administrator to add the database to **SQL Server AlwaysOn Availability Groups**.

To view the data source created, click **DataSource Settings** link.

Create a Repository

A **Repository** contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

To create a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The Central Configuration page appears.

2. Click **Repository Settings**.

   The Repository List page appears.

3. Click **Add**.

   Note: If the number of repositories exceeds the permitted limit for the license, then the message "You have exceeded the maximum number of repositories" appears, and the repository creation is stopped. Click **Close**.

   The **Manage Repository** page appears.

4. Enter the required details.
5. Click **OK**.

   The **Config Administrator** page appears.

6. Click to configure an administrator.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The User Lookup dialog box appears.

7. Select the provider from the provider drop-down list.
8. Enter the details to search the administrator for the repository that is created.

   Note: You can also search a user based on *ObjectSID* and *objectGUID* (applicable only for Active Directory provider).

9. Click **Search**.

   The user is listed under **Available Resources**.

10. Select and click the arrow to list the user under **Selected Resource**.
11. Click **Update**.

    The selected user is displayed in **User Lookup**.

12. Click **OK**.

    A message confirming the successful creation of an administrator appears.

13. Click **OK**.

    The **Repository List** page appears.

    For more information about configuring the system user, see Configure System User.

Manage Repository Window Fields

The following table explains the fields of the Manage Repository window:

Field Name	Description	Example
Repository DataSource	Lists all the data sources created in a Farm. The selected data source will be used to store data for the current repository.	TelematicsDatasource
Attach DataSource	Select Attach DataSource checkbox and then select a repository from the selected DataSource .Data associated with the selected repository will be copied to the new repository. The version of the installed product and destination DataSource should be the same as that of the DataSource from which the repository data is to be copied. For example, in an upgraded environment, from build Work Tasks version 1 to Work Tasks version 2, you cannot attach a DataSource created in build Work Tasks version 1 to build Work Tasks version 2.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	To match the build version of the installed product to the version of the DataSource: 1. If the DataSource was created in build Work Tasks version 1, then the entire build Work Tasks version 1 must be upgraded to Work Tasks version 2 by running the product installer in the upgrade mode. 2. All the Farm, DataSources, Repositories, and Lists of build Work Tasks version 1 must be upgraded to build Work Tasks version 2 by running the AVEVAWorkTasksUpgradeManager.exe located at the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder. 3. After upgrading all the AVEVA Work Tasks components to build Work Tasks version 2 build, that DataSource can be used in any machine that has same version by using this feature.	
Repository Name	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the repository name.	Telematics Repository
Description	Provide a description for the repository.	This stores Telematics Employee Leave Details.
From mail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might	Provide the valid email id that is specified in the **User Name** field while configuring **SMTP Settings** in the **Mail Server Settings** page. For more details, see Mail Server Setting.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	occur in the Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be sent to the mail ID defined in **Exception to mail**. The From address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To avoid this, restart the Workflow Engine Service and Communication Service.	
Exception to mail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails is sent to the email ID specified in **Exception to mail**.	Provide the valid email id.
Alert initiator of the Workflow	Determines if the status of a workflow should be sent as a notification mail to the initiator of the workflow.	A process with a rule to check the pending leave available for the employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
Servers	Lists the servers available in the Farm. Repository will be available only to the mapped servers.	Work Tasks Server Name
Enterprise Consoles	Lists all the Enterprise Consoles for a selected AVEVA Work Tasks Server. Repository will be available only to the mapped Enterprise Console.	http://worktaskservername:8001/EnterpriseConsole
Enable Theme	Select this checkbox to enable the defined theme.	-
Theme Name	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. It provides **Default** and **Lite** themes.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Resource Provider	Lists the various default resource providers supported by AVEVA Work Tasks. Resource providers are also termed as User Provider. A User Provider is a data store containing information about the user. AVEVA Work Tasks also supports custom resource provider. For more information about Resource Provider, see User Providers. AVEVA Connect and Azure Active Directory resource providers are also available after you configure them. To configure these providers, see AVEVA Connect Settings and Azure Active Directory Settings. AVEVA Work Tasks allows secured LDAP configuration. The default port number for LDAPS is 636. You can map the repository in IDE and use the Secured LDAP. The logged-in Active Directory is displayed by default, and **Active Directory Datasource** expects **LDAP://** or **Fully Qualified Domain Name** as value.	AVEVA Work Tasks Lists or Active Directory
Custom Application Folder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with a semicolon.	-
Hide Repository	Select this option to make the repository unavailable to the Farm.	-
Source path	Enter the path to the Source Elements Folder.	-
Attachment Storage Path	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	absolute path. - The default path is the **Attachments** folder in *C:\ProgramData\AVEVA Work Tasks*\. - The default path is used when no path is specified. - Ensure appropriate rights are set to the folder, where attachments are stored, for the following identities: -- The application pool identity for **Central Configuration** and **Enterprise Console(s)**. -- The account configured for the **Workflow Engine** service. - In case of mapped drives, ensure they are available to the identities. - In multiple-server environments, the path specified must be in a shared location.	

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Auto Log Off Settings for Enterprise Console	Automatically logs out the logged in user after the designated period of inactivity. Enter the time in minutes. This field accepts only valid integer values between 0 to 360. 0 minute means the user will not get automatically logged off. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. The default value for automatic log off is 30 minutes. You use this field to define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML.	0 to 360 (minutes)
Auto Log Off Settings for AVEVA Work Tasks Pro	Request for user credentials for AVEVA Work Tasks Pro app after the set time is elapsed. Enter the time in minutes. This field accepts only valid integer values between 0 to 2880. 0 minute means the user will not get automatically logged off. The default value is 30 minutes. If AVEVA Work Tasks Pro app is offline, the Auto Log Off will not get active, and the user will not be automatically logged off as per the defined settings.	0 to 2880 (in minutes)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Offline Support	Select this option to enable offline submission of items in AVEVA Work Tasks Pro app.	-
Refresh on Work Item submission	Select this option to enable Inbox refresh on Work Item submission in AVEVA Work Tasks Pro . Refresh option is enabled by default.	-
Timeout	Enter the time in seconds to set the timeout. If the value is set as 0, then there is no timeout. Default value is 60 seconds.	-
Label for Fill Form	Enter the label for Fill Form. The customized label will be displayed for the Fill Form in AVEVA Work Tasks Pro.	Work Tasks
Date Configuration Flag for Alternate Actors	Select the **Enable Date Settings** option to set the **From** date and **To** date as mandatory while creating alternate actors. For more information about creating alternate actors, see *Alternate Actors* topic in the *User Guide*.	-
Display Domain name with User Name	Select this checkbox to display the domain name along with the user name in the Enterprise Console and the List. The domain name will be displayed only: • If this checkbox is selected. • If the **Resource Provider** is selected as **Active Directory**.	-

User Providers

AVEVA Work Tasks supports the following User Providers by default:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Active Directory

When you select **Active Directory** as the **Resource Provider**, details such as **Active Directory datasource** and the **Active Directory search base** are populated by default.

Authentication User, **Authentication Password**, **User Log-on ID**, and **User Log-on Display Name** are optional fields. Access to the active directory might not be available for all users. In such cases, provide the active directory authentication user name and the active directory authentication password with which you can connect to the Active Directory.

AVEVA Work Tasks considers *SAM-Account-Name* as **User Log-on ID** by default. If you want to use active directory attributes other than the *SAM-Account-Name* user, then enter the desired active directory attribute details in the **User Log-on ID** field and **User Log-on Display Name** field. **User Log-on Display Name** is the user friendly display name of the active directory attribute. This **User Log-on Display Name** is referred in the User Lookup dialog box against the **User Log-on ID**.

Steps

1. When you select **Active Directory** as the **Resource Provider**, then the **Use Token Service** field appears. In this field, select one of the following:
   - If you do not want to use AIM authentication, select **Without Token Service**.
   - If you want to use AIM authentication, then select a server from the list of alias server names.
2. Enter **Active Directory datasource**.
3. Enter **Active Directory search base**.
4. Enter **Domain Name**.

   The domain name is case-sensitive.
5. Enter **Authentication User**.
6. Enter **Authentication Password**.
7. Check **Is Cross Domain Role Provider** checkbox, if cross domain users and roles mapping is required.

   Example: Users *John* and *Jim* of domain *TelematicsU* and users *Mike* and *Bob* from domain *TelematicsAU* are added to role Team HR of domain *TelematicsMain*.
8. Enter **User Log-on ID** if you want to use another Active Directory attributes instead of *SAM-Account-Name*.

   We recommend to use attributes of type *string* as input for **User Log-on ID.** However, *ObjectSID* and *objectGUID* are also supported.

   After you set the **User Log-on ID**, you cannot change it later.
9. Enter the **User Log-on Display Name**.

   After you set the **User Log-on Display Name**, you cannot change it later.

   This is the default display name of the user account of the active directory user used. **User Log-on Display Name** is used in user lookups.
10. Click **Test LDAP**.

    A message about successful LDAP test appears.

Note:
- Some of the active directory attributes or properties are not indexed. If you use an active directory attribute that is not indexed, it might impact the log-on validation performance based on the active directory entries. We recommend to use indexed attributes as **User Log-on ID** or index the attributes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- For an upgraded repository, you cannot change both **User Log-on ID** and **User Log-on Display Name**.
- You cannot localize **User Log-on ID** and **User log-on Display Name** fields.
- Disabled users will not be shown in user lookup search.

Using Forms

For Forms Resource Provider:

- If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.

1. In the **Resource Provider** drop-down list**,** select **Forms.**
2. In the **User Entity properties** field, enter XML data.

   Click **Sample Code** to get the XML Schema Template.

   Example

   ```
   <properties>
   <property name="userid" type="string" purpose="identifier" />
   <property name="username" type="string" purpose="name" />
   <property name="pwd" type="string" purpose="password" />
   </properties>
   ```
3. In the **User Provider Properties** field, enter the same XML Schema.

   There must be at least one identifier in the XML Schema. For example, UserID
4. In the **Datasource** field, enter a valid data source or specify a dll.

   The value for the data source can be specified as **Physical path of the dll** or **Physical path of the dll::param. Param** is not mandatory.

   See topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Build Business Process* section for creating the assembly.

   Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly, whereas one class can return multiple connection strings.

   Examples of data source parameter:

   - c:\DLLStore\GetConnectionString.dll
   - c:\GetConnectionString.dll::Leave

   If there are two data sources, *Leave* and *Licensing*, and only one DLL is used to return a connection string based on the data source selected. The parameter can be specified as **c:\GetConnectionString.dll::Leave** or **c:\ GetConnectionString.dll::Licensing**. The connection string can be returned from the connection dll based on this parameter.
5. Enter a proper table name or view name which holds the User Name and Password for the Authentication purpose.

   Example: Passmast (the table which is available in IMS_NEW Database)
6. Click **Test SQL Connection**.

   A message about successful test connection appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using ASP.NET Membership

This resource provider lists users defined in the asp.net membership database.

Lists

This resource provider lists users created using AVEVA Work Tasks Users Creation. If you are unable to determine a User Provider to create a repository, use AVEVA Work Tasks Lists.

To verify successful creation of the Repository:

1. Click **Enterprise Console** URL from the site path column.
   The repository created is listed.
   Add the created Enterprise Console link into "Add to Favorites" to easily navigate in future.
2. Click **Repository User Provider** link to logon to the repository.
   The Enterprise Console log-on page appears.
3. Enter the logon details, and then click **Login**.
   The Enterprise Console home page appears. This indicates successful creation of a Repository.
   All features can only be available for a user with administrative privileges.

Note: Consider you created the Repository and then deleted it. If you create the same Repository again immediately and try to log into it through Enterprise Console, the Provider does not list the Repository. You need to access IIS and recycle AVEVA Work Tasks from the Application Pool to get the Repository listed in the Provider list..

Verify the Installation

After you install AVEVA Work Tasks, verify that the product is installed successfully. To verify successful installation, create a simple Workflow using Process Designer. The tasks includes the following:

- Creating a Workflow
- Publishing the Workflow
- Testing the Workflow

Creating a Workflow

1. Log on to the **Enterprise Console**.
2. If the Repository is configured for Active Directory provider, go to step 4.
3. Enter the **User Name** and **Password**.
   The **User Name** and **Password** will be validated with the user provider selected while creating the repository.
   The default authentication provider is the Repository User Provider List.
4. In the **Enterprise Console**, click menu icon.
   All features can only be available for a user with administrative privileges.
5. From the menu, select **Workflows**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Workflow window appears.

6. On the Action bar, click **New**, and then click **Workflow**.
   The New Workflow window appears.
7. Enter **Title** and **Description**.
8. Click **Save & Continue**.
   The successful message appears.
9. Select **Design the Workflow now**.
   This is the default option.
10. Click **Finish**.
    The Process Designer window appears.
11. From the activities pane on the left, drag the Information activity to the Process Designer window.
12. The activity *Information1* is created.
    Click to create a link between two activities.
    The Link Action window appears.
    a. Select from the **From Action** drop-down box.
    b. Select from the **To Action** drop-down box.
    c. Click **OK**.
       The link is established.
13. Right-click *Information1*.
14. Select **Activity Properties** from the context menu.
    The Activity Properties pane appears.
    a. Enter **Name** and **Description**.
    b. Click to **Assign Actor(s)**.
       The Assign Actor(s) window appears.
    c. Select the required provider from the **Providers** drop-down list.
    d. Select values from the drop-down list.
    e. Click **Add**.
    f. Click **Update**.
15. Click to enter the **Subject** for Notification Contents.
    The window to enter subject for notification appears.
16. Click **Update**.
17. Click to enter the **Body** for Notification Contents.
    The window to enter the Body content appears.
18. Click **Update**.
19. From the Activity Properties pane, click **Save**.

Publishing the Workflow

1. On the **Publish** menu, click **Publish**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Published successful message appears.

2. Close the dialog box.

   The Enterprise Console screen lists the workflow created.

Testing the Workflow

1. Select the listed workflow.
2. Right-click the selected workflow.
3. Click **Publish and Test Run**.

   The **Status Finished successfully** appears.

   If Status is **Execution Pending** in the Process Execution window, then click on the **Refresh** button to get the status.
4. In the **Enterprise Console** menu, select **Inbox**.

   The Inbox lists the work item.
5. Click to view the work item listed.

   This indicates that the installation is successful.

Web Farm (Multiple Web servers), AVEVA Work Tasks Server, and Database on Different Machines

This section describes the activities involved while installing the Single Server for the scenario Web Farm (Multiple Web servers), AVEVA Work Tasks Server, and Database Server on different machines.

In this scenario, the BPM Server is installed on Machine 1 and the Client is installed on multiple servers namely Machine 3 (or Server 1), Server 2 and Server N in a Web Farm. "Server N" represents the number of machines in the Web Farm.

Ensure that you install the product in the following sequence:

- High-Level View of Server Installation
- High-Level View of Client Installation

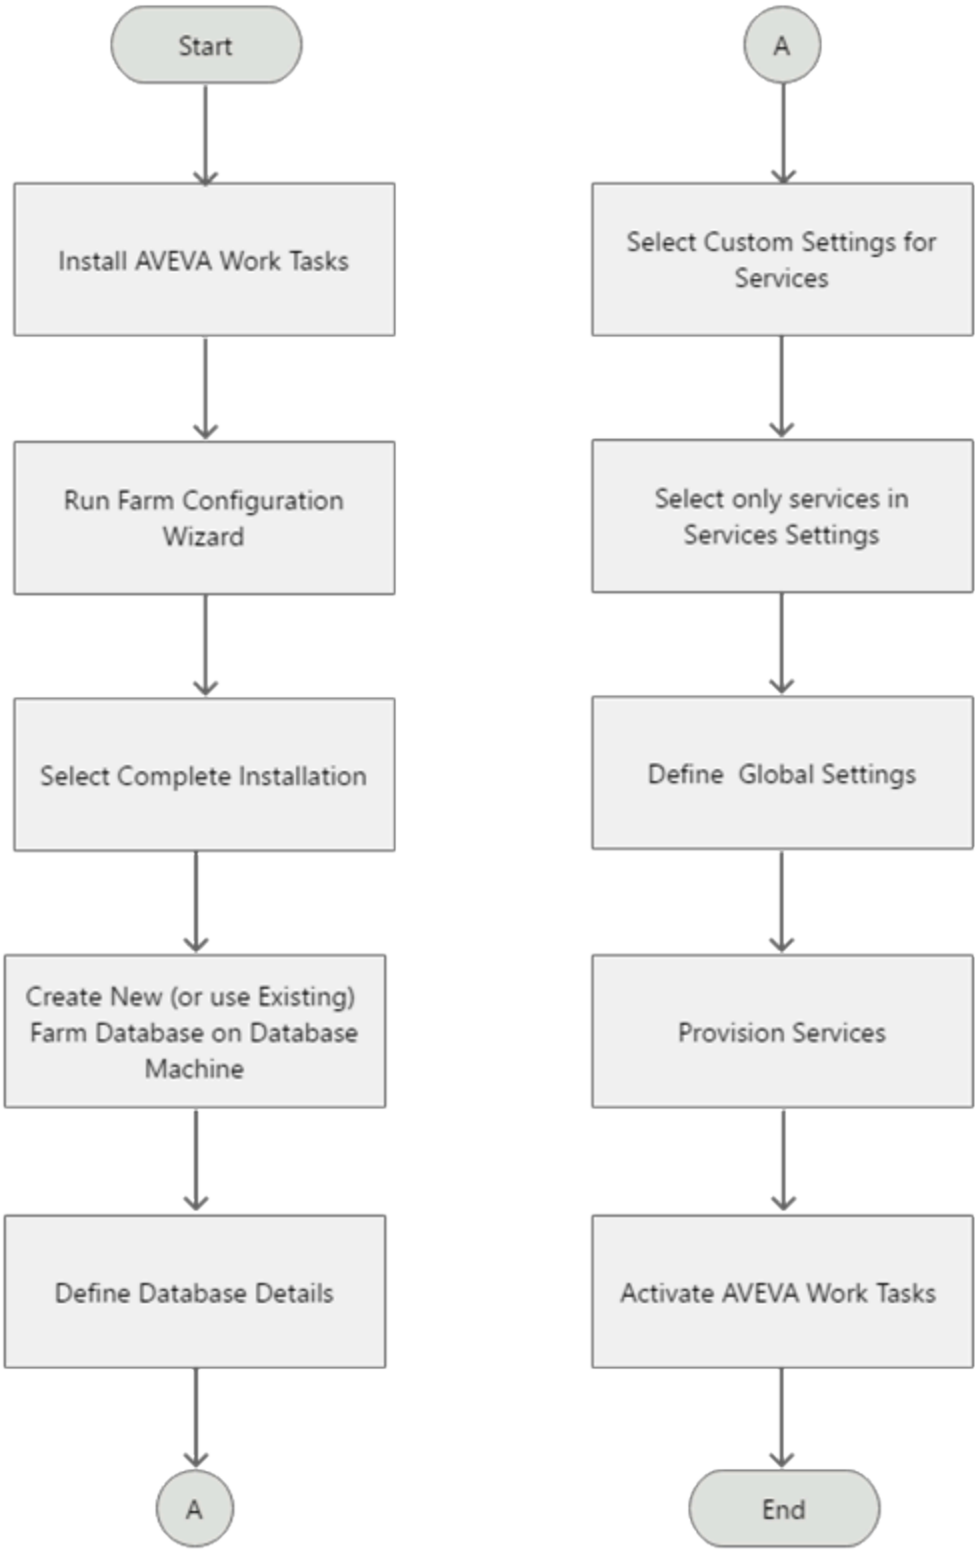
See Also: AVEVA Work Tasks Web Server Farm, Work Tasks Server, and AVEVA Work Tasks Database Server on Different Machines

High-Level View of Server Installation

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

The following flowchart illustrates a high-level view of the various installation steps with an overview of the various activities involved while installing AVEVA Work Tasks. Using this flowchart you can visually keep track of your activities while following the sequence of tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



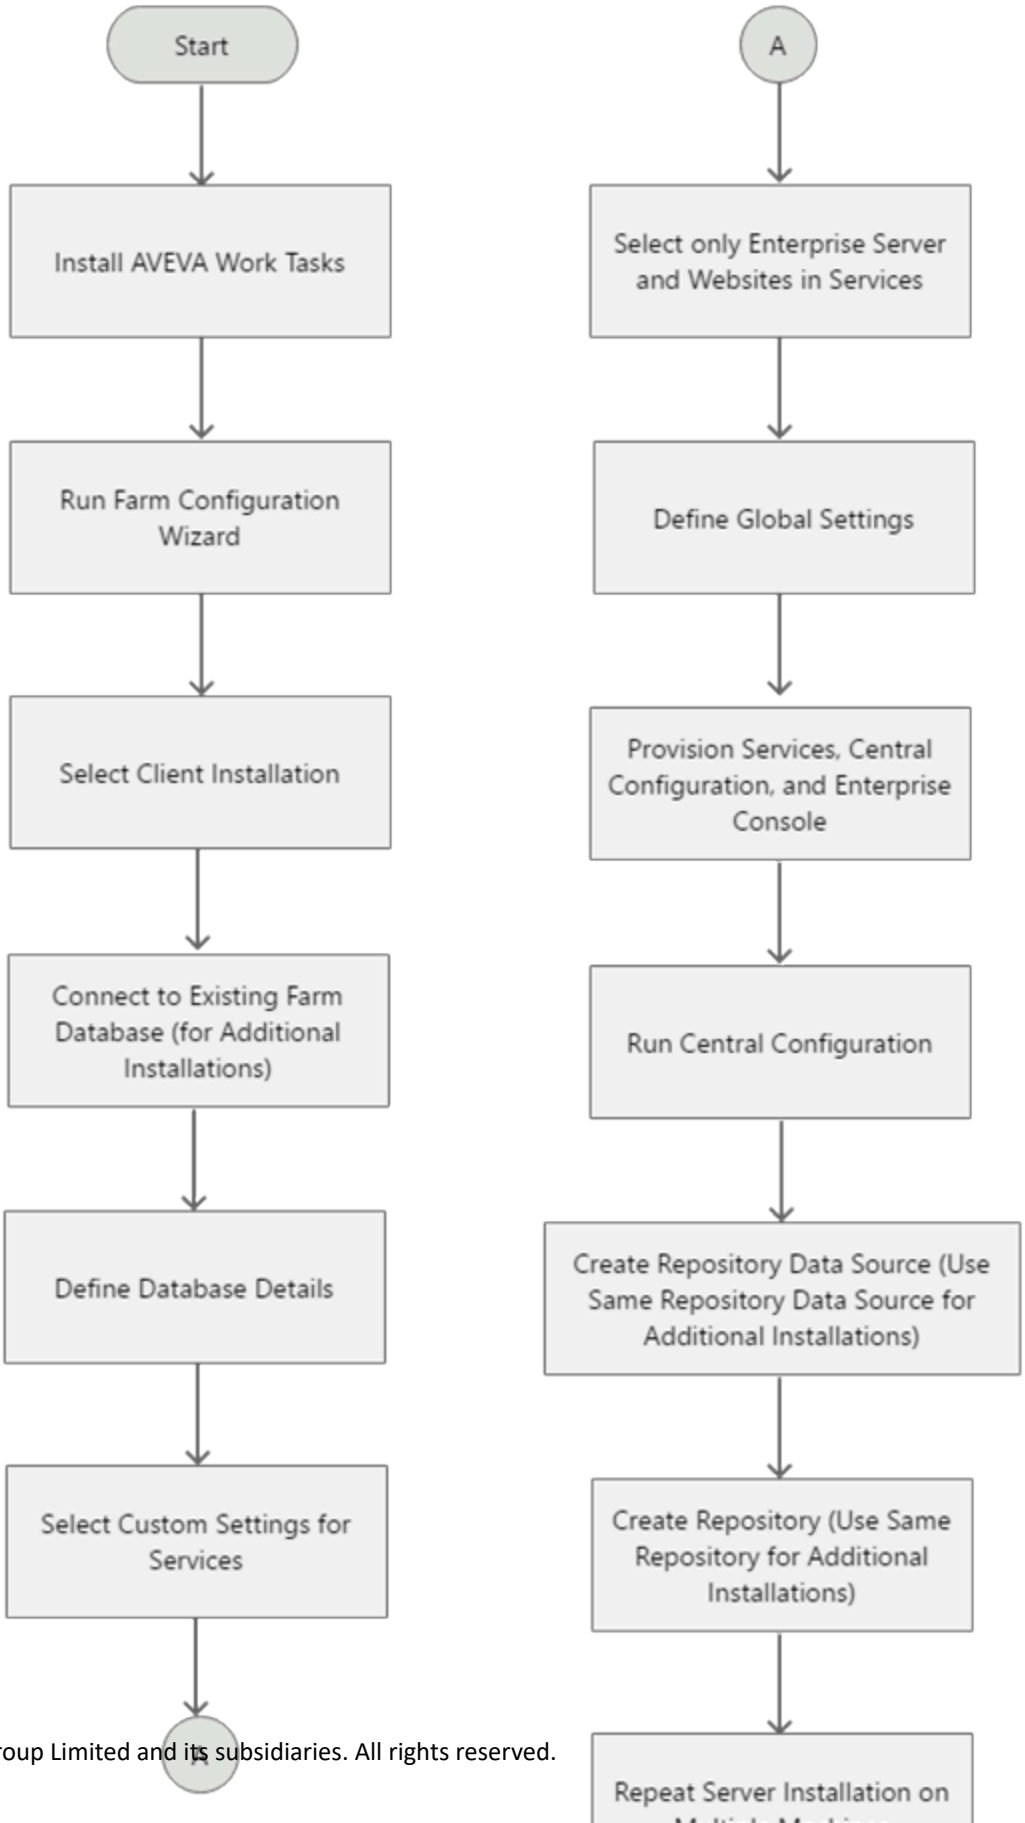
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

High-Level View of Client Installation

This section provides a high-level view of the Client installation. The Client components are installed on Web Servers. For more information on this scenario, see Single Server.

Before continuing with the installation, it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation

This section provides installation steps for the scenario Web Farm (Multiple Web servers), AVEVA Work Tasks Server, and Databases on different machines.

The installation includes the following:

- Installing Workflow Management Server
- Installing Workflow Management Client

AVEVA Work TasksServer has to be installed before installing AVEVA Work Tasks Client. In this scenario, the Client has to be installed on multiple machines.

AVEVA Work Tasks Server

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the current MSDTC settings.

2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.

3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.

5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.

6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.

4. Click **Next**.

   The License Server details are configured successfully.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.
4. Click **Next**.

   The **Edit Farm Settings** window appears.
5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.
6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
9. Click **Next**.

   The License Server details are configured successfully.

Select the type of installation

To select the type of installation:

1. In the Select the type of installation page, select **Complete Installation (Server)**.

   A Complete Standalone Deployment does not require a client installation.
2. Under **Create AVEVA Work Tasks Farm**:
   - Click **Create AVEVA Work Tasks Farm database** to create a new Farm database.
   - Click **Use existing AVEVA Work Tasks Farm database (Creates AVEVA Work Tasks Farm tables only if they do not exist)** to use an existing database as the Farm database.
3. Click **Next**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create Farm Database

Use the Create AVEVA Work Tasks Farm Database page to provide **New Database** details. Select the **Connection String** option to establish a connection with the database. This connection information is encrypted and stored.

You can enter either Windows or Microsoft SQL Server user settings for authentication.

Note:
- The Farm database password does not support **&** and **;** special characters.
- While setting up **Farm Database** with **Windows Authentication**, do not enter **FQDN** in the **Domain Name** field.

To Create Farm Database

1. Enter **Database Title**.
2. Select **Connection String**.

   See *Connection Provider* later in this topic, if you have selected the **Connection Provider** option.

   - Enter the following details:

     Server Name:

     Provide information about the database server on which the Farm database can be installed.

     If the **Database Type** is **SQL Server**, then you can specify an IPv6 address for the **Server Name**.

     If SQLExpress Instance need to be used as a Database instance of the Farm database, then **Server Name** should be <server name>\SQLExpress.

     To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

   - **Authentication Type**

     This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports Windows and SQL Server authentication process.

     Example: Windows
     If Windows Authentication is selected, the user configured for the Farm configuration will be used to access the database. This is the authentication recommended by AVEVA Work Tasks.

   - **Login**

     This field is used to enter the SQL login credential for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Password**

     This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Advanced Settings**

     This is an optional field. It is used to enter any additional connection information, such as connection Timeout. Example: Connection Timeout = 20.

     While creating a data source for repository, use the following custom settings to set properties for connection pool. These settings are case sensitive and should be mentioned only in lower case.

     ```
     encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
     ```

     encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

certificate is installed on the SQL Server for SSL encryption.

enableltm: AVEVA Work Tasks internally implements light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive. This property can be used to turn off this feature. The default value is set as True.

connectionretrywaittime: While opening a new connection, if the data base server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

maxconnectionretries: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

3. Click **Test Connection** to ensure database connectivity.
4. Click **Next**.

   The message *AVEVA Work Tasks Farm is Created* appears.
5. Click **OK**.

AlwaysOn Availability Groups feature of Microsoft SQL Server

The **AlwaysOn Availability Groups** feature of Microsoft SQL Server is a high-availability and disaster-recovery solution that provides an enterprise-level alternative to database mirroring. Introduced in Microsoft SQL Server 2012, AlwaysOn Availability Groups maximizes the availability of a set of user databases for an enterprise.

After you configure the AVEVA Work Tasks, you must add the created Farm Database to the SQL Server AlwaysOn Availability Groups. Contact your Database Administrator to add the database to SQL Server AlwaysOn Availability Groups.

Notes:

- The authentication user needs different rights assigned for different scenarios. If a user wants to create database (Farm or Repository Data Source Database), Authentication User needs to have minimum 'dbcreator' access rights on Database Server Instance.

- If database is already created, user needs to have following permissions on Database Server:

- SELECT, INSERT, UPDATE, and DELETE permissions.

- EXECUTE permission for Stored Procedures.

To choose Connection Provider

Complete the following steps to choose a connection provider:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Enter **Database Title**.
2. In the **Database Type** box, select a database type.
3. Select **Connection Provider**.

   This option is used to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.
4. Enter the following details:
   - **Assembly Path**:

     Click the icon to browse and choose the required dll file.

     If custom properties (enableltm, connectionretrywaittime, maxconnectionretries and sqlcommandtimeout) are required to be used in Assembly connection string, then user should select **Use existing Farm database** while creating a the Farm. See Creating or Using an Existing Database.

     See the topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub chapter in the *Build Business Process* section for creating the assembly. Make sure that, there should be only one class implementing *IDBConnectionString* interface within this assembly.
5. Click **Test Connection** to ensure database connectivity.
6. Click **Next**.
7. The message *AVEVA Work Tasks Farm is created* appears.
8. Click **OK**.

Define Security Settings

You can define the Security Settings using the Farm Configuration Wizard.

For more information on Security settings, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client.

To define the Security Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Security Settings** and **Service Settings** and then, click **Next**.
4. Select **Secure Communication** to establish secured communication between the AVEVA Work Tasks services through HTTPS.
5. Select **Secure Web Sites** check box to configure secured web sites. Uncheck the **Secure Web Sites** check box to use HTTP sites. By default the sites are created in HTTPS mode.
6. Enter the Port number. The default port for the HTTPS site is 8001, and for the HTTP site is 8000. You can enter any port number that IIS accepts. But if any other services or applications are already using the entered port number, AVEVA Work Tasks will not start.
7. Select the available certificate from the **Certificate** list. If your certificate is not listed, click the **Refresh** icon to repopulate the list.

   Note: If the required certificate is not listed, generate one using the System Management Server

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

(Configurator tool). Do not use a self-signed certificate without a proper root chain.

8. Click the **Validate** button to validate the certificate before configuring the security settings.

   Note: An Internet connection is needed to validate the certificate.

9. Click **Configure**, then **Next**, and then **Finish** to apply the new security settings.

Note:
- To update the port number, certificate, and websites from unsecure to secure or vice-versa, select **Security Settings** and **Service Settings** check box in **Edit AVEVA Work Task Farm Settings** window before updating the values. After the required details are provided, these settings get updated only when you click **Configure**, then **Next**, and then **Finish** as you navigate through the Farm Configuration Wizard..
- If the Quickflow is already deployed on a machine, you need to deploy it again after you update the security settings. If secured web site is configured, then you cannot change the server configuration for Quickflow in Central Configuration. However, if the **Secure Web Sites** checkbox is not selected, you can make the changes to the server configuration.
- Advance Server communication cannot be configured on HTTP/HTTPS.
- For resources of Load Balanced Server, ensure to configure all services with the same protocol (HTTP or HTTPS).
- It is recommended to use Standard SSL certificate instead of self-signed SSL certificate.

Using ASB Certificate for Secured Communication

ASB Certificate is a PCS-managed SSL certificate and renews automatically every 30 days when the certificate is still valid. The certificate is valid for two years. The PCS watchdog service on the runtime node checks the validity of the SSL certificate within 5 minutes from when it starts and once a day. PCS also renews the SSL certificate if it is expired.

If the runtime node is offline and later back online, the PCS watchdog service regularly checks the certificate validity and renews it if it is required. Consider restarting the PCS watchdog service to enforce the SSL certificate validity check within 5 minutes from the restarting time.

Furthermore, when the SSL certificate is renewed, PCS binds it to port 443 (by default) and changes the SslThumbprint PCS registry value. If AVEVA Work Tasks sites are hosted on port 443, certificate binding will be auto-renewed when the SSL certificate is renewed. It is recommended to check the bindings in IIS with every certificate renewal to ensure the application is running seamlessly.

To disable the certificate renewal, consider disabling the **ArchestrA Certificate Renewal Service** windows service.

Note: Client Service will try to automatically bind the renewed certificate. If there are any issues in browsing the website or starting the services after certificate renewal, users need to reconfigure the secure communication in Farm Configuration. To reconfigure, see the steps mentioned in above section *To define the Security Settings*.

Securing Communication between Services

To have a secure communication between the services, apply the below changes to the Windows registry and reboot the server:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
```

For more information on securing communication, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client and https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2015/2960358.

Define Services and Global Settings

You can define the Services and Global Settings using the Farm Configuration Wizard or through Configuration XMLs.

To define Services

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.

   Note: You can also customize the settings for these services and websites using the **Custom Settings** option. For more information about Service-related changes and Website-related changes, see Advanced Settings and Administering Web Servers respectively.

2. Click **Next**.

   The Global Settings dialog box appears.

3. In the **Communication** tab, enter key fields in **Email Settings** and **Exception Email settings** to configure exception e-mails.

   The following are the details:

   - **Host**: Enter information related to mail server.
     Example: Enter details related to Microsoft Exchange Server (IP address of the exchange server).
   - **Port**: Enter the port number for the mail server. The default port number is 25.
   - **From email**: Enter the from e-mail address.
     Example: admin@telematics.com
   - **To email**: Enter the to e-mail address.
     Example: alex@telematics.com

4. Click **OK**.

Note: To confirm the exception e-mail settings, click **Test SMTP**. An e-mail will be generated and sent to the **To email** address confirming successful configuration of the e-mail. The advanced settings like **Secure Socket Layer (SSL), Email Timeout, User Name,** and **Password** for the e-mail account holder, **Password Encrypted** flag will differ based on the mail server settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Define Central Configuration

1. Run **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Farm Configuration Wizard window appears.
2. Click **Next**.
3. The Edit Farm settings window appears.
4. Select **Service Settings**.
5. Click **Next**.

   The Services/Global Settings window appears.
6. Click against **Central Configuration** to edit AVEVA Work Tasks **Central Configuration settings**.

   The Central Configuration Settings page appears.
   - **http/https**: This option enables you to determine if you want a secured (https) or a non-secured site (http).
   - **Authentication Type**: This option allows you to provide the authentication type to access the Central Configuration. The available authentication types are Windows, AVEVA Connect, and Azure Active Directory.

     Note: The AVEVA Connect and Azure Active Directory authentication types are available only if these user providers are configured in the system.
     To configure AVEVA Connect user provider, see AVEVA Connect Settings.
     To configure Azure Active Directory user provider see Azure Active Directory Settings.
   - **Create at**: This field allows you to provide the Internet Information Service (IIS) path where the new site is created.
   - **Port Number**: This field is used to provide a port number for the Central Configuration.
7. Click against **Create at** to change the path of the Central Configuration.

   A message indicating that if the path has been changed the Central Configuration will no longer be accessible appears.
8. Click **Yes**.

   The IIS structure screen is displayed. Select the desired IIS path for the Central Configuration.
9. Click **OK**.

   The selected URL appears in the **Central Configuration Settings** screen.
10. Click **OK**.

Note:

- The default IIS path for Central Configuration is displayed. Click the edit icon to change the site path.

- If you want to update the authentication type to AVEVA Connect or Azure Active Directory of the already configured Central Configuration, you need to reconfigure the AVEVA Connect and Azure Active Directory user providers for the Central Configuration. For information on configuring user providers, see AVEVA Connect Settings and Azure Active Directory Settings.

- Central Configuration cannot be accessed in Chrome browser when configured with unsecured access (http://)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

for Azure Active Directory and AVEVA Connect authentication types.

Provision Services

While the installation is in progress, you can view the services that will be installed. This provides information on the progress of installation. At the end of the installation, a status indicating the completion of installation appears.

- Click **OK** to complete the installation.

AVEVA Work Tasks Client

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
4. Click **Next**.

   The License Server details are configured successfully.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.
4. Click **Next**.

   The **Edit Farm Settings** window appears.
5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.
6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
9. Click **Next**.

   The License Server details are configured successfully.

Select Client Installation

1. In the Select the type of installation page, select **Client**.
2. Click **Next**.

   The Database User Settings page appears.

Connect to an Existing Farm Database

You can use the Connect to existing database dialog box to connect to the existing Farm. You can select the Connection String or Connection provider for the new database.

1. Select the computer name on which the Farm Database is installed from the **Server Name** field.
2. Select **Connection String**.
3. Enter the following details:
   a. **Authentication Type**: This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports both Windows and SQL server authentication process. Example: Windows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

b. **User ID**: This field is used to enter the SQL user ID for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

c. **Password**: This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

d. **Advanced Settings**: This is an optional field. It is used to enter any additional connection information such as connection Timeout etc. Example: Connection Timeout = 20.

   While creating a data source for repository, use the following custom settings to set properties for the connection pool.

   encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;

   encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

   enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks controls the transaction from escalating to a distributed transaction which is very expensive.

   The above property can be used to turn off this feature. The default value is set as True.

   connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

   maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

   sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

   Note: These settings are case sensitive and should be mentioned only in lower case.

e. **Database**: This field is used to select the machine with database installed. Example: FarmDB.

   AVEVA Work Tasks will validate if at least one server is installed.

4. Click **Test Connection** to ensure database connectivity.

   You must have the following permissions on the Database Server:

   SELECT, INSERT, UPDATE, and DELETE permissions.

   EXECUTE permission for Stored Procedures.

5. Click **Next** to continue with the wizard.
6. Click **OK**.

Define and Provision the Enterprise Console

You can define the required AVEVA Work Tasks services.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to Define Enterprise Console

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.
2. Click **Next**.

   The **Installing Services** screen appears, indicating the progress of installation.

   A message *Installation is Complete* appears after all the services are installed.
3. Click **OK**.

Create a Repository DataSource

A **Repository DataSource** is used to store all repository related data. The **Repository DataSource** must be created on a machine where the **Central Configuration** site is installed.

Example

A TelematicsDataSource is created for TelematicsHR Repository.

A Repository contains Workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating the repository.

To create a Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**.

   The Central Configuration web page appears.
2. Click **DataSource Settings**.

   The Datasource List page appears.
3. Click **Add**.

   The Manage Datasource page appears.
4. Enter the required details.
   a. **Name**: Enter a valid data source name. Example: *TelematicsDataSource*.
   b. **Description**: Enter a description for the data source. Example: *This data source is used to store connection details*.
   c. **Connection String**: Select this option to establish a connection with the database. The connection string contains fields that that defines the connection. The connection information is encrypted and stored.

      Server Name

      To use a database on the local machine, enter "localhost", ".", or the local computer's name for the **Server Name**.

      Note: Server Name can be machine name/IP address/SQL Server AlwaysON/SQL Server instance name. Instead of entering "local host", it is preferable to give the local machine name.

      If the **Database Type** is **SQL Server**, then specify an IPV6/IPV4 address for the **Server Name**.
      To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: *localhost,1455*
      To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be *<server name>\SQLExpress*.

      Authentication Type

      Use this field to determine the process to validate a user who is trying to connect to the database.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

AVEVA Work Tasks uses Windows and SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. The **User ID** and **Password** field is disabled if Windows Authentication is selected. Example: *Windows*

Advanced Settings

Use this field to define advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection.
Example: *Connection Timeout = 20*
or
For defining maximum connections that can be opened in a connection pool.
Example: *max pool size = 250*
Default connection pool is set as 250. We recommend to enter a higher value on heavily loaded environment.
While creating a data source for a repository, use the following custom settings to set properties for the connection pool.
encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.
enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature, AVEVA Work Tasks controls the transaction from escalating to an expensive distributed transaction.
The above property can be used to turn off this feature. The default value is set as *True*.
connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is 30 seconds. The value should be set in seconds.
maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is infinite.
sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.
These settings are case sensitive and should be mentioned only in lower case.

Database:

Specify or select a database that can be used as a repository database. This database stores all repository related data. The repository database is created if it does not exist on the database server instance.
Example: *TelematicsDB*

Enable Table Partitioning:

Select to enable database table partitioning. For more information, see Partitioning Database.

d. **Connection Provider**: Use this to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.

The selected dll must be copied to all the machines, all servers and all clients, that are connected to the current Farm.

Assembly Path

Click to browse and choose the required dll file.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To use custom properties (enableltm, connectionretrywaittime, maxconnectionretries, and sqlcommandtimeout) in the Assembly connection string, the database must be created before. See *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Developer Guide* for creating the assembly. Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.

   A message about successful test connection appears.

6. Click **OK**.

   A message about successful creation of the data source appears.The message also states that the required tables will be created in the data source after a repository is associated with the data source.

When a data source is saved, an entry is created for the data source in the **Farm Database**. When a first repository is created for the data source, AVEVA Work Tasks tables are added to the data source. While creating a data source, the archival database is created with the same database name suffixed by *_BI*. This database is used for archival in future use.

Note: After you configure the AVEVA Work Tasks, you must add the created **Farm Database** to the **SQL Server AlwaysOn Availability Groups**. Contact your Database Administrator to add the database to **SQL Server AlwaysOn Availability Groups**.

To view the data source created, click **DataSource Settings** link.

Create a Repository

A **Repository** contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

To create a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The Central Configuration page appears.

2. Click **Repository Settings**.

   The Repository List page appears.

3. Click **Add**.

   Note: If the number of repositories exceeds the permitted limit for the license, then the message "You have exceeded the maximum number of repositories" appears, and the repository creation is stopped. Click **Close**.

   The **Manage Repository** page appears.

4. Enter the required details.
5. Click **OK**.

   The **Config Administrator** page appears.

6. Click to configure an administrator.

   The User Lookup dialog box appears.

7. Select the provider from the provider drop-down list.
8. Enter the details to search the administrator for the repository that is created.

   Note: You can also search a user based on *ObjectSID* and *objectGUID* (applicable only for Active Directory

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

provider).

9. Click **Search**.

   The user is listed under **Available Resources**.
10. Select and click the arrow to list the user under **Selected Resource**.
11. Click **Update**.

    The selected user is displayed in **User Lookup**.
12. Click **OK**.

    A message confirming the successful creation of an administrator appears.
13. Click **OK**.

    The **Repository List** page appears.

    For more information about configuring the system user, see Configure System User.

Manage Repository Window Fields

The following table explains the fields of the Manage Repository window:

Field Name	Description	Example
Repository DataSource	Lists all the data sources created in a Farm. The selected data source will be used to store data for the current repository.	TelematicsDatasource
Attach DataSource	Select Attach DataSource checkbox and then select a repository from the selected DataSource .Data associated with the selected repository will be copied to the new repository. The version of the installed product and destination DataSource should be the same as that of the DataSource from which the repository data is to be copied. For example, in an upgraded environment, from build Work Tasks version 1 to Work Tasks version 2, you cannot attach a DataSource created in build Work Tasks version 1 to build Work Tasks version 2. To match the build version of the installed product to the version of the DataSource:	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	1. If the DataSource was created in build Work Tasks version 1, then the entire build Work Tasks version 1 must be upgraded to Work Tasks version 2 by running the product installer in the upgrade mode. 2. All the Farm, DataSources, Repositories, and Lists of build Work Tasks version 1 must be upgraded to build Work Tasks version 2 by running the AVEVAWorkTasksUpgradeManager.exe located at the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder. 3. After upgrading all the AVEVA Work Tasks components to build Work Tasks version 2 build, that DataSource can be used in any machine that has same version by using this feature.	
Repository Name	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the repository name.	Telematics Repository
Description	Provide a description for the repository.	This stores Telematics Employee Leave Details.
From mail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might occur in the Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be	Provide the valid email id that is specified in the **User Name** field while configuring **SMTP Settings** in the **Mail Server Settings** page. For more details, see Mail Server Setting.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	sent to the mail ID defined in **Exception to mail**. The From address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To avoid this, restart the Workflow Engine Service and Communication Service.	
Exception to mail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails is sent to the email ID specified in **Exception to mail**.	Provide the valid email id.
Alert initiator of the Workflow	Determines if the status of a workflow should be sent as a notification mail to the initiator of the workflow.	A process with a rule to check the pending leave available for the employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
Servers	Lists the servers available in the Farm. Repository will be available only to the mapped servers.	Work Tasks Server Name
Enterprise Consoles	Lists all the Enterprise Consoles for a selected AVEVA Work Tasks Server. Repository will be available only to the mapped Enterprise Console.	http://worktaskservername:8001/EnterpriseConsole
Enable Theme	Select this checkbox to enable the defined theme.	-
Theme Name	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. It provides **Default** and **Lite** themes.	-
Resource Provider	Lists the various default resource providers supported by AVEVA Work Tasks.	AVEVA Work Tasks Lists or Active Directory

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	Resource providers are also termed as User Provider. A User Provider is a data store containing information about the user. AVEVA Work Tasks also supports custom resource provider. For more information about Resource Provider, see User Providers. AVEVA Connect and Azure Active Directory resource providers are also available after you configure them. To configure these providers, see AVEVA Connect Settings and Azure Active Directory Settings. AVEVA Work Tasks allows secured LDAP configuration. The default port number for LDAPS is 636. You can map the repository in IDE and use the Secured LDAP. The logged-in Active Directory is displayed by default, and **Active Directory Datasource** expects **LDAP://** or **Fully Qualified Domain Name** as value.	
Custom Application Folder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with a semicolon.	-
Hide Repository	Select this option to make the repository unavailable to the Farm.	-
Source path	Enter the path to the Source Elements Folder.	-
Attachment Storage Path	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an absolute path. - The default path is the **Attachments** folder in *C:\ProgramData\AVEVA Work*	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	Tasks\. - The default path is used when no path is specified. - Ensure appropriate rights are set to the folder, where attachments are stored, for the following identities: -- The application pool identity for **Central Configuration** and **Enterprise Console(s)**. -- The account configured for the **Workflow Engine** service. - In case of mapped drives, ensure they are available to the identities. - In multiple-server environments, the path specified must be in a shared location.	

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Auto Log Off Settings for Enterprise Console	Automatically logs out the logged in user after the designated period of inactivity. Enter the time in minutes. This field accepts only valid integer values between 0 to 360. 0 minute means the user will not get automatically logged off. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. The default value for automatic log off is 30 minutes. You use this field to define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML.	0 to 360 (minutes)
Auto Log Off Settings for AVEVA Work Tasks Pro	Request for user credentials for AVEVA Work Tasks Pro app after the set time is elapsed. Enter the time in minutes. This field accepts only valid integer values between 0 to 2880. 0 minute means the user will not get automatically logged off. The default value is 30 minutes. If AVEVA Work Tasks Pro app is offline, the Auto Log Off will not get active, and the user will not be automatically logged off as per the defined settings.	0 to 2880 (in minutes)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Offline Support	Select this option to enable offline submission of items in AVEVA Work Tasks Pro app.	-
Refresh on Work Item submission	Select this option to enable Inbox refresh on Work Item submission in AVEVA Work Tasks Pro . Refresh option is enabled by default.	-
Timeout	Enter the time in seconds to set the timeout. If the value is set as 0, then there is no timeout. Default value is 60 seconds.	-
Label for Fill Form	Enter the label for Fill Form. The customized label will be displayed for the Fill Form in AVEVA Work Tasks Pro.	Work Tasks
Date Configuration Flag for Alternate Actors	Select the **Enable Date Settings** option to set the **From** date and **To** date as mandatory while creating alternate actors. For more information about creating alternate actors, see *Alternate Actors* topic in the *User Guide*.	-
Display Domain name with User Name	Select this checkbox to display the domain name along with the user name in the Enterprise Console and the List. The domain name will be displayed only: • If this checkbox is selected. • If the **Resource Provider** is selected as **Active Directory**.	-

User Providers

AVEVA Work Tasks supports the following User Providers by default:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Active Directory

When you select **Active Directory** as the **Resource Provider**, details such as **Active Directory datasource** and the **Active Directory search base** are populated by default.

Authentication User, **Authentication Password**, **User Log-on ID**, and **User Log-on Display Name** are optional fields. Access to the active directory might not be available for all users. In such cases, provide the active directory authentication user name and the active directory authentication password with which you can connect to the Active Directory.

AVEVA Work Tasks considers *SAM-Account-Name* as **User Log-on ID** by default. If you want to use active directory attributes other than the *SAM-Account-Name* user, then enter the desired active directory attribute details in the **User Log-on ID** field and **User Log-on Display Name** field. **User Log-on Display Name** is the user friendly display name of the active directory attribute. This **User Log-on Display Name** is referred in the User Lookup dialog box against the **User Log-on ID**.

Steps

1. When you select **Active Directory** as the **Resource Provider**, then the **Use Token Service** field appears. In this field, select one of the following:
   - If you do not want to use AIM authentication, select **Without Token Service**.
   - If you want to use AIM authentication, then select a server from the list of alias server names.
2. Enter **Active Directory datasource**.
3. Enter **Active Directory search base**.
4. Enter **Domain Name**.

   The domain name is case-sensitive.
5. Enter **Authentication User**.
6. Enter **Authentication Password**.
7. Check **Is Cross Domain Role Provider** checkbox, if cross domain users and roles mapping is required.

   Example: Users *John* and *Jim* of domain *TelematicsU* and users *Mike* and *Bob* from domain *TelematicsAU* are added to role Team HR of domain *TelematicsMain*.
8. Enter **User Log-on ID** if you want to use another Active Directory attributes instead of *SAM-Account-Name*.

   We recommend to use attributes of type *string* as input for **User Log-on ID.** However, *ObjectSID* and *objectGUID* are also supported.

   After you set the **User Log-on ID**, you cannot change it later.
9. Enter the **User Log-on Display Name**.

   After you set the **User Log-on Display Name**, you cannot change it later.

   This is the default display name of the user account of the active directory user used. **User Log-on Display Name** is used in user lookups.
10. Click **Test LDAP**.

    A message about successful LDAP test appears.

Note:
- Some of the active directory attributes or properties are not indexed. If you use an active directory attribute that is not indexed, it might impact the log-on validation performance based on the active directory entries. We recommend to use indexed attributes as **User Log-on ID** or index the attributes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- For an upgraded repository, you cannot change both **User Log-on ID** and **User Log-on Display Name**.
- You cannot localize **User Log-on ID** and **User log-on Display Name** fields.
- Disabled users will not be shown in user lookup search.

Using Forms

For Forms Resource Provider:

- If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.

1. In the **Resource Provider** drop-down list**,** select **Forms.**
2. In the **User Entity properties** field, enter XML data.

   Click **Sample Code** to get the XML Schema Template.

   Example

   ```
   <properties>
   <property name="userid" type="string" purpose="identifier" />
   <property name="username" type="string" purpose="name" />
   <property name="pwd" type="string" purpose="password" />
   </properties>
   ```
3. In the **User Provider Properties** field, enter the same XML Schema.

   There must be at least one identifier in the XML Schema. For example, UserID
4. In the **Datasource** field, enter a valid data source or specify a dll.

   The value for the data source can be specified as **Physical path of the dll** or **Physical path of the dll::param. Param** is not mandatory.

   See topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Build Business Process* section for creating the assembly.

   Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly, whereas one class can return multiple connection strings.

   Examples of data source parameter:

   - c:\DLLStore\GetConnectionString.dll
   - c:\GetConnectionString.dll::Leave

   If there are two data sources, *Leave* and *Licensing*, and only one DLL is used to return a connection string based on the data source selected. The parameter can be specified as **c:\GetConnectionString.dll::Leave** or **c:\ GetConnectionString.dll::Licensing**. The connection string can be returned from the connection dll based on this parameter.
5. Enter a proper table name or view name which holds the User Name and Password for the Authentication purpose.

   Example: Passmast (the table which is available in IMS_NEW Database)
6. Click **Test SQL Connection**.

   A message about successful test connection appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using ASP.NET Membership

This resource provider lists users defined in the asp.net membership database.

Lists

This resource provider lists users created using AVEVA Work Tasks Users Creation. If you are unable to determine a User Provider to create a repository, use AVEVA Work Tasks Lists.

To verify successful creation of the Repository:

1. Click **Enterprise Console** URL from the site path column.
   The repository created is listed.
   Add the created Enterprise Console link into "Add to Favorites" to easily navigate in future.
2. Click **Repository User Provider** link to logon to the repository.
   The Enterprise Console log-on page appears.
3. Enter the logon details, and then click **Login**.
   The Enterprise Console home page appears. This indicates successful creation of a Repository.
   All features can only be available for a user with administrative privileges.

Note: Consider you created the Repository and then deleted it. If you create the same Repository again immediately and try to log into it through Enterprise Console, the Provider does not list the Repository. You need to access IIS and recycle AVEVA Work Tasks from the Application Pool to get the Repository listed in the Provider list..

Verify the Installation

After you install AVEVA Work Tasks, verify that the product is installed successfully. To verify successful installation, create a simple Workflow using Process Designer. The tasks includes the following:

- Creating a Workflow
- Publishing the Workflow
- Testing the Workflow

Creating a Workflow

1. Log on to the **Enterprise Console**.
2. If the Repository is configured for Active Directory provider, go to step 4.
3. Enter the **User Name** and **Password**.
   The **User Name** and **Password** will be validated with the user provider selected while creating the repository.
   The default authentication provider is the Repository User Provider List.
4. In the **Enterprise Console**, click menu icon.
   All features can only be available for a user with administrative privileges.
5. From the menu, select **Workflows**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Workflow window appears.

6. On the Action bar, click **New**, and then click **Workflow**.
   The New Workflow window appears.
7. Enter **Title** and **Description**.
8. Click **Save & Continue**.
   The successful message appears.
9. Select **Design the Workflow now**.
   This is the default option.
10. Click **Finish**.
    The Process Designer window appears.
11. From the activities pane on the left, drag the Information activity to the Process Designer window.
12. The activity *Information1* is created.
    Click to create a link between two activities.
    The Link Action window appears.
    a. Select from the **From Action** drop-down box.
    b. Select from the **To Action** drop-down box.
    c. Click **OK**.
       The link is established.
13. Right-click *Information1*.
14. Select **Activity Properties** from the context menu.
    The Activity Properties pane appears.
    a. Enter **Name** and **Description**.
    b. Click to **Assign Actor(s)**.
       The Assign Actor(s) window appears.
    c. Select the required provider from the **Providers** drop-down list.
    d. Select values from the drop-down list.
    e. Click **Add**.
    f. Click **Update**.
15. Click to enter the **Subject** for Notification Contents.
    The window to enter subject for notification appears.
16. Click **Update**.
17. Click to enter the **Body** for Notification Contents.
    The window to enter the Body content appears.
18. Click **Update**.
19. From the Activity Properties pane, click **Save**.

Publishing the Workflow

1. On the **Publish** menu, click **Publish**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Published successful message appears.

2. Close the dialog box.

   The Enterprise Console screen lists the workflow created.

Testing the Workflow

1. Select the listed workflow.
2. Right-click the selected workflow.
3. Click **Publish and Test Run**.

   The **Status Finished successfully** appears.

   If Status is **Execution Pending** in the Process Execution window, then click on the **Refresh** button to get the status.
4. In the **Enterprise Console** menu, select **Inbox**.

   The Inbox lists the work item.
5. Click to view the work item listed.

   This indicates that the installation is successful.

Intranet and Extranet Web Servers on Different Machines

This section describes the activities involved while installing the Single Server for the scenario Intranet and Extranet Web Servers on Different Machines.

In this scenario, the Server is installed on Machine 1, the Database is installed on Machine 2 and the Client is installed on multiple Web Farms namely Machine 3 (or Server 1), Server 2 and Server N. "Server N" represents the number of machines in a Web Farm.

Ensure that you install the product in the following sequence:

- High-Level View of Server Installation
- High-Level View of Client Installation

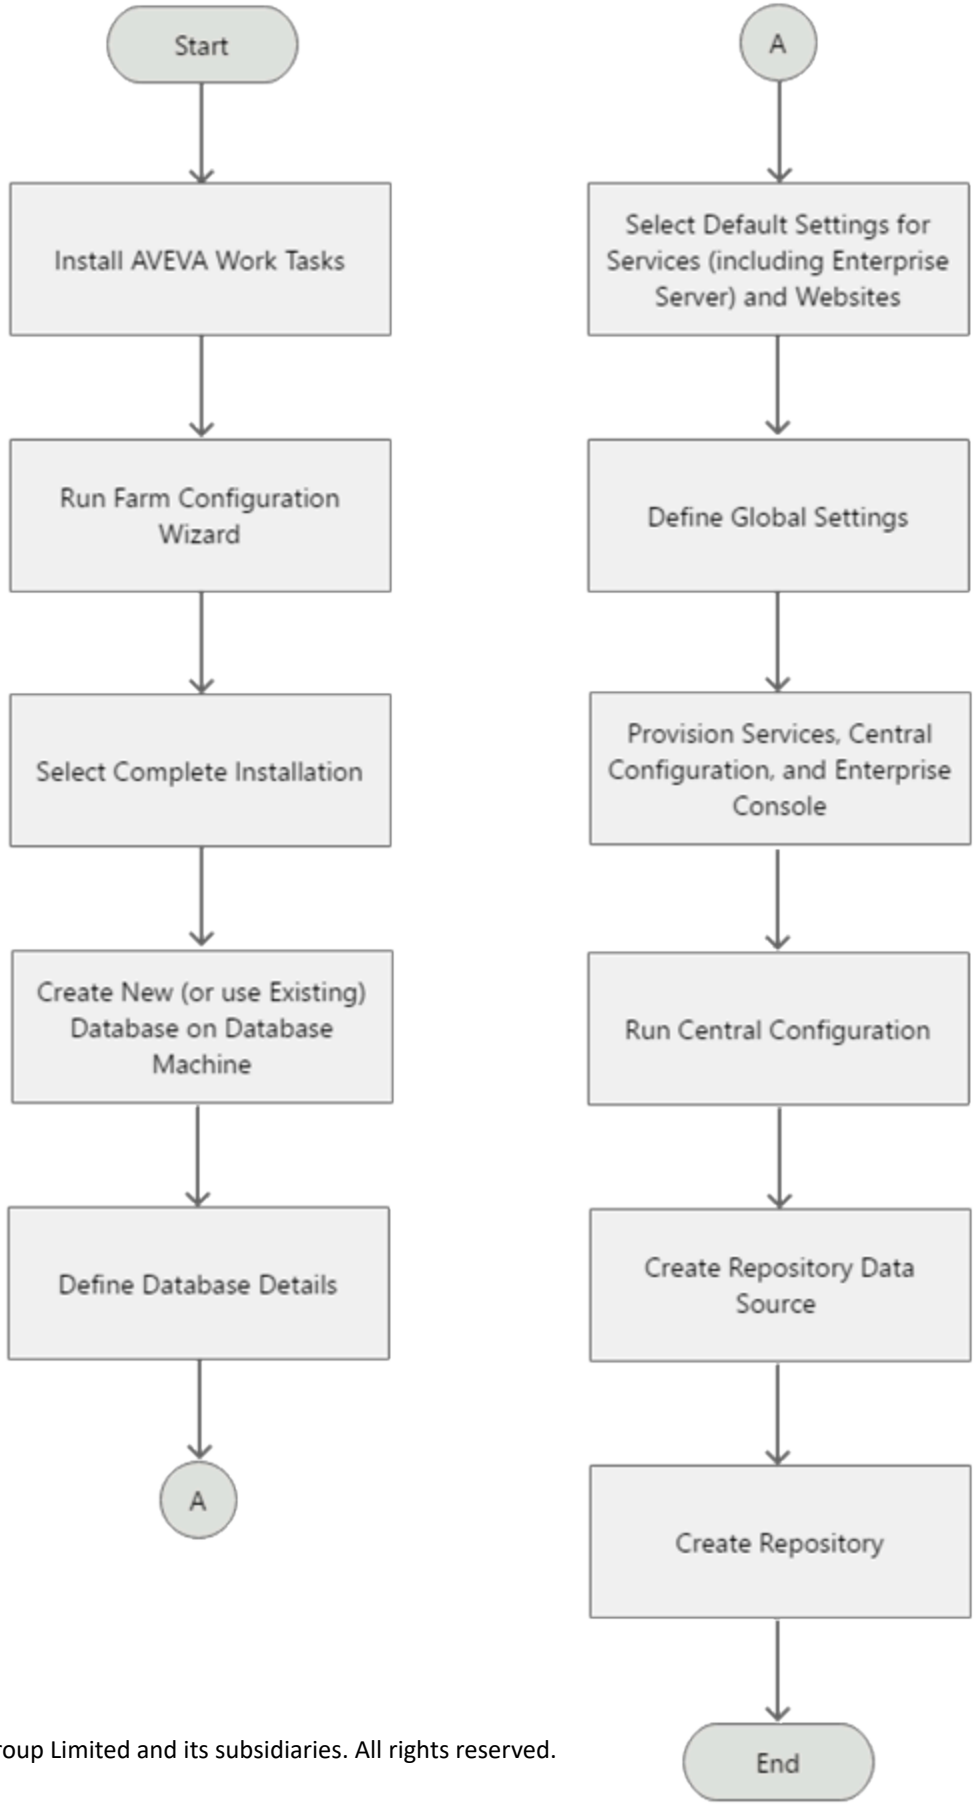
See Also: Setting up Intranet and Extranet Web Fronts

High-Level View of Server Installation

This section provides a high-level view of the various installation steps. The objective of this section is to provide an overview of the various activities involved while installing AVEVA Work Tasks Server. This section also enables you to visually keep track of your activities while following the sequence of tasks.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



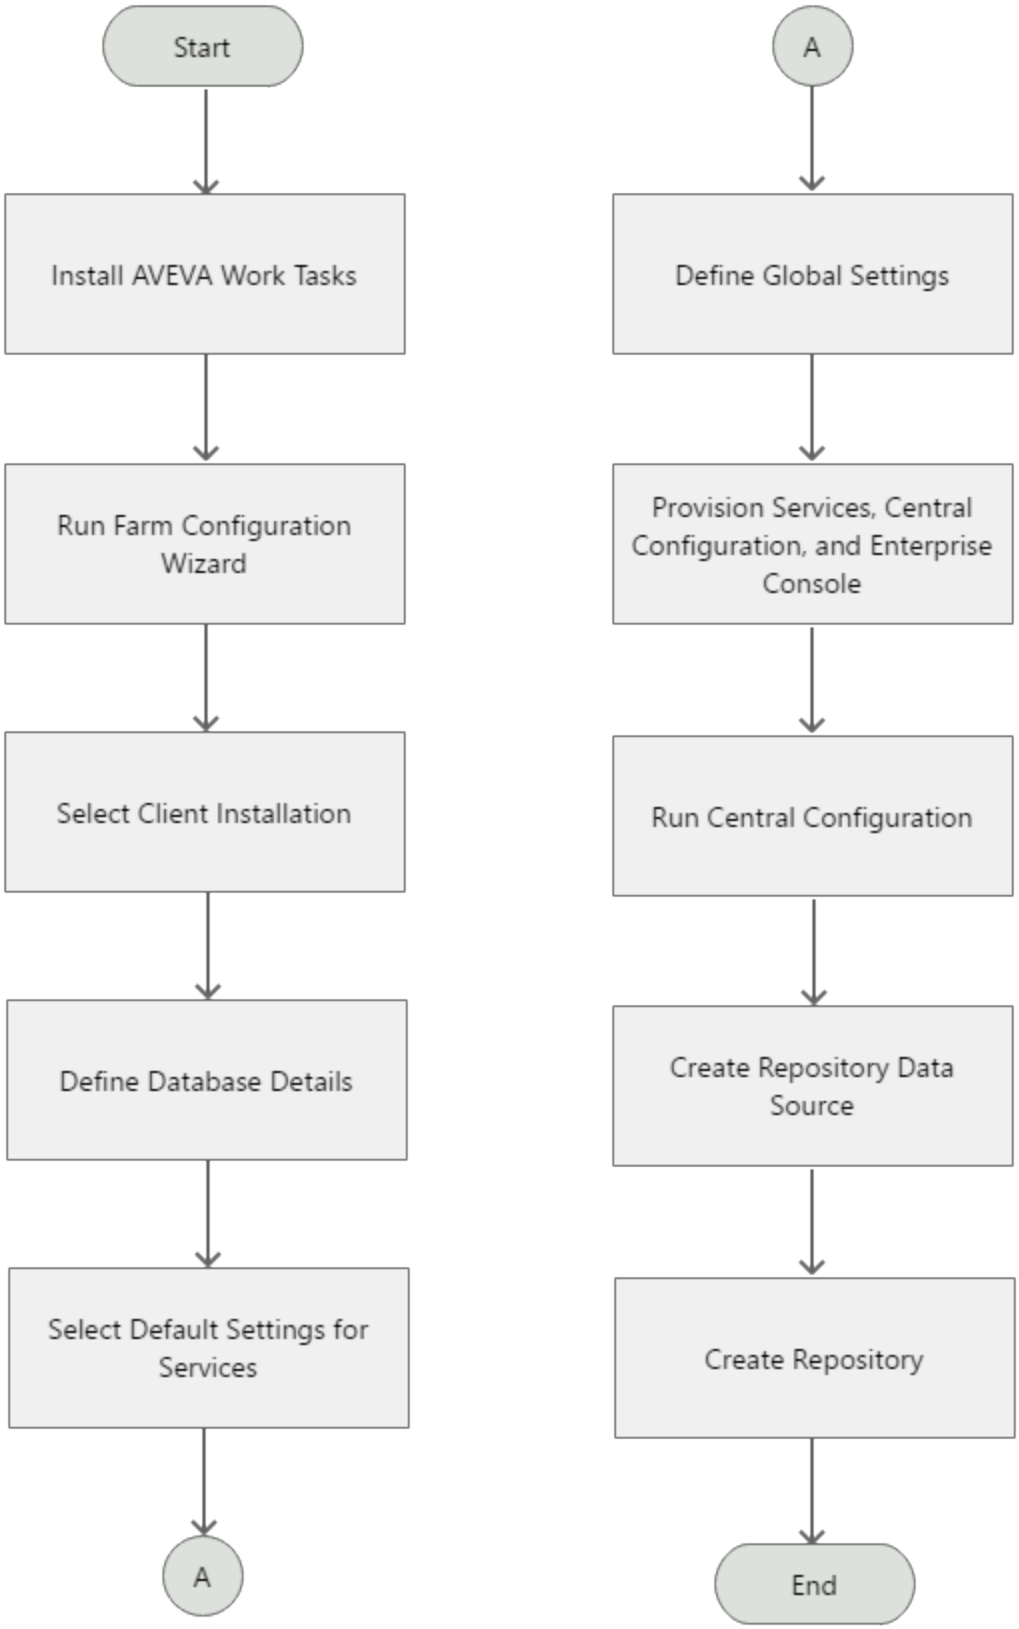
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

High-Level View of Client Installation

This section provides a high-level view of AVEVA Work Tasks Client installation. The Client components are installed on Web Servers. For more information on this scenario, see Wonderware Skelta BPM Professional Edition.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation

This section provides installation steps for the scenario Intranet and Extranet Web Servers on Different Machines.

The installation includes the following:

Installing Workflow Management Server

Installing Workflow Management Client

AVEVA Work Tasks Server has to be installed before installing the Client. In this scenario, the Client has to be installed on multiple machines on separate Web Farms.

AVEVA Work Tasks Server

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
4. Click **Next**.

   The License Server details are configured successfully.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.
4. Click **Next**.

   The **Edit Farm Settings** window appears.
5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.
6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
9. Click **Next**.

   The License Server details are configured successfully.

Select the type of installation

To select the type of installation:

1. In the Select the type of installation page, select **Complete Installation (Server)**.

   A Complete Standalone Deployment does not require a client installation.
2. Under **Create AVEVA Work Tasks Farm**:
   - Click **Create AVEVA Work Tasks Farm database** to create a new Farm database.
   - Click **Use existing AVEVA Work Tasks Farm database (Creates AVEVA Work Tasks Farm tables only if they do not exist)** to use an existing database as the Farm database.
3. Click **Next**.

Create Farm Database

Use the Create AVEVA Work Tasks Farm Database page to provide **New Database** details. Select the **Connection String** option to establish a connection with the database. This connection information is encrypted and stored.

You can enter either Windows or Microsoft SQL Server user settings for authentication.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note:
- The Farm database password does not support **&** and **;** special characters.
- While setting up **Farm Database** with **Windows Authentication**, do not enter **FQDN** in the **Domain Name** field.

To Create Farm Database

1. Enter **Database Title**.
2. Select **Connection String**.

   See *Connection Provider* later in this topic, if you have selected the **Connection Provider** option.

   - Enter the following details:

     Server Name:

     Provide information about the database server on which the Farm database can be installed.

     If the **Database Type** is **SQL Server**, then you can specify an IPv6 address for the **Server Name**.

     If SQLExpress Instance need to be used as a Database instance of the Farm database, then **Server Name** should be <server name>\SQLExpress.

     To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

   - **Authentication Type**

     This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports Windows and SQL Server authentication process.

     Example: Windows
     If Windows Authentication is selected, the user configured for the Farm configuration will be used to access the database. This is the authentication recommended by AVEVA Work Tasks.

   - **Login**

     This field is used to enter the SQL login credential for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Password**

     This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Advanced Settings**

     This is an optional field. It is used to enter any additional connection information, such as connection Timeout. Example: Connection Timeout = 20.

     While creating a data source for repository, use the following custom settings to set properties for connection pool. These settings are case sensitive and should be mentioned only in lower case.

     ```
     encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
     ```

     encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

     enableltm: AVEVA Work Tasks internally implements light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive. This property can be used to turn off this

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

feature. The default value is set as True.

connectionretrywaittime: While opening a new connection, if the data base server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

maxconnectionretries: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

3. Click **Test Connection** to ensure database connectivity.
4. Click **Next**.

   The message *AVEVA Work Tasks Farm is Created* appears.
5. Click **OK**.

AlwaysOn Availability Groups feature of Microsoft SQL Server

The **AlwaysOn Availability Groups** feature of Microsoft SQL Server is a high-availability and disaster-recovery solution that provides an enterprise-level alternative to database mirroring. Introduced in Microsoft SQL Server 2012, AlwaysOn Availability Groups maximizes the availability of a set of user databases for an enterprise.

After you configure the AVEVA Work Tasks, you must add the created Farm Database to the SQL Server AlwaysOn Availability Groups. Contact your Database Administrator to add the database to SQL Server AlwaysOn Availability Groups.

Notes:

- The authentication user needs different rights assigned for different scenarios. If a user wants to create database (Farm or Repository Data Source Database), Authentication User needs to have minimum 'dbcreator' access rights on Database Server Instance.

- If database is already created, user needs to have following permissions on Database Server:

- SELECT, INSERT, UPDATE, and DELETE permissions.

- EXECUTE permission for Stored Procedures.

To choose Connection Provider

Complete the following steps to choose a connection provider:

1. Enter **Database Title**.
2. In the **Database Type** box, select a database type.
3. Select **Connection Provider**.

   This option is used to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.
4. Enter the following details:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Assembly Path**:

  Click the icon to browse and choose the required dll file.

  If custom properties (enableltm, connectionretrywaittime, maxconnectionretries and sqlcommandtimeout) are required to be used in Assembly connection string, then user should select **Use existing Farm database** while creating a the Farm. See Creating or Using an Existing Database.

  See the topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub chapter in the *Build Business Process* section for creating the assembly. Make sure that, there should be only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.
6. Click **Next**.
7. The message *AVEVA Work Tasks Farm is created* appears.
8. Click **OK**.

Define Security Settings

You can define the Security Settings using the Farm Configuration Wizard.

For more information on Security settings, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client.

To define the Security Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Security Settings** and **Service Settings** and then, click **Next**.
4. Select **Secure Communication** to establish secured communication between the AVEVA Work Tasks services through HTTPS.
5. Select **Secure Web Sites** check box to configure secured web sites. Uncheck the **Secure Web Sites** check box to use HTTP sites. By default the sites are created in HTTPS mode.
6. Enter the Port number. The default port for the HTTPS site is 8001, and for the HTTP site is 8000. You can enter any port number that IIS accepts. But if any other services or applications are already using the entered port number, AVEVA Work Tasks will not start.
7. Select the available certificate from the **Certificate** list. If your certificate is not listed, click the **Refresh** icon to repopulate the list.

   Note: If the required certificate is not listed, generate one using the System Management Server (Configurator tool). Do not use a self-signed certificate without a proper root chain.
8. Click the **Validate** button to validate the certificate before configuring the security settings.

   Note: An Internet connection is needed to validate the certificate.
9. Click **Configure**, then **Next**, and then **Finish** to apply the new security settings.

Note:
- To update the port number, certificate, and websites from unsecure to secure or vice-versa, select **Security**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings and **Service Settings** check box in **Edit AVEVA Work Task Farm Settings** window before updating the values. After the required details are provided, these settings get updated only when you click **Configure**, then **Next**, and then **Finish** as you navigate through the Farm Configuration Wizard..
- If the Quickflow is already deployed on a machine, you need to deploy it again after you update the security settings. If secured web site is configured, then you cannot change the server configuration for Quickflow in Central Configuration. However, if the **Secure Web Sites** checkbox is not selected, you can make the changes to the server configuration.
- Advance Server communication cannot be configured on HTTP/HTTPS.
- For resources of Load Balanced Server, ensure to configure all services with the same protocol (HTTP or HTTPS).
- It is recommended to use Standard SSL certificate instead of self-signed SSL certificate.

Using ASB Certificate for Secured Communication

ASB Certificate is a PCS-managed SSL certificate and renews automatically every 30 days when the certificate is still valid. The certificate is valid for two years. The PCS watchdog service on the runtime node checks the validity of the SSL certificate within 5 minutes from when it starts and once a day. PCS also renews the SSL certificate if it is expired.

If the runtime node is offline and later back online, the PCS watchdog service regularly checks the certificate validity and renews it if it is required. Consider restarting the PCS watchdog service to enforce the SSL certificate validity check within 5 minutes from the restarting time.

Furthermore, when the SSL certificate is renewed, PCS binds it to port 443 (by default) and changes the SslThumbprint PCS registry value. If AVEVA Work Tasks sites are hosted on port 443, certificate binding will be auto-renewed when the SSL certificate is renewed. It is recommended to check the bindings in IIS with every certificate renewal to ensure the application is running seamlessly.

To disable the certificate renewal, consider disabling the **ArchestrA Certificate Renewal Service** windows service.

Note: Client Service will try to automatically bind the renewed certificate. If there are any issues in browsing the website or starting the services after certificate renewal, users need to reconfigure the secure communication in Farm Configuration. To reconfigure, see the steps mentioned in above section *To define the Security Settings*.

Securing Communication between Services

To have a secure communication between the services, apply the below changes to the Windows registry and reboot the server:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
"SchUseStrongCrypto" = dword:00000001
```

For more information on securing communication, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client and

https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2015/2960358.

Define Services and Global Settings

You can define the Services and Global Settings using the Farm Configuration Wizard or through Configuration XMLs.

To define Services

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.

   Note: You can also customize the settings for these services and websites using the **Custom Settings** option. For more information about Service-related changes and Website-related changes, see Advanced Settings and Administering Web Servers respectively.

2. Click **Next**.

   The Global Settings dialog box appears.

3. In the **Communication** tab, enter key fields in **Email Settings** and **Exception Email settings** to configure exception e-mails.

   The following are the details:

   - **Host**: Enter information related to mail server.
     Example: Enter details related to Microsoft Exchange Server (IP address of the exchange server).
   - **Port**: Enter the port number for the mail server. The default port number is 25.
   - **From email**: Enter the from e-mail address.
     Example: admin@telematics.com
   - **To email**: Enter the to e-mail address.
     Example: alex@telematics.com

4. Click **OK**.

Note: To confirm the exception e-mail settings, click **Test SMTP**. An e-mail will be generated and sent to the **To email** address confirming successful configuration of the e-mail. The advanced settings like **Secure Socket Layer (SSL), Email Timeout, User Name,** and **Password** for the e-mail account holder, **Password Encrypted** flag will differ based on the mail server settings.

Define Central Configuration

1. Run **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Farm Configuration Wizard window appears.

2. Click **Next**.
3. The Edit Farm settings window appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Select **Service Settings**.
5. Click **Next**.

   The Services/Global Settings window appears.
6. Click against **Central Configuration** to edit AVEVA Work Tasks **Central Configuration settings**.

   The Central Configuration Settings page appears.
   - **http/https**: This option enables you to determine if you want a secured (https) or a non-secured site (http).
   - **Authentication Type**: This option allows you to provide the authentication type to access the Central Configuration. The available authentication types are Windows, AVEVA Connect, and Azure Active Directory.

     Note: The AVEVA Connect and Azure Active Directory authentication types are available only if these user providers are configured in the system.
     To configure AVEVA Connect user provider, see AVEVA Connect Settings.
     To configure Azure Active Directory user provider see Azure Active Directory Settings.
   - **Create at**: This field allows you to provide the Internet Information Service (IIS) path where the new site is created.
   - **Port Number**: This field is used to provide a port number for the Central Configuration.
7. Click against **Create at** to change the path of the Central Configuration.

   A message indicating that if the path has been changed the Central Configuration will no longer be accessible appears.
8. Click **Yes**.

   The IIS structure screen is displayed. Select the desired IIS path for the Central Configuration.
9. Click **OK**.

   The selected URL appears in the **Central Configuration Settings** screen.
10. Click **OK**.

Note:

- The default IIS path for Central Configuration is displayed. Click the edit icon to change the site path.

- If you want to update the authentication type to AVEVA Connect or Azure Active Directory of the already configured Central Configuration, you need to reconfigure the AVEVA Connect and Azure Active Directory user providers for the Central Configuration. For information on configuring user providers, see AVEVA Connect Settings and Azure Active Directory Settings.

- Central Configuration cannot be accessed in Chrome browser when configured with unsecured access (http://) for Azure Active Directory and AVEVA Connect authentication types.

Provision Services

While the installation is in progress, you can view the services that will be installed. This provides information on the progress of installation. At the end of the installation, a status indicating the completion of installation appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Click **OK** to complete the installation.

AVEVA Work Tasks Client

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
4. Click **Next**.

   The License Server details are configured successfully.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note: The Farm Configuration Wizard should be run with administrative privileges.

4. Click **Next**.

   The **Edit Farm Settings** window appears.

5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.

6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

Note: AVEVA Work Tasks does not validate the License Server details entered.

9. Click **Next**.

   The License Server details are configured successfully.

Select Client Installation

1. In the Select the type of installation page, select **Client**.
2. Click **Next**.

   The Database User Settings page appears.

Connect to an Existing Farm Database

You can use the Connect to existing database dialog box to connect to the existing Farm. You can select the Connection String or Connection provider for the new database.

1. Select the computer name on which the Farm Database is installed from the **Server Name** field.
2. Select **Connection String**.
3. Enter the following details:
   a. **Authentication Type**: This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports both Windows and SQL server authentication process. Example: Windows.
   b. **User ID**: This field is used to enter the SQL user ID for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   c. **Password**: This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   d. **Advanced Settings**: This is an optional field. It is used to enter any additional connection information such as connection Timeout etc. Example: Connection Timeout = 20.

      While creating a data source for repository, use the following custom settings to set properties for the connection pool.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;

encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks controls the transaction from escalating to a distributed transaction which is very expensive.

The above property can be used to turn off this feature. The default value is set as True.

connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

Note: These settings are case sensitive and should be mentioned only in lower case.

e. **Database**: This field is used to select the machine with database installed. Example: FarmDB.

AVEVA Work Tasks will validate if at least one server is installed.

4. Click **Test Connection** to ensure database connectivity.

   You must have the following permissions on the Database Server:

   SELECT, INSERT, UPDATE, and DELETE permissions.

   EXECUTE permission for Stored Procedures.
5. Click **Next** to continue with the wizard.
6. Click **OK**.

Define and Provision the Enterprise Console

You can define the required AVEVA Work Tasks services.

Steps to Define Enterprise Console

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.
2. Click **Next**.

   The **Installing Services** screen appears, indicating the progress of installation.

   A message *Installation is Complete* appears after all the services are installed.
3. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create a Repository DataSource

A **Repository DataSource** is used to store all repository related data. The **Repository DataSource** must be created on a machine where the **Central Configuration** site is installed.

Example

A TelematicsDataSource is created for TelematicsHR Repository.

A Repository contains Workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating the repository.

To create a Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**.

   The Central Configuration web page appears.
2. Click **DataSource Settings**.

   The Datasource List page appears.
3. Click **Add**.

   The Manage Datasource page appears.
4. Enter the required details.
   a. **Name**: Enter a valid data source name. Example: *TelematicsDataSource*.
   b. **Description**: Enter a description for the data source. Example: *This data source is used to store connection details*.
   c. **Connection String**: Select this option to establish a connection with the database. The connection string contains fields that that defines the connection. The connection information is encrypted and stored.

      Server Name

      To use a database on the local machine, enter "localhost", ".", or the local computer's name for the **Server Name**.

      Note: Server Name can be machine name/IP address/SQL Server AlwaysON/SQL Server instance name. Instead of entering "local host", it is preferable to give the local machine name.

      If the **Database Type** is **SQL Server**, then specify an IPV6/IPV4 address for the **Server Name**.
      To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: *localhost,1455*
      To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be *<server name>\SQLExpress*.

      Authentication Type

      Use this field to determine the process to validate a user who is trying to connect to the database. AVEVA Work Tasks uses Windows and SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. The **User ID** and **Password** field is disabled if Windows Authentication is selected. Example: *Windows*

      Advanced Settings

      Use this field to define advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection. Example: *Connection Timeout = 20*
      or
      For defining maximum connections that can be opened in a connection pool.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example: *max pool size = 250*
Default connection pool is set as 250. We recommend to enter a higher value on heavily loaded environment.
While creating a data source for a repository, use the following custom settings to set properties for the connection pool.
encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.
enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature, AVEVA Work Tasks controls the transaction from escalating to an expensive distributed transaction.
The above property can be used to turn off this feature. The default value is set as *True*.
connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is 30 seconds. The value should be set in seconds.
maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is infinite.
sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.
These settings are case sensitive and should be mentioned only in lower case.

Database:

Specify or select a database that can be used as a repository database. This database stores all repository related data. The repository database is created if it does not exist on the database server instance.
Example: *TelematicsDB*

Enable Table Partitioning:

Select to enable database table partitioning. For more information, see Partitioning Database.

d. **Connection Provider**: Use this to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.

The selected dll must be copied to all the machines, all servers and all clients, that are connected to the current Farm.

Assembly Path

Click to browse and choose the required dll file.
To use custom properties (enableltm, connectionretrywaittime, maxconnectionretries, and sqlcommandtimeout) in the Assembly connection string, the database must be created before.
See *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Developer Guide* for creating the assembly. Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.

   A message about successful test connection appears.

6. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

A message about successful creation of the data source appears.The message also states that the required tables will be created in the data source after a repository is associated with the data source.

When a data source is saved, an entry is created for the data source in the **Farm Database**. When a first repository is created for the data source, AVEVA Work Tasks tables are added to the data source. While creating a data source, the archival database is created with the same database name suffixed by *_BI*. This database is used for archival in future use.

Note: After you configure the AVEVA Work Tasks, you must add the created **Farm Database** to the **SQL Server AlwaysOn Availability Groups**. Contact your Database Administrator to add the database to **SQL Server AlwaysOn Availability Groups**.

To view the data source created, click **DataSource Settings** link.

Create a Repository

A **Repository** contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

To create a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The Central Configuration page appears.
2. Click **Repository Settings**.
   The Repository List page appears.
3. Click **Add**.
   Note: If the number of repositories exceeds the permitted limit for the license, then the message "You have exceeded the maximum number of repositories" appears, and the repository creation is stopped. Click **Close**.
   The **Manage Repository** page appears.
4. Enter the required details.
5. Click **OK**.
   The **Config Administrator** page appears.
6. Click to configure an administrator.
   The User Lookup dialog box appears.
7. Select the provider from the provider drop-down list.
8. Enter the details to search the administrator for the repository that is created.
   Note: You can also search a user based on *ObjectSID* and *objectGUID* (applicable only for Active Directory provider).
9. Click **Search**.
   The user is listed under **Available Resources**.
10. Select and click the arrow to list the user under **Selected Resource**.
11. Click **Update**.
    The selected user is displayed in **User Lookup**.
12. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

A message confirming the successful creation of an administrator appears.

13. Click **OK**.

    The **Repository List** page appears.

    For more information about configuring the system user, see Configure System User.

Manage Repository Window Fields

The following table explains the fields of the Manage Repository window:

Field Name	Description	Example
Repository DataSource	Lists all the data sources created in a Farm. The selected data source will be used to store data for the current repository.	TelematicsDatasource
Attach DataSource	Select Attach DataSource checkbox and then select a repository from the selected DataSource .Data associated with the selected repository will be copied to the new repository. The version of the installed product and destination DataSource should be the same as that of the DataSource from which the repository data is to be copied. For example, in an upgraded environment, from build Work Tasks version 1 to Work Tasks version 2, you cannot attach a DataSource created in build Work Tasks version 1 to build Work Tasks version 2. To match the build version of the installed product to the version of the DataSource: 1. If the DataSource was created in build Work Tasks version 1, then the entire build Work Tasks version 1 must be upgraded to Work Tasks version 2 by running the product installer in the upgrade mode. 2. All the Farm, DataSources, Repositories, and Lists of build	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	Work Tasks version 1 must be upgraded to build Work Tasks version 2 by running the AVEVAWorkTasksUpgradeManager.exe located at the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder. 3. After upgrading all the AVEVA Work Tasks components to build Work Tasks version 2 build, that DataSource can be used in any machine that has same version by using this feature.	
Repository Name	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the repository name.	Telematics Repository
Description	Provide a description for the repository.	This stores Telematics Employee Leave Details.
From mail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might occur in the Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be sent to the mail ID defined in **Exception to mail**. The From address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To avoid this, restart the Workflow Engine Service and Communication	Provide the valid email id that is specified in the **User Name** field while configuring **SMTP Settings** in the **Mail Server Settings** page. For more details, see Mail Server Setting.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	Service.	
Exception to mail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails is sent to the email ID specified in **Exception to mail**.	Provide the valid email id.
Alert initiator of the Workflow	Determines if the status of a workflow should be sent as a notification mail to the initiator of the workflow.	A process with a rule to check the pending leave available for the employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
Servers	Lists the servers available in the Farm. Repository will be available only to the mapped servers.	Work Tasks Server Name
Enterprise Consoles	Lists all the Enterprise Consoles for a selected AVEVA Work Tasks Server. Repository will be available only to the mapped Enterprise Console.	http://worktaskservername:8001/EnterpriseConsole
Enable Theme	Select this checkbox to enable the defined theme.	-
Theme Name	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. It provides **Default** and **Lite** themes.	-
Resource Provider	Lists the various default resource providers supported by AVEVA Work Tasks. Resource providers are also termed as User Provider. A User Provider is a data store containing information about the user. AVEVA Work Tasks also supports custom resource provider. For more information about Resource Provider, see User Providers.	AVEVA Work Tasks Lists or Active Directory

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	AVEVA Connect and Azure Active Directory resource providers are also available after you configure them. To configure these providers, see AVEVA Connect Settings and Azure Active Directory Settings. AVEVA Work Tasks allows secured LDAP configuration. The default port number for LDAPS is 636. You can map the repository in IDE and use the Secured LDAP. The logged-in Active Directory is displayed by default, and **Active Directory Datasource** expects **LDAP://** or **Fully Qualified Domain Name** as value.	
Custom Application Folder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with a semicolon.	-
Hide Repository	Select this option to make the repository unavailable to the Farm.	-
Source path	Enter the path to the Source Elements Folder.	-
Attachment Storage Path	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an absolute path. - The default path is the **Attachments** folder in *C:\ProgramData\AVEVA Work Tasks*. - The default path is used when no path is specified. - Ensure appropriate rights are set to the folder, where attachments are stored, for the following identities: -- The application pool identity for **Central Configuration** and	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	Enterprise Console(s). -- The account configured for the **Workflow Engine** service. - In case of mapped drives, ensure they are available to the identities. - In multiple-server environments, the path specified must be in a shared location.	
Auto Log Off Settings for Enterprise Console	Automatically logs out the logged in user after the designated period of inactivity. Enter the time in minutes. This field accepts only valid integer values between 0 to 360. 0 minute means the user will not get automatically logged off. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. The default value for automatic log off is 30 minutes. You use this field to define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML.	0 to 360 (minutes)
Auto Log Off Settings for AVEVA Work Tasks Pro	Request for user credentials for AVEVA Work Tasks Pro app after the set time is elapsed. Enter the time in minutes. This field accepts only valid integer values between 0 to 2880. 0 minute means the user will not get	0 to 2880 (in minutes)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	automatically logged off. The default value is 30 minutes. If AVEVA Work Tasks Pro app is offline, the Auto Log Off will not get active, and the user will not be automatically logged off as per the defined settings.	
Offline Support	Select this option to enable offline submission of items in AVEVA Work Tasks Pro app.	-
Refresh on Work Item submission	Select this option to enable Inbox refresh on Work Item submission in AVEVA Work Tasks Pro . Refresh option is enabled by default.	-
Timeout	Enter the time in seconds to set the timeout. If the value is set as 0, then there is no timeout. Default value is 60 seconds.	-
Label for Fill Form	Enter the label for Fill Form. The customized label will be displayed for the Fill Form in AVEVA Work Tasks Pro.	Work Tasks
Date Configuration Flag for Alternate Actors	Select the **Enable Date Settings** option to set the **From** date and **To** date as mandatory while creating alternate actors. For more information about creating alternate actors, see *Alternate Actors* topic in the *User Guide*.	-
Display Domain name with User Name	Select this checkbox to display the domain name along with the user name in the Enterprise Console and the List. The domain name will be displayed only: • If this checkbox is selected. • If the **Resource Provider** is	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	selected as **Active Directory**.	

User Providers

AVEVA Work Tasks supports the following User Providers by default:

Active Directory

When you select **Active Directory** as the **Resource Provider**, details such as **Active Directory datasource** and the **Active Directory search base** are populated by default.

Authentication User, **Authentication Password**, **User Log-on ID**, and **User Log-on Display Name** are optional fields. Access to the active directory might not be available for all users. In such cases, provide the active directory authentication user name and the active directory authentication password with which you can connect to the Active Directory.

AVEVA Work Tasks considers *SAM-Account-Name* as **User Log-on ID** by default. If you want to use active directory attributes other than the *SAM-Account-Name* user, then enter the desired active directory attribute details in the **User Log-on ID** field and **User Log-on Display Name** field. **User Log-on Display Name** is the user friendly display name of the active directory attribute. This **User Log-on Display Name** is referred in the User Lookup dialog box against the **User Log-on ID**.

Steps

1. When you select **Active Directory** as the **Resource Provider**, then the **Use Token Service** field appears. In this field, select one of the following:
   - If you do not want to use AIM authentication, select **Without Token Service**.
   - If you want to use AIM authentication, then select a server from the list of alias server names.
2. Enter **Active Directory datasource**.
3. Enter **Active Directory search base**.
4. Enter **Domain Name**.

   The domain name is case-sensitive.
5. Enter **Authentication User**.
6. Enter **Authentication Password**.
7. Check **Is Cross Domain Role Provider** checkbox, if cross domain users and roles mapping is required.

   Example: Users *John* and *Jim* of domain *TelematicsU* and users *Mike* and *Bob* from domain *TelematicsAU* are added to role Team HR of domain *TelematicsMain*.
8. Enter **User Log-on ID** if you want to use another Active Directory attributes instead of *SAM-Account-Name*.

   We recommend to use attributes of type *string* as input for **User Log-on ID.** However, *ObjectSID* and *objectGUID* are also supported.

   After you set the **User Log-on ID**, you cannot change it later.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Enter the **User Log-on Display Name**.

   After you set the **User Log-on Display Name**, you cannot change it later.

   This is the default display name of the user account of the active directory user used. **User Log-on Display Name** is used in user lookups.

10. Click **Test LDAP**.

    A message about successful LDAP test appears.

Note:
- Some of the active directory attributes or properties are not indexed. If you use an active directory attribute that is not indexed, it might impact the log-on validation performance based on the active directory entries. We recommend to use indexed attributes as **User Log-on ID** or index the attributes.
- For an upgraded repository, you cannot change both **User Log-on ID** and **User Log-on Display Name**.
- You cannot localize **User Log-on ID** and **User log-on Display Name** fields.
- Disabled users will not be shown in user lookup search.

Using Forms

For Forms Resource Provider:

- If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.

1. In the **Resource Provider** drop-down list**,** select **Forms.**
2. In the **User Entity properties** field, enter XML data.

   Click **Sample Code** to get the XML Schema Template.

   Example

   ```
   <properties>
   <property name="userid" type="string" purpose="identifier" />
   <property name="username" type="string" purpose="name" />
   <property name="pwd" type="string" purpose="password" />
   </properties>
   ```

3. In the **User Provider Properties** field, enter the same XML Schema.

   There must be at least one identifier in the XML Schema. For example, UserID

4. In the **Datasource** field, enter a valid data source or specify a dll.

   The value for the data source can be specified as **Physical path of the dll** or **Physical path of the dll::param. Param** is not mandatory.

   See topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Build Business Process* section for creating the assembly.

   Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly, whereas one class can return multiple connection strings.

   Examples of data source parameter:

   - c:\DLLStore\GetConnectionString.dll
   - c:\GetConnectionString.dll::Leave

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If there are two data sources, *Leave* and *Licensing*, and only one DLL is used to return a connection string based on the data source selected. The parameter can be specified as **c:\GetConnectionString.dll::Leave** or **c:\ GetConnectionString.dll::Licensing**. The connection string can be returned from the connection dll based on this parameter.

5. Enter a proper table name or view name which holds the User Name and Password for the Authentication purpose.

   Example: Passmast (the table which is available in IMS_NEW Database)

6. Click **Test SQL Connection**.

   A message about successful test connection appears.

Using ASP.NET Membership

This resource provider lists users defined in the asp.net membership database.

Lists

This resource provider lists users created using AVEVA Work Tasks Users Creation. If you are unable to determine a User Provider to create a repository, use AVEVA Work Tasks Lists.

To verify successful creation of the Repository:

1. Click **Enterprise Console** URL from the site path column.

   The repository created is listed.

   Add the created Enterprise Console link into "Add to Favorites" to easily navigate in future.

2. Click **Repository User Provider** link to logon to the repository.

   The Enterprise Console log-on page appears.

3. Enter the logon details, and then click **Login**.

   The Enterprise Console home page appears. This indicates successful creation of a Repository.

   All features can only be available for a user with administrative privileges.

Note: Consider you created the Repository and then deleted it. If you create the same Repository again immediately and try to log into it through Enterprise Console, the Provider does not list the Repository. You need to access IIS and recycle AVEVA Work Tasks from the Application Pool to get the Repository listed in the Provider list..

Verify the Installation

After you install AVEVA Work Tasks, verify that the product is installed successfully. To verify successful installation, create a simple Workflow using Process Designer. The tasks includes the following:

- Creating a Workflow
- Publishing the Workflow
- Testing the Workflow

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Creating a Workflow

1. Log on to the **Enterprise Console**.
2. If the Repository is configured for Active Directory provider, go to step 4.
3. Enter the **User Name** and **Password**.
   The **User Name** and **Password** will be validated with the user provider selected while creating the repository.
   The default authentication provider is the Repository User Provider List.
4. In the **Enterprise Console**, click menu icon.
   All features can only be available for a user with administrative privileges.
5. From the menu, select **Workflows**.
   The Workflow window appears.
6. On the Action bar, click **New**, and then click **Workflow**.
   The New Workflow window appears.
7. Enter **Title** and **Description**.
8. Click **Save & Continue**.
   The successful message appears.
9. Select **Design the Workflow now**.
   This is the default option.
10. Click **Finish**.
    The Process Designer window appears.
11. From the activities pane on the left, drag the Information activity to the Process Designer window.
12. The activity *Information1* is created.
    Click to create a link between two activities.
    The Link Action window appears.
    a. Select from the **From Action** drop-down box.
    b. Select from the **To Action** drop-down box.
    c. Click **OK**.
       The link is established.
13. Right-click *Information1*.
14. Select **Activity Properties** from the context menu.
    The Activity Properties pane appears.
    a. Enter **Name** and **Description**.
    b. Click to **Assign Actor(s)**.
       The Assign Actor(s) window appears.
    c. Select the required provider from the **Providers** drop-down list.
    d. Select values from the drop-down list.
    e. Click **Add**.
    f. Click **Update**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

15. Click to enter the **Subject** for Notification Contents.
    The window to enter subject for notification appears.
16. Click **Update**.
17. Click to enter the **Body** for Notification Contents.
    The window to enter the Body content appears.
18. Click **Update**.
19. From the Activity Properties pane, click **Save**.

Publishing the Workflow

1. On the **Publish** menu, click **Publish**.
   The Published successful message appears.
2. Close the dialog box.
   The Enterprise Console screen lists the workflow created.

Testing the Workflow

1. Select the listed workflow.
2. Right-click the selected workflow.
3. Click **Publish and Test Run**.
   The **Status Finished successfully** appears.
   If Status is **Execution Pending** in the Process Execution window, then click on the **Refresh** button to get the status.
4. In the **Enterprise Console** menu, select **Inbox**.
   The Inbox lists the work item.
5. Click to view the work item listed.
   This indicates that the installation is successful.

Install Load Balanced Server

The Load Balanced Server supports the following scenarios:

- Web Farm with Clustered Services on Web Farm Machines with Database on a Different Machine
- Web Farm Connecting to Separate Services Cluster with Database on a Different Machine
- Single Server Capable of Adding Machines at Any Time
- Intranet and Extranet Web Servers on Different Machines
- Client and Server Installation

Complete the installation tasks for the scenario that matches your configuration.

Notes:
- For Enterprise Server deployment, it is mandatory to synchronize the date and time in all enterprise servers.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- For optimal performance, we recommend to run all the enterprise servers in the same version of the operating system. For example, ensure to run all the enterprise servers in 64-bit version of operating system.

- The Multicast tool ensures that all machines used for the Enterprise Server installation are able to communicate with each other. For more information about the multicast tool, see Tools Used in Enterprise Server.

Web Farm with Clustered Services on Web Farm Machines with Database on a Different Machine

This section describes the activities involved while installing the Load Balanced Server for the scenario Web Farm with Clustered AVEVA Work Tasks Services on Web Farm Machines with Database on a Different Machine.

In this scenario, AVEVA Work Tasks Server is installed on multiple servers namely Machine 2 (or Server 1), Server 2 and Server N in a Web Farm. "Server N" represents the number of machines in the Web Farm. The Database is installed on Machine 1.

Before installing ensure all Prerequisites are taken care.

Web Farm with Clustered Services on Web Farm Machines with Database on a Different Machine

High-Level View of Server Installation

This section provides a high-level view of the various installation steps. The objective of this section is to provide an overview of the various activities involved while installing the AVEVA Work Tasks Server. This section also enables you to visually keep track of your activities while following the sequence of tasks.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation

This section provides installation steps for the scenario Web Farm (Multiple Web servers), AVEVA Work Tasks Server, and Database Server on different machines.

In this scenario, the Server is installed on multiple machines in a Web Farm.

AVEVA Work Tasks Server

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
4. Click **Next**.

   The License Server details are configured successfully.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Wizard.

3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.

4. Click **Next**.

   The **Edit Farm Settings** window appears.

5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.

6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.

9. Click **Next**.

   The License Server details are configured successfully.

Select the Type of Installation - Enterprise Edition

Following points must be considered while installing AVEVA Work Tasks on the Enterprise Server:

- Ensure that you select the **Complete Installation** and **Enable load balancing** options.
- You can either create a new Farm database or use an existing one.

1. In the Select the type of installation page, select **Complete Installation (Server)**.

   A Complete Standalone Deployment does not require a client installation.

2. Select the **Enable load balancing (This feature requires and Enterprise license.)** check box for installing AVEVA Work Tasks on the Enterprise Server.

   The **Farm Configuration Wizard** dialog box appears.

3. Click **OK**.
4. To create a new Farm database, click **Create AVEVA Work Tasks Farm**, and then select one of the following:
   - **Create AVEVA Work Tasks Farm database**
   - **Use existing AVEVA Work Tasks Farm database (Creates AVEVA Work Tasks Farm tables only if they do not exist)**
5. To connect to an existing Farm database, click **Connect to existing AVEVA Work Tasks Farm (if the first server of the Enterprise Server is already installed)**.
6. Click **Next**.

   The Database User Settings page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create Farm Database

Use the Create AVEVA Work Tasks Farm Database page to provide **New Database** details. Select the **Connection String** option to establish a connection with the database. This connection information is encrypted and stored.

You can enter either Windows or Microsoft SQL Server user settings for authentication.

Note:
- The Farm database password does not support **&** and **;** special characters.
- While setting up **Farm Database** with **Windows Authentication**, do not enter **FQDN** in the **Domain Name** field.

To Create Farm Database

1. Enter **Database Title**.
2. Select **Connection String**.

   See *Connection Provider* later in this topic, if you have selected the **Connection Provider** option.

   - Enter the following details:

     Server Name:

     Provide information about the database server on which the Farm database can be installed.

     If the **Database Type** is **SQL Server**, then you can specify an IPv6 address for the **Server Name**.

     If SQLExpress Instance need to be used as a Database instance of the Farm database, then **Server Name** should be <server name>\SQLExpress.

     To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

   - **Authentication Type**

     This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports Windows and SQL Server authentication process.

     Example: Windows
     If Windows Authentication is selected, the user configured for the Farm configuration will be used to access the database. This is the authentication recommended by AVEVA Work Tasks.

   - **Login**

     This field is used to enter the SQL login credential for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Password**

     This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Advanced Settings**

     This is an optional field. It is used to enter any additional connection information, such as connection Timeout. Example: Connection Timeout = 20.

     While creating a data source for repository, use the following custom settings to set properties for connection pool. These settings are case sensitive and should be mentioned only in lower case.

     ```
     encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
     ```

     encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

certificate is installed on the SQL Server for SSL encryption.

enableltm: AVEVA Work Tasks internally implements light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive. This property can be used to turn off this feature. The default value is set as True.

connectionretrywaittime: While opening a new connection, if the data base server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

maxconnectionretries: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

3. Click **Test Connection** to ensure database connectivity.
4. Click **Next**.

   The message *AVEVA Work Tasks Farm is Created* appears.
5. Click **OK**.

AlwaysOn Availability Groups feature of Microsoft SQL Server

The **AlwaysOn Availability Groups** feature of Microsoft SQL Server is a high-availability and disaster-recovery solution that provides an enterprise-level alternative to database mirroring. Introduced in Microsoft SQL Server 2012, AlwaysOn Availability Groups maximizes the availability of a set of user databases for an enterprise.

After you configure the AVEVA Work Tasks, you must add the created Farm Database to the SQL Server AlwaysOn Availability Groups. Contact your Database Administrator to add the database to SQL Server AlwaysOn Availability Groups.

Notes:

- The authentication user needs different rights assigned for different scenarios. If a user wants to create database (Farm or Repository Data Source Database), Authentication User needs to have minimum 'dbcreator' access rights on Database Server Instance.

- If database is already created, user needs to have following permissions on Database Server:

- SELECT, INSERT, UPDATE, and DELETE permissions.

- EXECUTE permission for Stored Procedures.

To choose Connection Provider

Complete the following steps to choose a connection provider:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Enter **Database Title**.
2. In the **Database Type** box, select a database type.
3. Select **Connection Provider**.

   This option is used to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.
4. Enter the following details:
   - **Assembly Path**:

     Click the icon to browse and choose the required dll file.

     If custom properties (enableltm, connectionretrywaittime, maxconnectionretries and sqlcommandtimeout) are required to be used in Assembly connection string, then user should select **Use existing Farm database** while creating a the Farm. See Creating or Using an Existing Database.

     See the topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub chapter in the *Build Business Process* section for creating the assembly. Make sure that, there should be only one class implementing *IDBConnectionString* interface within this assembly.
5. Click **Test Connection** to ensure database connectivity.
6. Click **Next**.
7. The message *AVEVA Work Tasks Farm is created* appears.
8. Click **OK**.

Define Security Settings

You can define the Security Settings using the Farm Configuration Wizard.

For more information on Security settings, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client.

To define the Security Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Security Settings** and **Service Settings** and then, click **Next**.
4. Select **Secure Communication** to establish secured communication between the AVEVA Work Tasks services through HTTPS.
5. Select **Secure Web Sites** check box to configure secured web sites. Uncheck the **Secure Web Sites** check box to use HTTP sites. By default the sites are created in HTTPS mode.
6. Enter the Port number. The default port for the HTTPS site is 8001, and for the HTTP site is 8000. You can enter any port number that IIS accepts. But if any other services or applications are already using the entered port number, AVEVA Work Tasks will not start.
7. Select the available certificate from the **Certificate** list. If your certificate is not listed, click the **Refresh** icon to repopulate the list.

   Note: If the required certificate is not listed, generate one using the System Management Server

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

(Configurator tool). Do not use a self-signed certificate without a proper root chain.

8. Click the **Validate** button to validate the certificate before configuring the security settings.

   Note: An Internet connection is needed to validate the certificate.

9. Click **Configure**, then **Next**, and then **Finish** to apply the new security settings.

Note:
- To update the port number, certificate, and websites from unsecure to secure or vice-versa, select **Security Settings** and **Service Settings** check box in **Edit AVEVA Work Task Farm Settings** window before updating the values. After the required details are provided, these settings get updated only when you click **Configure**, then **Next**, and then **Finish** as you navigate through the Farm Configuration Wizard..
- If the Quickflow is already deployed on a machine, you need to deploy it again after you update the security settings. If secured web site is configured, then you cannot change the server configuration for Quickflow in Central Configuration. However, if the **Secure Web Sites** checkbox is not selected, you can make the changes to the server configuration.
- Advance Server communication cannot be configured on HTTP/HTTPS.
- For resources of Load Balanced Server, ensure to configure all services with the same protocol (HTTP or HTTPS).
- It is recommended to use Standard SSL certificate instead of self-signed SSL certificate.

Using ASB Certificate for Secured Communication

ASB Certificate is a PCS-managed SSL certificate and renews automatically every 30 days when the certificate is still valid. The certificate is valid for two years. The PCS watchdog service on the runtime node checks the validity of the SSL certificate within 5 minutes from when it starts and once a day. PCS also renews the SSL certificate if it is expired.

If the runtime node is offline and later back online, the PCS watchdog service regularly checks the certificate validity and renews it if it is required. Consider restarting the PCS watchdog service to enforce the SSL certificate validity check within 5 minutes from the restarting time.

Furthermore, when the SSL certificate is renewed, PCS binds it to port 443 (by default) and changes the SslThumbprint PCS registry value. If AVEVA Work Tasks sites are hosted on port 443, certificate binding will be auto-renewed when the SSL certificate is renewed. It is recommended to check the bindings in IIS with every certificate renewal to ensure the application is running seamlessly.

To disable the certificate renewal, consider disabling the **ArchestrA Certificate Renewal Service** windows service.

Note: Client Service will try to automatically bind the renewed certificate. If there are any issues in browsing the website or starting the services after certificate renewal, users need to reconfigure the secure communication in Farm Configuration. To reconfigure, see the steps mentioned in above section *To define the Security Settings*.

Securing Communication between Services

To have a secure communication between the services, apply the below changes to the Windows registry and reboot the server:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
```

For more information on securing communication, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client and https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2015/2960358.

Define Services and Global Settings

You can define the Services and Global Settings using the Farm Configuration Wizard or through Configuration XMLs.

To define Services

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.

   Note: You can also customize the settings for these services and websites using the **Custom Settings** option. For more information about Service-related changes and Website-related changes, see Advanced Settings and Administering Web Servers respectively.

2. Click **Next**.

   The Global Settings dialog box appears.

3. In the **Communication** tab, enter key fields in **Email Settings** and **Exception Email settings** to configure exception e-mails.

   The following are the details:

   - **Host**: Enter information related to mail server.
     Example: Enter details related to Microsoft Exchange Server (IP address of the exchange server).
   - **Port**: Enter the port number for the mail server. The default port number is 25.
   - **From email**: Enter the from e-mail address.
     Example: admin@telematics.com
   - **To email**: Enter the to e-mail address.
     Example: alex@telematics.com

4. Click **OK**.

Note: To confirm the exception e-mail settings, click **Test SMTP**. An e-mail will be generated and sent to the **To email** address confirming successful configuration of the e-mail. The advanced settings like **Secure Socket Layer (SSL), Email Timeout, User Name,** and **Password** for the e-mail account holder, **Password Encrypted** flag will differ based on the mail server settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Define Central Configuration

1. Run **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Farm Configuration Wizard window appears.
2. Click **Next**.
3. The Edit Farm settings window appears.
4. Select **Service Settings**.
5. Click **Next**.

   The Services/Global Settings window appears.
6. Click against **Central Configuration** to edit AVEVA Work Tasks **Central Configuration settings**.

   The Central Configuration Settings page appears.
   - **http/https**: This option enables you to determine if you want a secured (https) or a non-secured site (http).
   - **Authentication Type**: This option allows you to provide the authentication type to access the Central Configuration. The available authentication types are Windows, AVEVA Connect, and Azure Active Directory.

     Note: The AVEVA Connect and Azure Active Directory authentication types are available only if these user providers are configured in the system.
     To configure AVEVA Connect user provider, see AVEVA Connect Settings.
     To configure Azure Active Directory user provider see Azure Active Directory Settings.
   - **Create at**: This field allows you to provide the Internet Information Service (IIS) path where the new site is created.
   - **Port Number**: This field is used to provide a port number for the Central Configuration.
7. Click against **Create at** to change the path of the Central Configuration.

   A message indicating that if the path has been changed the Central Configuration will no longer be accessible appears.
8. Click **Yes**.

   The IIS structure screen is displayed. Select the desired IIS path for the Central Configuration.
9. Click **OK**.

   The selected URL appears in the **Central Configuration Settings** screen.
10. Click **OK**.

Note:

- The default IIS path for Central Configuration is displayed. Click the edit icon to change the site path.

- If you want to update the authentication type to AVEVA Connect or Azure Active Directory of the already configured Central Configuration, you need to reconfigure the AVEVA Connect and Azure Active Directory user providers for the Central Configuration. For information on configuring user providers, see AVEVA Connect Settings and Azure Active Directory Settings.

- Central Configuration cannot be accessed in Chrome browser when configured with unsecured access (http://)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

for Azure Active Directory and AVEVA Connect authentication types.

Define Enterprise Console

1. Run **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Farm Configuration Wizard page appears.
2. Click **Next**.

   The Edit AVEVA Work Tasks Farm settings page appears.
3. Select **Service Settings**.
4. Click **Next**.

   The Services/Global Settings page appears.
5. Click the **Advanced Settings for Enterprise Console** button.

   The Enterprise Console Settings page appears.

   Note: If Enterprise Console is running in secured mode (https), update the **Intranet Path** field with the associated fully qualified domain name in place of the server name.
   Example: If the fully qualified domain name is **mycert.mydomain.com**, then provide *https://mycert.mydomain.com/Enterpriseconsole* in the **Intranet Path** field.
6. Click **Save**.

   The created Enterprise Console is displayed in the **Existing Enterprise Consoles** grid.
7. Click **OK**.

   The Installing Service screen appears, indicating the progress of installation. The message *Installation is Complete* appears after all the services are installed.
8. Click **OK**.

Accessing Enterprise Console Settings in AVEVA Work Tasks Pro App App

You can configure the Enterprise Console settings such as Enterprise Console path, Repository name, corresponding Provider name, and User name in the Farm Configuration Wizard. You can generate a QR code to store these settings. This QR code can then be scanned by the AVEVA Work Tasks Pro App to automatically fill the settings in the Settings screen.

1. Run **Farm Configuration Wizard**.

   The Welcome to the **AVEVA Work Tasks** Farm Configuration Wizard page appears.
2. Click **Next**.

   The Edit **AVEVA Work Tasks** Farm settings page appears.
3. Select **Service Settings**.
4. Click **Next**.

   The Services/Global Settings page appears.
5. Click the **Advanced Settings for Enterprise Console** button.

   The Enterprise Console Settings page appears.
6. Click **Generate QR Code**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Scan QR Code** dialog box appears.

7. Click **Download**.

   The **Save As** dialog box appears.
8. Enter the **File name** for the QR code and select the **Save as type** as **PNG**.
9. Click **Save**.

   The QR Code is generated successfully.
10. Scan this QR Code in the AVEVA Work Tasks Pro App.

    The values configured for the following settings in the Farm Configuration wizard are considered by default.
    - Enterprise Console path. The local intranet Enterprise Console path is considered.
    - Repository name
    - Provider name
    - User name
11. Enter the password.

Provision Services

While the installation is in progress, you can view the services that will be installed. This provides information on the progress of installation. At the end of the installation, a status indicating the completion of installation appears.

- Click **OK** to complete the installation.

Create a Repository DataSource

A **Repository DataSource** is used to store all repository related data. The **Repository DataSource** must be created on a machine where the **Central Configuration** site is installed.

Example

A TelematicsDataSource is created for TelematicsHR Repository.

A Repository contains Workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating the repository.

To create a Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**.

   The Central Configuration web page appears.
2. Click **DataSource Settings**.

   The Datasource List page appears.
3. Click **Add**.

   The Manage Datasource page appears.
4. Enter the required details.
   a. **Name**: Enter a valid data source name. Example: *TelematicsDataSource*.
   b. **Description**: Enter a description for the data source. Example: *This data source is used to store*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

connection details.

c. **Connection String**: Select this option to establish a connection with the database. The connection string contains fields that that defines the connection. The connection information is encrypted and stored.

Server Name

To use a database on the local machine, enter "localhost", ".", or the local computer's name for the **Server Name**.

Note: Server Name can be machine name/IP address/SQL Server AlwaysON/SQL Server instance name. Instead of entering "local host", it is preferable to give the local machine name.

If the **Database Type** is **SQL Server**, then specify an IPV6/IPV4 address for the **Server Name**.
To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: *localhost,1455*
To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be *<server name>\SQLExpress*.

Authentication Type

Use this field to determine the process to validate a user who is trying to connect to the database. AVEVA Work Tasks uses Windows and SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. The **User ID** and **Password** field is disabled if Windows Authentication is selected. Example: *Windows*

Advanced Settings

Use this field to define advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection.
Example: *Connection Timeout = 20*
or
For defining maximum connections that can be opened in a connection pool.
Example: *max pool size = 250*
Default connection pool is set as 250. We recommend to enter a higher value on heavily loaded environment.
While creating a data source for a repository, use the following custom settings to set properties for the connection pool.
encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.
enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature, AVEVA Work Tasks controls the transaction from escalating to an expensive distributed transaction.
The above property can be used to turn off this feature. The default value is set as *True*.
connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is 30 seconds. The value should be set in seconds.
maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is infinite.
sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

generating an error. The default value is set as 300.
These settings are case sensitive and should be mentioned only in lower case.

Database:

Specify or select a database that can be used as a repository database. This database stores all repository related data. The repository database is created if it does not exist on the database server instance.
Example: *TelematicsDB*

Enable Table Partitioning:

Select to enable database table partitioning. For more information, see Partitioning Database.

d. **Connection Provider**: Use this to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.

The selected dll must be copied to all the machines, all servers and all clients, that are connected to the current Farm.

Assembly Path

Click to browse and choose the required dll file.
To use custom properties (enableltm, connectionretrywaittime, maxconnectionretries, and sqlcommandtimeout) in the Assembly connection string, the database must be created before.
See *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Developer Guide* for creating the assembly. Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.

   A message about successful test connection appears.

6. Click **OK**.

   A message about successful creation of the data source appears.The message also states that the required tables will be created in the data source after a repository is associated with the data source.

When a data source is saved, an entry is created for the data source in the **Farm Database**. When a first repository is created for the data source, AVEVA Work Tasks tables are added to the data source. While creating a data source, the archival database is created with the same database name suffixed by *_BI*. This database is used for archival in future use.

Note: After you configure the AVEVA Work Tasks, you must add the created **Farm Database** to the **SQL Server AlwaysOn Availability Groups**. Contact your Database Administrator to add the database to **SQL Server AlwaysOn Availability Groups**.

To view the data source created, click **DataSource Settings** link.

Create a Repository

A **Repository** contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

To create a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The Central Configuration page appears.

2. Click **Repository Settings**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Repository List page appears.

3. Click **Add**.

   Note: If the number of repositories exceeds the permitted limit for the license, then the message "You have exceeded the maximum number of repositories" appears, and the repository creation is stopped. Click **Close**.

   The **Manage Repository** page appears.
4. Enter the required details.
5. Click **OK**.

   The **Config Administrator** page appears.
6. Click to configure an administrator.

   The User Lookup dialog box appears.
7. Select the provider from the provider drop-down list.
8. Enter the details to search the administrator for the repository that is created.

   Note: You can also search a user based on *ObjectSID* and *objectGUID* (applicable only for Active Directory provider).
9. Click **Search**.

   The user is listed under **Available Resources**.
10. Select and click the arrow to list the user under **Selected Resource**.
11. Click **Update**.

    The selected user is displayed in **User Lookup**.
12. Click **OK**.

    A message confirming the successful creation of an administrator appears.
13. Click **OK**.

    The **Repository List** page appears.

    For more information about configuring the system user, see Configure System User.

Manage Repository Window Fields

The following table explains the fields of the Manage Repository window:

Field Name	Description	Example
Repository DataSource	Lists all the data sources created in a Farm. The selected data source will be used to store data for the current repository.	TelematicsDatasource
Attach DataSource	Select Attach DataSource checkbox and then select a repository from the selected DataSource .Data associated with the selected repository will be copied to the new repository.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	The version of the installed product and destination DataSource should be the same as that of the DataSource from which the repository data is to be copied. For example, in an upgraded environment, from build Work Tasks version 1 to Work Tasks version 2, you cannot attach a DataSource created in build Work Tasks version 1 to build Work Tasks version 2. To match the build version of the installed product to the version of the DataSource: 1. If the DataSource was created in build Work Tasks version 1, then the entire build Work Tasks version 1 must be upgraded to Work Tasks version 2 by running the product installer in the upgrade mode. 2. All the Farm, DataSources, Repositories, and Lists of build Work Tasks version 1 must be upgraded to build Work Tasks version 2 by running the AVEVAWorkTasksUpgradeManager.exe located at the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder. 3. After upgrading all the AVEVA Work Tasks components to build Work Tasks version 2 build, that DataSource can be used in any machine that has same version by using this feature.	
Repository Name	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the	Telematics Repository

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	repository name.	
Description	Provide a description for the repository.	This stores Telematics Employee Leave Details.
From mail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might occur in the Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be sent to the mail ID defined in **Exception to mail**. The From address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To avoid this, restart the Workflow Engine Service and Communication Service.	Provide the valid email id that is specified in the **User Name** field while configuring **SMTP Settings** in the **Mail Server Settings** page. For more details, see Mail Server Setting.
Exception to mail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails is sent to the email ID specified in **Exception to mail**.	Provide the valid email id.
Alert initiator of the Workflow	Determines if the status of a workflow should be sent as a notification mail to the initiator of the workflow.	A process with a rule to check the pending leave available for the employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
Servers	Lists the servers available in the Farm. Repository will be available only to the mapped servers.	Work Tasks Server Name
Enterprise Consoles	Lists all the Enterprise Consoles for	http://worktaskservername:8001/

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	a selected AVEVA Work Tasks Server. Repository will be available only to the mapped Enterprise Console.	EnterpriseConsole
Enable Theme	Select this checkbox to enable the defined theme.	-
Theme Name	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. It provides **Default** and **Lite** themes.	-
Resource Provider	Lists the various default resource providers supported by AVEVA Work Tasks. Resource providers are also termed as User Provider. A User Provider is a data store containing information about the user. AVEVA Work Tasks also supports custom resource provider. For more information about Resource Provider, see User Providers. AVEVA Connect and Azure Active Directory resource providers are also available after you configure them. To configure these providers, see AVEVA Connect Settings and Azure Active Directory Settings. AVEVA Work Tasks allows secured LDAP configuration. The default port number for LDAPS is 636. You can map the repository in IDE and use the Secured LDAP. The logged-in Active Directory is displayed by default, and **Active Directory Datasource** expects **LDAP://** or **Fully Qualified Domain Name** as value.	AVEVA Work Tasks Lists or Active Directory
Custom Application Folder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	a semicolon.	
Hide Repository	Select this option to make the repository unavailable to the Farm.	-
Source path	Enter the path to the Source Elements Folder.	-
Attachment Storage Path	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an absolute path. - The default path is the **Attachments** folder in *C:\ProgramData\AVEVA Work Tasks*\. - The default path is used when no path is specified. - Ensure appropriate rights are set to the folder, where attachments are stored, for the following identities: -- The application pool identity for **Central Configuration** and **Enterprise Console(s)**. -- The account configured for the **Workflow Engine** service. - In case of mapped drives, ensure they are available to the identities. - In multiple-server environments, the path specified must be in a shared location.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Auto Log Off Settings for Enterprise Console	Automatically logs out the logged in user after the designated period of inactivity. Enter the time in minutes. This field accepts only valid integer values between 0 to 360. 0 minute means the user will not get automatically logged off. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. The default value for automatic log off is 30 minutes. You use this field to define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML.	0 to 360 (minutes)
Auto Log Off Settings for AVEVA Work Tasks Pro	Request for user credentials for AVEVA Work Tasks Pro app after the set time is elapsed. Enter the time in minutes. This field accepts only valid integer values between 0 to 2880. 0 minute means the user will not get automatically logged off. The default value is 30 minutes. If AVEVA Work Tasks Pro app is offline, the Auto Log Off will not get active, and the user will not be automatically logged off as per the defined settings.	0 to 2880 (in minutes)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Offline Support	Select this option to enable offline submission of items in AVEVA Work Tasks Pro app.	-
Refresh on Work Item submission	Select this option to enable Inbox refresh on Work Item submission in AVEVA Work Tasks Pro . Refresh option is enabled by default.	-
Timeout	Enter the time in seconds to set the timeout. If the value is set as 0, then there is no timeout. Default value is 60 seconds.	-
Label for Fill Form	Enter the label for Fill Form. The customized label will be displayed for the Fill Form in AVEVA Work Tasks Pro.	Work Tasks
Date Configuration Flag for Alternate Actors	Select the **Enable Date Settings** option to set the **From** date and **To** date as mandatory while creating alternate actors. For more information about creating alternate actors, see *Alternate Actors* topic in the *User Guide*.	-
Display Domain name with User Name	Select this checkbox to display the domain name along with the user name in the Enterprise Console and the List. The domain name will be displayed only: • If this checkbox is selected. • If the **Resource Provider** is selected as **Active Directory**.	-

User Providers

AVEVA Work Tasks supports the following User Providers by default:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Active Directory

When you select **Active Directory** as the **Resource Provider**, details such as **Active Directory datasource** and the **Active Directory search base** are populated by default.

Authentication User, **Authentication Password**, **User Log-on ID**, and **User Log-on Display Name** are optional fields. Access to the active directory might not be available for all users. In such cases, provide the active directory authentication user name and the active directory authentication password with which you can connect to the Active Directory.

AVEVA Work Tasks considers *SAM-Account-Name* as **User Log-on ID** by default. If you want to use active directory attributes other than the *SAM-Account-Name* user, then enter the desired active directory attribute details in the **User Log-on ID** field and **User Log-on Display Name** field. **User Log-on Display Name** is the user friendly display name of the active directory attribute. This **User Log-on Display Name** is referred in the User Lookup dialog box against the **User Log-on ID**.

Steps

1. When you select **Active Directory** as the **Resource Provider**, then the **Use Token Service** field appears. In this field, select one of the following:
   - If you do not want to use AIM authentication, select **Without Token Service**.
   - If you want to use AIM authentication, then select a server from the list of alias server names.
2. Enter **Active Directory datasource**.
3. Enter **Active Directory search base**.
4. Enter **Domain Name**.

   The domain name is case-sensitive.
5. Enter **Authentication User**.
6. Enter **Authentication Password**.
7. Check **Is Cross Domain Role Provider** checkbox, if cross domain users and roles mapping is required.

   Example: Users *John* and *Jim* of domain *TelematicsU* and users *Mike* and *Bob* from domain *TelematicsAU* are added to role Team HR of domain *TelematicsMain*.
8. Enter **User Log-on ID** if you want to use another Active Directory attributes instead of *SAM-Account-Name*.

   We recommend to use attributes of type *string* as input for **User Log-on ID.** However, *ObjectSID* and *objectGUID* are also supported.

   After you set the **User Log-on ID**, you cannot change it later.
9. Enter the **User Log-on Display Name**.

   After you set the **User Log-on Display Name**, you cannot change it later.

   This is the default display name of the user account of the active directory user used. **User Log-on Display Name** is used in user lookups.
10. Click **Test LDAP**.

    A message about successful LDAP test appears.

Note:
- Some of the active directory attributes or properties are not indexed. If you use an active directory attribute that is not indexed, it might impact the log-on validation performance based on the active directory entries. We recommend to use indexed attributes as **User Log-on ID** or index the attributes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- For an upgraded repository, you cannot change both **User Log-on ID** and **User Log-on Display Name**.
- You cannot localize **User Log-on ID** and **User log-on Display Name** fields.
- Disabled users will not be shown in user lookup search.

Using Forms

For Forms Resource Provider:

- If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.

1. In the **Resource Provider** drop-down list**,** select **Forms.**
2. In the **User Entity properties** field, enter XML data.

   Click **Sample Code** to get the XML Schema Template.

   Example

   ```
   <properties>
   <property name="userid" type="string" purpose="identifier" />
   <property name="username" type="string" purpose="name" />
   <property name="pwd" type="string" purpose="password" />
   </properties>
   ```
3. In the **User Provider Properties** field, enter the same XML Schema.

   There must be at least one identifier in the XML Schema. For example, UserID
4. In the **Datasource** field, enter a valid data source or specify a dll.

   The value for the data source can be specified as **Physical path of the dll** or **Physical path of the dll::param. Param** is not mandatory.

   See topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Build Business Process* section for creating the assembly.

   Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly, whereas one class can return multiple connection strings.

   Examples of data source parameter:

   - c:\DLLStore\GetConnectionString.dll
   - c:\GetConnectionString.dll::Leave

   If there are two data sources, *Leave* and *Licensing*, and only one DLL is used to return a connection string based on the data source selected. The parameter can be specified as **c:\GetConnectionString.dll::Leave** or **c:\ GetConnectionString.dll::Licensing**. The connection string can be returned from the connection dll based on this parameter.
5. Enter a proper table name or view name which holds the User Name and Password for the Authentication purpose.

   Example: Passmast (the table which is available in IMS_NEW Database)
6. Click **Test SQL Connection**.

   A message about successful test connection appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using ASP.NET Membership

This resource provider lists users defined in the asp.net membership database.

Lists

This resource provider lists users created using AVEVA Work Tasks Users Creation. If you are unable to determine a User Provider to create a repository, use AVEVA Work Tasks Lists.

To verify successful creation of the Repository:

1. Click **Enterprise Console** URL from the site path column.
   The repository created is listed.
   Add the created Enterprise Console link into "Add to Favorites" to easily navigate in future.
2. Click **Repository User Provider** link to logon to the repository.
   The Enterprise Console log-on page appears.
3. Enter the logon details, and then click **Login**.
   The Enterprise Console home page appears. This indicates successful creation of a Repository.
   All features can only be available for a user with administrative privileges.

Note: Consider you created the Repository and then deleted it. If you create the same Repository again immediately and try to log into it through Enterprise Console, the Provider does not list the Repository. You need to access IIS and recycle AVEVA Work Tasks from the Application Pool to get the Repository listed in the Provider list..

Install on Multiple Machines

Repeat the same installation steps for other servers.

- Ensure that the same Farm database should be selected when configuring AVEVA Work Tasks Farm on other servers.
- Map the same repository for all the machines and the same repository can be accessed on all machines.
- After AVEVA Work Tasks installation on the second machine, go to *Central Config* site and map the current machine URLs for the existing repository.

Verify the Installation

After you install AVEVA Work Tasks, verify that the product is installed successfully. To verify successful installation, create a simple Workflow using Process Designer. The tasks includes the following:

- Creating a Workflow
- Publishing the Workflow
- Testing the Workflow

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Creating a Workflow

1. Log on to the **Enterprise Console**.
2. If the Repository is configured for Active Directory provider, go to step 4.
3. Enter the **User Name** and **Password**.
   The **User Name** and **Password** will be validated with the user provider selected while creating the repository.
   The default authentication provider is the Repository User Provider List.
4. In the **Enterprise Console**, click menu icon.
   All features can only be available for a user with administrative privileges.
5. From the menu, select **Workflows**.
   The Workflow window appears.
6. On the Action bar, click **New**, and then click **Workflow**.
   The New Workflow window appears.
7. Enter **Title** and **Description**.
8. Click **Save & Continue**.
   The successful message appears.
9. Select **Design the Workflow now**.
   This is the default option.
10. Click **Finish**.
    The Process Designer window appears.
11. From the activities pane on the left, drag the Information activity to the Process Designer window.
12. The activity *Information1* is created.
    Click to create a link between two activities.
    The Link Action window appears.
    a. Select from the **From Action** drop-down box.
    b. Select from the **To Action** drop-down box.
    c. Click **OK**.
       The link is established.
13. Right-click *Information1*.
14. Select **Activity Properties** from the context menu.
    The Activity Properties pane appears.
    a. Enter **Name** and **Description**.
    b. Click to **Assign Actor(s)**.
       The Assign Actor(s) window appears.
    c. Select the required provider from the **Providers** drop-down list.
    d. Select values from the drop-down list.
    e. Click **Add**.
    f. Click **Update**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

15. Click to enter the **Subject** for Notification Contents.
    The window to enter subject for notification appears.
16. Click **Update**.
17. Click to enter the **Body** for Notification Contents.
    The window to enter the Body content appears.
18. Click **Update**.
19. From the Activity Properties pane, click **Save**.

Publishing the Workflow

1. On the **Publish** menu, click **Publish**.
   The Published successful message appears.
2. Close the dialog box.
   The Enterprise Console screen lists the workflow created.

Testing the Workflow

1. Select the listed workflow.
2. Right-click the selected workflow.
3. Click **Publish and Test Run**.
   The **Status Finished successfully** appears.
   If Status is **Execution Pending** in the Process Execution window, then click on the **Refresh** button to get the status.
4. In the **Enterprise Console** menu, select **Inbox**.
   The Inbox lists the work item.
5. Click to view the work item listed.
   This indicates that the installation is successful.

Web Farm Connecting to Separate Services Cluster with Database on a Different Machine

This section describes the activities involved while installing the Load Balanced Server for the scenario Web Farm Connecting to Separate AVEVA Work Tasks Services Cluster with Database on a Different Machine.

In this scenario, AVEVA Work Tasks Server is installed in a cluster. The cluster includes Machine 1, Server 1, and Server N. "N" represents the number of machines in AVEVA Work Tasks Cluster.

AVEVA Work Tasks Client is installed in a Web Farm. The Web Farm contains Machine 3 (or Server 1), Server 2 and Server N. "N" represents the number of machines in the Web Farm.

Ensure that you install the product in the following sequence:

- High-Level View of Server Installation
- High-Level View of Client Installation

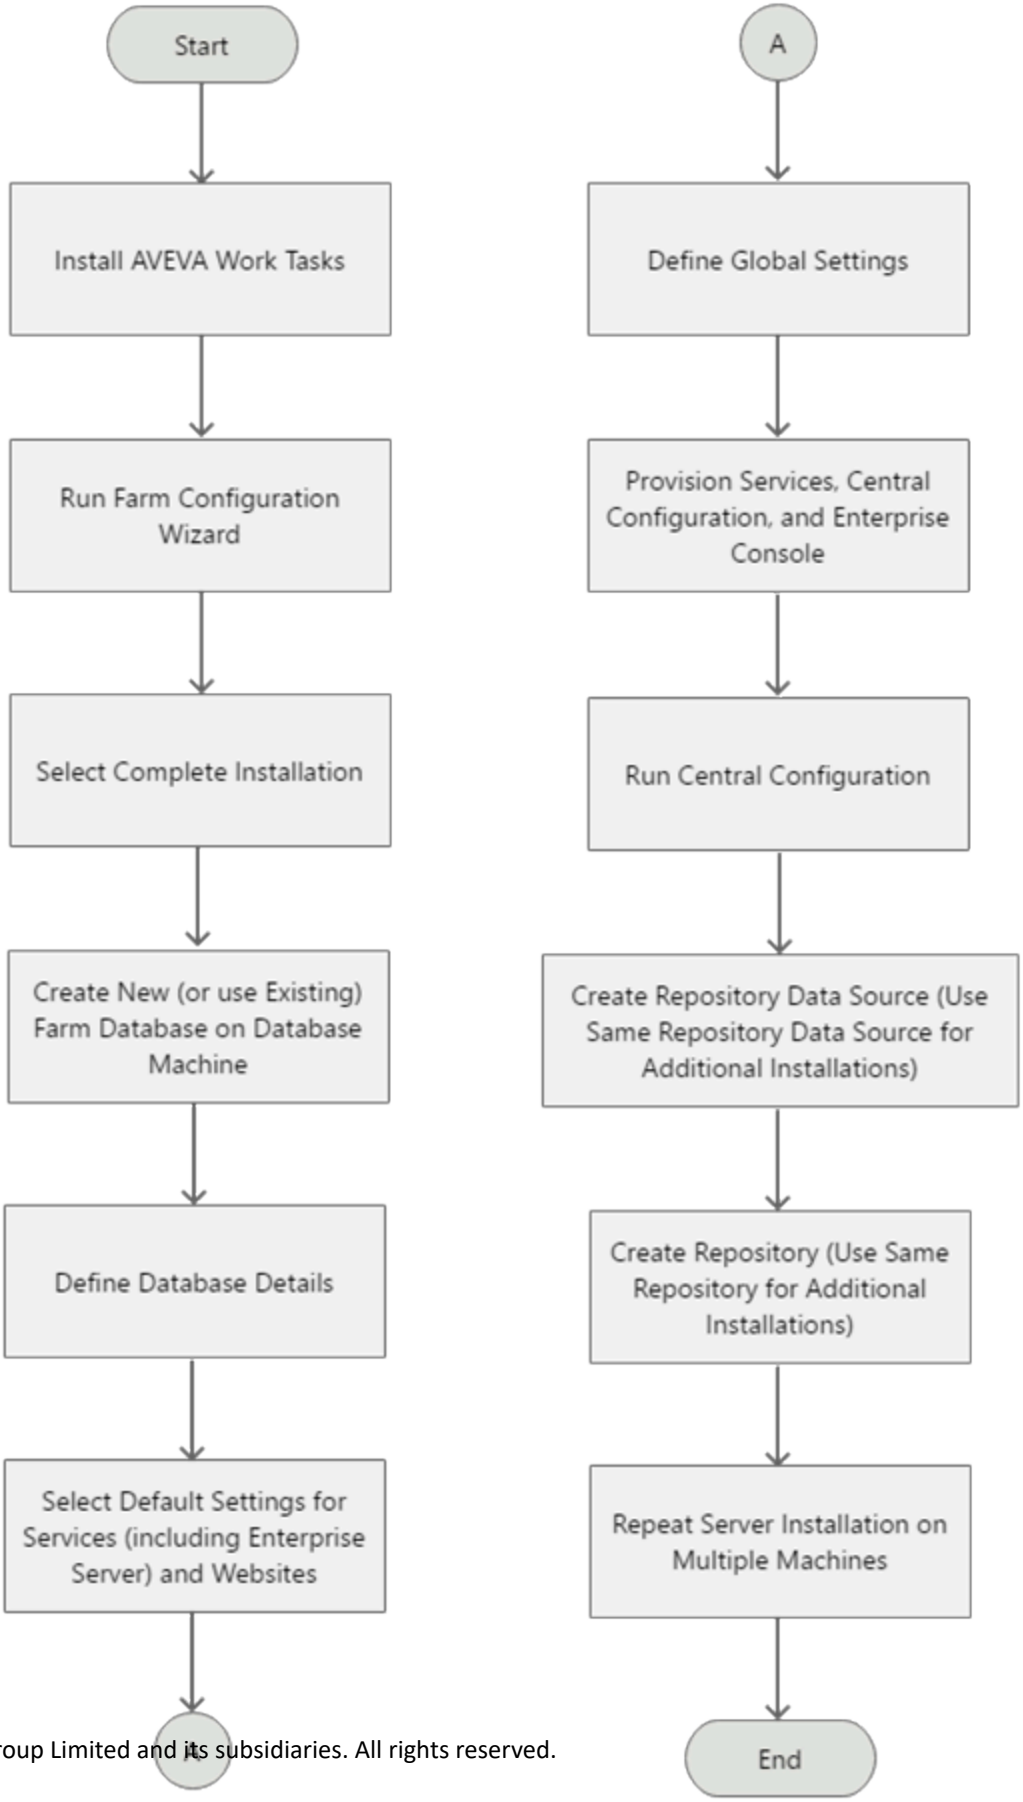
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

High-Level View of Server Installation

This section provides a high-level view of the various installation steps. The objective of this section is to provide an overview of the various activities involved while installing the AVEVA Work Tasks Server. This section also enables you to visually keep track of your activities while following the sequence of tasks.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



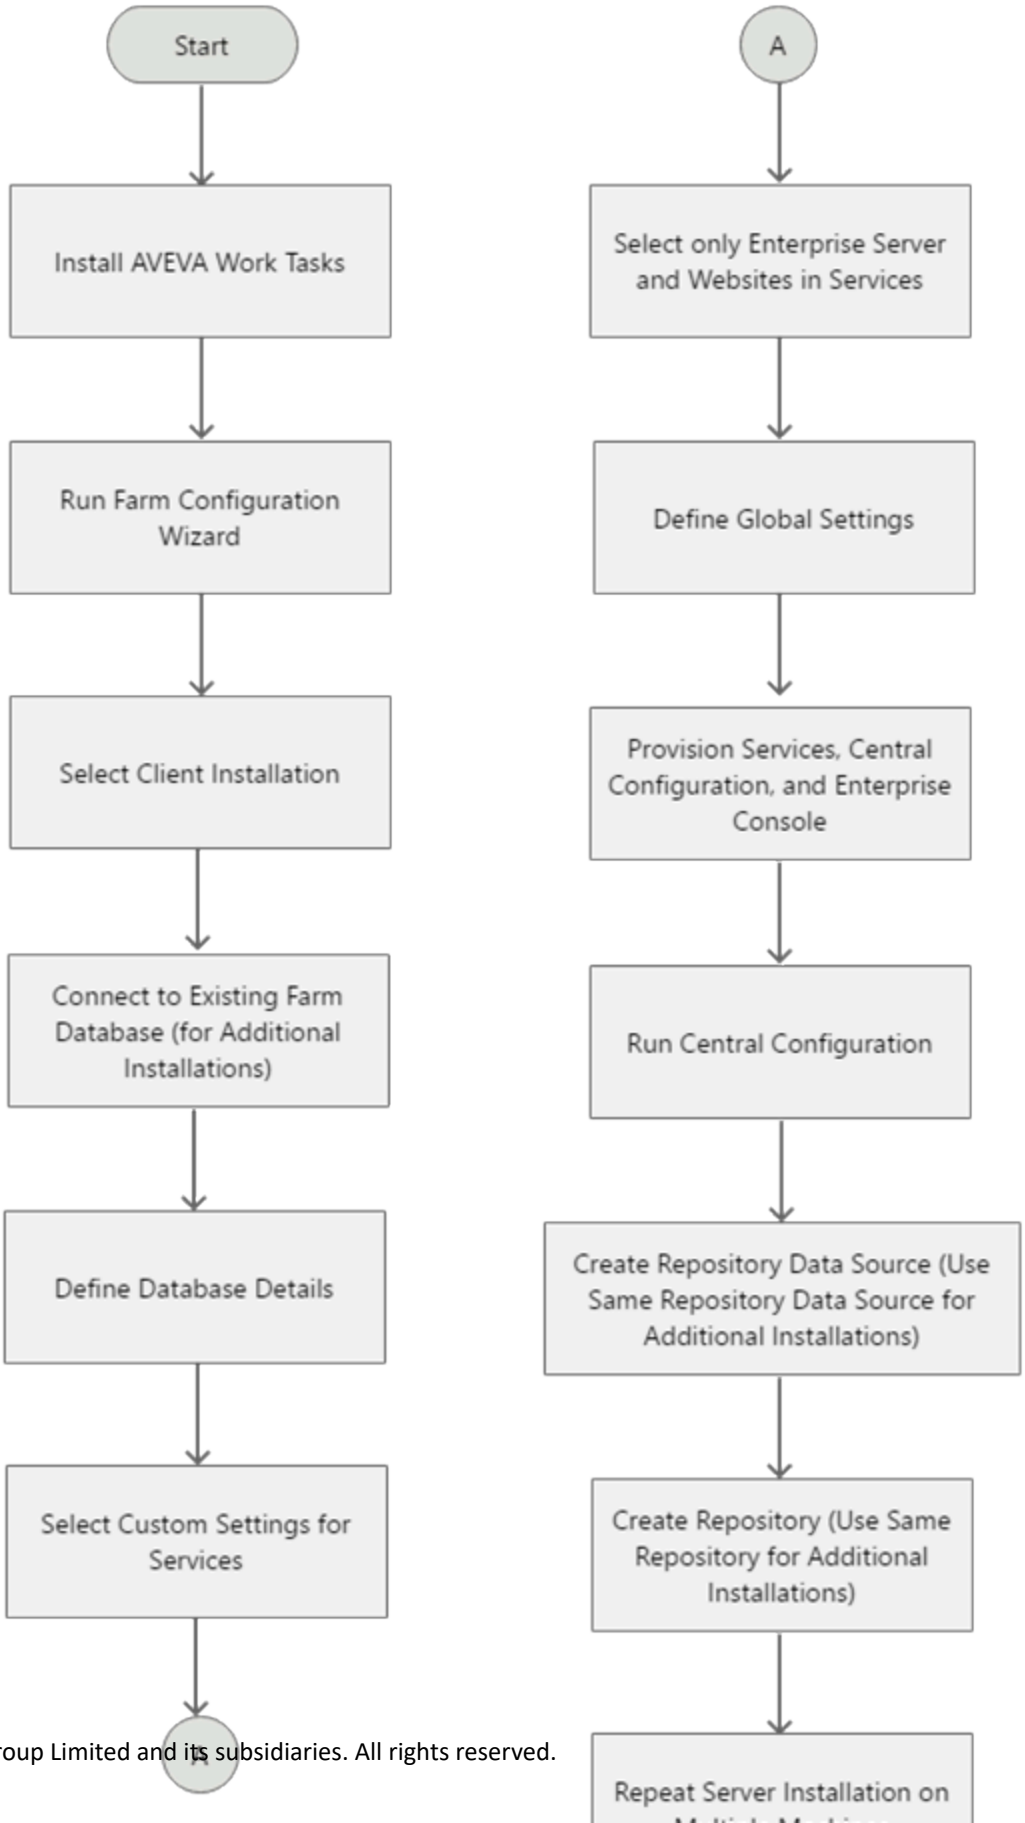
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

High-Level View of Client Installation

This section provides a high-level view of the AVEVA Work Tasks Client installation. The Client components are installed on Web Servers. For more information on this scenario, see Load Balanced Server.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation

This section provides installation steps for the scenario Web Farm Connecting to Separate AVEVA Work Tasks Services Cluster with Database on a Different Machine.

The installation includes the following:

- Installing AVEVA Work Tasks Server
- Installing AVEVA Work Tasks Client

The Server has to be installed on all the machines in a Cluster before installing the Client in a Web Farm.

AVEVA Work Tasks Server

This section describes the activities involved while installing AVEVA Work Tasks on a server machine.

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.

2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.

3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.

5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.

6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.

4. Click **Next**.

   The License Server details are configured successfully.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.
4. Click **Next**.

   The **Edit Farm Settings** window appears.
5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.
6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
9. Click **Next**.

   The License Server details are configured successfully.

Select the Type of Installation - Enterprise Edition

Following points must be considered while installing AVEVA Work Tasks on the Enterprise Server:

- Ensure that you select the **Complete Installation** and **Enable load balancing** options.
- You can either create a new Farm database or use an existing one.

1. In the Select the type of installation page, select **Complete Installation (Server)**.

   A Complete Standalone Deployment does not require a client installation.
2. Select the **Enable load balancing (This feature requires and Enterprise license.)** check box for installing AVEVA Work Tasks on the Enterprise Server.

   The **Farm Configuration Wizard** dialog box appears.
3. Click **OK**.
4. To create a new Farm database, click **Create AVEVA Work Tasks Farm**, and then select one of the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Create AVEVA Work Tasks Farm database**
- **Use existing AVEVA Work Tasks Farm database (Creates AVEVA Work Tasks Farm tables only if they do not exist)**

5. To connect to an existing Farm database, click **Connect to existing AVEVA Work Tasks Farm (if the first server of the Enterprise Server is already installed)**.
6. Click **Next**.

   The Database User Settings page appears.

Create Farm Database

Use the Create AVEVA Work Tasks Farm Database page to provide **New Database** details. Select the **Connection String** option to establish a connection with the database. This connection information is encrypted and stored.

You can enter either Windows or Microsoft SQL Server user settings for authentication.

Note:
- The Farm database password does not support **&** and **;** special characters.
- While setting up **Farm Database** with **Windows Authentication**, do not enter **FQDN** in the **Domain Name** field.

To Create Farm Database

1. Enter **Database Title**.
2. Select **Connection String**.

   See *Connection Provider* later in this topic, if you have selected the **Connection Provider** option.

   - Enter the following details:

     Server Name:

     Provide information about the database server on which the Farm database can be installed.

     If the **Database Type** is **SQL Server**, then you can specify an IPv6 address for the **Server Name**.

     If SQLExpress Instance need to be used as a Database instance of the Farm database, then **Server Name** should be <server name>\SQLExpress.

     To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

   - **Authentication Type**

     This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports Windows and SQL Server authentication process.

     Example: Windows
     If Windows Authentication is selected, the user configured for the Farm configuration will be used to access the database. This is the authentication recommended by AVEVA Work Tasks.

   - **Login**

     This field is used to enter the SQL login credential for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Password**

     This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Advanced Settings**

  This is an optional field. It is used to enter any additional connection information, such as connection Timeout. Example: Connection Timeout = 20.

  While creating a data source for repository, use the following custom settings to set properties for connection pool. These settings are case sensitive and should be mentioned only in lower case.

  ```
  encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
  ```

  encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

  enableltm: AVEVA Work Tasks internally implements light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive. This property can be used to turn off this feature. The default value is set as True.

  connectionretrywaittime: While opening a new connection, if the data base server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

  maxconnectionretries: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

  sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

3. Click **Test Connection** to ensure database connectivity.
4. Click **Next**.

   The message *AVEVA Work Tasks Farm is Created* appears.
5. Click **OK**.

AlwaysOn Availability Groups feature of Microsoft SQL Server

The **AlwaysOn Availability Groups** feature of Microsoft SQL Server is a high-availability and disaster-recovery solution that provides an enterprise-level alternative to database mirroring. Introduced in Microsoft SQL Server 2012, AlwaysOn Availability Groups maximizes the availability of a set of user databases for an enterprise.

After you configure the AVEVA Work Tasks, you must add the created Farm Database to the SQL Server AlwaysOn Availability Groups. Contact your Database Administrator to add the database to SQL Server AlwaysOn Availability Groups.

Notes:

- The authentication user needs different rights assigned for different scenarios. If a user wants to create database (Farm or Repository Data Source Database), Authentication User needs to have minimum 'dbcreator' access rights on Database Server Instance.

- If database is already created, user needs to have following permissions on Database Server:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- SELECT, INSERT, UPDATE, and DELETE permissions.

- EXECUTE permission for Stored Procedures.

To choose Connection Provider

Complete the following steps to choose a connection provider:

1. Enter **Database Title**.
2. In the **Database Type** box, select a database type.
3. Select **Connection Provider**.

   This option is used to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.
4. Enter the following details:
   - **Assembly Path**:

     Click the icon to browse and choose the required dll file.

     If custom properties (enableltm, connectionretrywaittime, maxconnectionretries and sqlcommandtimeout) are required to be used in Assembly connection string, then user should select **Use existing Farm database** while creating a the Farm. See Creating or Using an Existing Database.

     See the topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub chapter in the *Build Business Process* section for creating the assembly. Make sure that, there should be only one class implementing *IDBConnectionString* interface within this assembly.
5. Click **Test Connection** to ensure database connectivity.
6. Click **Next**.
7. The message *AVEVA Work Tasks Farm is created* appears.
8. Click **OK**.

Define Security Settings

You can define the Security Settings using the Farm Configuration Wizard.

For more information on Security settings, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client.

To define the Security Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Security Settings** and **Service Settings** and then, click **Next**.
4. Select **Secure Communication** to establish secured communication between the AVEVA Work Tasks services through HTTPS.
5. Select **Secure Web Sites** check box to configure secured web sites. Uncheck the **Secure Web Sites** check box

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

to use HTTP sites. By default the sites are created in HTTPS mode.

6. Enter the Port number. The default port for the HTTPS site is 8001, and for the HTTP site is 8000. You can enter any port number that IIS accepts. But if any other services or applications are already using the entered port number, AVEVA Work Tasks will not start.
7. Select the available certificate from the **Certificate** list. If your certificate is not listed, click the **Refresh** icon to repopulate the list.

   Note: If the required certificate is not listed, generate one using the System Management Server (Configurator tool). Do not use a self-signed certificate without a proper root chain.
8. Click the **Validate** button to validate the certificate before configuring the security settings.

   Note: An Internet connection is needed to validate the certificate.
9. Click **Configure**, then **Next**, and then **Finish** to apply the new security settings.

Note:
- To update the port number, certificate, and websites from unsecure to secure or vice-versa, select **Security Settings** and **Service Settings** check box in **Edit AVEVA Work Task Farm Settings** window before updating the values. After the required details are provided, these settings get updated only when you click **Configure**, then **Next**, and then **Finish** as you navigate through the Farm Configuration Wizard..
- If the Quickflow is already deployed on a machine, you need to deploy it again after you update the security settings. If secured web site is configured, then you cannot change the server configuration for Quickflow in Central Configuration. However, if the **Secure Web Sites** checkbox is not selected, you can make the changes to the server configuration.
- Advance Server communication cannot be configured on HTTP/HTTPS.
- For resources of Load Balanced Server, ensure to configure all services with the same protocol (HTTP or HTTPS).
- It is recommended to use Standard SSL certificate instead of self-signed SSL certificate.

Using ASB Certificate for Secured Communication

ASB Certificate is a PCS-managed SSL certificate and renews automatically every 30 days when the certificate is still valid. The certificate is valid for two years. The PCS watchdog service on the runtime node checks the validity of the SSL certificate within 5 minutes from when it starts and once a day. PCS also renews the SSL certificate if it is expired.

If the runtime node is offline and later back online, the PCS watchdog service regularly checks the certificate validity and renews it if it is required. Consider restarting the PCS watchdog service to enforce the SSL certificate validity check within 5 minutes from the restarting time.

Furthermore, when the SSL certificate is renewed, PCS binds it to port 443 (by default) and changes the SslThumbprint PCS registry value. If AVEVA Work Tasks sites are hosted on port 443, certificate binding will be auto-renewed when the SSL certificate is renewed. It is recommended to check the bindings in IIS with every certificate renewal to ensure the application is running seamlessly.

To disable the certificate renewal, consider disabling the **ArchestrA Certificate Renewal Service** windows service.

Note: Client Service will try to automatically bind the renewed certificate. If there are any issues in browsing the website or starting the services after certificate renewal, users need to reconfigure the secure communication in Farm Configuration. To reconfigure, see the steps mentioned in above section *To define the Security Settings*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Securing Communication between Services

To have a secure communication between the services, apply the below changes to the Windows registry and reboot the server:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
```

For more information on securing communication, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client and https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2015/2960358.

Define Services and Global Settings

You can define the Services and Global Settings using the Farm Configuration Wizard or through Configuration XMLs.

To define Services

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.

   Note: You can also customize the settings for these services and websites using the **Custom Settings** option. For more information about Service-related changes and Website-related changes, see Advanced Settings and Administering Web Servers respectively.

2. Click **Next**.

   The Global Settings dialog box appears.

3. In the **Communication** tab, enter key fields in **Email Settings** and **Exception Email settings** to configure exception e-mails.

   The following are the details:

   - **Host**: Enter information related to mail server.
     Example: Enter details related to Microsoft Exchange Server (IP address of the exchange server).
   - **Port**: Enter the port number for the mail server. The default port number is 25.
   - **From email**: Enter the from e-mail address.
     Example: admin@telematics.com

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **To email**: Enter the to e-mail address.
  Example: alex@telematics.com

4. Click **OK**.

Note: To confirm the exception e-mail settings, click **Test SMTP**. An e-mail will be generated and sent to the **To email** address confirming successful configuration of the e-mail. The advanced settings like **Secure Socket Layer (SSL), Email Timeout, User Name,** and **Password** for the e-mail account holder, **Password Encrypted** flag will differ based on the mail server settings.

Define Central Configuration

1. Run **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Farm Configuration Wizard window appears.
2. Click **Next**.
3. The Edit Farm settings window appears.
4. Select **Service Settings**.
5. Click **Next**.

   The Services/Global Settings window appears.
6. Click against **Central Configuration** to edit AVEVA Work Tasks **Central Configuration settings**.

   The Central Configuration Settings page appears.
   - **http/https**: This option enables you to determine if you want a secured (https) or a non-secured site (http).
   - **Authentication Type**: This option allows you to provide the authentication type to access the Central Configuration. The available authentication types are Windows, AVEVA Connect, and Azure Active Directory.

     Note: The AVEVA Connect and Azure Active Directory authentication types are available only if these user providers are configured in the system.
     To configure AVEVA Connect user provider, see AVEVA Connect Settings.
     To configure Azure Active Directory user provider see Azure Active Directory Settings.

   - **Create at**: This field allows you to provide the Internet Information Service (IIS) path where the new site is created.
   - **Port Number**: This field is used to provide a port number for the Central Configuration.
7. Click against **Create at** to change the path of the Central Configuration.

   A message indicating that if the path has been changed the Central Configuration will no longer be accessible appears.
8. Click **Yes**.

   The IIS structure screen is displayed. Select the desired IIS path for the Central Configuration.
9. Click **OK**.

   The selected URL appears in the **Central Configuration Settings** screen.
10. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note:

- The default IIS path for Central Configuration is displayed. Click the edit icon to change the site path.

- If you want to update the authentication type to AVEVA Connect or Azure Active Directory of the already configured Central Configuration, you need to reconfigure the AVEVA Connect and Azure Active Directory user providers for the Central Configuration. For information on configuring user providers, see AVEVA Connect Settings and Azure Active Directory Settings.

- Central Configuration cannot be accessed in Chrome browser when configured with unsecured access (http://) for Azure Active Directory and AVEVA Connect authentication types.

Provision Services

While the installation is in progress, you can view the services that will be installed. This provides information on the progress of installation. At the end of the installation, a status indicating the completion of installation appears.

- Click **OK** to complete the installation.

AVEVA Work Tasks Client

This section describes the activities involved while installing AVEVA Work Tasks on a client machine.

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.
   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.
   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.
   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.
   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.
   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.

4. Click **Next**.

   The License Server details are configured successfully.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.

4. Click **Next**.

   The **Edit Farm Settings** window appears.

5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.

6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.

9. Click **Next**.

   The License Server details are configured successfully.

Select Client Installation

1. In the Select the type of installation page, select **Client**.
2. Click **Next**.

   The Database User Settings page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Connect to an Existing Farm Database

You can use the Connect to existing database dialog box to connect to the existing Farm. You can select the Connection String or Connection provider for the new database.

1. Select the computer name on which the Farm Database is installed from the **Server Name** field.
2. Select **Connection String**.
3. Enter the following details:
   a. **Authentication Type**: This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports both Windows and SQL server authentication process. Example: Windows.
   b. **User ID**: This field is used to enter the SQL user ID for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   c. **Password**: This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   d. **Advanced Settings**: This is an optional field. It is used to enter any additional connection information such as connection Timeout etc. Example: Connection Timeout = 20.

      While creating a data source for repository, use the following custom settings to set properties for the connection pool.

      encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;

      encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

      enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks controls the transaction from escalating to a distributed transaction which is very expensive.

      The above property can be used to turn off this feature. The default value is set as True.

      connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

      maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

      sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

      Note: These settings are case sensitive and should be mentioned only in lower case.
   e. **Database**: This field is used to select the machine with database installed. Example: FarmDB.

      AVEVA Work Tasks will validate if at least one server is installed.
4. Click **Test Connection** to ensure database connectivity.

   You must have the following permissions on the Database Server:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

SELECT, INSERT, UPDATE, and DELETE permissions.

EXECUTE permission for Stored Procedures.

5. Click **Next** to continue with the wizard.
6. Click **OK**.

Define and Provision the Enterprise Console

You can define the required AVEVA Work Tasks services.

Steps to Define Enterprise Console

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.
2. Click **Next**.

   The **Installing Services** screen appears, indicating the progress of installation.

   A message *Installation is Complete* appears after all the services are installed.
3. Click **OK**.

Create a Repository DataSource

A **Repository DataSource** is used to store all repository related data. The **Repository DataSource** must be created on a machine where the **Central Configuration** site is installed.

Example

A TelematicsDataSource is created for TelematicsHR Repository.

A Repository contains Workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating the repository.

To create a Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**.

   The Central Configuration web page appears.
2. Click **DataSource Settings**.

   The Datasource List page appears.
3. Click **Add**.

   The Manage Datasource page appears.
4. Enter the required details.
   a. **Name**: Enter a valid data source name. Example: *TelematicsDataSource*.
   b. **Description**: Enter a description for the data source. Example: *This data source is used to store connection details*.
   c. **Connection String**: Select this option to establish a connection with the database. The connection string contains fields that that defines the connection. The connection information is encrypted and stored.

      Server Name

      To use a database on the local machine, enter "localhost", ".", or the local computer's name for the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Server Name.

Note: Server Name can be machine name/IP address/SQL Server AlwaysON/SQL Server instance name. Instead of entering "local host", it is preferable to give the local machine name.

If the **Database Type** is **SQL Server**, then specify an IPV6/IPV4 address for the **Server Name**.
To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: *localhost,1455*
To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be *<server name>\SQLExpress*.

Authentication Type

Use this field to determine the process to validate a user who is trying to connect to the database. AVEVA Work Tasks uses Windows and SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. The **User ID** and **Password** field is disabled if Windows Authentication is selected. Example: *Windows*

Advanced Settings

Use this field to define advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection.
Example: *Connection Timeout = 20*
or
For defining maximum connections that can be opened in a connection pool.
Example: *max pool size = 250*
Default connection pool is set as 250. We recommend to enter a higher value on heavily loaded environment.
While creating a data source for a repository, use the following custom settings to set properties for the connection pool.
encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.
enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature, AVEVA Work Tasks controls the transaction from escalating to an expensive distributed transaction.
The above property can be used to turn off this feature. The default value is set as *True*.
connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is 30 seconds. The value should be set in seconds.
maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is infinite.
sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.
These settings are case sensitive and should be mentioned only in lower case.

Database:

Specify or select a database that can be used as a repository database. This database stores all repository related data. The repository database is created if it does not exist on the database server instance.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example: *TelematicsDB*

Enable Table Partitioning:

Select to enable database table partitioning. For more information, see Partitioning Database.

d. **Connection Provider**: Use this to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.

The selected dll must be copied to all the machines, all servers and all clients, that are connected to the current Farm.

Assembly Path

Click to browse and choose the required dll file.
To use custom properties (enableltm, connectionretrywaittime, maxconnectionretries, and sqlcommandtimeout) in the Assembly connection string, the database must be created before.
See *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Developer Guide* for creating the assembly. Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.

   A message about successful test connection appears.

6. Click **OK**.

   A message about successful creation of the data source appears.The message also states that the required tables will be created in the data source after a repository is associated with the data source.

When a data source is saved, an entry is created for the data source in the **Farm Database**. When a first repository is created for the data source, AVEVA Work Tasks tables are added to the data source. While creating a data source, the archival database is created with the same database name suffixed by *_BI*. This database is used for archival in future use.

Note: After you configure the AVEVA Work Tasks, you must add the created **Farm Database** to the **SQL Server AlwaysOn Availability Groups**. Contact your Database Administrator to add the database to **SQL Server AlwaysOn Availability Groups**.

To view the data source created, click **DataSource Settings** link.

Create a Repository

A **Repository** contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

To create a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The Central Configuration page appears.

2. Click **Repository Settings**.

   The Repository List page appears.

3. Click **Add**.

   Note: If the number of repositories exceeds the permitted limit for the license, then the message "You have exceeded the maximum number of repositories" appears, and the repository creation is stopped. Click **Close**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Manage Repository** page appears.

4. Enter the required details.
5. Click **OK**.

   The **Config Administrator** page appears.
6. Click to configure an administrator.

   The User Lookup dialog box appears.
7. Select the provider from the provider drop-down list.
8. Enter the details to search the administrator for the repository that is created.

   Note: You can also search a user based on *ObjectSID* and *objectGUID* (applicable only for Active Directory provider).
9. Click **Search**.

   The user is listed under **Available Resources**.
10. Select and click the arrow to list the user under **Selected Resource**.
11. Click **Update**.

    The selected user is displayed in **User Lookup**.
12. Click **OK**.

    A message confirming the successful creation of an administrator appears.
13. Click **OK**.

    The **Repository List** page appears.

    For more information about configuring the system user, see Configure System User.

Manage Repository Window Fields

The following table explains the fields of the Manage Repository window:

Field Name	Description	Example
Repository DataSource	Lists all the data sources created in a Farm. The selected data source will be used to store data for the current repository.	TelematicsDatasource
Attach DataSource	Select Attach DataSource checkbox and then select a repository from the selected DataSource .Data associated with the selected repository will be copied to the new repository. The version of the installed product and destination DataSource should be the same as that of the DataSource from which the repository data is to be copied. For	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	example, in an upgraded environment, from build Work Tasks version 1 to Work Tasks version 2, you cannot attach a DataSource created in build Work Tasks version 1 to build Work Tasks version 2. To match the build version of the installed product to the version of the DataSource: 1. If the DataSource was created in build Work Tasks version 1, then the entire build Work Tasks version 1 must be upgraded to Work Tasks version 2 by running the product installer in the upgrade mode. 2. All the Farm, DataSources, Repositories, and Lists of build Work Tasks version 1 must be upgraded to build Work Tasks version 2 by running the AVEVAWorkTasksUpgradeManager.exe located at the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder. 3. After upgrading all the AVEVA Work Tasks components to build Work Tasks version 2 build, that DataSource can be used in any machine that has same version by using this feature.	
Repository Name	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the repository name.	Telematics Repository
Description	Provide a description for the repository.	This stores Telematics Employee Leave Details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
From mail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might occur in the Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be sent to the mail ID defined in **Exception to mail**. The From address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To avoid this, restart the Workflow Engine Service and Communication Service.	Provide the valid email id that is specified in the **User Name** field while configuring **SMTP Settings** in the **Mail Server Settings** page. For more details, see Mail Server Setting.
Exception to mail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails is sent to the email ID specified in **Exception to mail**.	Provide the valid email id.
Alert initiator of the Workflow	Determines if the status of a workflow should be sent as a notification mail to the initiator of the workflow.	A process with a rule to check the pending leave available for the employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
Servers	Lists the servers available in the Farm. Repository will be available only to the mapped servers.	Work Tasks Server Name
Enterprise Consoles	Lists all the Enterprise Consoles for a selected AVEVA Work Tasks Server. Repository will be available only to the mapped Enterprise Console.	http://worktaskservername:8001/EnterpriseConsole

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Enable Theme	Select this checkbox to enable the defined theme.	-
Theme Name	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. It provides **Default** and **Lite** themes.	-
Resource Provider	Lists the various default resource providers supported by AVEVA Work Tasks. Resource providers are also termed as User Provider. A User Provider is a data store containing information about the user. AVEVA Work Tasks also supports custom resource provider. For more information about Resource Provider, see User Providers. AVEVA Connect and Azure Active Directory resource providers are also available after you configure them. To configure these providers, see AVEVA Connect Settings and Azure Active Directory Settings. AVEVA Work Tasks allows secured LDAP configuration. The default port number for LDAPS is 636. You can map the repository in IDE and use the Secured LDAP. The logged-in Active Directory is displayed by default, and **Active Directory Datasource** expects **LDAP://** or **Fully Qualified Domain Name** as value.	AVEVA Work Tasks Lists or Active Directory
Custom Application Folder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with a semicolon.	-
Hide Repository	Select this option to make the repository unavailable to the Farm.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Source path	Enter the path to the Source Elements Folder.	-
Attachment Storage Path	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an absolute path. - The default path is the **Attachments** folder in *C:\ProgramData\AVEVA Work Tasks*. - The default path is used when no path is specified. - Ensure appropriate rights are set to the folder, where attachments are stored, for the following identities: -- The application pool identity for **Central Configuration** and **Enterprise Console(s)**. -- The account configured for the **Workflow Engine** service. - In case of mapped drives, ensure they are available to the identities. - In multiple-server environments, the path specified must be in a shared location.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Auto Log Off Settings for Enterprise Console	Automatically logs out the logged in user after the designated period of inactivity. Enter the time in minutes. This field accepts only valid integer values between 0 to 360. 0 minute means the user will not get automatically logged off. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. The default value for automatic log off is 30 minutes. You use this field to define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML.	0 to 360 (minutes)
Auto Log Off Settings for AVEVA Work Tasks Pro	Request for user credentials for AVEVA Work Tasks Pro app after the set time is elapsed. Enter the time in minutes. This field accepts only valid integer values between 0 to 2880. 0 minute means the user will not get automatically logged off. The default value is 30 minutes. If AVEVA Work Tasks Pro app is offline, the Auto Log Off will not get active, and the user will not be automatically logged off as per the defined settings.	0 to 2880 (in minutes)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Offline Support	Select this option to enable offline submission of items in AVEVA Work Tasks Pro app.	-
Refresh on Work Item submission	Select this option to enable Inbox refresh on Work Item submission in AVEVA Work Tasks Pro . Refresh option is enabled by default.	-
Timeout	Enter the time in seconds to set the timeout. If the value is set as 0, then there is no timeout. Default value is 60 seconds.	-
Label for Fill Form	Enter the label for Fill Form. The customized label will be displayed for the Fill Form in AVEVA Work Tasks Pro.	Work Tasks
Date Configuration Flag for Alternate Actors	Select the **Enable Date Settings** option to set the **From** date and **To** date as mandatory while creating alternate actors. For more information about creating alternate actors, see *Alternate Actors* topic in the *User Guide*.	-
Display Domain name with User Name	Select this checkbox to display the domain name along with the user name in the Enterprise Console and the List. The domain name will be displayed only: • If this checkbox is selected. • If the **Resource Provider** is selected as **Active Directory**.	-

User Providers

AVEVA Work Tasks supports the following User Providers by default:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Active Directory

When you select **Active Directory** as the **Resource Provider**, details such as **Active Directory datasource** and the **Active Directory search base** are populated by default.

Authentication User, **Authentication Password**, **User Log-on ID**, and **User Log-on Display Name** are optional fields. Access to the active directory might not be available for all users. In such cases, provide the active directory authentication user name and the active directory authentication password with which you can connect to the Active Directory.

AVEVA Work Tasks considers *SAM-Account-Name* as **User Log-on ID** by default. If you want to use active directory attributes other than the *SAM-Account-Name* user, then enter the desired active directory attribute details in the **User Log-on ID** field and **User Log-on Display Name** field. **User Log-on Display Name** is the user friendly display name of the active directory attribute. This **User Log-on Display Name** is referred in the User Lookup dialog box against the **User Log-on ID**.

Steps

1. When you select **Active Directory** as the **Resource Provider**, then the **Use Token Service** field appears. In this field, select one of the following:
   - If you do not want to use AIM authentication, select **Without Token Service**.
   - If you want to use AIM authentication, then select a server from the list of alias server names.
2. Enter **Active Directory datasource**.
3. Enter **Active Directory search base**.
4. Enter **Domain Name**.

   The domain name is case-sensitive.
5. Enter **Authentication User**.
6. Enter **Authentication Password**.
7. Check **Is Cross Domain Role Provider** checkbox, if cross domain users and roles mapping is required.

   Example: Users *John* and *Jim* of domain *TelematicsU* and users *Mike* and *Bob* from domain *TelematicsAU* are added to role Team HR of domain *TelematicsMain*.
8. Enter **User Log-on ID** if you want to use another Active Directory attributes instead of *SAM-Account-Name*.

   We recommend to use attributes of type *string* as input for **User Log-on ID.** However, *ObjectSID* and *objectGUID* are also supported.

   After you set the **User Log-on ID**, you cannot change it later.
9. Enter the **User Log-on Display Name**.

   After you set the **User Log-on Display Name**, you cannot change it later.

   This is the default display name of the user account of the active directory user used. **User Log-on Display Name** is used in user lookups.
10. Click **Test LDAP**.

    A message about successful LDAP test appears.

Note:
- Some of the active directory attributes or properties are not indexed. If you use an active directory attribute that is not indexed, it might impact the log-on validation performance based on the active directory entries. We recommend to use indexed attributes as **User Log-on ID** or index the attributes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- For an upgraded repository, you cannot change both **User Log-on ID** and **User Log-on Display Name**.
- You cannot localize **User Log-on ID** and **User log-on Display Name** fields.
- Disabled users will not be shown in user lookup search.

Using Forms

For Forms Resource Provider:

- If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.

1. In the **Resource Provider** drop-down list**,** select **Forms.**
2. In the **User Entity properties** field, enter XML data.

   Click **Sample Code** to get the XML Schema Template.

   Example

   ```
   <properties>
   <property name="userid" type="string" purpose="identifier" />
   <property name="username" type="string" purpose="name" />
   <property name="pwd" type="string" purpose="password" />
   </properties>
   ```
3. In the **User Provider Properties** field, enter the same XML Schema.

   There must be at least one identifier in the XML Schema. For example, UserID
4. In the **Datasource** field, enter a valid data source or specify a dll.

   The value for the data source can be specified as **Physical path of the dll** or **Physical path of the dll::param. Param** is not mandatory.

   See topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Build Business Process* section for creating the assembly.

   Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly, whereas one class can return multiple connection strings.

   Examples of data source parameter:

   - c:\DLLStore\GetConnectionString.dll
   - c:\GetConnectionString.dll::Leave

   If there are two data sources, *Leave* and *Licensing*, and only one DLL is used to return a connection string based on the data source selected. The parameter can be specified as **c:\GetConnectionString.dll::Leave** or **c:\ GetConnectionString.dll::Licensing**. The connection string can be returned from the connection dll based on this parameter.
5. Enter a proper table name or view name which holds the User Name and Password for the Authentication purpose.

   Example: Passmast (the table which is available in IMS_NEW Database)
6. Click **Test SQL Connection**.

   A message about successful test connection appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using ASP.NET Membership

This resource provider lists users defined in the asp.net membership database.

Lists

This resource provider lists users created using AVEVA Work Tasks Users Creation. If you are unable to determine a User Provider to create a repository, use AVEVA Work Tasks Lists.

To verify successful creation of the Repository:

1. Click **Enterprise Console** URL from the site path column.
   The repository created is listed.
   Add the created Enterprise Console link into "Add to Favorites" to easily navigate in future.
2. Click **Repository User Provider** link to logon to the repository.
   The Enterprise Console log-on page appears.
3. Enter the logon details, and then click **Login**.
   The Enterprise Console home page appears. This indicates successful creation of a Repository.
   All features can only be available for a user with administrative privileges.

Note: Consider you created the Repository and then deleted it. If you create the same Repository again immediately and try to log into it through Enterprise Console, the Provider does not list the Repository. You need to access IIS and recycle AVEVA Work Tasks from the Application Pool to get the Repository listed in the Provider list..

Verify the Installation

After you install AVEVA Work Tasks, verify that the product is installed successfully. To verify successful installation, create a simple Workflow using Process Designer. The tasks includes the following:

- Creating a Workflow
- Publishing the Workflow
- Testing the Workflow

Creating a Workflow

1. Log on to the **Enterprise Console**.
2. If the Repository is configured for Active Directory provider, go to step 4.
3. Enter the **User Name** and **Password**.
   The **User Name** and **Password** will be validated with the user provider selected while creating the repository.
   The default authentication provider is the Repository User Provider List.
4. In the **Enterprise Console**, click menu icon.
   All features can only be available for a user with administrative privileges.
5. From the menu, select **Workflows**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Workflow window appears.

6. On the Action bar, click **New**, and then click **Workflow**.
   The New Workflow window appears.
7. Enter **Title** and **Description**.
8. Click **Save & Continue**.
   The successful message appears.
9. Select **Design the Workflow now**.
   This is the default option.
10. Click **Finish**.
    The Process Designer window appears.
11. From the activities pane on the left, drag the Information activity to the Process Designer window.
12. The activity *Information1* is created.
    Click to create a link between two activities.
    The Link Action window appears.
    a. Select from the **From Action** drop-down box.
    b. Select from the **To Action** drop-down box.
    c. Click **OK**.
       The link is established.
13. Right-click *Information1*.
14. Select **Activity Properties** from the context menu.
    The Activity Properties pane appears.
    a. Enter **Name** and **Description**.
    b. Click to **Assign Actor(s)**.
       The Assign Actor(s) window appears.
    c. Select the required provider from the **Providers** drop-down list.
    d. Select values from the drop-down list.
    e. Click **Add**.
    f. Click **Update**.
15. Click to enter the **Subject** for Notification Contents.
    The window to enter subject for notification appears.
16. Click **Update**.
17. Click to enter the **Body** for Notification Contents.
    The window to enter the Body content appears.
18. Click **Update**.
19. From the Activity Properties pane, click **Save**.

Publishing the Workflow

1. On the **Publish** menu, click **Publish**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Published successful message appears.

2. Close the dialog box.

   The Enterprise Console screen lists the workflow created.

Testing the Workflow

1. Select the listed workflow.
2. Right-click the selected workflow.
3. Click **Publish and Test Run**.

   The **Status Finished successfully** appears.

   If Status is **Execution Pending** in the Process Execution window, then click on the **Refresh** button to get the status.
4. In the **Enterprise Console** menu, select **Inbox**.

   The Inbox lists the work item.
5. Click to view the work item listed.

   This indicates that the installation is successful.

Single Server Capable of Adding Machines at Any Time

This section describes the activities involved while installing the Load Balanced Server for the scenario Single Server Capable of Adding Machines at any point in time.

In this scenario the Server is installed on Machine 1. This setup supports scale-out and you can add more machines depending on the number of workflows that need to be processed.

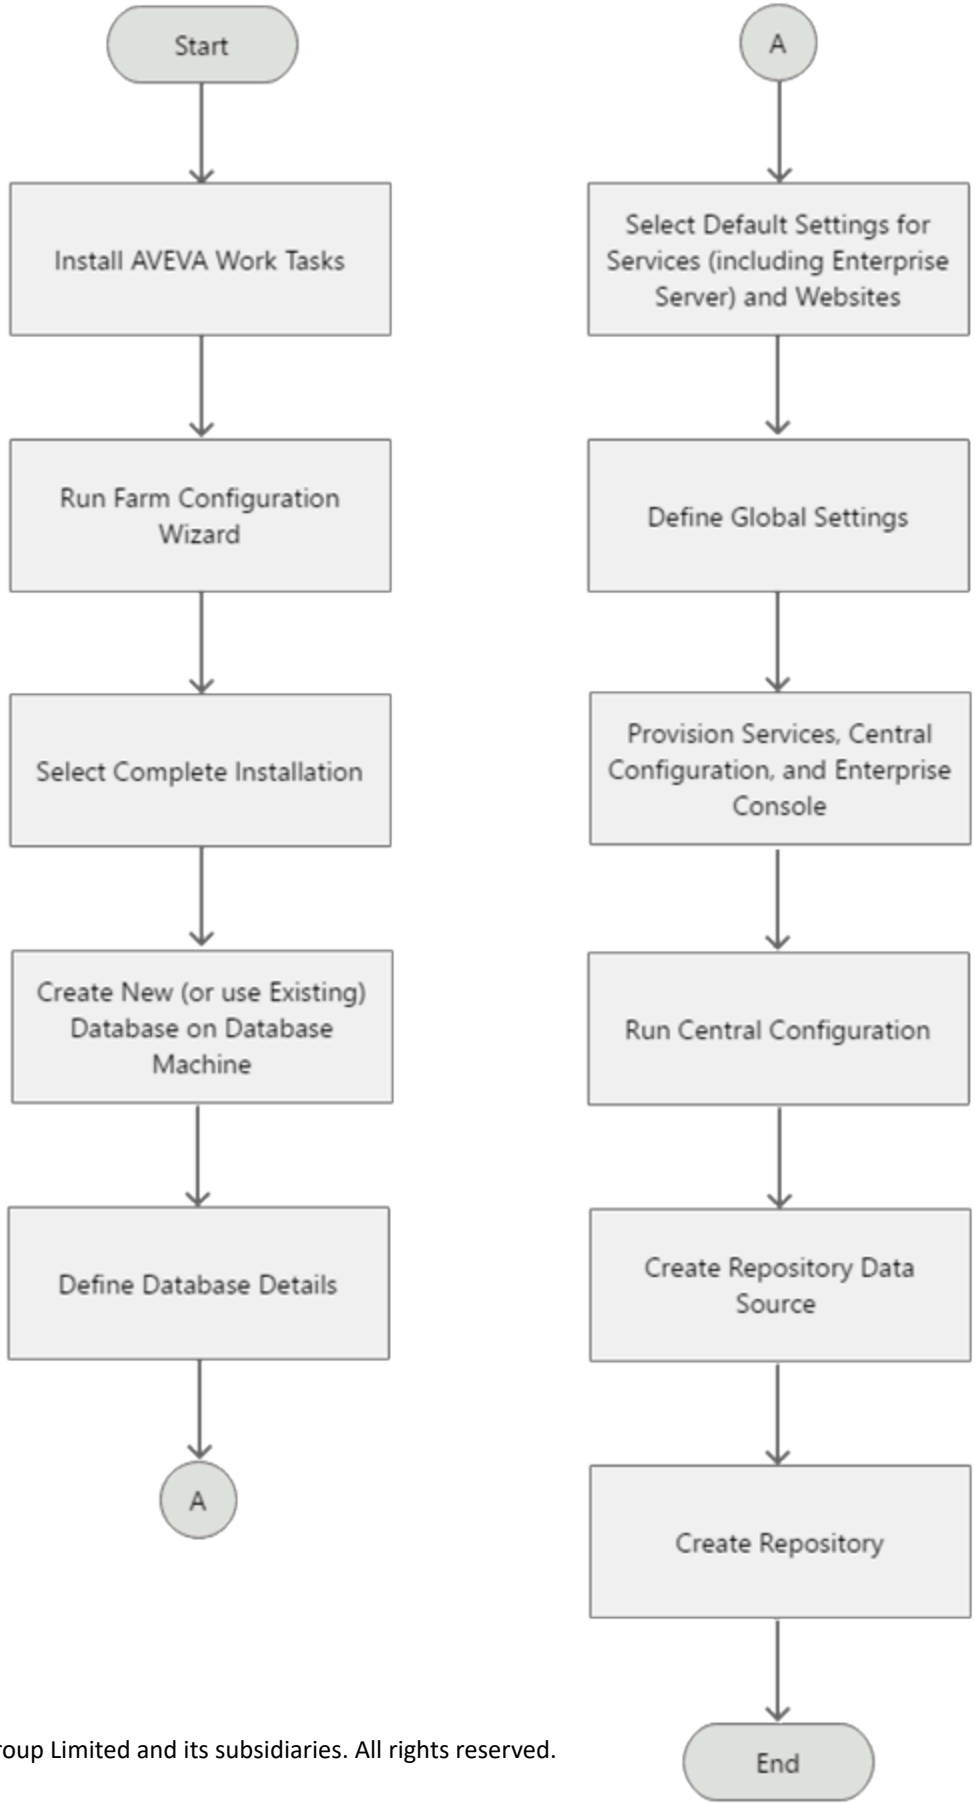
See Also: Single Server Capable of Adding Machines at Any Time

High-Level View of AVEVA Work Tasks Installation

This section provides a high-level view of the various installation steps. The objective of this section is to provide an overview of the various activities involved while installing AVEVA Work Tasks. This section also enables you to visually keep track of your activities while following the sequence of tasks.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation

This section provides installation steps for the scenario Single Server Capable of Adding Machines at any time.

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Wizard.

3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.

5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.

6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.

4. Click **Next**.

   The License Server details are configured successfully.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.

4. Click **Next**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Edit Farm Settings** window appears.

5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.

6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.

9. Click **Next**.

   The License Server details are configured successfully.

Select the Type of Installation - Enterprise Edition

Following points must be considered while installing AVEVA Work Tasks on the Enterprise Server:

- Ensure that you select the **Complete Installation** and **Enable load balancing** options.
- You can either create a new Farm database or use an existing one.

1. In the Select the type of installation page, select **Complete Installation (Server)**.

   A Complete Standalone Deployment does not require a client installation.

2. Select the **Enable load balancing (This feature requires and Enterprise license.)** check box for installing AVEVA Work Tasks on the Enterprise Server.

   The **Farm Configuration Wizard** dialog box appears.

3. Click **OK**.
4. To create a new Farm database, click **Create AVEVA Work Tasks Farm**, and then select one of the following:
   - **Create AVEVA Work Tasks Farm database**
   - **Use existing AVEVA Work Tasks Farm database (Creates AVEVA Work Tasks Farm tables only if they do not exist)**
5. To connect to an existing Farm database, click **Connect to existing AVEVA Work Tasks Farm (if the first server of the Enterprise Server is already installed)**.
6. Click **Next**.

   The Database User Settings page appears.

Create Farm Database

Use the Create AVEVA Work Tasks Farm Database page to provide **New Database** details. Select the **Connection String** option to establish a connection with the database. This connection information is encrypted and stored.

You can enter either Windows or Microsoft SQL Server user settings for authentication.

Note:
- The Farm database password does not support **&** and **;** special characters.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- While setting up **Farm Database** with **Windows Authentication**, do not enter **FQDN** in the **Domain Name** field.

To Create Farm Database

1. Enter **Database Title**.
2. Select **Connection String**.

   See *Connection Provider* later in this topic, if you have selected the **Connection Provider** option.

   - Enter the following details:

     Server Name:

     Provide information about the database server on which the Farm database can be installed.

     If the **Database Type** is **SQL Server**, then you can specify an IPv6 address for the **Server Name**.

     If SQLExpress Instance need to be used as a Database instance of the Farm database, then **Server Name** should be <server name>\SQLExpress.

     To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

   - **Authentication Type**

     This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports Windows and SQL Server authentication process.

     Example: Windows
     If Windows Authentication is selected, the user configured for the Farm configuration will be used to access the database. This is the authentication recommended by AVEVA Work Tasks.

   - **Login**

     This field is used to enter the SQL login credential for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Password**

     This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Advanced Settings**

     This is an optional field. It is used to enter any additional connection information, such as connection Timeout. Example: Connection Timeout = 20.

     While creating a data source for repository, use the following custom settings to set properties for connection pool. These settings are case sensitive and should be mentioned only in lower case.

     ```
     encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
     ```

     encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

     enableltm: AVEVA Work Tasks internally implements light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive. This property can be used to turn off this feature. The default value is set as True.

     connectionretrywaittime: While opening a new connection, if the data base server is not available, the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

maxconnectionretries: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

3. Click **Test Connection** to ensure database connectivity.
4. Click **Next**.

   The message *AVEVA Work Tasks Farm is Created* appears.
5. Click **OK**.

AlwaysOn Availability Groups feature of Microsoft SQL Server

The **AlwaysOn Availability Groups** feature of Microsoft SQL Server is a high-availability and disaster-recovery solution that provides an enterprise-level alternative to database mirroring. Introduced in Microsoft SQL Server 2012, AlwaysOn Availability Groups maximizes the availability of a set of user databases for an enterprise.

After you configure the AVEVA Work Tasks, you must add the created Farm Database to the SQL Server AlwaysOn Availability Groups. Contact your Database Administrator to add the database to SQL Server AlwaysOn Availability Groups.

Notes:

- The authentication user needs different rights assigned for different scenarios. If a user wants to create database (Farm or Repository Data Source Database), Authentication User needs to have minimum 'dbcreator' access rights on Database Server Instance.

- If database is already created, user needs to have following permissions on Database Server:

- SELECT, INSERT, UPDATE, and DELETE permissions.

- EXECUTE permission for Stored Procedures.

To choose Connection Provider

Complete the following steps to choose a connection provider:

1. Enter **Database Title**.
2. In the **Database Type** box, select a database type.
3. Select **Connection Provider**.

   This option is used to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.
4. Enter the following details:
   - **Assembly Path**:

     Click the icon to browse and choose the required dll file.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If custom properties (enableltm, connectionretrywaittime, maxconnectionretries and sqlcommandtimeout) are required to be used in Assembly connection string, then user should select **Use existing Farm database** while creating a the Farm. See Creating or Using an Existing Database.

See the topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub chapter in the *Build Business Process* section for creating the assembly. Make sure that, there should be only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.
6. Click **Next**.
7. The message *AVEVA Work Tasks Farm is created* appears.
8. Click **OK**.

Define Security Settings

You can define the Security Settings using the Farm Configuration Wizard.

For more information on Security settings, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client.

To define the Security Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Security Settings** and **Service Settings** and then, click **Next**.
4. Select **Secure Communication** to establish secured communication between the AVEVA Work Tasks services through HTTPS.
5. Select **Secure Web Sites** check box to configure secured web sites. Uncheck the **Secure Web Sites** check box to use HTTP sites. By default the sites are created in HTTPS mode.
6. Enter the Port number. The default port for the HTTPS site is 8001, and for the HTTP site is 8000. You can enter any port number that IIS accepts. But if any other services or applications are already using the entered port number, AVEVA Work Tasks will not start.
7. Select the available certificate from the **Certificate** list. If your certificate is not listed, click the **Refresh** icon to repopulate the list.

   Note: If the required certificate is not listed, generate one using the System Management Server (Configurator tool). Do not use a self-signed certificate without a proper root chain.
8. Click the **Validate** button to validate the certificate before configuring the security settings.

   Note: An Internet connection is needed to validate the certificate.
9. Click **Configure**, then **Next**, and then **Finish** to apply the new security settings.

Note:
- To update the port number, certificate, and websites from unsecure to secure or vice-versa, select **Security Settings** and **Service Settings** check box in **Edit AVEVA Work Task Farm Settings** window before updating the values. After the required details are provided, these settings get updated only when you click **Configure**, then **Next**, and then **Finish** as you navigate through the Farm Configuration Wizard..

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- If the Quickflow is already deployed on a machine, you need to deploy it again after you update the security settings. If secured web site is configured, then you cannot change the server configuration for Quickflow in Central Configuration. However, if the **Secure Web Sites** checkbox is not selected, you can make the changes to the server configuration.
- Advance Server communication cannot be configured on HTTP/HTTPS.
- For resources of Load Balanced Server, ensure to configure all services with the same protocol (HTTP or HTTPS).
- It is recommended to use Standard SSL certificate instead of self-signed SSL certificate.

Using ASB Certificate for Secured Communication

ASB Certificate is a PCS-managed SSL certificate and renews automatically every 30 days when the certificate is still valid. The certificate is valid for two years. The PCS watchdog service on the runtime node checks the validity of the SSL certificate within 5 minutes from when it starts and once a day. PCS also renews the SSL certificate if it is expired.

If the runtime node is offline and later back online, the PCS watchdog service regularly checks the certificate validity and renews it if it is required. Consider restarting the PCS watchdog service to enforce the SSL certificate validity check within 5 minutes from the restarting time.

Furthermore, when the SSL certificate is renewed, PCS binds it to port 443 (by default) and changes the SslThumbprint PCS registry value. If AVEVA Work Tasks sites are hosted on port 443, certificate binding will be auto-renewed when the SSL certificate is renewed. It is recommended to check the bindings in IIS with every certificate renewal to ensure the application is running seamlessly.

To disable the certificate renewal, consider disabling the **ArchestrA Certificate Renewal Service** windows service.

Note: Client Service will try to automatically bind the renewed certificate. If there are any issues in browsing the website or starting the services after certificate renewal, users need to reconfigure the secure communication in Farm Configuration. To reconfigure, see the steps mentioned in above section *To define the Security Settings*.

Securing Communication between Services

To have a secure communication between the services, apply the below changes to the Windows registry and reboot the server:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
```

For more information on securing communication, see https://docs.microsoft.com/en-us/mem/configmgr/core/

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

plan-design/security/enable-tls-1-2-client and
https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2015/2960358.

Define Services and Global Settings

You can define the Services and Global Settings using the Farm Configuration Wizard or through Configuration XMLs.

To define Services

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.

   Note: You can also customize the settings for these services and websites using the **Custom Settings** option. For more information about Service-related changes and Website-related changes, see Advanced Settings and Administering Web Servers respectively.

2. Click **Next**.

   The Global Settings dialog box appears.

3. In the **Communication** tab, enter key fields in **Email Settings** and **Exception Email settings** to configure exception e-mails.

   The following are the details:

   - **Host**: Enter information related to mail server.
     Example: Enter details related to Microsoft Exchange Server (IP address of the exchange server).
   - **Port**: Enter the port number for the mail server. The default port number is 25.
   - **From email**: Enter the from e-mail address.
     Example: admin@telematics.com
   - **To email**: Enter the to e-mail address.
     Example: alex@telematics.com

4. Click **OK**.

Note: To confirm the exception e-mail settings, click **Test SMTP**. An e-mail will be generated and sent to the **To email** address confirming successful configuration of the e-mail. The advanced settings like **Secure Socket Layer (SSL), Email Timeout, User Name,** and **Password** for the e-mail account holder, **Password Encrypted** flag will differ based on the mail server settings.

Provision Services

While the installation is in progress, you can view the services that will be installed. This provides information on the progress of installation. At the end of the installation, a status indicating the completion of installation appears.

- Click **OK** to complete the installation.

Create a Repository DataSource

A **Repository DataSource** is used to store all repository related data. The **Repository DataSource** must be

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

created on a machine where the **Central Configuration** site is installed.

Example

A TelematicsDataSource is created for TelematicsHR Repository.

A Repository contains Workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating the repository.

To create a Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**.

   The Central Configuration web page appears.
2. Click **DataSource Settings**.

   The Datasource List page appears.
3. Click **Add**.

   The Manage Datasource page appears.
4. Enter the required details.
   a. **Name**: Enter a valid data source name. Example: *TelematicsDataSource*.
   b. **Description**: Enter a description for the data source. Example: *This data source is used to store connection details*.
   c. **Connection String**: Select this option to establish a connection with the database. The connection string contains fields that that defines the connection. The connection information is encrypted and stored.

      Server Name

      To use a database on the local machine, enter "localhost", ".", or the local computer's name for the **Server Name**.

      Note: Server Name can be machine name/IP address/SQL Server AlwaysON/SQL Server instance name. Instead of entering "local host", it is preferable to give the local machine name.

      If the **Database Type** is **SQL Server**, then specify an IPV6/IPV4 address for the **Server Name**.
      To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: *localhost,1455*
      To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be *<server name>\SQLExpress*.

      Authentication Type

      Use this field to determine the process to validate a user who is trying to connect to the database. AVEVA Work Tasks uses Windows and SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. The **User ID** and **Password** field is disabled if Windows Authentication is selected. Example: *Windows*

      Advanced Settings

      Use this field to define advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection.
      Example: *Connection Timeout = 20*
      or
      For defining maximum connections that can be opened in a connection pool.
      Example: *max pool size = 250*
      Default connection pool is set as 250. We recommend to enter a higher value on heavily loaded environment.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

While creating a data source for a repository, use the following custom settings to set properties for the connection pool.
encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.
enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature, AVEVA Work Tasks controls the transaction from escalating to an expensive distributed transaction.
The above property can be used to turn off this feature. The default value is set as *True*.
connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is 30 seconds. The value should be set in seconds.
maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is infinite.
sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.
These settings are case sensitive and should be mentioned only in lower case.

Database:

Specify or select a database that can be used as a repository database. This database stores all repository related data. The repository database is created if it does not exist on the database server instance.
Example: *TelematicsDB*

Enable Table Partitioning:

Select to enable database table partitioning. For more information, see Partitioning Database.

d. **Connection Provider**: Use this to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.

The selected dll must be copied to all the machines, all servers and all clients, that are connected to the current Farm.

Assembly Path

Click to browse and choose the required dll file.
To use custom properties (enableltm, connectionretrywaittime, maxconnectionretries, and sqlcommandtimeout) in the Assembly connection string, the database must be created before.
See *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Developer Guide* for creating the assembly. Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.

   A message about successful test connection appears.

6. Click **OK**.

   A message about successful creation of the data source appears.The message also states that the required tables will be created in the data source after a repository is associated with the data source.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

When a data source is saved, an entry is created for the data source in the **Farm Database**. When a first repository is created for the data source, AVEVA Work Tasks tables are added to the data source. While creating a data source, the archival database is created with the same database name suffixed by *_BI*. This database is used for archival in future use.

Note: After you configure the AVEVA Work Tasks, you must add the created **Farm Database** to the **SQL Server AlwaysOn Availability Groups**. Contact your Database Administrator to add the database to **SQL Server AlwaysOn Availability Groups**.

To view the data source created, click **DataSource Settings** link.

Create a Repository

A **Repository** contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

To create a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The Central Configuration page appears.
2. Click **Repository Settings**.

   The Repository List page appears.
3. Click **Add**.

   Note: If the number of repositories exceeds the permitted limit for the license, then the message "You have exceeded the maximum number of repositories" appears, and the repository creation is stopped. Click **Close**.

   The **Manage Repository** page appears.
4. Enter the required details.
5. Click **OK**.

   The **Config Administrator** page appears.
6. Click to configure an administrator.

   The User Lookup dialog box appears.
7. Select the provider from the provider drop-down list.
8. Enter the details to search the administrator for the repository that is created.

   Note: You can also search a user based on *ObjectSID* and *objectGUID* (applicable only for Active Directory provider).
9. Click **Search**.

   The user is listed under **Available Resources**.
10. Select and click the arrow to list the user under **Selected Resource**.
11. Click **Update**.

    The selected user is displayed in **User Lookup**.
12. Click **OK**.

    A message confirming the successful creation of an administrator appears.
13. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Repository List** page appears.

For more information about configuring the system user, see Configure System User.

Manage Repository Window Fields

The following table explains the fields of the Manage Repository window:

Field Name	Description	Example
Repository DataSource	Lists all the data sources created in a Farm. The selected data source will be used to store data for the current repository.	TelematicsDatasource
Attach DataSource	Select Attach DataSource checkbox and then select a repository from the selected DataSource .Data associated with the selected repository will be copied to the new repository. The version of the installed product and destination DataSource should be the same as that of the DataSource from which the repository data is to be copied. For example, in an upgraded environment, from build Work Tasks version 1 to Work Tasks version 2, you cannot attach a DataSource created in build Work Tasks version 1 to build Work Tasks version 2. To match the build version of the installed product to the version of the DataSource: 1. If the DataSource was created in build Work Tasks version 1, then the entire build Work Tasks version 1 must be upgraded to Work Tasks version 2 by running the product installer in the upgrade mode. 2. All the Farm, DataSources, Repositories, and Lists of build Work Tasks version 1 must be upgraded to build Work Tasks	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	version 2 by running the AVEVAWorkTasksUpgradeManager.exe located at the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder. 3. After upgrading all the AVEVA Work Tasks components to build Work Tasks version 2 build, that DataSource can be used in any machine that has same version by using this feature.	
Repository Name	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the repository name.	Telematics Repository
Description	Provide a description for the repository.	This stores Telematics Employee Leave Details.
From mail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might occur in the Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be sent to the mail ID defined in **Exception to mail**. The From address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To avoid this, restart the Workflow Engine Service and Communication Service.	Provide the valid email id that is specified in the **User Name** field while configuring **SMTP Settings** in the **Mail Server Settings** page. For more details, see Mail Server Setting.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Exception to mail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails is sent to the email ID specified in **Exception to mail**.	Provide the valid email id.
Alert initiator of the Workflow	Determines if the status of a workflow should be sent as a notification mail to the initiator of the workflow.	A process with a rule to check the pending leave available for the employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
Servers	Lists the servers available in the Farm. Repository will be available only to the mapped servers.	Work Tasks Server Name
Enterprise Consoles	Lists all the Enterprise Consoles for a selected AVEVA Work Tasks Server. Repository will be available only to the mapped Enterprise Console.	http://worktaskservername:8001/EnterpriseConsole
Enable Theme	Select this checkbox to enable the defined theme.	-
Theme Name	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. It provides **Default** and **Lite** themes.	-
Resource Provider	Lists the various default resource providers supported by AVEVA Work Tasks. Resource providers are also termed as User Provider. A User Provider is a data store containing information about the user. AVEVA Work Tasks also supports custom resource provider. For more information about Resource Provider, see User Providers. AVEVA Connect and Azure Active Directory resource providers are	AVEVA Work Tasks Lists or Active Directory

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	also available after you configure them. To configure these providers, see AVEVA Connect Settings and Azure Active Directory Settings. AVEVA Work Tasks allows secured LDAP configuration. The default port number for LDAPS is 636. You can map the repository in IDE and use the Secured LDAP. The logged-in Active Directory is displayed by default, and **Active Directory Datasource** expects **LDAP://** or **Fully Qualified Domain Name** as value.	
Custom Application Folder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with a semicolon.	-
Hide Repository	Select this option to make the repository unavailable to the Farm.	-
Source path	Enter the path to the Source Elements Folder.	-
Attachment Storage Path	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an absolute path. - The default path is the **Attachments** folder in *C:\ProgramData\AVEVA Work Tasks*\. - The default path is used when no path is specified. - Ensure appropriate rights are set to the folder, where attachments are stored, for the following identities: -- The application pool identity for **Central Configuration** and **Enterprise Console(s)**. -- The account configured for the	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	Workflow Engine service. - In case of mapped drives, ensure they are available to the identities. - In multiple-server environments, the path specified must be in a shared location.	
Auto Log Off Settings for Enterprise Console	Automatically logs out the logged in user after the designated period of inactivity. Enter the time in minutes. This field accepts only valid integer values between 0 to 360. 0 minute means the user will not get automatically logged off. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. The default value for automatic log off is 30 minutes. You use this field to define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML.	0 to 360 (minutes)
Auto Log Off Settings for AVEVA Work Tasks Pro	Request for user credentials for AVEVA Work Tasks Pro app after the set time is elapsed. Enter the time in minutes. This field accepts only valid integer values between 0 to 2880. 0 minute means the user will not get automatically logged off. The default value is 30 minutes.	0 to 2880 (in minutes)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	If AVEVA Work Tasks Pro app is offline, the Auto Log Off will not get active, and the user will not be automatically logged off as per the defined settings.	
Offline Support	Select this option to enable offline submission of items in AVEVA Work Tasks Pro app.	-
Refresh on Work Item submission	Select this option to enable Inbox refresh on Work Item submission in AVEVA Work Tasks Pro . Refresh option is enabled by default.	-
Timeout	Enter the time in seconds to set the timeout. If the value is set as 0, then there is no timeout. Default value is 60 seconds.	-
Label for Fill Form	Enter the label for Fill Form. The customized label will be displayed for the Fill Form in AVEVA Work Tasks Pro.	Work Tasks
Date Configuration Flag for Alternate Actors	Select the **Enable Date Settings** option to set the **From** date and **To** date as mandatory while creating alternate actors. For more information about creating alternate actors, see *Alternate Actors* topic in the *User Guide*.	-
Display Domain name with User Name	Select this checkbox to display the domain name along with the user name in the Enterprise Console and the List. The domain name will be displayed only: • If this checkbox is selected. • If the **Resource Provider** is selected as **Active Directory**.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

User Providers

AVEVA Work Tasks supports the following User Providers by default:

Active Directory

When you select **Active Directory** as the **Resource Provider**, details such as **Active Directory datasource** and the **Active Directory search base** are populated by default.

Authentication User, **Authentication Password**, **User Log-on ID**, and **User Log-on Display Name** are optional fields. Access to the active directory might not be available for all users. In such cases, provide the active directory authentication user name and the active directory authentication password with which you can connect to the Active Directory.

AVEVA Work Tasks considers *SAM-Account-Name* as **User Log-on ID** by default. If you want to use active directory attributes other than the *SAM-Account-Name* user, then enter the desired active directory attribute details in the **User Log-on ID** field and **User Log-on Display Name** field. **User Log-on Display Name** is the user friendly display name of the active directory attribute. This **User Log-on Display Name** is referred in the User Lookup dialog box against the **User Log-on ID**.

Steps

1. When you select **Active Directory** as the **Resource Provider**, then the **Use Token Service** field appears. In this field, select one of the following:
   - If you do not want to use AIM authentication, select **Without Token Service**.
   - If you want to use AIM authentication, then select a server from the list of alias server names.
2. Enter **Active Directory datasource**.
3. Enter **Active Directory search base**.
4. Enter **Domain Name**.

   The domain name is case-sensitive.
5. Enter **Authentication User**.
6. Enter **Authentication Password**.
7. Check **Is Cross Domain Role Provider** checkbox, if cross domain users and roles mapping is required.

   Example: Users *John* and *Jim* of domain *TelematicsU* and users *Mike* and *Bob* from domain *TelematicsAU* are added to role Team HR of domain *TelematicsMain*.
8. Enter **User Log-on ID** if you want to use another Active Directory attributes instead of *SAM-Account-Name*.

   We recommend to use attributes of type *string* as input for **User Log-on ID.** However, *ObjectSID* and *objectGUID* are also supported.

   After you set the **User Log-on ID**, you cannot change it later.
9. Enter the **User Log-on Display Name**.

   After you set the **User Log-on Display Name**, you cannot change it later.

   This is the default display name of the user account of the active directory user used. **User Log-on Display Name** is used in user lookups.
10. Click **Test LDAP**.

    A message about successful LDAP test appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note:
- Some of the active directory attributes or properties are not indexed. If you use an active directory attribute that is not indexed, it might impact the log-on validation performance based on the active directory entries. We recommend to use indexed attributes as **User Log-on ID** or index the attributes.
- For an upgraded repository, you cannot change both **User Log-on ID** and **User Log-on Display Name**.
- You cannot localize **User Log-on ID** and **User log-on Display Name** fields.
- Disabled users will not be shown in user lookup search.

Using Forms

For Forms Resource Provider:

- If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.

1. In the **Resource Provider** drop-down list**,** select **Forms.**
2. In the **User Entity properties** field, enter XML data.

   Click **Sample Code** to get the XML Schema Template.

   Example

   ```
   <properties>
   <property name="userid" type="string" purpose="identifier" />
   <property name="username" type="string" purpose="name" />
   <property name="pwd" type="string" purpose="password" />
   </properties>
   ```
3. In the **User Provider Properties** field, enter the same XML Schema.

   There must be at least one identifier in the XML Schema. For example, UserID
4. In the **Datasource** field, enter a valid data source or specify a dll.

   The value for the data source can be specified as **Physical path of the dll** or **Physical path of the dll::param. Param** is not mandatory.

   See topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Build Business Process* section for creating the assembly.

   Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly, whereas one class can return multiple connection strings.

   Examples of data source parameter:

   - c:\DLLStore\GetConnectionString.dll
   - c:\GetConnectionString.dll::Leave

   If there are two data sources, *Leave* and *Licensing*, and only one DLL is used to return a connection string based on the data source selected. The parameter can be specified as **c:\GetConnectionString.dll::Leave** or **c:\ GetConnectionString.dll::Licensing**. The connection string can be returned from the connection dll based on this parameter.
5. Enter a proper table name or view name which holds the User Name and Password for the Authentication purpose.

   Example: Passmast (the table which is available in IMS_NEW Database)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Click **Test SQL Connection**.

   A message about successful test connection appears.

Using ASP.NET Membership

This resource provider lists users defined in the asp.net membership database.

Lists

This resource provider lists users created using AVEVA Work Tasks Users Creation. If you are unable to determine a User Provider to create a repository, use AVEVA Work Tasks Lists.

To verify successful creation of the Repository:

1. Click **Enterprise Console** URL from the site path column.

   The repository created is listed.

   Add the created Enterprise Console link into "Add to Favorites" to easily navigate in future.
2. Click **Repository User Provider** link to logon to the repository.

   The Enterprise Console log-on page appears.
3. Enter the logon details, and then click **Login**.

   The Enterprise Console home page appears. This indicates successful creation of a Repository.

   All features can only be available for a user with administrative privileges.

Note: Consider you created the Repository and then deleted it. If you create the same Repository again immediately and try to log into it through Enterprise Console, the Provider does not list the Repository. You need to access IIS and recycle AVEVA Work Tasks from the Application Pool to get the Repository listed in the Provider list..

Verify the Installation

After you install AVEVA Work Tasks, verify that the product is installed successfully. To verify successful installation, create a simple Workflow using Process Designer. The tasks includes the following:

- Creating a Workflow
- Publishing the Workflow
- Testing the Workflow

Creating a Workflow

1. Log on to the **Enterprise Console**.
2. If the Repository is configured for Active Directory provider, go to step 4.
3. Enter the **User Name** and **Password**.

   The **User Name** and **Password** will be validated with the user provider selected while creating the repository.

   The default authentication provider is the Repository User Provider List.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. In the **Enterprise Console**, click menu icon.
   All features can only be available for a user with administrative privileges.
5. From the menu, select **Workflows**.
   The Workflow window appears.
6. On the Action bar, click **New**, and then click **Workflow**.
   The New Workflow window appears.
7. Enter **Title** and **Description**.
8. Click **Save & Continue**.
   The successful message appears.
9. Select **Design the Workflow now**.
   This is the default option.
10. Click **Finish**.
    The Process Designer window appears.
11. From the activities pane on the left, drag the Information activity to the Process Designer window.
12. The activity *Information1* is created.
    Click to create a link between two activities.
    The Link Action window appears.
    a. Select from the **From Action** drop-down box.
    b. Select from the **To Action** drop-down box.
    c. Click **OK**.
       The link is established.
13. Right-click *Information1*.
14. Select **Activity Properties** from the context menu.
    The Activity Properties pane appears.
    a. Enter **Name** and **Description**.
    b. Click to **Assign Actor(s)**.
       The Assign Actor(s) window appears.
    c. Select the required provider from the **Providers** drop-down list.
    d. Select values from the drop-down list.
    e. Click **Add**.
    f. Click **Update**.
15. Click to enter the **Subject** for Notification Contents.
    The window to enter subject for notification appears.
16. Click **Update**.
17. Click to enter the **Body** for Notification Contents.
    The window to enter the Body content appears.
18. Click **Update**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

19. From the Activity Properties pane, click **Save**.

Publishing the Workflow

1. On the **Publish** menu, click **Publish**.

   The Published successful message appears.
2. Close the dialog box.

   The Enterprise Console screen lists the workflow created.

Testing the Workflow

1. Select the listed workflow.
2. Right-click the selected workflow.
3. Click **Publish and Test Run**.

   The **Status Finished successfully** appears.

   If Status is **Execution Pending** in the Process Execution window, then click on the **Refresh** button to get the status.
4. In the **Enterprise Console** menu, select **Inbox**.

   The Inbox lists the work item.
5. Click to view the work item listed.

   This indicates that the installation is successful.

Intranet and Extranet Web Servers on Different Machines

This section describes the activities involved while installing the Load Balanced Server for the scenario Intranet and Extranet Web Servers on Different Machines.

In this scenario, the Server is installed on Machine 1 and the Client is installed on multiple Web Farms namely Machine 3 (or Server 1), Server 2 and Server N in a Web Farm. "Server N" represents the number of machines in the Web Farm.

Ensure that you install the product in the following sequence:

- High-Level View of Server Installation
- High-Level View of Client Installation

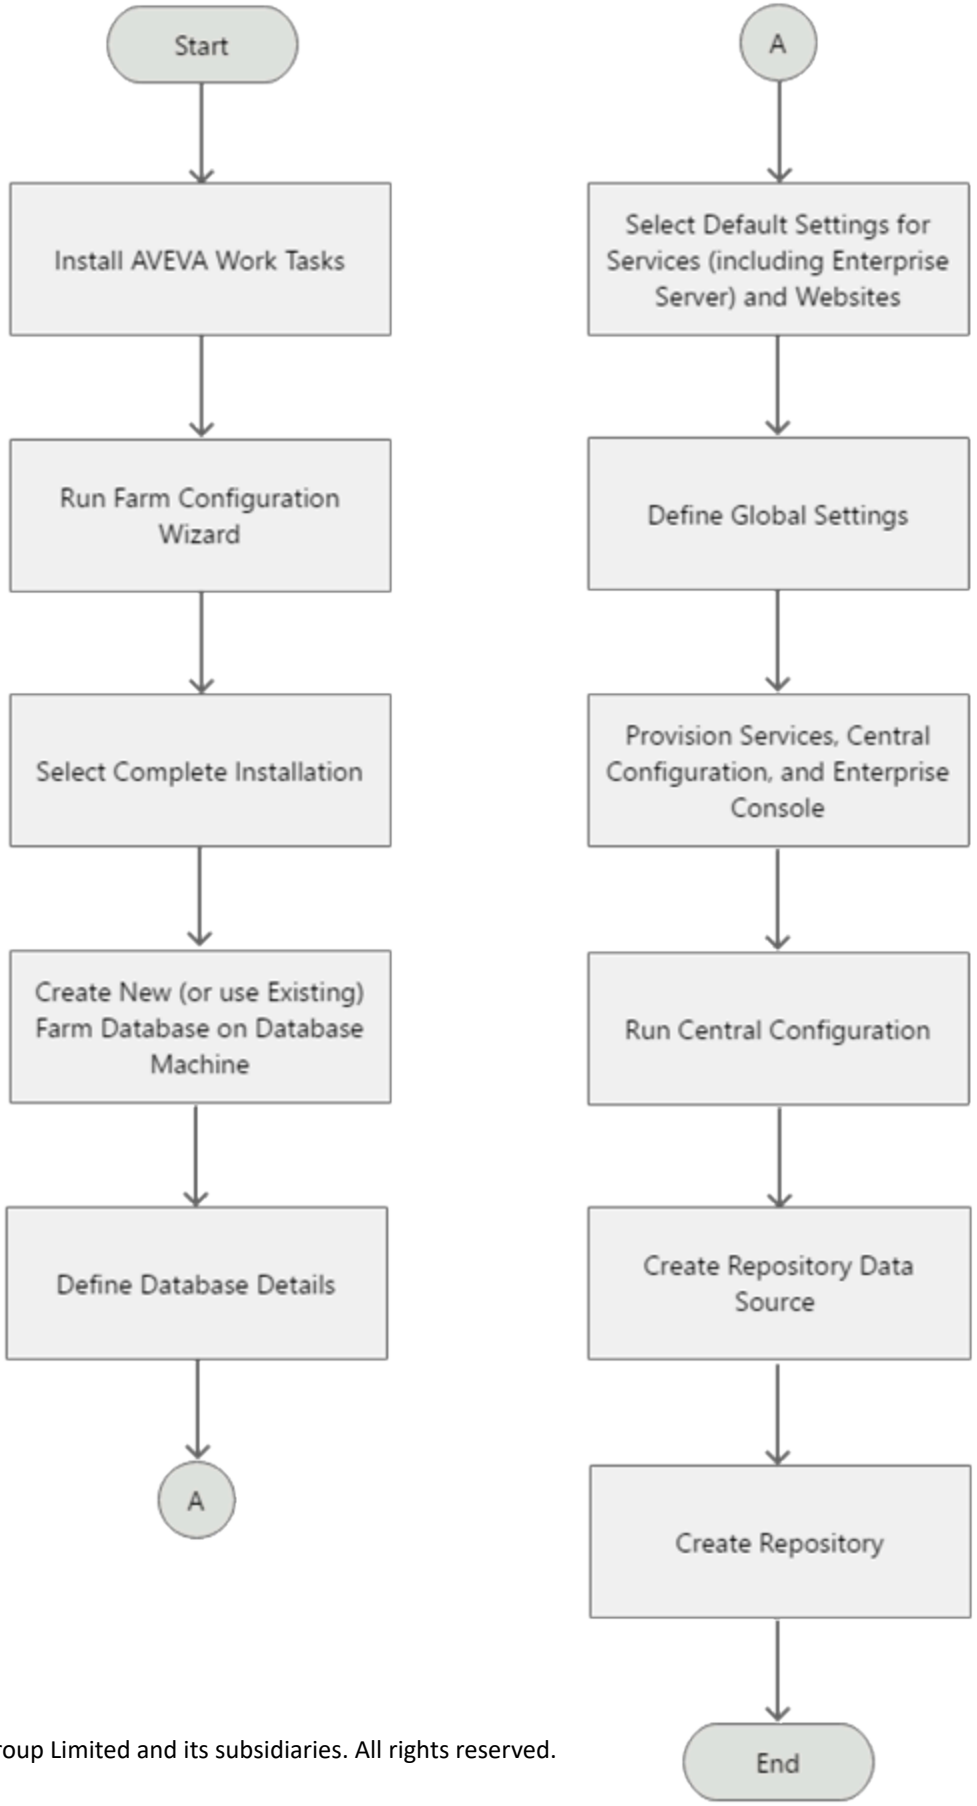
See Also: Intranet and Extranet Web Servers on Different Machines

High-Level View of Server Installation

This section provides a high-level view of the various installation steps. The objective of this section is to provide an overview of the various activities involved while installing AVEVA Work Tasks Server. This section also enables you to visually keep track of your activities while following the sequence of tasks.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



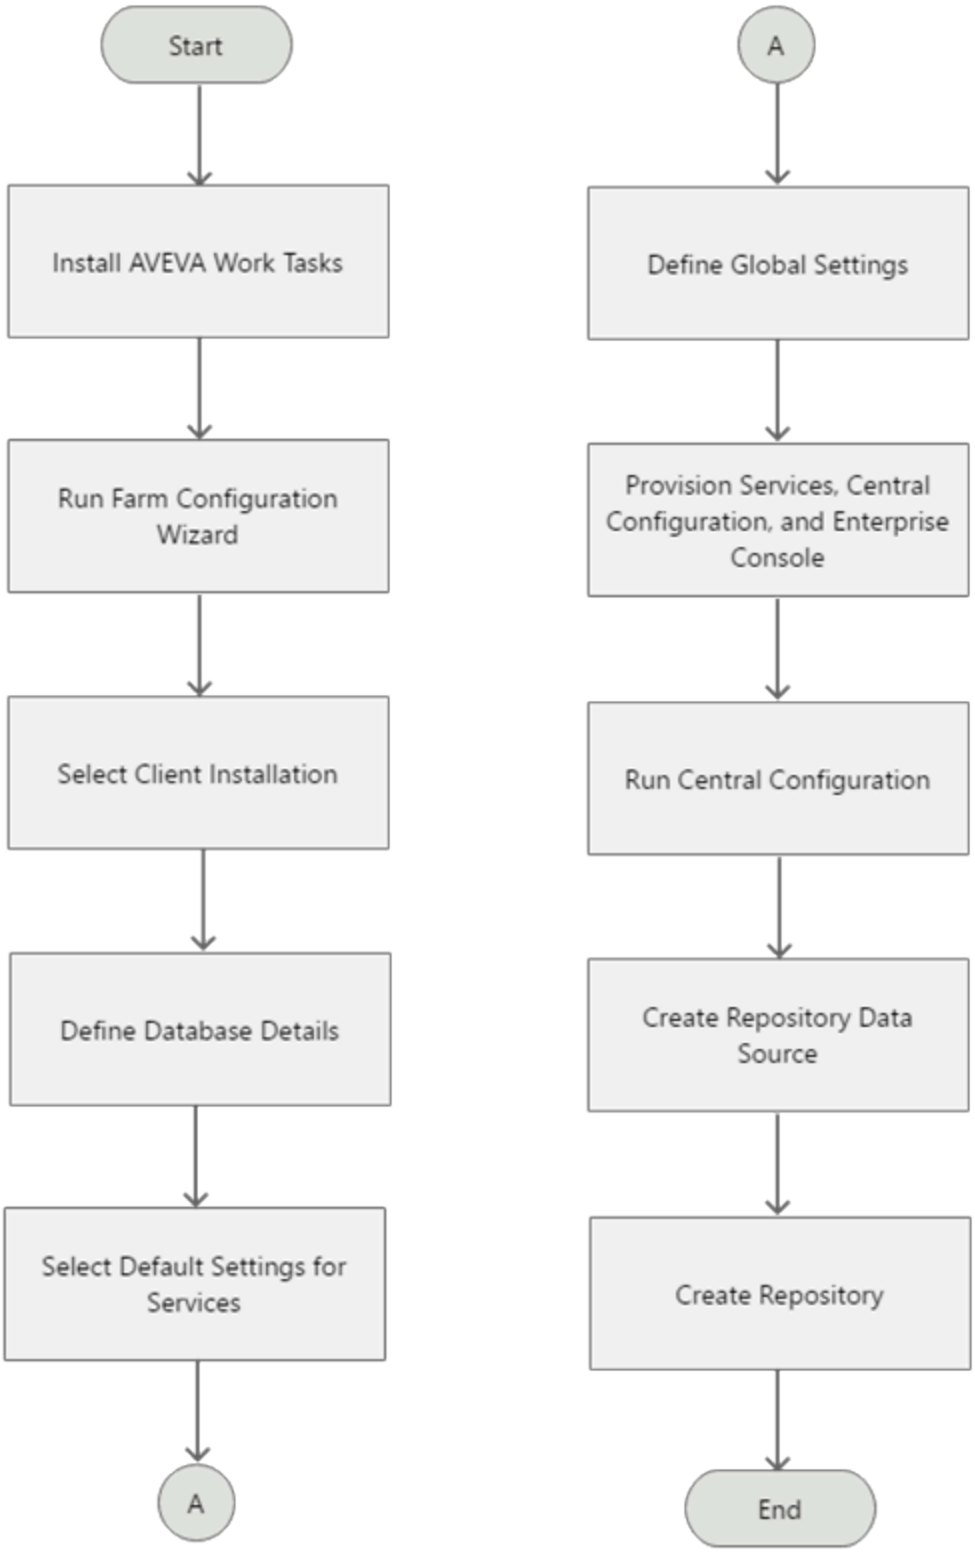
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

High-Level View of Client Installation

This section provides a high-level view of AVEVA Work Tasks Client installation. The Client components are installed on Web Servers. For more information on this scenario, see Load Balanced Server.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation

This section provides installation steps for the scenario Intranet and Extranet Web Servers on Different Machines.

The installation includes the following:

- Installing AVEVA Work Tasks Server
- Installing AVEVA Work Tasks Client

AVEVA Work Tasks Server has to be installed before installing AVEVA Work Tasks Client. In this scenario, the Client has to be installed on multiple machines.

AVEVA Work Tasks Server

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

the current MSDTC settings.

2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.

3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.

5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.

6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.

4. Click **Next**.

   The License Server details are configured successfully.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.
4. Click **Next**.

   The **Edit Farm Settings** window appears.
5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.
6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
9. Click **Next**.

   The License Server details are configured successfully.

Select the Type of Installation - Enterprise Edition

Following points must be considered while installing AVEVA Work Tasks on the Enterprise Server:

- Ensure that you select the **Complete Installation** and **Enable load balancing** options.
- You can either create a new Farm database or use an existing one.

1. In the Select the type of installation page, select **Complete Installation (Server)**.

   A Complete Standalone Deployment does not require a client installation.
2. Select the **Enable load balancing (This feature requires and Enterprise license.)** check box for installing AVEVA Work Tasks on the Enterprise Server.

   The **Farm Configuration Wizard** dialog box appears.
3. Click **OK**.
4. To create a new Farm database, click **Create AVEVA Work Tasks Farm**, and then select one of the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Create AVEVA Work Tasks Farm database**
- **Use existing AVEVA Work Tasks Farm database (Creates AVEVA Work Tasks Farm tables only if they do not exist)**

5. To connect to an existing Farm database, click **Connect to existing AVEVA Work Tasks Farm (if the first server of the Enterprise Server is already installed)**.
6. Click **Next**.

   The Database User Settings page appears.

Create Farm Database

Use the Create AVEVA Work Tasks Farm Database page to provide **New Database** details. Select the **Connection String** option to establish a connection with the database. This connection information is encrypted and stored.

You can enter either Windows or Microsoft SQL Server user settings for authentication.

Note:
- The Farm database password does not support **&** and **;** special characters.
- While setting up **Farm Database** with **Windows Authentication**, do not enter **FQDN** in the **Domain Name** field.

To Create Farm Database

1. Enter **Database Title**.
2. Select **Connection String**.

   See *Connection Provider* later in this topic, if you have selected the **Connection Provider** option.

   - Enter the following details:

     Server Name:

     Provide information about the database server on which the Farm database can be installed.

     If the **Database Type** is **SQL Server**, then you can specify an IPv6 address for the **Server Name**.

     If SQLExpress Instance need to be used as a Database instance of the Farm database, then **Server Name** should be <server name>\SQLExpress.

     To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

   - **Authentication Type**

     This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports Windows and SQL Server authentication process.

     Example: Windows
     If Windows Authentication is selected, the user configured for the Farm configuration will be used to access the database. This is the authentication recommended by AVEVA Work Tasks.

   - **Login**

     This field is used to enter the SQL login credential for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Password**

     This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Advanced Settings**

  This is an optional field. It is used to enter any additional connection information, such as connection Timeout. Example: Connection Timeout = 20.

  While creating a data source for repository, use the following custom settings to set properties for connection pool. These settings are case sensitive and should be mentioned only in lower case.

  ```
  encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
  ```

  encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

  enableltm: AVEVA Work Tasks internally implements light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive. This property can be used to turn off this feature. The default value is set as True.

  connectionretrywaittime: While opening a new connection, if the data base server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

  maxconnectionretries: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

  sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

3. Click **Test Connection** to ensure database connectivity.
4. Click **Next**.

   The message *AVEVA Work Tasks Farm is Created* appears.
5. Click **OK**.

AlwaysOn Availability Groups feature of Microsoft SQL Server

The **AlwaysOn Availability Groups** feature of Microsoft SQL Server is a high-availability and disaster-recovery solution that provides an enterprise-level alternative to database mirroring. Introduced in Microsoft SQL Server 2012, AlwaysOn Availability Groups maximizes the availability of a set of user databases for an enterprise.

After you configure the AVEVA Work Tasks, you must add the created Farm Database to the SQL Server AlwaysOn Availability Groups. Contact your Database Administrator to add the database to SQL Server AlwaysOn Availability Groups.

Notes:

- The authentication user needs different rights assigned for different scenarios. If a user wants to create database (Farm or Repository Data Source Database), Authentication User needs to have minimum 'dbcreator' access rights on Database Server Instance.

- If database is already created, user needs to have following permissions on Database Server:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- SELECT, INSERT, UPDATE, and DELETE permissions.

- EXECUTE permission for Stored Procedures.

To choose Connection Provider

Complete the following steps to choose a connection provider:

1. Enter **Database Title**.
2. In the **Database Type** box, select a database type.
3. Select **Connection Provider**.

   This option is used to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.
4. Enter the following details:
   - **Assembly Path**:

     Click the icon to browse and choose the required dll file.

     If custom properties (enableltm, connectionretrywaittime, maxconnectionretries and sqlcommandtimeout) are required to be used in Assembly connection string, then user should select **Use existing Farm database** while creating a the Farm. See Creating or Using an Existing Database.

     See the topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub chapter in the *Build Business Process* section for creating the assembly. Make sure that, there should be only one class implementing *IDBConnectionString* interface within this assembly.
5. Click **Test Connection** to ensure database connectivity.
6. Click **Next**.
7. The message *AVEVA Work Tasks Farm is created* appears.
8. Click **OK**.

Define Security Settings

You can define the Security Settings using the Farm Configuration Wizard.

For more information on Security settings, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client.

To define the Security Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Security Settings** and **Service Settings** and then, click **Next**.
4. Select **Secure Communication** to establish secured communication between the AVEVA Work Tasks services through HTTPS.
5. Select **Secure Web Sites** check box to configure secured web sites. Uncheck the **Secure Web Sites** check box

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

to use HTTP sites. By default the sites are created in HTTPS mode.

6. Enter the Port number. The default port for the HTTPS site is 8001, and for the HTTP site is 8000. You can enter any port number that IIS accepts. But if any other services or applications are already using the entered port number, AVEVA Work Tasks will not start.
7. Select the available certificate from the **Certificate** list. If your certificate is not listed, click the **Refresh** icon to repopulate the list.

   Note: If the required certificate is not listed, generate one using the System Management Server (Configurator tool). Do not use a self-signed certificate without a proper root chain.
8. Click the **Validate** button to validate the certificate before configuring the security settings.

   Note: An Internet connection is needed to validate the certificate.
9. Click **Configure**, then **Next**, and then **Finish** to apply the new security settings.

Note:
- To update the port number, certificate, and websites from unsecure to secure or vice-versa, select **Security Settings** and **Service Settings** check box in **Edit AVEVA Work Task Farm Settings** window before updating the values. After the required details are provided, these settings get updated only when you click **Configure**, then **Next**, and then **Finish** as you navigate through the Farm Configuration Wizard..
- If the Quickflow is already deployed on a machine, you need to deploy it again after you update the security settings. If secured web site is configured, then you cannot change the server configuration for Quickflow in Central Configuration. However, if the **Secure Web Sites** checkbox is not selected, you can make the changes to the server configuration.
- Advance Server communication cannot be configured on HTTP/HTTPS.
- For resources of Load Balanced Server, ensure to configure all services with the same protocol (HTTP or HTTPS).
- It is recommended to use Standard SSL certificate instead of self-signed SSL certificate.

Using ASB Certificate for Secured Communication

ASB Certificate is a PCS-managed SSL certificate and renews automatically every 30 days when the certificate is still valid. The certificate is valid for two years. The PCS watchdog service on the runtime node checks the validity of the SSL certificate within 5 minutes from when it starts and once a day. PCS also renews the SSL certificate if it is expired.

If the runtime node is offline and later back online, the PCS watchdog service regularly checks the certificate validity and renews it if it is required. Consider restarting the PCS watchdog service to enforce the SSL certificate validity check within 5 minutes from the restarting time.

Furthermore, when the SSL certificate is renewed, PCS binds it to port 443 (by default) and changes the SslThumbprint PCS registry value. If AVEVA Work Tasks sites are hosted on port 443, certificate binding will be auto-renewed when the SSL certificate is renewed. It is recommended to check the bindings in IIS with every certificate renewal to ensure the application is running seamlessly.

To disable the certificate renewal, consider disabling the **ArchestrA Certificate Renewal Service** windows service.

Note: Client Service will try to automatically bind the renewed certificate. If there are any issues in browsing the website or starting the services after certificate renewal, users need to reconfigure the secure communication in Farm Configuration. To reconfigure, see the steps mentioned in above section *To define the Security Settings*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Securing Communication between Services

To have a secure communication between the services, apply the below changes to the Windows registry and reboot the server:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
```

For more information on securing communication, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client and https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2015/2960358.

Define Services and Global Settings

You can define the Services and Global Settings using the Farm Configuration Wizard or through Configuration XMLs.

To define Services

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.

   Note: You can also customize the settings for these services and websites using the **Custom Settings** option. For more information about Service-related changes and Website-related changes, see Advanced Settings and Administering Web Servers respectively.

2. Click **Next**.

   The Global Settings dialog box appears.

3. In the **Communication** tab, enter key fields in **Email Settings** and **Exception Email settings** to configure exception e-mails.

   The following are the details:

   - **Host**: Enter information related to mail server.
     Example: Enter details related to Microsoft Exchange Server (IP address of the exchange server).
   - **Port**: Enter the port number for the mail server. The default port number is 25.
   - **From email**: Enter the from e-mail address.
     Example: admin@telematics.com

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **To email**: Enter the to e-mail address.
  Example: alex@telematics.com

4. Click **OK**.

Note: To confirm the exception e-mail settings, click **Test SMTP**. An e-mail will be generated and sent to the **To email** address confirming successful configuration of the e-mail. The advanced settings like **Secure Socket Layer (SSL), Email Timeout, User Name,** and **Password** for the e-mail account holder, **Password Encrypted** flag will differ based on the mail server settings.

Define Central Configuration

1. Run **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Farm Configuration Wizard window appears.
2. Click **Next**.
3. The Edit Farm settings window appears.
4. Select **Service Settings**.
5. Click **Next**.

   The Services/Global Settings window appears.
6. Click against **Central Configuration** to edit AVEVA Work Tasks **Central Configuration settings**.

   The Central Configuration Settings page appears.
   - **http/https**: This option enables you to determine if you want a secured (https) or a non-secured site (http).
   - **Authentication Type**: This option allows you to provide the authentication type to access the Central Configuration. The available authentication types are Windows, AVEVA Connect, and Azure Active Directory.

     Note: The AVEVA Connect and Azure Active Directory authentication types are available only if these user providers are configured in the system.
     To configure AVEVA Connect user provider, see AVEVA Connect Settings.
     To configure Azure Active Directory user provider see Azure Active Directory Settings.

   - **Create at**: This field allows you to provide the Internet Information Service (IIS) path where the new site is created.
   - **Port Number**: This field is used to provide a port number for the Central Configuration.
7. Click against **Create at** to change the path of the Central Configuration.

   A message indicating that if the path has been changed the Central Configuration will no longer be accessible appears.
8. Click **Yes**.

   The IIS structure screen is displayed. Select the desired IIS path for the Central Configuration.
9. Click **OK**.

   The selected URL appears in the **Central Configuration Settings** screen.
10. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note:

- The default IIS path for Central Configuration is displayed. Click the edit icon to change the site path.

- If you want to update the authentication type to AVEVA Connect or Azure Active Directory of the already configured Central Configuration, you need to reconfigure the AVEVA Connect and Azure Active Directory user providers for the Central Configuration. For information on configuring user providers, see AVEVA Connect Settings and Azure Active Directory Settings.

- Central Configuration cannot be accessed in Chrome browser when configured with unsecured access (http://) for Azure Active Directory and AVEVA Connect authentication types.

Provision Services

While the installation is in progress, you can view the services that will be installed. This provides information on the progress of installation. At the end of the installation, a status indicating the completion of installation appears.

- Click **OK** to complete the installation.

AVEVA Work Tasks Client

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Select Client Installation

1. In the Select the type of installation page, select **Client**.
2. Click **Next**.

   The Database User Settings page appears.

Connect to an Existing Farm Database

You can use the Connect to existing database dialog box to connect to the existing Farm. You can select the Connection String or Connection provider for the new database.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Select the computer name on which the Farm Database is installed from the **Server Name** field.
2. Select **Connection String**.
3. Enter the following details:
   a. **Authentication Type**: This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports both Windows and SQL server authentication process. Example: Windows.
   b. **User ID**: This field is used to enter the SQL user ID for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   c. **Password**: This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   d. **Advanced Settings**: This is an optional field. It is used to enter any additional connection information such as connection Timeout etc. Example: Connection Timeout = 20.

      While creating a data source for repository, use the following custom settings to set properties for the connection pool.

      encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;

      encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

      enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks controls the transaction from escalating to a distributed transaction which is very expensive.

      The above property can be used to turn off this feature. The default value is set as True.

      connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

      maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

      sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

      Note: These settings are case sensitive and should be mentioned only in lower case.
   e. **Database**: This field is used to select the machine with database installed. Example: FarmDB.

      AVEVA Work Tasks will validate if at least one server is installed.
4. Click **Test Connection** to ensure database connectivity.

   You must have the following permissions on the Database Server:

   SELECT, INSERT, UPDATE, and DELETE permissions.

   EXECUTE permission for Stored Procedures.
5. Click **Next** to continue with the wizard.
6. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Define and Provision the Enterprise Console

You can define the required AVEVA Work Tasks services.

Steps to Define Enterprise Console

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.
2. Click **Next**.

   The **Installing Services** screen appears, indicating the progress of installation.

   A message *Installation is Complete* appears after all the services are installed.
3. Click **OK**.

Create a Repository DataSource

A **Repository DataSource** is used to store all repository related data. The **Repository DataSource** must be created on a machine where the **Central Configuration** site is installed.

Example

A TelematicsDataSource is created for TelematicsHR Repository.

A Repository contains Workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating the repository.

To create a Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**.

   The Central Configuration web page appears.
2. Click **DataSource Settings**.

   The Datasource List page appears.
3. Click **Add**.

   The Manage Datasource page appears.
4. Enter the required details.
   a. **Name**: Enter a valid data source name. Example: *TelematicsDataSource*.
   b. **Description**: Enter a description for the data source. Example: *This data source is used to store connection details*.
   c. **Connection String**: Select this option to establish a connection with the database. The connection string contains fields that that defines the connection. The connection information is encrypted and stored.

      Server Name

      To use a database on the local machine, enter "localhost", ".", or the local computer's name for the **Server Name**.

      Note: Server Name can be machine name/IP address/SQL Server AlwaysON/SQL Server instance name. Instead of entering "local host", it is preferable to give the local machine name.

      If the **Database Type** is **SQL Server**, then specify an IPV6/IPV4 address for the **Server Name**.
      To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: *localhost,1455*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be *<server name>\SQLExpress*.

Authentication Type

Use this field to determine the process to validate a user who is trying to connect to the database. AVEVA Work Tasks uses Windows and SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. The **User ID** and **Password** field is disabled if Windows Authentication is selected. Example: *Windows*

Advanced Settings

Use this field to define advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection.
Example: *Connection Timeout = 20*
or
For defining maximum connections that can be opened in a connection pool.
Example: *max pool size = 250*
Default connection pool is set as 250. We recommend to enter a higher value on heavily loaded environment.
While creating a data source for a repository, use the following custom settings to set properties for the connection pool.
encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.
enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature, AVEVA Work Tasks controls the transaction from escalating to an expensive distributed transaction.
The above property can be used to turn off this feature. The default value is set as *True*.
connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is 30 seconds. The value should be set in seconds.
maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is infinite.
sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.
These settings are case sensitive and should be mentioned only in lower case.

Database:

Specify or select a database that can be used as a repository database. This database stores all repository related data. The repository database is created if it does not exist on the database server instance.
Example: *TelematicsDB*

Enable Table Partitioning:

Select to enable database table partitioning. For more information, see Partitioning Database.

d. **Connection Provider**: Use this to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The selected dll must be copied to all the machines, all servers and all clients, that are connected to the current Farm.

Assembly Path

Click to browse and choose the required dll file.
To use custom properties (enableltm, connectionretrywaittime, maxconnectionretries, and sqlcommandtimeout) in the Assembly connection string, the database must be created before.
See *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Developer Guide* for creating the assembly. Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.

   A message about successful test connection appears.

6. Click **OK**.

   A message about successful creation of the data source appears.The message also states that the required tables will be created in the data source after a repository is associated with the data source.

When a data source is saved, an entry is created for the data source in the **Farm Database**. When a first repository is created for the data source, AVEVA Work Tasks tables are added to the data source. While creating a data source, the archival database is created with the same database name suffixed by *_BI*. This database is used for archival in future use.

Note: After you configure the AVEVA Work Tasks, you must add the created **Farm Database** to the **SQL Server AlwaysOn Availability Groups**. Contact your Database Administrator to add the database to **SQL Server AlwaysOn Availability Groups**.

To view the data source created, click **DataSource Settings** link.

Create a Repository

A **Repository** contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

To create a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The Central Configuration page appears.

2. Click **Repository Settings**.

   The Repository List page appears.

3. Click **Add**.

   Note: If the number of repositories exceeds the permitted limit for the license, then the message "You have exceeded the maximum number of repositories" appears, and the repository creation is stopped. Click **Close**.

   The **Manage Repository** page appears.

4. Enter the required details.
5. Click **OK**.

   The **Config Administrator** page appears.

6. Click to configure an administrator.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The User Lookup dialog box appears.

7. Select the provider from the provider drop-down list.
8. Enter the details to search the administrator for the repository that is created.

   Note: You can also search a user based on *ObjectSID* and *objectGUID* (applicable only for Active Directory provider).

9. Click **Search**.

   The user is listed under **Available Resources**.

10. Select and click the arrow to list the user under **Selected Resource**.
11. Click **Update**.

    The selected user is displayed in **User Lookup**.

12. Click **OK**.

    A message confirming the successful creation of an administrator appears.

13. Click **OK**.

    The **Repository List** page appears.

    For more information about configuring the system user, see Configure System User.

Manage Repository Window Fields

The following table explains the fields of the Manage Repository window:

Field Name	Description	Example
Repository DataSource	Lists all the data sources created in a Farm. The selected data source will be used to store data for the current repository.	TelematicsDatasource
Attach DataSource	Select Attach DataSource checkbox and then select a repository from the selected DataSource .Data associated with the selected repository will be copied to the new repository. The version of the installed product and destination DataSource should be the same as that of the DataSource from which the repository data is to be copied. For example, in an upgraded environment, from build Work Tasks version 1 to Work Tasks version 2, you cannot attach a DataSource created in build Work Tasks version 1 to build Work Tasks version 2.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	To match the build version of the installed product to the version of the DataSource: 1. If the DataSource was created in build Work Tasks version 1, then the entire build Work Tasks version 1 must be upgraded to Work Tasks version 2 by running the product installer in the upgrade mode. 2. All the Farm, DataSources, Repositories, and Lists of build Work Tasks version 1 must be upgraded to build Work Tasks version 2 by running the AVEVAWorkTasksUpgradeManager.exe located at the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder. 3. After upgrading all the AVEVA Work Tasks components to build Work Tasks version 2 build, that DataSource can be used in any machine that has same version by using this feature.	
Repository Name	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the repository name.	Telematics Repository
Description	Provide a description for the repository.	This stores Telematics Employee Leave Details.
From mail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might	Provide the valid email id that is specified in the **User Name** field while configuring **SMTP Settings** in the **Mail Server Settings** page. For more details, see Mail Server Setting.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	occur in the Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be sent to the mail ID defined in **Exception to mail**. The From address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To avoid this, restart the Workflow Engine Service and Communication Service.	
Exception to mail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails is sent to the email ID specified in **Exception to mail**.	Provide the valid email id.
Alert initiator of the Workflow	Determines if the status of a workflow should be sent as a notification mail to the initiator of the workflow.	A process with a rule to check the pending leave available for the employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
Servers	Lists the servers available in the Farm. Repository will be available only to the mapped servers.	Work Tasks Server Name
Enterprise Consoles	Lists all the Enterprise Consoles for a selected AVEVA Work Tasks Server. Repository will be available only to the mapped Enterprise Console.	http://worktaskservername:8001/EnterpriseConsole
Enable Theme	Select this checkbox to enable the defined theme.	-
Theme Name	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. It provides **Default** and **Lite** themes.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Resource Provider	Lists the various default resource providers supported by AVEVA Work Tasks. Resource providers are also termed as User Provider. A User Provider is a data store containing information about the user. AVEVA Work Tasks also supports custom resource provider. For more information about Resource Provider, see User Providers. AVEVA Connect and Azure Active Directory resource providers are also available after you configure them. To configure these providers, see AVEVA Connect Settings and Azure Active Directory Settings. AVEVA Work Tasks allows secured LDAP configuration. The default port number for LDAPS is 636. You can map the repository in IDE and use the Secured LDAP. The logged-in Active Directory is displayed by default, and **Active Directory Datasource** expects **LDAP://** or **Fully Qualified Domain Name** as value.	AVEVA Work Tasks Lists or Active Directory
Custom Application Folder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with a semicolon.	-
Hide Repository	Select this option to make the repository unavailable to the Farm.	-
Source path	Enter the path to the Source Elements Folder.	-
Attachment Storage Path	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	absolute path. - The default path is the **Attachments** folder in *C:\ProgramData\AVEVA Work Tasks*\. - The default path is used when no path is specified. - Ensure appropriate rights are set to the folder, where attachments are stored, for the following identities: -- The application pool identity for **Central Configuration** and **Enterprise Console(s)**. -- The account configured for the **Workflow Engine** service. - In case of mapped drives, ensure they are available to the identities. - In multiple-server environments, the path specified must be in a shared location.	

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Auto Log Off Settings for Enterprise Console	Automatically logs out the logged in user after the designated period of inactivity. Enter the time in minutes. This field accepts only valid integer values between 0 to 360. 0 minute means the user will not get automatically logged off. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. The default value for automatic log off is 30 minutes. You use this field to define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML.	0 to 360 (minutes)
Auto Log Off Settings for AVEVA Work Tasks Pro	Request for user credentials for AVEVA Work Tasks Pro app after the set time is elapsed. Enter the time in minutes. This field accepts only valid integer values between 0 to 2880. 0 minute means the user will not get automatically logged off. The default value is 30 minutes. If AVEVA Work Tasks Pro app is offline, the Auto Log Off will not get active, and the user will not be automatically logged off as per the defined settings.	0 to 2880 (in minutes)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Offline Support	Select this option to enable offline submission of items in AVEVA Work Tasks Pro app.	-
Refresh on Work Item submission	Select this option to enable Inbox refresh on Work Item submission in AVEVA Work Tasks Pro . Refresh option is enabled by default.	-
Timeout	Enter the time in seconds to set the timeout. If the value is set as 0, then there is no timeout. Default value is 60 seconds.	-
Label for Fill Form	Enter the label for Fill Form. The customized label will be displayed for the Fill Form in AVEVA Work Tasks Pro.	Work Tasks
Date Configuration Flag for Alternate Actors	Select the **Enable Date Settings** option to set the **From** date and **To** date as mandatory while creating alternate actors. For more information about creating alternate actors, see *Alternate Actors* topic in the *User Guide*.	-
Display Domain name with User Name	Select this checkbox to display the domain name along with the user name in the Enterprise Console and the List. The domain name will be displayed only: • If this checkbox is selected. • If the **Resource Provider** is selected as **Active Directory**.	-

User Providers

AVEVA Work Tasks supports the following User Providers by default:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Active Directory

When you select **Active Directory** as the **Resource Provider**, details such as **Active Directory datasource** and the **Active Directory search base** are populated by default.

Authentication User, **Authentication Password**, **User Log-on ID**, and **User Log-on Display Name** are optional fields. Access to the active directory might not be available for all users. In such cases, provide the active directory authentication user name and the active directory authentication password with which you can connect to the Active Directory.

AVEVA Work Tasks considers *SAM-Account-Name* as **User Log-on ID** by default. If you want to use active directory attributes other than the *SAM-Account-Name* user, then enter the desired active directory attribute details in the **User Log-on ID** field and **User Log-on Display Name** field. **User Log-on Display Name** is the user friendly display name of the active directory attribute. This **User Log-on Display Name** is referred in the User Lookup dialog box against the **User Log-on ID**.

Steps

1. When you select **Active Directory** as the **Resource Provider**, then the **Use Token Service** field appears. In this field, select one of the following:
   - If you do not want to use AIM authentication, select **Without Token Service**.
   - If you want to use AIM authentication, then select a server from the list of alias server names.
2. Enter **Active Directory datasource**.
3. Enter **Active Directory search base**.
4. Enter **Domain Name**.

   The domain name is case-sensitive.
5. Enter **Authentication User**.
6. Enter **Authentication Password**.
7. Check **Is Cross Domain Role Provider** checkbox, if cross domain users and roles mapping is required.

   Example: Users *John* and *Jim* of domain *TelematicsU* and users *Mike* and *Bob* from domain *TelematicsAU* are added to role Team HR of domain *TelematicsMain*.
8. Enter **User Log-on ID** if you want to use another Active Directory attributes instead of *SAM-Account-Name*.

   We recommend to use attributes of type *string* as input for **User Log-on ID.** However, *ObjectSID* and *objectGUID* are also supported.

   After you set the **User Log-on ID**, you cannot change it later.
9. Enter the **User Log-on Display Name**.

   After you set the **User Log-on Display Name**, you cannot change it later.

   This is the default display name of the user account of the active directory user used. **User Log-on Display Name** is used in user lookups.
10. Click **Test LDAP**.

    A message about successful LDAP test appears.

Note:
- Some of the active directory attributes or properties are not indexed. If you use an active directory attribute that is not indexed, it might impact the log-on validation performance based on the active directory entries. We recommend to use indexed attributes as **User Log-on ID** or index the attributes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- For an upgraded repository, you cannot change both **User Log-on ID** and **User Log-on Display Name**.
- You cannot localize **User Log-on ID** and **User log-on Display Name** fields.
- Disabled users will not be shown in user lookup search.

Using Forms

For Forms Resource Provider:

- If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.

1. In the **Resource Provider** drop-down list**,** select **Forms.**
2. In the **User Entity properties** field, enter XML data.

   Click **Sample Code** to get the XML Schema Template.

   Example

   ```
   <properties>
   <property name="userid" type="string" purpose="identifier" />
   <property name="username" type="string" purpose="name" />
   <property name="pwd" type="string" purpose="password" />
   </properties>
   ```
3. In the **User Provider Properties** field, enter the same XML Schema.

   There must be at least one identifier in the XML Schema. For example, UserID
4. In the **Datasource** field, enter a valid data source or specify a dll.

   The value for the data source can be specified as **Physical path of the dll** or **Physical path of the dll::param. Param** is not mandatory.

   See topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Build Business Process* section for creating the assembly.

   Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly, whereas one class can return multiple connection strings.

   Examples of data source parameter:

   - c:\DLLStore\GetConnectionString.dll
   - c:\GetConnectionString.dll::Leave

   If there are two data sources, *Leave* and *Licensing*, and only one DLL is used to return a connection string based on the data source selected. The parameter can be specified as **c:\GetConnectionString.dll::Leave** or **c:\ GetConnectionString.dll::Licensing**. The connection string can be returned from the connection dll based on this parameter.
5. Enter a proper table name or view name which holds the User Name and Password for the Authentication purpose.

   Example: Passmast (the table which is available in IMS_NEW Database)
6. Click **Test SQL Connection**.

   A message about successful test connection appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using ASP.NET Membership

This resource provider lists users defined in the asp.net membership database.

Lists

This resource provider lists users created using AVEVA Work Tasks Users Creation. If you are unable to determine a User Provider to create a repository, use AVEVA Work Tasks Lists.

To verify successful creation of the Repository:

1. Click **Enterprise Console** URL from the site path column.
   The repository created is listed.
   Add the created Enterprise Console link into "Add to Favorites" to easily navigate in future.
2. Click **Repository User Provider** link to logon to the repository.
   The Enterprise Console log-on page appears.
3. Enter the logon details, and then click **Login**.
   The Enterprise Console home page appears. This indicates successful creation of a Repository.
   All features can only be available for a user with administrative privileges.

Note: Consider you created the Repository and then deleted it. If you create the same Repository again immediately and try to log into it through Enterprise Console, the Provider does not list the Repository. You need to access IIS and recycle AVEVA Work Tasks from the Application Pool to get the Repository listed in the Provider list..

Verify the Installation

After you install AVEVA Work Tasks, verify that the product is installed successfully. To verify successful installation, create a simple Workflow using Process Designer. The tasks includes the following:

- Creating a Workflow
- Publishing the Workflow
- Testing the Workflow

Creating a Workflow

1. Log on to the **Enterprise Console**.
2. If the Repository is configured for Active Directory provider, go to step 4.
3. Enter the **User Name** and **Password**.
   The **User Name** and **Password** will be validated with the user provider selected while creating the repository.
   The default authentication provider is the Repository User Provider List.
4. In the **Enterprise Console**, click menu icon.
   All features can only be available for a user with administrative privileges.
5. From the menu, select **Workflows**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Workflow window appears.

6. On the Action bar, click **New**, and then click **Workflow**.
   The New Workflow window appears.
7. Enter **Title** and **Description**.
8. Click **Save & Continue**.
   The successful message appears.
9. Select **Design the Workflow now**.
   This is the default option.
10. Click **Finish**.
    The Process Designer window appears.
11. From the activities pane on the left, drag the Information activity to the Process Designer window.
12. The activity *Information1* is created.
    Click to create a link between two activities.
    The Link Action window appears.
    a. Select from the **From Action** drop-down box.
    b. Select from the **To Action** drop-down box.
    c. Click **OK**.
       The link is established.
13. Right-click *Information1*.
14. Select **Activity Properties** from the context menu.
    The Activity Properties pane appears.
    a. Enter **Name** and **Description**.
    b. Click to **Assign Actor(s)**.
       The Assign Actor(s) window appears.
    c. Select the required provider from the **Providers** drop-down list.
    d. Select values from the drop-down list.
    e. Click **Add**.
    f. Click **Update**.
15. Click to enter the **Subject** for Notification Contents.
    The window to enter subject for notification appears.
16. Click **Update**.
17. Click to enter the **Body** for Notification Contents.
    The window to enter the Body content appears.
18. Click **Update**.
19. From the Activity Properties pane, click **Save**.

Publishing the Workflow

1. On the **Publish** menu, click **Publish**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Published successful message appears.

2. Close the dialog box.

   The Enterprise Console screen lists the workflow created.

Testing the Workflow

1. Select the listed workflow.
2. Right-click the selected workflow.
3. Click **Publish and Test Run**.

   The **Status Finished successfully** appears.

   If Status is **Execution Pending** in the Process Execution window, then click on the **Refresh** button to get the status.
4. In the **Enterprise Console** menu, select **Inbox**.

   The Inbox lists the work item.
5. Click to view the work item listed.

   This indicates that the installation is successful.

Client and Server Installation

This section describes the activities involved while installing AVEVA Work Tasks on a AVEVA Work Tasks Client and AVEVA Work Tasks Server.

The installation for this scenario can be incorporated in any scenarios mentioned above wherein the Server and the Client is involved.

Ensure that you install the product in the following sequence:

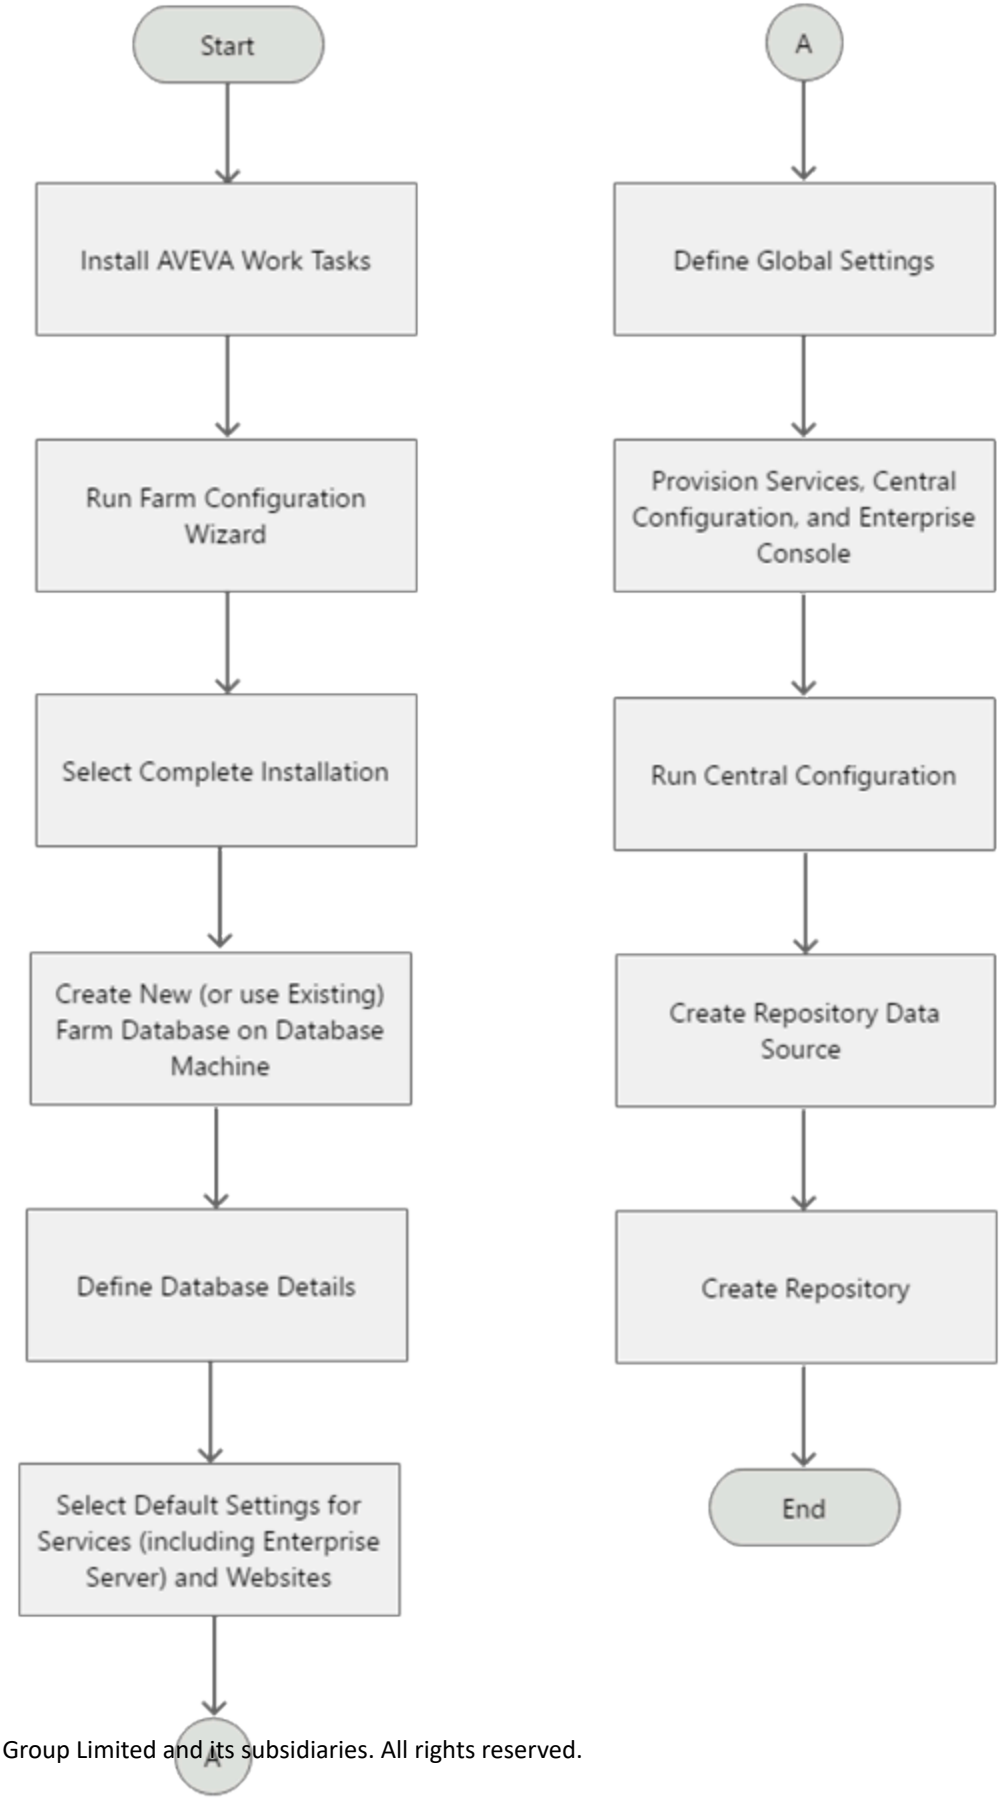
- High-Level View of Server Installation
- High-Level View of Client Installation

High-Level View of Server Installation

This section provides a high-level view of the various installation steps. The objective of this section is to provide an overview of the various activities involved while installing AVEVA Work Tasks Server. This section also enables you to visually keep track of your activities while following the sequence of tasks.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



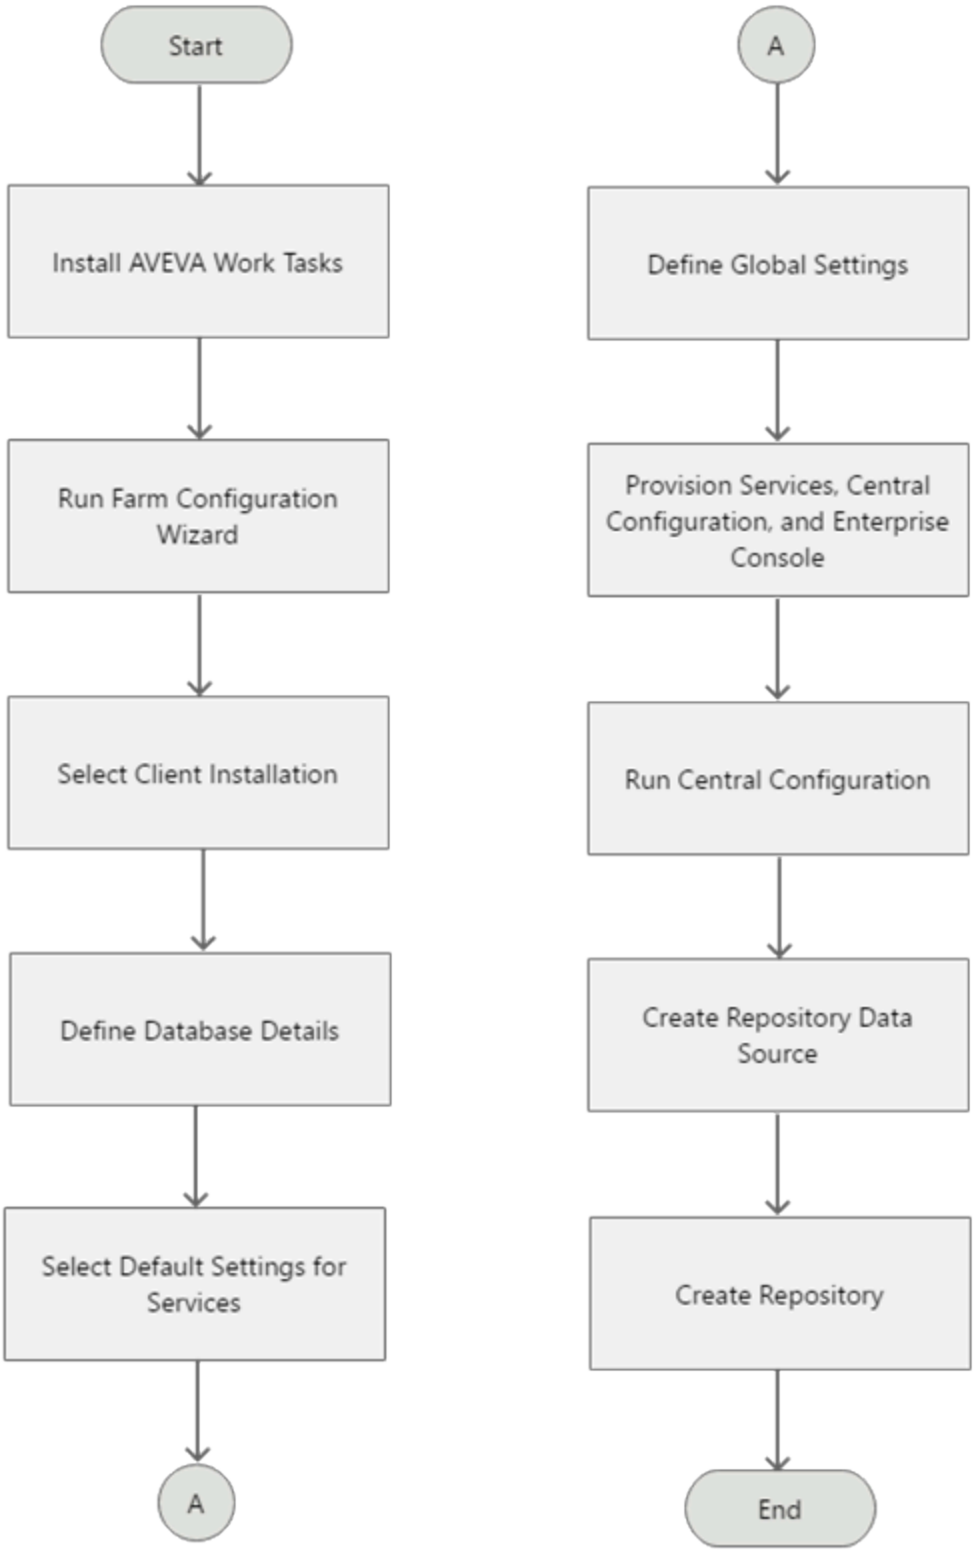
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

High-Level View of Client Installation

This section provides a high-level view of AVEVA Work Tasks Client installation. The Client components are installed on Web Servers.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation

This section provides installation steps for the scenario AVEVA Work Tasks Client and AVEVA Work Tasks Server Installation.

The installation includes the following:

- Installing AVEVA Work Tasks Server
- Installing AVEVA Work Tasks Client

The Server has to be installed before installing the Client.

AVEVA Work Tasks Server

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
4. Click **Next**.

   The License Server details are configured successfully.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.
4. Click **Next**.

   The **Edit Farm Settings** window appears.
5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.
6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
9. Click **Next**.

   The License Server details are configured successfully.

Select the Type of Installation - Enterprise Edition

Following points must be considered while installing AVEVA Work Tasks on the Enterprise Server:

- Ensure that you select the **Complete Installation** and **Enable load balancing** options.
- You can either create a new Farm database or use an existing one.

1. In the Select the type of installation page, select **Complete Installation (Server)**.

   A Complete Standalone Deployment does not require a client installation.
2. Select the **Enable load balancing (This feature requires and Enterprise license.)** check box for installing AVEVA Work Tasks on the Enterprise Server.

   The **Farm Configuration Wizard** dialog box appears.
3. Click **OK**.
4. To create a new Farm database, click **Create AVEVA Work Tasks Farm**, and then select one of the following:
   - **Create AVEVA Work Tasks Farm database**
   - **Use existing AVEVA Work Tasks Farm database (Creates AVEVA Work Tasks Farm tables only if they do not exist)**
5. To connect to an existing Farm database, click **Connect to existing AVEVA Work Tasks Farm (if the first server**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

of the Enterprise Server is already installed).

6. Click **Next**.

   The Database User Settings page appears.

Create Farm Database

Use the Create AVEVA Work Tasks Farm Database page to provide **New Database** details. Select the **Connection String** option to establish a connection with the database. This connection information is encrypted and stored.

You can enter either Windows or Microsoft SQL Server user settings for authentication.

Note:
- The Farm database password does not support **&** and **;** special characters.
- While setting up **Farm Database** with **Windows Authentication**, do not enter **FQDN** in the **Domain Name** field.

To Create Farm Database

1. Enter **Database Title**.
2. Select **Connection String**.

   See *Connection Provider* later in this topic, if you have selected the **Connection Provider** option.

   - Enter the following details:

     Server Name:

     Provide information about the database server on which the Farm database can be installed.

     If the **Database Type** is **SQL Server**, then you can specify an IPv6 address for the **Server Name**.

     If SQLExpress Instance need to be used as a Database instance of the Farm database, then **Server Name** should be <server name>\SQLExpress.

     To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

   - **Authentication Type**

     This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports Windows and SQL Server authentication process.

     Example: Windows
     If Windows Authentication is selected, the user configured for the Farm configuration will be used to access the database. This is the authentication recommended by AVEVA Work Tasks.

   - **Login**

     This field is used to enter the SQL login credential for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Password**

     This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.

   - **Advanced Settings**

     This is an optional field. It is used to enter any additional connection information, such as connection Timeout. Example: Connection Timeout = 20.

     While creating a data source for repository, use the following custom settings to set properties for

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

connection pool. These settings are case sensitive and should be mentioned only in lower case.

```
encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10;
sqlcommandtimeout=300;
```

encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

enableltm: AVEVA Work Tasks internally implements light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive. This property can be used to turn off this feature. The default value is set as True.

connectionretrywaittime: While opening a new connection, if the data base server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

maxconnectionretries: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

3. Click **Test Connection** to ensure database connectivity.
4. Click **Next**.

   The message *AVEVA Work Tasks Farm is Created* appears.
5. Click **OK**.

AlwaysOn Availability Groups feature of Microsoft SQL Server

The **AlwaysOn Availability Groups** feature of Microsoft SQL Server is a high-availability and disaster-recovery solution that provides an enterprise-level alternative to database mirroring. Introduced in Microsoft SQL Server 2012, AlwaysOn Availability Groups maximizes the availability of a set of user databases for an enterprise.

After you configure the AVEVA Work Tasks, you must add the created Farm Database to the SQL Server AlwaysOn Availability Groups. Contact your Database Administrator to add the database to SQL Server AlwaysOn Availability Groups.

Notes:

- The authentication user needs different rights assigned for different scenarios. If a user wants to create database (Farm or Repository Data Source Database), Authentication User needs to have minimum 'dbcreator' access rights on Database Server Instance.

- If database is already created, user needs to have following permissions on Database Server:

- SELECT, INSERT, UPDATE, and DELETE permissions.

- EXECUTE permission for Stored Procedures.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To choose Connection Provider

Complete the following steps to choose a connection provider:

1. Enter **Database Title**.
2. In the **Database Type** box, select a database type.
3. Select **Connection Provider**.

   This option is used to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.
4. Enter the following details:
   - **Assembly Path**:

     Click the icon to browse and choose the required dll file.

     If custom properties (enableltm, connectionretrywaittime, maxconnectionretries and sqlcommandtimeout) are required to be used in Assembly connection string, then user should select **Use existing Farm database** while creating a the Farm. See Creating or Using an Existing Database.

     See the topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub chapter in the *Build Business Process* section for creating the assembly. Make sure that, there should be only one class implementing *IDBConnectionString* interface within this assembly.
5. Click **Test Connection** to ensure database connectivity.
6. Click **Next**.
7. The message *AVEVA Work Tasks Farm is created* appears.
8. Click **OK**.

Define Security Settings

You can define the Security Settings using the Farm Configuration Wizard.

For more information on Security settings, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client.

To define the Security Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Security Settings** and **Service Settings** and then, click **Next**.
4. Select **Secure Communication** to establish secured communication between the AVEVA Work Tasks services through HTTPS.
5. Select **Secure Web Sites** check box to configure secured web sites. Uncheck the **Secure Web Sites** check box to use HTTP sites. By default the sites are created in HTTPS mode.
6. Enter the Port number. The default port for the HTTPS site is 8001, and for the HTTP site is 8000. You can enter any port number that IIS accepts. But if any other services or applications are already using the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

entered port number, AVEVA Work Tasks will not start.

7. Select the available certificate from the **Certificate** list. If your certificate is not listed, click the **Refresh** icon to repopulate the list.

   Note: If the required certificate is not listed, generate one using the System Management Server (Configurator tool). Do not use a self-signed certificate without a proper root chain.

8. Click the **Validate** button to validate the certificate before configuring the security settings.

   Note: An Internet connection is needed to validate the certificate.

9. Click **Configure**, then **Next**, and then **Finish** to apply the new security settings.

Note:
- To update the port number, certificate, and websites from unsecure to secure or vice-versa, select **Security Settings** and **Service Settings** check box in **Edit AVEVA Work Task Farm Settings** window before updating the values. After the required details are provided, these settings get updated only when you click **Configure**, then **Next**, and then **Finish** as you navigate through the Farm Configuration Wizard..
- If the Quickflow is already deployed on a machine, you need to deploy it again after you update the security settings. If secured web site is configured, then you cannot change the server configuration for Quickflow in Central Configuration. However, if the **Secure Web Sites** checkbox is not selected, you can make the changes to the server configuration.
- Advance Server communication cannot be configured on HTTP/HTTPS.
- For resources of Load Balanced Server, ensure to configure all services with the same protocol (HTTP or HTTPS).
- It is recommended to use Standard SSL certificate instead of self-signed SSL certificate.

Using ASB Certificate for Secured Communication

ASB Certificate is a PCS-managed SSL certificate and renews automatically every 30 days when the certificate is still valid. The certificate is valid for two years. The PCS watchdog service on the runtime node checks the validity of the SSL certificate within 5 minutes from when it starts and once a day. PCS also renews the SSL certificate if it is expired.

If the runtime node is offline and later back online, the PCS watchdog service regularly checks the certificate validity and renews it if it is required. Consider restarting the PCS watchdog service to enforce the SSL certificate validity check within 5 minutes from the restarting time.

Furthermore, when the SSL certificate is renewed, PCS binds it to port 443 (by default) and changes the SslThumbprint PCS registry value. If AVEVA Work Tasks sites are hosted on port 443, certificate binding will be auto-renewed when the SSL certificate is renewed. It is recommended to check the bindings in IIS with every certificate renewal to ensure the application is running seamlessly.

To disable the certificate renewal, consider disabling the **ArchestrA Certificate Renewal Service** windows service.

Note: Client Service will try to automatically bind the renewed certificate. If there are any issues in browsing the website or starting the services after certificate renewal, users need to reconfigure the secure communication in Farm Configuration. To reconfigure, see the steps mentioned in above section *To define the Security Settings*.

Securing Communication between Services

To have a secure communication between the services, apply the below changes to the Windows registry and reboot the server:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727]
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions" = dword:00000001
"SchUseStrongCrypto" = dword:00000001
```

For more information on securing communication, see https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/security/enable-tls-1-2-client and https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2015/2960358.

Define Services and Global Settings

You can define the Services and Global Settings using the Farm Configuration Wizard or through Configuration XMLs.

To define Services

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.

   Note: You can also customize the settings for these services and websites using the **Custom Settings** option. For more information about Service-related changes and Website-related changes, see Advanced Settings and Administering Web Servers respectively.

2. Click **Next**.

   The Global Settings dialog box appears.

3. In the **Communication** tab, enter key fields in **Email Settings** and **Exception Email settings** to configure exception e-mails.

   The following are the details:

   - **Host**: Enter information related to mail server.
     Example: Enter details related to Microsoft Exchange Server (IP address of the exchange server).
   - **Port**: Enter the port number for the mail server. The default port number is 25.
   - **From email**: Enter the from e-mail address.
     Example: admin@telematics.com
   - **To email**: Enter the to e-mail address.
     Example: alex@telematics.com

4. Click **OK**.

Note: To confirm the exception e-mail settings, click **Test SMTP**. An e-mail will be generated and sent to the **To**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

email address confirming successful configuration of the e-mail. The advanced settings like **Secure Socket Layer (SSL), Email Timeout, User Name,** and **Password** for the e-mail account holder, **Password Encrypted** flag will differ based on the mail server settings.

Define Central Configuration

1. Run **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Farm Configuration Wizard window appears.
2. Click **Next**.
3. The Edit Farm settings window appears.
4. Select **Service Settings**.
5. Click **Next**.

   The Services/Global Settings window appears.
6. Click against **Central Configuration** to edit AVEVA Work Tasks **Central Configuration settings**.

   The Central Configuration Settings page appears.
   - **http/https**: This option enables you to determine if you want a secured (https) or a non-secured site (http).
   - **Authentication Type**: This option allows you to provide the authentication type to access the Central Configuration. The available authentication types are Windows, AVEVA Connect, and Azure Active Directory.

     Note: The AVEVA Connect and Azure Active Directory authentication types are available only if these user providers are configured in the system.
     To configure AVEVA Connect user provider, see AVEVA Connect Settings.
     To configure Azure Active Directory user provider see Azure Active Directory Settings.
   - **Create at**: This field allows you to provide the Internet Information Service (IIS) path where the new site is created.
   - **Port Number**: This field is used to provide a port number for the Central Configuration.
7. Click against **Create at** to change the path of the Central Configuration.

   A message indicating that if the path has been changed the Central Configuration will no longer be accessible appears.
8. Click **Yes**.

   The IIS structure screen is displayed. Select the desired IIS path for the Central Configuration.
9. Click **OK**.

   The selected URL appears in the **Central Configuration Settings** screen.
10. Click **OK**.

Note:

- The default IIS path for Central Configuration is displayed. Click the edit icon to change the site path.

- If you want to update the authentication type to AVEVA Connect or Azure Active Directory of the already

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

configured Central Configuration, you need to reconfigure the AVEVA Connect and Azure Active Directory user providers for the Central Configuration. For information on configuring user providers, see AVEVA Connect Settings and Azure Active Directory Settings.

- Central Configuration cannot be accessed in Chrome browser when configured with unsecured access (http://) for Azure Active Directory and AVEVA Connect authentication types.

Provision Services

While the installation is in progress, you can view the services that will be installed. This provides information on the progress of installation. At the end of the installation, a status indicating the completion of installation appears.

- Click **OK** to complete the installation.

AVEVA Work Tasks Client

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Configure the License Server

You can configure the License Server details, such as License Server name and port.

To configure License Server

1. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
2. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
3. Click **Configure**.

   The confirmation messages appears in the **Configuration Message Log** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
4. Click **Next**.

   The License Server details are configured successfully.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Editing the License Server Details

- If the Farm Configuration Wizard is already open, click **Next** to continue with License Server configuration.

However, if the **Farm Configuration Wizard** is not open due to any reason, you can manually start the wizard. To manually start the wizard and then configure the License Server, complete the following steps:

1. Close the Farm Configuration Wizard window that is automatically opened.
2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then, select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.

   Note: The Farm Configuration Wizard should be run with administrative privileges.
4. Click **Next**.

   The **Edit Farm Settings** window appears.
5. In the **Edit Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box.
6. In the **License Server Name** box, type the name of the AVEVA Enterprise License Server. If you have already configured the license server, then the name of configured License Server is displayed.
7. In the **License Server Port** box, type the port number used by the AVEVA Enterprise License Server. Ensure that you enter a valid port number.
8. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the License Server details entered.
9. Click **Next**.

   The License Server details are configured successfully.

Select Client Installation

1. In the Select the type of installation page, select **Client**.
2. Click **Next**.

   The Database User Settings page appears.

Connect to an Existing Farm Database

You can use the Connect to existing database dialog box to connect to the existing Farm. You can select the Connection String or Connection provider for the new database.

1. Select the computer name on which the Farm Database is installed from the **Server Name** field.
2. Select **Connection String**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Enter the following details:
   a. **Authentication Type**: This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports both Windows and SQL server authentication process. Example: Windows.
   b. **User ID**: This field is used to enter the SQL user ID for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   c. **Password**: This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   d. **Advanced Settings**: This is an optional field. It is used to enter any additional connection information such as connection Timeout etc. Example: Connection Timeout = 20.

      While creating a data source for repository, use the following custom settings to set properties for the connection pool.

      encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;

      encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

      enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks controls the transaction from escalating to a distributed transaction which is very expensive.

      The above property can be used to turn off this feature. The default value is set as True.

      connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

      maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

      sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

      Note: These settings are case sensitive and should be mentioned only in lower case.
   e. **Database**: This field is used to select the machine with database installed. Example: FarmDB.

      AVEVA Work Tasks will validate if at least one server is installed.
4. Click **Test Connection** to ensure database connectivity.

   You must have the following permissions on the Database Server:

   SELECT, INSERT, UPDATE, and DELETE permissions.

   EXECUTE permission for Stored Procedures.
5. Click **Next** to continue with the wizard.
6. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Define and Provision the Enterprise Console

You can define the required AVEVA Work Tasks services.

Steps to Define Enterprise Console

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.
2. Click **Next**.

   The **Installing Services** screen appears, indicating the progress of installation.

   A message *Installation is Complete* appears after all the services are installed.
3. Click **OK**.

Create a Repository DataSource

A **Repository DataSource** is used to store all repository related data. The **Repository DataSource** must be created on a machine where the **Central Configuration** site is installed.

Example

A TelematicsDataSource is created for TelematicsHR Repository.

A Repository contains Workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating the repository.

To create a Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**.

   The Central Configuration web page appears.
2. Click **DataSource Settings**.

   The Datasource List page appears.
3. Click **Add**.

   The Manage Datasource page appears.
4. Enter the required details.
   a. **Name**: Enter a valid data source name. Example: *TelematicsDataSource*.
   b. **Description**: Enter a description for the data source. Example: *This data source is used to store connection details*.
   c. **Connection String**: Select this option to establish a connection with the database. The connection string contains fields that that defines the connection. The connection information is encrypted and stored.

      Server Name

      To use a database on the local machine, enter "localhost", ".", or the local computer's name for the **Server Name**.

      Note: Server Name can be machine name/IP address/SQL Server AlwaysON/SQL Server instance name. Instead of entering "local host", it is preferable to give the local machine name.

      If the **Database Type** is **SQL Server**, then specify an IPV6/IPV4 address for the **Server Name**.
      To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: *localhost,1455*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be *<server name>\SQLExpress*.

Authentication Type

Use this field to determine the process to validate a user who is trying to connect to the database. AVEVA Work Tasks uses Windows and SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. The **User ID** and **Password** field is disabled if Windows Authentication is selected. Example: *Windows*

Advanced Settings

Use this field to define advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection.
Example: *Connection Timeout = 20*
or
For defining maximum connections that can be opened in a connection pool.
Example: *max pool size = 250*
Default connection pool is set as 250. We recommend to enter a higher value on heavily loaded environment.
While creating a data source for a repository, use the following custom settings to set properties for the connection pool.
encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.
enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature, AVEVA Work Tasks controls the transaction from escalating to an expensive distributed transaction.
The above property can be used to turn off this feature. The default value is set as *True*.
connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is 30 seconds. The value should be set in seconds.
maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is infinite.
sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.
These settings are case sensitive and should be mentioned only in lower case.

Database:

Specify or select a database that can be used as a repository database. This database stores all repository related data. The repository database is created if it does not exist on the database server instance.
Example: *TelematicsDB*

Enable Table Partitioning:

Select to enable database table partitioning. For more information, see Partitioning Database.

d. **Connection Provider**: Use this to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The selected dll must be copied to all the machines, all servers and all clients, that are connected to the current Farm.

Assembly Path

Click to browse and choose the required dll file.
To use custom properties (enableltm, connectionretrywaittime, maxconnectionretries, and sqlcommandtimeout) in the Assembly connection string, the database must be created before.
See *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Developer Guide* for creating the assembly. Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.

   A message about successful test connection appears.

6. Click **OK**.

   A message about successful creation of the data source appears.The message also states that the required tables will be created in the data source after a repository is associated with the data source.

When a data source is saved, an entry is created for the data source in the **Farm Database**. When a first repository is created for the data source, AVEVA Work Tasks tables are added to the data source. While creating a data source, the archival database is created with the same database name suffixed by *_BI*. This database is used for archival in future use.

Note: After you configure the AVEVA Work Tasks, you must add the created **Farm Database** to the **SQL Server AlwaysOn Availability Groups**. Contact your Database Administrator to add the database to **SQL Server AlwaysOn Availability Groups**.

To view the data source created, click **DataSource Settings** link.

Create a Repository

A **Repository** contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

To create a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The Central Configuration page appears.

2. Click **Repository Settings**.

   The Repository List page appears.

3. Click **Add**.

   Note: If the number of repositories exceeds the permitted limit for the license, then the message "You have exceeded the maximum number of repositories" appears, and the repository creation is stopped. Click **Close**.

   The **Manage Repository** page appears.

4. Enter the required details.
5. Click **OK**.

   The **Config Administrator** page appears.

6. Click to configure an administrator.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The User Lookup dialog box appears.

7. Select the provider from the provider drop-down list.
8. Enter the details to search the administrator for the repository that is created.

   Note: You can also search a user based on *ObjectSID* and *objectGUID* (applicable only for Active Directory provider).

9. Click **Search**.

   The user is listed under **Available Resources**.

10. Select and click the arrow to list the user under **Selected Resource**.
11. Click **Update**.

    The selected user is displayed in **User Lookup**.

12. Click **OK**.

    A message confirming the successful creation of an administrator appears.

13. Click **OK**.

    The **Repository List** page appears.

    For more information about configuring the system user, see Configure System User.

Manage Repository Window Fields

The following table explains the fields of the Manage Repository window:

Field Name	Description	Example
Repository DataSource	Lists all the data sources created in a Farm. The selected data source will be used to store data for the current repository.	TelematicsDatasource
Attach DataSource	Select Attach DataSource checkbox and then select a repository from the selected DataSource .Data associated with the selected repository will be copied to the new repository. The version of the installed product and destination DataSource should be the same as that of the DataSource from which the repository data is to be copied. For example, in an upgraded environment, from build Work Tasks version 1 to Work Tasks version 2, you cannot attach a DataSource created in build Work Tasks version 1 to build Work Tasks version 2.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	To match the build version of the installed product to the version of the DataSource: 1. If the DataSource was created in build Work Tasks version 1, then the entire build Work Tasks version 1 must be upgraded to Work Tasks version 2 by running the product installer in the upgrade mode. 2. All the Farm, DataSources, Repositories, and Lists of build Work Tasks version 1 must be upgraded to build Work Tasks version 2 by running the AVEVAWorkTasksUpgradeManager.exe located at the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder. 3. After upgrading all the AVEVA Work Tasks components to build Work Tasks version 2 build, that DataSource can be used in any machine that has same version by using this feature.	
Repository Name	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the repository name.	Telematics Repository
Description	Provide a description for the repository.	This stores Telematics Employee Leave Details.
From mail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might	Provide the valid email id that is specified in the **User Name** field while configuring **SMTP Settings** in the **Mail Server Settings** page. For more details, see Mail Server Setting.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	occur in the Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be sent to the mail ID defined in **Exception to mail**. The From address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To avoid this, restart the Workflow Engine Service and Communication Service.	
Exception to mail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails is sent to the email ID specified in **Exception to mail**.	Provide the valid email id.
Alert initiator of the Workflow	Determines if the status of a workflow should be sent as a notification mail to the initiator of the workflow.	A process with a rule to check the pending leave available for the employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
Servers	Lists the servers available in the Farm. Repository will be available only to the mapped servers.	Work Tasks Server Name
Enterprise Consoles	Lists all the Enterprise Consoles for a selected AVEVA Work Tasks Server. Repository will be available only to the mapped Enterprise Console.	http://worktaskservername:8001/EnterpriseConsole
Enable Theme	Select this checkbox to enable the defined theme.	-
Theme Name	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. It provides **Default** and **Lite** themes.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Resource Provider	Lists the various default resource providers supported by AVEVA Work Tasks. Resource providers are also termed as User Provider. A User Provider is a data store containing information about the user. AVEVA Work Tasks also supports custom resource provider. For more information about Resource Provider, see User Providers. AVEVA Connect and Azure Active Directory resource providers are also available after you configure them. To configure these providers, see AVEVA Connect Settings and Azure Active Directory Settings. AVEVA Work Tasks allows secured LDAP configuration. The default port number for LDAPS is 636. You can map the repository in IDE and use the Secured LDAP. The logged-in Active Directory is displayed by default, and **Active Directory Datasource** expects **LDAP://** or **Fully Qualified Domain Name** as value.	AVEVA Work Tasks Lists or Active Directory
Custom Application Folder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with a semicolon.	-
Hide Repository	Select this option to make the repository unavailable to the Farm.	-
Source path	Enter the path to the Source Elements Folder.	-
Attachment Storage Path	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	absolute path. - The default path is the **Attachments** folder in *C:\ProgramData\AVEVA Work Tasks*. - The default path is used when no path is specified. - Ensure appropriate rights are set to the folder, where attachments are stored, for the following identities: -- The application pool identity for **Central Configuration** and **Enterprise Console(s)**. -- The account configured for the **Workflow Engine** service. - In case of mapped drives, ensure they are available to the identities. - In multiple-server environments, the path specified must be in a shared location.	

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Auto Log Off Settings for Enterprise Console	Automatically logs out the logged in user after the designated period of inactivity. Enter the time in minutes. This field accepts only valid integer values between 0 to 360. 0 minute means the user will not get automatically logged off. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. The default value for automatic log off is 30 minutes. You use this field to define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML.	0 to 360 (minutes)
Auto Log Off Settings for AVEVA Work Tasks Pro	Request for user credentials for AVEVA Work Tasks Pro app after the set time is elapsed. Enter the time in minutes. This field accepts only valid integer values between 0 to 2880. 0 minute means the user will not get automatically logged off. The default value is 30 minutes. If AVEVA Work Tasks Pro app is offline, the Auto Log Off will not get active, and the user will not be automatically logged off as per the defined settings.	0 to 2880 (in minutes)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
Offline Support	Select this option to enable offline submission of items in AVEVA Work Tasks Pro app.	-
Refresh on Work Item submission	Select this option to enable Inbox refresh on Work Item submission in AVEVA Work Tasks Pro . Refresh option is enabled by default.	-
Timeout	Enter the time in seconds to set the timeout. If the value is set as 0, then there is no timeout. Default value is 60 seconds.	-
Label for Fill Form	Enter the label for Fill Form. The customized label will be displayed for the Fill Form in AVEVA Work Tasks Pro.	Work Tasks
Date Configuration Flag for Alternate Actors	Select the **Enable Date Settings** option to set the **From** date and **To** date as mandatory while creating alternate actors. For more information about creating alternate actors, see *Alternate Actors* topic in the *User Guide*.	-
Display Domain name with User Name	Select this checkbox to display the domain name along with the user name in the Enterprise Console and the List. The domain name will be displayed only: • If this checkbox is selected. • If the **Resource Provider** is selected as **Active Directory**.	-

User Providers

AVEVA Work Tasks supports the following User Providers by default:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Active Directory

When you select **Active Directory** as the **Resource Provider**, details such as **Active Directory datasource** and the **Active Directory search base** are populated by default.

Authentication User, **Authentication Password**, **User Log-on ID**, and **User Log-on Display Name** are optional fields. Access to the active directory might not be available for all users. In such cases, provide the active directory authentication user name and the active directory authentication password with which you can connect to the Active Directory.

AVEVA Work Tasks considers *SAM-Account-Name* as **User Log-on ID** by default. If you want to use active directory attributes other than the *SAM-Account-Name* user, then enter the desired active directory attribute details in the **User Log-on ID** field and **User Log-on Display Name** field. **User Log-on Display Name** is the user friendly display name of the active directory attribute. This **User Log-on Display Name** is referred in the User Lookup dialog box against the **User Log-on ID**.

Steps

1. When you select **Active Directory** as the **Resource Provider**, then the **Use Token Service** field appears. In this field, select one of the following:
   - If you do not want to use AIM authentication, select **Without Token Service**.
   - If you want to use AIM authentication, then select a server from the list of alias server names.
2. Enter **Active Directory datasource**.
3. Enter **Active Directory search base**.
4. Enter **Domain Name**.

   The domain name is case-sensitive.
5. Enter **Authentication User**.
6. Enter **Authentication Password**.
7. Check **Is Cross Domain Role Provider** checkbox, if cross domain users and roles mapping is required.

   Example: Users *John* and *Jim* of domain *TelematicsU* and users *Mike* and *Bob* from domain *TelematicsAU* are added to role Team HR of domain *TelematicsMain*.
8. Enter **User Log-on ID** if you want to use another Active Directory attributes instead of *SAM-Account-Name*.

   We recommend to use attributes of type *string* as input for **User Log-on ID.** However, *ObjectSID* and *objectGUID* are also supported.

   After you set the **User Log-on ID**, you cannot change it later.
9. Enter the **User Log-on Display Name**.

   After you set the **User Log-on Display Name**, you cannot change it later.

   This is the default display name of the user account of the active directory user used. **User Log-on Display Name** is used in user lookups.
10. Click **Test LDAP**.

    A message about successful LDAP test appears.

Note:
- Some of the active directory attributes or properties are not indexed. If you use an active directory attribute that is not indexed, it might impact the log-on validation performance based on the active directory entries. We recommend to use indexed attributes as **User Log-on ID** or index the attributes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- For an upgraded repository, you cannot change both **User Log-on ID** and **User Log-on Display Name**.
- You cannot localize **User Log-on ID** and **User log-on Display Name** fields.
- Disabled users will not be shown in user lookup search.

Using Forms

For Forms Resource Provider:

- If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.

1. In the **Resource Provider** drop-down list**,** select **Forms.**
2. In the **User Entity properties** field, enter XML data.

   Click **Sample Code** to get the XML Schema Template.

   Example

   ```
   <properties>
   <property name="userid" type="string" purpose="identifier" />
   <property name="username" type="string" purpose="name" />
   <property name="pwd" type="string" purpose="password" />
   </properties>
   ```
3. In the **User Provider Properties** field, enter the same XML Schema.

   There must be at least one identifier in the XML Schema. For example, UserID
4. In the **Datasource** field, enter a valid data source or specify a dll.

   The value for the data source can be specified as **Physical path of the dll** or **Physical path of the dll::param. Param** is not mandatory.

   See topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Build Business Process* section for creating the assembly.

   Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly, whereas one class can return multiple connection strings.

   Examples of data source parameter:

   - c:\DLLStore\GetConnectionString.dll
   - c:\GetConnectionString.dll::Leave

   If there are two data sources, *Leave* and *Licensing*, and only one DLL is used to return a connection string based on the data source selected. The parameter can be specified as **c:\GetConnectionString.dll::Leave** or **c:\ GetConnectionString.dll::Licensing**. The connection string can be returned from the connection dll based on this parameter.
5. Enter a proper table name or view name which holds the User Name and Password for the Authentication purpose.

   Example: Passmast (the table which is available in IMS_NEW Database)
6. Click **Test SQL Connection**.

   A message about successful test connection appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using ASP.NET Membership

This resource provider lists users defined in the asp.net membership database.

Lists

This resource provider lists users created using AVEVA Work Tasks Users Creation. If you are unable to determine a User Provider to create a repository, use AVEVA Work Tasks Lists.

To verify successful creation of the Repository:

1. Click **Enterprise Console** URL from the site path column.
   The repository created is listed.
   Add the created Enterprise Console link into "Add to Favorites" to easily navigate in future.
2. Click **Repository User Provider** link to logon to the repository.
   The Enterprise Console log-on page appears.
3. Enter the logon details, and then click **Login**.
   The Enterprise Console home page appears. This indicates successful creation of a Repository.
   All features can only be available for a user with administrative privileges.

Note: Consider you created the Repository and then deleted it. If you create the same Repository again immediately and try to log into it through Enterprise Console, the Provider does not list the Repository. You need to access IIS and recycle AVEVA Work Tasks from the Application Pool to get the Repository listed in the Provider list..

Verify the Installation

After you install AVEVA Work Tasks, verify that the product is installed successfully. To verify successful installation, create a simple Workflow using Process Designer. The tasks includes the following:

- Creating a Workflow
- Publishing the Workflow
- Testing the Workflow

Creating a Workflow

1. Log on to the **Enterprise Console**.
2. If the Repository is configured for Active Directory provider, go to step 4.
3. Enter the **User Name** and **Password**.
   The **User Name** and **Password** will be validated with the user provider selected while creating the repository.
   The default authentication provider is the Repository User Provider List.
4. In the **Enterprise Console**, click menu icon.
   All features can only be available for a user with administrative privileges.
5. From the menu, select **Workflows**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Workflow window appears.

6. On the Action bar, click **New**, and then click **Workflow**.
   The New Workflow window appears.
7. Enter **Title** and **Description**.
8. Click **Save & Continue**.
   The successful message appears.
9. Select **Design the Workflow now**.
   This is the default option.
10. Click **Finish**.
    The Process Designer window appears.
11. From the activities pane on the left, drag the Information activity to the Process Designer window.
12. The activity *Information1* is created.
    Click to create a link between two activities.
    The Link Action window appears.
    a. Select from the **From Action** drop-down box.
    b. Select from the **To Action** drop-down box.
    c. Click **OK**.
       The link is established.
13. Right-click *Information1*.
14. Select **Activity Properties** from the context menu.
    The Activity Properties pane appears.
    a. Enter **Name** and **Description**.
    b. Click to **Assign Actor(s)**.
       The Assign Actor(s) window appears.
    c. Select the required provider from the **Providers** drop-down list.
    d. Select values from the drop-down list.
    e. Click **Add**.
    f. Click **Update**.
15. Click to enter the **Subject** for Notification Contents.
    The window to enter subject for notification appears.
16. Click **Update**.
17. Click to enter the **Body** for Notification Contents.
    The window to enter the Body content appears.
18. Click **Update**.
19. From the Activity Properties pane, click **Save**.

Publishing the Workflow

1. On the **Publish** menu, click **Publish**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Published successful message appears.

2. Close the dialog box.

   The Enterprise Console screen lists the workflow created.

Testing the Workflow

1. Select the listed workflow.
2. Right-click the selected workflow.
3. Click **Publish and Test Run**.

   The **Status Finished successfully** appears.

   If Status is **Execution Pending** in the Process Execution window, then click on the **Refresh** button to get the status.
4. In the **Enterprise Console** menu, select **Inbox**.

   The Inbox lists the work item.
5. Click to view the work item listed.

   This indicates that the installation is successful.

Install and Configure AVEVA Work Tasks in Silent Mode

You can install and configure AVEVA Work Tasks in silent mode. This is useful when the product is installed and configured as part of another product installation.

For example, while installing an OEM product, AVEVA Work Tasks can be installed as a part of the OEM product installation. AVEVA Work Tasks provides extension, integration, and embedding capabilities in different form. To leverage these capabilities with another product, AVEVA Work Tasks product can be installed as part of that product.

Prerequisites for Installing and Configuring in Silent Mode

- Before installing AVEVA Work Tasks in silent mode, ensure that all the prerequisites are installed. For more information about installation prerequisites, see Installation Prerequisites.
- Before configuring AVEVA Work Tasks in silent mode, ensure that the **WWSKBPMConfig.xml** and the **WWSKBPMConfig.xsd** files are available in the "Bin" folder.

Install in Silent Mode

You can install AVEVA Work Tasks in silent mode using AVEVA Work Tasks Installer with switches for silent mode.

The installation of AVEVA Work Tasks in silent mode considers user inputs from command-line parameters.

The full syntax for running the installer from the command line is as follows:

<Installer EXE Name>.exe /S /v/qn

For example: AVEVA Work Tasks 2023 SP1.exe /S /v/qn

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

where,

- /S denotes silent install
- /v denotes pass arguments to Msiexec (Basic MSI and InstallScript MSI projects). The /v option is used to pass command line options and values of public properties through to Msiexec.exe.
- /qn denotes an msiexec switch indicating to run with no user interface (UI).

This command string takes the default values for parameters, such as user name, installation location, and company name.

Silent installation command with custom values for parameters

If you want to provide custom values for these parameters, then enter the syntax for silent installation command as follows:

<Installer EXE Name>.exe /S /v"/qn INSTALLDIR=\"<Custom Path>\""

For example: AVEVA Work Tasks 2023 SP1.exe /S /v"/qn INSTALLDIR=\"C:\InstallationTest\""

Note:
- After you run the silent installer, wait for a minimum of 30 minutes until the installation is complete. Check the AVEVA Work Tasks installation folder to ensure that all the required files and folders are copied to the installation folder.
- Silent Installation of Work Tasks may exit after installing the .Net Framework 4.8 prerequisite. Machine restart is required for the .Net Framework to be considered as installed and only then can our installer proceed to the next pre- requisite.

You can also call the Installer from a batch file. For more information about sample batch file script for installing and configuring AVEVA Work Tasks in silent mode, see Sample Batch File Script for Installing and Configuring Workflow Management in Silent Mode.

Configure in Silent Mode

You can configure AVEVA Work Tasks in silent mode using the **AVEVAWorkTasksConfigurator.exe** console application, which is provided as part of the installation. The console application takes the required input from command line parameters or from the parameters configured in the Configuration file **WWSKBPMConfig.xml**.

Note: Only HTTP communication can be configured when AVEVA Work Tasks is installed using Silent Installation.

Configure in Silent Mode Using XML

You can configure AVEVA Work Tasks by defining values for parameters in the **WWSKBPMConfig.xml** configuration file.

1. Browse to the "Bin" folder, which is available in the path where the product is installed.
2. Open the **WWSKBPMConfig.xml** file.
3. Pass the values for the parameters available in the **WWSKBPMConfig.xml** file as per the requirements.

   You can individually configure the following settings in silent mode by specifying appropriate values for the **ConfigurationType** parameter, as listed in the table below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration Tasks	Value for the ConfigurationType parameter
Configuring License Server	AVEVALicensing
Configuring Farm	FarmDatabase
Configuring Data Source	DataSource
Configuring Repository	Repository
Configuring Client	Client

If you want to configure all the above settings together, then pass the value for the **ConfigurationType** parameter as **All**.

All the parameters in the configuration file are listed in the following table.

4. Save the XML file.
5. Open the Command Prompt in the Administrative mode.
6. Enter the path for the "Bin" folder, which is available in the path where the product is installed, and then press **Enter**.

   For example: CD <AVEVA Work Tasks Install Path>\Bin
7. On the Command Prompt, type **AVEVAWorkTasksConfigurator.exe**.

   The configuration progress is displayed in the **WTLogger Console**.

Settings Category	Node	Description
ConfigurationType	ConfigurationType **Note:** This is a mandatory parameter.	Enter the type of configuration you want to perform in silent mode. The values available are: • All • AVEVALicensing • FarmDatabase • DataSource • Repository • Client
FarmConfiguration > AVEVALicensing > LicenseServer	LicenseServerName **Note:** This is a mandatory parameter.	Enter the name of the License Server.
	LicenseServerPort **Note:** This is a mandatory	Enter the port number used by the License Server. Ensure that the port number is valid.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	parameter.	
FarmConfiguration > FarmDatabase	EnableLoadBalancing	Enter either True or False. If the value is set to True, load balancing is enabled on the server. If the the value is set to False, load balancing is disabled on the server.
Farm Configuration > FarmDatabase > ConnectionString	DatabaseType	Enter the database type. The default value is SQL Server.
	FarmDatabaseName **Note:** This is a mandatory parameter.	Enter the name of the Farm database.
	ServerName **Note:** This is a mandatory parameter.	Provide information about the database server on which the Farm database can be installed. If SQLExpress Instance need to be used as a Database instance of Farm database, then **Server Name** should be <server name>\SQLExpress. To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455
	AuthenticationType **Note:** This is a mandatory parameter.	Provide information on the process used to validate a user. AVEVA Work Tasks solution supports both Windows and SQL Server authentication process. Example: Windows

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	UserID	Enter the SQL User ID for SQL if the authentication type is SQLServer. Enter the Windows User ID along with the domain or host name, if the authentication type is Windows.
	UserPassword	Enter the password for the specified user ID.
	IsPasswordEncrypted	Enter either True or False. If the value is set to True, then enter the password in encrypted format. **Note**: To encrypt a password string, - Use SE.BPM.Converters.dll reference in the project. - Use Encrypt(3) to encrypt password string. Sample code: String password = “$kelta001”; String encryptedPassword = password.Encrypt(3); If the value is set to False, then enter the password in plain text format.
	DatabaseAdvanceSettings	Enter any additional connection information, such as connection Timeout. Example: Connection Timeout = 20. While creating a data source for repository, use the following custom settings to set properties

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description

		for connection pool. These settings are case sensitive and should be mentioned only in lower case.
		
		`encrypt=true;`
		`enableltm=true;`
		`connectionretrywaittime=30;`
		`maxconnectionretries=10;`
		`sqlcommandtimeout=300;`
		
		• **encrypt**: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption..
		
		• **enableltm**: AVEVA Work Tasks internally implements light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks control the transaction from escalating to a distributed transaction which is very expensive. This property can be used to turn off this feature. The default value is set as True.
		
		• **connectionretrywaittime**: While opening a new

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		connection, if the data base server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds. • **maxconnectionretries**: While opening a new connection, if the data base server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite. • **sqlcommandtimeout**: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.
GlobalSettings > Communication > EmailSettings	Host	Enter the name or IP address of the mail host.
	SMTPPort	Enter the port number for sending e-mails. The default port is 25.
	SSL	Define whether the e-mail has to be secured by SSL before it is sent. The default value is False.
	EmailTimeout	Enter timeout for e-mails in seconds. The default timeout is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		10000.
	SMTPUserName	Enter the user name for logging in to the mail server.
	SMTPPassword	Enter the password.
	IsSMTPPasswordEncrypted	Enter either True or False. If the value is set to True, then enter the password in encrypted format. If the value is set to False, then enter the password in plain text.
GlobalSettings > Communication > EmailSettings > ExceptionEmailSettings	FromEmail	Enter the e-mail Id from emails detailing exceptions in workflow execution need to be sent.
	ToEmail	Enter the e-mail Id to which exceptions must be sent.
Global Settings > Communication > EmailSettings > ExceptionEmailSettings > IMSettings	UserName	Enter user name in which IMs must be sent.
	Password	Enter the password.
Global Settings > Communication > Service Monitor Setting	Service Monitor Port	Enter the port number. This is the default port used by the AVEVA Work Tasks Service Monitor EXE.
Global Settings > HTTP > URLEncryptionSettings	UseHTTPContext	Enter True to use HTTP context. Enter False if you do not want to include http context info while building the secure query string parameter used internally in AVEVA Work Tasks controls to pass information from one page to another.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	HardcodedCorrectionFactor	This field is used to set a flag primarily used for load testing. The date correction factor used by AVEVA Work Tasks is retrieved through a cookie from client browser. This value cannot be derived when testing using ACT or any other load test tool. If this factor is set to True, AVEVA Work Tasks always uses the date correction factor for converting UTC date time stored in AVEVA Work Tasks tables to the local time. The default value is False.
Global Settings > HTTP > HTTPProxy	HTTPProxyURL	Enter the URL for HTTP Proxy.
	HTTPProxyUser	Enter a user name for HTTP Proxy.
	HTTPProxyPassword	Enter a password.
	HTTPProxyDomain	Enter the domain name.
	BypassLocalRequest	Enter True to bypass local requests.
	BypassList	Enter list of URLs in the bypass list; requests from a URL in this list will be ignored.
	IsHTTPProxyPasswordEncrypted	Enter either True or False. If the value is set to True, then enter the password in encrypted format. If the value is set to False, then enter the password in plain text.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
Global Settings > LogTransaction	DebugLevel	Select from three debug levels. • Level 1 shows minimal information in the AVEVA Work Tasks Logger Console, giving only information on the start and end of the workflow. Error messages are also shown in this mode. This is the default mode. • Level 2 shows detailed information of what is happening in the background. It will show all the messages logged from the actions. • Level 3 shows only messages indicating whether the action is executed. All error messages logged in the logger console will be sent to receiver email specified in Exception Emails.

	PersistExceptionInDatabase	Enter either True or False.
		• If the value is set to True, you will be allowed to persist the exceptions which are logged in AVEVA Work Tasks logger console to the repository database. This in turn allows you to view exceptions at the following levels:
		  • Workflow level
		  • Workflow Instance level
		  • Activity level
		• The default value is False. If the value is set to False, you will not be allowed to persist the exceptions which are

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		logged in the logger console to the repository database.

	PersistWarningInDatabase	Enter either True or False.
		• If the value is set to True, you will be allowed to persist the warnings which are logged in AVEVA Work Tasks logger console to the repository database. Which in turn allows you to view warnings at the following levels:
		  • Workflow level
		  • Workflow Instance level
		  • Activity level
		• The default value is False. If the value is set to False, you will not be allowed to persist the warnings which are logged in the logger console to the repository database.

GlobalSettings > FileWatcher	IterationCount	Set the iteration value for a file copy process. The default value is 200.
	FirstAttempt	The value in this field indicates the wait time after a file copy command is executed for the first time. This wait time is provided for an event to be generated after the file copy process is complete. The value specified is in milliseconds. The default value is 2000.
	NextAttempt	The value in this field indicates the wait time for subsequent attempts. The value specified is in

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		milliseconds. The default value is 4000. **Example** The value 4000 indicates that the wait time for subsequent attempts is four seconds.
GlobalSettings > MachineSettings	MachineAddress	Enter the address of the machine on which AVEVA Work Tasks is installed.
WorkflowEngineSettings > EngineSettings	WEServerPort	Enter the port number used by the Workflow Engine Service. The Workflow Engine communicates with other services using this port. The default value is 8855.
	WELoadBalanceServerPort	Enter the port number for the Load Balanced Server. This field is disabled if Load Balanced value is set to False.
	WELoadBalanceClientPort	Enter the port number for the Load Balanced Client. This field is disabled if Load Balanced value is set to False.
WorkflowEngineSettings > AutoResumeSetting	RepositoryNames	Enter the name of the repository.
	EnableLoggingAutoResumeMessage	It enables you to control the log messages in the logger console whenever the engine tries to resume the respective workflow instances.
WorkflowEngineSettings >	NoOfRetriesToResumeFEWorkflo	Enter the number of attempts

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
AutoResumeSetting > FEWorkflows	wInstances	that the Workflow Engine should make to resume the FE workflow instances. For example, if this value is set to 5 then the workflow engine would make 5 attempts to resume each of the FE workflow instance. If this value is set to 0 (zero) then, then auto resume of FE workflow instances does not occur.
	RemoveResumeHistoryOnFEWorkflowInstanceCompletion	If the value is set to True, the history of resumed FE workflow instances which have completed successfully would be deleted from the SWFECOUNT table. If the value is set to False, the history of resumed FE workflow instances which have completed successfully would be retained in the SWFECOUNT table.
	NoOfFEWorkflowInstanceToFetchSpecifiedTimeInterval	Set the number of workflow instances to be fetched for auto resume in the specified time interval.
	FETimeSpan	Set the time interval for resuming FE workflow instances. The value entered should be greater than 5 minutes.
WorkflowEngineSettings > AutoResumeSetting > EPWorkflows	EnableAutoResumeEPWorkflowInstance	Enable or disable auto resume of EP workflow instances.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	FetchWorkflowinstanceWhichHaveBeeninEPStateFor	Set the minimum time for which the workflow instances should have been in EP state. The value should be entered in days.hr:min:sec format. If this value is set as 5, the workflow engine tries to fetch the workflow instances which have been in EP state for at least 5 hours. The workflow engine calculates the time for which the workflow instances have been in EP state by comparing the LastUpdatedDateTime value from SWExecute table with the current time. The default time for which workflow instances have been in EP state is 5 hours. If the time set is less than 5 hours, then by default, the engine considers 5 hours as the minimum time.
	TimeIntervaltoFetchEPWorkflowInstances	Set the time interval for resuming EP workflow instances. Minimum value should be greater than 5 minutes.
	NoofEPWorkflowInstancesToBeFetchedInSpecifiedTimeInterval	Set the number of EP workflow instances to be fetched for auto resume in the specified time interval.
WorkflowEngineSettings > AutoResumeSetting > PendingWorkflows	EnableAutoResumeOfPendingWorkflowEvents	Enable or disable auto resume of pending workflow events.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	MinimumTimeForWhichTheWorkflowEventsAreinPendingState	Set the minimum time for which the workflow events should be in Pending state. If this value is set as 0.5:0:0, the workflow engine will fetch the events which are in Pending state for at least 5 hours. The workflow engine calculates the time for which the workflow events have been pending by comparing the LastUpdatedDateTime value from SWExecute table with the current time. The default time for which workflow events should be in pending state is 5 hours. If the time set is less than 5 hours, then by default, the engine considers 5 hours as the minimum time.
	TimeIntervalToFetchWorkflowInstancesWithPendingEvents	Set the time interval for resuming workflow instances with pending events. Minimum value should be greater than 5 minutes.
	NoOfWorkflowInstancesWithPendingEventsToBeFetchedIn SpecifiedTimeInterval	Set the number of workflow instances with pending events to be fetched for auto resume in the specified time.
AdvancedServerSettings	MultiCastPort	Use this port to check the connectivity between all the machines while running the Load Balanced Server. This is not used if the **Enterprise Server Mode** is **Database**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	HeartbeatInterval	Specify the heartbeat interval for the Enterprise Server. The default value is 3000 ms.
	HeartBeatTimeout	Specify the heartbeat timeout value for the Enterprise Server. The default value is 10 seconds.
	AverageCPUCount	Specify the average CPU count for the Enterprise Server. The default value is 10.
	MultiCastIP	Displays the multicast IP address. The default values are: • IPv4: 225.0.0.10 • IPv6: FF02::1
	TCPPort	Communication between the Workflow Engine and the Advance Server service is established through this port. This port is used to get the status of the least used server, and also analyze server performance. The default value is 8853.
	ASMode	Select the mode as Multicast or Database. • If you select the mode as Multicast, then it uses the configured Cluster Port, Cluster IP, and Multicast Local IP to share its server status with other servers. • If you select the mode as Database, the server status is stored in the database and is shared with other servers.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		The default value is Multicast.
	LocalIP	Displays the local server name or IP address. IP address supports both IPv4 and IPv6 address types.
	MultiCastLocalIP	Displays the multicast server name or IP address. Local IP address supports both IPv4 and IPv6 address types. This field is not used if you select the **Enterprise Server Mode** as **Database**.
TaskSchedulerSettings	TSServerPort	Enter the port number used by Task Scheduler service. This value must be modified if the default port value is in use. The default value is 8856.
	TSLoadBalancedServerPort	Enter the port number for the Load Balanced Server. This field is disabled if Load Balanced is set to False. The default value is 8853.
	TSLoadBalancedClientPort	Enter the port number for the Load Balanced Client. The default value is 8860.
	TaskFetchInterval	Enter the interval in seconds at which tasks have to be retrieved. The default value is 60.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	TSFileWatcher	Define a folder for File Watcher operation.
	TSThreadPoolSize	Define a thread pool size for the Workflow Engine. A thread pool size determines the number of threads reserved by a server for providing service requests. For the Workflow Engine deployed in a heavy load scenario, a higher thread pool size needs to be set. The default value is 25.
CommunicationServiceSettings > CommunicationServer	ListenerIPAddress	Enter the IP address to be monitored for incoming emails. This field defaults to the name of the logged in machine.
	ListenerPort	Enter the port number for the Listener IP Address. The default value is 8770.
	WaitTaskHandlerPath	Enter the assembly navigation path for handling timeouts and e-mail received.
	TaskHandlerClass	Enter the Class name for handling timeout tasks and incoming emails.
	BlockMailAddresses	Enter the e-mail addresses that should be blocked from processing.
CommunicationServiceSettings > CommunicationServer > AdvancedServerSettings	LoadBalancedServerPort	Enter the port number used by the Enterprise Server. This value must be modified if the default port value is in use. The default value is 8853.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	LoadBalancedClientPort	Enter the port number for the Client. The default value is 8864.
CommunicationServiceSettings > MailServer > Default	CommunicationServiceServerIP	Enter the IP address of the server where the Communication Service is installed.
	CommunicationServiceServerPort	Enter the Port number used by the Communication Service. The default value is 25.
CommunicationServiceSettings > MailServer > POP3	POPMailHost	Enter the IP address of the POP Mail Host.
	POPTimeInterval	Set the time interval to check the mail server for emails. The format for this field is day.hour.minute.seconds. The default value is 0.00:00:15.
	POPMailPort	Enter the port number for receiving e-mails. The default value is 110.
	IsSPAEnabled	Specify if a Secure Password Authentication is provided. The default value is False.
	IsPOPProvideEncryptedPwd	Enter either True or False. If the value is True, then enter the password in encrypted format. If the value is set to False, then enter the password in plain text.
	IsPOP3PasswordEncrypted	Enter either True or False.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		If the value is True, then enter the password in encrypted format. If the value is set to False, then enter the password in plain text.
	POPUsers	Enter the User Name and password of POP3 user.
CommunicationServiceSettings > SMSReceiver	EnableSMSReceiver	This field enables the Communication Engine to check for SMS. The default value is False.
	SMSTimeInterval	Enter the time interval at which the AVEVA Work Tasks Engine must check for SMS in the phone device. Example: 0.00:01:30 = 1 minute 30 secs The default value is 0.00:01:00.
	SMSTaskPath	Enter the Assembly path for handling timeout actions and warnings.
	SMSTaskClass	Enter the class name for handling timeout actions and warnings.
	NotificationSMSProvider	Enter the Assembly path for handling timeout actions and warnings.
CommunicationServiceSettings > SMSReceiver > ProviderConfigurations	ProviderConfiguration	These parameters are used for configuring the SMS infrastructure (sending and receiving SMS).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		• SMSProviderDeviceSettings: 8 databits, no parity, 1 stopbit • SMSProviderDialString • SMSProviderProviderType: Standard TAP provider You can specify 0 for UCP Provider, 2 for TAP provider, no request for LineFeed, and 3 for TAP provider, no request for EOT. • SMSEmailProviderAssembly • SMSEmailProviderClass • SMSEmailProviderEmailServer Enter the details specific to your service provider. AVEVA Work Tasks currently supports only GSM protocols for receiving SMS. • **Name**: Enter the name of the service provider. • **Assembly**: Enter the path. • **Class**: Enter the class name for receiving SMS. • **Device**: Enter device details.
CommunicationServiceSettings > SMSConfig	ConnectionSequences	Enter the sequence in which the Engine must choose the connection type for sending SMS. • **Connection Type**: This column is used to list the various connection types such as GSM, SMSPatternMatch, EmailProvider, SMSServiceProvider, and Hayes. • **Sequence Number**: This column is used to list the sequence of each connection type.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
CommunicationServiceSettings > SMSConfig > ResourceField	SMSResourceFieldsEmail	This field is mapped to the connection sequence table for sending SMS. The fields are mapped in the user provider for sending SMS. The three fields - Email, Mobile Phone Provider, and SMS Number are required to be mapped to the table. Some providers allow SMS to be sent through email. Enter your email address in the email field to send SMS to these providers.
	SMSResourceFieldMobilePhoneProvider	This field is mapped to the table for sending SMS. Enter the name of the Mobile Phone Provider in this field. Example: Hutch
	SMSResourceFieldSMSNumber	This field is mapped to the table for sending SMS. Enter the phone number to which the SMS has to be sent.
CommunicationServiceSettings > SMSConfigCustom > SMSPatternMatch	SMSPatternMatchAssembly	Define an assembly which handles sending and receiving SMS.
	SMSMessengerAssemblyClass	Enter the class name which handles sending and receiving SMS.
CommunicationServiceSettings > SMSConfigCustom > SMSPattern	SMSProvider	• **SMS Provider**: Provider name such as, Hutch or Airtel. • **Connection Type**: Connection type like EmailProvider, GSM, SMSServiceProvider or Hayes. • **SMS Pattern**: Pattern like 9845*, 98*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
CommunicationServiceSettings > SMSSendAction > CustomSMSProviders	CustomSMSProvider	• **Name**: Enter the name of the SMS Provider. • **SMSProviderSMSMessengerAssembly**: Enter the path to the assembly. • **SMSProviderSMSMessengerClass**: Enter the class information. • **SMSProviderDevice**: Enter the device for the custom SMS provider. • **SMSProviderDeviceSpeed**
NELoadBalance	NELoadBalanceServerPort	Enter the port number for the Load Balanced Server. This field is disabled if Load Balanced is set to False.
	NELoadBalanceClientPort	Enter the port number for the Load Balanced Client.
MobileNotificationServiceSettings	MNLoadBalanceServerPort	Enter the port number for the Load Balanced Server. This field is disabled if Load Balanced is set to False.
	MNLoadBalanceClientPort	Enter the port number for the Load Balanced Client.
	SchedulePeriod	If the notification is not delivered at the first attempt, you can set the interval between delivery attempts. The system tries to resend the notification at the interval defined in this field. The time entered should be in days:hr:min:sec format only. The

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		maximum limit is 10 minutes. The default value is 30 seconds.
	MessageRetryCount	If the notification is not delivered at the first attempt, you can set the number of retry attempts to deliver the notification. After the defined limit is reached, the notification expires. If the Retry Count value is set as 0, the failed notifications will not be resent. The default value is 5.
MobileNotificationServiceSettings > Register > RegistrationDetails	RegistrationRetryCount	A device needs to be registered in the Azure notification hub before it can receive notifications. If the device registration is not successful at the first attempt, you can set the number of retry attempts to register the device. If the Retry Count value is set as 0, the failed device registrations do not happen. The default value is 5.
	ScheduleDeviceRegistrationPeriod	If the device registration is not done at the first attempt, you can set the interval between device registration attempts. The system tries to re-register the device at the interval defined in this field. The time entered should be in days:hr:min:sec format only. The default value is 2 minutes.
	ClientId	Not applicable. The parameter is retained for backward compatibility.
	MachineId	Not applicable. The parameter is retained for backward compatibility.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
DataSource	DataSourceName **Note:** This is a mandatory parameter.	Enter the name of the datasource to be created.
	Description	Enter the description for the datasource.
	ServerName **Note:** This is a mandatory parameter.	Enter the database server or instance name. To use a database on the local machine, enter "localhost", ".", or the local computer's name for the Server Name. For SQL Server database type, specify IPv4 and IPv6 addresses for the Server Name. To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455 To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be <server name>\<instance name>.
	AuthenticationType **Note:** This is a mandatory parameter.	Use this field to determine the process to validate a user who is trying to connect to the database. AVEVA Work Tasks uses Windows or SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. For Example: Windows or SQLServer
	UserId	Enter the ID of the user who is trying to connect to the database.
	Password	Enter the password of the user.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	PasswordEncrypted	Enter either "True" or "False". If the value is set to "True", then the user has to enter the password in encrypted format. **Note**: To encrypt a password string, - Use SE.BPM.Converters.dll reference in the project. - Use Encrypt(3) to encrypt password string. Sample code: String password = “$kelta001”; String encryptedPassword = password.Encrypt(3); If the value is set to "False", then the user has to enter the password in plain text.
	AdvanceSettings	Provide the advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection. For Example: Connection Timeout = 20
	DatabaseName **Note:** This is a mandatory parameter.	Enter the name of the database that can be used as a datasource.
RepositorySettings	ResourceProvider	Enter one of the following values: • ActiveDirectory • Forms • ASPNETMembership • RepositoryUserProvider • ConnectUserProvider
	RepositoryDataSource **Note:** This is a mandatory parameter.	Select the data source that will be used to store data for the current repository.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	RepositoryName **Note:** This is a mandatory parameter.	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the repository name. For Example: Telematics Repository
	Description **Note:** This is a mandatory parameter.	Provide a description for the repository. For example: This stores Telematics Employee Leave Details.
	FromMail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might occur in the In this scenario, you have a Web Server and Services installed on the same machine. You can host this set up on multiple computers to form a Web Farm with clustered the Services. The Databases are installed on a machine by itself. While scaling out, ensure that the machine has both the Web Server and the Services installed. See: Web Server Farm with Clustered Work Tasks Services and Databases on Different Machines In this scenario, you can maintain

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		a Web Farm with the Web Servers and Services cluster on separate machines while the Databases are installed on a different machine. This deployment provides scalability and high availability of the Workflow Engine and the Web Servers. This is achieved by distributing the load equally among all the machines in the cluster and the Web Farm. Multiple servers in the Web Farm or the cluster run the same services. Failure of a server does not impact other servers. You can take the affected server offline while the other servers maintain the service. This type of installation provides Failover. Thus allowing you to easily add or remove machines from the Web Farm or from the cluster without affecting the execution of workflows. This is the optimal scenario for heavy load conditions and can be considered if you anticipate heavy load on the Workflow Engine or the Web Server. See: Web Farm Connecting to Separate Services Cluster with Database on a Different Machine Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be sent to the mail ID defined in **Exception to mail**. The from address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		avoid this, restart the Workflow Engine Service and the Communication Service. For example: admin@domain.com
	ExceptionToMail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails are sent to the email ID specified in Exception to mail. For example: admin@domain.com
	AlertInitiatorOfWorkflow	Determines if the status of a workflow should be sent as a notification mail to the initiator of the workflow. For example: A process with a rule to check the pending leave available for the employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
	EnableTheme	Set the value to enable the defined theme.
	ThemeName	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. AVEVA Work Tasks provides Default and Lite themes. Do not use the Default folder for any style sheet customizations.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	CustomApplicationFolder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with a semicolon.
	HideRepository	Set the value to make the repository unavailable to the Farm.
	SourceElements	Enter the path to the Source Elements Folder.
	AttachmentDefaultPhysicalStoragePath	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an absolute path. - The default path is the **Attachments** folder in the installation path. - The default path is used when no path is specified.
	AutoLogOffTime	Enter the time after which the logged in user must be automatically logged off after the designated period of inactivity. Enter the time in minutes. Ensure that you enter only valid integer values between 1 to 360. 0 minutes is an invalid value. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. If you do not specify a value, then

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		the log off time is not set for the repository, and the session does not log off automatically. You use also define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML. For example: 1 to 360 (in minutes)
	UserCredentialsTimeoutForApp	Enter the time in hours to request for user credentials for AVEVA Work Tasks Pro after the set time is elapsed. For example: 1 to 48 (in hours) The default value is 0, which disables this setting.
	IsWorkTasksProOfflineSupportEnabled	Enter either True or False for enabling/disabling offline support in AVEVA Work Tasks Pro app. If the value set is True, the offline support is enabled. If the value set is False, the offline support is disabled. The default value is True.
	IsWorkTasksProRefreshOnWorkItemSubmissionEnabled	Enter either True or False to allow/disallow refreshing the Inbox in AVEVA Work Tasks Pro app. If the value set is True, the Inbox is automatically refreshed on submitting the work item. If the value set is False, the Inbox is not refreshed on submitting the work item.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		The default value is True.
	TimeoutForWorkTasksPro	Set the time out value in seconds for AVEVA Work Tasks Pro app. The default value is 60.
	FillFormLabelForWorkTasksPro	Specify the label for the Fill Form for AVEVA Work Tasks Pro.
	DateConfigAlternateActors	Select the Enable Date Settings option to set the From date and To date as mandatory while creating alternate actors. For more information about creating alternate actors, see Alternate Actors topic in the *User Guide*.
	IsDomainNameToShowWithUser	Enter the value to determine whether the domain name must be displayed along with the user name in the Enterprise Console header. The domain name will be displayed only if the **Resource Provider** is selected as **Active Directory**.
	ActiveDirectoryDatasource **Note:** This is a mandatory parameter.	Enter the name of the Active Directory datasource.
	ActiveDirectorySearchBase **Note:** This is a mandatory parameter.	Enter the Active Directory Search Base to search active directories for users.
	DomainName **Note:** This is a mandatory parameter.	Enter the domain name.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
	AuthenticationUser	Enter the authentication user.
	AuthenticationPassword	Enter the password.
	IsCrossDomainRoleProvider	Specify whether cross domain users and roles mapping is required.
	UserLogonID	Enter the value if you want to use another Active Directory attributes instead of SAM-Account-Name. It is recommended to use attributes of type string as input for User Log-on ID. After you set the User Log-on ID, you cannot change it later.
	UserLogonDisplayName	Enter the User Log-on Display Name. This is the default display name of the user account of the active directory user used. User Log-on Display Name is used in user lookups. After you set the User Log-on Display Name, you cannot change it later.
	AspnetMembershipDataSource	Enter the data source for the user table.
	ApplicationName	Enter the application name for the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Node	Description
		ASP.NET Membership provider.
	UserEntityProperties	Enter the XML code that identifies user properties.
	UserProviderProperties	Enter the XML Schema. There must be at least one identifier in the XML Schema. For example: UserID
	FormsProviderDatasource	If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.
	DataTable	Enter a valid data source or specify a dll.
	UserLoginProperty	Enter the name of the User Table or View in the Datasource. This property value will be used as User ID when logging in to the Enterprise console.
	ProvisionMessageQueue	Enter the value as True to provision the repository for Message Queue.

You need not configure the ConnectConfiguration and Https settings in the XML:

```
<ConnectConfiguration enabled="false">
<ConnectEnvironment></ConnectEnvironment>

Configure DataSource in Silent Mode Using XML

A Repository DataSource is used to store all repository related data. The Repository DataSource must be created on a machine where the Central Configuration is installed.

You can configure a Data Source using the **WWSKBPMConfig.xml** configuration file.

For more information about the parameters in the **WWSKBPMConfig.xml** configuration file, see Configure in Silent Mode Using XML.

1. Open the **WTLogger Console**.
2. Browse to the "Bin" folder, which is available in the path where the product is installed.
3. Open the **WWSKBPMConfig.xml** file.
4. In the XML file, pass the values for the following mandatory parameters.
   - **ConfigurationType**: Enter the value as **Datasource**.
   - **DataSourceName**: Enter the name of the datasource to be created.
   - **Description**: Enter the description for the datasource.
   - **ServerName**: Enter the database server or instance name.

     To use a database on the local machine, enter "localhost", ".", or the local computer's name for the Server Name.

     For SQL Server database type, specify IPv4 and IPv6 addresses for the Server Name.

     To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

     To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be <server name>\<instance name>.
   - **AuthenticationType**: Enter the type of process to validate a user who is trying to connect to the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

database.

AVEVA Work Tasks uses Windows or SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database.

For Example: Windows or SQLServer

- **UserId**: Enter the ID of the user who is trying to connect to the database.
- **Password**: Enter the password of the user.
- **PasswordEncrypted**: Enter either "true" or "false".

  If the value is set to "true", then the user has to enter the password in encrypted format.

  If the value is set to "false", then the user has to enter the password in plain text.
- **AdvanceSettings**: Enter the advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection.

  Example: Connection Timeout = 20;
- **DatabaseName**: Enter the name of the database that can be used as a datasource.
- **EnableTablePartition**: Select to enable database table partitioning by entering either "true" or "false".
- **DatabaseSecondaryDataFilePath**: Enter the database secondary data file path, which should be on a Microsoft SQL Server machine with sufficient rights to create files on the specified path. Ensure, you provide a valid path as it is not validated by the business application. If the path is not specified, then the secondary database file will be created at the default path, where the primary database file exists.

Note: If **EnableTablePartition** is set to true for a SQL Server version that does not support table partition, then the data source is created without a table partition.

5. Save the XML file.
6. Run the **AVEVAWorkTasksConfigurator.exe**.

   The configuration progress is displayed in the **WTLogger Console**.

Configure License Server Details in Silent Mode Using XML

After installing or upgrading AVEVA Work Tasks in silent mode, you have to configure the license server.

For more information about parameters in the **WWSKBPMConfig.xml** configuration file, see Configure in Silent Mode Using XML.

1. Open the **WTLogger Console**.
2. Browse to the "Bin" folder, which is available in the path where the product is installed.
3. Open the **WWSKBPMConfig.xml** file.
4. In the XML file, pass the values for the following parameters.
   - **ConfigurationType**: Enter the value as **AVEVALicensing**.
   - **LicenseServerName**: Enter the name of the License Server.
   - **LicenseServerPort**: Enter the port number used by the License Server.
5. Save the XML file.
6. Run the **AVEVAWorkTasksConfigurator.exe**.

   The configuration progress is displayed in the **WTLogger Console**.

Note: If there are any errors while updating the license server details in silent mode, these exceptions are

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

not logged in the **WTLogger Console**.

Configure Farm in Silent Mode Using XML

You can configure the Farm settings using the **WWSKBPMConfig.xml** configuration file.

For more information about the parameters in the **WWSKBPMConfig.xml** configuration file, see Configure in Silent Mode Using XML.

1. Open the **WTLogger Console**.
2. Browse to the "Bin" folder, which is available in the path where the product is installed.
3. Open the **WWSKBPMConfig.xml** file.
4. In the XML file, pass the values for the following mandatory parameters.
   - **ConfigurationType**: Enter the value as **FarmDatabase**.
   - **FarmDatabaseName**: Enter the name of the Farm database.
   - **DatabaseType**: Enter the type of database. For example: SQLServer.

     Note: Ensure that you enter the database type value without any space.
   - **DatabaseAuthenticationType**: Enter the type of authentication. For example: Windows or SQLServer

     Note: Ensure that you enter the authentication type value without any space.
   - **DatabaseUserName**: Enter the name of the database user along with the domain name.
   - **DatabasePassword**: Enter the password for the database user.
   - **AdvancedSettings**: Enter the advanced settings for database. For example: Connection Timeout=20;
5. Save the XML file.
6. Run the **AVEVAWorkTasksConfigurator.exe**.

   The configuration progress is displayed in the **WTLogger Console**.

Configure Repository in Silent Mode Using XML

A Repository contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

You can configure a repository using the **WWSKBPMConfig.xml** configuration file.

For more information about the parameters in the **WWSKBPMConfig.xml** configuration file, see Configure in Silent Mode Using XML.

1. Open the **WTLogger Console**.
2. Browse to the "Bin" folder, which is available in the path where the product is installed.
3. Open the **WWSKBPMConfig.xml** file.
4. In the XML file, pass the values for the following mandatory parameters.
   - **ConfigurationType**: Enter the value as **Repository**.
   - **RepositoryDataSource**: Enter the name of the datasource on which the repository has to be created. Ensure that the specified datasource is already configured in the system.
   - **RepositoryName**: Enter the name of the repository.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Description**: Enter the description for the repository.

5. Save the XML file.
6. Run the **AVEVAWorkTasksConfigurator.exe**.

   The configuration progress is displayed in the **WTLogger Console**.

Configure Quickflow in Silent Mode Using XML

You can configure Quickflow using the **WWSKBPMConfig.xml** configuration file.

1. Open the **WTLogger Console**.
2. Browse to the "Bin" folder, which is available in the path where the product is installed.
3. Open the **WWSKBPMConfig.xml** file.
4. In the XML file, pass the values for the following mandatory parameters.
   - **ConfigurationType**: Enter the value as **Azure**.
   - **RepositoryDataSource**: Enter the name of the datasource on which the repository has to be created. Ensure that the specified datasource is already configured in the system.
   - **RepositoryName**: Enter the name of the repository.
   - **Description**: Enter the description for the repository.
5. Pass the following mandatory parameters for deploying the Quickflow using Azure service bus:
   - **SubscriptionId**: Enter the subscription ID of the Azure service bus.
   - **TenantId**: Enter the tenant ID of the Azure service bus.
   - **ClientId**: Enter the client ID of the Azure service bus
   - **ResourceGroupName**: Enter the resource group name of the Azure service bus
   - **ServiceBusNamespaceName**: Enter the name of the the Azure service bus
   - **ServiceBusUserName**: Enter the user name of the Azure service bus
   - **Location**: Enter the location where the Azure service bus is installed.
6. Save the XML file.
7. Run the **AVEVAWorkTasksConfigurator.exe**.

   The configuration progress is displayed in the **WTLogger Console**.

All the parameters to be configured in the configuration file are listed in the following table.

Settings Category	Nodes	Description
FarmConfiguration > ConnectConfiguration	ConnectEnvironment	Enter the name of the connect environment to be enabled.
FarmConfiguration > ConnectConfiguration > CentralConfig	ClientId	Not applicable. The parameter is retained for backward compatibility.
	ClientSecret	Not applicable. The parameter is retained for backward

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Settings Category	Nodes	Description
		compatibility.
	RedirectUris	Enter the CentalConfig URI to which the user is to be redirected.
FarmConfiguration > ConnectConfiguration > EnterpriseConsole	ClientId	Not applicable. The parameter is retained for backward compatibility.
	ClientSecret	Not applicable. The parameter is retained for backward compatibility.
	RedirectUris	Enter the EnterpriseConsole URI to which the user is to be redirected.
FarmConfiguration > ConnectConfiguration > Quickflow	ClientId	Not applicable. The parameter is retained for backward compatibility.
	ClientSecret	Not applicable. The parameter is retained for backward compatibility.
FarmConfiguration > ConnectConfiguration > Quickflow > AzureServiceBus	SubscriptionId	Enter the subscription id of the Azure service bus.
	TenantId	Enter the tenant id of the Azure service bus.
	ClientId	Not applicable. The parameter is retained for backward compatibility.
	ClientSecret	Not applicable. The parameter is retained for backward compatibility.
	ResourceGroupName	Enter the resource group name of the Azure service bus.
	ServiceBusNamespaceName	Enter the service bus name of the Azure service bus.
	ServiceBusUserName	Enter the service bus user name of the Azure service bus.

Settings Category	Nodes	Description
	Location	Enter the location where the Azure service bus is installed.

Configure Cryptography Settings in Silent Mode using XML

With Cryptography settings, you can use encryption algorithm in AVEVA Work Tasks.

You can configure Cryptography settings using the **WWSKBPMConfig.xml** configuration file.

For more information about the parameters in the **WWSKBPMConfig.xml** configuration file, see Configure in Silent Mode Using XML.

1. Open the **WTLogger Console**.
2. Browse to the "Bin" folder, which is available in the path where the product is installed.
3. Open the **WWSKBPMConfig.xml** file.
4. In the XML file, pass the value for the **Passphrase** parameter.

   Note: The value should have characters between 8 and 20, consisting of lowercase, uppercase, number, and special characters. Use the same passphrase for all servers in Load Balanced Server of AVEVA Work Tasks.
5. Save the XML file.
6. Run the **AVEVAWorkTasksConfigurator.exe**.

   The configuration progress is displayed in the **WTLogger Console**.

   Note:

   - While upgrading the product in silent mode, pass the argument as **Passphrase=Wonderware@123** to configure Cryptography Settings and use the encryption algorithm in the product.

   - For the Configuration Type = CLIENT, the Passphrase should be the same as that of the Server Passphrase.

Configure in Silent Mode using Command-Line Parameters

You can configure AVEVA Work Tasks in Silent mode using Command-Line parameters.

- Configure Farm in Silent Mode Using Command-Line Parameters
- Configure DataSource in Silent Mode Using Command-Line Parameters
- Configure Repository in Silent Mode Using Command-Line Parameters

Configure Farm in Silent Mode Using Command-Line Parameters

You can configure the Farm settings using the **AVEVAWorkTasksConfigurator.exe**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To configure the Farm on a Server

1. Open the Command Prompt in the Administrative mode.
2. Enter the path for the "Bin" folder, which is available in the path where the product is installed, and then press **Enter**.

   For example: CD <AVEVA Work Tasks Install Path>\Bin
3. On the Command Prompt, type **AVEVAWorkTasksConfigurator.exe**.
4. Pass the values for the following command line arguments:
   - **ConfigurationType** = **FARMDATABASE**.
   - **FarmDatabaseName** = <The name of the FARM database.>
   - **DatabaseServerName** = <The name of the database server.>
   - **DatabaseType** = <The type of database. For example: SQLServer>

     Note: Ensure that you enter the database type value without any space.
   - **DatabaseAuthenticationType =** <The type of authentication. For example: Windows or SQLServer>

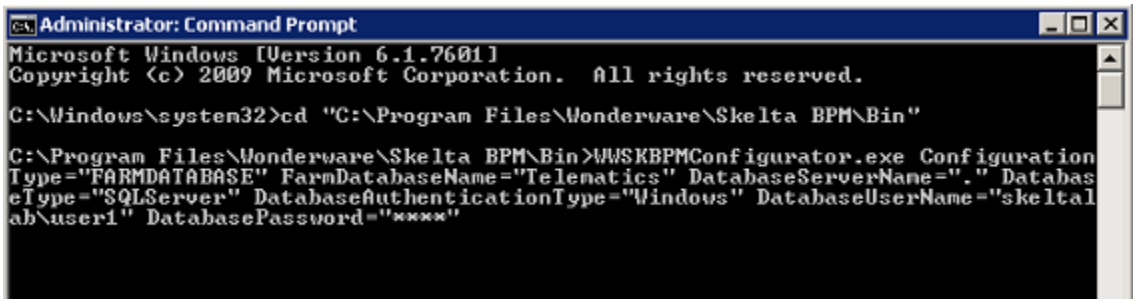
     Note: Ensure that you enter the authentication type value without any space.
   - **DatabaseUserName** = <The name of the database user along with the domain name.>
   - **DatabasePassword** = <The password for the database user.>
   - **AdvancedSettings** = <The advanced settings for database. For example: Connection Timeout=20;>

     Consider the following sample command.

     ```
     AVEVAWorkTasksConfigurator.exe ConfigurationType="FARMDATABASE"
     FarmDatabaseName="Telematics" DatabaseServerName="." DatabaseType="SQLServer"
     DatabaseAuthenticationType="Windows" DatabaseUserName="skeltalab\user1"
     DatabasePassword="****"
     ```

     Note: Before you copy the sample command to the Command Prompt, it is recommended that you verify this command in a Text Editor.

     After passing the above sample command, the Command Prompt appears as follows.



The progress of the Farm configuration is displayed in the **WTLogger Console**.

Note: The following settings are not configured as part of the Farm configuration in silent mode:
- Azure Settings
- ArchestrA Services Settings
- Enterprise Console Settings
- Central Configuration Settings

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To configure Farm on a Client

1. Open the Command Prompt in the Administrative mode.
2. Enter the path for the "Bin" folder, which is available in the path where the product is installed, and then press **Enter**.

   For example: CD <AVEVA Work Tasks Install Path>\Bin
3. On the Command Prompt, type **AVEVAWorkTasksConfigurator.exe**.
4. Pass the values for the following command line arguments:
   - **ConfigurationType: CLIENT**.
   - **FarmDatabaseName**: <The name of the FARM database.>
   - **DatabaseServerName**: <The name of the database server.>
   - **DatabaseType**: <The type of database. For example: SQLServer>

     Note: Ensure that you enter the database type value without any space.
   - **DatabaseAuthenticationType**: <The type of authentication. For example: Windows or SQLServer>

     Note: Ensure that you enter the authentication type value without any space.
   - **DatabaseUserName**: <The name of the database user along with the domain name.>
   - **DatabasePassword**: <The password for the database user.>
   - **AdvancedSettings**: <The advanced settings for database. For example: Connection Timeout=20;>

   The progress of the Client configuration is displayed in the **WTLogger Console**.

Configure DataSource in Silent Mode Using Command-Line Parameters

A Repository DataSource is used to store all repository related data. The Repository DataSource must be created on a machine where the Central Configuration is installed.

You can configure a Data Source using the **AVEVAWorkTasksConfigurator** Console Application.

1. Open the Command Prompt in the Administrative mode.
2. Enter the path for the "Bin" folder, which is available in the path where the product is installed, and then press **Enter**.

   For example: CD <AVEVA Work Tasks Install Path>\Bin
3. On the Command Prompt, type **AVEVAWorkTasksConfigurator.exe**.
4. Pass the values for the following command line arguments:
   - **ConfigurationType** = **DATASOURCE**.

     The parameter used to configure datasource.
   - **DataSourceName** = <The name of the datasource to be created.>
   - **Description** = <The description for the datasource.>
   - **ServerName** = <The database server or instance name.>

     To use a database on the local machine, enter "localhost", ".", or the local computer’s name for the **Server Name**.

     For SQL Server database type, specify IPv4 and IPv6 addresses for the Server Name.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: localhost,1455

To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be <server name>\<instance name>.

- **AuthenticationType** = <The process to validate a user who is trying to connect to the database.>

  AVEVA Work Tasks uses Windows or SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database.

  For Example: Windows or SQLServer
- **UserId** = <The ID of the user who is trying to connect to the database.>
- **Password** = <The password of the user.>
- **PasswordEncrypted** = <Enter either "True" or "False".>

  If the value is set to "True", then the user has to enter the password in encrypted format.

  If the value is set to "False", then the user has to enter the password in plain text.
- **AdvanceSettings** = <The advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection. Example: Connection Timeout = 20;>
- **DatabaseName** = <The name of the database that can be used as a datasource.>

  Consider the following sample command.

```
AVEVAWorkTasksConfigurator.exe ConfigurationType="DATASOURCE"
DataSourceName="TelematicsDataSource" Description="Telematics Datasource"
ServerName="Server1" AuthenticationType="SQLServer" UserId="skeltalab\user1"
Password="****" PasswordEncrypted="false" DatabaseName="TelematicsDB"
```

Note: Before you copy the sample command to the Command Prompt, it is recommended that you verify this command in a Text Editor.

The progress of the Data Source configuration is displayed in the **WTLogger Console**.

For more information about creating a datasource, see Creating a repository datasource.

Configure Repository in Silent Mode Using Command-Line Parameters

A Repository contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

You can configure a repository using the **AVEVAWorkTasksConfigurator** Console Application.

1. Open the Command Prompt in the Administrative mode.
2. Enter the path for the "Bin" folder, which is available in the path where the product is installed, and then press **Enter**.

   For example: CD <AVEVA Work Tasks Install Path>\Bin
3. On the Command Prompt, type **AVEVAWorkTasksConfigurator.exe**.
4. Pass the values for the following command line arguments:
   - **ConfigurationType** = **REPOSITORY.**

     The parameter used to configure a repository.
   - **RepositoryDataSource** = <The name of the datasource on which the repository has to be created. Ensure

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

that the specified datasource is already configured in the system.>

- **RepositoryName** = <The name of the repository.>
- **Description** = <The description for the repository.>

Consider the following sample command.

```
AVEVAWorkTasksConfigurator.exe ConfigurationType="REPOSITORY"
RepositoryDataSource="TelematicsDataSource" RepositoryName="TelematicsRepo"
Description="Telematics Repository"
```

Note: Before you copy the sample command to the Command Prompt, it is recommended that you verify this command in a Text Editor.

5. Enter the values for other parameters in the **WWSKBPMConfig.xml** configuration file. For more information about the parameters in the **WWSKBPMConfig.xml** configuration file, see Configure in Silent Mode Using XML.

Note:
- If you enter the password for the **Resource Provider** fields in plain text format in the XML, the password will be updated in the XML in an encrypted format, after the repository creation.
- If you create a repository in silent mode, the administrator for this repository is not configured. You must manually configure the Administrator for this repository and then perform an "iis reset".
- The maximum number of repositories, which can be created, depends on the permitted limit for the license.

The progress of the repository configuration is displayed in the **WTLogger Console**.

For more information about creating a repository and creating an Administrator for the repository, see Creating a repository.

Return Results for Silent Configuration

The return results are based on the outcome of the execution of **AVEVAWorkTasksConfigurator.exe**.

For example: If the value of the **ConfigurationType** parameter in the **WWSKBPMConfig.xml** configuration file is defined as **DataSource**, then the return result is displayed as "0" if the DataSource configuration is successful.

Similarly, based on the outcome for the selected configuration type, the return result is displayed. For more information about the **ConfigurationType** parameter in the **WWSKBPMConfig.xml** configuration file, see Configure in Silent Mode Using XML.

1. Open a Notepad file and add the following script.

```
echo off
cd <AVEVA Work Tasks Install path>\Bin AVEVAWorkTasksConfigurator.exe
echo %ERRORLEVEL%
```

2. Enter the appropriate value for **<AVEVA Work Tasks Install path>**.

   For example: *C:\Program files\AVEVA\Work Tasks\Bin*

3. Save the file with **.bat** extension.
4. Open the Command Prompt in the Administrative mode.
5. Type the path where the Batch file is saved, and then press **Enter**.
6. Type the name of the Batch file, and then press **Enter**.

   The return result of the **AVEVAWorkTasksConfigurator.exe** is stored in the **%ERRORLEVEL%** variable. The return result will be one of the following:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **0** - If the configuration is successful.
- **1** - If the configuration is not successful.
- **2** - If multiple instances of **AVEVAWorkTasksConfigurator.exe** are running.

Sample Batch File Script for Installing and Configuring in Silent Mode

You can install AVEVA Work Tasks in silent mode using the following sample Batch File script.

If you want to execute installation and configuration commands sequentially, then perform the following:

1. Open a Notepad file and add the following script.

```
Echo off
REM Script to execute silent AVEVA Work Tasks installation and configuration.
REM Configuration like creation of farm database, Datasource and repository.
REM
.....................................................................................
.............................
REM Below Command to execute AVEVA Work Tasks installer Silently in the default path
REM
.....................................................................................
.............................
echo AVEVA Work Tasks silent installation started......
REM.......................STEP 1 - BPM Installation
Silently.....................................................
<Path> AVEVA Work Tasks 2023 SP1.exe /S /v/qn
REM If above command is successful %ERRORLEVEL% will be zero. Non zero number else.
IF %ERRORLEVEL% EQU 0 (
   echo AVEVA Work Tasks silent installation completed successfully.
   REM The silent farm configuration executable required a configuration xml file.
   (WWSKBPMConfig.xml)
   REM The configuration file will be available in BPM installation "Bin" folder.
   (WWSKBPMConfig.xml)
   REM Get the configuration file from the installation location updated the
   mandatory nodes with relevant data.
   REM After the BPM installer installation is done silently, copy updated
   "WWSKBPMConfig.xml" AVEVA Work Tasks installation Bin folder.
   REM Below Command to copy updated "WWSKBPMConfig.xml" BPM installation Bin
   folder.
   REM ..................STEP 2 - Copy updated configuration file to installation
   Bin folder..........
   Copy /y <Path> WWSKBPMConfig.xml <AVEVA Work Tasks Install path>\Bin
   REM Below command to execute silent farm configuration executable.
   echo AVEVA Work Tasks silent farm configuration started....
   REM ..................STEP 3 - Move to the installation folder and call
   AVEVAWorkTasksConfigurator.exe ..........
   REM cd C:\Program files\AVEVA\Work Tasks\Bin
   cd <AVEVA Work Tasks Install path>\Bin AVEVAWorkTasksConfigurator.exe
   ConfigurationType="ALL"
   IF %ERRORLEVEL% EQU 0 (
   echo Silent farm configuration completed successfully.
   ) ELSE (
   echo Silent farm configuration failed. Please verify mandatory parameters in
   "WWSKBPMConfig.xml" and see WWSKLogger for details.
   )
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
) ELSE (
   echo AVEVA Work Tasks silent installation failed.
)
   REM AVEVA Work Tasks Installation and configuration completed.
```

2. Enter the appropriate value for **<path>**.

   For example: *C:\EXEPath\AVEVA Work Tasks 2023 SP1.exe /S /v/qn*

3. Enter the appropriate value for **<AVEVA Work Tasks Install path>**.

   For example: *Copy /y C:\ConfigFilePath\WSKBPMConfig.xml C:\Program files\AVEVA\Work Tasks*\\Bin

4. Save the file with **.bat** extension.
5. Open the Command Prompt in the Administrative mode.
6. Type the path where the Batch file is saved, and then press **Enter**.
7. Type the name of the Batch file, and then press **Enter**.

   The installation and configurations are performed sequentially.

Note:
- You can configure the other parameters for Farm, Data Source, and Repository either in the Batch file or in the **WWSKBPMConfig.xml** file.
- If the AVEVA Work Tasks installation is successful, then the value for **%ERRORLEVEL%** is zero; else, the value is any number except zero.

Limitations and Exceptions - Silent Installation and Configuration

- Creation of AVEVA Work Tasks Farm and Data Source through Connection Provider Assemblies is not supported.
- If you enter the password for the **Resource Provider** fields in plain text format in the Configuration XML, the password will be updated in the XML in an encrypted format, after the repository creation.
- If you create a repository in silent mode, the administrator for this repository is not configured. You must manually configure the administrator for this repository and then perform an "iis reset".
- The maximum number of repositories, which can be created, depends on the permitted limit for the license.

Installing AVEVA Work Tasks Add-in for Microsoft Outlook

The installation of AVEVA Work Tasks Add-in for Microsoft Outlook is supported only on machines where Microsoft Outlook 2016, Microsoft Outlook 2019, and Office 365 are installed.

Based on the version of Microsoft Outlook installed in your environment, the corresponding AVEVA Work Tasks Add-in for Microsoft Outlook is installed.

Example: If Microsoft Outlook 2016 is installed in your environment, the AVEVA Work Tasks Add-in for Microsoft Outlook 2016 will be installed.

Note: To install the latest AVEVA Work Tasks Add-in for Microsoft Outlook, uninstall the previous version and perform a fresh installation. Upgrade to latest version of AVEVA Work Tasks Add-in for Microsoft Outlook is not supported.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation Prerequisites

Before you install the **AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook**, ensure that you have installed **AVEVA Work Tasks** on your environment.

For more information about installing **AVEVA Work Tasks**, see Installing Different Editions.

Install AVEVA Work Tasks Add-in for Microsoft Office Outlook

Use the **AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook** installer to install AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook

1. Run the **AVEVA Work Tasks 2023 SP1-Outlook Addins.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook** screen appears.
2. In the **Welcome to the Installshield Wizard for AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook** page, click **Next**.

   The Customer Information dialog box appears.
3. Enter the **User Name** and **Organization** name.
4. Under **Install this application for**, select one of the following:
   - **Anyone who uses this computer (all users):** If the application can be accessed by all the users using this computer.
   - **Only for me (localadm):** If the application can be accessed by only the local administrator of the computer.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. In the InstallShield Wizard Completed dialog box, click **Finish**.

Uninstalling AVEVA Work Tasks Add-in for Microsoft Office Outlook

You can remove AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook in one of the following ways:

- Using the Add or Remove Program Option
- Using the AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook Installer

Using the Add or Remove Program Option

1. On the Windows **Start** menu, click **Control Panel**.
2. In the All Control Panel Items dialog box, click **Programs and Features**.
3. In the Uninstall or change a program dialog box, click **AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook**.
4. Click **Uninstall**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

A confirmation message appears.

5. Click **Yes** to remove **AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook**.

   A warning message appears.

6. Click **OK** to continue.

   A confirmation message appears.

7. Click **OK**.

Using AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook Installer

1. Run the **AVEVA Work Tasks 2023 SP1 Add-in for Microsoft Office Outlook** installer.

   The splash screen, and then the Welcome page appears.

2. Click **Next**.

   The Program Maintenance dialog box appears.

3. Select **Remove**, and then click **Next**.

   The Remove the Program dialog box appears.

4. Click **Remove**.
5. On the InstallShield Wizard Completed dialog box, click **Finish**.

Install Client on Windows Form Based Application

Client Installation on Windows

You can install the client and enable AVEVA Work Tasks functionality on a Windows Form-based application.

In a typical Server and Client installation, the Server Controls are used from the Enterprise Console Web Site. These Server Controls are by default implemented within the Enterprise Console Web site. For more information about the Server Controls, see Architecture.

Windows Form-based applications run on standalone systems and do not require Web browsers. In a Windows Form-based environment, AVEVA Work Tasks functionality can be implemented using two approaches.

The first approach is to embed the Server Controls through a browser control within the Windows form. This is similar to using a Web application in which AVEVA Work Tasks is implemented. The alternative approach is to use AVEVA Work Tasks run-time functionality using AVEVA Work Tasks APIs. However, the APIs can be used only with run-time functionalities. The design time functionalities such as defining a Queue, a Calendar and designing the process using process designer will not be possible with the APIs. The run-time APIs include:

- Getting information of a task or a work item getting assigned to a user, based on the defined process
- Taking action on a task or a work item. For example, approving or rejecting a task.

The following scenarios describe two distinct ways of integrating Windows form-based clients using AVEVA Work Tasks run-time API.

Scenario 1

In this scenario, the Client is installed on the same machine where the Windows form-based client is running. The number of the Client installation required will be equal to the number of Windows form-based applications. The Windows form-based applications make use of AVEVA Work Tasks run-time APIs to communicate with the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Client.

Example

A machine with 10 windows form-based applications will require 10 Client installations.

Scenario 2

In this scenario, Windows form-based application will interact or communicate with a single Client using Web service calls. The AVEVA Work Tasks run-time APIs will be implemented within this Web service calls. This Web service is not a part of the Client installation. This is the most preferred approach as the the Client is installed only on one machine.

Example

*A machine with 10 w*indows form-based applications will require a single Client installation.

Installation Planning Checklist

The installation planning checklist summarizes the tasks that you must perform to complete an installation. If you install the AVEVA Work Tasks products on more than one machine, complete the first installation using the detailed instructions in this guide. You can use this checklist to perform subsequent installations. Before you install the AVEVA Work Tasks products, prepare the machines where you plan to install the AVEVA Work Tasks products.

Complete the following pre-installation tasks:

- Integrate email server
- Identify server roles
- Select the database type
- Configure database user settings
- Identify user source
- Set up the communication protocol
- Set up the default ports

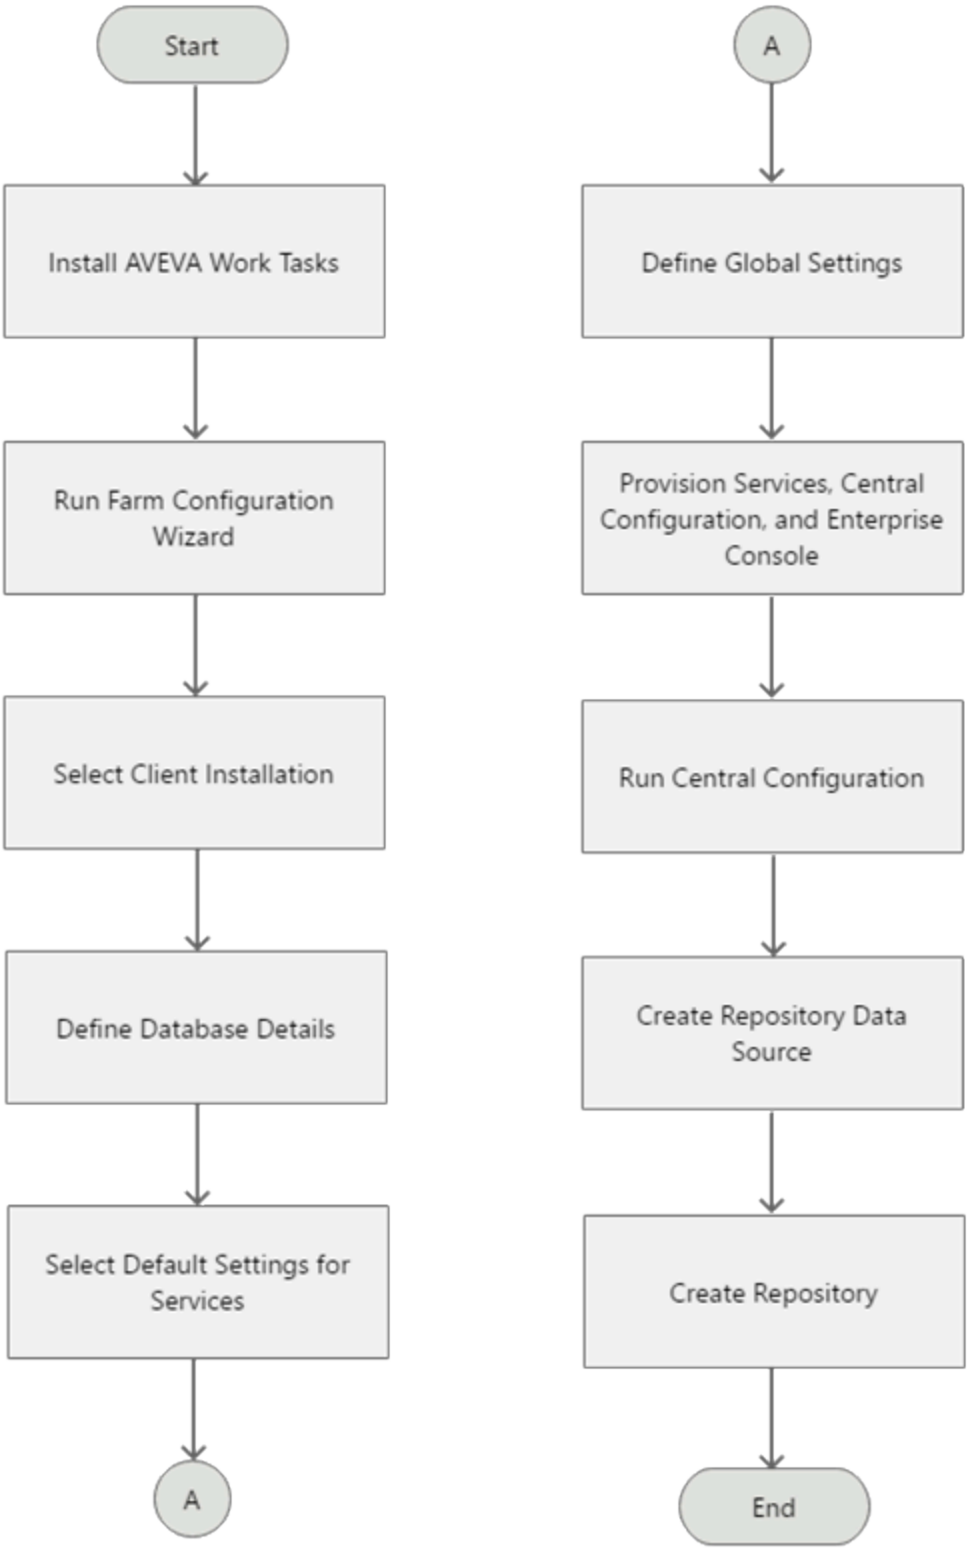
Before installing ensure all Prerequisites are taken care.

High-Level Installation View

This section provides a high-level view of the Client installation. The Client components are installed on Web Servers. For more information about this scenario, see Wonderware Skelta BPM Professional Edition.

Before continuing with the installation it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Installation

This section provides installation steps for the scenario **Installing AVEVA Work Tasks on a Windows Forms Based Application**.

Install AVEVA Work Tasks

You can use the AVEVA Work Tasks installer to install the AVEVA Work Tasks product.

Note: Ensure that the **ISSetupPrerequisites** folder is available in the same folder as the AVEVA Work Tasks installer.

1. Run **AVEVA Work Tasks 2023 SP1.exe**.

   The installer splash screen and then the **AVEVA Work Tasks 2023 SP1 - InstallShield Wizard** screen appears.
2. In the **Welcome to the InstallShield Wizard for AVEVA Work Tasks 2023 SP1** page, click **Next**.

   The License Agreement dialog box appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.
4. Select the **Destination Folder**.

   By default, the product is installed at **C:\Program Files\AVEVA\Work Tasks**. You can use the **Change** button to install the product at a custom location.

   In case the product is installed in a custom path, the installation folder will inherit the access control restrictions of the Program Files folder.
5. Click **Next**.

   The Ready to Install the Program dialog box appears.
6. Click **Install** to begin the installation.
7. On the InstallShield Wizard Completed dialog box, click **Finish**.

Start the Farm Configuration Wizard

The AVEVA Work Tasks Farm Configuration Wizard starts immediately after the AVEVA Work Tasks installation is complete.

1. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
2. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
3. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

If the Farm Configuration Wizard is not started automatically due to any reason, you can manually start the wizard by performing the following:

1. Close the Farm Configuration Wizard window that is automatically opened.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
3. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The Welcome to the Farm Configuration Wizard screen appears.
4. Click **Next**.

   A dialog box appears listing the unchecked MSDTC settings and asking your confirmation to continue with the current MSDTC settings.
5. If you want to continue with the current MSDTC settings, click **Yes**.

   The Cryptography Settings window appears.
6. Configure cryptography settings and click **Next**.

   The Configure License Server window appears.

Select Client Installation

1. In the Select the type of installation window, select **Client**.
2. Click **Next**.

Connect to an Existing Farm Database

You can use the Connect to existing database dialog box to connect to the existing Farm. You can select the Connection String or Connection provider for the new database.

1. Select the computer name on which the Farm Database is installed from the **Server Name** field.
2. Select **Connection String**.
3. Enter the following details:
   a. **Authentication Type**: This field is used to provide information on the process used to validate a user. AVEVA Work Tasks solution supports both Windows and SQL server authentication process. Example: Windows.
   b. **User ID**: This field is used to enter the SQL user ID for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   c. **Password**: This field is used to enter the SQL password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
   d. **Advanced Settings**: This is an optional field. It is used to enter any additional connection information such as connection Timeout etc. Example: Connection Timeout = 20.

      While creating a data source for repository, use the following custom settings to set properties for the connection pool.

      encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;

      encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.

      enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation a connection which is used from a transaction is returned back to the connection pool only when the transaction is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature AVEVA Work Tasks controls the transaction from escalating to a distributed transaction which is very expensive.

The above property can be used to turn off this feature. The default value is set as True.

connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is set as 30 Seconds. The value should be set in seconds.

maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is set infinite.

sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and generating an error. The default value is set as 300.

Note: These settings are case sensitive and should be mentioned only in lower case.

e. **Database**: This field is used to select the machine with database installed. Example: FarmDB.

AVEVA Work Tasks will validate if at least one server is installed.

4. Click **Test Connection** to ensure database connectivity.

   You must have the following permissions on the Database Server:

   SELECT, INSERT, UPDATE, and DELETE permissions.

   EXECUTE permission for Stored Procedures.
5. Click **Next** to continue with the wizard.
6. Click **OK**.

Define and Provision the Enterprise Console

You can define the required AVEVA Work Tasks services.

Steps to Define Enterprise Console

1. In the **Services/Global Settings** page, the **Use default settings for services** option is selected by default.
2. Click **Next**.

   The **Installing Services** screen appears, indicating the progress of installation.

   A message *Installation is Complete* appears after all the services are installed.
3. Click **OK**.

Verify the Installation

After you install AVEVA Work Tasks, verify that the product is installed successfully. To verify successful installation, create a simple Workflow using Process Designer. The tasks includes the following:

- Creating a Workflow
- Publishing the Workflow
- Testing the Workflow

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Creating a Workflow

1. Log on to the **Enterprise Console**.
2. If the Repository is configured for Active Directory provider, go to step 4.
3. Enter the **User Name** and **Password**.
   The **User Name** and **Password** will be validated with the user provider selected while creating the repository.
   The default authentication provider is the Repository User Provider List.
4. In the **Enterprise Console**, click menu icon.
   All features can only be available for a user with administrative privileges.
5. From the menu, select **Workflows**.
   The Workflow window appears.
6. On the Action bar, click **New**, and then click **Workflow**.
   The New Workflow window appears.
7. Enter **Title** and **Description**.
8. Click **Save & Continue**.
   The successful message appears.
9. Select **Design the Workflow now**.
   This is the default option.
10. Click **Finish**.
    The Process Designer window appears.
11. From the activities pane on the left, drag the Information activity to the Process Designer window.
12. The activity *Information1* is created.
    Click to create a link between two activities.
    The Link Action window appears.
    a. Select from the **From Action** drop-down box.
    b. Select from the **To Action** drop-down box.
    c. Click **OK**.
       The link is established.
13. Right-click *Information1*.
14. Select **Activity Properties** from the context menu.
    The Activity Properties pane appears.
    a. Enter **Name** and **Description**.
    b. Click to **Assign Actor(s)**.
       The Assign Actor(s) window appears.
    c. Select the required provider from the **Providers** drop-down list.
    d. Select values from the drop-down list.
    e. Click **Add**.
    f. Click **Update**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

15. Click to enter the **Subject** for Notification Contents.
    The window to enter subject for notification appears.
16. Click **Update**.
17. Click to enter the **Body** for Notification Contents.
    The window to enter the Body content appears.
18. Click **Update**.
19. From the Activity Properties pane, click **Save**.

Publishing the Workflow

1. On the **Publish** menu, click **Publish**.
   The Published successful message appears.
2. Close the dialog box.
   The Enterprise Console screen lists the workflow created.

Testing the Workflow

1. Select the listed workflow.
2. Right-click the selected workflow.
3. Click **Publish and Test Run**.
   The **Status Finished successfully** appears.
   If Status is **Execution Pending** in the Process Execution window, then click on the **Refresh** button to get the status.
4. In the **Enterprise Console** menu, select **Inbox**.
   The Inbox lists the work item.
5. Click to view the work item listed.
   This indicates that the installation is successful.

Install AVEVA Work Tasks Locales for Brazilian Portuguese

AVEVA Work Tasks supports Brazilian Portuguese operating system out of the box. A separate installer for Brazilian Portuguese locales is available which can be installed after installing **AVEVA Work Tasks 2023 SP1**. Before you run the Brazilian Portuguese installer, we recommend you to back up the existing files and folders of the previous installation.

Prerequisites

- Install **AVEVA Work Tasks 2023 SP1**. For information about installing AVEVA Work Tasks, see Installing Different Editions.
- Back up the following folders before you run the locales installer:
  - *C:\Program files\AVEVA\Work Tasks\\WorkflowElements\Default\en-US\Actions\XML*
  - *C:\Program files\AVEVA\Work Tasks\\WorkflowElements\Default\en-US\Templates*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to install

You can use the **AVEVA Work Tasks Brazilian Portuguese Localization** installer to install the **AVEVA Work Tasks** product in Brazilian Portuguese.

1. Run the **AVEVA Work Tasks 2023 SP1-pt-BRLocale.exe**.

   A message to overwrite the files appear.
2. Click **Yes** to confirm the overwrite and continue the installation.

   The **Welcome to the Installation Wizard for AVEVA Work Tasks Brazilian Portuguese Localization** page appears.
3. Click **Next**.

   The install page appears.
4. Click **Install** to begin the installation.
5. On the InstallShield Wizard Completed dialog box, click **Finish**.

   AVEVA Work Tasks is successfully installed in Brazilian Portuguese.

After you install

Add the following entry within the **<system.web>** tag in the **web.config** file of the **Enterprise Console**:

```
<globalization culture="pt-BR" uiCulture="pt-BR" requestEncoding="utf-8"
responseEncoding="utf-8"/>
```

Set a Repository to Support Multiple Locales

AVEVA Work Tasks supports setting a repository supporting multiple locales. You can set this up both in a new environment as well as in an existing environment.

New Installation

1. Install **AVEVA Work Tasks**.

   - Follow the Installation.
2. Create or use an existing **Farm Database.**

   - **New Farm Database:** Follow the steps to create a new farm.

   - **Existing Farm Database**: Follow the steps to use an existing farm.
3. Create a **Data Source**.

   - Follow the steps to create a data source.
4. Create a **Repository**.

   - Follow the steps to create a repository.
5. Create multiple **Enterprise Console** for different locales.

   - Each **Enterprise Console** support a locale, therefore create a console for each locale. Also, ensure to setup the appropriate authentication for the console based on the environment.

   - Follow the steps to create an **Enterprise Console**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Map **Enterprise Console** to the repository.

   - The consoles created for the different locales must be mapped to the same repository.

   - Follow the steps to map **Enterprise Console**.

7. Set up locales for **Enterprise Console**.

   - Follow the steps to set up locales for **Enterprise Console**. See *Steps to Localize AVEVA Work Tasks* in the *Build Business Process* section.

Existing Installation

1. Create multiple **Enterprise Console** for different locales.

   - Each **Enterprise Console** support a locale, therefore create a console for each locale. Also, ensure to setup the appropriate authentication for the console based on the environment.

   - Follow the steps to create an **Enterprise Console**.

2. Map **Enterprise Console** to the repository.

   - The consoles created for the different locales must be mapped to the same repository.

   - Follow the steps to map **Enterprise Console**.

3. Set up locales for **Enterprise Console**.

   - Follow the steps to set up locales for **Enterprise Console**. See *Steps to Localize AVEVA Work Tasks* in the *Build Business Process* section.

AVEVA Licensing

The AVEVA Enterprise Licensing system is a common platform that allows you to effectively and efficiently manage AVEVA Software product licenses. AVEVA Enterprise licensing system is composed of a browser-based License Manager and a License Server that together allow you to share and deliver licenses for your installed products.

More information about AVEVA Enterprise Licensing and how it works is available in following topics:

- About AVEVA Enterprise Licensing
- How does Licensing work?
- Licensing for AVEVA Work Tasks

About AVEVA Enterprise Licensing

License Manager

License Manager allows you to quickly access and maintain licenses for all AVEVA Software products in your different environments by means of its scalable, flexible design features:

- Browser-based for scalability and ease of use; can be remotely accessed by any web browser.
- Light-weight standalone software you can install on the same node as the License Server computer, or on any other node based on your deployment needs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Manage one or multiple License Servers to best organize and manage the licenses in your unique environment.

License Server

License Server provides all the functionality to acquire, store, maintain, and serve licenses to your installed AVEVA software.

- Where all licenses and related information is stored and maintained.
- Securely serve any types of software application being licensed, including Windows browsers, tablets, and mobile devices.
- Provide current license usage information.

Installed Products

After the AVEVA Software product is installed it relies on the licensing system to enable its functionality. During product installation you decide from which License Server you want the product to get its license. If a License Server is installed on the same computer, it will use that one as the default. You can decide to install the License Server on a different computer to point to a single License Server for all installed products, or different License Servers installed for different groups of installed products. All the products installed on the same computer would point to the same License Server.

For more information about AVEVA Enterprise Licensing, refer the AVEVA Enterprise Licensing documentation available in *<InstallPath>\Program Files (x86)\Common Files\ArchestrA\Licensing Framework\License Manager*.

How does Licensing work?

This section describes the licensing workflow. This example assumes that both License Manager and License Server are installed on the same computer, and that the computer can connect to the Internet.

1. **Purchase one or more AVEVA Software products**: Along with your installation media or downloads, you will receive one or more entitlement files containing licenses details.
2. **Start License Manager**: It opens in a browser window and accesses the installed License Manager components.
3. **Select the License Server**: Use the License Manager to select an available server to host the licenses you want to activate.
4. **Import the entitlement file**: Import the entitlement file. After importing, the License Manager displays the available licenses.

   The Entitlement File contains information for specific product licenses that is imported into the License Manager to activate purchased licenses.
5. **Activate licenses**: License Manager contacts the AVEVA Activation Server over the Internet to activate the selected licenses on the License Server.

   The Activation Server activated licenses on the License Server.
6. **Manage your licenses**: Licenses are now available for the products you want to use. You can now:
   - activate new licenses

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- deactivate current licenses
- reserve and unreserve licenses

7. **Install the purchased products**: You can go ahead and install the products following the individual product installation instructions. Also make sure you have at least one license server and one license manager installed as well
8. **Configure and Run your products**: The installed products, when running, will acquire their licenses from the License Server and will release them when no longer needed.

For more information about Licensing, refer the AVEVA Enterprise Licensing documentation available in *<InstallPath>\Program Files (x86)\Common Files\ArchestrA\Licensing Framework\License Manager*.

Licensing for AVEVA Work Tasks

Prerequisites

- Ensure that the AVEVA License Manager and AVEVA License Server is installed on a machine, which is on the local network and can be accessed by all the AVEVA Work Tasks servers and clients.
- In the AVEVA License Configurator, ensure that you provide the details of the machine where the License Manager and License Server are installed.
- Ensure that the AVEVA LICAPI is installed as a prerequisite during the AVEVA Work Tasks installation.

Types of Licenses

The following are the types of licenses and their precedence, when all these licenses are available together:

1. Single Server
2. Load Balanced Server

Scenarios

- If load balance is enabled during Farm configuration, then the Load Balanced Server license is acquired, based on its availability. The Advance Server Service is installed and is enabled.
- If load balance is disabled during Farm configuration, then either the Single Server license is acquired, based on the availability. The Advance Server Service is installed and is disabled.
- To use Forms Designer, the Forms Server license has to be acquired. The Forms Server license is released when the Client service is stopped. The Forms license should be activated on all Web server(s) rendering the Forms.
- If the **corecount** license is activated and acquired along with any of the Standard licenses, then the client connection license is not checked, and there is no limit for the number of user connections.
- If "CPU Cores" count license is activated, then the "CPU Cores" count must depend on the system CPU Core count.

  For example: If the system has a 4 Core Processor, then the "CPU Cores" count in the license must be 4 or above.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Services

Workflow Engine Service

- The Workflow Engine service starts only when the following conditions are met:
  - The license is activated.
  - The **concworkflow** and/or **developer** features are available.
- When you start the Workflow Engine Service, the **concworkflow** and **corecount** license features will get acquired based on the License type. However, after this service is stopped, the license features acquired above are released.
- Before starting the Workflow Engine Service, the license availability is checked. If any server license is not activated and available, then the Workflow Engine Service is not started.
- The Workflow Engine Service checks the license periodically i.e. at an interval of 24 hours.
  - Consider a scenario where the user deactivates the server license when the license has been activated and the Workflow Engine service is running. After 24 hours, if the Workflow Engine Service is still running but the license is deactivated, then the grace period for the license is activated. A warning message is displayed to the Administrator through an exception email. The Workflow Engine Service service checks for license activation every day. If the license is not yet activated after the 7th day, then the Workflow Engine Service service is stopped. If the license is activated, then the Workflow Engine Service service will continue to run. .
- The licenses acquired by the Advance Server service and the Workflow Engine Service will be released when the Client Service is stopped.
- You can log on to the Enterprise Console only if the Client service and the Workflow Engine Service are running.

Grace Period for AVEVA License

The Workflow Engine Service checks the license periodically i.e. at an interval of 24 hours.

Consider a scenario where the user deactivates the server license when the license has been activated and the Workflow Engine service is running. After 24 hours, if the Workflow Engine Service is still running but the license is deactivated, then the grace period (of 7 days) for the license is activated.

In this scenario, a warning message is displayed to the Administrator through an exception email. Also, the message "Your system is currently running on a grace period" is displayed on the following:

- Enterprise Console
- Central Configuration
- Farm Configuration wizard
- Service Monitor > Workflow Engine Service

The Workflow Engine service checks for the license activation every day. If license is not yet activated after the 7th day, then the Workflow Engine Service is stopped. However, if the license is activated, then the Workflow Engine Service will continue to run.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Change Load Balance Settings

You can change load balance settings for AVEVA Work Tasks Server installation.

To Change Load Balance Settings

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
2. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** screen appears.
3. Click **Next**.
4. In the **Edit AVEVA Work Tasks Farm Settings** window, select the **Load Balance Settings** check box.
5. Click **Next**.

   The **Load Balance Settings** window appears.
6. Perform one of the following:
   - If load balancing is not enabled on the server, select the **Enable load balancing** check box, to enable load balancing.
   - If load balancing is enabled on the server, clear the **Enable load balancing** check box, to disable load balancing.

   Note:
   - Before you disable load balancing, ensure that you manually stop all the AVEVA Work Tasks Services.

   - If an Enterprise License is not available in the License Server, then a warning message appears indicating that the Enterprise License is not available.
7. Click **Next**.

   The load balance settings are configured successfully.

Client Connection License for System Platform IDE

In System Platform IDE, the Workflow Gateway object must be selected to browse the Enterprise Console menu. After the Enterprise Console menu is loaded in the System Platform IDE, any page can be loaded. Before the page is loaded, the Client Connection License is acquired. If the license is available, then the selected page is loaded successfully. However, if the license is not available, a blank page is displayed.

For multiple users to browse the AVEVA Work Tasks controls in System Platform IDE from the same device, separate Client Connection Licenses should be acquired..

Note:
- You can view the details of the consumed licenses from the **Usage Summary** tab in the **AVEVA License Manager Portal**.
- If you have acquired the license to access the controls and then you log out or exit, the Client Connection License is not released. The acquired license is available only after 20 minutes for the other user to use.

The Device ID maintained for the connection is a combination of the following:

- IP address (IPV6 or IPV4) of the machine from which the user logs on to the Enterprise Console
- IDE

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For example: If user "John" logs in to the Enterprise Console in the System Platform IDE, then the Device ID is displayed as *10.13.200.120$IDE*.

Where:

- IP Address is 10.13.200.120
- IDE
- $ is the separator

Releasing Client Connection License for System Platform IDE

The connection license for System Platform IDE gets released when the session timeout occurs.

Client Connection License for InTouch

When you browse the AVEVA Work Tasks controls as graphics in InTouch, the Client Connection License is acquired before the page is loaded. If the license is available, then the selected page is loaded successfully. However, if the license is not available, a blank page with an appropriate message is displayed.

For multiple users to browse the AVEVA Work Tasks controls in InTouch from the same device, separate Client Connection Licenses should be acquired.

Note:
- You can view the details of the consumed licenses from the **Usage Summary** tab in the **AVEVA License Manager Portal**.
- If you have acquired the license to access the controls and then you log out or exit, the Client Connection License is not released. The acquired license is available only after 20 minutes for the other user to use.

The Device ID maintained for the connection is a combination of the following:

- IP address (IPV6 or IPV4) of the machine from which the user logs on to the Enterprise Console
- IDE

For example: If user "John" logs in to the Enterprise Console in the System Platform IDE, then the Device ID is displayed as *10.13.200.120$IDE*.

Where:

- IP Address is 10.13.200.120
- IDE
- $ is the separator

Releasing Client Connection License for InTouch

The connection license for InTouch gets released when the session timeout occurs.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Session-based Client Connection License

Acquiring Client Connection License

- The maximum number of connections which can be active at a time depends on the value set for the AVEVA Concurrent Client Connection license limit. Each user logging in to an Enterprise Console will consume a license. If a user logs in through different browsers or repositories, then each login consumes one license.

  For example: If you have purchased the Client Connection License with a Quantity of 20 Pack, a maximum of 20 connections can be active at a time.

  Note:
  - You can view the details of the consumed licenses from the **Usage Summary** tab in the **AVEVA License Manager Portal**.
  - If the AVEVA Core Count license is activated, then the client connection license will not be consumed when the user logs on to Enterprise Console.
  - If the license limit is exceeded when logging in with the AIM based Active Directory provider, an alert message will be displayed. After clicking the **OK** button, the user will remain on the same page.

- The Unique Device ID maintained for the connection is the Host name or IP address of the machine from which the user logs on to the Enterprise Console. The user name for the connection is the user ID string used for logging on to the repository. For example: admin, corp\user1

  For example: If user "admin" logs in to the Enterprise Console in the Google Chrome browser, then the **Device** is displayed as *<Unique Device ID>_<Appended Unique Characters>* and **User** is displayed as *admin*.

- After a license is acquired and the user logs on to Enterprise console, the license gets acquired again after every 5 minutes for an active session.

Releasing Client Connection License

The connection license gets released in the following scenarios:

- When a user logs out from the Enterprise Console by clicking the **Log Out** menu option. The license is released based on the Device ID and the user, as explained in the Acquiring Client Connection License section.
- If the user has configured the **Auto Log Off** setting while creating the repository, and if the user does not perform any activity in the Enterprise Console for the time period specified in this setting.

  For example: If the time period in the **Auto Log Off** setting is configured as 5 minutes. The user is logged off if the user session is inactive for 5 minutes.
- If the user has logged in to the Enterprise Console and if the user closes the browser window without clicking the **Log Out** menu option.

Note: In some cases, when a user closes the browser window without logging out, the Client Connection License is not released immediately. In such cases, the Client Connection License is released after 40 minutes.

Releasing Client Connection License – Customized Log out

If a user has customized the logout option instead of using the Enterprise Console logout, then the client

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

connection license consumed after logging in to the Enterprise Console is not released.

The user has to release the client connection license from their logout custom code.

The following code can be used to release the client connection license.

```
Skelta.Entity.UserContext UserCtx = new Skelta.Entity.UserContext();
string userName = UserCtx.GetUserName();
string deviceId = string.Empty;
if (HttpContext.Current.Request.Cookies[userName + "_skdeviceid"] != null)
{
deviceId = HttpContext.Current.Request.Cookies[userName + "_skdeviceid"].Value;
}
Workflow.NET.Security.Client.SELicensing.LicenseConnectionManager licManager
= new Workflow.NET.Security.Client.SELicensing.LicenseConnectionManager();
bool licenseReleased = licManager.ReleaseClientConnectionLicense(deviceId, userName);
if (licenseReleased)
{
HttpRuntime.Cache.Remove(deviceId);
Response.Cookies[userName + "_skdeviceid"].Expires = DateTime.Now.AddDays(-1);
}
```

AVEVA Work Tasks Pro

Work Tasks Pro is a premium mobile application for AVEVA Work Tasks. It is designed for business professionals who use a mobile phone or a tablet device to access work items, while on the move.

If you are an administrator, complete the following tasks to enable the users to use the Work Tasks Pro application in a mobile device:

1. Configure Azure Setting
2. Set MobileWorkList Delivery Channel

The product versions that Work Tasks Pro support are:

- AVEVA Work Tasks 2023 SP1
- AVEVA Work Tasks 2023
- AVEVA Work Tasks 2020 Update 2
- AVEVA Work Tasks 2020 Update 1
- AVEVA Work Tasks 2020
- Workflow Management 2019 Update 1
- Workflow Management 2019

Note: AVEVA Work Tasks supports JavaScript based on the ES5 (ES2014) standard, applicable for Forms.

AVEVA License Utilization

AVEVA Work Tasks Pro app acquires license from the Enterprise Console (EC) server to which it gets connected. When you log on to the app and get connected to the EC server, the EC server acquires a license for the app. The license gets released only when you log out from the app.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

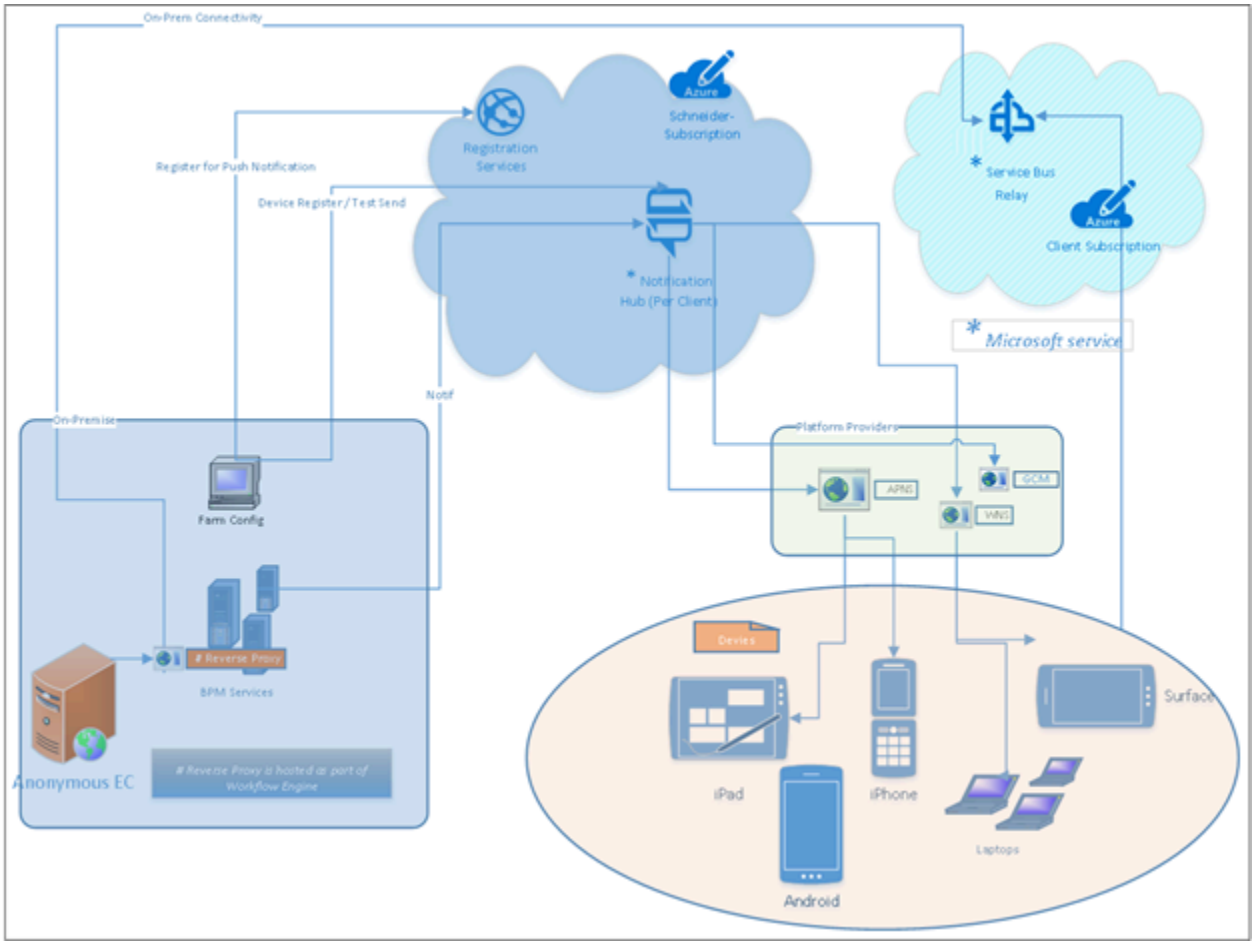
If the app is killed by the system (in case of iOS device system process based on factors listed in the Background Processing in iOS or in other devices due to system based behaviors) or done manually, while the user is logged-in, then the background process would not get triggered in case of iOS. So, the license would still be consumed and not released. But if you open the app, it will check if the auto-logoff needs to be triggered, then it would perform the same and release the license.

Also note that when performing logoff or auto-logoff is triggered (done by app when it is active or by the iOS background process), if the EC Server is not available, it would not be able to release the license. But if you log in with same or another user in the same device (which you can only when the server connectivity is available), then the license would get updated accordingly, rather than creating a new license.

Similar to auto-logoff, there is a session timeout for AIM, AVEVA Connect, and AAD Token Based repositories. The app internally refreshes the session tokens. But in case the EC server connectivity is not available at that moment, then it would show a session timeout message. In such cases, the user would be logged-out, but the license would not be released, as the EC Server connectivity is not available. As in the case of earlier behavior with auto-logoff, if you login with the same or another user in the same device (which you can only when the server connectivity is available), then the license would get updated accordingly, rather than creating a new license.

Push Notification Architecture for AVEVA Work Tasks Pro

The Push Notification of AVEVA Work Tasks Pro App comprises of Azure Notification Hub wherein, the mobile application communicates with the AVEVA Work Tasks Server through Azure Service Bus.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The following section explains how to achieve the desired functionality for mobile applications.

- **Push Notification**

  When a task is assigned to a mobile application user, a notification alert has to be sent to their mobile device.

  The mobile channel which is a part of the workflow engine, tries to communicate with a push notification engine called Notification Hub. This is a multi-platform, scalable, push notification engine meant for quickly sending millions of messages or alerts from any back-end to any mobile device.

  With a single cross-platform API call, you can easily send targeted and personalized push notifications to any mobile platforms from on-premise back-end.

  The mobile channel which is a part of the workflow engine, communicates with the notification hub, provisioned for each client. However, if the workflow engine fails to establish the communication, the notification alert information gets stored in the database. If notifications are not sent, the notification service will retry based on settings configured in Retry Settings.

  The local Mobile Notification Service, which gets deployed with the AVEVA Work Tasks installation, ensures reliable delivery of the stored messages. The local Mobile Notification Service polls the information and schedules it for delivery on the basis of Retry Settings. The reliable delivery mechanism ensures that all the stored messages are delivered and no messages are lost during the transmission.

- **Registration Services**

  Registration service enables AVEVA Work Tasks to send notifications. Hosted REST service for registration enables AVEVA Work Tasks to send notifications. For registration process, see Register to Mobile Notification Service.

  After successful registration and validation, the notification hub will be provisioned for each client and a key is assigned for each user. Based on the authentication, notification messages are sent.

  After the notification hub is provisioned, whenever AVEVA Work Tasks tries to send notification to mobile devices, communication happens only through notification hub. This hub is unique to each client and is responsible in communicating with the relevant platform provider and delivers the notification.

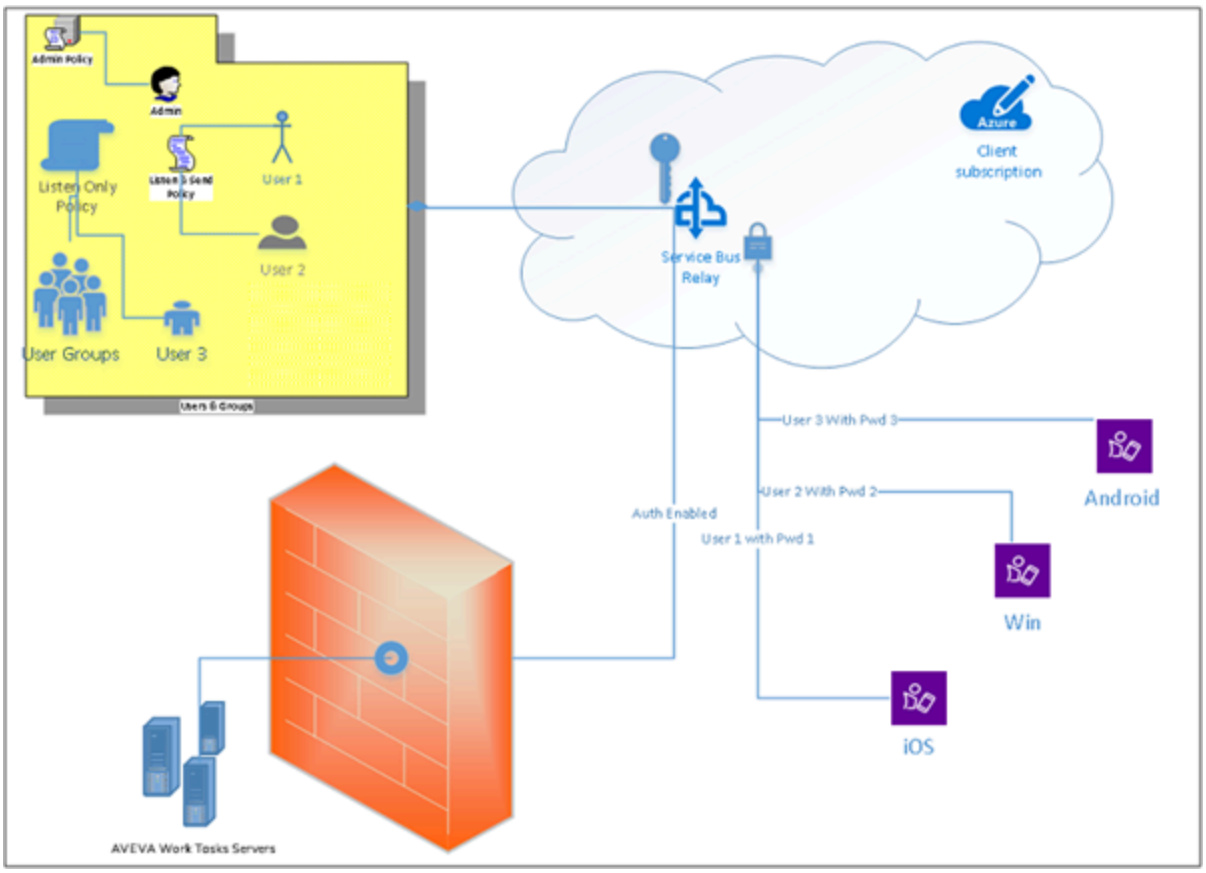
- **Platform Providers and Mobile Application**

  The platform providers deliver the notification alerts to the respective mobile devices, whenever a new task is assigned to the mobile application user. The alert is delivered to the mobile device service even when the mobile application is offline.

Enhanced Security

Any request sent from mobile to the server to fetch information might cause security threat. As a result, an enhanced authentication has been established for security.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



For more information on enhanced security, see Enabling Enhanced Security.

Install AVEVA Work Tasks Pro

AVEVA Work Tasks Pro is a premium mobile application for AVEVA Work Tasks. It is designed for business professionals who use a mobile phone or a tablet device to access work items, while on the move. It is an easy-to-use application that provides a quality visual experience.

Note:
- Sometimes the AVEVA Work Tasks Pro app on UWP does not get updated from the Microsoft Store from the AVEVA Work Tasks Pro page. We recommend you navigate to Library page in the Microsoft Store and update the app.
- AVEVA Work Tasks supports JavaScript based on the ES5 (ES2014) standard, applicable for Forms.

Capabilities

- View and act on tasks
- Receive real time notifications
- Fill form that initiates a process
- Approve or reject requests/events
- Flag tasks based on importance
- View work items based on categories

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Search for the assigned tasks
- Submit forms offline

Prerequisites

Complete the following prerequisites before you install and access AVEVA Work Tasks Pro on your mobile device.

Software Requirements

- To successfully configure and use the AVEVA Work Tasks Pro mobile applications, install **AVEVA Work Tasks** on your computer.

  For more information about installing **AVEVA Work Tasks**, see Installing Different Editions.
- Before installing AVEVA Work Tasks Pro on your device, verify if you have the right version of AVEVA Work Tasks configured.

Hardware Requirements

For more information about the supported versions of iOS, Windows, and Android, refer the *AVEVA Work Tasks 2023 SP1 Release Notes*.

Other Requirements

- Good Internet connectivity and a Service Bus Namespace if you want to access AVEVA Work Tasks Pro through Windows Azure.
- Good Internet connectivity to connect to Windows Azure if you want to receive Push Notification for AVEVA Work Tasks Pro.
- Port 80 or 443 to communicate to the Push Notification servers.
- Port 9350, 9351, 9352, or 9353 to communicate with Service Bus for the AVEVA Work Tasks Pro application. These ports are used by the AVEVA Work Tasks services, when the AVEVA Work Tasks Pro application is used outside Corporate Network.

  The Apple devices require separate ports for Push Notification. For more information, see Apple Push Notification service.

High Level View of Configuration and Installation of AVEVA Work Tasks Pro

This section provides a high-level view of the various configuration and installation steps required to use the Work Tasks Pro application. The objective of this section is to provide an overview of the various activities involved in this process. This section also enables you to visually keep track of your activities while following the sequence of tasks.

Each block in the flowchart below is associated with a step. Before continuing with the installation, it is presumed that you have read and understood the Prerequisites section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Access AVEVA Work Tasks Pro

The AVEVA Work Tasks Pro application can be accessed outside the corporate network through Windows Azure. The mobile application communicates with the AVEVA Work Tasks server which is within the firewall through Windows Azure. It is recommended to access the application through Windows Azure, as it provides high level of security as the application runs behind the firewall. Also, this setup does not require additional network settings to access the application on the go.

The speed at which the tasks are downloaded and can be acted upon, depends on the internet connectivity. Hence, is it recommended to have a good internet connectivity.

Following are the methods of accessing AVEVA Work Tasks Pro:

- Accessing AVEVA Work Tasks Pro within the Corporate Network (by making AVEVA Work Tasks host IP address static)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Accessing AVEVA Work Tasks Pro Outside the Corporate Network

To access AVEVA Work Tasks Pro through Azure, you will need to configure the Service Bus Listener. A Service Bus Listener is required to listen to the communication requests from the mobile devices to the Enterprise Console. After you configure a service bus listener, a **Service Bus Listener URL** is generated. This URL is to be provided to the mobile user to access the application in mobile devices.

Important: The Service Bus Listener URL must be unique for every Farm. If you are using the same URL for multiple Farms, ensure that the combination of the Listener Namespace and Service Bus Namespace is unique. For example, if the Service Bus Listener URL for a farm is *http://Telematics.servicebus.windows.net//MobileEC*, the combination of Listener Namespace (MobileEC) and Service Bus Namespace (Telematics) should not be used for any other farm configuration.

To configure the Service Bus Listener:

1. Use an existing Service Bus Namespace, if available or create a new Service Bus Namespace through Windows Azure Management Portal
2. Configure Service Bus Listener through the Farm Configuration Wizard (see Configure Service Bus Listener)

Note: You cannot configure AVEVA Work Tasks Pro to connect to the repositories configured with service bus and token services.

Access AVEVA Work Tasks Pro within the Corporate Network

1. Install AVEVA Work Tasks. For more information, see Install AVEVA Work Tasks.
2. Create the Enterprise Console with an anonymous authentication. For more information, see Create Enterprise Console with Anonymous Authentication.

   Note: We recommend to use HTTPS protocol while creating Enterprise Console with anonymous authentication for a secure connection.
3. Configure the AVEVA Work Tasks Mobile Notification Service settings. For more information, see Configuring Wonderware Skelta BPM Mobile Notification Service Settings.
4. Enter the Enterprise Console intranet URL in URL field of AVEVA Work Tasks Pro.

Access AVEVA Work Tasks Pro Outside the Corporate Network

1. Install AVEVA Work Tasks. For more information, see Install AVEVA Work Tasks.
2. Create the Enterprise Console with an anonymous authentication. For more information, see Create Enterprise Console with Anonymous Authentication.
3. You can make Enterprise Console accessible outside the corporate network in either of the following two ways:
   - Host the local Enterprise Console intranet URL on the internet.
   - Configure Azure URL. For more information, see Configuring Azure Setting.
4. Configure the AVEVA Work Tasks Mobile Notification Service settings. For more information, see Configuring Wonderware Skelta BPM Mobile Notification Service Settings.
5. Enter the Enterprise Console internet/Azure URL in URL field of AVEVA Work Tasks Pro.

For more information about setting up ports used by AVEVA Work Tasks services, when the AVEVA Work Tasks

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Pro applications are used outside Corporate Network, see Setting up Ports.

Install and Configure AVEVA Work Tasks Pro App

To install AVEVA Work Tasks Pro application

1. Download the **AVEVA Work Tasks Pro** application from the relevant store. The **AVEVA Work Tasks Pro** icon appears on the device screen.
2. Tap **Accept** to agree to the **End User License Agreement** and configure the application.

To configure AVEVA Work Tasks Pro application

To get started with using the AVEVA Work Tasks Pro app, you need to set the configuration.

Access Account

If you are opening the application for the first time, the **Manage Account** screen appears automatically.

- To access the **Manage Account** screen, swipe from the left edge of the screen, and then tap **Manage Account**.

Configure Server

- **Server Path:** Enter the URL of the Enterprise Console. For using the application with Azure, enter the Azure URL of the Enterprise Console.
- **Repository:** In the Repository list, tap on a repository name. When you tap on the repository control, the repositories and providers are populated.
- **Provider:** In the Provider list, tap on a provider name.

Configure Credentials

- **User Name:** Enter your user name.
- **Password:** Enter your password.

To access through Azure Active Directory

If your account is added as a federated user account to Azure Active Directory, you are automatically navigated to the Microsoft Login page (company login page).

To access through Azure Active Directory,

1. In the **Email** box, type your email ID.
2. Click **Sign In**.

Note:
- If you do not have the privileges to access Azure Active Directory, an error message appears indicating that you are not authorized to access this account.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To access through AVEVA Connect

If your account is added as a federated user account to AVEVA Connect, you are automatically navigated to the AVEVA Login page (company login page).

To access AVEVA Connect,

1. In the **Email** box, type your email ID.
2. Click **Sign In**.

   The AVEVA Connect Home page appears.

Note:
- If you do not have the privileges to access AVEVA Connect, an error message appears indicating that you are not authorized to access this account.

To access through AVEVA Identity Manager

To access the AVEVA Work Tasks Pro app using AIM authentication, enter the following details in the **AVEVA Identity Manager** login page:

- **User Name**: Enter the user name.
- **Password**: Enter the password.

To save Configuration

- **LOG ON:** Tap to save the configuration information and log in to the application.

To scan Account Settings using the QR Code

You can generate a QR code in the Farm Configuration Wizard to store settings such as Server Path, Repository, and Provider. You can then scan this QR code in the AVEVA Work Tasks Pro app to automatically fill these settings in the Manage Account screen.

1. Tap the **Scan QR Code** icon.
2. Scan this QR Code in the AVEVA Work Tasks Pro app.

   The values configured for the following settings in the Farm Configuration wizard are considered by default.
   - **Server Path**
   - **Repository**
   - **Provider**
3. Enter the user name and password.

To delete Account

You can clear all the settings configured for an account.

1. In the **Manage Account** screen, tap the Overflow Menu.
2. Tap **Delete Account**.

   All the settings configured for the account are cleared.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Verify Installation

After you install AVEVA Work Tasks Pro, verify the successful configuration and installation of AVEVA Work Tasks Pro on your mobile device. The following steps are based on the following assumptions:

- AVEVA Work Tasks is installed.
- Service Bus Listener URL has been generated.
- Users have been added (admin and John in this scenario).
- AVEVA Work Tasks Pro application has been installed and configured.

To verify the installation

1. In the **Enterprise Console,** click menu icon, and then click Workflows.
2. Create a *Leave Approval* workflow.
3. Add an **Approval** activity.

   Set its properties as explained below:

   a. **Name**: Enter a name for the activity, say *Leave Approval*.
   b. **Delivery Channel**: In the Delivery Channels window, select the **MobileWorkList** check box in the **Channels** section.

      Click **Save Channels**. This enables the activity to deliver the task to the Inbox in the mobile devices.
   c. **Assign Actor**: Set the actor to whom the task is to delivered. For example, admin.
   d. **Subject**: Set the subject for the leave approval task.
   e. **Body**: Set the Body text for the leave approval task.
4. Click **Save** to save the property changes.
5. Drag and drop an Information activity.

   Set its properties as explained below:

   a. **Name**: Enter a name for the activity, say Leave Approved.
   b. **Delivery Channel**: In the Delivery Channels window, select the **MobileWorkList** check box in the **Channels** section.

      Click **Save Channels**.
   c. **Assign Actor**: Set the actor to whom the information is to delivered. For example, John.
   d. **Subject**: Set the subject for the leave approval information.
   e. **Body**: Set the Body text for the leave approval information.
6. Click Save to save the property changes.
7. Drag and drop another Information activity.

   Set its properties as explained below:

   a. **Name**: Enter a name for the activity, say Leave Rejected
   b. **Delivery Channel**: In the Delivery Channels window, select the **MobileWorkList** check box in the **Channels** section.

      Click **Save Channels**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

c. **Assign Actor**: Set the actor to whom the information is to delivered. For example, John.
d. **Subject**: Set the subject for the leave rejection information.
e. **Body**: Set the Body text for the leave rejection information.

8. Click **Save** to save the property changes.
9. Publish and Test Run the workflow.
10. Log on to the AVEVA Work Tasks Pro mobile application as admin user. For details about configuration settings, see Install and Configure AVEVA Work Tasks Pro App.

    The user will be able to see the assigned task in the Inbox.
11. Tap on the task to view and act on it. Enter comments and click either approve or reject.
12. Log on to the AVEVA Work Tasks Pro mobile application as John. The approval or rejection information has been delivered to John's Inbox.

Note: The Backup and Restore option in iTunes will not restore the configuration settings of Work Tasks Pro. The user needs to re-configure the AVEVA Work Tasks Pro.

Configure AVEVA Work Tasks Pro

You can configure the MobileWorkList option in the Delivery Channel property of the human activities. You can also block or unblock the mobile application installed in the mobile devices.

- Delivery Channel - MobileWorkList
- Block or Unblock Mobile Application

Delivery Channel - MobileWorkList

The Delivery Channel property in Human Activities has to be set to send the tasks to the recipient through different modes of delivery like mail, web, and mobile. In order to send the tasks to the mobile device, the MobileWorkList option in the Delivery Channel property needs to be selected. This allows mobile users to view and act upon the tasks from the Inbox that is rendered on their mobile devices. This option is available in three of the Human activities - Approval, Information, and Invoke Form.

You can configure the MobileWorkList option in the Delivery Channel property of the human activities.

To configure 'MobileWorkList' option in the Delivery Channels property:

1. In the Process Designer, drag and drop the Approval/Information/Invoke Form activity on to the design area. Right-click the activity and the properties pane appears on the right side of the design area.
2. In the **Activity Properties** pane, expand the **Configuration** node and select the **Delivery Channels** property.
3. In the **Delivery Channels** window, select the **MobileWorkList** check box in the Channels section.
4. Click **Save Channels**.

   This enables the activity to deliver the task to the Inbox in the mobile devices.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Block or Unblock Mobile Application

You can block or unblock the mobile application installed in the mobile devices. This feature can be used when a user loses the mobile device and would want to block the access to the application installed in the lost device. Through this feature you can block unauthorized use of the application. After the device is retrieved, the same feature can be used to unblock the application.

The blocking or unblocking feature takes approximately 3 minutes to reflect the changes on the device. Upon receiving a request from a mobile user, the administrator should inform the mobile user about the time taken for the changes to be reflected on the device.

To Block/Unblock Mobile Application on Devices:

1. In the **Central Configuration** page, click the **Block/Unblock Mobile Application on Devices** link to navigate to the page.
2. Select the required option from Search Criteria list. Available options are **User**, **Blocked Devices**, **Unblocked Devices**, and **All**.
   - To view the connection based on the User:
     a. Select the repository to which the user belongs to, from the Repository Name list.
     b. Select the required user from the User Lookup.
   - If you select the **Blocked Devices** or **Unblocked Devices** option, the blocked or unblocked devices are listed.
   - If you select the All option, then all the devices are listed.
3. Click **Go**. This would list all the devices based on the selected search criteria. The list displays the Device ID/ UUID, Device Name, Device Type, OS Version of the application, if the device is blocked, Push Notification Token ID, Audit History of the block or unblock requests, and Connection details of the application.
4. Select the device in which you want to block or unblock the application.
5. To block or unblock all the devices listed here, select the Device ID/UUID.
6. Click **Block** or **Unblock** as per your requirement. The Block Device or Unblock Device appears.
7. Enter the comments for blocking or unblocking respectively. Specify the reason given by the user of the application to block or unblock the application and also the mode of communication used by the user to make this request.

To View Audit History of the Application

1. Follow steps 1-5 from the section To Block/Unblock Mobile Application on Devices. The list of blocked/ unblocked devices are listed.
2. Click the View link in the Audit History column.

   The Audit History appears displaying the following details:
   - Details of the administrator who has acted upon this request
   - Date of the execution of the request
   - Comments added by the administrator while executing the request

To View Device Connections

The View Device Connections allows you to view a list of all the repositories that were configured to a particular

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

device. In this screen you can also clear the active session tokens.

1. Follow steps 1-5 from the section To Block/Unblock Mobile Application on Devices. The list of blocked/ unblocked devices are listed.
2. From the list, click the View link in the Connections column.

Notifications will not be sent to blocked device, even if it has an active session token.

The View Device Connections screen appears displaying the following details:

- **Repository Name**: value specified in the Settings Configuration of the application
- **Provider Name**: value specified in the Settings Configuration of the application
- **User Name**: value specified in the Settings Configuration of the application
- **Last Sync Date**: last date and time when the user logged on the application
- **Connection Name**: displays the Connection Name given during the AVEVA Work Tasks Pro configuration.
- **Session Token**: is the unique identifier which is used to identify the connection between the repository and the device. When the session token's value is zero, it indicates that the specific repository is not connected with device.
- **Clear Session Token**: It is used to clear the session token. Clearing the session toke stops sending notifications to the device. This releases the client connection license acquired for the user.

Advanced Settings

To configure advanced settings:

1. Run the **Farm Configuration Wizard**, and click **Next**.
2. In the Edit **AVEVA Work Tasks** Farm Settings window, select **Service Setting**.
3. Click **Next**.

   The Services/Global Settings window appears.
4. Select **Custom settings**.
5. Click against a service to configure the service. For information about configuring a service, see Service Settings.
6. Click against a Website service for configuring Website settings. For information about configuring a Website service, see Change Web Site Settings.
7. Click against Global Settings. For information about configuring global settings, see Global Settings.
8. Click **Finish**.

Service Monitor

You can use the Service Monitor feature to start, stop, or restart the AVEVA Work Tasks Services. When you launch Windows or start the Farm Configuration Wizard, the Service Monitor feature is automatically started. However, you can also manually start the Service Monitor feature.

For more information about the services, see Service Settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To start or stop a service using the Service Monitor window

1. In the **Microsoft Taskbar**, double-click the icon.
   The **AVEVA Work Tasks Service Monitor** dialog box appears.
2. Perform one of the following:
   - To start a service, click the ▶ icon next to that service.
     The selected service is started and the status of the service is displayed in Blue color.
   - To stop a service, click the ■ icon next to that service.
     The selected service is stopped and the status of the service is displayed in Red color.
     The following notifications are displayed in the Microsoft Taskbar:
     - **Some services stopped working**: When a few AVEVA Work Tasks services are stopped.
     - **All services stopped working**: When all the AVEVA Work Tasks services are stopped.
   - To restart a service, click the ↻ icon next to that service.
     The selected service is restarted and the status of the service is displayed in Orange color.

   Note: The **Start**, **Stop**, and **Restart** icons will be enabled or disabled for a service, based on the status of that service.

To start or stop a service using the context menu

1. In the **Microsoft Taskbar**, right-click the icon.
   The **AVEVA Work Tasks Service Monitor** context menu appears.
2. Select the service and then perform one of the following:
   - To start a service, click ▶ **Start**.
     For example: To start **AVEVA Work Tasks - Client Service**, select **AVEVA Work Tasks - Client Service** from the context menu, and then click ▶ **Start**.
     The selected service is started and the status of the service is displayed in Blue color.
   - To stop a service, click ■ **Stop**.
     The selected service is stopped and the status of the service is displayed in Red color.
     The following notifications are displayed in the Microsoft Taskbar:
     - **Some services stopped working**: When a few AVEVA Work Tasks services are stopped.
     - **All services stopped working**: When all the AVEVA Work Tasks services are stopped.
   - To restart a service, click ↻ **Restart**.
     The selected service is restarted and the status of the service is displayed in Orange color.

   Note: The **Start**, **Stop**, and **Restart** icons will be enabled or disabled for a service, based on the status of that service.

To configure settings for Service Monitor application

1. Browse to the *<AVEVA Work Tasks Install Path>\Bin* path, where the **AVEVAWorkTasksQuickLaunch.exe.config** file is available.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. In the **AVEVAWorkTasksQuickLaunch.exe.config** file, configure the values as follows.

```
<?xml version="1.0" encoding="utf-8" ?>
<configuration>
<startup>
<supportedRuntime version="v4.0" sku=".NETFramework,Version=v4.6.2" />
</startup>
<appSettings>
<add key="DisableApplication" value ="false"/>
<add key="RefreshApplicationTimerIntervalInMillisecond" value ="30000"/>
<add key="NotificationTimerIntervalInMillisecond" value="120000" />
<add key="AutoRefreshServiceDetailsScreen" value="true" />
</appSettings>
</configuration>
```

3. For the **DisableApplication** parameter, enter either of the following values:
   - **true**: If you want to disable the **Service Monitor** application.
   - **false**: If you do not want to disable the **Service Monitor** application.
4. For the **NotificationTimerIntervalInMillisecond** parameter, enter the time interval, in milliseconds, after which the notification must be displayed.

   For example: If you want the notification to be displayed after 2 minutes, enter the value as 120000.

   Note: The minimum value for this field is 10000 milliseconds (10 seconds) and the default value is 2 minutes (120000).
5. For the **RefreshApplicationTimerIntervalInMillisecond** parameter, enter the time interval, in milliseconds, after which the **AVEVA Work Tasks Service Monitor** application should be refreshed.

   For example: If you want the **Service Monitor** application to be refreshed after 30 seconds, enter the value as 30000.

   Note: The minimum value for this field is 5000 milliseconds (5 seconds) and the default value is 30 seconds (30000).
6. For the **AutoRefreshServiceDetailsScreen** parameter, enter either of the following values:
   - **true**: If you want the **Service Monitor** application screen to be automatically refreshed, at the interval specified in the **RefreshApplicationTimerIntervalInMillisecond** parameter.
   - **false**: If you do not want the **Service Monitor** application screen to be automatically refreshed, at the interval specified in the **RefreshApplicationTimerIntervalInMillisecond** parameter.
7. Save the **AVEVAWorkTasksQuickLaunch.exe.config** file.

   The settings for the **Service Monitor** application are configured successfully.

Service Settings

You can configure the following services for AVEVA Work Tasks:

- **Workflow Engine**: This service is required and must be running for processing AVEVA Work Tasks workflow requests.
- **Task Scheduler**: This service handles the execution of all tasks that have not taken place as scheduled (escalations).
- **Communication Service**: This service handles incoming e-mail and SMS communication.
- **Mobile Notification Service**: This service handles notifications sent to the AVEVA Work Tasks Pro mobile

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

application.

- **Advance Server service**: This service provides Load Balancing and Failover. This service will be enabled only if the Load Balanced Server license is acquired.

The Central Configuration Settings and the Enterprise Console Settings are available only after a Farm is created.

Note: For any of the services, if you update the port number, then manually restart the IIS server using the iisreset command.

Engine Settings

You can configure the **Workflow Engine settings** while installing the product or after installation at any point in time.

The following table provides information on the various fields and the default values for specific fields:

Field Name	Default Value	Description
Server Port	8855	This field denotes the port number used by the Workflow Engine Service. The Workflow Engine communicates with other services using this port.
Load Balanced	False	This field is used to set load balancing for AVEVA Work Tasks. This field is enabled only for the Load Balanced Server installation. To enable load balancing set the Load Balanced value to true.
Load Balanced Server Port	-	This field allows you to enter the port number for the Load Balanced Server. This field is disabled if Load Balanced value is set to False.
Load Balanced Client Port	-	This field is used to enter the port number for the Load Balanced Client. This field is disabled if Load Balanced value is set to False.

Steps to apply Engine Settings

- Click **OK** to apply these settings.

See also: Auto Resume Settings

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Task Scheduler Settings

Task Scheduler Services

This service handles the execution of all tasks that have not taken place as scheduled (escalations).

Task Scheduler does not persist any information in memory. All tasks are database persisted and are performed only when due time is reached.

The Task Scheduler use a queue to process the tasks in parallel. Due to queuing up of Task, you may not get accurate timeouts with seconds accuracy.

Example of the service behavior

Consider that there are 25 threads running for processing the tasks. The polling on Database occurs at 11:00 AM which fetches 30 tasks which are due to perform by 11:45. Since all of them has to be performed at 11:45, all the 25 threads go to sleep stage for 45 Seconds for the first 25 tasks and the rest of the 5 tasks get queued up as there are no threads to process the tasks. At 11:45, tasks get performed freeing up the threads. The 5 tasks which were queued get processed now. As you can see the accuracy of 11:45 is already.

Compromised for the 5 tasks as they might perform at 11:46 or 11:47 or 11:48. To set the Task Pool limit and Thread Pool size, see *Task Scheduler Settings* section later in this topic.

Load Test Behavior of Task Scheduler

The Task Scheduler is tested along with the load test that is normally done for the engine and cannot be tested separately. The test is regarding how much load the Task Scheduler can handle. The test for the engine varies from 1000 to 20,000 instances or more. During this load the task scheduler will be loaded with more than 10,000 tasks which might perform at the same time or at a different time. If all the tasks are due for a specific time there will be a delay for the task perform time.

If there are 10,000 tasks to be executed at the same time, definitely the memory usage will be high as all the tasks will be queued and will get executed in parallel.

For example, assume that the due time is December 11th, 12:30 P.M., on heavy load, if there are many tasks which have to be executed at the same time, some of the tasks will get performed by 12:35 or 12:40. This delay time is mainly due to the threads which are available in the Task Scheduler.

Task Scheduler uses threads for executing the tasks, so on heavy load, threads get queued up and wait for one task to be performed and then the next one. By default parallel there could be 25 tasks which will get executed at the same time, still on heavy load there will be a delay.

Task Scheduler pools the database every one minute to check the tasks which are due. For example, at December 12th 10:18 AM all tasks which are new and due by 10:18 AM will be picked and performed.

Task Scheduler Settings

The Task Scheduler Settings screen is used to customize settings for the various AVEVA Work Tasks tasks.

The following table provides information on the various fields and the default values for specific fields:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Default Value	Description
Server Port	8856	This field denotes the port number used by Task Scheduler service. This value must be modified if the default port value is in use.
Load Balanced	False	This field is used to set load balancing for AVEVA Work Tasks. This field is enabled only for the Load Balanced Server installation. To enable load balancing set the Load Balanced value to true.
Load Balanced Server Port	8853	This field allows you to enter the port number for the Load Balanced Server. This field is disabled if Load Balanced is set to False.
Load Balanced Client Port	8860	This field is used to enter the port number for the Load Balanced Client.
Task Fetch Interval	60	This field is used to specify the interval in seconds at which tasks have to be retrieved.
File Watcher		This field is used to define a folder for File Watcher operation.
Thread Pool Size	25	This field allows you to define a thread pool size for the Workflow Engine. A thread pool size determines the number of threads reserved by a server for providing service requests. For a Workflow Engine deployed in a heavy load scenario, a higher thread pool size needs to be set.

Steps to apply Task Scheduler settings

- Click **OK** to apply these settings.

Communication Service Settings

AVEVA Work Tasks Communication Service makes use of communication service settings for the following activities:

- **Wait for E-mail**: The workflow processes can be designed to be initiated or processed on receipt of email

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

matching specified parameters. The Communication service monitors the specified port and IP for incoming emails that could be used in the Workflows.

- **Wait for SMS**: The communication service can be setup to monitor incoming SMS.
- **Sending SMS**: The workflows can send SMS through a Global System for Mobile communication (GSM) device. The Communication Service uses settings and configuration specified in this screen for sending SMS.

The various communication settings are:

- Communication Server
- Mail Server (The Mail Server setting feature is moved to Central Configuration. For more information, see Mail Server Setting.)
- SMS Receiver
- SMS Config
- SMS Config Custom
- SMS Send Action

Communication Server

The Communication Server settings provides the IP address and the port to be monitored by AVEVA Work Tasks's Communication Engine for incoming e-mails.

The following table provides description of the fields with their default values:

Communication Service Server

Field Name	Default Value	Description
Listener IP Address	-	This field is used to enter the IP address to be monitored for incoming emails. This field defaults to the name of the logged in machine.
Port	8770	This field is used to enter the port number for the Listener IP Address.
Wait Task Handler Path	-	This field is used to provide the assembly navigation path for handling timeouts and e-mail received.
Wait Task Handler Class	-	This field is used to enter the Class name for handling timeout tasks and incoming emails.
Block Mail Addresses	-	This field is used to enter e-mail addresses that should be blocked

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Default Value	Description
		from processing.

Enterprise Server Settings

Field Name	Default Value	Description
Load Balanced	False	This field is used to set load balancing for AVEVA Work Tasks. This field is enabled only for the Load Balanced Server installation. To enable load balancing set the Load Balanced value to true.
Load Balanced Server Port	8853	This field denotes the port number used by Advance Server. This value must be modified if the default port value is in use.
Load Balanced Client Port	8864	This field is used to enter the port number for the Client.

Mail Server

For configuring Mail Server, see Mail Server Setting.

SMS Receiver

The WaitForSMS Action works with the help of the Communication Engine Service. The Communication Engine checks the Phone device periodically for SMS.

Field Name	Default Value	Description
Enable SMS Receiver	False	This field enables the Communication Engine to check for SMS.
SMS Time Interval	0.00:01:00	This field is used to specify the time interval at which the AVEVA Work Tasks Engine must check for SMS in the phone device. Example: 0.00:01:30 = 1 minute 30 secs
Wait Task Handler Path	-	This field is used to provide the Assembly path for handling timeout actions and warnings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Default Value	Description
Wait Task Handler Class	-	This field is used to provide the class name for handling timeout actions and warnings.
Provider Configuration	-	This field is used to enter the details specific to your service provider. AVEVA Work Tasks currently supports only GSM protocols for receiving SMS. • **Name**: Enter the name of the service provider. • **Assembly**: Enter the path • **Class**: Enter the class name for receiving SMS • **Device**: Enter device details

SMS Config

The SMS Send Action settings are used by the Notification Service to send SMS.

ProviderConfig: This is for Connection Type specific configuration settings. If you are using a provider other than the default provider specified here, you will have to add the details here. Currently five Connection

Types are supported:

- SMSPatternMatch
- GSM
- SMSProvider
- Hayes
- EmailProvider.

Under each Connection Type, apart from their configuration details, two compulsory nodes, SMSMessengerAssembly and SMSMessengerClass, ave to be specified.

This is the class which sends SMS for each provider. This class should implement ISMSSender interface.

The following are some examples for setting ProviderConfig:

```
<GSM>
<SMSMessengerAssembly>C:\ Workflow.NET.SMS.Messenger.dll</SMSMessengerAssembly>
<SMSMessengerClass>Workflow.NET.SMS.Messenger.SMSSender</SMSMessengerClass>
<Device> Nokia 6310i Modem </Device>
</GSM>
```

Note: As an alternative, "Nokia 6310i Modem" can be replaced by "COM 1", provided the Nokia phone is connected on COM1.

```
<SMSProvider>
<SMSMessengerAssembly>C:\ Workflow.NET.SMS.Messenger.dll</SMSMessengerAssembly>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<SMSMessengerClass>Workflow.NET.SMS.Messenger.SMSSender</SMSMessengerClass>
<Device> Standard 19200 bps Modem </Device>
<DeviceSpeed> 1200 </DeviceSpeed>
<DeviceSettings> "8, n, 1" </DeviceSettings>
<ProviderDialString> "02012345678" </ProviderDialString>
<ProviderType>1</ProviderType>
</SMSProvider>
```

Here are some details about values in the above example:

- DeviceSettings - 8 databits, no parity, 1 stopbit
- Provider type - Standard TAP provider
- You can specify 0 for UCP Provider, 2?for TAP provider, no request for LineFeed, and 3 for TAP provider, no request for EOT

```
<Hayes>
<SMSMessengerAssembly>C:\Workflow.NET.SMS.Messenger.dll</SMSMessengerAssembly>
<SMSMessengerClass>Workflow.NET.SMS.Messenger.SMSSender</SMSMessengerClass>
<Device> Standard 19200 bps Modem </Device>
</Hayes>
```

Field Name	Description
Connection Sequences	The Connection Sequences is used to provide the sequence in which AVEVA Work Tasks Engine must choose the connection type for sending SMS. **Connection Type**: This column is used to list the various connection types such as GSM, SMSPatternMatch, EmailProvider, SMSServiceProvider, and Hayes. **Sequence Number**: This column is used to list the sequence of each connection type.
Email	This field is mapped to the connection sequence table for sending SMS. The fields are mapped in the user provider for sending SMS. The three fields - Email, Mobile Phone Provider, and SMS Number are required to be mapped to the table. Some providers allow SMS to be sent through email. Enter your email address in the email field to send SMS to these providers.
Mobile Phone Provider	This field is mapped to the table for sending SMS. Enter the name of the Mobile Phone Provider in this field. Example:Hutch
SMS Number	This field is mapped to the table for sending SMS. Enter the phone number to which the SMS has to be sent.

The above settings can be directly used for AVEVA Work Tasks list provider to send SMS. No manual settings are

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

required. However, if different providers are used, the appropriate values need to be set.

SMS Config Custom

To use a connection type other than the default supported, provide SMS Pattern Match information for SMS Messenger Assembly and Class.

Group Name	Field Name	Description
SMS Pattern Match	SMS Messenger Assembly	This field is used to define an assembly which handles sending and receiving SMS.
	SMS Messenger Class	This field is used to enter the class name which handles sending and receiving SMS.
SMS Patterns	-	• **SMS Provider**: Provider name such as, Hutch or Airtel. • **Connection Type**: Connection type like EmailProvider, GSM, SMSServiceProvider or Hayes. • **SMS Pattern**: Pattern like 9845*, 98*.

SMS Send Action

SMS Config Custom Settings enable use of a custom SMS provider.

Field Name	Description
Custom SMS Provider	• **Name**: Enter the name of the SMS Provider. • **Assembly**: Enter the path to the assembly. • **Class**: Enter the class information. • **Device**: Enter the device for the custom SMS provider.
SMS Messenger Assembly	This field is used to define an assembly which handles sending and receiving SMS.
SMS Messenger Class	This field is used to define a Class which handles sending and receiving SMS.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description
Email Server	Name of the e-mail server.
Email Pattern	• **Provider Email Pattern Name**: Name of the e-mail provider. • **Email Pattern**:Pattern used by e-mail provider.

Client Service Settings

Service Monitoring

You can monitor the AVEVA Work Tasks Windows services such as, the Client Monitor, Advance Server, Task Scheduler (TS), Workflow Engine (WF Engine), and Communication Service (CS).

AVEVA Work Tasks architecture uses a plug-in model wherein, any Custom activity, COM-object, or SOA activity can be plugged in as part of the workflow. Sometimes, these activities show a high memory usage. Due to the increased memory usage, the WF Engine service at times gives “OutOfMemoryException” and cannot continue processing the workflow tasks which are in the queue. This in turn delays the execution of the workflows which are in the queue. In addition, the administrator might not know about this until they are alerted by the users about the delays in execution of work flows. To resolve this problem, the administrator will have to restart the Workflow Engine service.

The Service monitoring feature automates this restart process to avoid workflows pending in queues and the administrator's interference in the restart process.

Terminologies

Terms	Description
WF Engine	Workflow engine
TS	Task Scheduler service
Service/Windows Service	AVEVA Work Tasks Windows service
Process	Instance of AVEVA Work Tasks Windows service
Service monitor	AVEVA Work Tasks Client service
Admin	Administrator
CS	Communication service
AS	Advance Server service

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Types of Restarts

There are three types of restarting services:

Restart during Critical Memory Limit:

Whenever the memory limit of a process (instance of Windows service) reaches a Critical Value, the service is immediately restarted. During the Critical memory value of the process, there are high chances of the process throwing *OutOfMemoryException*. By restarting the process, we the *OutOfMemoryException* exception, and thereby, the workflows pending in the queue are avoided.

For more information about Critical Memory Limit, see Process Memory Calculation.

Restart during Warning Memory Limit:

When the memory limit of a process reaches a critical limit, the service is restarted immediately. Even when the service is in high load usage, the restart is unavoidable. To avoid restarting during high load usage, we need to restrict the process from reaching the critical memory limit.

The Client service will monitor this process. Whenever the service finds that the process has reached the warning memory limit for a particular duration of time, it will make a note of it.

If the warning memory limit is exceeding at a low usage time (night times), the service is restarted immediately at that time. The low usage time is configurable in the Configuration Settings.

This attribute is not enabled by default. The Administrator will have to enable in the Configuration Settings.

Restart during Maintenance Phase:

Load of the Workflow tasks will be maximum during a particular phase (duration) in a business cycle. For example, payroll clearance will happen at the end of every month.

In such situations, it is better to restart the service in advance to clean all unknown objects which may still be consuming the memory, so that there is sufficient memory to load the workflows for execution. Restart can happen at a low usage time such as late nights. The low usage time is configurable in the Configuration Settings.

This attribute is not enabled by default. The Administrator will have to enable in the Configuration Settings.

Features of Service Monitoring

Service monitoring has the following additional features. Some of these features are explained in detail in the later sections:

Note: Ensure that the Client service account has the permission to start and stop remaining services.

- Service monitoring can be disabled or enabled depending on the configuration. If the configuration file is not present, then the monitoring is disabled. If the configuration file has some invalid syntax and if there are any errors in the configuration file, then too the service monitoring will be disabled.
- The Client service has the ability to disable or enable monitoring types. In other words, the maintenance monitoring can be disabled and the remaining monitoring can be enabled. By default, the **Critical Memory Monitoring** option is enabled and the **Warning Memory** and **Maintenance Monitoring** options are disabled.
- The Client service has the ability to enable and disable monitoring feature for a specific AVEVA Work Tasks

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

service. For example, Monitoring only the Communication service can be enabled or disabled.

- Whenever the Client service is started, all AVEVA Work Tasks Windows services are also started. Similarly, whenever the Client service is stopped, all AVEVA Work Tasks Windows services are also stopped.
- If any AVEVA Work Tasks Windows service is stopped, it is restarted by the Client service.
- The Client service can also monitor service specific conditions, such as the Workflow engine thread hanging behavior. This is always enabled. To know more about Workflow Engine thread hanging behavior, see Workflow Engine.
- The Client service automatically restarts during its failure. Suppose a memory leakage in the client service stops the client service, then the client service is restarted after 5 minutes. However, it will not be restarted if it is stopped manually or from other applications.
- By default, the Client service sends alert emails when the services are restarted. However, you can configure whether the alert emails must be sent or not.
- If a service is not installed, it will not be monitored even if its configuration section values are present in the configuration file.
- If the **Workflow Engine** service is unable to acquire the required license, then the service does not get started. In this scenario, the Client service monitoring is disabled.
- If the load balancing feature is not enabled on a server, then the **Advance Server Service** will not be monitored by the Client service.
- In a load balanced environment, if the **Workflow Engine** service or the **Advance Server Service** is unable to acquire the required license, then the service does not get started. In this scenario, the client service monitoring is disabled.

Process Memory Calculation

Restart of a Windows service is based on the memory of its processes (instances of Windows service). The Client service will calculate the memory of the process.

We use System.Diagonstic.Process to calculate the memory associated with a specific process.

System.Diagonstic.Process has the following properties to get the memory of a process:

- **WorkingSet64**: This is a set of memory pages currently visible to the process in physical RAM memory. The working set includes both shared and private data. Shared memory is the read-only memory which is used by the multiple processes. Private memory is the read-write memory used by a specific process.
- **PrivateMemorySize64**: Private memory held by the process. It is the read-writable memory which cannot be shared with other processes.
- **VirtualMemorySize64**: Total virtual memory allocated by the OS to a process. The value will be more than WorkingSet64 + PrivateMemorySize64.
- **PagedMemorySize64**: Amount of paged memory allocated for the associated process.

The Client service can be configured to use any one of the or a combination of the above properties. Combination can be in terms of addition (+), subtraction (-), multiplication(*), and/or division(/).

Syntax for the configuration is as given below.

```
<MemoryCalcRule Rule="PrivateMemorySize64"/>
<MemoryCalcRule Rule="WorkingSet64 + PrivateMemorySize64"/>
```

Default is configured as

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<MemoryCalcRule Rule="PrivateMemorySize64"/>
```

- For a 64-bit machine, 1500MB is the default configured value. This value can be changed in Configuration Settings.

Types of Monitoring

The different types of monitoring available are:

- Maintenance
- Critical Memory Limit
- Warning Memory Limit

Maintenance

AVEVA Work Tasks services are monitored for the maintenance. As part of the maintenance, these services are restarted. Services can be restarted on a recurring bases. Recurring frequency can be weekly or monthly. Weekly can be every Saturday or Sunday or a combination of them. Monthly can be every first day of the month or second day of the month or combination of them.

Syntax for the configuration is as given below:

```
<MaintainanceRestart RestartAt="01:00" WeeklyRestartDay="Sat,Sun"
MonthlyRestartMonths="Jan,Feb" MonthlyRestartDate="1" />
```

- **RestartAt** is the time at which the services need to be restarted. Specify the value in the 24 hours format. E.g.: 23:00. This is a mandatory attribute.
- **WeeklyRestartDay** is the week day(s) on which the services need to be restarted.

  Specify the value as first 3 letters of the day, separated by comma. E.g.: Sun,Mon,Tue,Wed,Thu,Fri,Sat

  Specify the value as “All” if the services need to be restarted on all days. E.g.: All
- **MonthlyRestartMonths** is the month on which the services need to be restarted.

  Specify the value for “MonthlyRestartMonths” as the first 3 letters of a month. E.g.: Jan,Feb,Mar,Apr,May,Jun,Jul,Aug,Sep,Oct,Nov,Dec

  Specify “All” if you want to monitor the services for all the months. E.g.: All
- **MonthlyRestartDate** is the date on which the services need to be restarted. Ensure that you configure both the attributes together.

  Specify the value for “MonthlyRestartDates” attribute as comma separated dates. E.g.: 29,30,1,2,3 .

  If the values for both weekly and monthly attributes are mentioned, then the services will be restarted on both the days.

Either **Weekly Restart** configuration, **Monthly Restart** configuration, or a combination of both can be present.

In the example given below, restart happens on every Saturday and Sunday at 1AM.

```
<MaintainanceRestart RestartAt="01:00" WeeklyRestartDay="Sat,Sun"
MonthlyRestartMonths="" MonthlyRestartDate="" />
```

In the example given below, restart happens on the first of every month at 1AM. If a date mentioned in the configuration file is not present (for example February does not have 30 days), then that value is skipped.

```
<MaintainanceRestart RestartAt="01:00" WeeklyRestartDay="" MonthlyRestartMonths="All"
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
   MonthlyRestartDate="1" />
```

In the example given below, restart happens every Saturday, Sunday, and on the first of every month.

```
   <MaintainanceRestart RestartAt="01:00" WeeklyRestartDay="Sat,Sun"
   MonthlyRestartMonths="All" MonthlyRestartDate="1" />
```

To disable MaintainanceRestart, this node has to be deleted or commented.

Critical Memory Limit

Critical Memory Limit is the peak memory size, in MB, of a process. At this size, the process starts throwing OutOfMemoryException, and hence cannot perform any task.

During such a condition, the service needs to be restarted.

After the configured critical memory limit is reached, the service is restarted immediately. It will be configured as mentioned below.

```
   <CriticalMemory MemoryLimitInMB="700"/>
```

For a 64-Bit machine, 1500MB is the default configured value.

To disable Critical memory limit, the above node needs to be commented or deleted.

Warning Memory Limit

Warning Memory Limit of a service is the memory size of the process. At this size, the process can be on the verge of failure (OutOfMemoryException). If the memory size increases to a higher extent, the process can enter the phase of Critical Memory Limit. To avoid this, the process can be restarted when its load is less, probably during night time.

Process should be in warning memory phase for a specified duration (WarningTimeLimitInMinutes). Only then the service will be restarted. In addition, the warning memory limit is reached at the specified RestartAt time.

Configuration:

```
   <WarningMemory MemoryLimitInMB="500" TimeLimitInMinutes="10"
   RestartAt="01:00"/>
```

The above configuration means that if the process has reached the memory of 500MB at 1AM and it was 500MB for more than 10 minutes, only then the service is restarted.

All the three attributes are mandatory fields.

To disable Warning Memory monitoring, the above node should be deleted or commented.

Service Specific Monitoring

Service specific monitoring is used for monitoring the thread pool and checking the engine hanging behavior.

Workflow Engine

AVEVA Work Tasks services can have their own monitoring logic. The monitoring logic is executed by the Client Service.

Monitoring the thread pool and checking the engine hanging behavior:

At times, the Workflow Engine is unable to execute the Workflows though sufficient memory is available. In addition, it may not even throw up a MemoryOutOfException. The reason could be that some workflow threads

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

may be hanging and may not be released from the thread queue. Eventually, the pending workflows do not get the thread queue and hence do not get processed.

The Workflow Engine has a default thread pool configuration of 30 threads. However, repositories can have their own configuration in the Farm's SKConcurrentThreadPools.

For more information, see *Thread Pools at Repository Level* in the *Build Business Process* section.

For example, if there are three repositories where "Repository A" has a thread configuration of 20 threads in SKConcurrentThreadPools and "Repository B" and " Repository C" have no configurations in SKConcurrentThreadPools.

Then the total configured threads will be 20 + 30 = 50 threads.

The Client service will check the **InternalStatus** and **LastUpdatedDateTime** columns of the SWExecute table. After a new workflow execution starts, its status will be “ex” (executing) and **LastUpdatedDateTime** will be the current datetime. If a workflow status is "ex" for a duration of about 10 minutes (Configuration Settings in WFEngineThreadScanInterval node), then the engine is hanging as the workflow is not yet processed completely.

Out of 50 threads, if 30 threads are hanging, that is if their status is not changed from executing to complete, then there are chances that a lot of workflows are pending in queue. Hence, the Workflow Engine is hanging. The Client service has a threshold value of about 70% (Configuration Settings in the WFEngineThreadThresholdValue node). After the number of hanging threads reaches the threshold value, the service is restarted and hence all the threads are freed.

After the Client service is started followed by a change in the value of SKConcurrentThreadPools, then the Client service needs to be restarted to monitor with the updated values. Values from SKConcurrentThreadPools are cached in the Client service. This cache can be broken and recreated after the Client service is restarted.

Service Dependencies

The Client Service, Advanced Service, Workflow Engine, Task Scheduler, and Communication Service are inter-dependent. These dependencies will be considered for monitoring.

Dependencies

- If the Client service is stopped on a machine, all other services in that machine are also stopped. Similarly, if the Client service is started on a machine, all other services in that machine are also started.
- If a service crashes or is stopped manually, then its dependent services also must be stopped and restarted in a sequential manner.
- **Order of starting ad/or stopping the services**: Communication Service, Task Scheduler, and WorkFlow Engine.
- Advance service is present only in the load balanced environment. If the Advance service has to be stopped by the Client service, then stop the services in the following order: Advance Service, Communication Service, Task Scheduler, and Workflow Engine. Follow the same order while starting the services.
- For the remaining services (CS, TS, and WF Engine), if any service is stopped, then all the services are restarted in an order. For example, if Task scheduler needs to be stopped by service monitoring, then Communication Service, Task Scheduler, and WorkFlow Engine are stopped. The service monitoring will start Communication Service, Task Scheduler, and Workflow Engine in an order.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Load Balanced Environment

In a load balanced environment, ensure that the AVEVA Work Tasks Windows services are not restarted at the same time in all machines. Hence, if MaintenanceRestart is configured, ensure that the timing is not the same in all the boxes. If MaintenanceRestart timing is same, then the client service will restart the remaining Services at the same time in all the machines.

In a load balanced environment, the Communication Service is restarted only in one box. During Farm Configuration, the Administrator has to configure the Communication Server too. The configuration value "Listener IP Address" has to be the IP address or computer name of the machine where the Communication Service will be running.

The Client service will monitor the Communication Service only if the Computer name or IP address of the machine matches with the Listener IP Address. Else, the Client Service will not monitor the Communication Service in that box.

The Advanced Service is monitored only in a load balanced environment.

If it is a client machine which is installed with only the web server, then that machine will not be monitored.

Configuration Settings

The entire Service monitoring configuration is mentioned in the file **ServiceMonitoring.xml**. See the comment sections of **ServiceMonitoring.xml** to know the specification of each attribute.

By default, the **AppConstants** section is commented.

```
<?xml version="1.0" encoding="UTF-8"?>
<!--“” The services are not monitored if the config file is not present, or if the value
of the “ServiceMonitoringEnabled” attribute is set to “false”, or if the config file
throws an invalid format(syntax) error. Alert emails are sent if the value of the
“SendAlertEmailsEnabled” attribute is set to “true", or if the “SendAlertEmailsEnabled”
attribute is not present or has an invalid value.-->
-<SMConfig SendAlertEmailsEnabled="true" ServiceMonitoringEnabled="true">
<!--DO NOT CHANGE AppConstants. The AppConstants are used for internal processing and
are commented out by default. -->
<!-- <AppConstants> <!- The frequency (in seconds) at which the client service monitors
the memory of the services. By default, the client service will check the other BPM
services every ten seconds.-> <TimerIntToMonitor>10</TimerIntToMonitor> <!-The frequency
(in seconds) at which the client service checks if all the services are installed.->
<TimerIntToCheckServicesInstalled>60</TimerIntToCheckServicesInstalled> <!-Time (in
seconds) to wait for the status of a service to be changed from “stop pending” to
“stopped”.-> <WaitTimeForStopPendingStatus>300</WaitTimeForStopPendingStatus> <!-Time
(in seconds) to wait for the status of a service to be changed from “start pending” to
“running” . ->
<WaitTimeForStartPendingStatus>15</WaitTimeForStartPendingStatus> <!-Time (in seconds)
to wait between the stop and start of services. >
<SleepTimeBeforeStartStop>30</SleepTimeBeforeStartStop> <!-For the Workflow Engine, the
frequency (in minutes) to monitor the thread lock behavior. ->
<WFEngineThreadScanInterval>10</WFEngineThreadScanInterval> <!-The number of threads
that can be in the “locked” state, defined as a percentage value. ->
<WFEngineThreadThresholdValue>70</WFEngineThreadThresholdValue> <!-This flag enables
logging of all the debug messages related to Client Service Monitoring behavior in the
AVEVA Work Tasks logger. The default value is False.->
<EnableDebugLogMessages>false</EnableDebugLogMessages> </AppConstants> -->
<!-- DO NOT CHANGE MemoryCalcRule. The memory calculation rule can be based on
Performance Monitor attributes such as PrivateMemorySize64, WorkingSet64,
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
VirtualMemorySize64, and PagedMemorySize64 of the AVEVA Work Tasks processes. The rule
can have any one of or a combination of these attributes. E.g.: PrivateMemorySize64 +
WorkingSet64. “PrivateMemorySize64” can be used to measure process memory. The
"PrivateMemorySize64" attribute is considered by default, for monitoring, if the
MemoryCalcRule attribute is not present. -->
<MemoryCalcRule Rule="PrivateMemorySize64"/>
<!-- "MaintainanceRestart" is the time at which all the services can be restarted.
"RestartAt" is the time at which the services need to be restarted. Specify the value in
the 24 hours format. E.g.: 23:00
"WeeklyRestartDays" is the week day(s) on which the services need to be restarted.
Specify the value as first 3 letters of the day, separated by comma. E.g.:
Sun,Mon,Tue,Wed,Thu,Fri,Sat Specify the value as “All” if the services need to be
restarted on all days. E.g.: All
"MonthlyRestartMonths" is the month on which the services need to be restarted. Specify
the value for “MonthlyRestartMonths” as the first 3 letters of a month. E.g.:
Jan,Feb,Mar,Apr,May,Jun,Jul,Aug,Sep,Oct,Nov,Dec Specify “All” if you want to monitor the
services for all the months. E.g.: All
"MonthlyRestartDates" is the date on which the services need to be restarted. Ensure
that you configure both the attributes together. Specify the value for
“MonthlyRestartDates” attribute as comma separated dates. E.g.: 29,30,1,2,3
If the values for both weekly and monthly attributes are mentioned, then the services
will be restarted on both the days. If no attributes are mentioned or
“MaintainanceRestart” attribute is not present, then the maintenance monitoring does not
happen. Example of Maintenance restart: <MaintainanceRestart RestartAt="00:00"
WeeklyRestartDays="Sat,Sun" MonthlyRestartMonths="All" MonthlyRestartDates="1"/> -->
<!--<MaintainanceRestart RestartAt="" WeeklyRestartDays="" MonthlyRestartMonths=""
MonthlyRestartDates=""/>-->
<!-- If the “DefaultConfig” and “ServiceConfigs” nodes are not present, then the system
will monitor for the CriticalMemory of all AVEVA Work Tasks Services, with default
values. For the Workflow engine, the thread hanging behavior is also monitored. The
default CriticalMemory limit for a 64-Bit machine is 1500MB. -->
-<ServiceConfigs>
<!--For DefaultConfig, if the values for MonitorService, CriticalMemory, and
WarningMemory attributes are not mentioned for a service, then the default values for
these attributes are considered.
E.g.: To change the values for the Workflow Engine service, specify the attribute values
as follows:
<ServiceConfig Name="WFEngine" MonitorService="true"> <CriticalMemory
MemoryLimitInMB="1000"/>
<WarningMemory MemoryLimitInMB="800" TimeRangeInMinutes="10" RestartAt="00:00"/>
</ServiceConfig>
If the value of the “MemoryLimitInMB” attribute is zero, then the services will not be
monitored. If you do not want a service to be monitored, then set the value of the
“MontiorService” attribute for that specific service to “false”. -->
-<DefaultConfig MonitorService="true">
<!--<CriticalMemory MemoryLimitInMB="1000"/>-->
<!--<WarningMemory MemoryLimitInMB="0" TimeRangeInMinutes="10" RestartAt="00:00"/>-->
</DefaultConfig>
<ServiceConfig Name="AdvancedService"/>
<ServiceConfig Name="WFEngine"/>
<ServiceConfig Name="TaskScheduler"/>
<ServiceConfig Name="CommunicationService"/>
<ServiceConfig Name="ArchestrAMobileNotificationService"/>
</ServiceConfigs>
</SMConfig>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Application Constants

In the configuration file, there is a section for the **AppConstants**. Application constants are used by the service monitoring for the internal business logic. These values can only be changed after the careful analysis of service monitoring. By default it is commented.

If the **TimerIntToMonitor** is changed to five seconds from 10 seconds, after the client service is restarted, it will start scanning (monitoring) for the remaining AVEVA Work Tasks services for every five seconds.

Default Settings

Configuration has the default setting section "DefaultConfig". Default setting is for MonitorService property, CriticalMemory and WarningMemory sections. If these settings are not mentioned for a service, then the values are taken from the default settings. If a service has its own settings, then those settings will override the default settings.

If the "**MonitorService**" attribute is not present or its value is empty for a specific service, then the default section value is taken.

If the "**MonitorService**" attribute is not present even in the default section, then the MonitorService="true" will be considered.

If "**MonitorService**"="false" for a specific service, then that service will not be monitored. But, the same service can be restarted as it may be a dependent service of other AVEVA Work Tasks Window service. If service monitoring has restarted a AVEVA Work Tasks Window service, then its dependent services are restarted.

If the CriticalMemory node is not present or if the MemoryLimitInMB attribute is empty for a specific service, then the default setting is considered. If the MemoryLimitInMB value is zero, then the critical memory limit will not be monitored.

CriticalMemory monitoring is enabled by default. The critical memory limit is monitored even if "CriticalMemory" is not present in the default section. The monitoring is done based on the "PrivateMemorySize64" property of a process.

By default, the value for "MemoryLimitInMB" is considered as 1500MB for a 64 bit machine.

Similarly, for the WarningMemory section too, if the node value of "WarningMemory" is not found or if any of its attribute value is empty for a service, then the default configuration settings will be considered for a service.

If the value of MemoryLimitInMB attribute is zero, then the WarningMemory will not be monitored. If the WarningMemory section is not found in the defaultConfig section, then the WarningMemory monitoring will be disabled for all services which depend on the default configuration.

The Advanced Service, WorkFlow Engine, Task Scheduler, and Communication Service sections do not have any settings by default. These sections will take the values from the default settings. If you want to change any specific value, then you can mention the values in the respective sections.

User Scenarios

The Administrator needs to configure some of the setting of the client service, especially in case of a load balanced environment. In a load balanced environment, the client service should not restart the AVEVA Work Tasks services at the same time in all boxes.

The Administrator also needs to configure the scheduling time as it is recommended to schedule the restart at a low usage time.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Administrator wants to change the restart schedule time settings for the WarningMemory limit

If the Administrator wants to set night 2 AM as the restart time for the warning memory, then the Administrator can change the value to the desired timing in the WarningMemory configuration section of the default section. This will affect settings of all services as they are using the default settings.

```
<WarningMemory MemoryLimitInMB="800" TimeLimitInMinutes="10" RestartAt="02:00"/>
```

The Client service monitors the AVEVA Work Tasks service. The Client service will start monitoring the Warning memory limit at the configured time, that is 2AM.

At night 2AM, the WF engine shows a memory above 800MB for more than 10 minutes. The Client service will restart the WF engine and its dependent services. The Client service immediately stops the Communication Service, Task Scheduler, and WF engine and then starts these services again.

Administrator wants to change the restart schedule time settings for the Warning Memory limit only for WF Engine service.

The Administrator wants to set night 12 AM as the restart time for the warning memory for WF engine. For the remaining services, the administrator wants the default values for the settings.

In order to do this, the Administrator has to create the WarningMemory configuration section for the WF Engine and change the value to a desired timing. This same scenario holds good for CriticalMemory too.

```
<DefaultConfig MonitorService="true">
      <CriticalMemory MemoryLimitInMB="700"/>
<WarningMemory MemoryLimitInMB="500" TimeRangeInMinutes="10" RestartAt="2:00"/>
    </DefaultConfig>
    <ServiceConfig Name="AdvancedService" />

    <ServiceConfig Name="WFEngine">
       <WarningMemory MemoryLimitInMB="500" TimeRangeInMinutes="10" RestartAt="00:00"/>
    </ServiceConfig>
    <ServiceConfig Name="TaskScheduler" />
    <ServiceConfig Name="CommunicationService" />
```

Administrator wants to restart Services on the night of 25th of every month.

There are a bunch of monthly scheduled workflows to execute for salary processing on the 25th of every month. For faster processing, the process needs more memory.

The Administrator wants to restart the services before executing the workflows, so that more memory is available for the process.

The Administrator can even set the timing for a monthly maintenance.

```
<MaintainanceRestart RestartAt="01:00" WeeklyRestartDays="" MonthlyRestartMonths="All"
MonthlyrestartDates="25"/>
```

On the 25th of every month, when the time is 1AM, the following services are automatically stopped and restarted in the order specified below.

1. Advance service
2. Workflow Engine

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Task Scheduler service
4. Communication services

If SendAlertEmails= "true", then an email is sent to the configured email.

Administrator has configured all services for the load balanced environment. Administrator wants to have monitoring of service in load balanced environment.

In a load balanced environment, monitoring of service will also happen. Client service will monitor all AVEVA Work Tasks services which are in the same box. During Maintenance monitoring, in the load balanced environment, all services might be restarted at the same time if the scheduled timing is same. Ensure that all the services are not stopped at the same time in all the boxes.

This can be avoided by scheduling the Maintenance monitoring at different time in all boxes.

You can provide a gap of 15 minutes in scheduling time in all boxes.

The same applies for the WarningMemoryLimit too.

Administrator wants to disable sending of Alert emails

If the Administrator does not want to receive monitoring alert emails regularly, then the Administrator can disable sending of alert emails by changing the value for SendAlertEmails to False. Alert emails will not be sent.

Administrator wants to change Memory limit for the Critical memory setting

For WF engine, memory limit for the critical memory settings is 700 MB. The Administrator wants to change it to 1000 MB as the server machine is configured for the process virtual address space more than 2 GB.

For more information about the Memory Size of the process, check in the section Process Memory Calculation.

The Administrator can change the value to 1000 MB in the Workflow Engine section.

```
<ServiceConfig Name="WFEngine" ServiceName="AVEVA Work TasksWorkflow2"
               ProcessName="WFEngine.NET2"        MonitorService="true">
      <CriticalMemory MemoryLimitInMB="1000"/>
      <WarningMemory MemoryLimitInMB="500" TimeLimitInMinutes="10"
               RestartAt="01:00"/>
</ServiceConfig>
```

Whenever the Workflow Engine process memory reaches 1000 MB, the Workflow Engine service is stopped. Therefore, its dependent services, Task Scheduler, and Communication Service are also stopped.

Task Scheduler, Workflow Engine and Communication service are started.

Administrator wants to change Memory limit for the Warning memory setting

If the administrator wants to set the memory limit for the warning memory, the Administrator has to access the specific process section like Workflow Engine section and change the values as mentioned below:

```
<WarningMemory MemoryLimitInMB="800" TimeLimitInMinutes="10" RestartAt="02:00"/>
```

The Client service will start monitoring the Warning memory limit at night 2 AM. If the process memory is above 800 MB at that time, it will note it down and continue monitoring for the next 10 minutes (TimeLimitInMinutes

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

configuration). If the process memory is above 800 MB even after 10 minutes, then the Client service will restart the process along with its dependent services.

For the Warning memory limit, Administrator wants to change TimeLimitInMinutes section.

TimeLimitInMinutes is the configuration setting which defines the time duration (time range) for which the process needs to be in warning memory limit phase to restart the service. If the Administrator wants this configuration then the process needs to be running for at least 15 minutes with a warning memory limit of 800 MB at night 2:00 AM, to restart. Then the configuration setting must be as given below:

```
<WarningMemory MemoryLimitInMB="800" TimeLimitInMinutes="15" RestartAt="02:00"/>
```

Administrator wants to restart services on every Saturday and Sunday night as part of maintenance.

The Administrator can provide the following configuration:

```
<MaintainanceRestart RestartAt="01:00" RestartDay="Sat,Sun" MonitorService="true"/>
```

The services are restarted every Sunday night at 1 AM.

Administrator wants to restart the services on every Sunday as well as on the 25th of every month.

The Administrator can provide the combination of monthly as well as daily configuration. If the Administrator wants to start the service on every weekend as well as on the 25th of every month, then the configuration can be provided as follows:

```
<MaintainanceRestart RestartAt="01:00" WeeklyRestartDays="Sun"
MonthlyRestartMonths="All" MonthlyrestartDates="25"/>
```

Administrator wants to disable Maintenance monitoring for all service.

The Administrator can disable Maintenance monitoring of services on specific days where there might not be high load workflow execution.

To disable Maintenance monitoring, the administrator has to comment or remove the "MaintenanceRestart" attribute.

Administrator does not want monitoring of specific service.

If the Administrator does not want to monitor a service, then the Administrator can configure the value of the "MonitorService" attribute of that service to "false".

By setting the value of "MonitorService" to "false", the following features are disabled:

- MaintenanceRestart monitoring of service is stopped.
- CriticalMemory limit monitoring of service is stopped.
- WarningMemory limit monitoring of service is stopped.

If the AVEVA Work Tasks service is stopped, it will not be automatically started by the Client service.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Client service start or stop events will not have any affect on start or stop of the remaining AVEVA Work Tasks service.

Administrator wants to change the memory calculation rule

By default, the memory calculation of the AVEVA Work Tasks process is done based on the Performance Monitor attribute "PrivateMemorySize64".

The "PrivateMemorySize64" attribute provides the value of the total memory held in the process. For more information about memory of process, check the Process Memory Calculation section.

If the Administrator includes the "WorkingSet64", then the value will be:

```
<MemoryCalcRule>WorkingSet64 + PrivateMemorySize64 </MemoryCalcRule>
```

If the Administrator wants to use VirtualMemorySize64 instead of PrivateMemorySize64, then the configuration will be:

```
<MemoryCalcRule>VitualMemorySize64 </MemoryCalcRule>
```

Administrator wants to start all services a with single click.

The AVEVA Work Tasks Windows service can now be started and/or stopped automatically.

If the Client service is started, all its dependent services such as the Advanced service, Communication services, Task scheduler, and Workflow Engine are started in the specified sequence.

Similarly, if it is stopped, all its dependent services such as the Advanced service, Communication services, Task Scheduler and Workflow Engine are stopped in the specified sequence.

Administrator wants to stop all services.

The Administrator may want to stop all the AVEVA Work Tasks Windows services for maintenance or for other reasons. The Client service will have the feature of automatically stopping all the services. Hence, the administrator can stop the client service which will in turn stop all other services such as the Advanced service, Workflow Engine, Task Scheduler and Communication services are stopped in the specified sequence.

Administrator wants Communication service to be stopped.

The Administrator wants to stop Communication service as part of maintenance or for other reasons, but wants the remaining services to continue execution. The administrator does not want the Communication service to be automatically started.

In other words, the Communication service should not be monitored.

For any service to be excluded from monitoring, set the value of the "MonitorService" attribute to "false", under the specific "serviceconfig" section.

Administrator has changed the startup type of client service from automatic to manual.

On machine restart, the Client service will not be automatically started. However, the remaining AVEVA Work Tasks services are automatically started. The Administrator needs to manually start the Client service to monitor the remaining Services.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Technical Scenarios and Features

Due to "OutOfMemoryException" Workflow Engine service has stopped. Administrator wants it to be automatically started.

AVEVA Work Tasks architecture uses plug-in model. Any Custom activity, Com-object, or SOA activity can be plugged in as part of the workflow. Due to high memory usage by these activities, Workflow Engine is throwing OutOfMemoryException. Workflow Engine stops processing the workflows and hence workflows are stocked in piles in the queue. During such a condition, the Administrator has to restart the services. This can be automated by service monitoring.

In the production environment, service monitoring is enabled. One of the features of service monitoring is, restarting the service if it is stopped.

If the Workflow Engine service is stopped, Communication services, and Task Scheduler are also stopped. Then Communication services, Task Scheduler, and Workflow Engine are started in the given order. The SendAlertEmail is enabled and an email is sent.

The Maintenance restart and WarningMemory restart time are configured with an identical time for the Workflow Engine service.

At the specified time, the memory reaches a Warning memory limit. The order of execution of logic is Service specific monitoring logic followed by Maintenance monitoring, CriticalMemory monitoring, and Warning memory monitoring.

For the Workflow Engine, the Service specific monitoring is executed first. Then the Maintenance restart is executed and hence the service is restarted. But, the WarningMemory restart will not happen as the memory has decreased below the specified limit.

Client service had failed due to OutOfMemoryException

Suppose the client service has failed due to *OutOfMemoryException*. This should not stop monitoring the remaining services. It has to be restarted automatically.

Client service installer has the recovery option set, so that it recovers automatically when there are failures.

Workflows are pending in queue for long time. Not getting processed by Workflow Engine even though there is no OutOfMemoryException and memory is available for the process.

Client service monitors the Workflow queues SWExecute. All workflows which need to be executed by Workflow Engine will be stacked in this table.

Client service will check the LastUpdatedDateTime for all “executing” workflow tasks. If the status has not changed for a long time, say 10 minutes, then it means that the Workflow Engine is not able to release the existing threads and hence not able to continue with the new workflow tasks. During such a condition, the client service will restart the Workflow Engine.

If all workflows in thread queue are taking more than 10 minutes, the client service will restart Workflow Engine. If all the worklfows continue to hang, then the client service will restart again. This behavior will continue until the workflows complete execution within 10 minutes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Service monitoring in Development environment

In the development environment, the user will be verifying the workflows, services, adding the custom forms, and actions. The user may not want to restart the services over a high memory usage in development environment.

To avoid monitoring of the services in development environment, the application will have the configuration setting ServiceMonitoringEnabled="false".

Only if the setting ServiceMonitoringEnabled="true", the monitoring feature is enabled. For any other values, it is disabled.

Some of the configuration settings are empty for the Workflow Engine

If the Monitor service attribute is not present or the value is not present, then the default section value is taken.

If CriticalMemory node is not present or MemoryLimitInMB attribute is not present, then the default setting is considered. If the MemoryLimitInMB has an empty value, then the default setting is considered. If the MemoryLimitInMB=0, then the CriticalMemory monitoring will not process.

The same logic is applicable to the WarningMemory section. If the attribute (or node) is not found or its value is empty, then the default settings will be considered. If its MemoryLimitInMB=0, then the WarningMemory monitoring will not process.

Mobile Notification Service

The **Mobile Notification Service** ensures reliable delivery of notification to the registered mobile application. These notifications are sent through the Azure notification hub.

The timely delivery of notification depends on the network speed. Hence, we recommend to have a good internet connectivity.

An entry is made in the *SKNotificationMessage table* when there is connectivity failure and the workflow engine is not able to send a notification. The Mobile Notification Service reads *SKNotificationMessage* table, fetches the notification, and sends it to the registered mobile device.

The Mobile Notification Service Settings window has the following tabs that you can use to subscribe and configure this service:

- Register to Mobile Notification Service
- Retry Settings
- Enterprise Server Settings (This tab appears only in case of Enterprise Server environment.)

Register to Mobile Notification Service

The **Mobile Notification Service Settings** registration enables the system to send notifications to mobile devices.

Use the **Registration Details** section to register for sending notification to mobile devices. You can register *n* number of mobile devices to receive notifications.

Registration can be done anytime, either during Farm configuration at install time, or later. On clicking the **Register** button, the system gets enabled to send notifications. Also, all the available devices in the system get registered in the Azure notification hub.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note:
- It is recommended that the system acquires the license with the highest precedence available, before registering for Push Notification.
- In an Enterprise Server environment, if you register for Push Notification in one of the systems in the cluster, then the registration is completed on all the other systems in the cluster.
- The Load Balanced Server and Single Server licenses will point to Production Push Registration service.
- Restart the services when prompted by the Farm Configuration Wizard.

To register to Mobile Notification service

1. Run the **Farm Configuration Wizard**, and click **Next**.
2. In the Edit Farm Settings window, select **Service Settings**.
3. Click **Next**.

   The Services/Global Settings window appears.
4. Click the edit button near the **Mobile Notification Service**.

   The Mobile Notification Service Settings window appears.
5. Click the **Register** tab.
6. Click **Test Connection** to verify the connection.
7. Click **Register**.

   Note: The registration process might take a significant amount of time based on the Internet connectivity and the number of devices available in the system.

   A message about successful registration appears.
8. Click **OK**.
9. To send a test notification, perform the following in the **Test Notification** section.
   a. Select a device from the **Device** drop-down list.
   b. Enter a value in the **Badge Count** field. This number will be sent to the selected device as a test notification.
   c. Click **Send**.

      If a notification is successfully sent to the mobile device, a message about successfully sending notification appears.
10. Click **OK**.

    The system is successfully registered for sending notifications to mobile devices.

    Note: After registering the notification service, if you close the Farm Configuration Wizard and reopen it to send a Notification Badge Test Count, it results in an error. Hence, send the Notification Badge Test Count in the same session.

To regenerate the keys to register to Mobile Notification Service again

You can regenerate the notification hub key if the key is compromised in any circumstances.

Note:
- Ensure that you regenerate this key only if it is compromised and is used for malicious purposes.
- When you click the **Regenerate** button, you will have to wait for a minute for the notification/test notification to work.
- Regenerating the key after registering the notification service results in an error when attempting to send a Notification Badge Test Count.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. In the **Register** tab, click **Regenerate**.

   A confirmation message to regenerate the notification hub key appears.
2. Click **Yes**.

   A message about successful regeneration of the notification hub key appears.

   You must restart the AVEVA Work Tasks services for the changes to take effect.

To unregister from the Mobile Notification Service

To unregister from the Mobile Notification Service, perform the following:

1. In the **Register** tab, click **Unregister**.

   A message appears asking your confirmation to unregister the devices.
2. Click **Yes**.

   A message about successful unregistration appears and all the registered devices in the notification hub gets unregistered.

Retry Settings

Configuration in the **Retry Settings** tab enables you to configure the number of retries and the interval at which the system retries to send notifications and register devices.

The following image shows the **Retry Settings** tab:

Notification Retry Settings

- **Retry Count**: If the notification is not delivered at the first attempt, you can set the number of retry attempts to deliver the notification. After the defined limit is reached, the notification expires. If the **Retry Count** value is set as 0, the failed notifications will not be resent. The default value is 5.
- **Retry Interval**: If the notification is not delivered at the first attempt, you can set the interval between delivery attempts. The system tries to resend the notification at the interval defined in this field. The time entered should be in *days:hr:min:sec* format only. The maximum limit is 10 minutes. The default value is 30 seconds.

Device Registration Retry Settings

- **Retry Count**: A device needs to be registered in the Azure notification hub before it can receive notifications. If the device registration is not successful at the first attempt, you can set the number of retry attempts to register the device. If the **Retry Count** value is set as 0, the failed device registrations do not happen. The default value is 5.
- **Retry Interval**: If the device registration is not done at the first attempt, you can set the interval between device registration attempts. The system tries to re-register the device at the interval defined in this field. The time entered should be in *days:hr:min:sec* format only. The default value is 2 minutes.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Enterprise Server Settings

The **Enterprise Server Settings** tab is enabled only in the Enterprise Server mode. Configuration in this tab manages the load balance on the Server and Client.

- **Load Balanced**: Set load balancing for AVEVA Work Tasks. This field is enabled only for the Load Balanced Server installation. To enable load balancing, set the Load Balanced value to *True*.
- **Load Balanced Server Port**: Enter the port number for the Load Balanced Server. This field is disabled if Load Balanced is set to *False*.
- **Load Balanced Client Port**: Enter the port number for the Load Balanced Client.

Migrating Notification Services

Systems that are not configured to use TLS 1.2 would need the following registry entries for the new Notification Hub to work:

- [HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]

"SystemDefaultTlsVersions"=dword:00000001

"SchUseStrongCrypto"=dword:00000001

- [HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]

"SystemDefaultTlsVersions"=dword:00000001

"SchUseStrongCrypto"=dword:00000001

Note:
- Before you run the **AVEVA Work Tasks Notification Migration Wizard**, unregister from the existing Mobile Notification services. For information on unregistering, see Unregistering from the Mobile Notification Service.
- After unregistering the Mobile Notification services, close the **Farm Configuration Wizard** and then run the **AVEVA Work Tasks Notification Migration Wizard**.

To migrate Notification Services

To migrate the mobile notification service from earlier versions of the product, follow the steps given below:

1. Run the **AVEVA Work Tasks Notification Migration Wizard**.
2. Provide the Database Server name, Farm Database name, Authentication Mode, and the Database credentials.
3. Click **Migrate** to migrate the Notification details.
4. Run the **Farm Configuration Wizard**, and click **Next**.
5. In the Edit Farm Settings window, select **Service Settings**.
6. Click **Next**.

   The Services/Global Settings window appears.
7. Click the edit button near the **Mobile Notification Service**.

   The Mobile Notification Service Settings window appears.
8. Click **Test Connection** to verify the connection. Make sure the URL is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

mobilenotification.worktasks.connect.aveva.com, and then click **OK**.

9. Click **Register**.

Enterprise Server Settings

You can configure Enterprise Server Settings using the Multicast mode or the Database mode, while installing the product or after installation at any point in time.

The following table provides information about the various fields and the default values for specific fields:

Field Name	Default Value	Description
Enterprise Server Mode	Multicast	Select the mode as **Multicast** or **Database**. • If you select the mode as **Multicast**, then it uses the configured Cluster Port, Cluster IP, and Multicast Local IP to share its server status with other servers. • If you select the mode as **Database**, the server status is stored in the database and is shared with other servers.
TCP Port	8853	Communication between the Workflow Engine and the Advance Server service is established through this port. This port is used to get the status of the least used server, and also analyze server performance.
Cluster Port	8850	Use this port to check the connectivity between all the machines while running the Load Balanced Server. This is not used if you select the **Enterprise Server Mode** as **Database**.
Heartbeat Interval (ms)	3000	Specify the heartbeat interval for the Enterprise Server.
Heartbeat Timeout (seconds)	10	Specify the heartbeat timeout value for the Enterprise Server.
Average CPU Count	10	Specify the average CPU count for the Enterprise Server

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Default Value	Description
Cluster IP	• IPv4: 225.0.0.10 • IPv6: FF02::1	Displays the multicast IP address. This field is not used if you select the **Enterprise Server Mode** as **Database**. In case of Enterprise Server in Multicast mode, the Cluster IP address for IPv4 address family is *225.0.0.10* and the Cluster IP address for IPv6 address family is *FF02::1*.
Load Balanced Server	True	Set load balancing for AVEVA Work Tasks. This field is available only for the Load Balanced Server installation. To enable load balancing, set the **Load Balanced** value to *true*.
Local IP	-	Displays the local server name or IP address. IP address supports both IPv4 and IPv6 address types.
Multicast Local IP	-	Displays the multicast server name or IP address. Local IP address supports both IPv4 and IPv6 address types. This field is not used if you select the **Enterprise Server Mode** as **Database**.

Note:

- Ensure to restart the Advance Server service and other related services in all the servers and clients configured for Enterprise Server after changing the **Enterprise Server Mode**. Otherwise, the modified **Enterprise Server Mode** might not get reflected in the other servers or client.

- In an environment where both IPv4 and IPv6 addresses are configured and if both the **Local IP** and **Multicast Local IP** is the machine name, then IPv6 multicast Local IP is the **Cluster IP**, by default.

Global Settings

The Global Settings comprises of the following:

- **Communication Settings:**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

These are default email settings for sending emails.

This setting provides email IDs from and to which exception emails must be sent.

- **HTTP Settings**: This setting is used for interfacing with web services.
- **Log/Transaction settings**: This setting is used to configure log information and database transaction levels.
- **File Watcher Settings**: This setting is used for Iteration count, first attempt count and next attempt count.
- **Machine Setting:** This setting is used to configure information related to machine address on which AVEVA Work Tasks is installed.
- **Azure Setting:** This setting is used to configure Azure settings for mobile application.
- **ArchestrA Services:** This setting is used to configure ArchestrA events settings in a distributed environment.
- **OpenID Settings**: This settings is used to configure AVEVA Connect and Azure Active Directory user providers to access AVEVA Work Tasks.

HTTP Settings

The HTTP settings are for legacy AVEVA Work Tasks web service and are provided for backward compatibility.

Group Name	Field Name	Description
URL Encryption Settings	Use HTTP context	Select True to use HTTP context. Select False if you do not want to include http context info while building the secure query string parameter used internally in AVEVA Work Tasks controls to pass information from one page to another.
	Hard-Coded Correction factor	This field is used to set a flag primarily used for load testing. The date correction factor used by AVEVA Work Tasks is retrieved through a cookie from client browser. This value cannot be derived when testing using ACT or any other load test tool. If this factor is set to True, AVEVA Work Tasks always uses the date correction factor for converting UTC date time stored in AVEVA Work Tasks tables to the local time. The default value is False.
HTTP Proxy	URL	This field is used to provide the URL for HTTP Proxy.
	User	Enter a user name.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Group Name	Field Name	Description
	Password	Enter a password.
	Domain	Enter domain name.
	Bypass Local Request	Select True to bypass local requests.
	Bypass List	Enter list of URLs in the bypass list; requests from a URL in this list will be ignored.

Log or Transaction Settings

The Log or Transaction settings define the level of log information displayed in the AVEVA Work Tasks Console.

Field Name	Description
Debug Level	Select from three debug levels. • Level 1 shows minimal information in the AVEVA Work Tasks Logger Console, giving only information on the start and end of the workflow. Error messages are also shown in this mode. This is the default mode. • Level 2 shows detailed information of what is happening in the background. It will show all the messages logged from the actions. • Level 3 shows only messages indicating whether the action is executed. All error messages logged in the logger console will be sent to receiver email specified in Exception Emails.

Persist Exception in database	Select either True or False.
	• If True is selected, you will be allowed to persist the exceptions which are logged in the Logger Console to the Repository database. This in turn allows you to view exceptions at the following levels:
	  • Workflow level
	  • Workflow Instance level
	  • Activity level
	• This is the default value. If False is selected, you will not be allowed to persist the exceptions which

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description
	are logged in the Logger Console to the Repository database. Refer example scenario below.

Persist Warning in database	Select either True or False.
	• If True is selected, you will be allowed to persist the warnings which are logged in Logger Console to the Repository database. Which in turn allows you to view warnings at the following levels:
	  • Workflow level
	  • Workflow Instance level
	  • Activity level
	• This is the default value. If False is selected, you will not be allowed to persist the warnings which are logged in Logger Console to the Repository database.

Example Scenario

Consider the scenario where numerous workflows are running and an instance has failed, then, you can view the exception details from the UI instead of searching the log files.

1. In the **Farm Configuration Wizard**, go to **Service settings**.
2. In the **Global Settings** window, select **Log/Transactions** tab.
3. Select the appropriate values from drop down to enable the persistence of the exceptions or warning.

At Workflow Level:

1. In the **Enterprise Console**, click menu con, and then click **Workflows**.
   The Workflows page appears.
2. Select and right-click any workflow.
3. Click **View Exceptions** from the context menu.
   A pop-up window opens and lists all the exceptions occurred for that workflow. Here it lists all the exceptions occurred for different workflow instance.

At Workflow Instance level:

This can be viewed from BAM reports.

1. In the **Enterprise Console,** click menu icon, and then click **Reports**.
   The **AVEVA Work Tasks** Business Activity Monitoring page appears.
2. Click **Analyze**, click **Execution**, and then click **Failed**.
   This lists all the failed workflow instances.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Double-click and open any record.

   The **Process Execution view** of the record opens.

4. Click the **View** exception tab.

   All the exceptions occurred for this particular workflow instance are listed.

At Activity level:

This can be viewed from BAM reports.

- Go to **Enterprise Console**, point to **Reports**, point to **Analyze**, point to **Execution**, and then click **Failed** link.

This will list all the failed workflow instances. Select any record by double clicking the item. This will open the window where the user can see the workflow process from Analyst View, Progress view, or Execution View. Click any of the tabs and double click on the failed activity. This will open a new pop up window where details of that particular activity can be seen. In the window screen click on the **View Exceptions** tab which is present on the bottom right of the page which will lists all the exceptions occurred for this activity.

File Watcher Settings

The File Watcher settings are used to set a wait time for the file copy operation to complete. An event is generated after the copy operation. File Watcher waits for this event to trigger a workflow. The functioning of File Watcher can be better understood by the following example:

Example

A user has set the File Watcher with the following settings:

Wait for file copy iteration Count = 200

Wait for file copy first attempt (ms) = 2000

Wait for file copy next attempt (ms) = 4000

The above settings indicate that when a file copy operation is executed File Watcher does an iterative check for 200 times if the copy operation is complete. In the first attempt, File Watcher waits for 2000ms (2 sec) to check if the copy operation is complete. If it is complete the iterative check is terminated and a File Watcher event is triggered. If the copy operation is not completed the iteration count is incremented by one and during the second and subsequent attempts the File Watcher waits for 4000ms (4 sec). This activity continues till the copy operation is complete.

Thus File Watcher will wait for approximately 13 minutes (199 x 4000ms+ 2000ms) for a file copy operation to complete. An event is triggered as soon as the file copy operation is complete and File Watcher terminates the iterative check.

The example above indicates that you have to set the File Watcher values based on your requirements. If you need to copy a file with a large file size, set the Wait for file copy iteration Count to a higher value or increase the values for the fields Wait for file copy first attempt or Wait for file copy next attempt. If the copy operation is not completed within the set time, the message Could not find the copying file is displayed. A large file will require a longer wait time.

The following table lists the default values with field description:

Field Name	Description
Wait for file copy iteration Count	This field is used to set the iteration value for a file

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description
	copy process. The default value is 200. **Example** The value 200 indicates that the process will execute 200 times if the file copy process is not complete.
Wait for file copy first attempt (ms)	The value in this field indicates the wait time after a file copy command is executed for the first time. This wait time is provided for an event to be generated after the file copy process is complete. The value specified is in milliseconds. The default value is 2000. **Example** The value 2000 indicates that the wait time for copying files in the first attempt is two seconds.
Wait for file copy next attempt (ms)	The value in this field indicates the wait time for subsequent attempts. The value specified is in milliseconds. The default value is 4000. **Example** The value 4000 indicates that the wait time for subsequent attempts is four seconds.

Machine Setting

You use the **Machine Setting** tab to know the information related to machine address on which AVEVA Work Tasks is installed and **Service Monitor Setting** tab to define the port used by AVEVA Work Tasks Service Monitor EXE.

Group Name	Field Name	Description
Machine Setting	Machine Address	Enter the machine address on which AVEVA Work Tasks is installed. If the **Database Type** is **SQL Server**, then you can specify an IPv6 address for the **Machine Address**.
Service Monitor Setting	Service Monitor Port	Enter the port number. This is the default port used by the AVEVA Work Tasks Service Monitor EXE.

Azure Setting

Azure Setting is required for the AVEVA Work Tasks Pro App to access the AVEVA Work Tasks server through Internet. The mobile application communicates with the AVEVA Work Tasks server through Windows Azure

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Service Bus. This platform provides the channel through which the AVEVA Work Tasks Pro App can communicate with the On-Premise AVEVA Work Tasks Service.

To access the AVEVA Work Tasks features in a mobile device, you must configure the Service Bus Listener. A Service Bus Listener enables a secure communication mechanism between AVEVA Work Tasks Pro App and the Enterprise Console. After you configure a service bus listener, a Service Bus Listener URL is generated. Mobile users can access the application in mobile devices using the Service Bus Listener URL.

For more information, refer the following topics:

- User details: See Provide Server Details to Mobile User.
- Accessing AVEVA Work Tasks Pro Outside Corporate Network and within the Corporate Network: See Accessing Work Tasks Pro Outside Corporate Network and within the Corporate Network

Note: The Service Bus Listener URL must be unique for every Farm. If you are using the same URL for multiple Farms, ensure that the combination of the Listener Namespace and Service Bus Namespace is unique.

Before configuring Azure setting, ensure that you complete the following:

1. Create Enterprise Console with Anonymous Authentication
2. Configure Service Bus Listener

Create Enterprise Console with Anonymous Authentication

To successfully configure and use AVEVA Work Tasks Pro, we recommend you to create a new Enterprise Console that specifically caters to the mobile services.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
2. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The AVEVA Work Tasks Farm Configuration Wizard appears.
3. Click **Next**.

   The Edit AVEVA Work Tasks Farm Settings window appears.
4. Select **Service Settings**.
5. Click **Next**.

   The Services/Global Settings window appears.
6. Click the edit icon near **Enterprise Console** option.

   The Enterprise Console Settings window appears.
7. Click **New EC**.
8. In the **New Website** text box, enter a name for the Enterprise Console.

   For example, enter name as *MobileEnterpriseConsole*.
9. Click the edit icon near the **Create at** option to change the port number, if required.

   The default port is 8000.

   The IIS Structure window appears.
10. Select the path where you want to create a Enterprise Console.

    For example, select *AVEVAWorkTasksSites*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

11. Click **OK**.

    The selected path is displayed in the **Create at** text box.

    The mapped repositories are displayed in the **Repositories**.

12. Select the repository(s) that you want to map the newly created site.

    Use **Ctrl** or **Shift** keys to select multiple repositories.

    Note: The mapped repositories are auto-populated on entering the URL in the AVEVA Work Tasks Pro application. However, in an shared host environment, the repositories and providers are not auto-populated. Thus, the administrator must provide the repository and provider details to the AVEVA Work Tasks Pro user. You can configure the shared host environment through the following steps:

    a. Go to SKService table of Farm Database.

    b. In the property collection of **Global Settings**, update the property **issharedhostenvironment** to *True*.

13. Select the required **Authentication Type** as *Anonymous*.
14. Click **Save**.

    The created Enterprise Console appears in the **Existing Enterprise Consoles** section.

15. Click **OK**.
16. Click **Finish** in the Farm Configuration Wizard window.

To set anonymous authentication for existing Enterprise Consoles

You can set the anonymous authentication for existing Enterprise Consoles through IIS.

1. In the Administrative Tools window, click **Internet Information Services (IIS) Manager**.

   The Internet Information Services (IIS) Manager window appears.

2. Click **Sites**, click **Enterprise Console**, and then select **Authentication** from the right pane.
3. Click **Open Feature** on the Actions pane.
4. On the Authentication pane that opens, set **Anonymous Authentication** as *Enabled*.

Configure Service Bus Listener

To configure Service Bus Listener using the Farm Configuration Wizard:

1. Click the **Azure Setting** tab.

   The **Service Bus Listener Configuration for Mobile** section appears.

2. Enter the **Service Bus Namespace** obtained from the Windows Azure Management Portal, in this field.
3. Select the required **Enterprise Console** from the drop-down field.

   Note: Only the Enterprise Console of **Anonymous Authentication Type** are listed in this field.

4. Enter the issuer value of the service bus in the **Issuer** field.
5. Enter the Issuer key of the service bus in the **Key** field.
6. In the **Listener Namespace** field, the name of the selected Enterprise Console will be populated.

   This field is in read-only mode.

   Ensure that the computer name does not have a hyphen (-).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. Select the **Activate** check box to activate the listener.
8. Select the **Enable Enhanced Security** check box to enforce additional security at the service bus level.
9. Click **Save** to save the configuration.

   This configuration appears in the Existing Service Bus Listener Configurations section.
10. Click **Test Listener Status** to test the Service Bus Listener Configuration.

Note: The Service Bus Listener Url generated above will be used while configuring the AVEVA Work Tasks Pro application.

To Access Azure Settings in AVEVA Work Tasks Pro App

You can configure the Azure settings such as Enterprise Console path, Repository name, Provider name, and User name in the Farm Configuration Wizard. You can generate a QR code to store these settings. This QR code can then be scanned by the AVEVA Work Tasks Pro App to automatically fill the settings in the Settings screen.

1. Click the **Azure Setting** tab.

   The **Service Bus Listener Configuration for Mobile** section appears.
2. Click **Generate QR Code**.

   The **Scan QR Code** dialog box appears.
3. Perform either of the following:
   - If you have selected the **Enable Enhanced Security** check box, enter the user name in the **User Name** box, and then click **Generate**. The **Scan QR Code** dialog box appears.
   - If you have not selected the **Enable Enhanced Security** check box, go to step 4.
4. In the **Scan QR Code** dialog box, click **Download**.

   The **Save As** dialog box appears.
5. Enter the **File name** for the QR code and select the **Save as type** as **PNG**.
6. Click **Save**.

   The QR Code is generated successfully.
7. Scan this QR Code in the AVEVA Work Tasks Pro App.

   The values configured for the following settings in the Farm Configuration wizard are considered by default.
   - Enterprise Console path
   - Repository name
   - Provider name
   - User name
8. Enter the password.

Note:
- The Shared Access Signature (SAS) token is valid for 1 year and is automatically renewed after this duration.
- The secured Service Bus URL can be accessed only using QR Code. You cannot enter this URL in the app and log in.

Generate SAS Token

You must generate the QR code with Shared Access Signatures (SAS token) for users who can scan the code to

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

configure the Work Tasks Pro app.

For more information on SAS, see https://docs.microsoft.com/en-us/azure/service-bus-messaging/service-bus-sas.

To generate SAS token using the Farm Configuration Wizard

1. Click the **Azure Setting** tab.
   The **Service Bus Listener Configuration for Mobile** section appears.
2. Click **Generate QR Code**.
   The **Scan QR Code** dialog box appears.
3. Enter the user name for whom you want to generate the QR code, and then click **Generate**.
   The QR code contains SAS token for that user.
4. Click **Download** to save the QR code.
   Scan the QR code in the Work Tasks Pro App. For more information, see Configure Service Bus Listener.

To generate SAS token using the Enterprise Console

1. Log on to the Enterprise Console.
2. Point to the user menu, and then click **View QR Code**.
   The **View QR Code** dialog box appears.
3. Click **Download** to save the QR code.
   Scan the QR code in the Work Tasks Pro App. For more information, see Configure Service Bus Listener.

Provide Server Details to Mobile User

After the Service Bus details are configured, you can give the server details to the mobile application user, to access the application on mobile devices:

Server Details:

- **URL**: The Azure URL that is displayed in the Service Bus Listener URL column of the Existing Service Bus Listener section. This URL is obtained after configuring the Service Bus Listener for a particular Enterprise Console.
- **Provider**: The Provider name should be the same as the Instance Name of the repository. The Instance Name can be taken from the Instance Name column of the SKEntityDataSourceProvider table of the repository database.

ArchestrA Services

Consider a distributed environment where **AVEVA Work Tasks** is installed in one computer (say node 1) and both **ArchestrA Service Bus** (ASB) and **System Platform IDE** are installed in another computer (say, node 2). In this environment, use the **ArchestrA Services** tab to configure the ArchestrA Events setup so that node 1 can poll event details from node 2. Here node 1 acts as the ASB runtime node and node 2 acts as the ASB solution (or /Domain) node.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

However, if **AVEVA Work Tasks**, **ArchestrA Service Bus** (ASB), and **System Platform IDE** installed on the same computer, you do not need to perform these configurations.

In a distributed environment, ArchestrA services with System Platform 2014 and System Platform 2014 P01 is not supported.

Prerequisites

- In node 2, generate a registration passphrase for the ASB Service Repository node name. You can set the temporary passphrase on ASB Service Repository node using the **aaASBRegistrationUtility.exe** available in the following path:

  C:\Program Files (x86)\Common Files\ArchestrA\Services

Steps to configure the ArchestrA Services for a distributed environment

1. Click **Configure**.

   The **ASBInstall.exe** runs in the background to configure the ASB Install Utility.

   Note: After installing AVEVA Work Tasks, the ASB Install Utility is available in the following path:

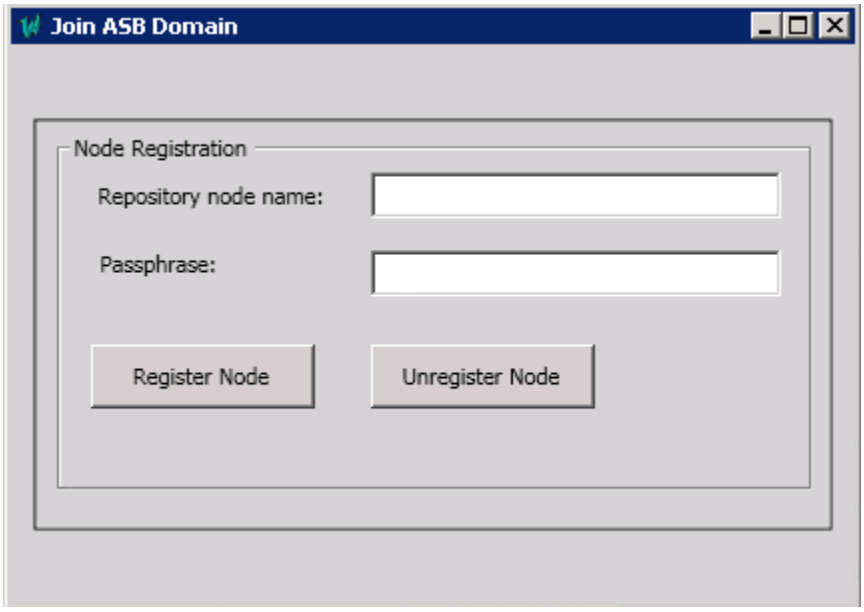
   C:\Program Files (x86)\Common Files\ArchestrA\Services\ASBInstall.exe

   You can run the **ASB Install Utility** with command line argument as follows:

   ```
   C:\Program Files (x86)\Common Files\ArchestrA\Services\ASBInstall.exe install
   ```

   This is an alternate approach to start the **ASB Install Utility**, if configuration fails.
2. Click **Launch** to connect node 1 and node 2.

   The Join ASB Domain dialog box appears.
3. Enter the **Repository node name** and **Passphrase**.
   - **Repository node name**: Indicates the ASB Service Repository node name. Here, name of node 2.
   - **Passphrase**: Indicates the registration passphrase generated for the ASB Service Repository node name.

4. Click **Register Node**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Click **Start** to start the **ArchestrA Watchdog Service**.
6. Click **Test Connection** to verify the connection.

   After upgrading to the required version of AVEVA Work Tasks, if **Test Connection** fails in a distributed environment then you must restart the computer.
7. If the connection is successful, click **OK**.

For information about associating a workflow with ArchestrA Event, see the *ArchestA Events* topic in the *User Guide*.

OpenID Settings

You can access Central Configuration and Enterprise Console through AVEVA Connect and Azure Active Directory user authentication.

Use the **OpenID Settings** tab to configure AVEVA Connect and Azure Active Directory authentication providers.

To configure AVEVA Connect provider, see AVEVA Connect Settings.

To configure Azure Active Directory provider, see Azure Active Directory Settings.

Redirect URIs for AVEVA Work Tasks Pro

In Microsoft Azure portal, where AVEVA Work Tasks Pro app is registered, you need to generate Redirect URI to get the authentication response.

To generate Redirect URI, provide the following details under **Authentication**:

- For iOS, provide **Bundle ID** as **com.schneiderelectric.worktaskspro**
- For Android, provide **Package name** as **com.schneiderelectric.worktaskspro** and **Signature hash** as **VXouuql0JzjKih7eCZqABlKW0Nw=**

For UWP, provide the Redirect URI as **https://www.worktaskspro.com**

Note:

- AVEVA Work Tasks needs to be registered with the selected Authentication Provider. Ensure that the following application URIs are added as Allowed Callback URIs.
For example:
Enterprise Console Redirect URIs:
-- https://{machinename}:{port}/EnterpriseConsole/BPMUITemplates/Default/Repository/Site/RepositoryList.aspx
-- https://{machinename}:{port}/EnterpriseConsole/BPMUITemplates/Default/Repository/Site/Login.aspx
Central Config Redirect URI: https://{machinename}:{port}/CentralConfig/CentralAdministration.aspx
Work Tasks Pro Redirect URI: https://www.worktaskspro.com

- You can switch to any of the authentication types (Windows, Anonymous, Azure Active Directory, or AVEVA Connect) to access Enterprise Console. To switch, you need to reconfigure Enterprise Console settings from Farm Configuration Wizard and set the required Authentication Type. But, in the case of Windows authentication type, Azure Active Directory and Aveva Connect repositories will not work.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

AVEVA Connect Settings

AVEVA Connect can be used as a user provider for creating a repository in AVEVA Work Tasks and can also be used to access AVEVA Work Tasks Pro app through AVEVA Connect.

In AVEVA Work Tasks, you can configure AVEVA Connect using the Farm Configuration Wizard. With this setting, the user is authenticated against AVEVA Connect provider and can access the AVEVA Work Tasks features.

To configure AVEVA Connect Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, point to **Work Tasks**, and then click **Farm Configuration Wizard**.

   The **AVEVA Work Tasks** Farm Configuration Wizard appears.
2. Click **Next**.

   The Edit **AVEVA Work Tasks** Farm Settings window appears.
3. Select **Service settings.**

   The **Enterprise Server settings** can be selected if the Farm Server Installation is using Enterprise Server Installation.
4. Click **Next**.

   The Services/Global Settings window appears.
5. Click against **Global Settings**.
6. In the **Global Settings window**, select **OpenID Settings** tab.
7. In the **Authentication Provider** drop-down list, select **AVEVA Connect**.
8. In the **Account ID** box, enter the account ID that you will use to access AVEVA Connect.
9. For **Client for User Authentication**,
   a. In the **Client ID** box, enter the client id for user authentication.
   b. In the **Client Secret** box, enter the client secret key for user authentication .
10. For **Client for Service Authentication**,
    a. In the **Client ID** box, enter the client id for service authentication.
    b. In the **Client Secret** box, enter the client secret key for service authentication.
11. For **Client for Work Tasks scope (ac_worktasks)**,
    a. In the **Client ID** box, enter the client id for Work Tasks scope.
    b. In the **Client Secret** box, enter the client secret key for Work Tasks scope.
12. For **Client for Work Tasks Pro Mobile App**,
    a. In the **Client ID** box, enter the client id for Work Tasks Pro app.
    b. In the **Client Secret** box, enter the client secret key for Work Tasks Pro app.
13. Click **Save** and then click **OK**.

    You can now update or create the repositories and configure Central Configuration and Enterprise Console with AVEVA Connect user provider.

    To create repository using AVEVA Connect as user provider, see Create a Repository.

    To configure Central Configuration with AVEVA Connect, see Define Central Configuration.

    To configure Enterprise Console with AVEVA Connect, see Add a New Enterprise Console.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note:

- The user or role search is always using the starting character that you enter and does not have any search option.

- Role condition set through Filter condition of To property in the Human Activity is not supported.

- System Platform IDE with the AVEVA Connect provider is not supported.

- To call an external Web API that uses an Access Token, that token will have **ac_worktasks** as a **scope**, and the **audience** will be **https://worktasks.connect.aveva.com**.

Azure Active Directory Settings

Azure Active Directory can be used as a user provider for creating a repository in AVEVA Work Tasks and can also be used to access AVEVA Work Tasks Pro app through Azure Active Directory.

Before configuring the Azure Active Directory settings in AVEVA Work Tasks, register the app in Microsoft Azure directory.

App Registration

You need to register the app in Microsoft Azure to generate the Client Id, Tenant Id, and Object Id.

To register the App:

1. Access the Microsoft Azure portal.
2. Click **View** under **Manage Azure Active Directory** on the **Microsoft Azure Home** page.
3. Click **App registrations** in the left navigation pane.
4. Click **New registration** tab.
   a. In the Name box, enter the display name for this application.
   b. For **Supported account types**, select **Accounts in this organizational directory only (AVEVA Solutions Limited only - single tenant)**.
   c. For **Redirect URI (optional)**, specify the URI to get the authentication response.
5. Click **Register**.

   The app is registered in the Azure Directory.

Azure Active Directory Settings

In AVEVA Work Tasks, you can configure Azure Active Directory using the Farm Configuration Wizard. With this setting, the user is authenticated against Azure Active Directory provider and can access the AVEVA Work Tasks features.

To Configure Azure Active Directory Settings

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, point to **Work Tasks**, and then click **Farm Configuration Wizard**.

   The **AVEVA Work Tasks** Farm Configuration Wizard appears.
2. Click **Next**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Edit **AVEVA Work Tasks** Farm Settings window appears.

3. Select **Service settings.**

   The **Enterprise Server settings** can be selected if the Farm Server Installation is using Enterprise Server Installation.

4. Click **Next**.

   The Services/Global Settings window appears.

5. Click against **Global Settings**.
6. In the **Global Settings window**, select **OpenID Settings** tab.
7. In the **Authentication Provider** drop-down list, select **Azure Active Directory**.
8. In the **Tenant ID** box, enter the tenant ID of the Azure Active Directory instance.
9. In the **Client ID** box, enter the client ID of the Azure Active Directory instance.
10. In the **Client Secret** box, enter the client secret key of the Azure Active Directory instance.
11. Click **Save** and then click **OK**.

Note:
- If you log out from the Central Configuration (CC) site, you are also logged out from the Enterprise Console (EC) site. To access the EC site again, you need to access the EC URL, provide the access credentials, and then continue to use the EC site.

- The Azure Active Directory provider is listed in the Resource Provider drop-down list. But if you create the repository with this Azure Active Directory provider, it will work only when you configure Azure Active Directory through the Farm Configuration Wizard.

- Once you configure Azure Active Directory from Farm Configuration Wizard,
-- the Application Pool of Central Configuration changes to AVEVA Work Tasks Integrated Mode.
-- while accessing the Enterprise Console and Central Configuration, you are redirected to the Microsoft Online Page for authentication.

- When the environment is configured to Azure Active Directory, the following are not supported:
-- Synchronize Users
-- Electronic Signature
-- Disable Users from Azure Active Directory
-- Security Workflow
-- Wizard for Human Activities (In Assign Actors property of Human Activities while building the filter condition, the ‘IN’ and ‘Not In’ operators are not supported.)
-- Role Condition Set through Filter Condition of To Property in the Human Activity
-- The user’s display name with characters like # and ^
-- System Platform IDE

- The user or role search uses the starting character that you enter and does not have any search.

- You cannot have both the AVEVA Identity Manager (AIM) and Azure Active Directory user providers together.

- Scheduler Event Association installed through package does not work in Azure Active Directory when logged-in user's display name has special characters.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

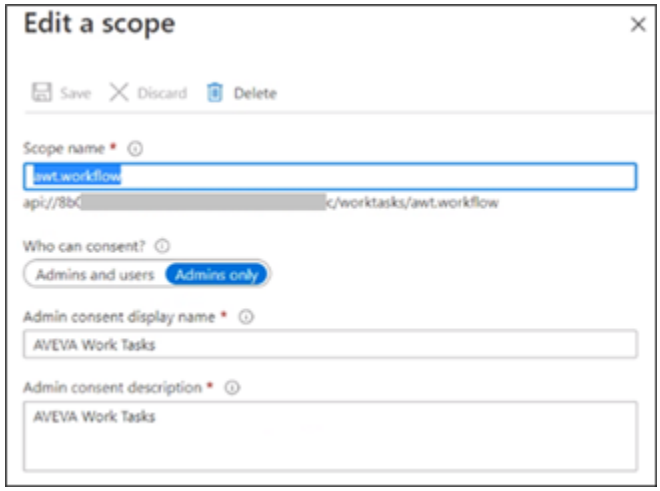
- It is recommended to use https sites for Azure Active Directory repository.

Create Custom Scope in Azure Active Directory

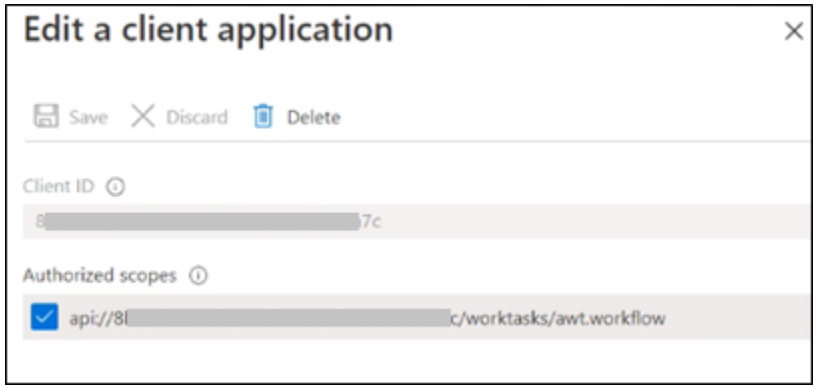
You use the custom scope in the Identity provider so that you can pass the same token to the Web API used in the workflow.

To create a custom scope in Azure Active Directory:

1. Access the **Microsoft Azure portal**.
2. Click **App registrations** in the left navigation pane.
3. Select the registered application.
4. Click **Expose an API** in the left navigation panel.
5. Click **Application ID URI** link and make sure the URI name has correct **client id** and **worktasks**. For example, *api://<client id>/worktasks*
6. To define the scope, click a link under **Scopes** for the registered application.
   a. Enter **awt.workflow** as the scope name.
   b. Enter the other details.



7. To authorize client applications, click a link under **Client Id**.
   a. Select the check box for the created custom scope under **Authorized scopes**.



8. Click **Save**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The custom scope for the Work Tasks application gets created in the Azure Active Directory.

Note: Make sure the Client ID matches the client id mentioned in the Farm Configuration Wizard.

Retrieve Additional User Properties for Azure Active Directory User Provider

You can retrieve additional user properties in Azure Active Directory (AAD) provider so that you can use that property in User Search and Assignment.

You need to add the additional property in the Definition XML as,

```
<property name="mailNickname" type="string" displayName="MailNickName"
entitymappedproperty="UserMailNickName" />
```

To Add Additional Property in the Definition Xml

1. In **Central Configuration**, go to **Repository Provider List**.
2. Select the repository configured with **Azure Active Directory Provider** and expand it.
3. Access the **Definition XML** of **User Entity** by clicking on the **Click here** option beside **User Entity**.
4. Edit the **Definition XML** and add the property for the new field.

   Example:

   ```
   <property name="UserMailNickName" displayname="MailNickName" type="string" />
   ```
5. Select the provider **Definition XML** and click the **Definition XML**
6. Edit the **Definition XML** and add,

   ```
   <property name="mailNickname" type="string" displayName="MailNickName"
   entitymappedproperty="UserMailNickName" />
   ```
7. Add the Locales text for the display name as,

   ```
   aadprovider.MailNickName:MailNickName
   ```
8. Do an IISReset to reflect the added property.

Auto Resume Settings

The Workflow Engine, a windows service, is responsible for workflow execution and routing of activities. Workflow instances and the activities within the workflow are assigned different status values based on the execution state. These status values are persisted in the database.

This section highlights the various methods available to resume specific workflow instances.

List of Workflow Status Values

Following is the list of status values which are assigned to the workflows during execution:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Status	Description
EP	Execution Pending This status is assigned to a workflow, when the workflow execution has not begun.
EX	Execution in Progress This status is assigned to a workflow, if any one of the workflow activity starts its execution.
SL	Sleep Mode The workflow is in Sleep mode when all the pending activities are in sleep mode.
FN	Finished Successfully The Workflow Execution is considered to be complete, if all the activities have completed execution.
FE	Workflow Execution Finished with Errors If any activity has an error while execution, the workflow stops with this status.
AB	Aborted This status is assigned to a workflow, when it gets aborted while execution.
PA	Paused This status is assigned to a workflow, when it is paused while execution.

Following is the list of status values assigned to the activities during runtime:

Status	Description
P	Execution Pending
E	Activity Executing
S	Sleep
C	Execution Completed
Z	Next action initiated
K	Activity killed
U	Activity paused

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

What happens when a workflow fails to execute?

When an activity within a workflow instance fails, the workflow instance is marked as Finished with Errors (FE) and the activity is marked as executing (E).

When can a workflow fail and finish with errors?

Following are some of the possible reasons for a workflow to fail:

- An activity in the workflow fails, which in turn can happen due to:
  - Invalid configuration settings for the activity properties
  - Uninitialized variable being used in the activity
  - Slow network connectivity
- Slow network connectivity to the database server

How can a workflow be modified and resumed?

If a workflow fails due to invalid configuration settings or due to improper use of variables, you can modify the workflow accordingly and then republish it.

For example, consider a workflow which has finished with errors as shown in the image given below. The activity Estimate due time has failed to execute. The user can check AVEVA Work Tasks log files or event viewer to identify the reason of failure. The workflow can then be modified accordingly, and then republished.

Different methods to resume workflow instances

- Using AVEVA Work Tasks APIs
- Using BAM reports
- Using the Auto Resume Feature

Using AVEVA Work Tasks API

AVEVA Work Tasks APIs can be used to resume workflow instances in FE state.

Given below is the sample code:

- **Namespace**: Workflow.NET.Engine
- **Assembly**: Workflow.NET.NET2.dll.

```
static void ResumeWorkflowWithErrors(int executionId, string application, string
workflow)
{
Client client = null;
try
{
client = new Client(application, workflow);
if (client.CanResumeWorkflowWithErrors(executionId))
client.ResumeWorkflowWithErrors(executionId);
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
}
catch (Exception exp)
{
Console.Write(exp.ToString());
}
finally
{
if(client != null)
client.Close();
client = null;
}
}
```

Ensure that the client object is closed in the final block.

To use BAM Reports

Follow the steps given below to resume FE workflow instances from BAM reports:

1. In the **Enterprise Console**, navigate to **Reports.**

   The **AVEVA Work Tasks** Business Activity Monitoring page appears.

   The tree view on the left side gets loaded with reports for different workflow instances.
2. Click **Failed** node available under **Analyze** > **Execution**.

   A report of all the workflow instances that have finished with errors appears.
3. Double-click on any of the workflow instance.

   The workflow progress view pop up window appears. The left side of the pop up window has icons to pause, abort, resume paused workflows, and to resume FE workflows.
4. Click the icon to resume workflow finished with errors.

   This would resume the activity which has failed to execute and the workflow would progress to the next state.

Automatically resuming from Workflow Engine

The workflow instances that have pending events or are in EP or FE state can be automatically resumed using the Auto Resume Feature. By default all the repositories that are configured in the farm are considered for resuming the workflow instances.

Auto Resume Settings

The **Auto Resume Settings** tab of the AVEVA Work Tasks Engine Settings is used to configure properties for automatically resuming workflow instances that have pending events or are in FE or EP state.

The following properties are applicable to all three types of workflow instances (FE, EP, Pending Workflow Events):

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
Select Repositories	All the repositories that are mapped to the current farm are listed here. The user can either select the Select All check-box to resume workflow instances from all the repositories or select the required repositories from the list.
Resume workflow instances that have pending events or are in FE or EP status from	Select a date which would be considered by the Workflow Engine while fetching the workflow instances. From the selected date onwards, all the workflow instances that have pending events or are in EP or FE status will be resumed automatically. This date selected here is compared with the LastUpdatedDateTime field from SWExecute table.
Enable logging of auto resume messages	It enables you to control the log messages in the logger console whenever the engine tries to resume the respective workflow instances.

FE Workflow Instances

The details of failed workflow instances that are automatically resumed by the Workflow Engine are stored in the SWFECount table. This table keeps track of the execution IDs of workflows that have finished with errors (FE) and the number of retries that engine has made to re-execute the failed workflow. After resuming the workflow, if the workflow executes successfully then the corresponding record is deleted from the SWFECount table. If the workflow instance is still in FE state even after the set number of retries, then an exception is emailed to the Admin configured in the To Email property in the farm configuration settings.

Configurations for Resuming FE Workflows

Given below is the list of properties that needs to be configured for resuming FE workflows:

Field	Description
Number of retries to resume FE workflow instances	The number of attempts that the Workflow Engine should make to resume the FE workflow instances. For example, if this value is set to 5 then the Workflow Engine would make 5 attempts to resume each of the FE workflow instance. If this value is set to 0 (zero) then, then auto resume of FE workflow instances does not occur.
Remove resume history when FE workflow instances are completed	If the value is selected as True, the history of resumed FE workflow instances which have completed successfully would be deleted from the SWFECOUNT table. If the value is selected as False, the history of resumed FE workflow instances which have completed

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field	Description
	successfully would be retained in the SWFECOUNT table.
Time interval to fetch FE workflow instances	It is used to set the time interval for resuming FE workflow instances. The value entered should be greater than 5 minutes.
No. of FE workflow instances to be fetched in the specified time interval	It is used set the number of workflow instances to be fetched for auto resume in the specified time interval.

EP Workflow Instances

Given below is the list of properties that needs to be configured to resume EP workflows:

Field	Description
Enable auto resume of EP workflow instances	This property is used to enable or disable auto resume of EP workflow instances. **Note**: The **Enable auto resume** setting does not apply to the scheduled workflows.
Fetch workflow instances which have been in EP state for	This property is used to set the minimum time for which the workflow instances should have been in EP state. The value should be entered in days.hr:min:sec format. If this value is set as 5, the Workflow Engine tries to fetch the workflow instances which have been in EP state for at least 5 hours. The Workflow Engine calculates the time for which the workflow instances have been in EP state by comparing the LastUpdatedDateTime value from SWExecute table with the current time. The default time for which workflow instances have been in EP state is 5 hours. If the time set is less than 5 hours, then by default, the Engine considers 5 hours as the minimum time.
Time interval to fetch EP workflow instances	It is used to set the time interval for resuming EP workflow instances. Minimum value should be greater than 5 minutes.
No. of EP workflow instances to be fetched in the specified time interval	It is used set the number of EP workflow instances to be fetched for auto resume in the specified time interval.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Pending Workflow Events

Given below is the list of properties that needs to be configured for resuming Pending Workflow Events.

Field	Description
Enable auto resume of pending workflow events	This property is used to enable or disable auto resume of pending workflow events. **Note**: The **Enable auto resume** setting does not apply to the scheduled workflows.
Minimum time for which the workflow events are in Pending state	This property is used to set the minimum time for which the workflow events should be in Pending state. If this value is set as 0.5:0:0, the workflow engine will fetch the events which are in Pending state for at least 5 hours. The workflow engine calculates the time for which the workflow events have been pending by comparing the LastUpdatedDateTime value from SWExecute table with the current time. The default time for which workflow events should be in pending state is 5 hours. If the time set is less than 5 hours, then by default, the engine considers 5 hours as the minimum time.
Time interval to fetch workflow instances with pending events	It is used to set the time interval for resuming workflow instances with pending events. Minimum value should be greater than 5 minutes.
No. of workflow instances with pending events to be fetched in the specified time interval	It is used set the number of workflow instances with pending events to be fetched for auto resume in the specified time interval.

Cache Refresh Settings

The performance of Enterprise Console can be improved by reusing previously fetched resources. The caches reduce latency and network traffic and thus lessen the time needed to display a representation of a resource. By making use of HTTP caching, Enterprise Console become more responsive.

Enterprise Console Web Application makes use of clientCache element of the staticContent element, which update the HTTP Header `Cache-Control` with `must-revalidate` and `max-age` request directives. The value set for the `max-age` request directive is 1 hour, which can be set using the cacheControlMaxAge attribute of the `clientCache` element.

After the product is installed, you can change the cacheControlMaxAge attribute value as per your requirement. The Enterprise Console Web Application's web.config file related to the caching is usually located at <product installation path>\Web\BPMUITemplates\Default\web.config and would contain the `clientCache` settings as below:

```
<system.webServer>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<staticContent>
<clientCache cacheControlCustom="must-revalidate" cacheControlMode="UseMaxAge"
cacheControlMaxAge="0.01:00:00" />
</staticContent>
</system.webServer>
```

It is recommended to set the `cacheControlMaxAge` attribute value to 0 for a staging or non-production environment, as there would be frequent changes to the files/resources used by the site, which is used for development.

Note: If you change the .js, .css, or image files, the changes for the same would be reflected in the browser as per the `cacheControlMaxAge` attribute in the web.config file.

Administration Tasks

This section provides information on:

- Manage Databases
- Configure Services
- Cryptography Settings
- Administer Web Servers
- Work with Central Configuration
- User Providers
- Debug

About Forms Designer

The Forms is an easy to use drag-and-drop interface used for designing forms. You can use the Forms Designer to quickly design forms, maintain form templates and define business logic. The Forms are used to trigger the Workflows.

The Forms does not require a separate installation. This is a part of the core product installation.

To use the Forms Designer, the Forms Server license has to be acquired. The Forms Server license is released when the Client service is stopped.

View Installed Products

You can use the **View Installed Products** feature to view the version number of AVEVA Work Tasks and its connectors that are installed on the system. The **View Installed Products** feature is a part of the Farm Configuration Wizard.

Complete the following tasks to get a list of the installed products:

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
2. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** screen appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Click the **Installed Products** link.

   The View Installed Products window appears.
4. Click the name of the product from the **Installed Products** section.

   This will populate the product details, such as the product name, product version, and the installation type in the **Product Details** section.
5. To copy the information, click the **Copy Info.**
6. Click **OK** to exit.

Manage Databases

This topic provides information on editing Database User Settings, changing the pool size, changing the password for Windows Active Directory and for SQL user credentials. Consider the following scenarios for editing Database User Settings:

Scenario 1

The Database User password has been modified in the Active Directory. This modification has to be updated in the database. If not modified, the user will not be allowed to log in to the Farm.

Scenario 2

The user login credentials has been modified in SQL database instance. This modification has to be updated in the Farm database. If not modified, the user will not be allowed to log in to the Farm.

Change Database User Settings for Windows Authentication

The database user settings can be authenticated by Windows or SQL. In case of Windows Authentication, if the user name and password is changed in Active Directory then the same has to be updated using the Farm Configuration Wizard. You can also use this option to switch from one authentication type to the other.

You need to ensure that there are no running workflows while changing database user settings.

Changing Database User Settings for Windows Authentication

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **AVEVA Work Tasks** Configuration Wizard appears.
2. Click **Next**.

   The Edit **AVEVA Work Tasks** Farm settings screen appears.
3. Select **Database User Settings**.
4. Click Next.

   The Database User Settings screen appears.
5. Enter the updated **User Name, Password**, and **Domain**.
6. Click **OK**.

   A message to ensure that the login has required permissions appears.
7. Click **OK**.

   A message indicating Database User settings edited successfully appears.
8. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Stop the following AVEVA Work Tasks services:
    a. Client Service
    b. Communication Service
    c. Task Schedule
    d. Mobile Notification Service
    e. Workflow Engine
10. In an Enterprise Server system, ensure to stop the **Advance Server Service**.
11. In a client computer, ensure to stop the **Client service**.
12. In a client machine which is connected to an Enterprise Server, ensure to stop the **Advance Server Service** and **Client Service**.
13. Close all AVEVA Work Tasks related sites and applications.
14. To stop IIS, run **Command Prompt** as an **Administrator**, and type **iisreset /stop**.
15. Delete the *WorkflowManagementTemp* folder from *C:\Windows\Temp*.
16. Delete the AVEVA Work Tasks Cache files and folders from *C:\Windows\Microsoft.NET\Framework64\v4.0.XXXXX\Temporary ASP.NET Files*.
17. Start the AVEVA Work Tasks related services.
18. To start IIS, run **Command Prompt** as an **Administrator**, and type **iisreset /start**.
19. Click **OK**.

Change SQL User Credentials for SQL Authentication

Database User settings can be authenticated by Windows or SQL. In case of SQL authentication, if the user name/password is changed in the SQL database then the same has to be updated using Farm Configuration Wizard. You can also use this option to switch from one authentication type to the other.

To change SQL User Credentials for SQL Authentication

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **AVEVA Work Tasks Farm Configuration Wizard** appears.
2. Click **Next**.
3. Select **Database Settings**.
4. Click **Next**.

   The Connect to existing database screen appears.
5. From the **Connection String** option, modify the **User Id** and **Password** for connecting to the database.
6. Click **Test Connection**.
7. Click **OK**.
8. Click **Next**.
9. Stop the following AVEVA Work Tasks services:
    - Client Service
    - Workflow Engine
    - Task Scheduler

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Communication Service
- Mobile Notification Service

10. In an Enterprise Server system, ensure to stop the **Advance Server Service**.
11. In a client computer, ensure to stop the **Client Service**.
12. In a client machine which is connected to an Enterprise Server, ensure to stop the **Advance Server Service** and **Client Service**.
13. Close all AVEVA Work Tasks related sites and applications.
14. To stop IIS, run **Command Prompt** as an **Administrator**, and type **iisreset /stop**.
15. Delete the *WorkTasksTemp* folder from *C:\Windows\Temp*.
16. Delete the AVEVA Work Tasks Cache files and folders from *C:\Windows\Microsoft.NET\Framework64\v4.0.XXXXX\Temporary ASP.NET Files*.
17. Start the AVEVA Work Tasks related services.
18. To start IIS, run **Command Prompt** as an **Administrator**, and type **iisreset /start**.

    The user credentials are updated.

See Also: Create Farm Database

Change Pool Size of Farm Connection Settings

To change Pool Size of the Farm

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **AVEVA Work Tasks** Farm Configuration Wizard appears.
2. Click **Next**.
3. Select **Database Settings**.
4. Click **Next**.

   The Connect to existing database screen appears.
5. Select the **Connection String** option.
6. Enter the pool size in the **Advanced Settings** field.

   For example, type Connection Timeout = 30.
7. Click **Test Connection**.
8. Click **OK**.

   This will change the pool size of the Farm Database.
9. Click **Next**.

   The message, *Connection settings edited successfully* appears.
10. Stop the following AVEVA Work Tasks services:
    a. Client Service
    b. Communication Service
    c. Task Schedule
    d. Mobile Notification Service

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

e. Workflow Engine

11. In an Enterprise Server system, ensure to stop the **Advance Server Service**.
12. In a client computer, ensure to stop the **Client service**.
13. In a client machine which is connected to an Enterprise Server, ensure to stop the **Advance Server Service** and **Client Service**.
14. Close all AVEVA Work Tasks related sites and applications.
15. To stop IIS, run **Command Prompt** as an **Administrator**, and type **iisreset /stop**.
16. Delete the *WorkflowManagementTemp* folder from *C:\Windows\Temp*.
17. Delete the AVEVA Work Tasks Cache files and folders from *C:\Windows\Microsoft.NET\Framework64\v4.0.XXXXX\Temporary ASP.NET Files*.
18. Start the AVEVA Work Tasks related services.
19. To start IIS, run **Command Prompt** as an **Administrator**, and type **iisreset /start**.
20. Click **OK**.

Change Database Settings

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **AVEVA Work Tasks** Configuration Wizard appears.
2. Click **Next**.

   The Edit **AVEVA Work Tasks** Farm Settings screen appears.
3. Select **Database Settings**.
4. Click **Next**.

   The Connect to existing database screen appears.
5. Modify the **Authentication Type** or **Advanced Settings**.

   If SQL Server authentication is selected, you have to key in the user name and password.
6. Click **Test Connection** to ensure database connectivity.
7. Click **OK**.
8. Click **Next**.
9. Stop the following AVEVA Work Tasks services:
   a. Client Service
   b. Communication Service
   c. Task Scheduler
   d. Mobile Notification Service
   e. Workflow Engine
10. In an Enterprise Server system, ensure to stop the **Advance Server** service.
11. In a client computer, ensure to stop the **Client Service**.
12. In a client machine which is connected to an Enterprise Server, ensure to stop both the **Advance Server** service and **Client Service**.
13. Close all AVEVA Work Tasks related sites and applications.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

14. To stop IIS, run **Command Prompt** as an **Administrator**, and type **iisreset /stop**.
15. Delete the *WorkflowManagementTemp* folder from *C:\Windows\Temp*.
16. Delete the AVEVA Work Tasks Cache files and folders from *C:\Windows\Microsoft.NET\Framework64\v4.0.XXXXX\Temporary ASP.NET Files*.
17. Start the AVEVA Work Tasks related services.
18. To start IIS, run **Command Prompt** as an **Administrator**, and type **iisreset /start**.

The following table provides information on the various fields used in Connection String.

Field Name	Description
Authentication Type	This field is used to provide information on the process used to validate a user. AVEVA Work Tasks supports both Windows and SQL server authentication process. Example: Windows.
User ID	This field is used to enter the SQL user ID for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
Password	This field is used to enter the password for SQL Server type of authentication. For Windows Authentication, this field appears disabled.
Advanced Settings	This is an optional field. It is used to enter any additional connection information such as connection Timeout etc. Example: Connection Timeout = 20.

Configure Services

Configuring services involves the following:

- Two-way Email Notification
- Change Service Settings
- Client Service Monitoring Settings

Two-way Email Notification

Mail Server

The Mail Server settings identify the mail server to be used by the AVEVA Work Tasks Communication Service for receiving emails.

Group Name	Field Name	Description
Default	This option is selected to make Work Tasks communication server act as	

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Group Name	Field Name	Description
	a mail server and process all emails received.	
	Server IP	This field is used to provide the IP address of the Work Tasks communication server.
	Server Port	This field is used to enter the Port number used by the Work Tasks communication server. The default port is 25.
POP3	This option is selected to setup POP3 mail servers.	
	POP3 Host	This field is used to enter the IP address of the POP Mail Host.
	POP3 Time Interval	This field is used to set the time interval to check the mail server for emails. The format for this field is day.hour.minute.seconds. The default POP time is 0.00:00:15.
	POP3 Port	This field is used to enter the port number for receiving emails. The default POP Mail Port is 110.
	Is SSL Enabled?	This field is used to specify if a Secure Password Authentication is provided. Default value is false.
	POP3 Authentication - Basic	
	Add Users	The table is used to enter the **User Name** (email address) and **Password** of POP3 users. The Communication Engine makes use of this email address. To add another user, click **Add User**.
	POP3 Authentication - OAuth2 (See Configure POP3 Settings to get the values for the below fields)	
	User Account	This field is used to specify the email of the user.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Group Name	Field Name	Description
	OAuth2 Token URI	This field is used to specify the OAuth token URI.
	Authorization Code URI	This field is used to specify the authorization code URI.
	Client Id	This field is used to specify the client Id.
	Client Secret	This field is used to specify the client secret.
	Redirection URI	This field is used to specify the redirection URI.
	OAuth2 Scope	This field is used to specify the OAuth2 Scope.
	Token Refresh	This field is used to specify the time in Day.Hour:Minute.Second to refresh the token.

You can use the email server settings for sending and receiving emails.

Activities specific to sending emails comprises:

- Change mail server for sending email
- Setting "From email address" globally and at Repository level

Activities specific to receiving emails comprises:

- Changing mail channel/email receiver settings
- Changing mail server settings
- Changing POP3 password
- Adding another user to receive emails

If you choose **Default**, the Communication Service will act like a mail server. All mails received by the **Communication Service** will be forwarded to the specific Workflow for processing.

If POP3 is not enabled in mail server, then the **Default** option can be used for getting the emails.

Complete the following settings to configure the default options:

1. Select **Default** option.
2. Set **Listener IP Address** under **Communication Server** tab and **AVEVA Work Tasks Communication Service Server IP** under **Mail Server** tab with the IP address of the machine where the Communication Service is installed (that is, AVEVA Work Tasks Server).
3. Create an Email ID in exchange server.
4. Forward all mails coming to this email Id to a new email ID. The new mail ID should be in

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

user@[IPAddressOfWorkflowManagementMachine] format.

user: Name of the user.

IPAddressOfWorkflow ManagementMachine: This should be the one configured in step 2.

In an Enterprise Server environment, you must create a machine specific email account for all the engines. The mails should be forwarded to all the engines.

Change Service Settings

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Service Settings**.

   The **Enterprise Server Settings** can be selected if the Farm Server Installation is using the Enterprise Server Installation.
4. Click **Next**.

   The **Services/Global Settings** page appears.
5. Click the configuration icon against any of the services to modify a service.

Client Service Monitoring Settings

Client service monitoring settings can be changed using the file ServiceMonitorConfig.xml which is present in the installed AVEVA Work Tasks bin folder.

For more information related to the service monitoring, see Client Service Settings.

Configuration files can be changed for the following settings:

- **For enabling or disabling of service monitoring:**

  Service monitoring can be enabled or disabled using the configuration attribute ServiceMonitoringEnabled. For enabling monitoring, set ServiceMonitoringEnabled="true". For disabling monitoring, set ServiceMonitoringEnabled="false".

- **Whether to Send Alert emails or not:**

  By default, emails will be sent to the administrator whenever any service restart happens.

  If the administrator does not want to get alert emails, then set SendAlertEmailsEnabled="false".

- **Scheduled maintenance restart of all the AVEVA Work Tasks service can be done in the section MaintainanceRestart.**

  By default, this is disabled and this section is commented in the configuration file.

  <!--<MaintainanceRestart RestartAt="" WeeklyRestartDays="" MonthlyRestartMonths="" MonthlyRestartDates=""/>-->

  Uncomment the node MaintainanceRestart in the configuration file, and give the appropriate values. A more detailed explanation of the MaintainanceRestart can be found in Maintenance.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Changing the default CriticalMemory setting:**

  Default CriticalMemory setting can be changed in the DefaultConfig section which affects all AVEVA Work Tasks service.

  Uncomment the CriticalMemory node and set the MemoryLimitInMB value for it. A more detailed explanation of the Critical memory can be found in Critical Memory Limit section.

- **Changing the default WarningMemory setting:**

  Default WarningMemory setting can be changed in the DefaultConfig section which affects all services. Uncomment the WarningMemory node and set the values for it. A more detailed explanation of the Warning memory can be found in Warning Memory Limit section.

- **Changing the service settings for a specific service:**

  If the specific service does not want to use the default settings, then it can override it with its own settings. Suppose WFEngine wants to have separate settings, then replace

  `"<ServiceConfig Name="WFEngine" />"`

  with

  ```
  <ServiceConfig Name="WFEngine" MonitorService="true">
  <CriticalMemory MemoryLimitInMB=""/>
  <WarningMemory MemoryLimitInMB="" TimeRangeInMinutes="" RestartAt=""/>
  </ServiceConfig>
  ```

  and set the appropriate values.

- **Enabling or disabling the service monitoring for a specific service:**

  If a specific service should not be monitored, then make MonitorService="false" for that service. By default, it takes the value from the DefaultConfig section where it is enabled.

  After the change, when the client service is restarted, the specified service will not be monitored for maintenance restart, critical memory limit, warning memory limit, and service specific monitoring logics.

  Example: `<ServiceConfig Name="CommunicationService" MonitorService="false"/>`

Cryptography Settings

You can export and import the cryptography settings of one server to the other servers. For Load Balanced Server of Work Tasks, import the cryptographic settings with the same passphrase in all the servers. Using the same passphrase will help the easier recovery of the servers.

The following are the application pools and services that access AVEVA Work Tasks:

Applications Pools

- AVEVA Work Tasks Integrated
- Quickflow

Services

- NetworkService
- Current

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- System

If you use any other application pool or service to access Work Tasks, you need to add them to one of the following groups:

- Administrators
- aaAdministrators
- aaConfigTools

To Export/Import Cryptography Settings

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** screen appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Cryptography Settings** and click **Next**.
4. On the **Cryptography Settings** page, do the following:
   a. Enter the passphrase for the settings.

      Note: The passphrase should have characters between 8 and 20, consisting of lowercase, uppercase, numbers, and special characters. Use the same passphrase for all servers in Load Balanced Server of AVEVA Work Tasks.
   b. Click **Import** to import the cryptography settings file in the server.
   c. Click **Export** to export the settings. Keep the file safe.
5. Click **Finish**.

   The cryptography settings get imported to or exported from the server based on the action performed.

To Configure Cryptography Settings using Cryptography Configurator Tool

1. Navigate to **[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin** and run **CryptographyConfigurator.exe** to configure the cryptography settings.
2. On the **Cryptography Settings** page, do the following:
   a. Enter the passphrase for the settings.

      Note: The passphrase should have characters between 8 and 20, consisting of lowercase, uppercase, numbers, and special characters. Use the same passphrase for all servers in Load Balanced Server of AVEVA Work Tasks.
   b. Click **Remove** to clear the cryptography settings from the logged-in server.
   c. Click **Import** to import the cryptography settings file in the server.
   d. Click **Export** to export the cryptography settings. Keep the file safe.
3. Click **Finish**.

   The cryptography settings gets removed, imported to, or exported from the server based on the action performed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Migrate Passphrase using Migration Tool

You can migrate the passphrase and the configuration settings from one machine to another using Passphrase Migration Tool. Using the tool, you can migrate the following:

- Farm Database
- Datasources
- Central Configuration

To migrate passphrase using Passphrase Migration tool,

1. Navigate to **[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin\Tool** and run **AVEVAWorkTasksPassphraseMigrationWizard.exe** to migrate the existing configuration settings.
2. On the **Passphrase Migration Wizard**, do the following:
   a. In the **Existing Passphrase** box, enter the exiting passphrase configured earlier in a machine.
   b. In the **New Passphrase** box, enter the new passphrase for migrating existing configurations to a different machine.

   Note: The passphrase should have characters between 8 and 20, consisting of lowercase, uppercase, numbers, and special characters. Use the same passphrase for all servers in Enterprise Edition of AVEVA Work Tasks.
3. Click **Migrate**.

   The wizard shows the status of the configurations getting migrated. Also, if you check the database tables, you will see that the database columns has the new encrypted values.

   Note: Do not run this tool for migrating the settings when,
   - AVEVA Work Tasks is provisioned with external connectors (for example, AVEVA System Platform), as external connectors are not supported.
   - DataSource is created using Connection provider as the DataSource will not get migrated.

Administer Web Servers

You can change the settings of web sites, change or set the desired port number for Central Configuration and Enterprise Console. You can also add new Enterprise Console site and map/un-map a repository from an existing Enterprise Console.

Change Web Site Settings

The Farm Configuration Wizard allows you to install either the Central Configuration or the Enterprise Console on the AVEVA Work Tasks Client machines. This topic provides steps to configure these Web site settings:

- Changing IIS path for the Central Configuration Web site
- Changing IIS path for the Enterprise Console Web site

  Note: A Fully Qualified Domain Name will be displayed while configuring Enterprise Console (EC) and Central Config (CC) sites for the fresh installation of the product.
  When the product is upgraded, the existing EC and CC sites will remain the same.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The new EC and CC sites created after the upgrade will have the Fully Qualified Domain Name.

To change IIS path for the Central Configuration Web site

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Configuration Wizard screen appears.
2. Click **Next**.

   The Edit AVEVA Work Tasks Farm Settings window is displayed.
3. Select **Service settings**.

   The **Enterprise Server Settings** can be selected if the Farm Server Installation is using Enterprise Server Installation.
4. Click **Next**.

   The Services and Settings page appears.
5. Click against **Central Configuration** to edit AVEVA Work Tasks **Central Configuration settings**.

   The Central Configuration Settings page appears.
   - **http/https**: This option enables you to determine if you want a secured (https) or a non-secured site (http). It is recommended to use **https** for a secure connection.
   - **Create at**: This field allows you to provide the Internet Information Service (IIS) path where the new site is created.
   - **Port Number**: This field is used to provide a port number for the Central Configuration.
6. Click against **Create at** to change the path of the Central Configuration.

   A message indicating that if the path has been changed the Central Configuration will no longer be accessible appears.
7. Click **Yes**.

   The IIS structure screen is displayed. Select the desired IIS path for the Central Configuration.
8. Click **OK**.

   The selected URL appears in the Central Configuration Settings screen.
9. Click **OK**.

To change the IIS path for the Enterprise Console Web site

1. Follow the steps from 1 to 5 as indicated for the Central Configuration above.
2. Click against Enterprise Console option.

   The settings for the selected Enterprise Console appears.
3. Select the row in the Existing Enterprise Consoles table.
4. Click **Delete**.

   A prompt appears to confirm the deletion.
5. Click against **Create at**.

   The IIS structure screen appears.
6. Select the required IIS path for Enterprise Console.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

7. Click **OK**.
8. Click **Save**.
9. Click **OK**.

Note: Central Configuration and Enterprise Console cannot be accessed in Chrome browser when configured with unsecured access (http://) for Azure Active Directory and AVEVA Connect authentication types.

Set Desired Port Number for Central Configuration and Enterprise Console During Installation

Enterprise Console and **Central Configuration** are virtual applications [or Virtual Directories] of a Website.

Virtual Applications URL contains the port number of a Website. Virtual applications always inherit the port number of a Website.

If the Website's port number (for the http binding) is changed, then automatically, Virtual Applications inherit the new port number (changed port number).

Example:

Consider the name of the Website is "Telematics" and it has the following two Virtual Applications:

- CentralConfig
- EnterpriseConsole

URL of "Telematics" Website is *http://<computer123:8000/*

Port number of http/https binding of the Telematics Website is *8000*

Change the port number of the Telematics website to *8009*

URL of Telematics Website and its Virtual Applications- Before change

- Website URL: *http://computer123:8000/*
- Central Configuration URL: *http://computer123:8000/CentralConfig*
- Enterprise Console URL: *http://computer123:8000/EnterpriseConsole*

URL of Telematics Website and its Virtual Applications -After Change

- Website URL: *http://computer123:8009/*
- Central Configuration URL: *http://computer123:8009/CentralConfig*
- Enterprise Console URL: *http://computer123:8009/EnterpriseConsole*

There are three ways to create the Website (under which we are going to create Enterprise Console and Central Configuration) with the desired port number:

- Create the Website with the Desired Port Number Through Farm Configuration Wizard
- Use an Existing Website
- Change the Port Number of AVEVA Work Tasks Sites

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Create Website with Desired Port Number Through Farm Configuration Wizard

Steps to create the Website with the desired port through Farm Configuration Wizard:

1. In Services/Global Settings page, select **Custom Settings**.

   By default, for custom settings, Website, Central Configuration, and Enterprise Console nodes will not be checked.
2. Select the above mentioned tree nodes, and then click **Next**.

   The Global Settings page appears.
3. Click **OK**.

   The Central Configuration Settings window appears.
4. Click the icon against **Create at** text box in the Central Configuration Settings page.

   The IIS structure screen appears.
5. Select the root node, and click **New Web Site**.

   The Website Settings page appears.
6. Type the **Website Name, Port number, Home directory**, and application pool value.
7. Click **OK**.

   Newly created site gets listed in the IIS Structure Page.
8. Select the site, and click **OK**.

   The selected URL with the desired port number appears in the Central Configuration Settings page.
9. Click **OK**.

   The Enterprise Console Settings page appears.
10. Click the icon against **Create at** text box.

    The IIS Structure gets displayed.
11. You can either create the new Website or select the newly created Website (for Central Config) and click **OK**.

    The selected URL with the desired port number appears in the Enterprise Console Settings page.
12. Click **Save** to add the Enterprise Console to the Existing Enterprise Consoles grid.
13. Click **OK**.

Change Port Number of AVEVA Work Tasks Sites

Steps to change the port number of AVEVA Work Tasks Sites

Note: These steps are specifically for Internet Information Services (IIS) 7.

1. In Services/Global Settings page, select **Custom Settings**.

   By default, for custom settings, Website, Central Configuration, and Enterprise Console nodes will not be checked.
2. Select the above mentioned tree nodes, and then click **Next**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Global Settings page appears.

3. Click **OK**.

   The Central Configuration Settings window appears.

4. Click **Start > Administrative Tools > Internet Information Services (IIS) Manager**.

   Alternatively, go to **Start > Run**. Type `inetmgr,` and then click **OK** to open Internet Information Services (IIS) Manager.

5. Find the site named "**AVEVAWorkTasksSites**".
6. Right-click **AVEVAWorkTasksSites** site and select **Edit Bindings**.
7. Select the http binding, and the click **Edit**.
8. Provide desirable port number and click **OK**.
9. Refresh the sites and check the updated port number is changed or not.
10. In the AVEVA Work Tasks Farm Configuration wizard, click the icon against **Create at** box in the Central Configuration Settings page.

    The IIS structure screen appears.

11. Select the desired IIS path for the Central Configuration (Select the site for which you have changed the port number- here AVEVA Work TasksSites).
12. Click **OK**.

    The selected URL with the desired port number appears in the Central Configuration Settings Page.

13. Click **OK**.

    The **Enterprise Console Settings** page appears. If you have changed the port number of the "AVEVA Work Tasks Sites" then automatically, the port number of Enterprise Console gets changed.

14. Click **Save**, so that Enterprise Console gets added to the Existing Enterprise Consoles grid.
15. Click **OK.**

Change Port Number of Central Configuration and Enterprise Console

Before you perform the settings mentioned in this section, ensure that the port number for the Central Configuration and the Enterprise Console are manually changed from the IIS manager.

For more information, see Setting Desired Port Number for Central Configuration and Enterprise Console During Installation and Change Port Number of AVEVA Work Tasks Sites.

To change the port number for Central Configuration

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Configuration Wizard appears.

2. Click **Next**.

   The Edit AVEVA Work Tasks Farm Settings screen is displayed.

3. Select **Service Settings**.
4. Click **Next**.

   The Service/Global Settings page appears.

5. Click against **Central Configuration**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Central Configuration Settings page appears.

- **http/https**: This option enables you to determine if you want a secured (https) or a non-secured site (http).
- **Create at**: This field allows you to provide the Internet Information Service (IIS) path where the new site is created.
- **Port Number**: This field is used to provide a port number for the Central Configuration.

6. Enter the new port number.

   The **Change Port number** button is enabled.
7. Click **Change Port Number.**
8. Click **OK**.

To change port number for Enterprise Console

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Configuration Wizard appears.
2. Click **Next**.

   The Edit AVEVA Work Tasks Farm Settings screen is displayed.
3. Select **Service Settings**.
4. Click **Next**.

   The Service/Global Settings page is displayed.
5. Click against Enterprise Console.

   The Enterprise Console Settings screen appears.
6. Select the required Enterprise Console entry in the Existing Enterprise Consoles table.
7. Enter a port number.

   The **Change Port** button is enabled.
8. Click **Change Port**.
9. Click **Save**.

Add a New Enterprise Console

The Farm Configuration Wizard allows you to create a new Enterprise Console.

Note: You can create as many Enterprise Consoles as you require, but you cannot create more than two Central Configuration sites.

To add a New Enterprise Console

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The Welcome to the AVEVA Work Tasks Farm Configuration Wizard appears.
2. Click **Next**.

   The Edit AVEVA Work Tasks Farm Settings window is displayed.
3. Select **Service settings**.
4. Click **Next**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Services/Global Settings page is displayed.

5. Click the icon against **Enterprise Console** option.

   The Enterprise Console Settings page appears.

6. In the **New Website** text box, enter a name for the Enterprise Console.

   For example, enter name as 'Telematics'.

7. To create the Enterprise Console in different port, click against **Create at** option, and then select the site with the required port.

   The default port is 8000.

   The IIS Structure page is displayed.

8. Select the path where you want to create an Enterprise Console.
9. Click **OK**.

   The selected path is displayed in the **Create at** text box.

   The mapped repositories are displayed in the Repositories.

10. Select the repository(s) to map to this created site.

    You can select multiple repositories by using Ctrl or Shift keys.

11. Select the required authentication type in the **Authentication Type** drop-down list.

    The available authentication types are Windows, Anonymous, AVEVA Connect, and Azure Active Directory.

    Note: The AVEVA Connect and Azure Active Directory authentication types are available only if these user providers are configured in the system.
    To configure AVEVA Connect user provider, see AVEVA Connect Settings.
    To configure Azure Active Directory user provider see Azure Active Directory Settings.

    See Authentication and Personalization topic to know more about Authentication Type.

12. Click **Save**.

    The created Enterprise Console is displayed in the Existing Enterprise Consoles section.

13. Click **OK**.
14. Click **Finish**.

Repeat the above steps to create one more Enterprise Console.

Note:
- If you want to update the authentication type to AVEVA Connect or Azure Active Directory of the already configured Enterprise Console, you need to reconfigure the AVEVA Connect and Azure Active Directory user providers for the respective Enterprise Console. For information on configuring user providers, see AVEVA Connect Settings and Azure Active Directory Settings.
- The Enterprise Console cannot be accessed in Chrome browser when configured with unsecured access (http://) for Azure Active Directory and AVEVA Connect authentication types.

Map or Un-map a Repository from an Existing Enterprise Console

To map a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Welcome to the AVEVA Work Tasks Configuration Wizard appears.

2. Click **Next**.
   The Edit AVEVA Work Tasks Farm Settings window is displayed.
3. Select **Service settings**.
4. Click **Next**.
   The Services/Global Settings page is displayed.
5. Click against Enterprise Console option.
   The Enterprise Console Settings page is displayed.
6. Select the existing Enterprise Console from Existing Enterprise Consoles section.
7. Select the required repository(s) to be mapped to the selected site.
   For example, select 'SPTest' and 'HCL-Roland-Repo' repositories using Ctrl key.
8. Click **Save**.
9. Click **OK**.
10. Click **Finish**.

To un-map a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.
   The Welcome to the AVEVA Work Tasks Configuration Wizard appears.
2. Click **Next**.
   The Edit AVEVA Work Tasks Farm Settings window is displayed.
3. Select **Service settings**.
4. Click **Next**.
   The Services/Global Settings page is displayed.
5. Click against Enterprise Console option.
   The Enterprise Console Settings page is displayed.
6. Select the existing Enterprise Console from **Existing Enterprise Consoles** section.
7. Deselect the repository(s) in the **Repositories** to un-map.
   This will un-map the selected repository from the selected Enterprise Console.
   You can select multiple repositories using the Ctrl or Shift keys.
8. Click **Save**.
9. Click **OK**.
10. Click **Finish**.

Edit Client Machines

You can configure the Client machine in the Farm Configuration Wizard.

To edit Client machines

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Welcome to the **AVEVA Work Tasks Farm** Configuration Wizard appears.

2. Click **Next**.

   The Edit **AVEVA Work Tasks** Farm Settings window appears.

3. Select **Service settings.**

   The **Enterprise Server settings** can be selected if the Farm Server Installation is using Enterprise Server Installation.

4. Click **Next**.

   The Services/Global Settings window appears.

5. Click against **Central Configuration** to edit the Central Configuration settings.

   The Central Configuration Settings page appears.

   - **http/https:** This option enables you to determine if you want a secured (https) or a non-secured site (http).
   - **Create at**: This field allows you to provide the Internet Information Service (IIS) path where the new site is created.
   - **Port Number**: This field is used to provide a port number for the Central Configuration.

6. Click against **Create at** to change the path of the Central Configuration. A message indicating that if the path is changed the Central Configuration will no longer be accessible appears.
7. Click **Yes**.

   The IIS structure screen is displayed.

8. Click **OK**.

To configure Enterprise Console on Client machines

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The Welcome to the **AVEVA Work Tasks** Configuration Wizard appears.

2. Click **Next**.

   The Edit **AVEVA Work Tasks** Farm Settings window appears.

3. Select **Service settings.**

   The **Enterprise Server settings** can be selected if the Farm Server Installation is using Enterprise Server Installation.

4. Click against Enterprise Console option.

   The settings for the selected Enterprise Console is displayed.

   To change port number of an Enterprise Console, select the required Enterprise Console entry in the Existing Enterprise Consoles table and modify the port number.

   - **New Website**: This field is used to provide the name of the Web site. Every Web site should have a unique name.
     - **http**: This option is to set the Web site as a non-secure site.
     - **https**: This option is to set the Web site as a secured site.
   - **Create at**: This field is used to provide the IIS path for installing the Web site.
   - **Internet Path**: This field is used to set the path for Internet users to access the Enterprise Console.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Intranet Path**: This field is used to set the path for Intranet users to access the Enterprise Console.
- **Repositories**: This field lists the Repositories mapped to the Enterprise Console.
- **Authentication Type**: This field is used to provide the authentication type required to access an Enterprise Console.
- **Existing Enterprise Consoles**: This field is used to list Enterprise Console already existing on the local machine.

5. Click **Save**.

Edit License Server Details

You can edit the license server details, such as license server name and port,

To edit License Server details

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click the **Farm Configuration Wizard.**

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** page appears.
3. In the **Edit AVEVA Work Tasks Farm Settings** window, select the **Configure License Server** check box.

   The **Configure License Server** dialog box appears.
4. In the **License Server Name** box, type the name of the AVEVA license server. If you have already configured the license server, then the name of configured license server is displayed.
5. In the **License Server Port** box, type the port number used by the AVEVA license server. Ensure that you enter a valid port number.
6. Click **Configure**.

   The confirmation messages appears in the **Configuration Messages** section, and the **Next** button is enabled.

   Note: AVEVA Work Tasks does not validate the license server details entered.
7. Click **Next**.

   The license server details are saved successfully.

Work with Enterprise Console List

The Enterprise Console List lists all the Enterprise Consoles mapped to repositories in the Central Configuration. This list enables easy access to the Enterprise Console. The columns in the list are Enterprise Console Name, URL and Mapped Repositories.

Note: EC plug-in is integrated with Email activity as part of the **Body** property, and the link gets embedded in the email body when you append it. When you click on the link in the email, it redirects you to the Enterprise Console List page.

To work with the Enterprise Console List

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **AVEVA Work Tasks** Central Configuration page appears.

2. Click **Enterprise Repository** from the Central Configuration home page.

   The Enterprise Console list appears.

3. Click on **Filter by repository name** to list Enterprise Consoles mapped to the selected repository.

Work with Central Configuration

The **Central Configuration** is a Web-based interface that you can use to define, create, and manage repositories for the workflows and execute them. The Central Configuration is setup on a computer with the Client installation. It can also be setup on a AVEVA Work Tasks Server.

The Farm Configuration Wizard is used to specify the location and settings for the Central Configuration. Only users who are part of the Administrators group and the AVEVA Work Tasks Admins group can logon to the Central Configuration.

Use the Central configuration to do the following:

- Create and manage data sources
- Create and manage repositories
- View the list of all the Enterprise Consoles mapped to repositories using the Enterprise Console List
- Manage Users
- View the list of User Providers mapped to a selected repository
- View the list of Enterprise Servers

Create a Repository DataSource

A **Repository DataSource** is used to store all repository related data. The **Repository DataSource** must be created on a machine where the **Central Configuration** site is installed.

Example

A TelematicsDataSource is created for TelematicsHR Repository.

A Repository contains Workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating the repository.

To create a Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**.

   The Central Configuration web page appears.

2. Click **DataSource Settings**.

   The Datasource List page appears.

3. Click **Add**.

   The Manage Datasource page appears.

4. Enter the required details.
   a. **Name**: Enter a valid data source name. Example: *TelematicsDataSource*.
   b. **Description**: Enter a description for the data source. Example: *This data source is used to store*

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

connection details.

c. **Connection String**: Select this option to establish a connection with the database. The connection string contains fields that that defines the connection. The connection information is encrypted and stored.

Server Name

To use a database on the local machine, enter "localhost", ".", or the local computer's name for the **Server Name**.

Note: Server Name can be machine name/IP address/SQL Server AlwaysON/SQL Server instance name. Instead of entering "local host", it is preferable to give the local machine name.

If the **Database Type** is **SQL Server**, then specify an IPV6/IPV4 address for the **Server Name**.
To use **SQL Server AlwaysOn Availability Groups**, enter the SQL AlwaysOn Group name or the IP address, and the port number (separated by comma). For example: *localhost,1455*
To use SQLExpress instance as a database instance of the repository database, the **Server Name** must be *<server name>\SQLExpress*.

Authentication Type

Use this field to determine the process to validate a user who is trying to connect to the database. AVEVA Work Tasks uses Windows and SQL Server authentication process. SQL Server authentication requires a user ID and a password already defined in the SQL Server database. The **User ID** and **Password** field is disabled if Windows Authentication is selected. Example: *Windows*

Advanced Settings

Use this field to define advanced connection settings like providing the time (in seconds) that a connection string must wait to connect to the database server before terminating the connection.
Example: *Connection Timeout = 20*
or
For defining maximum connections that can be opened in a connection pool.
Example: *max pool size = 250*
Default connection pool is set as 250. We recommend to enter a higher value on heavily loaded environment.
While creating a data source for a repository, use the following custom settings to set properties for the connection pool.
encrypt=true; enableltm=true; connectionretrywaittime=30; maxconnectionretries=10; sqlcommandtimeout=300;
encrypt: Ensures secure communication between AVEVA Work Tasks Server and SQL Server when a certificate is installed on the SQL Server for SSL encryption.
enableltm: AVEVA Work Tasks internally implements the light weight transaction mode by reusing the connection which is already open within the same transaction. With this implementation, a connection which is used from a transaction is returned back to the connection pool only when the transaction is completed. Since the same connection is used within the transaction, the transaction becoming distributed is reduced to a great extent. With this feature, AVEVA Work Tasks controls the transaction from escalating to an expensive distributed transaction.
The above property can be used to turn off this feature. The default value is set as *True*.
connectionretrywaittime: While opening a new connection, if the database server is not available, the default behavior is to retry for the connection. This setting can be used to set the wait time for retry for a new connection. The default value is 30 seconds. The value should be set in seconds.
maxconnectionretries: While opening a new connection, if the database server is not available, the default behavior is set to retry for a new connection. This setting can be used to set the retry count. The default value is infinite.
sqlcommandtimeout: Sets the wait time before terminating the attempt to execute a SQL command and

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

generating an error. The default value is set as 300.
These settings are case sensitive and should be mentioned only in lower case.

Database:

Specify or select a database that can be used as a repository database. This database stores all repository related data. The repository database is created if it does not exist on the database server instance.
Example: *TelematicsDB*

Enable Table Partitioning:

Select to enable database table partitioning. For more information, see Partitioning Database.

d. **Connection Provider**: Use this to provide connection related information from a Dynamic Link Library (dll). Connection related details are encrypted and stored in the library.

The selected dll must be copied to all the machines, all servers and all clients, that are connected to the current Farm.

Assembly Path

Click to browse and choose the required dll file.
To use custom properties (enableltm, connectionretrywaittime, maxconnectionretries, and sqlcommandtimeout) in the Assembly connection string, the database must be created before.
See *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Developer Guide* for creating the assembly. Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly.

5. Click **Test Connection** to ensure database connectivity.

   A message about successful test connection appears.

6. Click **OK**.

   A message about successful creation of the data source appears.The message also states that the required tables will be created in the data source after a repository is associated with the data source.

When a data source is saved, an entry is created for the data source in the **Farm Database**. When a first repository is created for the data source, AVEVA Work Tasks tables are added to the data source. While creating a data source, the archival database is created with the same database name suffixed by *_BI*. This database is used for archival in future use.

Note: After you configure the AVEVA Work Tasks, you must add the created **Farm Database** to the **SQL Server AlwaysOn Availability Groups**. Contact your Database Administrator to add the database to **SQL Server AlwaysOn Availability Groups**.

To view the data source created, click **DataSource Settings** link.

Manage Repository DataSource

You can use this option to modify an existing data source.

To modify Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The Central Configuration web page appears.

2. Click **DataSource Settings**.

   The Datasource List page appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. In the **DataSource** column, click the required data source to be modified.

   The Manage DataSource page appears.
4. Modify the required information related to the following fields in the connection string:
   - Authentication Type
   - User ID and Password
   - Advanced Settings
5. Click **Test Connection** to verify the database connectivity.

   If **SQL Server** authentication is used, enter the password again after clicking **Test Connection** and before clicking **OK**.
6. Click **OK**.

Create a Repository

A **Repository** contains workflow definitions, Queues, Calendars, Workflow execution data, and Business Activity Monitoring (BAM) data. The User Provider for the repository is also defined while creating a repository.

To create a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The Central Configuration page appears.
2. Click **Repository Settings**.

   The Repository List page appears.
3. Click **Add**.

   Note: If the number of repositories exceeds the permitted limit for the license, then the message "You have exceeded the maximum number of repositories" appears, and the repository creation is stopped. Click **Close**.

   The **Manage Repository** page appears.
4. Enter the required details.
5. Click **OK**.

   The **Config Administrator** page appears.
6. Click to configure an administrator.

   The User Lookup dialog box appears.
7. Select the provider from the provider drop-down list.
8. Enter the details to search the administrator for the repository that is created.

   Note: You can also search a user based on *ObjectSID* and *objectGUID* (applicable only for Active Directory provider).
9. Click **Search**.

   The user is listed under **Available Resources**.
10. Select and click the arrow to list the user under **Selected Resource**.
11. Click **Update**.

    The selected user is displayed in **User Lookup**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

12. Click **OK**.

    A message confirming the successful creation of an administrator appears.

13. Click **OK**.

    The **Repository List** page appears.

    For more information about configuring the system user, see Configure System User.

Manage Repository Window Fields

The following table explains the fields of the Manage Repository window:

Field Name	Description	Example
Repository DataSource	Lists all the data sources created in a Farm. The selected data source will be used to store data for the current repository.	TelematicsDatasource
Attach DataSource	Select Attach DataSource checkbox and then select a repository from the selected DataSource .Data associated with the selected repository will be copied to the new repository. The version of the installed product and destination DataSource should be the same as that of the DataSource from which the repository data is to be copied. For example, in an upgraded environment, from build Work Tasks version 1 to Work Tasks version 2, you cannot attach a DataSource created in build Work Tasks version 1 to build Work Tasks version 2. To match the build version of the installed product to the version of the DataSource: 1. If the DataSource was created in build Work Tasks version 1, then the entire build Work Tasks version 1 must be upgraded to Work Tasks version 2 by running the product installer in the upgrade mode.	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	2. All the Farm, DataSources, Repositories, and Lists of build Work Tasks version 1 must be upgraded to build Work Tasks version 2 by running the AVEVAWorkTasksUpgradeManager.exe located at the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder. 3. After upgrading all the AVEVA Work Tasks components to build Work Tasks version 2 build, that DataSource can be used in any machine that has same version by using this feature.	
Repository Name	Assign a name for the repository. Ensure that you do not use special characters other than **()-=[]{}|;,<>./!@$^`~** in the repository name.	Telematics Repository
Description	Provide a description for the repository.	This stores Telematics Employee Leave Details.
From mail	Email ID used by the email channel to send emails. We recommend to define the **From mail** and **Exception to mail** in a production environment. This will assist the process administrator to track any exception that might occur in the Workflow instance due to data mismatch or any configuration related issue. An email with exception details will be sent to the mail ID defined in **Exception to mail**. The From address of email channel mails continue to use the previously configured email ID, even after this property is edited and the repository is saved. To	Provide the valid email id that is specified in the **User Name** field while configuring **SMTP Settings** in the **Mail Server Settings** page. For more details, see Mail Server Setting.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	avoid this, restart the Workflow Engine Service and Communication Service.	
Exception to mail	Define an exception email ID. Exceptions generated by the Workflow Engine when an activity fails is sent to the email ID specified in **Exception to mail**.	Provide the valid email id.
Alert initiator of the Workflow	Determines if the status of a workflow should be sent as a notification mail to the initiator of the workflow.	A process with a rule to check the pending leave available for the employee exists. If this rule fails due to a data mismatch, the employee who submitted the leave application will receive an e-mail with details related to the exception as a notification.
Servers	Lists the servers available in the Farm. Repository will be available only to the mapped servers.	Work Tasks Server Name
Enterprise Consoles	Lists all the Enterprise Consoles for a selected AVEVA Work Tasks Server. Repository will be available only to the mapped Enterprise Console.	http://worktaskservername:8001/EnterpriseConsole
Enable Theme	Select this checkbox to enable the defined theme.	-
Theme Name	AVEVA Work Tasks supports themes that you can use to change the look and feel of the user interface. It provides **Default** and **Lite** themes.	-
Resource Provider	Lists the various default resource providers supported by AVEVA Work Tasks. Resource providers are also termed as User Provider. A User Provider is a data store containing information about the user. AVEVA Work Tasks also supports custom resource provider. For more information about	AVEVA Work Tasks Lists or Active Directory

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	Resource Provider, see User Providers. AVEVA Connect and Azure Active Directory resource providers are also available after you configure them. To configure these providers, see AVEVA Connect Settings and Azure Active Directory Settings. AVEVA Work Tasks allows secured LDAP configuration. The default port number for LDAPS is 636. You can map the repository in IDE and use the Secured LDAP. The logged-in Active Directory is displayed by default, and **Active Directory Datasource** expects **LDAP://** or **Fully Qualified Domain Name** as value.	
Custom Application Folder	Enter the names of the folders that contain the custom activities and custom resource providers. You must separate multiple folders with a semicolon.	-
Hide Repository	Select this option to make the repository unavailable to the Farm.	-
Source path	Enter the path to the Source Elements Folder.	-
Attachment Storage Path	Enter the path for storing attachments in the file system. **Note:** - The path specified should be an absolute path. - The default path is the **Attachments** folder in *C:\ProgramData\AVEVA Work Tasks*. - The default path is used when no path is specified. - Ensure appropriate rights are set to the folder, where attachments are stored, for the following identities:	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	-- The application pool identity for **Central Configuration** and **Enterprise Console(s)**. -- The account configured for the **Workflow Engine** service. - In case of mapped drives, ensure they are available to the identities. - In multiple-server environments, the path specified must be in a shared location.	
Auto Log Off Settings for Enterprise Console	Automatically logs out the logged in user after the designated period of inactivity. Enter the time in minutes. This field accepts only valid integer values between 0 to 360. 0 minute means the user will not get automatically logged off. The maximum time allowed is 360 minutes. In some cases there may be a slight time lag of few seconds which can be maximum of 10 seconds. The default value for automatic log off is 30 minutes. You use this field to define the log off time for all the providers of a particular repository. If you have administrator rights to a repository, you can also set separate log off time manually for each provider. For more information about manually setting the auto log off time at the provider level, see Configuring the Definition XML.	0 to 360 (minutes)
Auto Log Off Settings for AVEVA Work Tasks Pro	Request for user credentials for AVEVA Work Tasks Pro app after the set time is elapsed. Enter the time in minutes. This field accepts only valid integer values	0 to 2880 (in minutes)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	between 0 to 2880. 0 minute means the user will not get automatically logged off. The default value is 30 minutes. If AVEVA Work Tasks Pro app is offline, the Auto Log Off will not get active, and the user will not be automatically logged off as per the defined settings.	
Offline Support	Select this option to enable offline submission of items in AVEVA Work Tasks Pro app.	-
Refresh on Work Item submission	Select this option to enable Inbox refresh on Work Item submission in AVEVA Work Tasks Pro . Refresh option is enabled by default.	-
Timeout	Enter the time in seconds to set the timeout. If the value is set as 0, then there is no timeout. Default value is 60 seconds.	-
Label for Fill Form	Enter the label for Fill Form. The customized label will be displayed for the Fill Form in AVEVA Work Tasks Pro.	Work Tasks
Date Configuration Flag for Alternate Actors	Select the **Enable Date Settings** option to set the **From** date and **To** date as mandatory while creating alternate actors. For more information about creating alternate actors, see *Alternate Actors* topic in the *User Guide*.	-
Display Domain name with User Name	Select this checkbox to display the domain name along with the user name in the Enterprise Console and the List. The domain name will be displayed only:	-

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description	Example
	• If this checkbox is selected. • If the **Resource Provider** is selected as **Active Directory**.	

User Providers

AVEVA Work Tasks supports the following User Providers by default:

Active Directory

When you select **Active Directory** as the **Resource Provider**, details such as **Active Directory datasource** and the **Active Directory search base** are populated by default.

Authentication User, **Authentication Password**, **User Log-on ID**, and **User Log-on Display Name** are optional fields. Access to the active directory might not be available for all users. In such cases, provide the active directory authentication user name and the active directory authentication password with which you can connect to the Active Directory.

AVEVA Work Tasks considers *SAM-Account-Name* as **User Log-on ID** by default. If you want to use active directory attributes other than the *SAM-Account-Name* user, then enter the desired active directory attribute details in the **User Log-on ID** field and **User Log-on Display Name** field. **User Log-on Display Name** is the user friendly display name of the active directory attribute. This **User Log-on Display Name** is referred in the User Lookup dialog box against the **User Log-on ID**.

Steps

1. When you select **Active Directory** as the **Resource Provider**, then the **Use Token Service** field appears. In this field, select one of the following:
   - If you do not want to use AIM authentication, select **Without Token Service**.
   - If you want to use AIM authentication, then select a server from the list of alias server names.
2. Enter **Active Directory datasource**.
3. Enter **Active Directory search base**.
4. Enter **Domain Name**.

   The domain name is case-sensitive.
5. Enter **Authentication User**.
6. Enter **Authentication Password**.
7. Check **Is Cross Domain Role Provider** checkbox, if cross domain users and roles mapping is required.

   Example: Users *John* and *Jim* of domain *TelematicsU* and users *Mike* and *Bob* from domain *TelematicsAU* are added to role Team HR of domain *TelematicsMain*.
8. Enter **User Log-on ID** if you want to use another Active Directory attributes instead of *SAM-Account-Name*.

   We recommend to use attributes of type *string* as input for **User Log-on ID.** However, *ObjectSID* and *objectGUID* are also supported.

   After you set the **User Log-on ID**, you cannot change it later.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Enter the **User Log-on Display Name**.

   After you set the **User Log-on Display Name**, you cannot change it later.

   This is the default display name of the user account of the active directory user used. **User Log-on Display Name** is used in user lookups.

10. Click **Test LDAP**.

    A message about successful LDAP test appears.

Note:
- Some of the active directory attributes or properties are not indexed. If you use an active directory attribute that is not indexed, it might impact the log-on validation performance based on the active directory entries. We recommend to use indexed attributes as **User Log-on ID** or index the attributes.
- For an upgraded repository, you cannot change both **User Log-on ID** and **User Log-on Display Name**.
- You cannot localize **User Log-on ID** and **User log-on Display Name** fields.
- Disabled users will not be shown in user lookup search.

Using Forms

For Forms Resource Provider:

- If the selected repository data source is of type SQL Server, then Forms provider is of type SQL Server database.

1. In the **Resource Provider** drop-down list**,** select **Forms.**
2. In the **User Entity properties** field, enter XML data.

   Click **Sample Code** to get the XML Schema Template.

   Example

   ```
   <properties>
   <property name="userid" type="string" purpose="identifier" />
   <property name="username" type="string" purpose="name" />
   <property name="pwd" type="string" purpose="password" />
   </properties>
   ```

3. In the **User Provider Properties** field, enter the same XML Schema.

   There must be at least one identifier in the XML Schema. For example, UserID

4. In the **Datasource** field, enter a valid data source or specify a dll.

   The value for the data source can be specified as **Physical path of the dll** or **Physical path of the dll::param. Param** is not mandatory.

   See topic *Implementation of IDBConnectionString Interface* under *Data source Related Code Samples* sub-chapter in the *Build Business Process* section for creating the assembly.

   Ensure that there is only one class implementing *IDBConnectionString* interface within this assembly, whereas one class can return multiple connection strings.

   Examples of data source parameter:

   - c:\DLLStore\GetConnectionString.dll
   - c:\GetConnectionString.dll::Leave

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If there are two data sources, *Leave* and *Licensing*, and only one DLL is used to return a connection string based on the data source selected. The parameter can be specified as **c:\GetConnectionString.dll::Leave** or **c:\ GetConnectionString.dll::Licensing**. The connection string can be returned from the connection dll based on this parameter.

5. Enter a proper table name or view name which holds the User Name and Password for the Authentication purpose.

   Example: Passmast (the table which is available in IMS_NEW Database)

6. Click **Test SQL Connection**.

   A message about successful test connection appears.

Using ASP.NET Membership

This resource provider lists users defined in the asp.net membership database.

Lists

This resource provider lists users created using AVEVA Work Tasks Users Creation. If you are unable to determine a User Provider to create a repository, use AVEVA Work Tasks Lists.

To verify successful creation of the Repository:

1. Click **Enterprise Console** URL from the site path column.

   The repository created is listed.

   Add the created Enterprise Console link into "Add to Favorites" to easily navigate in future.

2. Click **Repository User Provider** link to logon to the repository.

   The Enterprise Console log-on page appears.

3. Enter the logon details, and then click **Login**.

   The Enterprise Console home page appears. This indicates successful creation of a Repository.

   All features can only be available for a user with administrative privileges.

Note: Consider you created the Repository and then deleted it. If you create the same Repository again immediately and try to log into it through Enterprise Console, the Provider does not list the Repository. You need to access IIS and recycle AVEVA Work Tasks from the Application Pool to get the Repository listed in the Provider list..

Configure Administrator User

You can configure a user account as an administrator. It is mandatory to configure a user account with administrative privileges after creating a AVEVA Work Tasks repository. The configured user account for a repository has full rights on the repository whereas the other users have limited rights. The configured user can control the security of the repository.

After a repository is created, the Central Configuration page appears:

By default, the administrator account for the selected User Provider will be populated in the drop down box.

Example

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If a Repository is mapped to the AVEVA Work Tasks List user provider then user [AVEVA Work Tasks List] will be populated, where user is an administrator in the List. Similarly, if the Repository is mapped to Active Directory user provider then Administrator [activedirectory] will be populated.

To configure a user as an Administrator

1. Click the user lookup icon.

   The User Lookup screen appears.
2. Enter the **User Name** in the **Search For** box.
3. Select **All Provider** from the **User-based Advanced Search-in Provider** field.
4. Click **Search**.

   The user is listed in the **Available Resources** box.

   If a resource is not found in the user provider, the message *No resources found* appears.
5. Select the user name from the **Available Resources** box and click the arrow mark to add the resource to the **Selected Resource** box.

   To add multiple users, select the multiple users from the **Available Resources** box, and then click the appropriate arrow mark.

   To remove a resource from the **Selected Resources** box, select the resource, and then click the appropriate arrow mark.

   To remove multiple resources from the **Selected Resources** box, select the multiple resources, and then click the appropriate arrow mark.
6. Select the user from the **Selected Resources** box and click **Update**.

   The user account appears in the **User Lookup** box.

   This user account will be configured as an administrator.
7. Click **OK** to configure the selected user as an admin user.

Configure System User

A system user is used by a File Watcher event for alerting workflows. Events for File Watcher are received without user context and uses the system user context while alerting workflows. The system user profile requires administrator level rights and can be re-configured at any time.

The File Watcher workflows fails if the system user configurations are invalid.

To configure a user as a System user

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click Central Configuration.

   The Central Configuration page appears.
2. In the **Central Configuration** page, click **Repository Settings**.

   The Repository List page appears.
3. On the **System User** column, click **Configure Now** against the required repository name.

   The Configure System User page appears.
4. Click the user lookup icon.

   The User Lookup dialog box appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Enter the user name in the **Search For** box.
6. From the drop down box, select a proper classification for the user name.
7. Select the required provider from the drop-down field, and enter the user name in the **Search For** box.
8. From the drop down box, select a proper classification for the user name.
9. Click **Search For**.

   The user is listed in the **Available Resources** box.

   A message about unable to find resources appears if the resource is not found in the user provider.
10. Select the user name from the **Available Resources** box and add the resource to the **Selected Resource** box.

    You can add or delete one or more users at the same time.
11. Select the user from the **Selected Resource** box, and then click **Update**.

    The user account appears in the **User Lookup** box. This user account is configured as an administrator.
12. Click **OK** to configure the selected user as a system user.

Configure Exception Mail Templates

You can configure the exception mail templates at the repository level.

There are two options to configure exception emails.

- You can configure exception mail templates for two groups, Group A and Group B, both at the workflow level. Do one of the following:
  - Select an existing default or sample template
  - Use an editor

    Based on the exception mail configuration, the members of each group will receive mails. There must be a notification to the users about the exception occurred in an activity. These users and the template for the exception mails can be configured in the **Configuration for Exception Mail Template** settings in the **Central Configuration**.
- You can configure exception mail templates for two groups, Group A and Group B, both at the repository level.

  It is not mandatory to set both user groups A and B.

  For example, you can configure *administrator* users in Group A and *normal* users can be configured in Group B.

  Do one of the following:
  - Select an existing default or sample template
  - Use an editor

    Based on the exception mail configuration, the members of each group will receive mails.

    Place the template file in the **..\WorkflowElements\ExceptionTemplate** folder. In the template file, place the placeholders in the html file.

To configure Exception Mail Template

1. Select the repository from the **Repository Name** drop-down list.
   a. You can configure users in the User Lookup dialog box or the Role Lookup dialog box.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

By default, the User is selected.

i. Click the **User Lookup** icon.
ii. The User Lookup dialog box appears.
iii. Select the required provider from the drop-down field.
iv. Enter the name of the user in the **Search For** field.
v. Select the **Display Name** from the drop-down list.
vi. Click **Search**.
vii. All the users are listed in the **Available Resources** section.
viii. Select the required user and click the right arrow to display the users in the **Selected Resource** section.
ix. Click **Update**.

b. To configure a user through **Role Lookup**, select the Role radio button.
   i. Enter the name of the required user, and click **Search**.
      All the users are listed in the **Available Resources** section.
   ii. Select the required user and click the right arrow to display the users in the **Selected Resource** section.
   iii. Click **Update**.

The user's name (either User or Role) appears in the **Exception Mail Group A** field.

2. Select the template from the **Template File** drop down list.
   You can select either a **Default** template or a **Sample** template.
3. Follow the same steps to select a User or Role and a template for the **Exception Mail Group B**.
4. Click **OK**.

Change Pool Size of Repository DataSource Connection Settings

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The Central Configuration page appears.
2. Click **DataSource Settings**.
   The DataSource List page appears.
3. Click the required data source to be modified.
   The Manage DataSource page appears.
4. Enter the pool size settings in the **Advanced Settings** field of the **Connection String** option.
5. Click **Test Connection**.
6. Click **OK**.
   The pool size of the **Repository DataSource** connection is changed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Change Password of SQL Server User Credentials Used to Connect to Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The Central Configuration page appears.
2. Click **DataSource Settings**.
   The DataSource List page appears.
3. Click the required data source to be modified.
   The Manage DataSource page appears.
4. Modify the **User ID** and **Password** field in the **Connection String** option.
5. Click **OK**.
   The password of SQL Server user credentials are changed.
6. Stop the following AVEVA Work Tasks services:
   a. Client Service
   b. Workflow Engine
   c. Task Scheduler
   d. Communication Service
   e. Mobile Notification Service
7. In an Enterprise Server system, ensure to stop the **Advance Server Service**.
8. In a client computer, ensure to stop the **Client service**.
9. In a client machine which is connected to an Enterprise Server, ensure to stop the **Advance Server Service** and **Client Service**.
10. Close all the AVEVA Work Tasks related sites and applications.
11. To stop IIS, run **Command Prompt** as an **Administrator**, and type **iisreset /stop**.
12. Delete the *WorkflowManagementTemp* folder from *C:\Windows\Temp*.
13. Delete the AVEVA Work Tasks Cache files and folders from *C:\Windows\Microsoft.NET\Framework64\v4.0.XXXXX\Temporary ASP.NET Files*.
14. Start the AVEVA Work Tasks related services.
15. To start IIS, run **Command Prompt** as an **Administrator**, and type **iisreset /start**.
16. Click **OK**.

Map or Un-map a Repository from Servers and Enterprise Consoles

To map a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The Central Configuration page appears.
2. Click **Repository Settings**.
   The Repository List page appears.
3. Click the repository that you want to map.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. In the **Servers Mapped** section, do the following:
   a. Select the server to be mapped from the **Servers** list.
   b. Select an Enterprise Console to be mapped from the **Enterprise Consoles** list.
5. Click **OK**.
   The selected repository is mapped to the select server.

To un-map a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The Central Configuration page appears.
2. Click **Repository Settings**.
   The Repository List page appears.
3. Click the repository for which you want to remove the mapping.
4. In the **Servers Mapped** section, do the following:
   a. Press **Ctrl** and click the required server in the **Servers** list.
   b. Press **Ctrl** and click the required Enterprise Console to be unmapped from the **Enterprise Consoles** list.

Hide or Unhide Repository

Use the **Hide Repository** to make the Repository unavailable to the Farm. You can make the repository available again by selecting the **Unhide** option.

To hide a Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The Central Configuration page appears.
2. Click **Repository Settings**.
   The Repository List page appears.
3. Select the check box against the repository that you want to hide.
4. On the **Select Actions** drop down list, select **Hide**.
5. Click **Go** to update the changes.
   The selected repository is hidden.

To unhide a hidden repository:

1. Go to the Repository List page.
2. Select the check box against the repository that you want to show.
3. Select **Unhide** from the **Select Actions** drop down list.
4. Click **Go**.
   The hidden repository appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Delete Repository

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The Central Configuration page appears.
2. Click **Repository Settings.**
   The Repository List page appears.
3. Select the box against the repository that you want to delete.
4. Click **Delete Repository**.
   A message confirming the deletion appears.
5. Click **OK**.
   The selected repository is deleted.

Delete Repository DataSource

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The Central Configuration page appears.
2. Click **DataSource Settings**.
   The DataSource List page appears.
3. Select the box against the data source that you want to delete.
4. Click **Delete**.
   A confirmation message about deleting the data source appears.
5. Click **OK**.

If the selected data sources are mapped to one or more repositories, you must delete all the repositories associated with the selected data sources before deleting the data sources.

Diagnostics

The **Diagnostics** feature allows you to run the diagnostics tests and determine if AVEVA Work Tasks is functioning properly.

You can select the services and run the diagnostics test to know the status of the selected services. The status of the selected services is displayed in the Logs section of the Diagnostics page. You can also filter the logs based on Pass or Fail status of the services, export the Logs, and maximize the Logs view.

You can select the Log levels to display the relevant messages. The following Log levels are available:

Level 1: This level shows minimal information in the Logs section. The Logs section displays information related to the start and end of a workflow. Error messages are also shown in this mode.

Level 2: This level provides detailed information of background activities. It will show all the messages logged from the actions.

Level 3: This level displays messages indicating whether an action is executed.

The following services can be diagnosed to check their availability in AVEVA Work Tasks:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Mobile Notification Service**: Tests whether Mobile Notification Service is running.
- **Azure Service Bus Relay**: Tests whether Azure Service Bus Relay is configured and the response is received from Http Web Request.
- **Message Broker (amqp/amqps)**: Tests whether the repository is provisioned and the Message Broker (amqp/amqps) exist in the repository.
- **Quickflow**: Tests whether Quickflow is deployed, AMQP protocol is validated on the Message Broker, and Quickflow Host is connected.
- **Service Communication**: Tests whether Enterprise Server service and all the AVEVA Work Tasks services are running.

To run the diagnostics test

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, point to **Work Tasks**, and then **Central Configuration**.

   The AVEVA Work Tasks **Central Configuration** page appears.
2. Click **Diagnostics Settings**.

   The **Diagnostics** page appears.
3. Select the check box against the items for which you want to run the diagnostics tests and then click **Test** button.

   After the diagnostic test is complete, the status of the selected items appears in the **Logs** section of the **Diagnostics** page.

To reset IIS

After you change the log level, click the **Reset IIS** button in the **Diagnostics** page to reset IIS and update the log level. On IIS reset all the AVEVA Work Tasks sites will get restarted.

To restart all services

After you change the log level, click **Restart Service** button in the **Diagnostics** page to restart all the AVEVA Work Tasks services and update the log level.

Note: If you modify the log level, ensure to restart services and reset IIS to update the log level.

Mail Server Setting

The **Mail Server Settings** web page allows you to configure SMTP server and POP3 server to send and receive emails from the workflow.

Note: Configuring the mail host with a valid username and password is mandatory. Sending emails anonymously is not supported, so provide the valid username and password for Basic authentication while configuring SMTP server and POP3 server.

SMTP Settings

The SMTP settings specified here are the default settings used by AVEVA Work Tasks. These settings are used to send notifications in the form of emails. The email settings can also be specified at the Repository level.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Exchange Server configured On Premises	Office 365 - Exchange Online
Host	Enter the name or IP address of the mail host.	Enter the name for the Exchange Online server, as **smtp.office365.com**.
Port	Enter the port number for sending e-mails. The default port is 25.	Enter the port number for sending e-mails. Ensure that you specify the value for port number as **587**.
Email Timeout	Enter timeout for e-mails in seconds. The default timeout is 10000.	Enter timeout for e-mails in seconds. The default timeout is 10000.
Is SSL Enabled?	This field is used to define if the e-mail has to be secured by SSL before it is sent. The default value is **False**.	This field is used to define if the e-mail has to be secured by SSL before it is sent. Ensure that the value is always set to **True**.
Authentication	This field is used to select the authentication type - **Basic** or **OAuth2**.	This field is used to select the authentication type - **Basic** or **OAuth2**.

For **Basic Authentication**, provide details in the below fields:

Note: Sending emails anonymously is not supported, so provide the valid username (valid email address) and password for **Basic** authentication.

Field Name	Description
User Name	Enter the user name for logging in to the mail server. Ensure that the user account is an Office 365 account with "administrator" privileges.
Password	Enter the password.
Exception From Email	Enter the e-mail Id that will be used to send exceptions which occurred during workflow execution. **Note**: Provide the valid email id that is specified for the **User Name** field.
Exception To Email	Enter the e-mail Id to which the emails detailing exceptions in the workflow execution must be sent.

For **OAuth2 Authentication** (See Configure OAuth2 to Access Google Account to get the values for the below fields)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Field Name	Description
OAuth2 Token URI	This field is used to specify the OAuth token URI.
Authorization Code URI	This field is used to specify the authorization code URI.
Client Id	This field is used to specify the client Id.
Client Secret	This field is used to specify the client secret.
Redirection URI	This field is used to specify the redirection URI.
OAuth2 Scope	This field is used to specify the OAuth2 Scope.
Token Refresh	This field is used to specify the time in Day.Hour:Minute.Second to refresh the token.

POP3 Settings

The Mail Server settings identify the mail server to be used by the Work Tasks communication service for receiving e-mails.

Note: Sending emails anonymously is not supported, so provide the valid username (valid email address) and password for **Basic** authentication.

Server	**Field Name**	**Description**
Default	This option is selected to make Work Tasks communication server act as a mail server and process all emails received.	
	Server IP	This field is used to provide the IP address of the Work Tasks communication server.
	Server Port	This field is used to enter the Port number used by the Work Tasks communication server. The default port is 25.
POP3	This option is selected to setup POP3 mail servers.	
	POP3 Host	This field is used to enter the IP address of the POP Mail Host.
	POP3 Time Interval	This field is used to set the time interval to check the mail server for emails. The format for this field is day.hour.minute.seconds. The default POP time is 0.00:00:15.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Server	Field Name	Description
	POP3 Port	This field is used to enter the port number for receiving emails. The default POP Mail Port is 110.
	Is SSL Enabled?	This field is used to specify if a Secure Password Authentication is provided. Default value is false.
	For Basic Authentication	
	Add Users	The table is used to enter the **User Name** (valid email address) and **Password** of POP3 users. The Communication Engine makes use of this email address. To add another user, click **Add User**.
	For OAuth2 Authentication (See Configure OAuth2 to Access Google Account to get the values for the below fields)	
	User Account	This field is used to specify the email of the user.
	OAuth2 Token URI	This field is used to specify the OAuth token URI.
	Authorization Code URI	This field is used to specify the authorization code URI.
	Client Id	This field is used to specify the client Id.
	Client Secret	This field is used to specify the client secret.
	Redirection URI	This field is used to specify the redirection URI.
	OAuth2 Scope	This field is used to specify the OAuth2 Scope.
	Token Refresh	This field is used to specify the time in Day.Hour:Minute.Second to refresh the token.

In case of **Default**, the Work Tasks communication server will act as a mail server and process all emails received. The user should configure the **Server IP** and **Server Port** of the mail server.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If POP3 is not enabled in a mail server, then **Default** option can be used for getting the emails.

Note: In an Enterprise Server environment, you must create a machine specific email account for all the engines. The mails should be forwarded to all the engines.

Configuring SMTP Settings

The SMTP Server settings identify the mail server to be used by the Work Tasks communication service for sending e-mails. You can configure the SMTP server using Central Configuration.

To configure SMTP Server with OAuth2 authentication, you need to provide the following OAuth2 authorization details:

- User Account
- OAuth2 Token URI
- Authorization Code URI
- Client Id
- Client Secret
- Redirection URI
- OAuth2 Scope
- Token Refresh

An example of Google account is considered to explain how to get the OAuth2 authorization details. For more information on configuring OAuth2 details, see Configure OAuth2 to Access Google Account.

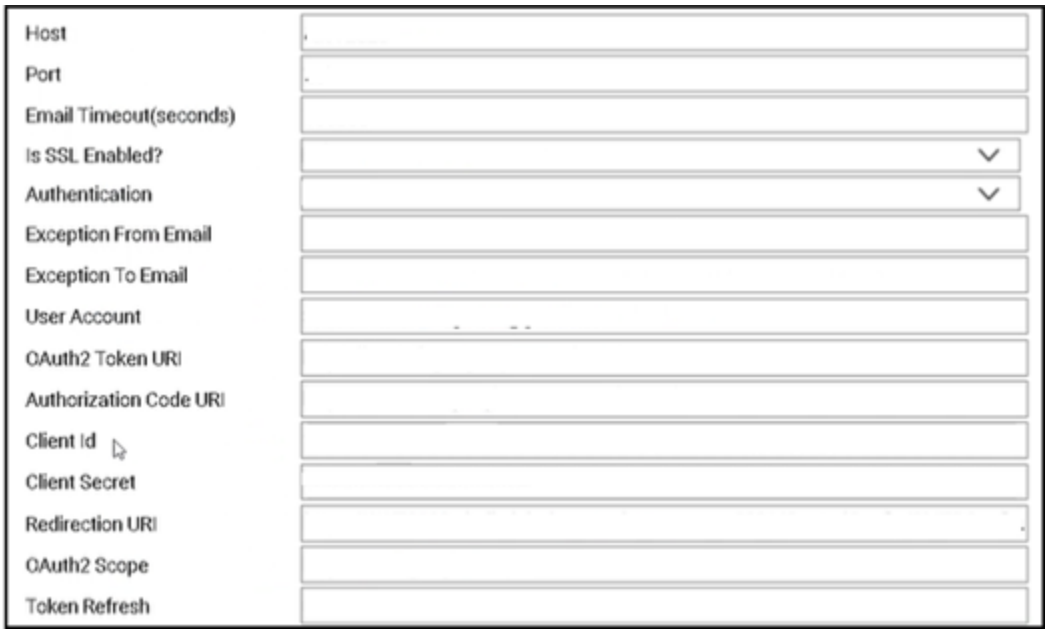
To configure SMTP Server

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The Central Configuration web page appears.
2. Click **Mail Server Settings**.
3. Select **SMTP Settings** tab.
   The **Manage SMTP Settings** page appears.
4. In the **Host** box, enter the SMTP server name.
5. In the **Port** box, enter the SMTP server port.
6. In the **Email Timeout** box, enter the timeout for emails in seconds.
7. For **Is SSL Enabled?** field, select **True** for secured password authentication.
8. For **Authentication** field, select either **Basic** or **Oauth2**.
   a. For **Basic** authentication, provide the **Username** and **Password** for accessing the SMTP mail server. Also, provide e-mail address in **Exception From Email** and **Exception To Email**. Click **Save** button to save the configuration.

      Note: Configuring the mail host with a valid username and password is mandatory. Sending emails anonymously is not supported, so provide the valid username and password.

   b. For **Oauth2** authentication, provide details in the fields shown in the screen below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



See **step 8** mentioned in Configure OAuth2 to Access Google Account to get the values for **OAuth2 Token URI**, **Authorization Code URI**, **Client Id**, **Client Secret**, and **Redirect URI** fields.

Provide the URL *http://<MachineName>:8000/CentralConfig/SMTPConfig.aspx* in **Redirect URI** field to configure SMTP server.

c. Click **Get Access Token** to get the access token. You are navigated to your mail account. For example, Google account is considered here.

d. Click **Continue** for verification and to provide access to your Google account to get the access token.

Configure POP3 Settings

You can access the Central Configuration to configure Mail server with POP3 and fetch emails from the configured POP3 server.

To configure Mail Server with POP3 and OAuth2 authentication, you need to provide the following OAuth2 authorization details:

- User Account
- OAuth2 Token URI
- Authorization Code URI
- Client Id
- Client Secret
- Redirection URI
- OAuth2 Scope
- Token Refresh

An example of Google account is considered to explain how to get the OAuth2 authorization details. For more information on configuring OAuth2 details, see Configure OAuth2 to Access Google Account.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To configure POP3 Mail Server

1. On the **Windows Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The Central Configuration web page appears.
2. Click **Mail Server Settings**.
3. Select **POP3 Settings** tab.

   The **Manage Mail Server Settings** page appears.
4. From the **Mail Server Configuration** drop-down, select either
   - **Default**: Provide **Server IP**, **Server Port** and then click **Save** button to save the changes.
   - **POP3**: Provide **POP3 Host**, **POP3 Port**, and **POP3 Time Interval**.

     There are two types of authentication available for POP3:

     Note: It is recommended to use **OAuth2** authentication. Support for **Basic** authentication varies by provider, so please review the provider's documentation before proceeding with its use.

   a. For **Basic** authentication, click **Add Users** to add **Username** and **Password**. Click **Save** button to save the configuration.

      Note: Configuring the mail host with a valid username and password is mandatory. Sending emails anonymously is not supported, so provide the valid username and password..

   b. For **Oauth2** authentication, provide details in the fields shown in the screen below:

   See **step 8** mentioned in Configure OAuth2 to Access Google Account to get the values for **OAuth2 Token URI**, **Authorization Code URI**, **Client Id**, **Client Secret**, and **Redirect URI** fields.

   Provide the URL *http://<MachineName>:8000/CentralConfig/ConfigMailServer.aspx* in **Redirect URI** field to configure POP3 server.

   c. Click **Get Access Token** to get the access token. You are navigated to your mail account. For example, Google account is considered here.

   d. Click **Continue** for verification and to provide access to your Google account to get the access token.

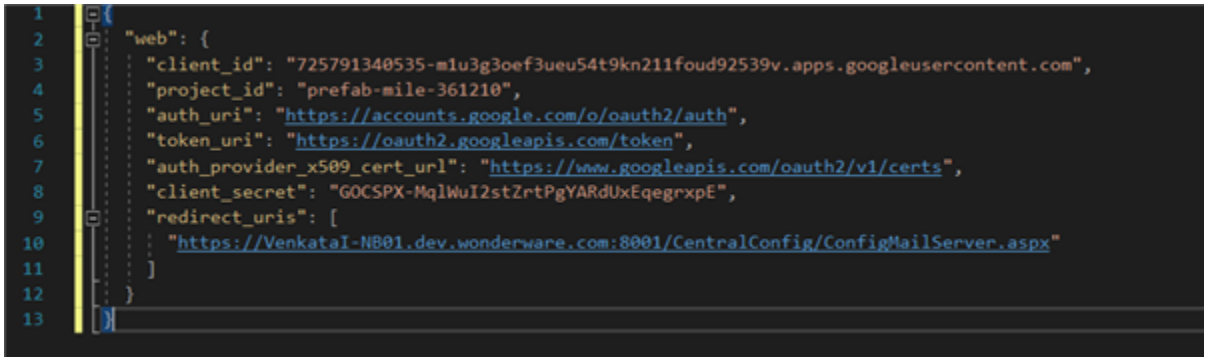
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configure OAuth2 to Access Google Account

You can use OAuth2 authentication to access mail servers (SMTP and POP3) to send and receive the emails from the configured SMTP and POP3 servers using Google account.

To configure OAuth2 details to access Google account

1. Browse the link https://console.cloud.google.com/apis/credentials and create a New Project.
2. Select **OAuth consent screen** option from the left pane and provide **App information**, **Domain**, and **Developer contact information**.
3. Provide **Authorised domains** and **Developer contact information**.
4. To manually add or remove scopes, access link https://mail.google.com/. Click **ADD TO TABLE** and then click **UPDATE**.
5. To add users, click **ADD USERS**, provide user email id, and then click **SAVE AND CONTINUE**.
6. Select **Credentials** option from the left pane and update **Authorized redirect URIs**.
7. Download OAuth Client JSON file.
8. Open downloaded JSON file.



9. Update **OAuth Token URI**, **Authorization Code URI**, **Client Id**, **Client Secret**, **Redirection URI** from the downloaded JSON file.

   OAuth Scope is as configured in https://mail.google.com/
10. Refresh Interval as **0.01:00:00**.
11. Click **Save** button to save the configuration.

Configure OAuth2 to Access O365 Account

You can use OAuth2 authentication to access mail servers (SMTP and POP3) to send and receive the emails from the configured SMTP and POP3 servers using O365 account.

Following are the steps to configure Oauth2 to access O365 account:

1. Create an Azure AD Tenant Account and purchase services from Microsoft 365

1. Access Microsoft Azure portal to create Azure AD Tenant account.
2. Purchase services from Microsoft 365.
3. Navigate to **Users > Active users** to check if you are listed under **Active users**.
4. Make sure the active user has the Mailbox permission. Also, the licences and apps permissions are activated

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

for the user.

5. Select **Mail** tab for the selected active user, select **Manage Email apps**, and then select the **Authenticated SMTP** option.

2. Register Exchange Online in the Azure Portal

For more information, refer to https://documentation.commvault.com/v11/essential/93448_registering_exchange_online_with_azure.html

1. Log on to the Azure portal (https://portal.azure.com/) using your global administrator account.
2. Go to Azure Active Directory.
3. In the navigation pane, click **App registrations**.

   The **App registrations** page appears.
4. Click **New registration**.

   The **Register an application** screen appears.
5. In the **Name** box, type a name for the app.
6. Under **Supported account** types, select **Accounts in this organizational directory only** (tenant_prefix - Single tenant).
7. To verify the status of the app and to authorize the app from the Command Center, under **Redirect URI**, enter the Command Center URL.
8. For example, enter https://host_name.domainname.com/commandcenter.
9. Click **Register**.
10. Copy and paste the following values in a document that you can access later:
    - Application ID
    - Directory ID

    Note: You will enter these values in the Commvault software when you complete the Office 365 guided setup.

3. Request and Grant Permissions for Azure APIs for Azure Apps

1. In the navigation pane, click **API permissions**.
2. Click **Add a permission**.
3. Click **Microsoft Graph** and complete the following steps:
   a. Click **Application permissions**.
   b. Select the following permissions:
      a. Group.Read.All
      b. SMTP.Send
      c. User.Read
   c. Click **Add permissions**.
4. On the app **API permissions** page, click **Add a permission**.
5. Click **APIs my organization uses** and complete the following steps:
   a. On the search bar, type **Office 365 Exchange Online**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

b. Select **Office 365 Exchange Online**, and then click **Application permissions**.
c. Select the following permissions:
    a. Group.Read.All
    b. SMTP.Send
    c. User.Read
d. Click **Add permissions**.

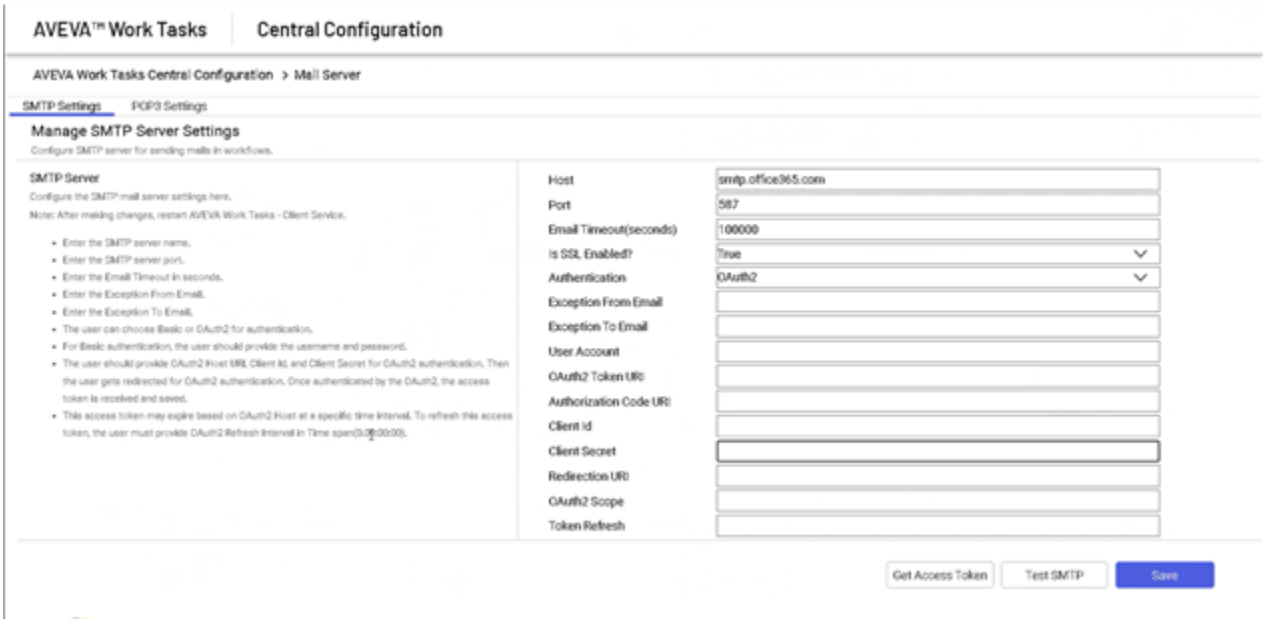
6. On the app **API permissions** page, click **Grant admin consent** for tenant_name.

4. Create a Client Secret

1. In the navigation pane, click **Certificates & secrets**.
   The **Certificates & secrets** page appears.
2. Click **New client secret**.
   The **Add a client secret** dialog box appears.
3. Enter a description, and then select the maximum value.
4. Click **Add**.
5. Copy and paste the client secret value in a document that you can access later.

5. Register Oauth2 in the CentralConfig Site

Access the Central Configuration site and navigate to **Mail Server** > **SMTP Settings** to register Oauth2..



View the Enterprise Servers List

You can view the list of servers that are running in Enterprise Server mode and the CPU performance for these servers.

The Enterprise Servers List node is available only when the Enterprise Server license is activated for the product.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The Central Configuration page appears.
2. Click **Enterprise Servers List**.

   The **View Enterprise Servers List** page appears.

   The list displays the following details:
   - **Host Name**: Displays the server name which is configured to work in the Enterprise Server mode.
   - **CPU Utilization (%)**: Displays the CPU utilization of the Enterprise Server in percentage.
   - **CPU Level**: Displays the CPU Level of the Enterprise Server. The level of CPU depends on the CPU usage. It can show the following values:
     - **Idle**: When the CPU utilization ranges from 0 to10.
     - **Normal**: When the CPU utilization ranges from 10 to 50.
     - **Overloaded**: When the CPU utilization is above 50.
     - **Down**: When the Enterprise Server is unable to communicate within the Heartbeat timeout.
   - **Registered Date Time**: Displays the date and time when the server was registered to work in the Enterprise Server mode.
   - **Last Updated Date Time**: Displays the last date and time when the request was received from the server.
   - **Is Server**: Displays whether the machine is a server.
   - **Service List**: Displays the list of services running on the server in the Enterprise Server mode. It can show the following list of services:
     - Task Scheduler Service as TS
     - Communication Service as CS
     - Workflow Engine Service as WS
     - Mobile Notification Service as MN

- **Engine Authority Server**: Displays which server acts as an Authority server for Workflow Engine.
- **Engine Least Used Server**: Displays which server acts as the Least Used server for Workflow Engine.

Configuring and Registering Token Service

You can manage AIM token configuration using:

- Configurator tool
- AVEVA Work Tasks Central Configuration

For Enterprise Console logout to function,

1. Configure SMS on a Web Server.

   To configure SMS, select the option '**This machine is the System Management Server**' in the **Configurator** window.
2. Token service should point to the machine where SMS is configured.

   To do this, navigate to **Central Configuration** > **Token Service Settings** page and for the *servername* in the **Token Service URL** field, provide the machine name where SMS is configured.

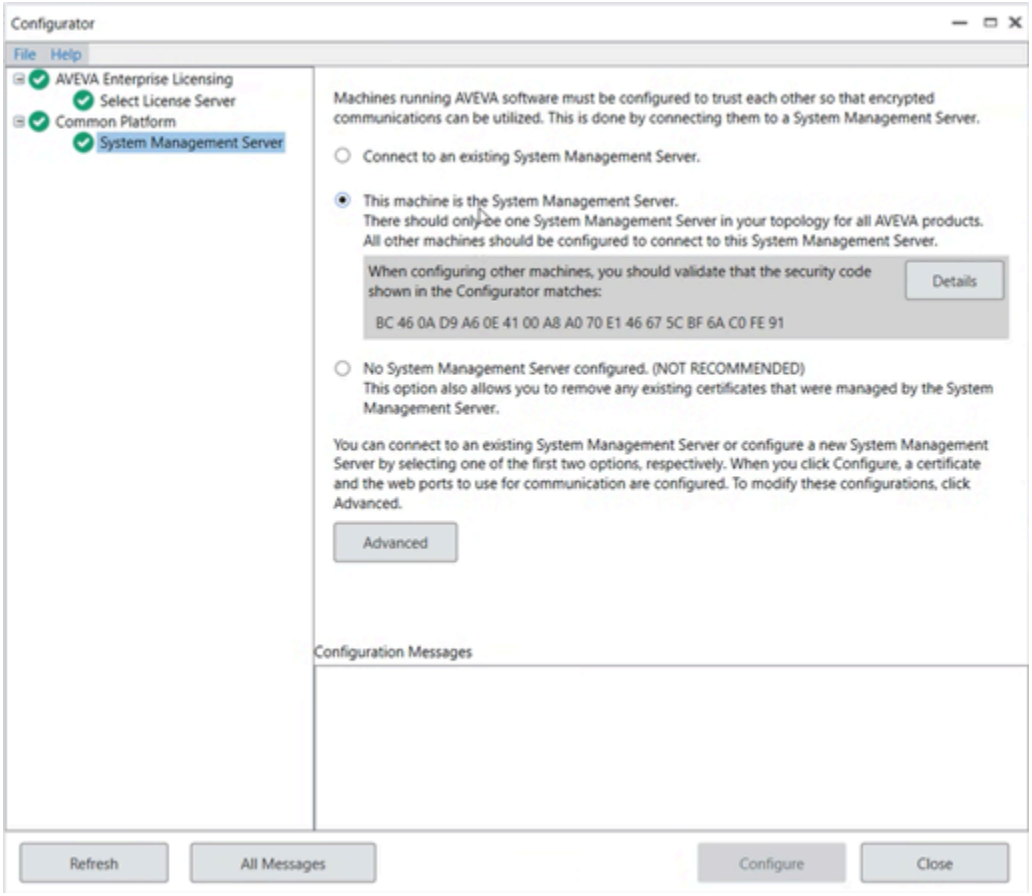
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Servers mapped should only point to the Enterprise Console where SMS is configured.

   To do this, navigate to **Central Configuration** > **Repository Settings** > **Servers Mapped** > **Enterprise Consoles** and select the Enterprise Console where SMS is configured.

Token Service Configuration using Configurator Tool

The **Configurator** window lists the System Management Servers as illustrated below:



- Click the **Configure** button to configure certificate manager.

Token Service Configuration and Registration using Central Configuration

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then right-click **Central Configuration**, and select **Run as Administrator**.

   The **Central Configuration** web page appears.

2. Click **Token Service**.

   The **Token Service** page appears.

3. Select the **Configure** check box to specify the server name and attach the certificate.

   The confirmation message appears whether you want to configure the token service.

   Note:
   - You need to select **Configure** check box to configure the token service. If not selected, the token service will

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

only get registered.
- If you reconfigure the token service, the existing configuration and the certificate will be deleted. Also, the applications which use the same token service will stop working.
-If the token service is reconfigured, the token service registered from Central Configuration should be re-registered.

4. Click **OK** to configure the token service.
5. In the **Server Name** box, select the server name where AIM is installed.
6. Click the attachment icon against the **Certificate** box to select the certificate. The selected certificate should be in pfx format.
7. In the **Password** box, enter the password for the selected certificate.
8. In the **Token Service URL** box, enter the URL of the server where AIM is installed and configured. The URL format should be *https://servername/identitymanager*. The *servername* should be fully qualified host name.
9. In the **Alias Name** box, enter the alias name for the token service.
10. In the **Registrar User** box, enter the user name used for registering to AIM.
11. In the **Password** box, enter the password for the Registrar user.
12. Click **Register**.

    The token service is registered successfully.
13. Click **Reset** and then repeat steps 3 - 11 to configure and register additional token services for authentication.

Note:
- While registering Token Service, all existing Enterprise Console URIs will be added to redirect URI. If you are creating a new Enterprise Console, you must re-register the Token Service.
- To access the Enterprise Console Web Site, ensure that Anonymous authentication is enabled and Windows authentication is disabled.

Enable or Disable Security for a Repository

To enable or disable the security

We recommend to enable Security for the repositories while working in the Production environment.

1. Connect to Farm database.
2. Query the properties column for the specified repository, as shown in following code snippet:

```
SELECT Properties, * FROM SKRepository
WHERE Name = 'RepositoryName'
```

It will display the following record for the specified repository. Select the properties column value and copy it:

```
<properties>
<property key="spexplorerDisplayLimit"><![CDATA[0]]></property>
<property ey="sourceelements"><![CDATA[WORKFLOWELEMENTS\Default]]></property>
<property key="fromemail"><![CDATA[admin@domain.com]]></property>
<property key="toemail"><![CDATA[admin@domain.com]]></property>
<property key="alertuser"><![CDATA[False]]></property>
<property key="filewatcher"><![CDATA[]]></property>
<property key="enablesecurity"><![CDATA[True]]></property>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<property key="enablewebparts"><![CDATA[True]]></property>
<property key="isadminconfigured"><![CDATA[True]]></property>
<property key="isThemeEnabled"><![CDATA[True]]></property>
<property key="theme"><![CDATA[Default]]></property>
<property key="isDMSEnabled"><![CDATA[False]]></property>
<property key="AutoMapActiveDirectoryProviders"><![CDATA[True]]></property>
</properties>
```

3. Modify the property value for enablesecurity property to ‘True/False’.
4. Update the column value for the specified repository.

```
UPDATE SKRepository
SET Properties = 'Modified properties'
WHERE Name = 'RepositoryName'
```

5. Do an IISRESET.

Enable or Disable Web Parts for a Repository

To enable or disable the Web Parts

We recommend to enable Security for the repositories while working in the Production environment.

1. Connect Farm database.
2. Query the properties column for the specified repository, as shown in below code snippet:

```
SELECT Properties, * FROM SKRepository
WHERE Name = 'RepositoryName'
```

It will display the record for the specified repository, select the properties column value and copy it. It will look something like this:

```
<properties>
<property key="spexplorerDisplayLimit"><![CDATA[0]]></property>
<property ey="sourceelements"><![CDATA[WORKFLOWELEMENTS\Default]]></property>
<property key="fromemail"><![CDATA[admin@domain.com]]></property>
<property key="toemail"><![CDATA[admin@domain.com]]></property>
<property key="alertuser"><![CDATA[False]]></property>
<property key="filewatcher"><![CDATA[]]></property>
<property key="enablesecurity"><![CDATA[True]]></property>
<property key="enablewebparts"><![CDATA[True]]></property>
<property key="isadminconfigured"><![CDATA[True]]></property>
<property key="isThemeEnabled"><![CDATA[True]]></property>
<property key="theme"><![CDATA[Default]]></property>
<property key="isDMSEnabled"><![CDATA[False]]></property>
<property key="AutoMapActiveDirectoryProviders"><![CDATA[True]]></property>
</properties>
```

3. Modify the property value for enablewebparts property to ‘True/False’.
4. Update the column value for the specified repository.

```
UPDATE SKRepository
SET Properties = 'Modified properties'
WHERE Name = 'RepositoryName'
```

5. Do an IISRESET.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

User Providers

Each Repository could potentially have its own user database, for example, one application may connect to Active Directory, the other may connect to AVEVA Work Tasks Databases, and others to Lightweight Directory Access Protocol (LDAP) or Active Directory Application Mode (ADAM).

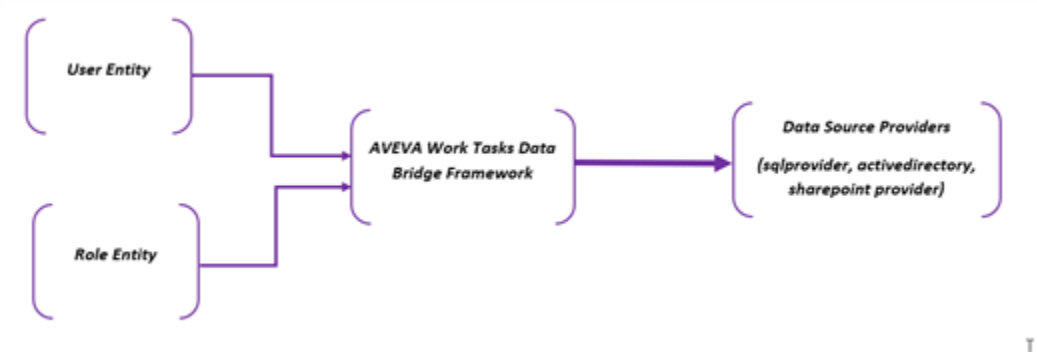
When AVEVA Work Tasks uses each of these Repositories, it needs to ensure that users of these Repositories can work with AVEVA Work Tasks without any complicated configurations. AVEVA Work Tasks also ensures that connection to these repositories are secure. The secure connection indicates that only authorized functionality is available to each and every resource.

Different repositories may be using the same authentication source, but may have different metadata and grouping information with them. For Example, the authentication source could be active directory, but there could be five other repositories which are using the same user and maintain Repository specific user metadata.

The user integration needs to be outside the Repository boundary since users can span across multiple Repositories. In AVEVA Work Tasks, we use a concept known as User Entity and Role Entity for managing users across different platforms.

User Entity manages all the information for the users across different data sources. Data Source may be Active Directory, SQL providers, and so on. The Role Entity manages users in roles.

Data bridge framework is the common framework that bridges the entity item and the corresponding data source providers. Each entity item will internally communicate with the Data bridge framework to know from which Data Source provider the entity details should be retrieved.



Change User Provider Properties

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**. The Central Configuration page appears.
2. Click **Repository Settings**. The **Repository List** page appears.
3. Click the desired repository from the **Repository Name** column.
4. Modify the properties from the **User Provider** properties box.

Add Additional User Providers

AVEVA Work Tasks allows you to have an additional provider for an existing repository. Because of this feature, one repository can make use of users from different providers. The example below illustrates the need to add additional User Providers.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example

There is a need for a AVEVA Work Tasks Repository to communicate to Active Directories from multiple domains. The two Active Directory domains are "Workflow Management" and "NG" and the existing repository is "Main Repo" connected to both the Active Directories.

To add additional User Providers

1. Create a Repository with an Active Directory (AD) as User Provider.

   While creating a Repository select the Active Directory as User Provider from the drop down box. The currently connected Active Directory [AVEVA Work Tasks AD in our case] details need to be filled. If the Active Directory details are not displayed, provide the details manually and check the connection, by clicking Test LDAP button. You can also use AVEVA Work Tasks Active Directory Tool, to retrieve the details.
2. Configure the repository created in step 1 with the other Active Directory [NG] available in the domain.
3. Navigate to the AVEVA Work Tasks Repository Database associated with the Repository.
4. View the User Provider/Authentication provider details maintained in the "SKEntity" and "SKEntityDataSourceProvider" Tables.
5. Locate two entries for the repository from the SKEntity table.

   The DefinitionXML column will have the XML schema, of the Authentication Provider of the repository.

   Sample Entry:

   UserEntity:

   ```
   <entity type="user"><properties><property name="UserName" displayname="Name"
   type="string" /><property name="UserId" displayname="Id" purpose="identifier"
   type="string" /><property name="UserDisplayName" displayname="Display Name"
   purpose="name" type="string"/><property name="UserEmail" displayname="Email"
   purpose="email" display="true" valuecollection="true" type="string" /><property
   name="UserDesignation" displayname="Designation" purpose="designation"
   type="string"/><property name="UserDepartment" displayname="Department"
   purpose="department" type="string"/><property name="UserManager"
   displayname="Manager" purpose="manager" type="string"/><property name="UserRole"
   displayname="Role" purpose="groupname"
   type="string"/></properties></entity>%%$#@@!!!*&
   ```

   RoleEntity:

   ```
   <entity type="role"></entity>%%$#@@!!!*&
   ```
6. Open the SKEntityDataSourceProvider table and make the necessary changes.
   a. Add Two more rows for the new authentication provider, Active Directory details, which is required to associate with the same repository.
   b. Provide the details of the new Active Directory in XML format.
   c. Enter the details in the SKEntityDataSourceProvider, before making the new AD entry. The columns, EntityId are mapped with SKEntity ID column.

   The DisplayName column has the display value. The Definition XML will have the XML schema of attributes used to identify users from the AD.

   Sample Entry:

   ```
   <dataproviders><provider name="activedirectory"
   type="activedirectory"><properties><property name="name" type="string"
   displayname="Resource ID" entitymappedproperty="UserName"/><property
   name="sAMAccountName" persistcolumn="UserIdString" type="string" purpose="identifier"
   displayname="Account Name" entitymappedproperty="UserId"/><property
   ```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
name="displayName" type="string" purpose="name" persistcolumn="Name"
displayname="Resource Name" entitymappedproperty="UserDisplayName"/><property
name="mail" type="string" purpose="email" displayname="Email"
entitymappedproperty="UserEmail"/><property name="title" type="string"
purpose="designation" displayname="Designation"
entitymappedproperty="UserDesignation"/><property name="department" type="string"
purpose="department" displayname="Department"
entitymappedproperty="UserDepartment"/><property name="manager" type="string"
displayname="Manager" suppressdn="true" purpose="manager"
entitymappedproperty="UserManager"/><property name="memberof" type="string"
purpose="groupname" displayname="Group" suppressdn="true"
entitymappedproperty="UserRole"/></properties><Preferences><SearchScope>Sub
Tree</Search Scope><Referral Chasing>External</Referral
Chasing><Timeout>60</Timeout><Size Limit>0</Size Limit><Authentication User>WORKFLOW
MANAGEMENT\anilk</AuthenticationUser><AuthenticationPassword
IsEncrypted="true">iB9rbif4XqNm4+8cO3nnTw==</AuthenticationPassword></Preferences><LD
APServer>LDAP://</LDAPServer><LDAPSearchBase>DC=Workflow
Management,DC=dom</LDAPSearchBase><LDAPBaseFilter>(objectCategory=Person)</LDAPBaseFi
lter><DomainName>WORKFLOW MANAGEMENT\</DomainName></provider></dataproviders>
```

This entry will be created when we create the repository, by providing a user provider. In our case its Active Directory -AVEVA Work Tasks .

7. Add another entry for the other domain that we need to configure with the repository.
   - The new entry will have the similar schema in the DefinitionXML column, as the one above, but the LDAP SearchBase will be pointed to the AD that we want to associate with the repository, as shown in the below sample:
   - The DisplayName column will have the value that we want to display in the EC Site.
   - The InstanceName will have to be different. This is mandatory.
   - The Provider column will have the same as other row entry value, activedirectory in our case.
   - After making the changes, the SKEntityDataSourceProvider will have a new row added as shown.
8. Navigate to the Central Configuration and click on the Repository Provider List link.
9. View the repositories and there respective Authentication Provider details.
10. Select the repository that was created with the changes. Observe that there are two entries under User Entity.

    Notice that the Repository has UserEntity mapped with two active directories-Workflow Management and NG.
11. Click on the Click Here link to view the DefinitionXML schema.

    This confirms that the necessary changes have been applied, and a repository associated with two user providers is created.
12. Navigate to the Enterprise Console page.

    Observe that the repository can be accessed by users of both the domains configured with the Repository.

    Now users from both the Active Directories, AVEVA Work Tasks and NG, can access the repository.

If there are users belonging to both the configured Active Directories, then you need to use <mappingfields> element to map the similar columns of the user properties from both the providers. This element will be part of the DefinitionXML column which has the XML schema.

A sample schema with <mappingfields> element is as below:

```
<mappingfields><mappingfield mappedfromprovider="activedirectory"><fields
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
mappedtoprovider="ngactivedirectory"><field name="sAMAccountName" mappedto="sAMAccountName"
/></fields></mappingfield><mappingfield
mappedfromprovider="ngactivedirectory"><fieldsmappedtoprovider="activedirectory"><field
name="sAMAccountName" mappedto="sAMAccountName" /></fields></mappingfield></mappingfields>
```

Configure User Providers

AVEVA Work Tasks Repository can be configured to use any of the following user providers for user authentication:

- Active Directory Server
- ASP.NET Membership
- Repository User Provider
- Forms
- List
- AVEVA Connect
- Azure Active Directory

User authentication is required to enable users to participate in human activities that form a part of the Workflow.

User authorization is handled in AVEVA Work Tasks through AVEVA Work Tasks security.

Windows Active Directory Server

Select Windows to use Windows Active Directory as the user provider. The logged in Active Directory is displayed by default in the Active Directory Data Source and Search Base fields. Enter another LDAP and search base connection, if required. Use the Test LDAP button from the UI to test the LDAP connection. If Test LDAP is unsuccessful, enter the authentication user name and password and check Test LDAP again.

The user information from Active Directory, like the SamAccountName, Display Name and Email ID, gets stored in a table. This is done to avoid sending frequent requests to the Active Directory. In addition, the user credentials are validated by using the Microsoft Win32 API LogonUser.

ASP.NET Membership

Select ASP.NET Membership. Enter the connection string to the data source and application name. Use the Test ASP.NET Membership button on the UI to test connection. The ASP.NET membership table already contains a column for password. Ensure that the value for the column **PasswordFormat** is set to 0 as this field currently supports only clear text format.

Forms

To retrieve user related information from another application database, select Forms. The following information must be provided for Forms user Data:

- Data source: Enter the data source for the user table.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Data Table: Enter the name of the table that stores user information. If user data is present in multiple tables, create a view and enter the name of the view in this field.
- User Entity Properties: Each column in the table or view can be provided as an attribute to the User Entity. Properties defined here are available to Workflow during design and execution. The User Entity properties must be provided as XML.

Sample XML Schema

```
<properties>
                    <property name="name" type="string" displayname="Full Name"
purpose="name"/>
                    <property name="empname" type="string" displayname="Name"
purpose="identifier"/>
                    <property name="Address" type="string" displayname="Address"/>
                     <property name="Sex" type="string" displayname="Sex"/>
                     <property name="Email" type="string" displayname="Email"
purpose="email"/>
               </properties>
```

Tags used in XML schema are:

- <properties>: The collection of fields that requires to be retrieved from the source database object.
- <property>: A single field reference in the source table or view.

Attributes of the <property> element are:

- name: Refers to the name of the column in the Database.
- type: Refers to the type of the column (int, string or guid).
- displayname: Refers to the name for display within .AVEVA Work Tasks
- purpose: Indicates how AVEVA Work Tasks should treat this column (name, email, and identifier).
- display: Indicates whether the column requires to be displayed or not (true or false).

User Provider Properties

Map the user entity properties to the fields in the user provider. To associate the password information in the Enterprise Console for forms authentication:

In the entity provider, add a column as purpose="password" as in the example below:

```
<property name="Password" type="string” display="false" purpose="password" />.
```

Currently the default provider supports only clear text password.

List

When a Repository is created, AVEVA Work Tasks user tables are automatically added to the Repository database. Select List to use this table. Lists within the AVEVA Work Tasks List Provider can be customized, see User List for more information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

AVEVA Connect

Select AVEVA Connect to use AVEVA Connect as the user provider and authenticate the user. To configure AVEVA Connect, see AVEVA Connect Settings.

Azure Active Directory

Select Azure AD to use Azure Active Directory as the user provider. To configure Azure AD, see Azure Active Directory Settings.

For more information on Azure Active Directory, see the links:

https://azure.microsoft.com/en-in/services/active-directory/

https://docs.microsoft.com/en-us/windows-server/identity/active-directory-federation-services

User List

The User list stores user details forAVEVA Work Tasks List provider, which can be customized to add new fields and edit existing fields. Customization can be done to the User List and the Form associated to the list present within the system folders of Manage List and Manage Forms respectively.

- The User list is present in the **System** folder of **Manage List** and contains customizable pre-defined lists.
- The form associated to the User List is present in **Manage Forms > Dynamic List Form > System** folder and contains customizable pre-defined forms.

Scenario

A workflow using Active Directory as user source needs additional user information for decision making. It may not always be possible to modify the user source to capture additional metadata. Customized User List provides an easy way to store additional information about a user and map the same to Active Directory.

Customizing User List

If the user wants to add any new fields in the User List, the user can go to manage List and edit the user List, add new controls, and regenerate the Form.

If a User wants to see Age filed in the Enterprise Console Settings Users List:

1. Add new column **Age** in SKEUsers Table in repository database.
2. Navigate to **Manage List** > **System** folder, select **Users list** and click **Design** from the ribbon bar.
3. The **List Designer** dialog is displayed
4. Drag and drop the Decimal Input control to the orange section in the Design Area
5. The **Control Property** dialog is displayed.
6. In the **Tag Name** field enter Age and in the **Description** field enter the Age of the User.
7. In the Bound to DBColumn type in Age.

   This field will be bound to the column created in database, hence the value entered in this field should be same as the name given to the column in SKEUserTable.
8. Click **Save**. The Age field will now appear in the List Designer.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Click **Submit** to submit the list and regenerate the Form.
10. Access Users from Enterprise Console Settings and create a new user.
11. The new field Age will be present in the User dialog.

In Manage List if user is adding any new control and if the form is regenerated the password field property will get changed. You have to follow the steps below to reset the properties for the password field:

1. Navigate to **Enterprise Console** > **Forms**.
2. Double click on the **Dynamic List Forms** folder and access the **System** folder.
3. Select the SKAWS_Users list, click **Design** in the ribbon bar.
4. Edit the **Password** field, and make the following changes.
   - In the **Basic** tab, set **Mode of text** as *Password*.
   - In the Appearance tab set:
     - **Persist password on postback** as *True*
     - Encryption mode as **AVEVA Work Tasks List type.**

Manage Users in List Provider

Use the **Users** option in the **Enterprise Console** to enable user maintenance tasks, such as adding new users to the Enterprise Console, editing and deleting existing users, and managing security.

To add additional users

1. In the **Enterprise Console**, click menu icon, click **Settings**, and then click **Users**.
   The **Users** page appears.
2. On the action bar, click **New**.
   The New User dialog box appears.
3. In the **Name** field, enter a unique name for the new user.
4. In the **Password** field, enter a password.
5. In the **Description** field, provide an appropriate description for the user.
6. In the Email field, enter a valid email ID.
   The following email IDs are invalid:
   - "Abc\@def"@example.com
   - "Fred Bloggs"@example.com
   - "Joe\\Blow"@example.com
   - "Abc@def"@example.com
   - customer/department=shipping@example.com
   - $A12345@example.com
   - !def!xyz%abc@example.com
   - firstname+lastname@domain.com
   - email@123.123.123.123

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- email@[123.123.123.123]
- "email"@domain.com

7. In the **Department** field, enter the user's department.
8. In the **Manager** field, choose the user's manager from the drop-down list.
9. In the **Role** field, specify the user's role.
10. In the **Mobile Phone Provider**, provide a valid name of the provider.
11. In the **SMS Number** field, provide a valid mobile phone number to send or receive SMS messages.
12. Click **Submit**.

    The new user is added to the User's list.

To edit users

1. Right-click the required user from the User's list and select the **Edit** option from the context menu.

   The **Edit User** dialog box appears.
2. Edit the required fields and click **Submit**.

   The edited user appears in the User's list.

To delete users:

- Right-click the required user from the User's list and select the **Delete** option from the context menu.

  Alternatively, you can select the user and select the **Delete** option from the menu bar.

  The selected user is deleted from the list.

To create users in Repository User Provider using API

To create a new user in Repository User Provider, use the API given below:

```
Skelta.Core.User user = new Skelta.Core.User("Repository Name");
user.Name = "UserName";
user.Email = "UserEmail@domain.com";
Hasher hasher = new Hasher();
byte[] salt = hasher.GenerateSalt();
user.Salt = Convert.ToBase64String(salt);
user.IterationCount = hasher.GenerateIterationCount();
user.Password = hasher.GenerateHash("password", salt, user.IterationCount);
user.Save();
```

Working with Repository-Provider List

The Repository Provider List displays the list of user providers mapped to a selected repository.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**. The Central Configuration page appears.
2. Click Repository-Provider List.
3. Select the Repository name from the drop down box to view the resource provider for a repository.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configure Provider Definition XML

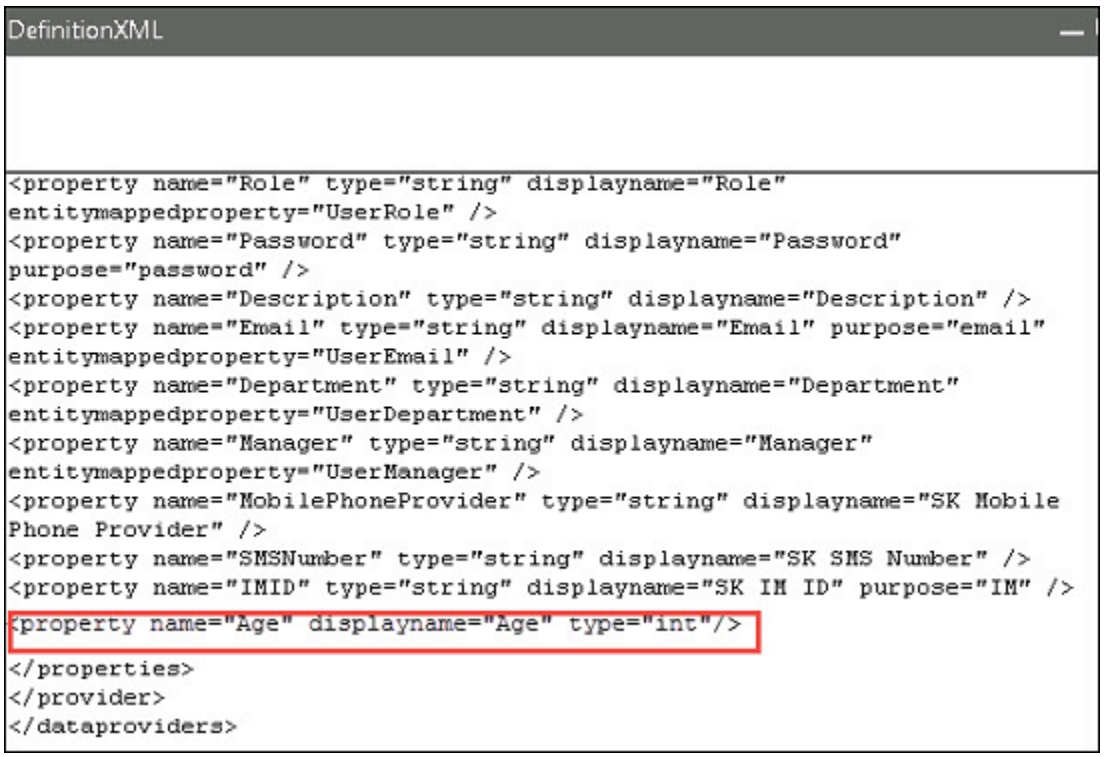
To add new properties

To use new provider properties or fields in a workflow, that property needs to be added in the Provider List Definition. To add a new property or to edit an existing property, follow the steps below:

1. In **Central Configuration**, go to **Repository Provider List**.
2. Select the **AVEVA Work Tasks List** repository and expand it.
3. Access the **Definition XML** of User Entity by clicking on the **Click here** option beside **User Entity**.
4. Add the property for the new field.

   Example:

   <property name="Age" displayname="Age" type="int"/>



5. Select **Edit the definition XM**L and click **Update**.
6. Close the Definition XML.
7. Expand **User Entity** and access the **Definition XML** of authenticationuserprovider.
8. Add the property for the new field.
9. Select the option **Edit the definition XML** and click **Update**.
10. Expand **User Entity** and access the **Definition XML** of authenticationuserprovider.
11. Close the Definition XML.

Performing these steps will ensure all operations can be performed based on the new field added to the User List. If you regenerate the form all the existing properties of the controls of SKAWS_Users form will be overwritten.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Auto Log Off Settings

To enable the **Auto Log Off** property at the provider level, use the `<AutoLogOff>` tag in the **DefinitionXML** and set the auto log off time. For example, `<AutoLogOffTime>5</AutoLogOffTime>`. Place this tag after the `<provider>` tag in the **DefinitionXML** file.

When you define an auto log off time for the repository, ensure the following:

- Enter valid time limit between 1 to 360 minutes. The system does not validate the time entered here, hence if you provide a time beyond the defined limit, you will not be logged out automatically.
- You can map multiple providers to a single repository. When you define the auto log off time both at provider level and repository level, the provider level time set take precedence over the repository level time set.

Note: If the Enterprise Console is opened in the same browser session and the **Auto Log Off** time is set for the repository, the following error message appears:
The user context is not valid. Please log on to the Enterprise Console and try again.

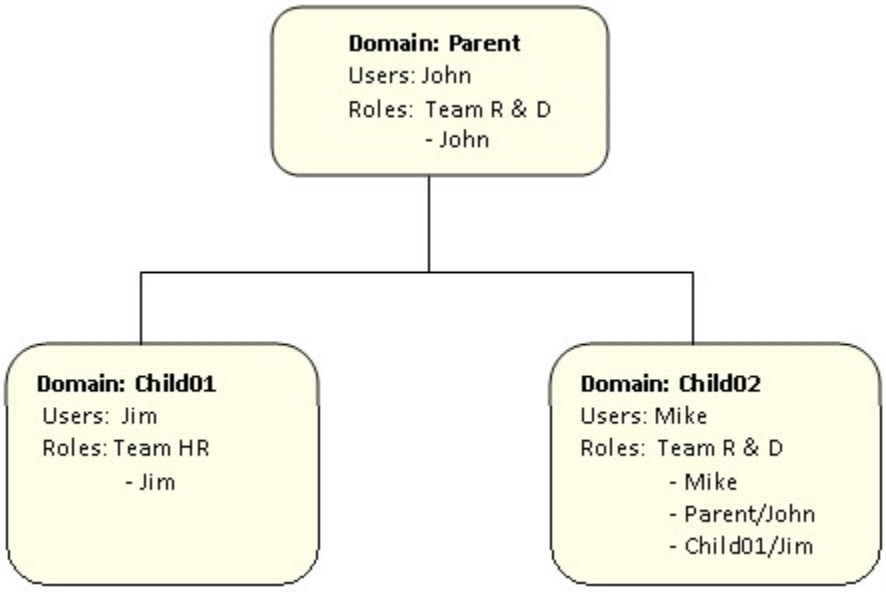
Enable an Existing Repository with Cross-domain Role Provider

Introduction to Cross Domain

An Active Directory role with users from different domains (cross domains) can be mapped to a AVEVA Work Tasks Role using AVEVA Work Tasks Role Provider.

For example, Users 'John' and 'Jim' of domain 'TelematicsUS' and users 'Mike' and 'Bob' from domain 'TelematicsAU' are added to role "Team HR" of domain 'TelematicsMain'. Now the "Team HR" role of domain 'TelematicsMain' contains four users 'John', 'Jim', 'Mike' and 'Bob'.

Consider the following scenario



- **Child01**: Domain Child01 has a user 'Jim' and a role 'Team HR'. User 'Jim' belongs to the role 'Team HR'.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Child02**: Domain Child02 has a user 'Mike' and a role 'Team R & D'. The 'Team R &D' role has the following users:
  - 'Mike' of domain Child02
  - 'John' of domain Parent
  - 'Jim' of domain Child01

To enable an existing repository(without cross-domain role provider) to a Cross-Domain Role Provider.

Prerequisite:

- All available active directory must be added as a provider for the repository.
- The domain controllers must be in the same Forest with parent-child relationship.
- Separate Forests are not supported.
- The **IsCrossDomain** property must be set as *True* for all the active directory role provider in **SKEntityDataSourceProvider** table in the **DefinitionXml** column.

After configuring the prerequisites, see Synchronize Roles.

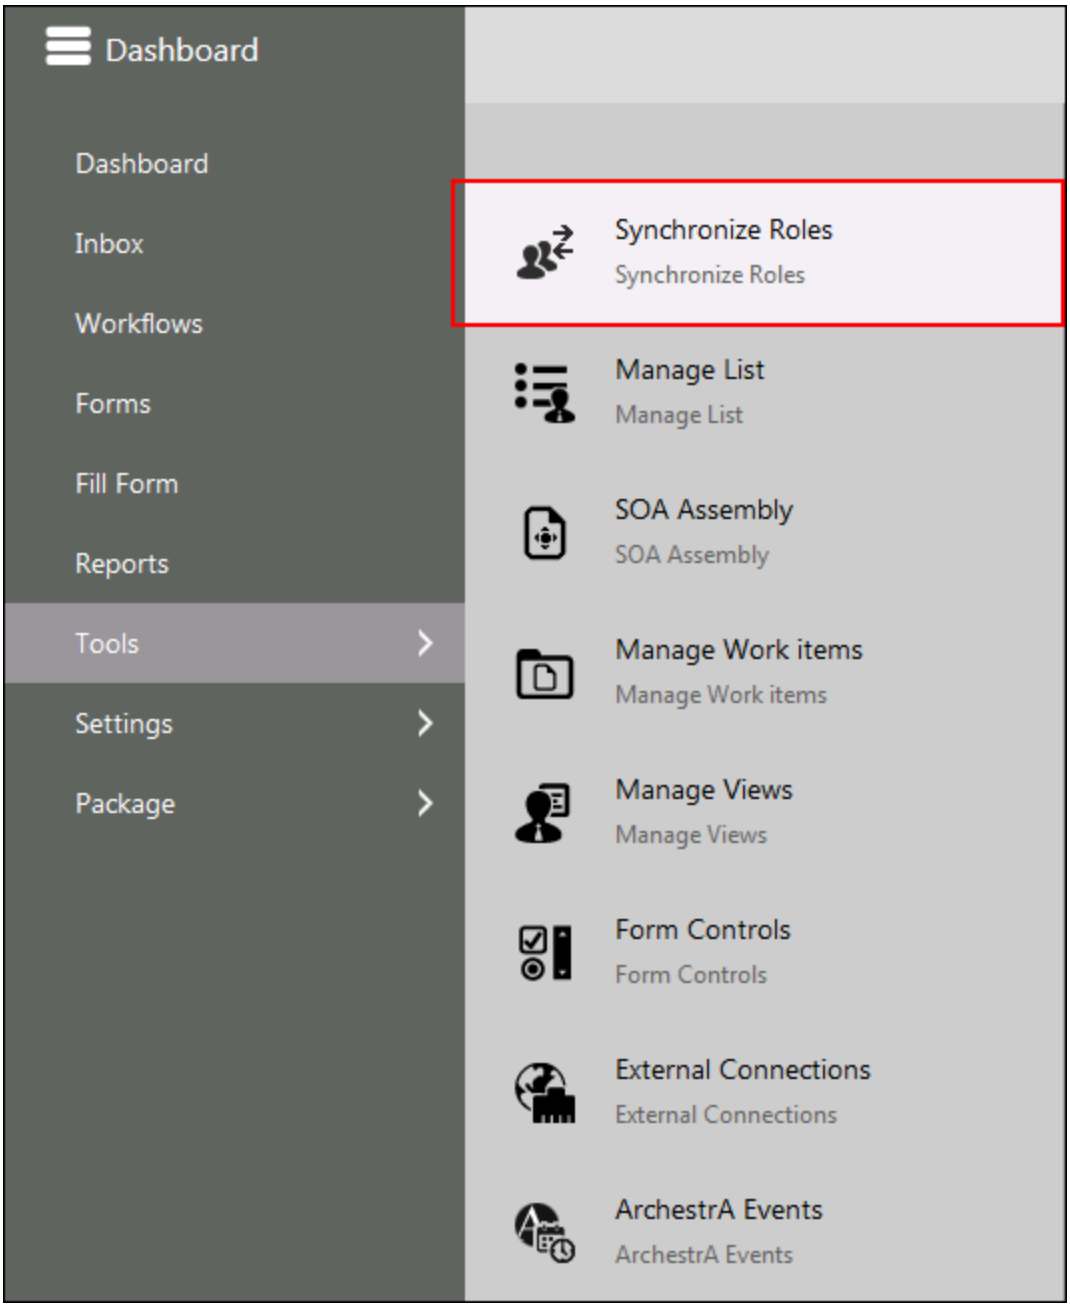
Synchronize Roles

If you want cross domain users and roles mapping across active directory provider, then use the **Synchronize Roles** option to map the roles.

Example: Users 'John' and 'Jim' of domain 'TelematicsUS' and users 'Mike' and 'Bob' from the domain 'TelematicsAU' are added to the role "Team HR" of the domain 'TelematicsMain'.

You can see the Synchronize Roles list item in the Enterprise Console menu that you can use to map the cross domain provider roles. This list item is not available by default in the Enterprise Console menu. While creating a repository, if you choose **Resource Provider** as **Active Directory** and enable the **'Is Cross Domain Role Provider'** option for cross domain users and roles mapping, then the **Synchronize Roles** sub-menu appears in **Enterprise Console** > **Tools**. This menu is available only for users with administrative rights.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



To synchronize roles

1. In the Enterprise console, click the **menu** icon, click **Tools,** and then click **Synchronize Roles**.
   The Synchronize Roles window appears.
2. Enter the role name in the **Search Role** text box.
3. Click **Search**.
   The available roles will be listed in **Choose Roles**.
4. Choose the required role to be synchronized.
   For example, search for 'team' role and it will list the available roles.
5. Click **Synchronize**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

After the synchronization of the selected role(s) is complete, a confirmation message about successful synchronization appears.

Delete Synchronization Cross Domain Tasks

To delete synchronization cross domain tasks

1. Go to Repository Data Source Database.
2. Open **SWTaskList** table.
3. Delete the required synchronization cross domain tasks for repository.

Note: Delete only those records whose Description column is 'Cross domain Role Refresh Task' for that repository.

Synchronize User Properties with Data Source Providers

You can synchronize the user properties with the data source provider. For example, User properties like Name, E-mail, and any persisted columns can be synchronized.

Synchronization can be done for Active and Inactive users but it cannot be done for the users who are not part of the data source provider.

1. In the **Central Configuration**, click **Manage Users**. The **Manage Users** page appears.
2. Click **Synchronize user properties with DataSource Providers**. The **Synchronize Users List** page appears.

Synchronize Active or Inactive User Properties with Data Source Providers

To synchronize Active or Inactive User Properties with Data Source Providers

1. In the **Manage Users** page, click **Synchronize** user properties with DataSource providers. The **Synchronize Users List** page appears.
2. In the User status drop down list, select the user status as Active User or Inactive User.
3. Click **Go** to list the active users.
4. Select the user(s) name from Synchronize Users List, and then click Synchronize Properties.

Example for Synchronizing Active User Properties

1. Log on to **Enterprise Console**.
2. Click **Manage** Users.
3. Click **Synchronize user properties with Data Source Providers**.
4. In the Repository name drop down list, select the repository name as 'SkeltaListRepository'.
5. In the User status drop down list, select the user status as Active User.
6. Click **Go** to list the active users.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To change the user properties of a user, for example, John:

1. In the Enterprise Console, click menu icon, point to Settings, and then click Users. The Users page appears.
2. Click Settings > Users from Enterprise Console pull down menu. The following screen is displayed.
3. Select the user, and then click Edit. The Edit User page appears.
4. Change email ID and password. For example, change 'john@WMDemo.com' to 'john@domain.com'.
5. Click Save. A dialog box confirming the updates appears.
6. Click OK.
7. Go to Synchronize Users List window and select the user. For example, select john.
8. Click Synchronize Properties to reflect the changes.

Schedule Synchronization of User Properties

Schedule Synchronization of User Properties can be used to schedule user properties.

To schedule Synchronization of User Properties

1. In the **Synchronize Users List** page, click Schedule synchronization of user properties. The Schedule User Properties page appears.
2. Click **Add New Task** to add repository. The Repository list appears.
3. Select the repository name.
4. Click **Add**. The Schedule dialog box appears.
5. Select **Start Date** from Date Picker.
6. Select **End Date** from Date Picker.
7. In the **Schedule Task** drop down list, select the task. Task can be on Daily basis, Weekly basis, or Monthly basis.
   - If Schedule Task selected is Daily, mention number of days.
   - If Schedule Task selected is Weekly, mention number of weeks and also select day(s) to run the task.
   - If Schedule Task selected is Monthly, mention date and also select the month(s) to run the task.
8. Select **Start Time** from Time Picker.
9. Check the Repeat Task check box to repeat the task. Select Minutes or Hour(s) from drop down list to repeat the task for specified hour(s) or minute(s).
10. Click **Save** to schedule the task.

Map Active Directory to SQL Provider

You can map Active Directory to SQL Provider.

Advantages of Mapping

- Mapping enables user accounts existing in multiple user providers to login or work on a given task from any of the user providers.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Duplicate entries for a user account from different user providers can be avoided.

Scenario:

Log on to the Enterprise Console using domain login and use the resource properties defined in the SQL provider (form) in workflow design.

To set mapping

Identify the column which is unique for all the providers, that is, user has to identify the common column which shares the same information for the given user across user providers. In this scenario email is considered as the common column.

Active Directory provider properties

```
<dataproviders>
<provider name="activedirectory" type="activedirectory">
<properties><property name="sAMAccountName" persistcolumn="UserIdString" type="string"
purpose="identifier" displayname="Account Name" />
<property name="displayName" type="string" purpose="name" displayname="Resource Name" />
<property name="mail" type="string" purpose="email" displayname="Email" />
<property name="title" type="string" purpose="designation" displayname="Designation" />
</properties>
<Preferences><SearchScope>SubTree</SearchScope>
<ReferralChasing>External</ReferralChasing><TimeOut>60</TimeOut><SizeLimit>0</SizeLimit>
<AuthenticationUser>skelta\testuser</AuthenticationUser><AuthenticationPassword
IsEncrypted="true">tj49KeDsRuxVbVZlZDFLFw==</AuthenticationPassword>
</Preferences>
<LDAPServer>LDAP://</LDAPServer>
<LDAPSearchBase>DC=Testskelta,DC=dom</LDAPSearchBase>
<LDAPBaseFilter>(objectCategory=Person)</LDAPBaseFilter>
<DomainName>TestSKELTA\</DomainName>
</provider>
</dataproviders>
```

SQL Provider Properties

```
<dataproviders>
<provider name="sqlprovider" type="sql server" authenticationsource="false">
<properties><property name="userid" type="int" purpose="identifier" />
<property name="name" type="string" displayname="Name" purpose="name" display="true"/>
<property name="email" type="string" displayname="Email ID" purpose="email"
persistcolumn="Email"/>
</properties>
<datasource>server=skeltadtp75a;database=TestUser;Integrated security=true</datasource>
<SourceTable>users</SourceTable>
</provider>
</dataproviders>
```

Instance name for ActiveDirectory is *activedirectory*.

Instance name for SQL is *sqlprovider*.

To map between Active Directory and SQL provider

The mail property from active directory and email property from database has the common field to map, that is, they both have the same information for the given user. Mail is an active directory property whereas email is a column in SQL provider.

```
<mappingfields>
<mappingfield mappedfromprovider="ActivedirectoryInstance name">
<fields mappedtoprovider="sql provider instance name">
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<field name="mail" mappedto="email" />
</fields>
</mappingfield>
<mappingfield mappedfromprovider=" sql provider instance name">
<fields mappedtoprovider=" ActivedirectoryInstance name ">
<field name="email" mappedto="mail" />
</fields>
</mappingfield>
</mappingfields>
```

A user can map between any number of providers and on any common columns. Provider instance name are taken from SKEntityDatasourceprovider table.

To map Active Directory provider with SQL provider

1. Create a AVEVA Work Tasks Repository with Active Directory as resource provider.
2. Insert a record to SKEntityDataSourceprovider with Application set to Repository name, EntityID taken from the SKEntity table (Userentity for mapping users), provider to sqlprovider and Instancename with any UserdefinedName.
3. Update the Defnitionxml column for the added record with appropriate resource XML data.

   Example

```
<dataproviders>
<provider name="sqlprovider" type="sql server" authenticationsource="false">
<properties><property name="userid" type="int" purpose="identifier" />
<property name="name" type="string" displayname="Name" purpose="name"
display="true"/>
<property name="email" type="string" displayname="Email ID" purpose="email"
persistcolumn="Email"/>
</properties>
<datasource>server=skeltadtp75a;database=TestUser;Integrated
security=true</datasource>
Authenticationsource="false" at the provider level disables the login to the
Repository from the Enterprise Console for this provider. Using the
"Authenticationsource" attribute, you can decide which provider to use for user
authentication while log in to the Enterprise Console. Add persistcolumn attribute
for the common properties in both the providers.
Update Definitionxml column of the active directory by adding persistcolumn attribute
for the common property.
Example
<dataproviders>
<provider name="activedirectory" type="activedirectory">
<properties><property name="sAMAccountName" type="string" purpose="identifier"
displayname="Account Name" entitymappedproperty="userid" />
<property name="displayName" type="string" purpose="name" displayname="Resource Name"
entitymappedproperty="name" />
<property name="mail" type="string" purpose="email" displayname="Email"
persistcolumn="Email" entitymappedproperty="email" />
</properties>
<Preferences><SearchScope>SubTree</SearchScope>
<ReferralChasing>External</ReferralChasing><TimeOut>60</TimeOut><SizeLimit>0</SizeLim
it>
<AuthenticationUser>skelta\testuser</AuthenticationUser>
<AuthenticationPassword
IsEncrypted="true">tj49KeDsRuxVbVZlZDFLFw==</AuthenticationPassword>
</Preferences>
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
<LDAPServer>LDAP://</LDAPServer>
<LDAPSearchBase>DC=Testskelta,DC=dom</LDAPSearchBase>
<LDAPBaseFilter>(objectCategory=Person)</LDAPBaseFilter>
<DomainName>TestSKELTA\</DomainName>
</provider>
</dataproviders>
```

For each of the property there can be entitymappedproperty attribute. This attribute value can be used to map to other property names from different providers if both the purpose are same.

4. Update Definitionxml of SKEntity table for the user entity.

   Example:

```
<entity type="user"><properties><property name="userid" type="string"
purpose="identifier" />
<property name="name" type="string" displayname="Name" purpose="name"
display="true"/>
<property name="email" type="string" displayname="Email ID" purpose="email"/>
</properties></entity>%%$#@@!!!*&<mappingfields>
<mappingfield mappedfromprovider="activedirectory"><fields mappedtoprovider="AD_SQL
provider"><field name="mail" mappedto="email" /></fields></mappingfield>
<mappingfield mappedfromprovider="AD_SQL provider"><fields
mappedtoprovider="activedirectory"><field name="email" mappedto="mail"
/></fields></mappingfield>
</mappingfields>
```

   The properties configured in definition xml of SKEntity table are available to create the query for assigning the activities to the resources. As per the above scenario, we are retaining only SQL provider properties. If we require active directory properties in the workflow design same can be updated in this column, however we need to make sure that the properties defined in the xml are unique. Also it is mandatory to append the mapping column.

   Important: Even if the identifier is of type int, you need to mention it as string globally (in SKEntity table). This is because when we are accessing the resource properties, it is in the string form that is, "providername::userid".

5. When the Activities are assigned to resources, it will look for the resource in both the providers and if common field found for the same, it will assign the activity to the user based on the mapped ID.

User Table

When the user with common field is found and if that users details are already created in SKVirtualActor table, AVEVA Work Tasks automatically maps that user using MappedToId.

Log on to Repository using Active Directory credentials.

Debug

You can debug AVEVA Work Tasks. The various methods implemented to debug include:

- Logger Console
- Setting the Debug Level
- Configuring Exception Email Settings
- Logger Message Categories
- Implementing Work Item Information interface

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Debugging Custom Actions or Properties using Debugger

Logger Console

The Logger Console is used to debug AVEVA Work Tasks. This is a utility that shows a real-time log of events during the execution of AVEVA Work Tasks. It is automatically installed at *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder when AVEVA Work Tasks is installed.

<AVEVA Work Tasks_installed path> is the path where AVEVA Work Tasks is installed on your system.

Steps to Debug

- Run **AVEVAWorkTasksLogConsole.NET2** from *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin*. Or

  On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click WTLogger Console.

  The **WTLogger Console** window appears.

  The events are displayed in the WTLogger Console when AVEVA Work Tasks is running. The WTLogger Console displays events using three types of log categories. These log categories are used to identify the type of information.

To set the Debug Level

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click Farm Configuration Wizard.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** screen is displayed.
3. Select **Service Settings**.
4. Click **Next**. The **Service/Global Settings** page is displayed.
5. Click against **Global Settings**. The **Global Settings** screen appears.
6. Click **Log/Transaction**.
7. Select the **Debug Level** from the drop down box.
8. Click **OK**.

The following debug levels are available:

- **Level 1**: This level shows minimal information in the Logger Console. The Logger console displays information related to the start and end of a workflow. Error messages are also shown in this mode.
- **Level 2**: This level provides detailed information of background activities. It will show all the messages logged from the actions.
- **Level 3**: This level displays messages indicating whether an action is executed.

All error messages logged in the Logger Console will be sent to the user e-mail ID. This e-mail ID is picked up from the SMTP node in the configuration file.

To configure Exception Email settings

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Configuration Wizard** appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** screen is displayed.
3. Select **Service Settings**.
4. Click **Next**. The **Service/Global Settings** page is displayed.
5. Click against **Global Settings**. The **Global Settings** screen appears.
6. In the **Exception Email Settings** section, enter From Email and To email.

Logger Message Categories

There are three categories of messages logged in the log files.

- **Information (i)**: This type of message is preceded by a lower case 'i'. It indicates messages containing general information about the events being logged. Each message of this type has four parts:
  - the event information
  - the module generating the event
  - the machine on which the event took place and
  - the date and time of the event
- **Warning (?)**: This type of message is preceded by a question mark '?'. These messages are warning notes to the users about the events being logged. The messages of this type have a structure similar to the 'Information' messages with the same four parts as mentioned earlier.
- **Error (!)**: This type of message is preceded by an exclamation mark '!'. It indicates error messages with details specific to the error. Messages of this type can be further classified into four parts similar to the other two messages. In addition, it has the 'Exception Stack Trace', which occurs before the machine name and date/time. It can be identified by the keyword 'Source' and it can be used to trace the source of the error.

Interpret Log Files

Two types of Log files are created by AVEVA Work Tasks:

- The first type of Log file is created for generic log messages. This Log file is created in the path - <AVEVA Work Tasks_installed path>\log. The Log files are saved in this folder using the date of logging as the filename with the format "MMDDYYYY" (there will be one Log file for each day).
- The second type of Log file is application-specific; it will log messages related to applications. These Log files are created in separate folders corresponding to each application. The folders are located in the path <AVEVA Work Tasks_installed path>\log and are saved with names in the format "<application name>+n" where "n" is a serial number of the log folder created.

To open and view a Log file

1. Navigate to the log file location using the relevant path,that is, "\Logs" or "\Logs\<application name>" depending on the type of Log file you need to view.
2. Locate the required Log file by looking at the date of the log file.
3. Open the log file in a text editor to view the details. It will display all the events for the day using three types of log categories to identify the type of information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Logger Activity

The Logger Activity can be used to log custom messages like information, warnings, and errors which should be logged to the Log Console from the workflow.

Use BAM Report

This report presents details related to failed workflows.

Implement Work Item Information interface

The Workflow Engine alerts the IWorkflowInformation interface on changes in the status of Actions or Workflows. The class implementing the Workflow.NET.Interfaces.IWorkflowInformation.NET2.dll interface is used to get the information from the Workflow Engine on change in the status of Action/Workflow. This interface is used only for getting information. It does not involve any transaction.

Debug Custom Actions/Properties using Debugger

Debugger can be added in the custom code to debug custom development done in AVEVA Work Tasks.

Log Files

These are files that log information or errors related to the product. These files are located in the <AVEVA Work Tasks_installed path>\Logs folder.

The log messages are represented by the following symbols:

- Information (i): This type of message is preceded by a lower case 'i'. It indicates messages containing general information about the events being logged. Each message of this type has four parts:
  - the event information
  - the module generating the event
  - the machine on which the event took place and
  - the date and time of the event
- Warning (?): This type of message is preceded by a question mark '?'. These messages are warning notes to the users about the events being logged. The messages of this type have a structure similar to the 'Information' messages with the same four parts as mentioned earlier.
- Error (!): This type of message is preceded by an exclamation mark '!'. It indicates error messages with details specific to the error. Messages of this type can be further classified into four parts similar to the other two messages. In addition, it has the 'Exception Stack Trace', which occurs before the machine name and date/time. It can be identified by the keyword 'Source' and it can be used to trace the source of the error.

Exception Messages

This topic describes some of the exception messages that appear in AVEVA Work Tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If the **password in Active Directory is modified**, you can see the following error message when you access the Central Configuration:

Cannot proceed further. A valid connection to the AVEVA Work Tasks Farm could not be established. Check the Database User setting specified in AVEVA Work Tasks Farm Configuration Wizard and MSDTC Settings.

You can also see the error message in the logger console as follows:

If the password in Active Directory is modified, you see the following error message when you access the Farm Configuration Wizard:

A valid connection to AVEVA Work Tasks database could not be established. Would you like to change the Database User Settings?

The Logger Console (related to the Farm Configuration Wizard) displays the following message:

To resolve the above issue, follow the steps given below:

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.
   The **Welcome to the AVEVA Work Tasks Configuration Wizard** appears.
2. Click **Next**.
3. The **Edit AVEVA Work Tasks Farm settings** screen appears.
4. Select **Database User Settings**.
5. Click **Next**. The **Database User Settings** screen appears.
6. Update the User Name, Password, and Domain.
7. Click **OK**. A message to ensure that the login has required permissions appears.
8. Click **OK**. A message indicating Database User settings edited successfully appears.
9. Click **OK**.

AVEVA Identity Manager

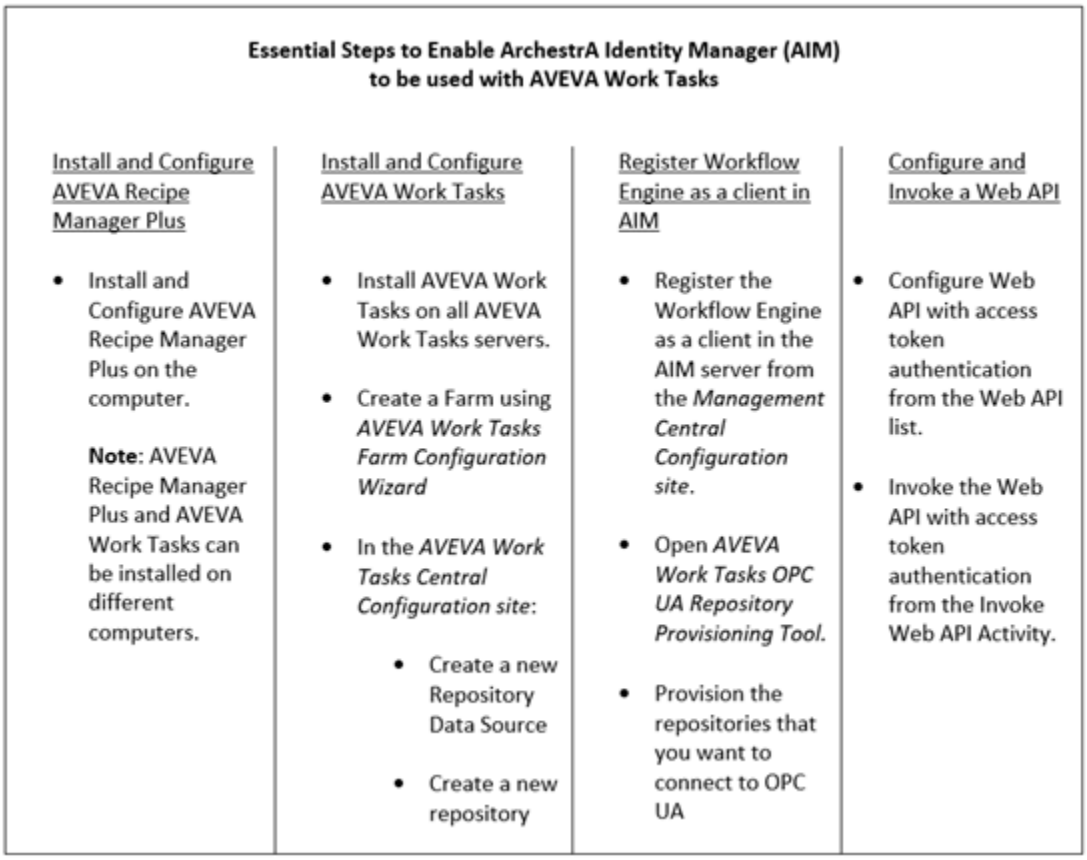
The AVEVA Identity Manager (AIM) provides a mechanism that handles user authentication requirements. It

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

issues a access token to a workflow engine server registered as a client , requesting access to a secure software application.

Enabling AVEVA Identity Manager to be used with AVEVA Work Tasks

The following image shows the essential steps required to enable AIM with AVEVA Work Tasks:



Step 1: Install and Configure AVEVA Work Tasks

- Install and configure **AVEVA Work Tasks**. For more information about installing and configuring workflow, see Installing Wonderware Skelta BPM.

Step 2: Register AVEVA Work Tasks as a client in AIM

- Register **AVEVA Work Tasks** as a client in AIM. For more information about registering as a client, see Configuring and Registering Token Service.

Step 3: Configure and Invoke a Web API

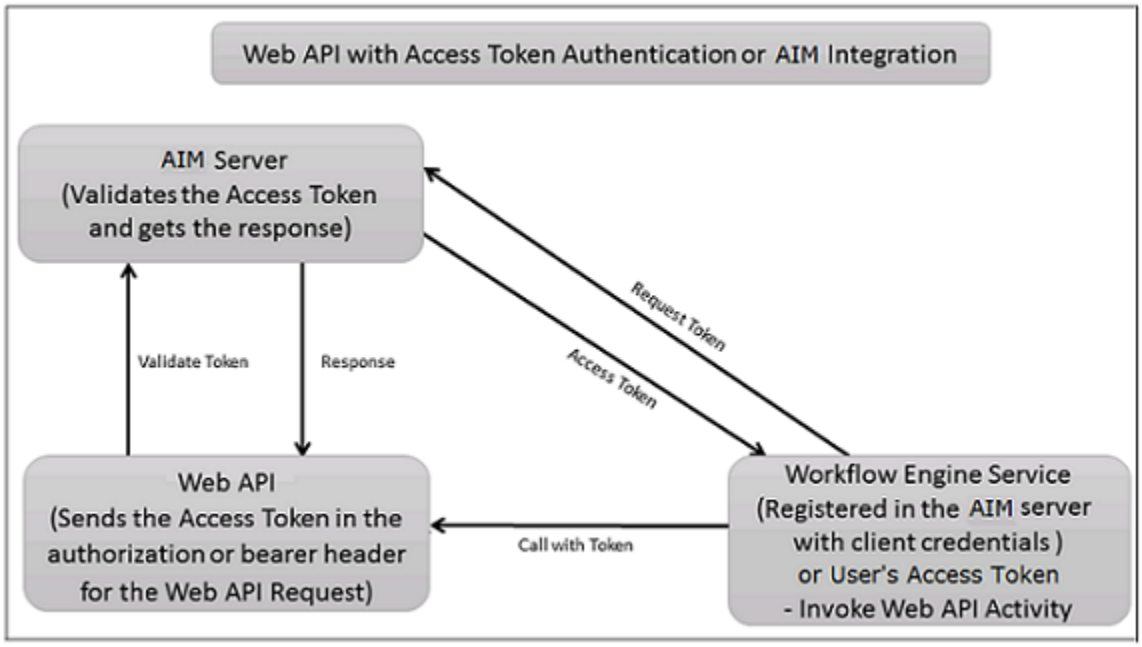
- Configure Web API with access token authentication from the Web API list.
- Invoke the Web API with access token authentication from the Invoke Web API Activity. For more information about configuring and invoking a Web API, see Web API with AIM Authentication.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Web API with AIM Authentication

Web API with Access Token Authentication or AIM Integration

The following image shows the sequence of the Web API Authentication :



1. The workflow engine server is registered in the AIM server. The registered workflow engine server acts as a client and requests the AIM server for an access token through the Invoke Web API Activity.

   This is applicable only if the **Use System Authentication** option in **Web API Activity Configuration** page is selected. If this option is not selected, then the current logged in user's access token is used.
2. The AIM server sends the access token to the client through the Invoke Web API Activity.
3. The Invoke Web API Activity invokes the Web API using the access token. It sends the access token in the authorization or bearer header for the Web API request.
4. The access token passed through the Web API request is validated internally in the AIM server.If the access token is valid, then the Web API request is executed successfully.
5. If the access token is invalid, then the AIM server responds with a 401 Unauthorized Error.

For information about registering a client in the AIM server, see Token Service.

For more information about Web API authentication, see *Web APIs* topic in the *Use Forms and Lists* section.

Consume Access Token from InTouch OMI App in AVEVA Work Tasks Controls

You can pass the access token from InTouch OMI App to AVEVA Work Tasks Controls to consume it for AIM authentication.

To consume access token from InTouch OMI App, update the **view.exe.config** file located at **<System Platform**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

IDE Install path>\Framework\Bin\ViewAppFramework and

<System Platform IDE Install path>\Framework\Bin\ModernEditors\Preview\ViewAppFramework with the following tags:

```
<add key="TokenServiceBase" value="<URL of AVEVA Identity Manager>" />
<add key="ClientId" value="SE_WSP_NG" />
<add key="Scope" value="openid profile system offline_access" />
```

Embedding AVEVA Work Tasks

You can package the AVEVA Work Tasks components within a custom installation.

Before continuing with the customization, ensure that you have installed AVEVA Work Tasks on your computer.

Example

A vendor (OEM customer) may need to package a AVEVA Work Tasks product along with their product installer to avoid a separate installation of AVEVA Work Tasks. This will ease the installation experience in the client environment since AVEVA Work Tasks will get installed along with the vendor's product.

Note: For Custom build application on AVEVA Work Tasks 2023 SP1, or when you upgrade the product to AVEVA Work Tasks 2023 SP1, it is recommended not to use Enterprise Console **appSettings** in web.config file.
For a custom build application, you need to bind the application to the **AVEVA Work Tasks Integrated** pool.

Add an Installation Path

You can define a custom installation path where AVEVA Work Tasks components will be copied during custom installation process. To enable AVEVA Work Tasks on a machine it is mandatory to have the components, UI related files copied to a folder and required libraries added to the global assembly cache.

To add an Installation Path

1. Create a directory in the machine where all AVEVA Work Tasks components and UI files will be copied.

   Example

   <drive>:\<custom_folder path>

   Note: The <drive>:\<custom_folder path> mentioned above can be any drive path on the machine where you would like to install AVEVA Work Tasks in custom installation mode.
2. During installation process, copy AVEVA Work Tasks libraries, UI related folders and files to the custom folder created. The files and folders required to be copied are:
   - BAMReports
   - Bin
   - DatabaseScripts
   - Locales
   - Logs
   - Documentation
   - WorkflowManagementWebService
   - Web

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- WorkflowElements

  Copying contents of Logs folder are an exemption.

  Copy security_approval_workflow.xml from AVEVA Work Tasks installation path to custom path, <drive>:\<custom_folder_path>

3. Add the libraries and dlls from the <drive>:\<custom_folder_path>\Bin folder to Global Assembly Cache (GAC). This can be performed by the installer or using the Visual Studio Command Prompt.

   Use the following command to add the Dlls to GAC:

   gacutil /i "<drive>:\<custom_folder_path>\Bin\Workflow.NET.NET2.dll"

   Example

   Considering that the path <drive>:\<custom_folder_path> created in step 1 is *C:\Program files\AVEVA\Work Tasks*, the following command must be used to add Workflow.NET.NET2.dll to GAC using Visual Studio Command Prompt.

   gacutil /i "*C:\Program files\AVEVA\Work Tasks*\\Bin\Workflow.NET.NET2.dll".

4. Repeat step 3 to add all the dlls to the GAC from the Bin folder except for the following dlls:
   - ASmsCtrl.dll
   - CustomAction.NET2.dll
   - LumiSoft.Net.dll
   - Skelta.HWS.SampleApp.CustomDocView.dll
   - Workflow.NET.ActionHandler.MSOfficeActions.NET2.dll
   - Workflow.NET.SMS.Messenger.NET2.dll
   - Workflow.NET.SMTPManagedSink.NET2.dll
   - Interop.AxMmCtlLib.dll
   - Microsoft.WindowsAzure.Diagnostics.dll
   - Microsoft.WindowsAzure.ServiceRuntime.dll
   - Microsoft.WindowsAzure.StorageClient.dll

To add the installation path mentioned in step 1 to the registry, refer section Entry for AVEVA Work Tasks Folders.

Add Registry Entries

This section provides information on how you can define your custom installation path in the registry, change background images for Farm Wizard, and create a shortcut path for the Central Configuration.

Entry for AVEVA Work Tasks Folders

You can define your custom installation path in the registry.

To define Entry for Folders

1. On the Windows **Start** menu, click **Run**.
2. Type **Regedit**.
3. Click **OK**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

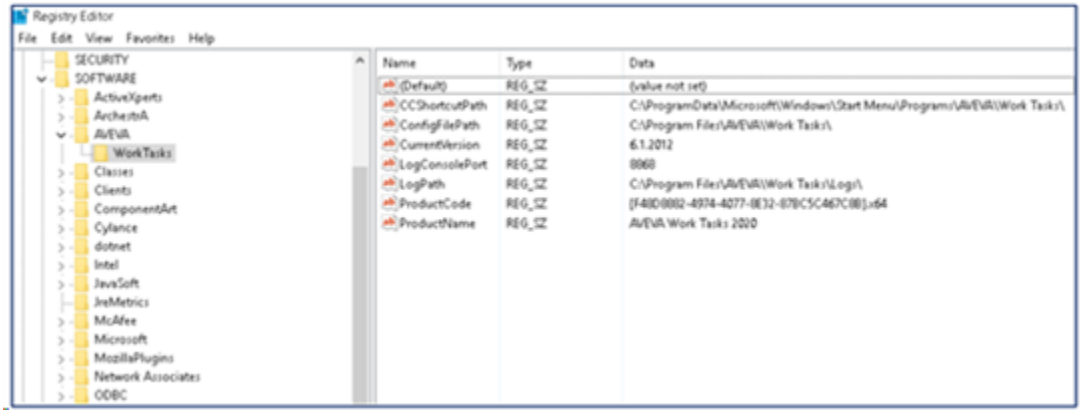
The Registry Editor screen appears.

4. Create a registry entry **HKEY_LOCAL_MACHINE\SOFTWARE\AVEVA\WorkTasks**. The keys required under this entry are *ConfigFilePath, LogConsolePort, LogPath*. The *ConfigFilePath* entry will be the same as the path defined in Add an Installation Path. The *LogPath* entry will save logs in a new folder under the defined installation path.

```
[HKEY_LOCAL_MACHINE\SOFTWARE\AVEVA\WorkTasks]
"ConfigFilePath"="C:\\Program Files\\AVEVA\Work Tasks\\" (This would be the custom
installation path of the software)
"LogConsolePort"="8868"
"LogPath"="C:\\Program Files\\AVEVA\Work Tasks\\Logs\\"  (This would be the custom
installation path of the software)
"CurrentVersion"="x.x.xxxx"   (Specify the current build version)
"ProductName"="\AVEVA\AVEVA Work Tasks 2023 SP1"
"ProductCode"="{F48D8882-4974-4077-8E32-87BC5C467C8B}.x64"   -- for 64 bit machine
```

Note: In all the .txt files in the Locales folder which contains the keyword "AVEVA Work Tasks", change the "AVEVA Work Tasks" to <Your Product Name>.

5. After the entry is created, the registry details will show the AVEVA Work Tasks folder details.



Entry for Farm Wizard Background Image

You change the background images for the Farm Wizard with custom Product Images. The Farm Configuration Wizard is used to install the Enterprise Console, the Central Configuration, define and configure the Service settings.

Add the following string-value pair in registry keys at HKEY_LOCAL_MACHINE\SOFTWARE\WorkTasksSilentInstallation.

To change the Background image for the Farm Wizard

1. On the Windows **Start** menu, click **Run**.
2. Type **Regedit**.
3. Click **OK**.
4. The Registry Editor screen appears.
5. Navigate to \HKEY_LOCAL_MACHINE\SOFTWARE\WorkTasksSilentInstallation
6. Add a String Value, *ConfigWizardImage*.
7. Update the string value "ConfigWizadImage" data value with the new image path.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Image width = 624 and Height = 513

To configure the AVEVA Work Tasks, see Start the Farm Configuration Wizard.

Entry for Central Configuration Shortcut Path

This section provides information on creating a shortcut path for the Central Configuration, if the application is installed in a different path apart from AVEVA Work Tasks installation path.

If the application is installed in default path, it will create a shortcut path based on the operating system version. For example, *C:\ProgramData\Microsoft\Windows\Start Menu\Programs\AVEVA\Work Tasks*

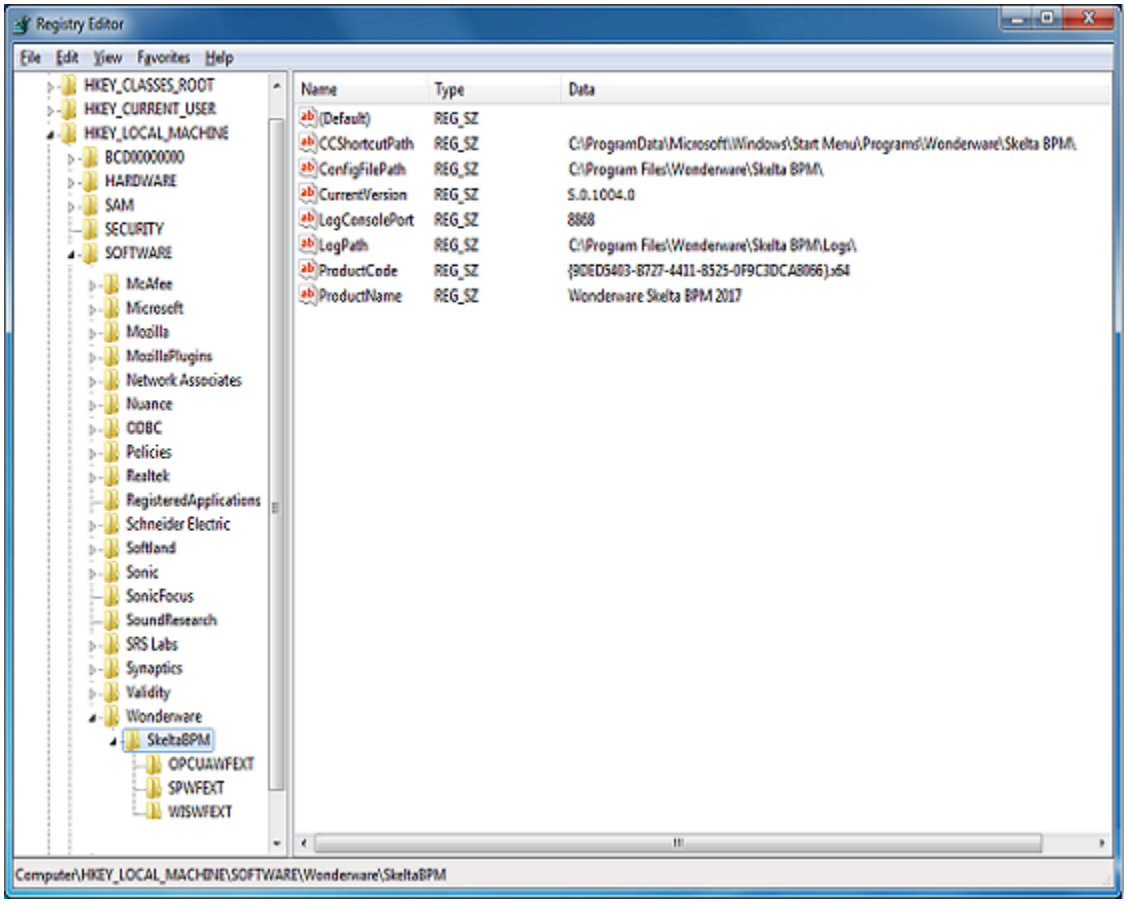
If the custom application is installed in a different path, say Start > Programs > Telematics, then create a shortcut path for the Central Configuration. You need to make a registry entry at:

C:\ProgramData\Microsoft\Windows\Start Menu\Programs\Telematics

User need to do the changes accordingly for other Operating Systems.

Add the following string-value pair in registry key.

- Key Name: CCShortcutPath
- Value need to be set as: C:\ProgramData\Microsoft\Windows\Start Menu\Programs\Telematics



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Customize UI Text

You can customize the text that appears on the AVEVA Work Tasks user interface.

To customize UI text

1. Navigate to the path **<drive>:\<custom_folder_path>** created in step 1 of the section Add an Installation Path.
2. Navigate to **Locales** > **en-US** folder.
3. Open the files listed in en-US folder in a text editor and make changes to the Value part. Ensure that you change only the Value part of the file.

Install Client Service

This topic provides information to install SKClientSrv.exe (AVEVA Work Tasks Client Service) in services.msc. This installation is required for the Services to function. In the case of default AVEVA Work Tasks installation, the Client service is installed by default. However, for custom installation the Client service have to be manually installed.

To install the Client Service

1. Open Microsoft Visual Studio Command Prompt.
2. Type **installutil -i** "**<drive>:\<custom_folder_path>\Bin\SKClientSrv.exe**".
3. Press **Enter**.

The *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin\SKClientSrv.exe* path displayed in the image above may vary and depends on the Custom installation path selected in Step 1 of the section Add an Installation Path. This service can start only after installing the Farm Server/Client.

Implement FarmEvents Interface

Overview

The IFarmEvent Interface exposes four events to capture the Farm Configuration file's Add/Edit event. This event is triggered when the CentralConfig.xml file is created or edited, before installing the service, and after the services are installed.

The steps mentioned in this section are not mandatory steps. If the user wants to implement IFarmEvents then the user can use the steps mentioned .

CentralConfig.xml file contains database user details and the Farm database connection string details.

Following is the description of event triggers, when a particular method is called:

- **OnCentralConfigFileCreation**: When CentralConfig.xml file is created.
- **OnCentralConfigFileEdit**: When CentralConfig.xml file is edited.
- **OnServiceInstallationStart**: When Service Installation is about to start.
- **OnServiceInstallationComplete**: When service installation is completed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To create a Custom IFarmEvent

1. Create a Custom class library implementing the IFarmEvent.

   DLL Reference

   Skelta.FarmConfiguration

   Workflow.NET.NET2

   Sample Code: A sample implementation code is shown below. This code notifies in the logger file after all the events have occurred.

```
using System;
using System.Collections.Generic;
using System.Text;
using Skelta.Core;
namespace FarmEvents
{
class MyFarmEvents: Skelta.FarmConfiguration.IFarmEvent
{
#region IFarmEventMembers
// Product key should be passed as Empty.
string productKey = "";
public void OnCentralConfigFileCreation(string productKey,
Skelta.FarmConfiguration.HandleSkeltaFarm.DatabaseUserCredentials databaseUser,
string databaseType, string connectionString)
{
Workflow.NET.Log log = new Workflow.NET.Log();
log.LogInformation("************** In OnCentralConfigFileCreation ***********");
log.Close();
}
public void OnCentralConfigFileEdit(string productKey,
Skelta.FarmConfiguration.HandleSkeltaFarm.DatabaseUserCredentials databaseUser,
string connectionString, string databaseType,
Skelta.FarmConfiguration.HandleSkeltaFarm.EditedConfiguration editedConfiguration)
{
Workflow.NET.Log log = new Workflow.NET.Log();
log.LogInformation("************** In OnCentralConfigFileEdit ***********");
log.Close();
}
public bool OnServiceInstallationComplete(Skelta.FarmManager.ServiceMappingCollection
serviceMappings)
{
Workflow.NET.Log log = new Workflow.NET.Log();
log.LogInformation("************** In OnServiceInstallationComplete ***********");
log.Close();
return true;
}
public bool OnServiceInstallationStart(Skelta.FarmManager.ServiceCollection services)
{
Workflow.NET.Log log = new Workflow.NET.Log();
log.LogInformation("************** In OnServiceInstallationStart ***********");
log.Close();
return true;
}
#endregion
#region ISkeltaAddInProvider Members
string _Settings;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
Guid _Id;
void ISkeltaAddInProvider.InitializeProvider(string settings, Guid id)
{
this._Settings = settings;
this._Id = id;
}
string ISkeltaAddInProvider.Settings
{
get { return _Settings; }
}
Guid ISkeltaAddInProvider.Id
{
get
{
return _Id;
}
}
#endregion
}
}
```

2. Compile the class and add the dll in the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\bin* folder. After this make an entry in the SKAddInProviders table mentioning the type as IFarmEvent. The name can be anything. The class name and the assembly path should be provided accordingly. The class name should be the name of the Custom Class (Namespace.ClassName).

```
INSERT INTO SKAddInProviders
(Type,[Name],ClassName,[Assembly],Settings,IsGacAssembly) VALUES
('IFarmEvent','EventName','NameSpace.ClassName','bin\<DLLName>.dll','',false)
```

Verify Embedded AVEVA Work Tasks

Installation of Embedded AVEVA Work Tasks can be verified by checking if the product name, title, label names, or window names of the product are replaced with the customized names/titles as specified in registry (see Entry for Activating and Deactivating Background Image) (HKEY_LOCAL_MACHINE > SOFTWARE > WorkTasksSilentInstallation > ProductNamePath) or the locales folder. The customized name or title can be seen in different locations in the Farm Configuration Wizard like: Activation and Deactivation windows, Product Name watermark in the Welcome to Farm Configuration wizard, Activate Key window, and the names of the services.

In the earlier sections we saw that the product name was changed from AVEVA Work Tasks to Telematics. Hence, in the Farm Configuration wizard the product name should appear as Telematics.

Farm Recovery

The Farm Recovery is performed to prevent problems that might occur (like data loss or interruptions to organizational operations) and to allow quick recovery.

The following are the files required to be backed up from the folder:

- *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin*: All the Work Tasks dlls and any custom dlls (if added)
- *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Locales* folder: For UI Localization

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\BPMUITemplates* folder
- *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\WorkflowElements* folder
- Farm Database
- Repository Data Source Database

Note:
- The Farm Recovery is supported for both HTTP and HTTPS protocol based sites. The HTTPS sites get recovered if the target machine has the same SSL certificate as in the source machine. Otherwise, the sites will get recovered in HTTP mode. After the recovery, edit the **Security Settings** page in **Farm Configuration Wizard** and update the certificate to configure the sites in HTTPS mode.

- After the Farm Backup and Recovery, you need to do the following:
-- Register the token service again and then redeploy the Quickflow application. For information on deploying Quickflow, see Deploy Quickflow. Ensure the primary System Management Server (SMS) is online during token service registration and redeploying the Quickflow application.
-- For OAuth2 authentication, update the **Redirection URI** in **SMTP Settings** and **POP3 Settings** in the **Mail Server** page with the server name on which the Farm Recovery was performed.

Overview

All AVEVA Work Tasks files are located in the AVEVA Work Tasks folder. If a backup is required for the AVEVA Work Tasks installed server machine then copy all the files located in the AVEVA Work Tasks folder. Before taking a backup, ensure that all the Services (Engine, Task Scheduler, and Communication Service) have been stopped and the product has been deactivated.

Restoring AVEVA Work Tasks Files

Before you restore AVEVA Work Tasks files to a different or on the same machine (from which a backup was taken), the AVEVA Work Tasks has to be installed again and activated. During the installation, AVEVA Work Tasks Web sites will be created again. Ensure that the customized data is replaced correctly.

The Farm database can be connected using the Farm Manager utility and the data source can be updated using the Central Configuration Web site.

After the installation, replace all the existing AVEVA Work Tasks files with the backup files. This will ensure that any customization done for XML files, images and Html templates have been replaced as before. Replacing existing AVEVA Work Tasks files will also ensure that any custom actions or properties or dlls added are replaced correctly. The BPMUITemplates folder must be replaced under the *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web* path.

Note:
- Ensure that the dlls present in GAC and in *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* are the same.

-The Central Configuration and the Enterprise Console will always be created under *DefaultWebsite/AVEVAWorkTasksSites* after the recovery of the Farm database.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Farm Recovery Scenarios

The scenario descriptions have been described under the following sections:

Server

- when the Server machine goes down
- when the Farm Database goes down
- when both machines go down
- when any one machine goes down

Client

- when the Client machine goes down

Recover Client

- Repository database Recovery

Server

- When the Server machine goes down

Recovery of the Services and the Farm database that are on the same machine

Prerequisites: Take a backup the Farm database.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
2. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.
   The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** screen appears.
3. Click **AVEVA Work Tasks Farm Recovery**.
   The **Recovery Type** screen appears.
4. Select the **Server** option to be recovered from Server or Client options displayed on the screen.
5. Select all the recovery types displayed under the **Server** option:
   - **Database Settings**
   - **Services**
   - **Central Configuration and Enterprise Console**
6. Click **Next**.
7. After a successful connection to the database, if the current server's name does not exist in the database, enter the Server name to be replaced.
   The Services will get installed and the Central Configuration and the Enterprise Console get created.
   A confirmation message appears.

   Note: Central Configuration and the Enterprise Console are always created under **DefaultWebsite/AVEVAWorkTasksSites**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Recovery of the Services and the Farm database on different machines

The Services are installed in machine1 and the Farm database exists in machine2.

Server machine goes down: In this case, only server machine containing the Services is crashed but the Farm database is up.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
2. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** screen appears.
3. Click **AVEVA Work Tasks Farm Recovery**.
4. Select **Server** from **Server** and **Client** options displayed on the screen.
5. Check all the recovery types displayed under the Server option: Database Settings, Services, and Central Configuration and Enterprise Console.
6. Click **Next**.

   Note: Central Configuration and Enterprise Console will always be created under **DefaultWebsite/AVEVAWorkTasksSites**.
7. Under Connection string, enter the details for the Farm database stored on machine2.

   After a successful connection to the database, if the current server's name does not exist in the database, enter the Server name to be replaced. The services get installed and the Central Configuration and the Enterprise Console get created. A confirmation message appears.

Farm Database machine goes down

This section describes the scenario when the machine, on which the Farm database resides, crashes while machine1, where the Services is running, is fine.

Prerequisites: Take a backup of the Farm database.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
2. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** screen appears.
3. Click **AVEVA Work Tasks Farm Recovery**.
4. From the **Server** and **Client** options, select the **Database recovery** check box.
5. Click **Next**.
6. Provide Connection string details for the Farm database that needs to be restored.

When both the machines go down

Refer to the scenario, *Recovery of AVEVA Work Tasks Services and Farm database that are on the same machine*.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Moving the Farm database from one machine to another machine

This section describes the recovery in the scenario when you move the Farm Database from one machine (source) to another machine (the destination).

Prerequisites: Take a backup of the Farm Database (from the source machine) and restore it to the destination machine.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
2. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** screen appears.
3. Click **AVEVA Work Tasks Farm Recovery**.
4. From **Server** or **Client** options**,** select the server to be recovered.
5. From the **Server options,** select the **Database recovery** check box.
6. Click **Next**.
7. Provide Connection String details for the Farm Database that needs to be restored.

Any Server machine goes down

In this scenario, temporarily shift the machine to some other machine. After the original server is up, shift back to the original server from the temporary machine.

To recover any server machine

Refer to the scenario, *AVEVA Work Tasks Services and Farm database on one machine for Solution*.

You must run the Farm Recovery options twice in this situation:

- The first time will be in the temporary machine
- The second time will be on the original machine

Client

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
2. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** screen appears.
3. Click **AVEVA Work Tasks Farm Recovery**.
4. From **Server** and **Client** options, select the Client to be recovered.
5. Provide Connection String details for the Farm database.

   The Central Configuration and the Enterprise Console get created.

Note: Central Configuration and Enterprise Console always get created under DefaultWebsite/AVEVAWorkTasksSites.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Farm Recovery

This section provides technical specification details for developers in order to provide a solution for Farm Disaster Recovery.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
2. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** screen appears.
3. Click **AVEVA Work Tasks Farm Recovery**.
4. Choose one of the options displayed on the screen. If you choose server then check one of the options as described below:
   - Recover Database: The **Database User Settings** page appears. On successful database connection this will create the CentralConfig.xml file.

     If the current server's name does not exist in the database, choose the Server Name to be replaced with any server from the Farm Database's Server Collection. This collection will only contain the servers that are currently not running.
     - Database changes
     - SKServer table – Name and Address will get replaced with current server's name.
     - SKService table – WorkflowManagementGlobalSettings – property smtphost, filewatcherip.
     - SKWebsite table – property localURL of each website.
     - SKServicemapping table - SMTPNotificationEngine2 – property listnerip, smtpserverip, pophost.
   - Recover Services: Load the properties of Services from the Farm database and install services.
   - Recover Central Configuration and Enterprise Console.
     - Load the AVEVA Work Tasks Web site properties.
     - If the path of the Web site does not exist then the local URL of the site is changed to the path of DefaultWebSite/AVEVAWorkTasksSites and other properties of the site are updated accordingly.
     - Create Central Configuration and Enterprise Console according to properties from the Farm database.

To recover Client

1. Provide the database connection option.
2. If the current client's name does not exist in the database, choose Client Name to be replaced with any server from Farm Database's Client Collection. SKServer table entry for client will get changed.
3. Recover Central Configuration and Enterprise Console.
   a. Load AVEVA Work Tasks Web site properties.
   If the path of the website does not exist then the local URL of the site is changed to the path of DefaultWebSite/AVEVAWorkTasksSites and other properties of the site are updated accordingly.
   b. Update AVEVA Work Tasks website properties accordingly.
   c. Create Central Configuration and Enterprise Console according to properties from Farm Database.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To recover Repository Database

Repository database information is stored in the Farm database. If the database server is changed, edit the changes from the Central Configuration Web site and update the changes.

To recover Quickflow

Deploy Quickflow again from the Central Configuration Web site to have the Quickflows running.

Move from Development Environment to Production Environment

The following options are available when you to move from development environment to production environment:

- Option 1: To move the Farm database and Repository database
- Option 2: To recover only product database

Option 1: To move the Farm database and Repository database

Development Environment:

1. Stop all AVEVA Work Tasks Services.
2. Create backup copies of the following files from the development environment
   - Any custom dlls if added.
   - *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Locales* folder for UI Localization
   - *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Logs* folder that has all the log files
   - *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Web**BPMUITemplates* folder
   - *[AVEVA Work Tasks Installed Path]**AVEVA**Work Tasks**Workflow Elements* folder
   - Farm Database
   - Repository Database

Production Environment:

1. Restore the backed up Farm database of development environment to production environment.
2. Install AVEVA Work Tasks in production environment.
3. Start the Farm Configuration Wizard on the production computer, and choose Farm Recovery.
4. Select Server or Client to be recovered.
5. Provide the database settings which will connect to restored the Farm database in production environment.
6. Install all the AVEVA Work Tasks Services, Central Configuration, and Enterprise Console.
7. In the Farm Configuration Wizard, go to the Enterprise Console Settings page, and update the URL of all the existing Enterprise Console to the URLs of the production environment.
8. Similarly, update the URLs in the Central Configuration with the production environment URLs.
9. In the Central Configuration, edit all the DataSources, and update the Server instance name, database name, connection settings.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Repository Data Source recovery:

Repository DataSource information is stored in the Farm database. If the database server is changed, you can edit the Server instance name, database name, and connection settings of Repository DataSource from the Central Configuration web site, and update the changes.

Recovery of AVEVA Work Tasks files:

During the installation of the product, AVEVA Work Tasks web sites will be created again. So here you need to consider the customized files are replaced correctly.

After the installation, replace all the existing AVEVA Work Tasks files with the original files. So that any customization done for XML file (for example, Actions.xml), images, html templates are replaced as before and if any custom actions or properties dlls added are replaced correctly. BPMUITemplates folder must be replaced under *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web* path.

Option 2: To recover only product database (With fresh Farm creation or recovered Farm, and if the Repository Data source does not exist in recovered Farm):

1. Creating new Repository DataSource:
   a. Export the workflow definition from development machine using Import or Export option in the Process Designer.
   b. Create a new Repository DataSource in production environment from the Central Configuration.
   c. Create a new Repository in production environment with the same Repository name as in the development environment.
   d. Import the exported (exported in step a.) workflow definition in production environment using Import or Export option in the Process Designer.
   e. Queues have to be re-configured if present in development environment. Queue will not get exported automatically.
2. Attaching existing Repository DataSource:
   a. Create a backup copy of the Repository DataSource database from the development computer.
   b. Recover this DataSource database in production computer.
   c. Create a new DataSource in production computer and use the same database created in step a. (For example, DataSource is created with name ProductionDatasource. Restored database named 'BackedUpdatabase' is used to create this data source.)
   d. Create a new repository. Choose Attach DataSource option.
   e. Select DataSource created in step b. This lists all the repositories in selected data source. Create the repository.(Example: Check Attach Data Source option. Select ProductionDatasource. This will list all repositories of ProductionDatasource. Now select the repository which needs to be copied and go ahead with Repository creation.)
   f. This will copy the repository details of the development environment to the production environment.

Repository Data Cleaning

1. If you do not want to keep Workflow runtime data, then run following script on the production database:

```
truncate table SKWorkItem
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
truncate table SKHWSActivity
truncate table SKWorkItemTransaction
Delete SWTaskList where cast(ClassName as nvarchar(max)) <>
'Skelta.WorkFlow.Scheduler.WorkFlowScheduler'
truncate table SKMultipleTimeoutWarning
truncate table SWActionEventLog
truncate table SWActionEventLong
truncate table SKWorkItemCounter
truncate table SKChannelWorkItem
truncate table SKWorkItemData
truncate table SKWorkItemFields
truncate table SWExecutionDetails
truncate table SWExecute
truncate table SWVariables
truncate table SKWorkflowEvents
truncate table SKChildWorkflows
truncate table SWCustomTimerDetails
truncate table SWClientTokenData
```

2. Queue Data:

   Queues will work fine only in case where Queue Participants are same in development and production environment. If different users need to be used in Queue on the production environment, user needs to create new Queue.

   To remove particular Queue data, see the following Queue tables:

   - SKQueue
   - SKQueueAccessRights
   - SKQueueParticipants

Reuse Repository Data

If you want to reuse existing repository data, such as workflows, forms into a new repository, complete the following steps:

1. Create new Repository Data source
   a. Export the workflow definition from development machine using Import or Export option in the Process Designer.
   b. Create a new Repository Data source in production environment from Central Configuration.
   c. Create a new Repository in production environment with the same Repository name as in development environment.
   d. Import the exported (exported in step a.) workflow definition in production environment using Import or Export option in the Process Designer.
   e. Queues have to be re-configured if present in development environment. Queue will not get exported automatically.
2. Attach existing Repository Data source
   a. Take a backup of Repository Data Source database from Development machine and recover this data source database in Production machine. (Let us say that the restored database's name is 'BackedUpdatabase')
   b. Create a new Data source in Production machine and use the same database created in step c. (Example:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Data source is created with name ProductionDatasource. Restored database named 'BackedUpdatabase' is used to create this data source.)

c. Create a new repository – Choose attach data source option.

d. Select Data source created in step c. This will list all the repositories in selected data source. Give name to the Repository and continue with creating the repository. (Example: Check Attach Data Source option. Select ProductionDatasource. This will list all repositories of ProductionDatasource. Now select the repository which needs to be copied and proceed with Repository creation.)

e. You can retain the resource providers in the attached data source by checking the Attach Providers option or create your own resource provider. Ensure that it is the same as the resource provider of the attached repository.

Note: The product installed version and data source version should be same for attaching data source.

Example:

Attaching a data source that was created in 5.0.0.0 build should not be performed in the 6.0.0.0 build.

Note: Choose the version number appropriately based on the environment.

To attach such a data source:

1. If the data source was created in 5.0.0.0 build, then the entire 5.0.0.0 build should be first upgraded to 6.0.0.0 build.
2. The 5.0.0.0 build should be upgraded to 6.0.0.0 build by running the latest msi file.
3. The Farm, Data Sources , Repositories, and Lists of 5.0.0.0 build should be upgraded to 6.0.0.0 by running the AVEVAWorkTasksUpgradeManager.exe located in the BIN folder.
4. After upgrading all the components to 6.0.0.0 build, that data source can be used in the 6.0.0.0 build that is installed in any machine by using this feature.
5. This will Copy the repository details of Development environment to Production environment.

Repository Data Cleaning

If you do not want to keep Workflow runtime data, then run the following script on Production database.

```
truncate table SKWorkItem
truncate table SKHWSActivity
truncate table SKWorkItemTransaction
truncate table SWTaskList
truncate table SKMultipleTimeoutWarning
truncate table SWActionEventLog
truncate table SWActionEventLong
truncate table SKWorkItemCounter
truncate table SKChannelWorkItem
truncate table SKWorkItemData
truncate table SKWorkItemFields
truncate table SWExecutionDetails
truncate table SWExecute
truncate table SWVariables
truncate table SKWorkflowEvents
truncate table SKChildWorkflows
truncate table SWCustomTimerDetails
truncate table SWFECount
truncate table SWRaw
truncate table SKScheduler
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
truncate table SKEventBindings
truncate table SKEEventAssociations
truncate table SKExecutionInstanceData
```

Note: You need to recreate all associations and BAM scheduling.

Queue Data:

Queues will work fine only when the Queue Participants are same in both development and production environment. If different users need to be used in Queue on the production environment, the user needs to create a new Queue.

To remove particular Queue data, see the following Queue tables:

- SKQueue
- SKQueueAccessRights
- SKQueueParticipants

Deployment Options

Deployment is the process of moving the solution from one machine to the another machine.

You can deploy the solution developed in **AVEVA Work Tasks** using multiple methods:

- Packages
- Farm Recovery
- Attach DataSource

The preferred deployment option is exporting and importing the packages.

Attach DataSource

Attach DataSource feature in **AVEVA Work Tasks** allows you to move a datasource from one environment to another. The **Attach DataSource** option is available in the **Central Configuration**.

A DataSource can have multiple repositories. For more information on repositories, see Create a Repository.

Refer Farm Recovery, if you want to move Farm Database.

Note: Ensure to use the same passphrase across the DataSource being moved from one environment to another.

Steps to Perform Attach DataSource

The following are steps to perform attach datasource:

1. Backup and restore the repository database from source to destination database server.
2. Navigate to **Central Configuration**.
3. Create the datasource with the backed up database. For more information, see Create a Repository DataSource.
4. Create the repository with the datasource created in **Step 3**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Select the **Attach DataSource** option.

   All the repositories associated to the selected datasource will be listed under **Repositories in the selected datasource** option.
6. Select a repository and enter name for the new repository.

   This name can be same as the name in the source machine or different from the source machine which is not listed in the destination machine.
7. Select a resource provider for the new repository.

   The resource provider should be same as of the previous one.

   If the repository is associated with multiple providers or a single provider, then select **Attach Providers** check box from the **Resource Provider**.
8. Select other default options and click **OK**.

   This will copy the repository details of the source to destination machine.

Note:
-It is recommended not to change the resource provider while performing **Attach DataSource**.

-AVEVA Work Tasks product version, including Hotfix, if any, should be same between Source and Destination.

-It is recommended not to perform **Attach DataSource** when the backup database has large transactional records. The completed records must be archived periodically.

User Scenarios

This section provides information on the following user scenarios and their solutions:

- A user develops a solution using AVEVA Work Tasks in the source machine and then deploys the solution to the destination machine.
- An operational production solution on AVEVA Work Tasks requires an upgrade to a new SQL server or supported operating system.
- Disaster recovery of an operational production solution in the event of system crash.
- For regulatory requirement, user needs BAM reports from an archived database.

Deploys a Solution from One Machine to Another

Description: A user develops a solution using AVEVA Work Tasks in the Source machine and then deploys the solution to the Destination machine.

Solution:

1. Create a backup of the repository database from the source machine.

   Example: Consider Database Name as “**TelematicsDB**”, Backup Filename as “**TelematicsDBBackup.bak**”, and Repository name as “**TelematicsRepo**”.
2. Restore the backed up database in the destination machine.

   Example: After restoring “**TelematicsDBBackup.bak**” in the destination machine, “**TelematicsDB**” database

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

will be created.

3. Create a new DataSource in the destination machine and use the same database created in **Step 2**.

   Example: Create a DataSource with name "**TelematicDataSource**" with the "**TelematicsDB**" database.
4. Create a new repository and select the DataSource created in **Step 3**.
5. Choose the **Attach DataSource** option.

   This lists all the repositories in selected datasource.
6. Select the repository which needs to be copied and proceed with creating a repository.

   Example: Select "**TelematicsRepo**".

   This will copy the repository details of the source to the destination machine.

Also, refer Steps to Perform Attach DataSource.

Solution Requires an Upgrade

Description: An operational production solution on AVEVA Work Tasks requires an upgrade to a new SQL server or supported operating system.

Solution: For solution to this scenario, refer Deploys a Solution from One Machine to Another.

Disaster Recovery of a Solution

Description: Disaster recovery of an operational production solution in the event of system crash.

Solution: For solution to this case, refer Best Practices for Maintaining AVEVA Work Tasks Databases and Steps to Perform Attach DataSource.

BAM Reports from an Archived Database

Description: For regulatory requirement, user needs BAM reports from an archived database.

Solution:

1. Create a backup of the repository database from the source machine.

   Example: Consider Database Name as "**TelematicsDB**", Backup Filename as "**TelematicsDBBackup.bak**", and Repository name as "**TelematicsRepo**".
2. Restore the backed up database in the destination machine.

   Example: After restoring "**TelematicsDBBackup.bak**" in the destination machine, "**TelematicsDB**" database will be created.
3. Create a new DataSource in the destination machine and use the same database created in **Step 2**.

   Example: Create a DataSource with name "**ArchiveDataSource**" with the "**TelematicsDB**" database.
4. Create a new repository and select the DataSource created in **Step 3**.
5. Choose the **Attach DataSource** option.

   This lists all the repositories in selected datasource.
6. Select the repository which needs to be copied and proceed with creating a repository.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Example: Select “**TelematicsRepo**”.

This will copy the repository details of the source to the destination machine.

Also, refer Steps to Perform Attach DataSource.

Uninstall AVEVA Work Tasks

This section provides information on uninstalling Client, Server, Farm, and AVEVA Work Tasks.

- Uninstall Client
- Uninstall Server
- Uninstall Farm
- Uninstall AVEVA Work Tasks

Uninstall Client

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
2. Right-click Farm Configuration Wizard, and then click **Run as administrator**.
3. Click **Next**.

   The Edit **AVEVA Work Tasks** Farm settings screen appears.
4. Click **Uninstall Client**.
5. Click **Next**.

   The message about successful uninstallation of AVEVA Work Tasks Client appears.

Note: Uninstalling the Client makes the Enterprise Console unavailable. The underlying repositories and workflows will continue to exist and function.

For more information about complete uninstallation of AVEVA Work Tasks, see Uninstall AVEVA Work Tasks.

Uninstall Server

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click Farm Configuration Wizard.

   The Welcome to the **AVEVA Work Tasks** Farm Configuration Wizard page appears.
2. Click **Next**.

   The Edit **AVEVA Work Tasks** Farm settings page appears.
3. Select **Uninstall Server**.
4. Click **Next**.

   A message appears indicating that you will not be able to connect to any Repository from the current server and all the Services will be unprovisioned.
5. Click **Yes**.

   A message indicating *Uninstalled Server successfully* appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Click **OK**.

Note: Uninstalling the Server does not remove the Farm database and the Repository database. However, it removes the Service, Server, Farm, Data Source, Repository, Service Mapping, and Repository Mapping entries from the Farm database.

For a complete information about uninstalling AVEVA Work Tasks, see Uninstall AVEVA Work Tasks.

Uninstall Farm

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then select **Farm Configuration Wizard**.
2. Right-click **Farm Configuration Wizard**, and then click **Run as administrator**.

   The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** screen appears.
3. Click **Next**. The MSDTC settings are verified.
4. Click **Yes** to continue with current MSDTC settings.

   The Edit **AVEVA Work Tasks** Farm settings window appears.
5. Select **Uninstall Server**.
6. Click **Next**.

   A message appears indicating that you will not be able to connect to any Repository from the current server and all the Services will be unprovisioned.
7. Click **Yes**.

   A message indicating *Uninstalled Server successfully* appears.
8. Click **OK**.

   The Farm is uninstalled successfully.

Uninstall AVEVA Work Tasks

Before uninstalling AVEVA Work Tasks, ensure to complete the following:

1. Uninstall all the associated connectors and extensions.
2. Uninstall the Farm. For more information, see Uninstall Farm.

   If you start the uninstallation of AVEVA Work Tasks before uninstalling the Farm, then the dialog box appears showing the steps to uninstall AVEVA Work Tasks.
3. Click **OK**.

   In this scenario, you have to uninstall the Farm and then uninstall AVEVA Work Tasks.

To uninstall AVEVA Work Tasks

1. Go to **Control Panel**, and click **Add or Remove Programs**.

   The Add or Remove Programs screen appears.

   Based on the Windows version on your computer, this screen might be different.
2. Select the appropriate version of **AVEVA Work Tasks**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Click **Uninstall** or **Remove** to begin the uninstallation.

   A message appears asking your confirmation to uninstall AVEVA Work Tasks.
4. Click **Yes**.

   The progress of uninstallation is displayed.

   A message appears indicating that the system will be restarted to update files and/or services.
5. Click **OK**.

   AVEVA Work Tasks is uninstalled successfully.
6. After uninstalling the AVEVA Work Tasks setup, the following folders will still remain in the installed folder. Remove these folders manually.
   - BIN folder (containing Licensing related files)
   - LOG folder (containing Log files)
   - BAMReports folder

Upgrading AVEVA Work Tasks

- You can upgrade to **AVEVA Work Tasks 2023 SP1** from the following version:
  - AVEVA Work Tasks 2023
- You can upgrade to **AVEVA Work Tasks 2023** from the following versions:
  - AVEVA Work Tasks 2020
  - AVEVA Work Tasks 2020 Update 1
  - AVEVA Work Tasks 2020 Update 2
- You can upgrade to **AVEVA Work Tasks 2020 Update 2** from the following versions:
  - AVEVA Work Tasks 2020
  - AVEVA Work Tasks 2020 Update 1
- You can upgrade to **AVEVA Work Tasks 2020 Update 1** from the following version:
  - AVEVA Work Tasks 2020
- You can upgrade to **AVEVA Work Tasks 2020** from the following versions:
  - Workflow Management 2019
  - Workflow Management 2019 Update 1

Upgrade Scenarios

The following are the upgrade scenarios:

- Upgrade in Standalone Environment
- Upgrade in Client - Server Environment
- Upgrade in Enterprise Server Environment

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Note

- The upgrade from AVEVA Work Tasks 2023 to AVEVA Work Tasks 2023 SP1 can be performed only after upgrading to AVEVA Work Tasks 2023 from any of the previous versions.

- This upgrade executes faster on computers with Windows Installer version 5.0. However, in computers with Windows Installer version 4.5 and lower, the upgrade process might take 40 to 45 minutes approximately, based on the configuration of the computer. This is due to the InstallValidate sequence which runs during the upgrade process and compares all the AVEVA Work Tasks 2023 files with AVEVA Work Tasks 2023 SP1 files.

Upgrade in Standalone Environment

In this scenario, the following AVEVA Work Tasks components are upgraded:

- Databases schema
- Repository properties
- List definitions
- Sites
- Services

Delete **WorkTasksTemp** and **AVEVA Work Tasks Cache** files from the client computer.

For information about the upgrade procedure, see Upgrade Procedure.

Upgrade in Client - Server Environment

Upgrade on Server Machine

In Server machine, the **AVEVAWorkTasksUpgradeManager** will upgrade the following AVEVA Work Tasks components:

- Databases schema
- Repository properties
- List definitions
- Sites
- Services

Upgrade on Client Machine

In the Client computer, the **AVEVAWorkTasksUpgradeManager** upgrades the **AVEVA Work Tasks Sites**.

Upgrade in Enterprise Server Environment

Before starting the upgrade of Enterprise Server Environment, stop the AVEVA Work Tasks services on all the machines where Enterprise Server is configured.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Upgrade on Server Machine
- Upgrade on Client Machine

Upgrade on Server Machine

In an Enterprise Server computer, the **AVEVAWorkTasksUpgradeManager** upgrades the following AVEVA Work Tasks components:

- Databases schema
- Repository properties
- List definitions
- Sites
- Services

For information about the upgrade procedure, see Upgrade Procedure.

Upgrade on Client Machine

In the Client computer, the **AVEVAWorkTasksUpgradeManager** upgrades the AVEVA Work Tasks Sites of AVEVA Work Tasks.

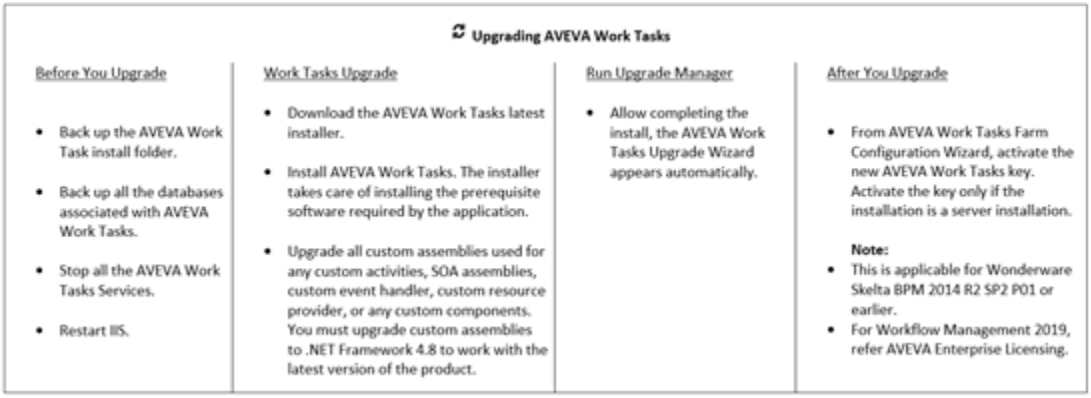
Note: In the **Enterprise Server Environment,** if a client computer upgrade is done, then the **Advance Server** service is manually installed on the client computer.

Use *installutil* command from Visual Studio command prompt to install the **Advance Server** service on the client computer.

For example, installutil –i "*C:**Program files**AVEVA**Work Tasks*\\Bin\AdvServr.NET2.exe".

Upgrade Procedure

The following image shows a graphical representation of the upgrade process of **AVEVA Work Tasks**:



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Before You Upgrade

Before you upgrade to the latest version of AVEVA Work Tasks, perform the following:

- Set up the computer to meet the requirements to run the installer of AVEVA Work Tasks.
- Back up the entire installed folder from the Install Path (For example: <Install Drive>:\Program Files\AVEVA\Work Tasks) and all the databases associated with the previous version of AVEVA Work Tasks. If there are any custom activities defined, you need to add these file details manually after the upgrade is complete.
- Create backup copies of all your existing databases, as the Database schema and content are changed during the upgrade process. Most databases provide a backup wizard or other user assistance for creating database backups. Contact your database administrator for more information.
- Upgrade all custom assemblies, such as custom activities, SOA assembles, custom event handler, custom resource provider, or any custom components to support .Net Framework 4.8 and to refer to the latest version of AVEVA Work Tasks assembly references.
- Ensure to use Connectors and Extensions, which are compatible with the latest version of AVEVA Work Tasks.
- Restart IIS.
- Perform the following tasks manually, if the **Upgrade Manager** fails to automatically complete any of these tasks. Ensure that you have Administrative privilege and sufficient rights to perform the following tasks.
  - Stop the following AVEVA Work Tasks services:
    - Client Service
    - Workflow Engine
    - Task Scheduler
    - Communication Service
    - Mobile Notification Service
    - To upgrade an Enterprise Server version, ensure to stop the Advance Server service.
    - To upgrade in a client computer, ensure to stop the Client service.
    - To upgrade in a client machine which is connected to an Enterprise Server, ensure to stop both the Advance Server service and Client service.
  - To stop IIS, run **Command Prompt** as an **Administrator**, type **iisreset /stop**, and then press **Enter**.
  - Delete the WorkTasksTemp folder from *C:\Windows\Temp*.
  - Delete the AVEVA Work Tasks Cache files and folders from *C:\Windows\Microsoft.NET\Framework64\v4.0.XXXXX\Temporary ASP.NET Files*.
  - Start the AVEVA Work Tasks related services.
  - To start IIS, run **Command Prompt** as an **Administrator**, type **iisreset /start**, and then press **Enter**.
- If you are using Oracle database for lookups, grids, or database activities, then ensure to reconfigure Oracle Data Handler.

Note: When you upgrade the product from earlier versions to AVEVA Work Tasks 2023 SP1, copy **TNSNAME.ORA** file from <Oracle Installation path>\NETWORK\ADMIN folder to the folders:
- <C:\Program Files\AVEVA\Work Tasks\Bin>
- <C:\Program Files\AVEVA\Work Tasks\Web\EnterpriseConsole\Bin>
- <C:\Program Files\AVEVA\Work Tasks\Web\EnterpriseConsole>

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Upgrading to AVEVA Work Tasks 2020

You can upgrade to AVEVA Work Tasks 2020 from Workflow Management 2019 and Workflow Management 2019 Update 1. However, if you want to upgrade from versions earlier than Workflow Management 2019, you must first upgrade to Workflow Management 2019 and then to AVEVA Work Tasks 2020.

When you upgrade the product to AVEVA Work Tasks 2020, the earlier product version is uninstalled and all the files are removed. Therefore, we recommend that you back up the files before upgrading the product.

Make sure that the user has appropriate rights for installing and upgrading software on the machine.

After the upgrade, you will see the following changes:

- The folder names are changed to reflect the new product naming.
- When you opt to back up the files during the upgrade process,
  - the CentralConfig.xml file is retained in the old Workflow Management install folder with a .bak suffix.
  - the BPM2019_Backup folder is created in the old Workflow Management install path. The existing Locales, Web, and WorkflowElements folders are moved to this backup folder.
- Workflow Management services are changed to AVEVA Work Tasks services.
- WorkflowManagementTemp and Workflow Management Cache files are removed from the machine.

Note: Customizations to files in Locales, Web, and WorkflowElements folders need to be applied again to the newly created files after upgrade.

To upgrade to AVEVA Work Tasks 2020

1. Run *AVEVA Work Tasks 2020.exe*.

   The installer splash screen, and then the Prerequisites installation screen appears.
2. Install the Prerequisites.

   Note: The system restarts after installing .NET Framework 4.8.
3. Click **Next** after installing the prerequisites.

   An alert message "*The installation process slows down when the installer backs up the Locales, Web, and WorkflowElements folders. Do you want the installer to take the backup?*" appears.
4. Perform one of the following:
   - Click **Yes** if you want the installer to take the backup.
   - Click **No** if you do not want the installer to take the backup.
   - If no option is selected, the installer waits for 20 seconds, and then continues the installation process without backing up the files.
5. Click **Next**.

   The system prompts you for the restart.
6. Click **OK** if you want to restart the machine.
7. After restart, on the InstallShield Wizard Completed dialog box, click **Finish**.
8. The **Upgrade Manager** automatically gets launched and performs the following tasks:
   - Stops the services and Application Pools.
   - Deletes the **WorkflowManagementTemp** and **Workflow Management Cache** files from the machine.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For more information on how to run the Upgrade Manager, see Run Upgrade Manager in the Administrator Guide.

You may be prompted to restart the machine. After the machine is restarted, launch the Upgrade Manager manually using AVEVAWorkTasksUpgradeManager.exe available in the <Installation Path>.

Notes:

- After the upgrade completes, the Work Tasks services and Application Pools start automatically.

- Work Tasks services names are changed. The new service name gets reflected after the restart of the machine. We recommend restarting the machine after running the Upgrade Manager.

- If the images do not appear properly in the upgraded **Enterprise Console** menu, ensure to update the images from the **Navigation Details** list.

a. Point to **admin**, and then click **Repository Settings**. The Repository Settings page appears.

b. Go to **Advanced Settings**, click **Manage Navigation List**. The Manage List appears.

c. Edit the **ImageName** in the NavigationLink Details window of the required Navigation Link item.

- The Default folder for the Attachments Storage Path in the Repository Settings is changed from C:\ProgramData\Workflow Management to C:\ProgramData\AVEVA Work Tasks.

- Clearing the browser cache on user machines where Enterprise Console is accessed is recommended for getting the (js, css, images, etc. files) changes to take effect after the upgrade. For more information on how to clear cache, see the Cache Refresh Settings section in the Administrator Guide.

Upgrading to AVEVA Work Tasks 2020 Update 1

You can upgrade to AVEVA Work Tasks 2020 Update 1 from AVEVA Work Tasks 2020. However, if you want to upgrade from versions earlier than AVEVA Work Tasks 2020, you must first upgrade to AVEVA Work Tasks 2020 and then to AVEVA Work Tasks 2020 Update 1.

When you upgrade the product to AVEVA Work Tasks 2020 Update 1, the earlier product version is uninstalled and all the files are removed. Therefore, we recommend that you back up the files before upgrading the product.

Make sure that the user has appropriate rights for installing and upgrading software on the machine.

When you upgrade the product to AVEVA Work Tasks 2020 Update 1, the existing files are overwritten by the latest files. Therefore, we recommend that you back up the files before upgrading the product.

Make sure that the user has appropriate rights for installing and upgrading software on the machine.

Note: Customizations to files in Locales, Web, and WorkflowElements folders need to be applied again to the newly created files after upgrade.

To upgrade to AVEVA Work Tasks 2020 Update 1

1. Run *AVEVA Work Tasks 2020 Update 1.exe*.

   The installer splash screen, and then the Prerequisites installation screen appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. Install the Prerequisites.

   Note: The system restarts after installing .NET Framework 4.8.

3. Click **Next** after installing the prerequisites.

   An alert message "*The installation process slows down when the installer backs up the Locales, Web, and WorkflowElements folders. Do you want the installer to take the backup?*" appears.

4. Perform one of the following:
   - Click **Yes** if you want the installer to take the backup.
   - Click **No** if you do not want the installer to take the backup.
   - If no option is selected, the installer waits for 20 seconds, and then continues the installation process without backing up the files.
5. Click **Next**.

   The system prompts you for the restart.

6. Click **OK** if you want to restart the machine.
7. After restart, on the InstallShield Wizard Completed dialog box, click **Finish**.
8. The **Upgrade Manager** automatically gets launched and performs the following tasks:
   - Opens **Cryptography Settings** window. Provide the **Passphrase** to proceed.
   - Stops the services and Application Pools.
   - Deletes the **WorkTasksTemp** and **Work Tasks Cache** files from the machine.

     For more information on how to run the Upgrade Manager, see Run Upgrade Manager in the Administrator Guide.

     You may be prompted to restart the machine. After the machine is restarted, launch the Upgrade Manager manually using AVEVAWorkTasksUpgradeManager.exe available in the <Installation Path>.

Notes:

- During AVEVA Work Tasks installation, if **Platform Common Service** and **Common Licensing API Framework** prompt to restart the machine, you can ignore and do a restart after completing installation. If you opt to restart the machine, the installation does not resume after a restart. You will have to run the installer to continue the installation.

- After the upgrade completes, the Work Tasks services and Application Pools start automatically.

- Clearing the browser cache on user machines where Enterprise Console is accessed is recommended for getting the (js, css, images, etc. files) changes to take effect after the upgrade. For more information on how to clear cache, see the Cache Refresh Settings section in the Administrator Guide.

- When you upgrade the product for the existing Web APIs in Azure Active Directory and AVEVA Connect repositories, the authentication mode will change to **Service to Service Access Token** authentication. For AVEVA Identity Manager, the authentication mode will be **User Access Token** authentication.

- If User Access Token is configured for the Web API and associated with Scheduler Event Association, the workflow fails.

- Deprecated SQL Server Management Objects (SMO) will not be removed from the system automatically.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Upgrading to AVEVA Work Tasks 2020 Update 2

You can upgrade to AVEVA Work Tasks 2020 Update 2 from AVEVA Work Tasks 2020 and AVEVA Work Tasks 2020 Update 1. However, if you want to upgrade from versions earlier than AVEVA Work Tasks 2020, you must first upgrade to AVEVA Work Tasks 2020 and then to AVEVA Work Tasks 2020 Update 2.

Make sure that the user has appropriate rights for installing and upgrading software on the machine.

When you upgrade the product to AVEVA Work Tasks 2020 Update 2, the existing files are overwritten by the latest files. Therefore, we recommend that you back up the files before upgrading the product.

Make sure that the user has appropriate rights for installing and upgrading software on the machine.

Note: Customizations to files in Locales, Web, and WorkflowElements folders need to be applied again to the newly created files after upgrade.

To upgrade to AVEVA Work Tasks 2020 Update 2

1. Run *AVEVA Work Tasks 2020 Update 2.exe*.

   The installer splash screen, and then the Prerequisites installation screen appears.
2. Install the Prerequisites.

   Note: The system restarts after installing .NET Framework 4.8.
3. Click **Next** after installing the prerequisites.

   An alert message "*The installation process slows down when the installer backs up the Locales, Web, and WorkflowElements folders. Do you want the installer to take the backup?*" appears.
4. Perform one of the following:
   - Click **Yes** if you want the installer to take the backup.
   - Click **No** if you do not want the installer to take the backup.
   - If no option is selected, the installer waits for 20 seconds, and then continues the installation process without backing up the files.
5. Click **Next**.

   The system prompts you for the restart.
6. Click **OK** if you want to restart the machine.
7. After restart, on the InstallShield Wizard Completed dialog box, click **Finish**.
8. The **Upgrade Manager** automatically gets launched and performs the following tasks:
   - Opens **Cryptography Settings** window. Provide the **Passphrase** to proceed.
   - Stops the services and Application Pools.
   - Deletes the **WorkTasksTemp** and **Work Tasks Cache** files from the machine.

     For more information on how to run the Upgrade Manager, see Run Upgrade Manager in the Administrator Guide.

     You may be prompted to restart the machine. After the machine is restarted, launch the Upgrade Manager manually using AVEVAWorkTasksUpgradeManager.exe available in the <Installation Path>.

Notes:

- During AVEVA Work Tasks installation, if **Platform Common Service** and **AVEVA Enterprise Licensing API Framework** prompt to restart the machine, you can ignore and do a restart after completing installation. If you

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

opt to restart the machine, the installation does not resume after a restart. You will have to run the installer to continue the installation.

- After the upgrade completes, the Work Tasks services and Application Pools start automatically.

- Clearing the browser cache on user machines where Enterprise Console is accessed is recommended for getting the (js, css, images, etc. files) changes to take effect after the upgrade. For more information on how to clear cache, see the Cache Refresh Settings section in the Administrator Guide.

- Deprecated SQL Server Management Objects (SMO) will not be removed from the system automatically.

- SAP Connection list will not be present after upgrade. Workflows with SAP activities will be replaced with dummy activities and the workflows may not get executed properly.

Upgrading to AVEVA Work Tasks 2023

Upgrading Scenarios

You can upgrade to AVEVA Work Tasks 2023 from the following versions:

- AVEVA Work Tasks 2020
- AVEVA Work Tasks 2020 Update 1
- AVEVA Work Tasks 2020 Update 2

However, if you want to upgrade from versions earlier than AVEVA Work Tasks 2020, you must first upgrade to AVEVA Work Tasks 2020, and then to AVEVA Work Tasks 2023.

Make sure that the user has appropriate rights for installing and upgrading software on the machine.

Upgrading to AVEVA Work Tasks 2023

When you upgrade the product to AVEVA Work Tasks 2023, the earlier product version is uninstalled and all the files are removed. Therefore, we recommend that you back up the files before upgrading the product.

After the upgrade, you will see the following changes:

- When you opt to back up the files during the upgrade process,
  - the CentralConfig.xml file is retained in the old AVEVA Work Tasks install folder with a .bak suffix.
  - the AWT2020_Backup folder is created in the old AVEVA Work Tasks install path. The existing Locales, Web, and WorkflowElements folders are moved to this backup folder.
- AVEVA WorkTasksTemp and AVEVA Work Tasks Cache files are removed from the machine.

Note:
- Customizations to files in Locales, Web, and WorkflowElements folders need to be applied again to the newly created files after an upgrade.
- The SAP Connection list will not be present after an upgrade. The workflows with SAP activities will be replaced with dummy activities, and the workflows may not get executed properly.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to Upgrade

1. Run *AVEVA Work Tasks 2023.exe* to upgrade to AVEVA Work Tasks 2023.

   The installer splash screen, and then the Prerequisites installation screen appears.
2. Install the Prerequisites.

   Note: The system restarts after installing .NET Framework 4.8.
3. Click **Next** after installing the prerequisites.
4. Perform one of the following:
   - Click **Yes** if you want the installer to take the backup.
   - Click **No** if you do not want the installer to take the backup.

     The installer waits 20 seconds for any input and continues the installation process without backing up the files if no user input is provided.
5. Click **Next**.

   The system prompts you for the restart.
6. Click **OK** if you want to restart the machine.
7. After restart, on the InstallShield Wizard Completed dialog box, click **Finish**.
8. The **Upgrade Manager** automatically gets launched and performs the following tasks:
   - Opens **Cryptography Settings** window. Provide the **Passphrase** to proceed.

     Note: While upgrading the product from AVEVA Work Tasks 2020 to AVEVA Work Tasks 2023, you are prompted to provide a **Passphrase**.
     But the Passphrase is not needed while upgrading from
     - AVEVA Work Tasks 2020 Update 1 to AVEVA Work Tasks 2023
     - AVEVA Work Tasks 2020 Update 2 to AVEVA Work Tasks 2023
   - Stops the services and Application Pools.
   - Deletes the **WorkTasksTemp** and **Work Tasks Cache** files from the machine.

     For more information on how to run the Upgrade Manager, see Run Upgrade Manager in the Administrator Guide.

     You may be prompted to restart the machine. After the machine is restarted, launch the Upgrade Manager manually using AVEVAWorkTasksUpgradeManager.exe available in the <Installation Path>.

Notes:
- During AVEVA Work Tasks upgrade, if **Operations Control Logger, Platform Common Service**, and **Common Licensing API Framework** prompt to restart the machine, you can ignore and do a restart after completing installation. If you opt to restart the machine, the installation does not resume after a restart. You will have to run the installer to continue the installation.

- After the upgrade completes, the Work Tasks services and Application Pools start automatically.

- It is recommended to clear the browser cache on the machines where Enterprise Console site is accessed to get the (js, css, images, etc. files) changes to take effect after the upgrade. For more information on how to clear cache, see the Cache Refresh Settings section in the Administrator Guide.

- Deprecated SQL Server Management Objects (SMO) will not be removed from the system automatically.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Upgrading to AVEVA Work Tasks 2023 SP1

Upgrading Scenarios

You can upgrade the product to AVEVA Work Tasks 2023 SP1 from AVEVA Work Tasks 2023. However, if you want to upgrade from versions earlier than AVEVA Work Tasks 2023, you must first upgrade to AVEVA Work Tasks 2023 and then to AVEVA Work Tasks 2023 SP1.

When you upgrade the product to AVEVA Work Tasks 2023 SP1 from versions earlier than AVEVA Work Tasks 2023, you cannot proceed with the upgrade process. The prerequisites for AVEVA Work Tasks 2023 SP1 get installed which are not compatible with the earlier product version's prerequisites, and you cannot revert the changes. Hence, before you start upgrading, backup all the files of the installed product version in case you want to revert. Also, make sure earlier versions of the product are upgraded to AVEVA Work Tasks 2023 before upgrading to AVEVA Work Tasks 2023 SP1.

Upgrading to AVEVA Work Tasks 2023 SP1

The upgrade will overwrite all files. Therefore, we recommend that you back up the files before upgrading the product.

Make sure that the user has appropriate rights for installing and upgrading software on the machine.

Note:
- Customizations to files in Locales, Web, and WorkflowElements folders need to be applied again to the newly created files after an upgrade.

Steps to Upgrade

1. Run *AVEVA Work Tasks 2023 SP1.exe* to upgrade to AVEVA Work Tasks 2023 SP1.

   The installer splash screen, and then the Prerequisites installation screen appears.
2. Install the Prerequisites.

   Note: The system restarts after installing .NET Framework 4.8.
3. Click **Next** after installing the prerequisites.
4. Perform one of the following:
   - Click **Yes** if you want the installer to take the backup.
   - Click **No** if you do not want the installer to take the backup.

     The installer waits 20 seconds for any input and continues the installation process without backing up the files if no user input is provided.
5. Click **Next**.

   The system prompts you for the restart.
6. Click **OK** if you want to restart the machine.
7. After restart, on the InstallShield Wizard Completed dialog box, click **Finish**.
8. The **Upgrade Manager** automatically gets launched and performs the following tasks:
   - Stops the services and Application Pools.
   - Deletes the **WorkTasksTemp** and **Work Tasks Cache** files from the machine.

     For more information on how to run the Upgrade Manager, see Run Upgrade Manager in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Administrator Guide.

You may be prompted to restart the machine. After the machine is restarted, launch the Upgrade Manager manually using AVEVAWorkTasksUpgradeManager.exe available in the <Installation Path>.

Notes:
- During AVEVA Work Tasks upgrade, if **Platform Common Service** and **AVEVA Enterprise Licensing** prompt to restart the machine, you can ignore and do a restart after completing installation. If you opt to restart the machine, the installation does not resume after a restart. You will have to run the installer to continue the installation.

- After the upgrade completes, the Work Tasks services and Application Pools start automatically.

- Clearing the browser cache on user machines where Enterprise Console site is accessed is recommended for getting the (js, css, images, etc. files) changes to take effect after the upgrade. For more information on how to clear cache, see the Cache Refresh Settings section in the Administrator Guide.

- Deprecated SQL Server Management Objects (SMO) will not be removed from the system automatically.

Run Upgrade Manager

After completing the upgrade, the **AVEVA Work Tasks Upgrade Wizard** appears automatically.

1. In the **AVEVA Work Tasks** Upgrade Wizard, click **Next**.
   The **AVEVA Work Tasks** Upgrade Progress window appears.
2. Click **Update** to continue with the upgrade.
3. Click **Close**.
   A message appears to restart the computer.
4. Restart the computer for the changes to take effect.
5. Check if the IIS is running. If not, manually restart the IIS.

Upgrading AVEVA Work Tasks in Silent Mode

You can upgrade to AVEVA Work Tasks 2023 SP1 in silent mode from AVEVA Work Tasks 2023. However, if you want to upgrade from versions earlier than AVEVA Work Tasks 2023, you must first upgrade to AVEVA Work Tasks 2023 and then to AVEVA Work Tasks 2023 SP1.

Prerequisites to Upgrade AVEVA Work Tasks in Silent Mode

1. Stop all the services.
2. Stop IIS.
3. Delete the WorkTasksTemp and Cache files from the computer.
4. Ensure that all the prerequisites are installed. For more information about installation prerequisites, see Installation Prerequisites.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configure License Server Details in Silent Mode Using XML

After installing or upgrading AVEVA Work Tasks in silent mode, you have to configure the license server.

For more information about parameters in the **WWSKBPMConfig.xml** configuration file, see Configure in Silent Mode Using XML.

1. Open the **WTLogger Console**.
2. Browse to the "Bin" folder, which is available in the path where the product is installed.
3. Open the **WWSKBPMConfig.xml** file.
4. In the XML file, pass the values for the following parameters.
   - **ConfigurationType**: Enter the value as **AVEVALicensing**.
   - **LicenseServerName**: Enter the name of the License Server.
   - **LicenseServerPort**: Enter the port number used by the License Server.
5. Save the XML file.
6. Run the **AVEVAWorkTasksConfigurator.exe**.

   The configuration progress is displayed in the **WTLogger Console**.

   Note: If there are any errors while updating the license server details in silent mode, these exceptions are not logged in the **WTLogger Console**.

Upgrading in Silent Mode Using Installer

You can upgrade to AVEVA Work Tasks 2023 SP1 in silent mode from the following version:

- AVEVA Work Tasks 2023

Upgrade Procedure

The syntax for running the AVEVA Work Tasks upgrade installer from the command line is as follows:

<Installer EXE Name>.exe /S /v/qn

For example: AVEVA Work Tasks 2023 SP1.exe /S /v/qn

where:

- /S denotes silent install
- /v denotes pass arguments to Msiexec (Basic MSI and InstallScript MSI projects). The /v option is used to pass command line options and values of public properties to Msiexec.exe.
- /qn denotes an msiexec switch indicating to run with no user interface (UI).

This command string takes the default values for parameters, such as user name, installation location, and company name.

This command considers the default settings for the upgrade. The installer automatically detects the current installation path and then performs the upgrade in the same path. For example: If the product was installed in a custom path, then the upgrade also happens in the same custom path.

The progress of the silent mode upgrade will not be displayed in the Command Prompt. However, the upgrade continues in the background. If you want the Command Prompt to be in waiting mode till the upgrade is

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

complete, execute the following command in a **.bat** file.

```
echo off
AVEVA Work Tasks 2023 SP1.exe /S /v/qn
if %ERRORLEVEL% EQU 0 (
echo AVEVA Work Tasks 2023 SP1 upgrade installation completed successfully.
)
```

Note: In scenarios where the AVEVA Work Tasks binaries/files are already open or are being used by any application, then the server might be automatically restarted after silent upgrade.

Upgrade in Silent Mode

Server Machine

You can upgrade to AVEVA Work Tasks 2023 SP1 in silent mode using the installer. After the assemblies and related resources are upgraded, you have to upgrade the Farm database, Repository database, and all the required configurations in silent mode, using **AVEVAWorkTasksSilentUpgradeManager.exe**.

Client Machine

You can upgrade the client machines in silent mode using **AVEVAWorkTasksSilentUpgradeManager.exe**. This EXE automatically detects whether the machine is a server or a client and then does the changes accordingly. After the upgrade is complete, Central Configuration and Enterprise Console are upgraded with the latest changes.

For more information about the return results for Upgrade, see Return Results for AVEVA Work Tasks Silent Upgrade.

To upgrade in Silent Mode

1. Open the Command Prompt in the Administrative mode.
2. Enter the path for the "Bin" folder, which is available in the path where the product is installed, and then press **Enter**.

   For example: CD <AVEVA Work Tasks 2023 SP1 Install Path>\Bin
3. On the Command Prompt, type **AVEVAWorkTasksSilentUpgradeManager.exe**.

   The progress of the upgrade is displayed in the **WTLogger Console**.

Return Results for AVEVA Work Tasks Silent Upgrade

1. Open a Notepad file and add the following script.

   ```
   echo off
   cd <AVEVA Work Tasks 2023 SP1 Installpath>\Bin\AVEVAWorkTasksSilentUpgradeManager.exe
   echo %ERRORLEVEL%
   ```
2. Enter the appropriate value for **<AVEVA Work Tasks Install path>**.

   For example: *C:\Program files\AVEVA\Work Tasks\Bin*
3. Save the file with **.bat** extension.
4. Open the Command Prompt in the Administrative mode.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

5. Type the path where the Batch file is saved, and then press **Enter**.
6. Type the name of the Batch file, and then press **Enter**.

   The return result of the **AVEVAWorkTasksSilentUpgradeManager.exe** is stored in the **%ERRORLEVEL%** variable. The return result will be one of the following:

   - **0** - If the upgrade procedure is successful.
   - **1** - If the upgrade procedure failed.
   - **2** - If multiple instances of **AVEVAWorkTasksSilentUpgradeManager.exe** are running.

Use an Existing Website

1. In Services/Global Settings page, select **Custom Settings**.

   By default, for custom settings, Website, Central Configuration, and Enterprise Console nodes will not be checked.
2. Select the above mentioned tree nodes, and then click **Next**.

   The Global Settings page appears.
3. Click **OK**.

   The Central Configuration Settings window appears.
4. Click the icon against **Create at** text box in the Central Configuration Settings page.

   The IIS structure screen appears.
5. Select the desired S\site and click **OK**.

   The selected URL with the desired port number appears in the Central Configuration Settings Page.
6. Click **OK**.

   The Enterprise Console Settings page appears.
7. Click the icon against **Create at** text box.

   The IIS Structure gets displayed.
8. Select the desired site and click **OK**.

   The selected URL with the desired port number appears in the Enterprise Console Settings Page.
9. Click **Save**, so that Enterprise Console will get added to the Existing Enterprise Consoles grid and then click OK button.

Best Practices and Guidelines

This section provides information on the guidelines and the best practices to be followed while using AVEVA Work Tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Best Practices for Securing AVEVA Work Tasks

Introduction

Security is a core functional requirement that protects critical information from accidental or deliberate theft, leakage, integrity compromise, and deletion.

This document provides the best practices, which will help you define your security practices, and set of security policies and processes for your organization. This will ensure that the data and assets are protected while using AVEVA Work Tasks.

- Securing Application Websites
- Securing Data
- Securing Ports
- Securing using Users and Roles
- Securing Application Configuration
- Securing Webservers
- Managing List Data

Securing Application Websites

Use of https

Central Configuration and Enterprise Console of AVEVA Work Tasks are web-based applications.

- Central Configuration is meant only for administration purposes. However, it can be accessed by any user, if it is not protected. Therefore, Central Configuration needs to be protected by securing the sites.
- Enterprise Console is meant to be used by various users. However, it can also be accessed through internet. Therefore, Enterprise Console needs to be protected.
- Recommend use of Standard SSL certificate instead of self-signed SSL certificate.
- AVEVA Work Tasks supports TLS 1.2 version.

Securing Sessions

- Use Auto log off to secure sessions.

Ways to Minimize Security Threats

- Ensure to use ‘https’ to host Enterprise Console.
- Ensure to use SSL certificates.
- Ensure to encrypt AppSettings in the **web.config** file for Central Configuration and Enterprise Console.

  Note: If you want to edit the values in the **web.config** file, run the **Command Prompt** as an **Administrator** and type *C:\WINDOWS\Microsoft.NET\Framework64\v4.0.30319.*

  For example,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To decrypt the value, type
`aspnet_regiis -pd "<place holder for section name>" -app "/<place holder for application name>" -site <place holder for site number>`

To encrypt the value, type,
`aspnet_regiis -pe "<place holder for section name>" -app "/<place holder for application name>" -site <place holder for site number> -prov "DpapiProtectedConfigurationProvider"`

where,
`<place holder for section name>` is section of the **web.config** file to be encrypted or decrypted
`<place holder for application name>` is application name (e.g. CentralConfig, EnterpriseConsole)
`<place holder for site number>` is site number to which AVEVA Work Tasks is bound to (e.g. site number is 2 for Enterprise Console)

For more information, refer Protected Configuration Provider.

Securing Data

Eliminating Database Security Threats

AVEVA Work Tasks is a highly database dependent application. The back end database is SQL Server.

- Ensure to protect the database with proper security measures.
- Keep periodic backups for any eventuality.

Ways to Minimize Security Threats on Database

- Protect the database server with limited access.
- Ensure to limit the database access rights only to the authorized users.
- Provide only required rights to the maintenance team.

Securing Ports

Eliminating Threat on Ports

AVEVA Work Tasks application depends on certain ports for communication. System uses TCP / UDP for communication. Packets of data move from or towards these ports.

Hackers are constantly trying to discover new ways to connect to machines so that they can install backdoors for later re-entry, trojans to collect financial details, or botnet clients.

There are different kinds of threats such as denial of service, men in the middle attack, and so on. The entry point for each of these attacks is a port.

Therefore, protecting these ports without affecting the functionality is the responsibility of the user.

Ways to Minimize Threat on Ports

- There are multiple ways to minimize threats on ports. These details are not in the scope of this document. It is recommended to refer to the industry standard mechanisms to minimize the threats on ports.

Note: For more information about the ports used by the system, refer the ‘Setting up Ports’ section in the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Administrator Guide.

Securing Access using Users and Roles

Eliminating Unauthorized Access

AVEVA Work Tasks provides authorization to secure data on every level. You can protect data with proper authorization.

Forms customization through scripting can introduce security vulnerabilities if the End-Users who author those scripts are unfamiliar with Secure Coding principles or are acting maliciously. Forms Designer permission role should only be assigned to users who are trusted not to abuse the system and are familiar with secure coding principles.

Ways to Secure Access

- Provide only accurate access to different users based on their usage.
- Provide role-based access to features.

Note: For Security-related information, refer the 'Security Framework' section in the *User Guide* .

Securing Application Configuration

Eliminating Threats on Application Configuration

Farm Configuration is the base configuration for AVEVA Work Tasks. Ensure that the system and the access to configuration are protected, by providing access to the Farm Configuration only to Administrators.

Ways to Protect Farm

- Ensure that the system can be access only by authorized users with Administrative privileges.

Ways to Protect Enterprise Console

- Ensure use of Active Directory provider or AIM configured with appropriate policy instead of AVEVA Work Tasks Repository provider.

Securing Webservers

To improve the AVEVA Work Tasks WebServers security, disable the weak ciphers and protocols .

You can use the tool IIS Crypto for enabling/disabling the protocols and weak ciphers. You need to restart the webserver after making the changes.

It is recommended to enable the following protocol and ciphers:

- Protocol - TLS 1.2 for server and client
- Ciphers - AES 128, AES 256

  Note: Assess the system for any impact on the other running applications before you enable/disable the protocols and ciphers.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Managing List Data

Eliminating threats on List Data

AVEVA Work Tasks provides List infrastructure to store data. Sensitive data can also be stored in the Lists. However, protecting this sensitive data is the responsibility of the organization and is important based on the business scenario.

- Ensure to protect sensitive and confidential information using adequate measures.

Ways to protect sensitive information

- Ensure to use password characters to show sensitive information.
- Enable audit trail to track repudiation.

Enhancing Security for Service Bus of Notification Bus

You can enable enhanced security for Azure Connections to enforce additional security at the service bus level.

For more information about enabling enhanced security, see Enabling Enhanced Security.

Conclusion

Ensure that the organization takes adequate measures to:

- Protect against information loss or leakage.
- Secure data, resources, and application.

Key Points

Ensure the following:

- Use https to host enterprise console.
- Protect the database with proper security measures.
- Provide role-based access to features.
- Protect the ports.
- Protect the system where services are running.

Enhancing Security of AVEVA Work Tasks Client Service running as Local System

AVEVA Work Tasks Client Service runs as a Local System and has higher privileges. It is used for:

- Quickflow configuration and deployment
- Service monitoring
- Package installation

To secure and run Client Service with the least privileges, you need to elevate the permissions through security settings for the Client Service.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To elevate the Client Service to run on Network Service,

1. Run the below command in the Command Prompt:

   ```
   netsh http add urlacl url=http://machinename:8863/ user="NT AUTHORITY\NETWORK SERVICE"
   ```

2. Restart the Client Service.

Note: You cannot configure and deploy Quickflow, perform Service Monitoring (or start other services), import and install the package if the Client Service is running as Network Service.

Improper Access Control List (ACL) in Custom Installation

In case AVEVA Work Tasks is installed in a custom path, the installation folder will inherit the access control restrictions of Program Files folder.

As a best practice to maintain security,

- Use the default path for installation
- Set ACL in case custom path is used for installation

Best Practices for Maintaining AVEVA Work Tasks Databases

A database must be maintained well in order to achieve optimum performance and reliability and high availability. A Database Professional has to perform the required maintenance tasks to achieve this. This document gives a brief of essential maintenance tasks to be performed for AVEVA Work Tasks software's database.

Note: It is highly recommended that a Database Professional performs the tasks mentioned in this document. The purpose of the document is to provide guidelines for maintenance activities. Essential maintenance tasks may vary based on specific implementation.

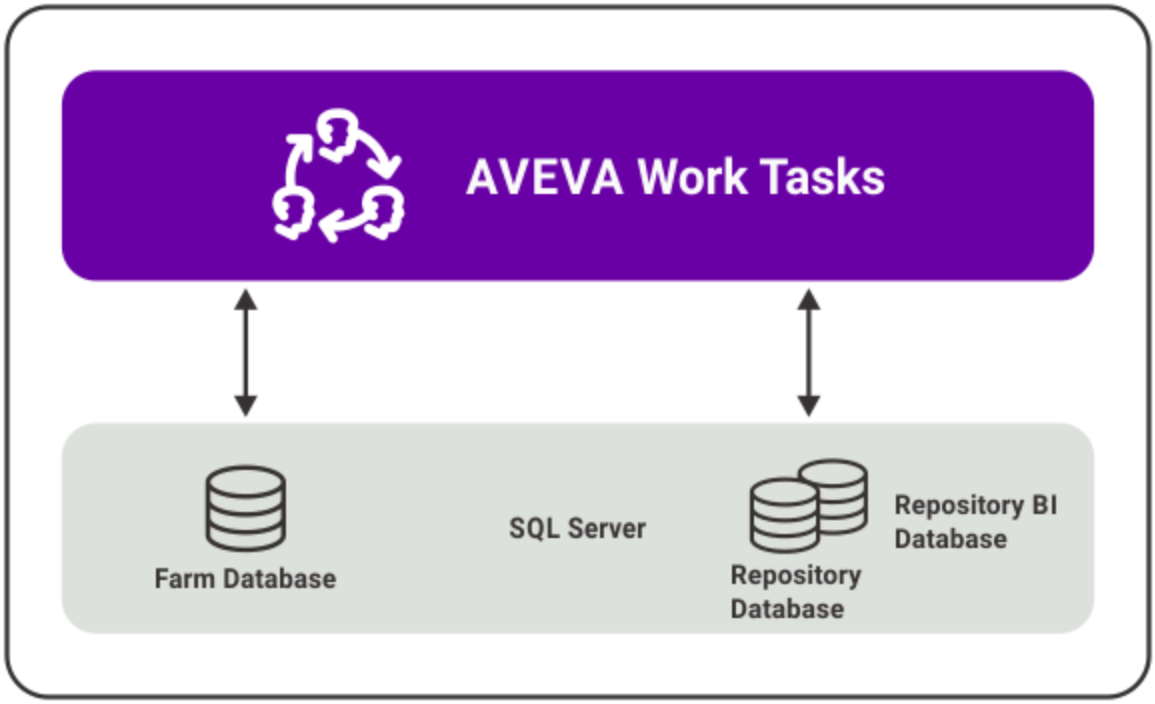
Databases in AVEVA Work Tasks

AVEVA Work Tasks uses the following databases.

- Farm Database in which the Farm Configuration settings are stored.
- Repository Database with tables pertaining to each repository.

The following figure displays the databases used by AVEVA Work Tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Maintenance Plan

Database maintenance includes a defined set of proactive tasks that a Database Professional needs to perform on a periodic basis to help ensure that their databases perform optimally and maintain high availability. In many cases, the individual maintenance steps taken might not, by themselves, seem all that important, but the accumulative effect of performing database maintenance tasks can be substantial.

Note: Under normal circumstances, it is recommended to perform the database maintenance tasks depending on the environment, intensity of transactions, and regulatory and organizational requirements.

The following sections describe some of the very important database maintenance tasks, which are categorized into high availability and optimum performance.

High Availability and Disaster Recovery

Backup and Restore

Protection of data is of prime importance to any organization. To protect the database, a proper disaster recovery plan and backup process should be in place. Based on the daily transactions count, full backup should be taken periodically, i.e. either Weekly or Daily.

Note: It is recommended to schedule a full backup and a transaction backup periodically, based on the transactions.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Managing MDF Files

An MDF file is a primary file to store the data of the database. Maintenance of the MDF file is important to get optimum performance and availability of the database. Ideally, the MDF file should be placed in an IO Device with the best IO throughput.

Pre-size the database based on the size requirement. For more information about database sizing, see Guidelines for Sizing Database.

You can also find out the size requirement by performing the following:

1. Watching the database growth for multiple weeks/months
2. Calculating the size for a longer period of time
3. Setting the database size in advance

The two major benefits of pre-sizing databases are:

- By pre-sizing databases, SQL Server would not have to depend on autogrowth to grow the database. This ensures that the performance is not affected when autogrowth occurs.
- Each autogrowth can contribute to physical file growth.

Managing LDF Files

An LDF file stores the database transactions that allow a database to be restored back to a specific point in time on any eventuality. SQL Server transaction log files are NTFS files that have a file extension of .ldf. A database can have multiple log files that reside on one or more drives. The growth of the file is based on transactions on to the database and maintenance strategies.

The backup strategy affects the growth of the LDF files. The LDF file size might increase when the database Recovery Mode is “Full”. Therefore, to reduce the LDF file size, it is recommended to schedule a Full Backup followed by incremental backups or to shrink the file size.

A Database Professional can achieve this using internal database commands such as **DBCC SHRINKFILE**.

Note: Ensure not to place the LDF file in the same drive as that of the MDF file.

Checking for Corruption

Corrupt databases are the worst nightmare of any Database professional. In any environment, from small business to enterprise, the compromise of integrity and availability of the data can constitute a business emergency or financial and reputation loss. Therefore, early detection and prevention of data corruption is essential, which can be achieved by meticulous planning. Ideally, the DBCC CHECKDB command should be run periodically to monitor the database corruption.

Data Corruption Detection

Following is a standard checklist used for data corruption and detection:

- List the “Page Verify Setting” for all of your Production and System Databases.
- Do you regularly and proactively check for potential database corruption.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- What method(s) do you use to identify potential database corruption.
- How often do you check for potential database corruption in each Production and System Database.
- List the average time taken to perform database corruption detection per database.
- Have you documented what you would do if data corruption is detected.

Eliminating Physical File Fragmentation

When the OS writes a file to disk, if continuous clusters are not available, the content is written elsewhere on the disk.

- When a file is stored in a non-contiguous manner on disk, the file is considered to be physically fragmented.
- Physical file fragmentation can contribute to an additional load on your I/O subsystem and reduce I/O performance because the disk has to work harder (thrash) to read and write data.

Ways to minimize physical file fragmentation:

- Ensure there is no physical file fragmentation before creating new database and log files.
- Pre-size MDF and LDF files instead of allowing autogrowth to automatically size files. This prevents physical file fragmentation.
- Regularly defragment arrays used for backups as they can become fragmented over time.

Physical File Fragmentation

The following need to be checked periodically.

- List the physical file fragmentation for every array with MDF, LDF, BAK, and TRN files.
- Monitor File Fragmentation
- Regularly perform Physical File Defragmentation
- What tool do you use to perform physical file fragmentation.
- Before creating or growing MDF or LDF files, do you check for Physical Fragmentation first.

Managing Indexes

AVEVA Work Tasks is a highly database dependent application. AVEVA Work Tasks has all the required indexes for ensuring optimum performance of the Workflow Engine. Since AVEVA Work Tasks can be extended by customization, the customized component may degrade the performance of AVEVA Work Tasks and its components. Therefore, it is advised that the indexing needs of the customized components and the extent of usage are looked into, from the performance perspective.

Custom tables are the tables created by the user for specific needs such as new custom Lists, custom application specific tables, and so on. For example, if an application uses AVEVA Work Tasks List infrastructure, then the users have to create indexes based on the custom tables.

You can use the database engine tuning advisor to arrive at the index requirement. Understanding the characteristics of your database, queries, and data columns can help you design optimal indexes.

It is also recommended to perform the following actions periodically:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Detect Index Fragmentation
- Fix Index Fragmentation
- Reorganize or Rebuild Indexes
- Create missing index
- Filter out unused indexes

Note: It is recommended to add only the required indexes, and avoid adding too many indexes.

Maintaining Statistics

SQL Server collects statistical information about indexes and column data stored in the database. These statistics are used by the SQL Server Query Optimizer to choose the most efficient plan for performing INSERT, SELECT, DELETE or UPDATE queries.

The statistical maintenance functionality of SQL Server, AutoStat, may generate unwanted overhead on a production system by performing one of the following actions:

- Initiating statistical updates during heavy production periods.
- Initiating an excessively high number of UPDATE STATISTICS processes at a given point in time.

Note: It is recommended to analyze the pros and cons before setting the statistics to the best desired mode and maintain it based on the requirement.

Statistics Maintenance

Following is a standard checklist used for index and statistics maintenance:

- What method(s) do you use to maintain Index and Column Statistics.
- How often do you run jobs to maintain Index and Column Statistics.
- If you use the REBUILD Method to Defragment Indexes, do you also update Statistics.
- If you use the REORGANIZE Method to Defragment Indexes, do you also update Statistics.
- If you update Statistics independent of Index Defragmentation, list the average time taken per database.
- Do you have “AUTO_UPDATE_STATISTICS_ASYNC” turned “On”. If Yes, list those databases.
- Do you use Filtered Statistics. If Yes, are they documented (SQL Server 2008).

Archiving Data

Increase in the AVEVA Work Tasks Database size inversely affects the performance of workflow execution. The database size can be reduced by archiving the data.

Note: It is recommended to archive the data based on year, financial year, or so on depending on business and regulatory requirements.

AVEVA Work Tasks archival script is available for SQL Server. Check with customer support for more details and for script.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Table Partitioning

SQL Server supports table and index partitioning. The data of partitioned tables and indexes is divided into units that can be spread across more than one file group in a database. The data is partitioned horizontally, so that groups of rows are mapped into individual partitions. All partitions of a single index or table must reside in the same database. The table or index is treated as a single logical entity when queries or updates are performed on the DB. This will provide better performance.

A remarkable performance improvement of AVEVA Work Tasks engine can be achieved in the SQL Server Enterprise versions using the SQL Server Table Partition feature.

Conclusion

These are the best practices for maintaining AVEVA Work Tasks Database. The implementation can be customized as per the requirement. Periodic database maintenance by a Database Professional or Expert is required to get optimum performance, reliability, and availability of the database.

The following are the key points for maintaining AVEVA Work Tasks Databases:

- Pre-size database based on transactions.
- Plan periodic database and log file backups.
- Manage indexes and maintain statistics.
- Archive database for exponential data growth if performance is affected.
- Follow a periodic and systematic backup strategy.
- Eliminate index fragmentation.
- Detect corrupted database pages.

Best Practice for Disabling Active Directory Users

Disable the user account in the Active Directory when the user is no longer associated with an organization or process. This makes the user account unusable until the user returns. As a best practice, the user accounts are often disabled for a period before deleting when the user leaves the organization.

Consider a scenario when Active Directory provider or AIM is used in the product for work item assignments, administrative, or system user accounts. The system considers only enabled users for Active Directory search and if the user information is used, the system may fail to access certain features. So before disabling a user in Active Directory, replace the user with an alternate user. To replace user with alternate user, see Replace User topic.

Best Practices for Handling Different Regional/Cultural Settings

The best practice to avoid issues related to different regional/cultural settings is to use the same collation and settings for all the instances used if you intended to develop content to be rolled out globally.

Consider a scenario where you have a centralized engineering team located in one region/country and the production sites globally. When you configure the Development or Test servers with specific regional and culture settings and roll out the solution to production site servers where the regional/culture setting is specific with that region, you may have some issues while working with AVEVA Work Tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Best Practice for Handling Cross Site Request Forgery in Custom Application

To handle Cross Site Request Forgery in custom applications, add the below code if you are using AVEVA Work Tasks 2020 or a later version:

- In case the webapp is not anonymous,

  ```
  AntiForgeryConfig.UniqueClaimTypeIdentifier = ClaimTypes.NameIdentifier;
  ```

- In the aspx page, under the form tag,

  ```
  <%=System.Web.Helpers.AntiForgery.GetHtml()%>
  ```

Guidelines for Sizing Database

This document explains the database growth pattern of AVEVA Work Tasks databases. It is intended to help the user understand about the disk space, memory, and processor speed requirements for best performance of AVEVA Work Tasks.

Note: The performance characteristics presented in this document are not to be interpreted as a benchmark measurement for all the supporting systems. Only empirical testing on the target system can provide accurate data. The actual database size, memory used, I/O required is based on the respective implementation, concurrent user access, and so on.

Overview

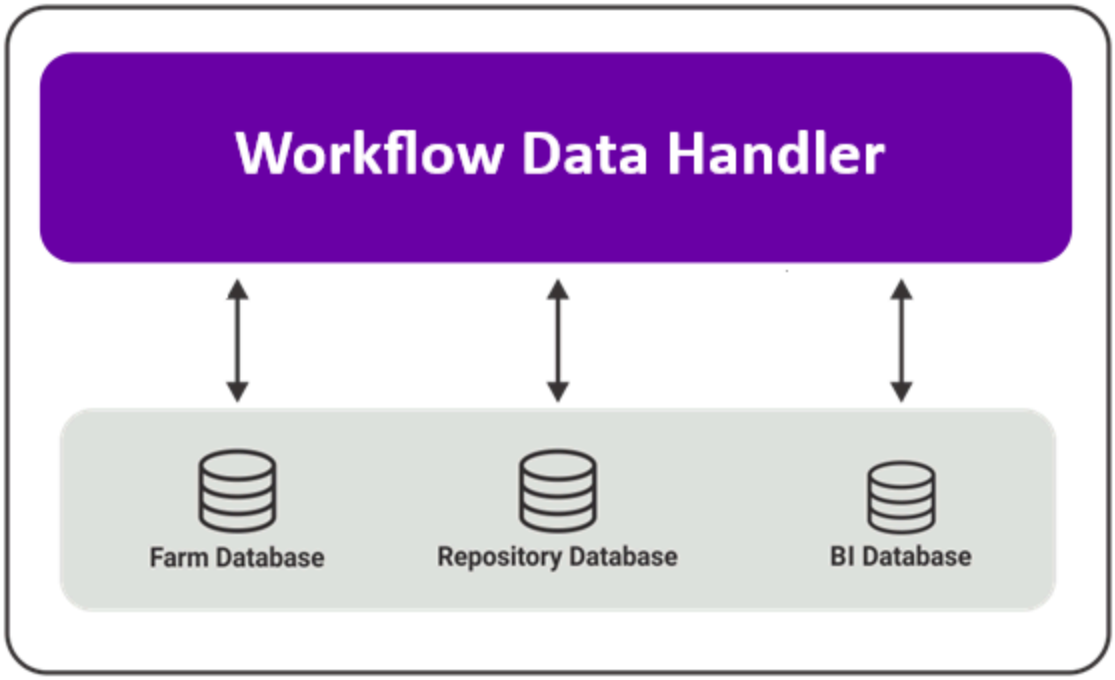
AVEVA Work Tasks supports different versions of Microsoft SQL Server to store operational data. The analysis for database sizing is done on Microsoft SQL Server 2008 (SP3) - 10.0.5512.0 (X64).

By default, AVEVA Work Tasks databases are set to grow in an "Auto growth" mode as SQL Server default settings. Based on the best practices recommended by Microsoft and database experts, you should set the size of the repository database depending on the transactions and growth pattern.

A database should be sized appropriately so that the database does not need to auto grow, but should be configured by the user when required. It is recommended to configure the **File Growth** value to fix growth, based on the database growth pattern.

A desirable approach is to have a separate disk for repository and farm database.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Note: It is highly recommended that a Database Professional performs the tasks mentioned in this document. The purpose of the document is to provide guidelines for sizing AVEVA Work Tasks database. Essential maintenance tasks may vary based on specific implementation.

Farm Database

The farm database is a configuration database, basically used to map repositories, support Enterprise Server configuration, and so on. The database may grow when there is a massive usage of communication activities, such as email and SMS.

Repository Database

The repository database is a database for the repository related data. All the operational data required for the application exists in the database to keep the database healthy. Data such as various activities related information, the list data, forms definition, and workflow definitions is stored in the repository database. The database growth always relates to the features, such as list and queue, used by the application.

BI Database

The BI database is a placeholder for future development on business intelligence reports and does not occupy any space.

Parameters that affect the performance of an application include the environment, various databases involved, kind of workflow, and number and types of activities. For database sizing, the prospective data is captured to show the database growth pattern based on a typical workflow having 72 activities with a combination of engine and human activities. The information of the environment on which the data is captured along with the workflow used is included.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Database Growth Pattern

Table Level Growth

Table level growth is purely based on the features and Workflow used. Based on the sample workflow, the table level record growth is as follows:

Table Name	Number of Records per 5000 instances	Number of Records per Instance	Remarks
SKChannelWorkItem	20000	4	
SKHWSActivity	20000	4	
SKWorkItem	20000	4	
SKWorkItemTransaction	20000	4	
SWActionEventLog	500000	100	
SWActionEventLong	500000	100	
SWExecute	5000	1	
SWExecutionDetails	360000	72	There are 72 activities for the workflow. Each activity has a record.
SWLong	5000	1	
SWVariables	45000	9	

Table Size

Farm Database

The details regarding the table size help in arriving at the maximum database growth pattern.

To calculate the storage needs, multiply the average row length and the number of records per month that will be entered into the database. This provides the details of the amount of storage required by each table. If a table has any variable length string fields, add 4 bytes to the average row length to account for overhead, which SQL Server requires when maintaining the table.

The following table shows different tables of the repository database and their size:

Table_name	Byte_Length
SKActivityNameConcurrency	1220
SKActivityTypeConcurrency	720

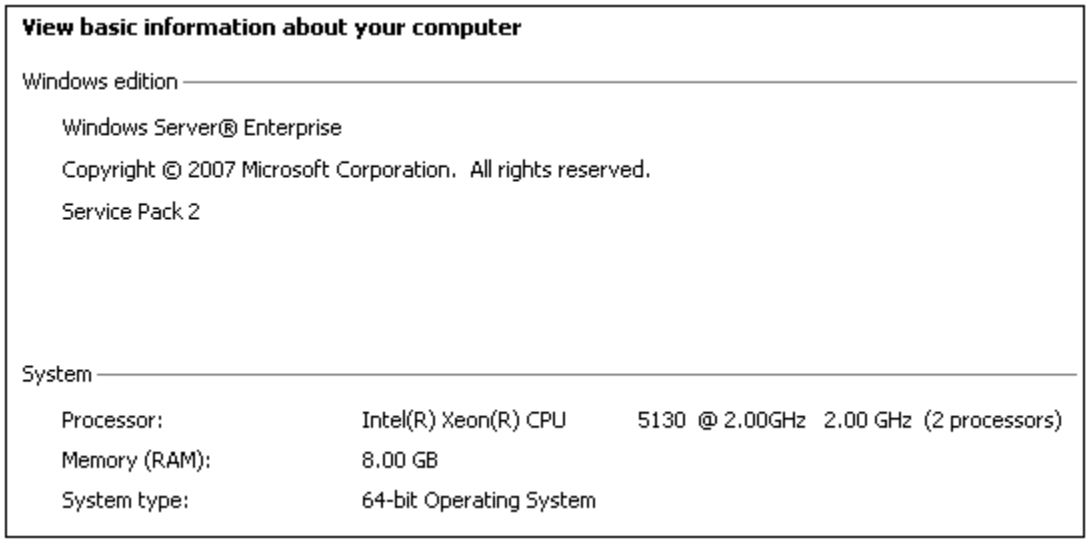
Environment

The environment used to capture the database sizing related information is the Enterprise server with two web server nodes, two workflow engine servers, and an SQL Server mentioned as Database Server. The system configuration of the environment is as follows:

Web Server Configuration

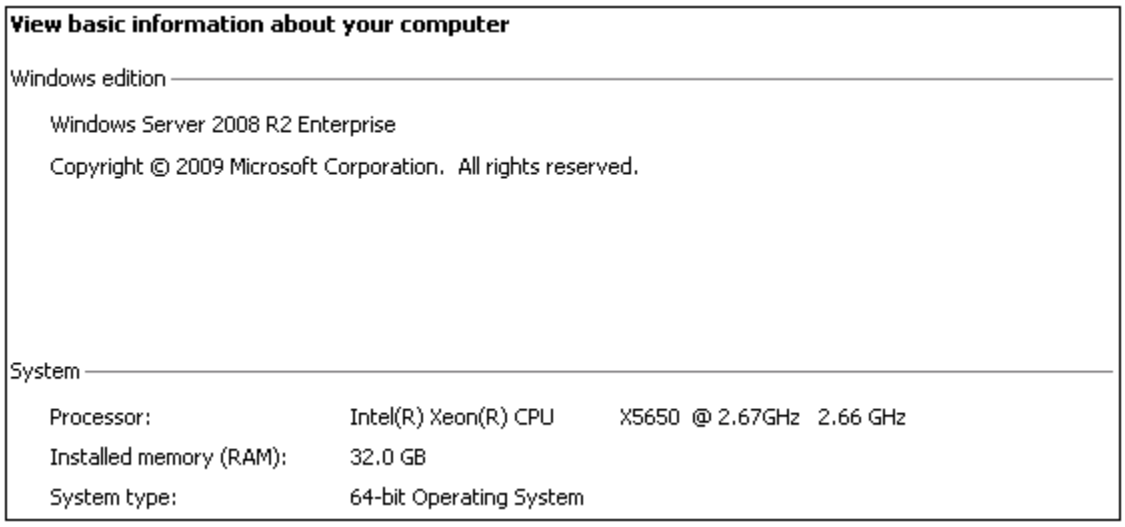


Engine Servers

The configurations for the engine servers are same as that of the Web Server.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Database Server

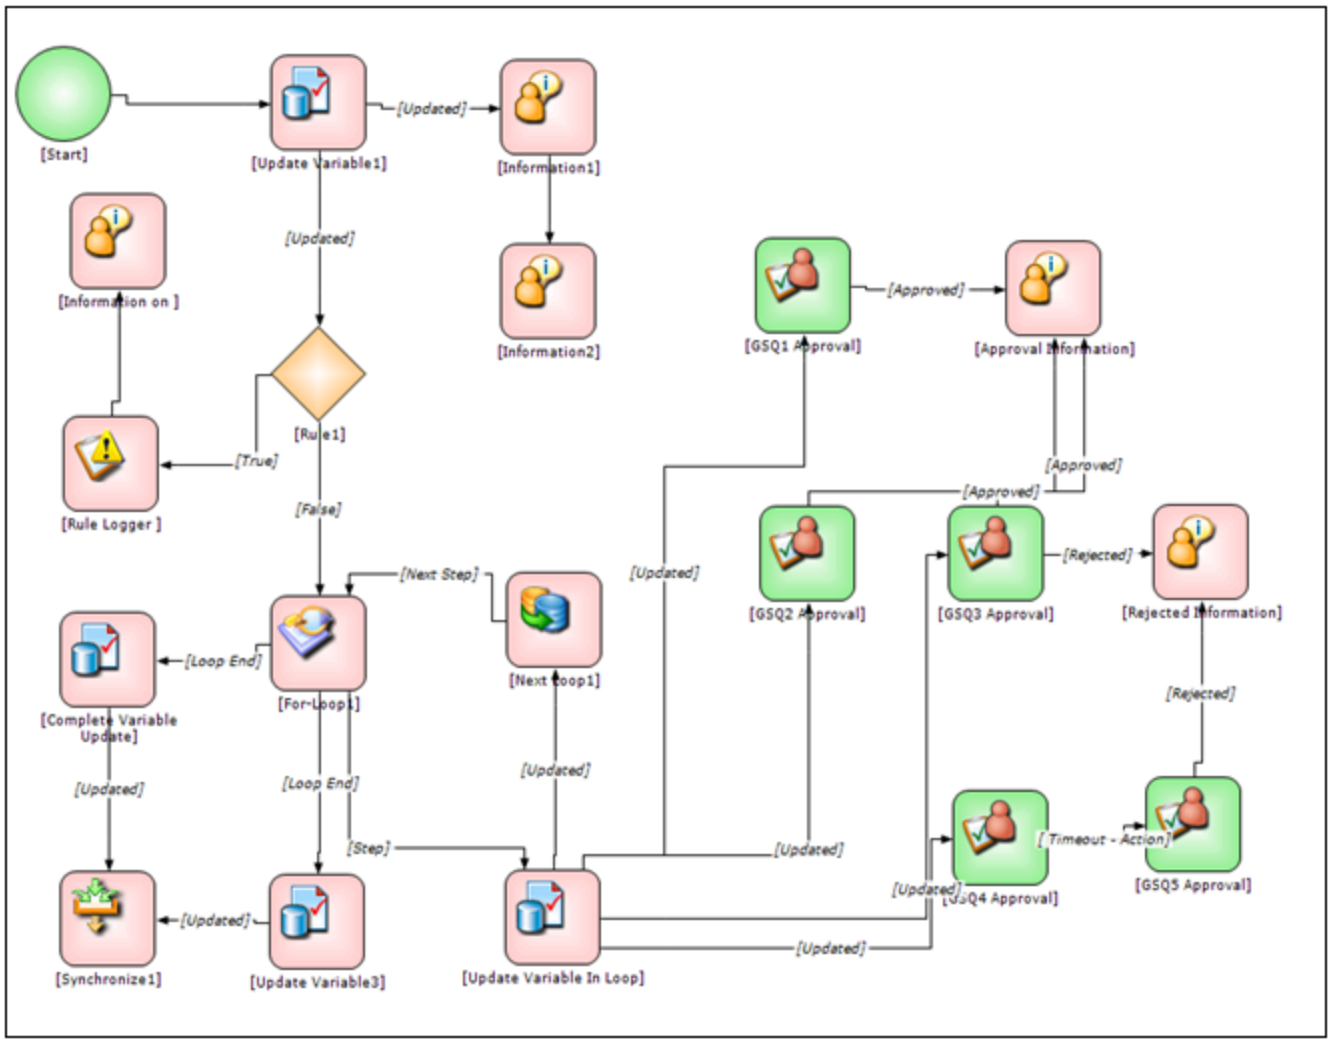


Server Startup Time	Aug 16 2013 4:30PM
Server Instance Name	SKELTARND2
Product Version	10.0.5512.0
Edition	Developer Edition (64-bit)
Windows ProcessID	2232
Active Sessions	1
Active Transactions	9
Active Databases	50
Total Server Memory (KB)	29810440

Workflow Used

The database growth pattern is captured based on the performance test workflows, which include 72 activities altogether and 5 queues with a combination of automatic dispatch pattern and manual pick. In parallel, work item tasks are assigned to the queues. The workflow diagram is as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



LogFile Size

Every SQL Server database has a transaction log, which records all the transactions and the database modifications made by each transaction. The transaction log must be truncated on a regular basis to keep it from filling up. However, some factors can delay log truncation. Therefore, monitoring log size is important. This can be achieved by logging some operations minimally to reduce their impact on transaction log size.

The transaction log is a critical component of the database. If there is a system failure, the transaction log is required for database recovery to bring the database back to a consistent state.

Note: Ensure that the transaction log is never deleted or moved without having a clear understanding of its effects.

For more information regarding management of log files, it is recommended to consult a Database Professional.

Number of Workflow instances	Log file Growth MB
433000	9697

478000	9697
483000	9697

TempDB

A temporary database is not directly used by AVEVA Work Tasks. However, the SQL Server internally uses this database for operations, such as sorting indexing. Therefore, it is recommended to maintain an ideal space for this database, to facilitate the above mentioned SQL server internal operations.

A default installation of any SQL Server edition will create a TempDB database with an 8MB data file and a 1MB transaction log file. For a lot of SQL Server installations, these file sizes are not sufficient. However, they are configured to auto grow by 10% as needed.

The auto grow feature enables a more hands-off approach to maintaining many SQL Server installations. However, this approach is not recommended because the database storage files cannot be used while they are autogrowing. This can lead to fragmentation of the files on the hard disk; thereby, leading to poor performance.

This recommendation is applicable to any SQL Server database, but it is even more relevant for the TempDB. When you restart your SQL Server instance, the TempDB is re-created (files will be reused if they already exist) and sized to the value specified in the database properties. The default values are 8MB for the data file and 1MB for the log file.

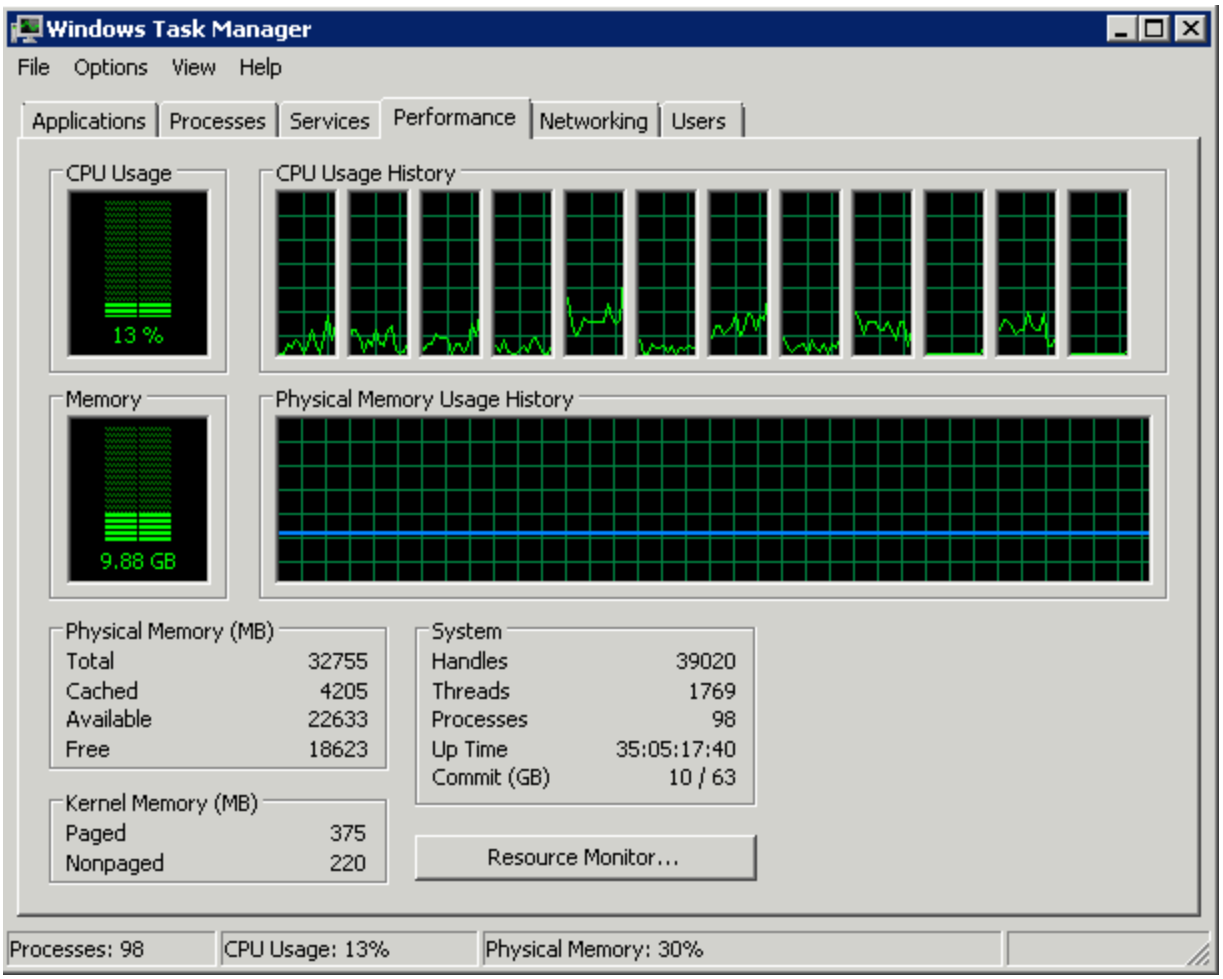
Note: The I/O operations are the most time consuming processes and the TempDb is being used exclusively by SQL Server for most of its operations. Therefore, it is recommended to have a separate disk for the TempDb than the operational database. A managed growth gives better performance. Please consult the Database Professional for the desired settings.

CPU Utilization

The CPU utilization on the database server is based on the queries or updates considered as a part of the workflow engine database activities. The CPU utilization varies with user interaction taken place as part of the UI activities. Various other parameters such as file fragmentation, I/O overheads, and so on also affect the CPU utilization. For more realistic information on the implementation, please consult a Database Professional.

Graph shows the CPU utilization.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



I/O Statistics

Reading and writing to the disk is the heart of any database management system. Input/Output (I/O) performance is critical for databases and can make or break an application. In many environments, I/O is the main bottleneck for the database performance. The main task of I/O is to retrieve and to store records within files. The I/O performance can be improved by analyzing the specific issues by a Database Professional. Various SQL Server reports are available for analyzing the I/O related performance. The I/O performance purely depends on the specific environment. Thus, providing a snapshot of the I/O statistics may not be helpful.

http://blogs.msdn.com/b/sqljourney/archive/2013/06/04/how-to-troubleshooting-sql-server-i-o-bottlenecks.aspx

http://www.quest.com/backstage/images/promotions/SQLServer-Perfmonance-Poster.pdf

Performance Matrix

Following are some of the important parameters to consider for database sizing. Ideally, an implementation should provide the following performance. Count values above the following are not advisable.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Area	Maximum Value	Type	Remarks
Number of Unattended Work items across queues	60000	Supported	Ideally there should not be this many items
Number of not acted Items in a Queue	15000	Supported	In the test environ 4 queues populated with 15000 items each
Execution Time in ms for an action on 100GB data	65	Threshold	Execution time in ms for an activity
Time taken in ms for 72 Actions on 100GB	4750	Threshold	Execution time in ms for a workflow instance
Number of execution of Workflow instance at any point of time on a Server	32	Threshold	At any point of time on any server, 32 instances of workflow can be running

Definitions

Term	Definition
Logfile	Database log file
TB	Tera Bytes
GB	Giga Bytes
MB	Mega Bytes
DB	Database

Special Notes

- Actual growth pattern will be based on the implementation.
- Set the size of the database for a better performance.
- Keep enough space in the SQL Server TempDB.
- Use 64-bit SQL server environment for better performance based on business requirement.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Actual server configuration purely depends on business requirement, such as concurrent users and workflow instances.
- Every implementation should have proper database management monitored by a Database Professional.
- I/O statistics must be monitored to check if it affects the actual performance an application.

Conclusion

The following values are approximate values, and might vary based on the implementation:

- Average Growth of Database per instance is **118.1726 KB**.
- Average Growth of Database per instance per Action is **1.641286 KB**.
- Database size requirement per day for a workflow having 10 activities and 100 instance is 1.6412 * 10 * 100 = 1641.2 KB, that is, **1.627MB** approximately.

Guidelines for Archiving Database

Introduction

Archiving and purging data from the production database helps in maintaining a healthy system, and also in keeping the archived data for future use. An archiving strategy is a plan that ensures that the correct data is archived in a correct way. Archiving without a strategy might result in poor overall system performance. The most successful archival implementations are those that are well-planned by taking several important aspects into account.

Assess your needs for archiving by answering the following questions:

- What data do we need to archive?
- When do we need to archive this data?
- How long do we need to maintain the archived data?
- Under which circumstances and how often will we need to retrieve archived data from either table archives or file archives?
- Do we require archived data that is stored in table archives to be moved to flat-file archives (i.e., do we require a multi-tier archiving strategy)?

Note: It is highly recommended that a Database Professional performs the tasks mentioned in this document. The purpose of the document is to provide guidelines for archiving AVEVA Work Tasks database. Essential maintenance tasks may vary based on specific implementation.
The Repository database and Farm database should reside on two different machines.

Benefits of Archiving

Archiving data reclaims disk space, lowers storage costs, reduces object maintenance, and improves the performance of active data.

The major benefits of archiving are interrelated. By reclaiming disk space that was consumed by inactive data, you can effectively lower your storage costs and reduce maintenance. As a result, access to your active data

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

becomes more efficient. When less data exists, utility processing requires less time; thereby, reducing the batch processing times.

In addition, lowering costs is the most important benefit of archiving your inactive data. Also, applications might experience improved performance and use less CPU, I/O, and memory resources, which results in further cost savings.

Archival Strategy for AVEVA Work Tasks Database

The Archiving Script is a database script used for removing the completed and aborted workflow data from the AVEVA Work Tasks databases. The main goal of archiving the databases is to ensure better performance by reducing the amount of data from the databases.

AVEVA Work Tasks has two databases – Repository database and Farm database.

To archive the databases, follow the steps given in:

- Archiving Repository Database
- Archiving Farm Database

The steps provided are applicable only if the product version is 4.3.4005.0 or later.

Archiving Repository Database

1. On executing the **AWTRepositoryArchivingScript.sql** script in the Repository database, the following tables and procedures are created.

Tables and Procedures	Description
SKDeleteTable	Table to store the ExecutionID and other details of the records to be deleted from the Repository database (Production database).
SKDeleteTableFor ArchiveDB	Table to store the ExecutionID and other details of the records to be deleted from the Archived database.
proc_SKInsertIntoSK DeleteTable	Procedure to insert ExecutionID, ProductionID, Application, Name, Data, LocalVariablesId, and ExecutionDetailsID into the SKDeleteTable table. **Note:** Records related to workflows with InternalStatus "FN" or "AB" will be inserted into the **SKDeleteTable** table.
proc_SKDeleteIn Batches	Procedure to delete all records of a table in batches, where the size of each batch size is 50000 records.
proc_SKDeleteFrom Production	Procedure to delete the Repository database records, and to update the 'Isdeleted' field of the **SKDeleteTable** table to 1, only if the delete was

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Tables and Procedures	Description
	successful. The procedure will delete workflow records with InternalStatus "FN" or "AB".
proc_SKDeleteFrom ArchivedDB	Procedure to delete workflow records, which have InternalStatus other than "FN" or "AB", from the Archived database. **Note:** Ensure that this procedure is executed only in the Archived database.
proc_SKSKDelete TableInArchiveDB	Procedure to insert ExecutionID, ProductionID, Application, Name, Data, LocalVariablesId, and ExecutionDetailsID into the **SKDeleteTableForArchiveDB** table. **Note:** - Records related to workflows with InternalStatus other than "FN" or "AB" will be inserted into the **SKDeleteTableForArchiveDB** table. - Ensure that this procedure is executed only in the Archived database.

Store the workflow data to be deleted from the Repository database in the **SKDeleteTable** table.

Execute the **proc_SKInsertIntoSKDeleteTable** procedure on the Repository database.

```
Exec proc_SKInsertIntoSKDeleteTable 'fromdate', 'todate', 'applicationname',
'executionstartid', 'executionendid'
```

Pass the parameters for the above procedure based on the workflow records to be deleted from the Repository database. Workflow data with InternalStatus ‘FN’ and ‘AB’ will be stored in the database. For example, to delete workflow records executed for a period of 2 years, execute the procedure as follows:

```
Exec proc_SKInsertIntoSKDeleteTable '01-01-2013', '12-31-2014', NULL, NULL, NULL
```

The above query will insert records between 01-01-2013 and 12-31-2014 with InternalStatus ‘FN’ and ‘AB’ into the SKDeleteTable table.

The records to be deleted are stored with ExecutionID, ProductionID, Application, Name, Data, LocalVariablesId, ExecutionDetailsID, and Isdeleted details in the SKDeleteTable table. Initially, the ‘Isdeleted’ field is ‘0’ for all the records to be deleted.

2. Store the workflow data to be deleted from the Archived database in the **SKDeleteTableFor ArchiveDB** table.

   Execute the **proc_SKSKDeleteTableInArchiveDB** procedure on the Repository database.

   ```
   Exec proc_SKSKDeleteTableInArchiveDB
   ```

3. Back up the Repository database.
4. Restore the above backup to new database. This can be the archived Repository database.
5. Delete the completed and aborted workflow instances related data from the Repository database tables.

   Execute the **proc_SKDeleteFromProduction** procedure on the Repository database to delete all the records similar to the ones that exist in the **SKDeleteTable** table. Workflow records with InternalStatus ‘FN’ or ‘AB’ will be deleted from database.

   Execute the following procedure:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

```
Exec proc_SKDeleteFromProduction
```

After the workflow records are deleted, the **Isdeleted** field of these records in the **SKDeleteTable** table is updated to '1'.

To delete 36118960 records, the system took approximately 39:25 minutes in a database of size 221121.63 MB. This time requirement will vary based on the system performance.

6. Delete the records other than that for the completed and aborted workflow from the Archived database.

   Execute the **proc_SKDeleteFromArchivedDB** procedure on the Archived database to delete all the Repository database table records that are available in the **SKDeleteTableForArchiveDB** table.

   Workflow records with InternalStatus other than 'FN' or 'AB' are deleted from the Archived database tables.

   Execute the following procedure :

   ```
   Exec proc_SKDeleteFromArchivedDB
   ```

Refer to the scenario explained in the Application Scenario section.

Archiving Farm Database

Note:
- Do not execute step 1 and step 2, if you have already executed while archiving Repository database and continue with step 3.
- If you want to archive only Farm database and do not want to archive the Repository database, then follow the archiving procedure from step 1.

1. Execute the **AWTRepositoryArchivingScript.sql** script in the Repository database.
2. Execute the **proc_SKInsertIntoSKDeleteTable** procedure in the Repository database. Refer the execution scripts given in Archiving Repository Database.
3. Execute the **proc_SKInsertIntoFarmTemptable** procedure on the Repository database.

   Note: Execute above procedure if the SQL Server system has restarted after step 2.

4. Execute the **AWTFarmArchivingScript.sql** script in the Farm database.

   The following tables and procedures are created on executing the above steps.

Tables and Procedures	Description
SKDeleteTableFarm	Table to store the ExecutionID and other details of the records to be deleted from the Farm database (Production database).
proc_SKDeleteFrom ProductionFarm	Procedure to delete the Farm database records, and to update the 'Isdeleted' field of the **SKDeleteTable** table to 1, only if the delete was successful. The procedure will delete workflow records with InternalStatus "FN" or "AB".
proc_SKDeleteFrom ArchivedFarm	Procedure to delete workflow records, which have InternalStatus other than "FN" or "AB", from the Archived database. **Note:** Ensure that this procedure is executed only in

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Tables and Procedures	Description
	the Archived database.
proc_SKDelete InBatches	Procedure to delete all records of a table in batches, where the size of each batch size is 50000 records.

5. Backup the Farm database.
6. Restore the above backup to new database. This can be the archived Farm database.
7. Execute the **proc_SKDeleteFromProductionFarm** procedure in Production Farm database.
8. Execute the **proc_SKDeleteFromArchivedFarm** procedure in Archived Farm database.

Archival Strategy for Custom Tables

The users are expected to create archiving script for custom tables.

Archival Strategy for Migrated Database

The users are expected to migrate to the appropriate versions of AVEVA Work Tasks databases before using the Archival Strategy.

Viewing BAM Reports for the Archived Database

- Use the **Attach Datasource** feature provided in Central Configuration to get the Archived database repositories.

  To attach existing archived repository datasource, do the following steps:

  1. Take a backup of the Archived database and recover this database in the Database Server. For example, the restored database name is BackedUpdatabase.
  2. Create a new Datasource and use the same database created in step a.

     Example: Datasource is created with the name ‘BackedupDatasource’. The restored database, named ‘BackedUpdatabase’, is used to create this datasource.
  3. Create a new repository for the datasource created in step b.
     a. Select the **Attach Datasource** check box. Select the datasource created in Step b. This will list all the repositories of the selected data source.
     b. Provide a name to the repository and continue with creating the repository. Ensure that the Resource Provider for the new repository is same as the Resource Provider of the archived repository selected from the drop-down list.

  Example: Select the **Attach Datasource** option. Select the BackedupDatasource from the **Repository DataSource** drop-down list. This will list all repositories of the BackedupDatasource. Select the repository which needs to be copied and then continue with repository creation. Ensure that the Resource Provider for the new repository is same as that of the Resource Provider selected for the archived repository.

  You can view the BAM reports for the newly created repositories from the Enterprise Console.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Application Scenario

Example Scenario

The following scenario explains the steps for the Archival Strategy.

Scenario Description

Consider a scenario where all workflow records related to employee leave details are stored in the database named Employees Leave Report. This database contains large amount of data, which affects the performance. Hence, all the completed and aborted workflow related data, which is not related to current financial year (2015), must be deleted from the database. A record of the deleted data must also be maintained in the Archived database.

This ensures that the Employees Leave Report database will have all the workflow related data for the current financial year (2015), and also all the executing or sleeping workflow related data for the previous financial years.

The Archived database will have only completed and aborted workflow instance records related to the previous financial years.

Scenario Application Details

The following application and workflow names are considered to describe this scenario effectively.

- Application Name/Repository Name: EmployeeRepo
- Workflow Name: LeaveReportWF

Consider that the **SWExecute** table contains the following entries. In this example, only few fields of the **SWExecute** table are considered.

ID	Production ID	Application	Name	InternalStatus	RequestedOn
1	1	EmployeeRepo	LeaveReportWF	FN	7/9/2013 17:00
2	1	EmployeeRepo	LeaveReportWF	AB	11/22/2014 11:16
3	2	EmployeeRepo	LeaveReportWF	FN	8/8/2013 19:22
4	2	EmployeeRepo	LeaveReportWF	AB	12/4/2013 9:15
5	2	EmployeeRepo	LeaveReportWF	SL	5/29/2013 15:32
6	2	EmployeeRepo	LeaveReportWF	SL	5/2/2014 6:09
7	2	EmployeeRepo	LeaveReportWF	PA	6/1/2013 20:56
8	2	EmployeeRepo	LeaveReportWF	SL	11/3/2014 14:45
9	2	EmployeeRepo	LeaveReportWF	FE	4/20/2013 10:00

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

ID	Production ID	Application	Name	InternalStatus	RequestedOn
10	2	EmployeeRepo	LeaveReportWF	FN	3/3/2015 16:35

Scenario Solution

The following section will give you a brief idea of each step in the archival strategy:

1. Run the **WSBPMArchivingScript.sql** script on the Employees Leave Report database. This will create the required tables and procedures.
2. Execute the **proc_SKInsertIntoSKDeleteTable** procedure as follows on the Employees Leave Report database to fetch the records of the previous financial years. This procedure will insert the fetched records into the **SKDeleteTable** table.

   ```
   Exec proc_SKInsertIntoSKDeleteTable '01-01-2013', '12-31-2014', NULL, NULL, NULL
   ```

   The above query will insert records between 01-01-2013 and 12-31-2014 with InternalStatus ‘FN’ and ‘AB’ into the SKDeleteTable table.

   The records to be deleted are stored with ExecutionID, ProductionID, Application, Name, Data, LocalVariablesId, ExecutionDetailsID, and Isdeleted details in the **SKDeleteTable** table. Initially, the ‘Isdeleted’ field is ‘0’ for all the records to be deleted.
3. Execute the **proc_SKSKDeleteTableInArchiveDB** procedure as follows on the Employees Leave Report database to fetch the records of the previous financial years. This procedure will insert the fetched records into the **SKDeleteTableForArchiveDB** table.

   ```
   Exec proc_SKSKDeleteTableInArchiveDB
   ```
4. Take a full backup of the Employees Leave Report database and rename it as ‘Backup Employees Leave Report’.

   Backup Employees Leave Report Database

ID	Production ID	Application	Name	InternalStatus	RequestedOn
1	1	EmployeeRepo	LeaveReportWF	FN	7/9/2013 17:00
2	1	EmployeeRepo	LeaveReportWF	AB	11/22/2014 11:16
3	2	EmployeeRepo	LeaveReportWF	FN	8/8/2013 19:22
4	2	EmployeeRepo	LeaveReportWF	AB	12/4/2013 9:15
5	2	EmployeeRepo	LeaveReportWF	SL	5/29/2013 15:32
6	2	EmployeeRepo	LeaveReportWF	SL	5/2/2014 6:09
7	2	EmployeeRepo	LeaveReportWF	PA	6/1/2013 20:56
8	2	EmployeeRepo	LeaveReportWF	SL	11/3/2014 14:45

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

ID	Production ID	Application	Name	InternalStatus	RequestedOn
9	2	EmployeeRepo	LeaveReportWF	FE	4/20/2013 10:00
10	2	EmployeeRepo	LeaveReportWF	FN	3/3/2015 16:35

5. Execute the **proc_SKDeleteFromProduction** procedure on the Employees Leave Report database to delete all the workflow records from the Repository database tables with InternalStatus 'FN' or 'AB'. After the workflow records are deleted, the 'Isdeleted' field in the **SKDeleteTable** table is updated to '1' for all deleted records. Now the 'Employees Leave Report' database contains the following records:

   Employees Leave Report Database

ID	Production ID	Application	Name	InternalStatus	RequestedOn
5	2	EmployeeRepo	LeaveReportWF	SL	5/29/2013 15:32
6	2	EmployeeRepo	LeaveReportWF	SL	5/2/2014 6:09
7	2	EmployeeRepo	LeaveReportWF	PA	6/1/2013 20:56
8	2	EmployeeRepo	LeaveReportWF	SL	11/3/2014 14:45
9	2	EmployeeRepo	LeaveReportWF	FE	4/20/2013 10:00
10	2	EmployeeRepo	LeaveReportWF	FN	3/3/2015 16:35

   Note: Even though the highlighted workflow instance record is in finished state, this row and the records related to it are not deleted because this record belongs to the current financial year (2015). As per the parameters passed in step 2, only the records from previous financial years need to be deleted.

6. Execute the **proc_SKDeleteFromArchivedDB** procedure in the Backup Employees Leave Report database to delete all the records except the records in the SKDeleteTableForArchiveDB. Workflow records with InternalStatus other than 'FN' or 'AB'. The value of the 'Isdeleted' field of the **SKDeleteTableForArchiveDB** table will remain as '0'.

Backup Employees Leave Report Database

ID	ProductionID	Application	Name	InternalStatus	RequestedOn
1	1	EmployeeRepo	LeaveReportWF	FN	7/9/2013 17:00
2	1	EmployeeRepo	LeaveReportWF	AB	11/22/2014 11:16
3	2	EmployeeRepo	LeaveReportWF	FN	8/8/2013 19:22

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

ID	ProductionID	Application	Name	InternalStatus	RequestedOn
4	2	EmployeeRepo	LeaveReportWF	AB	12/4/2013 9:15

Environment

The environment used for the sample exercise is an Intel Xenon computer with a 2.66 GHz processor and 32 GB RAM using Windows Server 2008 R2 Load Balanced Server.

Conclusion

After performing the above steps, the Employees Leave Report database will have data only related to the current financial year (2015) along with all the running workflow instances of the previous financial year.

The 'Backup Employees Leave Report' Archived database will have only those completed and aborted workflow instance records related to the previous financial year.

This is the method to reduce the amount of data from the production database to ensure better performance.

Guidelines for Partitioning Database

Overview

AVEVA Work Tasks stores application data in SQL Server. Important data cannot be destroyed due to analytical or legal requirements. Keeping the data in transactional database, results in alarming database growth. Though the latest database management system and hardware can handle large amount of data, it might still affect the performance of an application.

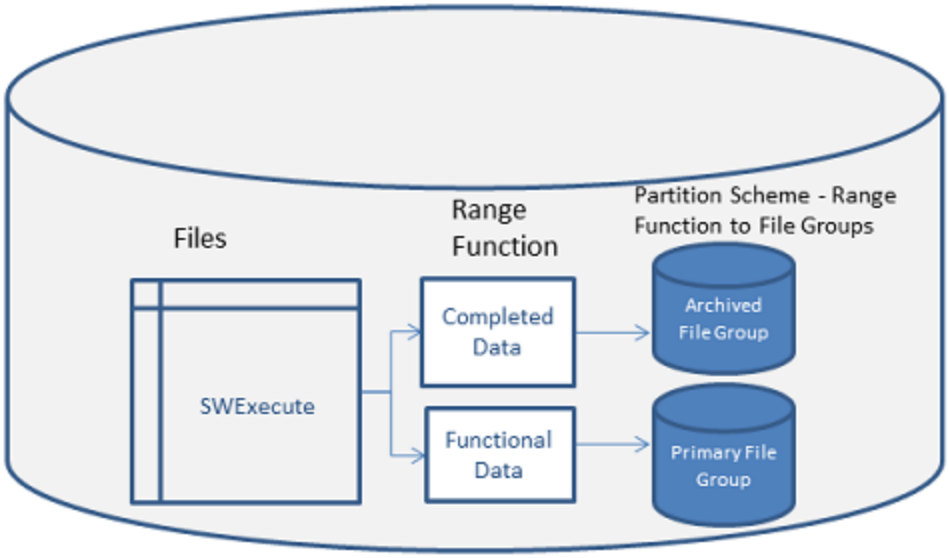
AVEVA Work Tasks can be used across different business domains. Based on the business requirement, workflows might run continuously, resulting in data table growth for a few tables. These tables are critical for the workflow engine. The alarming growth of these tables affects the performance of the application. Table partitioning capabilities provide an option to boost the performance, without affecting the other areas of the application.

The partitioning of the database is recommended for those business applications that run large number of workflow instances.

AVEVA Work Tasks uses Range Partition. Partitioning feature functions by moving data as follows:

- The completed workflow details to secondary partition.
- The running and active workflows to primary partition.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Special Note

The partition feature is available only on Microsoft SQL server versions and editions that support table partition feature. Refer to the Microsoft documentation to check the availability of the partition feature.

For more information on partitioning, see Partitioning Database.

Recommendations

- Computers with more than 16 GB RAM will require more disk space for paging, hibernation, and dump files.
- Depending on complexity and size of your database server, 30 GB or more of available hard disk space is recommended. Your hard drive for the database must have adequate available disk space to support the performance requirements of your specific deployment.

Best Practices for Features and Services

Services

- **Workflow Engine** - Workflow Engine is a Microsoft Windows service which processes the workflow actions or activities continuously. The workflow engine always connects to SQL server to pull and push data and uses thread pooling for processing the activities. Based on the system, proper thread pool settings are essential. The default, thread pool settings is 25. Refer thread pool settings <in Admin Guide>. Ensure to provide appropriate thread pool size based on the system configuration. Ensure to monitor CPU usage and Memory usage of the system <less usage of>.
- **Advance Server** - Advance server service enables load balancing in AVEVA Work Tasks. In an environment, ensure to disable the feature if the environment is not set for enterprise version.
- **Task Scheduler** - This service handles the execution of all tasks that have not taken place as scheduled (escalations). Task Scheduler does not persist any information in memory. All tasks are database persisted and are performed only when due time is reached. The Task Scheduler use a queue to process the tasks in

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

parallel. Due to queuing up of Task, you may not get accurate timeouts with seconds accuracy.

- **Client Service** - You can monitor the AVEVA Work Tasks Windows services such as, Client Monitor, Advance Server, Task Scheduler (TS), Workflow Engine (WF Engine), and Communication Service (CS).

Guidelines on using SQL AlwaysOn Availability Group

AVEVA Work Tasks supports SQL Server AlwaysOn Availability Groups for database.

For more information on setting up this feature, see:

- Microsoft documentation
- *Creating Farm Database* and *Creating Repository DataSource* topics

Guidelines for Configuring AVEVA Work Tasks in DMZ

Overview

You can setup an **Enterprise Console Web Application** with an external URL (accessible with an Internet connection) and with its content on an internal **Enterprise Console Web Server** (not connected to the Internet) hosted through an Internet Information Server (back end server). This is achieved by forwarding HTTP requests (client requests) to the Application Request Routing server (front end server), which in turn will internally route it to the back end server.

A reverse proxy in ASP.Net forwards client requests to the back end server, translates links and headers from the response received to the proxied URL, and then sends the response to the client.

Configuration

To set up this environment, configure the **Application Request Routing Front End Server**, and the **Back End Secured Server** as follows:

Configure Enterprise Web Application Proxy Server

(Application Request Routing Front End Server)

- Install Internet Information Server Extensions

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

  - Application Request Routing
  - URL Rewrite
- Configure Website on Application Request Routing Server
  - Setup Application Pool
  - Create Website
  - Enable Authentication to Anonymous
- Configure URL Rewrite
  - Setup Inbound Server
  - Setup Outbound Server
  - Setup Outbound Precondition

Configure Enterprise Console Web Server
(Back End Secured Server)

- Setup Website Authentication
- Setup Service Principal Names

Configure Application Request Routing Front End Server

Install Internet Information Server Extensions

The following Internet Information Server (IIS) extensions are prerequisites to configure the application request routing front end server:

- Application Request Routing
- URL Rewrite

Application Request Routing

Application Request Routing is an IIS extension that enables you to increase web application scalability and reliability through rule-based routing. For more information, refer to: https://www.iis.net/downloads/microsoft/application-request-routing.

Note: The latest version of Application Request Routing extension also includes the URL Rewrite extension.

URL Rewrite

URL rewrite is an IIS extension that enables you to create powerful inbound or outbound rules to implement URLs. This makes its ideal for a reverse proxy, if you only intend to forward the requests. For more information, refer to: https://www.iis.net/downloads/microsoft/url-rewrite.

Configuring Website on Application Request Routing Server

The **Application Request Routing Server** website is accessible to external users, and therefore must be secured appropriately with firewalls and other security measures.

- Create application request routing server website as follows:
- Setup an integrated application pool

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Create a website
- Setup website authentication by enabling only **Anonymous Authentication**

Configuring URL Rewrite

Add reverse proxy rules as follows:

- **Inbound Rules:** Enter IP address of the **Enterprise Console Web Server**
- **Outbound Rules:** Select **Rewrite the domain names of the links in HTTP responses**
- **From:** Enter the IP address along with the port (**8000**) of the **Enterprise Console Web Server**. For example, **10.012.123.45:800**0
- **To:** Enter the IP address or name of the **Enterprise Web Application Proxy Server** (**Application Request Routing Server**). For example, **ARRSERVER01**

Add outbound pre-conditions as follows:

- **Condition Input:** RESPONSE_CONTENT_TYPE
- **Check if input string:** Matches the Pattern
- **Pattern:** gzip

Configure Enterprise Console Web Server

Setup Website Authentication

By default, the **Enterprise Console Web Server** is set to **Windows Authentication**. Ensure the authentication has not changed.

Setup Service Principal Names

Setup two service principal names on **Enterprise Console Web Server**. The first one with the fully qualified system name and the second one with the system name. To setup **Service Principal Names**, run the **Command Prompt** as an **Administrator**, and then run the following commands:

First Service Principal Name

```
SETSPN -S HTTP/<ARR Server Name>.<Fully Qualified Domain Name> <Domain Name>\<User Name>
```

For example, if the ARR Server Name is **ARRSERVER01**, the Domain Name is **mydomain.com**, and the User Name is **myusername**, then the command is:

```
SETSPN -S HTTP/ARRSERVER01.mydomain.com mydomain\mysusername
```

Second Service Principal Name

```
SETSPN -S HTTP/<ARR Server Name> <Domain Name>\<User Name>
```

For example, if the ARR Server Name is **ARRSERVER01**, the Domain Name is **mydomain.com**, and the User Name is **myusername**, then the command is:

```
SETSPN -S HTTP/ARRSERVER01 mydomain\mysuserName
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Guidelines for Antivirus

Configure your antivirus software to prevent the files and directories listed below from being scanned. You can stop Windows Security from alerting you or blocking the program by adding the file to the exclusions list.

Note:
- Only do this for files or folders listed below. The paths listed here may be different based on your installation.
- Adding an exclusion for an unsafe program could expose your systems and data to increased risk.

ArchestrA and SMC Logger Storage folder exclusions:

- C:\ProgramData\ArchestrA\ and all subfolders
- C:\Program Files\Common Files\ArchestrA\
- C:\Program Files (x86)\Common Files\ArchestrA\
- C:\ProgramData\AVEVA Work Tasks\ and all subfolders

AVEVA Work Tasks, AVEVA License Manager and PCS folders exclusion:

- C:\Program Files\AVEVA\
- C:\Program Files (x86)\AVEVA\

Windows Temp folder exclusion:

Exclude the following folders

- C:\Windows\Temp\WorkTasksTemp

.Net Temp Folder (Could vary with .Net Version):

- C:\Windows\Microsoft.NET\Framework64\v4.0.30319\Temporary ASP.NET Files\centralconfig
- C:\Windows\Microsoft.NET\Framework64\v4.0.30319\Temporary ASP.NET Files\enterpriseconsole
- Custom Enterprise Console folders, if any

SQL Server Database exclusion:

Exclude the files in the SQL Server database location:

- C:\Program Files\Microsoft SQL Server\MSSQL.MSSQLSERVER\MSSQL\DATA\ (will vary by SQL Server version)

Exclude SQL Server database files within this directory with below listed types:

- .mdf
- .ldf
- .ndf

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Ports (Could vary based on configuration customization)

The following table lists the default ports used by various services while running AVEVA Work Tasks, exclude the ports as applicable:

Services	Port Type	Default Port number
Advance Server Services with Multicast IP address 225.0.0.10	multicast port	8850
	tcp port	8853
Workflow Engine	load balance server port	8853
	load balance client port	8859
	port	8855
SMTP services	smtp port	25
Communication services	listener port	8770
	pop-mail port	110
Task Scheduler services	load balance server port	8853
	load balance client port	8860
	port	8856
Service Monitor EXE	port	8866
License Server Port	port	55555
Client service	listener port	8863

Following ports used by AVEVA Work Tasks services, when the AVEVA Work Tasks Pro application is used outside Corporate Network, exclude the ports as applicable.

Services	Port Type	Default Port number
Workflow Engine	SB Over TCP	9350, 9351, 9352, 9353
Communication services	SB Over TCP	9350, 9351, 9352, 9353
Push Notification service	http port	80
	https port	443

Troubleshooting

For details on troubleshooting AVEVA Work Tasks, see the following sections:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Client Service Monitoring Errors
- Accessing Central Configuration and Enterprise Console

Prerequisites for Debugging Exceptions

There are various ways in which the user can view the details of the exceptions and warning messages that are encountered while using the product. AVEVA Work Tasks provides powerful debugging facilities which can be used to track configuration issues or exceptions during runtime.

Following are the components for debugging exceptions:

- Log Files
- Logger Console
- Event Viewer
- Email alert for Exceptions

Following topics provide extra information on settings for debugging:

- Understanding and Setting Debug Level
- Understanding log messages

Log Files

The log files are located in the <AVEVA Work Tasks installed path>\Logs (For example: *C:\Program files\AVEVA\Work Tasks\\Logs*) folder. Logs for a specific repository will be available inside the folder with repository name. Global exceptions will be logged directly under <AVEVA Work Tasks installed path>\Logs folder. The naming convention used for log files is “Current Year + Current Month + Current Day”.

Log files created under repository will contain repository name prefixed. For example, TelematicsRepository_20140213.log.

Logger Console

This is a debugging tool which can be used to watch the messages logged real time. The Logger Console can be used by developers to view the messages logged by AVEVA Work Tasks during development. Only one instance of the Logger Console can be opened at a time. The Logger Console can be opened only on AVEVA Work Tasks installed machines. We recommend to keep the Logger Console closed in production environment as the memory usage will be high. The log history for the Logger Console can be viewed from Log files.

To open the Logger Console,

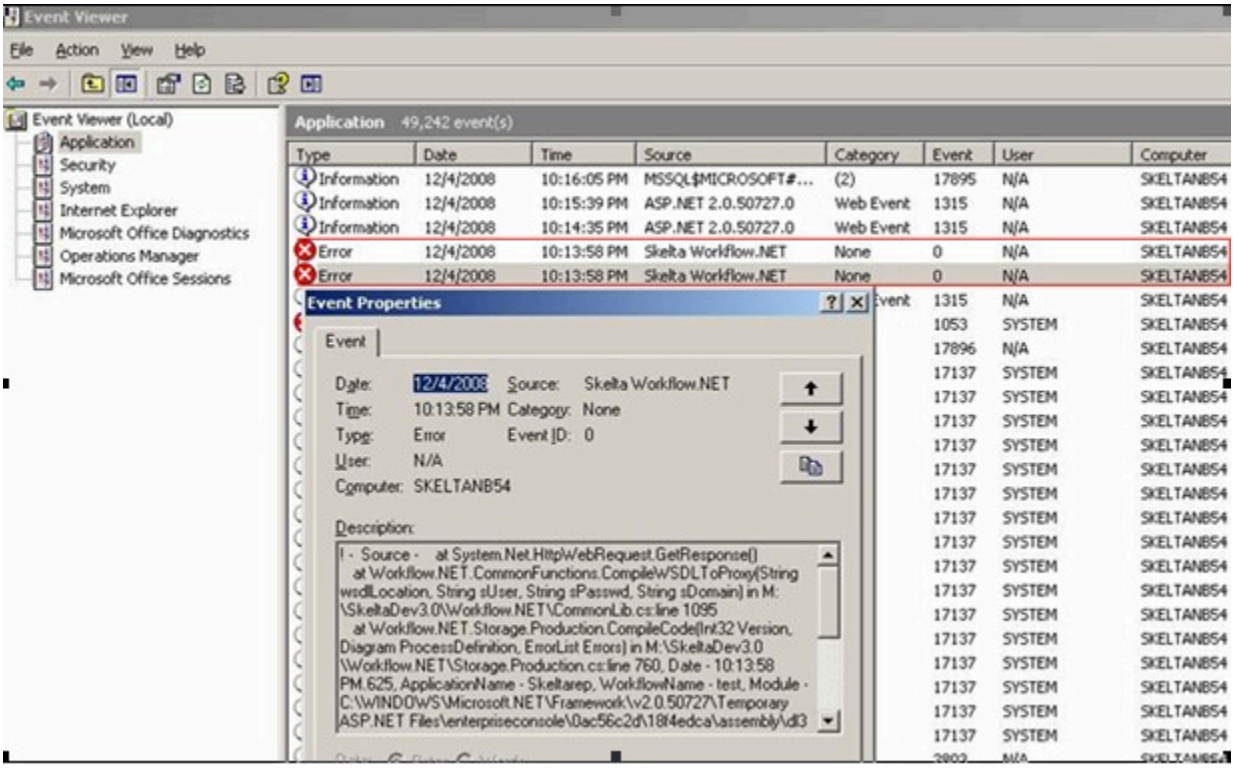
On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **WTLogger Console**.

Event Viewer

Exceptions and warnings are also logged in the Event Viewer. This helps users to check for exception or warning on the production environment. Users have an option to stop logging these exceptions. In addition, users can even avoid logging certain messages in the Event Viewer. Refer to the instructions given under the following headings -

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- To stop logging errors and warnings in the Event Viewer
- To stop logging specific warnings, messages, or errors in the Event Viewer



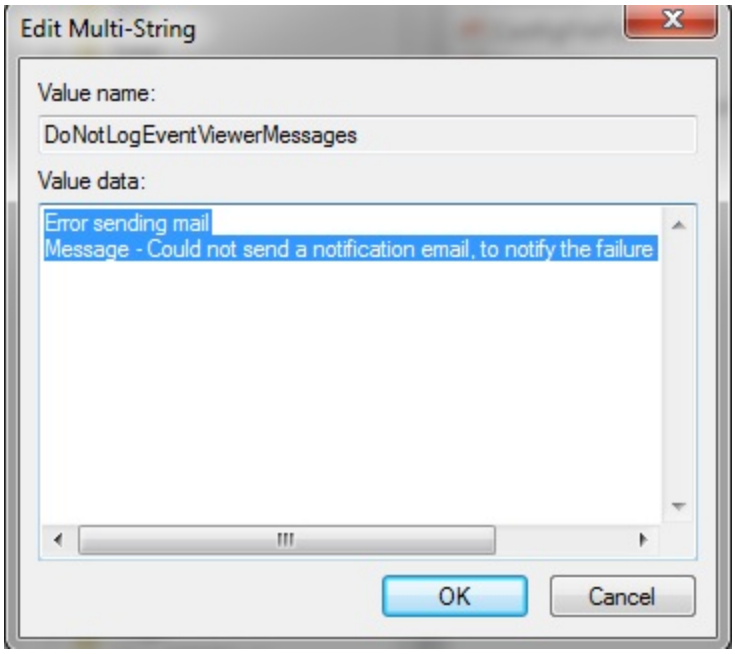
To stop logging errors and warnings in the Event Viewer, complete the following steps:

1. On the Windows **Start** menu, click **Run**.
2. Type **Regedit**.
3. Click **OK**.
4. The Registry Editor screen appears.
5. Create a Registry Key named "StopLoggingOnEventViewer" and set the value as Yes in AVEVA Work Tasks registry under "HKEY_LOCAL_MACHINE\SOFTWARE\AVEVA\WorkTasks".

To stop logging specific warnings, messages, or errors in the Event Viewer:

1. Create a new registry key named "DoNotLogEventViewerMessages" of type "Multi-String Value" in the path HKEY_LOCAL_MACHINE\SOFTWARE\AVEVA\WorkTasks.
2. Add the messages or a portion of a message that need to be omitted from being logged in the event viewer.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Restart the services.

   The error and warning messages specified in the key value will not be logged in the event viewer.

Email alert for Exceptions

Option to get email alerts for all exceptions logged from AVEVA Work Tasks. Mail settings and email id has to be configured for enabling this feature. After it is configured, the exceptions are sent as email message to the mail id specified in To Email field.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.
2. On the **Edit Settings** window, check **Service Settings**.
3. Click the icon next to **Global Settings**. Select the **Communication** tab, and set **From Email** and **To Email** fields.

Understanding and setting Debug Level

The number of messages getting displayed, varies based on the Debug Level which is set in Farm Configuration Wizard.

To change the Debug Level:

- Debug Level 1:

  Information related to starting and ending of a workflow instance and runtime exceptions occurred are logged. We recommends this Debug Level on production environment.
- Debug Level 2:

  Information related to starting and ending of a workflow instance, runtime exceptions occurred during workflow execution and step by step information of each activity execution (Example: Human activities log the number of resources available, Properties set for the activity, Task assigned information for each user) are logged. We recommends this Debug Level on developer environment.
- Debug Level 3:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Information related to starting and ending of a workflow instance, runtime exceptions occurred and Task (Human activity) assigned to user information are logged.

To set the Debug Level:

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**. The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** appears.
2. Click **Next**. The **Edit AVEVA Work Tasks Farm Settings** window appears.
3. Select **Service Settings**.
4. Click **Next**. The **Services/Global Settings** window appears.
5. Click against **Global Settings**. The **Global Settings** screen appears.
6. Click **Log/Transaction**.
7. Select the Debug Level from the drop down box.
8. Click **OK**.

Understanding log messages

The log messages are represented by the following symbols:

- **Information (i)**: This type of message is preceded by a lower case 'i'. It indicates messages containing general information about the events being logged. Each message of this type has four parts.
- **Warning (?)**: This type of message is preceded by a question mark '?'. These messages are warning notes to the users about the events being logged. The messages of this type have a structure similar to the 'Information' messages with the same four parts as mentioned earlier.
- **Error (!)**: This type of message is preceded by an exclamation mark '!'. It indicates error messages with details specific to the error. Messages of this type can be further classified into four parts similar to the other two messages. In addition, it has the 'Exception Stack Trace', which occurs before the machine name and date/time. It can be identified by the keyword 'Source' and it can be used to trace the source of the error.

Example

```
i - @#@Date - 10:48:52 PM.635@#@ApplicationName - LeaveApplication@#@WorkflowName -
EmployeeLeave@#@ExecutionId - 5@#@ExecutionDetailsId - 85@#@WorkItemId -
cd16d86c-5269-4f26-aa97-ad532bd65837@#@Module - C:\WINDOWS\assembly\GAC_MSIL\Skelta.HWS\
3.5.0.0__926ee05bf5158731\Skelta.HWS.dllC:\WINDOWS\assembly\GAC_MSIL\Skelta.HWS\
3.5.0.0__926ee05bf5158731\Skelta.HWS.dll , Assembly version = 3.5.9009@#@_MachineName -
skeltadtp22, Process - WFEngine.NET2@#@Message - Activity of type (Leave Form) added for
resource – Michelle Rose@#@
```

The following table explains the information available in the message:

Information	Description
i –	Type of log
Date - 10:48:52 PM.635	Log Date Time
ApplicationName – LeaveApplication	Repository Name
WorkflowName – EmployeeLeave	Workflow Name

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Information	Description
ExecutionId – 5	Workflow instance ID. Each workflow instance will have a unique ID.
ExecutionDetailsId – 85	Workflow Step ID.
WorkItemId - cd16d86c-5269-4f26-aa97-ad532bd65837	Work item or task ID.
Module -C:\WINDOWS\assembly\GAC_MSIL\ Skelta.HWS \3.5.0.0__926ee05bf5158731\ Skelta.HWS.dll C:\WINDOWS\assembly\GAC_MSIL \Skelta.HWS\3.5.0.0__926ee05bf5158731 \Skelta.HWS.dll , Assembly version = 3.5.9009	Assembly details to track message stack.
_MachineName - skeltadtp22	Machine Name
Process - WFEngine.NET2	Process from which the message was logged.
Message - Activity of type (Leave Form) added for resource – Michelle Rose	Custom Message

Since the message was logged as information, there is no stack information available.

For exceptions the first message will carry the stack trace. Check the following message.

```

Database Connection Errors while Installing Farm

Before going through this section, see Prerequisites for Debugging Exceptions.

Troubleshooting issues encountered for Database Connections while installing the Farm Server or the Farm Client are listed below.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. User receives 'Could not establish connection to the SQL Server data source, Login failed for user <UserName>' on the Create Farm Database page or on the Connect to existing database page.

Probable Cause

SQL Server Instance is not able to authenticate the user.

Solution

The user in the error message, needs to be added in the SQL Database Instance(entered in Server Name field). This user can be a Windows user or can be a SQL user.

- Add Windows user
- Add SQL user

Database User should have logon machine rights in the Database Server Instance and the Farm Server (Database User should be able to login in to these machines successfully).

Add Windows user

1. In SQL Server Management Studio, open Object Explorer and expand the folder of the server instance in which to create the new login.
2. Double click the Security folder, right-click Logins.
3. Click New Login.
4. On the General page, enter the name of a Windows user in the Login name box.
5. Select Windows Authentication.
6. Click OK. The user will get listed in the Logins folder.

Add SQL user

1. In SQL Server Management Studio, open Object Explorer and expand the folder of the server instance in which to create the new login.
2. Right-click the Security folder, point to New, and then click Logins.
3. Click New Login.
4. On the General page, enter a name for the new login in the Login name box.
5. Select SQL Server Authentication. Windows Authentication is the more secure option.
6. Enter a password for the login.
7. Select the password policy options that should be applied to the new login. In general, enforcing password policy is the more secure option.
8. Click OK.

Check *http://msdn.microsoft.com/en-us/library/aa337562.aspx* for more details.

2. Error: *Test Connection Succeeded. However the login - <UserName> does not have dbcreator role in <ServerInstanceName>.*

Probable Cause

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Farm Configuration Wizard is trying to create the Farm Database, entered in Database Title, using the <UserName> from the error message.

Solution

1. In SQL Server Management Studio, open Object Explorer and expand the folder of the server instance in which to create the new login.
2. Double click the Security folder, double click Logins.
3. Right-click on the <UserName>. Click Properties.
4. Click Server Roles. Check dbcreator.
5. Click OK.

3. The Create the Farm Database or Connect to existing database page does not respond while configuring the Farm.

Probable Cause

The local machine is not able to connect to the database server instance.

Solution

1. Connect to the database using an SQL Server Instance Client.
2. If Windows authentication was used while connecting, confirm that the database user has not changed the Active Directory password.
3. **Test Connection Tool by** AVEVA Work Tasks**:**

   This tool is used with the Load Balanced Server. Using the Test Connection tool, check if all the machines (Server and Client) are able to communicate with each other before installation. This test ensures that all the Server machines involved can actively support the Load Balancing and Failover support features of the Load Balanced Server. To check the communication between machines, the Test Connection tool must run simultaneously on all the machines.

   Messages received from all the machines are displayed by the Test Connection tool indicating that the machines are able to communicate with each other. Machines that are not able to communicate will not be able to receive or display messages from other machines.
4. **DTCTester Tool by Microsoft**:

   The MSDTC connection settings can also be checked using the DTCTester tool. Check the availability in Microsoft Download site.

   The DTCTester tool does the following:

   - Establishes a connection to SQL Server using a data source name (DSN), username and password. You can establish this connection via a command line using the default network library.
   - Creates a temporary table
   - Enlists the connection in a transaction
   - Does an insert on the temporary table
   - Commits the distributed transaction
   - Selects inserted value to make sure it was committed
   - Closes the connection

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

To use the DTCTester Tool:

1. Create an ODBC data source for your SQL Server through the ODBC utility in Control Panel.
2. Execute the following from the command line: dtctester <dsn name><user name><password>.
3. Replace the values in brackets as appropriate for your environment.

The table below lists the ports to be opened for DTC:

Port Number	Purpose
135	RPC EPM (end point mapper)
1433	TDS SQL traffic when using TCP/IP
1434	SQL 2000 Integrated Security
5100 - 5200	MSDTC (Dynamically assigned a port by the EPM)

Check Enable and Verify MSDTC for more details.

4. Error logged in the Logger Console: RunScript failed, ExecuteNonQuery failed for Database <Database Name>

Probable Cause

If the local machine is 64-bit, two dlls of 'Microsoft.SqlServer.BatchParser' with Processor Architecture as x86 and AMD64 should exist in the assembly. If you have only one version of this dll present, refer to the following solution.

Solution

1. Go to the following website:
   http://www.microsoft.com/en-in/download/details.aspx?id=29065
2. Download and install the following packages:
   - X64 Package (SQLSysClrTypes.msi) from the Microsoft System CLR Types for Microsoft SQL Server 2016 section
   - X64 Package (SharedManagementObjects.msi) from the Microsoft SQL Server 2016 Shared Management Objects section.

Client Service Errors

Before going through this section, see Prerequisites for Debugging Exceptions.

Issue

User receives 'Unable to run AVEVA Work Tasks Client Service' message.

Probable Cause

When one machine is having multiple IP addresses or running on LAN or High-Speed Internet.

Solution

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- While Installing the Configuration Farm
- While Editing the Configuration Farm

While Installing the Configuration Farm

1. In your installation scenario, when you have reached to the 'Defining Services and Global Settings' step, perform till step 3 which are instructed in this section.
2. Select the **Machine Settings** tab, and set Machine Address field to local IP Address.
3. Click **OK**.

While Editing the Configuration Farm

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.
2. From **Edit Settings** page, check **Service Settings**.
3. Click the icon next to **Global Settings**. Select the **Machine Settings** tab, and set **Machine Address** field to local IP Address.
4. Click **OK**.

Windows Service Errors

While starting a AVEVA Work Tasks windows service, if the status is "starting" for a long time and does not change to "running", then there are chances that the Database server is down or the service is not able to connect to the Farm database. Ensure the Database server is up and able to connect to the Farm database.

Client Service Monitoring Errors

- Client service monitoring is not enabled after changes to the ServiceMonitorConfig.xml. We can ensure if client service is enabled by checking in the log file for this message:

  Info:- AVEVA Work Tasks Services Monitoring. Monitoring is enabled: "".

  This message is logged every 10 minutes. This could be due to an invalid syntax in ServiceMonitorConfig.xml. Open the file in XML editor and ensure all syntaxes are proper. Ensure that changes made are not commented.

- Client service configuration file changes are not getting reflected. After making changes to ServiceMonitorConfig.xml, ensure the Client service is restarted. After the client service is restarted, it re-caches the configuration changes and all the changes will be considered.

- Client service is not able to start a AVEVA Work Tasks service. In some situations, client service may not be able to start a service. It will continue to restart the service and send restart failure emails. One of the reasons could be that the database server is down or is not getting connected to the windows services.

- Client service is restarting the remaining AVEVA Work Tasks windows services continuously in regular interval and sending the emails. Ensure that all services are able to connect to the database and the database is up. Other reason could be due to thread hanging behavior of WFEngine. See Workflow Engine for more information.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- In Service Monitoring, if the thread hanging or locking behavior is not getting monitored, then there are chances that cached variable value is zero. This can happen, if the database server is down while reading the data from the database. Restart the client service which will read data once again and recreate the cache.

Database Connection Errors

Before going through this section, see Prerequisites for Debugging Exceptions.

1. While opening the Central Configuration or while opening the Farm Configuration Wizard, the following database connection error message appears on Welcome to the AVEVA Work Tasks Configuration Wizard.

- *A valid connection to AVEVA Work Tasks database could not be established. Would you like to change the Database User Settings?*
- The following error message appears in the Central Configuration.

  Cannot proceed further. A valid connection to the AVEVA Work Tasks Farm could not be established. Check the Connection settings and also MSDTC settings.

  You will also get the message in the WTLogger Console:

  Probable Cause

Database User's credentials are changed:

- From Active Directory
- From SQL Database instance

Solution

From Active Directory

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **AVEVA Work Tasks Farm Configuration Wizard** appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm settings** screen appears.
3. Select **Database User Settings**.
4. Click **Next**.

   The **Database User Settings** screen appears.
5. Enter the updated User Name, Password, and Domain.
6. Click **OK**. The following confirmation message appears:

   Make sure that the login used for connecting to database has SELECT, INSERT, UPDATE, DELETE permissions on all tables and Execute permission on the Stored Procedures.
7. Click **OK**. A message indicating successful updates of database user settings appears.
8. Click **OK**.

From SQL Database instance

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.
   The **AVEVA Work Tasks Farm Configuration Wizard** appears.
2. Click **Next**.
   The **Edit AVEVA Work Tasks Farm settings** screen appears.
3. Click **Database Settings**.
   The **Connect to existing database** screen appears.
4. From the **Connection String** option, modify the User Id and Password for connecting to the database.
5. Click **Test Connection**. On success, the *Test Connection Succeeded* message appears.
6. Click **OK**.
7. Click **Next**. The user credentials are updated.

2. User is getting the following database connection error message while creating Repository Datasource or while opening an Enterprise Console.

Error while creating Repository Datasource in the Central Configuration:

Invalid connection string. Please check MSDTC settings and check if Database User Settings are valid, if you are using windows authentication. Check AVEVA Work Tasks Logger Console for more details.

Error while opening an Enterprise Console. This page gets hanged and displays the following message in the Logger Console.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Probable Cause

Database User Settings are not set and Windows authentication is used in the Repository Datasource.

Solution

- Either use Windows authentication for the Repository Datasource
- SQL authentication for the Repository Datasource

Steps for Windows authentication

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.
   The **AVEVA Work Tasks Farm Configuration Wizard** appears.
2. Click **Next**.
   The **Edit AVEVA Work Tasks Farm settings** screen appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Select **Database User Settings**.
4. Click **Next**.

   The **Database User Settings** screen appears.
5. Enter the updated User Name, Password, and Domain.
6. Enter Database User credentials.
7. Click **OK**.

Steps for SQL authentication

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **AVEVA Work Tasks Central Configuration**.

   The **Central Configuration** page appears.
2. Click **Datasource Settings**. The **Datasource List** appears.
3. Click required Datasource from Datasource column.
4. Make changes to user SQL authentication. Select **SQL** from **Authentication Type** drop down list.
5. Click **Test Connection**, and then click **OK**.

IIS Error while Configuring Farm Configuration

Before going through this section, see Prerequisites for Debugging Exceptions.

Issue

The following IIS error message appears while opening the Farm Configuration Wizard.

IIS is not installed. To proceed install IIS.

Probable Cause

IIS is not installed on your Server.

Solution

You must install a valid version of IIS before configuring the Farm Configuration.

ASP.NET Error while Configuring Farm Configuration

Before going through this section, see Prerequisites for Debugging Exceptions.

Issue

The following ASP.NET related error message appears while opening the Farm Configuration Wizard.

Failed to enable the IIS features automatically. Please enable them manually.

Probable Cause

IIS is installed on your Server, but ASP.NET is not installed on your system.

Solution

You must install ASP.NET before configuring the Farm Configuration.

For more information, see Configure Internet Information Services.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Windows Authentication or Anonymous Authentication Error

Before going through this section, see Prerequisites for Debugging Exceptions.

Issue

The following authentication error messages appears while opening the Farm Configuration Wizard.

Ensure that Windows Authentication is enabled to access the Central Configuration and Windows authentication or anonymous authentication is enabled to access the Enterprise Console.

Probable Cause

Windows Authentication or Anonymous Authentication is not enabled on your computer.

Solution

You must enable:

- Windows Authentication to access the Central Configuration
- Windows Authentication or Anonymous Authentication to access the Enterprise Console

For more information, see Windows Server 2008 or Windows Vista.

Non-Query Execution Failure

Before going through this section, see Prerequisites for Debugging Exceptions.

Issue:

Error on the Central Configuration: *ExecuteNonQuery failed for the Database <databaseName>*.

Probable Cause:

Workflow.NET.sql script located at <AVEVA Work Tasks installed path>\DatabaseScripts\SQLServer could not run on the database Instance.

Solution:

Run the Workflow.NET.sql file located at [AVEVA Work Tasks Installed Folder]\DatabaseScripts\SQLServer on the Database manually and in case of any issues while running the script, contact support.

Recommended collation for the SQL server are:

- SQL_Latin1_General_CP1_CI_AS
- SQL_Latin1_General_CP1_CS_AS

Note: This is valid only for SQL Server data source type.

Not Authorized to Access Site Error

Before going through this section, see Prerequisites for Debugging Exceptions.

Issue

While opening the Central Configuration, the following error message appears:

You are not authorized to access this site. You need to be a member of Group Administrators or

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

WorkflowManagementAdmins.

Probable Cause

The user who is accessing the Central Configuration is actually not a member of Administrators or AVEVA Work Tasks Admins group.

or

Anonymous Access to the Central Configuration is enabled.

Solution

The user accessing Central Configuration needs to be a member of the Administrators group for the machine.

Anonymous access rights for the CentralConfig site should be removed from IIS.

Steps

1. Click Start > Run.
2. Type inetmgr > Enter.
3. In the IIS, right click on the CentralConfig site > Directory Security > Edit. The Authentication Methods screen appears.
4. Uncheck Enable anonymous access. The site should use only Integrated Windows Authentication.
5. Click OK.

Enterprise Console Errors

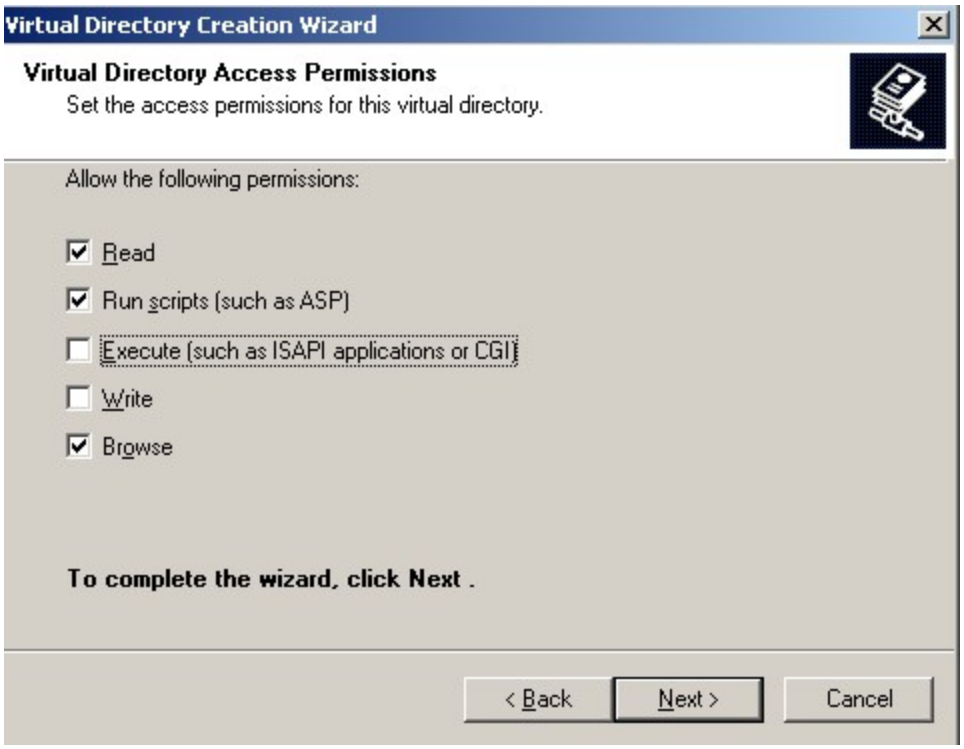
Before going through this section, see Prerequisites for Debugging Exceptions.

1. A message "The resource cannot be found" is displayed while opening the Enterprise Console.

Solution

1. Start > Run > inetmgr.
2. Expand Internet Information Services.
3. Expand AVEVAWorkTasksSites > EnterpriseConsole.
4. Right-click **EnterpriseConsole** > **New** > **Virtual Directory**.
5. Click **Virtual Directory**.
6. Click **Next**. Type BPMUITempaltes.
7. Click **Next**.
8. Select *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\BPMUITemplates*.
9. Click **Next**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



10. Click **Next**. Click **Finish**.
11. Right-click on newly created BPMUITemplates site. Click Properties.
12. Click **Remove**.
13. Click **OK**.

2. The following error message appears while opening the Enterprise Console:

Repositories are not mapped for the current site.

Resolution

- Check if any Repository is mapped to the Enterprise Console.
- Check status of the Enterprise Console in the Farm Database.

Steps to check Repository mapping to the Enterprise Console

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**. The **Central Configuration Web** page appears.
2. Click **Repository Settings**. The **Repository List** page appears.
3. From the Repository Name column, click on a **Repository**.
4. Map the Repository to the Enterprise Console.
5. Click **OK**.
6. Refresh Enterprise Console from Repository List page.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Steps to check the status of the Enterprise Console in the Farm Database

- Check in the Farm database, table SKWebSite, if the related Enterprise Console has the "IsActive" flag set to False, change it to True.

3. Login fails in case you create a new Enterprise Console and configure the repository with AVEVA Identity Manager (AIM)

Resolution

- Do the IIS reset.
- Reconfigure AIM from Central Configuration.

4. Application error occurs when you try to login to the Enterprise Console after a long time

Application error occurs when you have two repositories configured (say, AIM repository and AVEVA List repository) and you perform the actions below:

- You logged into one of the repositories (say, AIM repository) and after a long time you browse the Enterprise Console URL and try to login with different repository (say, AVEVA List repository).
- You logged out from one of the repositories (say, AIM repository) and try to login with different repository (say, AVEVA List repository).

Resolution

Clear the cookies and login again.

Authentication and Personalization

Issue

The user is able to view all the web parts only in the Browse mode and is unable to add, edit, or delete the web parts.

Probable Cause

Anonymous Authentication has been Enabled.

Resolution

The user has to check the IIS 7 settings and make the following changes:

Steps

1. Click Start.
2. Point to Administrative Tools > Internet Information Services (IIS) Manager.

   The Internet Information Services (IIS) Manager screen appears.
3. Expand Sites, select Enterprise Console, and then select Authentication from right pane.
4. Ensure that the authentication settings are as follows:
   - Anonymous Authentication: Disabled

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- ASP.NET Impersonation: Disabled
- Basic Authentication: Disabled
- Forms Authentication: Disabled
- Windows Authentication:Enabled

  If the status of the Anonymous Authentication is Enabled, then disable the Windows Authentication and enable Forms Authentication.

5. Right-click the Windows Authentication Mode and select Disabled.
6. Right-click the Forms Authentication Mode and select Enabled.

This always works in the above mentioned combination. If the Forms Authentication is enabled then the Windows Authentication must be disabled and the Anonymous Authentication must be enabled in the IIS Manager.

If in the above scenario, the Anonymous Authentication is not enabled, then the Auto-redirection for Active Directory will skip the login page and load the web parts only in Browse mode. In order to be able to add, edit, or delete the web parts, the user has to enable the Anonymous Authentication.

If the user changes the authentication mode to Forms, then the code given below should be added to the web.config file:

```
<authentication mode="Forms">
<forms timeout="500000" loginUrl="~/BPMUITemplates/Default/Repository/Site/Login.aspx">
</forms>
</authentication>
```

Performance Issue While Accessing Enterprise Console

Issue:

Performance issue while accessing different pages of Enterprise Console.

Probable Cause

SQL Server instance connectivity issues between the AVEVA Work Tasks server and the AVEVA Work Tasks database server.

Resolution

To identify possible cause of delayed response of Enterprise Console:

1. Open the SQL Server instance on AVEVA Work Tasks server.
2. Connect to an instance of the database server.
3. Execute a query which fetches large number of records. For example, Select * From SWExecute
4. Verify whether the query takes a long time to execute or throws any exception.

If the query takes a long time to execute or throws any exception, validate the SQL Server instance connectivity between the server and the database server.

This approach is applicable only when the engine and the database server are on two separate computers.

Also, verify that the connectivity between the Active Directory and AVEVA Work Tasks server is proper using the AVEVA Work Tasks Active Directory (ADGC) Tool. This approach is valid even when the server and the database

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

server are on the same computer.

Central Configuration is not Loading

Before going through this section, see Prerequisites for Debugging Exceptions.

Issue

Central Configuration is not loading. The following error message appears:

Unable to locate string resources under directory (C:\Program files\AVEVA\Work Tasks\locales\)

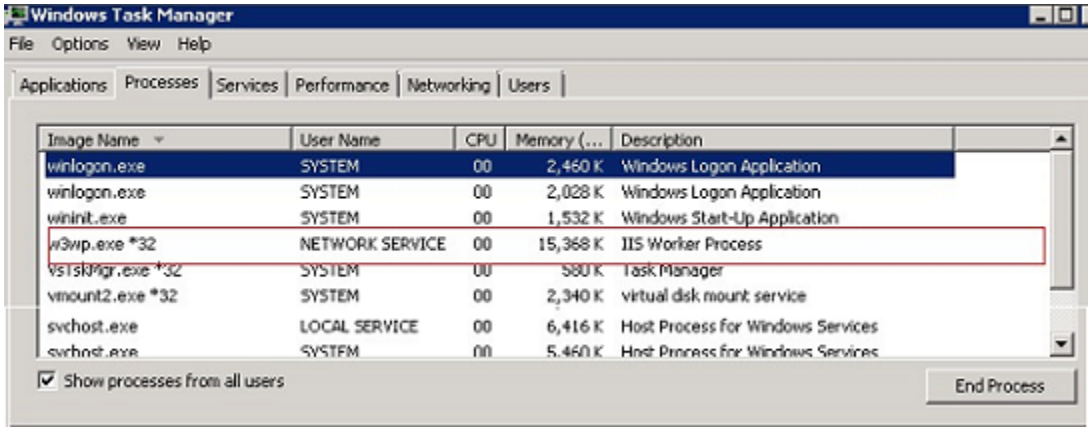
Probable Cause

This error occurs if the user specifies different installation path other than the default path (*C:\Program files\AVEVA\Work Tasks*) while installing AVEVA Work Tasks on a 64-bit machine with Windows Server 2008 and IIS7.

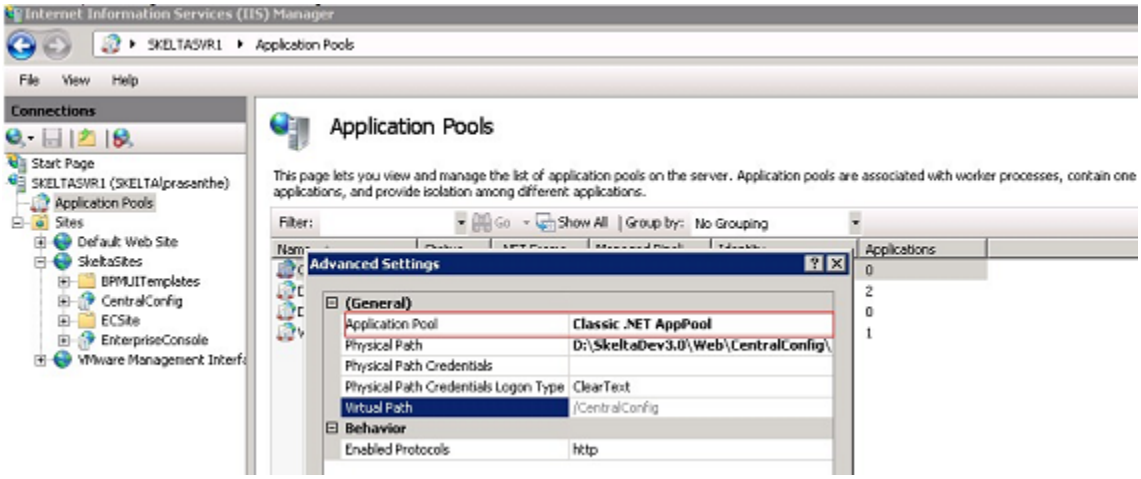
Resolution

To avoid the error, follow the configuration steps given below to run a 32-bit in 64-bit mode.

1. Go to Task Manager.
2. Click the Processes tab, and locate the w3wp process. The following figure shows the w3wp process is running on 32-bit machine.

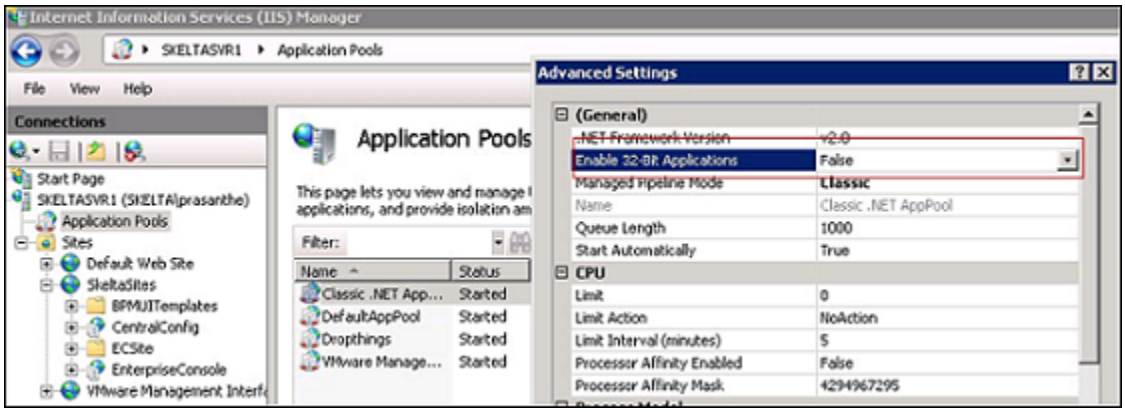


3. Go to the Internet Information Services (IIS) Manager, and check the pool configured for Central Config. The following figure shows that the pool is configured for 32-bit machine.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. To edit the pool settings to run in 64-bit mode, complete the following steps:
   a. Right-click on the Application Pool and select Advanced Settings or, select the same from the Actions pane after selecting Application Pool.
   b. In the Advanced Settings window, change Enable 32-bit Applications to True, if you want the Application Pool to spawn in a 32-bit mode.
   c. Click OK.



Communication Service Errors

Before going through this section, see Prerequisites for Debugging Exceptions.

1. You get the following error while setting Mail Settings in the Farm Configuration Wizard.

AVEVA Work Tasks Communication Service test failed. Service test failed

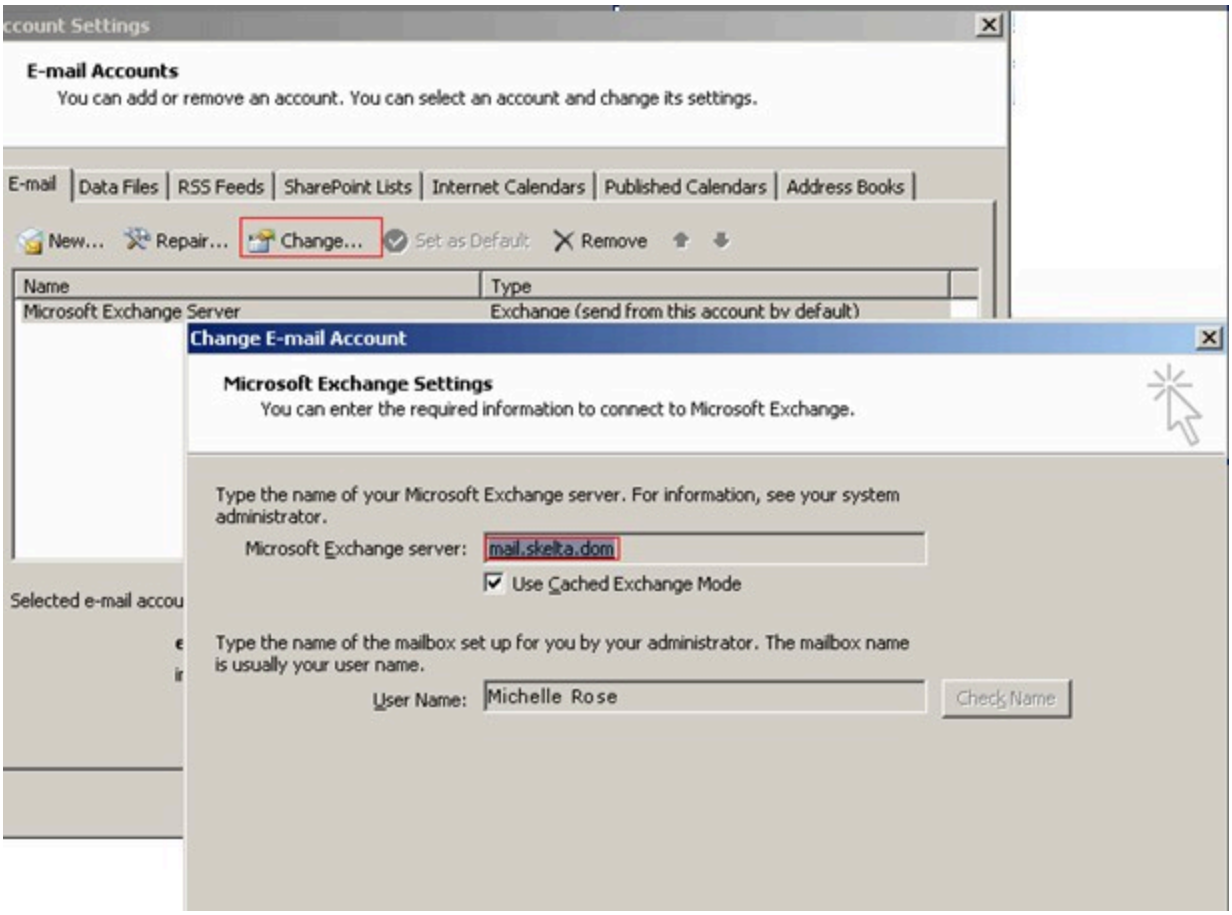
Following is the message displayed in the Logger Console:

```
! - Test SMTP failed, - Failure sending mail., Inner Exception :Unable to connect to the
remote server, Module - C:\Program Files\AVEVA\AVEVA Work Tasks\Bin\
AVEVAWorkTasksFarmConfigMgr.exe ,Assembly version = 6.0.1027.0, Source - at
System.Net.Mail.SmtpClient.Send(MailMessage message) at
Workflow.NET.EmailHandler.SendMail(String smtpServer, Int32 smtpPort, Boolean isssL, String
authenticationUserName, String authenticationuserPassword, Boolean ispasswordEncrypted,
String fromAddress, String toaddress, String subject,String body) at AVEVA Work
Tasks_Console_Setup.GlobalSettings.linkTestSMTP_LinkClicked(Object sender,
LinkLabelLinkClickedEventArgs e), BANVM-RND6, Process - AVEVAWorkTasksFarmConfigMgr
```

Solution

Check Host and Port settings for **Email Settings**. Host refers to Mail server and the port refers to the port in which mail server is listening for mails. (Example: Host value can be set as Machine name/IP of Microsoft exchange server. The default port for Microsoft Exchange server is 25). Microsoft exchange server name can be found in **Microsoft Office Outlook > Tools > Account Settings** option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



With reference to above image "mail.skelta.com" will be set as Host and Port will remain as 25. After settings Host & Port, Set values for "From Email" and "To Email" fields to test SMTP.

Exception logged in logger console:

```
! - Test SMTP failed, - Mailbox unavailable. The server response was: 6.7.1 Unable to relay
for michellerose@gmail.com, Module - C:\Program Files\AVEVA\AVEVA Work Tasks\Bin\
AVEVAWorkTasksFarmConfigMgr.exeC:\Program Files\AVEVA\AVEVA Work Tasks\Bin\
AVEVAWorkTasksFarmConfigMgr.exe , Assembly version = 3.0.*, Source - at
System.Net.Mail.SmtpTransport.SendMail(MailAddress sender, MailAddressCollection
recipients, String deliveryNotify, SmtpFailedRecipientException& exception) at
System.Net.Mail.SmtpClient.Send(MailMessage message)
```

Solution

Mail server configured does not support sending mail to an external mail id other than corporate account. Change the "To Email" to a proper corporate account and try.

2. Mail Channel or Wait-For-Email activity not working. Following error may pop up on start of the Communication Service.

```
? - Could not listen on port 8770. Please make sure that this port is available. Will try
to listen on this port after some time., Module - M:\SkeltaDev3.0\Bin\
Workflow.NET.Communication.NET2.dllM:\SkeltaDev3.0\Bin\Workflow.NET.Commuication.NET2.dll ,
Assembly version = 3.0.*.
```

Probable Cause

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

May be Port 8770 used for AVEVA Work Tasks - Communication Service may be used by some other application. This port is used for communication between the workflow engine and the communication engine.

Resolution

Change the Communication Service port number.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.

   The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** appears.
2. Click **Next**.

   The **Edit AVEVA Work Tasks Farm Settings** window is displayed.
3. Select **Service Settings**.
4. Click **Next**. The **Services/Global Settings** page appears.

   The **Enterprise Server Settings** can be selected if the Farm Server Installation is using Enterprise Server Installation.
5. Click against AVEVA Work Tasks - Communication Service to modify the Communication Service settings
6. Change the Port in Communication Server tab.

   Listener IP Address is AVEVA Work Tasks installed machine's IP Address.

Issue

The Communication Service no longer processes Mail Channel mails from the POP3 account after the From Email property has been changed for a repository.

Probable Cause

The POP3 account for the Communication Service has not been configured with the new Email ID that was configured for the From Email property of the repository.

Resolution

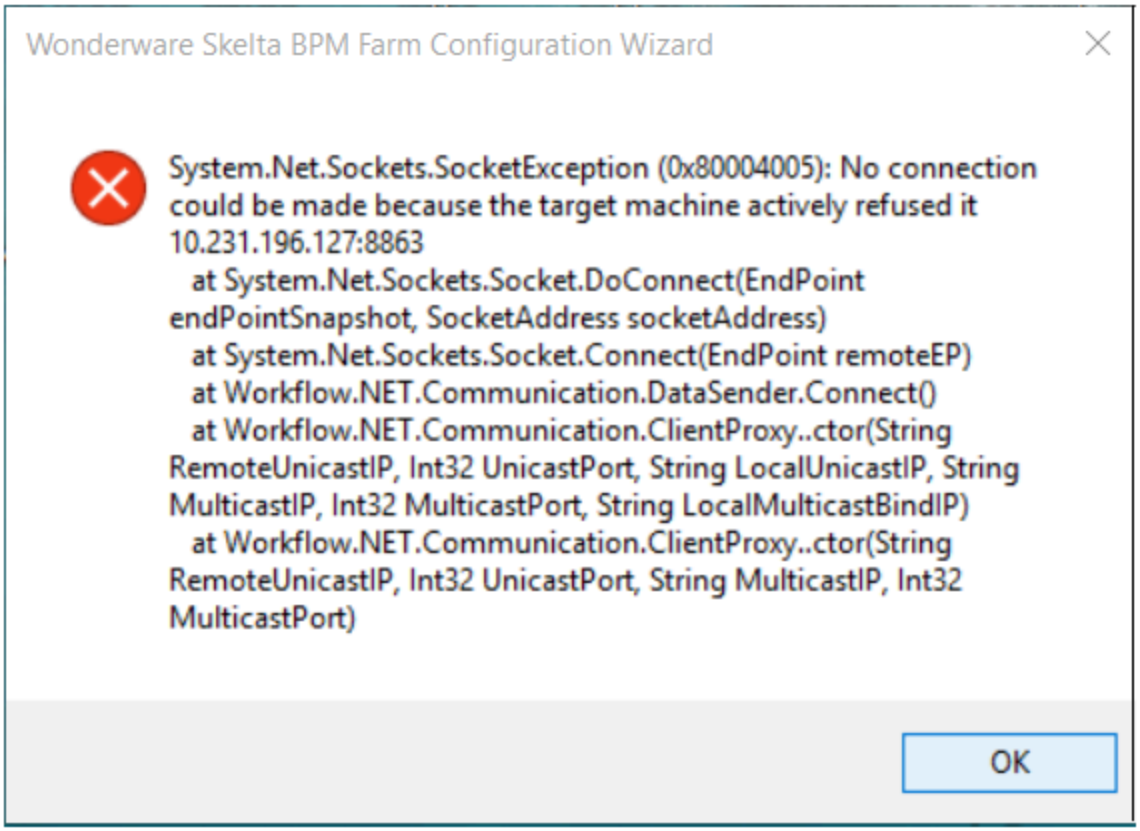
Add a new POP3 user or update the existing POP3 user with the email account that was configured for From Email property of the Repository, in the Communication Service settings of the Farm Configuration Wizard and restart the service.

Farm Configuration Error

1. Issue:

When you run the Farm Configuration Wizard, the following error message appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Probable Cause

This error occurs if there is a change in the IP address of the machine, where AVEVA Work Tasks is configured.

Resolution

Restart all the AVEVA Work Tasks Services.

2. Continuous Error Logs in WTLogger Console

The following errors are logged continuously in the WTLogger Console.

```
Error: Cannot add duplicate collection entry of type 'virtualDirectory' with uni
que key attribute 'path' set to '/BPMUITemplates'

? - Error while getting the data source type for application ( Filename:
Error: Cannot add duplicate collection entry of type 'virtualDirectory' with unique key
attribute 'path' set to '/BPMUITemplates'
```

Probable Cause

While uninstalling AVEVA Work Tasks from a machine, all the files might not be completely removed, due to some issues. When you install AVEVA Work Tasks on this machine, the above issue might occur.

Resolution

To resolve this issue, perform the following:

1. Browse to the Installed folder of AVEVA Work Tasks.
2. Remove the folder.
3. Restart the machine.
4. Install the latest version of AVEVA Work Tasks.

3. The Farm Configuration Wizard crashes while configuring License Server 3.6 version

Probable Cause:

The port number goes as blank while configuring License server.

Resolution:

Provide the port number as 55555 to continue with Farm configuration.

Workflow Test Run Errors

Before going through this section, see Prerequisites for Debugging Exceptions.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. Error: '*No published workflow '<WorkflowName>' found to execute.*

Probable Cause

The workflow is not published.

Solution

1. Go to Workflow List.
2. Right-click the workflow.
3. Publish the workflow.

2. While opening the Test Run window, error "*Workflow Engine not running*" is thrown.

Probable Cause

The Workflow Engine service is stopped.

Solution

Steps

1. Go to Run, and open services.msc. The Windows Services window appears.
2. Right-click Workflow Engine.
3. Click Start.

Move or Copy Item Activity Errors

Before going through this section, see Prerequisites for Debugging Exceptions.

Issue

Workflow ends with "executed with error". In Process Execution view, the last activity which was executed is Move Copy Item activity.

Probable Cause

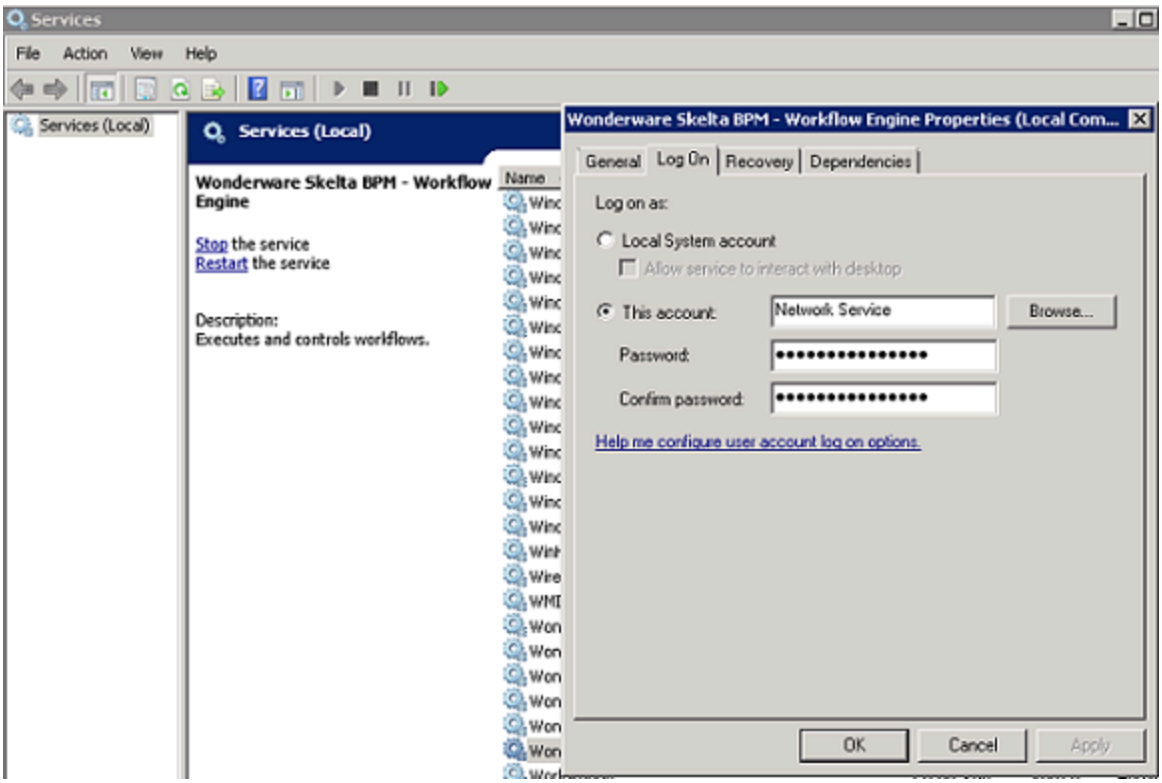
Using the Move Copy Item activity, the user may get an exception as "Access to the path <path> is denied" and "Source Path Not Found" in the Log files or Logger console or Event Viewer.

Solution

Ensure that all the services are running with the specified user account and that user should have read and write access on the physical or network folder.

Ensure that the password will not expire or change for this account.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



If it is Enterprise Server scenario, then specify a network location (\\<computer-name>\Source) as Source and Destination property for Move Copy Item activity. Also ensure that the services running on AVEVA Work Tasks Servers are running with the specified user account having rights on the physical or network folder specified in the source and destination property.

Changing Resource Account Credentials

Before going through this section, see Prerequisites for Debugging Exceptions.

This topic provides information about the settings to be used when the authenticated user credentials are changed.

Settings to be used after changing the resource account credentials to log on to AVEVA Work Tasks sites.

Settings to connect to the Enterprise Console:

- Changing Database User Settings for Windows Authentication
- Changing SQL User Credentials for SQL Authentication

Settings to connect to the Central Configuration:

- Changing Password of SQL User Credentials used to Connect to Repository Data Source

  If the password of impersonation user that is used for AVEVA Work Tasks SharePoint services authentication is changed, follow the steps for resetting the password in this link.
- Changing a Web Service Authentication User

  If the password is modified by the user then the same should be modified using Enterprise Console, Central

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configuration and SharePoint. If this is not done the user will not be able to login to any of the AVEVA Work Tasks sites.

Changing Database User Settings for Windows Authentication

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard.**
   The **Welcome to the AVEVA Work Tasks Farm Configuration Wizard** appears.
2. Click **Next**.
   The **Edit AVEVA Work Tasks Farm Settings** screen appears.
3. Select **Database User Settings**.
4. Click **Next**.
   The Database User Settings screen is displayed.
5. Enter the updated User Name, Password and Domain.
6. Click **OK**. A message to ensure that the login has required permissions is displayed.
7. Click **OK**. A message indicating Database User settings edited successfully is displayed.
8. Click **OK**.

Changing SQL User Credentials for SQL Authentication

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Farm Configuration Wizard**.
   The **Welcome to the AVEVA Work Tasks Configuration Wizard** appears.
2. Click **Next**.
   The **Edit AVEVA Work Tasks Farm Settings** screen appears.
3. Click **Database Settings**.
   The **Connect to existing database** screen appears.
4. From the Connection String option, modify the User Id and Password for connecting to the database.
5. Click **Test Connection**.
6. Click **OK**.
7. Click **Next**. The user credentials are updated.

Changing Password of SQL User Credentials used to Connect to Repository Data Source

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.
   The **AVEVA Work Tasks Central Configuration** page appears.
2. Click **Datasource Settings**. The **Datasource List** appears.
3. From the **Datasource** column, click the required data source to be modified. The **Manage Datasource** page appears.
4. From the **Connection String** option, modify the User ID and Password field.
5. Click **OK**. This will change the password of SQL user credentials.

Changing a Web Service Authentication User

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. From the Resource Provider drop down box, select the authentication provider for the AVEVA Work Tasks Repository selected from the previous step.
2. Enter the Login Name and Password.
3. Click Authenticate. After successful authentication, the screen to Re-Authenticate users appears.

You can Re-Authenticate with a different user credential if the authenticated user details does not have the required permissions.

You can either select, create or edit an impersonation user from the Select User drop down box, Create New User or Edit User option respectively. Follow the steps below to:

- Create/add a new impersonation user
- Edit an impersonation user

Adding the Impersonation User

The following steps will assist you to add a new impersonation user.

1. Click **Create New user**.
2. Enter **Display Name**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Enter **Login Name** and **Password**.
4. Click **Save**.

A windows authenticated login name and Password should be provided. The login name must be preceded with the domain name.

Editing the Impersonation User

Using Enterprise Console

The following steps can be used to create or modify an impersonation user using the Enterprise Console.

1. On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **Central Configuration**.

   The **AVEVA Work Tasks Central Configuration** page appears.
2. Click **Repository Settings**. The **Repository List** page appears.
3. From the Site Path column, click on the required Repository.
4. Log on to the Enterprise Console.
5. On the Enterprise Console menu, point to Settings, and then click Impersonation User.
6. Click **New** to create a new user. The **New User** screen appears.

   Alternatively, to edit an existing user select the required user and click **Edit**, or alternatively select **Edit User** from the context menu.
7. Enter the **Display Name**, **Account Name**, and **Password**.
8. Click **Save**. A message indicating Impersonation user saved successfully appears.

   If the Password is modified in the Active Directory then the same should be modified using the Enterprise Console or SharePoint. If this is not done the workflows will fail. The changes will take affect only after 3

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

minutes in the Workflow Engine.

9. Repeat Step 2 to Step 10 for all repositories where the impersonation user is used.
10. Reset IIS to clear the cache.

Using Microsoft SharePoint Central Administration

1. Select the required user to be edited from the **Select User** drop down box.
2. Click **Edit User**.
3. Modify the password by entering the new password.
4. Click **Save**. The changes are updated in the Database.

Users can also create or edit impersonation user through the Enterprise Console.

Error while Installing Configuration Farm or Web Sites

Before going through this section, see Prerequisites for Debugging Exceptions.

1. During install, you get the following error message:

Error: Cannot read configuration file

Probable Cause

This error occurs if the AVEVA Work Tasks sites, namely the Central Configuration and the Enterprise Console, exists in Internet Information Services (IIS) Manager.

Resolution

1. Open Internet Information Services (IIS) Manager.
2. Expand Web Sites.
3. Expand AVEVAWorkTasksSites.
4. Delete AVEVA Work Tasks sites, namely the Central Configuration and the Enterprise Console.
5. Install AVEVA Work Tasks based on your installation scenario again.

2. Websites created by the Farm Configuration wizard are not getting deleted while uninstalling Farm Configuration Wizard.

Probable Cause

This occurs if the the user creates a website with the same name as that of the parent website which was created by the Farm Configuration Wizard using the New Website feature in IIS Structure.

Example:

1. If Farm Configuration Wizard had a site which was created using the New Website feature in IIS with structure the name Telematics.
2. Later the user creates a Enterprise Console or Central Configuration or Virtual Directory with the name Telematics under the parent website Telematics (created in step 1).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Resolution

Ensure that the parent site is removed from the IIS.

Error while reinstalling AVEVA Work Tasks Client

Issue 1:

The AVEVA Work Tasks Server/Client configuration fails while using Farm Configuration Wizard, displaying an error message: "*The given key was not present in the dictionary.*"

Cause:

This issue occurs if **AVEVAWorkTasksSites** is already present in IIS before configuring the farm. In this scenario, an entry for AVEVAWorkTasksSites is not created in the SKWebSite table during the configuration process.

Solution:

To resolve this issue, follow these steps:

1. Open **IIS Manager**.
2. Locate and delete the **AVEVAWorkTasksSites** site from IIS.
3. Use the **Farm Configuration Wizard** to reconfigure the farm. Ensure that a new Farm Database is used during the configuration process.

Issue 2:

When clicking the **Edit** icon in Enterprise Console under Farm Configuration, the following error is displayed: *Index was out of range. Must be non-negative and less than the size of the collection. Parameter name: index*

Cause:

This issue occurs if **AVEVAWorkTasksSites** is already present in IIS before configuring the farm. In this scenario, an entry for AVEVAWorkTasksSites is not created in the SKWebSite table during the configuration process.

Solution:

To resolve this issue, follow these steps:

1. Open **IIS Manager**.
2. Locate and delete the **AVEVAWorkTasksSites** site from IIS.
3. Use the **Farm Configuration Wizard** to reconfigure the farm. Ensure that a new Farm Database is used during the configuration process.

Unable to Log on to Enterprise Console

Issue

When you log on to Enterprise Console, a message Unable to fetch provider appears and you will not be able to log on to Enterprise Console.

Probable Cause

The computer on which AVEVA Work Tasks is installed has a underscore (_) in the name. When underscore is used in the machine name, the cookies are not generated.

Resolution

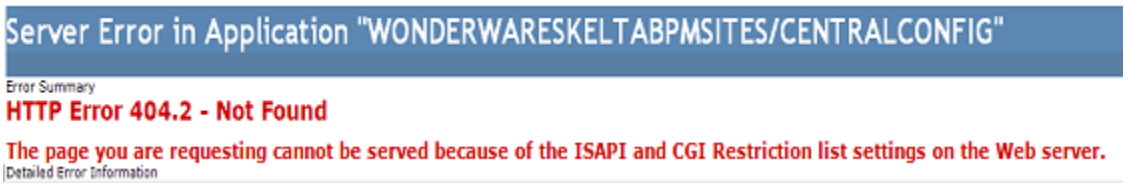
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Use the IP Address of the system on which AVEVA Work Tasks is installed to access Enterprise Console and Microsoft SharePoint. Do not use a computer name as it has an underscore (_).

Server Error in Application

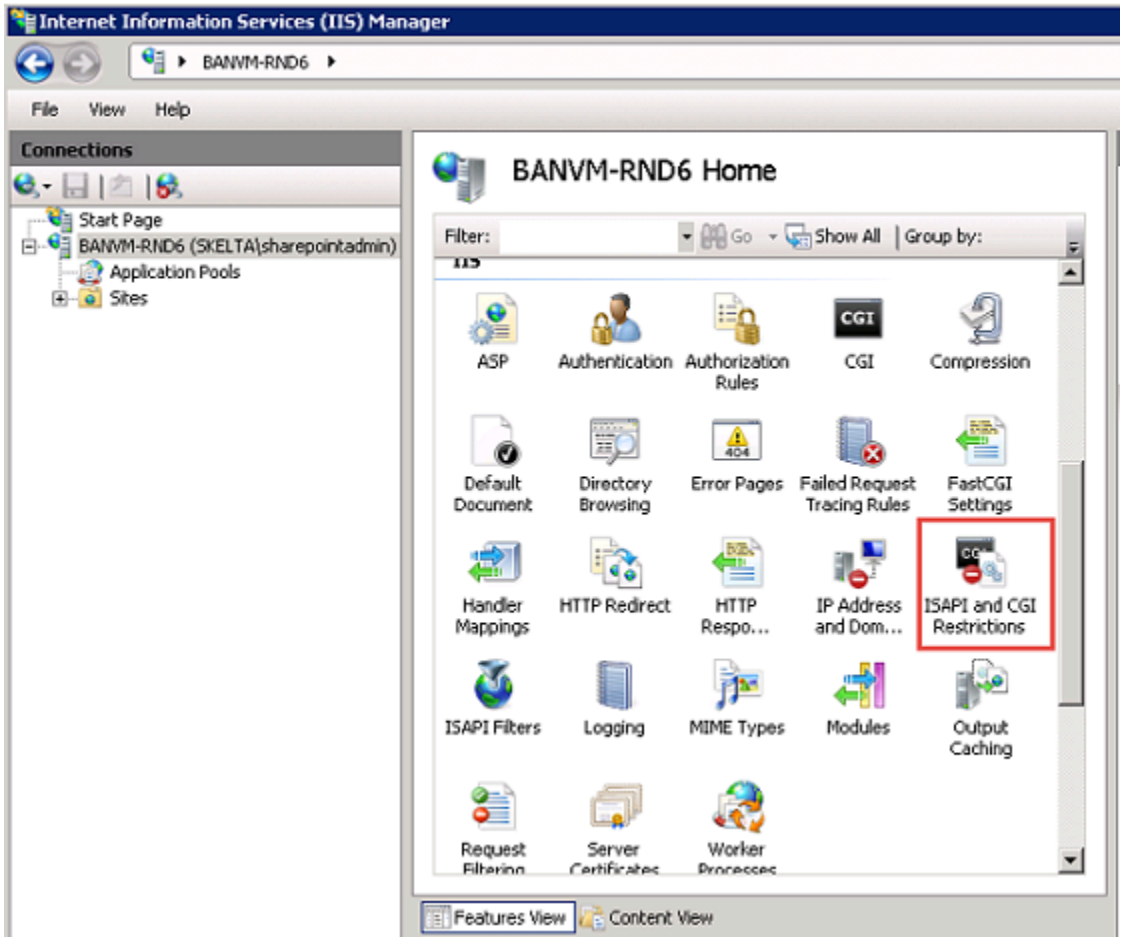
Issue

In a fresh installation environment, after configuring the AVEVA Work Tasks sites, when you try to open Central Configuration, you get the following error message:



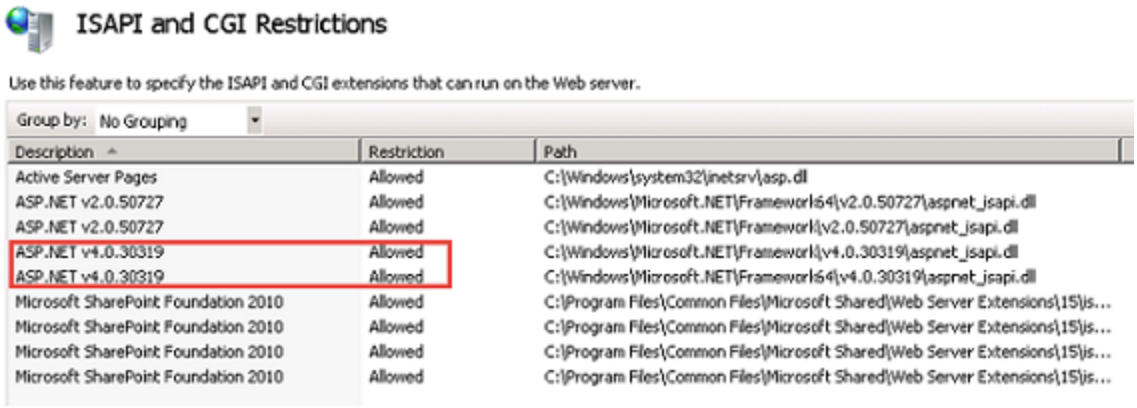
Resolution

1. Open the IIS Manager, and then go to server level.



2. In the Features View, click ISAPI and CGI Restrictions. The ISAPI and CGI Restrictions window opens.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Change the Restriction of ASP.Net v4.0.30319 to Allowed.

Troubleshooting AVEVA Work Tasks Upgrade

Issue:

Could not load file or assembly 'Microsoft.SqlServer.BatchParser

While creating a DataSource, the following error message appears:

Could not load file or assembly 'Microsoft.SqlServer.BatchParser, Version=12.0.0.0, Culture=neutral, PublicKeyToken=89845dcd8080cc91' or one of its dependencies. The system cannot find the file specified.

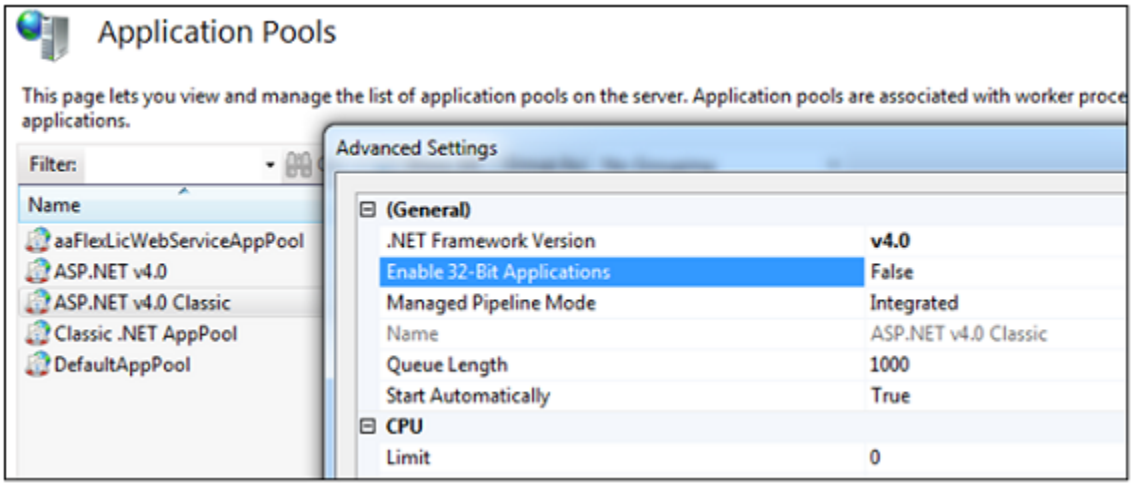
Probable Cause

The Application runs under different processor operating mode than the installed operating system. For example, on a 64Bit OS application runs in 32 bit mode.

Corrupt or wrong SMO installation.

Resolution

- Ensure that the correct SMO and CLR Type are installed in the system. For example, for 64-bit OS, install 64-bit SMO and 64-bit CLR Types.
- If the OS is 64-bit, set Enable 32-Bit Application flag to False.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

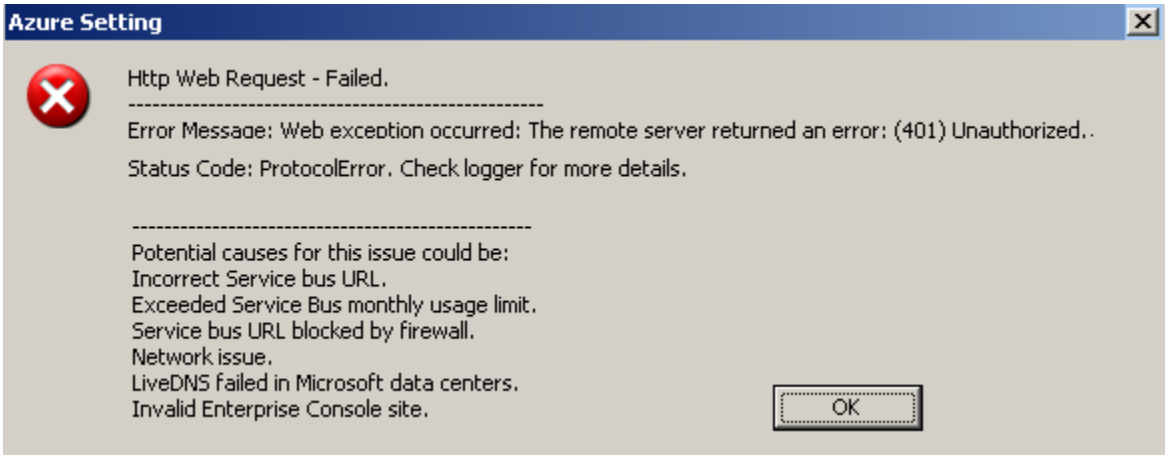
Service Bus Listener Error

1.The exception *Could not connect to workflow engine* appears on click of Test.

Resolution:

- In a Standalone environment, ensure the Workflow engine is running.
- In an Enterprise server environment, ensure the Advance Server Service is running in the server where the test is performed and ensure that the Workflow engine is running in at least one of the servers in the environment.

2. Web Exception occurred: The remote server returned an error: (401) Unauthorized..Status Code: ProtocolError. Check logger for more details.



Probable Cause:

Anonymous access is not enabled for the Enterprise Console in IIS 6.

Resolution:

1. Access IIS Manager.
2. Click **AVEVAWorkTasksSites**, and then click **Enterprise Console**.
3. Right-click **Enterprise Console** and select **Properties**. The **Properties** dialog box appears.
4. Click the **Directory Security** tab, and then click **Edit** in **Authentication and Access Control**. The **Authentication Mode** appears.
5. Select **Enable Anonymous access**, and enter the credentials of the administrator.
6. In **Authenticated Access**, select **Basic authentication** (password is sent in clear text).
7. Click **OK**.
8. Test the Service Bus Listener.

Mobile Notification Service Errors

Issue:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Notifications not received on the mobile device.

Resolution:

1. Verify if Push Notifications were allowed at the time of installation.
   - If Push Notifications were not allowed during installation, then reinstall AVEVA Work Tasks Pro.
   - If Push Notifications were allowed, then go to Notification Settings in your mobile device, and then enable Sound and Badge notification.

   Verify if notifications are received. If notification is still not received follow the next set of steps.
2. Verify the AVEVA Work Tasks log files, verify all the exceptions that start with the text 'AMNS_' and all exceptions form the process ArchestrAMobileNotificationService.exe.
   - Contact the support team with the exception. For more information about the logger console, see *Logger Console* section in the *Developer Guide*.
   - If exceptions are related to connectivity follow the next set of steps.
     To verify the connectivity between AVEVA Work Tasks server and Mobile Notification Service on the cloud, complete the following steps:
3. Open Farm Configuration Wizard.
4. Click **Next**.
5. Select **Service Settings** to open the **Services/Global Settings** screen.
6. Click **Next**.
7. Click against Mobile Notification Service to open the Mobile Notification Service Settings screen.
8. Go to the **Register** tab.
9. Click **Test Connectivity** in the **Register** section.
   - If connectivity test fails, check the network connection of the Server or contact your network administrator.
   - If connectivity passes, send a test notification to verify if notifications are successfully sent.
10. To send test notifications,
    a. In the **Registration Details** section, click **Test Notification**.

       The **Test Notification** dialog appears.
    b. Select a mobile device and click **Send Notification**.

    If the test notifications are not sent, view the Logger console for specific logs from the process ArchestrAMobileNotificationService.exe. Contact the support team with the exception.

Error: Could not load file or assembly or Error while creating instance

Issue:

After upgrading to AVEVA Work Tasks, you might get the following error:

Could not load file or assembly

or

Error while creating instance

Resolution:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

If custom assemblies are used for any custom activities, SOA assembles, custom event handler, custom resource provider, or any custom components, you must upgrade the custom assemblies to .NET framework supported version to work with the latest version of product.

Rebuild the custom assemblies with the latest version of product and with .NET framework supported version. Ensure to update the assembly in the appropriate path. If custom assemblies are in GAC, you must update the assembly in the GAC too as GAC for different versions of framework are different.

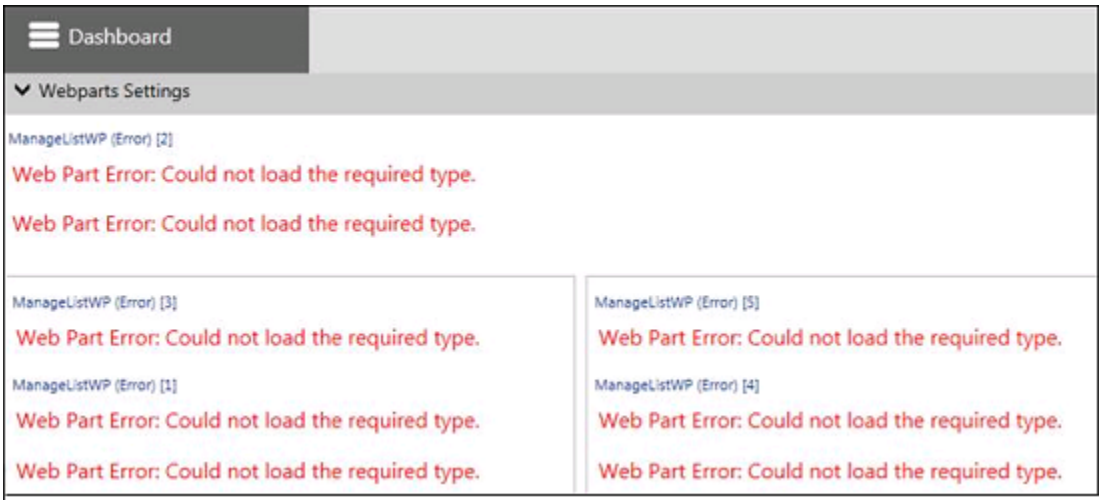
Web Part Error: Could not load the required type

Issue:

In **Wonderware Skelta BPM 2014** release onwards, when we create a new **Enterprise Console** and map an upgraded repository (upgraded from **Skelta BPM.NET 2011 SP4**) to the new site, then the following error appears while logging in to the repository:

Web Part Error: Could not load the required type

The following image shows the error snapshot:



Resolution:

Adding the following code to the **web.config** file of the newly created **Enterprise Console**:

```
<runtime>
<assemblyBinding xmlns="urn:schemas-microsoft-com:asm.v1">
<dependentAssembly>
<assemblyIdentity name="Skelta.WebParts" culture="neutral"
publicKeyToken="bc10944fa2f62aa6" />
<bindingRedirect oldVersion="5.0.0.0" newVersion="6.0.0.0" />
</dependentAssembly>
</assemblyBinding>
</runtime>
```

File Watcher Events Error

Issue:

The **File Watcher Workflows** configured using the existing **File Watcher Folder** are not triggered (even if the folder is pointing to the correct physical location) in the following scenarios:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- When you back up and restore the Farm database and the Data Source
- When you create a Repository using the **Attach Data Source** option

Resolution:

1. Edit and save the **File Watcher Folder**.
2. Restart all the AVEVA Work Tasks Services.

Access Denied to AVEVA Work Tasks Temp Folder along with System IO Errors

Issue

User receives an error while accessing **Central Configuration** or **Enterprise Console** and **Logger Console** logs System IO errors accessing specific file in **AVEVA Work Tasks Temp** folder (**C:\Windows\Temp\AVEVAWorkTasksTemp**).

Probable Cause

Access Control List (ACL) updated by Windows updates or policies.

Resolution

Provide access to **AVEVA Work Tasks Temp** Folder (**C:\Windows\Temp\WorkTasksTemp**):

- Delete and recreate **AVEVA Work Tasks Temp** folder.

  OR
- Provide access to account **ApplicationPoolIdentity**.

  OR
- Provide access to group **Everyone**.

  Note: This option is not recommended as it will leave your system open to security vulnerabilities.

References

For more information on:

- Application Pool Identities, see https://docs.microsoft.com/en-us/iis/manage/configuring-security/application-pool-identities
- Access Controls, see https://technet.microsoft.com/en-us/library/dd277411.aspx

Cache Refresh not Reflected after the Product Upgrade

The changes in the Enterprise Console like the js, css, images, etc. files are not getting reflected after the product

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

is upgraded or a package(which includes overwriting existing files) is installed.

Probable Cause:

- You have not cleared the browser cache after the product upgrade.
- The time (in seconds) set for `cacheControlMaxAge` attribute in the Web.Config file located in <product installation path>\Web\BPMUITemplates\Default\ of the Enterprise Console is not reached.

Resolution:

- After the product upgrade, delete the browser cache manually on the client browser. You need to clear the browser cache only once.
- If you change the .js, .css, or image files, the changes would reflect after the time specified for `cacheControlMaxAge` attribute.

For more information, see Cache Refresh Settings.

Unable to Re-install AVEVA Work Tasks

Issue

Unable to re-install AVEVA Work Tasks 2020 on a server after uninstalling it from the server.

Resolution

- Check if the Platform Common Services (PCS) is installed. You may check this in Add/Remove Programs.
- Restart ArchestrA Data Store service from Services Applet. It has dependent services, and those also need to be restarted.

Unexpected Error when Authenticating against Azure Active Directory

Issue

AVEVA Work Tasks does not work as expected if TLS 1.2 is not used to communicate or authenticate against Azure Active Directory.

Probable Cause

Microsoft Azure Active Directory does not support Transport Layer Security (TLS) protocols, TLS 1.1 and TLS 1.0.

Resolution

You need to enable support for TLS 1.2 in your environment. For more information, refer microsoft documentation on enabling support for TLS 1.2.

Swapping Repository Provider

You can swap the primary provider records to the secondary provider in SkVirtualActor table when the primary provider is not accessible or damaged.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Swapping is possible only if the repository you are accessing has multiple providers configured.

Note: Before you swap the provider, take the backup of SkVirtualActor table.

Issue

The repository provider you are accessing is damaged and not accessible.

Solution

Swap the damaged repository provider with the other provider available for that repository.

To swap the repository provider

1. Access **Central Configuration** site and navigate to **Repository Provider List**. For more information, see Repository Provider List.
2. Right-click the repository provider that is damaged and select the option **Swap Provider**.

   Note: The **Swap Provider** option is available only if the repository has more than one provider instances.

   The values get swapped from the primary provider to the secondary provider. The secondary provider is the one which is at the top of the provider list.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Connectors and Extensions User Guide

This section is for the system integrator responsible for installing the product and has knowledge of operating systems, relational database concepts, and the database engines in your environment. It assumes that you are familiar with the interface requirements for your supporting applications.

Key Features

The following section highlights the key features of the AVEVA Work Tasks connectors and extensions.

AVEVA Work Tasks Connector for System Platform

- Provides an IDE Extension to connect to the AVEVA Work Tasks repository.
- Provides an AppObject named WorkflowGateway for Connectivity configuration, and to route Outbound and Inbound connections.
- Provides complete process management inside IDE.
- Provides option to capture workflow events and bind the events to workflows.
- Provides option to interact (Read/Write attributes) with Galaxy through the workflow process.
- Provides ArchestrA Symbols for InTouch HMI.
- Provides the Historian EventScript library. This script library can be used to monitor triggered Historian event tags.

AVEVA Work Tasks Extension for System Platform

- Installs System Platform Plug-in on AVEVA Work Tasks server. The plug-in is required for Galaxy to connect to the AVEVA Work Tasks workflow repository.
- Modifies the user interface files for rendering the InTouch controls and to render the Enterprise Console functionality in IDE.

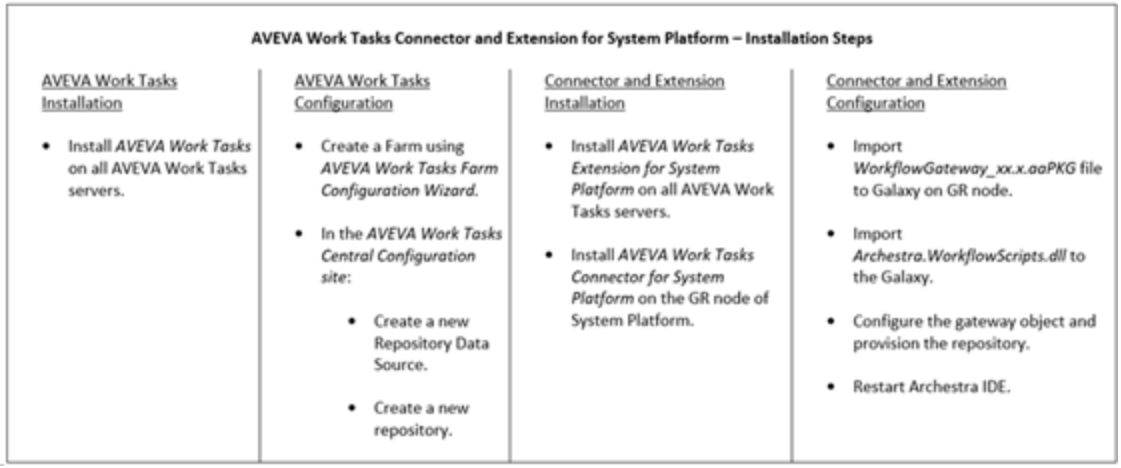
AVEVA Work Tasks Extension for OPC UA

- You use the AVEVA Work Tasks Extension for OPC UA to read or write tag values from the OPC UA server.
- Connect AVEVA Work Tasks workflow server to one or more existing OPC UA servers on the network.
- Read or Write Tag values from the OPC UA server which is connected to the AVEVA Work Tasks server.

Overview

The following image shows the installation sequence for AVEVA Work Tasks Connector and Extension for System Platform:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Step 1: AVEVA Work Tasks Installation

- Install AVEVA Work Tasks on all the servers.

Step 2: AVEVA Work Tasks Configuration

- Configure Workflow in AVEVA Work Tasks. For more information about configuring workflow, see *Administrator Guide*.

Step 3: AVEVA Work Tasks Extension and Connector for System Platform Installation

1. Install the AVEVA Work Tasks Extension for System Platform on all AVEVA Work Tasks installed computers (servers or clients), and verify the installation.
2. Install the AVEVA Work Tasks Connector for System Platform on the GR Node of System Platform, and verify the installation.

Alternatively,

AVEVA Work Tasks Connector and Extension for Information Server Installation

1. Install the AVEVA Work Tasks Extension for Information Server on all AVEVA Work Tasks Servers, and verify the installation.
2. Install the AVEVA Work Tasks Connector for Information Server on the Information Server, and verify the installation.

Step 4: Connector Configuration

1. Import *WorkflowGateway_xx.xx.aa.PKG* file in Galaxy on GR Node.
2. Import ArchestrA.WorkflowScripts.dll in the Galaxy.
3. Configure WorkflowGateway object in the Galaxy.
4. Provision a repository in AVEVA Work Tasks.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

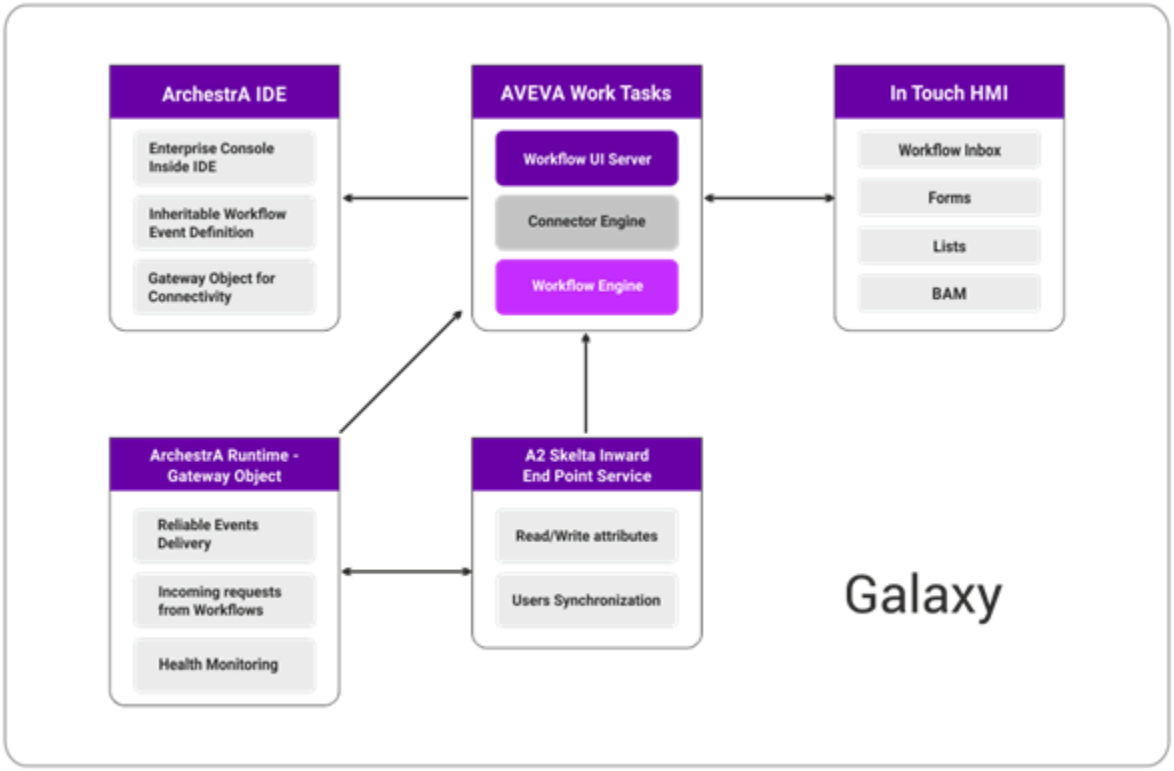
Connector for System Platform

The System Platform contains an integrated set of services and an extensible data model to manage plant control and information management systems. The System Platform supports both the supervisory control layer and the manufacturing execution system (MES) layer, presenting them as a single information source.

Modular applications sit on top of the System Platform. AVEVA Work Tasks and other third-party integrators are delivering a growing inventory of application components that use the System Platform services.

Architecture

The following image shows the architecture of AVEVA Work Tasks Connector for System Platform:



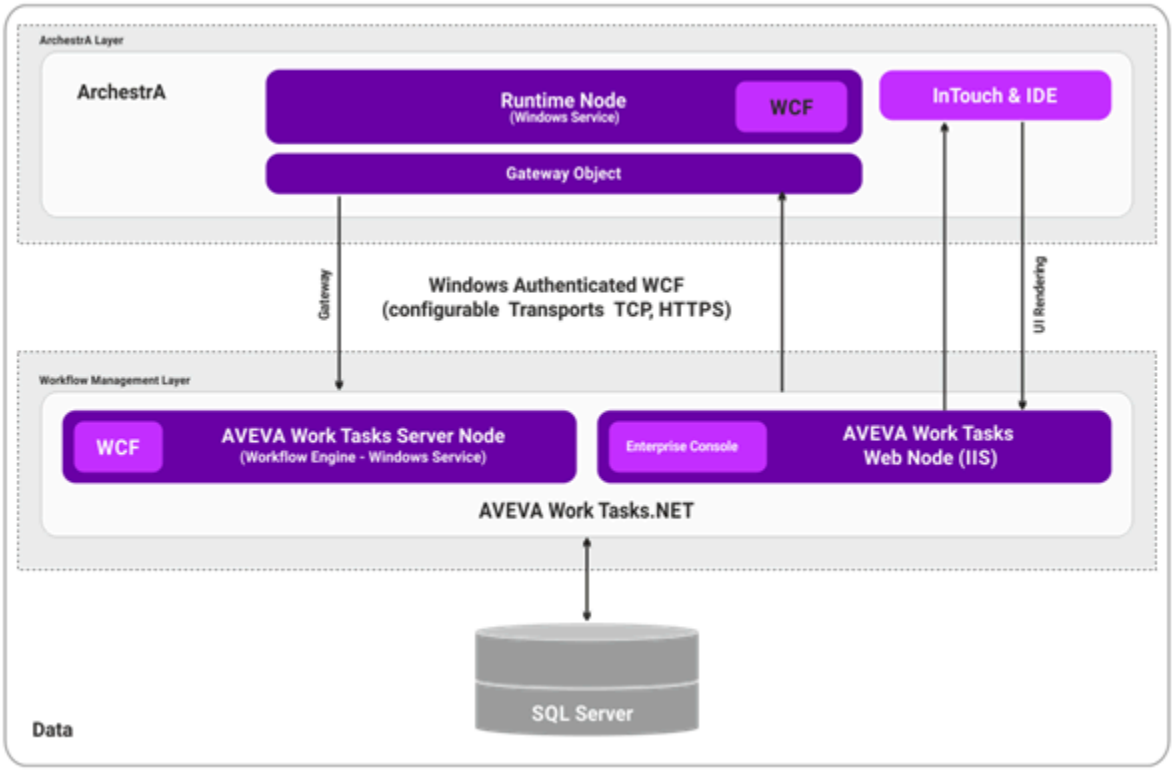
Principles of Integration with System Platform

- ArchestrA is used as IDE for contextual development of Workflows and Composite applications
- Work with Object-oriented concepts of System Platform
- Allows scalable deployments
- Allows redundancy for reliable operations
- Provides automated deployment across platforms
- ArchestrA graphics symbol for bringing process-specific UI inside HMI
- Get Events from any object
- Provides a scalable, easy to use and configurable, and inheritable model

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Enables existing users of IDE/HMI to work with workflows

High Level View of AVEVA Work Tasks Connector for System Platform Architecture



AVEVA Work Tasks and System Platform Integration

A WCF (Windows Communication Foundation) layer integrates the System Platform with AVEVA Work Tasks. An AppObject named WorkflowGateway, placed in the ArchestrA environment, manages the Outbound and Inbound communication between these layers.

- **Outbound connection** contains information related to the WCF service hosted inside the workflow engine (windows service). Outbound connection is used to trigger workflow during events in ArchestrA. The same connection is also used to get information from AVEVA Work Tasks layer.
- **Inbound connection** contains information related to the WCF service hosted inside the Runtime node as a windows service. Inbound connection is used to perform read/write attribute operation and also to synchronize user information from ArchestrA layer to AVEVA Work Tasks layer.

InTouch and System Platform IDE renders the Enterprise Console functionality.

Installation Scenarios

The following are the ways you can install connectors for System Platform:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Single Computer
- GR and System Platform IDE on Computer 1, InTouch and Runtime on Computer 2, and AVEVA Work Tasks on Computer 3
- GR and System Platform IDE on Computer 1, System Platform IDE on Computer 2, InTouch and Runtime on Computer 3, and AVEVA Work Tasks on Computer 4

Single Computer

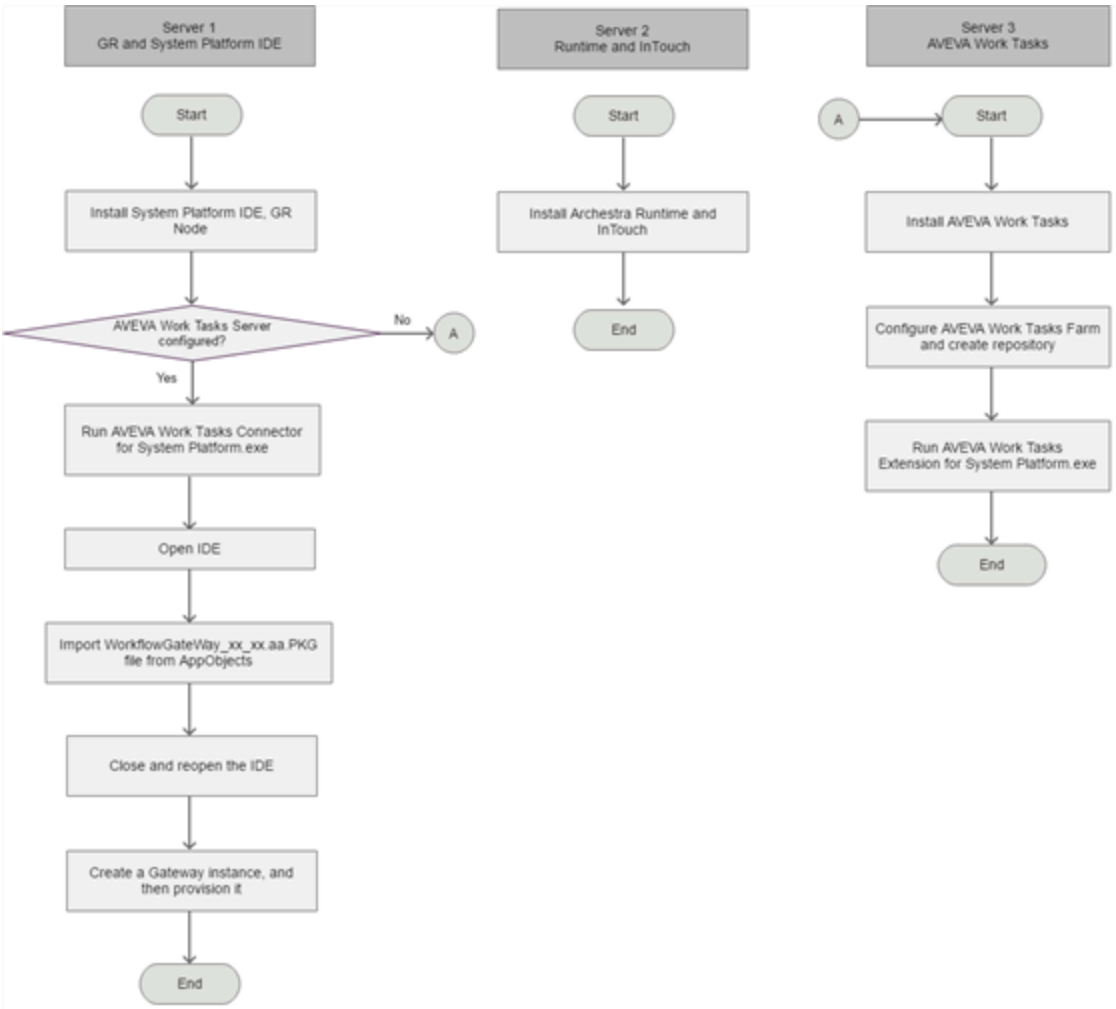
For complete details about installation steps, see the following topics:

1. Install Extension for System Platform
2. Install Extension for System Platform
3. Install Connector for System Platform

GR and System Platform IDE on Computer 1, InTouch and Runtime on Computer 2, and AVEVA Work Tasks on Computer 3

The following flowchart shows the steps to install AVEVA Work Tasks Connector for System Platform when GR and System Platform IDE are on Computer 1, InTouch and Runtime are on Computer 2, and AVEVA Work Tasks is on Computer 3.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



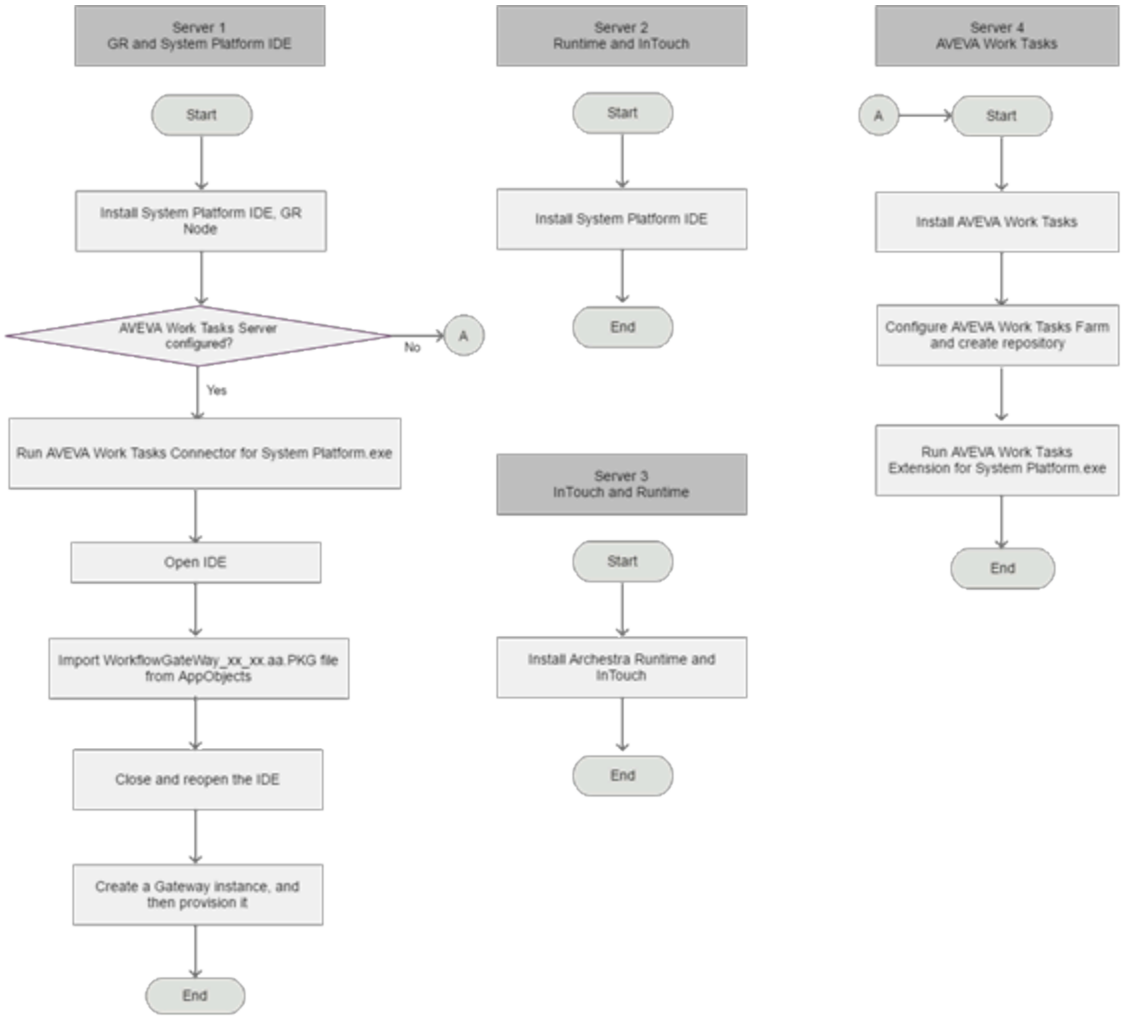
For complete details about installation steps, see the following topics:

1. Install Extension for System Platform
2. Install Extension for System Platform
3. Install Connector for System Platform

GR and System Platform IDE on Computer 1, System Platform IDE on Computer 2, InTouch and Runtime on Computer 3, and AVEVA Work Tasks on Computer 4

The following flowchart shows the steps to install AVEVA Work Tasks Connector for System Platform when GR and System Platform IDE on Computer 1, System Platform IDE on Computer 2, InTouch and Runtime on Computer 3, and AVEVA Work Tasks on Computer 4.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



For complete details about installation steps, see the following topics:

1. Install Extension for System Platform
2. Install Extension for System Platform
3. Install Connector for System Platform

Installation

AVEVA Work Tasks Connector for System Platform has a single installer for 64-bit computers. This installer should be installed on the GR Node of System Platform. It creates a Workflow folder under the ArchestrA installed path and stores the required dll files.

Note: AVEVA Work Tasks 2023 SP1 Connector for System Platform requires .Net framework 4.8 as a pre-requisite component.

The AVEVA Work Tasks Connector for System Platform plugs inside the System Platform server. It adds the following major components in System Platform IDE:

- WorkflowGateway AppObject
- AVEVA Work Tasks Enterprise Console menus and Content pages

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Adds a tab called Workflow for each and every Application Object. It is used to create events and associate workflow to those events.

In case of fresh installation, AVEVA Work Tasks 2023 SP1 Connector for System Platform is compatible with the following:

- AVEVA System Platform 2023 SP1

See the Product Compatibility for the System Platform compatibility information.

Install Connector for System Platform

To install AVEVA Work Tasks Connector for System Platform

1. Run the *AVEVA Work Tasks 2023 SP1 Connector for System Platform.exe* installer.

   The installer splash screen, and then the **AVEVA Work Tasks 2023 SP1 Connector for System Platform** screen appears.
2. Click **Next**.

   The License Agreement screen appears.
3. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.

   The Customer Information screen appears.
4. Enter the **User Name** and **Organization** name, and then click **Next**.
5. Click **Install** to begin the installation.
6. Click **Finish** to complete the installation.
7. Restart the System Platform IDE.

Installing the Connector for System Platform updates the following folders:

- The Object file **aaPKG** or **aaPDF** is saved in ArchestrA Installed Path > Workflow folder > AppObjects folder. This object needs to be imported to System Platform IDE.
- The **IDE extension DLLs** are stored in the IDE extension folder, **InTouch DLLs** in the InTouch folder, and **Script DLLs** in the Script Library folder.

Import files to System Platform IDE

After installing the Connector for System Platform, you have to import the following files:

- The WorkflowGateway object file, aaPKG or aaPDF
- ArchestrA.InTouch.SkeltaControls.dll to enable workflow features in InTouch HMI
- Script function library (ArchestWorkflowScripts.dll)
- AVEVA Work Tasks controls for InTouch OMI

To import WorkflowGateway Object file

The aaPKG or aaPDF file saved in the AppObjects folder has to be imported to System Platform IDE. Complete the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

following steps to import the files:

1. Open **System Platform IDE**.
2. From the **Galaxy** menu, select **Import** > **Objects** > **From Package**.

   The Import Objects from package window appears.
3. Browse to the path <**ArchestrA Installation Path**>**ArchestrA\Workflow\AppObjects**, select **WorkflowGateway_XX.X.aaPKG**, and then select **Open**.

   The Import Preferences window appears.
4. Click **OK**.

   The status of importing the object appears in the Import Automation Object(s) window.
5. After importing the object completes, click **Close**.
6. Close the System Platform IDE, and then open it again.

On importing the object to System Platform IDE

- The following dll files listed are stored in ArchestrA Installation folder > Framework > FileRepository > CustomCategoryUIFiles folder.
  - ArchestrA.Workflow.IDEExtension.dll
  - Skelta.ArchestrA.WinForms.dll
  - Skelta.WinForms.dll
  - Skelta.WinForms.Security.dll

    If these dll files are not added automatically, you must copy the files manually from **C:\Program Files (x86)\ArchestrA\Workflow\IDEExtension** to:
  - C:\Program Files (x86)\ArchestrA\Framework\FileRepository\CustomCategoryUIFiles
  - C:\Program Files (x86)\ArchestrA\Framework\Bin\IDEExtensions

- Verify whether the files stored in CustomCategoryUIFiles folder are copied to ArchestrA installed path > Framework > Bin >IDEExtensions folder. If not, they can be copied manually. The Workflow tab in System Platform IDE > Workflow - Toolbox tab will not be visible without these DLL files.

- Import ArchestrA.InTouch.SkeltaControls.dll to use additional controls that enables you to use workflow features in InTouch. For information about InTouch Controls, see Workflow Status View Inside InTouch.

To import Script Function Library (ArchestrAWorkflowScirpts.dll)

1. Open **System Platform IDE**.
2. From the **Galaxy** menu, select **Import** > Script Library.

   The Import Script Library window appears.
3. Select the **<Installation Path>\ArchestrA\Workflow\Scripts** folder.
4. Select **ArchestrAWorkflowScripts.dll** file, and then click **Open**.

To import AVEVA Work Tasks controls for InTouch OMI

1. Open **System Platform IDE**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. From the **Galaxy** menu, select **Import** > **Visualization** > **Client controls**.
   The **Import Client Controls** dialog box appears.
3. Select the **<Installation Path>\ArchestrA\Workflow\ClientControls** folder.
   The imported controls appear in the **Graphic Toolbox**.

To import ArchestrA App

1. Open **System Platform IDE**.
2. From the **Galaxy** menu, select **Import** > **Visualization** > **OMI App**.
   The **Import ArchestrA App** dialog box appears.
3. Select the **<Installation Path>\ArchestrA\Workflow\InTouchOMI\AVEVAWorkTaskApp** folder.
   The imported ArchestrA App appears as **AVEVAWorkTasksAppXXX** in the **Graphic Toolbox**.

Note:
- Import the ArchestrA App only once as System Platform IDE allows ArchestrA App imports multiple times by creating multiple objects with an increasing sequence number like AVEVAWorkTasksAppXXX. This may create discrepancy.

Install Connector for System Platform in Silent Mode

You can install the Connector for System Platform in silent mode using the **AVEVA Work Tasks** Connector for System Platform installer with switches for silent mode.

The installation of the Connector for System Platform in silent mode considers user inputs from command-line parameters.

The full syntax for running the AVEVA Work Tasks Connector for System Platform installer from the command line is as follows:

<Installer EXE Name>.exe /S /v/qn

For example: "AVEVA Work Tasks 2023 SP1 Connector for System Platform.exe" /S /v/qn

where,

- /S denotes silent install
- /v denotes pass arguments to Msiexec (Basic MSI and InstallScript MSI projects). The /v option is used to pass command line options and values of public properties through to Msiexec.exe.
- /qn denotes an msiexec switch indicating to run with no user interface (UI).

This command string takes the default values for parameters, such as user name, installation location, and company name.

Silent installation with logging

If you want to install in silent mode with logging, then enter the syntax for silent installation command as follows:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

<Installer EXE Name>.exe /S /v/qn /v"/L*v <Log File Path and Name>"

For example: "AVEVA Work Tasks 2023 SP1 Connector for System Platform.exe" /S /v/qn /v"/L*v c:\logfileName.log"

Return Results

The return result is stored in the **%ERRORLEVEL%** variable. Its value is **0** if the installation is successful and other than zero if the installation is not successful.

To get the return result, create and run a batch file with the following commands:

```
"AVEVA Work Tasks 2023 SP1 Connector for System Platform.exe" /S /v/qn
IF %ERRORLEVEL% EQU 0 (
echo Connector silent installation completed successfully.
) ELSE (
echo Connector silent installation not completed successfully.
)
```

Note: The installer will install connector files in the ArchestrA installation path automatically. After you run the silent installer, wait for a minimum of 30 minutes until the installation is complete. Check the installation folder to ensure that all the required files and folders are copied to the installation folder.

Verify Installation

The verification of the Connector for System Platform installation has been broadly divided into the following three steps.

Verify basic AVEVA Work Tasks Connector for System Platform installation

A folder "Workflow" gets created in the ArchestrA installed root folder. The user should be able to perform the following tasks successfully:

1. Import the **WorkflowGateway (WorkflowGateway_20.1.aaPKG)** from the **<ArchestrA installed root >\workflow\AppObjects** folder.
2. Create an instance of WorkflowGateway.
3. Open the WorkflowGateway and provide the AVEVA Work Tasks server information and authentication credentials.

Verify configuration of WorkflowGateway AppObject

1. Ensure that the Windows authentication credentials provided for AVEVA Work Tasks Server Connectivity (Outbound Connection) are valid.

   Click on the **Test Connection** button in WorkflowGateway to populate the workflow repositories configured in the AVEVA Work Tasks server.
2. Ensure that Workflow Repository authentication information is valid.

   Click on the **Authorize and Provision** button for provisioning the repository.
3. Ensure that *WorkflowGateway* AppObject has been provisioned successfully.

   Select a *WorkflowGateway* instance from the Workflow tool box drop-down list on the left upper corner

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

of IDE to list different menu options in the drop-down list, based on the logged-in user rights.

Verify runtime functionality of WorkflowGateway AppObject

- Verify if WorkflowGateway is deployed successfully on the RunTime node.

The WorkflowGateway attribute *GatewayObjectDeployErrMsg* should have the value *NoError* and the attributes *InvalidInboundConnAuthInfo* and *InvalidInboundConnPortInfo* should have the value as false after deployment.

Upgrade Connector for System Platform

You can upgrade to **AVEVA Work Tasks 2023 SP1 Connector for System Platform** from the following version:

- AVEVA Work Tasks 2023 Connector for System Platform

Prerequisites

- In the AVEVA Work Tasks server, upgrade **AVEVA Work Tasks 2023** to **AVEVA Work Tasks 2023 SP1**.
- Undeploy the Platform and Workflow Gateway Object.
- Upgrade the Connector to the latest version.

Steps to Upgrade

Importing files to System Platform IDE

After installing the Connector for System Platform, you have to import the following files:

- The WorkflowGateway object file, aaPKG or aaPDF
- ArchestrA.InTouch.SkeltaControls.dll to enable workflow features in InTouch HMI
- Script function library (ArchestWorkflowScripts.dll)
- AVEVA Work Tasks controls for InTouch OMI

The aaPKG or aaPDF file saved in the AppObjects folder has to be imported to System Platform IDE. Complete the following steps to import the files:

1. Open **System Platform IDE**.
2. Select **Galaxy** menu, select **Import**, and then select **Object(s)**.

   The Import Automation Object(s) window appears.
3. Go to ArchestrA Installed Path, select **Workflow**, select **AppObjects**, and then select the **WorkflowGateway_XX.X.aaPKG** file.
4. Click **Open**.

   The Import Preferences window appears.
5. Click **OK**.

   The status of importing the object appears in the Import Automation Object(s) window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. After importing the object completes, click **Close**.
7. Close the System Platform IDE, and then open it again.

On importing the object to System Platform IDE:

- The following dll files listed are stored in ArchestrA Installation folder > Framework > FileRepository > CustomCategoryUIFiles folder.
  - ArchestrA.Workflow.IDEExtension.dll
  - Skelta.ArchestrA.WinForms.dll
  - Skelta.WinForms.dll
  - Skelta.WinForms.Security.dll

    If these dll files are not added automatically, you must copy the files manually from **C:\Program Files (x86)\ArchestrA\Workflow\IDEExtension** to:
  - C:\Program Files (x86)\ArchestrA\Framework\FileRepository\CustomCategoryUIFiles
  - C:\Program Files (x86)\ArchestrA\Framework\Bin\IDEExtensions

- Verify whether the files stored in CustomCategoryUIFiles folder are copied to ArchestrA installed path > Framework > Bin >IDEExtensions folder. If not, they can be copied manually. The Workflow tab in System Platform IDE > Workflow - Toolbox tab will not be visible without these DLL files.

- Import ArchestrA.InTouch.SkeltaControls.dll to use additional controls that enables you to use workflow features in InTouch. For information about InTouch Controls, see Workflow Status View Inside InTouch.

- Import Script Function Library (ArchestrAWorkflowScirpts.dll)
  1. Open **System Platform IDE**.
  2. Select **Galaxy** menu, select **Import**, and then select **Script Function Library**.

     The Import Script Function Library window appears.
  3. Go to ArchestrA Installed Path, select **Workflow**, and then select **Scripts**.
  4. Select **ArchestrAWorkflowScripts.dll** file, and then click **Open**.

To import ArchestrA App:

1. Open **System Platform IDE**.
2. Select **Galaxy** menu, select **Import**, and then select **ArchestrA Apps**.

   The **Import ArchestrA App** dialog box appears.
3. Select the **<Installation Path>\ArchestrA\Workflow\InTouchOMI** folder.

   The imported ArchestrA App appears as **AVEVAWorkTasksAppXXX** in the **Graphic Toolbox**.

Note:
- Import the ArchestrA App only once as System Platform IDE allows ArchestrA App imports multiple times by creating multiple objects with an increasing sequence number like AVEVAWorkTasksAppXXX. This may create discrepancy.

- When you upgrade the product, it will not overwrite/upgrade the existing AvevaWorkTasksApp and it may

---

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

create issues related to old and new versions. Hence it is recommended to delete the existing AvevaWorkTasksApp and then import the new one.
Also, make sure that the older/existing AvevaWorkTasksApp is not being used in any of the ViewApp/Layout, etc. otherwise, it will cause some warnings in the logger.

Uninstall Connector for System Platform

To uninstall AVEVA Work Tasks Connector for System Platform

1. Delete all the *WorkflowGateway* instances and templates.
2. Close all the IDEs.
3. Uninstall the Connector for System Platform.

Impact of AVEVA Work Tasks Connector for System Platform uninstallation

Following is the list of files which will be deleted from the respective folders:

- ArchestrA > Workflow > IDEExtention folder
  - ArchestrA.Workfow.IDEExtention.dll
  - ArchestrA.WorkflowScripts.dll
  - Skelta.ArchestrA.Winforms.dll
  - Skelta.Winforms.Security.dll
- ArchestrA > Workflow > AppObjects folder
  - WorkflowGateway_20.1.aaPKG
- ArchestrA > Workflow > InTouch folder

- Skelta.Winform.Security.dll
- ArchestrA.Workflowscripts.dll

Limitations

- The Workflow-Toolbox provides a list of the WorkflowGateway instances configured in Galaxy. Selecting a WorkflowGateway instance will list the Enterprise Console menu for the mapped repository in the Tree view. Clicking on the link will open the respective tab window on the right side of the IDE. Using the Workflow-Toolbox users can work with multiple repositories. However, there is no support for working with multiple repositories (WorkflowGateway instance) at the same time. Close all the open windows for a repository, before working on another repository. Switching over to one repository while having one or more windows open for a different repository could lead to termination of session. Multiple presses on the Back button on these windows is not supported.

- Authentication or the Verifier user credential used for the 'Write' Attribute should be user-created before deploying WorkflowGateway. Any user used for authentication or verification after WorkflowGateway deployment may not work and require a redeploy of WorkflowGateway.

Extension for System Platform

AVEVA Work Tasks Extension for System Platform is installed in all the servers and client machines. It will add the required assemblies and files under the AVEVA Work Tasks installation folder.

Install Extension for System Platform

Install **AVEVA Work Tasks**, before installing Extension for System Platform.

In case of fresh installation, AVEVA Work Tasks 2023 SP1 Extension for System Platform is compatible with the following:

- AVEVA System Platform 2023 SP1

Install Extension for System Platform

Steps to install AVEVA Work Tasks Extension for System Platform

If you are installing AVEVA Work Tasks in the Enterprise Server mode, install the AVEVA Work Tasks Extension for System Platform on all the servers.

1. Stop all the AVEVA Work Tasks services.
2. Run the **AVEVA Work Tasks 2023 SP1 Extension for System Platform.exe** installer.

   The installer splash screen, and then the **AVEVA Work Tasks 2023 SP1 Extension for System Platform** screen appears.
3. Click **Next**.

   The License Agreement screen appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.

   The Customer Information screen appears.
5. Enter the **User Name** and **Organization** name.
6. Under **Install this application for**, select one of the following:
   - **Anyone who uses this computer (all users):** If the application can be accessed by all the users using this computer.
   - **Only for me (localadm):** If the application can be accessed by only the local administrator of the computer.
7. Click **Next**.

   The Click Install to begin the installation screen appears.
8. Click **Install** to begin the installation.

   After the installation is complete, the InstallShield Wizard Completed screen appears.
9. Click **Finish** to complete the installation.

Files Installed by AVEVA Work Tasks Extension for System Platform:

The AVEVA Work Tasks Extension for System Platform installation copies the following files:

- DLL files to the Bin folder
- Localization files to the Locals folder
- BPMUITempates files under the Web folder
- Workflow elements files under the WorkflowElements folder

The AVEVA Work Tasks Extension for System Platform does the following:

- Creates an entry in the **SKAddInProviders** table with the name field *'ArchestrA'*.
- Creates a new record in the table **SKReleaseVersionStamp** which stores the current product release version and product name. If the table is not present, the installer will create a new table. This table will be stored in Farm Database.
- The following installed files are copied from the **Bin** directory to all the **Enterprise Console site Bin** folders:
  - ArchestrA.Workflow.EventHandler.dll
  - Skelta.WinForms.Security.dll
  - ArchestrA.Workflow.Activity.Runtime.dll
  - Skelta.Connector.CommonLibrary.dll
  - Skelta.Connector.Proxy.dll
  - Skelta.ArchestrA.Connector.Client.Proxy.dll
  - ArchestrA.Workflow.Codebehind.InTouch.dll
  - ArchestrA.Workflow.Codebehind.IDE.dll
  - Skelta.ArchestrA.Connector.Client.dll

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Install Extension for System Platform in Silent Mode

You can install AVEVA Work Tasks Extension for System Platform in silent mode using the AVEVA Work Tasks Extension for System Platform installer with switches for silent mode.

The installation of the Extension for System Platform in silent mode considers user inputs from command-line parameters.

The full syntax for running the AVEVA Work Tasks Extension for System Platform installer from the command line is as follows:

<Installer EXE Name>.exe /S /v/qn

For example: "AVEVA Work Tasks 2023 SP1 Extension for System Platform.exe" /S /v/qn

where,

- /S denotes silent install
- /v denotes pass arguments to Msiexec (Basic MSI and InstallScript MSI projects). The /v option is used to pass command line options and values of public properties through to Msiexec.exe.
- /qn denotes an msiexec switch indicating to run with no user interface (UI).

This command string takes the default values for parameters, such as user name, installation location, and company name.

Silent installation with logging

If you want to install in silent mode with logging, then enter the syntax for silent installation command as follows:

<Installer EXE Name>.exe /S /v/qn /v"/L*v <Log File Path and Name>"

For example: "AVEVA Work Tasks 2023 SP1 Extension for System Platform.exe" /S /v/qn /v"/L*v c:\logfileName.log"

Return Results

The return result is stored in the **%ERRORLEVEL%** variable. Its value is **0** if the installation is successful and other than zero if the installation is not successful.

To get the return result, create and run a batch file with the following commands:

```
"AVEVA Work Tasks 2023 SP1 Extension for System Platform.exe" /S /v/qn
IF %ERRORLEVEL% EQU 0 (
echo Extension silent installation completed successfully.
) ELSE (
echo Extension silent installation not completed successfully.
)
```

Note: The installer will install extension files in the installation path automatically. After you run the silent installer, wait for a minimum of 30 minutes until the installation is complete. Check the installation folder to ensure that all the required files and folders are copied to the installation folder.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Verify Installation

You can verify the installation of the AVEVA Work Tasks Extension for System Platform from the AVEVA Work Tasks Connector for System Platform installation.

You can check the **SKProduct** table in the Farm database for the Product name along with the version number and the Build Version. The Build Version information will be in the 6.X.XXXX format.

Uninstall Extension for System Platform

To uninstall AVEVA Work Tasks Extension for System Platform:

1. Delete all the WorkflowGateway instances and templates.
2. Close all the IDEs.
3. Uninstall AVEVA Work Tasks Connector for System Platform.
4. Uninstall AVEVA Work Tasks Extension for System Platform.
5. All the files installed inside AVEVA Work Tasks installation folder are removed.

   Note: Also, ensure that the AVEVA Work Tasks Extension for System Platform is uninstalled before uninstalling AVEVA Work Tasks.

After uninstalling the Extension for System Platform, the following files are deleted from the respective folders:

- *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Bin* folder
  - ArchestrA.Connector.Plugin.dll
  - ArchestrA.Workflow.Activity.Runtime.dll
  - ArchestrA.Workflow.Codebehind.IDE.dll
  - ArchestrA.Workflow.Codebehind.InTouch.dll
  - ArchestrA.Workflow.EventHandler.dll
  - ArchestrA.Workflow.Events.dll
  - ArchestrA.Workflow.GalaxySecurity.dll
  - ArchestrA.Workflow.GalaxySecurityProvider.dll
  - Skelta.ArchestrA.Connector.Client.dll
  - Skelta.ArchestrA.Connector.Client.Proxy.dll
  - Skelta.Connector.CommonLibrary.dll
  - Skelta.Connector.Proxy.dll
  - Skelta.WinForms.Security.dll
- *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\ECSite\Bin* and *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Web\EnterpriseConsole\Bin* folder
  - ArchestrA.Workflow.EventHandler.dll
  - Skelta.WinForms.Security.dll
  - ArchestrA.Workflow.Activity.Runtime.dll

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Skelta.Connector.CommonLibrary.dll
- Skelta.Connector.Proxy.dll
- Skelta.ArchestrA.Connector.Client.Proxy.dll
- ArchestrA.Workflow.Codebehind.InTouch.dll
- ArchestrA.Workflow.Codebehind.IDE.dll

- *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\IntegrationScripts* folder
  - All the files and folders will get deleted.

- *[AVEVA Work Tasks Installed Path]\AVEVA\Work Tasks\Locales\en-US* folder
  - AAWaitForEvent.txt
  - AAWFAssoication.txt
  - InTouch.txt

- *Web\BPMUITemplates\Default\ ActivityImages*, *Web\BPMUITemplates\Default\ ArchestrA*, *Web\ BPMUITemplates\Default\ Help*, *Web\BPMUITemplates\Default\ InTouch*, *WorkflowElements\ Default* folders
  - Some AVEVA Work Tasks Extension for System Platform related files will get deleted.

Upgrade Extension for System Platform

You can upgrade to **AVEVA Work Tasks 2023 SP1 Extension for System Platform** from the following version:

- AVEVA Work Tasks 2023 Extension for System Platform

Prerequisites

- In the AVEVA Work Tasks server, upgrade **AVEVA Work Tasks 2023** to **AVEVA Work Tasks 2023 SP1** version.

Steps to Upgrade

If you are installing AVEVA Work Tasks 2023 SP1 in the Enterprise Server mode, install the AVEVA Work Tasks 2023 SP1 Extension for System Platform on all the servers.

1. Stop all the AVEVA Work Tasks services in the AVEVA Work Tasks server.
2. Run the **AVEVA Work Tasks 2023 SP1 Extension for System Platform.exe** installer.

   The installer splash screen, and then the **AVEVA Work Tasks 2023 SP1 Extension for System Platform** screen appears.
3. Click **Next**.

   The License Agreement screen appears.
4. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.

   The Customer Information screen appears.
5. Enter the **User Name** and **Organization** name.
6. Under **Install this application for**, select one of the following:
   - **Anyone who uses this computer (all users):** If the application can be accessed by all the users using this

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

computer.

- **Only for me (localadm):** If the application can be accessed by only the local administrator of the computer.

7. Click **Next**.

   The Click Install to begin the installation screen appears.

8. Click **Install** to begin the installation.

   After the installation is complete, the InstallShield Wizard Completed screen appears.

9. Click **Finish** to complete the installation.
10. Restart all the AVEVA Work Tasks services.

Extension for OPC UA

The OPC Unified Architecture (OPC UA) is a set of specifications that are not based on Microsoft COM. You can use the AVEVA Work Tasks Extension for OPC UA to read or write tag values from the OPC UA server.

Capabilities:

- Connect AVEVA Work Tasks to one or more existing OPC UA servers on the network.
- Read or write tag values from the OPC UA server which is connected to the workflow server.

The following are the **prerequisites** to access the application server:

- To access AVEVA Work Tasks server, Windows Authentication User information is required.
- The user must be a part of Roles Administrators, SkeltaAdmins, or the SkeltaRemoteUsers.
- The user should have administrative rights to the workflow repository.

Install Extension for OPC UA

Install the **AVEVA Work Tasks Extension for OPC UA** with **AVEVA Work Tasks** installation on all AVEVA Work Tasks client and servers.

Run the *AVEVA Work Tasks 2023 SP1 Extension for OPC UA.exe* installers on a 64-Bit computers to install Extension for OPC UA.

Note: If the Work Tasks farm is configured with **Windows** authentication, the user attempting the installation must have the **sysadmin** role on the database server.

Installation Sequence

The following image shows the installation sequence for **AVEVA Work Tasks Extension for OPC UA**:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. AVEVA Work Tasks Installation

   Install AVEVA Work Tasks on all the AVEVA Work Tasks servers.
2. AVEVA Work Tasks Configuration

   Configure Workflow in AVEVA Work Tasks. For more information about configuring workflow, see *Administrator Guide*.
3. AVEVA Work Tasks Extension for OPC UA Installation and Configuration
   a. Install AVEVA Work Tasks Extension for OPC UA on all the AVEVA Work Tasks servers.
   b. Provision a repository for OPC UA using the AVEVA Work Tasks OPC UA Repository Provisioning Tool.
   c. Verify the AVEVA Work Tasks Extension for OPC UA installation.

Install AVEVA Work Tasks

To know about installing **AVEVA Work Tasks**, see *Installing AVEVA Work Tasks* section in the *Administrator Guide*.

Install Extension for OPC UA

Complete the following steps to install the **AVEVA Work Tasks Extension for OPC UA**.

1. Stop all the AVEVA Work Tasks services.
2. Run the *AVEVA Work Tasks 2023 SP1 Extension for OPC UA.exe* on the 64-bit computer. You must run the installer with the *Run as administrator* option.

   The installer splash screen, and then the **AVEVA Work Tasks 2023 SP1** Extension for OPC UA dialog box appears.
3. Click **Next**.

   The License Agreement screen appears.
4. Read the terms, select the **I accept the terms in the license agreement** option, and then click **Next**.

   The Customer Information screen appears.
5. Enter the **User Name** and **Organization** name.
6. Click **Next**.

   The Click Install to begin the installation screen appears.
7. Click **Install** to begin the installation.

   After the installation is complete, the InstallShield Wizard Completed screen appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. Click **Finish** to complete the installation.

Provision Repository Using OPC UA Repository Provisioning Tool

The **AVEVA Work Tasks OPC UA Repository Provisioning Tool** is used to provision a workflow repository for OPC UA. Only the provisioned repositories can be connected to OPC UA. Workflow repository provisioning for OPC UA should be done only after installing AVEVA Work Tasks.

The **AVEVA Work Tasks OPC UA Repository Provisioning Tool** gets installed during the installation of AVEVA Work Tasks Extension for OPC UA.

To Provision a Repository for OPC UA:

1. Run the **AVEVA Work Tasks OPC UA Repository Provisioning Tool**.

   On the Windows **Start** menu, point to **Programs**, point to **AVEVA**, and then click **AVEVA Work Tasks OPC UA Repository Provisioning Tool**. The **AVEVA Work Tasks** Extension for OPC UA Configuration window appears which displays all the repositories from the computer.
2. Right-click on any cell column of the particular repository, and then select the **Provision**.

   Alternatively, click the row arrow corresponding to the particular repository. When the repository row gets selected, click **Provision**.

   The following warning message appears:

   Provisioning will modify the repository database by adding new tables and adding or updating of records in the existing tables. It is highly recommended to take a backup of the repository database before provisioning, as there is no option to revert the provisioned changes. To revert back the repository database to its previous state, use the Database Restore option. Do you want to Continue?
3. Select **Yes** to provision the workflow repository.

   Repository is successfully provisioned.
4. Click **Close**.

Note: To unprovision an already provisioned repository, right-click on any cell column of the particular repository, and then select **Unprovision**.

Upgrade Extension for OPC UA

You can upgrade to **AVEVA Work Tasks 2023 SP1 Extension for OPC UA** from the following version:

- AVEVA Work Tasks 2023 Extension for OPC UA

Prerequisites

- In the AVEVA Work Tasks server, upgrade **AVEVA Work Tasks 2023** to **AVEVA Work Tasks 2023 SP1** version.

Steps to Upgrade

1. Stop all the AVEVA Work Tasks services in the AVEVA Work Tasks server.
2. Install **AVEVA Work Tasks 2023 SP1 Extension for OPC UA** in the server.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. Restart all the AVEVA Work Tasks services.

Work with Connectors for System Platform

The System Platform is an industrial software platform for Supervisory HMI, SCADA, and Production and Performance Management. System Platform contains an integrated set of services and an extensible data model to manage plant control and information management systems. System Platform supports both the supervisory control layer and the manufacturing execution system (MES) layer, presenting them as a single information source. Modular applications sit on top of the System Platform. Wonderware and other third-party integrators are delivering a growing inventory of application components that use System Platform services.

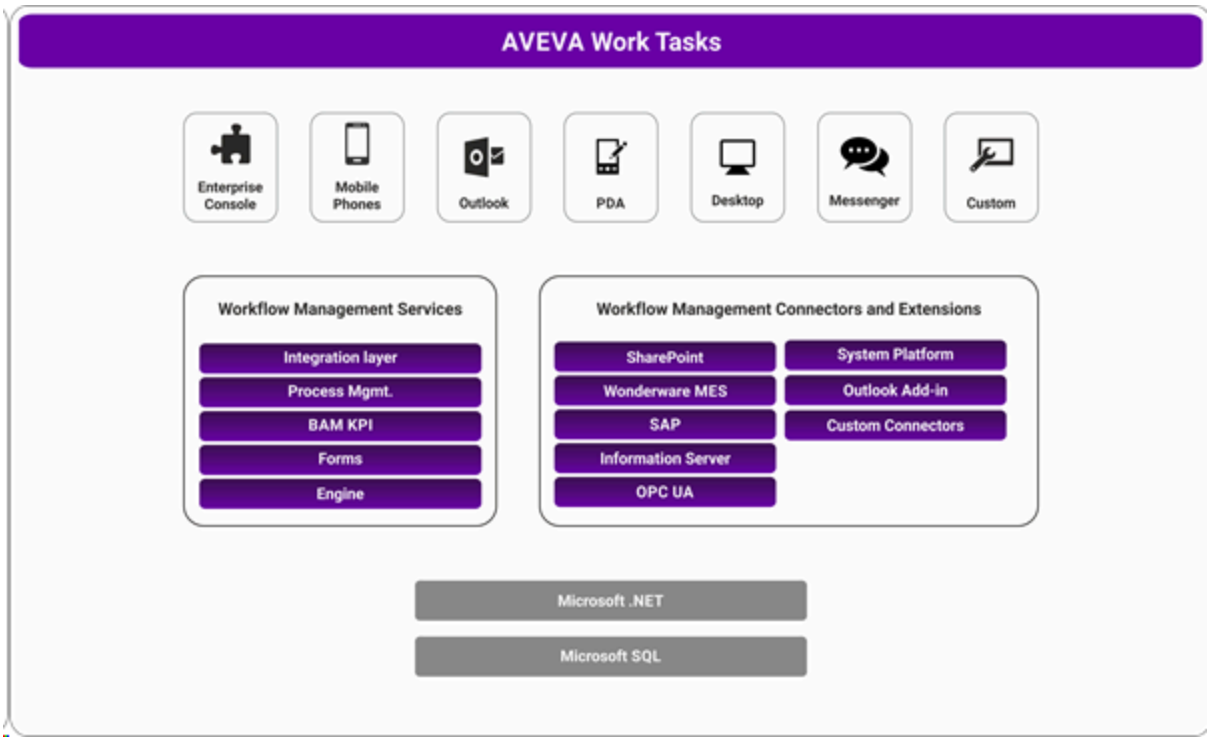
The AVEVA Work Tasks Connector for System Platform provides the following features:

- Configurable read/write and wait-for-event workflow activities for Application Server integration
- Access to Enterprise Console from Information Server
- Extends standard objects in System Platform IDE with a workflow tab to configure workflow events
- Enable Historian events to invoke workflows
- ArchestrA graphic templates for task delivery and response
- View and respond to workflow tasks in InTouch for System Platform

Overview

AVEVA Work Tasks provides a real time, end-to-end institutionalization of processes across hierarchies in a manufacturing organization. Productivity, both on the plant floor and the top floor is a function of robust and complex processes. The ability to follow such processes, especially in the backdrop of disruptive events on the plant floor is critical. End-to-end process management and procedural data management across hierarchies has always been an area of concern. AVEVA Work Tasks addresses this concern by enabling comprehensive, end-to-end process institutionalization across a manufacturing enterprise.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Features of AVEVA Work Tasks:

- Workflow Capability: Collaboration and workflow can be implemented at all levels, within and across levels with AVEVA Work Tasks Workflow.
- Collaboration: Drive higher levels of people-centric and system-centric collaboration.
- Inter-operability: Drive higher levels of inter-operability beyond technical integration.
- Procedural Key Performance Indicators (KPI): Provide procedural KPIs for expanded operations.
- Procedural data management: Centralized management of processes for enterprises.
- Connectors: Availability of out-of-the-box productized connectors.
- Holistic business processes: Workflows should be able to span across levels. An event occurring at Level 1 (controls) requires interaction at Level 2 (supervisory) and spawns actions at Level 3 (advanced applications).
- BPM + Composite Applications: BPM helps organizations to improve business processes. Composite applications are built by combining multiple existing functions into a new application, thus addressing extensibility.
- Composite Workflow Execution Framework: Move beyond technical integration to provide framework to orchestrate manufacturing/infrastructure services and plant-level business processes across disparate domains (people, processes and systems).
- Embed workflow capability: Embed workflow capability into applications at all levels that translates real-time business events into actionable information.

Workflow Features Inside System Platform IDE and Runtime

This topic provides information on how to use the Workflow Features inside System Platform IDE and during

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

runtime.

Overview of a Gateway Object

A Workflow Gateway object allows you to connect to multiple AVEVA Work Tasks servers from within a Galaxy. It also facilitates connection back from the server.

Multiple Gateway Objects can be present in each Galaxy. Each of these Gateway objects can connect to either the same or different workflow repositories. The mapping between workflow repositories and Galaxies can be many-to-many.

The Gateway Object handles connectivity from:

- The System Platform IDE and ArchestrA runtime node to the server
- The server to the ArchestrA runtime node

Connectivity from the System Platform to the server is called **Outbound Connection.** Connectivity from the server to the System Platform is called **Inbound Connection.**

The Gateway Object provides connectivity to the server during the configuration and deployment of the Gateway Object. The connectivity is provided to the server to:

- Fetch workflow repository information
- Provision the workflow repository
- Synchronize user information

During deployment, the Gateway Object connects to the server to provide information of the runtime node. The runtime node contains the **WCF** client service needed to perform read/write on attributes.

The communication between AVEVA Work Tasks and System Platform is handled using the Windows communication service. These connections are secured using Windows authentication. To do a call on the WCF hosted in the server,

- The Client (System Platform - Runtime node or System Platform IDE Node) requires valid Windows authentication user information of the server.
- Valid Windows authentication user information to the WCF hosted in the runtime node is also required.

  The WCF hosted in runtime node is primarily used to read or write attribute values.There is a second level of authorization to access the workflow repository available in the server under a farm.
- Only a user who has administrative rights in the workflow repository can make a connection to the WCF (Windows Communication Foundation) service and access workflow repository-specific information.

Initial Gateway Setup

Complete the following steps to setup the Initial Gateway:

Notes: The screen captures shown here are from System Platform 2023 IDE.

1. Open **System Platform IDE**.
2. On the **Galaxy** menu, click **Configure**, and then click **Security**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Security** dialog box appears.

3. On the **Authentication Mode** tab, change the authentication from **None** to **Galaxy**.

Note: Select **OS User based** or **OS Group based** to use system users or roles respectively. In such cases, configure users or roles under **Users** or **Roles** tab respectively.

4. On the **Users** tab, click the **Add** button, enter a username, and then click **Change Password**.

   The user is added, and the **Change Password** dialog box appears.

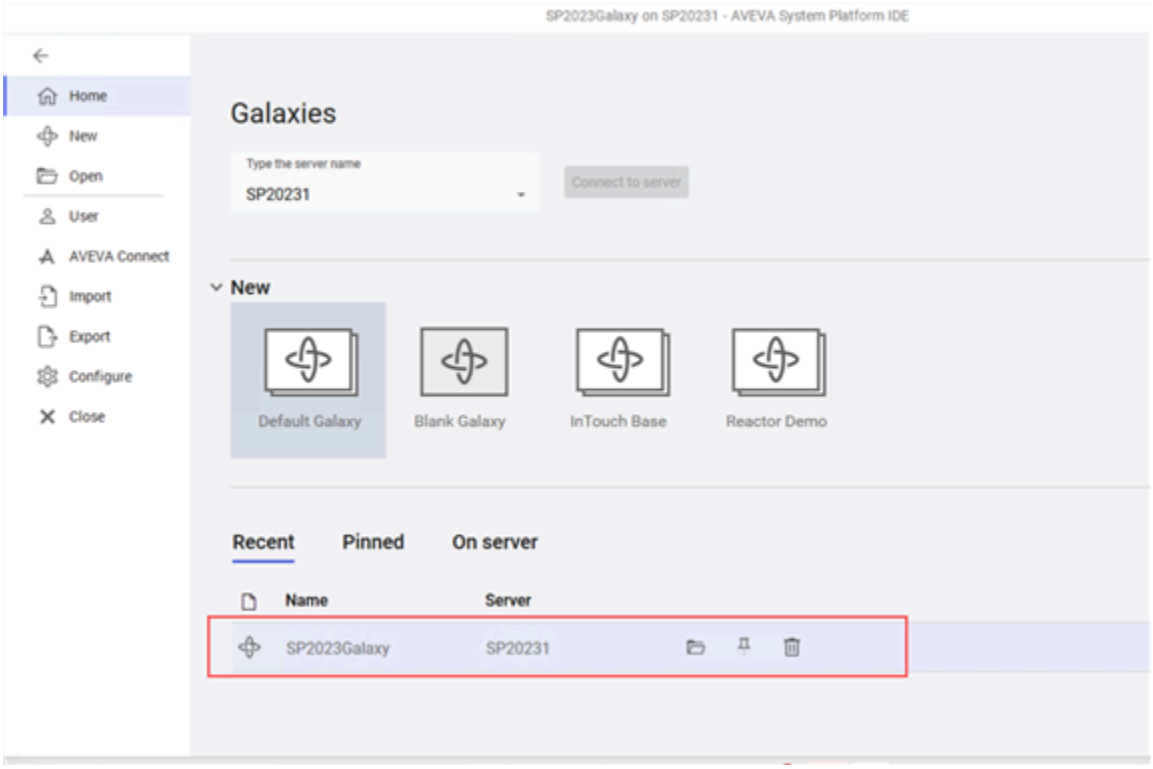
5. In the **New Password** and **Confirm New Password** boxes enter a password for the user, and then click **OK**.

   The password is saved for the user.

6. On the **Roles** tab, Select **Administrator**, and then click **OK**.
7. In the **System Platform IDE**, on the **Galaxy** menu, click **Change User**.

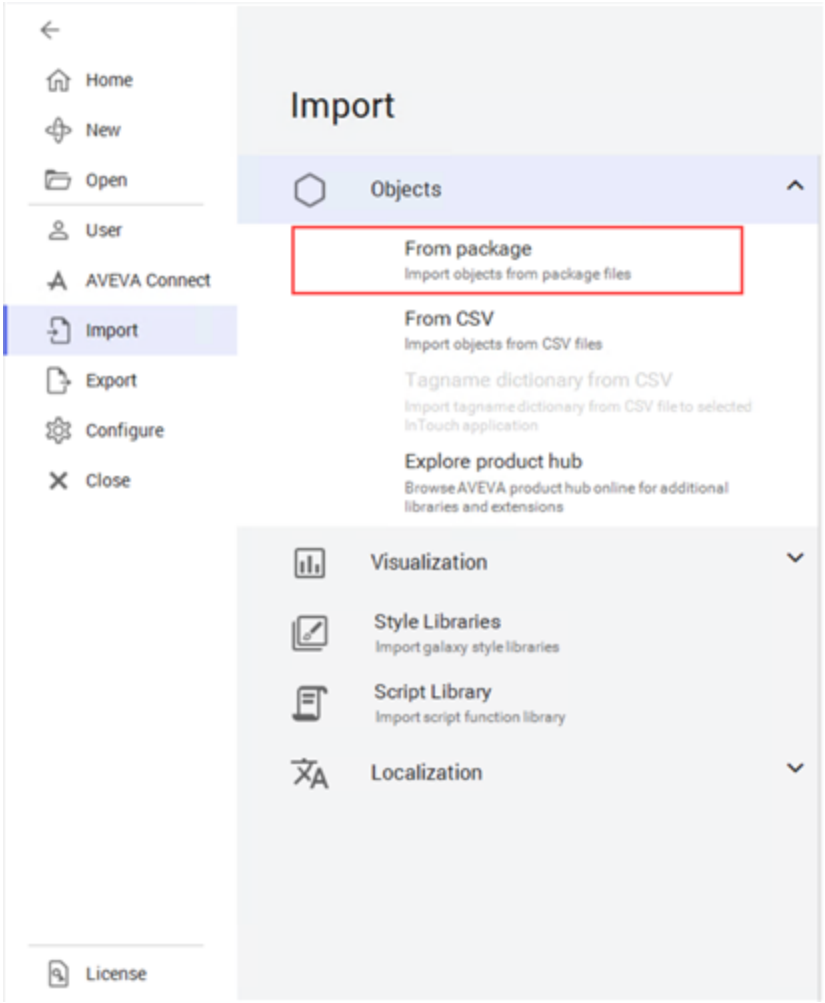
   The **Change User** dialog box appears to log on with new user credentials

8. To connect to a Galaxy, select the desired <Galaxy name> from the list. For instance, in this example, we are connecting to **SP2023Galaxy**.



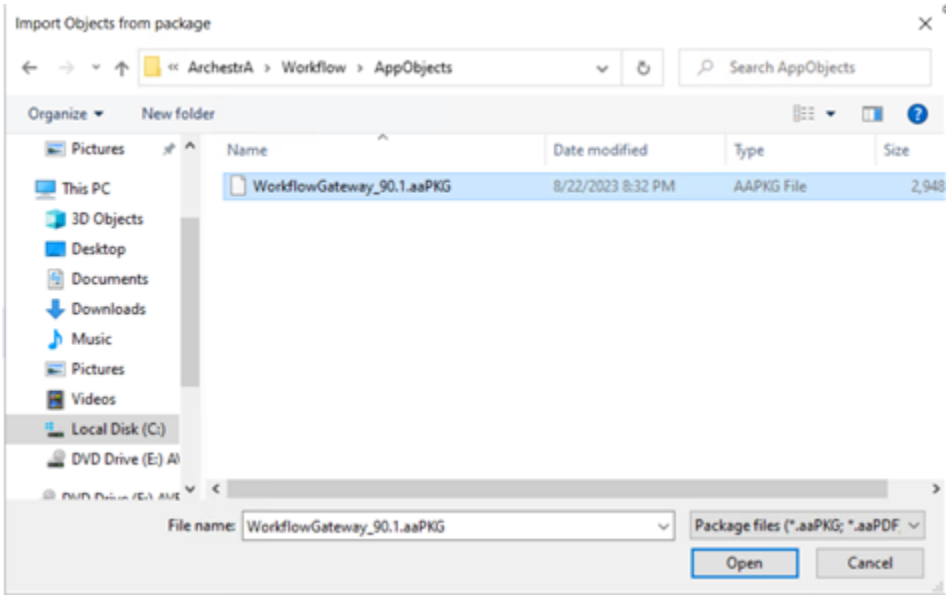
9. To import the objects, point to **Import** on the **Galaxy** menu, select **Objects** and then select **From package**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The Import Objects from package dialog box appears.

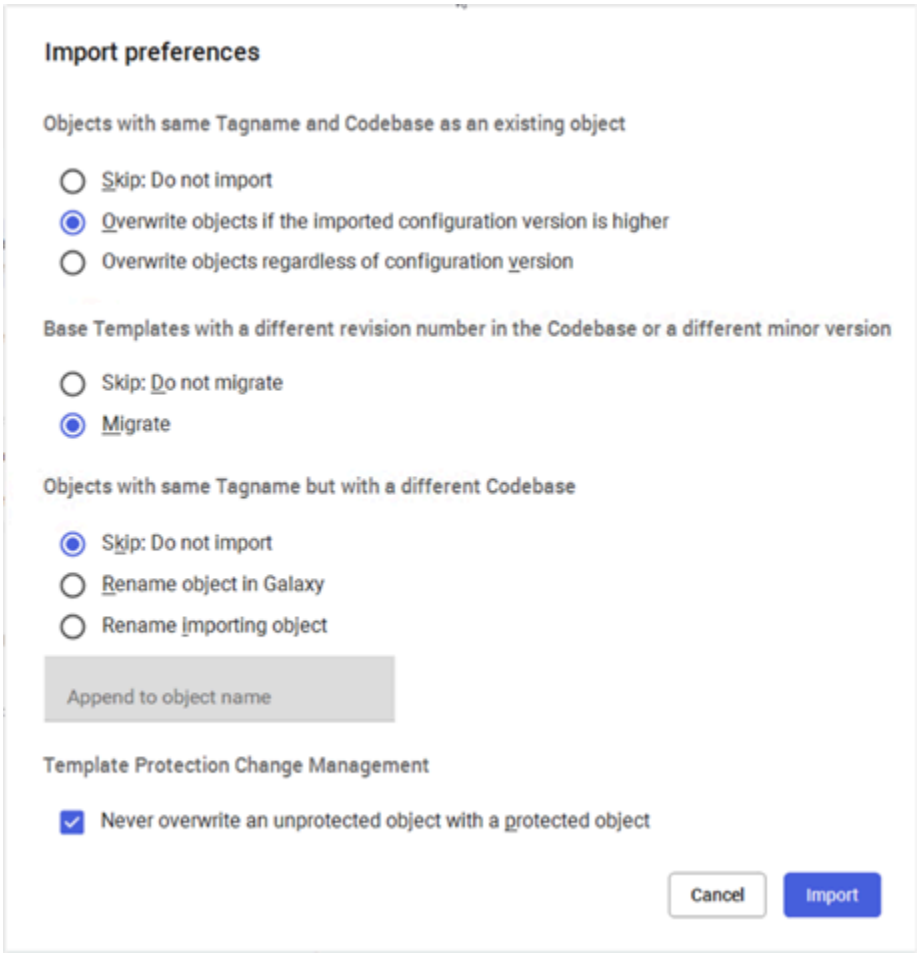
10. Open the *AppObjects* folder from the **..\<Archestra Installation Path>\Archestra\Workflow** path.



11. Select the **WorkflowGateway** file (for example, **WorkflowGateway_90.1.aaPKG**), and then click **Open**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

12. In the Import Preferences dialog box, select the appropriate options.



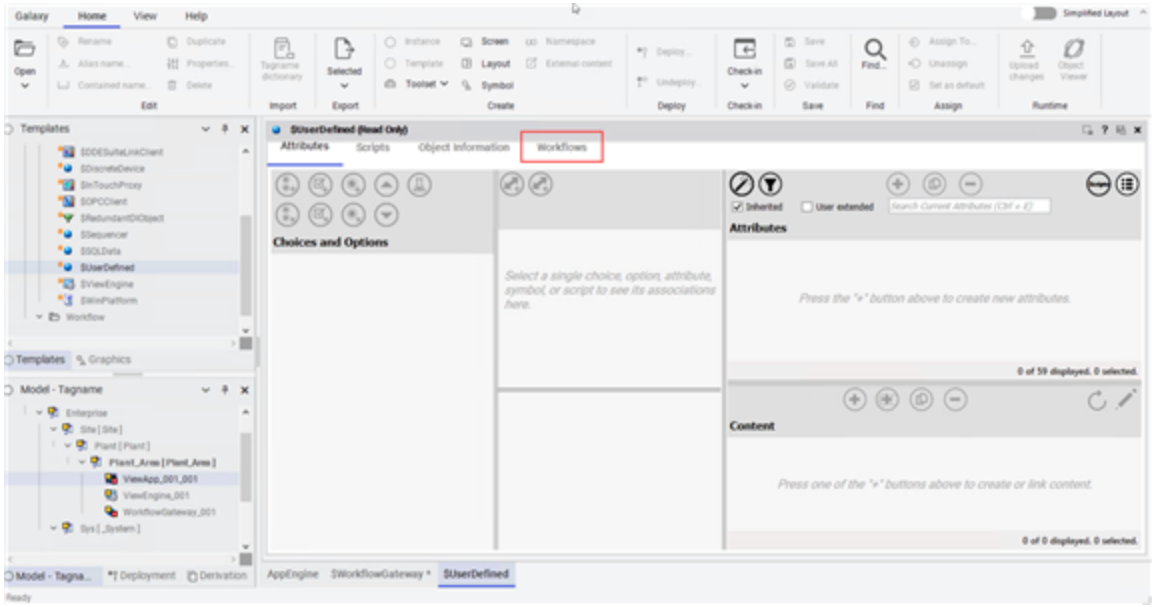
13. Click **OK**.

    The Import Completed dialog box appears after the import completes.

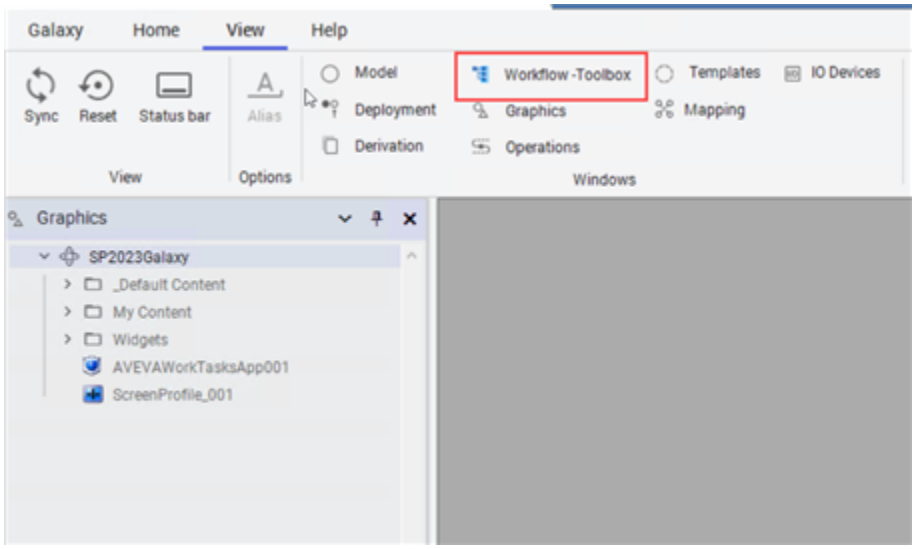
14. After the import is complete, close and re-start the IDE to ensure that the IDE extension appears.

    To confirm that the IDE extension is enabled, verify that the **Workflows** tab for an object is visible. You will also see a **Workflow-Toolbox** tab in the **Templates** section.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



If the **Workflow-Toolbox** is not visible, navigate to **View** menu and select **Workflow-Toolbox**.

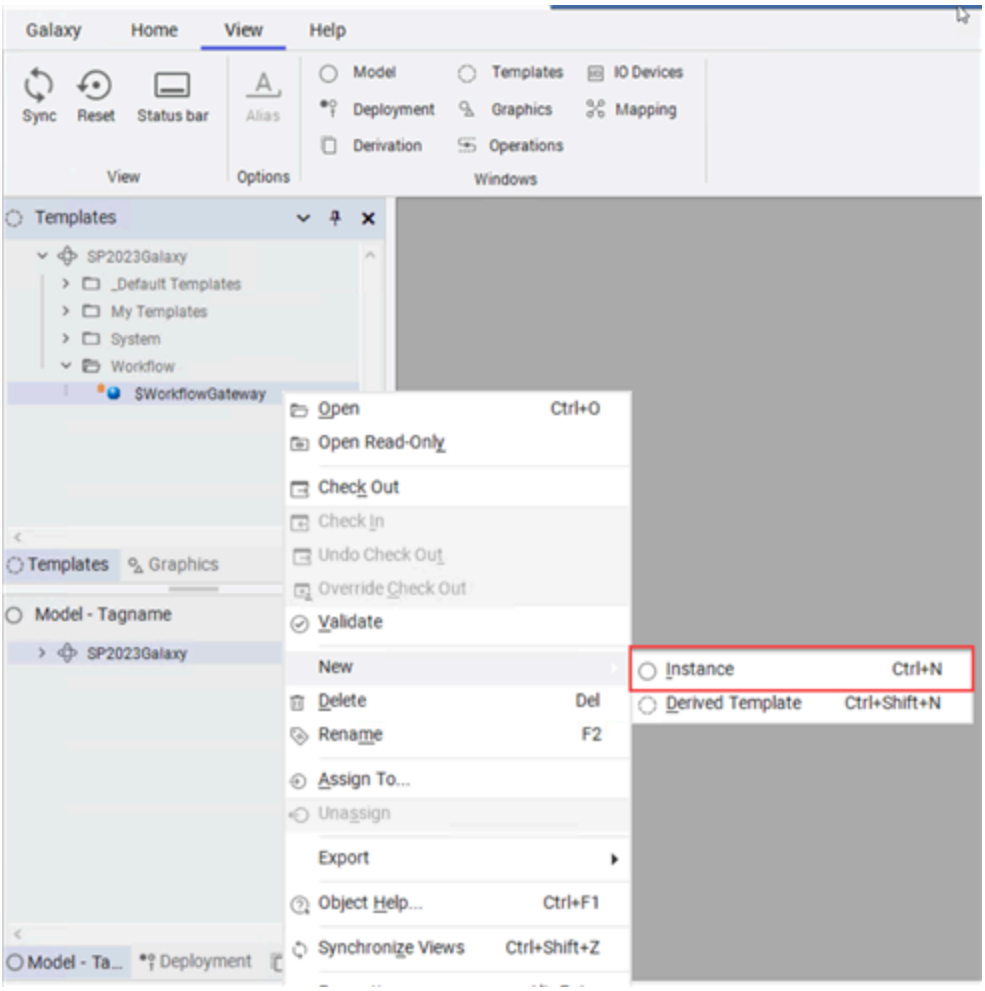


If the **Workflow-Toolbox** or the **Workflows** tab does not appear, copy the DLLs manually from ..\<Archestra Installation Path>\Archestra\Workflow\IDE Extension to **..\<Archestra Installation Path>\Archestra\Framework\BIN\IDE Extensions**.

After you copy the DLLs, restart the System Platform IDE to ensure that the **Workflow-Toolbox** and the **Workflows** tabs appear in the IDE.

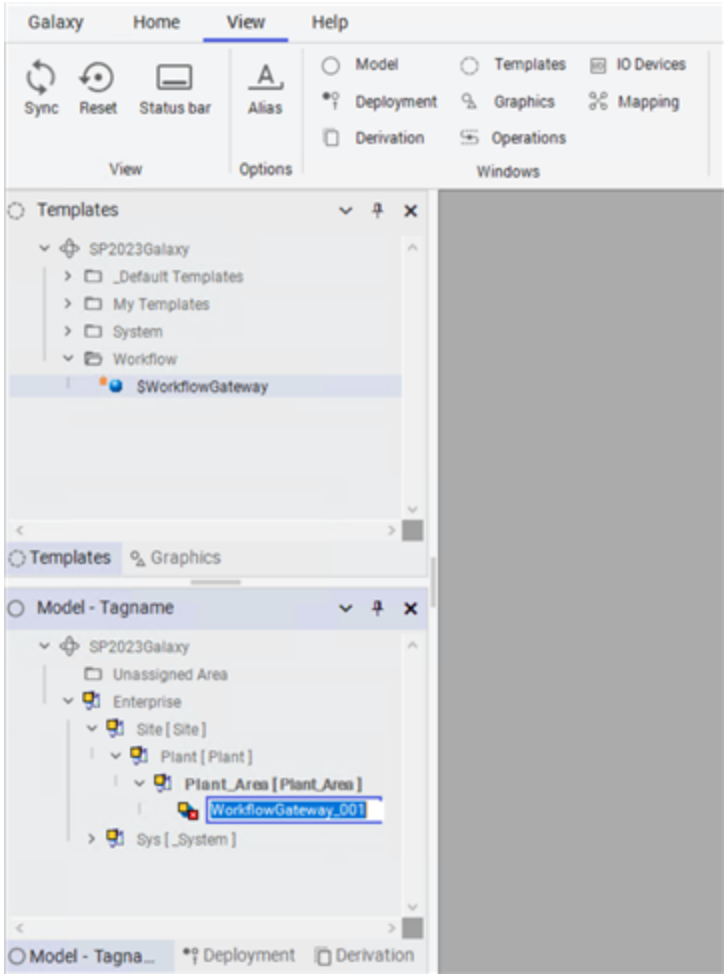
15. In the **Galaxy** menu, click **Import** to import the script library (ArchestrA.WorkflowScripts.dll) from the following path:
    - 64-bit machine: C:\Program Files (x86)\ArchestrA\Workflow\Script Library
16. Right-click **$WorkflowGateway**, point to **New**, and then select **Instance** to create an instance of a workflow gateway.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The *WorkflowGateway_001* instance is created under **Unassigned Area** in the **Model Tagname** section as shown in the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



If the WorkflowGateway object is created in the **Unassigned Area**, the user must drag it to the desired container.

AIM Authentication for accessing Enterprise Console in System Platform IDE

You can use AVEVA Identity Manager (AIM) authentication for AVEVA Work Tasks Enterprise Console (EC) website in **System Platform IDE**. To enable AIM authentication, ensure that in **Central Configuration** when the **Resource Provider** is set to **Active Directory**, the **Use Token Service** is set to the appropriate server.

When you access the EC website for the first time, you will be navigated to the AIM authentication page. After authentication, you can access all the EC pages without any prompt for AIM authentication again for each page.

To configure System Platform IDE Security

1. In the **System Platform IDE**, on the **Galaxy** menu, click **Configure**, and then click **Security**.

   The **Security** dialog box appears,
2. On the **Authentication Mode** tab, select **OS User based** or **OS Group based**.
3. On the **Users** tab, under **Authorized Users Available**, add users, and then under **Associated Roles for Administrator**, map **Administrator** role.
4. Click **OK**.

   The **System Platform IDE** will close and reopen.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Sometimes, you may face issues related to Anti-forgery. These issues might be because of cache. To resolve this issue, follow the below steps:

1. Close System Platform IDE.
2. Open browser window.
3. Clear browser cache.
4. Close all browser windows.
5. Open System Platform IDE and try accessing EC pages.

Configure Gateway

After you set up the Initial Gateway, you must configure it. This includes adding credentials for access to Workflow Server which is the first level of authentication.

Prerequisites:

- Before provisioning a repository, make sure you configure Galaxy security to any of the valid choices. Do not change the Galaxy security after provisioning.
- After you configure the Gateway Object and use it for creating events, do not change its name.

To configure the Gateway

1. Double-click the instance that you created while setting up the initial gateway.

   For example, double-click *WorkflowGateway_001* in the Deployment section.
2. In the Gateway Configuration tab that opens, enter the values for the following fields:
   - **Unique Environment Name**: The server is capable of communicating with multiple Galaxies in a single process. In a multi-Galaxy environment, you cannot ensure the uniqueness of the Galaxy name. An **Unique Environment Name** is used as work around for this.

     In an environment with a single Galaxy, or multiple Galaxies with unique names, the Unique Environment Name can be the same as the Galaxy name.

     In an environment with multiple Galaxies where different Galaxy environments share the same name, each separate Galaxy environment needs to be provided with an unique name while connecting to the server. An unique name is required to avoid naming conflicts.

     By default, in the **Unique Environment Name** field, the Galaxy name is populated. You can edit this once at the beginning. However, once configured and saved, the Unique Environment Name field becomes read-only.
   - **Passphrase**: The passphrase to configure Cryptography Settings and use the encryption algorithm in the product. Click **Import** to import the saved cryptography settings.

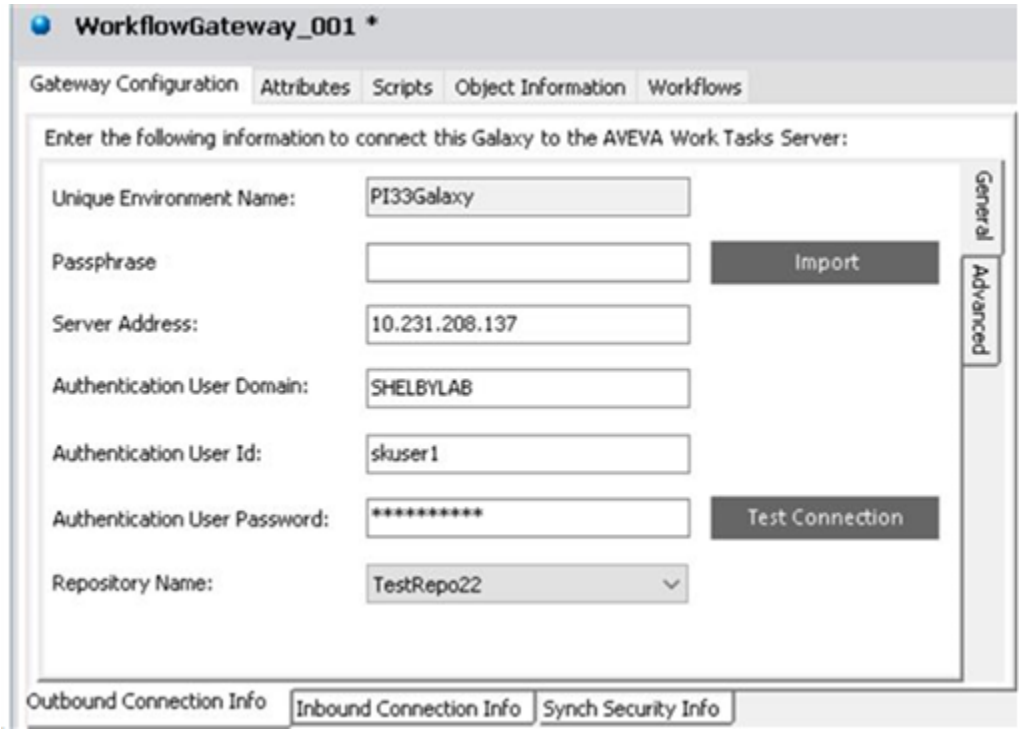
     Note:
     - When you provision the Gateway object to multiple AVEVA Work Task Servers, provide the same Passphrase settings on all the AVEVA Work Tasks Servers.
     - The passphrase value should have characters between 8 and 20, consisting of lowercase, uppercase,

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

number, and special characters.

- **Server Address**: Address of the server.
- **Authentication User Domain**: User domain of the server. The domain name is case sensitive.
- **Authentication User Id**: User ID of the server.

  Authentication User Password: Password for the user name of the server.



3. Click **Test Connection** to verify the authentication.
   - If **Test Connection** is successful, the **Repository Name** field is populated with the available repositories.
   - If authentication is not successful, verify the credentials. If authentication is not successful consistently, contact the network administrator to ensure that the user credentials provided are part of the Administrators, SkeltaAdmins, or the SkeltaRemoteUsers roles, and there are no communication issues between the machines. Also, the SkeltaAdmins or SkeltaRemoteUsers roles need to be manually created.
4. In the **Repository Nam**e field, select the workflow repository to connect to. The Provision window appears.
5. Add credentials to access the workflow repository which is the second level of authentication. To authorize and provision access of and mapping to the workflow repository, perform the following steps:

   Workflow Repository Authentication Info

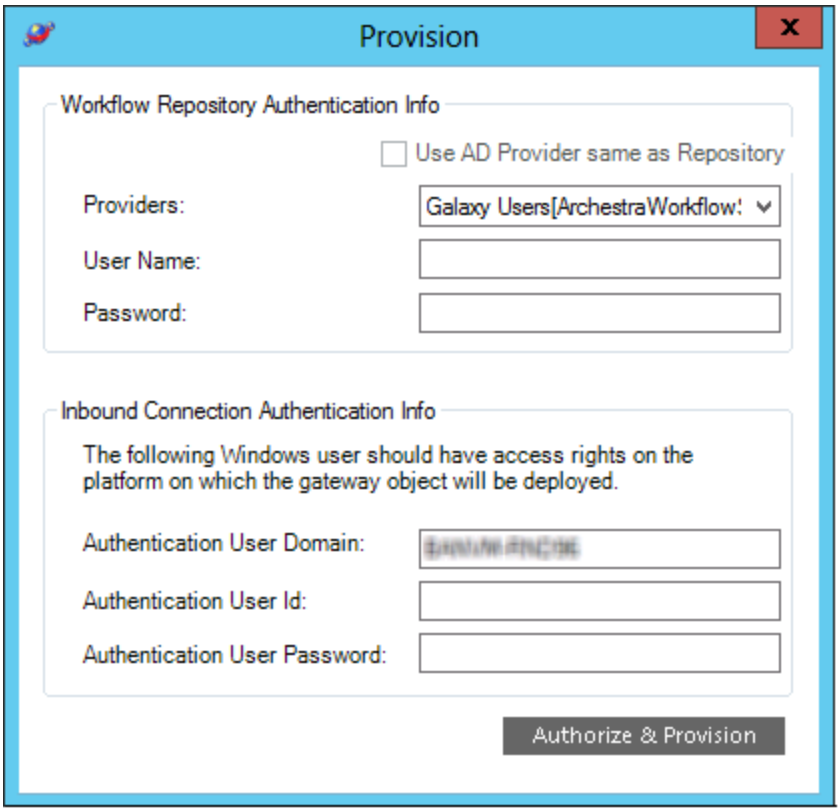
   a. In the **Providers** field, select Active Directory or AVEVA Work Tasks List based on the provider for which the workflow repository is created.

   b. Enter the user name and password details based on the user provider. For the default user name and password, contact the technical support team or refer the *Get Started Guide* in the ISO file of AVEVA Work Tasks.

      The user must have administrator rights on the workflow repository.

   c. Select **Use AD Provider same as Repository** to leverage Active Directory users instead of Galaxy users.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



6. For **Inbound Connection Authentication Info**, enter the credentials of GR Node in the **Authentication User Domain**, **Authentication User Id**, and **Authentication User Password** fields.

   Note: The **Authentication User Domain** is case sensitive and must be provided in proper case.

7. Click **Authorize & Provision**.

   The repository is now provisioned to be connected to the Galaxy. The repository and galaxy are now connected.

The **Use Active Directory Service Provision** check box appears only if all the following conditions are satisfied:

1. The Galaxy User security is Operating System user or Operating System group.
2. The repository to provision is created using the Active Directory authentication.
3. The Galaxy user and repository user domain are same.

On provisioning, the users in Galaxy are available to the workflow after creating a user provider for the Galaxy.

Galaxy users can log on to the **Enterprise Console** as *ArchestrA Users* after provisioning and deploying the gateway object to a workflow repository. If the users log on before provisioning and deploying the gateway object, the following message appears:

Deploy the workflow gateway object to login. Users can login only after the gateway object associated to the repository <repository name> is deployed from the System Platform IDE.

After deploying the gateway object, if the security mode in the galaxy has been changed, then the workflow gateway object needs to redeployed.

The following activities take place during provisioning:

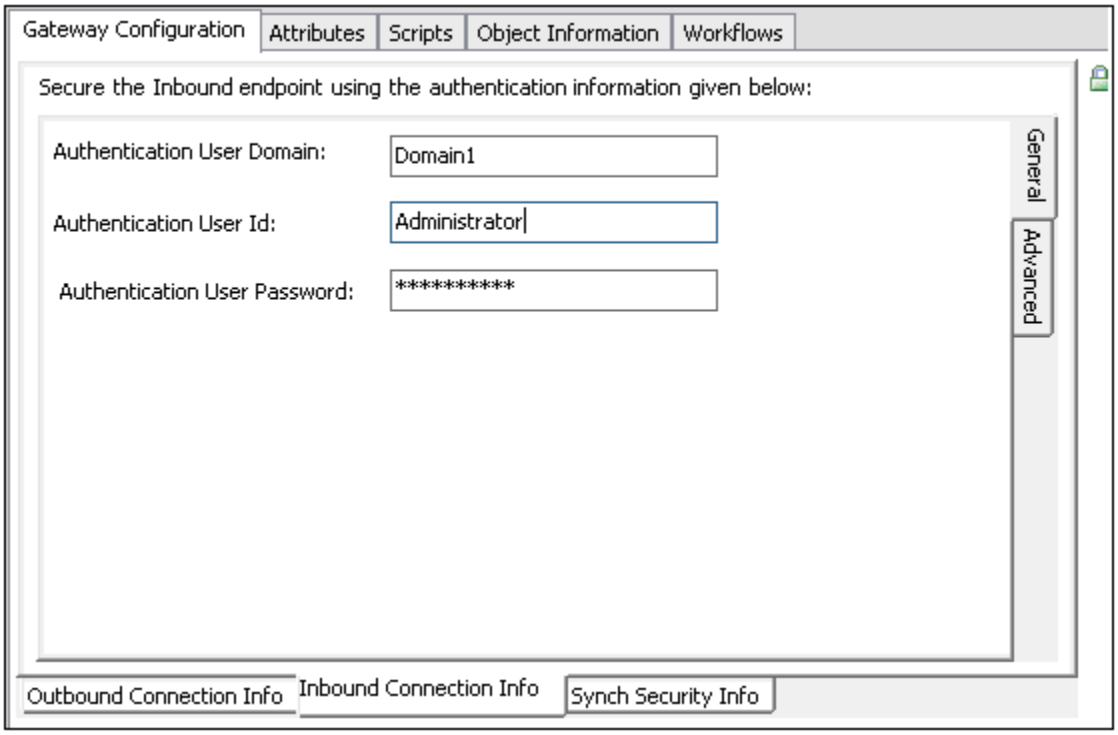
- The logged in user is added as administrator in the workflow repository based on the user authentication

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

provided during provisioning. This is done only if the user is an administrator in the workflow repository.

- Galaxy information is stored in AVEVA Work Tasks using tables and lists. The Galaxy users are synchronized to the workflow repository.
- Enabling a new user provider to map the Galaxy users to the repository allows the Galaxy users to be a part of the AVEVA Work Tasks workflow activities.
- The Galaxy users can also access the AVEVA Work Tasks functionalities, such as Inbox, Forms, Business Activity Monitoring (BAM), Process Designer.

The details that you enter in the **Inbound Connection Info** tab is the same as the **General** inbound tab as shown in the following image:



Unprovisioning a Provisioned Workflow Repository

You can unprovision a provisioned workflow repository. Unprovisioning is an option of the workflow gateway object to roll back the changes done to the workflow repository. While unprovisioning, the workflow and associations created during provisioning the workflow repository, are not deleted.

While moving the workflow repository database from one environment to another environment, you must unprovision the workflow repository.

To unprovision a provisioned workflow repository, complete the following steps:

1. Open the derived template or instance of the workflow gateway object.
2. Click **Test Connection** to validate the connection.
3. Select the provisioned repository from list of available repositories in the **Repository Name** field.

   The Provision dialog box appears.
4. Click **Un Provision**.

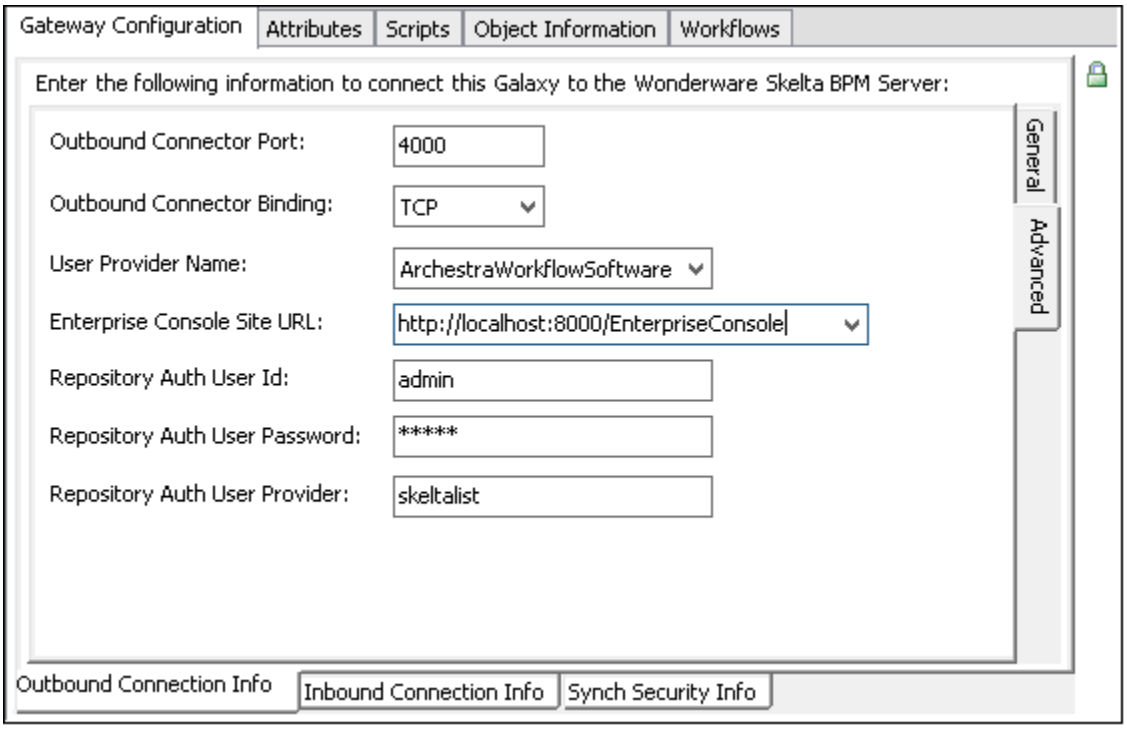
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Using the Advanced Tabs

Advanced tabs are available for Inbound and Outbound Connection settings, for more control on the Gateway configuration.

Outbound Connection Info: Advanced Options

The following image shows the fields of the **Outbound Connection Info** tab.



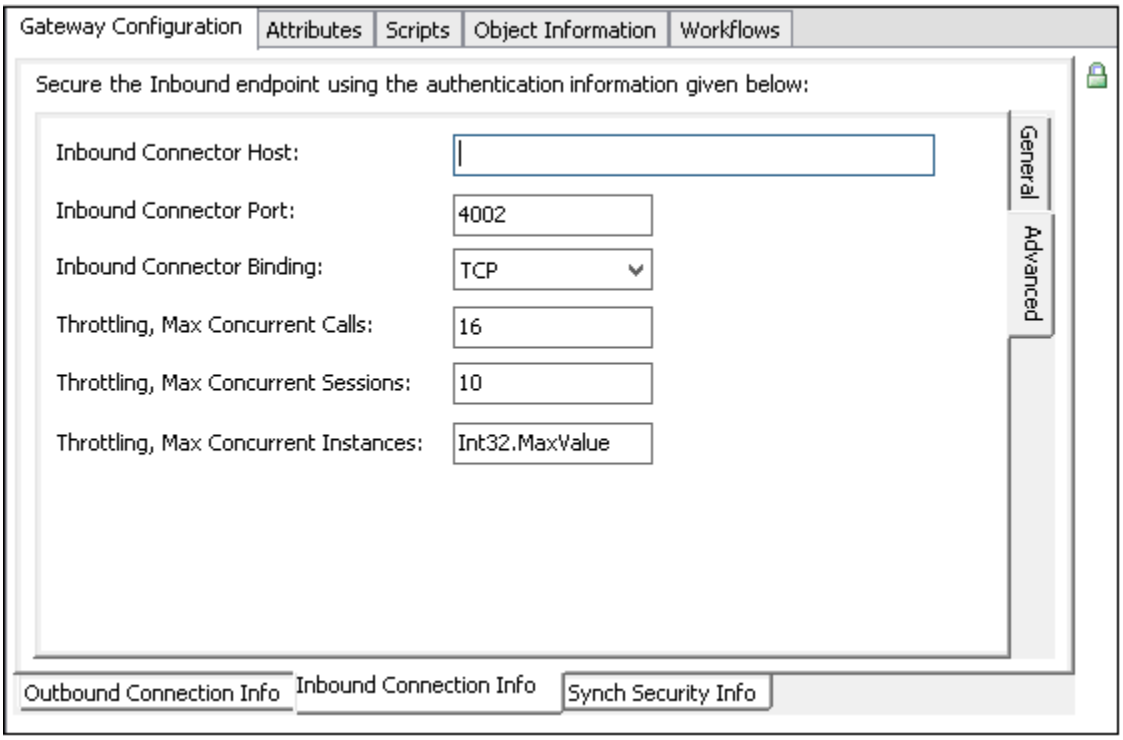
The **Outbound Connection Info** tab contains the following fields:

- **Outbound Connector Port**: This field can be edited after you provision the workflow repository for the Galaxy.
- **Outbound Connector Binding**: Binding protocol for the connection, preferably used when Workflow Server is within the same network. Choose from the following options:
  - **TCP**: Default binding protocol for the connection, preferably used when Workflow Server is within the same network.
  - **HTTPS:** Secure connectivity over the Internet.
- **Operation Timeout**: Time period after which the request made to the Workflow server does end if not connected.
- **Connection Life Time**: The duration for which the of the connection between the Galaxy and the Workflow Server lasts.
- **User Provider Name**: Repository user provider, either Active Directory or Skelta List.
- **Theme**: Theme of the repository.
- **Enterprise Console Site URL**: The URL used to access the workflow repository from the Workflow Server.
- **Repository Auth User Id**: Captured during and displayed during provisioning.
- **Repository Auth User Password**: Captured during provisioning.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Inbound Connection Info: Advanced Options

The following image shows the fields of the **Inbound Connection Info** tab.



The **Inbound Connection Info** tab contains the following fields:

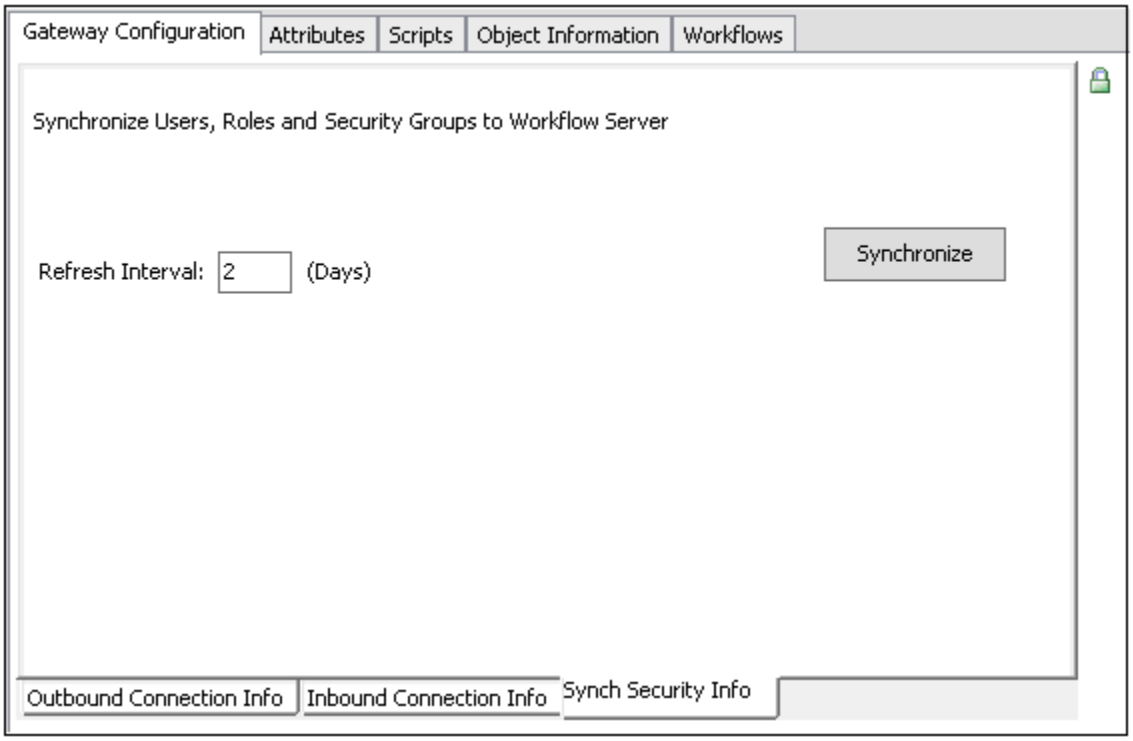
- **Inbound Connector Host**: Default runtime node where the Gateway object is deployed.
- **Inbound Connector Port**: Connection Port by AVEVA Work Tasks to fetch any data from Galaxy.
- **Inbound Connector Binding**: Binding protocol for the connection, preferably used when Workflow Server is within the same network. Choose from the following options:
  - **TCP**: Default binding protocol for the connection, preferably used when Workflow Server is within the same network.
  - **HTTPS**. Secure connectivity over the Internet.
- **Operation Timeout**: Time period after which the request made from the Workflow server to the Galaxy will end, if not connected.
- **Connection Life Time**: Time period that the connection will last between the Workflow Server and the Galaxy.
- **Throttling, Max Concurrent Calls**: Connector service properties, the maximum number of messages that can actively be processed. Each client channel can have one pending message that does not count against this total until the service begins to process it. Increase this value if you want your service to process a larger message load.
- **Throttling, Max Concurrent Instances**: Connector service properties, the maximum number of InstanceContext objects in a service that can be executed in a single instance.
- **Throttling, Max Concurrent Sessions**: The maximum number of sessions that a service can accept at one time.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Sync Security Info: Advanced Options

Use this tab to synchronize users, roles, and security groups to the Workflow Server. Set the refresh interval for automatic synchronization in a specific time-frame. To synchronize, click **Synchronize**.

After changing the Advanced options, you save the object. You can now access the Enterprise Console functionality from the Workflow Toolbox.



Note:
- In a scenario where a derived template of workflow gateway object is provisioned with a workflow repository, one instance of the Gateway Object is deployed in the GR Platform and another instance deployed in the Boot Platform. If the inbound connector host name is changed the ArchestrA Read/Write activity will not work.

- The user, which is set as **Change Network Account** needs to be mapped to the Administrators group in order to avoid SkeltaConnectorClientArchestrA service installation/uninstallation during deploy/undeploy of Workflow Gateway Object.

- To set up the zoom level, refer to Setting Zoom for the Web Browser Control in System Platform and InTouch.

- To lookup/search the user from Galaxy User's provider, search with **Galaxy User Name** search filter, instead of **Galaxy User Full Name** search filter.

- When the user is searched based on the **All Providers** search filter, the user name from different providers is listed in a single line separated by comma, and the user from all providers may not be assigned the work item. Hence, it is good to use separate providers to search the user and assign the work item. .

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Define Workflow Events in AppObject

The Gateway object should be configured before associating an event for the AppObject. In the example below, you will associate an event to the *Drum_Conveyor* object.

The *Drum_Conveyor* object has an attribute named *Cycle*, which changes when the drum is moved in the conveyor. This value varies from one to six, based on the different stages covered by the drum.

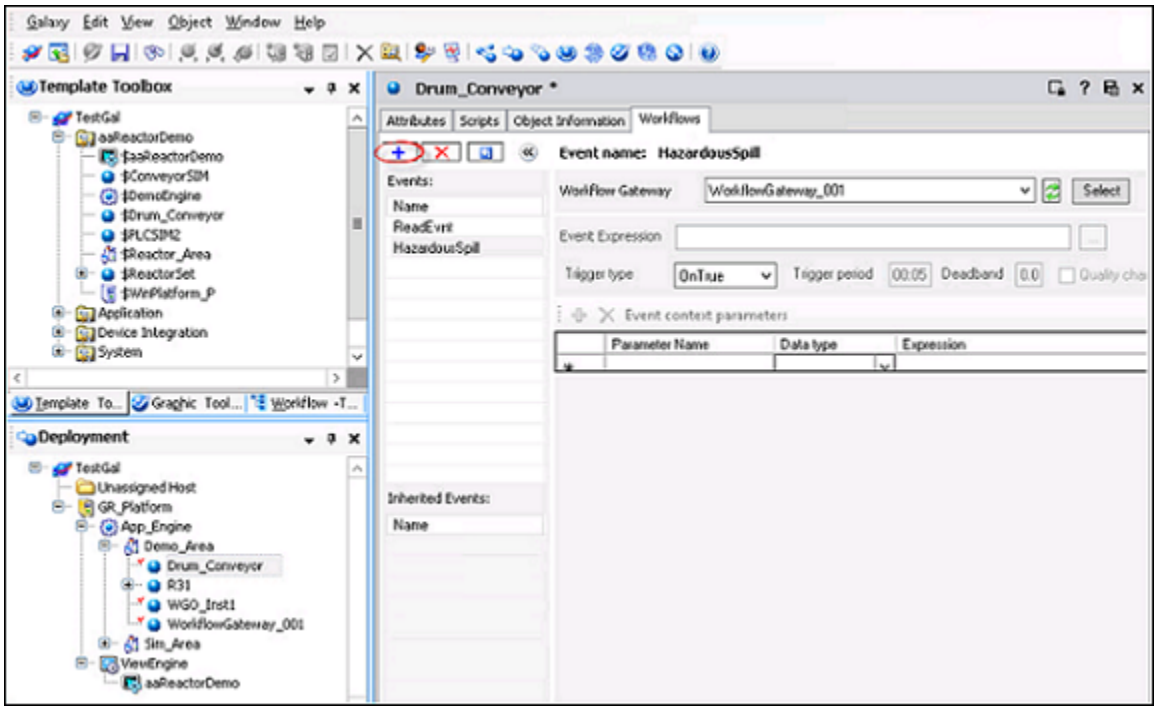
For example, the Starting of the Drum Movement in conveyor is marked as 1 and the Cycle Attribute and Falling of the Drum due to any issue in the conveyor is marked as 6. You will define an event to trigger a workflow when the attribute value changes to '6'.

To define workflow events in AppObject

1. Open the Drum_Conveyor object and select the **Workflows** tab.
2. Click the **Add Event** button to add a new event.

   For example, *HazardousSpill*.

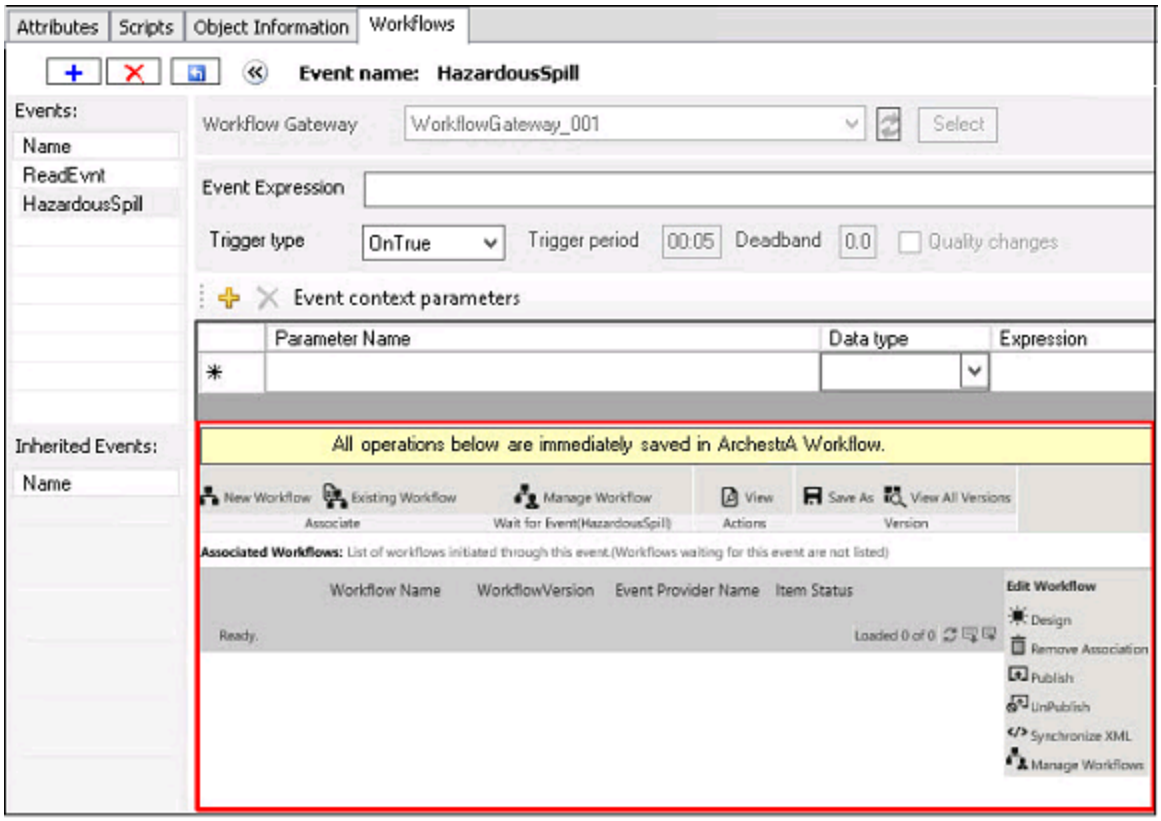
   The event gets added to the Events list.



3. Select a **Workflow Gateway** instance that contains the connection information to AVEVA Work Tasks, and then click **Select**.
4. Select the event from the **Events** list.

   The event association window appears on the lower right of the screen as shown in the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The following options are available in the event association window:

- **New Workflow**: Use this option to create a new workflow to be associated with the event.
- **Existing Workflow**: Use this option to associate an existing workflow with the event.
- **Manage Workflow**: Use this option to open the workflow list for managing the workflow.
- **View**: Use this option to view the selected workflow in a read only mode in the Process Designer. This eliminates the need to unpublish a published workflow to view it.
- **Save As**: When a workflow is first saved, it is saved with version number 1.0. The Save As option enables you to save the workflow with a different version.

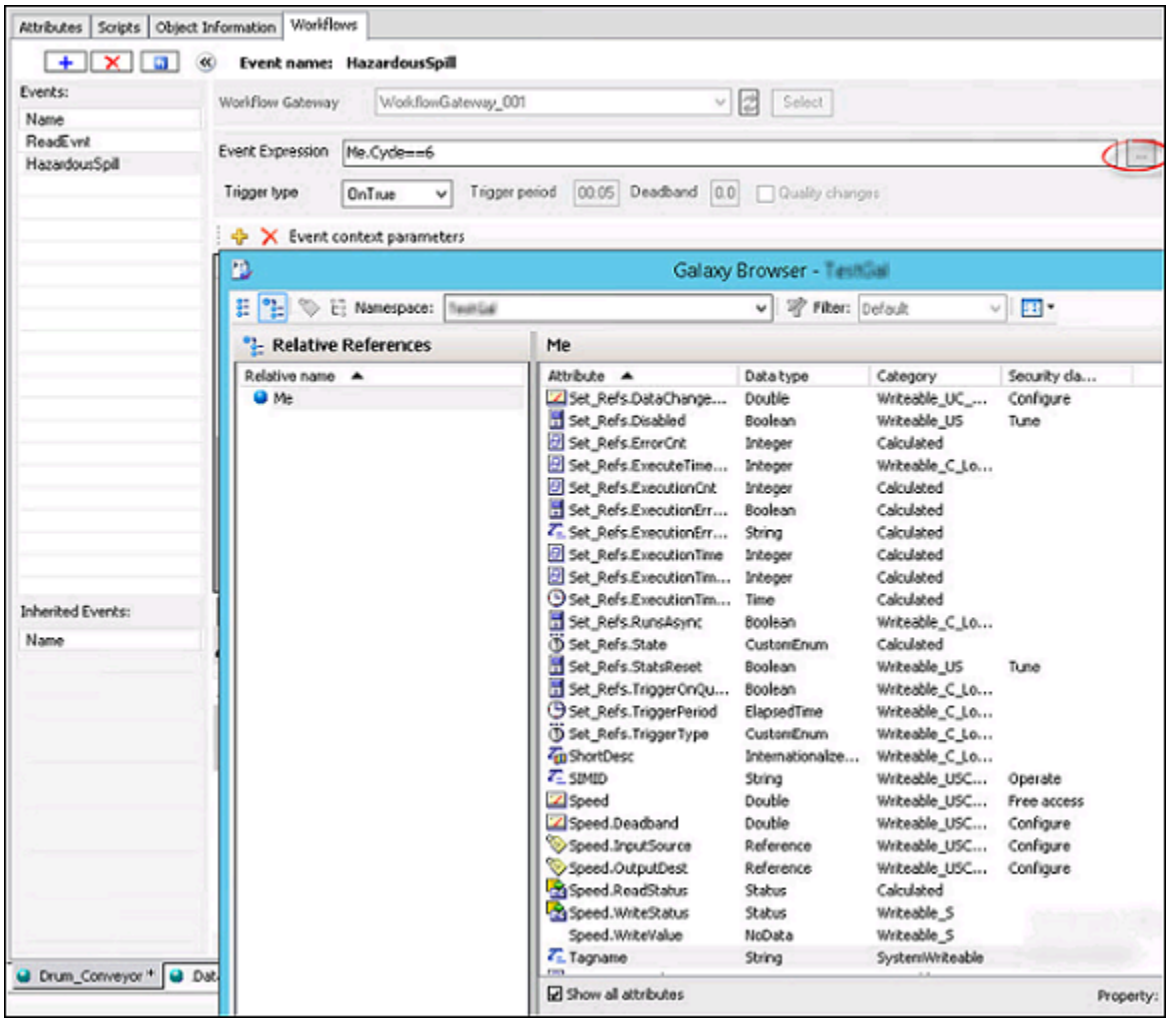
  The versioning scheme for workflows is as follows:
- **Next Version**: This option adds 1 to the lowest level of the last saved workflow version. If the last saved version is 1.1.1, then selecting this option saves the workflow as 1.1.2.
- **Next Minor Version**: This denotes a minor version for the last saved version. If the last saved version is 1, the next minor version would be 1.1. If the last saved version is 1.1, the next minor version would be 1.1.1.
- **Next Major Version**: The next major version increments the workflow version by 1. If the last saved version is 1.1.1, selecting this option assigns 2 as the version number.
- **Specific Version**: Select this option to view a list of the next version numbers under the above three options.
  The version number in Workflows list is updated with the last saved version number (if all the versions are in draft) and the version with which it is published if the workflow is published
- **View All Versions**: This option enables you to view all the versions of the selected workflow.

5. Set the **Event Expression**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For example, set the **Event Expression** as `Me.Cycle == 6`.

6. Set the **Event context parameters** that you want to pass to the workflow. Click to add the parameter.



7. Set the event contextual parameters to be passed to the workflow when the event is fired.

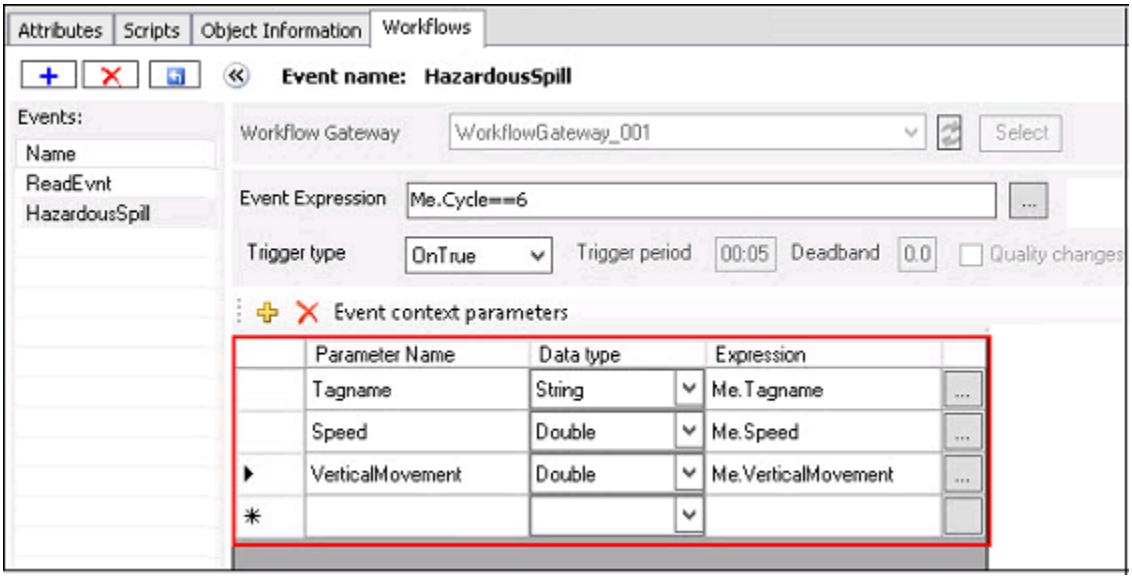
   On True is the default **Trigger type**. The AVEVA Work Tasks Event conditions can be configured using the following trigger types:

   - **On True (Default)**: The workflow gets triggered when the condition specified in the Event Expression is True.
     For example, the Trigger Type is selected as On True and the event expression is set as Me.Cycle==6, the workflow gets triggered only when the event expression is True.
   - **On False**: The workflow gets triggered when the condition specified in the Event Expression is False.
     For example, the Trigger Type is selected as On False and the event expression is set as Me.Cycle<6, the workflow gets triggered only when the event expression is False.
   - **Periodic**: The Time Period field is enabled when the trigger type selected is Periodic. The workflow gets triggered at specific intervals as specified in the Time Period field. The default value for Time Period is 5 minutes. This trigger does not require an expression.
     For example, the Trigger Type is selected as Periodic and Time Period is set as 1:00, the workflow gets triggered periodically after every hour.
   - **Data Change**: The Deadband field is enabled when the Trigger Type is selected as Data Change. The

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Deadband prevents the trigger to be raised again and again, if the event expression value moves around a specific target.
For example, the Trigger Type is selected as Data Change and the event expression is set as Me.Cycle==10. The Deadband value is set as 2. The trigger is raised when the event expression's value reaches 10. The trigger would be raised again only when the event expression's value reaches below 8.

The following image shows the Event context parameters set for the example scenario:



Note: You can use relative referencing support at the Event Context Parameter level and for the attribute read or write at the AttributeReadWrite activity level. You can use relative references like MyContainer, MyPlatform, MyEngine, MyArea, and Me.

Create New Workflow

Create a new workflow using the **Create Workflow** option.

1. Enter the **Title** and **Description** for the workflow, and then click **Save & Continue**.

   The Process Designer window appears.

   The event contextual parameters are passed as the XML variable. You can view the event contextual parameters in the XmlVariables property of Start Activity.
2. Design the workflow.

   When the value of the cycle changes to six, the associated workflow will be triggered.

Associate an Existing Workflow to a Workflow Event

Associate an existing workflow to a workflow event. Only Workflows in draft status can be associated to an event.

To associate an Existing Workflow to a Workflow Event

1. In the Workflows tab, click Associate Existing to associate the existing workflow to a workflow event.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. In the Title drop-down, select the workflow you want to associate.
3. Select the version number from the drop-down list adjacent to the Title drop-down list.
4. Enter the Description.
5. Click Save & Continue.

   The associated process designer window appears.

   The ArchestrA Context XML variable is now added to the workflow, if it is not added already.

You can use the Synchronize XML option to synchronize Event Context Parameters with the ArchestrAXMLData XML variable of the selected workflow.

- Design: Select a workflow and click on Design menu to open the process designer for editing the workflow.
- Remove Association: This will remove selected workflow's association with the event. For deleting the same workflow, go to manage workflow and delete it.
- Publish: This will publish the selected workflow.
- UnPublish: This will unpublish the workflow and change the status of the workflow to draft.

The following operations take place for synchronization:

- All newly added event context parameters in System Platform IDE are added to the XML variable in the Workflow.
- All newly added nodes under AAParameters for the XML variable in Workflow are added to the Event context parameters in ArchestrA.
- If any parameter/node is deleted, it will be ignored in the synchronize operation.
- Only drafted versions of the workflows can be synchronized. If you want to synchronize a published version, go to manage workflow and unpublish it and then synchronize it.

Note: You have to manually map the parameter to the expression.

Wait-for-AAEvent Activity in a Workflow

The Wait-for-AAEvent Activity is used to wait for an ArchestrA event within a workflow. An event should be specified for the specific object in System Platform IDE.

In the following example, an event called **Spill** will occur when the object's Cycle attribute value changes to six. We will configure a process that waits for the event **Spill** to occur. After the event occurs, the context parameters of the event are captured.

1. Create an Event Expression *Me.Cycle==6*.
2. Pass relevant parameters.
3. Click on the **Manage Workflow** menu.

   The Workflow list appears.
4. You can either create a new workflow process which will wait for a Spill event or select a workflow which should wait for the Spill event.
5. Create a new workflow.

   The **Process Designer** window appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Select ArchestrA from the activities drop-down menu.
7. Drag **Wait-for-AAEvent** activity to the designer pane.

   The **Wait-for-AAEvent Set Event Filters** screen appears.
8. Enter the required details.

   Click Save & Close to save the property.

   Note: The Workflows which are associated at the template level, wait for the respective template instances.

   Defined In Object Name in the **Wait-for-AAEvent Set Event Filters** property is used to capture the object or template name in which the specific instance is defined. The instance name is passed while starting the workflow and it can be accessed through variables.

   For example, consider a workflow associated with an alarm template. Workflow is triggered whenever the alarm status is ON. Alarm can have multiple instances like Temperature alarm and Pressure alarm.

   - If the status of both Temperature and Pressure alarm is ON, two instances of the same workflow will be triggered.
   - The workflows internally wait for the respective alarm's status to be OFF. When the Temperature alarm status is OFF, the workflow which was triggered by the Temperature alarm will proceed and it will not affect the other instance of the workflow which was triggered by the Pressure alarm.

     Object Name in the **Wait-for-AAEvent Set Event Filters** property is used to capture the name of the instance, which triggered this event.
9. Click on the icon in the **Create Output XMLVariable** property.

   The **Create Output XmlVariable** screen appears.
10. Enter a unique XML variable name.
11. Click Save & Close.

    An XML Variable with the structure of the ArchestrA context parameters is created and the same is populated in the ArchestrA Data XML variable drop-down menu.
12. Save the property to save the ArchestrA Context XMLVariables.
13. Access the XML variables property of the Start activity for verifying the newly created variable.

Note: Both the properties explained above use ArchestrA context values. When the Enterprise Console is accessed, ArchestrA context related variables needs to be set manually.

AttributeReadWrite Activity

Use the **AttributeReadWrite** activity to perform the read and write operation between AVEVA Work Tasks and System Platform IDE.

Activity Properties:

You can configure the **AttributeReadWrite** activity by specifying appropriate values for the properties in the **Activity Properties** area. Click **Activity Properties** in the toolbar or select the **Properties** option from the short-cut menu of the **AttributeReadWrite** to access the Activity Properties.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Name & Description

You can use these properties to specify the name and description for the activity.

- **Name**: Use this property to specify a name for the activity.

  Property Type: Mandatory
- **Description**: Use this property to add a brief description about the activity.

  Property Type: Optional. Set this property only if required.

Configuration

You can use these properties to configure the functionality of this activity.

- **Unique Environment Name**: Identifies the Galaxy and Runtime node on which the galaxy is deployed to perform the read or write operation on the System Platform attribute.
  - You can manually enter the value for this property. This value will be considered for further execution of the current activity.

    Or
  - If the property does not have a value, then the value defined for this property in the "ArchestrAXMLData" XML variable is used during the execution of the **AttributeRead/Write** activity. The "ArchestrAXMLData" XML variable is automatically created when you associate a workflow with an ArchestrA event.

    See also: Configure AttributeReadWrite Activity to Perform Read Operation and Configure AttributeReadWrite Activity to Perform Write Operation.
- **Relative Reference Object**: Relative references are especially useful in templates while passing context parameters to workflows.
  - You can manually enter the value for this property. This value will be considered for further execution of the current activity.

    Or
  - If the property does not have a value, then the value defined for this property in the "ArchestrAXMLData" XML variable is used during the execution of the **AttributeRead/Write** activity. The "ArchestrAXMLData" XML variable is automatically created when you associate a workflow with an ArchestrA event.

    For more information, see Relative Referencing.
- **Retry Count**: Use this property to enter the number of retries, in case of a communication error. If the error is due to invalid data, it will not be retried.

  Property Type: Optional. Set this property only if required.
- **Retry Wait Time**: Use this property to enter retry wait time in seconds, in case of an error.

  Property Type: Optional. Set this property only if required.
- **Attribute Operation**: Define the attribute operation type. The attribute operation type defines whether the action should be read or write.
- **Select Attribute**: Select the attribute type for the Attribution Operation.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Looping Behavior

You can use this property to specify the looping behavior of the activity.

Loop through this action if output is: This property is used to specify the condition for looping the activity by selecting an activity output from the drop down.

Property Type: Optional

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property. Click this property to see the default configured mapped error outputs in red with their check boxes selected.

Configure AttributeReadWrite Activity to Perform Read Operation

You can read entire UDA of array type from System Platform and assign the same to variables of type array within a workflow. You can also read specific index of UDA of type array from System Platform and assign the same to variables within a workflow.

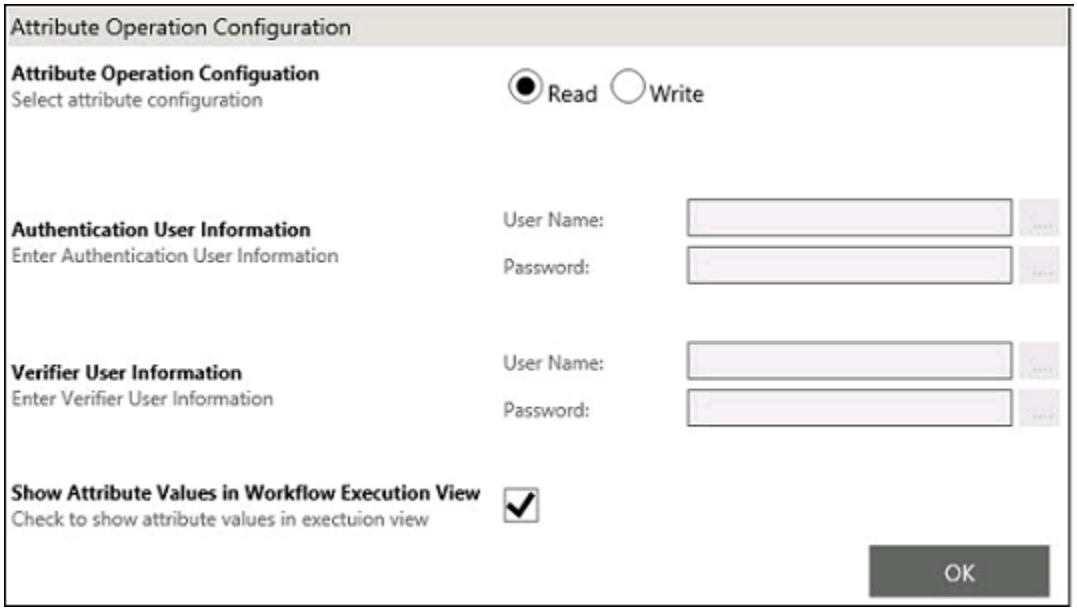
To read a specific index of UDA of type array from System Platform use Expression Builder.

Example: To read the 5th Element of the array , enter `return "UserDefined_001.Array1[4]";` in the expression builder.

To configure AttributeReadWrite activity to perform a read operation

1. Drag-and-drop the **AttributeReadWrite** activity to the Process Designer window.
2. Set the unique environment name from Expression Editor.
3. Click the edit icon in the **Attribute Operation** property.

   The Attribute Operation Configuration dialog box appears.



4. Select **Read**, and then click **OK**.
5. In the **Condition** drop-down menu, select a variable to store the attribute value.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

You can add the variable and type from **Variables** property in the **Start** activity.

In a Remote Galaxy, the value of update variable for the **Select Attribute** is in the following format:

Remote or Paired Galaxy_Name:ObjectName.UDA name

In a local Galaxy, the value of update variable for the **Select Attribute** is in the following format:

Me.UDA name

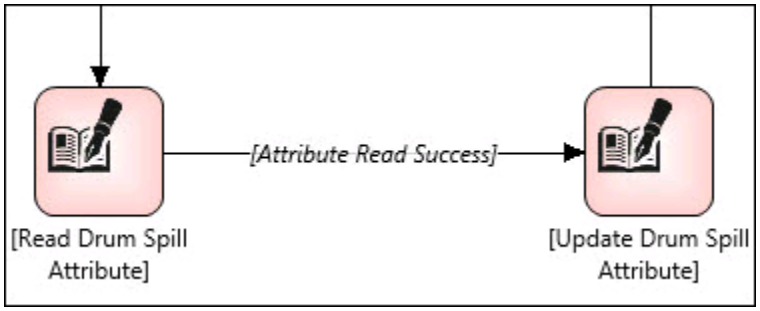
6. In the Actions tree menu, select the **Value** drop-down menu, and then select the Galaxy Browser attributes from which you want the read action to be performed.

   The Galaxy Browser option appears only if you design the workflow in the IDE context.

   The Relative Reference dialog box appears.

   This dialog box displays support for relative referencing. Except for Me, you must manually enter all other relative references. For more details about relative referencing, see Relative Referencing.

7. Create a link between the next activity based on the output options **Attribute Read Success** *or* **Attribute Read Failure**.



8. Publish the workflow.

   You can view the workflow in the Process Execution View dialog box.

   In the **Execution View**, the details of the Read/Write activity executed in a workflow appears in the **Step Details** tab. The **Execution View** page can be opened by double-clicking a top level row in any of the reports. The **View** represents the workflow up to the activity or execution status where the view is opened.

If any error occurs during Read operation, the error message will be logged with an appropriate error code generated from System Platform in the ArchestrA Logger.

For more information about the error logs, see *MxStatusDetail ValuesSystem* under the section *Status and Error Codes* of the *MXAccess Toolkit User's Guide* of *System Platform* documentation.

Configure AttributeReadWrite Activity to Perform Write Operation

You can write entire UDA of array type to System Platform using a variable of array type within a workflow. However, unlike Read operation, you cannot write specific index of UDA of array type.

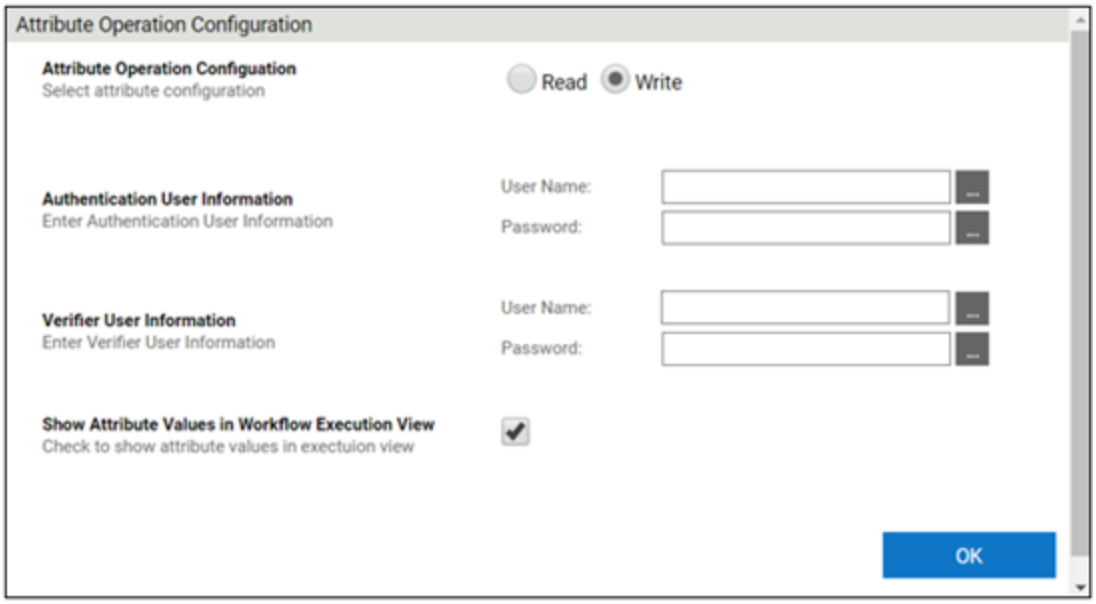
To configure AttributeReadWrite activity to perform a write operation

1. Drag-and-drop the AttributeReadWrite activity to the **Process Designer** page.
2. Set the unique environment name from Expression Editor.
3. Click the edit icon in the **Attribute Operation** property.

   The Attribute Operation Configuration window appears.

4. Select **Write** option in the Attribute Operation Configuration window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

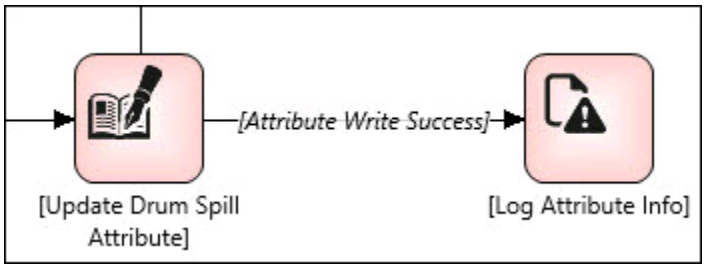


5. Enter the **User Name** and **Password** for **Authentication User Information** to authenticate user information. This credential information is needed for **Operate**, **SecuredWrite**, and **VerifiedWrite** user accounts.
6. Enter the **User Name** and **Password** for **Verifier User Information** to verify user information. This credential information is needed for **VerifiedWrite** user account.
7. Click **OK**.
8. Set the authentication information from **Variable**, **Content**,or **XML variable**.
9. Select the desired **Type** from the drop-down list, and click **Update**.
10. Select the attribute to which the write action needs to be performed in the **Condition** drop-down list. Using expression builder or a variable get the value.

    The variable and type can be added from **Variables** property in **Start** activity.

    For write operation, the Galaxy Browser appears in the Condition drop-down list. The browser appears only if the workflow is designed in the IDE context.

    The Relative Reference dialog box appears. This dialog box displays support for relative referencing. Except for Me, you must manually enter all other relative references. For more details about relative referencing, see Relative Referencing.
11. Create a link between the next activity based on the output options **Attribute Write Success** or **Attribute Write Failure**.



12. Publish the workflow.

    The workflow can be viewed in the Process Execution View page. In the **Execution View**, the details of the Read/Write activity executed in a workflow appears in the **Step Details** tab. The **Execution View** page can be opened by double-clicking a top level row in any of the reports. The **View** represents the workflow up to the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

activity or execution status where the view is opened.

If any error occurs during Write operation, the error message will be logged with an appropriate error code generated from System Platform in the ArchestrA Logger.

For more information about the error logs, see *MxStatusDetail ValuesSystem* under the section *Status and Error Codes* of the *MXAccess Toolkit User's Guide* of *System Platform* documentation.

Relative Referencing

Relative references are especially useful in templates while passing context parameters to workflows. You can use relative references like *MyContainer, MyPlatform, MyEngine, MyArea, and Me* to refer to contained objects within that container.

Relative referencing supports event context at the parameter level and the attribute read or write at the **AttributeReadWrite** activity level.

The following valid relative references refer to the current object:

- Me
- MyContainer
- MyArea
- MyPlatform
- MyEngine

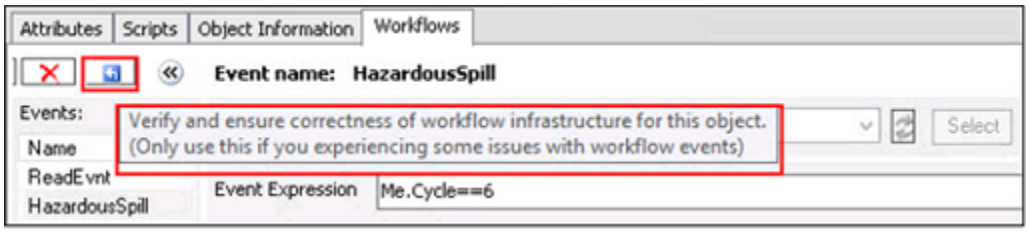
When you use relative references, like *MyContainer*, you can refer to contained objects within that container. For example, a reference to *MyContainer.InletValve.PV* is equivalent to *Tank1.InletValve.PV* in the following hierarchy:

- Tank1: Cannot reference at this level because this is not contained.
- InletValve: Can reference at this level because this object is contained.

Example:

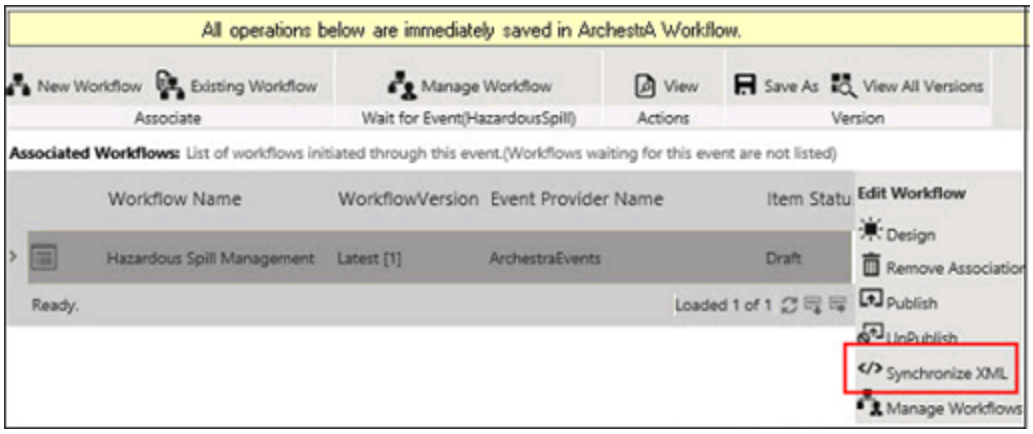
If System Platform-Workflow Connector Version 1.1.1222.0 is used and events to trigger workflows are configured, then do the following steps to use the relative referencing support in the **System Platform-Workflow Connector Version 1.5.1229** for the existing events:

1. Select an existing event, and then click **Verify** to ensure correctness of workflow infrastructure for this object icon.



2. Select a workflow, and then click the **Synchronize XML** option for that workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. Deploy the existing gateway object again.

Wait-For-AAEvent Activity

Activity Description:

Use the **Wait-For-AAEvent** activity to wait for a number of events from ArchestrA for a particular time period. You can set the number of events and the time period in the properties of that activity. It can store the event context details into specified XML variables.

Activity Properties:

You can configure the **Wait-For-AAEvent** activity by specifying appropriate values for the properties in the **Activity Properties** area. Click **Activity Properties** in the toolbar or **select** the Properties option from the short-cut menu of the **Wait-For-AAEvent** activity to access the **Activity Properties**.

Name & Description

You can use these properties to specify the name and description for the activity

- **Name**: Use this property to specify a name for the activity.

  Property Type: Mandatory.
- **Description**: Use this property to add a brief description about the activity.

  Property Type: Optional. Set this property only if required.

Configuration

Use these properties to configure the functionality of the activity.

- **Set Event Filters**: Use this property to filter the ArchestrA event. Whenever an event occurs, it checks this filter, and if a match is found, the activity is alerted. When you open the **Properties** association page in System Platform IDE, it populates all the default values.

  Property Type: Mandatory

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- **Valid for Events**: Use this property to specify the number of events for which the activity must wait. It indicates that the activity must wait till the specified number of events are received.

  Property Type: Optional. Set this property only if required.
- **Select Output XML Variable**: Use this property to set XML Variable for storing event context. A new XML variable is created or an existing XML variable of the similar schema is selected. When an event occurs, this XML variable is populated with event context data and it is used later in the flow of the process. The synchronization option is used if the event parameters in the IDE are modified later. For more information about synchronization, see *User Guide*.

Escalation & Timeout

Use this property to specify escalation and timeout settings for the activity.

- **Timeout for Action**: Use this property to set timeouts for this activity. If specified, the activity will be timed out after the specified time span.

  Property Type: Optional. Set this property only if required.

Miscellaneous

- **Update List XMLVariables**: Use this property to insert records into AVEVA Work Tasks Information List. This property is automatically set when you create an XML variable using **Select Output XML Variable**.

  Property Type: Optional. Set this property only if required.

Looping Behavior

Use this property to specify the looping behavior of the activity.

- **Loop through this action if output is**: Use this property to specify the condition for looping the activity by selecting an activity output from the drop down.

  Property Type: Optional. Set this property only if required.

Exception Behavior

Each activity has the Raise Error on Unhandled Linked Output property. Click on this to see the default configured mapped error outputs in red with their check boxes selected.

Activity Outputs:

The **Wait-For-AAEvent Activity** returns the following values:

- **Event Received**: This output is displayed when an ArchestrA event matching the specified filter condition is received.
- **Action Completed**: This output is displayed when the activity has timed out.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Workflow Features Inside InTouch

This topic provides information on how to use the Workflow Features inside InTouch.

- Initial Steps
- Inbox Inside InTouch
- Workflow Status View Inside InTouch
- BAM Inside InTouch
- Lists Inside InTouch
- Forms Inside InTouch
- List Forms Inside InTouch
- WorkItemInboxCount in InTouch

Initial Steps

You can use workflow features from Inside InTouch.

1. In the **System Platform IDE**, click **Galaxy**, click **Import**, and then click **Client Control**.

   The Import Client Control(s) dialog box appears.
2. Go to the following path and import `ArchestrA.InTouch.SkeltaControls.dll`:

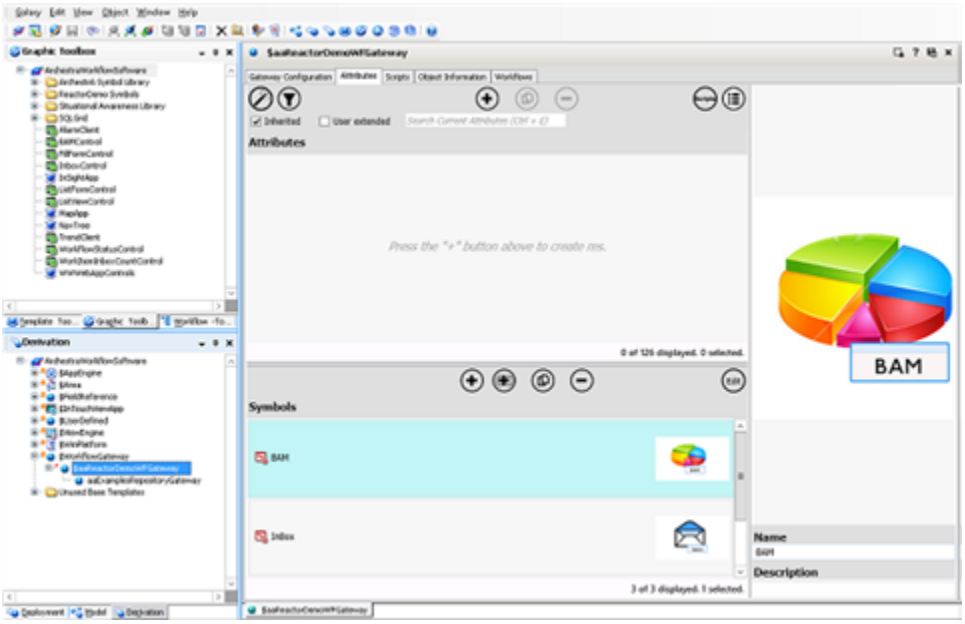
   C:\Program Files\ArchestrA\Workflow\InTouch\ArchestrA.InTouch.SkeltaControls.dll

   The imported graphic object appears in the Graphic Toolbox in System Platform IDE as shown in the following image:

   If the same version of the control exists, then you will be prompted to rename the existing controls.
3. To embed the graphics in an ArchestrA object, open the ArchestrA object, click the Attributes tab, and then

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

click **+**.



4. Click the **Add** button, and then enter the name of the graphic symbol that is added in the **Name** field.
5. Click **Edit** to create the symbol in the Graphic Editor.

   The Graphic Editor appears.

6. Click the **Embed graphic** icon.

   The ArchestrA Object browser appears.
7. In the ArchestrA Object browser, select the **Graphic Toolbox**, and then select the required graphic control.

Note:
- The control must be placed on the **Workflow Gateway** object.
- In case the control is placed on a user-defined object, then ensure:
-- The object has an attribute called **ConnectionString**.
--- The value of this **ConnectionString** attribute is same as that of the **ConnectionString** attribute (hidden) of the **Workflow Gateway** object.
- To set up the zoom level, refer to Setting Zoom for the Web Browser Control in System Platform and InTouch.

AIM Authentication for Controls in InTouch HMI

You can use AVEVA Identity Manager (AIM) authentication for AVEVA Work Tasks Controls in **InTouch HMI**. To enable AIM authentication, ensure that in **Central Configuration** when the **Resource Provider** is set to **Active Directory**, the **Use Token Service** is set to the appropriate server. Otherwise, the control will be loaded within the context of the default user, if specified. If the default user is not specified, then the control will be loaded

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

within the context of the user who configured the workflow gateway.

Note:
- Ensure to import the ArchestrA app before configuring AIM for InTouch HMI.
- When using AIM authentication for controls in InTouch HMI, ensure all controls are configured for AIM authentication.
- When the InTouch HMI window having AVEVA Work Tasks control is opened for the first time, it navigates to AIM authentication page. After providing the credentials, it authenticates with AIM, and on successful authentication, the controls get loaded.
- If multiple controls are placed in a single InTouch HMI window, then for the first time you may see AIM authentication page on each AVEVA Work Tasks controls. To avoid authenticating each control, do as follows:
-- Open a single AVEVA Work Tasks control in the InTouch HMI window.
-- After AIM authentication with one control, close the window, and then re-open it.

To configure System Platform IDE Security

1. In the **System Platform IDE**, on the **Galaxy** menu, click **Configure**, and then click **Security**.

   The **Security** dialog box appears,
2. On the **Authentication Mode** tab, select **OS User based** and **OS Role based**.
3. On the **Users** tab, under **Authorized Users Available**, add users, and then under **Associated Roles for Administrator**, map **Administrator** role.
4. Click **OK**.

   The **System Platform IDE** will close and reopen.

Sometimes, you may face issues related to Anti-forgery. These issues might be because of cache. To resolve this issue, follow the below steps:

1. Close System Platform IDE.
2. Open browser window.
3. Clear browser cache.
4. Close all browser windows.
5. Open System Platform IDE and try accessing controls.

Inbox Inside InTouch

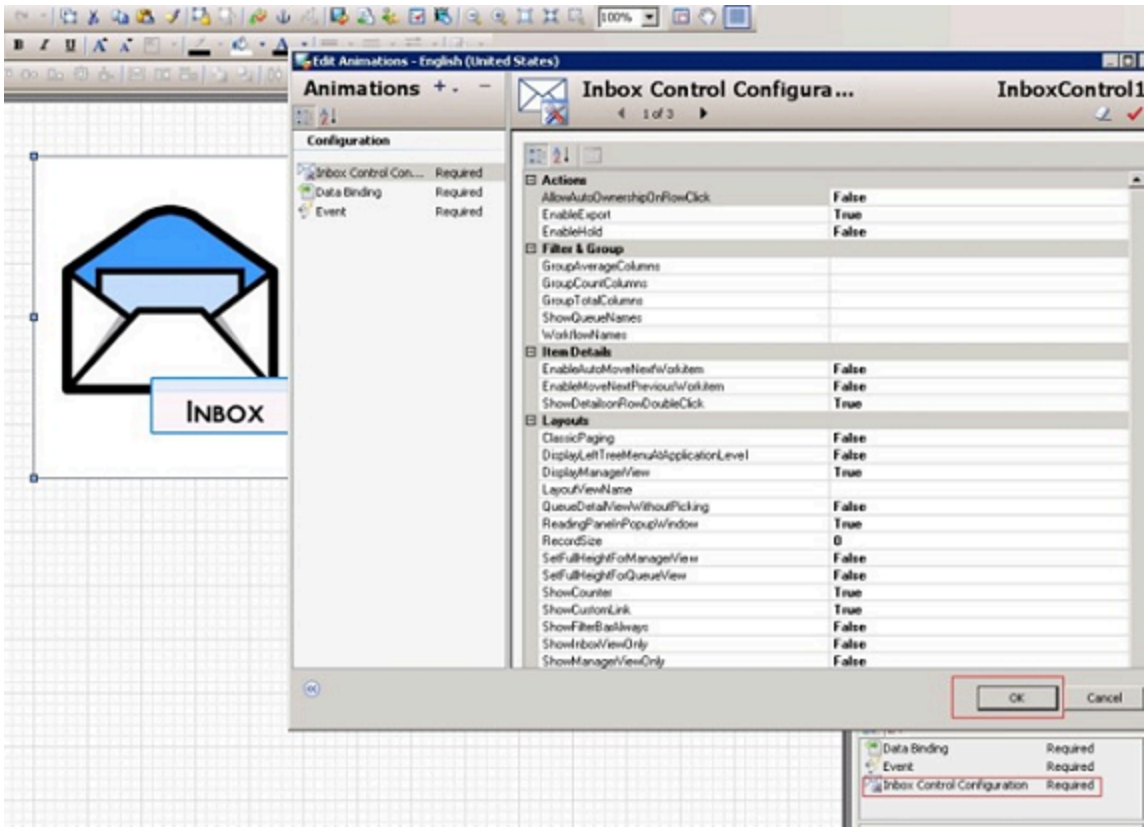
Follow steps 1-7 listed in the Initial Steps and continue:

1. Select the control in the editor.

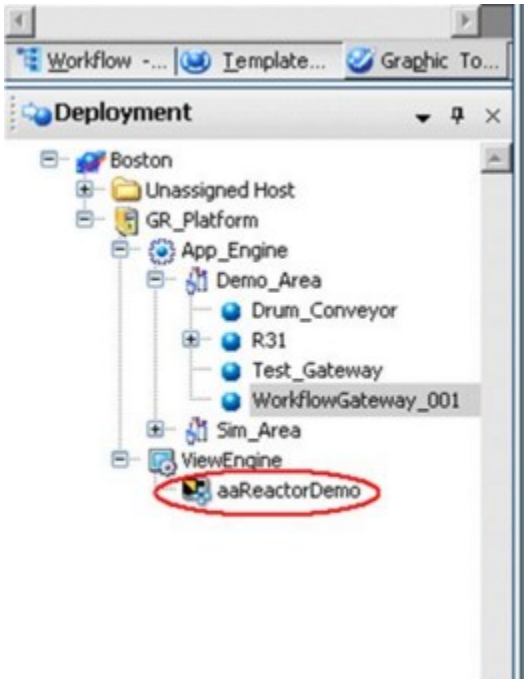
   The Edit Animations window appears.
2. In the Animations pane, double-click and open Inbox Control Configurations.

   A new configuration page appears. You can configure the Inbox Control in this page.
3. After configuring the Inbox, click OK.
4. Save and close the editor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



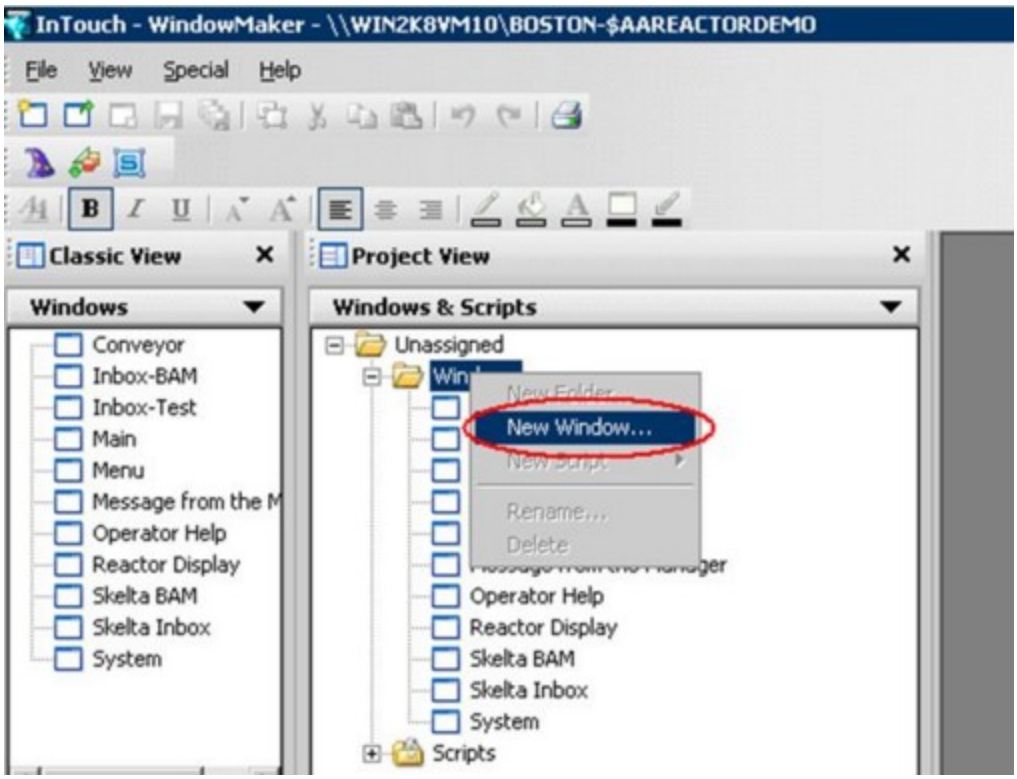
5. Select the instance and deploy in the System Platform IDE.



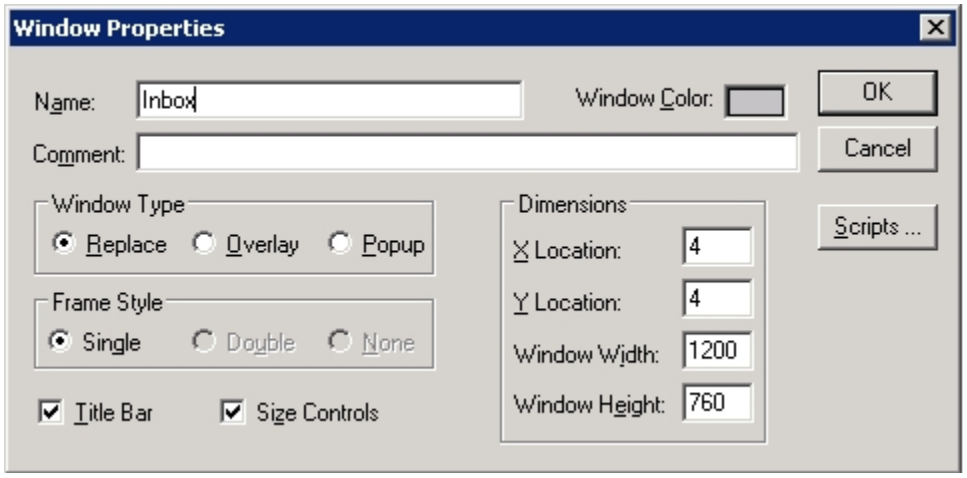
6. Double-click the $InTouchViewApp instance (aaReactorDemo) under ViewEngine from the System Platform IDE.

   The InTouch - WindowMaker window appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

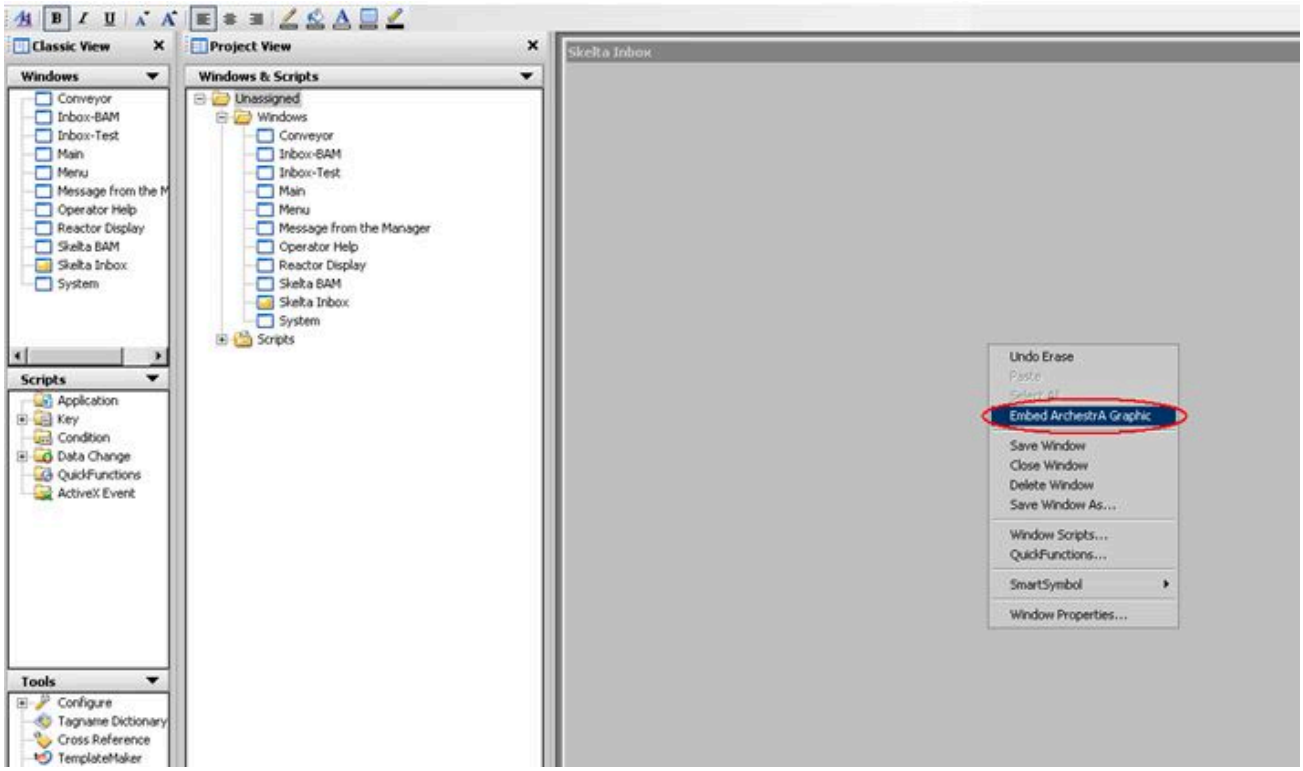


7. Create a new window for the Inbox control.
8. Provide the name and size for the window.

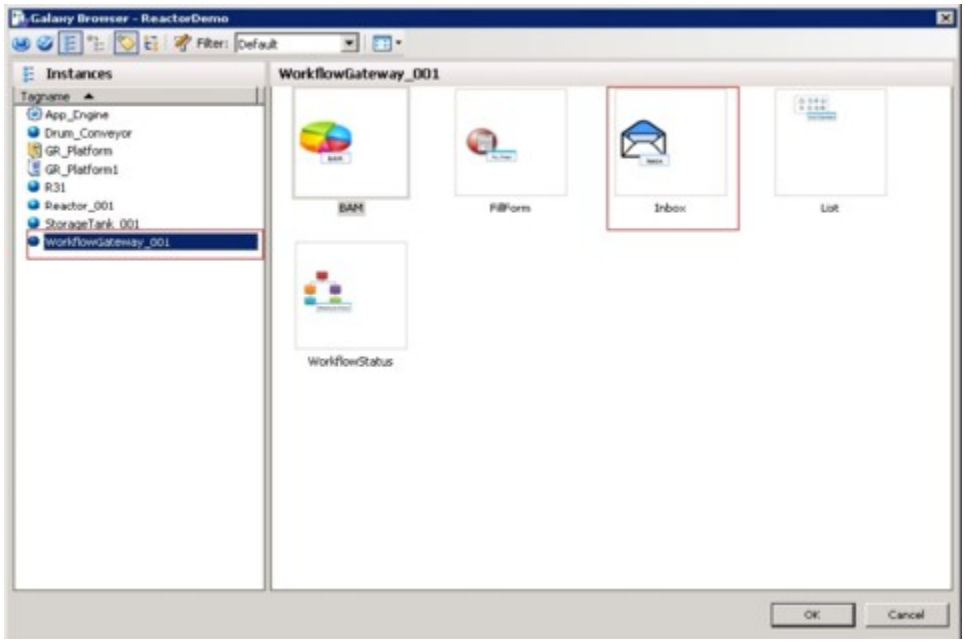


9. Right-click inside the newly opened window, and then select **Embed ArchestrA Graphi**c.
   The ArchestrA Galaxy Browser appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

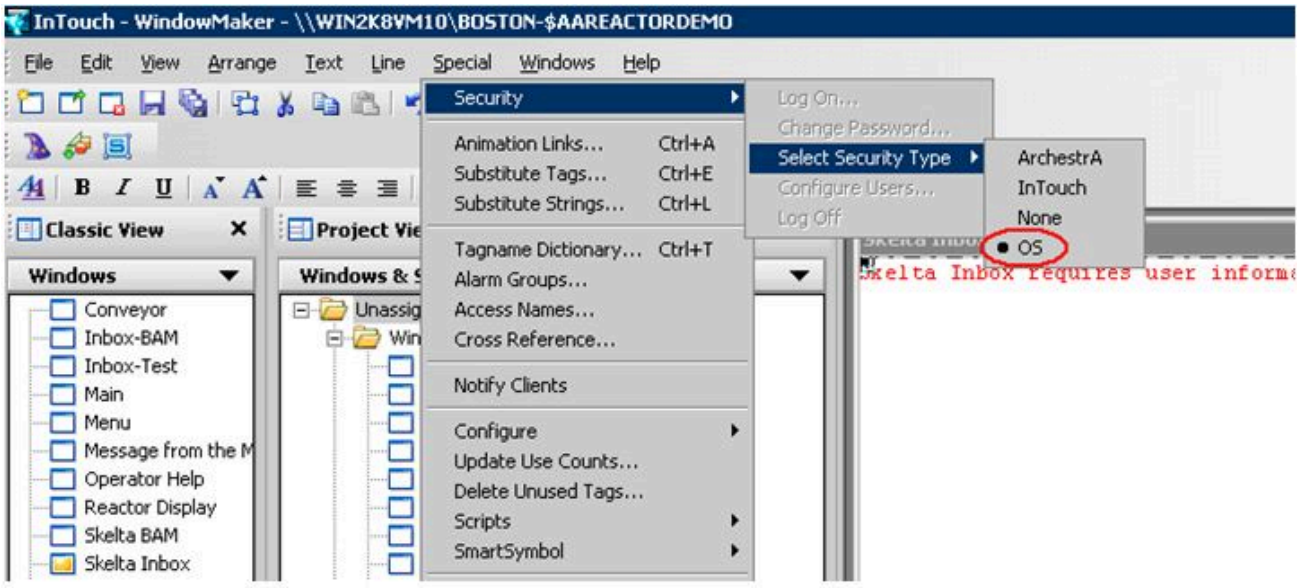


10. Select the Instances tab, and then select the object to which the graphic symbol is added. Select the name of the required graphic object (Inbox).



11. Enable security for the Inbox window, if required.

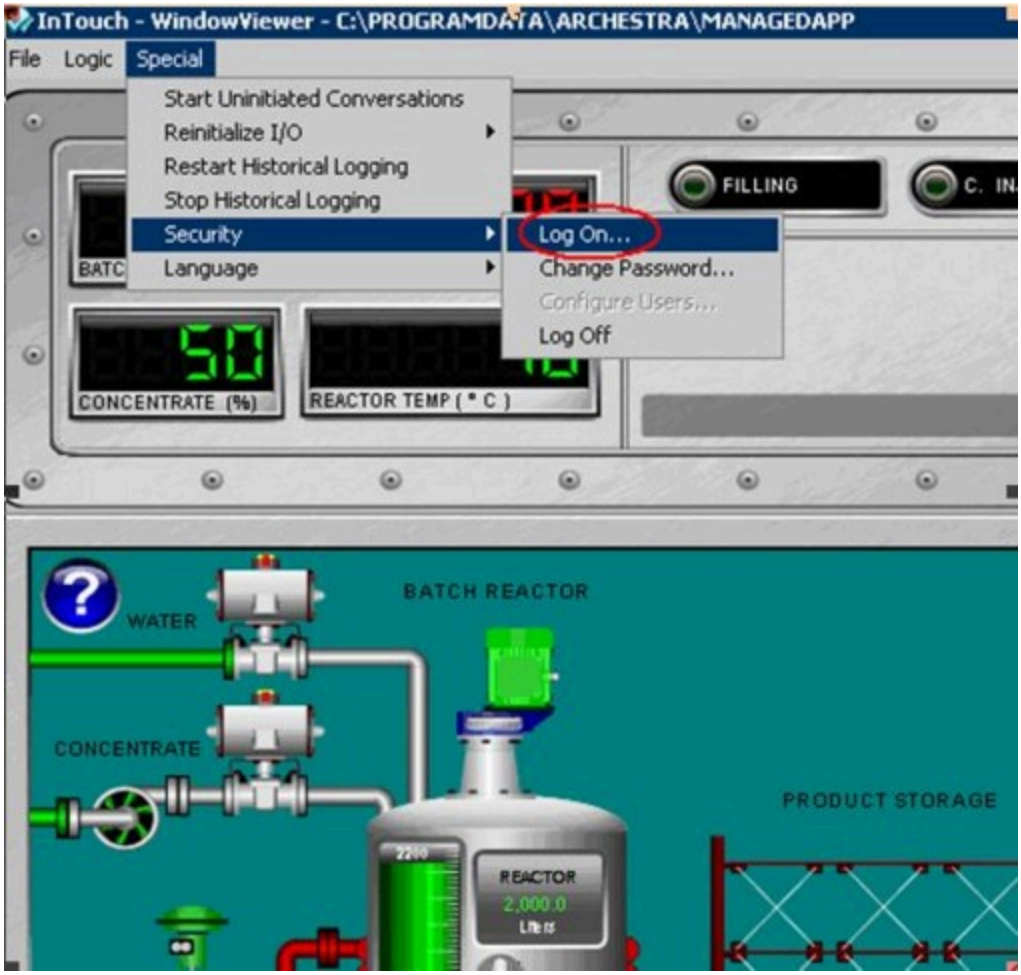
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

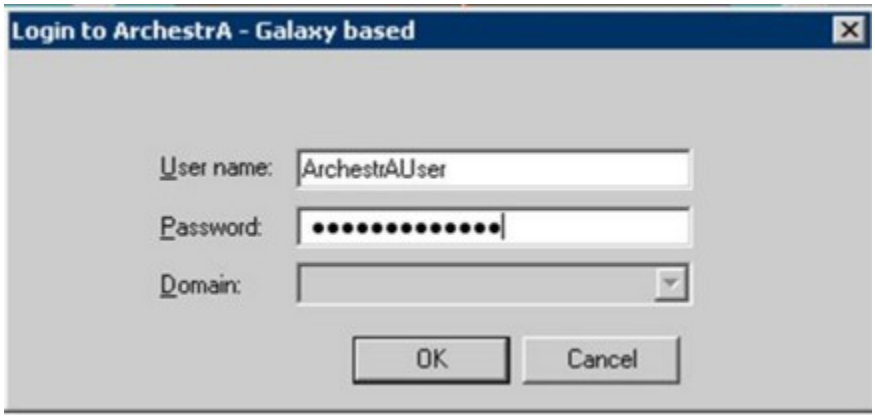


12. Save the window and exit InTouch WindowMaker.
13. Save and close the object in the System Platform IDE.
14. Deploy the $InTouchViewApp instance.
15. Open the InTouch Viewer.
16. Click Special, click Security, and then click Log On.

    The login dialog box appears.

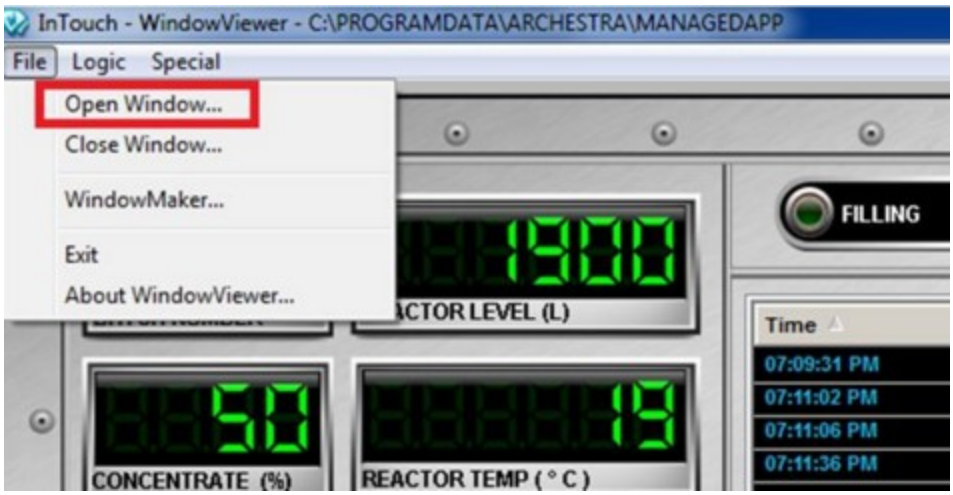
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

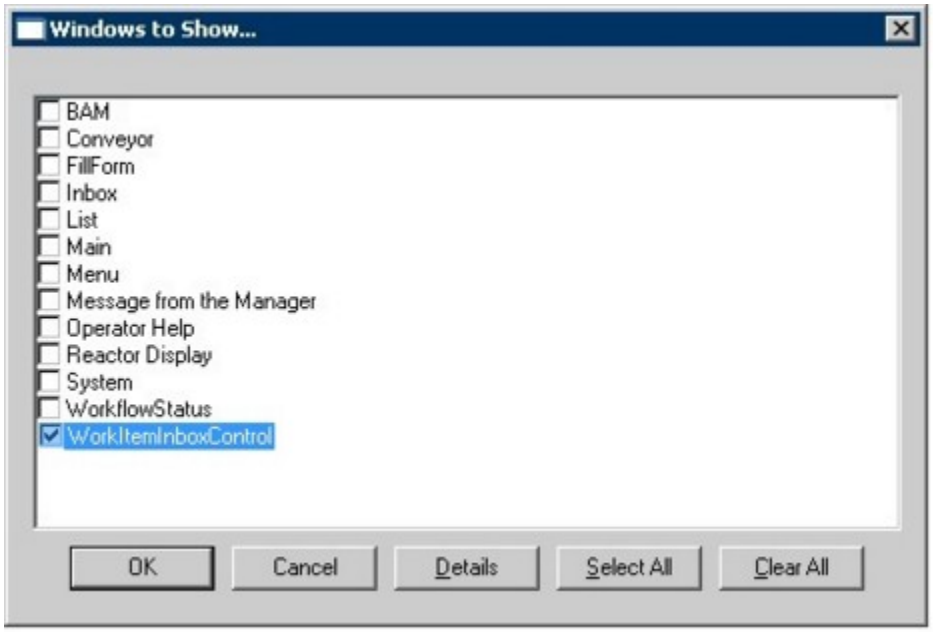




17. Enter the credentials, and then click OK.
18. Open the Inbox (the one created) window from the file menu.
    The Inbox Control loads in the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

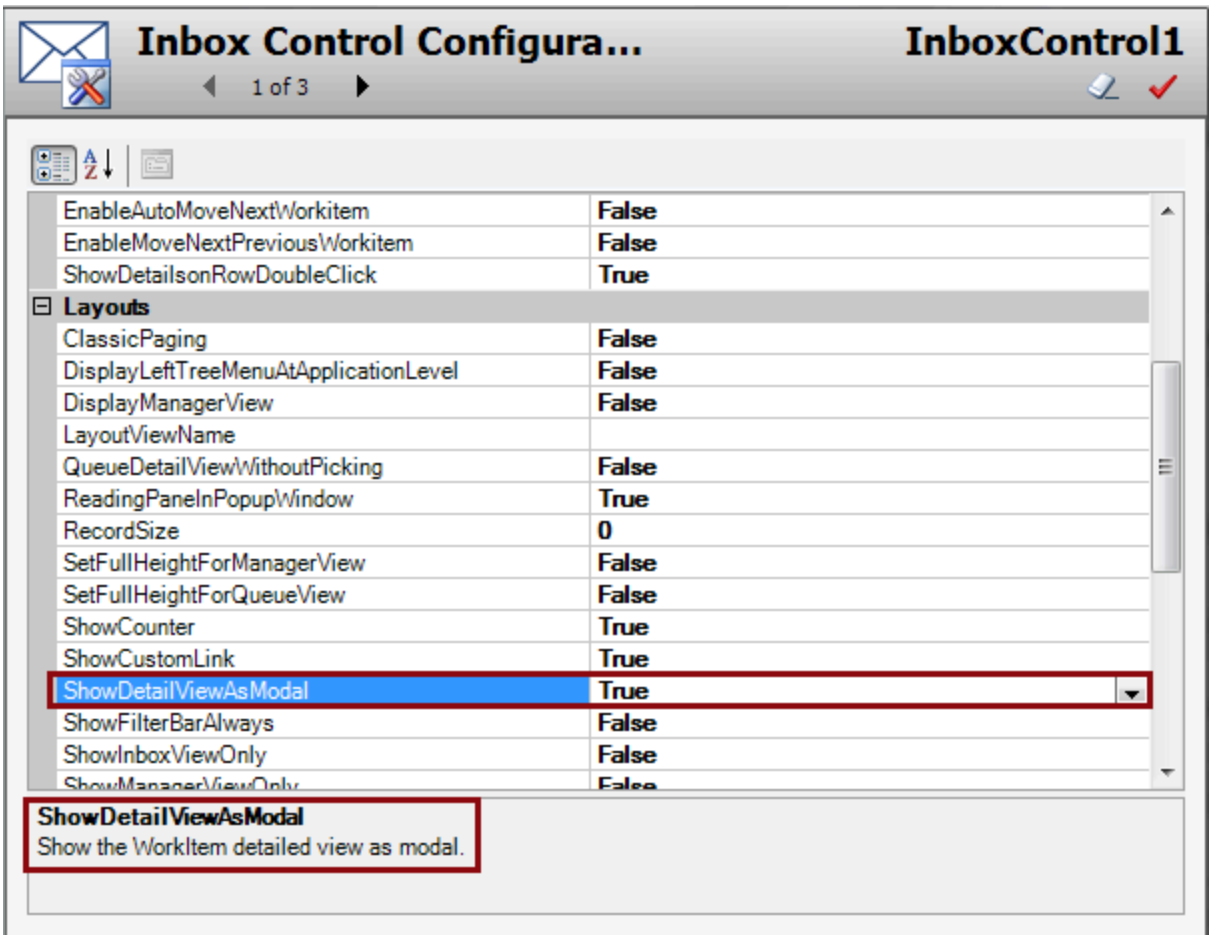




Modal or Modaless Window Property

When you click a work item to edit, you can choose the editor to appear as a modal window or a modaless window. Change the value of the parameter, **ShowDetailViewAsModal** to *True* if you want the editor to open as a modal window, as shown in the following image:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



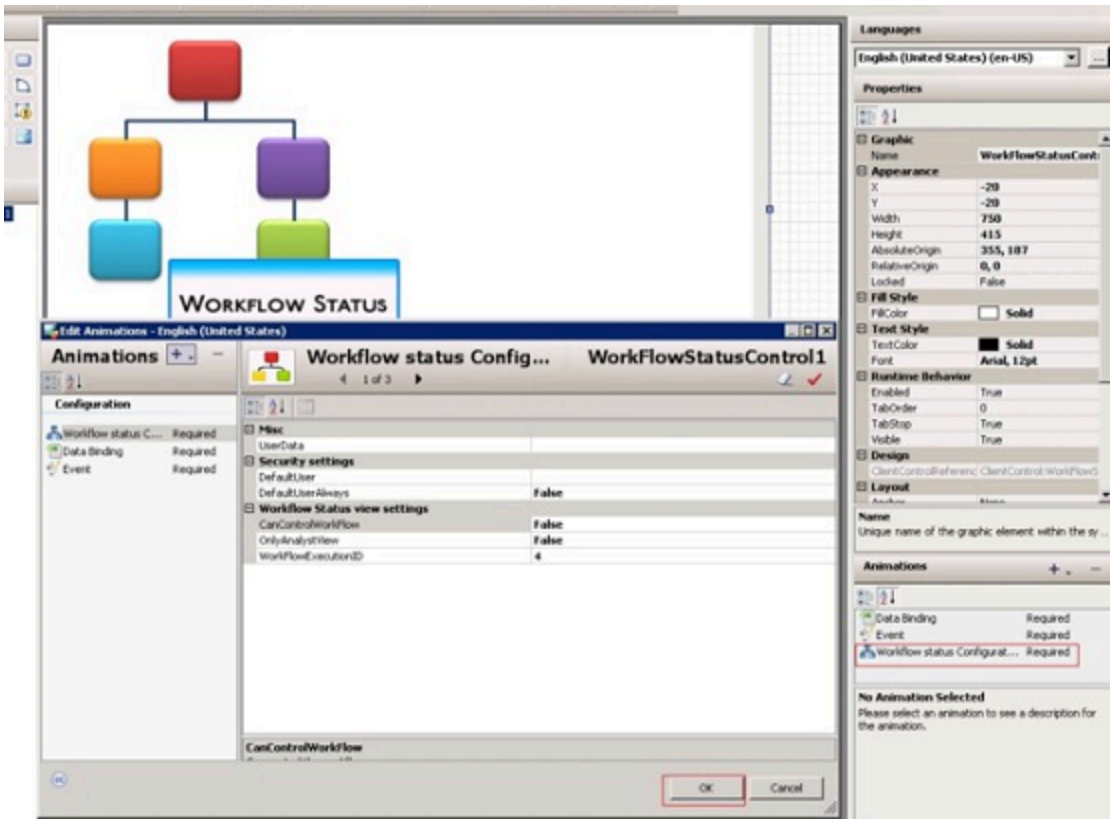
Note: The Inbox Control size must be more than the size of the Work Item Detail View modal window.

Workflow Status View Inside InTouch

Follow Step 1 to Step 7 listed in the Initial Steps and continue:

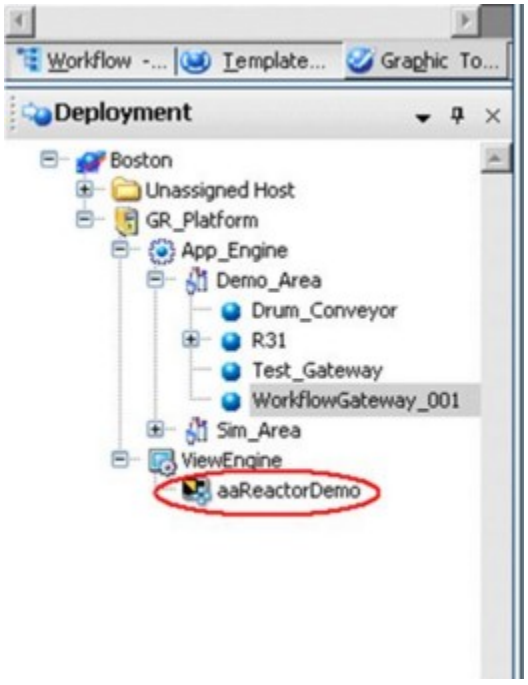
1. Select the control in the editor.
   The Edit Animations window appears.
2. In the Animations pane, double-click and open Workflow status Configuration.
   A new configuration page appears. You can configure the Control in this page.
3. After configuring the Workflow Status, click OK.
4. Save and close the editor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



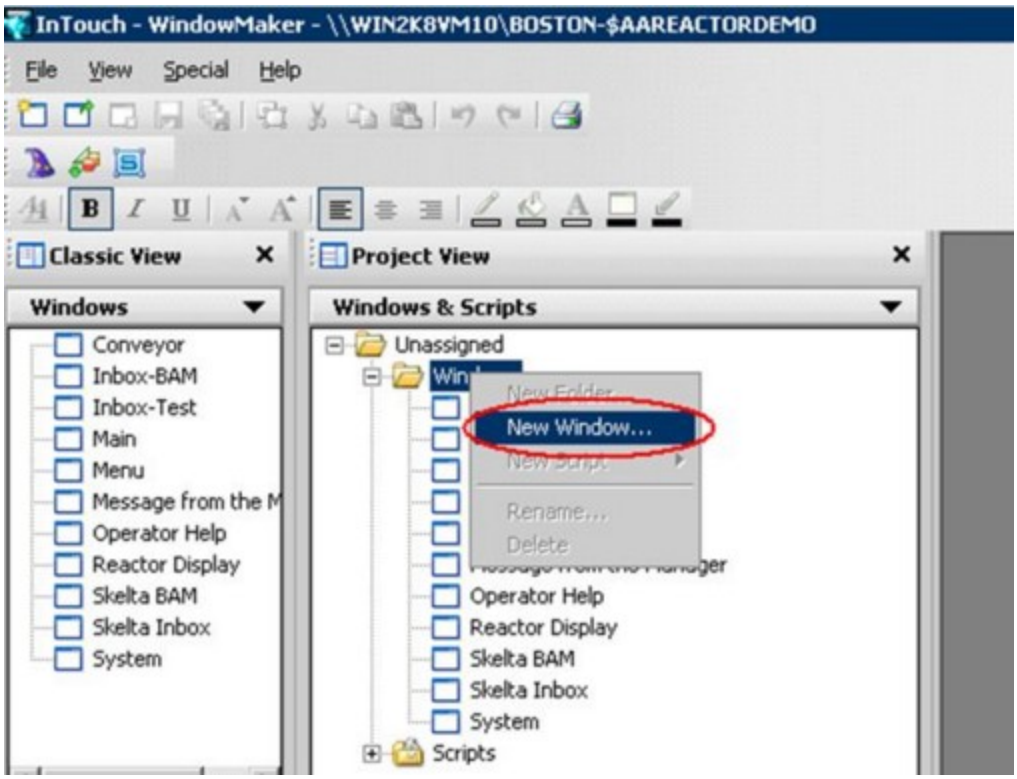
5. Select the instance and deploy in the System Platform IDE.
6. Double click the $InTouchViewApp instance (aaReactorDemo) under ViewEngine from the System Platform IDE.

   The InTouch WindowMaker window appears.

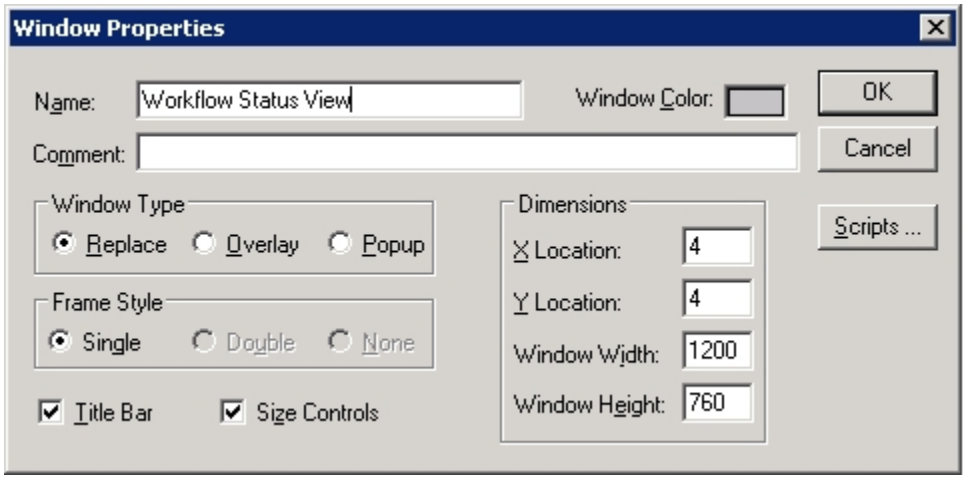


7. Create a new window for the Workflow Status View control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

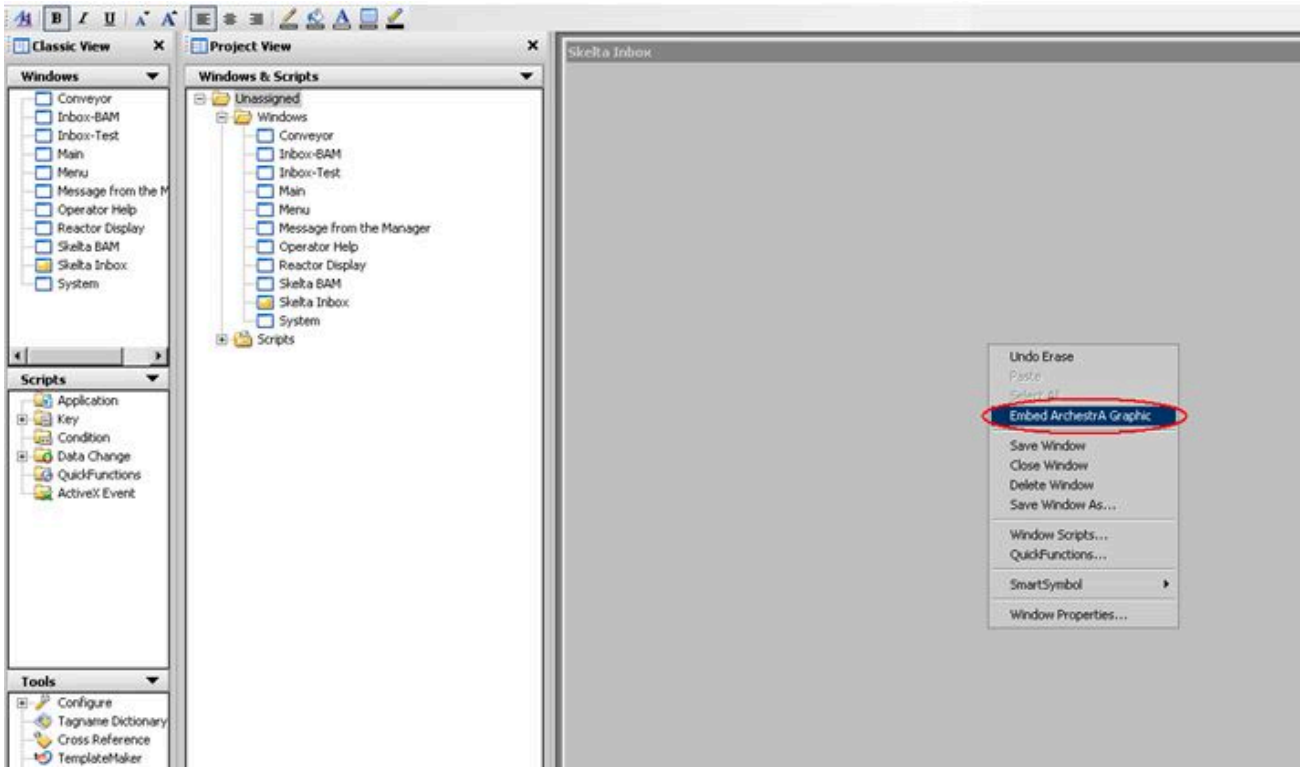


8. Provide the name and size for the window.

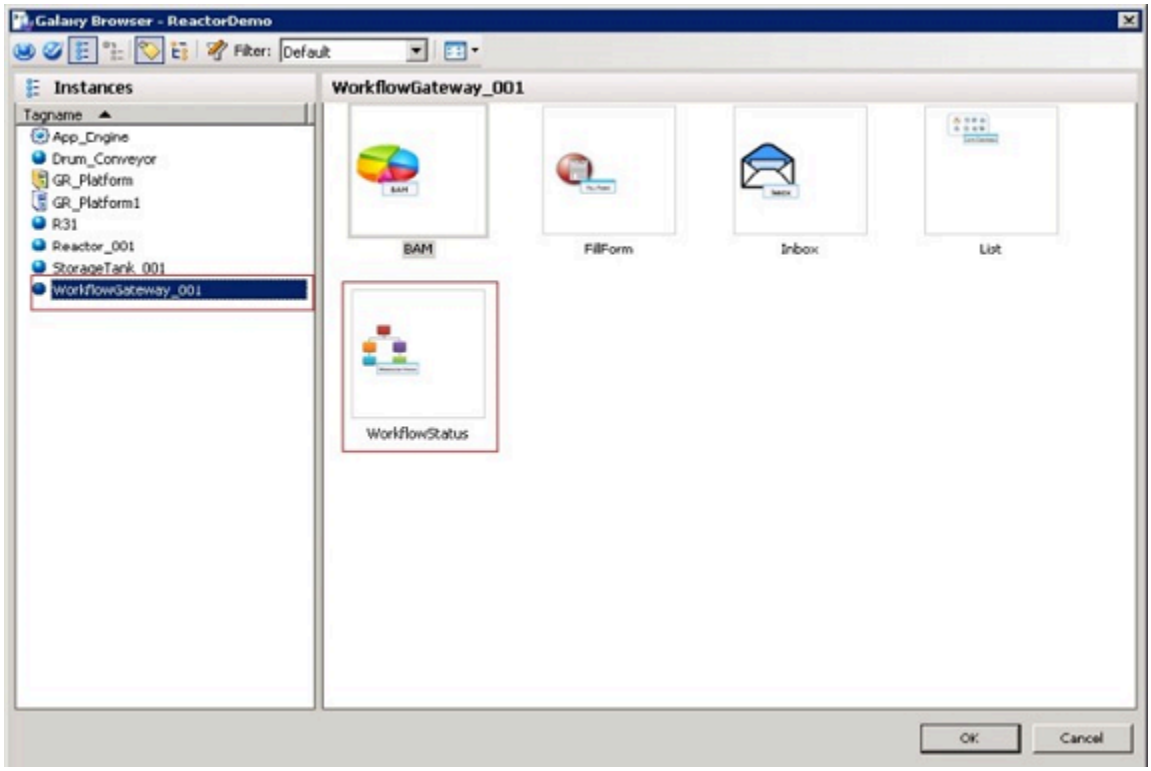


9. Right-click inside the newly opened window and select "Embed ArchestrA Graphic" option.
   The ArchestrA Galaxy browser appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

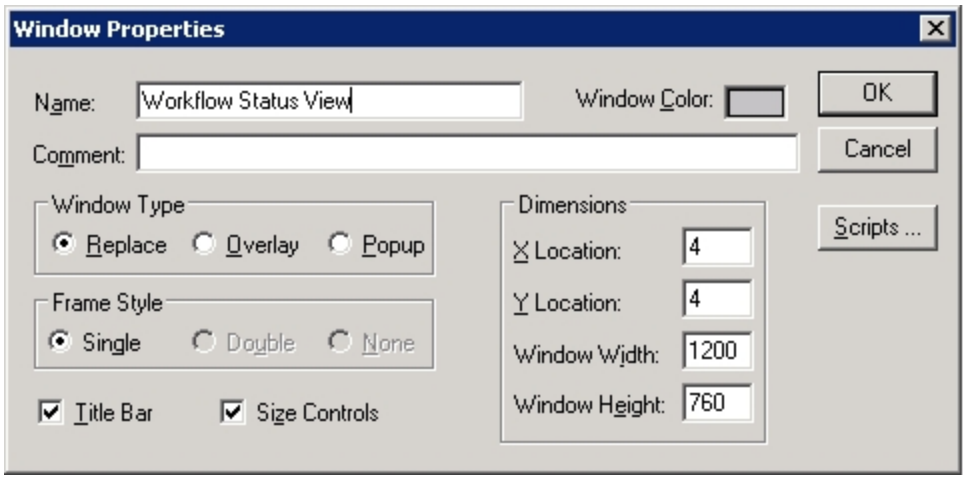


10. Select the Instances tab, and select the object to which the graphic symbol has been added.

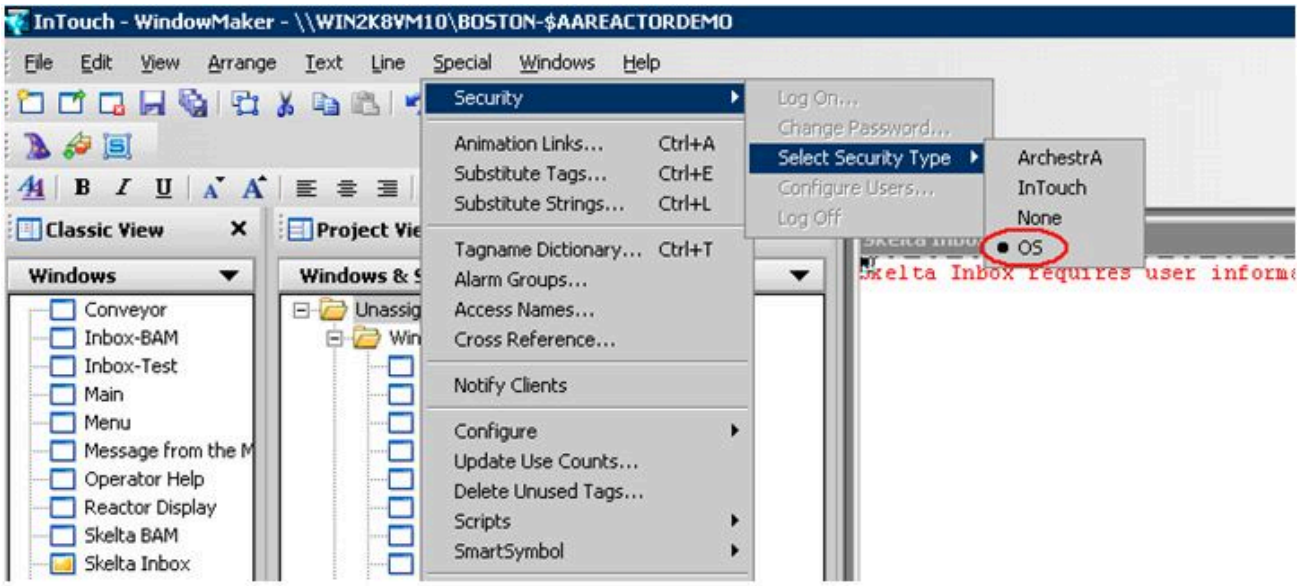


11. Select the name of the graphic object (Workflow Status View) that has to be displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

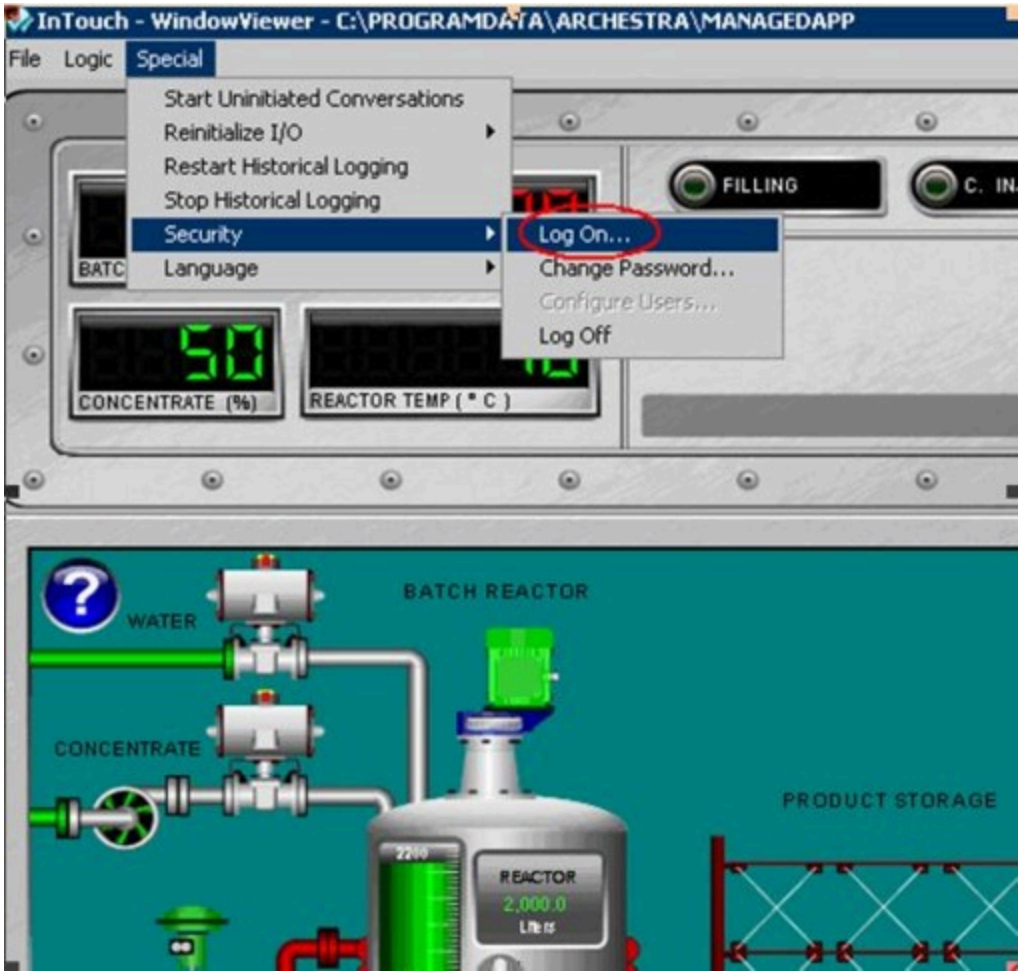


12. Enable security for the Workflow window, if required.

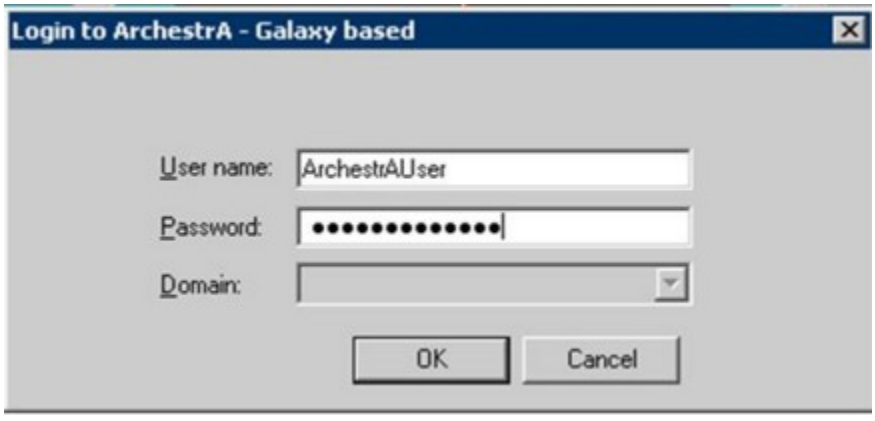


13. Save the window, and exit InTouch WindowMaker.
14. Save and close the object in the System Platform IDE.
15. Deploy the $InTouchViewApp instance.
16. Open the InTouch Viewer.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

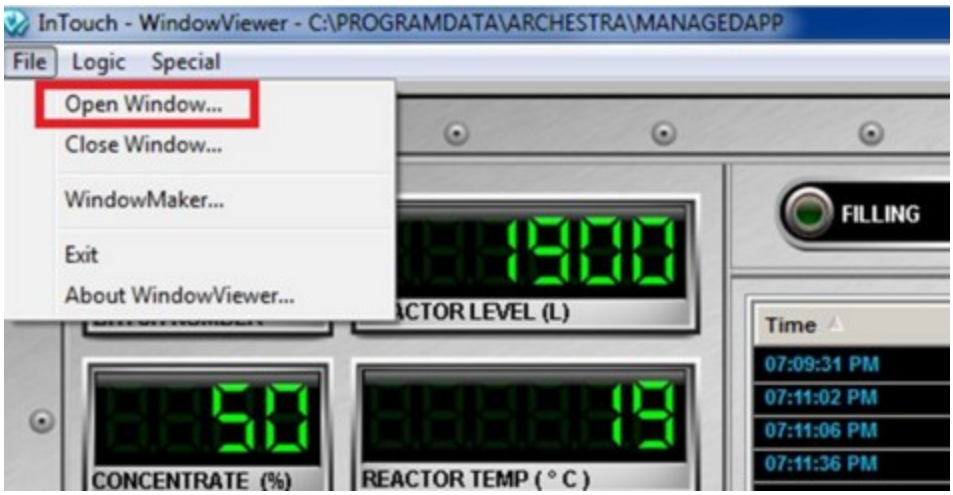


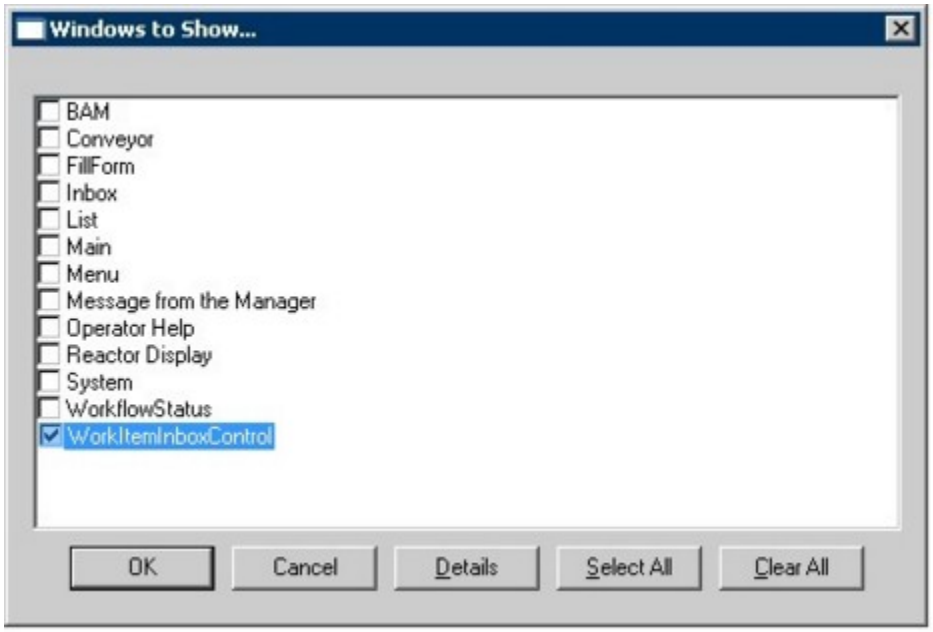
17. Click Special, click Security, and then click Log On.
    The login dialog box appears.
18. Enter the Credentials and click OK.



19. Open the created Workflow Status View window from the file menu.
    The Workflow Status View Control loads in the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



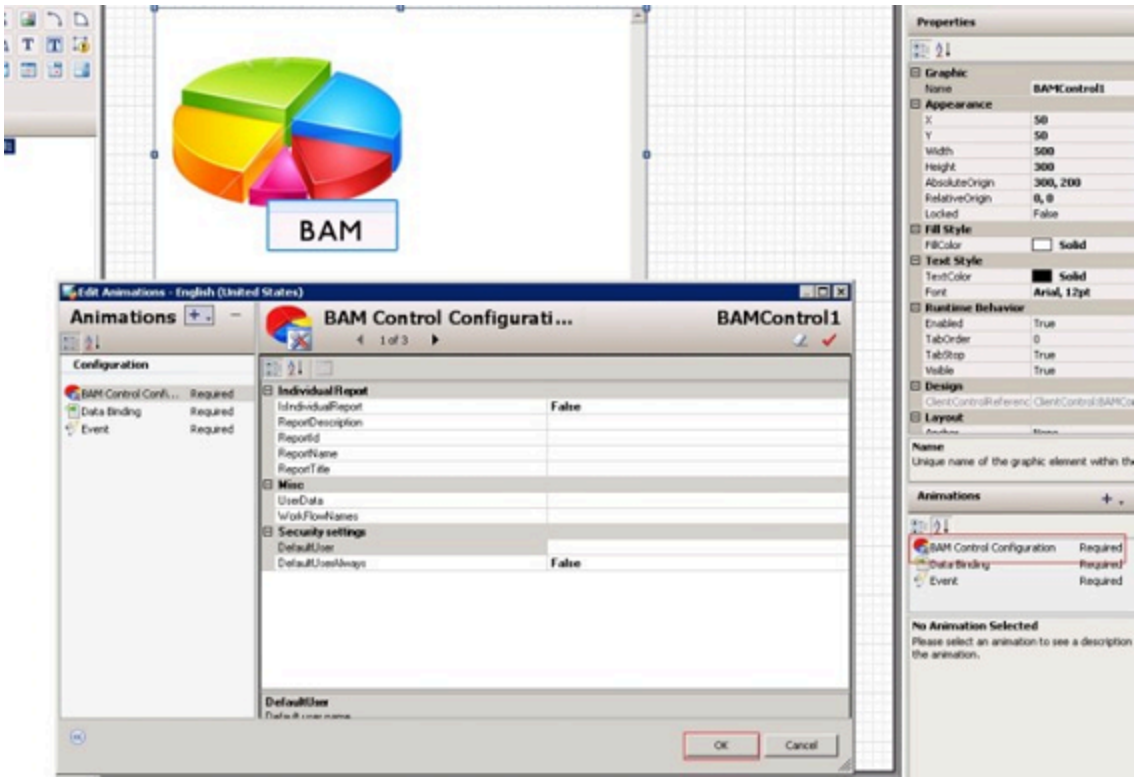


BAM Inside InTouch

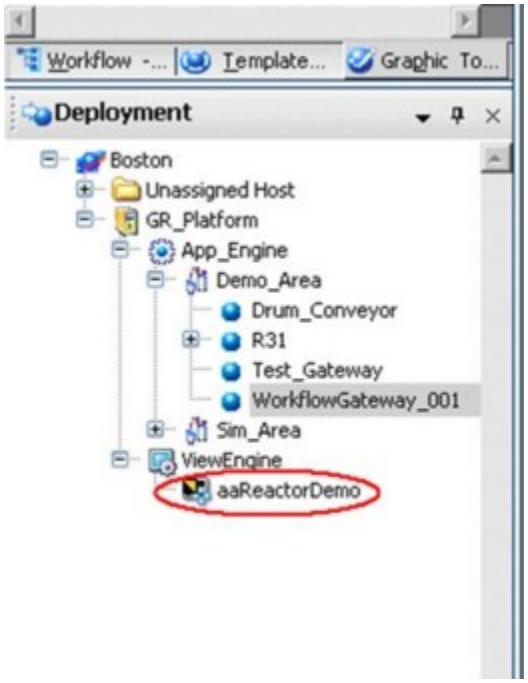
Follow Step 1 to Step 7 listed in the Initial Steps and continue:

1. Select the control in the editor and double click on BAM Configuration under Animations. This will open up a new configuration page from where the BAM control can be configured. After configuring the BAM Configuration, click "OK". Save and close the Editor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

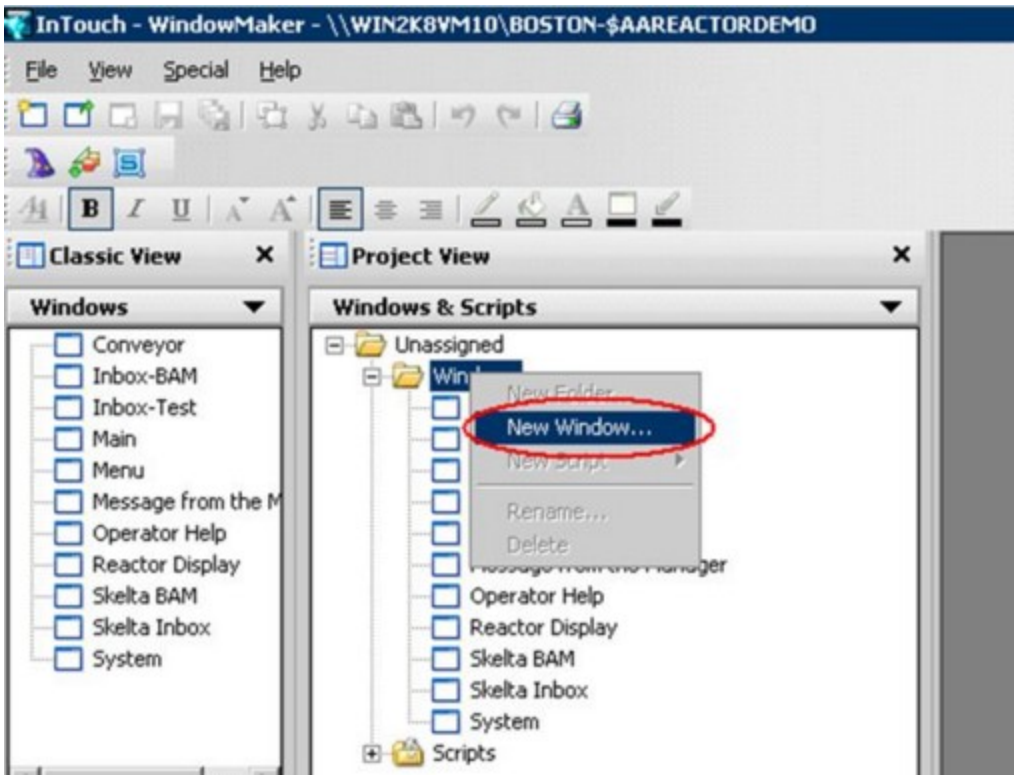


2. Select the instance and deploy in the System Platform IDE, double click the $InTouchViewApp instance (aaReactorDemo) under ViewEngine from the System Platform IDE.

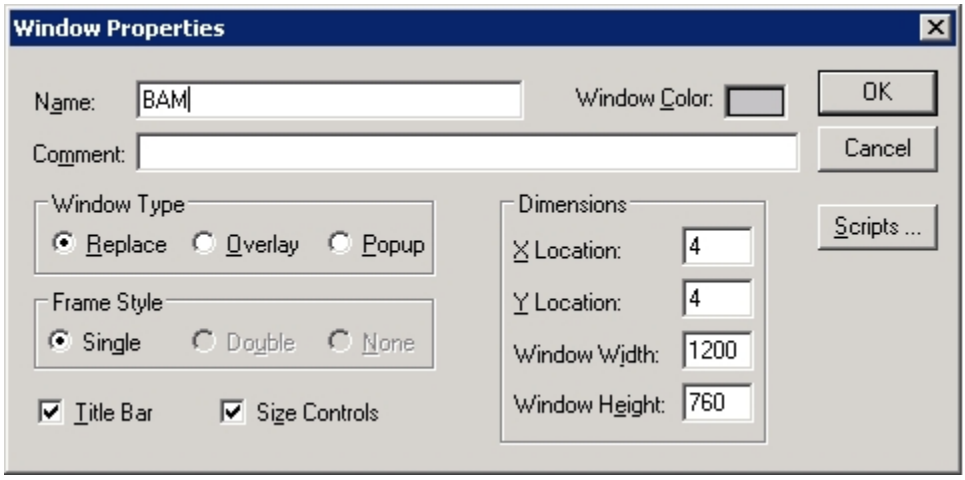


3. The InTouch WindowMaker appears. Create a new window for the BAM control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

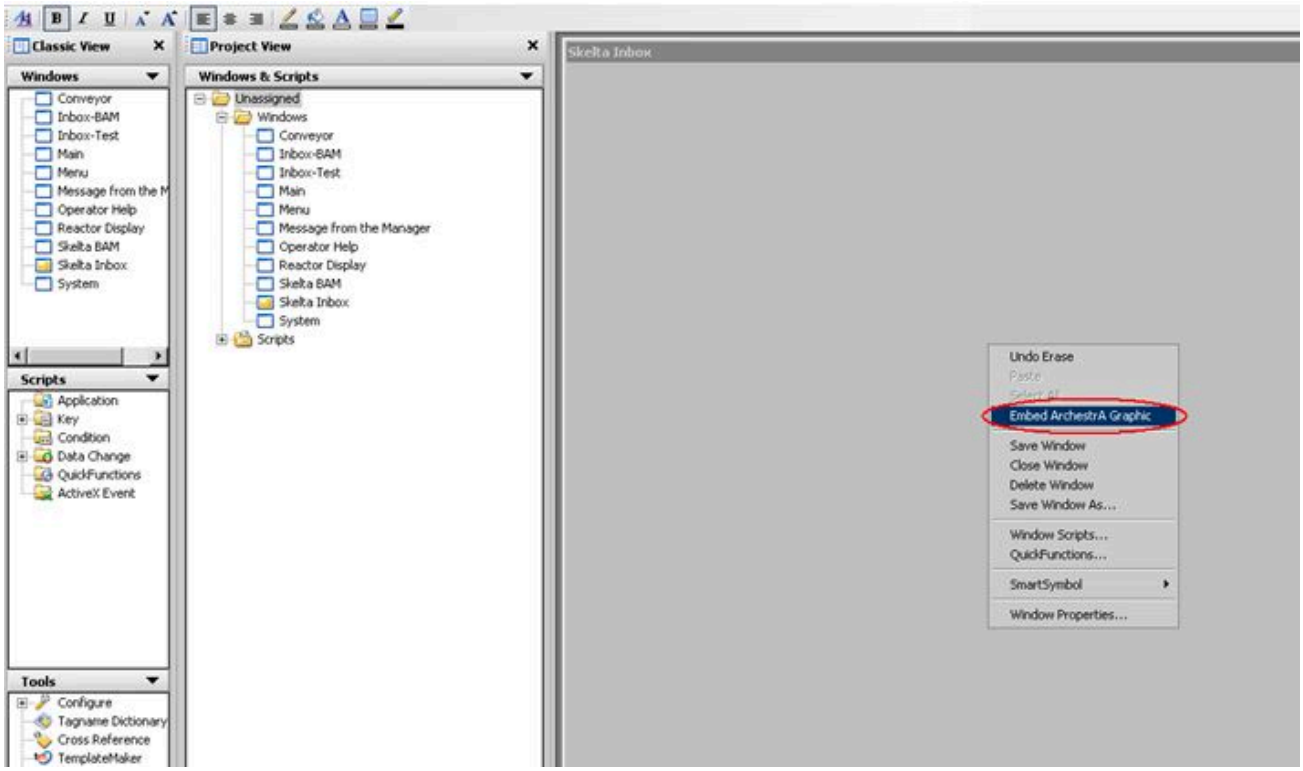


4. Provide the name and size for the window.

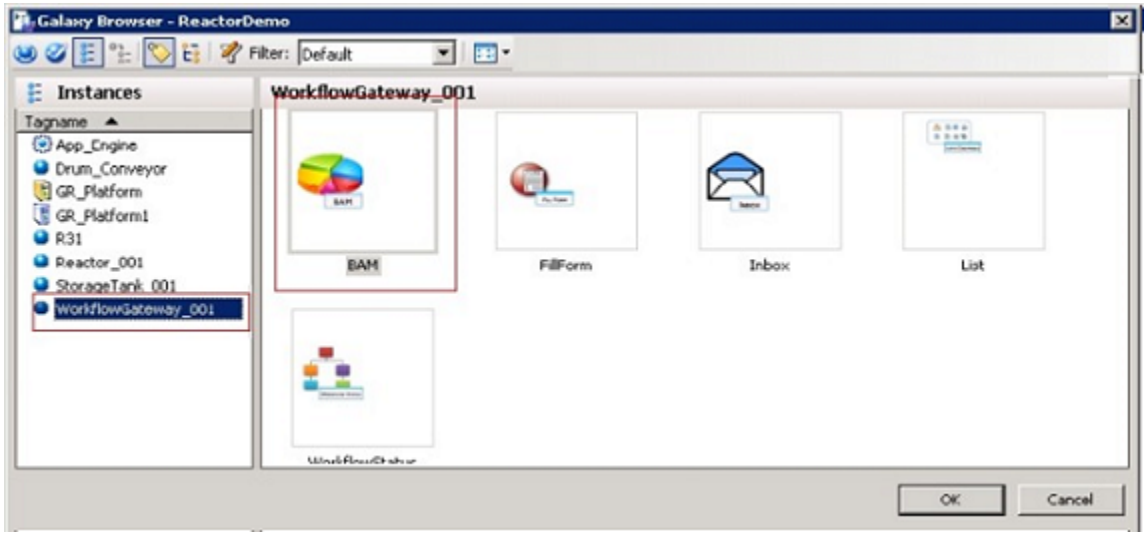


5. Right-click inside the newly opened window and select "Embed ArchestrA Graphic" option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

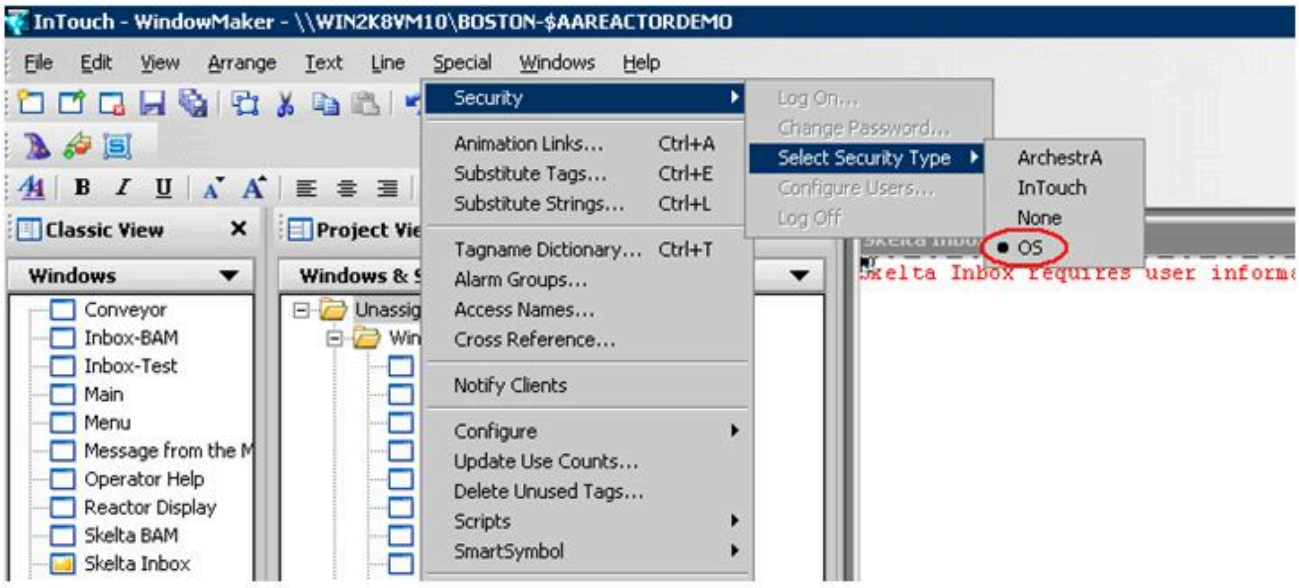


6. This opens up the ArchestrA Galaxy Browser. Select the "Instances" tab and select the object to which the graphic symbol has been added. Select the name of the graphic object (BAM) that has to be displayed.



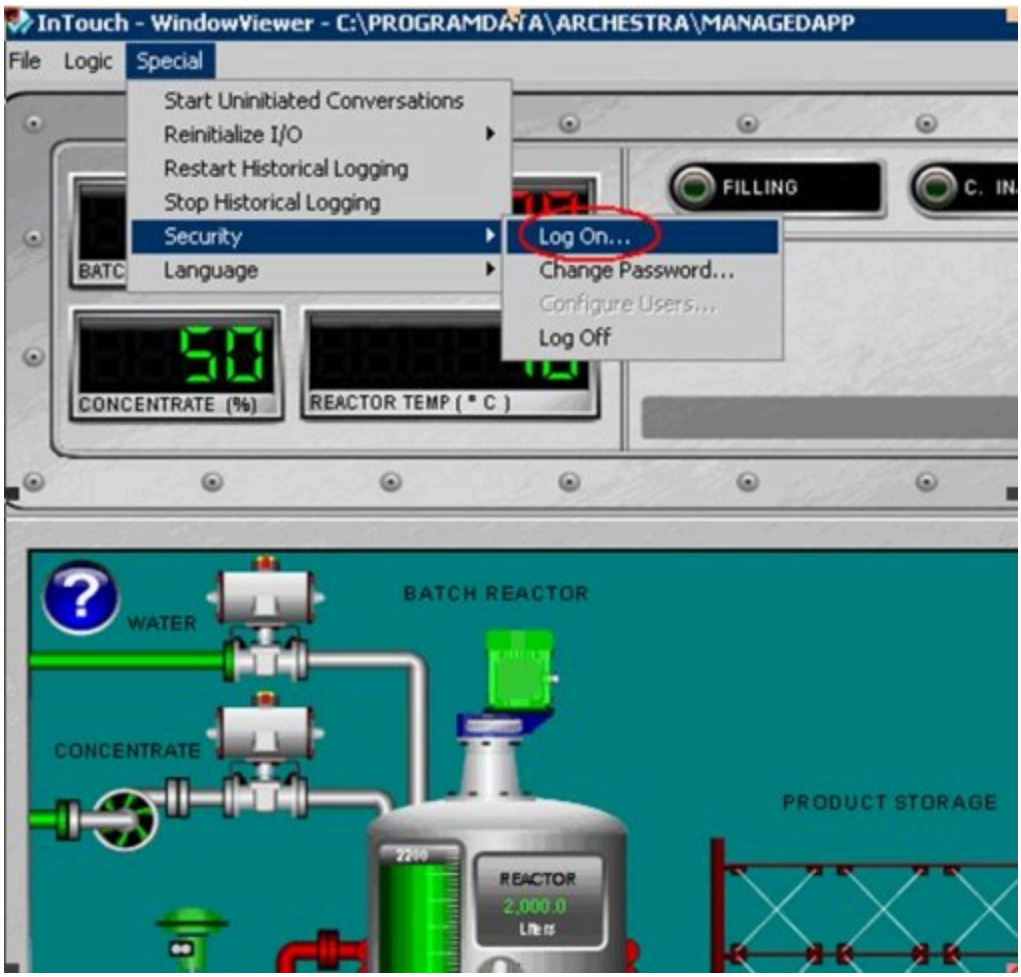
7. Enable security for the BAM window if required.

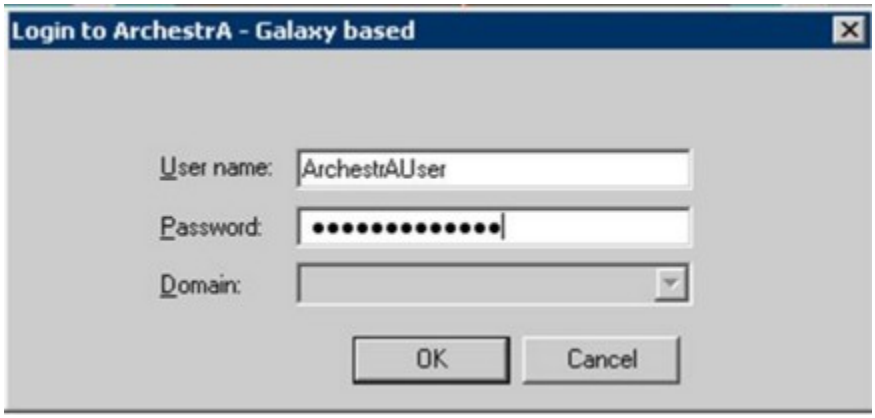
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



8. Save the window and exit InTouch WindowMaker.
9. Save and close the object in the System Platform IDE.
10. Deploy the $InTouchViewApp instance.
11. Open the InTouch Viewer and navigate to Special-> Security->Log On.
12. Enter the Credentials and click OK.

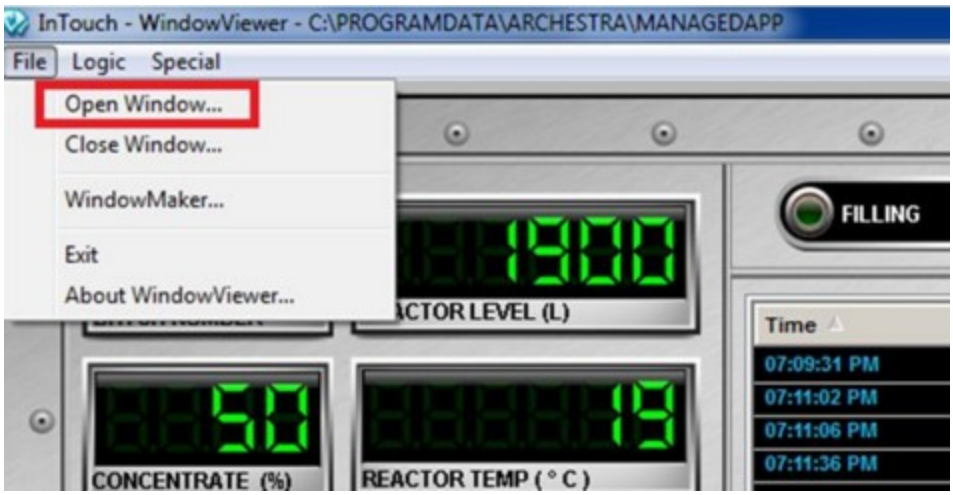
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

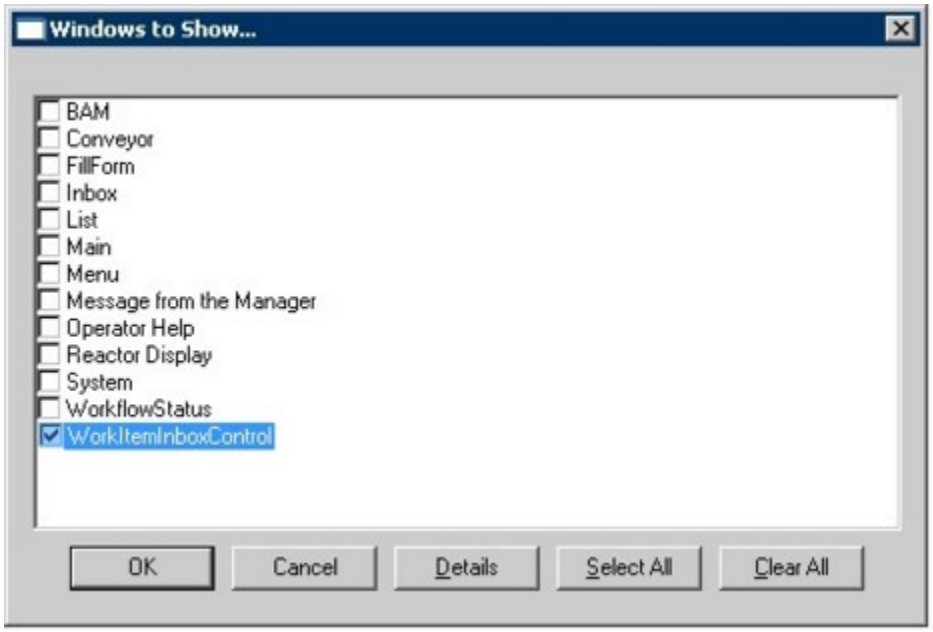




13. Open the created BAM window from the file menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.





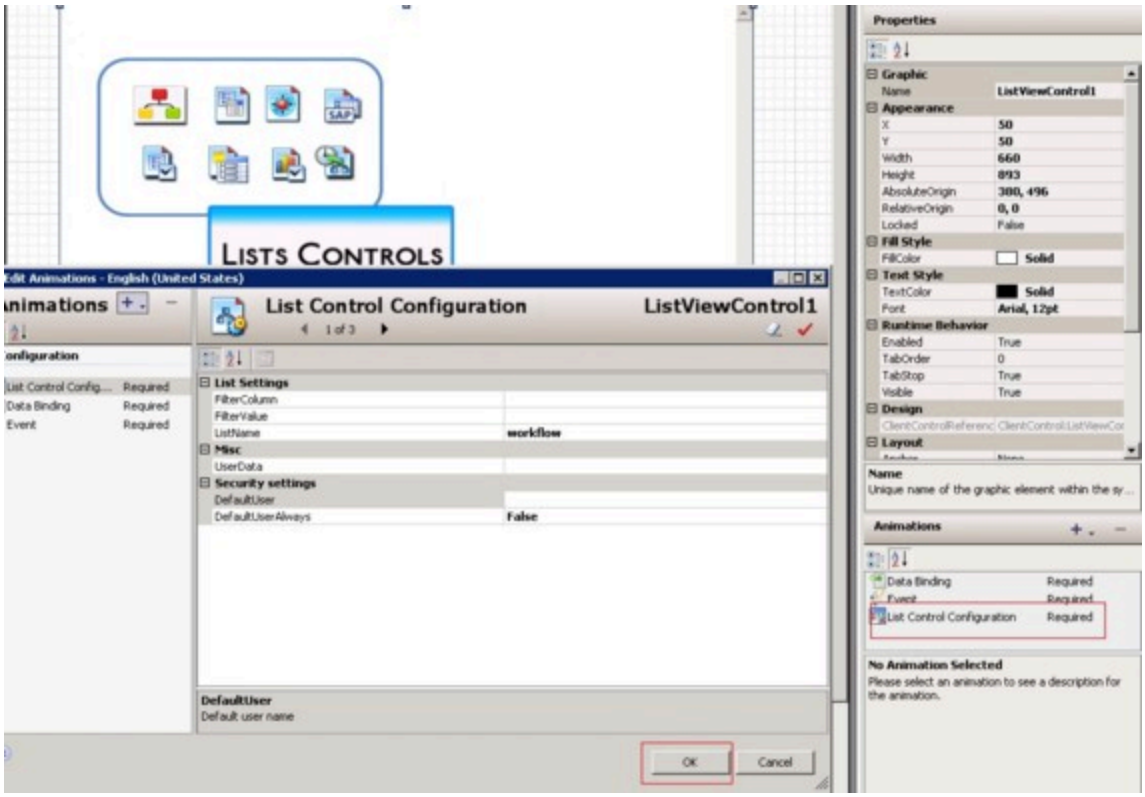
14. The BAM Control loads in the window.

Lists Inside InTouch

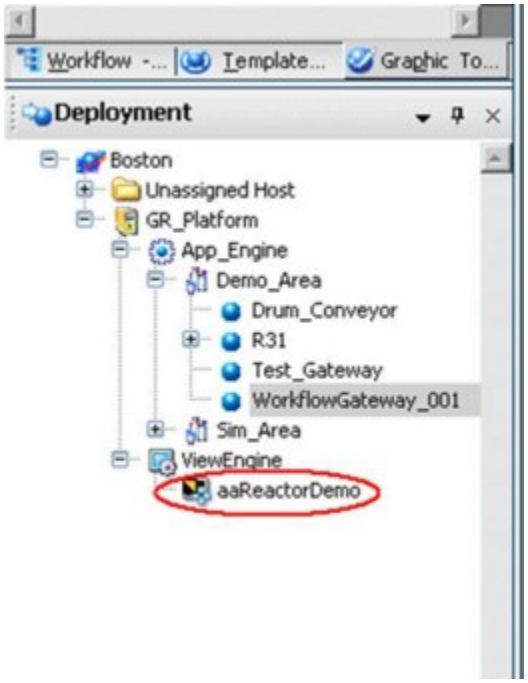
Follow Step 1 to Step 7 listed in the Initial Steps and continue:

1. Select the control in the editor and double click on Lists Configuration under Animations. This will open up a new configuration page from where the Lists control can be configured. After configuring the Lists, click OK. Save and close the Editor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



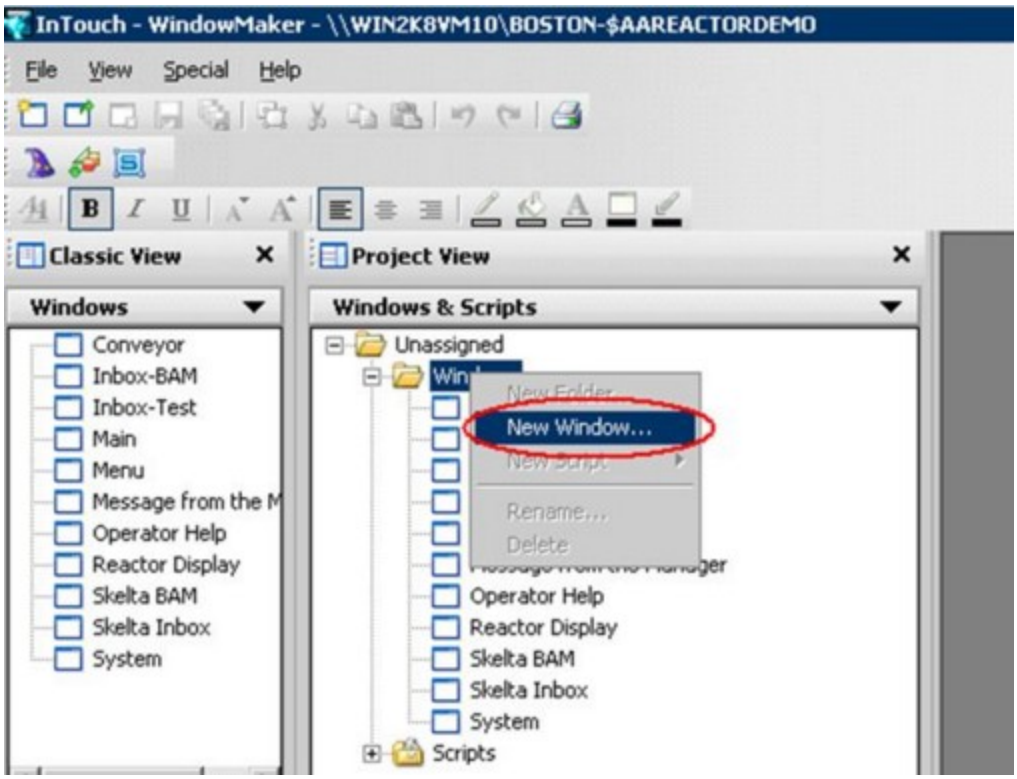
2. Select the instance and deploy in the System Platform IDE.
3. Double-click the $InTouchViewApp instance (aaReactorDemo) under ViewEngine from the System Platform IDE.



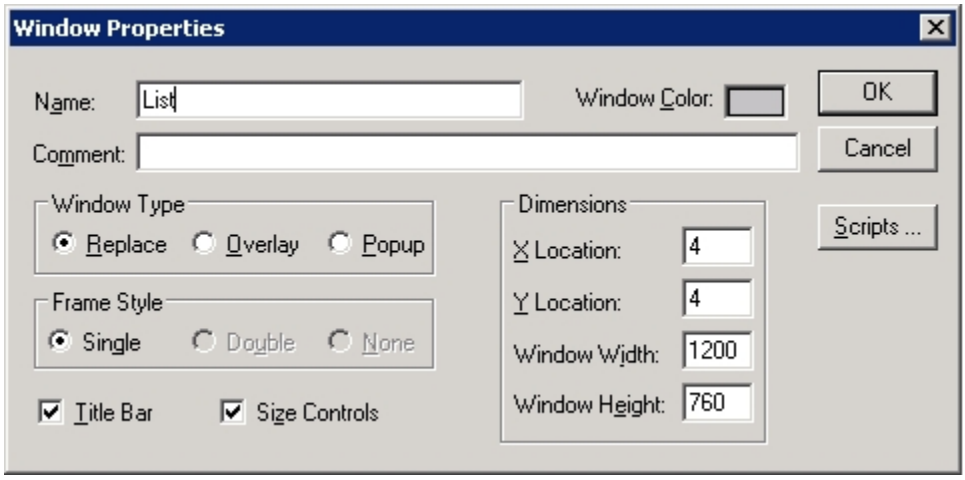
The InTouch WindowMaker appears.

4. Create a new window for the Lists control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

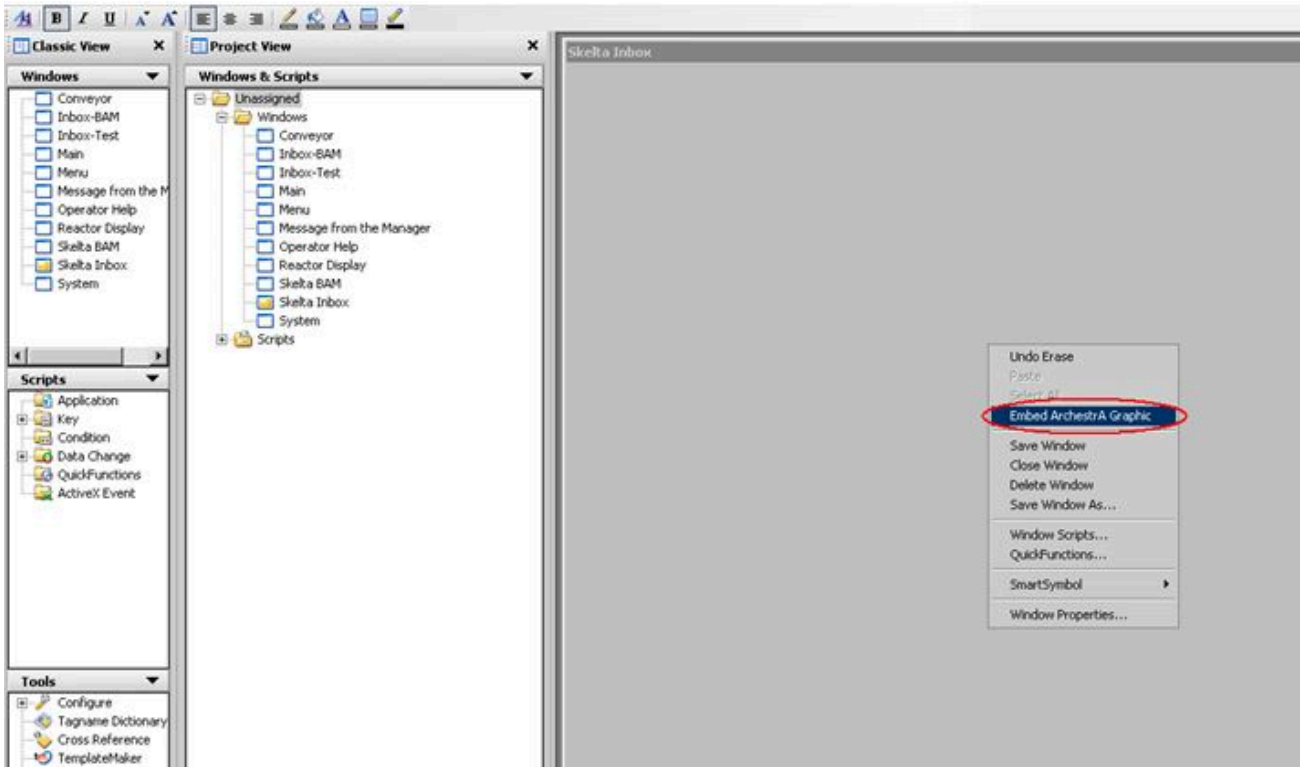


5. Provide the name and size for the window.



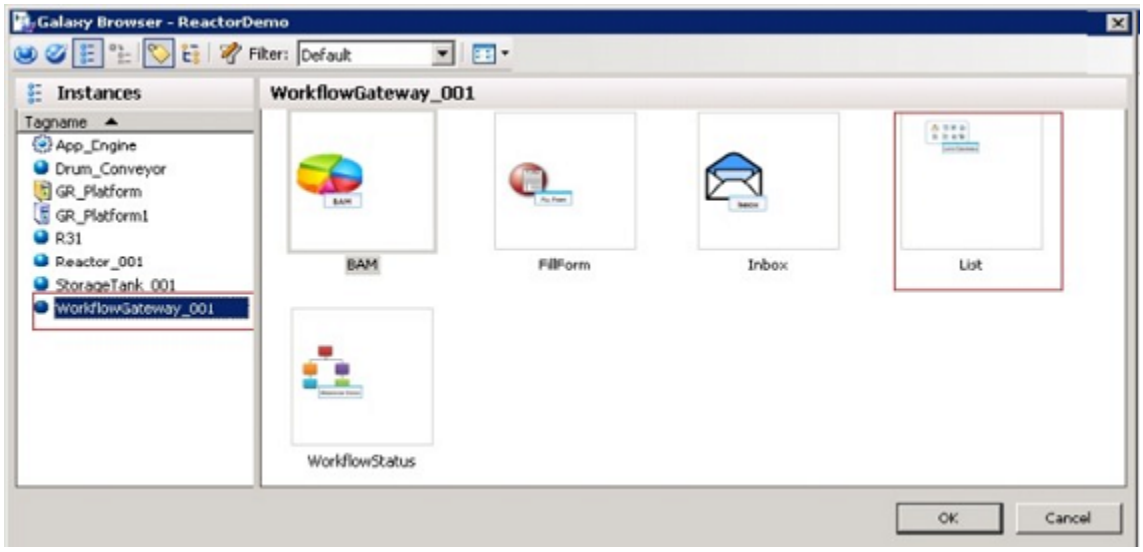
6. Right-click inside the newly opened window and select the Embed ArchestrA Graphic option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



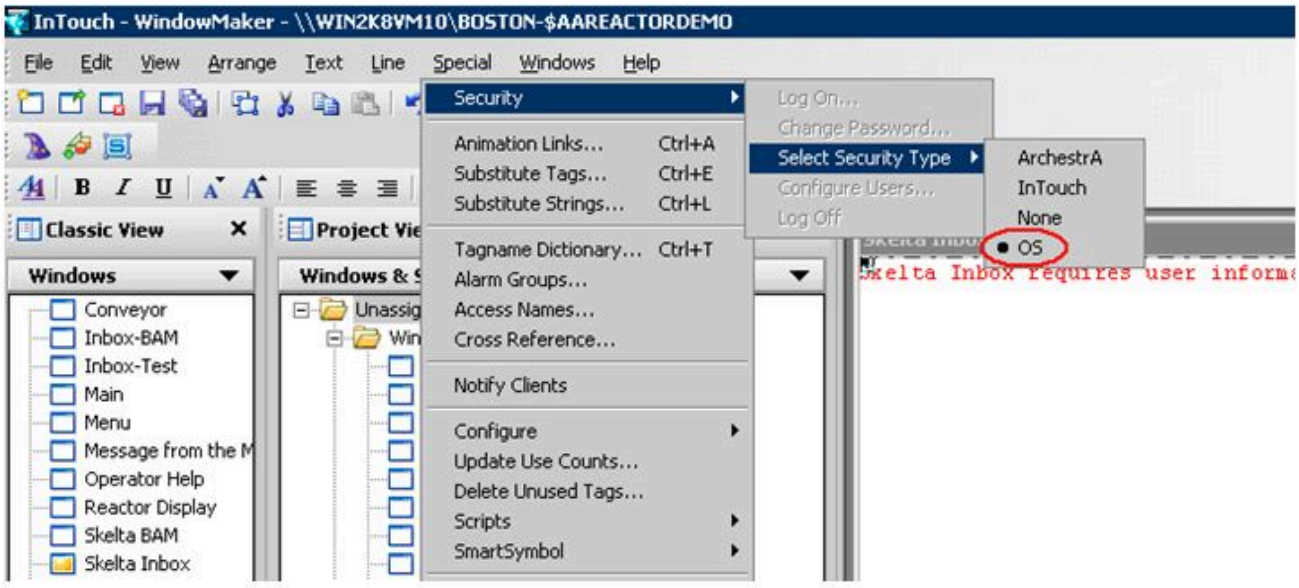
This opens up the ArchestrA Galaxy Browser.

7. Select the Instances tab and select the object to which the graphic symbol has been added.
8. Select the name of the graphic object (Lists) to be displayed.



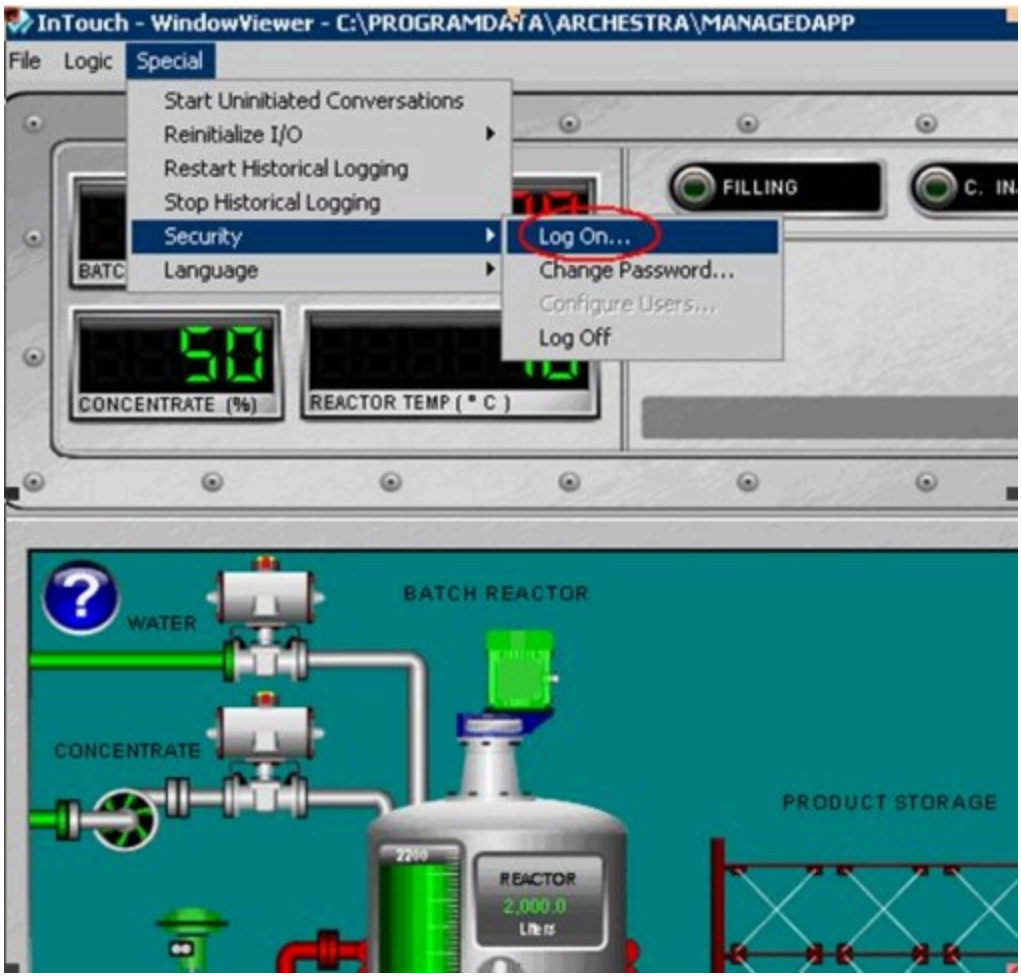
9. Enable security for the Lists window, if required.

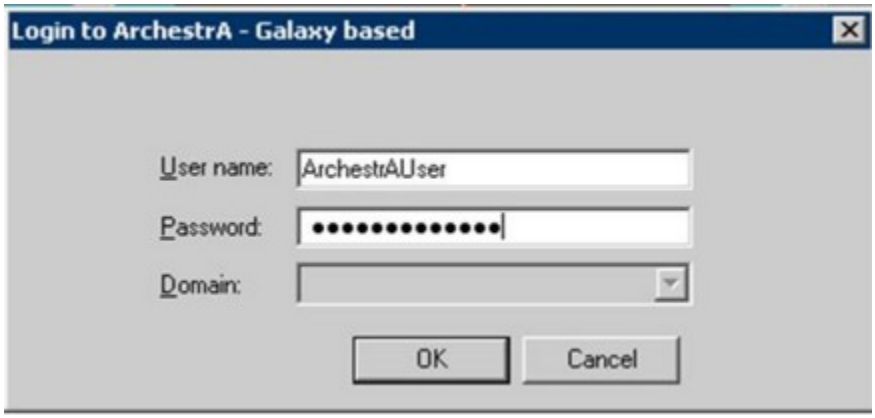
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



10. Save the window and exit InTouch WindowMaker.
11. Save and close the object in the System Platform IDE.
12. Deploy the $InTouchViewApp instance.
13. Open the InTouch Viewer and navigate to Special-> Security->Log On.
14. Enter the credentials and click OK.

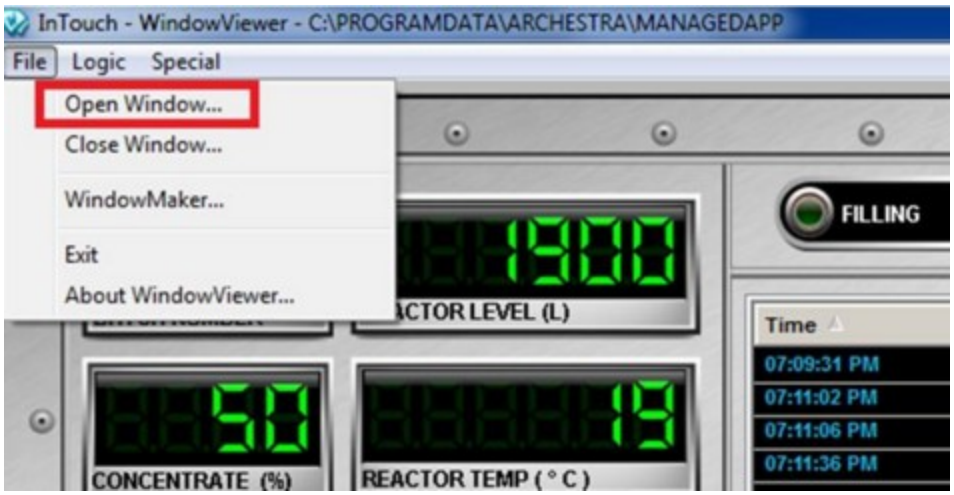
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

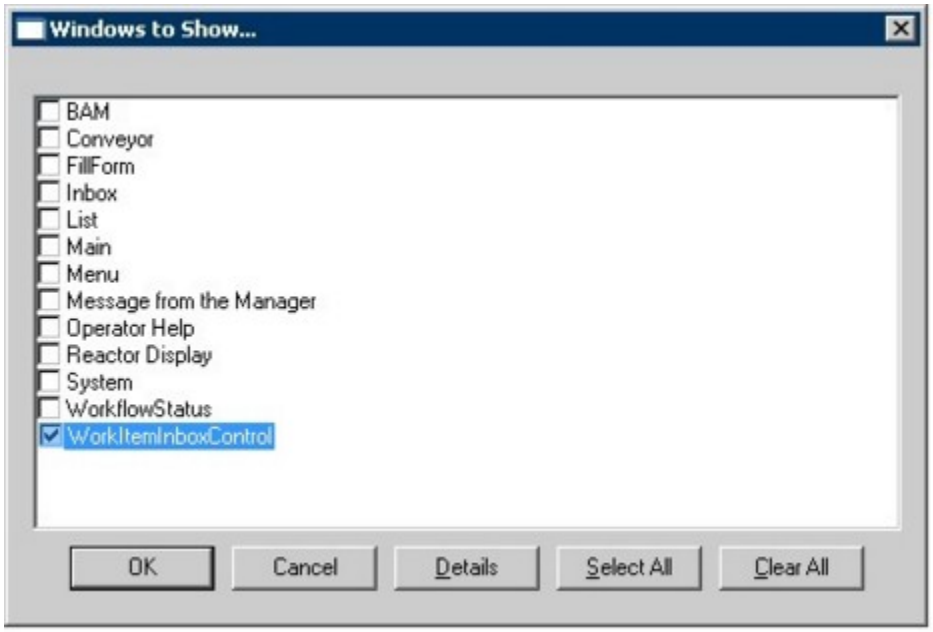




15. Open the created Lists window from the File menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.





16. The Lists Control loads in the window.

Forms Inside InTouch

Follow Step 1 to Step 7 listed in the Initial Steps and continue:

1. Select the control in the editor and double-click **Forms Configuration** under **Animations**.

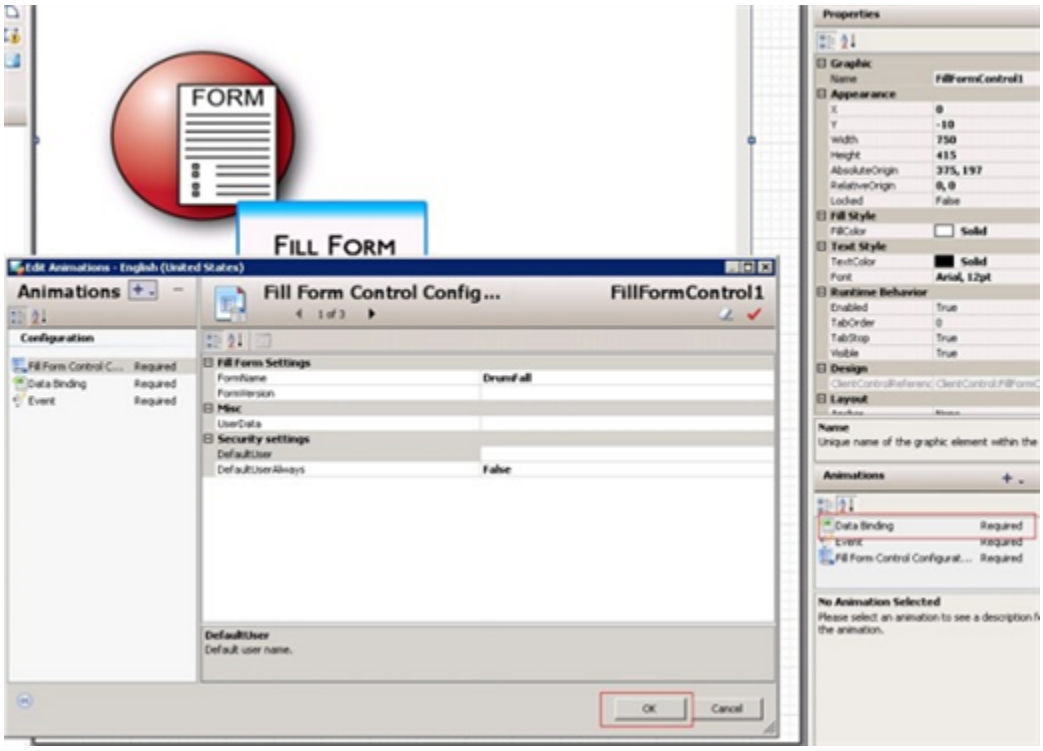
   This will open up a new configuration page from where the Forms control can be configured.
2. Under **Fill Form Settings**, perform the following:
   a. In the **Form Name** field, enter the form name.
   b. In the **Form Version** field, enter the version of the form, which must be considered by the Fill Form.

      For the Fill Form control to consider the latest published version of the form, enter the value as **0** or leave this field blank.

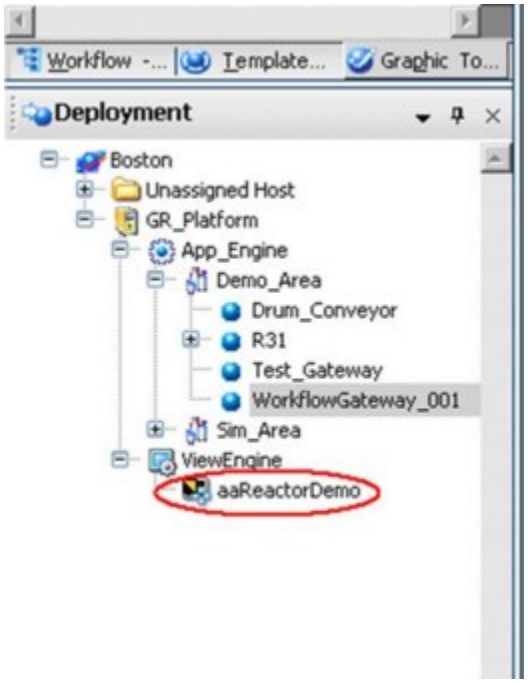
      If you enter an invalid version, then the "The given version does not exist for the form" message appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. After configuring the Forms, click **OK**.
4. Save and close the Editor.



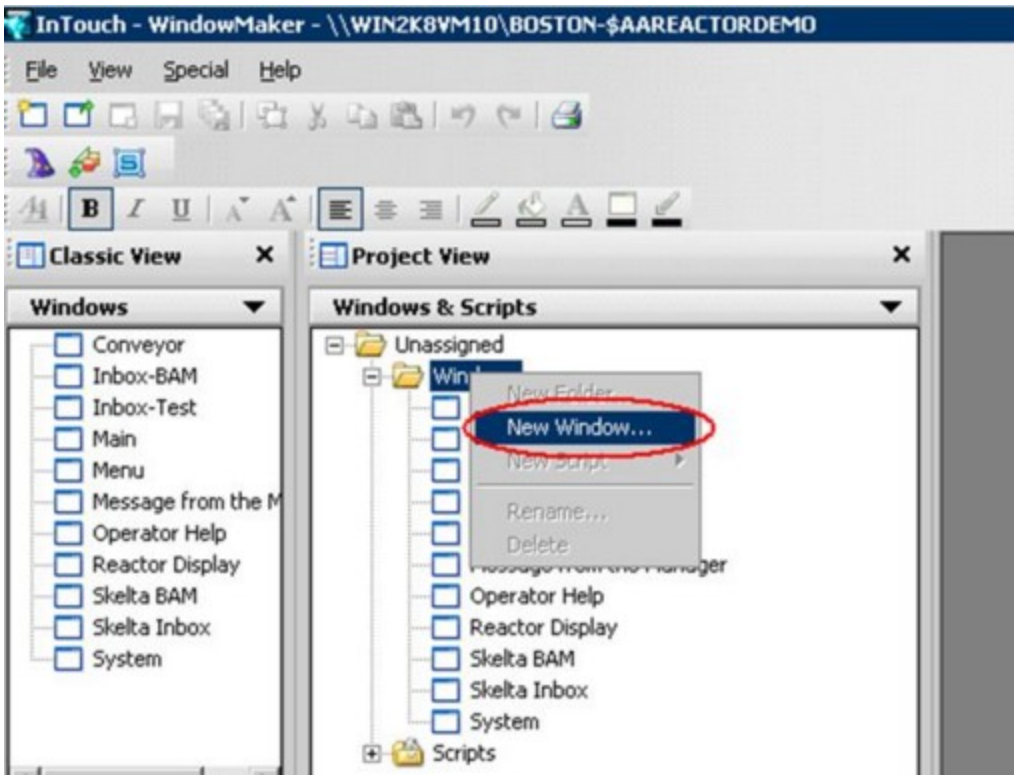
5. Select the instance and deploy in the System Platform IDE.
6. Double-click the $InTouchViewApp instance (aaReactorDemo) under ViewEngine from the System Platform IDE.



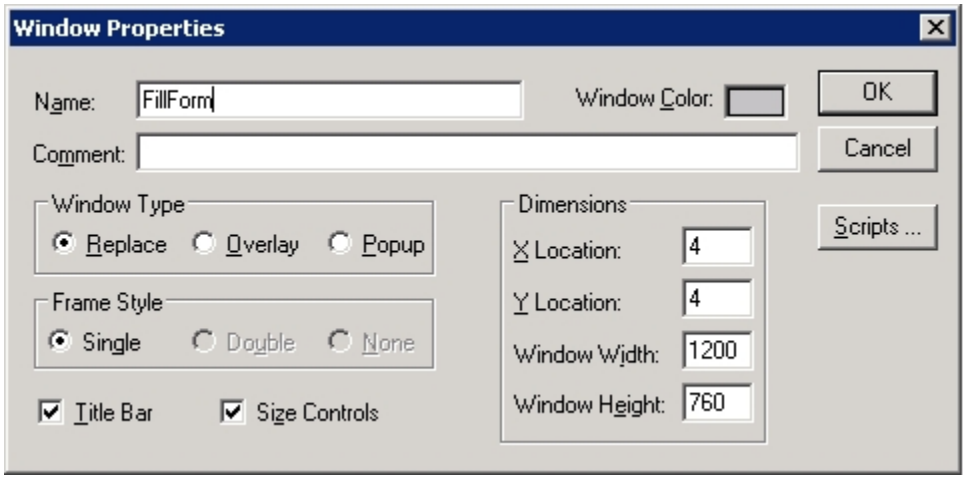
The InTouch WindowMaker appears.

7. Create a new window for the Forms control.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

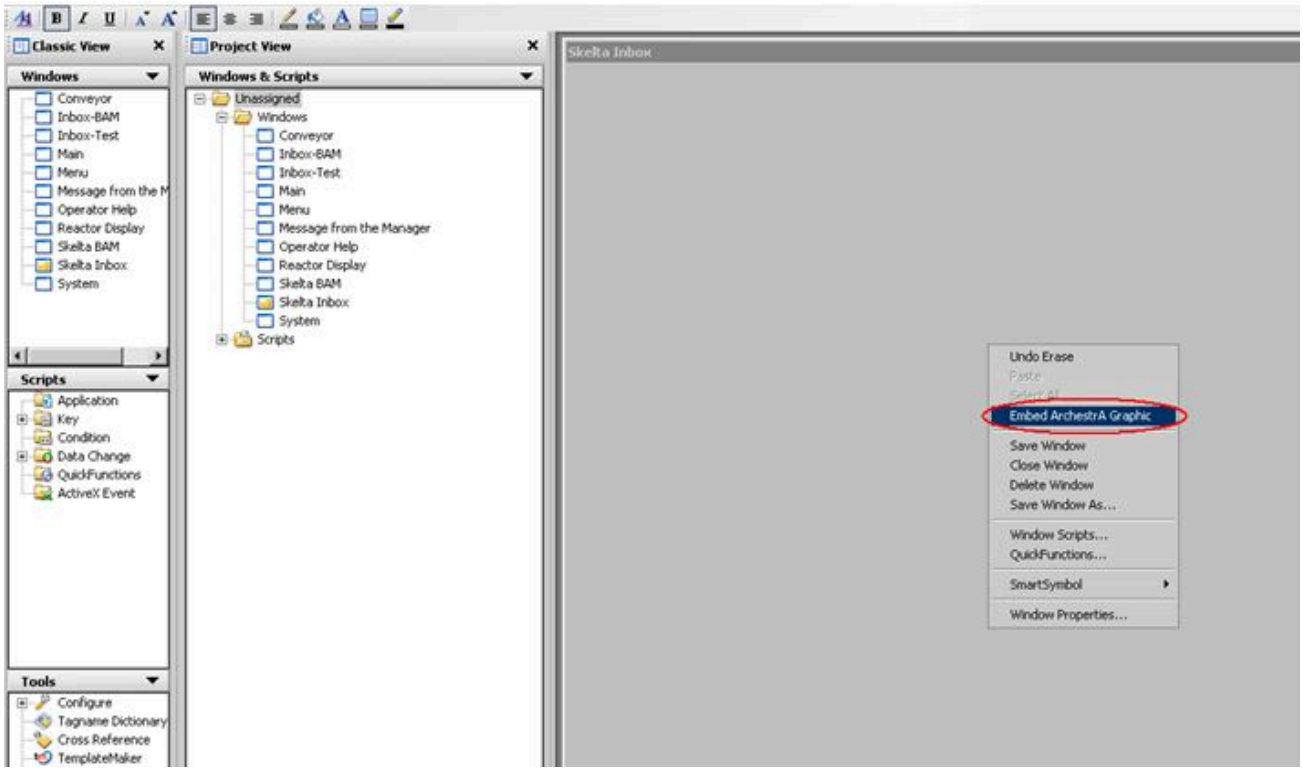


8. Provide the name and size for the window.



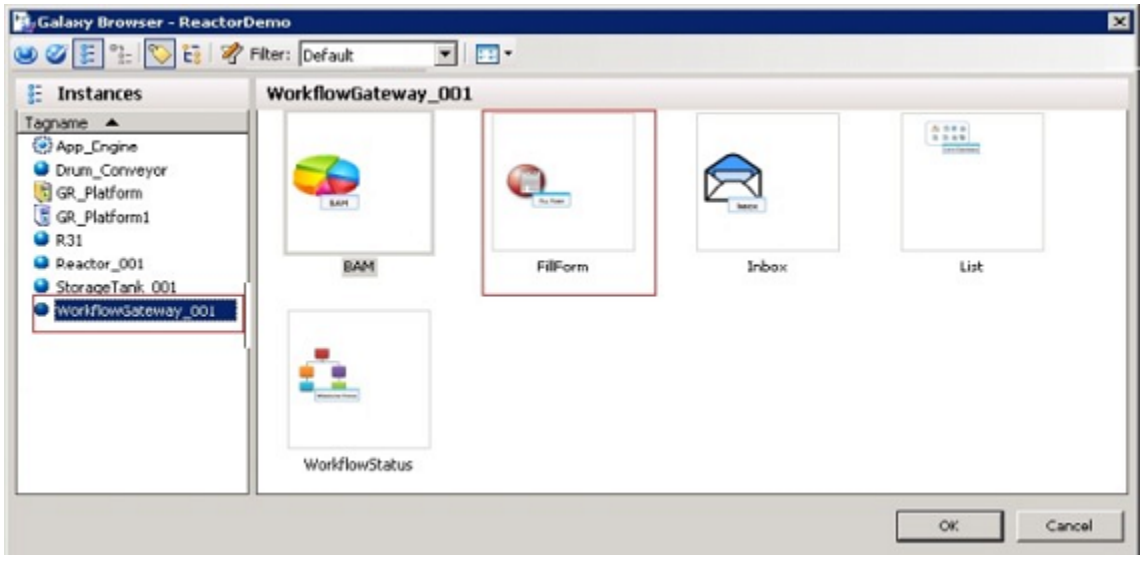
9. Right-click inside the newly opened window and select the Embed ArchestrA Graphic option.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



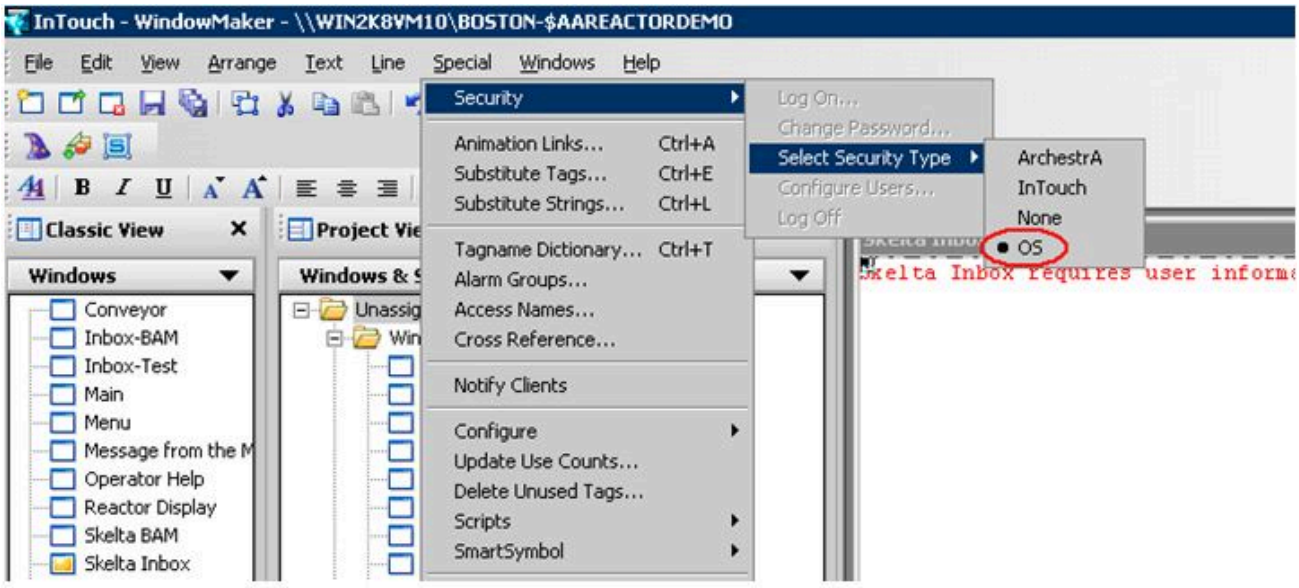
This opens up the ArchestrA Galaxy Browser.

10. Select the Instances tab and select the object to which the graphic symbol has been added.
11. Select the name of the graphic object (Forms) that has to be displayed.



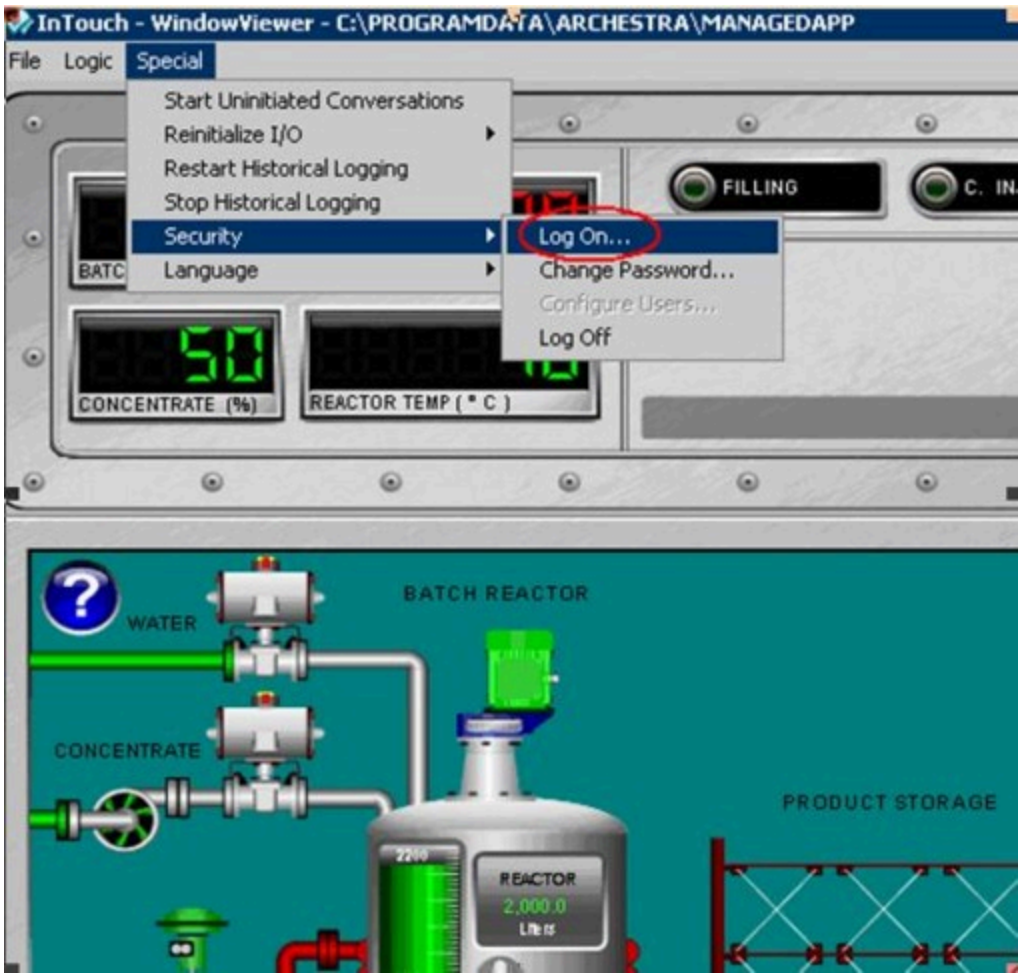
12. Enable security for the Forms window, if required.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

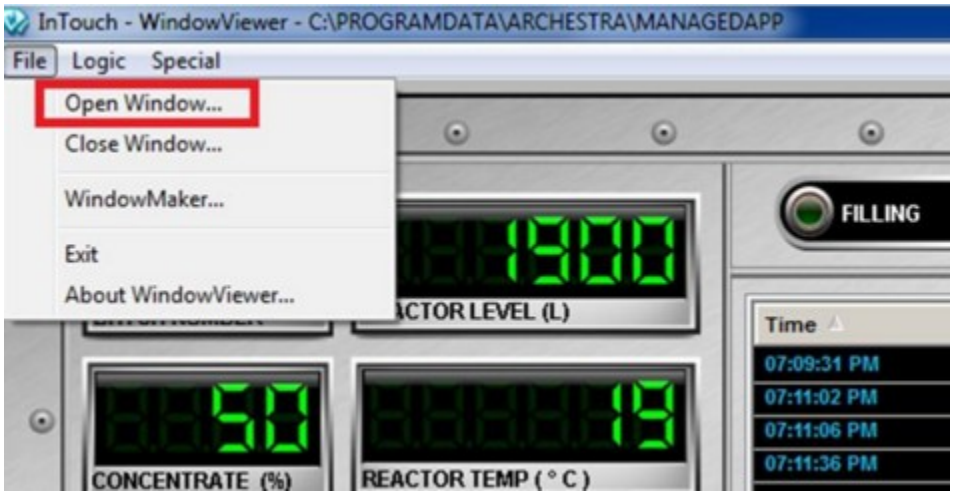


13. Save the window and exit InTouch WindowMaker.
14. Save and close the object in the System Platform IDE.
15. Deploy the $InTouchViewApp instance.
16. Open the InTouch Viewer and navigate to Special-> Security->Log On.
17. Enter the credentials and click OK.

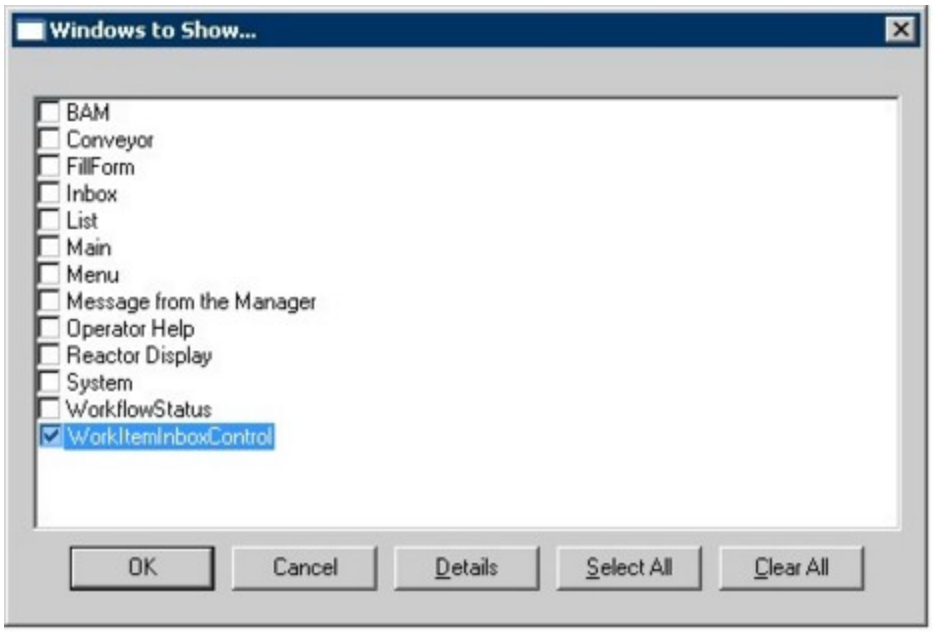
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



18. Open the created Forms window from the File menu.



© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The Forms Control loads in the window.

Note: InTouch does not support the execution of **window.resizeTo(x, y)** JavaScript function.

Pass Contextual Information in Forms from InTouch

You can pass real-time values from InTouch symbols to the InTouch Fill Form symbol.

Passing Contextual Information in Forms from **InTouch**, through attributes, is supported only for **String** data type.

Requirement

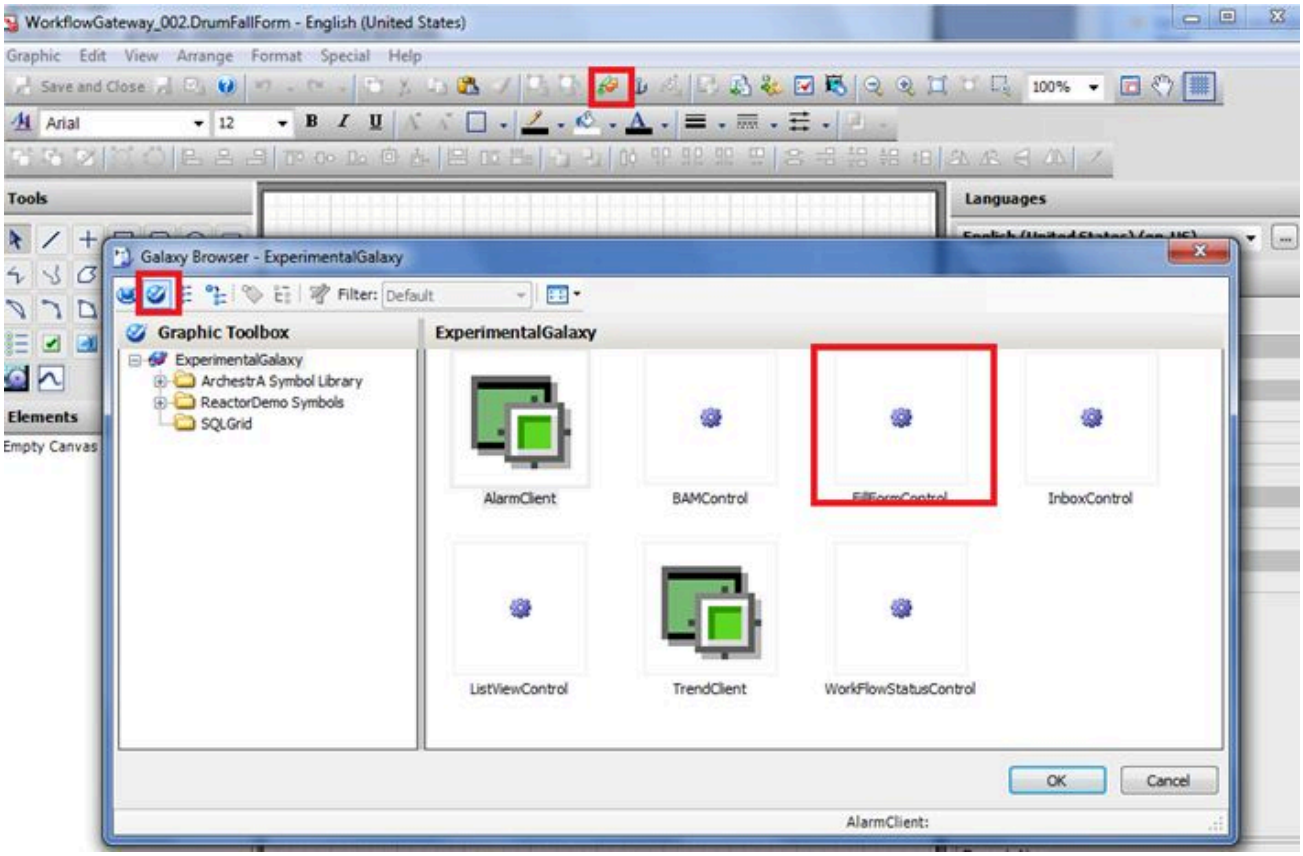
From InTouch Windows viewer, the run time values of InTouch symbols should be able to populate in a AVEVA Work Tasks form symbol at a predefined event.

Procedure

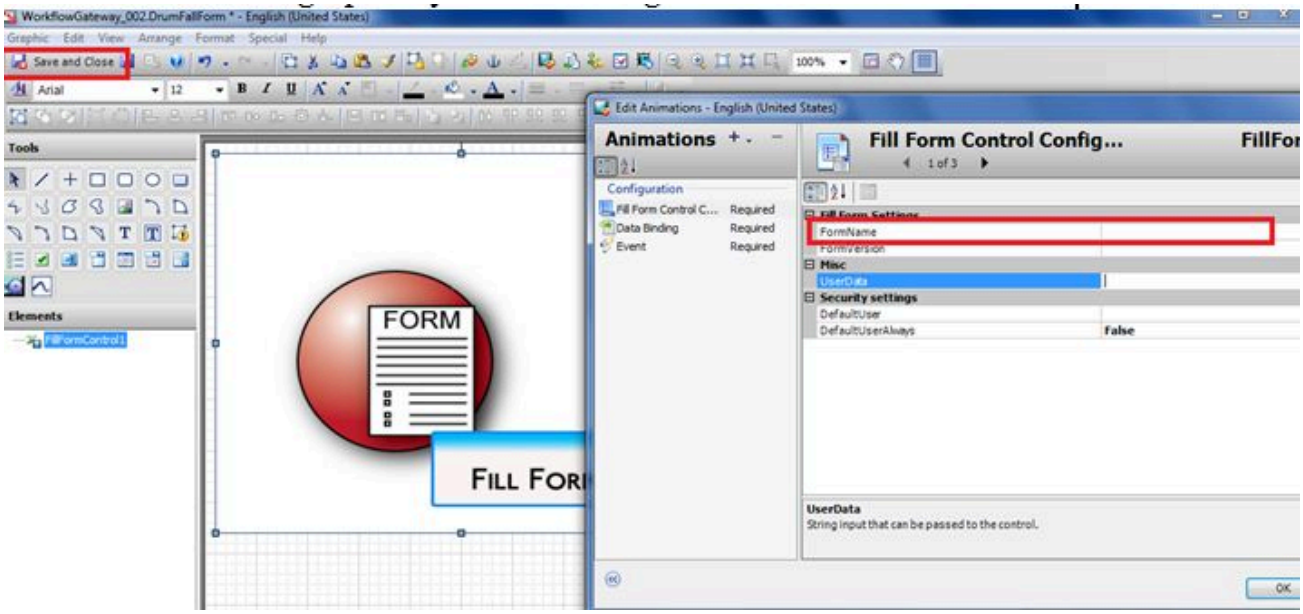
The steps to achieve this requirement will be explained with the Reactor Demo example that can be created by default while creating Galaxy.

1. Create the form to be filled on the Intouch event in the repository that is connected to the WorkflowGateway object. In this example, a "DrumFall" form is created with two text inputs that will display the Drum count and the Conveyor speed.
2. From the System Platform IDE, create a UDA of the type string and user writable to the WorkflowGateway object.
3. From the System Platform IDE, open the WorkflowGateway object instance and select the graphics tab. Create a new graphic object named DrumFallForm.
4. Double-click the symbol name and open the ArchestrA graphic symbol editor.
5. On the top of the graphic editor, click on the Embed Graphic icon which will pop up the Galaxy Browser.
6. Select the Graphic Tool box icon on the top left corner of the Galaxy Browser.
7. Select the FillFormControl symbol and click OK.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



8. Click on the graphic editing area which will paste the FillForm symbol in the editor.
9. Double-click on the graphic symbol to configure. Provide the form name to be filled.



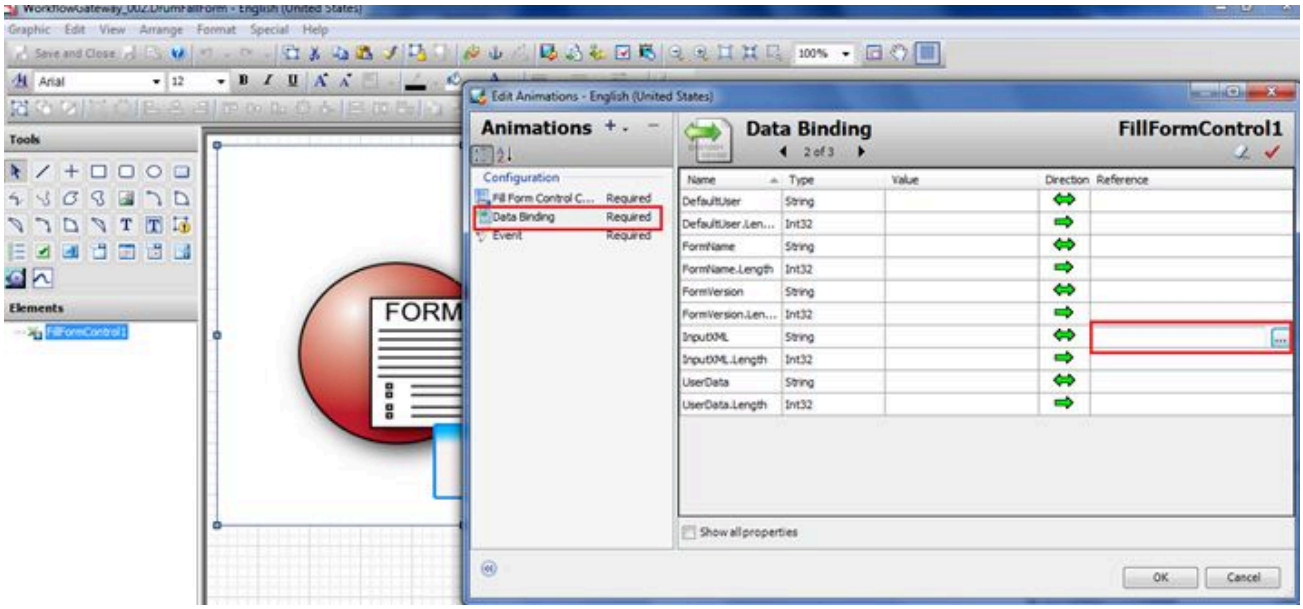
10. Click on the DataBinding tab of the Animations window. For the "InputXML" field, click on the button in the "Reference column".

    This opens the Galaxy Browser.

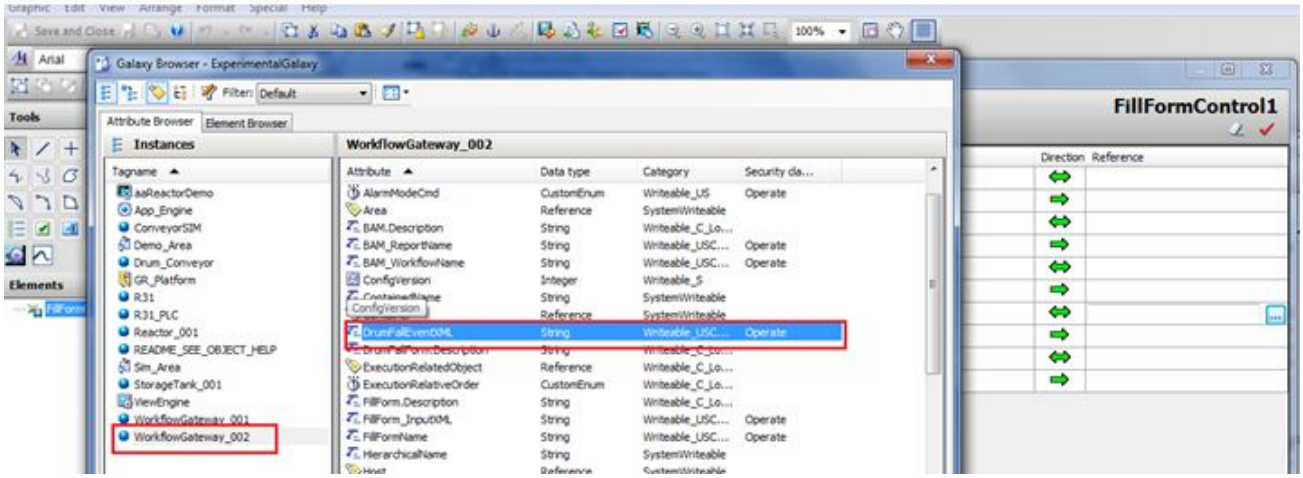
    Note: The value from the Value script takes precedence over the InputXML (that is the value for the controls)

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

and the Default Value, and the InputXML takes precedence over the Default Value for the controls on the form.



11. From the Galaxy Browser, select the object on which the UDA "DrumFallEventXML" was created and press OK.



12. Click OK and then click on Save and Close on the Graphic Editor.

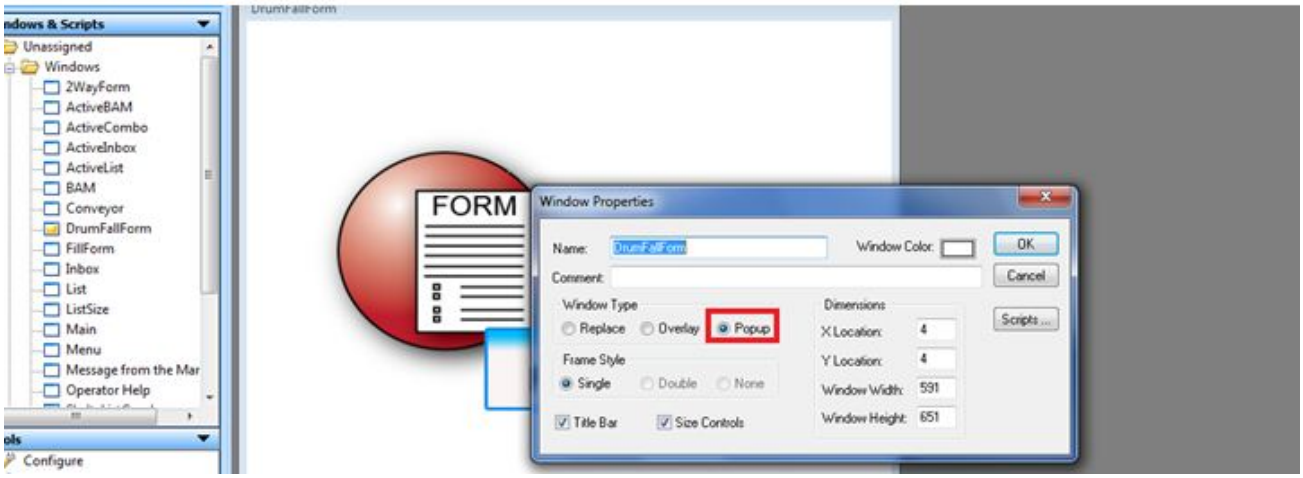
    This will successfully create the FillForm graphic control.

    Deploy the WorkflowGateway object.

13. Create a window in the InTouch window maker. Double-click on the ViewEngine object (aaReactorDemo) to open the windows maker.

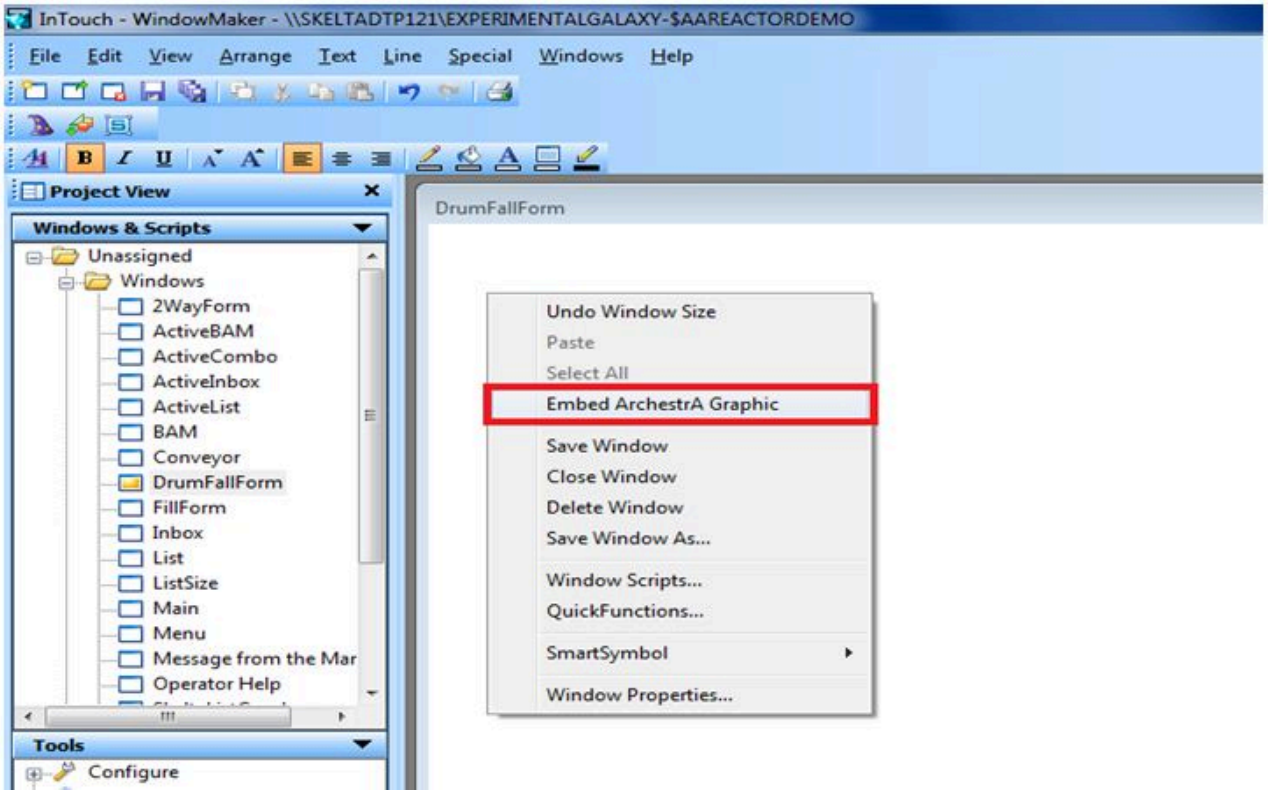
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

14. Create a new window from the windows maker by selecting File> New window, and name it "DrumFallForm". Set the Window type as "Popup".

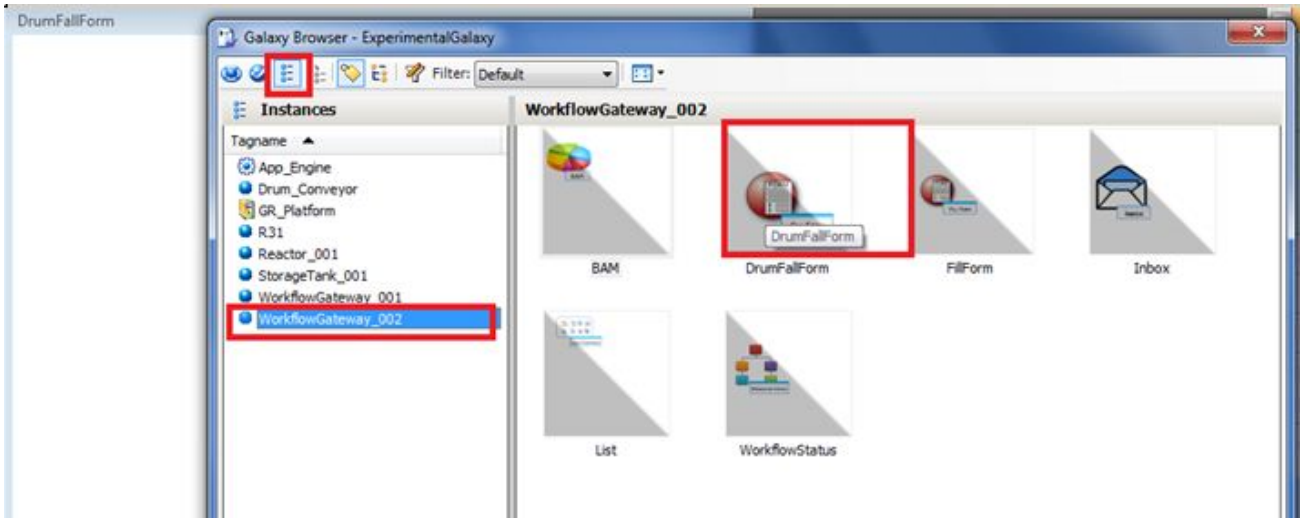


15. Right-click inside the window area and select "Embed ArchestrA Graphic". This opens the Galaxy Browser.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

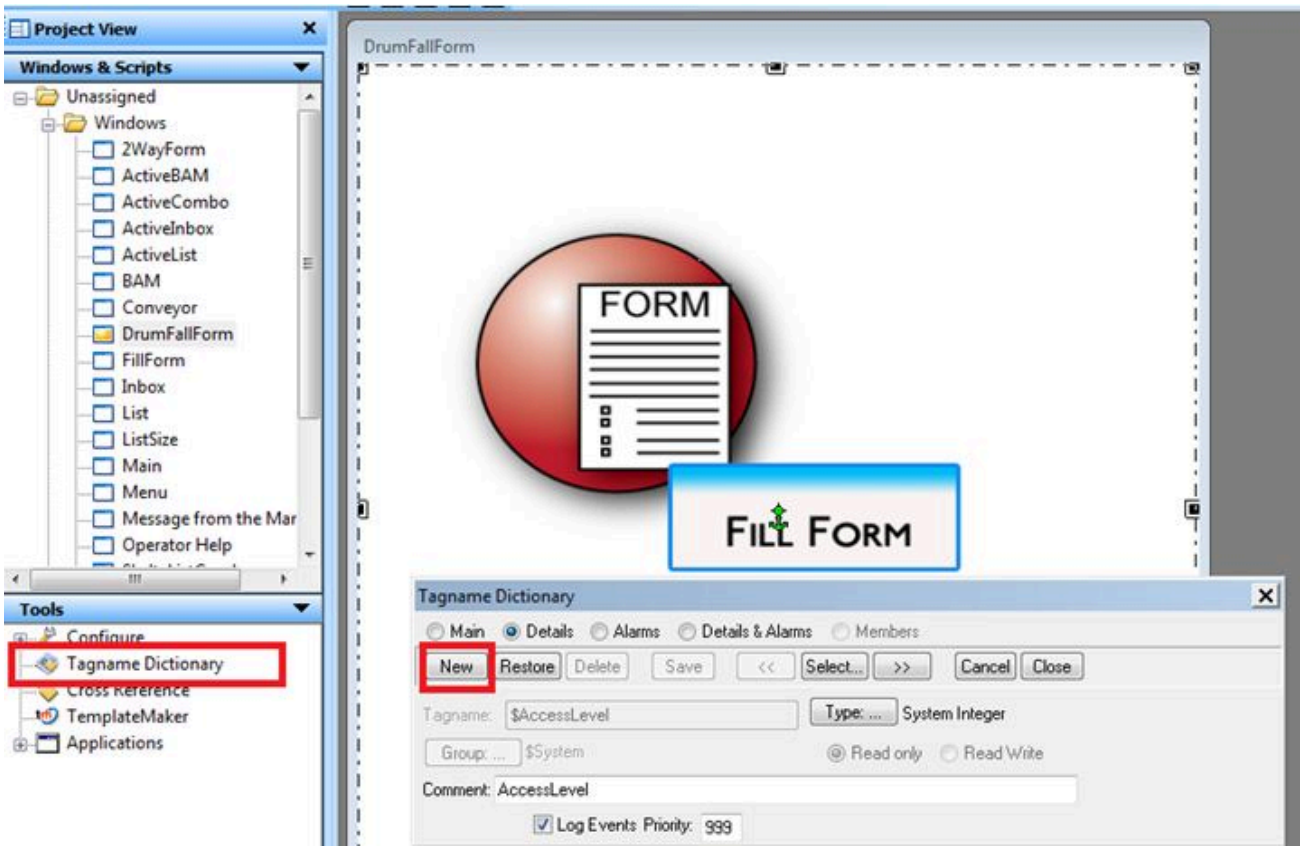


16. From the Galaxy Browser, select the Object instances icon and select the instance to which the Fill Form control has been added. Double-click the "DrumFallForm" symbol. Click on the window area which will paste the symbol to the window.



17. Next, create tags. From the Tools window, double-click to open the "Tagname Dictionary" and click on New.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

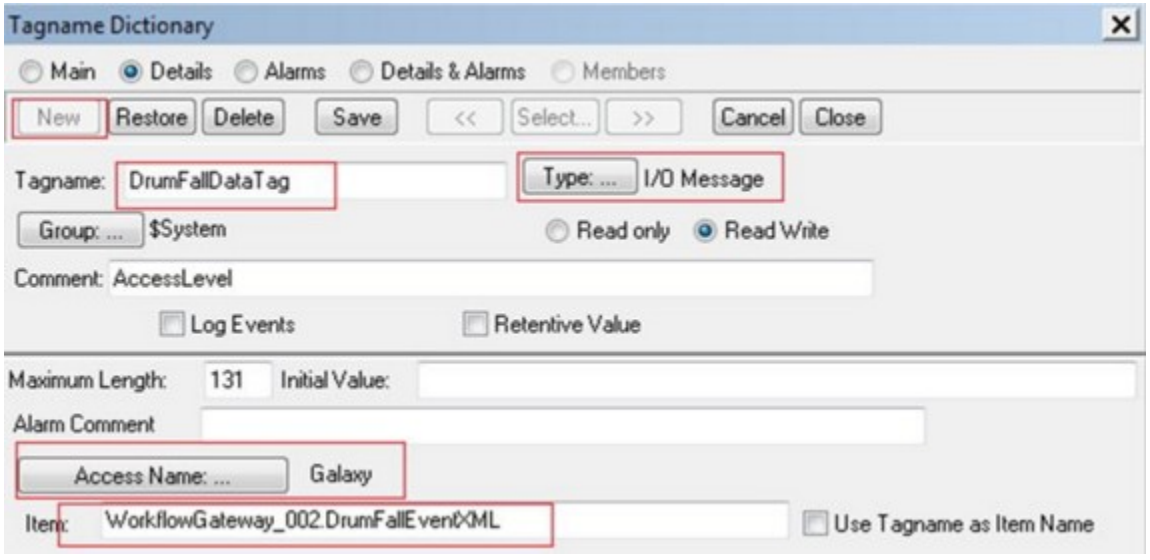


18. Type a name for the tag (DrumFallDataTag) and select the "type" as I/O "Message".

    Set the Access Name property as "Galaxy".

    In the Item property, give the name "Objectname.UDA" to which the tag should write values. (WorkflowGateway_002.DrumFallEventXML)

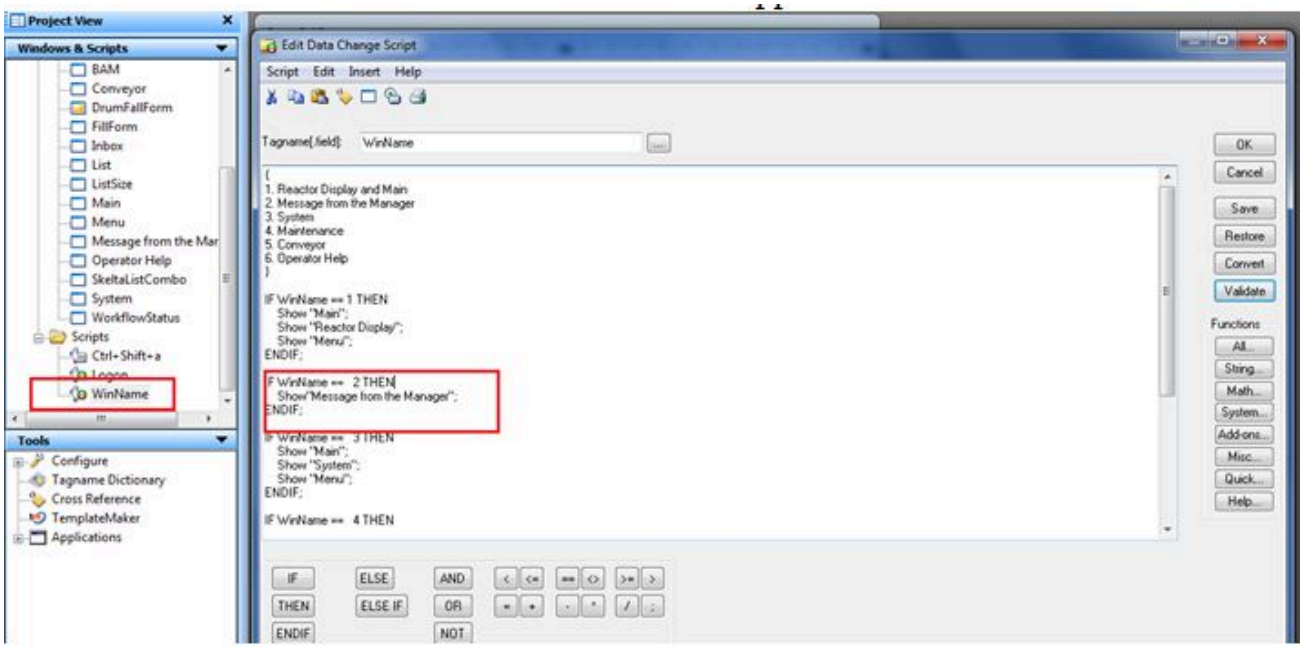
19. Click Save and Close to save and close the Tagname Dictionary.



20. Write the required script.

    From the Windows and Scripts box, double-click to open the "WinName" script. The condition "WinName==2" is when the drum fall happens.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



In this condition, first assign the data to the DrumFallDataTag created. The data should be in XML format which should match the syntax of the instance XML of the "DrumFall" form, when previewed. As the maximum length of an attribute in System Platform cannot exceed 1023 characters, pass only the XML for the required controls. Add the required dynamic values from the Drum Conveyor in the XML as shown.

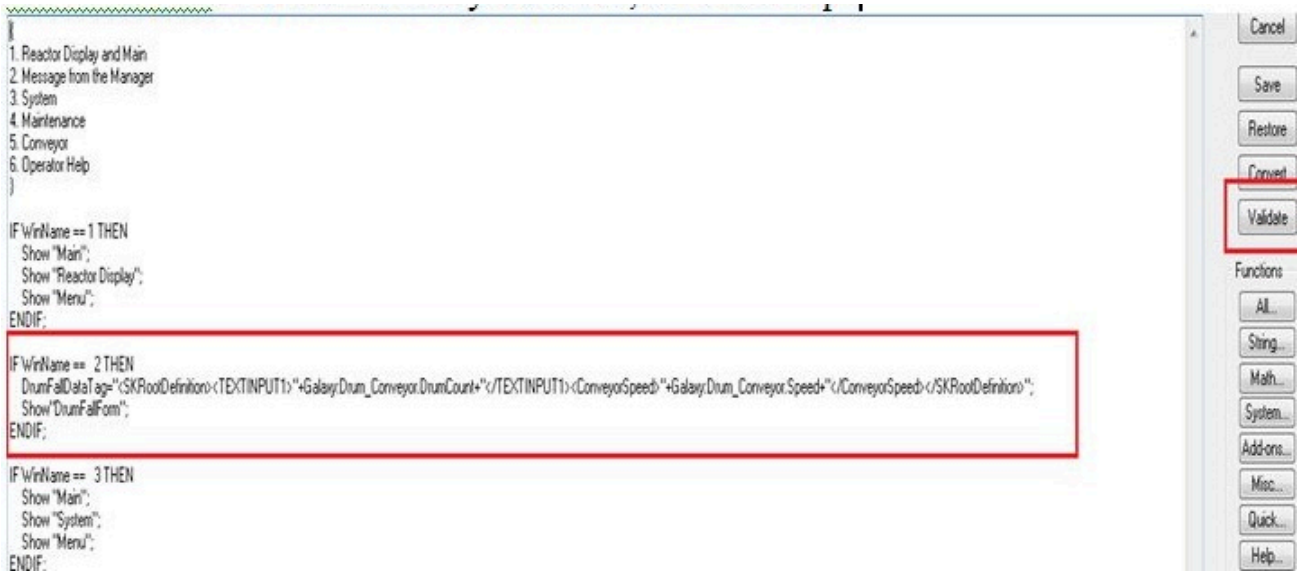
For example,

DrumFallDataTag="<SKRootDefinition><TEXTINPUT1>"+Galaxy:Drum_Conveyor.DrumCount+"</TEXTINPUT1><Conve

21. Write the script to open the DrumFallForm window.

    For example, Show"DrumFallForm";

22. Click Validate and if successfully validated, save the script.



23. Save all the open windows and exit the window maker.
24. Deploy the ViewEngine object (aaReactorDemo).

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Run the conveyor example. The form pops up.

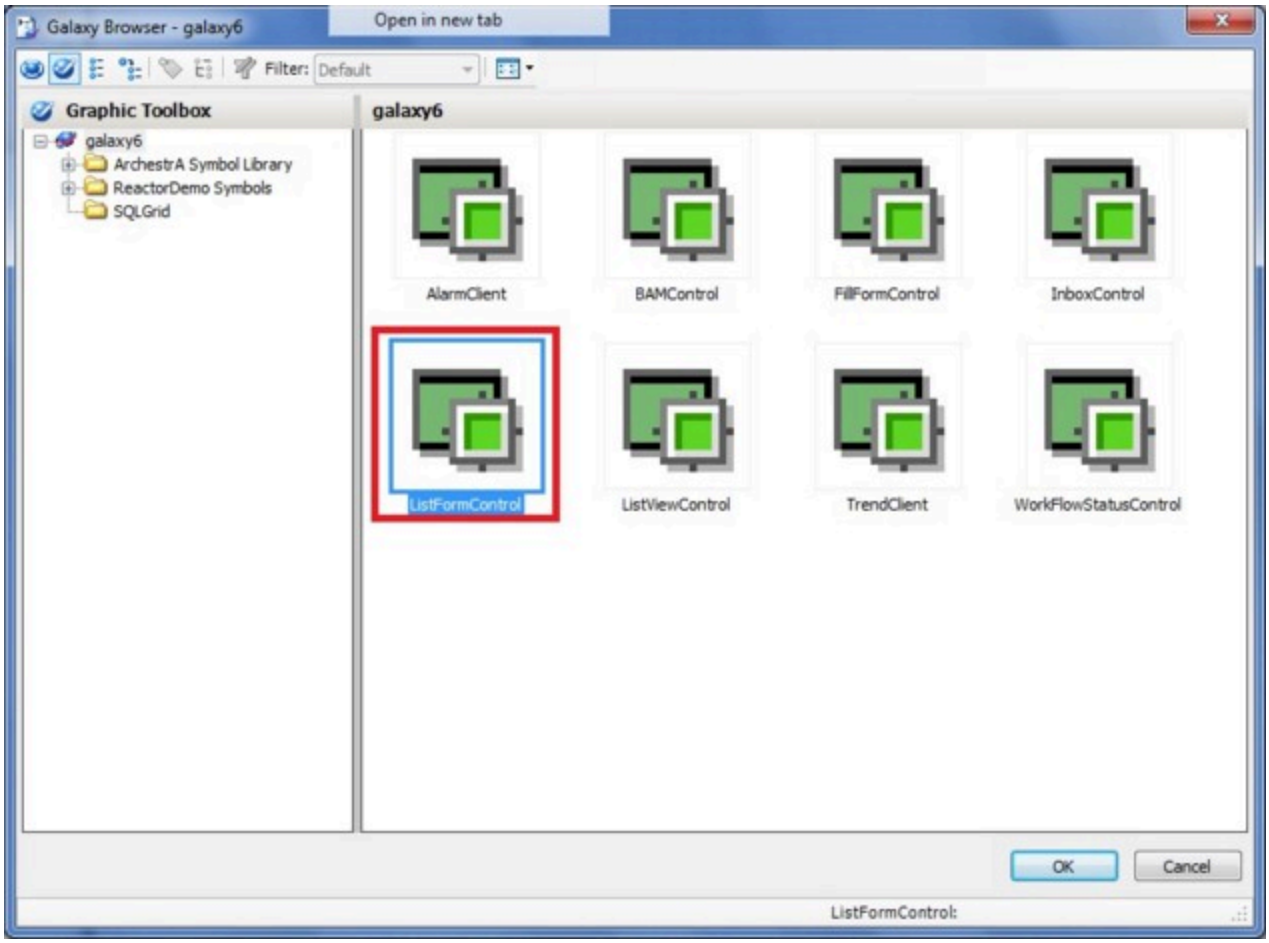
1. Open the InTouch viewer and login with the credentials.
2. Click on the Open window and select the Conveyor window.
3. Change the control from Auto to Manual, and manually transfer a drum and make it fall.
   The DrumFallForm will get displayed with the current drum count and the conveyor speed at the time of fall.

List Forms Inside InTouch

Follow Step 1 to Step 7 listed in the Initial Steps and continue:

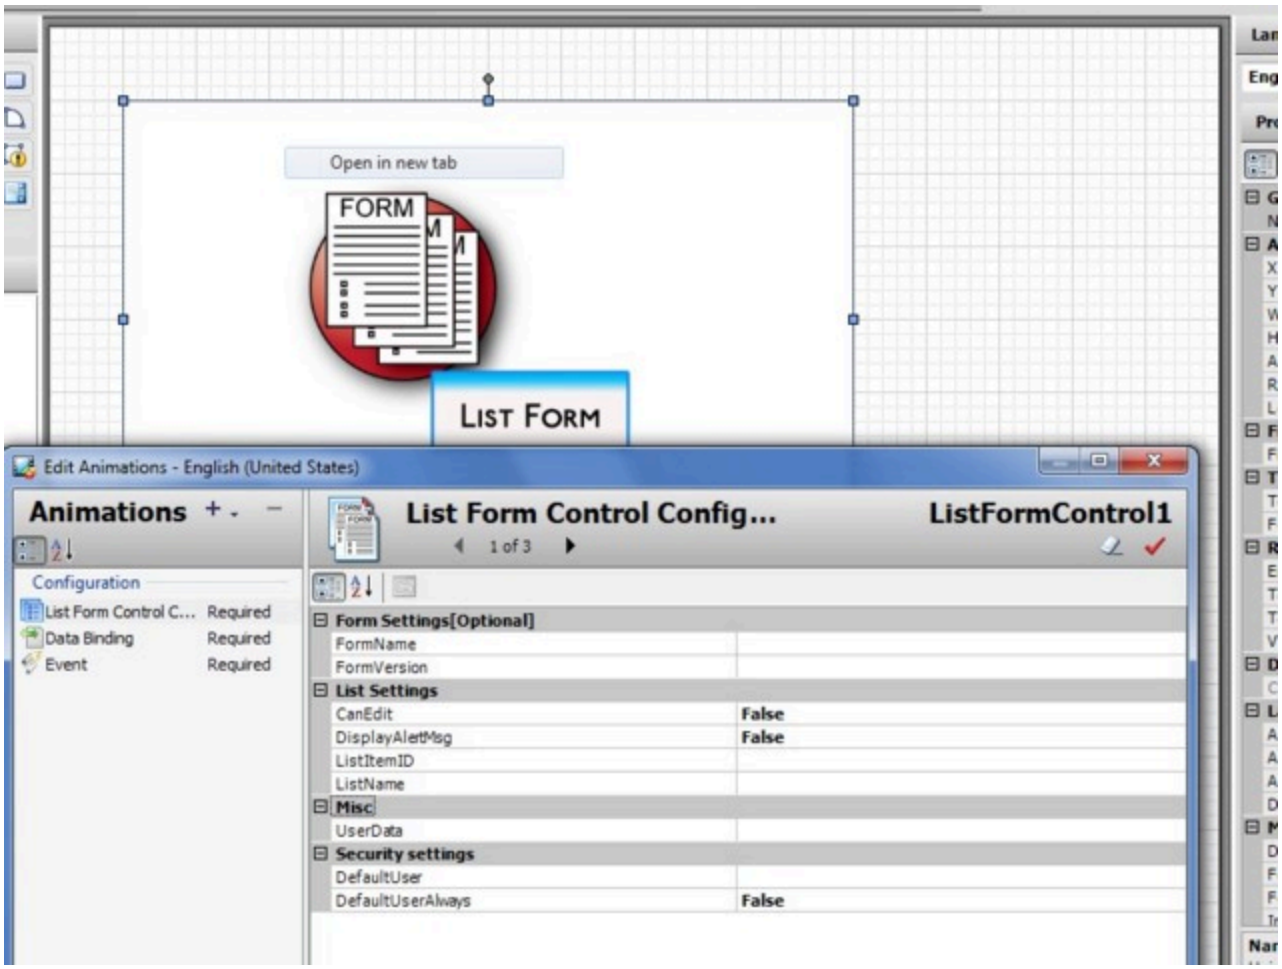
1. Select ListFormControl in the Galaxy Browser.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



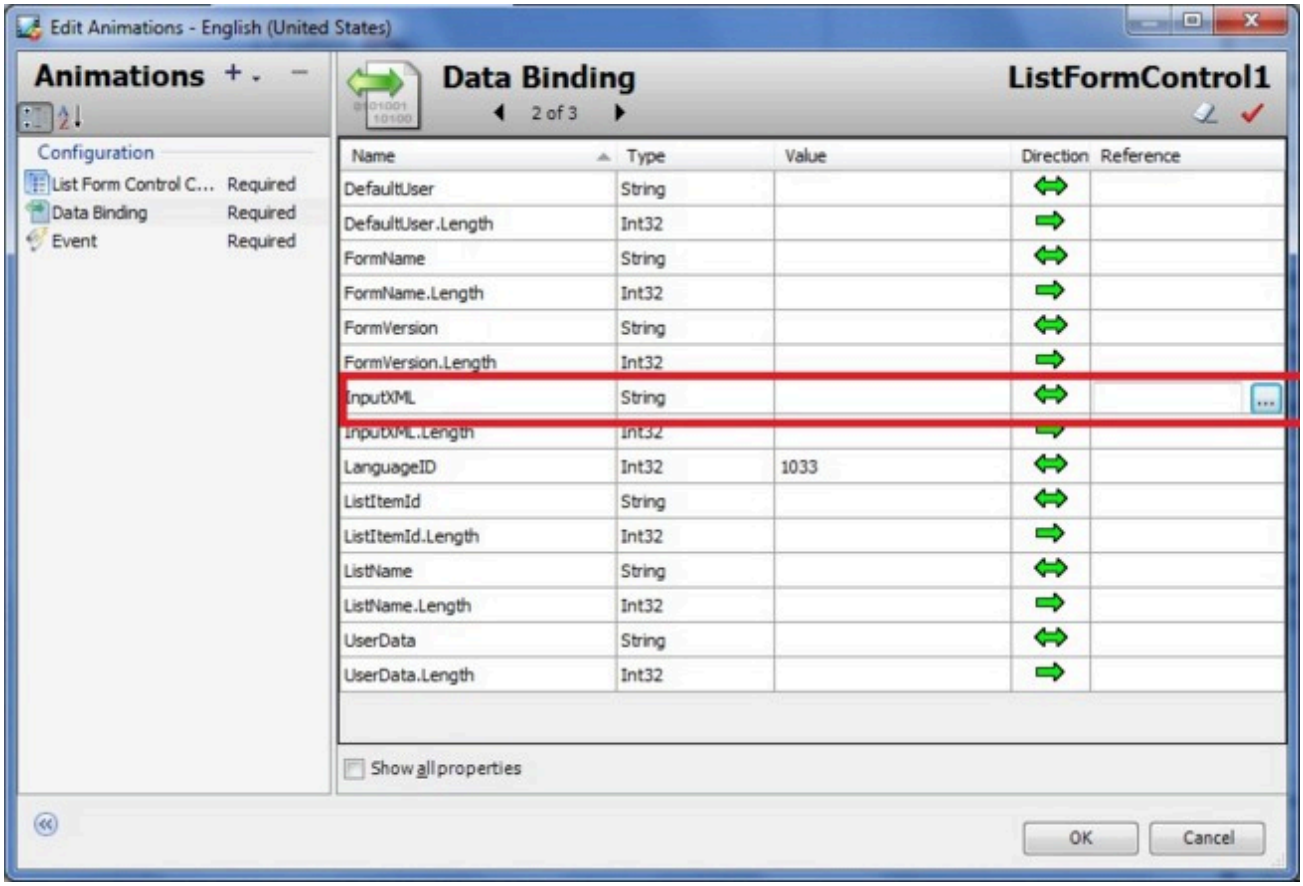
2. Animations. This will open up a new configuration page from where the List Form control can be configured. After configuring the List Form, click "OK".

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



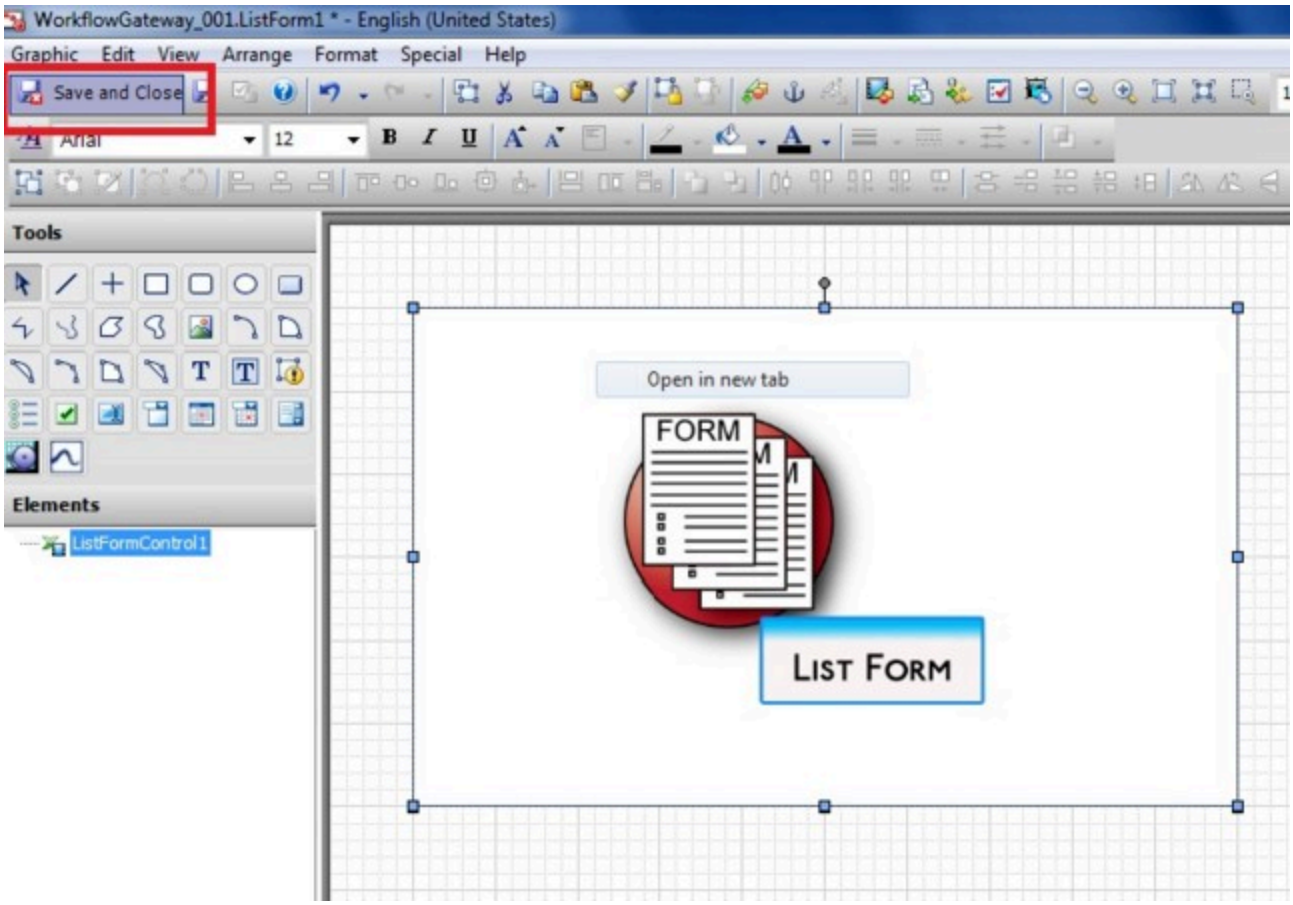
You can set the form instance XML for a List Form in Add Item mode dynamically. The InputXML property of the control should be data-binded to the UDA containing the form instance XML. For more information about the procedure, refer to Pass Contextual Information in Forms from InTouch.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

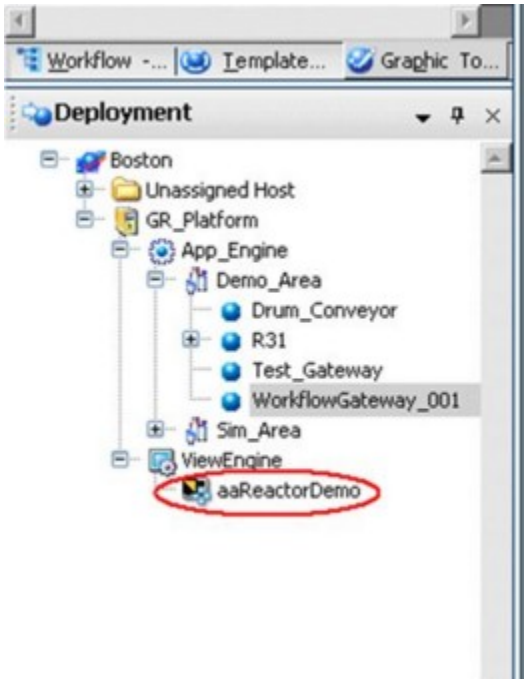


3. Save and close the Editor.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



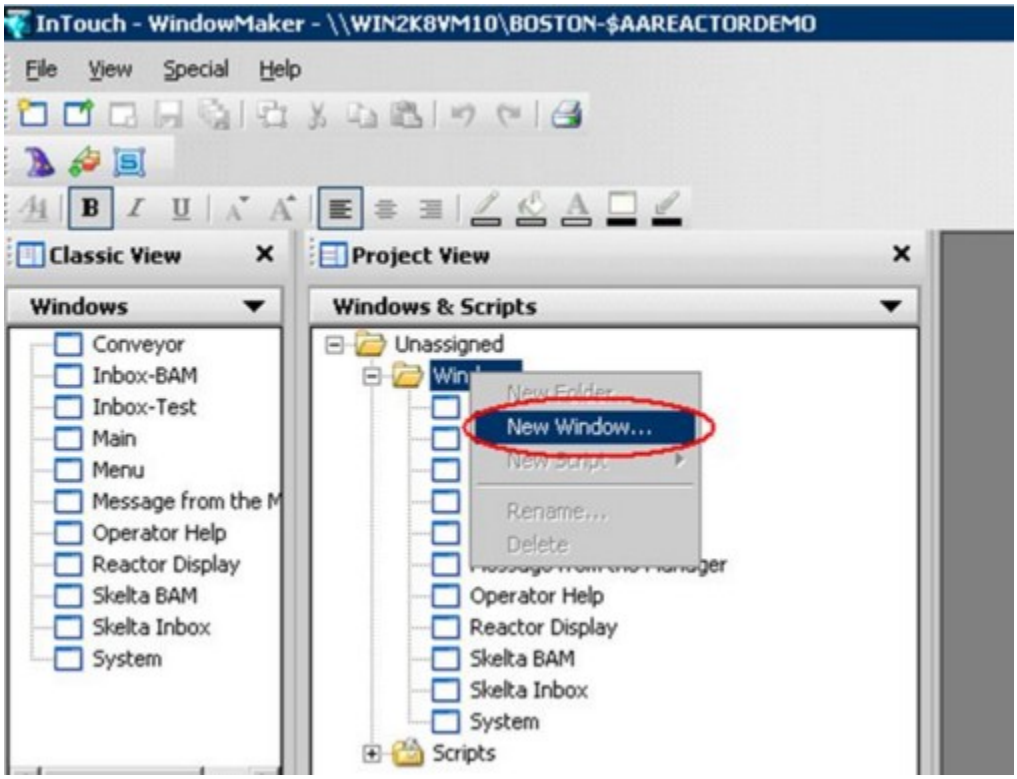
4. Select the instance and deploy in the System Platform IDE.
5. Double-click the $InTouchViewApp instance (aaReactorDemo) under ViewEngine from the System Platform IDE.



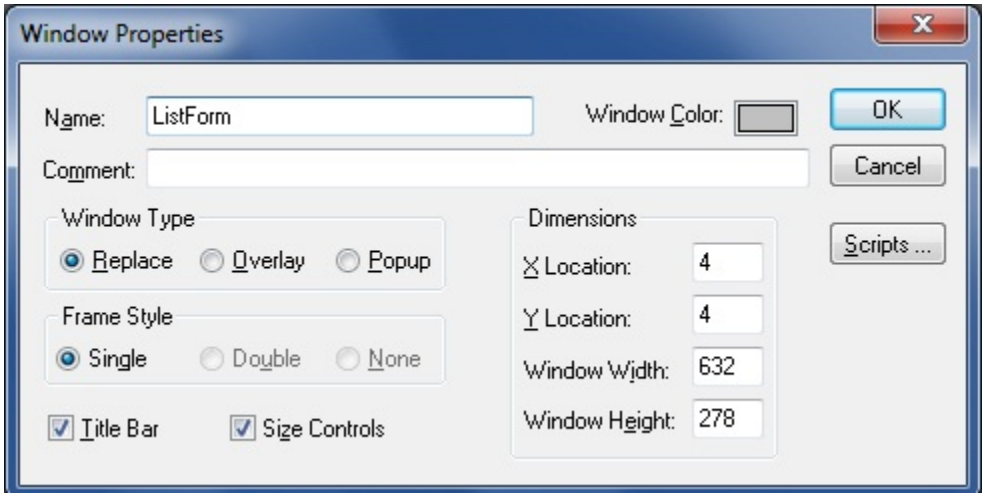
The InTouch WindowMaker appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Create a new window for the Lists control.

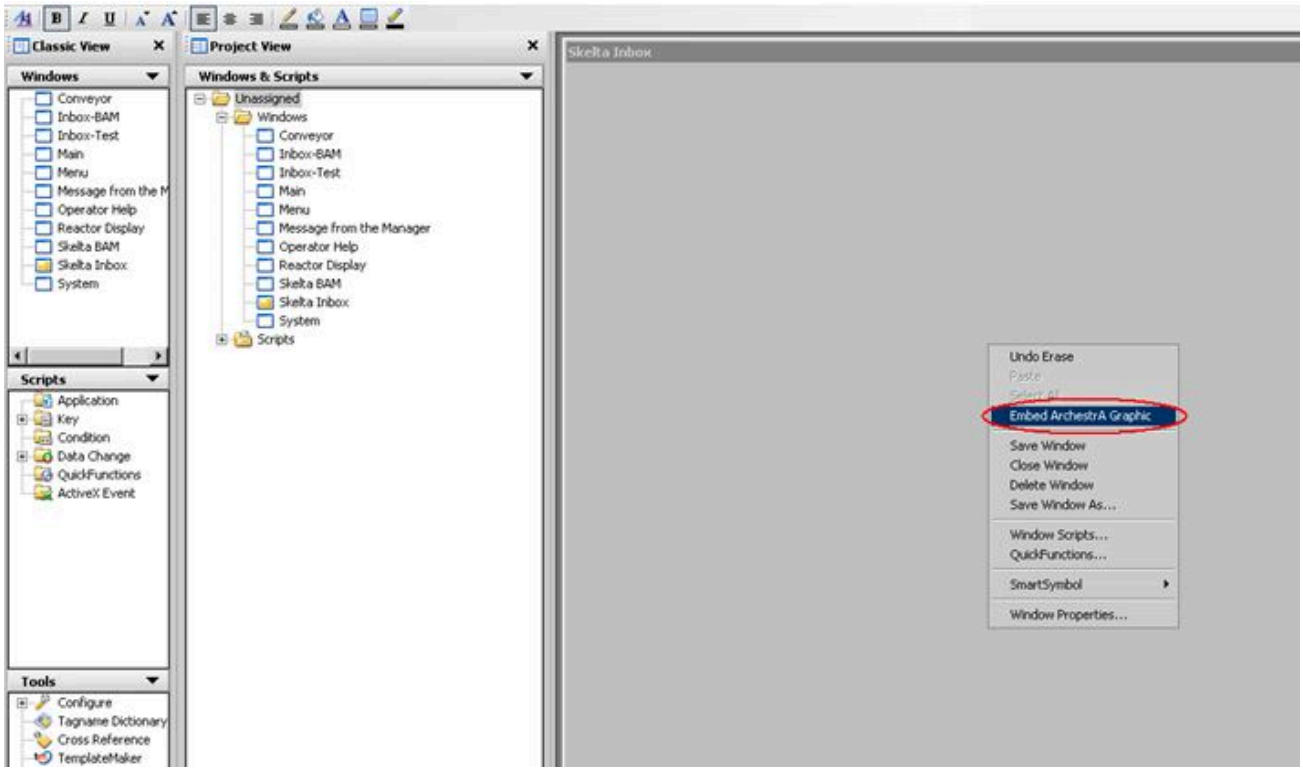


7. Enter the name as "ListForm" and click OK.



8. Right-click inside the newly opened window and select "Embed ArchestrA Graphic" option.

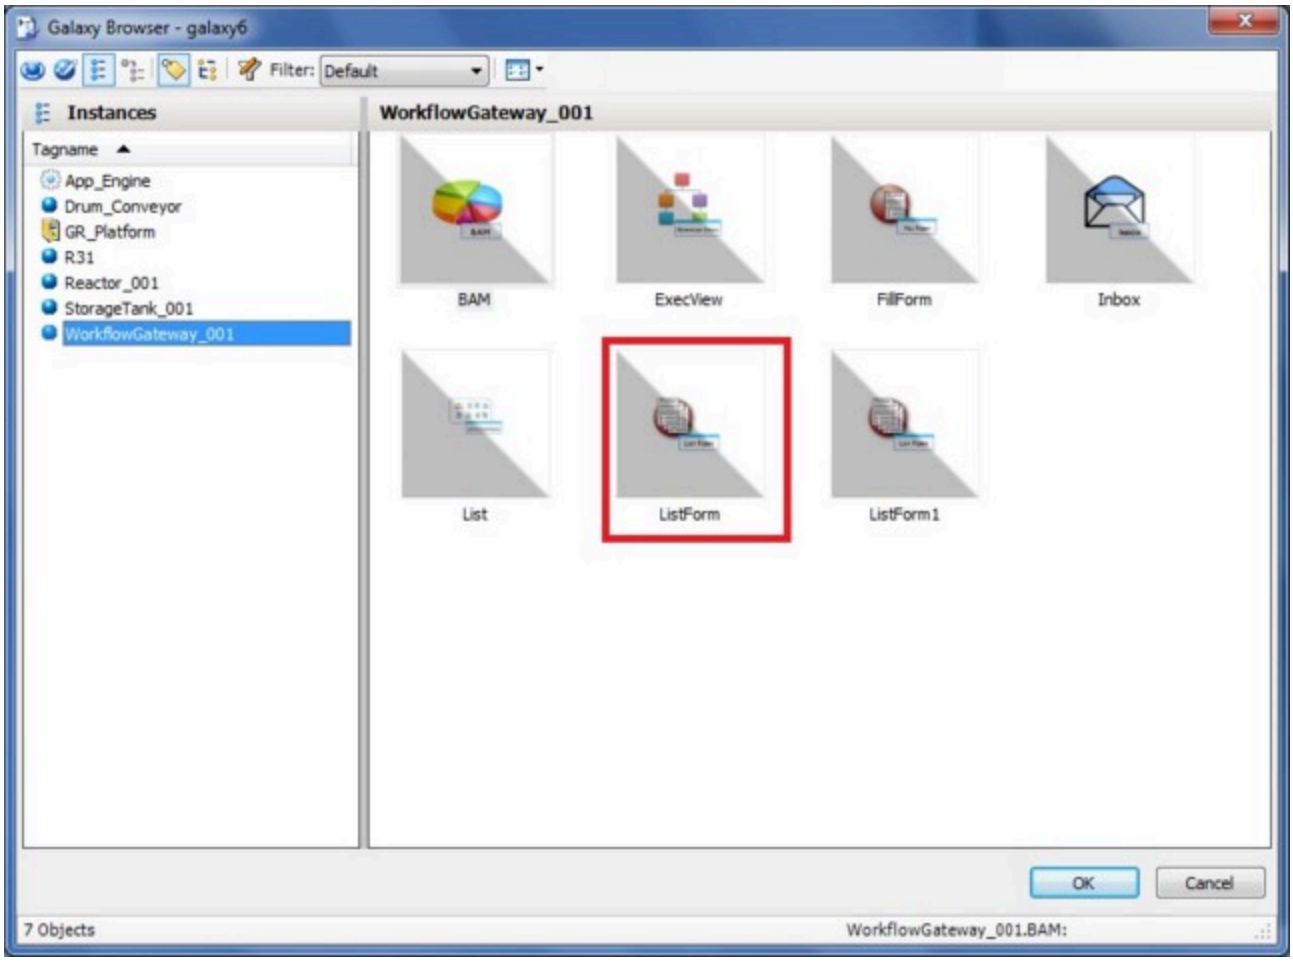
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



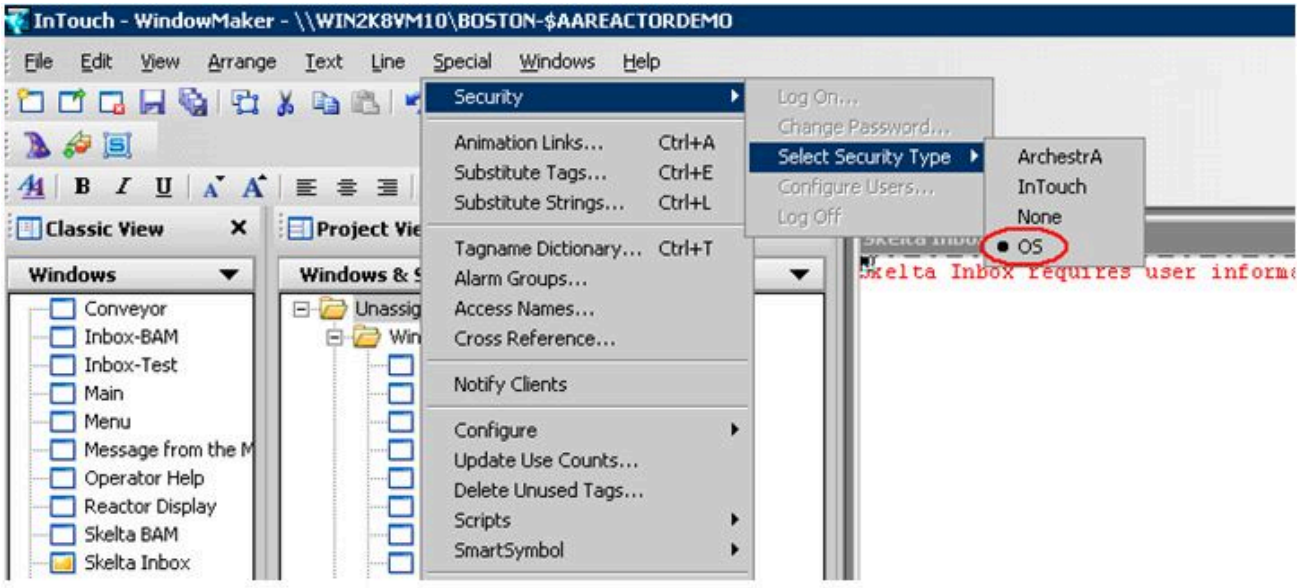
This opens up the ArchestrA Galaxy Browser.

9. Select the Instances tab and select the object to which the graphic symbol has been added.
10. Select the name of the graphic object (ListForm) that has to be displayed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



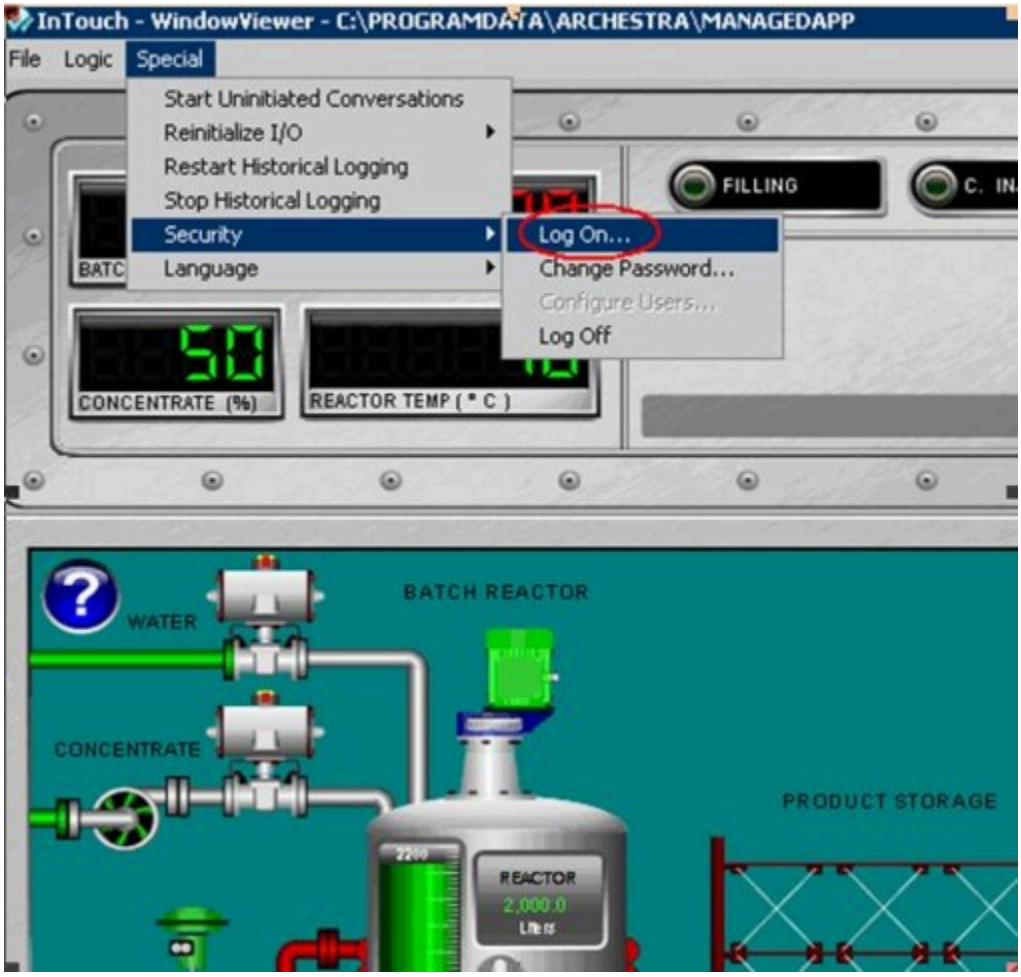
11. Enable security for the Lists window if required.

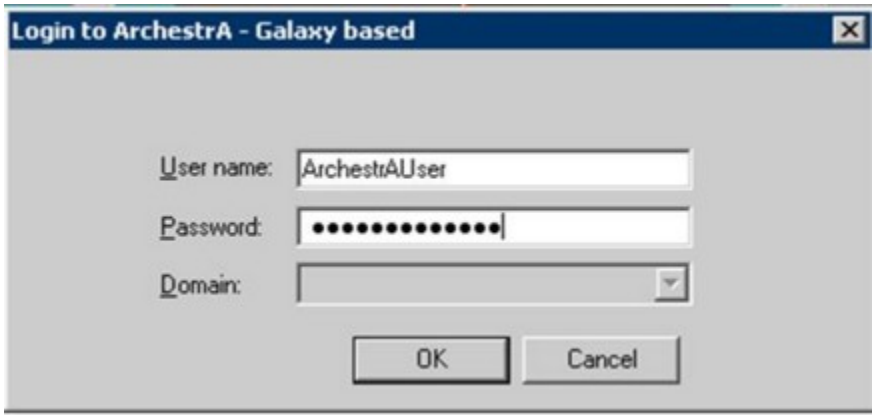


12. Save the window and exit InTouch WindowMaker.
13. Save and close the object in the System Platform IDE.
14. Deploy the $InTouchViewApp instance.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

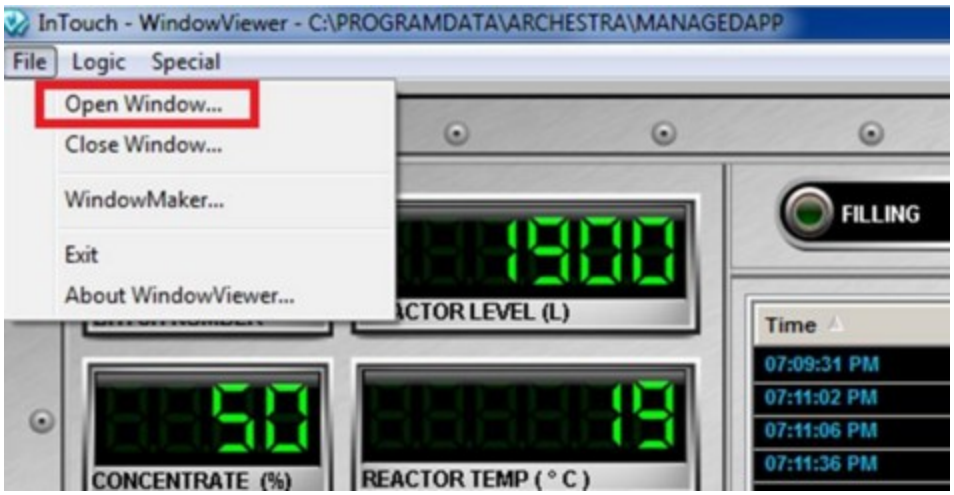
15. Open the InTouch Viewer and navigate to Special-> Security->Log On.
16. Enter the credentials and click OK.



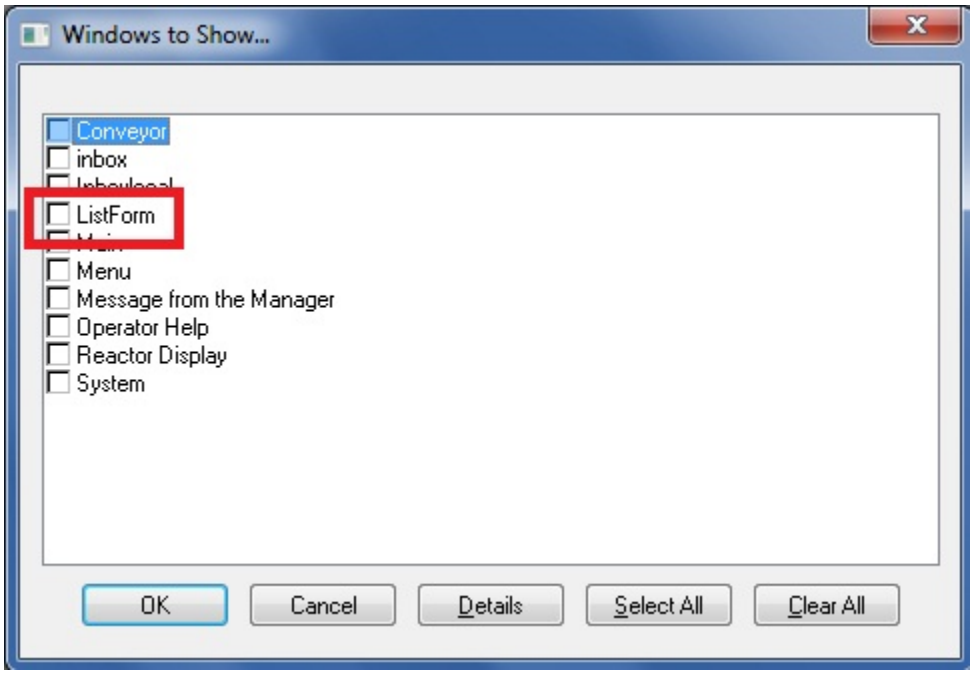


17. Open the created List Form window from the File menu.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



The Lists Control loads in the window.



WorkItemInboxCount in InTouch

The WorkItemInboxCount control in InTouch displays the count of work items in the Inbox that have not been acknowledged or acted upon by the user. Also, the work items that have been assigned to Queues will be considered only when they are available in the user's Inbox. The count being displayed can be refreshed automatically or manually based on the configuration settings.

To use WorkItemInboxCount In InTouch

Follow Step 1 to Step 7 listed in the Initial Steps and continue:

1. Select the control in the editor and double-click.
2. Select Configuration under Animations to configure the control.

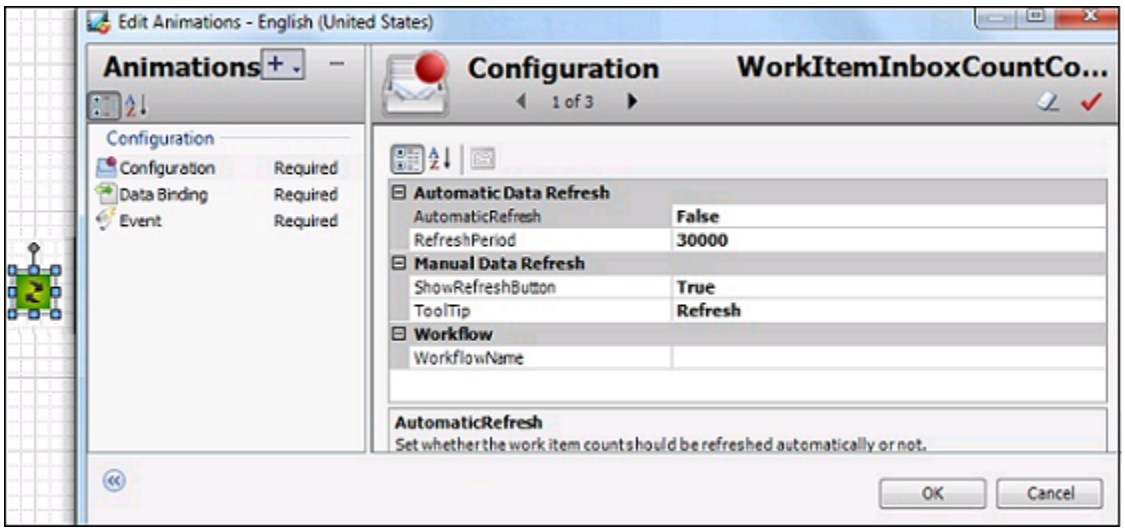
   Following are the properties of WorkItemInboxCount control:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- AutomaticRefresh: This property is used to set whether the work item count should be refreshed automatically or not.
- RefreshPeriod: This property is used to set the refresh period in milliseconds. The minimum value for Refresh Period is 30000.

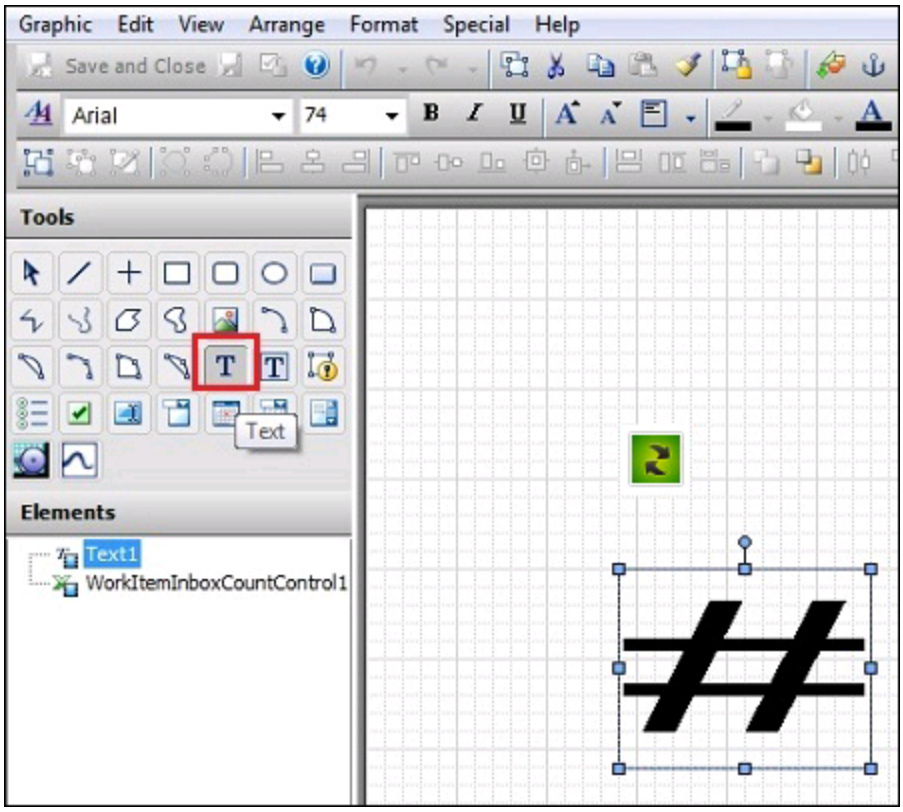
  If value of the RefreshPeriod property is set less than 30000, the value is automatically refreshed to the minimum value of 30000.
- ShowRefreshButton: This property is used to set whether manual data refresh button is visible or not.
- ToolTip: This property is used to set the tool tip for the Refresh button.
- WorkflowName: This property is used to set the workflow name for which the work item count will be visible. It has to be left blank to get the work item count of all the workflows.

3. After configuring the control, click OK.



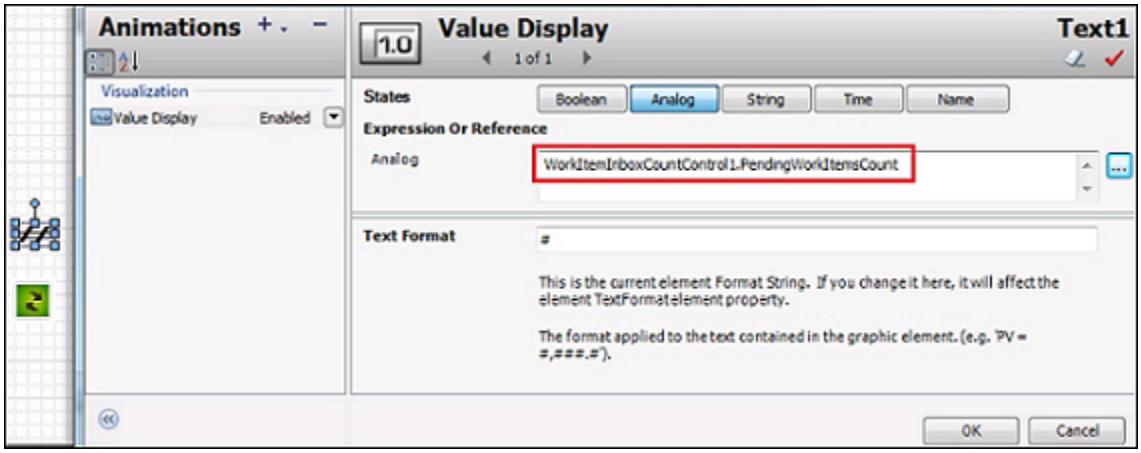
4. Drag and drop a Text control and set its Text property value as '#'.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



This hash (#) feature of InTouch will be used to display the pending work item count. The public property "PendingWorkItemsCount" of the WorkItemInboxCount control will be updated with the pending work item count.

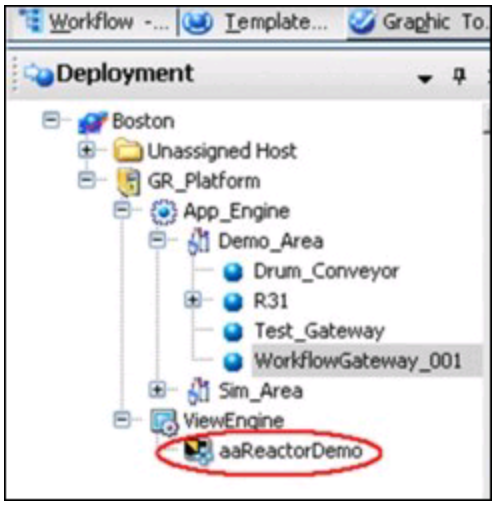
will be replaced by the value of the PendingWorkItemsCount property.



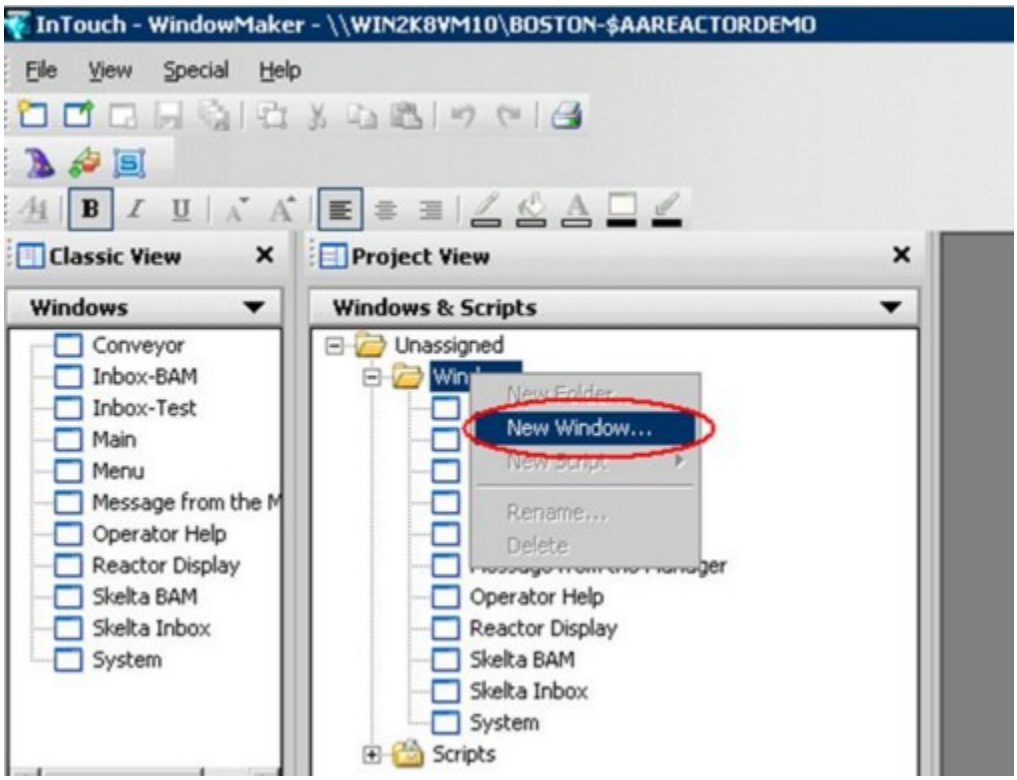
5. Select the WorkflowGateway object instance and deploy it in the System Platform IDE.
6. Double-click the $InTouchViewApp instance (aaReactorDemo) under ViewEngine from the System Platform IDE.

   The InTouch WindowMaker appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

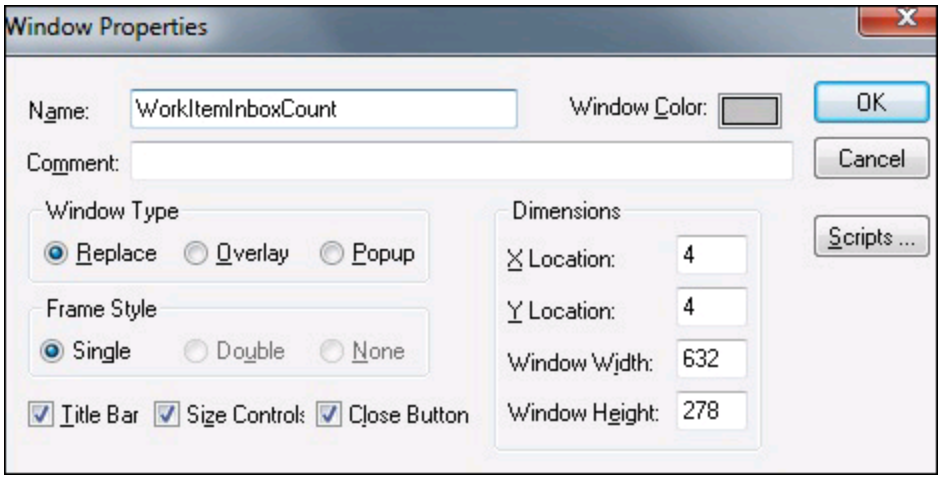


7. Create a new window for the WorkItemInboxCount control.



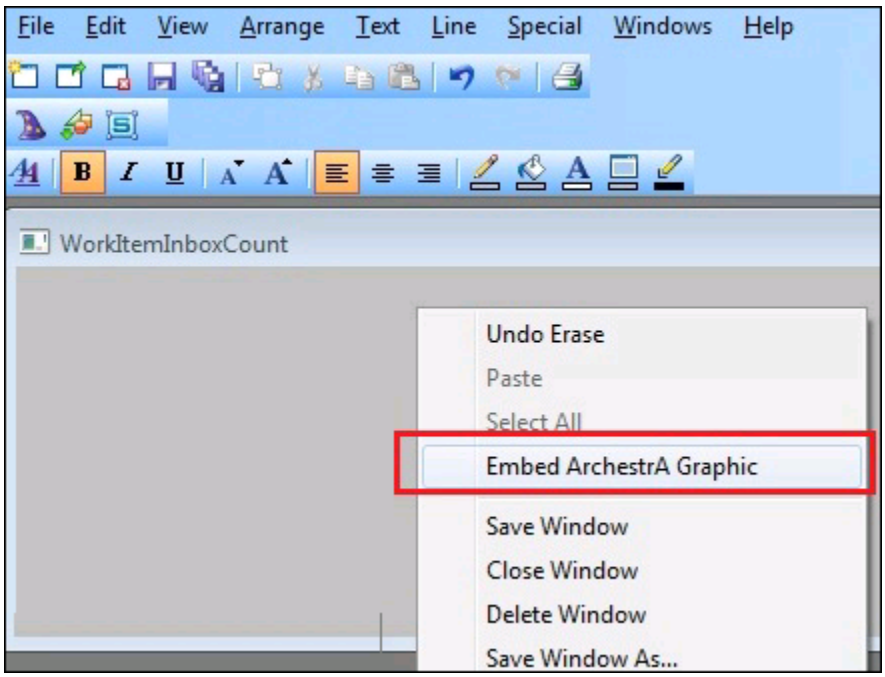
8. Provide the name and size for the window.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



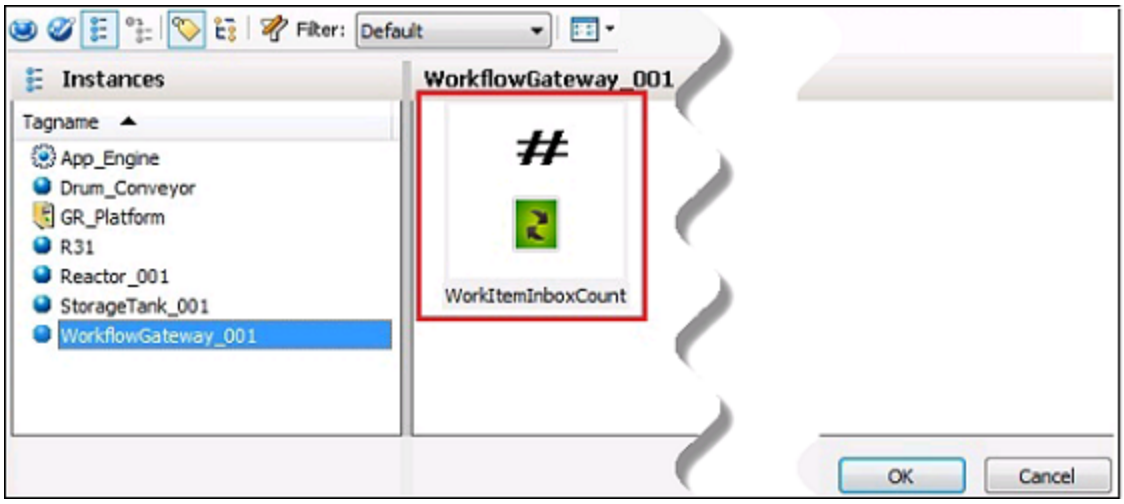
9. Right-click in the WorkItemInboxCount window and select **Embed ArchestrA Graphic** option.

   The ArchestrA Galaxy Browser appears.

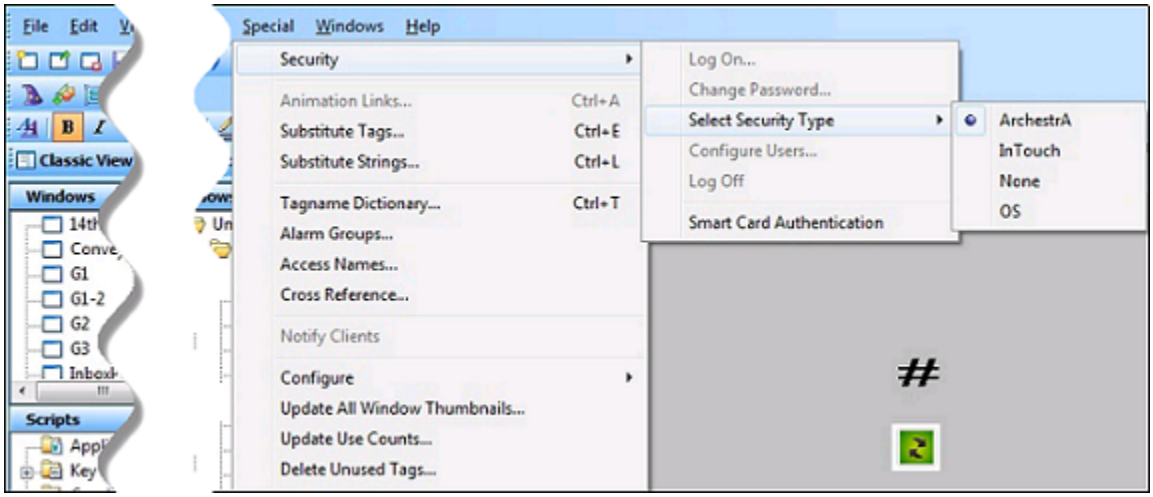


10. Select the Instances tab and select the WorkflowGateway instance to which the graphic symbol has been added.
11. Select the required graphic object ('WorkItemInboxCount').

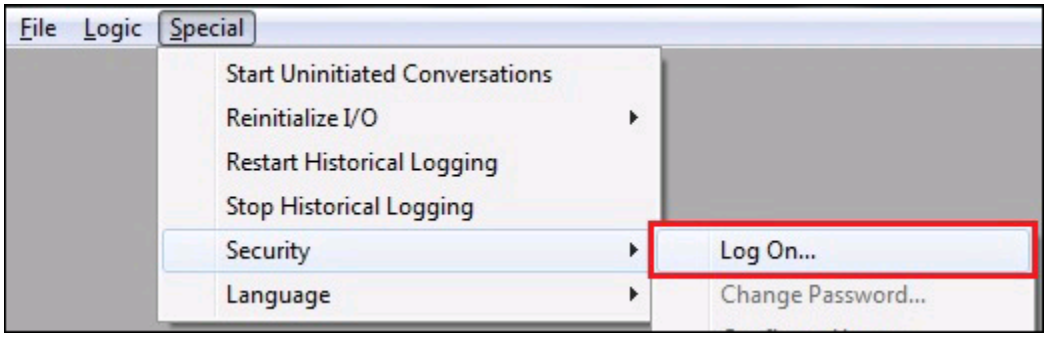
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



12. Enable security for the 'WorkItemInboxCount' window.
13. Select Security Type as "ArchestrA".

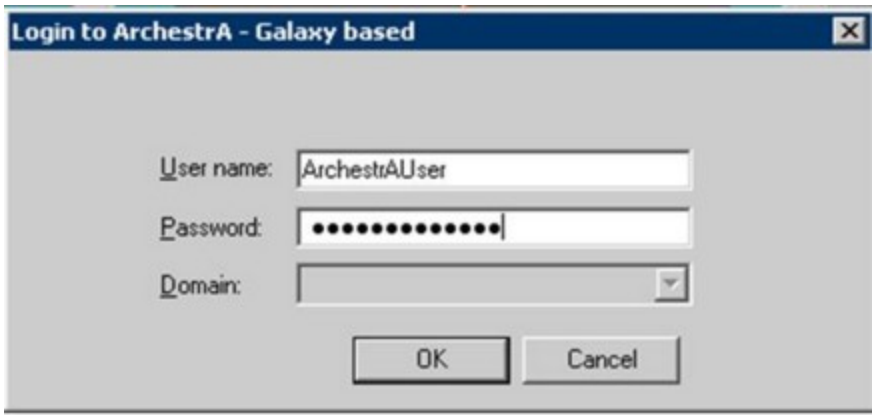


14. Save the window and exit InTouch WindowMaker.
15. Save and close the object in the System Platform IDE.
16. Deploy the $InTouchViewApp instance.
17. Click the Runtime button on the right hand side.
18. Open the InTouch Viewer and navigate to Special > Security > Log On.



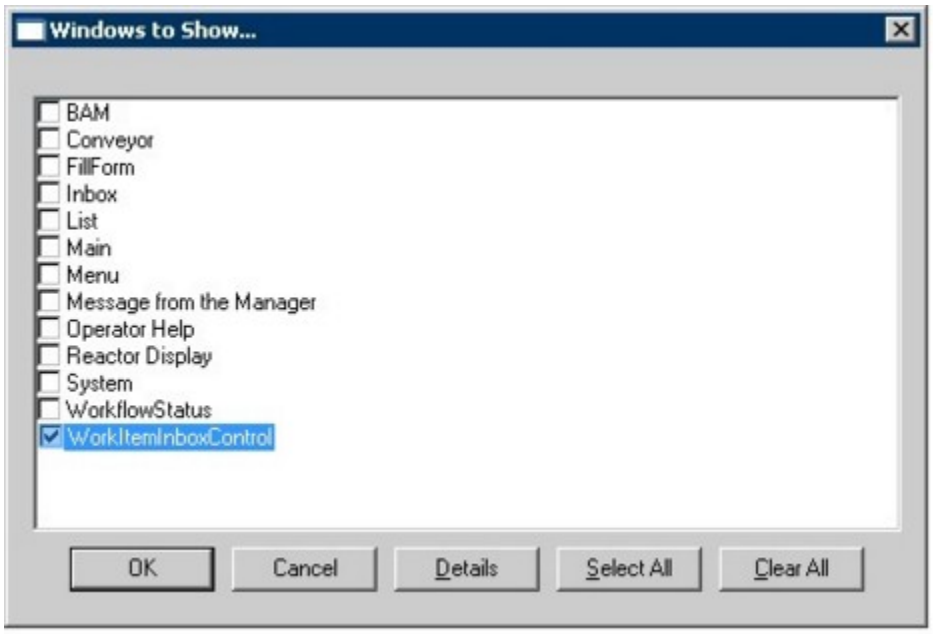
19. Enter the Credentials and click OK.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



20. Open the Work Item Inbox Count (the one created) window from the file menu.

    The WorkItemInboxCount control loads in the window.



Note: To use new controls after upgrading AVEVA Work Tasks, re-import ArchestrA.InTouch.SkeltaControls.dll. In the Import Preference dialog select 'Skip: Do not import' to ensure the existing controls are not overwritten. For more details about how to import ArchestrA.InTouch.SkeltaControls.dll, see Initial Steps.

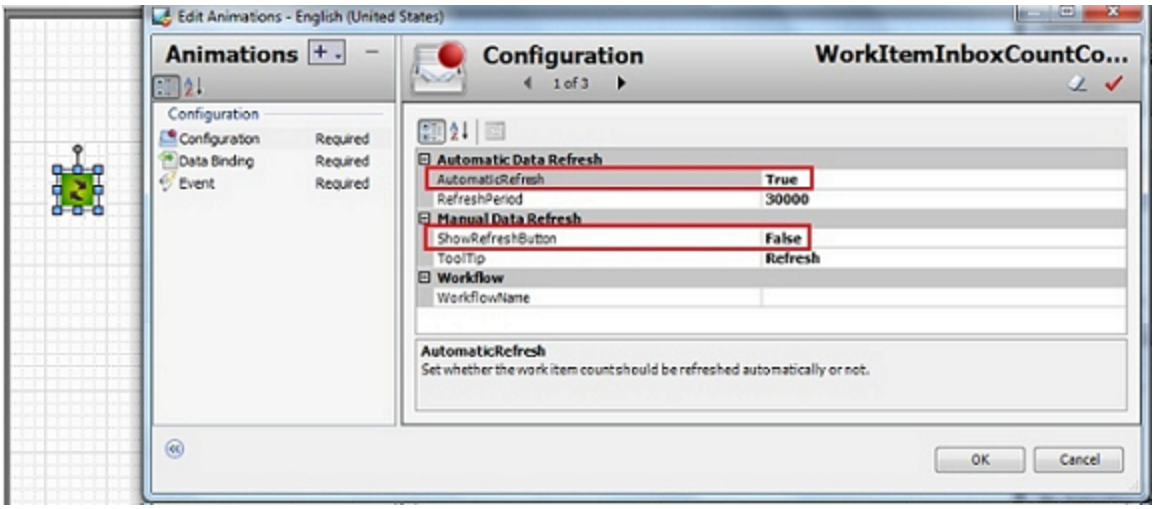
Open Inbox using WorkItemInboxCount

This section gives you step by step description on how to use the WorkItemInboxCount control to open Inbox:

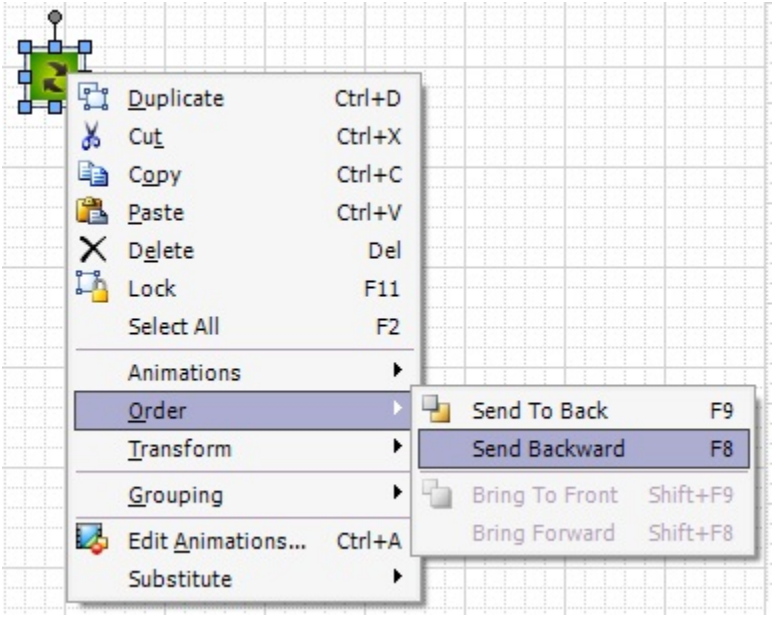
Follow steps 1-7 listed in the Initial Steps and continue:

1. Select the control in the editor and double-click. Select Configuration under Animations to configure the control. Set the properties as shown below:

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

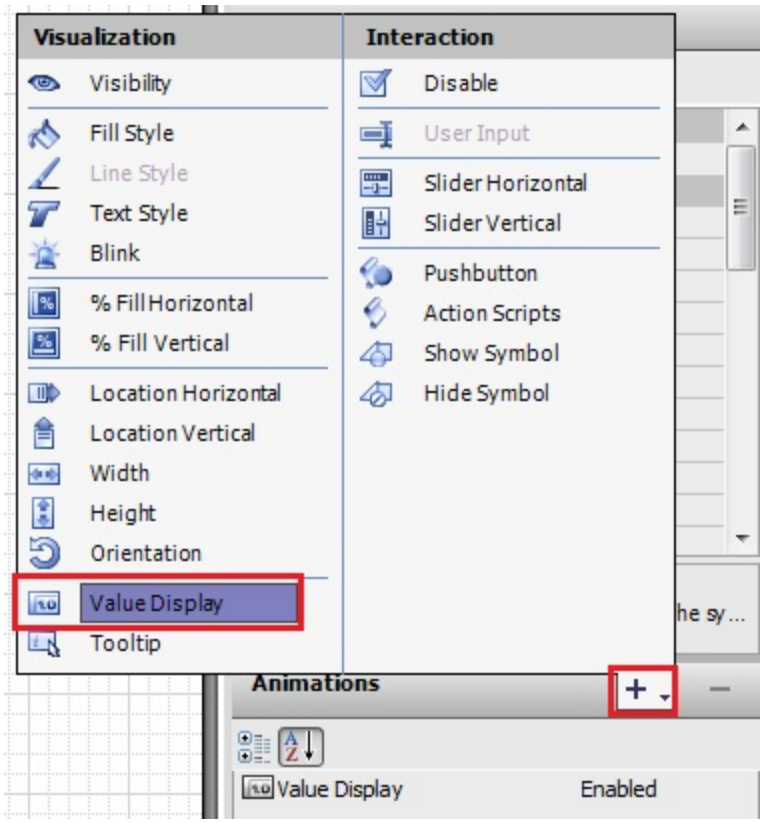


2. Right click the control and select Order -> Send Backward.



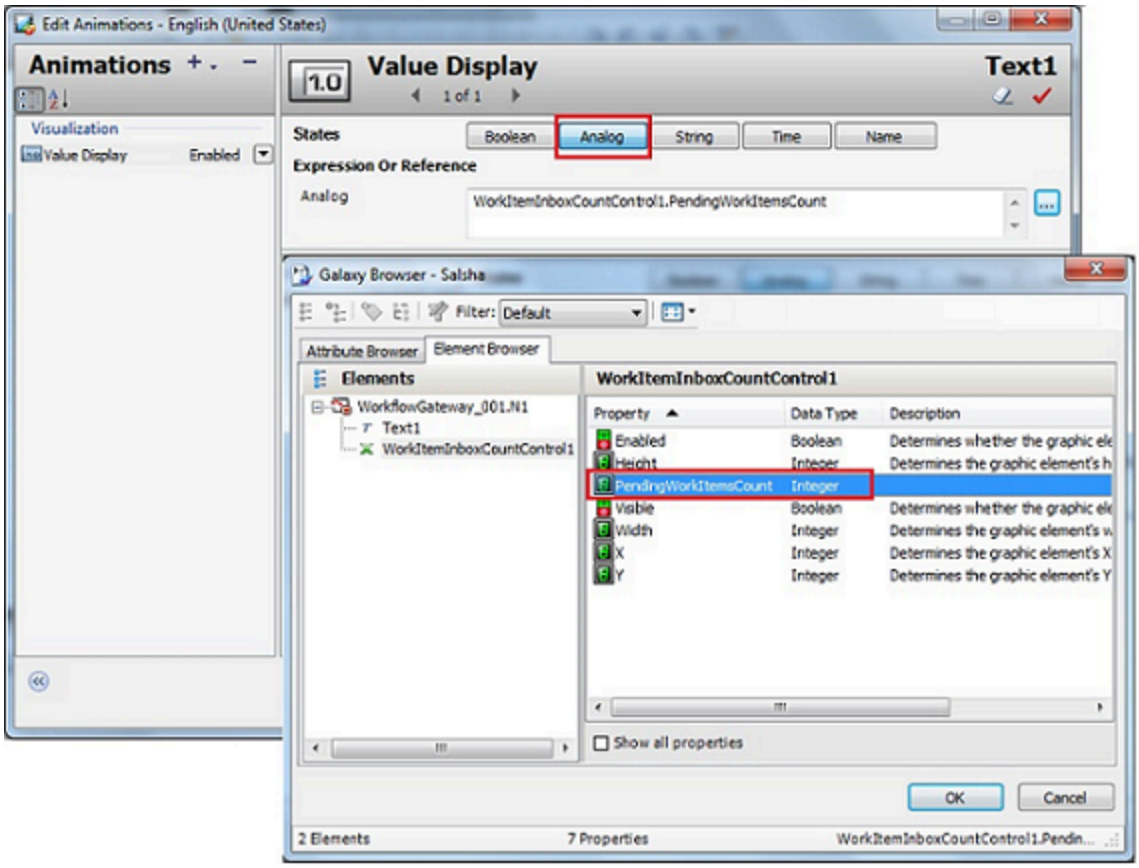
3. Add a button and place it above the WorkItemInboxCount control. Select Value Display as highlighted in the image given below. The Text property of the button should be set as #. # would be replaced by the actual work item count during run-time.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

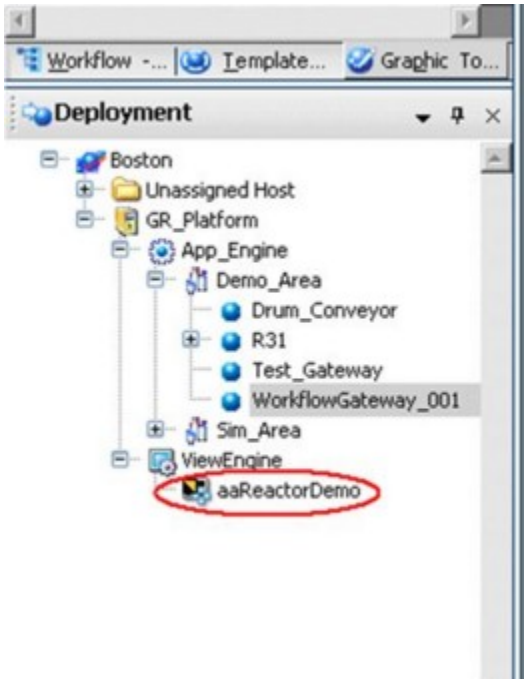


4. In the Value Display screen select Analog.
   The Galaxy browser window appears.
5. Select PendingWorkItemsCount from the Element Browser tab.
6. Click OK.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

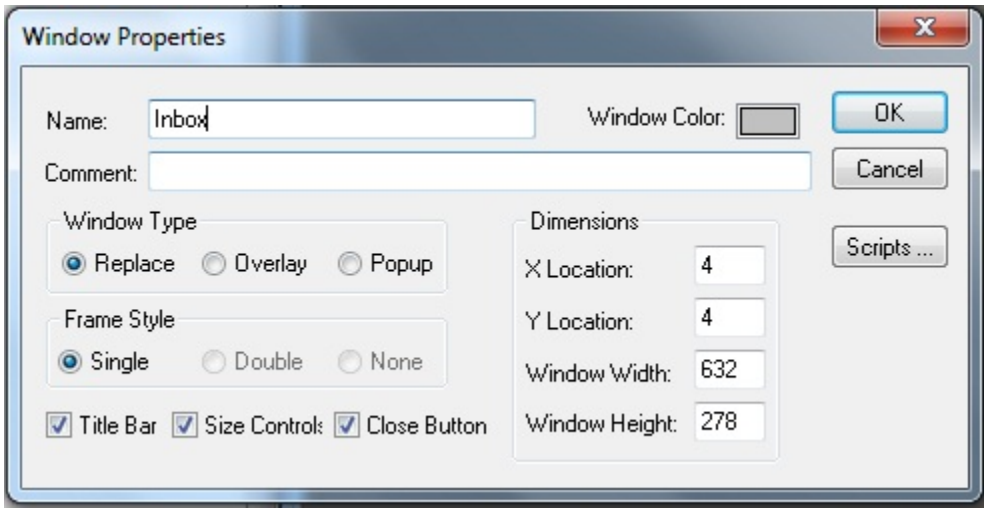


7. Create a graphic symbol for Inbox.
8. Deploy the respective Workflow Gateway Object.
9. Double-click the $InTouchViewApp instance (aaReactorDemo) under ViewEngine from the System Platform IDE.

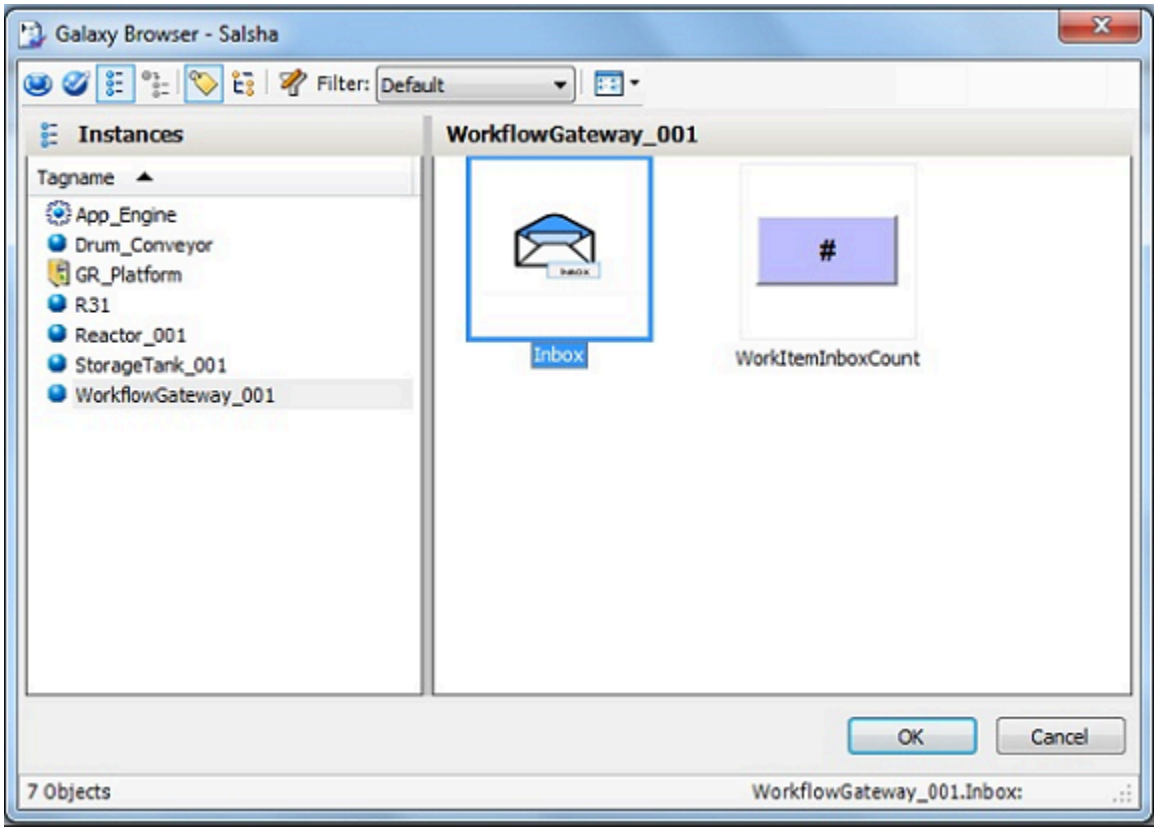


© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

10. Click File -> New Window. Add a new window named Inbox.

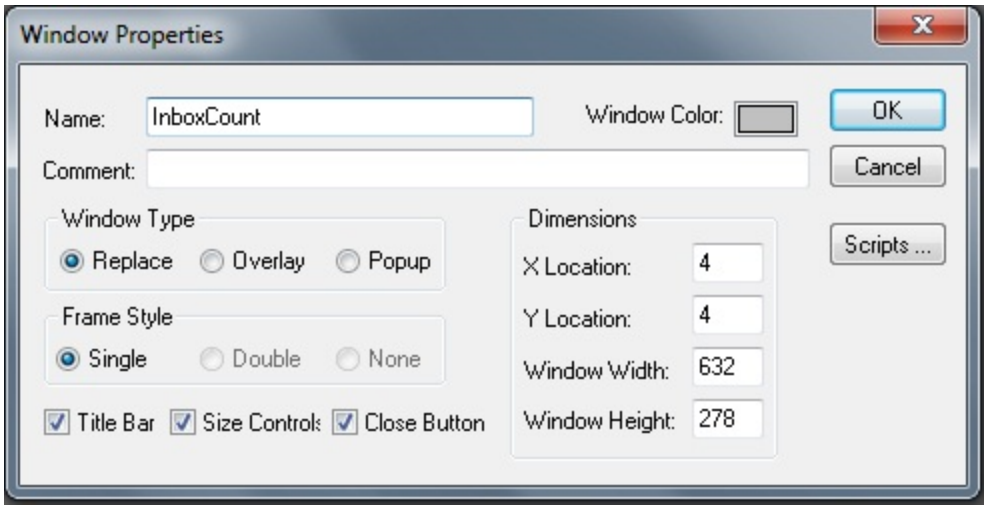


11. Open the Galaxy Browser.
12. Select the respective Workflow Gateway Object.
13. Select the Inbox graphic symbol and then click OK.

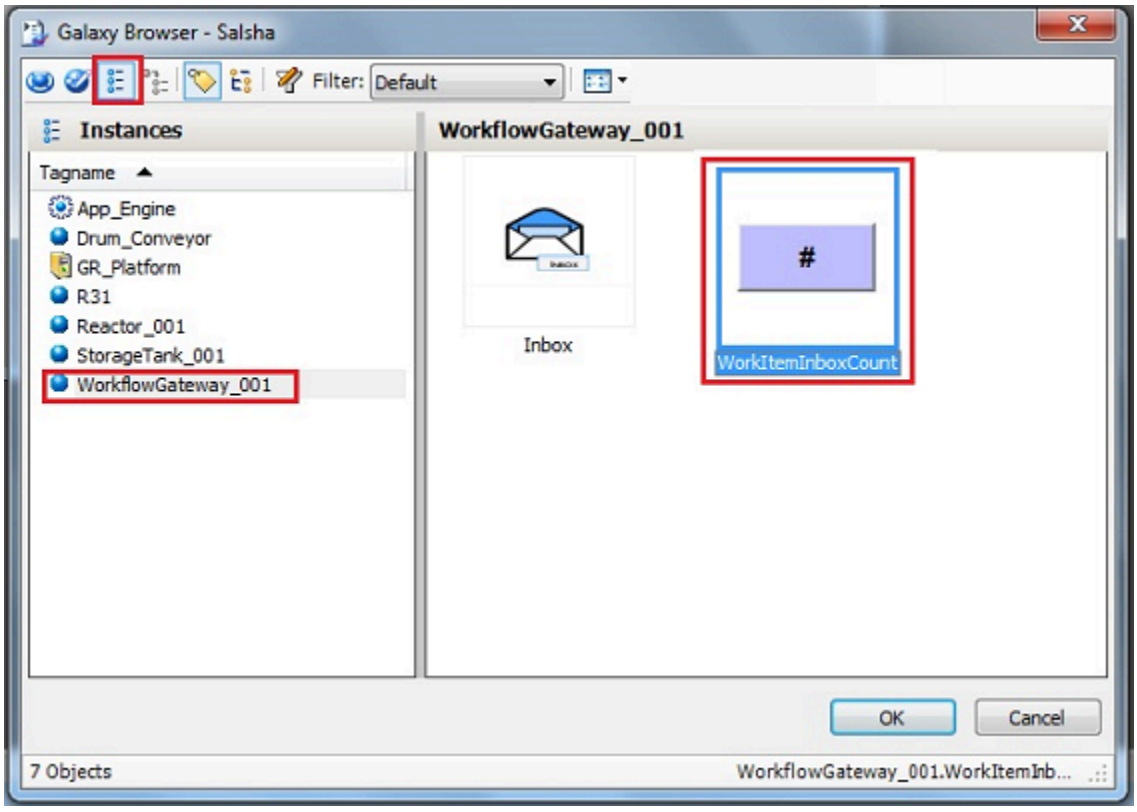


14. Save and close the Inbox window.
15. Click File -> New Window and add a new window named InboxCount.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

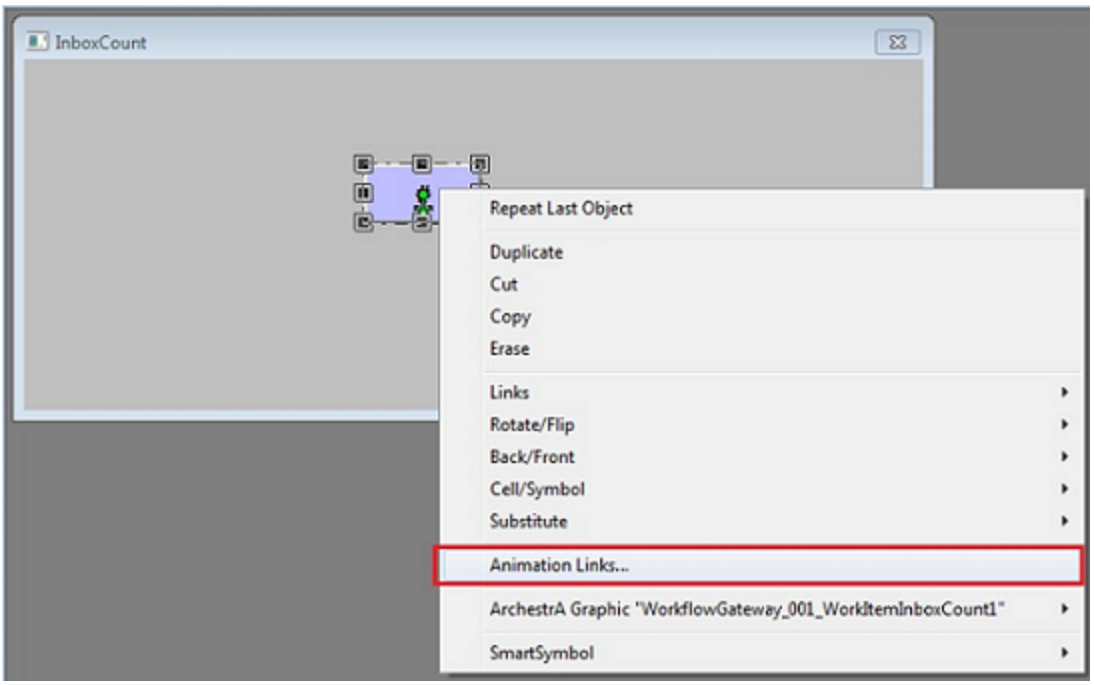


16. Open the Galaxy Browser.
17. Select the respective Workflow Gateway Object.
18. Select the WorkItemInboxCount graphic symbol and then click OK.

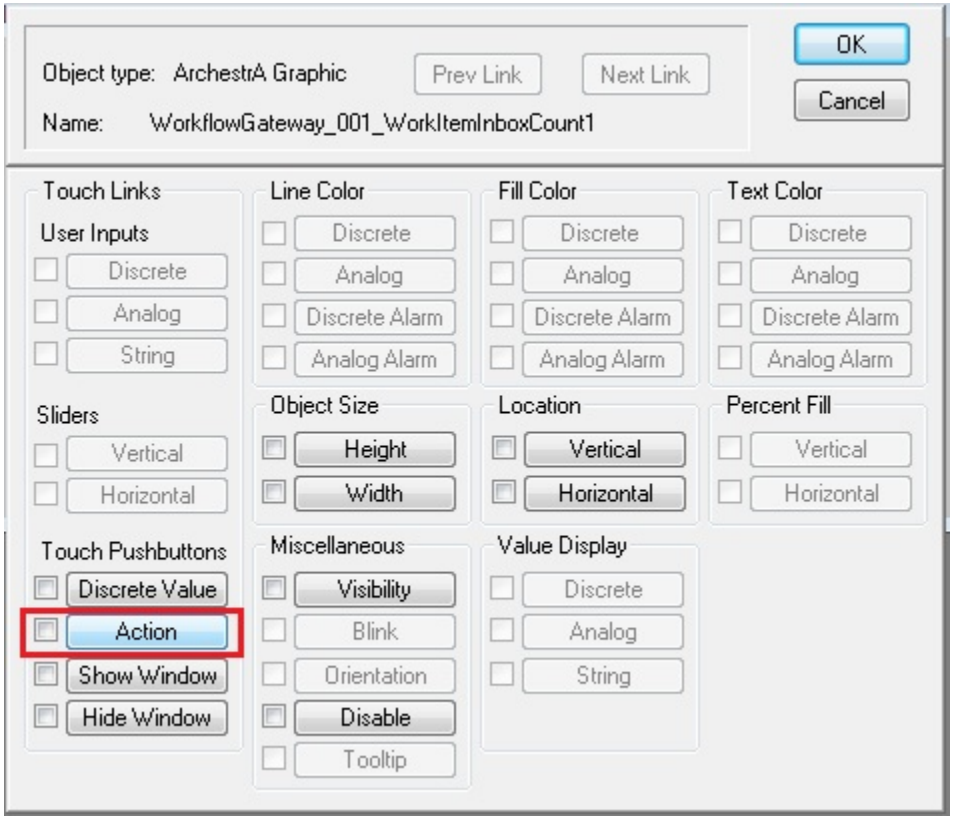


19. InboxCount screen appears. Right click the button and select Animation Links.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

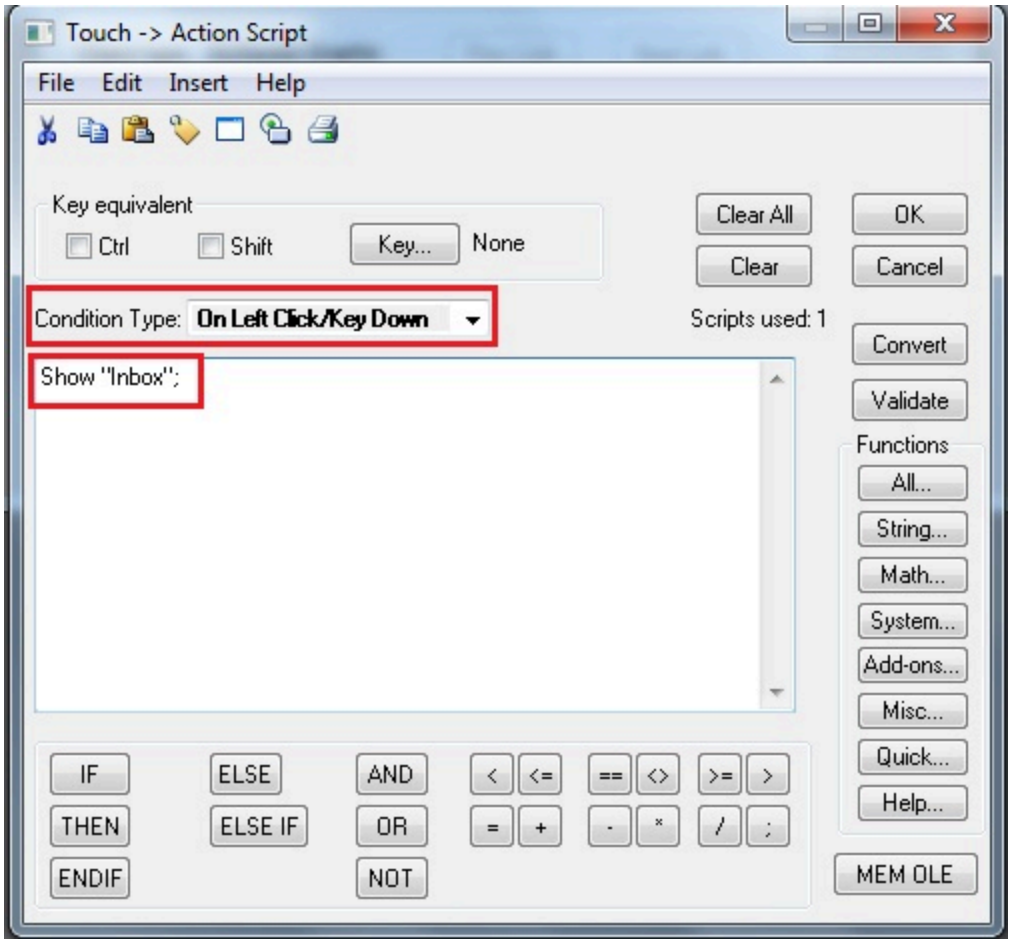


20. Click Action in the screen which appears.

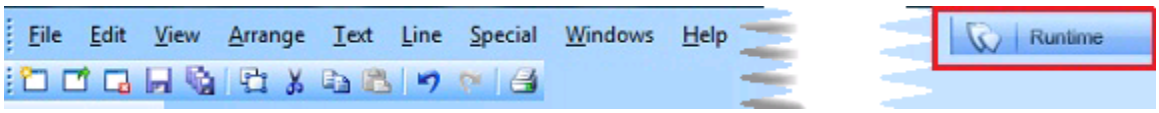


21. Select the Condition Type as On Left Click/Key Down and write the script as Show "Inbox".
22. Click OK.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

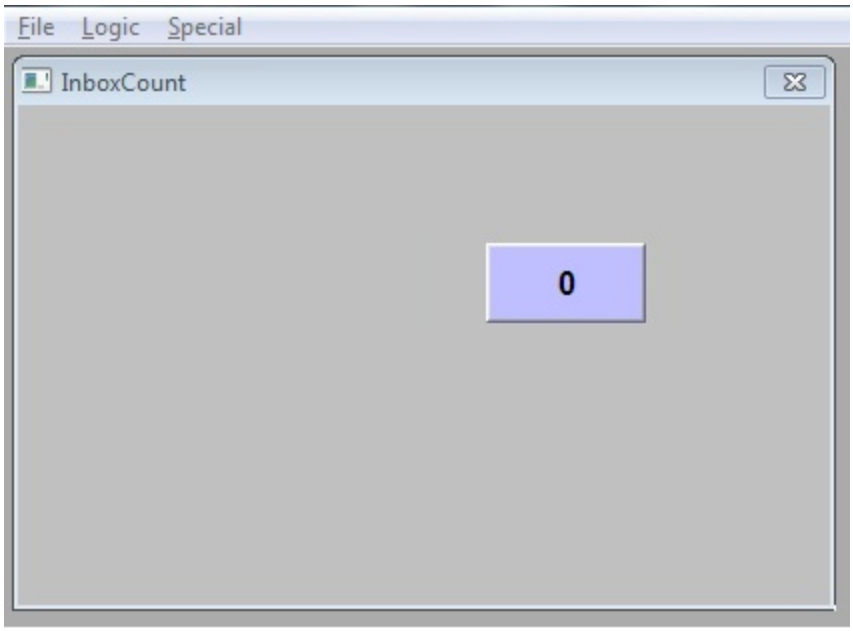


23. Click the Runtime button on the right hand side.

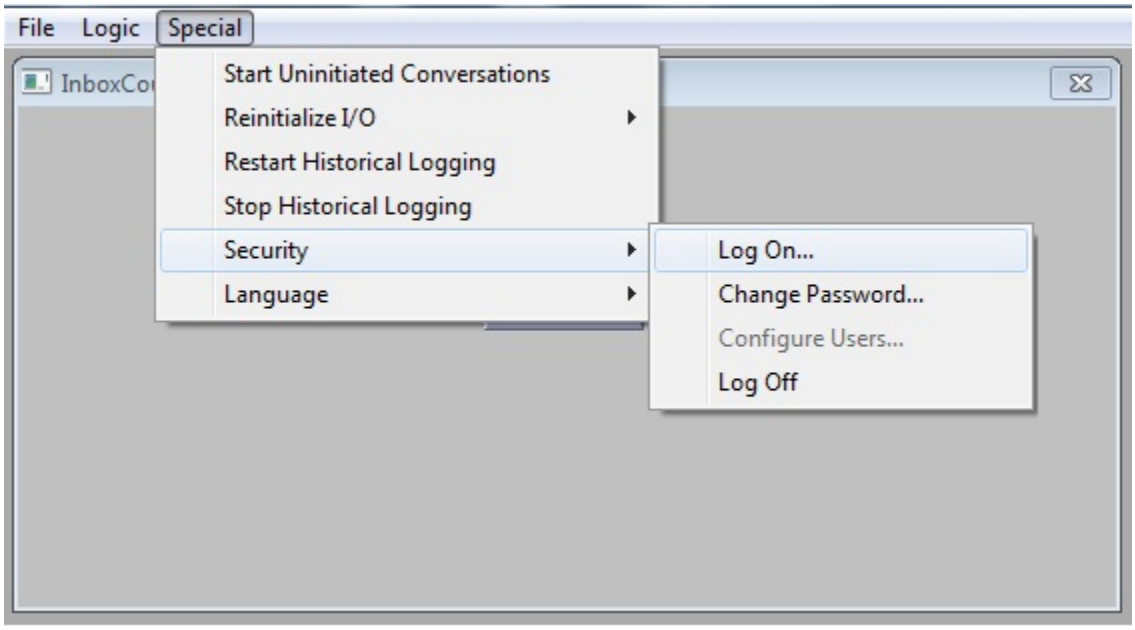


The InboxCount window appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

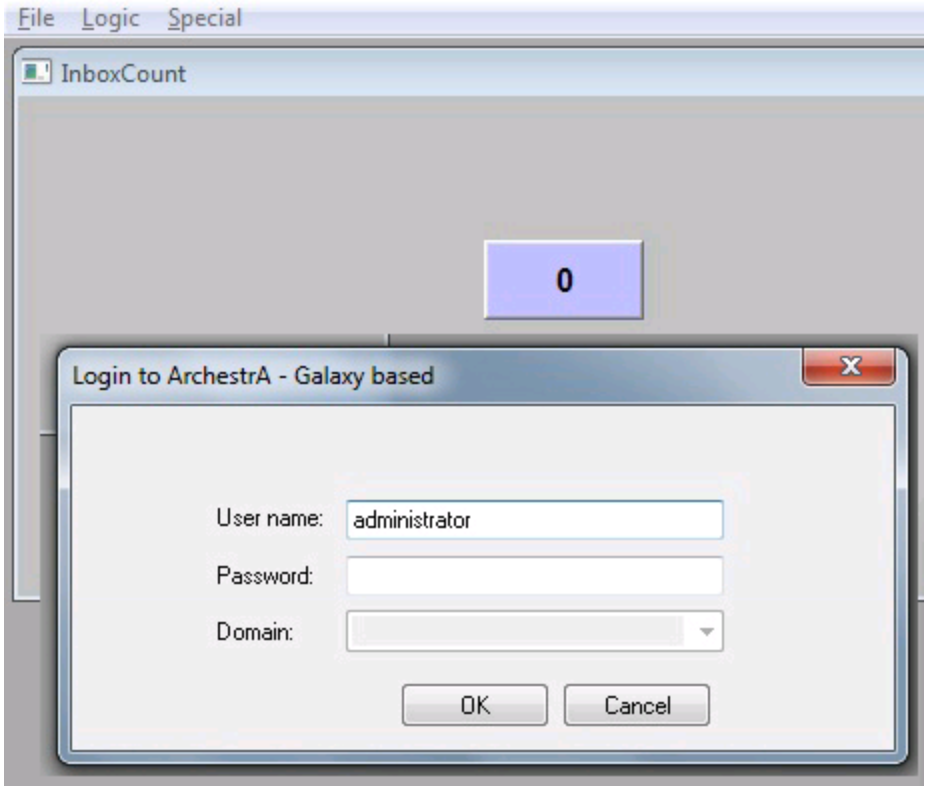


24. Navigate to Special -> Security -> Log On.

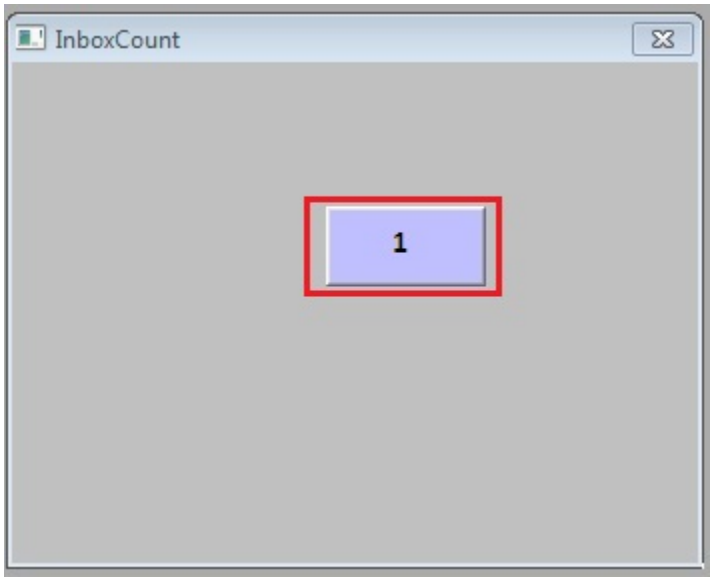


25. The login screen appears. Enter User Name and Password. Click OK.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

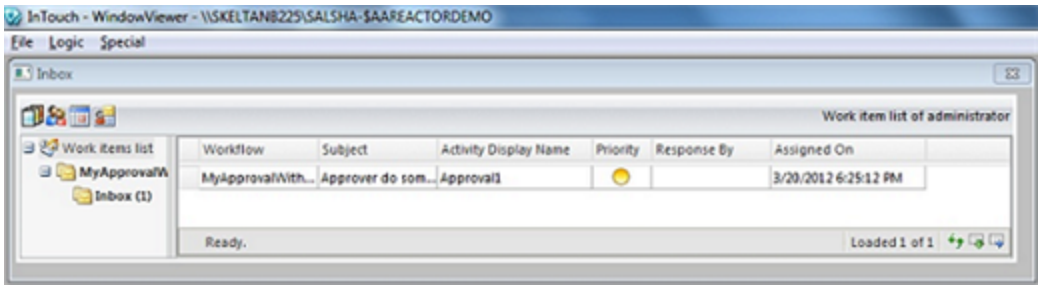


26. The actual work item count gets updated. Click the button to open the Inbox.



27. The Inbox screen appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Workflow Features Inside InTouch OMI

This topic provides information on how to use the Workflow Features inside InTouch OMI.

- Initial Steps
- AIM Authentication for Controls in InTouch OMI
- Forms Inside InTouch OMI
- Inbox Inside InTouch OMI
- List View Inside InTouch OMI
- List Form Inside InTouch OMI
- BAM Inside InTouch OMI
- Workflow Status Inside InTouch OMI
- Inbox Work Items Count Inside InTouch OMI
- Cryptography Settings Inside InTouch OMI

Initial Steps

You can use workflow features from inside **InTouch OMI**.

Note: The following steps are applicable when using System Platform 2023.

1. Setup the Initial Gateway Setup.
2. In the **System Platform IDE**, select **Import** > **Visualization** > **OMI App** from the **Galaxy** menu.
   The **Import OMI App** dialog box appears.
3. Select the **<ArchestrA Installation Path>\ArchestrA\Workflow\InTouchOMI\AVEVAWorkTasksApp** folder.
   The imported app appears as **WorkTaskApp00X** in the **Graphics**.
4. Select **Home** menu, and then select **Screen** from the ribbon bar.
   A new screen profile is created with the default settings, and appears in the **Graphics**.
5. Select **Home** menu, and then select **Layout** from the ribbon bar.
   A new layout is created with the default settings, and appears in the **Graphics**.
6. In the **Template**, select **<Galaxy Name>** > **System** > **$ViewEngine**.
7. Right-click **$ViewEngine**, select **New**, and then select **Instance**.
   A new instance of the view engine is created, and appears in the **Templates**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

8. In the **Templates**, select **<Galaxy Name>** > **ViewApps** > **$ViewApp**.
9. Right-click **$ViewApp**, select **New**, and then select **Derived Template**.

   A new derived template is created, and appears in the **Templates**.

   Double-click and configure (screen profile and layout) the derived template, if required.
10. Right-click the derived template, select **New**, and then select **Instance**.

    A new instance of the derived template is created and will appear either in the **Unassigned Area** or in the designated container set as default.
11. Drag and drop the instance of the ViewEngine to the required platform.
12. Drag and drop the instance of the ViewApp to the view engine.

If you are using a version earlier than System Platform 2023, follow these steps:

1. Setup the Initial Gateway Setup.
2. In the **System Platform IDE**, on the **Galaxy** menu, click **Import**, and then click **ArchestrA Apps**.

   The **Import ArchestrA App** dialog box appears.
3. Select the **<Installation Path>\Workflow\WorkTaskApp** folder.

   The imported app appears as **WorkTaskApp00X** in the **Graphic Toolbox**.
4. On the **Galaxy** menu, click **New**, and then click **Screen Profile**.

   A new screen profile is created with the default settings, and appears in the **Graphic Toolbox**.
5. On the **Galaxy** menu, click **New**, and then click **Layout**.

   A new layout is created with the default settings, and appears in the **Graphic Toolbox**.
6. In the **Template Toolbox**, select **<Galaxy Name> > System > $ViewEngine**.
7. Right-click **$ViewEngine**, click **New**, and then click **Instance**.

   A new instance of the view engine is created, and appears in the **Template Toolbox**.
8. In the **Template Toolbox**, select **<Galaxy Name> > System > $ViewApp**.
9. Right-click **$ViewApp**, click **New**, and then click **Derived Template**.

   A new derived template is created, and appears in the **Template Toolbox**.

   Double-click and configure (screen profile and layout) the derived template, if required.
10. Right-click the derived template, click **New**, and then click **Instance**.

    A new instance of the derived template is created, and appears in the **Template Toolbox**.
11. Drag and drop the instance of the view engine to the required platform.
12. Drag and drop the instance of the view app to the view engine.

Note: If the screen profile and layout are not configured when the derived template is created, then configure the same by double-clicking the instance of the view app.

Localizing AVEVA Work Tasks Controls in InTouch OMI

By default, locales are provided for **English (United States)** at **<Installation Path>\Workflow\InTouchOMI\WorkTaskApp\Locales\en-US** folder. For other locales, create locale files in the respective locales folder, and change the regional settings of the operating system to match the locale.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

For example, to change the locale to **English (United Kingdom)**, create the locale files in the **en-GB** folder of the **Locales** folder, and change the regional settings of the operating system to **English (United Kingdom)**.

By default, the locale of the object is set to **English (United States)**.

AIM Authentication for Controls in InTouch OMI

You can use AVEVA Identity Manager (AIM) authentication for AVEVA Work Tasks Controls in **InTouch OMI**. To enable AIM authentication, ensure that in **Central Configuration** when the **Resource Provider** is set to **Active Directory**, the **Use Token Service** is set to the appropriate server. Otherwise, the control will be loaded within the context of the default user, if specified. If the default user is not specified, then the control will be loaded within the context of the user who configured the workflow gateway.

Note:
- Ensure to import the ArchestrA app before configuring AIM for InTouch OMI.
- When using AIM authentication for controls in InTouch OMI, ensure all controls are configured for AIM authentication.

Configuring application to point to AIM

Preview View App

1. Go to **<ArchestrA Installed Path>\Framework\Bin\ModernEditors\Preview\ViewAppFramework**.
2. Edit **View.exe.config** file to include the following key value pairs:

```
<!-- Configure the AIM by adding the following key value pairs.
Replace "your_token_server" and "your_client_id" with proper values. -->
<add key="TokenServiceBase" value="https://<AIM Server Name>/identitymanager" />
<add key="ClientId" value="SE_WSP_NG" />
<add key="Scope" value="openid profile system offline_access" />
```

Deployed View App

1. Go to **<ArchestrA Installed Path>\Framework\Bin\ViewAppFramework**.
2. Edit **View.exe.config** file to include the following key value pairs:

```
<!-- Configure the AIM by adding the following key value pairs.
Replace "your_token_server" and "your_client_id" with proper values. -->
<add key="TokenServiceBase" value="https://<AIM Server Name>/identitymanager" />
<add key="ClientId" value="SE_WSP_NG" />
<add key="Scope" value="openid profile system offline_access" />
```

Configuring System Platform IDE Security

1. In the **System Platform IDE**, on the **Galaxy** menu, click **Configure**, and then click **Security**.
   The **Security** dialog box appears,
2. On the **Authentication Mode** tab, select **OS User based** or **OS Role based**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. On the **Users** tab, under **Authorized Users Available**, add users, and then under **Associated Roles for Administrator**, map **Administrator** role.
4. Click **OK**.

   The **System Platform IDE** will close and reopen.

Using AIM authentication for controls

1. **Complete the** Initial Steps.
2. In the **System Platform IDE**, double-click on the instance of the view app.

   The instance of the view app is opened.
3. Open the layout and add a panel on the top.
4. On the **Toolbox** tab, click **TitleBarApp**, and then drag and drop **TitleBarControl** in the **Layout**.
5. On the **Toolbox** tab, click **WorkTaskApp**, and then drag and drop a control to the default panel in the **Layout**.
6. On the **Properties** tab, configure other settings for the control as required.
7. Click **Save**.

   The control, along with the set properties, is saved.
8. Click **Preview** to preview the control in **InTouch OMI**, if required.
9. In the **System Platform IDE**, right-click on the instance of the view app, and then click **Deploy**.

   The **Deploy** dialog box appears, and shows the progress of the deployment.
10. Click **Close**.

    The control can now be used inside **InTouch OMI**.
11. Run **AVEVA OMI Application Manager**, and then click **Launch** for the configured instance of the view app to use the control.

Note:
- When running **AVEVA OMI Application Manager**, if you get an error that “You should be part of either the Administrators, WorkTasksAdmins, or WorkTasksRemoteUsers role.”, then run **AVEVA OMI Application Manager** as an **Administrator**.
- For customization purposes, you can manually create a symbol to log on instead of using the **TitleBarApp** as follows:

1. In the **System Platform IDE**, on the **Galaxy** menu, click **New**, and then click **Symbol**.
A new symbol is created, and appears in the **Graphic Toolbox**.
2. Double-click on the symbol, add two buttons, and then label them as **Login** and **Logout**.
3. Right-click **Login** button, click **Edit Animations**, and then add **Action Scripts** as follows:
```
ShowLoginDialog();
```
4. Right-click **Logout** button, click **Edit Animations**, and then add **Action Scripts** as follows:
```
Logout();
```
5. Open the layout and add a panel on the top.
6. On the **Toolbox** tab, click the symbol, and then drag it to the top panel in the **Layout**.
7. On the **Toolbox** tab, click the symbol, and then drag it to the top panel in the **Layout**.

Forms Inside InTouch OMI

You can use forms inside **InTouch OMI**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

1. **Complete the** Initial Steps.
2. In the **System Platform IDE**, double-click on the instance of the view app.

   The instance of the view app is opened.
3. On the **Toolbox** tab, click **WorkTaskApp**, and then drag and drop the **Fillform** control to a panel in the **Layout**.
4. On the **Properties** tab, map or enter the **Workflow Gateway**.
5. On the **Properties** tab, map or enter the **Form Name**.
6. On the **Properties** tab, map or enter the **Form Version**, if required.

   Note: If the version of the form is not specified, then the system makes use of the latest published version of the form.
7. On the **Properties** tab, map or enter the **Input XML**, if required.
8. On the **Properties** tab, set the **Display Alert Message** to **True**, if you want to display an alert message when the form is submitted.
9. On the **Properties** tab, set the **Default User Always** to **True**, if you want to specify the default user. Otherwise, the user who configured the **Workflow Gateway** object will be considered as the default user.
10. On the **Properties** tab, map or enter the **Default User**, if the **Default User Always** is set to **True**. The user set here will be considered as the user for submission of the form.
11. On the **Properties** tab, configure other settings as required.
12. Click **Save**.

    The control, along with the set properties, is saved.
13. Click **Preview** to preview the **Fill Form** in **InTouch OMI**, if required.
14. In the **System Platform IDE**, right-click on the instance of the view app, and then click **Deploy**.

    The **Deploy** dialog box appears, and shows the progress of the deployment.
15. Click **Close**.

    The **Fill Form** can now be used inside **InTouch OMI**.
16. Run **Wonderware Application Manager**, and then click **Launch** for the configured instance of the view app to use the **Fill Form**.

Note:
- The **Fill Form** control shows published forms including those not associated to workflows. It even shows forms disabled in the **Enterprise Console**.
- If **Security Level** changes are made with respect to the rights given to the user, then the view app should be redeployed before previewing the **Fill Form**.
- When running **Wonderware Application Manager**, if you get an error that “You should be part of either the Administrators, SkeltaAdmins, or SkeltaRemoteUsers role.”, then run **Wonderware Application Manager** as an **Administrator**.

If **InTouch OMI** is setup on a different machine, then launching the instance of the view app will lead to an error about unauthorized user. In such cases, configure the **Internet Options** as follows:

1. On the **Security** tab, under **Select a zone to view or change security settings**, click **Trusted sites**.
2. Click **Sites**, in the **Add this website to the zone** box, type the URL of the **Enterprise Console** set for the **Workflow Gateway** object, click **Add**, and then click **Close**.
3. Under **Security level for this zone**, click **Custom level**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

4. Under **Settings**, browse to **User Authentication > Logon** and click **Automatic logon with current username and password**, and then click **OK**.
5. Click **OK** to close **Internet Options**.

Passing Contextual Information in Forms from InTouch OMI

You can pass real-time value from InTouch OMI property to Fill Form control. Passing contextual information through attributes or hard-coded value is supported only for String data type.

The XML that is passed populates values of the controls on the form when loading the form. You can pass only the XML for the required controls. However, ensure the XML matches the syntax of the instance XML and does not exceed 1023 characters.

Example

To populate only the text controls **TEXTINPUT1** and **TEXTINPUT2**:

Script the XML as follows:

```
<SKRootDefinition><TEXTINPUT1>Value1
</TEXTINPUT1><TEXTINPUT2>Value1</TEXTINPUT2></SKRootDefinition>
```

OR

Bind the attribute as follows:

```
InputXmlAttribute="<SKRootDefinition><TEXTINPUT1>"+Galaxy:Drum_Conveyor.DrumCount+"</TEXTIN
PUT1><TEXTINPUT2>"+Galaxy:Drum_Conveyor.Speed+"</TEXTINPUT2></SKRootDefinition>";
```

Here **InputXmlAttribute**, **Galaxy:Drum_Conveyor.DrumCount**, and **Galaxy:Drum_Conveyor.Speed** are attributes, and the **InputXmlAttribute** attribute is of string data type.

Passing Contextual Information in Forms using Navigation App

You can pass the contextual information from the selected Asset using Navigation app to Fill Form control. When you use the Navigation app, you need to enter the attribute names in braces {}.

Example:

Form Name: {Attribute001}

Form Version: {Attribute002}

Input XML: {Attribute003}

Form Name is read from the {Attribute001} of the selected Asset.

Form Version is read from the {Attribute002} of the selected Asset.

Input XML is read from the {Attribute003} of the selected Asset.

Inbox Inside InTouch OMI

You can use inbox inside **InTouch OMI**.

1. **Complete the** Initial Steps.
2. In the **System Platform IDE**, double-click on the instance of the view app.

   The instance of the view app is opened.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

3. On the **Toolbox** tab, click **WorkTaskApp**, and then drag and drop the **Inbox** control to a panel in the **Layout**.
4. On the **Properties** tab, map or enter the **Workflow Gateway**.
5. On the **Properties** tab, set the **Default User Always** to **True**, if you want to specify the default user. Otherwise, the user who configured the **Workflow Gateway** object will be considered as the default user.
6. On the **Properties** tab, map or enter the **Default User**, if the **Default User Always** is set to **True**. The user set here will be considered as the user for submission of the work item.
7. On the **Properties** tab, configure other settings as required.
8. Click **Save**.

   The control, along with the set properties, is saved.
9. Click **Preview** to preview the **Inbox** in **InTouch OMI**, if required.
10. In the **System Platform IDE**, right-click on the instance of the view app, and then click **Deploy**.

    The **Deploy** dialog box appears, and shows the progress of the deployment.
11. Click **Close**.

    The **Inbox** can now be used inside **InTouch OMI**.
12. Run **Wonderware Application Manager**, and then click **Launch** for the configured instance of the view app to use the **Inbox**.

Note: When running **Wonderware Application Manager**, if you get an error that "You should be part of either the Administrators, SkeltaAdmins, or SkeltaRemoteUsers role.", then run **Wonderware Application Manager** as an **Administrator**.

If **InTouch OMI** is setup on a different machine, then launching the instance of the view app will lead to an error about unauthorized user. In such cases, configure the **Internet Options** as follows:

1. On the **Security** tab, under **Select a zone to view or change security settings**, click **Trusted sites**.
2. Click **Sites**, in the **Add this website to the zone** box, type the URL of the **Enterprise Console** set for the **Workflow Gateway** object, click **Add**, and then click **Close**.
3. Under **Security level for this zone**, click **Custom level**.
4. Under **Settings**, browse to **User Authentication > Logon** and click **Automatic logon with current username and password**, and then click **OK**.
5. Click **OK** to close **Internet Options**.

List View Inside InTouch OMI

You can use list view inside **InTouch OMI**.

1. **Complete the** Initial Steps.
2. In the **System Platform IDE**, double-click on the instance of the view app.

   The instance of the view app is opened.
3. On the **Toolbox** tab, click **WorkTaskApp**, and then drag and drop the **ListView** control to a panel in the **Layout**.
4. On the **Properties** tab, map or enter the **Workflow Gateway**.
5. On the **Properties** tab, map or enter the **List Name**.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. On the **Properties** tab, map or enter the **List View Name**.
7. On the **Properties** tab, map or enter the **Show Ribbon Bar**, if required.
8. On the **Properties** tab, map or enter the **Show Header**, if required.
9. On the **Properties** tab, map or enter the **Show Views**, if required.
10. On the **Properties** tab, set the **Default User Always** to **True**, if you want to specify the default user. Otherwise, the user who configured the **Workflow Gateway** object will be considered as the default user.
11. On the **Properties** tab, map or enter the **Default User**, if the **Default User Always** is set to **True**. The user set here will be considered as the user for submission of the work item.
12. Click **Save**.

    The control, along with the set properties, is saved.
13. Click **Preview** to preview the **List View** in **InTouch OMI**, if required.
14. In the **System Platform IDE**, right-click on the instance of the view app, and then click **Deploy**.

    The **Deploy** dialog box appears, and shows the progress of the deployment.
15. Click **Close**.

    The **List View** can now be used inside **InTouch OMI**.
16. Run **Wonderware Application Manager**, and then click **Launch** for the configured instance of the view app to use the **List View**.

Note:
- If **Security Level** changes are made with respect to the rights given to the user, then the view app should be redeployed before previewing the **List View**.
- When running **Wonderware Application Manager**, if you get an error that “You should be part of either the Administrators, SkeltaAdmins, or SkeltaRemoteUsers role.”, then run **Wonderware Application Manager** as an **Administrator**.

If **InTouch OMI** is setup on a different machine, then launching the instance of the view app will lead to an error about unauthorized user. In such cases, configure the **Internet Options** as follows:

1. On the **Security** tab, under **Select a zone to view or change security settings**, click **Trusted sites**.
2. Click **Sites**, in the **Add this website to the zone** box, type the URL of the **Enterprise Console** set for the **Workflow Gateway** object, click **Add**, and then click **Close**.
3. Under **Security level for this zone**, click **Custom level**.
4. Under **Settings**, browse to **User Authentication > Logon** and click **Automatic logon with current username and password**, and then click **OK**.
5. Click **OK** to close **Internet Options**.

List Form Inside InTouch OMI

You can use list form inside **InTouch OMI**.

1. **Complete the** Initial Steps.
2. In the **System Platform IDE**, double-click on the instance of the view app.

   The instance of the view app is opened.
3. On the **Toolbox** tab, click **WorkTaskApp**, and then drag and drop the **ListForm** control to a panel in the

2. Click **Sites**, in the **Add this website to the zone** box, type the URL of the **Enterprise Console** set for the **Workflow Gateway** object, click **Add**, and then click **Close**.
3. Under **Security level for this zone**, click **Custom level**.
4. Under **Settings**, browse to **User Authentication > Logon** and click **Automatic logon with current username and password**, and then click **OK**.
5. Click **OK** to close **Internet Options**.

BAM Inside InTouch OMI

You can use BAM (Business Activity Monitoring) inside **InTouch OMI**.

1. **Complete the** Initial Steps.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

2. In the **System Platform IDE**, double-click on the instance of the view app.

   The instance of the view app is opened.
3. On the **Toolbox** tab, click **WorkTaskApp**, and then drag and drop the **BAM** control to a panel in the **Layout**.
4. On the **Properties** tab, map or enter the **Workflow Gateway**.
5. On the **Properties** tab, map or enter the **Report ID**.
6. On the **Properties** tab, map or enter the **Report Name**.
7. On the **Properties** tab, map or enter the **Report Title**.
8. On the **Properties** tab, map or enter the **Report Description**, if required.
9. On the **Properties** tab, map or enter the **Workflow Names**.
10. On the **Properties** tab, select **Display Individual Report**,if you want to show individual report.
11. On the **Properties** tab, set the **Default User Always** to **True**, if you want to specify the default user. Otherwise, the user who configured the **Workflow Gateway** object will be considered as the default user.
12. On the **Properties** tab, map or enter the **Default User**, if the **Default User Always** is set to **True**. The user set here will be considered as the user for submission of the work item.
13. Click **Save**.

    The control, along with the set properties, is saved.
14. Click **Preview** to preview the **BAM** in **InTouch OMI**, if required.
15. In the **System Platform IDE**, right-click on the instance of the view app, and then click **Deploy**.

    The **Deploy** dialog box appears, and shows the progress of the deployment.
16. Click **Close**.

    The **BAM** can now be used inside **InTouch OMI**.
17. Run **Wonderware Application Manager**, and then click **Launch** for the configured instance of the view app to use the **BAM**.

Note:
- If **Security Level** changes are made with respect to the rights given to the user, then the view app should be redeployed before previewing the **BAM**.
- When running **Wonderware Application Manager**, if you get an error that “You should be part of either the Administrators, SkeltaAdmins, or SkeltaRemoteUsers role.”, then run **Wonderware Application Manager** as an **Administrator**.

If **InTouch OMI** is setup on a different machine, then launching the instance of the view app will lead to an error about unauthorized user. In such cases, configure the **Internet Options** as follows:

1. On the **Security** tab, under **Select a zone to view or change security settings**, click **Trusted sites**.
2. Click **Sites**, in the **Add this website to the zone** box, type the URL of the **Enterprise Console** set for the **Workflow Gateway** object, click **Add**, and then click **Close**.
3. Under **Security level for this zone**, click **Custom level**.
4. Under **Settings**, browse to **User Authentication > Logon** and click **Automatic logon with current username and password**, and then click **OK**.
5. Click **OK** to close **Internet Options**.

Workflow Status Inside InTouch OMI

You can use Workflow Status inside **InTouch OMI**.

1. **Complete the** Initial Steps.
2. In the **System Platform IDE**, double-click on the instance of the view app.

   The instance of the view app is opened.
3. On the **Toolbox** tab, click **WorkTaskApp**, and then drag and drop the **WorkflowStatus** control to a panel in the **Layout**.
4. On the **Properties** tab, map or enter the **Workflow Gateway**.
5. On the **Properties** tab, map or enter the **Workflow Execution ID**.
6. On the **Properties** tab, select **Enable Workflow Controls**, if you want to enable controlling of the workflow, if required.
7. On the **Properties** tab, select **Display Analyst View Only**, if you want to show only the Analyst's view, if required.
8. On the **Properties** tab, set the **Default User Always** to **True**, if you want to specify the default user. Otherwise, the user who configured the **Workflow Gateway** object will be considered as the default user.
9. On the **Properties** tab, map or enter the **Default User**, if the **Default User Always** is set to **True**. The user set here will be considered as the user for submission of the work item.
10. Click **Save**.

    The control, along with the set properties, is saved.
11. Click **Preview** to preview the **Workflow Status** in **InTouch OMI**, if required.
12. In the **System Platform IDE**, right-click on the instance of the view app, and then click **Deploy**.

    The **Deploy** dialog box appears, and shows the progress of the deployment.
13. Click **Close**.

    The **Workflow Status** can now be used inside **InTouch OMI**.
14. Run **Wonderware Application Manager**, and then click **Launch** for the configured instance of the view app to use the **Workflow Status**.

Note:
- If **Security Level** changes are made with respect to the rights given to the user, then the view app should be redeployed before previewing the **Workflow Status**.
- When running **Wonderware Application Manager**, if you get an error that “You should be part of either the Administrators, SkeltaAdmins, or SkeltaRemoteUsers role.”, then run **Wonderware Application Manager** as an **Administrator**.

If **InTouch OMI** is setup on a different machine, then launching the instance of the view app will lead to an error about unauthorized user. In such cases, configure the **Internet Options** as follows:

1. On the **Security** tab, under **Select a zone to view or change security settings**, click **Trusted sites**.
2. Click **Sites**, in the **Add this website to the zone** box, type the URL of the **Enterprise Console** set for the **Workflow Gateway** object, click **Add**, and then click **Close**.
3. Under **Security level for this zone**, click **Custom level**.
4. Under **Settings**, browse to **User Authentication > Logon** and click **Automatic logon with current username**

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

and password, and then click **OK**.

5. Click **OK** to close **Internet Options**.

Inbox Work Items Count Inside InTouch OMI

You can use Inbox Work Items Count inside **InTouch OMI**.

1. **Complete the** Initial Steps.
2. In the **System Platform IDE**, double-click on the instance of the view app.

   The instance of the view app is opened.
3. On the **Toolbox** tab, click **WorkTaskApp**, and then drag and drop the **InboxWorkItemsCount** control to a panel in the **Layout**.
4. On the **Properties** tab, map or enter the **Workflow Gateway**.
5. On the **Properties** tab, map or enter the **Workflow Name**.
6. On the **Properties** tab, select **Enable Automatic Refresh**, if you want to enable refreshing of work items count automatically, if required.
7. On the **Properties** tab, map or enter the **Refresh Period**.

   Note: If **Refresh Period** is set to less than **30000** ms, then the value is automatically set to the minimum value of **30000** ms.
8. On the **Properties** tab, select **Display Refresh Button**, if you want to show the Refresh button.
9. On the **Properties** tab, map or enter the **Tooltip** for the Refresh button.
10. On the **Properties** tab, set the **Default User Always** to **True**, if you want to specify the default user. Otherwise, the user who configured the **Workflow Gateway** object will be considered as the default user.
11. On the **Properties** tab, map or enter the **Default User**, if the **Default User Always** is set to **True**. The user set here will be considered as the user for submission of the work item.
12. Click **Save**.

    The control, along with the set properties, is saved.
13. Click **Preview** to preview the **Inbox Work Items Count** in **InTouch OMI**, if required.
14. In the **System Platform IDE**, right-click on the instance of the view app, and then click **Deploy**.

    The **Deploy** dialog box appears, and shows the progress of the deployment.
15. Click **Close**.

    The **Inbox Work Items Count** can now be used inside **InTouch OMI**.
16. Run **Wonderware Application Manager**, and then click **Launch** for the configured instance of the view app to use the **Inbox Work Items Count**.

Note:
- If **Security Level** changes are made with respect to the rights given to the user, then the view app should be redeployed before previewing the **Inbox Work Items Count**.
- When running **Wonderware Application Manager**, if you get an error that “You should be part of either the Administrators, SkeltaAdmins, or SkeltaRemoteUsers role.”, then run **Wonderware Application Manager** as an **Administrator**.

If **InTouch OMI** is setup on a different machine, then launching the instance of the view app will lead to an error

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

about unauthorized user. In such cases, configure the **Internet Options** as follows:

1. On the **Security** tab, under **Select a zone to view or change security settings**, click **Trusted sites**.
2. Click **Sites**, in the **Add this website to the zone** box, type the URL of the **Enterprise Console** set for the **Workflow Gateway** object, click **Add**, and then click **Close**.
3. Under **Security level for this zone**, click **Custom level**.
4. Under **Settings**, browse to **User Authentication > Logon** and click **Automatic logon with current username and password**, and then click **OK**.
5. Click **OK** to close **Internet Options**.

Cryptography Settings Inside InTouch OMI

You can import the cryptography settings from a server where AVEVA Work Tasks is installed to this server.

To Import Cryptography Settings

1. Open InTouch OMI application, and then click **Launch**.

   The **AVEVA Work Tasks Cryptography Settings** screen appears.

   Note: The Cryptography Settings screen is available if there are AVEVA Work Tasks controls in InTouch OMI and you are importing the Cryptography settings for the first time. Later to update the settings, you need to place the **.settings** file in the InTouch OMI user's ViewApp Instance folder i.e., *C:\Users\<user name>\AppData\Local\ViewApps\<viewapp instance>\Controls\AVEVAWorkTasksApp001*
2. On the **Cryptography Settings** page, do the following:
   a. Enter the passphrase for the settings.

      Note: Enter the same passphrase that you configured in AVEVA Work Tasks for Cryptography Settings using Farm Configuration Wizard.
   b. Click **Import** to import the cryptography settings file in the server.
3. Click **Finish**.

   The cryptography settings get imported to the InTouch OMI server.

Historian Server

You can monitor multiple and specific Historian Event tags using the Historian server. You can also trigger the Workflow from System Platform based on an action in the Historian Server.

Trigger Workflow from the Historian Server

You can trigger the Workflow from System Platform based on an action in the Historian Server.

Prerequisites

- ArchestrA should be installed.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

- Gateway object should be imported.
- AppEngine process owner should have Registry read permissions and file read-write permissions.

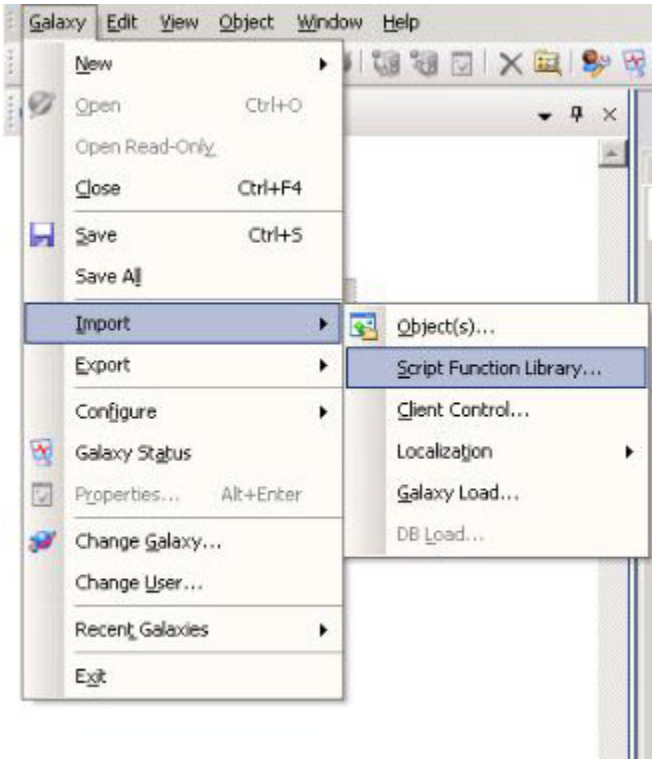
Historian

1. Creating Historian Event tag

   You can create a new Historian event tag or use an existing Historian event tag for triggering System Platform workflow. For creating the Historian event tag, see the Historian documentation available in Start > Programs > Wonderware Historian folder.

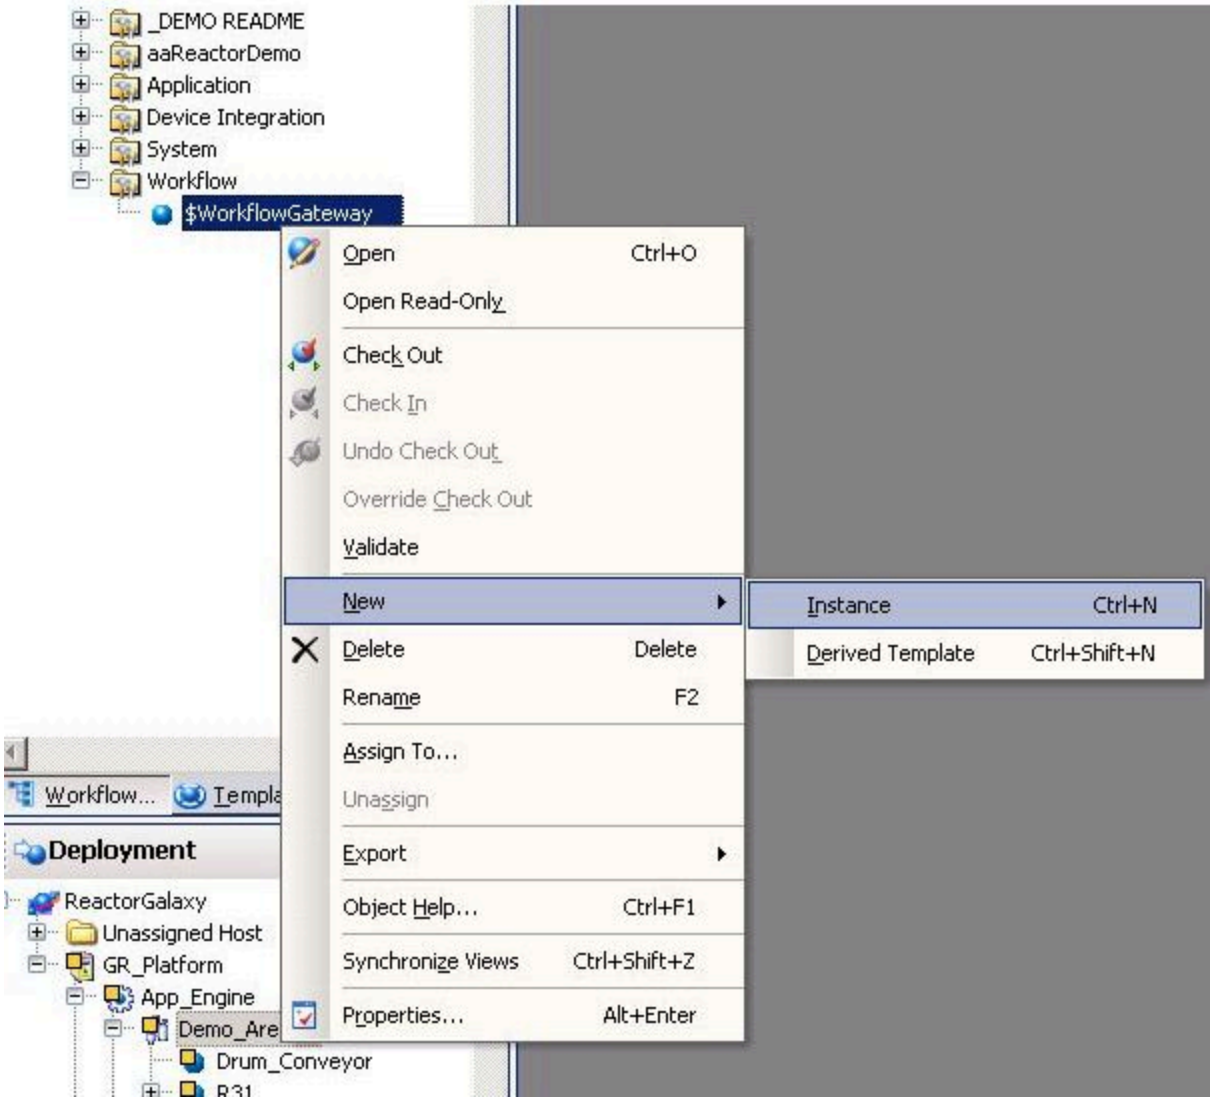
2. System Platform IDE: Importing Script Function Library

   Import the script library (Historian.EventScript.dll) from <A2 Install Path>\Workflow\ScriptLibrary



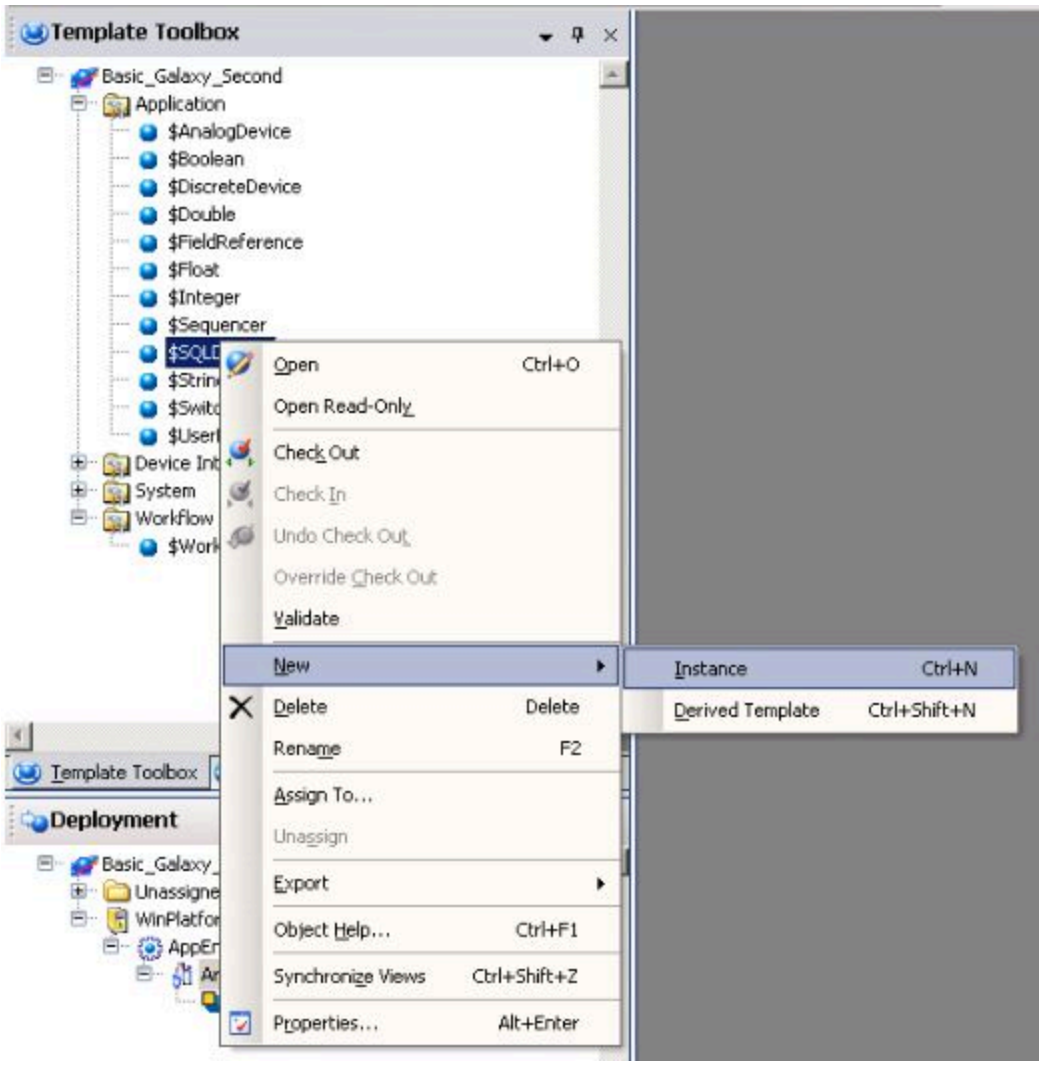
3. Creating Gateway object: Create a new instance. Right-click $WorkflowGateway, point to New, and select Instance. An instance with name WorkflowGateway_001 is created.

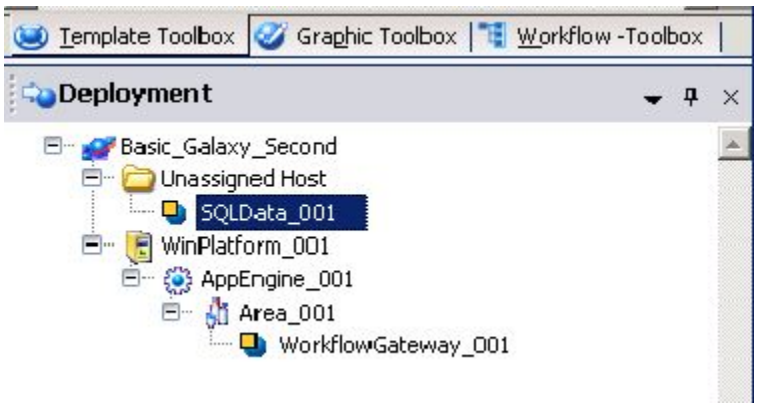
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



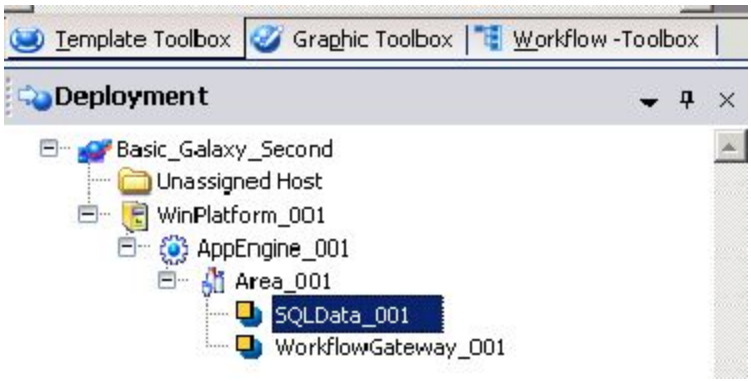
4. Assign this instance to the proper AppEngine and area.
5. Next, configure the Gateway object, as described in Initial Gateway Setup.
6. Next, you can create an instance of the app object from a template, such as the SQL Data template.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.





© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Monitor Multiple Historian Event Tag

Follow steps 1-7 listed in Trigger Workflow from the Historian Server and continue:

1. Next, you need to create a user-defined attribute (UDA) (by clicking the + sign) for each Historian event tag to trigger a workflow for a Historian event occurrence. The category for the UDA should be User Writeable.
2. Write a script to get the triggered event information from Historian.

   You need to run the script in asynchronous mode. Select the Runs Asynchronously check box. The sample script is given below:

```
dim dataTables as System.Data.DataTable;
'Add UDA for each Event Tag; Make all the values of attributes as false here
SQLData_001.On_SysStatusEvent_Trigger = false;
dataTables =
Historian.EventScript.HistorianEvent.GetTriggeredEvents("HistorianDatabaseServerName"
, "DatabaseName", true, "", "","GalaxyName", "ObjectName", me.Last_Lookup_Key);
If(dataTables <> null)Then
'Add if else to check each tag;
if(dataTables.Rows[0]["TagName"] == "SysStatusEvent")Then
'Make the respective attribute value as true if the event tag name matches;
SQLData_001.On_SysStatusEvent_Trigger = true;
EndIF;
if(dataTables.Rows[0]["TagName"] == "ExternalEvent")Then
'Make the respective attribute value as true if the event tag name matches;
SQLData_001.On_ExternalEvent_Trigger = true;
EndIF;
me.Last_Lookup_Key = dataTables.Rows[0]["EventLogKey"]
Endif;
dataTables = null;
```

Explanation of the script:

- The Historian.EventScript.dll has one public static method named as GetTriggeredEvents. The script above shows how to invoke the GetTriggeredEvents method.
- The GetTriggeredEvents method return type is System.Data.DataTable. The data type will have two columns, EventLogKey and TagName.
- Last_Lookup_Key is the value of the last EventLog fetched from the Historian database. If the primary server fails for any reason, the backup server will automatically start monitoring the Historian server using the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Last_Lookup_Key value.

- The GetTriggeredEvents method has seven parameters, as described below:

Parameter Name	Datatype
serverName	String
databaseName	String
isWindowsAuthentication	Boolean
userId	String
password	String
galaxyName	String
objectName	String
lastProcessedNumberRead	Integer

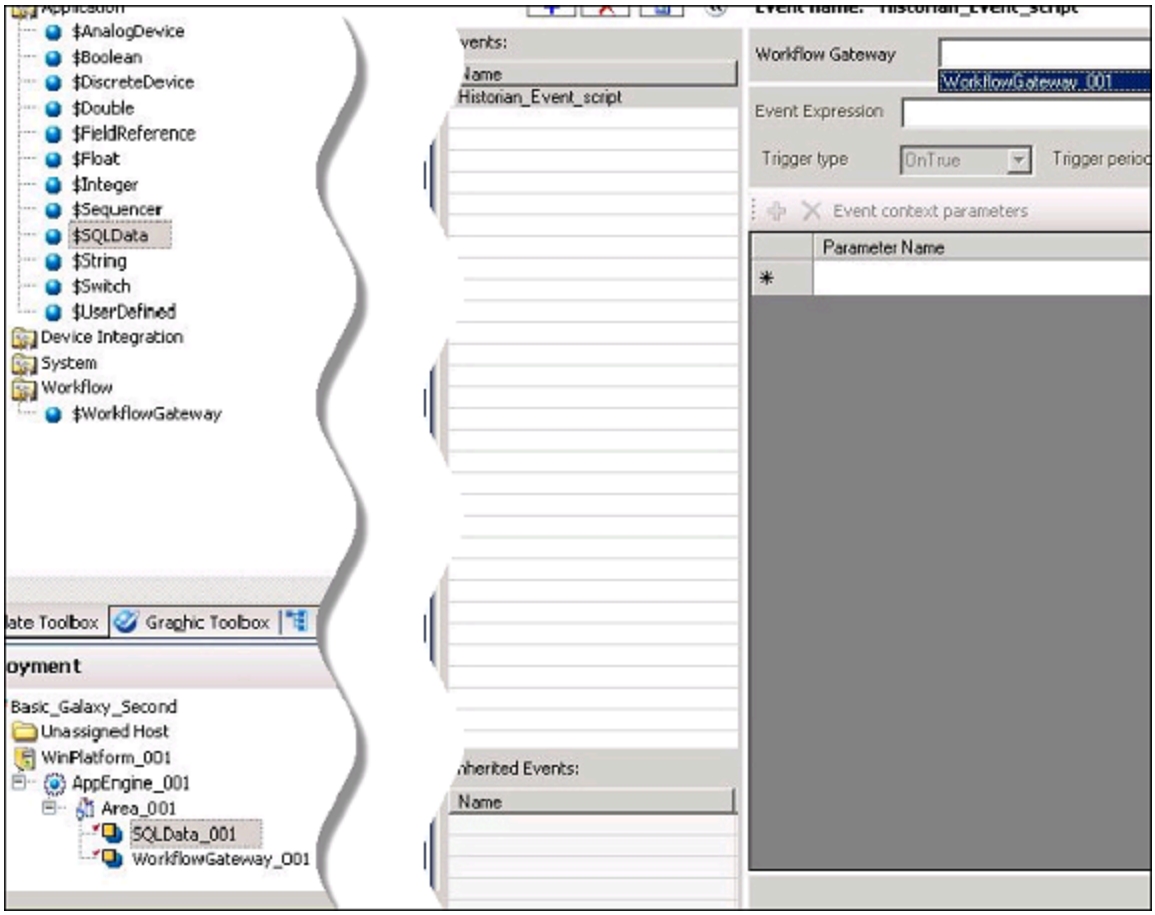
Ensure to set the SQLData_001.On_SysStatusEvent_Trigger to 'false' at the beginning of the script.

Associating Workflow Event with System Platform Workflow

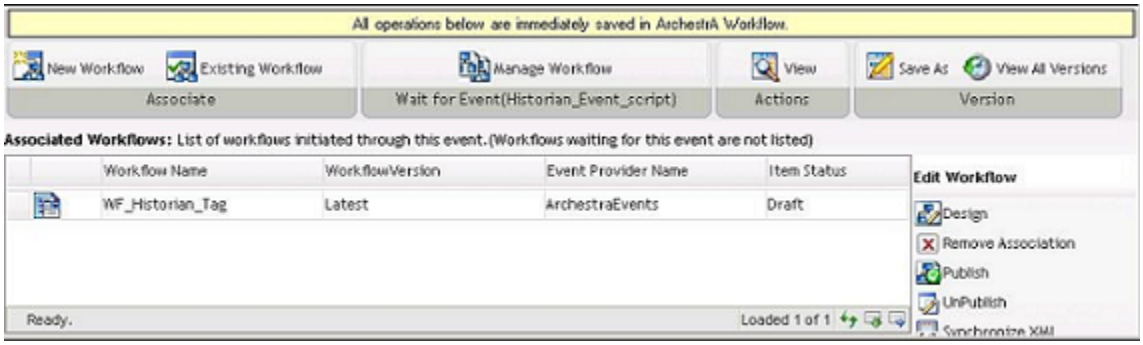
1. Create a workflow event to attach the workflow. Select the Workflows Tab of SQLData_001.

   For event association details, refer to Associate an Existing Workflow to a Workflow Event.
2. Click the + sign to add an event, Historian_Event_script. Select WorkflowGateway_001 from the Workflow Gateway drop-down list and click Select.

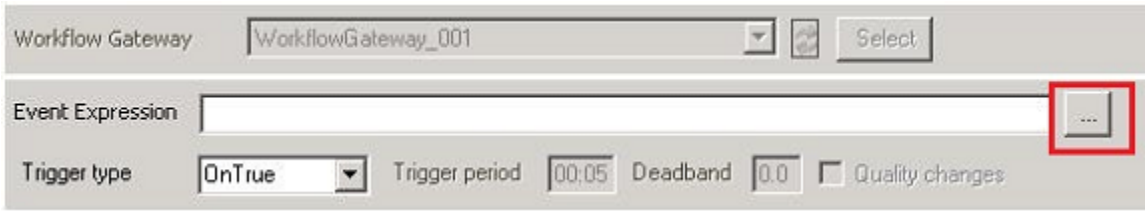
© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



3. The Associated Workflows section appears. You can create a new workflow or use an existing workflow to associate with this event.
4. After you add the workflow, it appears in the Associated Workflows list.



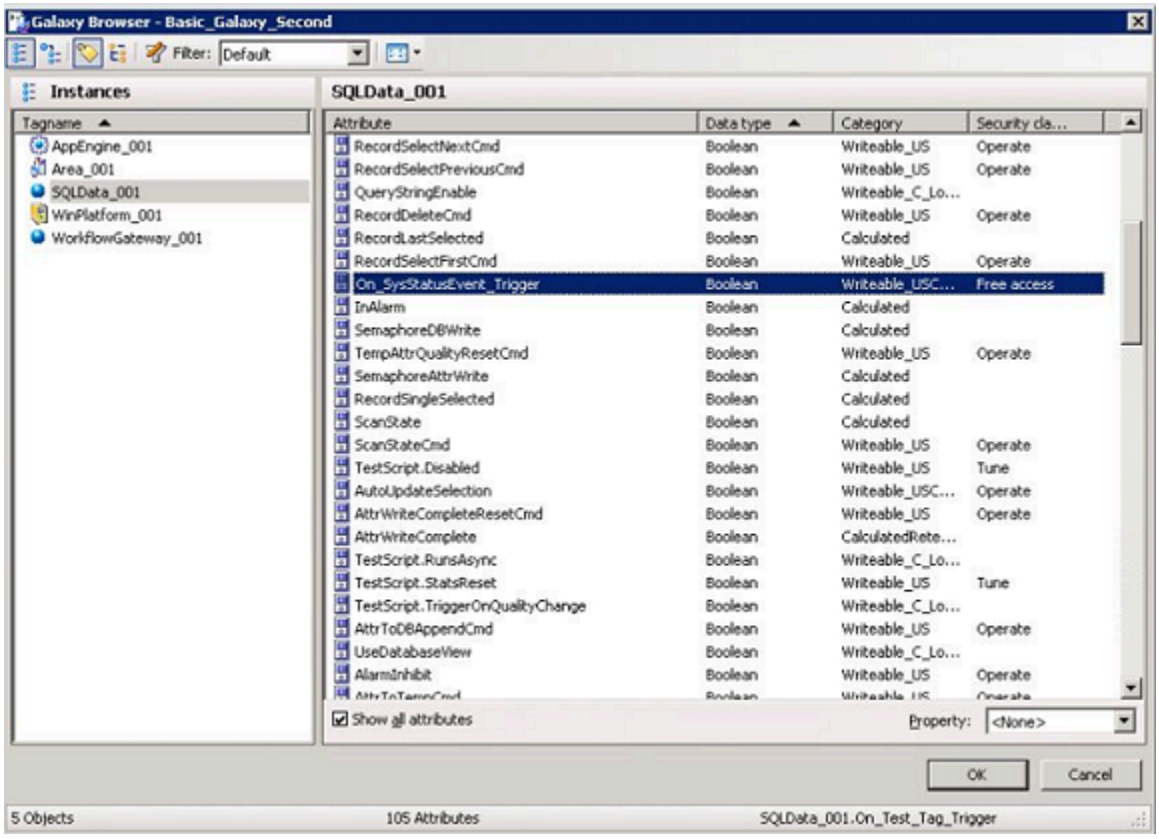
5. Next, you need to set the event expression. Click the Expression Editor button on the right side. The workflow gets triggered depending on the Trigger Type selected.



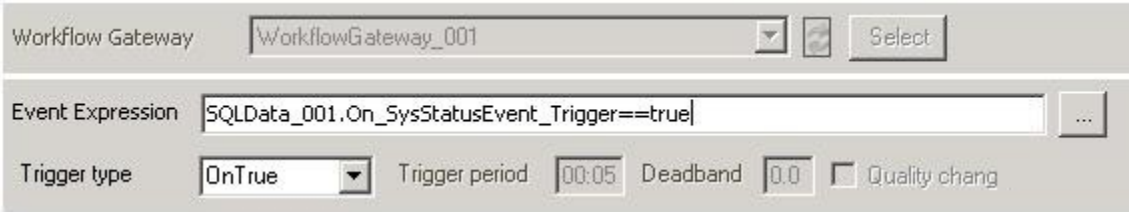
The Galaxy browser appears.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

6. Select the SQLData_001, On_SysStatusEvent_Trigger attribute and click OK.

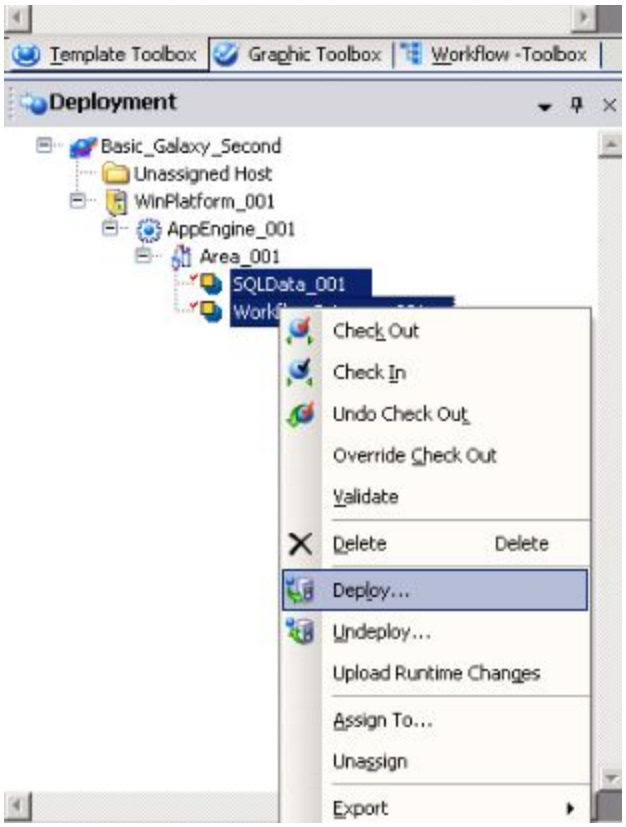


7. The SQLData_001.On_SysStatusEvent_Trigger attribute appears in the EventExpress (OnTrue) box. Add ?==true? after the attribute name and click the Save button.



8. Next, deploy the objects by right-clicking on the SQLData_001 and WorkflowGateway_001 objects and selecting Deploy.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.



Continue to monitor the EventHistory table of the Historian database. If any matching tags are inserted, the WF_Historian_Tag workflow will be fired.

Monitor Specific Historian Event Tag

1. Follow the steps listed in Trigger Workflow from the Historian Server.
2. Next, you need to create a user-defined attribute (UDA) (by clicking the + sign) for each Historian event tag to trigger a workflow for a Historian event occurrence. The category for the UDA should be User Writeable.
3. Next, write a script to get the triggered event information from Historian.

   You need to run the script in asynchronous mode. Select the Runs Asynchronously check box. Sample script is given below:

```
dim dataTables as System.Data.DataTable;
'Add UDA for each Event Tag; Make all the values of attributes as false here
SQLData_001.On_SysStatusEvent_Trigger = false;
dataTables =
Historian.EventScript.HistorianEvent.GetTriggeredEventsForSpecificTag("HistorianDatab
aseServerName", "DatabaseName", true, "", "","GalaxyName", "ObjectName",
"SysStatusEvent", me.Last_Lookup_Key);
If(dataTables <> null)Then
SQLData_001.On_SysStatusEvent_Trigger = true;
me.Last_Lookup_Key = dataTables.Rows[0]["EventLogKey"]
Endif;
dataTables = null;
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Explanation of the script:

- The Historian.EventScript.dll has one public static method named as GetTriggeredEventsForSpecificTag. The script above shows how to invoke the GetTriggeredEvents method.
- The GetTriggeredEvents method return type is System.Data.DataTable. The data type will have two columns, EventLogKey and TagName.
- Last_Lookup_Key is the value of the last EventLog fetched from the Historian database. If the primary server fails for any reason, the backup server will automatically start monitoring the Historian server using the Last_Lookup_Key value.
- The GetTriggeredEvents method has seven parameters, as described below:

Parameter Name	Datatype
serverName	String
databaseName	String
isWindowsAuthentication	Boolean
userId	String
passWord	String
galaxyName	String
objectName	String
tagName	String
lastProcessedNumberRead	Integer

Ensure to set the SQLData_001.On_SysStatusEvent_Trigger to false at the beginning of the script.

Associating Workflow Event with System Platform Workflow

1. Next, you create a workflow event to attach the workflow. Select the Workflows tab of SQLData_001.
   For event association details, refer to Associate an Existing Workflow to a Workflow Event.
2. Click the + sign to add an event, Historian_Event_script. Select WorkflowGateway_001 from the Workflow Gateway drop-down list and click Select.

Continue to monitor the EventHistory table of the Historian database. If any matching tags are inserted, the WF_Historian_Tag workflow will be fired.

Retrieve Historian Data Using Database Activity

AVEVA Work Tasks has a powerful feature where it can connect to and retrieve data from Wonderware Historian Server using an AVEVA Work Tasks Database Activity. You can use this functionality in many scenarios, a few of which are described below:

Your network administrator needs data on the number of system status event tags that have been fired in a particular time-frame, which can then be used to optimize system performance.

Using the Database Activity, you can fetch data from the Historian database on how many SysStatusEvent event tags have been triggered in the last one week.

How you go about it:

Use the queries shown below in the database activity to get the desired output.

Sample Script 1: This script gets the Event Trigger history for a specific EventTag for a specific time-span.

```
--Get Event Trigger history for a particular EventTag for the last 10 days
SELECT isnull((select HierarchicalName from
dbo.faaGetHierarchicalAttributeNames(Tag.TagName)),Tag.TagName)as HierarchicalName ,
Description, DateTime = convert(nvarchar, DateAdd(mi,60,DateTime), 21), DetectDateTime =
convert(nvarchar, DateAdd(mi,60,DetectDateTime), 21)
FROM EventHistory
INNER JOIN Tag ON Tag.TagName = EventHistory.TagName
WHERE Tag.TagName IN ('SysStatusEvent')
AND DateTime >= DateAdd(DAY,-10,GetDate())
AND DateTime <= GetDate()
```

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Samples Script 2: This script gets all the Event Trigger history for all EventTags for a specific time-span.

```
--Get All Event Trigger history for last 10 days
SELECT isnull((select HierarchicalName from
dbo.faaGetHierarchicalAttributeNames(Tag.TagName)),Tag.TagName)as HierarchicalName ,
Description, DateTime = convert(nvarchar, DateAdd(mi,60,DateTime), 21), DetectDateTime =
convert(nvarchar, DateAdd(mi,60,DetectDateTime), 21)
FROM EventHistory
INNER JOIN Tag ON Tag.TagName = EventHistory.TagName
WHERE DateTime >= DateAdd(DAY,-10,GetDate())
AND DateTime <= GetDate()
```

Samples Script 3: This script gets details of all Analog tags.

```
--Get detail of all Analog Tag
SELECT isnull((select HierarchicalName from
dbo.faaGetHierarchicalAttributeNames(Tag.TagName)) ,Tag.TagName)as HierarchicalName ,
Description = Tag.Description, MinRaw, MaxRaw, Unit, MinEU, MaxEU, StorageRate,
StorageType, DateCreated
FROM AnalogTag, Tag, EngineeringUnit
WHERE Tag.TagName = AnalogTag.TagName
AND AnalogTag.EUKey = EngineeringUnit.EUKey
```

To create Database connection object in the Workflow

1. Open the Database Connections object.
2. Click on New Connection.
3. Enter title, description and uncheck the "Connect to repository data source" check box
4. Database Type will be SQL server as the data store of Historian is Microsoft SQL server.
5. Keep the Connection Type as Connection string.
6. Mention the server name (Server name of Historian Database).
7. Select the Authentication type.

   If Authentication type is "SQL server", then mention User Id, Password and Advance Settings.
8. Click the Refresh buttons to get all the databases in the specified server.
9. Select runtime for historian data.
10. Click Test Connection.

    If the connection succeeds, the Save button will be enabled.
11. Click the Save button.

    The connection string is stored.

To add the Database Activity

Database Activity is an activity inside the workflow wherein the workflow actually establishes the connection to the database server and performs actions to retrieve or update data in the database. The activity helps to execute Queries, Stored Procedure and Functions in workflows with ease.

The database activity can execute your queries, stored procedures and functions and carry the result in an XML variable where the schema will load the columns of the table in your database and will contain the value as per the given query.

For Insert and Update statements, we need not give the XML Variable Name since it does not return any value.

1. Hover the cursor on Enterprise Console and click on Workflows.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The Workflow window will open.

2. Click on the Workflow ribbon in the ribbon bar.
3. Enter the workflow name and description.
4. Click on Save and Continue. A window appears.
5. Click on Finish.

   (Design the Workflow Now option should be checked before clicking on Finish: this is a default selection).

   Workflow Design Editor will appear.
6. Add the database activity to the Workflow design.
7. Go to the properties of the Database Activity.
8. Change the Activity Name, if required. Add the Description, if required.
9. Select the database connection from the drop down and click on Save button.
10. Click on the Query Builder icon.

Query Builder

1. Select Command Type Query
2. Enter Query, you can use the same query mentioned I the scenario section.
3. Click on the Load Parameters button. It will load all the parameters below.
4. Enter the value of the parameter.
5. Enter the output XML variable name.
6. Save the information by clicking on the Save button.
7. If you want you can click on View Schema button to view the schema of the HistorianDataLoad variable as displaying in the below screen.
8. Click on Close button to close the view schema window.

Note: Multiple queries are not supported. If multiple queries are used, XML variable will carry the result of the last query written.

To log data in Console logger:

Close the query window and back to workflow design editor.

1. Drag and Drop "Logger" from Engine Activity. Right click on the logger image and click on property.
2. In Activity property, modify name if need. Add description if required.
3. Select "i – Information" as LogType.
4. Click on the right-most button to open the LogMessage property page.
5. Select XML Variable as Field.
6. The drop-down list will be populated on selecting the drop-down field.
7. Select "HistorianDataLoad" in the drop-down list.
8. Select Table in the last drop-down list and click on Append button.
9. After append, click on the Update button of the page.
10. On clicking Update, this page will be closed and the workflow design page will be on focus. Now we are done with the Workflow.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

11. Click TestRun. Before clicking "TestRun", open the Logger Console.
12. If it succeeds, then check the Logger console whether all expected rows have been logged or not.

Information Server

You can configure workflow Repository and Farm for Information server. You can also configure workflow server to add the Repository details.

Configure Repository Using AVEVA Work Tasks Connector for Information Server

Configure Repository Using AVEVA Work Tasks Connector for Information Server

- Provide connectivity from Information Server to the Workflow Repository.
- Enable Information Server users to access the Workflow Repository functionality from within Information Server.
- Enable access to Central Configuration where users can create or edit workflow repositories, and use its functionalities.

Configure Workflow Repository and Farm for Information Server

To configure Database Credentials for Information Server Database

1. Run the AVEVA Work Tasks Connector for Information Server application (Programs > AVEVA> AVEVA Work Tasks > Information Server > AVEVA Work Tasks Connector for Information Server).

   The Database Server Name and Database Name appears.

   - Database Server Name: Displays the Information Server Database Server name. This is auto-populated from the Registry and is Read-only.
   - Database Name: Displays the Information Server Database name. This is Read-only.
2. Select the Windows radio button to test the connection using the Windows authentication mode. You need not type User ID or Password, if you select this option.

   Or

   Select the SQL Server radio button to test the connection using the SQL Server authentication mode. Type "User Id" or "Password", if you select this option.

   Enter the "SQL Server" username in User Id.

   Enter the "SQL Server" password in Password.

   The credentials should have row insertion and deletion permission for the SuiteVoyager database.
3. Click the Test Connection button.
   - If the connection succeeds, the Next button will be enabled.
   - If the connection fails, you have to re-enter the details.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Configure Workflow Server to Add Repository Details

To configure the Workflow Server to Add the Repository Details for AVEVA Work Tasks

1. Enter the **Unique Environment Name**.

   The Unique Environment Name, by default, is a combination of the machine name and Information Server, and is editable the first time. After repository configuration is done, it cannot be edited.
2. Enter the Workflow server address.
3. Enter the AVEVA Work Tasks user domain.
4. Enter the user ID of the AVEVA Work Tasks user.
5. Enter the AVEVA Work Tasks user password.
6. To check if authentication is successful, and to see the list of repositories available, click **Test Connection**.

   If the authentication is successful, the **Repository Name** field is populated with repositories available.

   If the connection fails, you need to re-enter the details.
7. Select the repository name from the **Repository Name** drop-down list.

   The Provisioning screen appears.
8. Select the provider from the drop-down list, username and password, depending on provider selection.
9. Click **Authorize** to enable provisioning.

   The Workflow Server and Repository Details screen appears.
10. Click **Connect** to configure the repository for WIS.

Manage Connected Workflow Repositories

The Manage Connected Workflow Repositories screen appears.

Next, you can add or delete workflow repositories by using the Add New or Delete buttons respectively.

When you connect, this repository is listed in WIS under Workflow Repositories node. Also, the Central Configuration link of the Repository is created under the Workflow Farm node.

Administrative Activity

The administrator can perform three activities to customize the workflow repositories and workflow farm links to the specific users:

- Add Custom Panel
- Add User Permissions
- Perform Workflow Repository Functionality Within Information Server

Add Custom Panel

1. Select **Administration > Panel Manager > New Panel**.
2. Add the Panel name and click anywhere in the right pane.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

The **Edit**, **Delete**, and **Rename** options appear. You can edit, delete and rename the panel, using these options.

3. To configure the options, click **Edit**.
4. Drag and drop activities into the Custom Panel.
5. Click **Users** to add users.

   The updated Custom Panel shows the new custom panel configuration.
6. Click **Save Panel Content** to save the Custom Panel.

   A message appears indicating that the panel tree information is saved successfully.

Add User Permissions

1. Click **Users** under **Panel Content** to add users for the custom panel that you created.
2. Under **Panel User Access**, select the required domain from the **Domain** drop-down list.
3. Click **Retrieve Users from Selected Domain**.

   The list of user names is displayed under **Domain Users**.
4. To add a user, select the user name and click **Add**. You can add multiple users.

   You can also remove users by clicking the **Remove** button.
5. Click **Save Panel Content**.

   A message appears indicating that the panel tree information is saved successfully.

Perform Workflow Repository Functionality Within Information Server

Within Information Server, a user sees the Custom Panel as per details that the administrator has set for the user.

Workflow Farms

In the Workflow Farm, you can perform any workflow-related operation using the available links.

Workflow Repositories

- Click the **WISRepo** repository link.

  An automatic pop-up screen appears to display the Inbox, if the user authentication type is Active Directory.
  - If the user authentication type is AVEVA Work Tasks List (not Active Directory), you will be directed to a Login page for entering the credentials.
  - If the pop-up page does not open automatically, click the repository name in the right pane to open the repository.

Troubleshoot Issues

Issue:

In case of multiple providers, unable to browse the AVEVA Work Tasks website for URL mapped to Information

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

Server.

Resolution:

1. In the **AVEVA Work Tasks Connector Configuration for Information Server** window, delete the provisioned repository.
2. Click **Add New** to add a new repository.

   The Server and Repository details window appears.
3. Enter the **Unique Environment Name, Server address, Authentication User Domain, Authentication User ID, Authentication,** and **User Password**.
4. Click **Test Connection**.
5. In Provision window, select the **Provider**.
6. Enter user name and password, and then click **Authorize**.

   The Repository name will be populated in the Server and Repository details window.
7. Go to **Advanced** tab.
8. Select the correct **User Provider Name** from the available list.
9. Click **Connect**.

Intelligence Data Inside Workflows

You can use the database activity to fetch the data from the AVEVA Work Tasks Intelligence (EMI) datastore. For details, see the subsequent topics.

Fetch Data from Intellience Datastore

You can use the database activity to fetch the data from the AVEVA Work Tasks Intelligence (EMI) datastore.

Database activity, a part of Engine activities, is an activity inside the workflow where the workflow establishes the connection to the database server and performs actions to retrieve data from the database. This activity executes user queries and the result is in created in an XML variable. This ml variable has the schema of columns of the database table and contains values based on the query made.

Before creating the database activity, you need to create a database connection object, which connects to the AVEVA Work Tasks Intelligence datastore.

Scenario: The AVEVA Work Tasks Intelligence datastore has the historical OEE data of the plant. This data can be sent to corporate management, plant management, and engineers, for them to know details of the performance, quality, and availability of the plant. For example, corporate management can be updated with the production information, such as total numbers of products, defective products, expenses of plant on a weekly basis.

For this feature to happen as part of the workflow, we need to create the database activity to fetch the data from the fact table and the dimension tables.

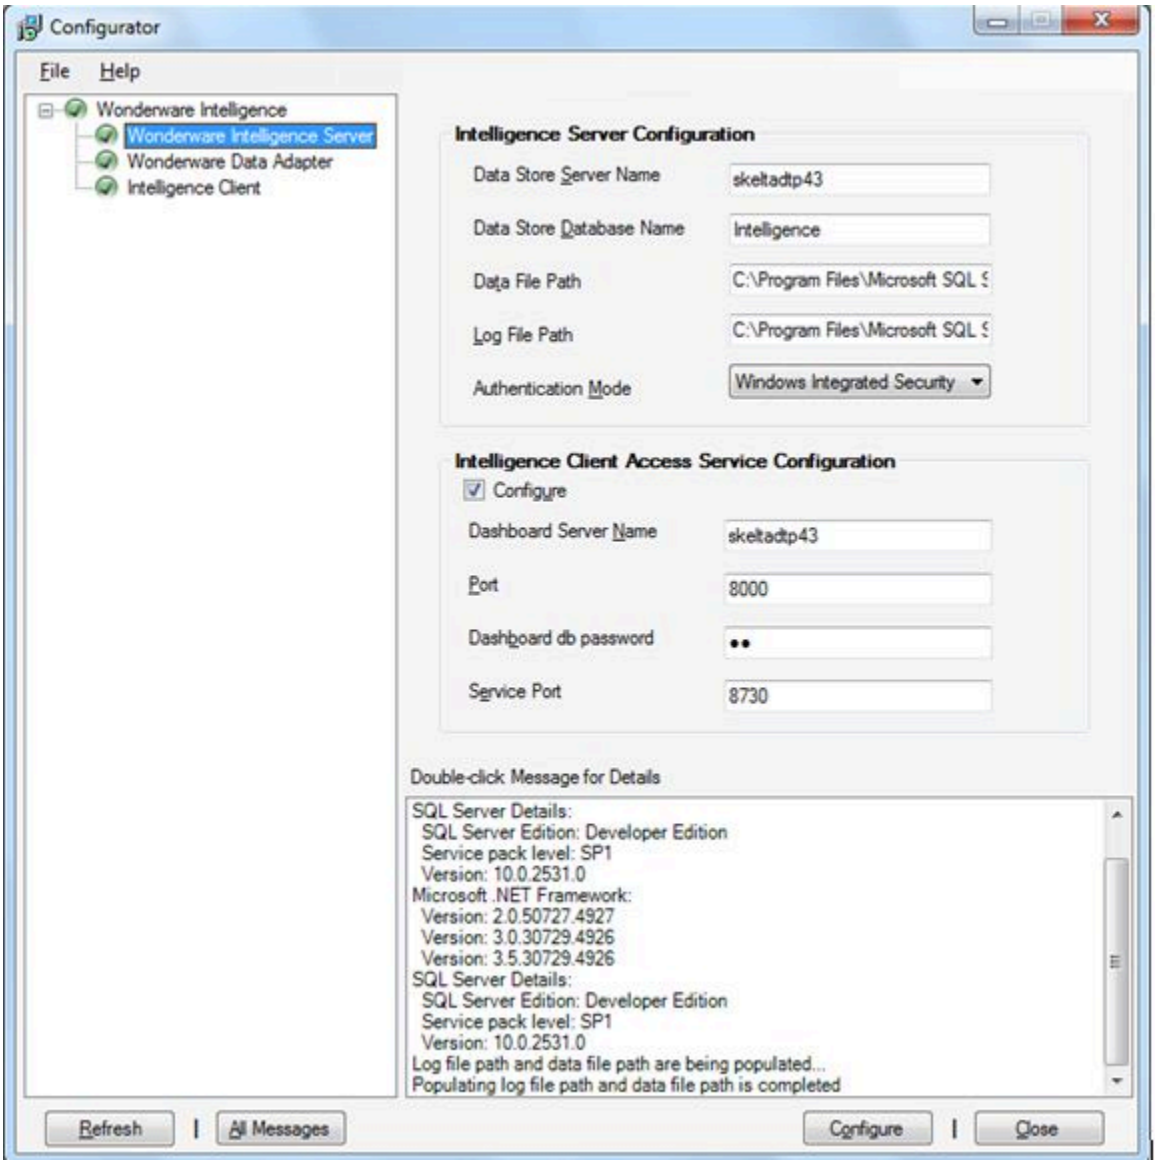
Configure Workflow

You need to first create the database connection to create the database activity.

To create the database connection for an activity, you need the server name, database name and database

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

authentication information of the datastore. You can get this information from the Wonderware Intelligence configuration.



To create a Database Connection for the Workflow:

1. Open the Database Connections object.
2. Click on New connection.
3. Enter title, description and uncheck the "Connect to repository datasource" check box.
4. Select SQL server as the database type.
   Keep the Connection string as Connection Type.
5. Enter the server name (Server name of datastore).
6. If the authentication type is SQL Server, then enter User Id, Password and Advance Settings.
7. Enter the Database name (datastore name).
8. Click on the refresh buttons to get all the databases on the specified server.

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

9. Click on Test connection.

   If the connection succeeds, the Save button is enabled.
10. Click Save.

    The Connection object is created and listed.

Add Database Activity

You can add the database activity to the existing workflow or to a new work flow. In the workflow, using the database activity, you can fetch the production information of the industrial plants and show them in the logger. This information can be mailed to users in real-time and can be scheduled using scheduling activity.

To add Database Activity

1. Select the Workflows option to create a new workflow.
2. To create a new workflow, click on Workflow.
3. Add the title for the workflow.
4. Click Save & Continue.
5. Select Design the Workflow now option.
6. Click Finish to design the workflow.
7. Go to the Engine activities to find Database activity.
8. Add the database activity to the workflow design.
9. Go to Properties of the database activity.
10. Change the Activity Name if needed.
11. Add the Description if needed.
12. Select the database connection from the drop-down list and click Save.
13. Click on the Query Builder icon to create the query to fetch data from Intelligence datastore.

Query Builder

1. To enter the query, click on the Query Builder property to open the property window.

   Set the following properties:

   - Command Type: Select the Query command.
   - Query: You can enter the query either in the text box or from Expression builder.
   - Output XML variable

   Example: The query can be "Select * from FactTable" and if the query is to be passed with parameters, then the query will be "Select * from FactTable where DefectiveProducts >@defectiveProducts". Here @ defectiveProducts is the parameter.
2. Click Load Parameters. It loads the parameters within the query. In the Value field you can pass the value for the parameter or assign the values from a workflow variable. Enter the Output XML variable to store the select result set in the XML format. Click Save.

   The query used in this example fetches the product-related information from the fact table and product dimension table. It fetches the total number of products, defective products and expenses based on the

© 2015-2025 AVEVA Group Limited and its subsidiaries. All rights reserved.

ProductionDate range and setting of defective products > 1000. The variable @defectiveProducts value is kept constant to 1000. The production date range values come for the work flow variables.

select p.Product, p.ProductType, f.TotalProducts, f.DefectiveProducts, f.TotalExpenses from FactTable f inner join Product p on f.productId = p.productId where f.DefectiveProducts > @defectiveProducts and ProductionDate between @currentDate1 and @currentDate2

3. Save the information. Click on 'View Schema' to view the schema of the output XML variable "outXmlInfo".

   The XML Variable "outXmlInfo" will be added in the Start Activity > XML Variables.

   Parameter values cannot update data types like ‘image’, ‘blob’ and ‘unique identifier’ from XML variables or variables.

4. Output XML Variable for return value: The Output XML variable will have the schema of the table as per the query entered. If the query is "Select * from Products", the XML variable will have all the columns as attributes in the schema. These can be looped through and used in the subsequent activities. The Output XML Variable name should be unique.

   To create an XML Iterator of the output XML Variable, the node selected should always be the "Table" node. XML Iterator can be created in the XMLVariables section of Start activity.

Activity outputs: The Database Activity returns the following values.

- Successful: Displayed when the query is executed.
- Unsuccessful: Displayed when the query execution is unsuccessful.

Add ForEach Loop

In case, if it is required to iterate through each node of the output XML variable, then we can use the foreach-loop.

In the following example, we will iterate through the output variable @outXmlInfo and log the values of each node.

1. Drag the ForEach-Loop activity from the Engine Activities section to the workflow.
